However, as creatures essentially of light, the beneficent demons were most drawn to, and acted as mediums of, light: light scintillating from the faceting of gems and crystals, reflecting from pools and mirrors (natural or man made), refracting through lenses, beaming from lamps and lanterns, haloing clouds, and in shimmering mirages. Indeed the entire realm of optics was theirs, and necessarily so, given that Ficino thought of light as in some ways the spirit, or as linked to the spirit, of the natural world, its source being in the sun but its essence radiating through the length and breadth of the cosmos as life itself, as visible animation. In the *Platonic Theology* 8.13, citing the followers of both Orpheus and Heraclitus, Ficino actually calls light ‘visible soul’ and soul ‘invisible light’. Hence the importance for him of Zoroastrian and Hermetic light worship or of light in worship, and the haunting significances of the reference to God in St. James' Epistle 1:17 as ‘the father of lights’ and of the noonday setting with the stridulating cicadas of Plato's *Phaedrus*. These harmonizing insects Ficino identified with demons, in the particular sense of men who had entered, after philosophizing for the requisite three millennia, a quasi immaterial, light-filled, demonic condition, being ruled entirely by their intelligences and about to repossess their glorified spirit-star bodies as their envelopes or vehicles. All light demons, whether erstwhile philosophers or planetary spirits, were benevolent, intellectual, even musical presences, higher pneuma-borne souls whom we will ultimately accompany in the universal cavalcade Jupiter leads across the intellectual heaven, thence to gaze from afar at the intelligible beings, the Ideas in their collectivity as both the unfolding or radiance of Beauty, and the enfolding or incandescence of Truth.

This demonological world is not confined, furthermore, to aromatic, musical or intellectual invocation in hymns or prayers at such threshold times as dawn, noonday, and dusk. For Ficino was also fascinated by ancient *idolum* theory. On the one hand, there was the materialist view, articulated most memorably by Lucretius, that effluvia or

material images, *idola*, emanated from all objects, and were seen most obviously in mirrors (hence the Aristotelian story that mirrors bled in the presence of menstruating women). On the other hand, there were enigmatic references in Plotinus, Proclus, the *Orphica*, and the *Chaldaean Oracles*, to the idolum as the densest and most visible form of the spiritual body, to its being in some respects the shadow or other residual self. Plotinus' references to Homer's account of the shade, the idolum, of Hercules in the *Enneads* 1.1.12 and 4.3.27 were especially notable since they pointed to the readers' own demonic duality, their condition not so much as souls tied to bodies, but as higher souls tied to lower secondary souls, that is to say, to images or reflections of themselves. Life was seen now as the Platonic mirror, however distorting, to which Socrates alludes in the *Republic* 596DE when he speaks of the sophisticated or "easy way" in which the created world might be reproduced catoptrically: 'You could do it most quickly if you should choose to take a mirror and carry it about everywhere. You will speedily produce the sun and all the things in the sky, the earth and yourself and the other animals'. Following Plotinus, Ficino interpreted this as an enigmatic reference to the World Body as it reflects the idolum of the World Soul, an idolum that is in turn identified with the twice-born Dionysus, lord of ecstasy and dance. Optics, accordingly, and its accompanying plane geometry, and especially (given the section in the *Timaeus*) the geometry of right triangles and the Pythagorean theorem that determines the squares and square-roots, the "powers" of their sides, became the key to understanding the nature of our reflected, catoptric demi-lives as Dionysian images tied to images, to *idola* and *effluvia*. It also became the key to understanding the demons and, by implication, our own ascending, philosophical, Apollonian selves, as beings who can pass like Alice through the terpsichorean illusions of the mirror plane into the world of intellectual, uranian light.

In such an ascent, man will again become the Hermetic and Orphic "spark", the "colleague" of a star that we once were, before our precipitation from Cancer, the Moon's constellation and "the gate of mortals", down through the nest of planetary spheres. As man ascends again towards Capricorn, Saturn's constellation and "the gate of the gods", he assumes the demonic, stellar, luminous body that is eternally his, and that Zoroaster had assumed when he devised an astral alphabet. For man, Ficino writes in a generic letter to the human race, is an earthly star enveloped in a cloud, while a star is a heavenly man (*Opera*, 659).

6. CONCLUSION

Ficino was voyaging through the straits of unorthodoxy out into the open seas of the ancient Gnostic heresies, including Manichaeism, that had been attacked by various Church Fathers, preeminently Augustine, and by Plotinus, Ficino's greatest Platonic authority next to Plato himself. That such esoteric and magical speculations did not get him into trouble is a measure of his personal diplomacy (testifying to his commitment to accommodation) and of the solidity and weight of his other philosophical and theological works. A century later → Giordano Bruno was burned at the stake for notions that were no more revolutionary. Ficino bequeaths us both the venerable Christian emblem of man as *viator* and the pagan emblems of him as a cicada, an Orpheus with his lyre strung to the planetary modes, a Hermetic seal, a Zoroastrian magus, a spark struck from the flint of dionysian matter, a starry charioteer in the *biga* of the soul. For his audacious attempt to reconcile Platonism with Christianity went far beyond Platonism: it became a life-long ecumenical quest to introduce into orthodoxy an encyclopedic range of unorthodox spiritual, magical, and occult beliefs keyed to the theme of the soul's ascent from the cave of illusion. That he had a profound posthumous impact upon western thought and culture for two centuries or more speaks to the European elite's continuing, if clandestine, interest in the exploration of many ideas that Plato himself would not have recognized and that had been censured and even persecuted by the Church. Ficino fervently believed, however, *a bono in bonum omnia diriguntur*. It is this credo, inscribed on the walls of his Platonic "academy" which gives to his labyrinthine pages a remarkable unity and generosity in the service of what was always a fundamentally Plotinian and therefore optimistic search for the "flower" in the mind, the oneness that is for him the object of both intellectual and spiritual ascent.

MICHAEL J.B. ALLEN

Fictuld, Hermann, * 14.11.1700 (?)
place unknown, † 1777(?) place
unknown

Hermann Fictuld is the pen name used by an individual whose identity is disputed. In 1879 the

historian of → Freemasonry Nettelblatt (Nettelblatt, 766, n. 625) quoted a manuscript he had found (he did not say where), written by the freemason Baron Ernst Werner von Raven and partly devoted to the latter's relationship with Fictuld in the years 1768-1769. 'According to this manuscript', writes Nettelblatt, Fictuld's 'real name was Johann Heinrich Schmidt von Sonnenberg. Born on 7. March 1700. As early as 1716 he became the helpmate [Gehülfe] of a military surgeon in Temesvar (Hungria) and was instructed by him in → alchemy. Later, he became acquainted with Baron Prugg von Pruggenstein from Innsbruck, who gave him further teachings in this matter'. The end of Fictuld's preface to his *Cabala mystica naturae* disconfirms the date of birth given in Nettelblatt's manuscript, because Fictuld writes he finished that book 'on my birthday, 14. November 1739'. In this same manuscript, Raven also wrote that Fictuld had instructed the persons (among whom was Raven himself) desirous to send him letters to address them to 'Baron von Minsthoff, Langenthal, Switzerland'. Moreover, the anonymous author of *Sehr rare . . . Kunststücke* (Part III, Zittau/Leipzig, ed. of 1763, Preface) claimed that Fictuld's name was actually Hans Schmidt, that he was a physician from 'Huttwill' in the Canton of Bern, and that he recently made a lot of money at the Court of a Prince thanks to his teachings bearing on the Philosopher's Stone. Indeed, the idea that he was Swiss appears in another anonymous author who mentions the works of 'the still living Adept Hermann Fictuld in Switzerland' (*Kurtze Nachricht vom Auro Potabili*, Leipzig, 1767, 18).

The name "Minsthoff" (or very similar ones) mentioned by Raven is to be found in four other documents: 1) Duveen claims that on the last page of Fictuld's *Azoth et Ignis* (1749) he had seen 'printed 8 lines in cryptography', which revealed that Fictuld's real name was 'Johann Ferdinand von Meinstoff' or 'Meinstorff' (Duveen 214, 215; but Duveen's interpretation has not been checked as yet). 2) J.F. von Frydau wrote in his *Send-schreiben an einen . . . Prinz . . . in welchem von dem . . . Stein der Weisen gehandelt wird* (Quedlinburg/Leipzig, 1762) that Fictuld's *Probierstein* (1740) was written by 'H. Fictuld und Baron Meinstoff'. This ambiguous note might indicate that these were two different persons. 3) In a letter from → Friedrich Christoph Oetinger to L.F. Castell-Rehweiler (13. May 1763, in *Oetingers Leben und Briefe*), Oetinger mentions a 'Baron von Meinstoff' who – the formulation is not clear – might be either Fictuld himself or someone close to the latter.

4) In 1779 the anonymous editor of the *Hermetisches ABC* (1779, III, 5, 251) claims to count Fictuld among the 'late wonderful and true wise men whom [he] liked very much' and says that his name was 'Meinstof' (spelt 'Weinstoof' in III, 251, which is possibly the source of the spelling used by Ferguson, see below) and that he came from Langenthal (hence, he adds, Fictuld was sometimes called Mummenthaler as a joke). Ferguson identified Fictuld as 'Weinstof' and wrote that he died in 1777 at the age of seventy-eight (Ferguson, I, 273). It would be interesting to know where Ferguson found this information concerning the date of Fictuld's death. Following Duveen, Brey Mayer and Häussermann (609) identify Fictuld as "Johann Ferdinand von Meinstorff". All these statements might contain some kernel of truth, and research into the German nobility archives may prove fruitful. In 1788 Johann Salomon Semler was of the opinion that the pen name was to be read 'HerMann F I C t V L D', as a chronogram for 1656, but Semler did not deduce anything further from this interpretation (Ferguson, I, 272 f).

Fictuld early developed a strong interest in → Rosicrucianism, and for years he toyed with the idea of giving birth to a new Rosicrucian society. In *Aureum Vellus* (written in 1747, published in 1749) he mentions the Rosicrucians with great praise, although at that time he had in mind mostly the Order of the Golden Fleece founded by Philip III the Good (in the same book, Fictuld goes as far as tracing the origins of Rosicrucianism not to Christian Rosenkreuz, but to Philip III). A manuscript dated as early as 1761 that is preserved in the Hungarian Archives of the Festetics family and considered by the historian of Freemasonry Abafi (*alias* Ludwig Aigner) to be the most important source of information for the first period of the "Gold- und Rosenkreuz", contains the rituals and statutes of a Society of the "Rosae Crucis". The account given in this document of the Order's founding is taken almost word for word from Fictuld's *Aureum Vellus* (Abafi, 81-85).

Besides, in the manuscript quoted above, Raven wrote that he received from Fictuld many letters (ca. 1767-1768) describing certain alchemical procedures. Raven was expected to compensate Fictuld financially for this information. In 1769 a certain "Br. O" replaced Fictuld as Raven's instructor. Raven describes how he quarrelled with this Brother, who in 1770 threatened to expel him from an 'association', which he occasionally referred to in his letters as 'the Society of the Ros[y] C[ross]'. Therefore, Raven's text provides evidence of the early existence in 1770 of a Rosicrucian soci-

ety. The latter was probably the first version of the fringe-masonic Order of the “Gold- und Rosenkreuz” (The Gold and Rosy Cross, “officially” born in 1777). Furthermore, Raven reveals that in the late 1760s Fictuld had become an authoritative member of the aforementioned “Society of the Ros[y] C[ross]” in which he had formerly been a rather isolated ‘instructor’. Be that as it may, it is strongly documented that later on, in the late 1770s and in the 1780s, Fictuld’s books had become part and parcel of the bibliography strongly recommended by the Superiors of the Order of the Gold- und Rosenkreuz.

In addition to Raven, Fictuld exchanged letters with Friedrich Christoph Oetinger, and in his *Probiertestein* (Touchstone) he devoted an entry to him that spread Oetingers’s reputation as far as England (a fact noted with satisfaction by Oetinger). Fictuld even sent to him one of his works before publication, asking him for his advice. But Oetinger had some misgivings. He found Fictuld ‘too little exercised in the spelling of [the letters of] the Holy Spirit, and too much attracted into the x and y of Nature’ (*Oetingers Leben und Briefe*, letters to L.F. Castell-Rehweiler, 1763-1764).

Judging from the dates given in the prefaces to his works (written in German exclusively), Fictuld wrote from 1731 to ca. 1760. The first books deal not only with alchemy, but with → magic and Kabbalah [→ Jewish Influences] as well. As a matter of fact, all his publications correspond to the way he presented himself as early as 1750, namely as a ‘Liebhaber der Theosophischen und Hermetischen Philosophischen Geheimnisse’ (an amateur in the mysteries of theosophy, hermeticism and philosophy’, see preface to his *Abhandlung von der Alchymie*, 1754). His writings fall into four main categories, which occasionally overlap in one and the same book. 1) Alchemy proper. He never tires of defending the alchemical worldview against its opponents and is lavish in descriptions of the procedures designed to prepare the Philosopher’s Stone. Like many authors writing about this subject, he exhibits a wide knowledge of alchemical literature. His writings thereon often present themselves as conversations between “philosophers”, a *topos* directly inspired by the classic alchemical work *Turba Philosophorum* (so much so that he gave this very title to one of his books). 2) Bio-bibliographical descriptions of authors who wrote on alchemy and/or philosophy of Nature. This second category is represented by the several editions of his book *Probiertestein*, which claims to be (as the title indicates) a ‘chemical and philosophical touchstone in which are tested the writ-

ings of the true Adepts as well as those of the misleading sophists’. 3) Arithmological and/or neokabbalistic speculations (for example, in *Cabbala mystica naturae*). 4) Writings which are mostly theosophical in character and which contain, for example, interpretations of Greek myths (in particular the Golden Fleece) and texts (like the *Emerald Tablet*), speculations on the Bible (preferably on the narratives on the original Falls, or on the Divine Wisdom), and developments of a Paracelsian orientation [→ Paracelsianism].

It is not surprising that *Aureum Vellus* (a big appendix [121-379] to *Azoth et Ignis*), which belongs primarily to the fourth category, was very influential among the “new Rosicrucians” since in it Fictuld discusses the chivalric Order of the Golden Fleece founded by Philip III the Good. This work is probably the only alchemical book entirely devoted to this Greek myth, which like many authors before him he interprets as ‘a hermetic [= alchemical] alphabet’. But contrary to the interpretations of most of his predecessors he does not deal with alchemy alone. A theosophical inspiration runs through the whole work, notably in the long appendix which consists of a commentary of the *Emerald Tablet*. Here, and in his *Turba Philosophorum* (1763), Fictuld provides one of the most detailed interpretations of that text ever written.

Fictuld’s language is oftentimes bombastic. At its best, it is reminiscent of the rococo style. But the vivid imagination he displays makes his books worthwhile reading. His erudition still provides a valuable resource for historians interested in late 18th century esoteric thought. Moreover, he typifies the kind of theo-alchemy (alchemy blended with theosophy, or the reverse) in Germany current at that time, interwoven with the inspiration of the so-called radical → Pietism. His works do not deserve the oblivion into which they have fallen. They merit a thorough scholarly study.

Firth, Violet Mary → Fortune, Dion

Flamel, Nicolas, *ca. 1330 Pontoise, † 22.3.1418 Paris

Flamel’s life, although destined to be legendary, had no outstanding features on the face of it. It was first that of a public writer, then of a comfortable artisan, the proprietor of a studio for the binding of manuscripts, on whom, as his ultimate professional honor, the University bestowed the title of *libraire-juré*, authorized copier of manuscripts. More than this busy career, Flamel’s wife seems to have been the origin of his fortune. At her death in 1397, she bequeathed her husband a large sum of money and much revenue from rental properties. Flamel, at his death on 22 March 1417, left an impressive legacy: about 4000 gold crowns mainly intended for charitable works and pious gifts. Flamel’s reputation as an alchemist would be born from this wealth, which was difficult to explain, but also from allegorical motifs painted on arcades that had been built at his orders, in 1389 and in 1407, at the cemetery of the Holy Innocents.

As noted by Didier Kahn, the first trace of the myth of Flamel the alchemist goes back to the end of the 15th or the beginning of the 16th century, when a French adaptation of *Flos florum* (a Latin treatise on → alchemy from the 14th century attributed to → Arnau de Vilanova) was published with the simple title: *Le Livre Flamel*. Subsequently, Flamel was incorrectly presented as the author of several other texts – notably the *Sommaire philosophique* (a French poem of the 15th century) and *Désir désiré* (1618, a French version of the *Thesaurus philosophiae* of Efferarius Monachus [14th century]) – and promoted as an authority in the field of hermetic research. The alchemical interpretation of the arches in the cemetery of the Innocents bolstered the idea that Flamel was an adept. Robertus Vallensis, their first exegete, in his *De antiquitate et veritate artis alchemiae* (1561) refers his readers, as regards the matter of pictorial illustration of the “mysteries of chemistry”, to ‘the enigma of Nicolas Flamel, who depicts two serpents or dragons, one winged, the other wingless, and a winged lion, etc.’ and that one can ‘see today in Paris at the cemetery of the Holy Innocents’.

It is in the *Livre des figures hiéroglyphiques* (1612) that the detailed story of Flamel as a maker of gold is found for the first time. An unknown publisher, Arnauld de la Chevalerie, published it twice in 1612 in a collection including *Trois traités de la philosophie naturelle*. The questions of the

dating and the real author of the text have not yet been resolved. If it ever really existed, the original Latin from which Arnould de la Chevalerie claims to have made the translation has disappeared in any case. According to Robert Halleux, there are of this work ‘no manuscripts prior to the edition’, and it is ‘now established that it can be dated to no earlier than the end of the 16th century’, because of a citation of Lambsprinck published by Nicolas Barnaud in 1599. Claude Gagnon attributes the paternity of the book to the publisher himself, under whose pseudonym would be hiding, according to him, the writer Béroalde de Verville (1556-1626). The *Livre des figures* forms a triptych with clearly distinct parts. The first of them is equivalent to a sort of narrative preamble in which Flamel reports how a mysterious work fell into his hands, the book of Abraham, and continues to relate his difficulties in piercing its arcana, his initiation by a certain master Canches, and finally his realization of the philosopher’s stone. Following this, he decided to have hieroglyphs painted on an arch, which referred to the alchemical art and would be helpful to those who would be able to decipher them. Next, these symbols are explained in two stages. First, in two introductory chapters the author sets forth his two keys of interpretation. One of them is theological; the other, called ‘philosophical’, is established ‘according to the authority of Hermes’. The eight remaining chapters give detailed alchemical commentaries on the different motifs of the arch. The latter is illustrated separately on two full pages. It would seem that the Flamelian explications are made according to the rules of the ancient art of memory [→ Mnemonics] (Greiner 2000). This mnemotechnique result in a presentation of the two spheres of theology and of chemical experiments as closely associated operations belonging to the domains of the spirit and of matter respectively, thus furnishing the reader with a totalizing vision of the making of the philosopher’s stone. As such the Book of pseudo-Flamel is primarily a testimony of the rise of Christian alchemy in France at the beginning of the 17th century.

FRANK GREINER

Fludd, Robert, * 1574 Milgate House (Kent), † 8.09.1637 London

Fludd was born in his family manor. The fifth son of Sir Thomas Fludd, he would always remain very proud of his noble origins: we can see on the title page of his printed works that he has his university title preceded by Armiger or Esquire. We know little of his childhood. He was probably entrusted to a tutor for his basic studies; later he enrolled in Saint John’s College, Oxford. While many students issued from the gentry considered their time at university as no more than a social necessity, Fludd prepared for his examinations in earnest and obtained his M.A. in 1598.

We have some information on his centers of interest during this period: he devoted part of his free time to → music and to what he called *mea astrologia* [→ Astrology]. This in fact allowed him, according to an anecdote included in 1617 in his masterly book *Utriusque Cosmi . . . Historia* (History of the Two Worlds), to unmask a thief. He was thus already known for his competence in the domain of astrology, but such research was considered neither blameworthy, nor, above all, in discord with the dominant religious tendencies at St. John’s

College. In fact most of the clergy of the Anglican Church were trained at this university, where serious knowledge of the Scriptures was required of the students. Fludd shows his perfect knowledge of the Bible by the citations that he makes throughout his work. The basis of the philosophy then taught at the university was still Aristotelian. It is difficult to perceive whether the Neoplatonic [→ Neoplatonism] or hermetic [→ Hermetic Literature] currents had penetrated the university world, but what is certain is that Fludd knew the works of Petrus Ramus, a well-known anti-Aristotelian whose books were at St. John's.

After obtaining his M.A., Fludd left for travels on the continent that would last six years. He worked as a tutor in aristocratic families, for example for Charles de Lorraine and his brother, with whom he studied mathematics and various related sciences such as land surveying and establishing fortifications. This knowledge would fill part of the second volume of his *Utriusque Cosmi . . . Historia*, which also includes a treatise on geomancy, composed in Avignon for the Papal Vice-Legate, as well as a study on music.

When he could finally get to Italy, he stayed first in Livorno, and then in Rome. There he met a Swiss named Grutherus, who taught him engineering and the use of Paracelsian remedies [→ Paracelsianism]. One of them was the famous "weapon-salve" (based upon applying salve to the weapon that has caused a wound rather than caring for the wound itself; it was supposed to work on the basis of sympathy): a medication that later caused a controversy between Fludd and William Foster. In 1602, the traveler returned to Italy, and in Padua he met William Harvey, with whom he was to remain in contact and to whose discoveries regarding blood circulation he gave his full attention.

We have little information about his contacts in Germanic territory, but there is no doubt that he passed through the Court of the Elector Palatine at Heidelberg and that of the Landgrave of Hesse-Kassel. Fludd certainly turned this long stay abroad to advantage, by improving his knowledge in the areas that seem to have interested him from the period of his studies at St. John's College; and he found his medical vocation confirmed in an atmosphere where the theories of → Paracelsus were particularly in vogue.

Upon his return to England in 1605, Fludd enrolled at Christ Church College, Oxford, but it would seem that he encountered difficulties in conducting his medical studies. In fact, he was admitted to the London College of Physicians only in 1609. He was mainly criticized for his insolent atti-

tude, that offended all the members of the Jury. The inflated idea that he had of his origins, combined with hypersensitivity, explains moreover the violence of his later reactions to any criticism of his theories, whether from Libavius, Merenne, Gassendi, Kepler, William Foster or any other of his many critics. A few years later, however, Fludd was completely accepted in the college, and he was elected Censor in 1618 and 1627, and again in 1633 and 1634.

The exercise of Paracelsian medicine required Fludd to have an apothecary at his service, to manage his personal laboratory, where he prepared drugs for his patients and engaged in many alchemical experiments. He had a wide clientele. We know little about his method of therapy, except that he began by establishing his patient's horoscope, and that as a good disciple of Paracelsus he employed certain plants and chemical preparations. To this he added taking the pulse and examining the patient's urine: classical elements of diagnosis that he sets forth in his *Medicina Catholica* (I, b and II, b). His bedside manner was particularly appreciated: he attached much importance to the spoken word and to prayer.

Apart from these consultations, Doctor Fludd devoted his time to assembling all the writings that he had already partly composed at Oxford and during his travels, and that would eventually be assimilated into his voluminous work *Utriusque Cosmi . . . Historia*. The publication in 1617 of the first volume, about the macrocosm, did not fail to make quite some waves. Fludd had dedicated it to King James I, whom he qualified as Ter Maximus; but certain courtiers – Francis Bacon may have been one of them – called the monarch's attention to the often enigmatic illustrations contained in the work, and their occasionally obscure commentaries. As a result, James I, who was more or less obsessed with → witchcraft, asked the author to come and explain the meaning of his book. But if Fludd's theories certainly aroused *calumniators* (he himself uses this term), he also had many supporters and friends, in the country and on the continent, and the interview with James I went very well. The king's support for him was henceforth assured; and he even obtained a patent for his steel-making process and later the revenue from a property in Suffolk; these benefits were continued by the next monarch, Charles I.

Fludd's position was nevertheless made delicate due to his publication in 1616 of a work supporting the cause of → Rosicrucianism, entitled *Apolo-gia compendaria, Fraternitatem de Rosea Cruce suspicionis et infamiae maculis aspersam, veritas*

quasi Fluctibus abluens et abstergens (Summary Apology for the Rosicrucian Brotherhood, sullied with stains of suspicion and infamy, but cleansed with the Waters of truth). These “stains” came from the work of a German Lutheran alchemist, Andreas Libavius, who had attacked the *Fama* (1614), the *Confessio* (1615) and the *Chymische Hochzeit Christiani Rosencreutz* (1616). Libavius accused their authors of heresy, attempted sedition, and diabolical → magic. Fludd reacted violently; according to him, the Brothers had no political ambition but merely affirmed their attachment to Christ and to a renovated religion. As for the marvelous things they promised, these could be obtained by means of natural magic, kabbalah [→ Jewish Influences] and astrology, all of them “arts” that our doctor knew well and that he claimed were in no way diabolical. In fact, Fludd himself did not hesitate to apply as a candidate for joining the Brotherhood. He thought that he could permit himself to do so because he despised carnal and worldly pleasures, wished to improve education, and was motivated solely by thirst for wisdom.

As he had promised in the *Apologia*, he developed his arguments the following year, in 1617, in a much longer work, the *Tractatus apologeticus integritatem Societatis de Rosea Cruce defendens* (Apologetic tract to defend the integrity of the Rosicrucian Society). Several works that have long been available only in manuscript, but have recently been published – the *Declaratio brevis* dedicated to James I (written probably as early as 1618) and *A Philosophicall Key* (written somewhat later) – show that when Fludd first heard of the Rosicrucian manifestoes, he had already composed a large part of his *Utriusque Cosmi . . . Historia*; therefore if he broadly shared the ideas of the Rosicrucians, he had nevertheless borrowed nothing from them for his work, and had never met any member whatsoever of the Brotherhood.

Many critics have pointed out the complex nature of Fludd’s thought, or at least its difficulty. But fortunately he had a talent for illustrating his sometimes long and confusing discussions with engravings and diagrams, which were ironically referred to as “hieroglyphs” by Kepler, but which have certainly been responsible for the fact that his name has survived in history. Because of their great number and their quality, they first captured the attention of bibliophiles, some of whom then began to study the doctrine they were supposed to illustrate.

The influence on Fludd of the Florentine Academy, especially → Marsilio Ficino and → Giovanni Pico della Mirandola, is of the greatest importance;

this, together with many borrowings from the Bible, is the foundation on which he built his entire system of thought. Fludd’s universe is based upon the relationships of musical harmony (following Pythagoras and Plato), with the purity of spirit progressively diminishing as it descends down to the most material level. The arts, technology, science and medicine are presented according to a similar framework. Fludd’s philosophy is first and foremost a religious one: it is “Mosaic”, as he himself calls it in his last work, *Philosophia Moysaica*, and based on biblical interpretation. Fludd takes the time to be explicit in this regard: if he might sometimes seem to deviate from the thinking of certain Church Fathers, this is because Scripture often has a double meaning, but he considers his works to be always in line with orthodoxy. If, moreover, he cites Plato, this is because he believes that this philosopher had knowledge of the work of → Moses; and → Hermes Trismegistus he believes to be in agreement with Moses as well. This was not the opinion of the monk and mathematician Marin Mersenne, who saw in Fludd’s works a dangerous syncretism of hermetico-kabbalistic origin that no longer had anything in common with authentic Christianity. A brutal controversy ensued between the two men and their supporters, which lasted more than ten years; the title of a short work by Fludd, *Sophiae cum Moria Certamen* (Combat of Wisdom with Madness), gives an idea of its violence.

The synthesis finally produced by Fludd contains some original ideas, such as in particular his invention of a diagram of intersecting pyramids that represents the descent of spirit (called *pyramis formalis*) and the ascent of matter. Fludd was particularly proud of it and did not hesitate to include it among the seven microcosmic arts, along with prophecy, the art of memory [→ Mnemonics], chiromancy, etc. The figure on page 89 of *Utriusque Cosmi Historia* (I, a), about the divisions of each of the worlds, gives a perfect image of his conception of the cosmos. First there is the *empyrean*, that is the highest heaven, which is composed of three parts corresponding to the divisions of the angelic hierarchy; then follow the seven circles of the planets that move in the *etheric heaven*; and finally the four parts of the elementary world, which are those of the four elements, fire, air, water, earth. The ascending pyramid stops at the edge of the supercelestial kingdom of God and the other pyramid stops just before the circle depicting the earth. These pyramids intersect the celestial regions at precisely fixed intervals.

Intervals and proportions play a very great role in Fluddian thinking, and immediately recall the

idea of the music of the spheres. The English doctor – who had been interested in music since his youth and who knew of Plato’s heptachord and the Kabbalistic interpretation of the divine names – presents the world as organized according to the rules of a divine monochord; in fact, he used the term *Monochordum Mundi* as the title of his last reply to Kepler. The latter had accused him of using calculations and curves *hermetico more*, while he himself was studying only the planets, according to a rigorous mathematical method. In fact it was not enough for Fludd to apply his system to the whole macrocosm; he believed that Man’s body and all his organs obeyed diapasons corresponding to the three heavens as well (*Utriusque Cosmi Historia* II, a 1, p. 275).

Fludd’s God is unique and absolute: many of the figures in his *Utriusque Cosmi Historia* confirm this for us by enthroning the Hebrew tetragrammaton or the equilateral triangle at their summit. But, just as the Kabbalists distinguished a “luminous aleph” from a “tenebrous aleph” in the first letter of the Hebrew alphabet, Fludd sees in God a tenebrous aspect comparable to unorganized chaos, the expression of the divine *noluntas*, and on the other hand, an active state that brings the universe into being; this is the manifestation of the divine *voluntas*, so that this active state is necessarily good. The emblem on the title page of *Philosophia Mosaica* intends to express this duality and clarifies this aspect of his vision: the weather-glass, a sort of thermometer-barometer used to predict the weather, but that the doctor had invented above all for philosophical purposes. According to him, the expansion and the contraction of air which are made visible by the apparatus, are manifestations analogously related to the hot-cold antagonism, which is similar to that of light and shadows, both of which have issued from God. The movements of contraction and expansion immediately recall breathing: for Fludd all life on earth and in the cosmos depends on the divine breath. When God exhales, all the evil principles recede, but when He holds His breath, they can wreak havoc on humanity and the universe. Such is the manifestation of the divine *Voluntas* and *Noluntas*. Given the hierarchical structure of the cosmos as imagined by Fludd, beneficial effects are transmitted by the ministry of the angels who are active throughout the universe, but who can also become passive and “frozen” and thus make it possible for the opposing demons to act. The angels’ mission is to govern the winds of the four cardinal points, whose effects are antagonistic. But even more than being the masters of the winds, the angels are in charge of

the stars and the planets, which have an influence on our earthly existence as well. We can understand how important it was for the doctor to set up a patient’s horoscope before considering any therapy.

The question of the beginning of this universe also greatly interested Fludd. He claimed that before the Creation there had existed a *materia prima* or *hylè*, described by him as a ‘dark cloud as black as pitch’; in response to critics who might see in it an entity coeternal with divinity, he hastens to quote Saint → Augustine, who compared this original state to silence in relation to speech. The first divine manifestation was light, and in this Fludd could claim the support of Moses, Plato and Hermes. The words *fiat lux* brought forth the highest heaven, the empyrean, filled with light that only the intellect can perceive. Then everything unfolded according to the hierarchical order, traversed by the pyramids described above. Noteworthy is the capital role of the primordial waters in the separation of the worlds; they are the vehicles of the creative light that splits the heavens in two, and then imposes order on matter, to constitute the three reigns of our world: animal, vegetable and mineral. This is not, of course, common water, but “alchemical water”; Fludd undoubtedly alludes to it in his essay “Of the Excellency of Wheat”, which comprises the greater part of his *A Philosophicall Key* and which also appears in his *Anatomiae Amphitheatrum*.

When the first heaven and the lower heaven had been organized, God created the sun, which he made the seat of the quintessence. He placed it in the center of the intermediary heaven (or etheric) where it participates with both God and the Earth. In a way, it is the visible representation of God. What follows is borrowed by Fludd not from *Genesis* but from a myth of Orphic origin. In his *Tractatus Theologo-Philosophicus*, as in *A Philosophicall Key*, there appears a sort of demiurge, *Demogorgon*, flanked by *Eternity* (or Nature) and by *Chaos* who gave birth to *Litigium* (or Conflict), which is the source of so many evils that it had to be thrown down with *Chaos* into the tenebrous center of the earth. Nature brought another son into the world, Pan, to whom was entrusted the creation of the Microcosm, Man, who was created in perfect correspondence with the Macrocosm. His sensory organs are as many as there are planets; just as God is enthroned in the loftiest heaven, Man’s intellect is in his head; in the middle part of his body is placed a little tabernacle, the heart, that provides blood to the members, just as the sun floods the macrocosm with its rays, giving it light,

etc. Demogorgon needs only to blow part of his divine fire into him.

Fludd's Creator never abandons his creation. He intervenes ceaselessly, through the intermediary of Nature, which is in musical sympathy with him. Fludd tried to represent Nature in one of the first illustrations in *Utriusque Cosmi Historia* (I, a, pp. 4-5). She is the minister closest to God: connected to him by a chain, to her other hand is attached, also by a chain, a monkey that represents the microcosmic Art. In his later works, Fludd speaks less of Nature and more of the World Soul. He thinks that the kabbalists meant to describe the same principle with their *Metatron* who has dominion over the World, and in whom he sees (in his *Monochordum Mundi*) 'the Soul of the Messiah, or the Virtue of the Tetragrammaton, in which is the light of the Living God, and in which is the light of *Ensof*, beyond which one cannot go'.

Fludd drew from all the sources available to him – the Bible and the kabbalah, music, astrology, alchemy, as well as technology – to construct his image of the universe. He can be seen as one of the last representatives of the Renaissance homo universalis. If some historians have seen in Fludd no more than an experimenter still too restricted by the bonds of alchemy, others will point out the importance he attached to the experimental foundations of his lengthy philosophical theories. Some of the debates stimulated by his work are still topical today.

SYLVIE EDIGHOFFER

Foix-Candale (= Foix de Candale),
François, * August 1512 Bordeaux,
† 5.2.1594 Bordeaux

Foix-Candale belonged to a family of the old Catholic nobility which provided some of the most ardent leaders of resistance to the Huguenots in the Southwest. He succeeded his brother as Bishop of Aire-sur-l'Adour near Bordeaux in 1570. Although that post remained merely formal, he was made Cardinal in 1587. Well versed in geometry, he acquired a reputation as a specialist in instruments of measurement. He used his castle of Puy-Paulin near Bordeaux as a "grand salon littéraire", gathering humanists, mathematicians, etc. Foix-Candale is considered one of the greatest humanists in Bordeaux in the second half of the 16th century, along with people like the historian Jacques Auguste de Thou, the publisher Simon Millanges, Joseph Scaliger and, of course, Michel de Montaigne (who, like Foix-Candale, had been a member of the Parliament of Bordeaux). His cousin Henri de Navarre (the future Henri IV) trusted him enough to send him in 1576 with a diplomatic mission to Elizabeth I of England.

Foix-Candale is an important figure in the history of Neo-Alexandrian → Hermetism, the ensemble of esoterically oriented commentaries (from the end of the 15th through the 20th centuries) of the Greek *Hermetica* in general, and of the *Corpus Hermeticum* (2nd and 3rd centuries) in particular. He first authored an edition (1566) of Euclid's *Elementa*, with commentaries which later inspired → John Dee. In that book, he stressed the necessity of the Pythagorean approach to numbers [→ Number Symbolism] and praised the idea, widespread in his time, that mathematics has a spiritual value. His last work (1584) does not deal with numbers but

with the nature of the sacrament of the Eucharist. Even more than his first book, this one is strongly inspired by Hermetism.

In between his book on Euclid and his book on the Eucharist, he published three further texts. As noted by Frances A. Yates, all three mark 'new heights of ecstatic religious Hermetism' (1964, 173). They present themselves as editions, with his own commentaries, of treatises belonging to the *Corpus Hermeticum*. They consist of: (A) a Greek-Latin edition based upon the edition by Turnebus of 1554 (68 pp.), published in 1574; (B) a Greek-French edition of these texts (72 pp.), also in 1574; and (C) a book in French (759 pp. in folio), consisting for the most part of a new edition of them, published in 1579, but now accompanied by long philosophical expositions. His manuscript of this last book had been finished by 1572, but its publication was delayed due to the turmoil caused by the events of St. Bartholomew's Day. It is this last-mentioned book which made him most famous, because it is filled with his expositions of various aspects of Hermetism. It differs from the former two books in that it is much bigger, and Foix-Candale devotes much more space to his personal speculations than to purely philological considerations.

There are some similarities between this book of 1579 and the *Essais* (1580) of Foix-Candale's friend Michel de Montaigne. Both evince an extremely tolerant attitude in religious matters. This is a striking trait in a France then plagued by feuds between Protestant and Catholics, though it was a trait common in people for whom Hermetism was a staple diet. From a literary point of view, Foix-Candale's book consists of a long series of hardly interconnected discourses, written in a fluid style as the inspiration goes, very much like the *Essais*. The titles of most of Montaigne's essays are less an indication of what is to follow than a pretext for a free-wheeling association of ideas. Likewise in Foix-Candale's *Le Pimandre*, extracts from the C.H. serve as titles for expounding ideas which are oftentimes only tenuously related to these extracts or the titles. In this connection, another book, already a "classic" in esoteric literature, → Valentin Tomberg's *Meditationen . . .*, (1st ed. 1972) may also be compared to Foix-Candale's, in that each title of a chapter bears the name of a → Tarot card, though what follows is oftentimes somewhat removed from the symbolism of the card.

Foix-Candale's intellectual make-up was profoundly influenced by his study of Hermetic philosophy. At the beginning of his 1574 edition, in the dedicatory epistle to Emperor Maximilian II,

he writes that → Hermes Trismegistus possessed knowledge of the divine equal to the apostles and the evangelists, and the rest of his epistle abounds in similar statements. Later, in his unpublished treatise on the Eucharist, he does not hesitate to rely upon Hermetic authority in defending the Roman Catholic doctrine of transubstantiation. Although he never seems willing to abandon or compromise his commitment to a Catholicism that would stimulate a religious reunion of all Christian confessions, he believes that Hermes Trismegistus was a contemporary of 'Saturn, King of Egypt' who preceded Abraham by several generations, and goes as far as claiming that Hermes' texts (the *Corpus Hermeticum*) are superior in form and understanding to the books of → Moses. He claims that Hermetic philosophy is a means of purification, that prepares one for the unifying experience of contemplating the divine. But in so doing he frequently seems to imply that salvation is made possible less by redemption and forgiveness of sins than by a spiritual "regeneration" – as he calls it – which is achieved through a form of gnosis. In this emphasis of salvation through knowledge ('piété avec cognoissance', 243), he goes even further than predecessors and contemporaries of a hermetic persuasion such as → Lefèvre d'Étaples, Gabriel du Préau, → Symphorien Champier, → Lodovico Lazzarelli or Philippe Duplessis de Mornay.

Foix-Candale does not extend to nature this notion of purification or "regeneration". Nature does not need to be regenerated, and man's "regeneration" does not take place through her. But nature is not lifeless for that: Foix-Candale sees her as a kind of big immortal animal. He holds long discourses on the Soul of the World, which range chronologically between Ficinian Platonism and the speculations of → Ralph Cudworth. He is lavish in his discussions of → astrology. Each star and planet has a power of its own which enables it to exercise a specific influence upon the sublunary world. The earth is replete with spirits or *daimones* put in charge of carrying out the will of God and immersed within a very subtle matter. He speculates also about the kind of body that the angels may have, about their sex, about divine and human androgyny, etc. He believes in the existence of the elementals (spirits of the four elements) and even narrates how he himself met spirits or goblins somewhere in the mountains of southern France. As a matter of fact, his book contains certain reflections that have a Paracelsian character as he wrote when → Paracelsianism was just beginning to get known in France.

Like many other French Hermetists of the Renaissance (but contrary to most Italian ones), Foix-Candale is wary of the magical aspects of certain passages contained in the Hermetic writings, and above all in the *Asclepius*. Therefore he tends to underplay them or to blame them on the supposed “translator”, the evil magus Apuleius. More generally, he is not interested in magical or theurgical practices. But → alchemy is for him a different matter, and his book contains expositions on this subject which should be put into the context of both his cosmological outlooks and the alchemical literature of his time. About his own activities in this domain he always remained very discreet, but he was himself an alchemist, or at least a spagyrist. He had a laboratory where he produced his medicines, including a panacea called “Eau de Candale” which has remained famous in France through the subsequent centuries. His neighbour and friend Michel de Montaigne mentions him in his *Essais* (II, XII) as someone engaged into the quest of the Philosopher’s Stone, and the poet Agrippa d’Aubigné describes a tour of his laboratory in the company of himself and of Henri de Navarre. Except in his book of 1579, Foix-Candale did not publish anything on alchemy, but his knowledge was appreciated by specialists like → Clovis Hestieu de Nuysement and other theoreticians or practitioners of the *Opus Magnum*.

Foix-Candale’s *Le Pimandre* of 1579 ranks among the most representative works to have been produced by the Neo-Alexandrian Hermetic current in the second half of the 16th century. More generally, it stands out as one of the most remarkable texts in Western esoteric currents since the early Renaissance, even until the present time. Surprisingly, it has not been newly edited since 1587. A third edition with philological and historical commentaries is badly needed.

ANTOINE FAIVRE

Formisano, Ciro → Kremmerz, Giuliano

Fortune, Dion (ps. of Violet Mary Firth), * 6.12.1890 Bryn-y-Bia, Llandudno, Wales, † 8.1.1946 London

Occultist [→ occult / occultism] author, founder of the group which eventually became the Society of the Inner Light, originally conceived as an “outer court” of the → Hermetic Order of the Golden Dawn. Fortune was initiated into the Golden Dawn in 1919 (adopting the magical motto *Deo non Fortuna*, whence her pen name) but was subsequently evicted on account of personal conflicts with Moina Mathers (1865-1928, colleague and by then widow of → S.L. McGregor Mathers). Fortune continued to run the Fraternity of the Inner Light as an independent organization, still based on Golden Dawn principles, until her death (and for some years after it by the popular account). She was an amateur of psychology, a conscious and canny popularizer of occult ideas and methods, and a prolific author, both of textbooks on magic of a “how-to” variety, and of occult novels which depict the construction of magical rituals in such detail that the novels, too, have served as a set of ritual sourcebooks (both for post-Gardnerian Neopagan witchcraft [→ Neopaganism] and for ritual magicians more explicitly indebted to the magical tradition she founded). Her books

continue to be popular among Neopagans and occultists and most of them remain in print.

By her own account Fortune came to occultism through the study of psychology. Some of her early experiences are chronicled in *Psychic Self-Defense* (1930), a remarkable book which is part anecdotal evidence, part do-it-yourself exorcism manual, part autobiography, and some part no doubt fiction. In its opening pages, Fortune describes an experience of being the victim of what at the time of writing she construes as a “psychic attack” by her employer, which took place when she was about twenty (or around 1910) and left her in poor health for some years afterwards. The effort to recover from this breakdown led her to take up the study of psychology, and subsequently, ‘in order to understand the hidden aspects of the mind’, occultism (*Psychic Self-Defense*, 19). In 1922 she published (under the name she reserved for her psychological writings, Violet Firth) a compendium of her lectures on psychology under the title *Machinery of the Mind*: a brief, popularizing digest of psycho-analytic ideas which (though useless as a commentary on Freud and of little interest to the practicing occultist) still gives insight into how easily then fashionable notions of psychology might be melded with the ideas of occultism. In later writings she continues to refer to the study of psychology as the thing which precipitated her into occultism, and it is likely that her ability to draw on the jargon of repressions, complexes, and mental pathologies did much to contribute to the popularity and accessibility of her books, inasmuch as her prose flows back and forth easily between esoteric and mystical language and a more modernizing, secular, and scientific rhetoric which tends to ease the fundamental alterity of the former.

Though the primary source for the shape and style of Fortune’s magic was the Golden Dawn, other strands of influence include Christian Science (the religion in which she was raised) and Theosophy. Fortune’s theosophical readings appear to have been important to the early development of her occult ideas, though she did not actually join the → Theosophical Society until 1924, acting upon instructions from the inner planes to do so. Soon thereafter she became president of the Christian Mystic Lodge of the Theosophical Society at her base of operations in London, 3 Queensborough Terrace. While she herself perceived a continuity between her activities under the auspices of the Theosophical Society and the Golden Dawn, not everyone felt comfortable with her dynamic personality and confident leadership. In 1927, having quarrelled with some of its other members

(whom she accused of corruption in the *Transactions* of the Christian Mystic Lodge), she resigned from the Theosophical Society. In the same time period she was evicted from the Golden Dawn due to the exacerbation of her psychic conflicts with Moira Mathers, and shortly thereafter she declared the existence of a new Fraternity of the Inner Light, which continued to operate, with her at its head, in the same location at 3 Queensborough Terrace. The newly declared fraternity initially involved the same core group of people who had previously attended meetings of the Christian Mystic Lodge; indeed throughout Fortune’s conflicts with the larger societies there is a continuity to her own group provided not only by its incarnate membership but also by the inner planes masters with whom Fortune had been in contact since 1922 (two years prior to her membership in the Theosophical Society), who evidently commanded the interest and loyalty of those who had been working with her up to this point. Because Fortune’s outlook tended to be broadly synthetic in any case, her personal conflicts never caused her to lose her sense of community with people involved in other forms and styles of occultism. Later on Fortune became familiar with → Aleister Crowley’s writings, which for the most part she respected; of Crowley’s *Magick in Theory and Practice* (1929) she declares that she approves the theory though condemns the practice (more mildly than many after her) as potentially dangerous for the neophyte (‘The Occult Field Today’, in *Applied Magic*, 60-64).

A colorful influence on her earlier writings is a teacher she does not name in any of her own works, but who is identifiable by external evidence as Theodore Moriarty (1873-1923), a charismatic figure, psychic, medium, Freemason and adept. It is unclear exactly when or where she met Moriarty; some experiences with him are retailed in *Psychic Self-Defense*, others recounted in the series of pot-boiling short stories ostensibly based on incidents at his “nursing home” for the psychically challenged which were first published in 1922 and collected into a volume as *The Secrets of Dr Taverner* in 1926. She describes the tales as ‘studies in supernormal pathology’, and comments that ‘far from written up for the purposes of fiction, [they] have been toned down to make them fit for print’ (*Secrets of Dr Taverner*, vii-viii). Despite the disclaimer, these tales fit into the genre of the horror story (as does also her first novel, *The Demon Lover*, published in 1927) more than that of the case study, though perhaps their chief interest lies in the attempt to couple the two genres.

In 1927 Fortune married Dr. Thomas Penry Evans (1892-1959), and the time period between her marriage and her death in 1946 saw the publication of some of her strongest and most popular writing, including *Sane Occultism* (1929), *Psychic Self Defense* (1930), *The Mystical Qabalah* (1935) and the novels *Winged Bull* (1935), *The Goat Foot God* (1936), and *The Sea Priestess* (1938). Perhaps her best novel, *Moon Magic*, was begun in the last years of her life though not published until 1956. The late novels have a similar pattern: the protagonist (an intelligent male, sexually deprived, and solitary), comes into contact with primordial spiritual forces through psychic experiences brought on by illness or disappointment; he meets a sensual, magically experienced and assertive woman, whom he assists in reconstructing or revitalising a ritual space (disused church or old priory, or, in the case of *The Sea Priestess*, an abandoned fort), after which the male and female protagonists work magical rituals to bring the cosmic forces which they have begun to channel into balance. Besides containing treasure troves of ritual ideas and techniques, these novels are overtly wish fulfillment fantasies, successful magical romances with gothic elements, and they continue to have a readership. Her own marriage, though it seems in some respects to adhere to the basic plot outline discoverable in the novels (she and Evans spent years constructing a ritual space and doing magic together there), may have had less satisfying results from the perspective of wish fulfillment: having fallen in love with a younger woman, Evans petitioned for and was granted a divorce in 1939.

As a writer, Fortune's gifts are generally more practical than philosophical. Above all she was a deft synthesizer of ideas, and her continued influence derives largely from her ability to bring difficult esoteric concepts into a lucid and readily accessible prose.

CLAIRE FANGER

Fraternitas Saturni

The most important magical secret lodge of the 20th century in the German-speaking world. Unlike most secret occult groups, the *Fraternitas Saturni* has no legendary tradition. A Brotherhood of Saturn is said to have existed in Scandinavia at the turn of the 19th century and there may have been a group with a similar name in Warsaw under the leadership of → Jean-Marie Hoené-Wronski (1776-1853).

The *Fraternitas Saturni* was founded *de facto* in Berlin on May 8, 1926, by Eugen Grosche (order name Gregor A. Gregorius; 1888-1964) and four fratres, but the official date of foundation is Easter 1928. It derived from the Pansophical Lodge of the Lightseeking Brethren of the Orient-Berlin, also founded by Grosche. Grosche had functioned there, however, only as secretary, at the request of the pansophist Heinrich Tränker (order name Recnartus; 1880-1956). Tränker had been the first person to use the name of Pansophia for a strictly esoteric movement in Germany, and since 1921 he also acted as Grand Master of the O.T.O. (→ Ordo Templi Orientis) in Germany. The Pansophical Lodge was closed in 1926 due to a dispute between Tränker and → Aleister Crowley who, having been invited by Tränker to stay at his house, had come to Germany. Crowley's demand that all German groups under Tränker's aegis should submit to the Crowleyan world lodge A.A. (Argenteum Astrum) met with rejection. The dispute escalated and a majority of Lodge members (not including Tränker) were admitted to the newly-founded *Fraternitas Saturni*, which assumed the so-called Crowleyan Law of the New Aeon, while modifying it as follows: "Do what thou wilt, *is* (according to Crowley, *shall be*) the whole of the law. Love is the law, love under will, compassionless love". The specific *Fraternitas Saturni* formula "compassionless love" was added to emphasize the severe,

Saturnian character of the Brotherhood. The Fraternitas Saturni remained in contact with Crowley but was organisationally independent. Further members joined the Fraternitas Saturni in 1928 following the dissolution of the Orden mentalischer Bauherren (established 1922 in Dresden by Wilhelm Quintscher, 1893-1945), which also worked rites involving sex magic. It is not clear whether the National Socialist ban of the Fraternitas Saturni occurred in 1933 or as late as 1936. In 1936 Grosche emigrated to the Tessin, then to North Italy, from where he was expelled in 1943 and forced to return to Germany.

After the war, Grosche endeavoured to reassemble the former members of the Fraternitas Saturni. Initially he was living in the Soviet occupation zone, where he had problems on account of his esoteric interests. In 1950 he moved to West Berlin, where he tried to build up the Fraternitas Saturni as an umbrella organisation for various esoteric groups in the German-speaking world. He also contacted Hermann Joseph Metzger (1918-1990), who had newly-founded the O.T.O. and the Illuminati Order in Switzerland. While the collaboration with the O.T.O. soon lapsed, the Fraternitas Saturni quickly revived. In April 1950, the first issue of the long-standing monthly lodge periodical *Blätter für angewandte okkulte Lebenskunst* was published, which lay out the theoretical and practical basis of Fraternitas Saturni doctrine (type-written carbon copies of important essays were already being sent to members in 1948-1950). On 18.3.1957, the anniversary of the death of the last Grand Master of the Knights Templar, the Fraternitas Saturni announced itself as the Grand Lodge of the Fraternitas Saturni at Berlin and officially registered itself as such. It supported outer courts (*Vorhöfe*) in several German cities. Grosche was nominated Grand Master. His death in 1964 unleashed a violent power struggle. Following the death of his successor Margarete Berndt (order name Roxane; 1920-1965), a triumvirate took over at Easter 1966. Thereupon Guido Wolther (born 1922, order name Daniel) became Grand Master. In order to attain a higher level of magical work, Wolther founded a new secret league within the Fraternitas Saturni, known as AMOS (Ancient and Mysterious Order of the Brotherhood of Saturn) and limited it to nine members. A strict "new training programme" followed, involving only "knowledge grades", which had to be really achieved rather than merely conferred as an honour. A new order periodical *Vita Gnosis* was founded and distributed only to members of those specific working grades. Because of this Wolther

fell out of favour and in 1969 Walter Jantschik (order name Jananda; born 1939) was elected Grand Master. But since he held only a lower degree (8°), further dissent followed. Shortly after this election, the internal order literature was made public. Dr Adolf Hemberger (1929-1991), Professor of Methodology and Scientific Theory at the University of Gießen, holder of an economics diploma and member of several occult groups, self-published essential parts of the secret records of the Fraternitas Saturni, thus unleashing a storm of protest. Jantschik meanwhile planned an "esoteric university" with higher degrees. But in 1969 a member who had only joined that same year was elected Grand Master, and henceforth the fraternity increasingly concerned itself with a general philosophy of life rather than with practical magic. From this time on, the history of the Fraternitas Saturni becomes tortuous. Splits, new foundations, dissolution and reunions follow in swift succession. Despite this decline, the lodge has survived (albeit possibly with interruptions) up to the present. Apart from various schismatic groups which formed and mostly disappeared over the years (Fraternitas Luminis, Fraternitas Uranis, Ordo Saturni, and an independent Frankfurt group c. 1962-63, already active when Grosche was still alive) the (original?) Fraternitas Saturni is once again magically active.

According to its own account the Fraternitas Saturni is a 'just, enlightened, perfect, secret, magical and ritual' lodge. "Just" (*gerecht*) means that the novice is expected to work on himself, in order to become a "square" (*winkelgerecht*; i.e. perfectly fitting like a brick in a building) member of human society and the Lodge. The Fraternitas Saturni is "enlightened" because its super-rational knowledge is mediated through the direct experience of magical rituals and not through logic. The Fraternitas Saturni is "secret" because public names and offices have no value inside the lodge. It is characterised as a Brotherhood because the members' bonds within it are supposed to continue beyond death. The Fraternitas Saturni accepts women and men on an equal basis. Woman however is regarded as the 'bleeding wound of the cosmos', and her "Moon powers" are the negative manifestation of Saturn. Man's task is to overcome these demonic energies.

The organisational structure of the Fraternitas Saturni shows a thirty-three degree system, resembling the Ancient and Accepted Scottish Rite and the Droit Humain, which carries Latin designations. After the Pronaos from the 1° to the 3° come intermediate grades, which lead to a Rosicrucian

Chapter from the 12° onwards. From the 21° onwards we have the High Degrees and finally the Highest Chapter from the 30° to the 33°. The Lodge Daimonium holding the 33° (the Gradus Ordinis Templi Orientis Saturni, abbreviated to GOTOS), functions as the spiritual head of the Lodge. The GOTOS, as an “egregor” (a subtle essence charged by group magical practices) in the sphere of Saturn, magnetically attracts and stores the power of the magical Chain of the Brotherhood. This GOTOS is compared to Baphomet, the Lodge Daimonium of the Knights Templar. The Fraternitas Saturni is administratively organized into the offices of Grand Master, Executive, (consisting of the Guardian of the Ritual, Secretary, and Archivist), Regional Masters, and Local Masters. A detailed Lodge Rule governs internal matters, admission and ejection, disputes, as well as the possibility of changing the rituals etc.

The use of hammer, spirit-level, set-square and plummet supply evidence of Masonic influence (trowel and dividers, and the columns of Joachim and Boaz are absent). In the context of the Fraternitas Saturni, however, their meaning is magical and not merely symbolic. There are no organisational links to regular → Freemasonry.

The Fraternitas Saturni describes itself as a ‘pansophical society with a responsibility to train interested persons in the theory and practice of the pansophical sciences (occultism [→ occult/occultism], → magic, yoga, → mysticism, → astrology etc.) and to support them as assistant, guide and leader on the path to divine light’. The doctrines of the Fraternitas Saturni are very eclectic, in contrast to the O.T.O. groups, which mostly subscribe to the teachings of Crowley. Ancient Egyptian wisdom accompanies the magic of → Agrippa von Nettesheim; grimoires and → witchcraft (chiefly concerning plants and drugs) are used as well as Masonic symbolism. The Fraternitas Saturni uses Kabbalah [→ Jewish Influences] in the sense of Agrippa von Nettesheim and sees no problem in assimilating the doctrines of modern occult groups such as the → Hermetic Order of the Golden Dawn, the Adonistenbund, the O.T.O., or modern magicians like Franz Bardon (1909-1958). Astrology is especially important, as the relation of the self to cosmic powers is a basic assumption of the magician. → Ariosophy has exerted a certain influence (chiefly during the early years) because the Fraternitas Saturni uses ancient Nordic mysticism, magic and folklore for non-Christian wisdom teaching. There are also references to the glacial cosmogony (*Welteislehre*) of Hanns Hörbiger (1860-1931) in Fraternitas Saturni cosmosophy.

Ordinary → spiritualism is rejected because one’s own will has to be surrendered. There is practically no reference to → Tarot. The emphasis of the doctrine naturally lies in magic, whereby the Fraternitas Saturni makes no distinction between “white” and “black” magic: everyone is free and responsible for his own karma. The invocation of so-called elementary and planetary spirits is given particular attention. Sex magic certainly belongs in the domain of Fraternitas Saturni knowledge, but contrary to current prejudice the Fraternitas Saturni is not exclusively a sex magical order. Whether the published sex magic rituals, such as the notorious 18° (Gradus Pentalphae), are actually worked or are merely a fantastic or “commercial” invention is unclear. The phallus is regarded as the earthly manifestation of the divine power of will and imagination; the vagina is the symbol for chaos as the creative ground of being; and the male seed is the vehicle of the divine spirit. Tantric practices are also taught, which are supposed to lead to a transformation of the powers of generation into spiritual energy. A period of chastity lasting up to 180 days is therefore prescribed before important rituals. Total abstinence is (theoretically) demanded for the highest degrees.

The teachings of the Fraternitas Saturni basically represent a Gnostic doctrine [→ Gnosticism] concerned with knowledge. Man is capable of discovering his inherent divinity through self-realization. The Fraternitas Saturni member does not seek to dissolve in the cosmos, but wants to fashion it. At the beginning of time darkness represented the more powerful primal element, but light was contained within it. A Logos was necessary in order for the light to dawn; and this Logos was Lucifer, the Light-Bringer. Lucifer is the demiurge, who created our visible world by breaking the static cosmic order. The result was War in Heaven, by which death entered the world. Lucifer is regarded as the “higher octave” of Saturn (Satan representing its “lower octave”), the outermost planet and polar opposite of the Sun in ancient cosmology. Because of this ongoing opposition Lucifer is still fighting the Solar Logos. The principal battlefield is our earth, which contains a negative-astral and a positive-mental sphere apart from its physical form. Saturn is seen as the great judge with scales and sword, entrusted with weight, measure and number. He is the Guardian of the Threshold, or the gateway to transcendence. Because he betrayed divine mysteries to mankind, he has been punished. His heavy, dark, leaden qualities must be transformed into gold by the magician, in an alchemical process involving the “repolarisation of lights”. In

this coincidence of opposites Saturn becomes the Sun, because the Solar Principle (“Chrestos Principle”) was originally the inner nucleus of the Saturn Principle. Only non-initiates regard Saturn as Satan; the initiate however practices spiritual Solar service by worshipping Saturn, and contributes thus to the homecoming of the “dark brother”.

Even Eastern teachings have found their way into the Fraternitas Saturni. At least in Grosche’s time there was a belief in → reincarnation and karma, and the awakening of the chakras was deemed necessary for spiritual ascent. The Aquarian Age is also heralded. But in contrast to the customary → New Age view, the Fraternitas Saturni emphasizes, that Saturn was originally the astrological regent of Aquarius. Although after the discovery of Uranus in modern times, that planet is now generally regarded as its regent, one should not forget the original role of Saturn. Accordingly, in the view of the Fraternitas Saturni, the new Aquarian era is determined by both planets that is by the solitariness and hardness of the clarified Saturn as well as by the intuitive energy of Uranus.

The anti-Christian stance and sex magic of the Fraternitas Saturni have understandably provoked opposition in the churches and public media. That most Grand Masters have had a reputation for indulging in sex and drugs has made things worse. On the other hand, the Fraternitas Saturni never courted the public exhibition of theatrical satanism as with Aleister Crowley or the Church of Satan. While the Fraternitas Saturni has recruited members by means of occult magazines, it has never sought the spotlights of publicity and has always regarded itself as an elite group. It has sought to address persons who were ready for hardness, solitariness and the burden of adversity, corresponding to the character of Saturn. Thus even in its heyday it has probably never had more than 200 members. Nevertheless it has produced a comprehensive, original and varied literature, which in itself guarantees it an important place in the history of magical and occult orders.

HANS THOMAS HAKL

Freemasonry

1. FREEMASONRY AS AN ESOTERIC SOCIETY
2. ESOTERICISM AND MASONIC SYMBOLISM
3. IS THE RITUAL OF MASONIC INITIATION OF AN ESOTERIC TYPE? 4. SECRET DOCTRINES AND FREEMASONRY

The relations between Freemasonry and → esotericism are problematic. They depend essentially on the idea that freemasons generally have about their own institution: is it above all an “esoteric society”, an initiatic society – and are those the same thing? –, an intellectual circle, or simply a fraternal association? Masonry has given different answers at different times and places, and the experts who study the history and sociology of this institution from the outside do not necessarily agree among themselves.

The ambiguity of the word “esotericism” is particularly salient in Masonry. Certainly it can be

taken as designating a whole field of speculations, often confused, or else it may simply serve as title for a bookseller's shelves or for some publisher's series; but it seems that in masonic usage it vacillates between two special meanings. (1) First of all there is → secrecy, the notion of a hidden knowledge to be deciphered, a teaching encoded to conceal it from the profane. In this sense, masonic esotericism refers primarily to the classic *discipline of the mysteries* of which the masonic institution, as a “secret society”, is a special case. (2) Alternatively, masonic esotericism, for the masons themselves, is inseparable from the initiatic dimension of the institution which is supposed to lead to an intimate experience, an inner liberation, and, to quote Mircea Eliade's apt definition, to ‘an ontological mutation of the existential regime’ (*Birth and Rebirth*, 1958). In this second sense, masonic esotericism has more in common with a *gnosis*, with the idea that a mystery is inherent in the things themselves, and that the penetration of this mystery occurs through a hermeneutic that is simultaneously a lived experience, capable of granting a kind of higher knowledge.

Hence, to be in a position to wonder either about the masonic “secret” or about “the initiatic” in Masonry, one has to pose certain preliminary questions. We begin with the problem of masonic symbolism. William Preston (1742-1818), in his famous definition of masonry – one among many others –, distinguishes between *allegories* that “veil” and *symbols* that “illustrate” it (*Illustrations of Masonry*, 1772). Since the 18th century, the masonic texts have often used other terms, such as *emblems* or even *hieroglyphs*. No one can deny that masonry makes lavish use of images and figures, to which it intends to give a more or less precise intellectual or spiritual meaning. But is that esotericism in either – or even both – of the two senses mentioned above? Furthermore, one of the most characteristic traits of Freemasonry is obviously the use of rituals, based on speeches that present the candidate certain legendary or mythical characters: the dramaturgy of the degrees is supposed to teach essential lessons in an allusive, indirect, and subtle manner. In this way, masonry is a kind of “esoteric theatre”. Lastly, since the 19th century an important faction in masonry has claimed to reject all dogmatic thinking and to espouse “freedom of conscience”; yet many masonic systems have evidently justified their procedures by means of a more or less clearly defined doctrine.

I. FREEMASONRY AS AN ESOTERIC SOCIETY

Is Freemasonry essentially an esoteric society, taking this epithet in the two special senses already highlighted? Operative masonry, being that of the stonemasons' craft typically situated in the Middle Ages, is known through texts from the 12th century onwards, and much better known from the 13th. The earliest of the *Old Charges*, which are documents stemming directly from the lodges of operative masons, go back to the end of the 14th century (*Regius*, circa 1390; *Cooke*, circa 1420). They were written down by clerics, the sole possessors of the knowledge in question, who supervised the workers to keep them obedient to the rules of Christian life. Beside moral prescriptions (the “charges”), these texts merely contain a “Craft History” that is fabulous, legendary, and mythical: careless of chronology or verisimilitude, it links the work of the cathedral builders to that of the builders of the Tower of Babel or the Temple of Solomon, whose heirs and successors they are supposed to be.

Although we know almost nothing of the life and practices of the medieval builders' lodges, it seems that the induction of a new apprentice or the recognition of workers confirmed in the status of “fellow” was marked by a very simple ceremony, whose essential part was an oath taken on the Gospels. In England, the text handed down from the 17th century contains solely professional “obligations”. Yet one often hears of the “builders' secret” as one of the treasures bequeathed by masonic tradition from age to age, whose source was none other than the medieval lodges. One must be clear about the nature of this secret. At a period when many crafts, notably that of the mason, were regulated by texts that were often quite restrictive, the training of workmen and their conditions of work were strictly controlled. A major concern was to protect the professional skills as far as possible, so as to reserve the privilege of their exercise to those who were worthy. Hence there was a strong tendency not to spread technical knowledge, and especially not to put it into writing, which in any case would have been of little use at a time when almost all the workers were illiterate. There was surely no other reason for the orality of the tradition, allegedly the infallible proof of an esoteric tradition understood in the sense of a “secret”.

Nonetheless, these practices may explain the later appearance of an esoteric significance in the sense of a secret language, secondarily attributed to usages which were originally purely conventional and justified by professional needs. A striking

example is the institution of the “Mason Word”, known in Scotland from the beginning of the 17th century but certainly much older. In the Scottish operative lodges, this Mason Word was transmitted to the new masons, probably starting with the degree of Apprentice. It allowed these “regular” workmen to enjoy exclusive employment by the Masters, thus keeping out the *cowans*, who were unqualified masons and unrecognized by the lodge. The secret was a purely professional one. However, there was a practice, attested in Scotland from the beginning of the 17th century, of admitting as benefactors and honorary members certain local dignitaries (“Gentlemen Masons”) by giving them also the Mason Word – of which they could make no professional use – which gradually transformed this secret into an esoteric instruction. In 1691, Robert Kirk, while describing various Scottish customs, wrote that the Mason Word is ‘like a Rabbinical Tradition, in way of comment on Jachin and Boaz, the two pillars erected in Solomon’s Temple with an Addition of some secret Signe delayered from Hand to Hand’. Robert Moray (circa 1600–1673), an artilleryman, engineer, antiquarian given to esoteric speculations, and the first Gentleman Mason whose name is known to history, possessed the Mason Word as early as 1640; and this was doubtless one of the first seeds of masonic esotericism in the sense of a hidden knowledge.

The personality of Robert Moray is emblematic of the intellectual movement which led during the 17th century to the emergence of “speculative masonry”, i.e., a masonry which instead of making practical use of the tools of the trade applies them to the moral life. Remarkably enough, in 1660 Moray became the first President of the Royal Society. In this milieu, from which modern science would be born, the Hermetic and Kabbalistic Renaissance still re-echoed, notably in the Rosicrucian movement [→ Rosicrucianism], as Frances Yates has well shown (1972). It was through this unexpected channel that speculations taken from an old alchemical and magical source contributed to forming the spirit of speculative masonry and giving it its esoteric tone, in the “gnostic” sense mentioned above.

In one of the foundational texts, the *Discourse* written in Paris in 1736 by André Michael de Ramsay (1686–1743), incipient French masonry proclaimed that it ‘aspires to unite all men of sublime taste and agreeable humour, through love of the fine arts, where ambition becomes a virtue, where the interest of the fraternity is that of the entire human race, whence all the nations may draw solid knowledge, and where all the subjects of the differ-

ent kingdoms may act together without jealousy, without discord, and in mutual affection’. As we shall see, the affirmation of an esoteric filiation going back to the origin of humanity would come much later. In England, it was probably not until the later 18th century, with the publication of *The Spirit of Masonry* (1775) by William Hutchinson (1732–1814), that there was any acceptance of the concept of masonry as being principally the elucidation of a symbolic corpus. Even so, English rituals right up to the present day insist on the essentially moral meaning of the masonic symbols, which appear much more as conventional allegories than as mystical secrets, as Preston’s definition clearly shows.

It was in 20th century France that the esoteric vision of masonry was given an impressive theoretical basis by the vast work of → René Guénon (1886–1951). He first entered the lists in the world of Parisian occultism [→ occult / occultism], especially that surrounding the magus → Papus (1865–1916), himself founder of a pseudo-masonic order around 1887. This was → Martinism, whose somewhat confused doctrine, explained in 1891 in Papus’s *Traité méthodique de science occulte*, attempted a sort of synthesis between “the wisdom of the Ancients” and the infancy of modern science. The motto of the movement, inscribed on the cover of Papus’s journal *L’Initiation*, was: ‘The supernatural does not exist’. Guénon, soon disillusioned by the inconsistency of this kind of thinking, was next drawn to Hinduism, then attracted by the Sufi Muslim circles that had formed in Paris. In due course he received the *baraka*, and was permanently influenced by a vision of religious and world history taken from a school of thought close to the *Frères musulmans* (Muslim brothers), whose main characteristic was a blanket condemnation of the modern world. After a brief passage through the masonic lodges, from which he definitively distanced himself, Guénon wrote many books and articles in which he developed his vision of the “Primordial Tradition”, postulating an esotericism common to all the peoples of mankind and affirming the absolute degeneracy of the contemporary age (*La crise du monde moderne*, 1925; *Le règne de la quantité et les signes des temps*, 1945). Applying this same grid of interpretation to Freemasonry, of which he had only a very slight personal experience, he devoted many writings to it (*Écrits sur la franc-maçonnerie et le compagnonnage*, 1964), considering it to be one of the few organizations in the West that still possessed the keys to a universal esotericism. At the same time, Guénon severely criticized what he presumed to

consider the deviations and disavowals of a masonry which, especially in France, had supposedly forgotten its deep roots and lost the meaning of its own symbols. Guénon stated the masonic institution, through its degrees, contains a powerful esotericism and a “spiritual influence” leading, as at Eleusis, from the “Lesser Mysteries” to the “Greater Mysteries”, and opening the path to a unitive vision and to liberation of the soul. In parallel to this valuation of masonry, René Guénon constantly stressed the necessity for the initiated mason of “traditional exotericism”, meaning the effective attachment to a “regular” religious tradition (predominantly one of the religions of the Book), which masonry would permit one to penetrate esoterically. René Guénon’s thought has permanently influenced a faction of masonry, especially French and Italian, while meeting with much less success in Anglo-Saxon masonry, whose preference is for a purely moral or psychological reading of the masonic rituals.

2. ESOTERICISM AND MASONIC SYMBOLISM

Since one cannot avoid referring to operative masonry as the source of masonic symbolism, the question arises of whether any esoteric reflections took place in the lodges during the medieval period. The answer appears entirely negative. No evidence has ever reached us that allows one to imagine any secret teaching being dispensed to the workmen who built the cathedrals. The lodges transmitted the secrets of the craft, the art of building, which was no slight matter; it was jealously guarded and to a certain extent concealed, but not secret, for all that. Moreover, these workmen were carefully overseen by priests who were often the sponsors of the works, and we know that it was the latter who wrote down the oldest texts of the operative period. The moral prescriptions mentioned in them scarcely differ from those of the manuals in current use by the clergy for the edification of their flock.

A simple moral interpretation could certainly have been suggested to the workmen by the tools of their trade, at a time when everything, in a way, was a bearer of meaning. For example, a metal square was found inside a pile of a bridge near Limerick, Ireland, bearing the date 1507 and the inscription: ‘I will strive to live with love and care, upon the level, by the square’. But it must be admitted that masonic symbolism in all its luxuriant diversity, together with its esoteric connotations, was a creation that postdated the operative period; it was introduced perhaps as early as the end of the

16th century, and certainly during the 17th, by those who wanted to found on the ancient model of the craft guilds a new society dedicated to philanthropy and later to free philosophical speculation. One can even say that masonic symbolism existed before speculative masonry, but outside any professional or operative context. Thus in the great architectural treatises of the Renaissance, which are essentially the work of educated amateurs or dilettanti, it was usual to give moral or spiritual interpretations to the three principal orders of architecture – Doric, Ionic, and Corinthian. In one of the main treatises of the French 17th century, Philibert de l’Orme’s *Les Livres de l’Architecture* (published 1648), there is a whole passage about the symbolism of the cross. The portrait that Philibert draws of the ideal architect is a sort of prefiguration of the 18th-century mason: he is devoted to ancient and architectural matters, naturally, but is also a philosopher, a theologian, and even versed in the sciences and in medicine! He is the ideal polymath, such as was well represented in the membership of the Royal Society from its beginnings: a type for whom Robert Moray, as we have seen, served as model. One tributary of this current was the emblematic literature that was so popular throughout the 16th and into the 17th century, compiling hundreds of enigmatic figures, each associated with a virtue, a quality, or a short motto. Many of these “symbols” would reappear several decades later in the decoration of the masonic lodges.

Knowing as we do the identifiable sources of the masonic symbols, it is very unlikely that a secret or genuinely initiatic content would have been ascribed to them from their beginnings. As Ramsay recalled in 1737: ‘We have secrets; they are figurative signs and sacred words, which comprise a language sometimes mute, sometimes most eloquent, to communicate over great distances and to recognize our Brethren no matter what their language or their native land’. It was only by playing on a much later, indeed quite recent interpretation, that these symbols assembled on the “tracing boards” could be compared to mantras, to supports for meditation opening onto an inner experience. That some minds were capable of such a development is probably due to the fact that these figures and boards play a major role during the ceremonies in which the masonic degrees are conferred.

3. IS THE RITUAL OF MASONIC INITIATION OF AN ESOTERIC TYPE?

If we consult the oldest texts, notably the Scottish manuscripts of the Haughfoot group (1696-

circa 1720), the masonic ceremonies of the pre-speculative period were quite simple. The lodge is an oriented space containing some of the objects connected with the mason's trade, into which the candidate is brought blindfold, and there receives light. Under the sanction of a solemn oath and the threat of terrible punishments, the secrets of his degree are revealed to him, in this case the Mason Word. No other teaching is given.

However, from the 1730s onwards, in England and soon after in France, a new movement arose and rapidly grew to a considerable size: that of the high degrees. All through the 18th century, many dozens of rituals containing legends most often inspired by the Bible, populated by new symbols borrowed from all quarters and loaded with words derived more or less accurately from Hebrew, plunged the masons into a strange and puzzling world. Reading the thousands of manuscripts that survive in the chief masonic archives of Europe leaves one with an ambivalent impression. Not least, history shows that a number of these degrees were invented and sold at a high price by adventurers who made a sort of commerce out of masonry.

This body of documents, however, allows us to understand that masonic ritual intends not so much to teach the candidate through discourse as to involve him in an experience: a sort of sacred drama, a mystery in the medieval sense of the word, which is supposed to awaken spiritual resonances in him. It is a masonic commonplace that the true secret of masonry does not reside in the "words, signs and tokens" taught in the degrees, but in the inner experience of their recipient. This secret is thus reputedly incommunicable and inviolable. Such a conception also justifies the apparent absurdity of certain rituals, for it is not their literal sense that matters, but the profound and existential sense that the candidate lives through in his inmost being.

The exact nature of this inner experience always remains debatable. One can distinguish schematically between the Guénonian concept, which sees in the process of initiation the transmission of a "spiritual influence" in harmony with the "subtle constitution" of the human being, and a more current and strongly psychologized interpretation, which associates the masonic ritual with the techniques used in psychoanalysis: thought-associations, waking dream, and psychodrama.

This concept of masonic esotericism as ineffable initiatic experience clearly sets aside the doctrinal content of the rituals, i.e., their "catechisms" and classic "lectures". It is the lived experience that is favored here above any discursive teaching. How-

ever, this approach does not exhaust the question of the esotericism at the heart of masonry, because throughout its history several masonic systems have claimed that they possess an authentic esoteric doctrine.

4. SECRET DOCTRINES AND FREEMASONRY

Very early on, masonry integrated into its rituals various themes borrowed from esoteric currents such as → Christian theosophy and so-called spiritual → alchemy. It also came to include elements of a theurgical character, likewise connected with theosophy. During the extraordinary flowering of high degrees, masonic systems appeared having an overtly esoteric teaching, taking this term as referring to the currents of thought that historians include under it: theosophy and alchemy (mentioned above), the kabbalah [→ Jewish Influences], arithmology [→ Number Symbolism], and several others. Here we shall mention only a few examples.

The most remarkable case is perhaps that of the → *Ordre des Élus Coëns*, propagated from the 1760s onward by → Martinès de Pasqually (1708/9-1774). This system, masonic in appearance, began with the universal masonic model of the three degrees of Apprentice, Fellow, and Master, but it pursued the specific goal of theurgy. Drawing on sources that are still partly unknown, Martinès de Pasqually offered both a doctrine (later summarized in his *Traité de la Réintégration* [Treatise on Reintegration]) and a practice, aimed at causing the manifestation of higher spirits by means of the order's complicated ceremonies. According to Martinès, the two approaches were connected. The doctrine explained the fall of man and the necessity of his "reconciliation" with his creator, as a prelude to the end of time when the whole universe might be "reintegrated" in the divine unity. In the course of the rituals (called "operations"), the spirits were summoned, and their presence attested that the candidate had been approved by them. The highest degree of Réau-Croix was supposed to place the candidate in the virtual state of "reconciliation".

The system of the *Élus Coëns* did not survive the departure of its founder in 1772 – he died in San Domingo two years later. Properly speaking, the *Ordre des Élus Coëns* was not masonic, but it deeply affected the Régime Ecosais Rectifié (RER) created by → J.B. Willermoz (1730-1824), one of Martinès' disciples. Beginning in 1774, Willermoz imported to France a masonic system of Templar inspiration [→ Neo-Templar Traditions] stemming

from Germany: the *Stricte Observance Templière* (SOT). The traces were already visible there of a supposed secret doctrine inherited from the “poor knights of Christ”, a theme that would inspire a whole lineage of masonic degrees up to the end of the 18th century, notably the *Chevalier Kadosh*. Modern historians of the Order of the Temple have never been able to present credible proof that such a secret teaching really existed among the Templars prior to their suppression in 1312. Embarrassed by this unconvincing claim of Templar filiation, Willermoz modified the system and integrated Martinesian doctrine into it, while doing away with theurgy. At the summit of the pyramid of degrees he added two secret classes, the *Profès* and the *Grands Profès*, whose reception ceremony consisted exclusively of the reading of a long instructional discourse, which summarized the main points of Martinesian doctrine and applied them to masonic symbolism. This instruction is firmly stamped with the theosophy of the period, being not only that of Martinès de Pasqually but also of → Louis-Claude de Saint-Martin. It is noteworthy that the scheme previously described is reversed here: it is now the theoretical teaching, not the initiatic experience, that transmits a theosophic content. Thus we are dealing not with something “lived”, but with a “knowledge” borrowed from the particular esoteric current that is theosophy. The teaching texts of the RER stress the existence of a secret history transmitted from age to age by an unbroken line of Initiates. This history reveals that at every epoch since humanity’s origins a ‘primitive, essential and fundamental Order’ has existed in the shadow of public history, possessing the keys that explain the origin of Man and the Universe, to which masonry – to be precise, the masonry of the Rectified Rite – is the ultimate heir. The RER, which survives to this day especially in Switzerland, France, and Belgium, was thus probably the first masonic system to present masonry as an esoteric school, whose symbols and rituals were not mere allegories and whose ultimate teaching, revealing the essential verities about the origin and destiny of man and the universe, belonged to the initiates of the highest rank. What is specifically theosophic in the high degrees of the RER is a whole “illuminated” reflection on the mysterious relationships between a complex divine world, a living Nature, and the history of man, all presented in dramaturgical fashion.

Another esoteric current greatly in favor within masonry since the 18th century was the alchemical one. By way of the Rosicrucian tradition introduced into Germany at the beginning of the 17th

century and still widely re-echoing in Europe, degrees inspired by Hermeticism [→ Hermeticism and Hermetic Societies] made their appearance – e.g. the *Chevalier du Soleil*, circa 1750 – and sometimes structured an entire masonic system. One such can be seen in Baron Tschoudy’s *L’Etoile flamboyante*, published in 1766, which describes a very imaginary Society of Unknown Philosophers; another, in the Gold- und Rosenkreuz which began in Germany in 1777 and survived for a dozen years, mingling the Templar fable with the alchemical theme. There was also the *Rite Ecossais Philosophique* which was quite successful in France at the end of the 18th and the first years of the 19th century.

Connections between this Hermetic masonry and “operative” alchemists were very rare. In the masonic context it was an exclusively spiritual alchemy that was envisaged. The process of masonic initiation was thus assimilated to the Great Work, and the spiritual progress of the initiate paralleled with the ripening of the Philosophic Egg in the athanor, of which the lodge was the equivalent. This was a matter of borrowing pure and simple, taking from an ancient esoteric current the explicative keys which it hoped to adapt to a new context.

Napoleon’s Egyptian campaign combined with the vogue of → Egyptomania – of which Abbé Terrasson’s *Sethos* (1731) had been a precursor – to create, at the start of the 19th century, the Egyptian Rites of masonry, allowing their authors to introduce into the masonic rituals a most romantic vision of the ancient Mysteries, notably as expounded by Jacques Etienne Marconis de Nègre (1796-1868) in *L’Hiérophante, développement complet des mystères maçonniques*, 1839.

From the end of the 18th century, Jewish Kabbalah inspired certain masonic systems such as the → Asiatic Brethren, founded in 1799. While this branch did not have much of a posterity, another conception of Kabbalah, often based on misinterpretations and a very vague knowledge of the sources, became a commonly acknowledged origin of masonic teachings, especially at the end of the 19th century in the high degrees of the Ancient and Accepted Scottish Rite, furnishing the rituals with symbols, tables, and instructional texts. A typical illustration of this is *Morals and Dogma of the Ancient and Accepted Scottish Rite of Freemasonry* (1871) by the great American ritualist Albert Pike (1809-1891), whose proximate source was the French occultist → Eliphas Lévi (1810-1875, author of *Dogme et rituel de la haute magie*, 1856).

In England, the motherland of masonry, the term “fringe masonry” is used to designate a masonry preoccupied with occult knowledge and hidden learning that has never had a widespread development in that country. John Yarker (1833-1913) was its most convinced and zealous propagator (author of *The Arcane Schools*, 1909). In the later 19th century, systems of high degrees emerged from this movement such as the Societas Rosicruciana in Anglia (“Soc. Ros.” or SRIA, founded 1867), many of whose members gravitated to an order that was not masonic but esoteric and magical, though originally including many masons: the → Hermetic Order of the Golden Dawn (1888). In the same vein, → Annie Besant (1847-1933), the successor of → H.P. Blavatsky as head of the → Theosophical Society, introduced fringe-masonic ideas into the English-speaking branches of an Order admitting women (such orders are known as Co-masonry), Le Droit Humain. One of the dignitaries of this order, → Charles Leadbeater, a bishop of the Liberal Catholic Church, gave a long exposition of its principles in *The Hidden Life in Freemasonry*, 1926.

In France, the occult side of Freemasonry was quite popular at the end of the 19th century, although French masonry itself was undergoing a mainly secular and humanist evolution, more interested in social commitment than in mystical speculation. The work of Oswald Wirth (1860-1943) is relevant here. Wirth was the spiritual heir of → Stanislas de Guaita (1861-1897), himself one of the representatives of the Parisian occultist current of the 1880s. In a series of works that were very popular among French masons, Wirth expounded a conception of masonic symbolism inspired by a highly personal vision of alchemy and magnetism (*La franc-maçonnerie rendue intelligible à ses adeptes*, 1894-1922; *Le symbolisme hermétique dans ses rapports avec l'alchimie et la franc-maçonnerie*, 1910). His influence remained strong in the French masonic milieu, but had almost no effect outside the French-speaking countries. One should compare Wirth's production to a whole literature of esoteric pretensions influenced by the → New Age, which sees in masonry today the possible nexus of a new synthesis between the teachings of the great religious and mystical currents, indistinctly blended, and the most worrying (and often the least understood) discoveries of contemporary science.

These debates, queries, and persistent doubts serve once again to underline the extreme complexity of Freemasonry, both intellectual and moral. The first divulgation of masonic practices,

Le secret des francs-maçons (The Secret of the Freemasons), printed in Paris in 1744, playfully evokes the mystery in a way that is timely even today: ‘Pour le public un franc-maçon/Sera toujours un vrai problème/Qu'il ne saurait résoudre à fond/Qu'en devenant maçon lui-même’ (For the public, a freemason will always be a real problem, which cannot be resolved except by becoming a mason oneself).

ROGER DACHEZ

Fulcanelli

As far as one can tell, the name of Fulcanelli appeared for the first time in Spring, 1926, on the cover of the first of two works published under this pseudonym: *Le Mystère des cathédrales et l'interprétation ésotérique des symboles hermétiques du Grand Œuvre* (The mystery of the cathedrals and the esoteric interpretation of the Hermetic symbols of the Great Work). Only a small number of copies was issued; the book contained a Preface by →

Eugène Canseliet (1899-1982) and plates by the painter Jean Julien Champagne (1877-1932). It was followed in 1930 by *Les demeures philosophales et le symbolisme hermétique dans ses rapports avec l'art sacré et l'ésotérisme du Grand Œuvre* (Philosophic residences and Hermetic symbolism in its relationship to sacred art and the esotericism of the Great Work), prefaced and illustrated by the same. A third work was intended to complete the trilogy, *Finis gloriae mundi* (The end of the world's glory), but for unknown reasons it was never published.

The only useful biographical information on Fulcanelli is the little that is given by his only known disciple, Eugène Canseliet, in articles, prefaces, "memoirs", and in interviews which for the most part remain unpublished. According to Canseliet, Fulcanelli was born in 1839 and educated at the École Polytechnique in Paris. He was an engineer by profession, and, like most of the other pupils from such schools, was called up to serve in the Engineers' regiments, notably during the defence of Paris in 1870-1871. Canseliet tells us nothing more precise about Fulcanelli's mundane life. Was he married? Did he have children? We have not the shadow of an answer. All that we know, and that only through Canseliet, is that during the end of the 19th and the beginning of the 20th century Fulcanelli led a divided existence: on the one hand in Parisian society, frequenting salons in which he met scientists, politicians of national importance, and artists; and on the other, devoted to the study of alchemical texts and to laboratory practice. Fulcanelli lived in Paris, but also owned a small town house in Marseille, at least in 1915 or 1916 when Canseliet first met him, where he seems to have spent several years during the First World War. The story continues that Fulcanelli attained the final alchemical "coction" and obtained the Philosopher's Stone during the 1920s, at an unspecified date but certainly after the transmutation of 1922, which Canseliet records as having taken place in the Sarcelles gas factory. At this point Fulcanelli disappeared from Canseliet's life, but the latter remained closely linked to Champagne by friendship and alchemical researches right up to the painter's death. In 1952 (or 1953), Canseliet claims to have met Fulcanelli once more in Seville, under unusual circumstances.

Despite the absence of tangible evidence, or perhaps because of that, several investigations, biographies, and articles on Fulcanelli and his presumed identity have been published from the 1960s onwards, and especially since 1980. After the second edition of Fulcanelli's works appeared,

the best-seller *Le matin des magiciens* (The morning of the magicians, 1960) by Jacques Bergier (1912-1978) and Louis Pauwels (1920-1997) helped to make the alchemist a more popular figure. Bergier goes into considerable detail about → alchemy and relates his own meeting with an alchemist, presented as having been Fulcanelli, in 1937 – at the very moment when Bergier and his scientific colleagues were working on atomic energy. The purpose of the encounter was to warn the scientific world of the dangers of such manipulations. At the end of his life, Bergier confided to friends that the man he met in 1937 was → René Schwaller de Lubicz, which is impossible to verify.

Two years later, Robert Ambelain (1907-1997) published the results of his own researches and those of Jules Boucher (1902-1955): 'Jean-Julien Champagne alias Fulcanelli'. Ambelain emphasized the quasi-master-disciple relationship that existed between Champagne and Canseliet. His researches ascertained that Fulcanelli's publisher had never met anyone other than these two; the same applied to the concierge of the apartment building in Rue de Rochecouart where they had both lived from 1925 to 1932. Ambelain concluded by discerning Champagne's name in the engraving at the end of *Le Mystère des cathédrales*. Although his proofs were not totally convincing (resting as they did on unverifiable statements by people now deceased), they cannot be rejected out of hand.

Another important source for Fulcanelli's possible identity appeared in 1987, with a book on René Schwaller de Lubicz (1887-1961) by the Luxembourg-American writer André VandenBroeck. During 1959 and 1960, VandenBroeck was a frequent visitor to Schwaller, who disclosed an important and hitherto unknown fact: that at the end of the 1910s, Champagne and Schwaller had known each other. Champagne (said Schwaller) had discovered some ancient pages inserted in an alchemical book, and showed them to him: they dealt with alchemical experiments. The two worked together on them and discussed their respective researches: Schwaller had been collecting documents on the Hermetic symbolism of the cathedrals, and he confided to Champagne that he wished to publish his findings. Champagne, most interested in the manuscript, offered to read it, and perhaps to use his contacts in the world of esoteric publication to get it published. After reading it, Champagne declared that it should not be published, because it revealed too many secrets. A few years later, Schwaller was astounded to find his own work

forming the substance of *Le Mystère des cathédrales*. He guessed that Champagne had compiled it with the assistance of the erudite book-dealer Pierre Dujols (1860-1926) and of the young Eugène Canselier, who signed the Preface. This much Schwaller told to André VandenBroeck, by the latter's account. The "Schwaller hypothesis", according to which the essential ideas of *Le Mystère des cathédrales* were supplied by Schwaller de Lubicz, developed (perhaps with further assistance from others) by Jean Julien Champagne who hid behind the pseudonym of Fulcanelli, and seen through publication by Canselier, is supported by Geneviève Dubois, who has published a letter from Canselier to Schwaller that confirms some of VandenBroeck's information.

The other hypotheses of Fulcanelli's identity (that he was Pierre Dujols, Camille Flammarion [F. Courjeaud 1995], Jules Violle [P. Rivière 2000], etc.) are unsupported by any documents, proofs, or concrete evidence, and as such can only appeal to opinion, not to the slightest historical validity. Given the present state of knowledge, all the evidence seems to point towards J.J. Champagne, and it seems impossible to offer an alternative hypothesis that satisfies the rules of historical method.

The importance and fascination of the question of Fulcanelli's identity should not obscure the great interest that his two works hold within the context of alchemical literature. First, they are written in a particularly fine style – supple, precise, and readable – and these qualities have favored their reception in the years since World War II by a far wider public than alchemical publications usually attract. The books belong as much to the field of erudition as to that of alchemy. They have a lofty viewpoint, a serenity, and a freedom from the polemical tendency so often found in this literature. Fulcanelli appears as a Christian Hermeticist rooted in the classic texts and especially in the French tradition, from → Nicolas Flamel to the early 19th century writer Cyliani (the manuscript reputedly discovered by Champagne, which led to his experiments with Schwaller, dated from Cyliani's time). The strongly French character of Fulcanelli's work shows in two further respects. Most of his alchemical discourses take as their starting-point the sculptural program of a Gothic cathedral or a château of the Renaissance era. Moreover, he makes great play with the *langue des oiseaux* (language of the birds): a way of phonetically interpreting words and phrases in order to discover an inner, alchemical meaning, always expressed in French even when the original words are in Latin or English. Fulcanelli's models in this were perhaps

the alchemical writer Cesare Della Riviera (*Il mondo magico de gli heroi* [The magical world of the heroes], 1605) and the antiquarian Claude-Sosthène Grasset d'Orcet (1828-1900).

The ideas that the monumental buildings of France may enshrine a secret alchemical teaching, and that the same secrets lie hidden in certain great works of literature, are immensely appealing, especially to armchair alchemists. But for the practical alchemist, the value of Fulcanelli's work (and of Canselier's) is greater still. He describes phenomena and hints at laboratory procedures and substances in a tantalizing way, coming closer, perhaps, than any of his predecessors to giving real instruction to the aspirant. Whatever claim can be made for the reality of alchemy, and particularly for the transmutation of base metals into gold with which Fulcanelli, almost alone in the 20th century, has been credited, his writings have set in motion a renaissance of practical alchemy that shows no sign of diminishing.

In 1999, there appeared in London a book claiming to be the celebrated third volume of Fulcanelli's trilogy. Jacques d'Arès, the author of the preface, explains that the manuscript was sent to him as an attachment to an electronic mail message from "Fulcanelli", who stated that he had chosen d'Arès as being the spiritual heir of Paul Le Cour and Philéas Lebesgue. The "master" added that this manuscript was different from the first *Finis gloriae mundi*, and that its communication to the public had been forced upon him by 'compelling reasons, concerning the destiny of all mankind . . .' (23). Now aged 160(!), Fulcanelli apparently felt obliged to write a work in which he breathlessly condemns the conquest of space, experimentation on embryos, nuclear energy, etc., and predicts the fragmentation of the (currently) United States of America, then sent it to Jacques d'Arès through the latest communication channels. Thus there is repeated a pattern well known to historians of Hermeticism: that of attaching a prestigious name to one's own lucubrations – and gaining an audience thereby.

RICHARD CARON

Galatino, Pietro, * ca. 1460 Galatina (Puglia), † about 1540 Roma

Galatino's surname derives from the town where he was born from a family of Albanian origin which, some time before, had reached the Italian coast under pressure of the Turkish expansion. According to one tradition, the name of the family was Colonna, according to other sources, Mongiò. While still young, Galatino joined the Observant Friars Minor in St. Catherine's monastery in Galatina; in 1515 he became Vicar of the Franciscan Observance in Puglia and in 1517 Minister, re-elected in 1536, of the St. Nicholas' district. When in Naples, in 1506, he offered his work *De optimi principis diademate* to Ferdinand the Catholic and in 1507 he wrote the *Divini nominis Tetragrammaton interpretatio contra Judaeos*. Galatino reached Rome in the last years of the pontificate of Julius II, to whom he dedicated his *Oratio "Cum ieiunatis"*. As a chaplain of the cardinal Lorenzo Pucci, he had an *Oratio de circumcissione dominica*

printed in 1515, which was dedicated to Pope Leo X. To the same Pope he dedicated, in 1519, a *Libellus de morte consolatorius*. He spent the rest of his life in Rome, becoming "artium et sacrae theologiae professor"; but whether he ever taught in the University "La Sapienza" is uncertain. His numerous works, almost all still unpublished, were collected in 1539, under licence of Paul III, in the Franciscan monastery of S. Maria in Aracoeli, and then transferred to the Vatican Library. Posterior to that date we have no information about him.

During his Roman period, Galatino came into contact with the intellectual circles interested in Hebrew culture, the kabbalist tradition and prophetism: he met → Egidio da Viterbo and Georgius Benignus Salviati (Dragišič), entered into correspondence with → Johannes Reuchlin, improved his knowledge of Hebrew mysticism under Elia Levita's guidance, and learned Ethiopian from John Potken. Urged by the cardinals Lorenzo Pucci and Adriano Castellesi, he defended Reuchlin in his *De arcanis catholicae veritatis* (12 books), written in 1515-1516, a work which earned him a high reputation. It presents a dialogue between Johannes Reuchlin and Jakob Hoogstraeten. With this work, Galatino wanted to prove that the basic tenets of the Christian religion are contained in the talmudic and kabbalistic texts. The talmudic approach leads to an allegorical interpretation of the Holy Scriptures, the kabbalistic one to an anagogic reading. The conclusion is that no Christian can afford to neglect studying the hebraic tradition. In his demonstration, Galatino made so much use of Raimundus Martini's *Pugio fidei* and Porchetus de Salvaticis' *Victoria adversus impios Hebraeos* that he was charged with plagiarism. But, even if the work does not have the value of originality, it does offer a large collection of hebraic and Christian sources. In addition one can find → Hermes Trismegistus, the moderns Egidio da Viterbo, Reuchlin, Agostino Giustiniani and → Giovanni Pico della Mirandola as parts of his project of "concordia". Galatino's work is relevant as a synthesis which had an important audience and was reprinted many times during the 17th and 18th centuries. The years after writing his *De arcanis catholicae veritatis* were spent on compiling exegetic and prophetic works: Galatino shared the hopes, widespread in this period, of a religious and political renewal; he awaited a palingenesis under the guidance of an Angelic Shepherd, who would appear flanked by a sovereign of the final times, as stated by numerous prophecies. Only at that moment the "arcania Dei" of the Scriptures would be completely revealed, going beyond the literal

and allegorical meaning. Galatino wanted to make a personal contribution to this anagogic interpretation of the Scriptures and he tried to apply some kabbalistic techniques to the New Testament. Galatino tried to interpret his age by making use of prophetic texts from several epochs, particularly those belonging to the Joachimite tradition and – particularly relevant – the *Apocalypsis Nova* attributed to Beato Amadeo.

Georgios Gemistos

Gichtel, Johann Georg,
* 4.3.1638 Ratisbon (Germany),
† 21.1.1710 Amsterdam

Gichtel’s life can be divided into three primary sections: from 1638 to 1664, when he had problems with the clerical authorities in Ratisbon; from 1665 through 1667, when he moved about, staying for a time with Friedrich Breckling (1629-1711); and from 1668 to his death in 1710, the time during which he lived, wrote, and taught in Amsterdam. Much of our information comes from this last period, during which he established his community of the “Brethren of the Angelic Life”, the *Engelsbrüder*, or “Angelic Brethren”, and became more well known as a theosopher.

Gichtel’s family was pious, his father was a pharmacist, and Gichtel went to study law at Strasbourg. During this time he came to know → Knorr von Rosenroth, the Christian Kabbalist, and stud-

ied under Johann Schmidt, Heinrich Böckler, and Philipp Jacob Spener, all renowned historians or theologians, particularly Spener. But in 1664, at the age of 26, Gichtel’s life changed radically, when he began to realize something of his spiritual calling, and began to become directly involved in the turbulent Protestant reform movements of his day.

Gichtel was always combative, as we can see in his letters, and certainly this comes through in the biography appended to his letters. There we read Gichtel’s account of his ouster from Ratisbon: Ratisbon ministers denounced Gichtel as a heretic, an enthusiast, and an Anabaptist, and had him thrown in prison for thirteen weeks, though he claimed that he belonged to no sect, nor disputed with anyone. The last assertion seems unlikely. Brought before the intransigent Johann Heinrich Ursinus and his fellow clergymen, Gichtel was combative in his responses, so much so that he cowed them into silence and it was afterward said that he had a devil that knew how to handle Scripture. Even Gichtel’s own mother eventually told him to leave the ministers alone (VII.35).

Although one would think Gichtel’s denunciation and imprisonment would have been the low point of his life, in fact it was the turning point, for in prison he had a vision in which, while ‘wrestling with Satan’, he fell to earth and felt exalted into the spirit. He then saw a large serpent ‘lying in a three-fold coil around my heart’, while in the midst of the circle appeared a light, in which the Lord appeared. Thereafter the serpent was ‘cut up in innumerable pieces’. After recovering from the experience, Gichtel felt a great strength of faith and realized that this was merely the beginning of a long spiritual struggle (II.742-744). This experience was really the beginning of Gichtel’s subsequent life, for after this serpent-vision he felt set free, and travelled to Switzerland and then to Holland, where he took refuge for the rest of his life – all the while engaged in the spiritual struggle he described here in its inception in prison.

In the winter of 1666, Gichtel arrived in Schwoll, Switzerland, where he was given shelter by Lutheran minister Friedrich Breckling. During this time Gichtel did preach, but saw that there was little value in mere preaching – ministers, he thought, merely flung words at their congregations. By October, 1667, Breckling was being attacked by his fellow Lutheran ministers, and while Gichtel himself tried to defend him (even though the two had already had a falling out) in a letter written 5 October 1667, Gichtel’s support probably contributed to Breckling’s own troubles. Gichtel left Schwoll and ended up in Amsterdam, cold and virtually

penniless, where he was approached by a complete stranger who laid down six silver ducats and left. This kind of miraculous event evidently happened fairly regularly around Gichtel, whose debts were shortly paid off totally through the largesse of a Dutch book dealer. In fact, although Gichtel was to reside in Amsterdam for decades to come, he was supported all this time by friends or benefactors.

Gichtel's biography is Protestant hagiography: not for nothing is his biography in *Theosophica Practica* entitled *The Wonderful and Holy Life of the Chosen Champion and Blessed Man of God Johann Georg Gichtel*. Readers must check their disbelief in miracles at this work's portals, for Gichtel's life apparently grew more and not less miraculous as time went on. For example, we read of how Gichtel was forced to bed for over a year since 'Breckling and his wife with their fiery prayers strove against his [Gichtel's] soul'. But after that time, an 'invisible hand' lifted Gichtel from his bed to the ground, and 'Satan's powers were broken'.

If Gichtel's friendship with Breckling ended rather nastily, his friendship with Alhart de Raedt [Raadt] ended in an equally or, if possible, even worse situation. De Raedt was a professor of theology at Harderwijk who had had to leave his chair because of another theological controversy. No doubt introduced to Gichtel by Breckling, de Raedt and Gichtel became fast friends in 1682, and in the words of Gichtel's biographer, 'they would have imparted their hearts to each other, and no one that visited them left them unmoved' (VII.185ff.).

But eventually Gichtel began to suspect that all was not well with de Raedt, that indeed a "foreign spirit" had crept into him. In a crucial incident, de Raedt prayed for a young man who had gone mad, and the more de Raedt prayed, the more insane the young man in another room became, until eventually he hanged himself. In a later such incident, a man with whom de Raedt lived for a time went quite insane and had to be chained, eventually escaping and coming to Gichtel looking 'quite wild and terrible'. Through prayer, the account goes, Gichtel was able to help restore the man to sanity again. In 1684, Gichtel invited all the Angelic Brethren to sit together at a table, and de Raedt reportedly sat apart and cried, because of his offenses – a story that reminds one of the Last Supper, with de Raedt playing the part of Judas. Thereafter, the two never met again, though de Raedt became Gichtel's bitter enemy (VII.212-213).

Between this time and Gichtel's death in 1710, his reputation spread through the Netherlands, and to England and Germany. Gichtel corresponded with numerous theosophers or aspirants,

and knew what was happening in theosophical circles elsewhere in Europe. He weighed English theosopher → Jane Lead's assertion of *apocatastasis*, or universal restoration, and eventually rejected it as conflicting with → Boehme's views. As the center of the Angelic community in Amsterdam, Gichtel was a spiritual advisor to both men and women, and people not part of this group would also seek him out for advice. Gichtel saw the world as the venue for spiritual struggles between good and evil, a perspective that infuses his many volumes of letters entitled *Theosophia Practica*, and that also pervades the work of Jacob Boehme, which Gichtel edited and published under the title *Theosophia Revelata*.

In the volumes of Gichtel's *Theosophia Practica*, we find many references to paranormal or miraculous events. He wrote about how he was able through prayer to assist the soul of a friend who had committed suicide; of how he was able to help people by taking their obsessions onto himself through prayer; of how he and his "angelic brethren" were always given what they needed to survive; of how he was able to put a ghost to rest; and of how he was able to discern whether an alchemical recipe was legitimate or merely fraudulent (I.335; VII.215; V.3188, 3210-3211, 3343).

Gichtel's letters are strikingly empty of references to current events or well-known people, but instead emphasize what we may call "hierohistory". Essentially, hierohistory refers to records of the dates and times of individual spiritual events or revelations. Gichtel's letters and biography exemplify this tendency very well, and one often gets the impression that, for Gichtel, hierohistory takes absolute precedence over the progression of linear time. In a sense, Gichtel's *Theosophia Practica* is simply an extended hierohistory, the specific cycles of revelation for Gichtel and his circle being chronicled both at the beginning and at the biographic conclusion of this seven-volume magnum opus of letters.

Gichtel's death is forecast in hagiographical fashion at the end of *Theosophia Practica* by reference to archetypal cycles of time. The Divine Sophia (Wisdom) reportedly appeared to Gichtel in definite temporal cycles during his life, and these cycles culminated forty days before his death, when 'the heavenly mother of wisdom revealed herself anew in 1709, December 13'. This time of revelation was the greatest, Gichtel said, since the time of de Raedt's apostasy; and according to Johann Georg Graber, it reached its zenith in the Angelic group after Gichtel's physical death early in 1710 (VII.340-341). This cycle of revelation, Graber

tells us, was renewed in subsequent years among the remaining Angelic community.

Gichtel's primary written work, as we have seen, was his voluminous collection of letters, but he left several other major works behind as well. Among these is a treatise, dated 1696, entitled *Eine kurze Eröffnung und Anweisung der dreyen Principien und Welten Im Menschen* (A Brief Revelation and Instruction on the Three Principles and Worlds in Man), published in 1723. This work – which has been reprinted several times under the erroneous title *Theosophia Practica* – includes some very important illustrations on planetary symbolism and the human microcosm, detailing the process of theosophical illumination that is discussed at length in the text. The treatise is extremely ascetic in emphasis, focusing on the “wooing” of Sophia and on advice to the aspirant on struggles against demons and temptations.

Gichtel also edited the first major collection of Boehme's writings, entitled *Theosophia Revelata*, published in three successive editions: 1682, 1715, and 1730. Between 1680 and 1682, Gichtel and his colleagues accomplished this remarkable project of collating disparate texts and producing a single, fourteen-volume edition in octavo. It was in fact the primary German edition of Boehme until the work of Werner Buddecke in the 20th century. These two multivolume series – Boehme's work in *Theosophia Revelata*, and Gichtel's own letters in *Theosophia Practica* – were deliberately complementary, Boehme offering the primary revelational paradigm of theosophy, and Gichtel concentrating on its practical implications through guiding letters.

While Gichtel certainly belongs to the tradition of Boehme, his emphasis was not on Boehmean exegesis, but upon direct spiritual experience that he details in his letters. His contributions to the Boehmean tradition include the following: (1) an emphasis on rigorous asceticism in order to “woo Sophia”, or divine Wisdom personified as feminine; (2) an intense emphasis on demonic temptations in life that must be overcome (i.e., daily life as intense spiritual-ascetic struggle); (3) cycles of Sophianic revelations at specific intervals (“hierohistory”); (4) an emphasis on the androgyny of Adam prior to the Fall, and on the central role of Sophia in restoring the soul of the theosophical practitioner to primordial spiritual wholeness symbolized as androgyny; (5) explicit reference to traditions of practical and spiritual → alchemy; (6) miraculous or paranormal events, including clairvoyance. All of these themes are to be found in Boehme, though in far more symbolic form. Gichtel's work is marked above all as unique by his

particularly detailed chronology of Sophianic revelation in specific temporal cycles, or hierohistory, by his practical theosophic community (the Angelic Brethren), and by his letters filled with details of his own theosophic and paranormal experiences. Gichtel's essential contribution to the theosophical tradition is his emphasis on theosophic praxis and experience.

Gichtel has been criticized by Gorceix and others as having been a misogynist, but while there is no doubt that Gichtel insisted on chastity as part of his path toward spiritual marriage with Sophia, an emphasis on chastity is not the same as hatred of women (Gorceix 1975, 125; Versluis 1999, 36-37). Gichtel wrote that he had often refused proposals of marriage from various women, but this is consistent with his worldview affirming chastity. It is also the case that he corresponded with and offered spiritual advice to women as well as to men. Gichtel was unquestionably an irascible character who argued with a great many people, but he remains among the most important of the theosophers, and his letters shed a great deal of light on Boehme and on a theosophic spiritual path. The major study remains that of Gorceix (1975); detailed discussion is also found in Hutin (1960), Thune (1948), and Versluis (1999). Translated excerpts from *Theosophia Practica* are found in Versluis (2000).

ARTHUR VERSLUIS

**Giorgio [Zorzi], Francesco, * 7.4.1466
(?) Venice, † 1.4.1540 Asolo**

Giorgio was born in Venice at a date which is undocumented, but which study of his astrological nativity indicates to be April 7, 1466, thus disproving his previous identification with one Dardi Zorzi. The scarcity of sure information on his youth and early manhood prevents us from knowing about his intellectual formation or his possible places of study. We know only that he belonged to the powerful patrician family of the Zorzi, and that he was a close relative of Alberto Marino Zorzi, "Reformer" of the University of Padua, and of Marin Sanudo, the author of the *Diari* which furnish important information about him. There is an old tradition that Giorgio, like other young patricians, completed his philosophical studies at the Paduan "Studio", but it is undocumented, as is the statement that he taught before becoming a friar. Nor can one establish the exact date of his entry into the order of the Observant Friars Minor, perhaps in the Venetian monastery of San Francesco della Vigna, or whether he pursued a regular theological education in the Studio del Santo, the school of the Venetian Franciscan Province. However, Giorgio's familiarity with the Scotist doctrines that he often cites, and his reading of → Albertus Magnus and Thomas Aquinas, seems to confirm this hypothesis. His evident familiarity with the works of → Marsilio Ficino and → Giovanni Pico della Mirandola, with the Hermetic texts and the Talmudic and Kabbalistic traditions, suggests close contact with the Venetian intellectual circles influenced by the Platonic "Renaissance" and with the scholars of the Venetian Jewish community, such as Jacob Mantino, Elia Levita, Elia Menahem Halfon, as well as with the printer Gersom Soncino. Such contacts, together with the probable connections with → Egidio da Viterbo and the Venetian Augustinians engaged with editing the Joachimite and pseudo-Joachimite texts, may explain the most typical aspects of Giorgio's thought, expressed above all in the third "cantico" of *De Harmonia mundi*.

These interests, studies, and personal experiences did not hinder Giorgio from participating in the life of the Franciscan community, including a busy preaching activity and perhaps even a voyage to the Holy Land, and from maintaining excellent

relations with the political institutions of Venice. In 1500 he was elected Guardian of the monastery of San Francesco della Vigna, then apostolic delegate for the celebration of the Jubilee. At the same time he found himself involved in the trial of the physician Giovanni Maria, a follower of Francesco Biondo, who had promulgated his heterodox ideas in Venice. It is unclear what Giorgio's role was in this affair, which brought him a brief excommunication; but the consequences were not serious, for in 1504 he was re-elected Guardian and continued to preach with much success in Venice, on the mainland, and also beyond the Venetian domains. He was even confessor of the Poor Clares of the monastery of Santo Sepolchro, and of the abbess, Chiara Bugni, a "visionary" and "thaumaturge" who enjoyed considerable fame in the city. The church authorities carefully investigated the ecstasies and visions of the abbess, which were then celebrated by Giorgio in his own "Life" of Bugni. A commission of the theologians excluded any charge of fraud or heterodoxy, but nevertheless in 1512 the nun had to accept segregation in a sort of conventual prison, where she lived out her last years.

Not even this affair lessened the favor which Giorgio enjoyed with the Senate and Signoria, which included him among the candidates for the Patriarchate in 1504, 1508, and 1523. After the Venetian defeat at Agnadello (1509), he was their intermediary with Andrea da Capua, duke of Teroli and commander of the Spanish-Neapolitan troops stationed at Vicenza, who was considering a truce in anticipation of a shifting of alliances. The mission was unsuccessful; but again, during the war of the Holy League, Giorgio sent important confidential reports to the main Venetian institutions. In spring, 1512 he met with Francesco II Gonzaga before proceeding to Ferrara, where he stayed with Alfonso d'Este, and reported on these conversations in person to the Doge. Meanwhile Giorgio pursued his monastic career. He was superintendent of the building of the sanctuary of Motta di Livenza, and in 1513 was elected Provincial, then Provincial Vicar, a post confirmed for the next two years. As such, he took part in the general chapter of the Observants in Assisi (1514), and in 1517 in the "supreme chapter" of Rome that sanctioned the definitive separation between the Conventuals and the Observants. Giorgio was named "definitore generale cismontano" of the latter. Although he retired in 1517-1518 to the monastery of San Girolamo at Asolo to begin the laborious writing of *De Harmonia mundi*, he took part in the general chapters of Lyon (1518) and Carpi (1521), where he was re-elected Definitore General. Finally,

in 1523 he became Provincial Minister, and was reconfirmed until 1525.

The exercise of these offices brought Giorgio closer to those who, reacting to the schism of the Reformation and the crisis of ecclesiastical institutions, hoped for a profound renovation of the Roman Church which would not only eliminate the corruption of the clergy, the monastic orders, and the hierarchy, but would return the Christian faith to its origins. Especially in the 1520s, Giorgio hoped that the reform of the Observants might be the example of a real Christian rebirth; and indeed in 1523, at the general chapter of Burgos, he sided with the “general” Francisco Quiñones, sharing his reforming proposals. It is not surprising that Giorgio was friendly with the Venetian supporters of the so-called “Catholic Reformation”, such as Gasparo Contarini, and with personalities such as Cortese, Giberti, Fregoso, and even Carafa, who after the Sack of Rome found the Venetian environment more congenial. However, in 1523 Giorgio found himself involved in a delicate disciplinary investigation concerning some “unruly” brethren whom he had not punished sufficiently. The Cismontine Commissary General suspended him from his post of Provincial, then, because Giorgio, with other Venetian friars, had not presented himself at the chapter of Mantua, the General excommunicated him, causing him to appeal to the pontifical legate and to the Pope. This was resolved only through the direct intervention of Quiñones, who in December 1525 absolved Giorgio but punished the other brethren. We do not know whether this altercation was provoked by mere disciplinary questions, or by some heterodox attitude as was common among the Observants, made suggestible by millenarist ferments and sometimes leaning toward the acceptance of Protestant doctrines. No longer re-elected, Giorgio returned to Asolo, where he had meanwhile finished writing *De Harmonia mundi*, published in Venice in September, 1525.

It is difficult to sum up such a complex work, which has the form of a musical poem composed of three “songs”, and in which the continuous reference to Platonic, Neoplatonic [→ Neoplatonism], and Hermetic texts [→ Hermetic Literature] is intertwined with astrological doctrines [→ Astrology] and alchemical allusions [→ Alchemy]. Long quotations from the Gospels, especially St. John’s, the Apocalypse, and the Pauline Epistles cohabit with mathematical speculations of a Pythagorean and magical type [→ Number Symbolism]. Giorgio’s preferred Kabbalistic doctrines [→ Jewish Influences] encounter the “Christian wisdom” of the Church Fathers (especially Origen), → August-

tine, and the greater Minorite masters. Such a rich erudition cannot be explained solely by the extraordinary accomplishments of → Ficino and Pico della Mirandola, but rather by the return to the Hebrew biblical tradition urged in recent works by Felice da Prato and Sante Pagnini, by the publication of writings of pure Kabbalistic inspiration such as Agostino Riccio’s *De motu octavae sphaerae*, and by the prolific efforts of Egidio da Viterbo in his attempt to christianize the Kabbala. *De Harmonia* aims to be the expression of a shared “wisdom” that is at once philosophical and theological, speculative and mystical; an interpretation of the supreme divine and cosmic mystery whose “illumination” descends through all the “revelations”: the Bible, the *prisca theologia*, the Word of Christ. Giorgio draws from these divine “springs” and their exegesis those fundamental themes which invariably influenced the religious culture of the mature Cinquecento, whether Catholic or heterodox: the “central” significance of man in the hierarchical and harmonious order of the cosmos; his liberty and dignity as a creature who comprehends the whole universe within himself; the supreme “mediating” function of Christ, the “incarnate Word” conceived as the unique “intermediary” between the eternal Monad and the infinite multiplicity of creation; the return of all to the One through the progressive *reductio* that every man can achieve in the privacy of his own spirit, if he follows the “path” of redemption by Christ, receives his “blessing”, and “imitates” his example. Finally, in the third cantico, perhaps added later, the Franciscan – like Ficino in the *Libri de Vita* – comes to connect the *deificatio hominis* (deification of man), with the beneficial use of astrological and magical techniques that facilitate the celestial ascent, just as his Kabbalistic exegesis aims toward the millenarist expectation of the new Jerusalem and of the new Adam who will reign together with Christ.

Giorgio credits this knowledge of these eternal truths to the sages of every age and every people, who have enjoyed the secret divine “illumination” and transmitted it from the immemorial time of the *prisca theologi* and the *poetae theologi* up to the more recent meditations of the Fathers and Doctors of the Church, of Francis of Assisi and → Nicholas of Cusa. To them is due the lofty speculation on the One that is eternal and immutable but not immobile or sterile, thus the generator of every multiplicity in the infinite production of the world. From this unity and “first, most fecund mind” proceeds a “most similar offspring”, the true image of the Father, who generates it with a “unique and

uninterrupted" act. This "offspring" is the "Word of God" that Plato calls "son", and Orpheus sings of in the myth of Minerva born from the head of Jupiter. But the "Son" is the very principle that generates the love of divine goodness, linking every "intelligence" to the supreme Mind. Thus Giorgio proceeds to deduce the generative process from the One to the many, as conceived by the *sapientes*, and especially by Plato's *Timaeus*, Orpheus, Boethius, the Magi and the "Chaldean theologians", who have shown that the creation of the *fabrica mundi* (world-material) has been achieved following the musical and mathematical model of the perfect ternary number. The heavens and the stars have been made by the "perfect artisan" in such a way as to move with the greatest harmony and diffuse their good influences on all inferior things. Thus no calamity, mishap or catastrophe can be attributed to God, the fount of all goodness, because his celestial "ministers" operate according to his will, without ever violating human free will or disturbing the divine order of the world and the perfect reciprocal communication of all things. Christ the Word, "root" of all the "virtues" operating in the cosmos and of the "light" that forms it, attracts every earthly life and nature to himself and leads back to unity the multiplicity that is dispersed in the immense cosmic architecture. He is indeed the "redeemer" who has shown to man, placed by God between time and eternity, the finite and the infinite, how to ascend to the pure angelic intelligences and thence to return to his own origin and celestial nature. Thus the human soul, which the sacrifice of the highest cosmic and spiritual intermediary has redeemed from original sin, can again become God's favorite child; and when it has finally put off its dissonant and inharmonious "matter", it will reveal its harmony of pure spiritual and immortal substance, awaiting the last judgment when beatitude will be absolute and everything will return to its one source. As the soul pursues this journey, it will be able to enjoy all the natural energies and potencies, using the "good" magical arts of "haruspicy", chiromancy, geomancy and physiognomy [→ Divinatory Arts], which allow the "elect" to receive exceptional knowledge and powers as they approach the higher form of revelation, the "rapture" in which the omnipotent divine will reveals the mystery of the future and unveils eternity.

The publication of *De Harmonia* at a time that was so perilous for Christendom, riddled with violent religious and political conflicts, was received with great interest in the religious circles that entertained reforming notions; but it did not fail also to

attract intellectuals who were later considered heretics. Not by chance did Bembo express his doubts about its ample usage of the Kabbalah, 'a most suspect and dangerous thing', while other readers distrusted its attitude toward traditional theological doctrines, harbinger of possible heretical conclusions. The book was soon diffused throughout Europe, as witness the Paris editions of 1543 and 1564 and the French version (1578, 1588) by →Guy Lefèvre de la Boderie, a disciple of →Guillaume Postel, himself an admirer of Giorgio.

During the following years, Giorgio was one of the main figures in the religious life of Venice. He was charged by the Senate in 1527 to promulgate the Jubilee conceded by Clement VII, and returned to San Francesco della Vigna as Reader in Sacred Scripture and Teacher of the Hebrew Language. In the dramatic spring of that year, on the eve of the Sack of Rome, Quiñones, on the orders of Clement VII, asked him to convince the Venetian Senate to lay down arms and support the final efforts to avoid war. Giorgio's intervention was in vain; but the following year, when he obtained the conversion of a rabbi, he was solemnly honored in San Marco in the presence of the Doge. His most dramatic effort of religious politics was his involvement in the complicated affair launched by Henry VIII's request for a divorce from Catherine of Aragon. Giorgio supported the humanist Richard Croke, sent to Italy to collect the opinions of professors, church dignitaries, biblical scholars, theologians, and even rabbis who were disposed to recognize the validity of the reasons put forth by the English king. The friar's activity succeeded in gathering support not only from various theologians of Venice, Padua, and Vicenza, but even of Elia Menahem Halfon, Baruch di Benevento, Calò Calonymos, and the converted rabbi Marco Raffaele. Not even the papal prohibition, on pain of excommunication, of writing or speaking against the validity of this marriage induced him to give up. But he did not disobey the papal brief of Clement VII (2-6-1530) which summoned him to Rome, so that with his "singular doctrine" he might assist the papacy and the Church. Even the Senate had warned Giorgio not to become further involved with the "English question", just as it refused the request of the Bishop of London, John Stokeslay, that the Paduan theologians might make their opinion known. Giorgio's stay in Rome, where it seems that he toned down his attitude, did not change the Pope's decision, after which a severe, life-threatening illness forced him to lessen his efforts. It is difficult to agree with the identification

made by Roth of Giorgio as the “authoritative” Italian Franciscan present at the end of 1530 or 1531 at the English court, where, incidentally, his close associate Marco Raffaele found refuge.

Shortly after his return to Venice, and thence to Asolo – perhaps as early as March 1531, when the Signoria named him among the candidates for the diocese of Brescia – Giorgio found himself involved in a bitter conflict which set the supporters of Paolo Pisotti, General of the order, against the former Venetian Provincials and a group of young friars who supported the radical reforms of the Observants. When the future “heretic” Bernardino Ochino was sent to Venice as Pisotti’s “commissary”, it embittered the meeting and led to the intervention of Carafa and Gian Matteo Giberti, Bishop of Verona, in favor of the “reformers”. The crisis lasted till the end of 1533, when Pisotti renounced the generalship. Giorgio, acquitted of his adversaries’ accusations, could then return to dedicate himself to Kabbalistic studies, biblical exegesis, and ever bolder spiritualist meditations. Already in 1532 he had met Luca Bonfius, friend of → Heinrich Cornelius Agrippa, with whom he had a long conversation about the most important Kabbalistic themes; and the following year Agrippa, defending himself from the accusations of Corrado di Ulma, had cited Giorgio among the greatest students of the Kabbalah. The friar’s fame was already widespread among European followers of the *secretior theologia* (more secret theology), whilst on the other side he regained authority in his order, becoming in 1534 Custodian, and in 1535 again Provincial and Procurator of the “fabric” of San Francesco della Vigna. The latter office allowed him to realize his idea of the canon of harmony and mathematical proportion to be used in the construction of temples, as a symbol of the universal harmony. Finally in July, 1536, he published in Venice *In Scripturam Sacram Problemata* (Problems in Holy Scripture), a work which had considerable success, especially in France where it was reprinted in 1575 and 1622.

In this book, Giorgio used a completely different procedure, tackling the “problematic” discussion of scriptural passages, of their apparent divergences and the different meanings to be attributed to them through recourse to Kabbalistic interpretation. In the dedication to Paul III he says that he has written this work solely to help the faithful, who are seeking in the divine Word the most “sweet” and solid wisdom. He points to the Bible as the source of all knowledge, from mathematics to geometry, from → music to “true and divine” astronomy, from medicine to natural philosophy

and ethics. Thus in the *Problemata* he says that he has treated not only the problems concerning the origin and order of the *fabrica mundana*, but also the creation of man, the coming of the Mosaic revelation and the history of the Law; also the themes concerning “vaticination” from the biblical prophets to the prophecies of → Hermes, → Zoroaster, Orpheus, Pythagoras, and Plato, derived from the communal divine *officina*, and thence to the more secret truths of the Gospels. Above all, he announces that he will have recourse to Kabbalistic exegesis according to the method of the *Zohar*, by which the sense of the Scripture may vary in 72 “facets”, thereby revealing unknown “treasures” of wisdom. It is no surprise that in this book the most subtle theological and dogmatic arguments, subjected to Kabbalistic analysis, alternate with prophetic, messianic, and eschatological themes aimed at the expectation of the necessary *renovatio* of man and the world.

In the first section, *De mundi fabrica*, the friar revives the defence of the creationist doctrine against Averroes and the Peripatetics; but he asserts that God has created a unique, universal soul from which he has drawn the individual souls, infused in Adam and other men. Giorgio accepts the Platonic myth of the original, androgynous nature of man, which he says Plato took from → Moses, a prophet illuminated by divine wisdom. Thus Giorgio shows his intention to interpret the sacred texts in complete liberty, in search of recondite and arcane meanings foreign to traditional exegesis, and in particular of propositions that refer directly to trinitarian dogma. He emphasizes the work done by the Son-Word in the formation of the cosmos, dominating the original chaos and the dark formlessness of primordial matter. Moreover, the conception of sacred history, discussed in nine groups of problems, allows Giorgio to extend the Old Testament revelation up to the coming of Christ, the universal mediator, so as to consider the Mosaic law in close symbolic continuity with the Christian message.

The true significance of the *Problemata* appears only in the third tome, dedicated to the *Prophetarum oracula* (oracles of the prophets). While Giorgio praises the supreme value of prophecy, he considers “natural reason” and philosophy as frivolous and vain in comparison with that “divine gift” perceptible to the “spiritual senses” alone, because the true prophet must express himself in enigmatic form, presenting the divine truth only in obscure form, comprehensible by few. Moreover, when Giorgio discusses the significance of the sacraments, particularly bap-

tism, and their “potency”, he insists on their “spiritual” and “symbolic” character, whether it is a matter of penitence, baptism, or the “sacrifice” of the Mass and the Eucharist, of which Christ is the only priest. He alone who participates in complete inner purity can unite himself with God in *charitas* (love), like the grains of wheat in bread, while the false Christians, no longer his children, will be subjected to God’s strict justice.

Like the *problemata* on the secret reason that God permits the evils and disasters of the world, the interpretation of the sacraments is resolved within the eschatological perspective of the war between good and evil, concluded by the coming of the “new men” reborn in Christ and the end of worldly rites and observances, necessary under the Law but now abolished by the sacrifice of Christ, “celestial man”, and by faith in him. Then in the fourth tome, the friar discusses original sin and the fullness of time, which is now very close; he returns to the divine-human nature of Christ and his supreme thaumaturgic virtue, revealed by the messianic name that dismays the demons with its powers and its numeric virtue, in which the power of all the divine names is collected. Certainly, faith in the man-God is now too scarce among “worldly men”, and the very “mystical body of Christ”, the Church, can no longer preserve that divine “treasure”, while the mystery persists of “Judaic incredulity” toward the true Messiah so long awaited. In the fourth and fifth tomes Giorgio appeals not only to Paul, Augustine and other Fathers, but to Hermes, Orpheus, Zoroaster, Pythagoras and Plato, to renew the ancient “secret wisdom”, interpret the supreme mystery of the Trinity, and recognize the divine glory, conqueror of demonic cunning, which is only revealed when one despises the desires and temptations of the mortal and ephemeral body. Giorgio also discusses the Kabbalistic significance of the angelic natures; the heavens, stars, and celestial influences governed by them; and lastly the “secret” arts among which is → alchemy, often wrongly used but worthy of faith. Thus there emerges the image of the Christian “thaumaturge” to whom divine wisdom has revealed the most hidden mysteries of the cosmos, which he uses for his final identification with the Word as redeemer of his earthly and carnal nature.

The publication of the *Problemata* caused doubts and fears even among Giorgio’s friends. Contarini, especially, judged severely the interpretations of trinitarian dogma as being close to the Arian heresy, and the prevalence of rabbinic and Kabbalistic exegesis over Christian theologians. Giorgio defended his work, asserting its absolute

orthodoxy; then, returning to Asolo, devoted himself to writing an unpublished commentary on the Kabbalistic Conclusions of Pico, and to the composition in Italian of the *Elegante poema* and its *Commento*, perhaps interrupted by his death. In the introductory *Argomento*, he writes that he intends to ‘make clear and bright many places in Scripture that seem more occult and obscure’ by ‘following the poetic custom’, that is, with a poem evidently imitative of Dante, on the lines of the Platonic and prophetic interpretation of the *Commedia* proposed by Ficino and Landino. The *Poema* and *Commento*, which resume the doubts and Kabbalistic exegesis of the *Problemata*, survive in a single manuscript tradition which must have circulated only among the friar’s most faithful followers, among them perhaps → Giulio Camillo.

Giorgio died in Asolo in April 1, 1540, while his works were still circulating in Europe. But later, after the harsh attack by the Dominican Sisto da Siena (1566) and the drastic accusations by Bellarmino (1585), came the final condemnation of *De Harmonia* and the *Problemata*, sanctioned by the *Index romanus* of Sixtus V (1590) and repeated in the *Index librorum prohibitorum et expurgandorum* of Giovanni Maria Guazzelli (1607).

CESARE VASOLI

Gnostic Church

The Gnostic Church (Église Gnostique), created in 1890 by Jules-Benoît Doinel (1842-1902), was born in the environment of modern → spiritualism and the → Theosophical Society. Doinel had for some years frequented esoteric and occultist circles, and, while practicing spiritualism, had attended the Swedenborgian Church [→ Swedenborgian Traditions]. In 1875 he met Léon Denis (1846-1927), for whom he would always have a great admiration. From 1882 to 1893 Doinel belonged to the sect of Guillaume Monod (1800-1896), a reformed minister who believed himself to be the new Christ, and gave lectures there which

Monod praised, considering Doinel to be his prophet, a reincarnation of Nehemias. Doinel's masonic career began in 1884. He was initiated Master in 1885 with the 'congratulations and encouragement' of Albert Pike (1809-1891). From 1886 to 1893 he was Orator of his Orléans lodge, and became its Worshipful Master in 1892. The following year, he attained the degree of Rose-Croix within the Parisian chapter "L'Étoile Polaire".

As far as the Gnostic Church is concerned, everything began as a result of a spiritualist séance held at the end of 1889 at Lady Caithness's (1832-1895). The circle of friends grouped around this lady was much concerned with spiritualism, on the one hand, and with ancient → gnosticism, on the other. During this particular séance, in which Doinel participated, the "spirit" of Guilhabert de Castres, former Bishop of Montségur, manifested to demand the creation, or re-creation, of a "Gnostic Church". Doinel became convinced that he had received a "gnostic investiture" on this occasion, and was indeed the elect appointed to head this church, which he called Nouvelle Église Gnostique Universelle (New Universal Gnostic Church). It was primarily a matter of giving new life to ancient gnosticism, broadly understood (not only → Valentinus, but also personages such as Apollonius of Tyana and → Simon Magus, and even Origen, figure as authorities here). After founding his church, Doinel consecrated its bishops, including → Papius (1865-1916). Then he joined Papius's Martinist Order [→ Martinism: Second Period], and became a member of its Supreme Council.

The goal of the Gnostic Church was to create a spiritual and elitist → Freemasonry under the sign of Gnosis. In his study of the Gnostic Church, René Le Forestier has emphasized one of its particularities, viz. that its directors wished to teach an elite: 'while the postulates of the gnostic doctrines and the dogmas of the Cathar religion had been made known to all the disciples and catechumens, . . . it was quite different with the new Gnostic Church, where the three orders of the faithful were like masonic "degrees"' (Le Forestier 1990, 50-51). A bridge was in fact established with the lodges of the Scottish Rite, thanks to the "Ordre des chevaliers faydits [the name given to the Cathar lords] de la Colombe du Paraclet", which was an imitation of a Templar Masonic System (or "Rite"), known as the Strict Observance. 'Only knights should belong to Gnosis, to Martinism, and to Kabbalah'; their password *Ad Spiritum per Helenam* 'was most significant, and the Order de la Colombe du Paraclet, creation of the Gnostic Church, was fortunate in attracting to the latter the attention of enthusi-

asts for the occult sciences, and bringing it proslaves' (ibid., 56-57). The ties between the Gnostic Church and Freemasonry would never be broken.

The adherence of the leaders of the Gnostic Church to the Martinist Order was a constant. This was notably the case with Doinel's successor, Synésius (Léonce Fabre des Essarts, 1848-1917), as with the neo-gnostic bishops Théophile (Léon Champrenaud, 1870-1925) and Simon (Albert de Pouvourville, 1861-1940). These last two published the periodical *La Voie* (1904-1907), and, in 1907, *Les Enseignements secrets de la Gnose* (The secret teachings of gnosis). The same adherence applied (1909-1912) to Palingenius (→ René Guénon, 1886-1951).

Doinel presided over the Très Haut Synode, i.e. the group of "bishops" who were at the head of this Gnostic Church. We have very little information on this synod's activity. Le Forestier states that within it a 'council of members of the third degree' practiced a ritual of magical character that was in favor in certain occult Orders, notably the → Élus Coëns. Doinel presided over the synod for the last time in September, 1894. At this point, in fact, he broke with his church, going so far as to denigrate it in a book that appeared in the same year (under the pseudonym of Jean Kostka), *Lucifer démasqué* (Lucifer unmasked). Yet he re-joined it at the end of his life, then holding only the simple title of bishop.

Another organization was in liaison with the Gnostic Church, thanks to → François-Charles Barlet (Albert Faucheux): the → Hermetic Brotherhood of Luxor, defined by Guénon in the review *La Gnose*, its organ, as 'one of the rare serious initiatic fraternities that currently still exist in the West' and as 'foreign to any occultist movement' (*La Gnose*, no. of November 1911). René Guénon's entrance onto the stage marked the rejection, at the heart of the Gnostic Church, of sympathy and complicity with spiritualist and reincarnationist theories. Guénon's contributions to the review *La Gnose* were his first writings, in which the seeds of his future work were already present. He there declared expressly the continuity of the lineage of Doinel, announced the publication of 'all that we have been able to collect of the printed or unpublished writings of Jules Doinel (T Valentin), who was the Restorer of Gnosis in the 19th century' (*La Gnose*, no. 1, November 1909, p. 2), and reaffirmed 'the bonds that have always united Gnosticism and Masonry, bonds which we will demonstrate all the better by reproducing some masonic discourses (already published some time before in *La Chaîne d'Union* by F. Jules Doinel [T Valentin], who was simultaneously Patriarch of the

Gnostic Church and member of the Council of the Order of the Grand Orient of France' (*La Gnose*, no. 5, March 1910, 84).

Another of the bishops consecrated by Doinel, Bardesane (Lucien Mauchel/Chamuel [1867-1936]), elected president of the Holy Synod of the Gnostic Church in 1932, extended his authority in 1934 over the Supreme Council of the Ordre Kabbalistique de la Rose-Croix. The delegate of this order to the Brussels Convention was Frère Yesir (Victor Blanchard, 1877-1953), incidentally head of the Ordre Martiniste Synarchique and of the Fraternité des Polaires, and also delegate of the Ordre Kabbalistique de la Rose-Croix de France, instituted by F. Jollivet-Castelot. At this convention, Blanchard, alias Yesir, became Imperator d'Orient, i.e. one of the three elected Emperors of the F.U.D.O.S.I. (Federatio Universalis Dirigens Omnes Ordines Societatesque Initiationis [Universal Federation Directing All Orders and Societies of Initiation]). After Doinel's departure, Fabre des Essarts took over leadership of the Gnostic Church but was faced with a secession, that of the bishop-primate of Lyon, Johannès, pseudonym of Jean/Joanny Bricaud (1881-1934).

Bricaud had already trodden a long path through the occultist milieu (Masonry, Martinism, Vintras's Church of Carmel, the Johannite Church, the Chaldeo-Latin Church) and had frequented → Maître Philippe of Lyon. In 1908, Bricaud held at Lyon the Holy Synod, which raised him to the patriarchal throne under the name of John II. He was then initiated into the Ancient and Primitive Rite of Memphis-Misraïm. In 1911 he signed, with Papus, the treaty that made the Église Gnostique Universelle the official church of the Martinist Order (along with the Gallican Church of France). Wishing to reserve initiation for an elite, he took Freemasonry as the model, 'raising the number of gnostic degrees to 33'. Very ambitious, Bricaud entered into relations with the occultist circles of Europe and the United States, and allied himself with the heads of the principal dissident organizations of the Roman church. In 1912, he instituted the "Gnostic Legates", and many personalities of the occult world received this title. Thus Charles Détré/Téder (1855-1918) became Legate for England, Spain, and the British colonies; Dr. Krauss (Grand Master of the Samaritains Inconnus), Legate for Bavaria; the famous → Theodor Reuss (Grand Master General of the → Ordo Templi Orientis and of the Ancient and Primitive Oriental Order of Memphis-Misraïm), Legate for Switzerland. The ties between the latter and Bricaud are easy to understand: Bricaud had a great admiration

for Vintras, and valued the form of sexual magic sanctioned by the latter. Theodor Reuss, co-founder with Carl Kellner of the O.T.O., became Sovereign Patriarch and Primate of the E.G.C. (Ecclesia Gnostica Catholica), and in 1918 published a "Gnostic Mass" written by → Aleister Crowley.

Upon Détré's death, Bricaud became head simultaneously of the Ancient and Primitive Rite of Memphis-Misraïm, the Martinist Order, and the Rose-Croix Kabbalistique et Gnostique. His successor Constant Chevillon (T Harmonius, 1880-1944) took over the headship of these organizations. Chevillon allied himself with Reuben Swinburne Clymer (1878-1966) and his Rosicrucian order, rival to the A.M.O.R.C. – the Rosicrucian order created by → Harvey Spencer Lewis (1883-1939) – and belonged to the F.U.D.O.F.S.I. (Fédération Universelle des Ordres Fraternités et Sociétés Initiatives [Universal Federation of Initiatic Orders, Fraternities, and Societies]).

After the tragic death of Chevillon in 1944, the Église Gnostique Universelle was successively headed by Antoine Fayolle (T Marcos), in 1948 by Charles-Henry Dupont (T Charles-Henry, 1877-1960), and finally in 1960 by Robert Ambelain (T Jean III). The latter, head of the Martinist Order, "put to sleep" the Église Gnostique Universelle, transferring his activities to his own Église Gnostique Apostolique, founded in 1958.

LADISLAUS TOTH

Gnosticism I: Gnostic Religion

1. THE PROBLEM OF DEFINITION
2. GNOSTIC VIEWS (A. GOD AND THE DIVINE WORLD B. FALL AND CREATION C. SALVATION D. ETHICS) 3. BACKGROUNDS AND RELATIONSHIPS (A. JUDAISM B. GREEK PHILOSOPHY C. HERMETISM D. CHRISTIANITY) 4. CONCLUSION

I. THE PROBLEM OF DEFINITION

The term “Gnosticism” is a scholarly invention, coined by the Cambridge Platonist → Henry More (1614-1687), who used it in a pejorative sense (Layton 1995). In Antiquity, the religious phenomenon it designates was simply called “Gnosis” (Gr. *gnōsis*, “knowledge”) or, by its opponents, “the Gnosis falsely so called” (already in 1 Timothy 6:20). In this connection, the word Gnosis does not refer to rational, philosophical knowledge, but to religious, spiritual insight, based on revelation. From the beginning, the modern word Gnosticism has been used in particular to indicate a special brand of Gnosis that flourished in the 2nd and 3rd centuries and was vehemently combated by several early Christian writers because of its “heretical” doctrine of creation and salvation. But even in this limited sense, it proved increasingly difficult to exactly determine its characterizing features, especially after the discovery of the Nag Hammadi Library (→ Gnosticism II). Especially in German scholarship, the words “Gnosis” and “Gnosticism” have always been used indiscriminately to indicate both the great Gnostic systems of the 2nd and 3rd centuries and the more general spiritual current they belonged to. The English-speaking world preferentially used the word “Gnosticism”. The terminological obscurity was further complicated by the fact that, under the influence of early Christian anti-heretical literature, the adjective “Gnostic” was – as it still is – used almost exclusively to refer to the “Gnosticism” considered heretical by the church fathers, which gave the term a pejorative meaning. Not without reason, A.D. Nock, in his review of the first volume of Jonas's now classic *Gnosis und spätantiker Geist*, exclaimed: ‘I am left in a terminological fog’ (I, 444). To create more clarity on this point, the primary objective of the first great colloquium on Gnosticism, held in Messina in 1966, was to establish generally accepted definitions of the terms “Gnosis” and “Gnosticism”. The final document of this colloquium (in Italian, French, English and German) was a ‘Proposal for a Terminological and

Conceptual Agreement with regard to the theme of the Colloquium' (Bianchi, XXVI-XXIX, English version). It proposed to reserve the term "Gnosticism" for the movement that began 'with a certain group of systems of the Second Century A.D.' and to regard "Gnosis" as 'knowledge of the divine mysteries reserved for an élite', i.e. of an esoteric kind. The characteristics of Gnosticism 'can be summarized in the idea of a divine spark in man, deriving from the divine realm, fallen into this world of fate, birth and death, and needing to be awakened by the divine counterpart of the self in order to be finally reintegrated'. The proposal emphasized: 'Not every *Gnosis* is Gnosticism, but only that which involves . . . the idea of the divine consubstantiality of the spark that is in need of being awakened and reintegrated. This *Gnosis* of Gnosticism involves the divine identity of the *knower* (the Gnostic), the *known* (the divine substance of one's transcendent self) and the *means by which one knows* (*Gnosis* as an implicit divine faculty that is to be awakened and actualized)'. As was to be expected, the Messina definitions did not receive unanimous scholarly approval, for the description of the *Gnosis* of Gnosticism could also be applied to currents that certainly did not fit the proposed definition of Gnosticism. To mention only one influential scholar, Kurt Rudolph almost immediately (1967) rejected the separation between *Gnosis* and Gnosticism. In accordance with the German scholarly tradition, he continued to use both terms for the religion of salvation through *Gnosis* that flourished in the first centuries of our era, but later on (1985) he preferred the term *Gnosis* and advised to eliminate the term Gnosticism 'as far as possible, since it is not only pejorative, but also confusing' (Rudolph 1996, 34-52 [1985], 144-148 [1967]). The term Gnosticism was completely discredited by Michael Williams in his *Rethinking "Gnosticism": An Argument for Dismantling a Dubious Category* (1996). Based on a solid knowledge of the primary and secondary sources, his book contains a massive attack on what is usually understood by the terms "Gnostic", "Gnosis", "Gnosticism" and "Gnostic Religion". He rightly argues that there never existed one clearly definable religious system that could be called Gnosticism. He shows that many texts that are commonly thought to represent the "Gnostic religion" do not contain the characteristics usually ascribed to it (separation between the supreme God and the Creator, protest exegesis, anti-cosmic world rejection, hatred of the body, Gnostic ethics as either libertine or ascetic, etc.). In his view,

terms such as "Gnosis" and "Gnostic" are so vague that they have lost any specific meaning and, therefore, should be avoided. Of course, even Williams could not deny that a number of 2nd-century texts unquestionably show the existence of a group of related and more or less coherent systems that together are usually, as in Messina, labelled "Gnosticism". The dominant idea in these systems is the assumption that the world has not been created by the supreme transcendent God, but by a lower, imperfect and even bad Demiurge, who is identified with the God of the Jews (see below). Williams proposed to speak in this connection of "biblical demiurgical" texts and traditions; but this new terminology does not bring us much further, for one still needs to specify what kind of biblical demiurgical texts and traditions are meant, that is to say, those that through a specific interpretation of biblical myths proclaim that salvation is only possible through *Gnosis*, i.e. an esoteric knowledge of the origin and destination of one's inner self.

From the above it may have become clear that an unambiguous definition of what is understood by the much-used terms "Gnosis", "Gnosticism" and "Gnostic" is impossible; but nevertheless some degree of clarification is necessary. It is undeniable that there existed in Antiquity a broad and variegated religious current characterized by a strong emphasis on esoteric knowledge (*Gnosis*) as the only means of salvation, which implied the return to one's divine origin. This religious current can best be referred to as the "Gnostic Movement" or "Gnostic religiosity". The great Gnostic systems of the 2nd and 3rd centuries are integral parts of this broader Gnostic movement and should not be isolated from it. The main characteristic of these systems is that their central ideas are expressed in myths, which may vary from one system to another, but as a whole display strong similarities. For that reason, and to maintain the link with the Gnostic current in general, it is preferable to speak here of mythological Gnostic texts or systems. The term "Gnosticism", if used at all, should be reserved for these more or less coherent expressions of mythological *Gnosis*. The people who believed and proclaimed that salvation is possible only through revealed, secret *Gnosis* should be called "Gnostics", i.e. "those who know". There were Gnostics who used this term as a self-designation, for instance the followers of → Prodicus and the people referred to in Irenaeus, *Adversus haereses*, I, 29 (Smith). The emphasis on secrecy alone is not decisive to label an idea or a system as Gnostic: in Greek philoso-

phy (Pythagoreanism and Platonism) as well as in Alexandrian Christian theology (the *Sentences of Sextus*, → Clement of Alexandria, Origen, and the *Teachings of Silvanus*), there was a strong tendency to maintain secrecy about some central doctrines or mysteries (van den Broek 1996, 264-270), but nobody would classify these doctrines as “Gnostic” and their adherents as “Gnostics”. Rather, the decisive criterion for designating an idea or text as Gnostic is whether or not it involves a concept of knowledge that considers Gnosis the indispensable means of salvation, indeed salvation itself. In this sense, the esoteric *Gospel of Thomas* can be labelled Gnostic, even though it shows no traces of mythological Gnosis. On the other hand, Clement of Alexandria, who always speaks of his ideal Christian as “the true Gnostic”, cannot be called a Gnostic, because he declared simple faith alone sufficient for salvation. The Gnostic knows of his divine origin and destination. According to the second-century Christian Gnostic Theodotus, Gnosis is the knowledge of ‘who we were and what we have become, where we were and into what we have been thrown, whither we hasten and from what we are redeemed, what is birth and what rebirth’ (Clement of Alexandria, *Excerpts from Theodotus*, 78, 2). The central Gnostic idea of revealed, secret Gnosis as a gift that illuminates and liberates man’s inner self is found in all periods, as is abundantly shown by the present Dictionary. For that reason, the terms “Gnosis” and “Gnostic” are applicable to all ideas and currents, from Antiquity to the present day, that stress the necessity of esoteric knowledge. The term “Gnosticism”, however, should be used with respect to the Gnostic systems of Antiquity only.

2. GNOSTIC VIEWS

The Gnostic ideas of Antiquity display such an enormous variety that it is impossible to reduce them to one coherent system. However, there is a certain set of views that can be considered characteristic of the Gnostic movement, even if most of them also occur in contexts that are not Gnostic at all. To this kernel of Gnostic thought belongs the idea of a completely transcendent God, who produces a divine world, to which the human being’s inner self originally belonged. Through a tragic course of events, which is often more implied than openly exposed, man became separated from his divine origin, which made him forget his high descent. Return to his place of origin is only possible through Gnosis, which in some way or another is imparted to him through revelation.

A. GOD AND THE DIVINE WORLD

The starting point of all Gnostic theology, both in its mythological and its more speculative form, is the idea of God’s absolute transcendence. In a number of texts, this idea is expressed in the same terminology of negative theology that was also used by pagan philosophers and hermetists as well as by Christian theologians. God is ineffable, invisible, unbegotten, incomprehensible, immeasurable, incorruptible, unnameable, etc. Long enumerations of these negative qualifications of God are, for instance, found at the beginning of the *Apocryphon of John* (NHC II, 1), the *Tractatus Tripartitus* (NHC I, 5), and *Eugnostus the Blessed* (NHC III, 1 and V, 1). The negative theology of the Gnostics went even further than that of the Greek philosophers and most Christian theologians. The latter held that God, although unknowable in his essence, could at least partially be comprehended by the human mind (*nous*), through philosophical reasoning and contemplation of the cosmic order; but the Gnostics denied this and declared knowledge of God to be possible only through revelation.

A central theme of Hellenistic philosophy was the relationship between the One and the Many, the Monad and the infinite Dyad. In these speculations, the One was always identified with the Good, whereas evil somehow arose from the principle of duality and multiplicity, mostly associated with matter. The Middle Platonists preferred a triad of basic principles of the universe, which could be described differently by the individual philosophers (Dillon). The first principle was mostly seen as Mind, but sometimes it was thought to be above Mind and Being; in that case the second principle was considered Mind. The Platonic ideas, which formed the patterns of visible reality, were conceived of as the thoughts of God and, accordingly, located either in the first or the second principle. The third principle was often identified with primal, formless matter, which by receiving the imprints of the ideas became the created world. A detailed discussion of the complicated Middle Platonist views on the first principles of being is impossible in the present context. May it suffice to say that the Gnostic authors, who often show themselves to be rather well educated, almost inevitably made use of these philosophical speculations to express their fundamentally religious ideas. In many Gnostic systems, a triad of divine hypostases constitutes the apex of the divine world. Most of those described by Hippolytus start from three basic principles of the universe, *inter alia* → Justin the Gnostic, the →

Naassenes, the → Perates, and the → Sethians. The Perates distinguished between the Unbegotten (*agenēton*), the Self-begotten (*autogenes*) and the Begotten (*gennēton*), which are also described as the Father, the Son and Matter (Hippolytus, *Refutatio* V, 17,1). A similar terminology is found in the *Discourse on the Ogdoad and the Ennead* (NHC VI, 57, 13-18; 63-21-23), in the Naassene system, and partly also in *Eugnostus the Blessed* (NHC III, 72, 22; 75, 6-7). The *Paraphrase of Shem* says of 'the great powers that were in existence in the beginning': 'There was Light and Darkness and there was Spirit between them' (NHC VII, 1, 25-28; the same principles occur in the Sethian system according to Hippolytus, *Refutatio* V, 19).

There is, however, an important difference between the Middle- and Neoplatonist ideas on the principles of the universe and those of the Gnostics. The latter assumed a much greater number of levels of being than the philosophers were prepared to accept. In the middle of the third century, this led to a conflict in the school of Plotinus, which was also frequented by Gnostics. In his *Against the Gnostics* (*Enneads* II, 9), Plotinus rejected the Gnostic introduction of a great number of other hypostases within and outside the three basic principles he acknowledged himself (the One, Mind and Soul). This switch from philosophical reasoning to religious mythology is clearly to be seen in *Zostrianus* (NHC VIII, 1), which Plotinus' pupil Amelius, at the master's instigation, refuted in no less than forty books (Porphyry, *Life of Plotinus*, 16). Especially the mythological Gnostic texts and systems abound in a cascade of divine entities down from the summit of Being, but both the direct and the indirect sources show that there were great differences at this point, which led to quite different pictures of the structure of the divine world. Some Gnostic texts do mention these lower entities, sometimes even by name, but without further information about their origin and mutual relationship.

The divine realm as a whole is mostly called the *Pleroma* ("Fullness"), and described as constituted of a variety of divine qualities and attributes, called *aeons*. These aeons successively develop out of God, which means that the development of the Pleroma in fact represents the self-realization of the ineffable God. The Gnostic mythological texts show a great variety of aeons and their interrelations, but some aeonic systems exerted a particular influence, especially those of the "Gnostics" behind the *Apocryphon of John* and the Valentines (→ Valentinus and Valentinians). There were

Gnostics who indulged almost exclusively in endless speculations about the structure of the divine world. The most bewildering example of this is to be found in the *Books of Jeû* and the *Untitled Treatise* of the Bruce Codex.

Before discussing some aspects of the development of the Pleroma, a clarification of the concept of aeon may be in order. The Greek word *aiōn* means "(a long space of) time", "age", and in plural "eternity" (e.g. Romans 16:27: 'until the aeons [of aeons]'). In the Hellenistic world, infinite Time was honoured as a God under the name of Aion, especially in Alexandria. From the meaning "age" the word aeon also evolved into another word for "world" (e.g. Matthew 12:32: 'this aeon' versus the 'the coming aeon'). In some early Christian texts, God is called 'the King of the aeons' (1 Timothy 1:17), who through his Son has created the aeons (Hebrews 1:2), so that Clement of Rome (ca. 95 A.D.), in his *Letter to the Corinthians*, 35, 3, could speak about God as 'the Creator and Father of the aeons'. The exact meaning of these expressions is a matter for dispute, but it will be clear that they could easily be interpreted in a Gnostic sense. For a correct understanding of the Gnostic concept of aeons it should be realized that, just like the Pleroma as a whole, the Gnostic aeons have a distinct spatial aspect. That explains why, for instance, it is said in the *Apocryphon of John* that the race of Seth and other Gnostics are placed in specific aeons (BG 36, 1-15 parr. = Synopsis 22, 18-23, 12), and also why in the *Gospel of Truth* the aeons are often called "spaces", which are emanations of the Father (NHC I, 27, 11). The aeons are aspects of the ineffable God, but at the same time they are also forms of time and space. There may be an influence here of Greek interpretations of the Persian Zervan Akarana, the Unbegotten Time, from which the opposed gods Ormuzd and Ahriman have come forth: according to Eudemus of Rhodos (4th century B.C.) this primal principle was called both "Place" and "Time" (Frg. 150, ed. Wehrli, VIII, 71). Although there are clear similarities, the aeons differ from other → intermediary beings because of their often artificial nature (personified abstract concepts) and their functions.

As said above, the development of the Pleroma is the self-realization of God: the Unknown Father becomes conscious of himself. A well-known description of this development is that of the *Apocryphon of John*, which has a close and more original parallel in Irenaeus, *Adversus haereses* I, 29, and partly also in the *Gospel of the Egyptians*.

Other interesting pleromatic structures are those of *Eugnostus the Blessed* and the Valentinians (Irenaeus, *AH* I, 1). According to the *Apocryphon*, the Unknown Father saw himself reflected in the light-water that surrounded him, he recognized himself, and immediately his thought became an independent female entity, called Ennoia (“Thought”), who is also called Barbelo. The Father and Barbelo generate the Light, who is also called Autogenes and identified with Christ (probably a secondary addition). Then this original trinity of Father, Mother and Son expands into the spiritual, divine world of the Pleroma. The Father adds to Barbelo the aeons Prognōsis (“Foreknowledge”), Aphtharsia (“Incorruptibility”) and Aeōnia Zōē (“Eternal Life”), and to the Light (Christ) he adds the aeons Nous (“Mind”), Thelēma (“Will”), and Logos (“Word”). These two tetrads are then combined into an ogdoad that consists of four pairs, which generate a number of other aeons, which in their turn do the same. The identification of the aeons with abstract concepts that together form the Fullness of God shows that this myth of the development of the Pleroma is of a clearly artificial character. Just as in the *Apocryphon of John*, the top of the Valentinian Pleroma is formed by an ogdoad that also consists of four pairs of aeons. The first pair consists of the Unknown Father, called Bythos (“Depth”), and his Ennoia (“Thought”), also called Charis (“Grace”) and Sigē (“Silence”). They generate the second level of divine being: Nous (“Mind”) and Aletheia (“Truth”), which produce the third level: Logos (“Word”) and Zoē (“Life”), which in their turn bring forth Anthropos (“Man”) and Ecclesia (“Church”). In the myth of the *Apocryphon of John* and Irenaeus, *AH* I, 29, the coming forth of the Anthropos, ‘the perfect and true Man’, also called Adamas, is narrated at the end of the section on the Pleroma. But in both texts the last aeon is called Sophia (“Wisdom”), who becomes responsible for the split in the Pleroma and the origin of evil and, as a corollary, the creation of the world. The insertion of many aeons between the Unknown Father and Sophia was apparently intended to make the distance between the transcendent God and the cause of evil as great as possible.

There are strong indications, however, that the complicated Gnostic myths of the Pleroma developed out of a much simpler model, which was more mythological and presented Anthropos and Sophia as the first manifestations of the transcendent God. According to *Eugnostus the Blessed*, the ‘self-grown, self-created Father’ conceived the

idea of having ‘his likeness come into being’, and ‘immediately the beginning of that Light manifested itself as an immortal androgynous Man’ (NHC III, 76, 14-24). His female aspect is *inter alia* called ‘All-wise Begettress Sophia’ (III, 3-4). Immortal Man and his Sophia put forth another androgynous Man, called the Son of Man, whose female aspect is also called Sophia. This pair generates a third androgynous Man, the Son of the Son of Man, whose female name is again Sophia. In other Gnostic systems, too, the first principles are called Man and the Son of Man, for instance in those of → Monoimus, the Naassenes, and Irenaeus *AH*, I, 30, which is presupposed in the second part of the *Apocryphon of John* (see below). In *Eugnostus*, the addition of the second and third pairs is an obvious amplification of an originally more simple myth that only knew of one Anthropos and Sophia (Schenke 1962 [2]). The figures of Anthropos and Sophia derive from Jewish speculations about the first manifestations of God that were based on biblical texts. Wisdom herself says, in Proverbs 8:22, ‘The Lord created me *the beginning* of his ways, before all else he made, long ago’, which led to the idea of Wisdom as the creative agent of God: in Genesis 1:1 the words “in the beginning” were accordingly interpreted as “through Wisdom”. In Wisdom of Solomon 7:25, Wisdom is described as an emanation of God, ‘a pure effluence from the glory of the Almighty, . . . the reflection of everlasting light’. Speculations on the manifestation of God as a heavenly Man were triggered off by Ezekiel 1:26-28, which describes a vision of the Glory of God in ‘the likeness as the appearance of a man’ (King James Version), appearing in fire and light. The figure of a heavenly Man as manifestation of the transcendent God has had an enormous influence in Judaism, → Hermetism (*Poimandres*), and Gnostic and non-Gnostic Christianity. The attribution of a human shape to the radiant manifestation of God’s Glory caused the heavenly Anthropos to be always associated with Light. The Jewish Alexandrian writer Ezekiel the Dramatist (2nd century B.C.) describes in his *Exodus*, 66-89, a vision by → Moses of a man (Gr. *phōs*, with another accentuation also “light”), who sat on a throne, with a diadem on his head and a sceptre in his left hand. Before the man – who is apparently God’s viceregent on earth – disappears, he summons Moses to sit down on the throne and accept the *regalia*, which makes him a divine being. The association of Heavenly Man with light played an important role in Gnostic speculations about the first manifestation of God.

According to *On the Origin of the World*, NHC II, 107, 25-108, 14, the Demiurge became aware that 'an immortal Man of Light had been existing before him', which refers to the primeval light of Genesis 1:3 ('Let there be light!'). At the Demiurge's request, the radiant light manifested itself: 'As that light appeared, a likeness of Man, which was very marvellous, revealed itself in it'. The association with Genesis 1:3 (Light) and Ezekiel 1:26 (likeness of a man) is clearly visible not only in this text, but also in that of *Eugnostus the Blessed* (NHC III, 76, 14 ff.), quoted above (Fossum 1985, 266-291).

It is of interest to note that *Eugnostus* not only describes the apex of the divine world in terms of the Jewish myth of Anthropos and Sophia, but also in those of Platonic philosophy. Immortal Man is identified with Nous ("Mind"; NHC V, 6, 6-7; cf. III, 104, 8) and Sophia with Alêtheia ("Truth"; NHC III, 77, 3-10; V, 6, 8-10). According to Plato, Nous and Aletheia are noetic entities produced by the Good (*Republic*, 517b; cf. also 490b). Plato already placed the Good above Mind and Being and, accordingly, the Middle Platonists identified the Good with the supreme, ineffable God. Read with the eyes of a second-century Platonist, the master himself had taught in the *Republic* that the unknowable, transcendent God puts forth two noetic entities, Nous and Aletheia. The author of *Eugnostus the Blessed* apparently knew a tradition that identified the transcendent Jewish God with the Good of Platonism, and the latter's first products, Nous and Aletheia, with the former's pre-eminent divine hypostases, Anthropos and Sophia. In the Valentinian myth of the Pleroma, Nous and Aletheia also form the second level of being, but there are some considerable differences with the tradition of *Eugnostus*, which make it probable that the priority belongs to the latter. In *Eugnostus*, the supreme, ineffable God is strictly monadic; the principle of androgynous duality is first expressed in Immortal Man and his Sophia. It is to such a conception that Plato's view of the Good as producing Nous and Aletheia could be applied. In the Valentinian system, the principle of duality and fecundity was transferred to the deepest ground of being itself, by changing its monadic essence into Bythos and Sige, Depth and Silence (though there were Valentinians who adhered to a more monadic view of the supreme God). The Valentinian Pleroma seems ultimately based on speculations on the structure of the divine world that were closely related to those expressed in *Eugnostus the Blessed* (van den Broek 1996, 122-129).

B. FALL AND CREATION

That the human soul, or at least its higher part, was of divine origin, had somehow fallen into its earthly existence, and had to strive for its return to heaven, was a common idea in the Graeco-Roman world. It had been an integral part of Platonic philosophy since Plato's *Phaedrus*. While the Gnostic view of the origin and destination of one's inner self fits this general scheme, its elaboration was not philosophical but religious and mythological, even if use was made of philosophical categories. An important difference between the philosophical and the Gnostic views in this regard is that the Gnostics assumed a pre-cosmic Fall, which had taken place within the divine Pleroma. In many Gnostic texts this Fall is not mentioned or only vaguely hinted at: they concentrate on the bondage of human beings to the evil powers that dominate our world, and on the way to escape from it. The Gnostic, i.e. esoteric, character of these texts is apparent above all from their emphasis on revealed knowledge as the decisive means of salvation. But other writings, especially those that belong to the great systems of the 2nd century, present a full account of how evil originated within the divine Pleroma and eventually led to the creation of the material world and the body as the prison of man's real self (Dahl, Logan, van der Vliet). However, in this regard too, a clear Gnostic doctrine did not exist; there were only variations on a common theme, namely that of a fatal rupture within the Pleroma.

According to the basic text of Gnostic mythology, the *Apocryphon of John*, the split in the deity was caused by the lowest aeon, Sophia (BG 36, 16-47, 13 parr. = Synopsis 24, 1-37, 5). As the Father had brought forth Ennoia out of himself, she wanted to produce her image in the same way, without the consent of the Father and her counterpart. For that reason she is called "lascivious". As a result of her lewd thought, she produced an ugly, imperfect being: a dragon with a lion's head and fiery eyes, which she called Jaldabaoth. The etymology of this name is still disputed. For a long time, it was thought to mean "Son of Chaos"; more recent explanations are "Begetter of (S)abaoth" (also interpreted as "Begetter of the Powers") and "Son of Shame" (Black). Another name given to Jaldabaoth is Saklas, which derives from the Aramaic *Saklā* ("Fool"). In order to hide her son, Sophia pushed him out of the Pleroma. However, he had extracted a great power from his mother and created his own world and his own aeons, 360 "angels" in all, among them the twelve signs of the zodiac and the seven planets. Having

finished his creation, he said: 'I am a jealous God, there is no one except me!' (a combination of Exodus 20:5 and Isaiah 45:5). It is for that reason that he was called Saklas, for only 'the Fool says in his heart: there is no God' (Psalm 14:1 and 53:2). The myth of Irenaeus, *AHI*, 29, which is so closely related to that of the *Apocryphon* with respect to the constitution of the Pleroma, gives another account of the Fall of Sophia (29, 4). The sect of the Gnostics behind this text denied that Sophia had a pleromatic counterpart. On the contrary, she wanted to have one; and as she did not find it within the Pleroma, she sought it outside the divine realm, but did not find it there either. Realizing that she had acted against the will of the Father, she brought forth a product of herself. She did so with the best intentions, but nevertheless her son was full of ignorance and pride. Sophia repented, but had to remain outside the Pleroma, above the eighth sphere. Though it does not fit its main story, the *Apocryphon* also knows of her 'moving to and fro' outside the Pleroma (which is connected with the moving of the Spirit above the waters of Chaos in Genesis 1:2) and of her repentance and her being placed in the ninth sphere 'until she has corrected her deficiency'. Related ideas are found in *On the Origin of the World* and the *Hypostasis of the Archons* (NHC II, 4 and 5). It is of interest to note that the Valentinians spiritualized the fall of Sophia. According to them, she wanted to have the same union with the Father as Mind had, i.e. to know him, which means that, in fact, she represents the impossible search for knowledge of the depths of the Father. She would have been swallowed up by the sweetness of the Father, had she not been pushed back (Irenaeus, *AHI*, 2, 2).

The Fall of Sophia and the origin of the bad Demiurge serve as a prelude to what the Gnostics were primarily interested in: the explanation of how the divine element had come to reside in man and how it could return to its original state. The story as told by the *Apocryphon* (BG 47, 14-55, 17 parr. = Synopsis 37, 6-56, 10) is not wholly coherent with the preceding section (which indicates a combination of various sources), but it has much in common with the views that Irenaeus, *AHI*, 30, ascribes to 'other people' than the "Gnostics" he described in I, 29. The incoherence is brought out by the sudden introduction of Man and the Son of Man, as the supreme God and his first manifestation. As Jaldabaoth had declared himself the only God, a voice resounded saying: 'Man exists and the Son of Man!', and 'the holy and perfect Father, the first Man' revealed himself to him in human

form. The radiant image of the heavenly Man was reflected in the waters of Chaos and the Demiurge said to the powers that attended him (or they said to themselves): 'Let us create a man in the image and likeness of God' (cf. Genesis 1:26). The seven planetary powers of Jaldabaoth made up the components from which the *psychic* body of man was made, which shows a clear influence of Plato's *Timaeus* (van den Broek 1996, 67-85). The long recension of the *Apocryphon* even assigns the composition of the body to no less than 365 "angels" (demons), who are all mentioned by name. There is little doubt that this list derives from magical sources (van der Vliet, 179-237). The assistants of the Demiurge proved to be incapable of awakening and raising the motionless psychic body of Adam. Then the Father of the All sent his son Autogenes with four great lights to the world of Ialdabaoth and they advised him: 'Blow into his face something of your spirit and the artefact will arise' (cf. Genesis 2:7). The Demiurge, who is now identified with the biblical Creator, blew his Spirit, i.e. the divine power of his mother, into the body and it began to move. In this way the divine spirit entered the human being, who because of this spirit was more intelligent than the powers and the Demiurge himself. They realized that he was free from wickedness, and to imprison his divine element they made the material body. This is followed in the *Apocryphon* by the story of Paradise, which, however, is explained in a Gnostic sense: the Tree of Life is a tree of death and the command not to eat of the Tree of Knowledge of Good and Evil was meant to prevent Adam from discovering his divine descent.

Even if a Gnostic text does not presuppose a myth of the kind described above, its perception of the human condition is the same as that of the mythological texts: man's inner self is of divine origin, but he is unaware of it, because he is entangled in this material world and subjected to the passions of the body. He needs to be saved.

C. SALVATION

Living in ignorance is often compared with a state of drunkenness or a sleep haunted by nightmares, and the attainment of knowledge is compared with becoming sober again and awakening in the bright daylight (for instance *Gospel of Truth*, NHC I, 22, 16-20; 28, 24-30, 16). Gnostic salvation is not the remission of sins but the rectification of a situation of ignorance. It might be said that ignorance is the original sin or, in the words of the *Gospel of Philip*, NHC II, 34, 30-31: 'Ignorance is the mother of all evil'. In the section

that precedes this statement, the author compares ignorance, the root of wickedness, with the root of a tree: if it is hidden in the earth, the tree sprouts and grows, but if it is exposed, the tree dries up and dies. And from this simile he draws the conclusion: 'As for ourselves, let each one of us dig down after the root of evil that is within one, and let one pluck it out of one's heart from the root. It will be plucked out if we recognize it. But if we are ignorant of it, it takes root in us and produces its fruit in our heart. It masters us. We are its slaves'. Gnosis is the spiritual understanding of our divine origin and the world we live in. As such, it is in fact self-knowledge, as Jesus says to his twin-brother Thomas in the *Book of Thomas the Contender*, NHC II, 138, 16-18: 'For he who has not known himself has known nothing, but he who has known himself has at the same time already achieved knowledge about the depth of the All' (a variant of the Armenian hermetic *Definitions* 9, 4; cf. *Gospel of Thomas*, 67, NHC II, 45, 19-20). But this spiritual knowledge of oneself and the All must be awakened: one must learn to understand. The spiritual leader of a Gnostic community can teach his pupils the essentials of Gnosis, but in the end his teachings derive from divine inspiration and revelation. This revelation is mostly given by a divine Revealer, who is often called the Saviour.

In Christian Gnostic texts the Saviour is identified with Christ, but in non-Christian texts, or at least those in which no Christian influence is discernible or which are only superficially Christianized, the Saviour is called by other names. In the *Paraphrase of Shem* (NHC VII, 1), the Revealer and Saviour is Derdekeas, the Son or Likeness of the Light, i.e. the second divine being, who gives his salvific revelation to a certain Shem. It has been suggested that this Shem is no other than Seth, the third Son of Adam, but there is no convincing evidence for this. However, in the *Gospel of the Egyptians* Seth appears as the Saviour, who imparts saving knowledge to those who belong to him ("the race of Seth") and who, certainly secondarily, is identified with Christ (NHC III, 64, 1-3; IV, 75, 15-17: 'Jesus the living one, he whom the great Seth has put on'). A similar doctrine about Seth was professed by the → Archontics. In the *Apocryphon of John* it is Christ who answers John's questions, like a teacher instructs his pupil, but the real saving figure is a female power, called Epinoia of the Light, who 'assists the whole creature, by toiling with him, and by restoring him to his fullness (*plērōma*) and by teaching him about the descent of his seed and

by teaching him about the way of ascent' (NHC II, 19-23 parr. = Synopsis 54, 8-13). The word *epinoia* means "thinking, reflection, thought" and is here virtually identical with *emoia*, which in the *Apocryphon* is used as name of the Mother, the second divine being. At the end of the long version of the *Apocryphon* there is a beautiful *Hymn of Pronoia*, also called the *Providence Monologue*, in which it is not Epinoia or Ennoia but Pronoia ("Providence") who acts as the Revealer and Saviour of mankind. There is no doubt that in this case Pronoia stands for the personified Wisdom, the manifestation of God in the world according to Jewish speculations (Waldstein 1995; van den Broek 1996, 86-116).

For Christian Gnostics, Christ was the Saviour *par excellence*. The *Gospel of Truth*, NHC I, 118, 16-20, says of Jesus that 'he enlightened those who were in darkness through forgetfulness. He enlightened them and showed them a way. The way, then, is the truth which he taught them' (cf. John 14:6). He is the Saviour because he reveals the truth about the unknown Father; his death on the cross has no salvific meaning. The Gnostics usually adhered to a docetic Christology, which means that they denied that Christ had a material body of flesh and blood. For them, and also for those who ascribed to Jesus a real human body and soul, as, for instance, Justin the Gnostic did, the crucifixion was primarily the event in which Christ's pneumatic being was separated from its bodily envelope. Some Christian Gnostic texts, however, described the meaning of salvation in terms that were strongly influenced by biblical images and, for that reason, came close to those found in more "orthodox" writings. Thus the *Gospel of Philip*, NHC II, 52, 35-53, 4, uses the terminology of ransom: 'Christ came to ransom some, to save others, to redeem others. He ransomed those who were strangers and made them his own'. But in this text as well, Christ is the Revealer of the hidden mystery of the Father. The *Gospel of Truth* in particular makes use of biblical images and expressions that even suggest a salvific meaning in the crucifixion. Christ was 'nailed to a tree and became a fruit of the knowledge of the Father. It did not, however, cause destruction because it was eaten (cf. Genesis 2:17), but it gave gladness to those who ate it' (NHC I, 18, 24-28). Jesus, 'the merciful one, the faithful one, patiently accepted the sufferings . . ., since he knows that his death is life for many' (NHC I, 20, 10-14). Nevertheless, the *Gospel of Truth* is a thoroughly Gnostic work: Christ 'became a way for those who were gone astray and knowledge for those

who were ignorant, a discovery for those who were searching, and a support for those who were wavering, immaculateness for those who were defiled' (NHC I, 31, 28-35). Christian Gnostics of the 2nd century could sometimes speak about Jesus with much more warmth and spiritual depth than their non-Gnostic fellow Christians.

The completion of the Gnostic's road of salvation is the return of his divine particle to the Pleroma. This happens at his death, but the salvation is in fact already enjoyed in this earthly life. The divine spark in human beings is often called the Pneuma (Spirit). The Valentinians, in particular, developed a subtle theory about the pneumatic, the psychic and the hylic (material) natures in the individual human being as well as in humankind as a whole. The treatise *On the Origin of the World*, NHC II, 122, 1-9, also distinguishes between three types of human beings: Pneumatics, Psychics and Choics (earthly people), which may point to Valentinian influence. However, many texts simply speak about the soul as the divine element in man. This is found, for instance, in the reports on the Archontics and the Naassenes, who both adhered to mythological forms of Gnosis, and also in non-mythological writings such as the *Treatise on the Soul* (NHC II, 6) and the *Authentikos Logos* (NHC VI, 3). In the *Apocryphon of John*, Christ describes three possible fates of the soul. The soul that has come to knowledge 'is saved and taken up to the repose of the aeons'. Those who have not yet come to know the All are reincarnated in the prison of the body 'until they are saved from forgetfulness and the soul acquires knowledge and thus becomes perfect and is saved'. Only those who once had Gnosis but renounced it 'will be tortured with eternal punishment' (BG 67, 18-71, 2 = Synopsis 70, 19-73, 14).

The ascent of the soul to the divine realm could only take place if it knew the passwords or possessed the seals that permitted it to pass the hostile rulers of the seven heavens. This idea was not typically Gnostic in itself, but it played an important role in the Gnostic imagination. Examples of passwords are to be found in the first *Apocalypse of James*, (NHC V, 32, 24-36, 1), the *Gospel of Mary* (BG 15, 1-17, 7), the *Gospel of Thomas*, log. 50 (NHC II, 41, 31-42, 7), and Origen's *Contra Celsum*, VI, 30-31. The two *Books of Jeu* give an elaborate description, with drawings, of the "seals" and "signs" and the many aeons the soul has to pass through on its way upwards. Finally, the soul or the pneuma arrives at the place of its origin, the Pleroma. The state of bliss that it enjoys there is often called the *Anapausis* ("rest, repose").

The *Gospel of Truth*, in which this conception plays a prominent role, says of those who have found the Anapausis of the Pleroma that 'they rest in him who is at rest, . . . and the Father is within them and they are in the Father, being perfect, being undivided in the truly Good One, being in no way deficient in anything, but they are set at rest, refreshed in the Spirit' (NHC I, 42, 21-33).

D. ETHICS

Not only the anti-Gnostic writers, but the authentic Gnostic sources as well, testify that the Gnostic believers felt themselves elected and predestined to Gnosis. They were the 'Immovable race' and belonged to the 'generation without a king' (*Apocalypse of Adam*, NHC V, 82, 19f. and 83, 1ff.), and as such they had overcome the power of evil. The anti-Gnostic writers often inferred from this possibly somewhat arrogant attitude that the Gnostics felt themselves morally free to do whatever they wanted. The accusation of moral licentiousness – a well-known means of bringing opponents into disrepute – was often raised against the Gnostic believers. This has led to the long-standing scholarly opinion that there were two different types of Gnostics: ascetics, who stuck to a thoroughly ascetic way of life, including the rejection of marriage, and libertines, who rejected asceticism and even indulged in sexual licentiousness. However, the reports of the anti-Gnostic authors contain very little information that gives colour to their allegations of immoral behaviour in Gnostic groups; and even if they seem to have a point, for instance in the case of the → Carpocratians and the → Borborites, the evidence asks for a careful interpretation. Of more weight is the fact that there are no authentic Gnostic texts that advocate immoral behaviour. On the contrary, the whole Nag Hammadi Library is thoroughly ascetic, and it may be assumed that it was because of their asceticism that some non-Gnostic writings, such as the *Teachings of Silvanus* and the *Sentences of Sextus*, were included in the collection. But even if the Gnostics themselves taught a strong asceticism and did not show any indication of immoral or non-ascetic behaviour, their opponents suggested that they simply were keeping up appearances. Examples of such negative polemics are Irenaeus on → Saturnilus (*Adversus haereses*, I, 24, 2), Clement of Alexandria on the followers of Prodicus (*Stromateis*, III, 30, 2-3), and Epiphanius on the Archontics (*Panarion*, 40, 2, 4). All the evidence suggests that the adherents of the Gnostic movement propagated and practised an ascetic way of life, which,

however, did not need to imply the rejection of marriage. An important group like the Valentinians, for instance, held marriage in high esteem and considered it an image of the union of the soul with its heavenly counterpart in the Pleroma. The moral ideas of Clement of Alexandria, to whom we owe this information (*Stromateis*, III, 1, 1), did not differ much from those of Valentinus. At most there may have been a relative difference of emphasis between Gnostic and non-Gnostic Christians with respect to moral ideas and practices, in so far as the former tended to have a more negative view of the material world and the body and, therefore, may have been more inclined to a strongly ascetic way of life than their non-Gnostic fellow-Christians.

3. BACKGROUNDS AND RELATIONSHIPS

The origin of the Gnostic movement has been the subject of much debate, but this has not led to any kind of scholarly consensus. The main reason for this is that actually there never existed one clearly definable “Gnosticism”, but only a variety of related religious ideas and currents, which had the idea of salvific, revealed Gnosis as their common denominator. Michael Williams (1996) has convincingly argued that it is useless to continue the search for *the* origin of this complicated and variegated religious phenomenon. However, as he also pointed out, it is quite possible to clarify the origin and history of specific Gnostic traditions, such as those of Valentinianism and of what he called the “biblical demiurgical texts”. The authentic Gnostic texts of the Nag Hammadi Library show that important notions derived from Judaism, Greek philosophy and Christianity had a considerable influence on the various elaborations of the central Gnostic idea of salvation through knowledge.

A. JUDAISM

There is a broad scholarly consensus that Jewish traditions played an important part in the formation of mythological Gnosis, although opinions differ about the interpretation of this phenomenon [→ Jewish influences I]. As was already pointed out above (2A), the figures of Anthropos and Sophia can only be explained from Jewish speculations about the first manifestations of the transcendent God. Traditions found in the Jewish apocrypha and pseudepigrapha, but also speculations known only from Merkavah mysticism (Gruenwald 1982) have contributed to the formation of the Gnostic myths. Close analysis of such basic mythological texts as the *Apocryphon of John*, the *Hypostasis of the Archons* and *On the*

Origin of the World has brought to light such a wealth of Jewish parallels that the conclusion that they originated in a Jewish milieu is inescapable. This has raised the question of whether the emergence of the Gnostic Demiurge and his identification with the biblical Creator can also be explained from Jewish sources. Rabbinic polemics show that there were *minim*, dissident Jews, who speculated about the existence of Two Powers in heaven, God and his agent or vice-regent, who was known under various names (Angel of the Lord, the Lesser Jahweh, the Name, Shekina, Man, Wisdom, etc.) and who shared in or was wholly responsible for the creation of the world (Segal, Fossum). The rabbis were vehemently opposed to this idea, because they considered it a serious threat to Jewish monotheism. It should be noticed, however, that in the Jewish (and Samaritan) sources there is no evidence whatsoever that this divine agent or intermediary was ever placed in opposition to God. Various suggestions have been made to explain how Jews could have come to a degradation of the God of their fathers to the status of a lower and bad Demiurge, but none of them have succeeded in convincing the majority of scholars. There is no evidence that suggests the existence of a distinctly mythological Gnosis in Judaism. Nevertheless, it seems certain that the earliest myths about the origin of evil and the world were developed by Jews who were well informed about apocryphal and mystical Jewish traditions, but had apparently lost the faith of their fathers in the God of Israel as the creator of the world. This might be explained out of a deeply felt disappointment with the apparent inability of this God to prevent the tragic events that happened to the Jewish people in the first century. However this may be, there is no reason to see the whole Gnostic movement as derived directly from Judaism.

B. GREEK PHILOSOPHY

The authentic Gnostic texts demonstrate beyond doubt the influence of Greek philosophy on Gnostic thought. Hippolytus of Rome (ca. 220) already argued that the Gnostics, like all heretics, had derived their ideas and systems from Greek philosophy and → astrology (Koschorke 1975). More recently, several experts in classical philosophy have studied the complicated relationship between philosophical and Gnostic ideas, with less prejudice and more competence than Hippolytus (*inter al.* Mansfeld, Armstrong, Dillon, Turner). The central question is whether or not Greek philosophy could have given rise to

the Gnostic idea of the bad world and the evil Demiurge. In Orphism and early Pythagoreanism one may find an anthropological pessimism (incarnation as punishment, the body as a tomb) of which most Gnostics would have approved, but it is neither based on nor does it correspond to an equally pessimistic cosmology. Almost all Greek philosophers were convinced of the essential goodness of the cosmos; if they accepted a Demiurge, they declared him to be good as well. Only the Epicureans held that the world is not good, but a 'random, meaningless, transitory and very badly arranged cosmos' (Armstrong); but not only did they reject the idea of a Demiurge, their whole philosophy of life was in sharp contrast with that of the Gnostics. Especially in the 2nd century, there were Platonists who in several respects came close to the position of the more radical Gnostics. Plutarch and Atticus assumed a maleficent world soul as the principle of evil in the material universe, and Numenius taught the existence of two souls, a good and a bad one, both in the universe and in man; but neither of them introduced a Gnostic kind of strict cosmic dualism. The Neoplatonists [→ Neoplatonism I], and Plotinus in particular, espoused a more positive and world-accepting attitude and strongly opposed the Gnostic view of the universe and its maker (Elsas).

The problems that were the philosophers' concern – the relationship between the One and the many, or between the supreme God and lower levels of being, and the origin of evil – were of equal interest for the Gnostic thinkers. Since the latter did not live in a vacuum, they inevitably made use of current philosophical ideas to express their religious convictions. Moreover, from Hellenistic times onward, philosophy, and later Platonism in particular, had become increasingly religious. Under these circumstances, one understands that it is often difficult to draw a sharp borderline between philosophical and Gnostic writings, especially in the case of non-mythological Gnostic texts. In general, however, one can say that the philosophers sought philosophical solutions to philosophical problems, even if their language was religiously coloured, whereas the Gnostic thinkers sought religious answers to religious problems, even if they made use of philosophical terminology. The philosophers aimed at understanding, the gnostics sought and proclaimed salvation through revealed knowledge. A good example of the relationship between (even mythological) Gnosis and philosophical speculation is provided by the Gnostic treatise *Zostrianus*, which was known in the school of Plotinus. Describing the

supreme God by means of the terminology of negative and affirmative theology (NHC VIII, 64, 11-84, 22), the author makes use of the same Middle- or Neoplatonic source that was also used by the fourth-century Christian writer Marius Victorinus in his *Adversus Arium*, I, 49-50 (Tardieu 1996). Comparison of the texts shows that the Gnostic author quotes his source literally. However, he presents its contents as a revelation, which Zostrianus has received from an angelic interpreter called Salamex, during a heavenly journey. This Salamex has revealed to him the three aeons of Barbelo, which contain numerous other aeons, who are mentioned by name. The vision ends with the words: 'Behold, Zostrianus, you have heard all these things of which the gods are ignorant'. Although the work testifies to a considerable Neoplatonic influence on third-century Gnostic speculations, its author was a fully-fledged Gnostic, who adhered to a type of "Sethian" Gnosis. Gnostic thought was not "a Platonism run wild" (Nock), nor was it a department of the "Platonic underworld" (Dillon).

C. HERMETISM

The philosophical Hermetica [→ Hermetic Literature I] and Gnostic literature in general have much in common, but there are also considerable differences. The similarities between Gnosticism and Hermetism are due to the fact that both originated and developed in the same time, in the same oriental part of the Mediterranean world, Egypt, and Alexandria in particular, and in the same spiritual climate. Both Gnostics and hermetists adhered to the widespread philosophical concept of God as a completely transcendent Being, who can only be described in the terms of negative theology. An important difference, however, was that according to the hermetists, the human mind was able to know God at least partially through the contemplation of the cosmos. Although the hermetists recognized that the material world could wholly absorb the human being, the cosmos always remained for them the beautiful product, the first son, of the supreme God. They could sometimes speak of the world as the 'plenitude of vice' (C.H. VI, 4), but they never ascribed the origin of the world to an imperfect and evil Demiurge. The "Way of Hermes" implied instruction concerning the nature of the cosmos, with the help of all kinds of sciences: theories of space and movement, astronomy (which included → astrology), medicine and → magic. Its aim was to make the world transparent toward God. Gnostic cosmological instruction, especially that of the

mythological and radical type, only aimed at explaining how this world of darkness and evil had come into being. Another difference is that the abundant Gnostic mythology has no counterpart in Hermetism. The hermetic speculations about the divine world have nothing to offer that might be compared with the abundant Gnostic descriptions of the divine Pleroma. The only hermetic text that relates the origin of the world and man in the form of a myth is the *Poimandres* (C.H. I), but it is precisely this text that shows most clearly, *inter alia* by the introduction of the heavenly Anthropos, that it comes from the same background as, for instance, the *Apocryphon of John*. The *Poimandres* could be called a gnosticizing hermetic composition, but the author nevertheless remains a hermetist. He does not teach that the cosmos and the human body are bad in themselves, as the radical Gnostics did, but finds the origin of evil in sexual desire, which makes him an ascetic hermetist. In many respects, Gnosticism seems to have been a radicalization of important hermetic notions. Just like the Gnostics, the hermetists were convinced that the human soul or mind had its origin in God and that only through the gift of knowledge the original integrity could be restored, – an integrity which could already be experienced in this earthly life. Both offered a road to salvation, but this has led to two different religious systems.

D. CHRISTIANITY

The Gnostic movement did not arise as a Christian heresy. Although there are no Gnostic works that in their present form are demonstrably pre-Christian, several treatises are certainly non-Christian or so superficially Christianized that the non-Christian original is still clearly recognizable. Moreover, the Gnostic religion of the → Mandaeans (“Gnostics”) cannot by any means be explained as an offshoot of early Christianity. A Gnostic work should only be called Christian if it presents Jesus or Christ as the decisive Saviour, who imparts salvific knowledge to the Gnostic believer.

In New Testament scholarship there has been much debate concerning the question of possible Gnostic influences on earliest Christianity. As an example, we may mention the discussion about the relationship between the prologue of the Gospel of John and the *Trimorphic Protennoia* (NHC XIII, 1). It has been claimed that the latter represents an earlier and better Gnostic version of the threefold descent of the Saviour than the prologue ascribes to the Logos. However, this threefold descent, which also determines the structure

of the *Hymn of Pronoia* at the end of the *Apocryphon of John*, is derived from Jewish speculations about three descents of Wisdom. These speculations have apparently determined the myth of the threefold descent of the Saviour into the world of darkness, both in evidently Gnostic mythological texts and in the Gospel of John (van den Broek 1996, 86-116). Although this Gospel rejects the idea of a bad Demiurge (John 1:3, but cf. 8:44), it may nevertheless be called Gnostic too, since it puts much emphasis on the salvific meaning of Gnosis (John 1:18; 17:3). As a matter of fact, the Gospel of John easily lent itself to Gnostic exegesis (Pagels). If this Gospel had been unknown and had first come to light with the Nag Hammadi Library, it would certainly have been classified as a Gnostic or “gnosticizing” work.

The relationship between the Gnostic movement and early Christianity can be best explained from the fact that both developed in the same spiritual climate, which was strongly influenced by Jewish ideas expressed in mythical forms. As said above (section 3A), Jews must have played an important role in the formation of the Gnostic myths. From Philo we know that there were Jews in Alexandria who rejected the beliefs and practices of their paternal religion. But the deeply pessimistic view of the human condition expressed in the early Gnostic myths cannot have been limited to some apostate Jews. It apparently reflected a more general experience of alienation from the world and a longing for salvation by spiritual knowledge, which is also evident in those Gnostic writings that do not show any specific Jewish influence. The Christian anti-Gnostic works of the 2nd and 3rd centuries testify to the great attraction of Gnostic views, and of the religious experience upon which they were based, on Christian thinkers or teachers and their followers. The result was a distinct Gnostic current within the variegated world of early Christianity. The most influential Gnostic variant of Christianity seems to have been Valentinianism, which was based on older mythological constructions (see above). That Valentinus and even his pupil Ptolemy were simply well educated Christian Platonists, who did not yet teach the “Valentinian” mythological Gnostic system that was taught by their followers, as has been argued from a church-historical point of view (Markschies), is highly unlikely. In the middle of the 2nd century, ecclesiastical leaders in Rome began to define the boundaries of the Church and, accordingly, to reject views that for a time had been acceptable within the Christian communities. The Christian teachers who taught the prevalence

of Gnosis over faith or ascribed the creation of the world to a lower Demiurge were expelled from the Church and vehemently fought.

4. CONCLUSION

The Gnostic movement in Antiquity has many faces, which makes an unambiguous definition virtually impossible. The scholarly term "Gnosticism" suggests a uniformity that never existed. If used at all – and then, of course, without any pejorative connotation –, the term should be reserved for the more elaborate mythological systems that were developed from the 2nd century onward. The Gnostic character of a considerable number of texts can be disputed, since their contents show a position intermediate between a distinct Gnostic and more philosophical, hermetic, or generally Christian views. The decisive criterion is whether or not esoteric knowledge is held to be indispensable for personal salvation, i.e. the return to one's divine origin. But even this criterion is not always easy to apply, because the indispensability of Gnosis is sometimes merely presupposed rather than explicitly expressed. However, all these ambiguities are no reason to deny the existence of Gnostic religiosity in the Roman world and to declare terms as "Gnostic", "Gnosticism", "Gnostic movement", etc. meaningless. The Gnostic religion, its mythological variants included, was not a degenerated form of Greek philosophy, nor did it arise as a Christian heresy. To some extent it was a religion in its own right, or at least a distinct religious mentality, which expressed itself in an almost inextricable combination of important notions derived from Jewish mysticism, Greek philosophy, and Christian theology. Its central belief found a succinct expression in the Christian Gnostic *Testimony of Truth*, NHC IX, 44,30-45, 6: 'When man comes to know himself and God who is over the truth, he will be saved, and he will crown himself with the crown unfading'.

Gnosticism II: Gnostic literature

1. ORIGINAL GREEK TEXTS 2. COPTIC TEXTS DISCOVERED BEFORE 1945 3. THE NAG HAMMADI LIBRARY (A. INTRODUCTION B. NON-GNOSTIC WRITINGS C. GOSPELS AND RELATED TEXTS D. MYTHOLOGICAL TEXTS E. APOCALYPTIC AND POLEMICAL TEXTS F. VALENTINIAN TEXTS G. ASCENTS TO HEAVEN) 4. THE TESTIMONY OF ANTI-GNOSTIC WRITERS

1. ORIGINAL GREEK TEXTS

Most of the authentic Gnostic writings have been preserved in Coptic, but there is little doubt that all of them were originally translated from the Greek. The vehement opposition by the leaders of the Church against the basic ideas of → Gnosticism led to the almost complete extinction of the once flourishing Greek Gnostic literature. The works of anti-Gnostic writers, such as Irenaeus, Hippolytus and Epiphanius, have preserved many testimonies of the ideas and sometimes even the religious practices of individual Gnostic teachers and their schools or sects. But since these testimonies were written down by opponents who wanted to show how heretical or ridiculous were the ideas that they discussed, one must always ask to what extent any report can be trusted. However, sometimes these authors transmit extensive excerpts from original Gnostic documents, or even a complete treatise. A well-known example of such extracts is the *Excerpts from Theodotus* by → Clement of Alexandria, although in this case it is not always easy to decide where Theodotus' text ends and Clement's begins. A complete 2nd-century text has been preserved in Epiphanius of Salamis, *Panarion*, 33, 3-7. It is the famous *Letter to Flora* by the Valentinian Gnostic Ptolemy [→ Valentinus and Valentinians] about the correct interpretation of the five books of Moses. Making an appeal to Jesus, the author distinguishes between the Law of God, the additions by → Moses, and the "injunctions" of the elders. According to Ptolemy, these last two have to be rejected. The first, however, can again be divided into three kinds of law: the pure Law of God, i.e. the Ten Commandments, then those laws that are to be interpreted symbolically, and finally the unjust law of retaliation (an eye for an eye, etc.). Jesus has rejected the latter, introduced the symbolic interpretation, and fulfilled the pure Law of God. In the 2nd century, the interpretation of the Old Testament became a hotly-debated issue in the Christian church. Considerable differences

notwithstanding, Ptolemy's ideas have much in common with those of his contemporary Justin Martyr († 165). His Gnostic point of view becomes visible in his remarks about the nature of the creator and lawgiver. Just like → Marcion's Demiurge, he is said to be righteous; however, he is neither the supreme God nor the devil, but a being midway between them, neither unambiguously good nor thoroughly evil. Moreover, the *Letter to Flora* is obviously an exoteric writing, for at the end Ptolemy promises his 'sister' that she will come to a deeper understanding when she is ready for it. Another Greek text, almost certainly a testimony of Valentinian Gnosticism, is the epitaph for Flavia Sophe (probably 4th century). Sophe's sorrowing husband addresses his beloved wife as follows: 'You whose desire was for the light of the Father, Sophe, my sister, my bride, anointed though the bath of Christ with imperishable holy perfume, you hastened to gaze on the divine faces of the aeons, the Angel of the Great Counsel, the true Son, when you went to the Bridal Chamber and rose [incorruptible] to the Father's house' (McKechnie).

2. COPTIC TEXTS DISCOVERED BEFORE 1945

In 3rd- and 4th-century Egypt, Gnosticism (and → Manichaeism as well) continued to attract a considerable number of adherents, whereas elsewhere it had lost much of its influence. Especially in the 4th century, many Gnostic works, most of them written in the 2nd or 3rd century, were translated from Greek into Coptic: the last stage of the Egyptian language, which was spoken by the Christians. Before the discovery of the Nag Hammadi Library in 1945, only a few of these original Gnostic texts were known, having been discovered in the 18th and 19th centuries.

The first of these texts to become known was the *Pistis Sophia*, preserved in the *Codex Askewianus*, called after Antoninus Askew, who bought it from a London antiquarian around 1750. After Askew's death (1772), it was acquired by the British Museum in 1785. Where it was found and how it came to London is still unknown. The best scholarly edition of the text was published by Carl Schmidt in 1925. This edition remains indispensable because of its critical apparatus, which, unfortunately, was reorganized by Violet MacDermot in the reprint of Schmidt's text that accompanied her own English translation (1978). Schmidt had already published an excellent, and much-used, German translation in 1905 (4th edition by H.-M. Schenke, 1981).

The *Pistis Sophia* consists of dialogues between Jesus and his male and female disciples, among whom Mary Magdalen takes first rank. These dialogues are divided into four parts, which are clearly indicated in the text of the manuscript. The first three parts belonged together from the beginning; the fourth part may originally have been an independent treatise. The first three parts contain numerous exegeses of biblical Psalms, of five *Odes of Solomon*, and of some of the *Psalms of Solomon*; all are interpreted with respect to the salvation of Pistis Sophia, the aeon that had become the cause of evil, and its consequences for the individual soul. The fourth part is a revelation about the construction of the aeonic world and the rites that the soul needs to know in order to ascend through the heavens to the transcendent Father. The Coptic manuscript is generally dated to the middle of the 4th century; the date of the Greek original of the *Pistis Sophia* is difficult to establish, but there are reasons to assign it to the second half of the 3rd century (see below).

The second Gnostic manuscript discovered in the 18th century is the *Codex Bruceanus*, called after the Scotch traveller James Bruce, who bought it in Egypt in 1773. Since 1848 it has been in the Bodleian Library, Oxford. The manuscript contains two texts, written in different hands, of which the first, in two parts, is usually called the *Books of Jeû* and the second the *Untitled Treatise*. The *Books of Jeû* are also mentioned in the *Pistis Sophia*, 99 and 134, where they are said to have been written by Enoch in Paradise; most probably this reference does indeed refer to the first two books of the Bruce Codex. The full title of this work is mentioned at the end of the first book: the *Book of the Great Initiatory Discourse (of Jeû)*. It contains enumerations of numerous heavenly beings, descriptions (with drawings) of their places or “treasures”, and magical names and formulas that the soul needs to know during its ascent to its place of origin. The second part of the Bruce Codex, the *Untitled Treatise*, certainly did have a title once, but it has been lost because of the bad condition of the manuscript. Tardieu has proposed to call it the *Celestial Topography*. Like the *Books of Jeû*, it deals with the structure of the heavenly world, its places (which are often called “depths”), and the powers that dominate it. The *Books of Jeû* and the *Untitled Treatise* belong to the same spiritual world as the *Pistis Sophia*. There are correspondences with *Zostrianus* (NHC VIII,1) and other works that reflect the influence of Neoplatonism (see below), which implies that

they cannot have been written before the middle of the 3rd century.

In 1896 the papyrological department of the State Museums of Berlin acquired a Coptic codex that, shortly before, had been found in Akhmim (Upper Egypt). The codex was registered as *Papyrus Berolinensis 8502*, mostly referred to as BG (= (Codex) Berolinensis Gnosticus) in Coptic Gnostic studies. It contains three Gnostic works – the *Gospel of Mary*, the *Apocryphon of John*, and the *Sophia of Jesus Christ* – and one non-Gnostic writing, the *Act of Peter*, which belongs to the literary genre of the apocryphal Acts of the Apostles. The great Coptic scholar Carl Schmidt (1868–1938) immediately recognized the importance of this codex for Gnostic studies, but his efforts to get it published were very unsuccessful. In 1912, when Schmidt’s edition was nearly ready for publication, the whole of it was destroyed by an accident. Two World Wars and personal circumstances caused the edition of the Berlin codex to be delayed further, until it was finally published by Walter C. Till in 1955. But paradoxically, by that time it might be said that the edition came too early, because meanwhile three other copies of the *Apocryphon of John* and one of the *Sophia of Jesus Christ* had been discovered at Nag Hammadi. Till could do no more than note a number of variant readings of these texts in his critical apparatus. Since these two Gnostic writings from the BG cannot be understood in isolation from the same or related texts in the Nag Hammadi Library, they will be discussed in more detail in the next section.

The *Gospel of Mary* is preserved only in a fragmentary state: pages 1–6 and 11–14 of the originally 19 pages of the manuscript are missing. A Greek fragment, which parallels BG 17, 6–19, 3, and shows considerable textual differences, is found in Papyrus Rylands 463. The first part of the preserved text starts with the closing section of a revelatory dialogue between Jesus, called the Saviour or the Lord, and his disciples, which ends with Jesus’ command to go out and preach the gospel of the kingdom. The disciples are afraid of the sufferings ahead, but encouraged by Mary (Magdalen), they begin to discuss the words of the Saviour. Then Peter asks Mary: ‘Sister, we know that the Saviour loved you more than the other women. Tell us the words of the Saviour which you remember and which you know; we do not know them, nor have we heard them’ (BG 10, 1–6). Then Mary tells the disciples about a vision she once had and about a revelation she received from the Saviour about the ascent of the soul and the

formulas it has to know in order to overcome the powers that try to prevent it from moving upwards through the heavens. The apostle Andrew doubts the authenticity of this revelation: 'I at least do not believe that the Saviour said this. For certainly these teachings are strange ideas'. Peter agrees and makes Mary cry by saying: 'Did he (the Saviour) really speak with a woman without our knowledge and not openly? Are we to turn about and all listen to her? Did he prefer her to us?'. Levi rebukes "hot-tempered" Peter: 'If the Saviour made her worthy, who are you to reject her?'. He exhorts the apostles to go forth and preach the Gospel, which they do (BG 17, 10-19, 2). This text testifies to the importance of the female disciple Mary Magdalen, and women in general, in the Gnostic communities. Andrew and Peter, however, seem to give voice to the increasing conviction in non-Gnostic circles that secret and deviant teachings should not be accepted and that women should not be active as teachers.

3. THE NAG HAMMADI LIBRARY

A. INTRODUCTION

In December 1945, Egyptian peasants found a pottery jar with Coptic manuscripts in a cave near Nag Hammadi, Upper Egypt. The jar contained at least 12 codices and eight leaves of another one that were inside the front cover of what was later called Codex VI. Through middlemen and antiquity dealers all the codices were eventually acquired by the Coptic Museum in Cairo, although it took one of them two decades to arrive there. It was smuggled out of Egypt and bought by the Jung Institute in Zurich, through the mediation of the Dutch professor Gilles Quispel. This codex became known as the Jung Codex; after the publication of its texts, it was reunited with the other codices in Cairo. Following some confusion about the classification of the codices, the scholarly world reached agreement on an internationally accepted numbering: the Jung Codex became Nag Hammadi Codex (NHC) I and the eight leaves in Codex VI were counted as NHC XIII.

Although there are many individual editions of separate tractates, two groups of scholars have set themselves the task of editing and translating the whole Nag Hammadi Library. Under the auspices of the Institute for Antiquity and Christianity at Claremont, California, a complete edition of all codices with English translations was published under the title "The Coptic Gnostic Library", in the series "Nag Hammadi [later: and Manichaean] Studies" (Brill, Leiden). A group of

French speaking scholars at Laval University, Quebec, started the "Bibliothèque Copte de Nag Hammadi" (Université Laval/Peeters, Quebec/Louvain), which at present already contains editions of a considerable number of Nag Hammadi treatises, but is still on its way to completion. The Laval series is especially valuable because of the extensive introductions and commentaries that accompany the texts and French translations. The enormous increase in Gnostic studies that resulted from the discovery of the Nag Hammadi Library has been recorded in the excellent bibliographies of D.M. Scholer.

The thirteen codices of Nag Hammadi contain at least 52 texts and 46 different works, of which 40 were previously unknown. Four treatises are present in two copies (the *Gospel of Truth* [NHC I, 3 and XII, 2], the *Gospel of the Egyptians* [NHC III, 2 and IV, 2], *Eugnostus the Blessed* [NHC III, 3 and V, 1], and *On the Origin of the World* [NHC II, 5 and XIII, 2]) and one even in three copies (the *Apocryphon of John* [NHC II, 1, III, 1, and IV, 1]). In order to give an impression of the contents of the Nag Hammadi Library and the location of the individual tractates, it is useful here to enumerate all the texts (using the English titles adopted by the team of the "Coptic Gnostic Library").

Codex I: 1. *The Prayer of the Apostle Paul*.
2. *The Apocryphon of James*. 3. *The Gospel of Truth*. 4. *The Treatise on the Resurrection*. 5. *The Tripartite Tractate*.

Codex II: 1. *The Apocryphon of John*. 2. *The Gospel of Thomas*. 3. *The Gospel of Philip*. 4. *The Hypostasis of the Archons*. 5. *On the Origin of the World*. 6. *The Exegesis on the Soul*. 7. *The Book of Thomas the Contender*.

Codex III: 1. *The Apocryphon of John*. 2. *The Gospel of the Egyptians*. 3. *Eugnostus the Blessed*. 4. *The Sophia of Jesus Christ*. 5. *The Dialogue of the Saviour*.

Codex IV: 1. *The Apocryphon of John*. 2. *The Gospel of the Egyptians*.

Codex V: 1. *Eugnostus the Blessed*. 2. *The Apocalypse of Paul*. 3. *The (First) Apocalypse of James*. 4. *The (Second) Apocalypse of James*. 5. *The Apocalypse of Adam*.

Codex VI: 1. *The Acts of Peter and the Twelve Apostles*. 2. *Thunder: Perfect Mind*. 3. *Authoritative Teaching*. 4. *The Concept of our Great Power*. 5. *Plato, Republic 588a-589b*. 6. *The Discourse*

- on the Eighth and Ninth. 7. *The Prayer of Thanksgiving*. 8. *Asclepius* 21-29.
- Codex VII: 1. *The Paraphrase of Shem*. 2. *The Second Treatise of the Great Seth*. 3. *The Apocalypse of Peter*. 4. *The Teachings of Silvanus*. 5. *The Three Steles of Seth*.
- Codex VIII: 1. *Zostrianus*. 2. *The Letter of Peter to Philip*.
- Codex IX: 1. *Melchizedek*. 2. *The Thought of Norea*. 3. *The Testimony of Truth*.
- Codex X: 1. *Marsanes*.
- Codex XI: 1. *The Interpretation of Knowledge*. 2. *A Valentinian Exposition*: 2a. *On the Anointing*. 2b. *On Baptism A*. 2c. *On Baptism B*. 2d. *On the Eucharist A*. 2e. *On the Eucharist B*. 3. *Allogenes*. 4. *Hypsiphron*.
- Codex XII: 1. *The Sentences of Sextus*. 2. *The Gospel of Truth*. 3. *Fragments*.
- Codex XIII: 1. *Trimorphic Protennoia*. 2. *On the Origin of the world*.

It is useless to discuss the Nag Hammadi writings in the order they appear in the codices. Therefore, to describe the rich contents of this collection, the texts will be arranged according to more or less coherent categories. References to the enormous scholarly literature on these texts are omitted; they can easily be found in the editions of the separate texts and in Scholer's bibliographies.

B. NON-GNOSTIC WRITINGS

The Nag Hammadi Library contains several works that certainly did not originate in a Gnostic milieu. The most conspicuous example is NHC VI, 5, a fragment of the ninth book of Plato's *Republic* (588a-589b). This passage was most probably taken from a doxographical handbook, for it also occurs in Eusebius, *Praeparatio evangelica*, XII, 46, 2-6 and is repeatedly quoted or referred to by Neoplatonic philosophers. The text may have been slightly abridged and gnosticized before its translation into Coptic, but there is no certainty at this point, for the Coptic translator apparently had so little command of Greek that without comparison with Plato's original text the result of his work has become incomprehensible.

Other texts that are non-Gnostic, or of which the Gnostic inspiration is very dubious, are the *Apocryphon of James* (NHC I, 2), the *Exegesis on the Soul* (NHC II, 6), the *Authoritative Teaching* (or *Authentikos Logos*; NHC VI, 3), the *Acts of Peter and the Twelve Apostles* (NHC VI, 1),

Thunder: Perfect Mind (NHC VI, 2), the three hermetic writings of NHC VI, 6, 7 and 8 (see → Hermetic Literature I), the *Teachings of Silvanus* (NHC VII, 4) and the *Sentences of Sextus* (NHC XII, 1). One of these works, the *Acts of Peter and the Twelve Apostles*, though interesting in itself, does not need a separate discussion here: it belongs to the literary genre of the apocryphal Acts of the Apostles.

The *Apocryphon of James* purports to be a secret revelation received by James and Peter, originally written in Hebrew. The present title of this work is based on its contents; it has no title in the manuscript. A letter by James, to a recipient whose name has been lost, informs the reader that Jesus had appeared to the twelve disciples 550 days after his resurrection and selected James and Peter for the special and secret revelation that follows. The *Apocryphon* contains nothing that is specifically Gnostic. Although Jesus says that only 'through knowledge' the kingdom of heaven can be received (NHC I, 8, 23-27), he also puts much emphasis on the necessity of faith, even to the extent of also saying: 'But you, through faith and knowledge, have received life' (NHC I, 14, 8-10). The speeches of Jesus are often reminiscent of those in the Gospel of John. The *Apocryphon* is a very interesting early Christian document, but there is no reason to declare it a specimen of Gnostic literature.

The *Exegesis on the Soul* and the *Authoritative Teaching* describe the fate of the soul from its fall into matter to its return to heaven. To strengthen his arguments, the author of the *Exegesis* not only quotes texts from the Old and the New Testament, but also from Homer's *Odyssey*. The *Authoritative Teaching* teaches ideas on the soul that are known from Middle Platonism and the Neoplatonist philosopher Porphyry; the presence of Christian influences is disputed. A common characteristic of these two treatises is their strong emphasis on rigorous moral behaviour and continence in sexual matters. It was most probably for this reason that they were included in the Nag Hammadi Library. The same holds for the *Teachings of Silvanus* and the *Sentences of Sextus*, both of which belong to the rare early Christian sapiential literature. The *Sentences* were already known through the Greek original and translations in Latin and several oriental languages; they are usually dated around 200 A.D. Because of the fragmentary state of the Coptic manuscript only the sentences 157-180 and 307-397 have been preserved. The *Teachings*, which were previously unknown, show some influence of the *Sentences*,

but are much more openly Christian than the latter and may, in their present form, date from the beginning of the 4th century.

The Thunder: Perfect Mind is a fascinating hymnal work, but very difficult to classify because of the absence of distinct Christian, Jewish or Gnostic features. It is a revelatory self-proclamation of an unnamed female being, whose utterances mostly begin with 'I am' and in most cases are of an antithetical and paradoxical nature, for instance: 'I am the whore and the holy one. I am the wife and the virgin. I am the mother and the daughter' (NHC VI, 13, 18-21). Similar contradictory expressions in a hymnal style are found in Gnostic, Mandaeen and even Indian literature. They most probably served to emphasize the absolute transcendence of the self-revealing deity. There are also parallels in the Isis aretalogies and in Jewish Wisdom literature, but without the antitheses and paradoxes. It has been suggested that the revealer is Sophia, but for this there is no conclusive evidence.

C. GOSPELS AND RELATED TEXTS

The Nag Hammadi Library contains four writings that are labelled as Gospels: the *Gospel of Truth* (NHC I, 3 and XII, 2), the *Gospel of Thomas* (NHC II, 2), the *Gospel of Philip* (NHC II, 3), and the *Gospel of the Egyptians* (NHC II, 2 and IV, 2). Only one of them, the *Gospel of Thomas*, can be called, at least partly, a gospel in the usual sense of the word. However, there are some other treatises that transmit traditions about words and deeds of Jesus, which for reasons of convenience will also be discussed in this section: *Thomas the Contender* (NHC II, 7) and the *Dialogue of the Saviour* (NHC III, 5).

The *Gospel of Thomas* contains 114 sayings of Jesus, but no stories about his birth, actions or death. Prior to its discovery, the existence of this gospel was known from a few references and quotations in early Christian literature. After its discovery, the famous but very fragmentary "Unknown Sayings of Jesus", which had been found in Oxyrynchus, proved to represent three different manuscripts of the Greek text of the *Gospel of Thomas*. Only half of the sayings are also found in the canonical gospels. From the beginning, scholarly discussion has concentrated on two major questions: 1. how Gnostic is the *Gospel of Thomas*, 2. does it contain a tradition of the sayings of Jesus that is independent of the canonical gospels? With respect to the first question, according to a growing scholarly consensus this Gospel cannot be called Gnostic, at least if

this term is taken in its usual sense of representing a form of mythological Gnosis; however, there are still scholars who contest this. There can be no doubt, on the other hand, that the label "Gnostic" is appropriate if it is taken in the sense of "esoteric". This is immediately clear from the opening sentences: 'These are the secret sayings that the living Jesus spoke and Didymus Judas Thomas wrote down. And he said: "Whoever finds the interpretation of these sayings will not taste death"'. About the second question opinions are still divided, but a majority of scholars now think that, on the one hand, the *Gospel of Thomas* contains at least a nucleus of independent sayings by Jesus, which can be dated around 50 A.D., and that, on the other hand, other sayings are clearly influenced by the synoptic traditions. The authenticity of the previously unknown sayings is disputed: some of them may be authentic, while others obviously presuppose later theological developments. Whatever its early development may have been, in its present form – which is mostly dated to the first half of the 2nd century – the *Gospel of Thomas* proclaims that understanding the esoteric meaning of Jesus' sayings resolves the duality that exists between God and man and within the human being itself.

The introductory words of *Thomas the Contender* are very reminiscent of those of the *Gospel of Thomas*: 'The secret words that the Saviour spoke to Judas Thomas, which I, even I Mataias, wrote down'. Although this shows that the work purports to have an esoteric message, there are no references to a specific Gnostic myth. It is a revelatory dialogue between Jesus and his twin brother Thomas, who is called the Contender (*athlētēs*, 'the one who struggles', i.e. against the passions). Accordingly, the main teaching of Jesus turns out to be strongly ascetic.

The *Dialogue of the Saviour* is, in its present form, the result of a complicated literary history. The greater part of it reflects its primary source: a dialogue between Jesus and his disciples Judas, Mary Magdalen and Matthew. The sayings of Jesus have parallels in the Gospels of Matthew and Luke and particularly in those of John and Thomas, but the *Dialogue* seems to reflect an independent tradition. Unfortunately, the text is very fragmentary due to the bad state of the manuscript. For that reason the Gnostic character of this work cannot be determined with certainty; it seems, however, to be rather superficial.

The *Gospel of Truth* is not a gospel in the usual sense of the word, but a Gnostic meditation on the person and work of Jesus as the revealer of salvific

Gnosis. It has no explicit title in the manuscript; its name derives from the first words of the tractate: 'The gospel of truth is joy for those who have received from the Father of truth the grace of knowing him' (NHC I, 16, 31-33). The work shows a considerable number of Valentinian notions, which, however, are not arranged according to the system that the anti-Gnostic writers ascribe to Valentinus and the Valentinians. Irenaeus, *Adversus haereses*, III, 11, 9, says that the Valentinians possessed a *Gospel of Truth*, and another anti-heretical writer, Pseudo-Tertullian, *Adversus omnes haereses*, 4, reports that Valentinus had his own gospel, but he does not mention its name. There has been much disagreement about whether the Nag Hammadi *Gospel of Truth* and the Valentinian gospel mentioned by Irenaeus are identical. Based on the sources presently at our disposal, the question cannot be settled with certainty, although the arguments in favour of the two texts being identical seem more compelling than those against it. The same holds for the question of the possible authorship of Valentinus. Whoever the author may have been, his work evinces his impressive qualities as a writer. He must have been a highly gifted person, a powerful religious thinker and a poet, who cannot have remained unnoticed by his contemporaries. He might indeed have been Valentinus himself.

The *Gospel of Philip* is not a coherent treatise but a compilation of short notes (in some modern editions numbered 1-127) about various subjects, written from a Valentinian perspective. Important subjects are, *inter alia*, the difference between Gnostic and non-Gnostic Christians and, especially, the sacraments. The author seems to know five sacraments: 'The Lord did everything in a mystery: baptism, chrism, eucharist, redemption, and bridal chamber' (NHC II, 67, 28-31). The mystery of the bridal chamber means the completion of the Gnostic's salvation: it implies the unification of the (female) soul with its "angel", its heavenly counterpart. The work also contains some previously unknown sayings of Jesus and a few stories about him that are not recorded in the canonical gospels, for instance in NHC II, 63, 25-30: 'The Lord went into the dye works of Levi. He took seventy-two different colours and threw them into the vat. He took them out all white. And he said: "Even so has the Son of Man come as a dyer"'.

The *Gospel of the Egyptians* is, in the manuscript, also called *The Holy Book of the Great Invisible Spirit*. The two copies in the Nag

Hammadi Library are independent translations from the Greek. It is a mythological Gnostic work, closely related to the tradition of the *Apocryphon of John*. There is no relationship with the apocryphal *Gospel of the Egyptians*, of which fragments have been preserved in Clement of Alexandria.

D. MYTHOLOGICAL TEXTS

Various forms of Gnostic mythology have found concrete shape in a number of Nag Hammadi tractates. An important mythological tradition, to which modern scholars often attach the label "Sethian" [→ Sethians], is the one found in the *Apocryphon of John* (NHC II, 1; III, 1; IV, 1 and BG 8502, 2), the *Hypostasis of the Archons* (NHC II, 4), *On the Origin of the World* (NHC II, 5 and XIII, 2), the *Gospel of the Egyptians* (see above) and other works that are clearly influenced by the same complex of ideas. These texts show considerable differences with respect to concrete details, but they all clearly reflect the same mythological structure. *Eugnostus the Blessed* (NHC II, 3 and V, 1), which only deals with the constitution of the Pleroma, belongs to an early stage of the same tradition. It is also reflected in a part of the *Letter of Peter to Philip* (NHC VIII, 2), which for that reason will also be discussed in this connection. The final hymn in the longer recension of the *Apocryphon* (the *Hymn of Pronoia*) belongs to a tradition that has also strongly influenced the mythological structure of the *Trimorphic Protennoia* (NHC XIII, 1). The myth transmitted in the *Paraphrase of Shem* (NHC VII, 1), however, has no relationship with that of the texts just mentioned.

The *Apocryphon of John* may be called the basic text of mythological Gnosis. Two versions, a shorter and a longer one, in four manuscripts, testify to its importance. NHC III, I and BG 8502, 2 contain independent translations of the shorter version; NHC II, 1 and IV, 1 present, with variants, a translation of the longer version. After an introduction in which Christ reveals himself to John as the Father, the Mother and the Son, the *Apocryphon* continues with a description of the supreme God, the emanation of the Mother, called Ennoia or Barbelo, the birth of the Son and the further development of the Pleroma. This section has a close and even more original parallel in Irenaeus, *Adversus haereses*, I, 29, and partially also in the *Gospel of the Egyptians*. However, the story of the creation of Adam presupposes another tradition about the highest divine beings (Man and the Son of Man). It has a parallel in Irenaeus,

AHI, 30 and other texts, and was apparently borrowed from another source. Thereupon the first chapters of Genesis are retold from a Gnostic perspective, which takes the form of a dialogue between Christ and John. The longer version ends with a beautiful hymn by the female saviour of mankind, Pronoia, which has been suppressed in the shorter version. The esoteric character of the *Apocryphon* becomes apparent at the end of the tractate, when the Saviour says to John: 'I am saying these things to you that you might write them down and give them secretly to your fellow spirits, for this mystery is that of the immovable race' (II, 31, 29-31 par. = Synopsis 82, 5-9). The complicated textual history of the *Apocryphon* cannot be reconstructed with certainty, and the same holds for the exact development of its myth, of which the basic elements are already ascribed to → Satornilus (ca. 120). Accordingly, it is impossible to assign an exact date to it: most probably it originated in the 2nd century and then became involved in an ongoing process of rewriting and expanding, which may have continued until the 4th century.

The *Hypostasis of the Archons* and *On the origin of the World* both present a Gnostic interpretation of the first chapters of Genesis. They are closely related, but at the same time they show so many differences that their relationship has to be explained from the use of common sources. There are also distinct parallels with the *Apocryphon of John*. Both texts are difficult to date, although they are often assigned to the 3rd century A.D. As its name indicates, the *Hypostasis* primarily deals with the threatening reality of the archons, the rulers of the world of darkness, who have enslaved the human being. But in the end the Gnostics will be saved through the gift of Gnosis, 'and they will ascend into the limitless light' (NHC II, 97, 7-8). The untitled treatise of NHC II, 5 and XIII, 2 (of which only a small fragment has been preserved), owes its title, *On the Origin of the World*, to modern scholarship, based on its contents. To describe the primeval history of the world, the author has made use of many sources, which he sometimes mentions by name. The work evinces a strong influence of Jewish apocryphal and apocalyptic traditions, whereas there are only a few superficial Christian elements, which suggests that it is basically a non-Christian Gnostic text. The process of salvation already begins with the activities of Pistis Sophia, who was also the cause of the creation of the world of darkness, and of another divine entity, Sophia Zoë. The Jewish apocalyptic influence becomes apparent in the

description of the total destruction of the world of matter and the forces of evil (NHC II, 125, 23-127, 17).

Other works belonging to the same mythological tradition, or at least influenced by it, are several tractates that were known in the school of Plotinus (see below) and also the small treatise called the *Thought of Norea* (NHC IX, 2). Norea, who in other texts is described as the daughter of Adam and Eve or as the wife of Noah or Shem, is presented here as the saved Saviour, whose vicissitudes reflect the salvation of the Gnostic. In the *Hypostasis of the Archons* (NHC II, 91, 34-92, 3) she is called 'an assistance for many generations of mankind' and 'the virgin whom the forces did not defile'.

Eugnostus the Blessed is a non-Christian Gnostic tractate with strong Jewish influences. It describes the development of the Pleroma, beginning with the transcendent 'self-grown, self-constructed Father' and his shining likeness, called Immortal Androgynous Man, whose female name is All-wise Begettress Sophia. The work only deals with the structure of the heavenly world, not with the origin of evil and the creation of the world. It has been claimed that it once was the first part of *On the Origin of the World*, which, however, must remain a (albeit well-argued) hypothesis. Corresponding ideas in Philo suggest an Alexandrian origin, possibly in the beginning of the 2nd century. A later Gnostic author christianized *Eugnostus*, by making it a dialogue between Christ and his disciples, called the *Sophia of Jesus Christ* (NHC III, 4 and BG 8502, 3). He added the figures of Sophia as the cause of evil and Christ as the Saviour who has come from heaven to break the power of the archons. A similar procedure of transforming a non-Christian Gnostic text into a Christian one may also have been applied to other Gnostic texts, such as the *Apocryphon of John* and *On the Origin of the World*.

In the *Apocryphon of John*, the appearance of Christ and the subsequent revelation is provoked by a number of anxious questions that John asks himself. A similar situation is depicted in the *Letter of Peter to Philip*. This tractate opens with a letter of Peter to Philip, in which he invites him to come together with the other apostles. Probably this letter is a later addition, perhaps inspired by the fact that Peter at the end of the text encourages his fellow apostles and sends them away to preach the gospel. A transition to the second part of the tractate is made by the information that Philip agreed and that the apostles assembled on the Mount of Olives. What follows is a revelatory

discourse by Christ, in answer to questions raised by the apostles. They want to know the nature of the deficiency of the aeons and their pleroma, how they themselves have become detained in their earthly existence, and in what manner they should return to their origin. Christ answers with a short summary of the myth as told in the tradition of the *Apocryphon of John*. In addition, Christ informs them that they will have to fight the archons by preaching the Gospel and by suffering for it.

The *Trimorphic Protennoia* betrays a complicated literary development, the basis of which seems to have been three self-predications ('I am . . .') of a female Saviour, called Protennoia ("First Thought"), who reveals herself as Voice, Speech, and Word. She has descended three times from heaven to the world of darkness, to save her fallen "members". The same scheme of a threefold descent is found in the *Hymn of Pronoia* at the end of the longer version of the *Apocryphon* and in the Prologue of the Gospel of John. There has been much discussion about the question of which text can claim priority at this point; it seems certain, however, that there is no direct interrelationship between them, but that all three have been influenced by Jewish speculations on the threefold descent of Wisdom. This basic structure of the *Trimorphic Protennoia* has been expanded by the insertion of several doctrinal passages, which evince some influence from the tradition of the *Apocryphon of John* and also show a superficial christianization.

A completely different mythology is found in the *Paraphrase of Shem*. It describes a revelation which Shem (spelled Sēm) received from a divine being, Derdekeas, during his ascent to heaven. The *Paraphrase* assumes three basic principles of the universe: Light, Darkness and the Spirit between them. Hippolytus, *Refutatio*, V, 19, ascribes the same principles to the Sethians, but for the rest there are no correspondences between their ideas and those of the *Paraphrase*. This work explains how the light of the Spirit came to be held in bondage by Nature, and how the creation of heaven and earth and the subsequent history of the world are part of an attempt to save the power of the spirit. Derdekeas is the son or likeness of the Light, and as such he is both revealer and saviour. The work contains several references to biblical and Jewish traditions (the Flood, the tower of Babel), but distinct Christian elements are lacking. There is some resemblance with Manichaean traditions [→ Manichaeism], but not enough to suggest any kind of interdependency. The *Para-*

phrase has a weak composition and is difficult to interpret, perhaps partly due to an inadequate, faulty translation from the Greek into Coptic. Interesting features are the positive evaluation of the Sodomites, the polemics against water baptism, and the prominence of eschatology. As a matter of fact, it can be characterized as a Gnostic apocalypse.

E. APOCALYPTIC AND POLEMICAL TEXTS

The Nag Hammadi Library contains several tractates that present themselves as apocalypses: the *Apocalypse of Paul* (NHC V, 2), the *(First) Apocalypse of James* (NHC V, 3), the *(Second) Apocalypse of James* (NHC V, 4), the *Apocalypse of Adam* (NHC V, 5), and the *Apocalypse of Peter* (NHC VII, 3). Other apocalyptic works that must be discussed in this connection are the *Concept of our Great Power* (NHC VI, 4), *Melchizedek* (NHC IX, 1), and *Hypsiphron* (NHC XI, 4). The *Apocalypse of Peter* contains some interesting polemics against other Christian Gnostics; this is also the case for the *Testimony of Truth* (NHC IX, 3) and the *Second Treatise of the Great Seth* (NHC VII, 2), which for this reason will also be dealt with in this section.

The *Apocalypse of Adam* is the only one of the texts just mentioned that does not show a clear Christian influence. It presents itself as a revelation, received by Adam from three heavenly visitors and narrated by him to his son Seth. Adam explains how he and Eve lost their original Gnosis at the moment they were split into two individuals by the wrathful 'god, the ruler of the aeons and the powers', i.e. when they lost their androgynous unity. The saving knowledge was transferred to the heavenly Seth, who is 'the seed of the great generation' (the Gnostics). Adam reveals to his son Seth, whom he had called after the great Seth, that the creator-god will be unable to prevent the transmission of knowledge through the generations, despite his attempts to destroy mankind by flood and fire. A saviour figure, called "the Illuminator", will prevail over the powers of darkness and save the elect. Although baptism is mentioned several times, the work does not contain explicit references to the Christian tradition. There are some correspondences with the *Gospel of the Egyptians*, the *Untitled Treatise* of the Bruce Codex, *Zostrianus* (VIII, 1) and *Trimorphic Protennoia* (NHJC XIII, 1), which *inter alia* becomes apparent by their common use of three sets of angel names: Abrasax, Sablo, Gamaliel – Micheus, Michar, Mnesonous – Iesseus, Maza-

reus, Iessedekus. The emphasis on baptism in several of these texts may reflect some connection with Jewish baptist circles. According to Epiphanius, *Panarion*, 26, 8, 1, the “Gnostics” used ‘apocalypses of Adam’ and likewise the Cologne Mani Codex, 48, 16-50, 7 cites an *Apocalypse of Adam*, which, however, does not seem to have been identical with NHC V, 5. The absence of clear references to Christian ideas as well as the influence of Jewish apocalyptic and possibly also baptist traditions suggests an early date, probably the 2nd century.

The *Apocalypse of Paul* has no relationship with a Greek work of the same name that has been known for a long time. It relates how a little child, who is also called the (Holy) Spirit, guides Paul through nine heavens to the tenth, where he embraces his fellow spirits. Building on 2 Corinthians 12:2-4, the revelation starts with the visit to the fourth heaven, where the souls are being interrogated and sometimes sent back to another existence on earth, whereas in the fifth heaven the souls are punished. Of the other heavens only the seventh receives a more than superficial discussion. Paul sees there an old man, wearing a white garment and sitting upon a throne that was seven times brighter than the sun (cf. Daniel 7:9). It is the Demiurge, the god of the Old Testament, who does not want to let him pass to the next heaven and threatens him with his “principalities and authorities”. But when Paul gives him the sign he has received from the Spirit, the old man ‘turned his face downwards to his creation and to those who are his own authorities’ and allows him to pass to the Ogdoad (NHC V, 22, 23-24,1). The *Apocalypse of Paul* most probably dates from the second century: Irenaeus (ca. 180), *Adversus haereses*, II, 30, 7, already knew a Gnostic tradition that ascribed to Paul an ascent to the heavens above that of the Demiurge.

In the manuscript, the tractates of NHC V, 3 and 4 are both called the *Apocalypse of James*, and it is only for reasons of convenience that modern scholars have numbered them. Both texts are revelatory discourses rather than apocalypses in the usual sense of the word. They relate the revelations Jesus gave to James the Just, the Brother of the Lord, who played an important role in Jewish Christianity. The *First Apocalypse* deals with suffering, both of Jesus and James, and with the soul’s ascent to heaven. After his resurrection, Jesus, whom James always addresses as “Rabbi”, informs James about the docetic nature of his crucifixion and teaches him the formulas the soul needs in order to pass by the “toll collectors” of

the various heavens. The *Second Apocalypse* is cast in the form of a two-part report to Theuda, the father of James, by a Jerusalem priest called Mareim. The first section deals with revelations James has received from Jesus; the second section, which most probably had an independent circulation at one time, deals with James’s death. Especially the *Second Apocalypse* shows strong Jewish-Christian influences, but at the same time it is clearly a Gnostic composition: the author alludes to the bad, ignorant Demiurge (NHC V, 54, 7-15; 58, 2-6) and mentions the aeons (53, 8) and the archons (56, 19), and the whole work emphasizes that knowledge is indispensable for salvation. The *Apocalypses of James* are mostly ascribed to the 2nd century, but there is no certainty on this point.

The *Apocalypse of Peter* contains an account of three revelations received by the apostle Peter and explained by Jesus the Saviour. The first vision deals with the hostile Jews who try to kill Jesus and his followers: they are called ‘blind ones who have no guide’ and interpreted as at least six groups of opponents of the author’s Gnostic views, including both orthodox believers and other Gnostics. These inner-Christian polemics take up a considerable part of the whole treatise (NHC VII, 73, 10-81,3) and seem to have been the author’s main concern. The second and third revelations instruct Peter about the correct Gnostic interpretation of the crucifixion and resurrection of Jesus. On the cross he sees a glad and laughing Jesus, who is the ‘Living Jesus’; the one into whose hands and feet the nails are driven is his ‘physical part’, the ‘substitute’. Jesus’ resurrection means the unification of the Living Jesus with the perfect light of the spiritual Pleroma. The work originated most probably in the 3rd century: its vehement polemics against other Christians, both Gnostic and non-Gnostic, makes a date before the end of the 2nd century improbable.

In this connection, attention must be drawn to another treatise in which polemics play an important part, the *Testimony of Truth* (NHC IX, 3). Almost half of this text has been lost because of the fragmentary state of the manuscript. Its original title being unknown, scholars have given it one that is based on its contents. The work consists of two parts: a well-constructed homily and miscellaneous additions. The homily, addressed to a Christian Gnostic congregation, warns against the erroneous ideas of non-Gnostic Christians, who, for instance, think that martyrdom leads to immediate salvation or that marriage and procreation are allowed, whereas in fact they are ‘defilement’.

The homily then describes the behaviour of the true Gnostic and ends with a characteristic Gnostic confession: 'When man comes to know himself and God who is over the truth, he will be saved and he will crown himself with the crown unfading'. The miscellaneous part starts with a firm rejection of the god of the Old Testament and then continues with polemics against → Valentinus, → Basilides and his son Isidore, the Simonians (see → Simon Magus), and also against water baptism. Unfortunately, this part of the manuscript is in such a bad state that most details of the author's argumentation escape us.

The *Second Treatise of the Great Seth* is a revelation by Jesus Christ to the 'perfect and incorruptible ones'. It reveals the true story of Jesus, including his commission by the heavenly 'multitudinous assembly of the rejoicing Majesty', his descent to earth and his struggle with and victory over the powers of darkness, his seeming crucifixion, and his return to the Pleroma. In a long passage (VII, 55, 14-56, 19) apparently directed against the orthodox interpretation of the crucifixion, Christ explains that he 'did not die in reality but in appearance'. In reality 'I was rejoicing in the height over all the wealth of the archons . . . And I was laughing at their ignorance'. In the second part of the treatise the author attacks the orthodox Christians who persecute the elect: they 'think that they are advancing the name of Christ, since they are vain in ignorance' (VII, 59, 19-60, 1). Christ rejects the Christology of the orthodox and their claim to be the true Church: in fact, the archons made an imitation of the ineffable union that exists among the children of light by 'proclaiming the doctrine of a dead man and falsehoods to resemble the freedom and purity of the perfect assembly' (60, 13-61, 3).

The *Concept of our Great Power* betrays a complicated literary history. It divides history into three "aeons": the 'aeon of the flesh', which ends with the Flood, then the 'psychic' aeon, in which the Saviour appears, and finally the last aeon in which all kinds of disasters occur, ending with the consummation of the world by fire and the redemption of the Gnostic believers. They will go to the 'unchangeable aeon' of the Great Power, who is the supreme God, exalted 'above all powers', including the 'Father of the flesh', i.e. the creator god of the Old Testament. The Saviour is not mentioned by name, but from what is said about him it becomes obvious that he is identified with Christ.

Melchizedek is an apocalyptic work, which derives its modern title from the fact that it pur-

ports to transmit the revelation that the Old Testament figure of Melchizedek (Genesis 14:18) had received from several heavenly beings. The tractate contains, *inter alia*, a long list of hymnal invocations of divine entities ('Holy are you, . . .') that also appear in the mythological tradition of the *Apocryphon of John* and the *Gospel of the Egyptians*. The manuscript of this tractate is severely damaged, but what is left leaves no doubt about the fact that Melchizedek is identified with Jesus Christ.

A further unknown female visionary appears in the short tractate *Hypsiphron* (NHC XI, 4). It contains a vision that was revealed to a certain Hypsiphron ('High-minded One') 'in the place of her virginity', but the manuscript is so badly damaged that it has become impossible to grasp the message of this short treatise.

F. VALENTINIAN TEXTS

The Nag Hammadi Library contains several works that can be classified as Valentinian, although none of them completely fits the Valentinian schools and systems described by the church fathers. Valentinian treatises are: the *Gospel of Truth* (NHC I, 3 and XII, 2), the *Treatise on Resurrection* (NHC I, 4), the *Tripartite Tractate* (NHC I, 5), the *Gospel of Philip* (NHC II, 3), the *Interpretation of Knowledge* (NHC XI, 1) and the *Valentinian Exposition* with the fragments on the Anointing, Baptism and the Eucharist (NHC XI, 2).

Although a Valentinian origin has been claimed for all five tractates of NHC I, this can only be proven with respect to its tractates 3, 4 and 5. Most probably the *Apocryphon of James* (NHC I, 2) is not a Gnostic text at all (see above), whereas for the *Prayer of the Apostle Paul* (NHC I, 1) the evidence is far from compelling. The *Prayer*, which is written on the front flyleaf of the codex, is a hymn of praise and at the same time a prayer for redemption (I, A, 22-23: 'redeem my eternal light-soul and my spirit'). The Creator is called 'the psychic God' (I, A, 31), which is in accordance with the terminology of the Western branch of Valentinianism, but not necessarily an indication that the whole prayer is of Valentinian inspiration. The general similarity to other Gnostic and hermetic hymns and prayers, and to the invocations found in magical texts as well, make it conceivable that the author simply used a term of Valentinian provenance to characterize the creator.

The *Treatise on Resurrection* deals with the question of how to interpret the Christian doc-

trine of the resurrection. It has the form of a doctrinal letter addressed to a certain Rheginus. For this reason the tractate was formerly also called the *Letter to Rheginus on the Resurrection*; it has no title in the manuscript. As a good Gnostic, the author says that the resurrection can already be achieved in this life: 'flee from the divisions and the fetters, and already you have the resurrection . . . why not consider yourself as risen?' (NHC I, 49, 13-24). But that does not mean that the resurrection of the dead is of less importance. As Son of God, Christ vanquished death and as Son of Man he realized the restoration of the Pleroma. He was able to do so, 'because he was originally from above, a seed of the truth', before the cosmos came into being (NHC I, 44, 21-38). This Christology betrays the author's Valentinianism. As could be expected, he denies the resurrection of the flesh: he subscribes to Paul's view that the dead will be raised in a spiritual body.

The *Tripartite Tractate* has no title in the manuscript. It received its modern title because the text is divided by scribal decoration into three parts. It is an elaborate and highly speculative theological treatise, written by an original thinker. The first part describes the transcendent Father and the aeonic world that emanated from him, the second part deals with the creation and the Fall, and the third part with the coming of the Saviour. Though the work obviously belongs to the Western branch of Valentinianism, it presents a radical revision of some important Valentinian notions. One of them is that the function of Sophia as the aeon who stirs the process of creation is taken over by the Logos. At this point, as also with respect to Christology and many other themes, the author comes close to the views of orthodox theologians from the 3rd century, such as Origen, but he has also much in common with the Valentinian Gnostic Heracleon, who wrote an influential commentary on the Gospel of John. The unknown author of the *Tripartite Tractate*, one of the longest of the Nag Hammadi Library (88 pages), was a powerful thinker who obviously did not want to hide his light under the bushel of a Valentinian minority: he wanted to address the Church as a whole.

The *Interpretation of Knowledge* is a homily probably directed at a group of Gnostic believers who were still members of a larger Christian community. The author offers an explanation of the major themes of the Christian tradition, using many terms and expressions that were current among Valentinian Gnostics. The community appears to be torn by jealousy and hatred over the

issue of spiritual gifts. Gnostics should not be proud and presumptuous because of their Gnosis. Christ is the great example of unity and humility. The author takes up Paul's simile of the Church as a composite body, in which the eye and the hand and the foot each have their own function and special gift and are not jealous at each other but work together: 'be thankful that you do not exist outside the body!' (XI, 18, 33-34). This document provides a unique picture of a mixed Christian community, many of which must still have existed at the end of the 2nd and in the first half of the 3rd century.

The *Valentinian Exposition* is also unique in its kind. It presents an original Valentinian account of the origin of the Pleroma, the Fall of Sophia and the creation of the world, together with fragments of a Valentinian celebration of baptism and the eucharist. It is also of great interest because it provides inside information about theological controversies among the Valentinians themselves. The reports of the church fathers about disagreements on specific issues turn out to be right: the author repeatedly argues for certain interpretations of the Valentinian myth, rejecting the views favoured by others, for instance with respect to the cause of Sophia's suffering.

G. ASCENTS TO HEAVEN

The Nag Hammadi Library contains several Gnostic treatises that show the influence of Neoplatonism and are focused on the ascent to heaven more than on the Gnostic myth of fall and salvation. These writings are the *Three Steles of Seth* (NHC VII, 5), *Zostrianus* (VIII, 1), *Marsanes* (NHC X, 1) and *Allogenes* (NHC XI, 3). The *Books of Jeû* and the *Untitled Treatise* of the Bruce Codex belong to the same category.

In his *Life of Plotinus*, 16, Porphyry relates that in the school of Plotinus there were people who 'had abandoned the old philosophy' and held that 'Plato had not penetrated to the depths of intelligible reality'. In support of their views they appealed to 'Revelations by Zoroaster, Zostrianus, Nicotheus, Allogenes, Messos, and other people of the kind'. It is virtually certain that the Nag Hammadi writings *Zostrianus* and *Allogenes* are identical with the books of the same name mentioned by Porphyry. Moreover, the revelations described in *Allogenes* are addressed by Allogenes to his "son" Messos, who is also mentioned by Porphyry. About 265, Plotinus took the offensive against these Gnostics: not only did he himself write a full treatise against them (*Enneads* II, 9: *Against the Gnostics*), but he also induced his

most faithful pupils, Amelios and Porphyry, to do the same. Amelios wrote forty treatises against *Zostrianus*, of which, unfortunately, not a single one has been preserved. Plotinus' main objections to the Gnostics are: 1. they introduce a great number of levels of being, whereas he only accepts three (the One, Mind, and Soul), and 2. they affirm that the world and its creator are bad, whereas he holds that the world is good and beautiful, originating from the divine World-Soul. There is no doubt that Plotinus reacted against what he had read in books like *Zostrianus* or the *Untitled Treatise* of the Bruce Codex. In his attack on the Gnostics' complete rejection of the visible creation and their idea that they will ascend to another, new earth, he remarks that they introduce strange hypostases such as "Exiles", "Antitypes" and "Repentances" (*Enneads*, II, 9, 6). These 'strange hypostases' are also mentioned in *Zostrianus* (NHC VIII, 4, 20-5, 29; 8, 10-20; etc.) and the *Untitled Treatise* (Baynes, 180; Schmidt-MacDermot, 263). The strong influence of later Platonism on *Zostrianus* can also be seen in the latter's description of the transcendent God (VIII, 64, 11-84, 22), which is based on the same Middle- or Neoplatonic source that was used by the fourth-century Christian writer Marius Victorinus in his *Adversus Arium*, I, 49-50. Another indication of philosophical influence is the appearance of the Neoplatonic triad Existence-Life-Thought in the *Three Steles of Seth* (VII, 122, 18-21; 125, 28-32; cf.; 123, 18-21), *Zostrianus* (VIII, 15, 10-17), and *Allogenes* (XI, 49, 26-38; 61, 33-39).

Plotinus' observation that the Gnostics are 'giving names to a multitude of intelligible realities' is abundantly confirmed by these authentic Gnostic writings. Unfortunately, the manuscripts of *Zostrianus* and *Marsanes* are so severely damaged that great portions have been lost. *Marsanes*, in particular, shows that the heavenly ascent was accompanied and effectuated by theurgical rites, which have their counterpart in magical practices and related ideas in the Neoplatonist Iamblichus. The knowledge of the divine world revealed in these texts and the invocations used are apparently sufficient for salvation. The *Three Steles of Seth* contain hymns to the three fundamental levels of divine being: the divine Son (Autogenes), the divine Mother (Barbelo), and God the Unknown Father. A short introduction in prose claims that Dositheus, traditionally seen as the predecessor of Simon Magus, has transmitted these hymns to the elect. This is followed by an interesting personal remark: 'Many times I joined in giving glory with

the powers, and I became worthy of the immeasurable majesties'. This implies that these hymns are to be said during the ascent to heaven, which is confirmed by some remarks, after the third hymn and again in prose, about how the hymns should be used. First they must be spoken one after another in ascending order, and then there should be silence: 'After the silence, they descend from the third; they bless the second and after these the first. The way of ascent is the way of descent' (NHC VII, 127, 11-21). This shows that the mystic experience of the individual was reenacted in a liturgical celebration by the Gnostic community.

Although there may be some vague allusions to Christian ideas in *Zostrianus*, these texts are fundamentally non-Christian. As far as the entities of the aeonic world are concerned, there are clear links with the mythological tradition of the *Apocryphon of John* and the *Gospel of the Egyptians*. But the classic Gnostic myth as a whole had apparently lost its interest for Plotinus' Gnostics; they were primarily interested in the last stage of the salvation: the ascent to the divine world.

4. THE TESTIMONY OF ANTI-GNOSTIC WRITERS

Before the Berlin Gnostic Codex and the Nag Hammadi writings became known, the student of the Gnostic current in Antiquity had to rely almost exclusively on the reports about Gnostic schools and systems by anti-Gnostic writers. And this was all the more so, since the bewildering original works of the *Codex Askewianus* and the *Codex Brucianus* were generally thought to be late productions of an already declining Gnosis. Most of the anti-Gnostic writers were Christian theologians who considered the Gnostic movement a threat to the Christian Church and its doctrines. But Platonic philosophers such as Plotinus and his pupils also wrote treatises against the Gnostics, because in their view the ideas about a multitude of intelligible realities were not based on solid philosophical reasoning but on very dubious revelations.

The numerous authentic Gnostic works that are now available have made it perfectly clear that there was never one single Gnosticism. Instead, there existed a broad current of frequently inter-related ideas, expressed by individuals, schools or communities, which had one common denominator: esoteric, revealed Gnosis as the only means of salvation. Except for their common emphasis on salvific Gnosis, the author of the thoroughly

Christian *Gospel of Truth* cannot have had much in common with that of the non-Christian *Three Steles of Seth*. The church fathers, however, although admitting its variegated character, described the Gnostic movement as one coherent current, which had started with Simon Magus and through a succession of Gnostic teachers had led to the Gnostic schools, systems and communities they knew or had heard about. Since they were almost exclusively interested in the ideas of Christian Gnostics, they speak about Gnosticism as a Christian heresy – an idea that has long dominated Gnostic studies and is still defended by some church historians even today. Nevertheless, the anti-Gnostic polemics of such writers as Irenaeus, Hippolytus and Epiphanius contain so much information about the ideas of individual Gnostics, their schools or communities, and even their rituals, that they will always remain of great importance for Gnostic studies. Surprisingly, none of the Nag Hammadi writings proves to be in complete agreement with any of the many systems described by the church fathers. On the other hand, the church fathers give information about a great number of real or alleged Gnostic teachers and groups for which there is no counterpart in the authentic Gnostic writings. A discussion of many of them is to be found elsewhere in the present Dictionary (→ Archontics, Audians, Basilides, Borborites, Cainites, Carpocratians, Cerinthus, Elchasai, Justin the Gnostic, Marcion, Marcus the Magician, Menander, Monoimus, Naassenes, Ophites, Perates, Prodicus, Saturnilus, Sethians, Simon Magus, Valentinus and Valentinians).

The study of the early Christian anti-Gnostic writers is beset with many problems. In a few cases they transmit an original Gnostic document (see first section, above), but mostly they give only a summary of the ideas of individual Gnostics or Gnostic groups, sometimes with a few isolated quotations from a relevant Gnostic text. The information is often so sketchy that the real meaning of the views that are being criticized remains in the dark. They use both direct and indirect sources, and the value of the latter in particular is difficult to determine. Since their goal is to fight against views that in their eyes are dangerous, the major question about these polemical writers concerns their trustworthiness. Did they really try to understand their opponents? In how far did they misunderstand their sources, or consciously manipulate them? These questions cannot be neglected in any study of the patristic evidence. They can only be answered, if at all, by carefully analyzing the information in question and evaluate it

against the background of the polemic's theological intentions.

The first anti-Gnostic work we know of is the so-called *Syntagma* of Justin Martyr († 165), which he himself mentions in his first *Apology*, 26: 'We have also a treatise, written against all heresies that have arisen, which, if you wish to read it, we will give to you'. Unfortunately, this work is lost, but it is quite certain that much of it found its way into the extensive anti-Gnostic works of Irenaeus, Hippolytus and Epiphanius. According to Eusebius, *Church History*, IV, 7, 15-8,1, Justin's younger contemporary Hegesippus also fought the impious heresies, but his work is lost as well. Although there are other authors who provide first-hand information about Gnostics, such as → Clement of Alexandria and Tertullian (ca. 200), Irenaeus, Hippolytus and Epiphanius are by far the most important and, therefore, deserve a short discussion.

Irenaeus originally came from Asia Minor, where he had heard the famous bishop Polycarpus. In 178, he became bishop of Lyons and Vienne in the Rhone valley, where he witnessed the rapidly spreading influence of Christian Gnostics of the Valentinian type. In order to refute their ideas he composed an extensive work in five volumes, entitled *Refutation and Overthrow of the Gnosis Falsely so Called*, mostly referred to as *Adversus Haereses (Against Heresies)*. The work was originally written in Greek, but except for a number of fragments, it has survived completely only in a Latin translation. Irenaeus seems to have had first-hand knowledge of the Valentinian school of Ptolemy and of the teachings and liturgical practices of → Marcus the Magician, but he also gives information about other teachers and groups he considers Gnostic. Irenaeus presents this material in Book I, and in the next books he refutes the Gnostic views from various angles: in Book II from reason, in Book III from the teaching of the apostles, and in Book IV from the sayings of Jesus; Book V is mainly devoted to a defence of the resurrection of the flesh, which was generally rejected by the Gnostics. Although he sometimes demonstrably made use of excellent sources, Irenaeus does not really try to understand his opponents; he characterizes their ideas and myths as ridiculous, unreasonable, impious and contrary to the true faith of the Church.

An important aspect of Irenaeus' work, which had a great influence on later heresiology, and for a long time on the study of Gnosticism as well, is his "historical" approach to the Gnostic

movement. According to him, it was a heresy that had started with Simon Magus and through a chain of teachers had been transmitted and variously elaborated up to its manifestation in the Valentinians and other Gnostics of his own days. This description of the development of Gnostic thought accords with the usual presentation of the history of Greek philosophy: as a succession of teachers within a school of thought, who provide their own interpretation and elaboration of the founder's fundamental ideas. The Greek word *haireisis* was used to indicate such a school or a faction within it, but in the Christian vocabulary of the second half of the 2nd century its meaning began to change from that of a divergent opinion that was open to discussion to that of impious "heresy". Most probably, Irenaeus already found this idea of a Gnostic genealogy in the *Syntagma* of Justin, who speaks about this work in connection with Simon Magus. Justin was a philosopher and a (Christian) school-head himself, which may have induced him to describe the variety of thought within Christianity in the same way as was usually done with respect to Greek philosophy. It is not exactly known which heresiarchs filled Irenaeus' complete list of successive teachers, but according to *AH*, I, 23-27, it comprised at least the following names: Simon Magus, Menander, Saturnilus, Basilides, and Carpocrates, with whom Cerinthus and the Ebionites are connected, apparently because they taught the same doctrine about Jesus. Cerdo and his pupil Marcion are said to derive from the Simonians. There is a general scholarly consensus that this Gnostic genealogy and similar ones in later authors have no historical value whatsoever.

Hippolytus was a learned Roman priest, who around 220 became the first "anti-pope", after a conflict with his bishop Callistus on doctrinal and moral issues. He wrote two anti-heretical works, the *Syntagma against all heresies* and the *Refutation of all heresies (Refutatio omnium haeresium)*. The former is lost, although some scholars think that it can be partly reconstructed from Pseudo-Tertullian's *Adversus omnes haereses*, Philastrius' *Liber de haeresibus* and Epiphanius' *Panarion*. The *Refutatio*, written after 222, consists of ten books, of which books II and III are lost. The first book deals with the Greek philosophical schools and opinions, the fourth with astrology and magic; books V-IX contain a refutation of 33 Gnostic sects, whereas book X, *inter alia*, gives a summary of the previous refutations. Hippolytus consistently tries to prove that the Gnostic systems and myths he describes have

simply been derived from Greek philosophy or mythology; however, his arguments are far from being convincing, and often amount to sheer nonsense.

A major problem with Hippolytus' *Refutatio* concerns the presence in his work of what, with a German term, is usually called his "Sondergut", i.e. his description of Gnostic systems for which there is no counterpart in Irenaeus or other sources. It comprises at least the whole of book V (Naassenes, Perates, Sethians, Justin the Gnostic), VI, 9-18 (the Simonian *Apophysis megalē*) and 29-37 (Valentinians), VII, 20-27 (Basilides), VIII, 8-11 (Docetists) and 12-15 (Monoimus). An intriguing feature of this "Sondergut" is that the systems it describes are characterized by evident parallels with respect to both content and wording, by frequent allegorical interpretations of Greek mythological material, and by a much more frequent and variegated use of biblical texts than is found in the authentic Nag Hammadi documents. Of the various solutions that have been proposed to explain these common characteristics, three may be mentioned here, the last one of which is most likely: 1. Hippolytus himself has adapted a collection of sources he had at his disposal, 2. this dossier had already been composed and adapted by a non-Christian Gnostic before it came into Hippolytus' possession, 3. this was done by a Christian Gnostic. In any case, the fact that the sources used by Hippolytus have obviously been manipulated often prevents firm conclusions about (details of) the systems described and refuted in his *Refutatio*.

Epiphanius of Salamis (ca. 315-403) served for thirty years as head of a monastery near Eleutheropolis in Palestine, before he was consecrated bishop of Constantia in the island of Cyprus in 367. He was famous for his learning and his zeal for ecclesiastical orthodoxy. Between 374 and 377 he wrote an extensive anti-heretical work called *Panarion* or *Medicine Chest*, intended as an antidote to those who had been bitten by the serpent of heresy. It deals with 80 heresies of which the first 20 belong to the Greek and the Jewish world. The Christian heresies start with Simon Magus and end with the 4th-century Messalians. Epiphanius' work is indispensable because of the many and sometimes excellent sources he quotes or makes use of, but at the same time its value is very much restricted by the fact that he is obviously incapable of handling his sources. His reports about the individual heresies are confused and confusing; he often misunderstands what he has read or heard; he sees connec-

tions between persons and currents that certainly did not exist; he often contradicts himself; and his explanations are seldom to the point. It is no wonder that scholars have reached sometimes completely divergent opinions about the Gnostic and other sects that are dealt with by Epiphanius. Reading his work is mostly frustrating and often unrewarding, but it cannot be ignored.

The discovery of so many original Gnostic writings at Nag Hammadi has not made the study of the testimonies of the church fathers superfluous. Notwithstanding their often scanty information and their biased attitude, the anti-Gnostic authors testify to the existence of Gnostic works and systems other than those contained in the Coptic codices. In late Antiquity, there must have circulated a great number of Gnostic books, which varied enormously with respect to both content and style. The authentic works that have been preserved are often difficult to interpret because of their obscure language and unknown presuppositions, and sometimes the testimonies of the church fathers do contribute to a better understanding. Only by careful analysis of the direct and indirect sources, combined with in-depth studies of the spiritual and social climate of late Antiquity in which the Gnostic movement originated and flourished, may we nourish hopes of reaching a better understanding of the Gnostics' experience of the divine and their interpretation of the world in which they were living.

ROELOF VAN DEN BROEK

Goethe, Johann Wolfgang von,
* 28.8.1749 Frankfurt am Main,
† 22.3.1832 Weimar

Goethe's relationship to esoteric traditions is a constant throughout his life, and its complexity reflects that of the mystical and esoteric currents as they developed from the end of the 18th century into the era of → Romanticism. As both a witness and a participant in the successive phases of interest in esotericism between 1770 and 1830, his point of view adjusted to the evolving contexts of esoteric knowledge and their changing impact on culture and society. His relation to this tradition was not free from ambivalence and was sometimes critical, giving rise to parodic and satirical expressions (e.g. in the play *Der Groß-Cophta*, 1791).

We can distinguish several main phases in Goethe's relationship to esoteric traditions, the first being that of Frankfurt (1768-69), where he was introduced into some alchemical and theosophical works. This was due to the pietist Susanna Catharina von Klettenberg (1722-1774), who was the niece of the alchemist Johann Hector von Klettenberg (1684-1720), and to her doctor, Johann Friedrich Metz (1720-1782). The famous episode told in the eighth book of Goethe's autobiography, *Dichtung und Wahrheit* (Poetry and

truth), describes his reading at this time as having been marked by an eclectic approach to such works as the *Aurea catena Homeri* (Golden chain of Homer, 1723) by Anton Josef Kirchweyer, the *Opus mago-cabbalisticum et theosophicum* (Magic-kabbalistic and theosophic work) of → Georg Welling (1735), and the *Eröffneter Weg zum Frieden mit Gott und allen Creaturen* (Open way to peace with God and all creatures, 1747) by Johann Conrad Dippel (1673-1734). The reception of → Paracelsus and → Paracelsianism, of → Jacob Boehme's theosophy [→ Christian Theosophy], and their continuation in the writings of → Friedrich Christoph Oetinger were decisive for Goethe's intellectual formation, while → Rosicrucianism, with the *Chemical Wedding of Christian Rosenkreuz* (1616), was also part of this background. In all his writings, Goethe shows familiarity with the main philosophical themes of Hermeticism: macrocosm and microcosm, the idea of polarity, the unity of living nature and the divine, the alchemical idea of transformation. These would remain major themes of his work until the end of his life. The young Goethe's interest in esotericism also belongs within the context of a personal religious crisis which went in parallel with the advance of collective secularization. The religious framework within which the alchemical [→ Alchemy], gnostic [→ Gnosticism], and Neoplatonic [→ Neoplatonism] traditions were transmitted to him was that of → Pietism, which, as represented by → Gottfried Arnold (1666-1714), was a bearer of the esoteric and alchemical traditions. This group of influences led Goethe to develop a "private religion", not identified with any confessional structure, which was still at the center of his preoccupations during his late period. His stay in Strasbourg in 1770, one of the European capitals of esotericism at the end of the Enlightenment, brought him into contact not only with Johann Gottfried Herder (1754-1803) but with Johann Heinrich Jung, called → Jung-Stilling (1740-1817). In the latter's presence, Goethe encountered another approach to esotericism, from which he quickly distanced himself.

This first phase was followed in the last decade of the 18th century by a more critical, even sceptical one as Goethe, now established in Weimar and exercising political functions, came into contact with the world of secret societies. Like Friedrich Schiller (1759-1805) and several of his contemporaries, Goethe was personally involved in → Freemasonry and → Illuminism. His *Groß-Cophta* presents an intrigue centered on the charlatan → Cagliostro, embroiled in the "Diamond Necklace

Affair"; it is a violent satire on the mystifications to which certain "magi" resort, and a criticism of the collective forms of embracing esoteric doctrines. Goethe also expressed a sort of scepticism in the first part of *Faust* (1808), which reveals all his ambivalence towards certain aspects of the occult. But these critical positions in no way detracted from his deep convictions as a thinker, who in the course of his development took notice of Kant's doctrine and of its proclaimed limits to knowledge, but never renounced a Hermetic vision of the world and of man. Many of Goethe's works are marked by the presence of Hermetic themes. An example from his lyric poetry is *Die Geheimnisse* (The secrets, 1784), but it is above all his narrative works that reveal the presence of an esoteric anthropology. Some of them are constructed around the symbolism of the alchemical Great Work, such as his *Märchen* (Fairytale, 1795) and *Die Wahlverwandtschaften* (The elective affinities, 1809).

After 1800, Goethe's theoretical reflections and literary work were affected by contact with the romantic philosophy of nature and with its major works, such as that of → F.W. Schelling. More particularly, he was influenced by the reception of the → animal magnetism theory: by Franz Anton Mesmer, Adam Karl August von Eschenmayer (1768-1852), Josef Ennemoser (1787-1854), → Johann Wilhelm Ritter, and → Justinus Kerner, who inspired Goethe's mediumistic personages such as Odile in the *Wahlverwandtschaften* and Makarie in *Wilhelm Meisters Wanderjahre* (Wilhelm Meister's years of travel). Esotericism is present not only in the literary work but also in his scientific and aesthetic writings, with the *Farbenlehre* (Theory of colours, 1810) and the Goethean conception of the symbol. His notions of systole and diastole and the archetype of an "original" plant (*Urpflanze*), already formulated in 1790 in the *Metamorphose der Pflanzen* (Metamorphosis of plants), seek to preserve the concept of a unity of nature and of man, as against the mechanistic and mathematical model imposed by the Newtonian paradigm. On the basis of the *Bildungsroman* (novel of education) tradition, which he helped to form, Goethe wrote novels of initiation: *Wilhelm Meisters Lehrjahre* (Wilhelm Meister's apprentice years, 1795-1796), where Wilhelm is received into a mysterious "Society of the Tower"; *Wilhelm Meisters Wanderjahre* (1829), with the presence of a female initiate, Makarie; and the intrigue of the *Wahlverwandtschaften* (1809), based on alchemical symbolism.

The ultimate achievement of Goethe's esotericism was the second part of *Faust*, finished in the

year of the author's death, which is a succession of "mysteries" founded on alchemical figures such as the "homunculus". Many modern interpretations of the esoteric tradition (e.g. → Carl Gustav Jung, → Rudolf Steiner) have treated Goethe, and more particularly *Faust*, as a major point of reference.

The continuity of Goethe's relationship with the esoteric traditions is visible throughout all these phases. By means of representations drawn from Hermeticism, then a philosophy of nature that follows in the same channels, he aimed at a unitary comprehension of reality, natural, human, and divine, and of Nature as a totality. His approach to Hermeticism did not rest on outmoded positions, but took notice of current developments in science, in thought, and in anthropology (e.g. the theories of Rousseau, the idea of "genius", sensualism, Kantian criticism, the Romantic philosophy of nature), and often embodied a personal response to them. Goethe's esoteric culture was also at the service of a religious aim, and marked by tension between a Christian esotericism and the vision of a religion beyond all confessional anchorage, such as presented in the doctrine of the "three respects" in *Wilhelm Meisters Wanderjahre*.

CHRISTINE MAILLARD

Gohory, Jacques (also known as **Leo Suavius**), * 20.1.1520 Paris, † 15.3.1576 Paris

Perhaps of Italian descent, Gohory belonged to a family of the lesser nobility that destined him to study law, then to an overly demanding career as a diplomat and lawyer. These important functions did not agree with him. He is thus seen to complain in an epistle dated 1544 about 'the fortune of his birth', that had placed him in a family whose chief members were employed in the affairs of the kingdom. Repelled by 'the Courts as much of Princes as of Justice', as he says himself in the introduction to his *Instruction sur l'herbe petum*, he retired of his own accord 'to the contemplation of Nature', in order to deal with 'only her, beyond the troubles, vices and confusions of the world' and to discover her 'beautiful secrets'. In fact, without thus renouncing his duty as a lawyer at the Parliamentary court, where he remained incumbent for thirty-two years, until his death, Gohory would devote himself mainly to literature and research and would produce many works whose diversity evinces the encyclopedic breadth of his culture. He thus translated *Le premier livre de la première decade de Tite-Live* (1548), and two works by Machiavelli, *Discours sur la première decade de Tite-Live* (1544) and *Le Prince* (1571). He further added to the last text the first French biography of the Italian philosopher; he collaborated on the translations of Colonna's *Hypnerotomachia Poliphili* (1546) and the novel *Amadis*, of which he made known books X (1553), XI (1554), XIII (1571) and XIV (1575). Beyond his taste for history, politics and literature, his writings reflect a constant interest in natural philosophy, which is

often identified in his mind with occult philosophy [→ occult / occultism]: his interest in medicinal plants or natural curiosities led him to defend the therapeutic virtues of tobacco in his *Instruction sur l'herbe Petum* (1572) or to make a French version of *Occulta Naturae Miracula* (1567) by Lemnius Levinus, a collection of surprising observations in which superstition, science and erudition form an inextricable mixture. But it was especially as the introducer of → Paracelsianism into France that Gohory would be known in the scholarly community of his era: as he reports it himself, he was notably in relationship with Jean Fernel (1497-1558), Ambroise Paré (ca. 1509-1590), Jean Chastellan and Leonardo Botal, as many famous interlocutors with whom he discussed his ideas on medicine and spagyric. In the Saint-Marceau district, his “Lyceum philosophal” (1571-1576), a botanical garden that also functioned as a little academy, in addition often served as an outdoor setting for his scholarly conversations.

Excepting the *Clavis totius philosophiae chymicae* by Gérard Dorn published in Lyon in the same year 1567, the *Theophrasti Paracelsi . . . universale compendium* by Gohory is the first French work devoted to → Paracelsus. As its title indicates, the *Compendium* is a summary of the philosophy and therapeutic principles of the German doctor, with his biography, a bibliographical draft, and one of his writings: the *De Vita longa* followed by commentaries. The tone of the text is often polemical: Gohory criticizes notably the translations of Paracelsus furnished by Dorn in his *Clavis*; he defends → Trithemius against the criticisms of Charles de Bovelles (1479-1553), and Jean Wier (1515-1588) against the censure of Cardano (1501-1576). Elsewhere he tones down the novelty of the Paracelsian system by attaching it to distant historical origins. Thus, its sources are to be discovered among the ancient alchemists, and in the works of → Roger Bacon, → Marsilio Ficino or Joannes Valentianus. As Allen G. Debus has emphasized, Gohory gives of the Paracelsian doctrine a representation strongly influenced by the *Philosophia ad Athenienses*. He conceives of Man as a small microcosm whose intimate functioning is organically and analogically connected with the laws of the natural world; he rejects the theory of humors and insists on the need for a doctor to have a full knowledge of chemistry and astronomy: the first in order to prepare his remedies, and the second to know at what propitious time to administer them. Among medications, he recommends the use of antimony and drinkable gold. Animism, → magic and kabbalah [→ Jewish Influences] fur-

ther play a primary role in this work, no doubt less faithful to the spirit of Paracelsus than to that of the hermeticist tradition such as it was illustrated, for example, in the occult philosophy of → Cornelius Agrippa.

As the *Compendium* reveals, spagyric medicine, → alchemy and magic are fundamentally mysterious subjects for Gohory. Indeed, for him science is combined with a secret tradition that he traced back, as did many of his contemporaries, to Egyptian origins. This initiatory understanding of knowledge led him to be interested in steganography in a short tract, *De usu et mysteriis notarum liber* (1550), strongly impregnated with the teachings of Johannes Trithemius, or again to gloss alchemically a series of engravings dedicated to the quest for the Golden Fleece in *Hystoria Iasonis Thessaliae Principis de Colchica velleris aurei expeditione* (1563). His literary activities themselves reflect his taste for a scholarly exegesis responsive to esoteric allusions. Also in his Commentary on the *Livre de la Fontaine Périlleuse* (1572), he gives his readers many keys of alchemical interpretation applied to an allegory of courtly style. In this respect, Gohory reveals himself an heir to the lessons in hermeneutics already dispensed in the works of the Italians Aurelio Augurelli (1456-1530) and Giovanni Bracesco (ca. 1481-?), but also appears as an innovator in his own country where, before him, such an approach to literary texts had never been taken so far. Perhaps as much as his Paracelsian stances, his speculations as a subtle interpreter would make a mark. Pierre Borel (toward 1620-1671), in any case, would still remember him in the mid-17th century, listing in his *Bibliotheca chimica* (1654) the novel *Amadis* and the *Hypnerotomachia Poliphili* by Colonna, works partially translated by Gohory and that, according to him, hid under a fabulous veil an interesting alchemical content.

FRANK GREINER

Golden Dawn → Hermetic Order of the Golden Dawn

Grashof, Carl Louis Fredrik →
Heindel, Max

Grail Traditions in Western Esotericism

According to most contemporary scholars, the Grail mythology in the Middle Ages was not connected to extra-Catholic esotericism, but either to a Roman Catholic eucharistic spirituality or to a literature designed for the purpose of providing (non-esoteric) entertainment. After what the Italian historian Franco Cardini called 'the eclipse of the Grail', the myth resurfaced in the 19th century in the Romantic literary and artistic milieu [→ Romanticism], particularly that of the composer Richard Wagner (1813-1883) and the painter Dante Gabriel Rossetti (1828-1882). The romantic interpretation of such artists was influential in introducing the Grail into Theosophical circles [→ Theosophical Society], in which scholars such as Charles Williams (1866-1945) and Jesse Weston (1850-1928) promoted a non-Catholic interpretation of the Grail as a universal symbol with pre-Christian origins. Within the same milieu, → Arthur Edward Waite (1857-1942) tried to reconcile the Christian and the pagan interpretation of the Grail, by establishing a "Hidden Church of the Holy Grail", the membership of which was largely drawn from the Theosophical Society and the → Hermetic Order of the Golden Dawn. In fact, one of the splinter groups of the Golden Dawn, established in Havelock North, New Zealand in 1916 by Robert William Felkin (1853-1926) and Reginald Gardiner (1872-1959), following an eso-

teric "work" started by Gardiner in 1907 before Felkin's arrival in 1916, created a cult of the Grail and an Order of the Table Round (not to be confused with the Order of the Round Table, which was a juvenile branch of the Theosophical Society). Other esoteric authors who had been members of the Golden Dawn also developed their own Grail rituals, including → Aleister Crowley (1875-1947), whose Grail was definitely anti-Christian, and → Dion Fortune (pseudonym of Violet Firth, 1890-1946), whose thinking, in turn, evolved from a Christian to a pagan interpretation of the myth within her Community of the Inner Light (the Christian element re-emerged in the Community after Fortune's death). A Christian esotericism centred on the Grail was promoted in France by Lithuanian poet → Oscar Venceslas de Lubicz Milosz (1877-1939), and it later inspired the establishment of an Order of the Grail by Auguste-Edouard Chauvet (1863-1946), James Chauvet (1885-1955, not a relative of the former), and Octave Béliard (1876-1951). A Christian-oriented esoteric reading of the Grail myth also emerged within → Anthroposophy, thanks to → Rudolf Steiner (1861-1925), whose insights were developed particularly by Walter Johannes Stein (1891-1957) and by the Italian Anthroposophist → Massimo Scaligero (pseudonym of Antonio Scabelloni, 1906-1980), whose interest in the Grail originally derived from his encounter with the pagan interpretation of the myth elaborated on by → Julius Evola (1898-1974). Although not supported by academic historians, the idea that the Grail was a symbol of the Cathar [→ Catharism] resistance to Catholicism acquired widespread support within the Neo-Cathar movement [→ Neo-Catharism] of Antonin Gadal (1877-1962) and Déodat Roché (1877-1978). Through this milieu, the alleged Cathar connection to the Grail inspired in the 1930s the mysterious activities of Otto Rahn (1904-1939), an SS officer who visited Southern France looking for the Grail reputedly hidden there by the Cathars, as also the esoteric spirituality of → Jan van Rijckenborgh (pseudonym of Jan Leene, 1896-1968) and his Lectorium Rosicrucianum, that Gadal himself eventually joined after World War II. Through these authors, the Grail continued its ubiquitous career among contemporary esoteric movements in three different incarnations: Christian (although not necessarily Catholic and eucharistic), neo-pagan, and Gnostic.

The larger esoteric movement centred on the Grail myth is the Grail Movement, founded by Oskar Ernst Bernhardt (1875-1941), a German esoteric author known under the pen name of

Abd-ru-shin (“Son of Light” in the Persian language). He was born in Bischofswerda in 1875, and from 1900 on travelled extensively in the Middle and Far East, the United States, and Europe; he also published several novels, short stories, and theatrical pieces. The outbreak of World War I found him, a German citizen, in an enemy country, the United Kingdom, and he was interned on the Isle of Man. In 1923, he circulated the first parts of *The Grail Message*, the publication of which continued through to 1937. *The Grail Message*, a complicated esoteric work, found interested readers particularly in Germany, France, the former Czechoslovakia, and Austria. Bernhardt decided, in fact, to settle in Austria, at the Vomperberg (Tyrol), together with a handful of followers of what later became known as the Grail Movement. In 1938, Austria was occupied by Nazi Germany, whereupon *The Grail Message* was banned, the Vomperberg centre closed, and Abd-ru-shin arrested. Released from jail in September 1938, he was banished firstly to Schlauroth (near Görlitz, Saxony), and then to Kipsdorf, where he died in 1941.

The Grail Message includes 168 talks, which purport to explain the structure of the whole universe and of the laws that govern it. The border between the divine and human realms is the Grail Castle, where the Holy Cup of the Grail represents God’s direct irradiation. Creation is the spread of God’s rays, with their consequent and gradual cooling beyond this border. This is how different planes of the universe were generated, a scheme very reminiscent of what we find in the Theosophical Society. Firstly the “original spiritual” level, then the “spiritual” level and so on down to matter, originated, it is believed, from the cooling and solidification of the divine rays. Crucial for this descent of the rays are two characters, known as Parsifal and the pristine Queen, or Mother. A Force flows down from the Holy Grail and sustains the whole of creation. Planet Earth is part of the creation’s denser and lower level. Human beings, however, keep within themselves a spiritual spark capable of reminding them of their divine origin. By cultivating this spark through their subsequent reincarnations, humans can transcend the lower planes of matter, achieve a higher spiritual consciousness, and ultimately return to their heavenly home. At the Vomperberg, and in other places, the Grail Movement celebrates three spiritual feasts each year: the Feast of the Holy Ghost (Pentecost) on May 30; the Feast of the White Lily on September 7; and the Feast of the Radiant Star on December 29.

After World War II, the Vomperberg centre was re-opened and the Movement re-established under the leadership of Maria Kauffer Freyer (née Taubert, who was later adopted into the wealthy Kauffer family: 1887-1957), who was Bernhardt’s second wife (his first wife, Martha Oener, her daughter Edith Nagel, and Nagel’s descendants never played a role in the Movement, whilst the only male child of this first marriage died in World War I). Maria married Bernhardt in 1924, and her three children by her first marriage (Irmgard [1908-1990], Alexander [1911-1968] and Elizabeth [1912-2002] Freyer) also legally changed their last name from Freyer to Bernhardt. Maria led the movement until her death in 1957, and was succeeded first by Alexander and then by Irmgard (whose name had been changed to Irmingard by Abd-ru-shin himself, for esoteric reasons). The fact that Maria’s children succeeded her, was never recognized by an important part of the large Brazilian constituency of the movement, which under the leadership of Roselis von Sass (1906-1997), who had been one of Abd-ru-shin’s and Maria’s most beloved disciples, created a splinter group under the name Ordem do Graal na Terra (web site: www.graal.org.br). Brazilian loyalists to Alexander and Irmingard remained in the Sociedade do Graal no Brazil, the local branch of the Movement; in 1989, after thirteen years of litigations, the Sao Paulo court ruled that the latter could not claim the exclusive copyright on Abd-ru-shin’s writings in Brazil.

The most important schism occurred between 1999-2001, although its origin can be traced back to Irmingard Bernhardt’s will. When Irmingard died in 1990, she left the Grail properties, including the Vomperberg, to Claudia-Maria (1961-1999), a natural child of Irmingard’s adopted daughter Marga (b. 1943); both Claudia-Maria and her husband Siegfried (b. 1955) had legally adopted the surname Bernhardt, with Irmingard’s blessing. The International Grail Movement, led by Siegfried Bernhardt, maintains to this date the control of the headquarters at the Vomperberg (web site www.gralswerk.org) and of the trademark “International Grail Movement”, except in the English-speaking countries. Irmingard, on the other hand, left the copyrights of the Grail literature to an International Grail Foundation, led by Herbert Vollmann (1903-1999, the husband of Elizabeth Bernhardt, Irmingard’s younger sister). It was Irmingard’s hope that the two legal entities, the Movement and the Foundation, would peacefully cooperate. In fact, Siegfried’s alleged infidelity to his invalid wife, Claudia-Maria, provoked a family

crisis, and in 1999, shortly before his death, Vollmann asked his followers to no longer acknowledge “the Mountain” (i.e. the Vomperberg) but to follow “the Light” (the Foundation and its literature, for which he appointed Jürgen Sprick as his successor, and the Foundation’s current leader). The Foundation maintains ownership of the copyright on the founder’s writings, and controls both the publishing house Stiftung Graalsbotschaft and the web site www.graal.org. In the United States, Great Britain, Australia, Canada, and Nigeria, the Foundation has maintained the “International Grail Movement” trademark, and operates under this name, thereby creating a certain amount of confusion with the International Grail Movement led by Siegfried Bernhardt from the Vomperberg. A substantial number of members followed Vollmann in the separation from the Movement, and are currently establishing places of worship alternative to the Vomperberg, to which they are prevented entry, with many unsolved legal issues remaining. The total membership of the two main branches of the Grail Movement (including the International Movement and the Foundation, but not the splinter groups, the larger of which is the Brazilian *Ordem do Graal na Terra*, with smaller branches in the Czech Republic and elsewhere following local leaders, some of whom claim to receive visions and revelations from the founder) is currently 20,000. The international readership of *The Grail Message* is certainly much larger.

MASSIMO INTROVIGNE

Grand Jeu, Le

Historians are today restoring to *Le Grand Jeu* (“The Big Game”) the prominent place that it deserves in the spiritual, artistic and literary history of the first half of the 20th century. Long eclipsed

by Surrealism, the *Le Grand Jeu* group now appears in a new light that permits us to better outline its contours and appreciate its originality – particularly as regards its metaphysical perspectives – in relation to the endeavors of André Breton (1896-1966) and his epigones.

The adventure of *Le Grand Jeu* began at the Lycée de Reims (France) in 1922, when a few students of the class of *troisième* (Br: fourth year, US: 9th grade), about fifteen years old, exceptionally precocious, and passionate about the absolute, began a little initiatory society. They decided to challenge social values and break through the rational limits of the mind in order to reach the “Beyond”, by means of all kinds of experiments inherited from the practice of ‘deranging all the senses’ advocated by Arthur Rimbaud (1854-1891). Roger Vailland (1907-1965), Roger Gilbert-Lecomte (1907-1943), René Daumal (1908-1944) and Robert Meyrat (1907-1997) were trying to rediscover the holistic knowledge of the world that they believed had once been the spontaneous possession of traditional people, and still existed primarily in children today. To distinctly mark their wish of returning to the origins, and their faith in the creative virtues of child-like awareness, these young men soon called themselves the “Phrères [sic] Simplistes”. Their revolt against social and intellectual shackles was exhibited by pataphysical or dadaist provocations; but on a deeper level – inspired by *La saison en enfer*, by Lautréamont (1846-1870), by Poe (1809-1849), → Nerval, → Huysmans and → Novalis – they often identified themselves with visionary angels, fallen creatures close to Satan, ‘come down from heaven on a stretcher’ (R. Gilbert-Lecomte). They claimed to be able to travel in other realms, to perceive the musical rhythm of the universe and to discern the expansion and metamorphoses of time. All their experiences took place in the context of what would soon become “experimental metaphysics”. This included techniques for “projection of the astral body”, the inhalation of carbon tetrachloride (by Daumal), and experiments in extraretinal vision and extrasensory perception. As early as this period, it was a matter, for them, of transcending the limits of the mind and gaining access to the immediate perception of another universe believed to be incommensurable with our sensory knowledge and irreducible to our understanding. The Simplistes were thus engaged in a true revolution of consciousness, systematized and proclaimed by *Le Grand Jeu* from 1928 on.

In Paris, in 1927, Daumal, Vailland and Gilbert-Lecomte grouped around the painter Joseph Sima

(1891-1971), an artist of Czech origin fascinated by the spiritual quest. Sima in his work was concerned with abolishing matter-spirit dualism and recovering a vision of the original unity. The Simplists were enthusiastic about such endeavours, which echoed their own aspirations and went far beyond traditional aesthetics, being presented as an authentic means of knowledge, a “clairvoyance” in Rimbaud’s sense of the term; art should be a metaphysical experience, free of any hedonistic connotations. The friendship with this artist whose concerns were so close to theirs strengthened the Simplists’ aspirations, and other kindred spirits soon joined them – André Rolland de Renéville (1903-1962), Monny de Bouilly (1904-1968), Georges Ribemont-Dessaignes (1884-1974), Maurice Henry (1907-1984), Hendrik Cramer (1884-1945), Arthur Harfaux (1906-1995), and Pierre Minet (1909-1975). Supported morally and financially by Léon-Pierre Quint (1895-1958), the Simplists published in the course of summer 1928 the first number of the review *Le Grand Jeu*. Two more would follow, one in the spring of 1929, the other in the autumn of 1930. The three issues of this review – and a few pages of a fourth that did not make it beyond the planning stage – constitute the basic referential corpus for anyone who attempts to understand the *Le Grand Jeu* enterprise and evaluate its influence, especially in relation to esoteric thought.

The inner quest of the protagonists of *Le Grand Jeu* may be compared with a mystical endeavor to attain an immediate omniscience, whose secret, lost since times immemorial, must urgently be rediscovered so that Man can attain the perfect realization of his condition. The prenatal universe, the return to origins, and the condition of childhood are as many recurrent themes in the texts of Daumal and Gilbert-Lecomte. Avid readers of → René Guénon’s works on the primordial Tradition and on the *Crise du monde moderne* (1927), and aware of Lévy-Bruhl’s (1857-1939) writings on primitive mentality, the poets of *Le Grand Jeu* were also vitally interested in the intuitions of hermetic thought, with the main representatives of which they were familiar. Pythagoras, Heraclitus, Plato, Plotinus, Apollonius of Tyana, → (Pseudo-) Dionysius Areopagita, → Giordano Bruno, → Swedenborg, → Louis-Claude de Saint-Martin, and → Fabre d’Olivet are cited or mentioned, sometimes several times, in the three numbers of their review. This apparently disparate list of philosophers, magi or great initiates conceals, however, a basic coherence: the idea – a true act of faith for these young explorers of thought – that the

world is a unity, that there is neither spirit nor matter, but only Spirit-Matter, and that dualism has been transcended. Coupled with this is the conviction that everything acts and reacts upon everything else, and the microcosm and the macrocosm, in line with the hermetic tradition, are in symbolic correspondence and exercise a secret power on each other.

To attain the awareness of this unity, and especially to *live* it from the inside, the mind must break through its limits, lose its individuality, transcend the narrow self, and become universalized, until it regains the primordial integrity of its nature. As Gilbert-Lecomte wrote, ‘the particle of being that was assigned to our consciousness at the beginning of the world was not irremediably separated from the universal being’. In order for man to *reintegrate* himself – in the sense that theosophy confers on this term –, it is his duty to transgress all the boundaries, revolt against all conditioning and against all social, cultural, moral, ecclesiastical or religious constraints – in short, to practice a systematic ‘Break-Dogma’ (*Le Grand Jeu*, no. II). The goal is to shatter the principles of Aristotelian logic that, by the radical distinction of subject and object or of dream and reality, impose on us a deformed and false vision of the nature of things. The adepts of *Le Grand Jeu*, adopting Rimbaud’s opinion that ‘our pale reason is hiding infinity from us’, wanted ‘... to tear down the colossus with a cretin’s head that represents Western science’ (*Grand Jeu*, no. II).

The “experimental metaphysics” put into practice by the partisans of *Le Grand Jeu* would offer a means of acceding to ‘this still point in its own vibrating interior’, to the ‘*punctum stans* of the old metaphysics’ (Gilbert-Lecomte) where all contradictions are abolished. But such a breakthrough is possible only if we take leave of our habitual mental categories and dare to engage, at the risk of our annihilation, all our physical and spiritual potentials in a quest that fundamentally challenges the very act of knowing. Identification with the Vision comes at this price. *Le Grand Jeu* tells us first to establish a connection between the visible and the invisible, the separation between which is only apparent and which represents a gross limitation of our deficient and atrophied senses and ways of thinking. One has to restore unity to the body, and learn to conceive of it, not in the Cartesian manner as a substance radically different from the spirit, but rather as its symbolic image. From there on, by means of new so-called “extra-sensory” experiences, psychic states of various degrees of intensity will manifest

themselves, and as many stages of knowledge; the initiatory process may finally lead to ideal omniscience. Drugs, narcotics, perception of the “subtle body”, paramnesia, sleep deprivation, waking dreams, extra-retinal vision, and the experience of death itself are only means to gain access to a higher consciousness, a different plane of reality analogous to the astral plane defined by the occultists. Perhaps more precisely, this plane is the *mundus imaginalis* (the imaginal), the intermediary space of which → Henry Corbin (1903-1978) speaks in relation to the theosophies of Islam: a *mesocosm* situated between the perceptible and the intelligible, where spirits are incarnated and where bodies are spiritualized. The coveted Absolute thus has a precise and unambiguous position in relation to perceptible experience: ‘The spirit is ONE’, says Gilbert-Lecomte, ‘and has nothing in common with the perceptible world’. Therefore “experimental metaphysics” cannot start from sensations alone. It makes use of the body only in order to escape from it. The sensory experiences that it uses like a trampoline are not directed to the acquisition of powers – which would imply magic – but toward the pursuit of Knowledge, a spiritual awakening, and a continuously expanding field of consciousness. For consciousness, at the very instant when it expands unto infinity and risks dissolving into the void of emptiness or fall into sleep, can, in ‘a lightning-flash’ (Gilbert-Lecomte), reconquer the lost unity. A note, composed collectively for number II of *Le Grand Jeu* (May 1929) clearly explains this point: ‘... A Man can, according to a certain so-called mystical method, attain the immediate perception of another universe, incommensurable with his senses and irreducible to his understanding . . . Knowledge of this universe belongs in common to all those who, at one period of their life, have wished desperately to pass beyond the possibilities inherent to their species and have begun the mortal departure’.

Although the adepts of *Le Grand Jeu* never spoke of the Fall in the sense of → Christian theosophy, they considered man a fallen creature. To regain his true nature and original state, man must attempt to change his current and limited mode of consciousness in order to acquire the supplement of soul that will rescue him from the “absence” here on earth and lead him to rediscover the “true life” glimpsed by Rimbaud. Although certainly desecralized, this approach remains formally faithful to the religious scheme of Christianity and its theosophical avatars. The fault that casts Man down to a status lower than his original one is strongly stigmatized by *Le Grand Jeu*. This catas-

trophe is the result, especially in the West, of the immoderate cult of reason and science; of the break of the connection that used to magically unite us to nature; and finally, of the lethal tendency among Westerners to take into account only matter, only the reign of quantity, and ignore the qualitative essence of things. Such is the original sin of our technico-scientific civilization in the eyes of Dau-mal and Gilbert-Lecomte.

To rise again after this Fall is possible, as we have seen, only by engaging the whole being of Man in a metaphysical adventure, fully lived and boldly risked, that involves the individual’s body and soul. This adventure requires him to play a crucial game, a sort of “who loses wins”, in the course of which, by venturing as far as the extreme limits of the mind, he may either glimpse the supreme illumination, or else be dramatically annihilated in insanity or death. Mere research of an intellectual nature does not suffice; a quest that remains limited to conceptual speculation will prove ineffective in restoring to consciousness the ability to embrace the infinite. While *Le Grand Jeu* finds its place in the history of modern esoteric thought, it bears rather few similarities to purely gnostic endeavors; it relates more to the alchemical process [→ Alchemy], which attempts to harmonize the different planes of being by means of a purification and transmutation of psychic and physical elements. The adepts of *Le Grand Jeu*, like the initiates of the Great Work, were aware of the dangers of this most perilous path and subscribed to the famous adage: “Nonnulli perierunt in opere nostro” (some have perished in our work). The discovery of the Philosopher’s Stone, the access to the Self as a unique principle presiding over the *hierogamos* (the sacred marriage that reconciles the opposites), and the contemplation of the “circle whose center is everywhere and circumference nowhere”, in short: all these hermetico-alchemical approaches account for the undertaking of *Le Grand Jeu* better than traditional metaphysical constructs can. The latter are not considered to have any truly effective impact insofar as they do not proceed to a total metamorphosis of Man seen in his double nature of incarnated creature and spiritual principle.

When the members of *Le Grand Jeu* dispersed (end of 1932) and the review ceased to appear, the two main protagonists of this dazzling odyssey took different paths and their destinies definitively separated. Gilbert-Lecomte, a modern archetype of the *poète maudit* (cursed poet), did not succeed, despite repeated efforts, to tear himself away from the deadly demands of the “black goddess” (opium). In a fatal, suicidal impulse, consumed

more than ever by the desire for self-annihilation and dissolution, he pursued his asymptotic quest for the Absolute as far as the final destruction, which tragically came wearing the hideous mask of tetanus (1943). As for René Daumal, he freed himself from the grip of drugs. After his encounter with Alexandre de Salzmann (1874-1933), a disciple of → Gurdjieff whose powerful influence he experienced, he progressively gave up poetry to devote himself to a deep study of Sanskrit and the translation of Indian sacred texts. At the same time, he made ceaseless efforts at realizing his desire for integral transformation, practicing a strict asceticism to accede to the heights of spiritual simplicity (*Le Contre-Ciel*, 1936; *Le Mont analogue*, posthumous, 1950); he died prematurely of tuberculosis in 1944.

JEAN-LUC FAIVRE

Guaïta, Stanislas, Marquis de,
* 6.4.1861 Alzeville (Moselle),
† 19.12.1897 Alzeville

The descendant of a noble Catholic Italian family settled at the Château d'Alzeville in imperial Lorraine, young Stanislas was educated at the religious boarding-school of la Malgrange, near Nancy. Here in 1878-1879 he discovered literature, in the company of the future novelists Maurice Barrès (1862-1923) and Paul Adam (1862-1920), as well as another writer, Albert de Pouvoirville (1861-1940), who holds an important place in Parisian occultism [→ occult / occultism] under his

Taoist initiate's name, Matgioï. Guaïta tried his luck in Paris as a poet, publishing in 1881 *Oiseaux de passage: rimes fantastiques . . .* (Birds of passage: fantastic rhymes), followed by *La muse noir: heures de soleil* (The black muse: sunny hours, 1883) and *Rosa mystica* (Mystic rose, 1885). His reading of → Péladan's initiatic novel *La Vice Suprême* (The supreme vice, 1884) excited him by opening up new horizons; but, along with all those occultists of the period who had inherited the Romantic concept of the spiritual mission of the writer, literary expression would remain fundamental for him. Guaïta's apartment at Rue Trudaine, Paris, became a meeting-place for the esoteric world, all the more attracted by an extraordinary library that his fortune had allowed him to acquire. Associated from 1884 on with Joséphin Péladan, who claimed to be the inheritor of the initiation into a Toulouse branch of the Rose-Croix, Guaïta progressed rapidly in his knowledge of the occult. In 1886 he published a kind of historical résumé of the masters of the occult after the fashion of → Eliphas Lévi: *Au seuil du mystère* (At the threshold of the mystery), and at the end of 1887, turning to the practical side, he founded an "Ordre Kabbalistique de la Rose-Croix". This was directed by six known members (Péladan, → Papus, Paul Adam, → Barlet, then → Sédir and the Abbé Alta [1842-1933]) and six unknown ones.

The functioning of this initiatic society was chaotic, like that of the contemporary Martinist Order "reawakened" by Papus together with Guaïta. Like most of the occultist groups, they were obsessed with the idea of accomplishing an historical social mission. The themes developed in Guaïta's written work, *Le temple de Satan* (Satan's temple, 1891), *La clef de la magie noire* (The key to black magic, 1897), and his articles in *L'Initiation* confirm the fact: the great names of esoteric thought, from → Khunrath to → Boehme, → Fabre d'Olivet, and Eliphas Lévi, are utilized within the perspective of a final unveiling of the truth by means of a synthesis of the knowledge gained by science with the experience of the past transmitted by esotericism. Initiatic degrees were conferred after the model of university examinations: e.g., the "Licentiate in Kabbalah" obtained through library study. In 1887, Guaïta employed a secretary who would play an important role in the renaissance of symbolic and spiritualist → Freemasonry in France, Oswald Wirth (1860-1943). After the latter conveyed to Guaïta some papers of the Abbé Boullan (1824-1893), an occultist priest of Lyon who directed a community founded by the "prophet" Pierre-Michel Vintras (1807-1875), Guaïta embarked on a

veritable “magical war”, whose echoes reached the popular press. The affair ended with a spectacular duel (1893). Boullan was indirectly the model for → Huysman’s character in *Là-bas*. Another typically Parisian polemic opposed Guaita to Péladan, who quit the Rose-Croix Kabbalistique (1890-1891) to create a branch that was exclusively Catholic and oriented to artistic activities. In poor health and a great consumer of morphine, Guaita returned home to die at age 36 in his paternal château, where his family sought to dispel the memory of his life as an occultist.

Oiseaux de passage, Paris: Berger & Levrault, 1881 ♦ *Au seuil du mystère*, Paris: Chamuel, 1896 ♦ *Essais de sciences maudites, le serpent de la Genèse*, Paris: Carré, 1890 (1st ed. 1886) ♦ *Le Temple de Satan*, Paris: Librairie du merveilleux, 1891 ♦ *La Clef de la magie noire*, Paris: Trédaniel, 1995 (1st ed. Paris, 1897).

Michelet, Jollivet-Castelot) ♦ René Philipon, *Stanislas de Guaita et sa bibliothèque occulte*, Paris: Dorbon, 1899 ♦ Maurice Barrès, *Un rénovateur de l’occultisme, Stanislas de Guaita*, Paris: Chamuel, 1898 ♦ Philippe Encausse, *Sciences occultes . . .*, Paris: Ocia, 1949, 57-109 ♦ André Billy, *Stanislas de Guaita*, Paris: Mercure de France, 1971 ♦ Jean-Pierre Laurant, *L’Esotérisme chrétien en France au XIX^e siècle*, Lannan, L’Age d’Homme, 1992, chs. 4-5.

JEAN-PIERRE LAURANT

Guénon, René Jean Marie Joseph, * 15.11.1886 Blois, † 7.1.1951 Cairo

Guénon was born in central France in the town of Blois in November 1886. His parents – and family – were strict Catholics. The strong sense of tradition found in late 19th-century French Catholicism was ingrained in Guénon during his earliest and most formative years, and was to affect his perspective throughout his life. As a boy, and again throughout his life, he was afflicted with *une santé fort délicate* (a very delicate health) – to the degree that at one point in his graduate school career it prevented him from attending classes. Education and learning were early and strong influences upon his life, owing largely to the proximity and involvement of his childless maternal aunt, Mme. Duru, who lived next door and was a primary school teacher. His father was an architect. Thus Guénon was raised in a home environment where learning generally, and mathematics and geometry specifically, were prominent.

Guénon’s early education was in Jesuit-run institutions. At the age of twelve he was enrolled in Notre-Dame des Aydes, where he remained until 1901, when he was transferred by his father to the Collège Augustin-Thierry. His academic record throughout these years was exceptionally good; he won several prizes, among them two for physics and Latin. In 1902 he received his baccalaureate, and in the following year his Bachelor of Philosophy with honors. In 1904 Guénon arrived in Paris, where he enrolled in the Collège Rollin. His field was advanced mathematics, and he was studying to prepare for the *licence de mathématique*. After two years, however, he withdrew from the university for reasons which are unclear. One of his biographers, Paul Sérant, speculates that it was due either to ill health or to the seductions of the intellectual life that Paris could offer a provincial and bright, curious youth.

Regardless of the reasons for his withdrawal from the university, this action proved to be a decisive one in Guénon’s life, since it was at this point, in 1906, that he began in earnest to pursue a course of study to which he had been introduced only shortly before, viz., the study of esotericism and occultism [→ occult / occultism]. It is fair to say that for the first of these years from 1906, Guénon was a protégé of Gérard Encausse (a.k.a. Papus), described by Paul Chacornac as the ‘undisputed leader’ of the French occult movement since 1888, the year in which Encausse became Corresponding Secretary of the → Theosophical Society in France. Guénon had first met Encausse while attending classes at the Ecole Hermétique, a school that formed the outer or public vehicle of the Parisian occult movement directed by Encausse. Guénon was admitted into all the various occult organizations controlled by Encausse, including the Ordre Martiniste. Throughout these years, while centered in Paris, Guénon both participated in and carried out research in occult and Masonic groups and esoteric religious doctrines. In 1908 he broke away from Encausse and his organizations and, until 1911 upon its dissolution by Guénon, he was head of the Ordre du Temple Renové (O.T.R.). For a period he was heavily involved in the → Gnostic Church in Paris, where he assumed the Gnostic name of Palingenius and the role of holy bishop. Upon the urging of Synesius, patriarch of the Gnostic Church, Guénon began a review called *La Gnose*, of which he was editor until 1912.

It was also in this period, around 1912, that he adopted Islam through the medium of a Swedish Theosophist named John Gustaf Aguéli, a.k.a. Abdul-Hadi, and was accepted as a pupil

by Aguéli's teacher Sheikh Abder-Rahman Elish el-Kebir for preparation and initiation into a Sufi sect. Several of Guénon's biographers view 1912 as a pivotal year in his life, not only because of his new association with Islam and his corresponding break with most of the former occult organizations with which he had been associated, but also because of his marriage.

In 1912 Guénon married Berthe Loury from Tours, which marriage lasted sixteen years until he was left a widower by her untimely death in 1928. Guénon's life during the period from 1912 to 1930 was shared between Blois and Paris, except for a short interim during 1917-1918 when he was appointed instructor of philosophy at Setif, Algeria. He tried, but failed, to earn a *docteur-ès-lettres* from the Sorbonne following his short stay in Algeria. In 1923 Guénon marked the end of his investigations and interest in occultism and → spiritualism with the publication of *L'Erreur spirite* (The Spiritist Error), and turned his concentration solely on that area for which he was to become renowned: metaphysics, *la Tradition primordiale*. Beginning in 1925, Guénon began submitting articles to the journal *Le Voile d'Isis* whose editor was Paul Chacornac. Within the space of three or four years Guénon became that journal's principal contributor; he remained so through 1936 when the journal's name changed to *Études Traditionnelles*, and thereafter throughout his life.

In the Fall of 1929, Guénon met Marie Dina, the wealthy daughter of a Canadian railroad baron, and the widow of an Egyptian engineer. As a great admirer of Guénon's work she proposed to become, essentially, his patron, and offered to establish a publishing house (*Véga*) to serve as the vehicle for his writings. *Véga* was to publish Guénon's original metaphysical works in addition to all the French translations he could make of traditional Islamic texts. Guénon and Mme. Dina embarked for Cairo, Egypt on March 5, 1930, in order to obtain the first of the Sufi texts for translation and publication. They planned to be in Egypt only for three months, but circumstances changed and Mme. Dina returned to France while Guénon remained in Cairo. Mme. Dina's enthusiasm for the whole project waned, and Guénon was left in Cairo where he began a process of gradual assimilation into the Arabic culture. By the end of 1932 he had apparently decided not to return to France, and committed himself to becoming both a Muslim Sufi and an Egyptian.

Guénon remained in Cairo until his death in 1951. There he perfected his Arabic and became, in effect, a practicing Sufi and fully integrated

into Egyptian society. In 1933 Guénon met Sheikh Muhammad Ibrahim, an elderly lawyer whom he visited often. The following year he married his second wife, the Sheikh's daughter, Fatima, and they moved to Doki, a suburb of Cairo. Toward the end of his life he began to suffer continuous bouts of ill health, so he and his family moved back into central Cairo. Two daughters were born to them in 1944 and 1947; a third child – a son – was born in 1949, and another son was born four months after Guénon's death in 1951. In 1948 he officially became a naturalized Egyptian citizen, but throughout his expatriation, Guénon always kept abreast of the intellectual and political climate of France, and the West. His writings remained constant and prolific as they had been before his departure from France, during this period focusing more on the process of attaining effective metaphysical insight, though still under the same genre of "Tradition", or *sophia perennis*.

While Guénon published scores of articles and reviews in numerous journals, he is best known for his major works published in book form. Though the subjects of his books cover a relatively wide range of fields of inquiry, within the larger context of world religions and esotericism and metaphysics, there are several common themes that run through them all. There is, first, the theme of a "universal principle", which inheres in all, and of which it may be said that every other principle is derived. Then there are the related subjects of revelation, initiation, and Intellect (this last concept contains a component of "intuition", by means of which knowledge and understanding of an esoteric truth may be directly apprehended without recourse to reason and dialectic). These and certain other, related subjects such as periodicity, polarity, correspondence, and aeviternity, collectively, are referred to as "first principles". Guénon held that the first principles of the Tradition, or *philosophia perennis*, are essential, and that substance proceeds from essence; that Traditional societies were those wholly informed by these first principles and thereby unanimous and substantively reflective of the essential principles; that a key characteristic of Traditional culture is the absence of a bifurcation (or, alternatively, a fusion) of sacred and secular; that the description "Traditional" encompasses pre-modern non-literate or tribal societies as well as literate civilizations; and that due to inexorable cosmic cycles the modern world is at present virtually entirely secular and therefore the antithesis of → Tradition.

Guénon's first book, *Introduction générale à l'étude des doctrines hindoues* (unsuccessfully

submitted as a thesis for the title *docteur-ès-lettres* at the Sorbonne) was published in 1921, and during the thirty-year period that began then and ended with his death in 1951, he published seventeen seminal works of metaphysics and esotericism whose lucidity and penetration have been described as mathematical in their precision and personal detachment. Two of his greatest books, *La crise du monde moderne* (The Crisis of the Modern World) and *Le règne de la quantité et les signes des temps* (The Reign of Quantity and the Signs of the Times), deal primarily with the vicissitudes of modernity in the West, *i.e.*, since the Middle Ages, and the inversions of metaphysical truths that according to Guénon form the structure of modern culture. Two of his other books, first translated into English in 2003, reflect Guénon's substantial deficiency in what he himself referred to as the "historical method" (his only two books to make an attempt in that direction): *L'erreur spirite* (The Spiritist Error) a book about the rise of spiritualism in the 19th century and the problems associated with it, and *Le Théosophisme: Histoire d'une pseudo-religion* (Theosophy: History of a Pseudo-Religion), a putative history of the Theosophical Society that purports to be an exposé of its esoteric *bona fides*. The remainder of his books are expositions of symbolism, metaphysics, and esotericism as these are expressed within the world's religions, and discussions of the primordial Tradition, in which subjects – and in the treatment of which – he excelled.

During the last three decades of his life, and especially after his immigration to Egypt, Guénon engaged in a long-term correspondence and close relationship with Ananda K. Coomaraswamy (1877-1947), the curator of the Indian and Asian collection of the Boston Museum of Fine Arts in the United States. Coomaraswamy, who had received his Ph.D. from the University of London in 1906 and who was a master of Greek, Latin, Pali, and Sanskrit, produced a tremendous published corpus of scholarly materials on the *philosophia perennis* – a term more or less interchangeable with Guénon's *Tradition primordiale* – based upon his own translations of the sacred texts of these languages. Together, Coomaraswamy and Guénon became the founders, with no prior plan or intention to do so, of what has come to be referred to as the "Traditional school" of esotericism and metaphysics in the 20th century. Another principal proponent of these Traditional views in the succeeding generation was → Frithjof Schuon, considered by many to be the preeminent expositor of the Tradition in the second half of the 20th century. The Tra-

ditional school would attract to it numerous other students and writers on the subjects of esotericism and metaphysics, including Titus Burckhardt, Martin Lings, Marco Pallis, Leo Schaya, William Stoddart, and Seyyed Hossein Nasr, to name a few.

In addition to the Traditionalists *per se*, there exist many individuals in the West who were and are to varying degrees affected by the thought of Guénon, but who were or are not part of this central core of the Traditional school. In France, for example, Guénon had a relatively significant impact on literature and contemporary thought: André Breton, Georges Vallin, Romain Rolland, René Daumal and, to a degree perhaps more apocryphal than actual, André Gide, were all influenced by the writings of Guénon.

The Italian → Julius Evola had been a spokesman for his own particular theories of political philosophy, one of which he referred to as "pagan imperialism", but in 1930 Evola turned to the concepts of Tradition and Traditional cultures as espoused by Guénon. This was the same year Guénon left France for Cairo, and it marked a significant turning point in Evola's philosophy. From this basic Traditional foundation, Evola began his assiduous critiques of liberalism, Marxism, nationalism, and even Christianity, which gained him the reputation – at least in Italy – of being a *maître à penser*.

Among the more reputable and renowned scholars in the United States who have written about and to some extent have been influenced by Guénon are Mircea Eliade, Huston Smith, and Jacob Needleman. Others, like Roger Lipsey, Seyyed Hossein Nasr, and Joseph Epes Brown, are more directly identified with the school of Traditional thought *per se*. Although the former are typically cautious not to rely excessively or even expressly on Guénon in their writings, *i.e.* with regard to citations, their reliance on Traditional perspectives is most significant. Huston Smith, more than Mircea Eliade or Jacob Needleman, expressly incorporates the works of Guénon and of Coomaraswamy, whom he cites in his publications. In *Forgotten Truth: The Primordial Tradition* (1976), Smith was careful to avoid the terms "Tradition" and *philosophia perennis* (in Latin or English), referring instead to the "primordial philosophy" and similar constructions. He nonetheless made perfectly clear to whom he was indebted and what constitutes, for him, the primordial tradition.

Guénon's influence, whether effected directly or through those who followed him in the Traditionalist forum, has continued to spread since the first half of the 20th century. Those who openly admit that their expressions are wholly or partially

shaped by the Traditional perspective may be said to be within the Traditional forum. Others may not acknowledge the influence expressly but nonetheless infuse it in their oeuvre. Those in the latter category range in scope from poets like T.S. Eliot and Kathleen Raine to scholars like Mircea Eliade and → Henry Corbin to mendicants like Swami Ramdas and Thomas Merton. Many more could be added to this list by tracing in further detail the emanations of pervading influence of the Tradition as espoused by Guénon. Guénon's influence has also grown within the Muslim world. Prior to the Islamic revolution in Iran in the 1980s, Tehran was a very active center for Traditionalist thought and activity. It continues to retain strong elements of a Traditionalist interpretation of Islam, though somewhat more guarded in the present day's milieu. Another venue for the appreciation of Guénon and his Traditionalist vision of Islam is Turkey where, owing to the process of reintegrating an intellectual Islam into its post-1949 culture, the views of Guénon and Traditionalists such as S.H. Nasr have found a certain acceptance.

WILLIAM QUINN

Gurdjieff, George Ivanovitch,
* 13.1.1866 (?) Alexandropol (Russia),
† 29.10.1949 Neuilly, Paris

Greco-Armenian holistic philosopher, thaumaturge, and teacher of Sacred Dances (whose ancillary personae as musicologist, therapist, hypnotist, raconteur, explorer, polyglot, and entrepreneur exercise the taxonomic mind). Gurdjieff's work comprises one ballet, some 250 Sacred Dances, 200 piano pieces composed in collaboration with his pupil Thomas Alexandrovitch de Hartmann (1886-1956), and four books, the *magnum opus* being *Beelzebub's Tales to His Grandson*. For more than 35 years he privately taught, by example and oral precept, a previously unknown doctrine styled "The Work", attracting – and often quixotically repulsing – groups of gifted disciples: Russian, English, American, and French. His system integrated a semantic critique, a social critique, an epistemology, a mythopoeic cosmogony and cosmology, a phenomenology of consciousness, and a practical *Existenzphilosophie*.

Gurdjieff's sketch of his infancy and early childhood (1866-1877) finds a modicum of corroboration in vestigial family memories, traditions, and photographs. The eldest son of a Cappadocian Greek father and an illiterate Armenian mother, he was born in the Greek quarter of Alexandropol, a Russian garrison town bordering Ottoman Turkey. In practically Old Testament conditions, Ioannas Giorgiades, a well-to-do grazier on the Shiraki Steppe, imposed on his son a character-forming, even Spartan, regime; and, as an amateur *ashokh* or bardic poet, imbued him with an inextinguishable interest in an oral tradition at once living and archaic (not least the Epic of Gilgamesh). Cattle plague (1873) impoverished the family, and the Russo-Turkish war (1877) drew them hopefully to the captured Turkish citadel town of Kars.

At this early juncture balanced encyclopaedism is balked by Gurdjieff's cavalier burning of his personal papers in spring 1930 and by a curious absence of collateral evidence. For the ensuing thirty-three years we are, *pro tem*, chasteningly reliant on Gurdjieff's four autobiographic-

didactic texts which – although innocent of consistency, Aristotelian logic, and chronological discipline – have the ring of a poetic truth. From these alone derives our notion of Gurdjieff's private tutoring by "Dean Borsh"; his unprogressed vocations as a doctor and a priest; his wonder at a succession of paranormal phenomena; and his burgeoning existential question as to the cosmic function of the biosphere and of humanity. Gurdjieff's auto-mythopoesis equally furnishes us the twenty-six adult years (1885-1911) of his long quest for, and synthesis of, valid esoteric sources. None of Gurdjieff's fifteen companions, the "Seekers of Truth", have resolved into recognisable historical entities. His apologists' attempts to differentiate and substantiate five successive expeditions – to Egypt, Crete, and the Holy Land; to Abyssinia and the Sudan; to Persia and Transoxiana; to Siberia; and finally to Afghanistan, the Pamirs, and India – display ingenuity but are necessarily compromised by self-indexicality, i.e. reliance on the correlation of purely internal evidence. Soberingly, Gurdjieff's putative decade in Central Asia (1897-1907), including his pivotal initiatic experience in the "Sarmoung Monastery", finds no support in the meticulous journals of contemporary explorers (Sven Hedin, Sir Aurel Stein, Albert Le Coq, Paul Pelliot, and Count Kozui Otani).

Yet, given the vastness of the territory, Gurdjieff's verve, and his predilection for aliases and disguise, these important caveats fall well short of conclusively invalidating his spiritual Odyssey: absence of proof is not proof of absence. Wholesale scepticism as to Gurdjieff's Central Asian venture confronts its own difficulties in accommodating his relevant linguistic command, his well-attested knowledge of the region's musical modalities and tribal carpets, and his arguably unique grasp of its dance – folk and liturgical.

With Gurdjieff's arrival in Metropolitan Russia (ca. New Year 1912), biography finally rests on defensible ground. Significant among Gurdjieff's earliest associates in Moscow is his cousin the monumental sculptor Sergei Dmitrievich Mercourov (1881-1952). In St Petersburg in 1913, while affecting the title "Prince Ozay", Gurdjieff briefly engages with his first British pupil: the young musical student Paul [later Sir Paul] Dukas (1889-1967); and in 1914 attracts the Finnish alienist Leonid Robertovich de Stjernvall (1872-1938). In November 1914, Gurdjieff enticingly advertises his prospective ballet *The Struggle of the Magicians* as 'the property of a certain Hindu'. Consequently, in April 1915 Gurdjieff attracts the

Russian journalist and polymath → Piotr Demianovich Ouspensky, successful author of the speculative metaphysical study *Tertium Organum*; and, in December 1916, the well-established Russian classical composer de Hartmann. These two crucial accessions in war-time Petrograd bracket a concentrated teaching phase, arguably the most significant and brilliant of Gurdjieff's entire ministry: certainly he will never again so explicitly exhibit his teaching's arithmosophical constituent and systemic integration, nor recruit pupils as contributive to its dissemination.

Mere days before Tsar Nicolas II is deposed (February 1917) Gurdjieff presciently goes south, soon followed by his cadre whom he shepherds through the ensuing Russian Civil War. In Essentuki he contrives two seminal "workshops" of intense psycho-somatic experimentation, which witness *inter alia* his inception of life-long work on Sacred Gymnastics (later termed "Movements" or Sacred Dance). Finally, in August-September 1918, he audaciously extricates his nucleus (excepting an increasingly disaffected Ouspensky) on foot over the Caucasus mountains, crossing Red and White lines five times.

The year 1919 in Menshevik Georgia is quadruply notable: for the accession (Easter) of Jeanne de Salzmann (1899-1990) a gifted young French-Swiss eurhythmics pupil of Emile Jaques-Dalcroze, and of her husband Alexandre Gustav de Salzmann (1874-1934) an associate of Rilke and Kandinsky; for the inaugural public demonstration of Gurdjieff's Sacred Dance in Tbilisi Opera House (22 June); for the notional founding of Gurdjieff's Institute for the Harmonious Development of Man (September); and thereafter for Gurdjieff's work (co-opting de Hartmann) on the scenario and music of *The Struggle of the Magicians*. Relatively unproductive are Gurdjieff's transitional spells in Constantinople (July 1920-July 1921) and Germany (August 1921-July 1922). The latter, however, is enlivened by Gurdjieff's extravagant prospectus for his Institute and by two brief spring visits to London, where he quarrels irretrievably with Ouspensky, but from whom he captures the allegiance of "Alfred Richard" (James Alfred) Orage (1873-1934), the mystically predisposed editor of the critical weekly *New Age*.

In July 1922, on a restricted Nansen Passport for Russian refugees, Gurdjieff relocates in France (where he will remain domiciled for twenty-seven years until his death). On 1 October he settles in his most famous seat, the Prieure des Basses Loges at Fontainebleau-Avon, and opens his Institute: thus, at 56, Gurdjieff is finally circumstanced to

bring West his gleanings in the East. His Russian nucleus is soon substantially augmented by new pupils, whose preponderant British element includes Orage and Dr Henry Maurice Dunlop Nicoll (1884-1953), a former protege of → C.G. Jung. More illustrious is the terminally consumptive New Zealand short story writer “Katherine Mansfield” (Kathleen Mansfield Murry, b. 1888), whose death on 9 January 1923 undeservedly stigmatises Gurdjieff, most enduringly in France. Although, in summer 1923, “open evenings” of music and Sacred Dance in the Prieure Study House attract some international notables, e.g. Diaghilev and Sinclair Lewis, the mixed reception given Gurdjieff’s flamboyant and fully orchestrated demonstration at the Théâtre des Champs-Élysées (December 1923) predicates a decade of French indifference.

Exceptionally significant is 1924. A pivotal demonstration (2 February) at the Neighbourhood Playhouse, Greenwich Village (on the first of Gurdjieff’s nine American excursions) excites the New York intelligentsia, drawing *inter alia* Jane Heap (1883-1964), co-editor of *The Little Review*, Gorham B. Munson (1896-1969), the critic, and “Jean” (Nathan Pinchback) Toomer (1894-1967), author of *Cane*. After founding his Institute’s New York branch (April), Gurdjieff returns to France, where his work is bluntly recanalised by a near-fatal car accident (8 July). Still convalescent, Gurdjieff formally disbands his Institute (26 August); empowers Orage to supervise America; ceases teaching Movements; and – resolved henceforward to propagate his ideas more enduringly – embarks (16 December) on his vast trilogy *All and Everything*.

Milestones on the problematic decade 1926 to 1935 are: the death (26 June 1926) of Gurdjieff’s wife Julia Osipovna Ostrowska (b. 1889); his self-sacrificial dismissal of intimate Prieuré retainers (May 1928); his effectual expulsion (June 1929) of Thomas de Hartmann; and (February 1930) of the composer’s wife Olga Arkadijevna (1885-1979), Gurdjieff’s devoted secretary and amanuensis; his contrived break with Orage, and enturbulation of the American groups (December 1930); the closure of the Prieuré and disbandment of the Institute (May 1932); the private publication (March 1933) of Gurdjieff’s imprudent tract *Herald of Coming Good* (hastily repudiated and suppressed); the outright loss of the Prieuré (May 1933); the deaths of Alexandre de Salzmann (March 1934) and Orage (November 1934); and, finally, Gurdjieff’s irrevocable abandonment of writing (May 1935). Against these must be handsomely weighed: Gurdjieff’s

unprecedented musical collaboration (July 1925-May 1927) with Thomas de Hartmann, yielding 170 new piano compositions; and, above all, his prodigious accomplishment of *Beelzebub and Meetings* (see bibl.).

In October 1935 Gurdjieff far-sightedly prompts Jane Heap to propagate his work in London; and from among her former expatriate associates in Paris constitutes (January 1936) “The Rope”, a minuscule group of lesbian literati, with whom he constructively experiments until autumn 1937. In summer 1936 – now aged 70, and deprived, not least by his own will, of virtually all his closest companions – Gurdjieff acquires a modest Paris apartment at 6 rue des Colonels-Renard. Here in 1938 transpires his first personal contact with René Daumal (1908-1944), poet and former member of → *Le Grand Jeu* a prior student of Work ideas first under Alexandre de Salzmann then Jeanne de Salzmann. With World War II looming, Gurdjieff makes a brief penultimate trip to New York (spring 1939) but resists promptings to settle securely in New Jersey, and returns (May) to France; similarly he declines to vacate Colonels-Renard when the Germans invest Paris (June 1940). In October 1940 Jeanne de Salzmann (already Gurdjieff’s *de facto* deputy) presents to him her gifted preparatory group including the journalist and photographer Henri Tracol (1909-1997) and his wife Henriette (née Lannes) (1899-1980). Despite the Occupation’s hazards and rigour, Gurdjieff’s Paris group progressively enlarges. At the *Salle Pleyel* (in morning classes supported only by piano extemporisation) Gurdjieff works indefatigably on new Movements – the “39 Series”. In afternoons and evenings he supervises readings of his texts and hosts ritualistic meals featuring an inviolable succession of ceremonious “Toasts to the Idiots”. VE-day (6 May 1945) heralds Gurdjieff’s consumatory phase (richly documented in memoirs), as tributary streams of British and American pupils merge with the French. Momentum is lent by the death of Ouspensky (2 October 1947) and by the near death of Gurdjieff himself in a second car crash (8 August 1948). On a final visit to New York (December 1948-February 1949) Gurdjieff confides his American endeavour to Henry John Sinclair, 2nd Baron Pentland (1907-1984); and approves publication of Ouspensky’s *In Search of the Miraculous*. In Paris in October 1949 Gurdjieff’s health finally collapses: his receipt (21st) of a proof copy of *Beelzebub* crowns his life’s work; he gives instructions to Jeanne de Salzmann (27th) for his texts’ posthumous publication, and sends a message to de Hartmann requesting compositions for the 39

Series. Aged 83, Gurdjieff dies at the American Hospital at Neuilly (29th), and is buried (November 3) at Fontainebleau-Avon according to the rite of the Russian Orthodox Church.

Gurdjieff's followers view his teaching as implicated in the man himself ('the function of a master is not limited to the teaching of doctrines, but implies an actual incarnation of knowledge'). He nevertheless bequeaths posterity a free-standing critique, nourishingly, if contentiously, explanatory on three levels: individual, social and cosmic. This panoramic and triple-tiered ideology coheres, constituting a *concordia universa* which by any standards is impressive. Underpinning its integration are Gurdjieff's two axiomatic, universally interacting laws: a dialectical "Law of Three" and a more technically complex "Law of Seven" (assigning to each completing process seven *irregularly* developing phases). Tempering the high intellectuality of this model is Gurdjieff's manifest practicality: he is not offering a set of self-supportive notional abstractions – rather he is harnessing his deepest ontological findings about "world creation and world maintenance" to an eminently approachable *Existenzphilosophie*. As to axiology, Gurdjieff's *summum bonum*, his supreme intrinsic value, is the universal evolution of consciousness: all his subordinate values, ethical, psychological, aesthetic etc. are pragmatically ranked according to this exacting criterion.

Gurdjieff's mythopoeic cosmogony (see *Beelzebub*) presents the Megalocosmos as issuing by *Fiat* from God the Father, expressly to circumvent the encroachments of His holy adversary and coeval – Time. Thereafter, the laws, constants, and parameters in-built in the Megalocosmos preclude God's intervention there; Gurdjieff's is thus a classic Deism of the "absentee landlord" type, in which God, notwithstanding his intuited compassion, lacks effectuality at creation's periphery and forfeits direct transactions with earth. To this scenario Gurdjieff poignantly adds the idea of God's unassuageable sorrow at His inability to alleviate the suffering of far-removed sentient beings. Substituting the term "Absolute" for God, Gurdjieff's formal cosmology (Petrograd group 1916) elaborates in arithmosophical detail a "Ray of Creation" – a cosmicization of being, hierarchically disposed through an involutory *solfeggio* (*DOminus* the Lord. *SI*dera the stars, *LA*ctea the Milky Way, the *SOLar* system etc.). This model of the universe aspires to bridge incrementally the discontinuity between creation and an ultra-transcendent Creator (the "Wholly Other" of Kierkegaard and Barth); to resolve the "ghost in the machine"

dilemma of Cartesian dualism; to give the broadest conceivable canvas to principles of relativism and scale; and to submit the entire natural order to a discrete principle of discontinuity with a musical analogue (redolent of certain late 20th century paradigms in quantum physics).

Overall, however, Gurdjieff's philosophy of nature issues an uncompromising challenge to the hegemony of reductionist technoscience. Gurdjieff's universe is sacred, qualitative, and dramatic: science's universe is secular, quantitative and mechanical. Gurdjieff's universe has a centrum (the "Holy Sun Absolute"): science's universe is isotropic. Gurdjieff's universe is growing in "being": science's growing in "space-time". Gurdjieff's universe is living (hylozoistic in Spinoza's sense): science's inherently inanimate. Gurdjieff's universe has an ontological dependence on the Creator, and a hierarchy of subordinate levels; science's universe is value-free. Arguably Gurdjieff's prime scientific heresy is his attribution to the moon of unsubstantiable macro-effects on the earth and its fauna and flora. Gurdjieff's "moon" transpires as a nascent body (cf. Kepler), symbiotically coupled with the biosphere, activating all organic life on earth (just as a clock's pendulum impels its mechanism), and "fed" by certain "wavicles" liberated at the death of all terrestrial life forms (cf. Posidonius).

Gurdjieff's "Ray of Creation" is not static: its key dynamic of "reciprocal feeding" anticipates, indeed extrapolates, various Green and holistic paradigms (Schweitzer's "reverence for life", Vernadsky's biosphere, and Arne Naess's "deep ecology"). At play on the cosmological level, Gurdjieff's symbiotic principle mimics a Benthamite utilitarianism, its *idée fixe* being the greatest good of the greatest entities: in the big Thrasymachean pecking order – cosmos, galaxy, sun, planets – the earth ranks poorly and its intricate and beautiful biosphere is merely epiphenomenal. Unsurprisingly, human beings en masse are dismally situated: reified on a scale not dreamt of by Adorno, they are eternally subservient to an alien solar economy and demiurgic politics – in effect (to invoke metaphor) factory-farmed for the sweet savour of their abjection and the phosphorescence of their mortality.

Gurdjieff's space-Odyssey *Beelzebub* elaborates an historical and social critique of feignedly extra-terrestrial objectivity (the literary device termed "celestial optics"). Following the three Abrahamic world religions, Gurdjieff initiates human history with a variant of The Fall which complements his favoured theodicy and axiology. Thereafter, in Manichaeic temper, he models two discrete streams of human history: conscious v. uncon-

scious; initiatic v. profane; the first current everlastingly transports true spiritual authority and morally vindicated elites (cf. Ortega y Gasset), and the second current temporal power and culturally inflected oligarchies (cf. Robert Michels).

Notwithstanding the cordiality of Gurdjieff's fraternal ideal and his abundantly attested "good Samaritanism", he never surrenders ideologically to modernity's politically correct egalitarianism; in his historiography the masses essentially constitute the genetic humus whence arise, with tragic rarity, authentically "learned beings" e.g. Leonardo da Vinci. *Beelzebub's* Everyman, by contrast, is exhibited as deeply asleep, blindly and aimlessly struggling and suffering; torn by war and passion, fouling everything he touches; sporadically aroused from torpid preoccupation with 'digestion, mother-in-law, John Thomas, and cash', only to be duped by the Caesarism of powerful demagogues (themselves the unsuspecting dupes of planetary imperatives). In sum, man is a pitiable creature who, by virtue of malign residues of The Fall, clings ingeniously to the very instruments which wound, the patterns which betray.

In stressing 'The Terror of the Situation' Gurdjieff is neither neutral nor fatalistic: his is no perverse celebration of the socially Dadaesque but an epic lamentation at the ascendancy of paranoid forms over normative. Freighting *Beelzebub* with value-judgements (pietistic, patriarchal, traditionalist, pacifist, internationalist, holistic etc.), Gurdjieff tenders ethology as critique, with abundant *Sollen* implicit in his *Sein* (cf. Dickens & Marx). His wry bitter-sweet iconoclasm thus allies itself not to the nihilistic paradigm (as does Adorno's) but to a revolutionist paradigm of meaning; he sweeps the ground clear professedly to build a new and better world. Yet whether Gurdjieff seriously presents as a social reformer, or even entertains the possibility of esotericism's accomplishing benign and stable effects on a Weberian scale, remains highly debatable. His life evidences no political adhesion; his teaching no breath of millenarianism; and his Ray of Creation dooms all generalised humanistic utopias to wither in the chill of the cosmic *Realpolitik*.

Although Gurdjieff salutes the magnanimity and efficacy of traditional esoteric schools down the ages, he reserves to a minuscule segment of humanity the preventient grace and spiritual hunger which plants one's feet on an authentic Way. For this small candidate-meritocracy Gurdjieff himself propounds an evolutionary, dynamic, or redemptive psychology – not cultivated in religious seclusion (still less on a psychiatrist's couch) but

in the vortex of day-to-day life. Gurdjieff's call is urgent and uncompromising: awake from your unsuspected hypnotic sleep to consciousness and conscience; struggle to attain imperishable "being"; elevate the taste of "I am" from cheap egotism to an essential presence replete with noetic content; come to know yourself – then create, by dint of 'conscious labour and intentional suffering', the soul you imagine you already possess.

In assessing this exhortatory prospectus, encyclopaedism must concede the danger of false cognates (Gurdjieff's Petrograd phase, incidentally, reveals him sharply differentiating *signifiant* from *signifié*). The key words of Gurdjieffian psychology – "self-observation", "self-remembering", "awakening", "being", "essence", "presence", "sensation", "inner work", "centres" – contest ground already colonised by multiple preconceptions and misconceptions. If the specificity of Gurdjieffian terminology is to be respected, it must be grasped that his seasoned pupils dedicated years of arduous experiential pupillage to discovering, and ceaselessly refurbishing, empirically valid referents for these expressions. *Hic labor, hic opus est*.

Abjuring lop-sided genius, Gurdjieff promotes the harmonious development of head, heart, and hand – respectively supporting the intellectual, emotional, and physical temperaments through his writings, music, and Movements. He nevertheless issues a ubiquitous demand for mobilised attention. Contemplatively deployed, this ever-refined attention builds a progressively deeper awareness of nuances of one's physical existence – approaching the Cartesian mind/body mystery in profound interior silence, while putatively opening the psyche to benign supernal influences.

Albeit Gurdjieff emerges as an agent and advocate of tradition, braiding recognisable and hallowed strands of Western and oriental esotericism, he is certainly no mere syncretist. Even jettisoning his surreal ideological provocations (e.g. that the sun neither heats nor lights), his system abounds in markedly original extrapolations and paradigms. Consider his stress on semi-tonal intervals and shocks in the diatonic scale, which differentiates his system from → Robert Fludd; or his intricate synthesis of the Laws of Three and Seven (in his key symbol the "enneagram" and in the "Food Diagram", correlating food, air, and impressions).

Gurdjieff necessarily bears his share of the irony which the 20th century's overweening currents of positivism, scientism, and structuralism reserve for esotericism *in toto*. But, beyond this generalised alienation, Gurdjieff's case is exacerbated by his emphatic individuality – a "hero" of sorts in the

age of the anti-hero; an unrepentant patriarch in a phase of post-feminist sensibility; a proponent of spiritual hierarchy in a world where equality is a social shibboleth. Throughout his life Gurdjieff curiously courted opprobrium by charlatanesque role-playing (while his teaching, incidentally, has posthumously contended with ill-considered revisionism, slipshod and counter-productive advocacy, and many distorting appropriations). All in all – with the important caveat that the “missing years” may yet fall prey to investigative scholarship – Gurdjieff’s emerging cultural status is impressive. His writing, music, and dance are respectively acclaimed by André Breton, Frank Lloyd Wright, and Lincoln Kirstein, while the dismissive epithets of → René Guénon, D.H. Lawrence, Wyndham Lewis, and François Mauriac seem curiously ill-considered today – eclipsed by positive and markedly better informed valuations e.g. from Peter Brook, Jerzy Grotowski, and Basarab Nicolescu.

Gurdjieff’s is a life and a teaching suffused with the starkest of ontologies: ‘I travail: therefore I am’. To populate this concept mythopoetically, to structure it dialectically, to loft it, level by level, towards the conceived fountainhead of consciousness – such is Gurdjieff’s intellectual achievement. But heart, as well as head, begs recognition here. The noteworthy photographs of Gurdjieff in grandfatherly old age, and the poignancy of his late improvisations on the harmonium, hint at this affective dimension. Gurdjieff is palpably anguished by humanity’s reeling disorientation. He abominates war. He suffers from our suffering. Full of years, full of sorrows, the “Teacher of Dancing” emanates an implacable compassion. Yet to “domesticate” him, to divest him of the sharp sting of the real, would betray fact: incontestably among the most influential 20th century esotericists, he stands formidably at the root of a potent contemporary tradition, whose vector resists scrutiny. Strange, nevertheless, that one intuits in him, finally, a benign source candidly and generously approachable.

JAMES MOORE

Gurdjieff Tradition

The tradition definable as Gurdjieffian derives its specific character and inspiration from the direct teaching of → G.I. Gurdjieff. Before his death, Gurdjieff entrusted the task of transmitting the teaching to his chief pupil, Jeanne de Salzmann (1889-1990), and a small circle of other pupils in France, England and America who acknowledged her leadership. Under her guidance, the first centers of “the Work” – as the teaching calls itself, echoing alchemical terminology – were established in Paris, London, New York and Caracas. Over the past half-century other centers have radiated from them to major cities of the Western world. Most of the groups maintain close correspondence with the principal centers, usually in relationship to one or two first-generation Gurdjieff pupils who personally guide the work of these affiliated groups. The general articulation of these various groups is a cooperative one, rather than one based on strictly sanctioned jurisdictional control. There are also groups which no longer maintain close correspondence with the main body of pupils and operate independently. And there are numerous other organizations led by individuals who claim no historical lineage with either Gurdjieff or his direct pupils. We limit ourselves here to the teaching as

it has been studied and transmitted by the direct Gurdjieff lineage. This teaching can historically be designated as the Gurdjieff tradition.

The theoretical teaching embraces an all-encompassing body of ideas dealing with universal laws and how they govern the whole of man's life on Earth, and in the past half century a vast body of exposition and commentary has accumulated about these ideas (see bibl.). Nevertheless, the teaching remains essentially an oral tradition, continually unfolding – without fixed doctrinal beliefs or external rites – as a way towards freeing humanity from the waking-sleep that holds man in a kind of hypnotic illusion. At the same time, Gurdjieff taught that man's possibilities are very great, and that his destiny is to actualize his true individuality as a bridge between a subtle world above and the unknown world below.

A central focus of the Gurdjieff teaching is the awakening to consciousness and the creation of proper conditions that can support this multi-leveled process. For this, a preparatory work is necessary, as stated by Jeanne de Salzmann: 'According to Gurdjieff, the truth can be approached only if all the parts which make the human being, the thought, the feeling, and the body, are touched with the same force in a particular way appropriate to each of them – failing which, development will inevitably be one-sided and sooner or later come to a stop. In the absence of an effective understanding of this principle, all work on oneself is certain to deviate from the aim. The essential conditions will be wrongly understood and one will see a mechanical repetition of the forms of effort which never surpass a quite ordinary level' (Foreword to *Life is Real Only Then, When "I Am"*).

Gurdjieff gave the name of "self-remembering" to the central state of conscious attention in which the higher force that is available within the human structure makes contact with the functions of thought, feeling and body. The individual "remembers", as it were, who and what he really is and is meant to be, over and above his ordinary sense of identity. This attention is not a function of the mind but is the active spiritual force which all the functions of man obey as the "inner master".

Consistent with the knowledge behind many contemplative traditions of the world, such as the pre-Socratics and especially the Niptic current of Hesychastic Christianity – which speaks of an "attention that comes from God" – the practice of the Gurdjieff work places chief emphasis on preparing the inner world of man to receive this higher attention. When the inner world is prepared

the spirit enters instantly – to use the language of Meister Eckhart.

Great care was taken by Gurdjieff to delineate the cosmic laws that at one and the same time govern both the processes of the universal world and the processes of man's inner life and development. Of these laws, two are fundamental – the law of three and the law of seven or the law of the octave. The law of three states that three forces – active, passive and neutralizing – are necessary for any creation, either at the cosmic level or within the process of the individual search for inner rebirth. The law of seven, for its part, governs the nature of process, stating that all processes develop in seven steps – with two intervals, as represented in the major scale in music with its two intervals of the semi-tone. Both the law of three and the law of seven are contained in the esoteric symbol of the enneagram – a symbol which has been appropriated by individuals and groups outside of the tradition and employed in ways having no correspondence with its meaning in the Gurdjieff tradition.

It is clear that from the beginning of his mission, Gurdjieff adapted the transmission of the teaching to the subjectivity of his pupils, explaining elements that corresponded to their capacities and needs, while holding back other aspects of the whole teaching until they could be received. It is therefore misleading to take any one exposition or interpretation as definitive. → P.D. Ouspensky, for example, considered his own deeply influential and faithful account as no more than '*fragments* of an unknown teaching'.

Seen in this light, and as in other spiritual teachings, the dynamic life of the tradition supports the individual search, and helps to overcome the seemingly universal impulse of resistance or inertia: the tendency toward attachment or "identification", as the Gurdjieff teaching expresses this idea, and the gradual fixing on partial aspects, institutionalized forms, dogmatic doctrines and a habitual reliance on the known rather than facing and entering the unknown. According to the Gurdjieff teaching, the forms exist only to help to discover, to incarnate, and to elaborate a formless energy of awakening, and without this understanding the forms of the teaching become an end in themselves and lose their meaning.

At present, the comparatively invariant general forms of practice in the Gurdjieff tradition may be characterized as follows:

Group Meetings: Gurdjieff taught that one man alone cannot see himself. In group meetings students regularly come together to participate in a

collective atmosphere that is said to function as a principal means for the transformation of the individual state of consciousness. Although questions are shared and responded to in words, the fundamental support of the group is directed to the individual work of facing oneself and consciously suffering one's own inner lack until the descent of a new energy is possible. The leader, as part of his or her own search, strives to be sensitive, not so much to the content of the exchange, but to the process of the developing energy. In their turn group leaders just as urgently need to work in groups, albeit at a more advanced level. In this way, a redefinition of the conventional image of the spiritual leader is inevitable. At each level, what is apparently understood needs to be re-examined and verified in the movement of a dynamic living esoteric school.

The *dances and movements*, which Gurdjieff taught, were partially a result of his research in the monasteries and schools of Asia, and are of a nature that seems unique in the modern Western world. In certain respects, they are comparable to sacred dances in traditional religious systems (for example, the 'Cham dances of Tibetan Buddhism or the dervish dances of the Sufis). Like them, the Gurdjieff movements are based on the view that a series of specific postures, gestures, and movements supported by an intentional use of melody and rhythm and an essential element of right individual effort can help to evoke an inner condition which is closer to a more conscious existence, or a state of unity, which can allow an opening to the conscious energy of the Self. The movements are now regularly given at major centers of the work by specially prepared pupils who emphasize the need for exactitude and sincerity of intention, without which the movements cannot provide the help for which they were brought.

The Gurdjieffian practice of *guided meditation* is difficult to characterize in a few words apart from observing that, although it is far from being a technique or method, it corresponds in its essentials to the contemplative aspect of life that is embedded in the heart of all the religious traditions of the world. The Gurdjieffian approach to sitting meditation was gradually emphasized and developed by Jeanne de Salzmann in the 1960's. Here the pupil searches for a quality of seeing and an embodied presence that sustains and supports his attempt to know and directly experience what he is, including both his limitations and his possibilities.

Work in Life. To be able to work in life in the full sense would be considered a very high achievement. The struggle to be "present" in everyday life

constitutes a major aspect of the Gurdjieff practice, a struggle which entails the question of full engagement in the duties and rewards of the life of man on Earth, now and here. In this context, Gurdjieff restored and created many inner exercises, some intended mainly for the meditative practice and others for the conditions of everyday life. Such exercises are understood as providing a structure that makes possible use of everyday life as material for self-observation and the gradual growth of self-awareness. Through repetition of such exercises, the individual may begin to come into touch with a deep sense of need which allows an opening to the spiritual energies within oneself. According to Gurdjieff, without a relationship to this more central aspect of oneself, everyday life is bound to be an existential prison, in which the individual is held captive, not so much by the so-called forces of modernity as by the parts of the self which cannot help but react automatically to the influences of the world around him. The help offered by the special conditions of the work is therefore understood not as replacing man's life in the world, but as enabling him, in the course of time, to live life with authentic understanding and full participation.

Briefly, the movement toward awakening which is meant to be supported by the ideas and these forms of practice becomes in fact an organic process in life and movement and for that reason, dogmatic approaches will inevitably fail. The movement toward awakening, then, requires an understanding not only of the constituent forces and laws which govern man's psyche and actions, but also a deep sensitivity and appreciation of individual subjective needs and conditions. In other words, for an effective guidance, the principle of relativity must be recognized in the transmission of the teaching: individuals must be approached according to their respective levels of development and experience. Gurdjieff might have stressed one view to a student at a certain level of understanding and quite another view when that student had reached another level. This might give the appearance of contradiction, but in fact it was consistent in applying only those aspects of the whole teaching truly necessary at a given moment. The same principle applies to the ideas, some of which seemed more accessible at one period while others still remained to be revealed in the unfolding life of the teaching. In this light, it is interesting to note that groups that break away at different moments to work by themselves and on their own run the risk of clinging dogmatically to certain specific forms and practices.

For example, the work of “self-observation” is given new meaning as the developing attention lets go of its effort, joining and willingly submitting to an impartial conscious seeing, resting in its vision. The action that might take place in this condition – meditation or even outer action – is held to reflect the simultaneous dual nature of an impersonal consciousness and a personal attention which has a new capacity to manifest and act in the world. The qualities of both these aspects of consciousness and attention are considered quite unknown to the ordinary mind. In this new relationship of individual attention and a divine impersonal consciousness, man is believed to become a vessel, serving another energy which can act through him, an energy which at the same time transforms the materiality of the body at the cellular level. This understanding of inner work introduced by de Salzmann has been transmitted in the oral tradition of the Gurdjieff teaching and can be found today in many of the Gurdjieff Foundation groups worldwide.

The half century that has passed since Gurdjieff's death has witnessed dramatic developments with respect to the reception of his ideas – as well as a proliferation of interpretations and applications. Louis Pauwels' derogatory *Monsieur Gurdjieff*, published in 1954, was for a time the only book about Gurdjieff, other than Ouspensky's. Although late in his life Pauwels repudiated his earlier views and spoke of the great value of Gurdjieff's teaching, the negative tone of *Monsieur Gurdjieff* strongly influenced public opinion in France and elsewhere. Starting in the early 1960s, however, numerous accounts and testimonies by pupils who were close to Gurdjieff began to present a far more comprehensive view of the ideas, as well as a positive description of Gurdjieff the teacher. The number of these accounts has continued to grow until the present day and, taken together, they offer a far more balanced and nuanced picture of the teaching and the man than was available in the first decade after his death (see *Bibl.*).

The broader cultural influence of the Gurdjieff teaching has also become clearer. In the field of psychology, the practice of group therapy (e.g. Skynner and Slavson) owes much to the Gurdjieff idea about the necessity of group work; and the very phrases “self-observation” and “work on oneself” have not only entered into many psychological and psychotherapeutic disciplines, but have even entered into the vernacular of the English language. The idea of consciousness as the key to spiritual development owes much to Gurdjieff's identification of this aspect of the psyche as the

uniquely human element, over and above the analytic and combinatory powers of the mind.

In the arts, the insights of Gurdjieff have been acknowledged by leading figures such as Frank Lloyd Wright (architect), Thomas de Hartmann (composer), Peter Brook (theater), Lincoln Kirstein (dance) and in many other venues including literature, philosophy and the study of religion. Often, his ideas are applied without acknowledgement, and a study of this aspect of the reception of his teaching needs to be undertaken to show the surprising extent to which his ideas and terminology, in widely varying interpretations and alterations, have become a significant cultural and philosophical influence in contemporary arts, letters and various forms of therapeutic praxis, including such unexpected areas as corporate management training.

Among pupils who broke away from the main community of pupils after Gurdjieff's death and established groups of their own which continue to be active, the most significant are Willem Nyland, and J.G. Bennett. The reasons behind these breaks are not easily discernible from the outside, and are not “doctrinal” in the familiar sense of the term. Doubtless, personal issues are often prominent. During Gurdjieff's lifetime, as is known, many advanced pupils were compelled to leave by Gurdjieff himself, who rigorously resisted any tendency toward devotion or attachment to his person. This was most notably the case with Thomas de Hartmann. In many other instances, such as with P.D. Ouspensky, Gurdjieff may have considered it necessary to place strong emotional challenges before his pupils at certain key junctures in the process of their inner work, and the result was sometimes that they broke away from him. However, it is idle to speculate in this general area; it is still too early in the life of this teaching to speak in broadly familiar categories of “orthodoxy”, “schisms” or “heresies”. It is sufficient to note that each generation of the Work has witnessed this process of independent creation of groups, whereby individuals, after a period of membership in the mainstream tradition, leave to create their own organizations. It is impossible to estimate the number of individuals involved in these organizations, although probably all of them combined have fewer members than the main network of some 10,000 pupils worldwide.

JACOB NEEDLEMAN

Hahn, Michael, * 2.2.1758 Altdorf,
† 20.1.1819 Sindlingen

Hahn came from a family of Pietists (→ Pietism). He felt the presence of God within him as early as the age of twelve. Toward 1777, he received the grace of an illumination that he himself called a *Zentralschau* (Central Vision). He compensated for a neglected education by much reading. In 1784, a second illumination confirmed him in his desire to center his whole life on God and to preach his kingdom. Through his zeal and piety, he attracted to himself crowds of believers eager to hear him. His disciples, the *Michelianer*, would endeavour to continue his work. Often neglecting the theosophical (→ Christian Theosophy) aspect of his thought, they would especially retain its pietistic tendency.

This Swabian theosopher deserves particular mention for his tireless efforts to order his theosophical concepts in a coherent system, whence a certain rationality that is never absent. One cannot consider him a Pietist, a separatist or a pure mystic. His thinking always evokes these tendencies, but his insistence on demanding personal reflection from the believer makes him a son of the *Aufklärung*. Nevertheless, Hahn, whose faith found equal support in esoteric gnosis, was indeed a Christian theosopher even if his system can at times appear incomplete. All his thinking flowed from his "Central Vision" (*Zentralschau*), which he strove to explicate as clearly as possible.

To understand the Bible, keystone of all, erudition is less important than a personal encounter with God. Knowledge of God and knowledge of

self must blend in the intimate experience that operates in the *Centralgrund* (inner Center) of man. The whole mystery of the complex relationships between God, Man and the universe is written in Man the microcosm. It is enough for a free will to be united with a deepened personal will for it to be clarified and elucidated. From then on, by sinking into the contemplation of the image of divinity, Man can "see" with the eye of God. However, the depth of thinking gives this inexpressible experience all its scope. The true Christian must think for himself. He will then grasp all the intimate motivations of the divine Economy by observing that what is in God is also in Man.

Conscious of having developed a system that was proper to himself, Hahn was nonetheless indebted to → Boehme and to → Friedrich Christoph Oetinger for elements that are part of it. The undetermined foundation of the Boehmean *Ungrund*, the unmanifest transcendent God, similar to the Father, is revealed in the Son in a plural immanence that affects all creation. In its ardent desire to know itself, the *Ungrund* gives birth to the *Urgrund*, the Son, who becomes the "Central point of God" and of all creatures. The Father is Fire, but less wrathful than in Boehme, and more harmonious even if duality inhabits Him. The Son is Light manifested, the *männliche Jungfrau* (masculine virgin) who controls, by His central position, the good and the evil activated in the creative process. A reflection of the Son, the primordial Adam was androgynous. One finds in Hahn, together with the Oetingerian idea that any spirit tends to manifest itself "in bodies" (*Geistlichkeit*), the theory of the double fall. Both Lucifer, who wanted to arrogate the Son's nature, and Man fell, tempted by the fallen angel and enclosed in the opaque matter of our visible world, where a few rays of the divine Light still shine through. Although Christ has redeemed the whole of undeserving humanity, the true Christian must tend to spiritual perfection for a true rebirth (*Wiedergeburt*) and not remain content with a conventional faith. God is not only merciful, he is also just: our faults are forgiven and there are no eternal punishments (*Apocatastasis*), but a purifying fire (*Läuterungsfeuer*) is necessary, the trials that accompany it being an integral part of the grace that God grants us.

The Unity of God in all his living members is the object of the quest of every true Christian community. The Roman Church and the neology rife in the Protestant milieu are far from this ideal. The Evangelical Church, by the free will that it grants the believer, is preferable. Neither a separatist nor a

Pietist, Hahn hardly got along with the members of the clergy, who saw in him an eccentric with an equivocal doctrine. Nevertheless, in his apocalyptic and eschatological considerations, he had the prudence, contrary to Johann Albrecht Bengel, not to make short-term prophecies. If the influence of Gerhard Tersteegen and German → mysticism is perceptible in his work, the influence of Boehme and Friedrich Christoph Oetinger is more so. However, the extreme tension of a Boehme seeking to circumscribe the good and evil at work in creation, and the considerations of Oetinger on → alchemy and palingenesis remain equally foreign to him. Far from straining over the insoluble problem of evil, he stresses the profound harmony of the consubstantial elements in God, Man and the universe. He considers that Boehmenism contains a good share of unresolved dualism and insists rather on the primacy of divine unity. Without beginning or end, God uses linear time as a material apt to open up eternal perspectives through the history of salvation set forth in the typology of Holy Scripture. One must ceaselessly scrutinize Holy Scripture to grasp its hidden truths, because faith does not go without understanding nor understanding without faith. Hahn's christology is too anchored in the depths of the God-filled soul for the Son, despite the theosopher's requirement that his presence be apprehended equally by reason, ever to be regarded as a mere principle exemplifying redemption and grace.

Hahn's rich personality and charisma explains the number of his admirers and disciples. Little concerned about orthodoxy, he exhorted them, on the one hand, to read the Bible and its most inspired commentators from Luther to Bengel, and, on the other hand, to exercise their personal thinking. It alone, according to him, was capable of providing answers relevant to the times in which they were living.

Los Angeles

Writer, Collector, Lecturer. Hall was raised by his maternal grandmother, Mrs. Arthur Whitney Palmer, and spent a wandering childhood in San Diego, Washington, New York, Sioux Falls, and other cities of the United States. Apart from a short spell at a military school, he was without formal education. In California he came under the influence of the → Theosophical Society. He began his public career in 1920 in Santa Monica, giving a series of lectures on → reincarnation. He became a lifelong admirer of → H.P. Blavatsky and her *Secret Doctrine*. In 1921 he conceived the plan of an encyclopedic work on esoteric traditions and began to collect materials for it. In 1922 he founded a journal, *The All-Seeing Eye* (first monthly, then irregular). At about this time, he became the pastor of a church called The Church of the People, which met at Trinity Auditorium at Ninth and Grand in Los Angeles. In 1923-1924, thanks to a wealthy patron or patrons whose identity was never revealed, he was able to make an extensive tour of Europe, Egypt, and Asia, and to lay the basis for a magnificent collection of books and artefacts representing the spiritual traditions of East and West. The following years were spent writing, compiling, financing, and commissioning the illustrations for his masterwork *The Secret Teaching of All Ages* (1928). This oversized volume, often reprinted, contains 54 color plates by Augustus Knapp and hundreds of illustrations from books and manuscripts, many of them by now in Hall's library. It was designed by the eminent typographer John Henry Nash. The text is an introduction to almost every facet of Western esotericism, and, more briefly, to Eastern religions. It carries a strong atmosphere of → Freemasonry and of Theosophy.

Southern California, with its Theosophical and Rosicrucian centers [→ Rosicrucianism] and its openness to exotic religions, was a natural home to Hall's endeavors. In 1934 he founded the Philosophical Research Society, whose initials, P.R.S., stood also for the combined wisdom of Philosophy, Religion, and Science. In 1934-1935 he went to London and Paris to acquire rare books dispersed in the Lionel Hauser sale (see his *Codex Rosae Crucis*). A large building adorned with sphinxes (3910 Los Feliz Boulevard, Los Angeles) was built to house Hall's library and the lecture-room in which he gave addresses on Sunday mornings.

These long impromptu talks and other lectures continued regularly until shortly before his death, and formed the basis for innumerable publications of the P.R.S.

Hall is said to have authored over 200 books, in addition to hundreds of essays and to editing the *P.R.S. Journal* (called *Horizon* from 1940-1954). They were virtually all published by his Hall Publishing Company, then by the P.R.S. Hall was honored by the 33rd degree of Scottish Rite Freemasonry. In 1950 he married Marie Bauer, a fellow-adherent of the theory that Sir → Francis Bacon wrote the plays of Shakespeare (see her *Foundations Unearthed*, 1940). After Hall's death, there was a long lawsuit between his widow and other claimants to his estate. This was settled to Mrs. Hall's satisfaction in 1993, allowing the P.R.S. to continue its activities. Many of the library's treasures were sold, notably the collection of Japanese art and many of the alchemical books. Hall's alchemical collection, including the manuscripts of Dr. Sigismund Bacstrom which Hall had owned since 1923, was acquired by the J. Paul Getty Museum, Malibu.

Hall was a blend of the scholar-collector with the inspirational writer and speaker. He formed his own "academy" of followers and readers who appreciated the depth, sincerity, and wide sympathies of his learning. Hall's philosophy also had a strong element of → "New Thought", and he always dwelt on the positive aspect of things. From a scholarly point of view, his writing may appear inaccurate and banal, but he had a gift for making complex subjects, such as → Neoplatonism or occult anatomy, comprehensible to a lay audience. Although open to the claims of the occult sciences [→ occult/occultism], he did not promote them, and in later life moved closer to Buddhism. Hall is most comparable to G.R.S. Mead and to the American Platonists Thomas M. Johnson (1851-1919), and Kenneth Sylvania Guthrie (1871-1940). He may be remembered as the last link in the American Transcendentalist tradition.

JOSCELYN GODWIN

Hamvas, Béla, * 23.3.1897 Eperjes (today Presov in Slovakia), † 7.11.1968 Budapest

Hungarian philosopher, and one of the most comprehensive gnostic thinkers of the 20th century. Hamvas was born in a family of Lutheran pastors serving in Upper Hungary, today's Slovakia. After World War I the family moved to Budapest, where Hamvas studied classical languages, read German and Hungarian at the university, and received his MA in 1923. He started working as a journalist, but soon settled as a librarian at the Budapest Public Library, a most congenial occupation for him. In 1935 he became the co-founder of Karoly Kerenyi's circle, *Szigeet* (Island), in the context of which he published essays on a wide variety of topics, including Russian mystics (Berdjaev) and existentialist philosophers (Heidegger and Jaspers). During the war he served at the Russian front, then resumed his job in the library from where in 1948 he was released because his views were incompatible with the communist regime. A particularly shocking event to him was the destruction of his manuscripts as well as his private library during a bombing attack on Budapest in 1945. From that time on a long series of afflictions followed. Georg Lukács, chief ideologue of the Hungarian communist government, prohibited the publication of his works. Being expelled from the library, Hamvas had to take a job as a stock-attendant in an industrial plant. In the 1950s he was forced to work at a power station outside Budapest and could go home only on weekends. Even after 1956 when he applied for rehabilitation, his request of being restored to his position as a librarian was refused. He retired in 1964 and spent his last years in

Budapest as a charismatic mystic around whom a growing circle of students gathered. After he died of a stroke, immediately a cult around his person began. His works were typed and passed from hand to hand as “samizdat” (illegal publications bypassing state censorship) until the late 1980s, from which time on his writings have been published in comprehensive editions. Today he is widely appreciated as one of Hungary’s most original philosophers.

Hamvas’s literary output is large and versatile. He excelled in *belles lettres*, and wrote a number of strange novels in which modernist and mystical elements are mixed with grotesque irony. Most famous among them is *Karnevál* (Carnival, 1948-1951, published in 1985). He was an accomplished essayist, one of the finest in 20th century Hungarian literature. He put together several collections of essays during his career, such as *Láthatatlan történet* (The invisible story, 1940-1941), *A bor filozófiája* (The philosophy of wine, 1947), *Silentium* (1950), and *Patmosz* (Pathmos, 1959-1966). Another genre in which he felt at home was translating and editing/annotating works of mystical philosophy from a wide range of cultures and periods, including 25 chapters of the *Vedas*, the *Upanishads*, and *The Flowers of Tao* (1943); the *Apocalypse of Enoch* (1944); Jakob Boehme’s *Psychologia vera* (1946); the *Tabula smaragdina* (1950); and *Sefer Yetsirah* (1954). Particularly notable is his annotated anthology of “the Tradition” [→ Tradition] which was published under the title *Az ősök nagy csarnoka* (The great hall of the ancestors, 1943) and to which he added a monumental introductory essay titled “Ekstasis”.

Beyond these, Hamvas also wrote major individual works in the form of carefully constructed and logically arranged monographs, none of which appeared in print during his lifetime. His “opus magnum” is *Scientia sacra: the Spiritual Tradition of the Ancients* (1943-1944, first published 1988), a compelling account of human wisdom in the midst of the madness of war. The second part of this work deals with a comparison of Christianity and “the Tradition” (*Scientia sacra II*, 1960-63), while his *Mágia szutra* (Magia sutra [1950], first published 1994) discusses the practical application of “the Tradition” in view of attaining the ideal of ‘a consciously purified way of life’.

Hamvas’s philosophy may be referred to as “sacral metaphysics”, and his approach is related to that of → Julius Evola, → Leopold Ziegler, and → René Guénon. His main concern was the most ancient past, as remote as the lost Golden Age. As opposed to → Rudolf Steiner, he never thought of

mixing the spheres of natural science with that of hermeticism, and claimed that the investigation of nature was confined to the surface material world only. For a philosopher like him, the occult relations of the universe are effective in the transcendental and supernatural spheres, to which the development of science is irrelevant.

In *Scientia sacra*, Hamvas aimed at synthesizing the Tao, the Vedas, Buddhism, the Hebrew kabbalah [→ Jewish Influences], Egyptian hermeticism, and the teachings of the Persian → Zoroaster. In the first part of the work Hamvas discusses the tradition that has preserved the memory of the Golden Age and that, according to him, may lead humankind back to the happiness of the lost antediluvian state. The second book is devoted to archaic man, who still participated in the occult knowledge. Hamvas reviews various accounts about the loss of Eden, and against that background provides a reconstruction of the major stages of man’s historical existence: the primordial state – sin – the awakening – repetition (the “development” constituting the further phases of awakening) – the outer darkness (offering a choice between purposeful pilgrimage and random roaming) – and liberation. Liberation is the state towards which the magus is striving; and since occult knowledge is embedded in the analogical symbols of the ancients, the magus has to become a philologist of sorts in order to be able to analyse and interpret the esoteric tradition. The subject of the third book is “Cult and Culture”. A comparison of ancient and modern cultures reveals that real knowledge is not to be gained from rational and analytical science, but belongs only to the sacral way of life.

Hamvas’s personal experience of the “world crisis” of the 20th century, culminating in two World Wars, was of decisive importance to his life. He saw no other way of escaping from this apocalyptic collapse than by means of a reintegration of the individual in the community in the context of a revitalization of inspired ancient laws and wisdom. His continuing popularity proves that this program still has a strong appeal.

GYÖRGY E. SZÓNYI

Hardenberg, Friedrich von → Novalis

Hartmann, Franz, * 22.11.1838
Donauwörth, † 7.8.1912 Kempten

German physician, author, and leading German Theosophist. Hartmann first worked as a pharmacy assistant in Kempten. In 1859 he was enlisted as a volunteer in the 1st Artillery Regiment of Bavaria during the Austrian-Italian War. In 1860 he commenced studies in pharmacy (receiving his state qualification in 1862) and medicine at Munich University. In July 1865 he took passage as a ship's doctor on a vessel bound from Le Havre to New York and spent the next eighteen years in the United States. The same year 1865 he completed his medical training and opened a practice for eye ailments at St Louis. In 1867 he acquired U.S. citizenship; and in 1870 he travelled to New Orleans and thence by ship to Mexico, visiting Mexico City, Cordova and Orizaba, where he became acquainted with Indian tribes. He resumed medical practice at New Orleans, where he became interested in American → spiritualism, attending the seances of Mrs Rice Holmes and Kate Wentworth and studying the writings of Judge Edmonds and → Andrew Jackson Davis. In 1873 he travelled to Texas where he bought a ranch, married the sister of a neighbour but widowed after seven months. In 1878 he settled in Georgetown, Colorado, engaging in gold and silver mining besides his medical practice, and from 1882 served as coroner for Clear Creek County; he continued to be interested in spiritualism, encountered Theosophical literature, and entered into correspondence with → H.S. Olcott. In 1882 he joined the → Theosophical Society in the U.S.A. In September 1883 he left Colorado to visit the Theosophists

in India, with brief visits to Japan and China en route. In December he arrived at Adyar, where he came to play a major role at Theosophical Society headquarters. In April 1885 he returned to Europe with → H.P. Blavatsky. In 1891 he became founder-director of a sanatorium at Hallein, near Salzburg, and in August 1896 President of a new German Theosophical Society at Berlin founded by Katherine Tingley of the American Theosophists. In September 1897 he founded the *Internationale Theosophische Verbrüderung* at Munich. From 1899, Hartmann collaborated with Hugo Vollrath (b. 1877) on Theosophical lecture tours and publishing. In 1906, Vollrath founded the *Theosophische Verlagshaus* in Leipzig, which systematically publishes Hartmann's works besides translations of H.P. Blavatsky, → Annie Besant and → Charles Leadbeater.

From his youth, Hartmann combined mystical and idealistic speculations with his interest in medicine and science. Following experiments with spiritualism in the United States, Hartmann discovered Theosophy, which became his life's work. While Blavatsky and Olcott were in Europe, Hartmann presided at Theosophical Society headquarters in Adyar during the investigation of the Society of Psychical Research into the Coulomb scandal in 1884. After his return to Europe in 1885, Hartmann decided that Theosophy required a new foundation to counter negative publicity. At Kempten he frequented the pietistic group around the weaver Alois Mailänder (1844-1905). In September 1889 Hartmann founded, together with Alfredo Pioda and Countess Constance Wachtmeister, a Theosophical lay-monastery at Ascona, Switzerland. His Theosophical monthly periodical *Lotusblüten* (1892-1900), later revived as *Neue Lotusblüten* (1908-1912), provided a forum for the fast-growing number of German Theosophists. Although Hartmann's collaboration with the American theosophists under Katherine Tingley in 1896 was short-lived, his *Internationale Theosophische Verbrüderung* acted as a major platform for the movement in Germany. Between 1894 and 1907 Hartmann collaborated with the German Theosophical publishers C.A. Schwetschke of Brunswick, Wilhelm Friedrich and the Theosophische Centralbuchhandlung, both at Leipzig. Their extensive book-series attracted a German readership for the writings of Hartmann and other German Theosophists such as Rudolph Böhme, Hugo Göring and Arthur Weber, together with translations of Annie Besant and Charles Leadbeater.

Besides his Theosophical activities, Hartmann was also linked with other occult and fringe-

masonic orders. He was associated with Carl Kellner (1851-1905), initiator of the → Ordo Templi Orientis, who used ligno-sulphite in the manufacture of cellulose at Hallein. Hartmann used a by-product of this process for the treatment of lung ailments at his neighbouring sanatorium. Hartmann was associated in 1897 with Leopold Engel (1858-1931) in an Order of the Illuminati at Dresden, which was absorbed by → Theodor Reuss in 1902. In September 1902 Hartmann became Deputy Grand Commander General in Reuss's Rite of Memphis and Misraim; and in October 1905, following Kellner's death, Hartmann became Honorary Grand Master General. These fringe-masonic groups were succeeded by Reuss's Ordo Templi Orientis in 1906.

Hartmann was one of the most prolific writers of his generation on Theosophy, → magic and esotericism. His publications, written in both English and German, almost all follow his involvement with the Theosophical Society. Hartmann's earliest works were devoted to → Rosicrucianism, → Paracelsus, → Jacob Boehme, magic, the astrological geomancy of → Cornelius Agrippa and other topics in the Western esoteric tradition. *The Life of Jehoshua, Prophet of Nazareth* described the psychical and spiritual processes experienced on the path of initiation. From 1892 he developed his prodigious output on Theosophy. He wrote two translations in prose and verse of the *Bhagavad Gita* and was instrumental in the German translation, in collaboration with Dr Robert Froebe, of Blavatsky's *The Secret Doctrine* (1897-1901). He also translated Blavatsky's *The Voice of the Silence* and several oriental scriptures, such as the *Atma Bodha*, the *Tattwa Bodha*, and the *Tao-Teh-King*. His own publications in German number more than thirty books and hundreds of articles in his magazine. The books include commentaries on Theosophy, studies of karma and → reincarnation, the doctrine of Buddhism, as well as further studies of Paracelsus and → alchemy.

NICHOLAS GOODRICK-CLARKE

Haslmayr (or Haselmayer),
Adam, * ca. 1560 Bolzano,
† 1630 Augsburg (?)

Haslmayr was born around 1560 in Bolzano, South Tyrol. By 1588 he was the organist in a Cordelier convent, while teaching Latin and fulfilling the duties of an imperial secretary (*Notarius Caesareus*). In 1593, Archduke Ferdinand of the Tyrol granted him a patent of nobility. According to Haslmayr's own account, in the following year he began to discover the works of → Paracelsus. It was the latter's belief that God reveals himself to mankind both through his Word and through the marvels of Nature, which it is man's mission to discover. Thanks to → alchemy, conceived in its broadest sense, man is therefore able, and obligated, to transform the world, to realize the "new man" in himself, and to lead Nature to its perfection.

Reading this aroused Haslmayr to such enthusiasm that in 1603 he did not hesitate to address to Archduke Maximilian of Austria a compendium of Paracelsus's ideas, which, to say the least, were not completely orthodox. The Archduke apparently took notice of this: he ordered an inquiry, in consequence of which Haslmayr was summoned to Innsbruck and underwent an interrogation, in which Jesuit theologians took part. They condemned the non-Catholic ideas of his writing, but considered him more as a person of confused mind than as a

true heretic, who should no longer be entrusted with educational duties.

In 1605 Haslmayr settled near Innsbruck in the town of Schwaz, where mining activity had aroused a lively interest in alchemy. After that he lived in Hall (Tyrol), where he translated medical works of the French Paracelsian Joseph Duchesne (known as Quercetanus). In 1607 he came to know the Paracelsian Benedictus Figulus, author of a *Rosarium novum*, whose thought was very close to certain ideas expressed in the *Fama Fraternitatis* (see Edighoffer 1987, II, 695). Manuscript copies of this Rosicrucian manifesto [→ Rosicrucianism] were circulating in the Tyrol from 1610 onwards. At this time, Haslmayr was in correspondence with Archduke Maximilian, to whom he had sent a Paracelsian recipe on the making of an *aurum potabile* intended to protect from poisons and to cure gout.

However, Haslmayr brought many serious troubles on himself by requesting the Archduke to ban an anti-Paracelsian book published by an emulator of the Jesuits, the official physician of Hall, Hippolyte Guarinoni. The latter immediately hit back, accusing Haslmayr of being a heretic and of preventing his own children from attending church. Haslmayr replied by accusing Guarinoni of being a “cacosopher”, but his arguments were weak, seeing that he himself had ignored the obligations of the Concordat of 1605.

Denounced by his adversary, Haslmayr was imprudent enough to write a number of pamphlets explaining his position: that his absence from the sacraments was not due to any leanings toward the ideas of Luther, Calvin, or Zwingli, but to the conviction that with Paracelsus and the Rosicrucians, the time of the Holy Spirit had begun. His naïvety went so far as to bring his profession of faith in person to Vienna in July 1612, and to request an audience with Maximilian. Summoned to the Chancery, he was charged to bear to the privy councillors of the Archduke in Innsbruck a sealed letter, which in fact sealed his fate: it stated that on presentation of this document, the bearer was to be arrested and sent to the galleys in Genoa until he had repented and begged the Archduke for mercy.

On the eve of this dramatic event, Haslmayr was innocent enough to address the Archduke once again, with a letter in which he asked for a grant to go in search of the Brethren of the Rose-Cross! He thought that he could find them in the region of Montpellier, probably on the strength of the prophecy known as the “Lion of the North”. On August 21, 1612, he naïvely presented this *Epistola adhortatoria humilitate demissa* (A Letter of

Encouragement, Sent with Humility), together with the sealed letter, to the Chancery of the Tyrol. On interrogation, he refused to retract. Condemned to the galleys on October 15, he was sent to Genoa and chained on a trireme. His sentence would last four and a half years, because it was only in January, 1617 that Archduke Maximilian allowed him to be transferred to a hospice in Genoa.

All the same, Haslmayr seems to have had certain privileges during this period. At Genoa he was protected by the powerful Andea Grimaldi, a lover of alchemy, as well as by Antonio de' Medici, and he had kept many correspondents in Europe. Some of his friends had even suggested escaping from the galleys. He also found the time to write treatises which he dedicated to his benefactors and to Cosimo de' Medici, Grand Duke of Tuscany.

In Germany, his best defenders were Carl Widemann and Prince August von Anhalt. The former was a physician, but in practice a copyist and collector of manuscripts by Paracelsus, → Weigel, and Schwenckfeld. As for the Calvinist Prince August, he preferred a spirituality of the Weigelian type to the organized church. August had read Johann Arndt's *Vom wahren Christenthum* (On True Christianity), he venerated Paracelsus, and owned an alchemical laboratory. He had founded a press for the publication of esoteric works, and planned at one point to appoint Haslmayr as its director. Ever since 1611, August had wanted to read the manuscript of the *Fama Fraternitatis*, and it was probably he who financed the printing of Haslmayr's *Responsio*, or *Antwort An die lobwürdige Brüderschaft der Theosophen von Rosen-Creutz* (Response to the Praiseworthy Fraternity of the Theosophers of the Rosy Cross).

In March, 1612 came the first printing of this text, which would be published regularly in the editions of the first Rosicrucian writings between 1614 and 1617, with the exception of the one which contains both the Latin text and the German translation of the *Confessio Fraternitatis* (Cassel 1615). Haslmayr's encomium is marked by a large number of biblical citations; by a hope inspired by the prophet Isaiah (ch. 65) when he promises to a “small remnant” of the righteous a life of felicity on a renovated earth; and by reference to the *Theologia Germanica*, of which Luther had published two editions. But the deepest inspiration stems from Paracelsus, to whom Haslmayr often refers and whose prophecies of the Three Treasures and the Lion of the North he quotes. Haslmayr believes that the Rosicrucians are called upon to spread ‘the

eternal, divine and Theophrastic truth', in view of which he expects the advent of "Elias Artista" as described by Paracelsus. According to Haslmayr, the end of time is imminent: 1613 will be the year of the Judges, and 1614 that of the Judgment.

Haslmayr's vision of the Rose Cross does not, in fact, accurately reflect the spirit of this multiform and polyvalent myth. → Johann Valentin Andreae, who was its principal creator, wrote in the preface to his utopian work *Christianopolis* that the Fraternity 'offered vast and strange things for the *curiosi* to browse upon'. Haslmayr was certainly one of the first among these *curiosi*.

ROLAND EDIGHOFFER

Haugwitz, Christian (August?) (Karl?) Heinrich (Curt?), * 11.6.1752 Peucke bei Oels (?), † 9.2.1832 Venice (?)

Christian Karl Heinrich, first Baron (Freiherr) and later Count (Graf) of Haugwitz, is known as a statesman whose political career with the Prussian government in Berlin culminated in his becoming President of the Province of Silesia, Ambassador to Vienna, then, in 1791, Minister of State and member of the Cabinet. Simultaneously, he played an active and lifelong role in the world of European → Freemasonry, exemplifying the mystical and religious current that flourished in France and Germany from the 1760s onwards. Being an aristocrat and politically quite conservative, after the French Revolution he became a determined enemy of Freemasonry.

After studies at the University of Göttingen, Haugwitz emulated many wealthy young men of his time by making a long Italian journey. In Flo-

rence he frequented the Grand Duke of Tuscany, who showed a marked taste for mysterious sciences and mystical secrets. Returning to Germany, he was initiated into the Minerva Lodge of Leipzig, then affiliated to the Union Lodge of Frankfurt. Subsequently he joined lodges that were "rectified" according to the Dresden Reform, i.e., the Stricte Observance Templière. Soon he was made Chevalier Profès in the Ordre Intérieur, and took as his masonic name (*nomen ordinis*) Eques a Monte Sancto (Knight of the Holy Mountain). From then onward he displayed a somewhat muddled eclecticism, adding an affinity to the system of Zinzendorf (1700-1760) and taking part in the activities of the Provincial Lodge which represented the Swedish Rite in Silesia.

From 1777, Haugwitz was much taken with the mystical doctrines of the Swiss Christian Kauffmann (1753-1795), described in → Lavater's *Physiognomische Fragmente* as 'the apostle blest by the Divinity', and associated his master's theosophic teachings with those of the Moravian Brethren. As an ardent Pietist [→ Pietism], Haugwitz rapidly became the head of a group first called Les Confidants de Saint-Jean (The Confidants of Saint John), then Les Frères de la Croix (The Brothers of the Cross). Haugwitz and his brethren wished to 'penetrate the mysteries of the natural world and the divine world which Jehovah long ago, in his infinite goodness, revealed to Adam'. They also believed that through interior prayer, 'by uniting oneself to the Lord by virtue of the cross and the grace of Jesus Christ, initiates might receive strength, power, and domination over all earthly things, as well as a portion of the Divine Wisdom' (cited in Le Forestier, 584).

It was in this spirit that Haugwitz undertook to reinterpret, and if possible reform Freemasonry. In 1778 he came to know Duke Ferdinand of Brunswick (1721-1792), and became very close to Landgrave Charles of Hesse-Cassel (1744-1836). Thanks to these two eminent leaders of the Stricte Observance, he was able to enter into relations with → Jean Baptiste Willermoz (1730-1824), who had consigned to the two secret classes of Profès and Grand Profès, codified at the Convent of Lyon (1778), the secret and supreme teachings of what would become the Régime Ecosais Rectifié. There was an uneasy confrontation between the Silesian Pietism of Haugwitz and the esoteric Christianity of the → Chevaliers Bienfaisants de la Cité Sainte, and even more so with the → Élus Coëns, which Willermoz had inherited after the death of his master → Martinès de Pasqually (1708/9-1774).

In 1781, Charles of Hesse-Cassel informed Willermoz that Haugwitz had communicated to him ‘the first degrees of true masonry’, i.e., those of the *Frères de la Croix* – whereas Willermoz himself seemed to be hesitating to reveal to Haugwitz all the mysteries of the Grande Profession. In April of the same year, Ferdinand of Brunswick envisaged a kind of fusion between Haugwitz’s system and that of Willermoz; and in August, the latter at last consented to receive Haugwitz into the Grande Profession.

The divergences soon became evident between Willermoz’s system, founded on impressive ceremonies and complex teachings, and the humble and submissive prayer that Haugwitz advocated for attaining illumination. Haugwitz came to the point of demanding justifications and explanations concerning the sources of the doctrinal texts used by Willermoz – of which the latter was himself the author. Willermoz preferred to evade this problem, which highlighted two very different conceptions of mystical masonry. From the beginning of 1782, he preferred to advise Ferdinand, the Magnus Superior Ordinis, to leave it to the general Convent assembled at Wilhelmsbad. Ferdinand decided for Willermoz, provoking Haugwitz to an angry and definitive retreat. However, we still find Haugwitz involved with the preparation of the Convent of the *Philalèthes*, held in Paris in 1785, which ended in confusion.

When in September 1810 the aged Willermoz, after twenty years of silence, re-established contact with Charles of Hesse-Cassel in a long and moving letter, he asked the prince ‘what has become of this dear and worthy Baron d’Haugwitz (a Monte sancto) of Kapitz, and the wise school that he founded on solid instructions which had been communicated to you, and of which several essential portions are in my hands? Do he and his school still exist? Has he attained the final goal of his labors? Has he been authorized to communicate them *in plenis* [fully] to prepared and selected men?’ As for Haugwitz, having quit the Régime Ecossais Rectifié out of pique, he seems to have lost none of his rancor when in 1822, at the Congress of Verona, he stated against all the evidence ‘that a plot against the social order and the sovereigns [was] hatched at Wilhelmsbad’. Fortunately Willermoz, who died two years later, never knew anything of this.

ROGER DACHEZ

Heindel, Max (ps. of Carl Louis Fredrik Grasshof), * 23.7.1865 Aarhus (Denmark), † 6.1.1919 Oceanside (California)

According to the biography written by his second wife Frau Augusta Foss, née Voß (1865-1949) which has been taken over by almost all later authors, Heindel was a member of the aristocracy. However, according to the church register and the baptismal certificate issued at Aarhus on 15.10.1865, Heindel was the son of an immigrant baker from Germany, Frantz Ludvig Grasshof and his Danish wife, Anne Sörine Withen, the daughter of a clog-maker. When he was three years of age, Heindel lost his father through an accidental explosion. At the age of sixteen (perhaps nineteen) Heindel went to Glasgow and worked as a tobacconist, as can be inferred from the local marriage register. In 1885 he married Catherine Wallace, the daughter of a maid servant, who bore him two girls. Heindel subsequently worked as a ship’s mechanic with the merchant navy at Liverpool, but he returned to Denmark, where he ran an import business with his brother. In 1896 he emigrated to the USA, first settling in Somerville near Boston and then in Los Angeles (1903). At this time he was plagued by health problems (lameness and a heart disease) and financial difficulties. In 1903 he attended a lecture of the → Theosophical Society, where he met the woman who was to become his second wife, Frau Augusta Foss, an astrologer and active Theosophist. Heindel joined the Theosophical Society and within a year he

had already become vice-president in California; however he left the Society after three or four years. In 1905 his first wife had died, after what seems (according to his second wife) to have been an unhappy marriage. At a Theosophical Society lecture in Minnesota in 1907 Heindel met Frau Dr. Alma von Brandis, who gave him money for a trip to Germany, in order to make the acquaintance of → Rudolf Steiner (1861-1925). During a stay of several months in Berlin, Heindel studied Steiner's Rosicrucian teachings. Augusta Foss writes in her biography that Heindel was disappointed by Steiner's teachings and received the Rosicrucian doctrine from 'elder brothers' near Berlin, where he spent a month in their temple. However a statement of Rudolf Steiner himself and Heindel's fundamental text *The Rosicrucian Cosmo-Conception*, written after this stay and the first edition of which (1909) contains a dedication to Steiner 'for much valuable information', suggest that Heindel largely took over the ideas of Steiner (secret at the time) and published them with the financial and stylistic assistance of friends. In 1908, in Columbus, USA, Heindel founded his first Rosicrucian group [→ Rosicrucianism]. Further groups soon followed, in Seattle, North Yakima, Washington and Portland. Probably with the help of rich followers, Heindel was finally able to buy property on "Mount Ecclesia" in Oceanside, 120 km south of Los Angeles, where the headquarters of his Rosicrucian Fellowship was established. Its official dedication as such did not occur until 25 December 1920. In 1910 Heindel married Augusta Foss, and in the same year he just barely survived an acute heart problem. During the following year he built up his Rosicrucian Fellowship and wrote books on its fundamental doctrines, until his death in 1919. His wife then assumed leadership of the community until her own death in 1949. The Lectorium Rosicrucianum of Haarlem, Holland (established in 1924), is probably a schismatic group of the Rosicrucian Fellowship.

Heindel's doctrine is essentially a form of Christian esotericism, the foundations of which may be traced to the influence of Steiner. At the time of Heindel's visit, Steiner was still the head of the German section of the Theosophical Society, but was already turning against the latter's increasing emphasis on influences from the far east and looking for an alternative in Rosicrucianism. Esoteric Christianity is proclaimed by Heindel the coming world-religion. The community is characterized by a certain ecclesiastical tendency including the celebration of mass, usually without priests, in its own places of worship, decorated with a rose-

decked cross. There are also specific ceremonies for weddings and funerals. Cremation is forbidden. A twelve-sided white temple stands in Mount Ecclesia itself, and there are guest-houses and a sanatorium. The community demands from its members to abstain from alcohol, tobacco and the eating of meat, because man must be purified of his bestial sympathies before his divine powers can be consecrated and employed. Higher initiates also abstain from sexual love. Prior to being received into the Rosicrucian Fellowship as a regular member one must serve as a "probationer" and practice entirely independently, while observing a rule of silence. Members living at a distance are instructed by correspondence courses. There is a special emphasis on spiritual healing, which is taught in addition to → astrology. Healing the sick, and selfless service of one's neighbour, are counted among the highest commandments of the community. Apart from the number seven (the outer symbol of the community is a cross with seven roses and a pentagram in the background, $7 + 5 = 12$), the number twelve possessed a very special significance for Heindel. According to his teachings, twelve great spiritual hierarchies assist mankind in its evolution. The Rosicrucian order is said to consist of twelve brothers who congregate around a thirteenth (as the twelve apostles did around Jesus Christ), who forms the connecting link to a higher Central Council. Only seven brothers may fulfil their good deeds in the world, while the remaining five are active on an inner plane. The number twelve also refers to the zodiac, in connection with the extraordinary importance of astrology within the community. Through its continuous publication of the ephemerides since World War I, the Rosicrucian Fellowship has probably contributed significantly to the widespread practice of astrology in the USA.

Throughout, Heindel's doctrine bears the stamp of Theosophy and → Anthroposophy, including these movement's belief in → reincarnation and the law of karma. Christ (the highest initiate of the solar period) incarnated at the baptism of Jesus of Nazareth, who still had to atone for bad karma by means of his crucifixion. According to Heindel, the universe consists of seven worlds (the world of God, of primal spirits, of the spirits of life, of the Divine Spirit, of thoughts, of desires, and at the lowest level, of bodies). In addition there are four kingdoms: those of minerals, plants, animals and men. Like the cosmos as a whole, men must develop through seven periods, each one ruled by one of the seven planets. The evolution of mankind is thus achieved through a succession of higher

ances, reminiscent of Theosophy and Anthroposophy. In the current time-period, the germ of the last race will develop from the melting-pot of nations in the USA, which as yet has no racial spirit of its own. The representative of this new race will be marked by a special kind of perfection. Heindel's conception of God is hierarchical as well, being composed of a supreme essence followed by seven great logoi. The cosmic sphere is the lowest and consists of 823,000 hierarchies. Christian Rosenkreuz is the symbolic name of an advanced spiritual teacher, who came to Europe in the 13th century. He remained in constant incarnation (although in different bodies) and influenced people like → Francis Bacon, → Jacob Boehme, → Johann Wolfgang von Goethe and Richard Wagner.

In 1995 the Rosicrucian Fellowship reported a number of 8,000 members worldwide. Most members are found in the United States, Germany, Switzerland, Austria, the United Kingdom, and Brazil.

HANS THOMAS HAKL

Helmont, Franciscus Mercurius van, * 20.10.1614 Vilvorde, † 12.1698 Ter Borg

Son of → Joan Baptista van Helmont. Adviser to Prince Karl Ludwig, Elector of the Palatine (1617-1680), and Prince Christian August of Sulzbach (1622-1708). Granted patent of nobility and title of Baron by Emperor Leopold I for conciliation efforts among German princes. Imprisoned by the Roman Inquisition on the charge of "Judaizing" (1661-1663), but freed on the grounds of insufficient evidence. Famous as an alchemist, Kabbalist, Quaker convert, author, and physician. Skilled weaver, wood-worker, and tailor. Reputed to be a Rosicrucian [→ Rosicrucianism] and to possess the philosopher's stone (he denied both). Collaborated with → Christian Knorr von Rosenroth in the publication of the *Kabbala denudata* (1677, 1684). Close friend of Gottfried Wilhelm Leibniz, John Locke, → Henry More, Anne, Viscountess Conway, and Sophie, Duchess of Hanover. Authored and co-authored books on chemistry, medicine, kabbalah [→ Jewish Influences], philosophy, and theology.

Little is known about van Helmont's early life except that he was educated entirely at home by his father, the renowned chemist J.B. van Helmont, whose eclectic philosophy combined Paracelsian iatrochemistry, stoic and neoplatonic vitalism, and mystical elements. With the death of his two older brothers, van Helmont became even closer to his father, acting as his laboratory assistant. He did not attend university, probably because of his father's dissatisfaction with his own university education. Consequently the most formative influence on his early thought was that of his father. Like him, he was a vitalist and rejected material or mechanical explanations of physical events. He also rejected the galenic theory of humors and accepted his father's view that diseases are specific entities that attack specific organs and require specific chemically prepared remedies. Both the elder and younger van Helmont emphasized the psychological roots of illness, a theme emphasized in a work published toward the end of van Helmont's life, *The Spirit of Diseases* (1694). As a

result of his laboratory work with his father he became a skilled chemist and gained a reputation for discovering and compounding miraculous medicines, which explains why he was sought after as a physician throughout his life.

Van Helmont was not entirely happy with his education. In the preface to the posthumous edition of his father's works, which he edited and published in 1648, he describes himself as 'not content', desiring 'thorowly to know the whole sacred Art, or Tree of Life, and to enjoy it' (*Oriatrike*, 3). To this end he taught himself Latin and German by reading the New Testament many times in both languages and traveled throughout Europe seeking enlightenment from a variety of unorthodox sources, which included mystics, followers of → Jakob Boehme, Kabbalists, Collegiants, and Quakers. Between 1644 when he left home after his father's death and 1648 he became acquainted with members of the Palatine family, becoming especially close in later years to the two eldest sons, Karl Ludwig (1617-1680) and Rupert (1619-1682), and to the two most distinguished and learned of the Palatine Princesses, Elizabeth (1618-1680), to whom Descartes dedicated his *Principia Philosophiae*, and Sophie (1630-1714), later the Duchess of Hanover and patron of Leibniz. In 1650 he was invited to Sulzbach by Duke Christian August (1622-1708), who asked for van Helmont's help in resolving the conflict between the Lutherans and Catholics in his territories. Van Helmont received a patent of nobility from Emperor Leopold in 1658 in recognition of the diplomatic and practical services he performed for these members of the German aristocracy.

The second major influence shaping van Helmont's mature thought were the teachings of the Jewish Kabbalah. How he became acquainted with the Kabbalah is unknown, although it is probable that he came into contact with Jewish and Christian Kabbalists in Amsterdam. By the time he published his first book in 1667 his kabbalistic philosophy was formulated in a way that would never change throughout his long life. He was convinced that the Kabbalah represented the *prisca theologia* granted by God to Adam and that it consequently offered profound insights into the natural and supernatural worlds. Through the Kabbalah mankind would come to share a single religion and obtain the philosophical basis for a complete understanding of the natural world.

Van Helmont's role as advisor to Prince Christian August of Sulzbach led to his arrest by the Roman Inquisition on the charge of "judaizing" in 1661, which suggests that his kabbalistic phi-

losophy was already in place six years before the publication of his first book. Christian August's ardently Catholic cousin Philip Wilhelm, Duke of Neuburg, was convinced that van Helmont was undermining Christian August's Catholic faith by encouraging him to study Hebrew and the Kabbalah and by advocating the settlement of Protestants and Jews in the Sulzbach territories. He persuaded the Inquisition to imprison van Helmont on the grounds that van Helmont's judaizing had led him to reject the Sacraments, to interpret Christ's death and resurrection allegorically, and to claim that anyone could be saved in his own faith. Van Helmont was released after a year and half probably due to the intervention of Christian August.

While imprisoned van Helmont began work on his first book, his *Kurtzer Entwurff des eigentlichen Naturalphabets der heiligen Sprache* (Short sketch of the truly natural alphabet of the holy Hebrew language). In this work, van Helmont argued that Hebrew was the *Ursprache*, the divine language of creation in which words exactly expressed the essential natures of things. While time and ignorance had led to the corruption of Hebrew, van Helmont contended that he had rediscovered its original written form, which corresponded to the tongue movements made while pronouncing individual letters. Van Helmont was convinced this discovery would lead to the correct understanding of the biblical text and consequently provide the basis for an ecumenical religion rooted in the Jewish Kabbalah and capable of uniting Christians, Jews, and pagans. Furthermore, because it was the *Ursprache* Hebrew provided access to both the divine and natural worlds. Studying it would therefore lead to a better understanding of the natural world and to the advancement of learning in all fields, including natural science.

Van Helmont collaborated with Christian Knorr von Rosenroth in the publication of the *Kabbala denudata* (1677, 1684), a collection and translation of the largest number of kabbalistic texts (particularly Lurianic kabbalistic ones) available to the Latin-reading public until the 19th century. The first part was published in Sulzbach at the Hebrew press jointly financed by van Helmont, Knorr, and Christian August. On the basis of two kabbalistic concepts, *tikkun* (restoration) and *gilgul* (→ reincarnation), van Helmont believed he had discovered the foundation for an impregnable theodicy. By attributing the inequalities and misfortunes of life to the faults of previous existences, the Kabbalah reaffirmed God's goodness and justice. Human beings were responsible for their own sin

and suffering; but God was lenient and granted every soul the necessary time and assistance to achieve redemption. On the basis of the doctrine of *tikkun* van Helmont categorically rejected the existence of an eternal hell. Punishment was “medicinal”; it was only inflicted on a creature for its own good and improvement. This was an unorthodox and unusual view at the time since the fear of hell was considered the only way to keep most people virtuous.

Like → Francis Bacon, van Helmont envisioned Solomon’s Temple as a haven for the arts and sciences revealed in the Hebrew Scriptures. He was convinced he had found a key to unlock the door to this Temple in the kabbalah, an idea illustrated in the frontispiece of the *Kabbala denudata*, which shows the kabbalah as a young maiden running towards the entrance of a building marked *Palatium Arcanorum* (Palace of Secrets). This explains why the *Kabbala denudata* was dedicated not simply to the “lover of Hebrew”, but also to the “lover of philosophy” and to “the lover of chemistry” (which, in this case, meant natural philosophy in general). For van Helmont science and religion, or chemistry and the Kabbalah, were two routes to recovering God’s original revelation.

Van Helmont’s life-long interest in reform and social progress is illustrated by two other early works he published in collaboration with Knorr, translations of Octavius Pisani’s *Lycurgus Italicus* (1666) and Boethius’s *Consolation of Philosophy* (1667). Pisani, a lawyer and scholar, argued that crime was the product of social inequality and to prevent it required improved education, health, and welfare, a view endorsed by van Helmont. Like Boethius, van Helmont was both a philosopher and a statesman deeply concerned with the issue of justice. He shared Boethius’s neoplatonic and stoic orientation and concurred with his view that true happiness can be found only in God, who is the highest good. A constant theme in van Helmont’s writing is that real evil does not exist because God is all powerful and all good. Everything that happens to an individual happens for his ultimate benefit; virtue is never unrewarded, just as vice is always punished.

When it comes to defining the key elements in van Helmont’s alchemical and kabbalistic philosophy, his merging of the material and spiritual realms is crucial. His vitalistic, organic philosophy allowed no place for dead matter in the form of lifeless atoms propelled by external forces. Matter and spirit were dual aspects of a single entity, substance, and every created substance was engaged in constant transmutation and evolution towards a

higher state. Van Helmont took this idea from the Lurianic kabbalah, a form of kabbalah that arose in the 16th century among the disciples of Isaac Luria (1534-1572). Luria believed that everything was alive and full of souls, and that as a result of repeated reincarnations every soul would return to its divine source. This was the message of the treatise “Concerning the Revolutions of Souls”, written by his disciple Hayyim Vital, and included in a Latin translation in the *Kabbala denudata* (II, pt. 3, 244ff.). Van Helmont echoed this idea in his short treatise published in the *Kabbala denudata* (I, pt. 2, 308ff.) and later in English as *A Cabbalistical Dialogue* (1682).

Van Helmont’s epistemology, which stresses the role of the → imagination, intuition, and experiment in the acquisition of knowledge, reflects his alchemical, kabbalistic, and Paracelsian background. For van Helmont, as for many of his contemporaries, imagination and illumination are powerful forces that reveal hidden levels of reality and provide access to divine knowledge. The elder van Helmont stressed this point in all his works. Like his father, van Helmont also advocated experiment. An emphasis on experimental learning and the rejection of written authority is a constant refrain among natural philosophers during the scientific revolution, although scholars have recognized it as an exaggeration of actual scientific practice.

Van Helmont was an extensive traveler and a tireless proselytizer for his kabbalistic philosophy. In 1670 he arrived in England, where he met the Cambridge Platonist Henry More, who implored him to treat his good friend Anne, Viscountess Conway for her increasingly severe and incapacitating headaches. Although van Helmont could not help Conway as a physician, he could as a kabbalist by enabling her to envision her own suffering as part of the divine redemptive process of *tikkun*. Van Helmont stayed with Conway until her death nine years later. During this period they collaborated on several kabbalistic works (*Two Hundred Queries Concerning the Doctrine of the Revolution of Humans Souls*, 1684 and *A Cabbalistical Dialogue . . .*, 1682). Conway also wrote a small treatise on her own, *The Principles of the Most Ancient and Modern Philosophy*, in which she employed kabbalistic theories to refute the theories of Hobbes, Descartes, and Spinoza.

Van Helmont’s association with Conway is not only memorable for their mutual interest in the kabbalah but also for the profound effect their kabbalistic philosophy had on contemporary Quakers. The Quakers were ardent proselytizers.

But when they made their first missionary visit to Conway in 1675, they found more than they bargained for in van Helmont. A sect of “Helmontian” Quakers arose from this encounter. These Quakers found in the kabbalistic idea of reincarnation a solution to the problem posed by the fact that Christianity could not offer salvation to those who lived before Christ or in parts of the world that never heard of him. The doctrines of *tikkun* and *gilgul* solved this problem by providing individuals with the opportunity to be reincarnated until they achieved salvation. This solution was not to the liking of the Quakers as a whole. George Fox, the founder of the Quakers, was particularly critical. After Conway’s death he called for a meeting to investigate van Helmont’s ideas. They were eventually rejected, and van Helmont left the Society, although he spoke with admiration of the Quakers to his dying day.

Van Helmont was a close friend of both Leibniz and Locke and may have acted as an intermediary between the two. He visited Hanover, where he discussed the kabbalah, → alchemy, medicine, and natural philosophy with Leibniz and Sophie, Duchess of Hanover. The Leibniz archives in Niedersächsische Bibliothek in Hanover provide evidence that the friendship between van Helmont and Leibniz was close. They shared an interest in chemical experiments and arts and manufacturing processes, discussing at length such practical inventions as more efficient wheelbarrows, improved flax combs, shoes with springs for fast getaways, a carriage that would run on a flat surface, better cooking pots, a method of spinning with two hands, and a way to print with feet. Leibniz was interested in van Helmont’s kabbalistic philosophy, encouraging him to publish his ideas and even helping him to the point of ghostwriting his last book, *Quaedam praemeditatae & consideratae cogitationes super quatuor priora capita libri primi Moysis* (1697), a kabbalistic interpretation of Genesis. Leibniz’s epitaph for van Helmont is a striking tribute to their friendship: ‘Here lies the other van Helmont, in no way inferior to his father./ He joined together the arts and sciences and/ Revived the sacred doctrines of Pythagoras and the Kabbalah./ Like Elaus he was able to make everything he needed with his own hands./ Had he been born in earlier centuries among the Greeks./ He would now be numbered among the stars’ (Niedersächsische Landesbibliothek, Hanover, MS Helmont, LBr 389, fol. 125).

It has been alleged that Leibniz derived the term “monad” from various philosophers, ranging from → Giordano Bruno to Henry More. However,

a strong case can be made for van Helmont as his most direct and important source. Van Helmont accepted the kabbalistic idea that every created entity progresses to an increasingly higher state as a result of repeated reincarnations. “Dull”, “sluggish”, or “sleepy” monads, to use van Helmont’s adjectives, would eventually become “active”, and “awake” monads. Leibniz adopted this scheme in his own work, expressing it more philosophically. Michael Gottlieb Hansch described Leibniz drinking a cup of café latte and speculating that the monads existing in it might one day become human souls (*Godofredi Guilielmi Leibnitii Principia Philosophiae More Geometrico Demonstrata*, Frankfurt & Leipzig, 1728, 135). Leibniz’s correspondence with the Lutheran millenarian and advocate of universal salvation Johann Wilhelm Petersen reveals that by the end of his life he accepted the radical, kabbalistic idea of *tikkun* and believed that every created thing would eventually reach a state of perfection.

Van Helmont figures prominently in Locke’s correspondence. He met Locke during the 1680s when Locke was in exile in Holland and visited him later in England. Locke read van Helmont’s books, commented on them, and even helped to get them published. Excerpts from the *Kabbala denudata* exist among Locke’s manuscripts. Locke is clearly critical of the kabbalah. He entitles one of his notes “Dubia circa philosophiam Orientalem” and brings up a point he makes so forcefully throughout his *Essay Concerning Human Understanding* about the danger of using ‘words without a clear and distinct notion’. But he was clearly interested in the very same questions broached in that work: what is the nature of God, the Messiah, spirits, and matter; why was the world created, and why did souls fall; do souls preexist and are they restored to their original purity? Furthermore, Locke accepted the possibility of reincarnation (*Essay*, II.xxvii.27).

Van Helmont’s medical and scientific theories also interested Locke. Locke was a member of the Royal Society and a practicing alchemist. In the journals Locke kept while in Holland, he included van Helmont’s recipes for making boot polish, preparing a primitive blackboard from kid’s skin, and preserving beer. Like Leibniz, Locke shared van Helmont’s interest in practical inventions, which explains the presence among Locke’s papers of a drawing dated 1688 illustrating a device made by van Helmont for polishing stones. Locke also recorded van Helmont’s cures for gangrene, plague, and scabies and his observations on the way crystals and pebbles ‘grow and nourish’.

Van Helmont’s friendship with Leibniz and

Locke indicates the difficulty of making clear-cut distinctions between rationalists, empiricists, esotericists, and scientists during the 17th century. Leibniz and Locke associated with van Helmont because of their mutual interest in alchemy and natural philosophy, their sincere interest in religious issues, and their desire to restore religious peace by promoting tolerance and ecumenism. For all their philosophical differences, Leibniz and Locke shared certain unorthodox religious views that were similar in many regards to those advocated by van Helmont. All three men rejected the doctrine of original sin, predestination, and the eternity of hell. Even more significantly, they rejected Christ's essential role in salvation. Orthodox Christians routinely dubbed any diminution in Christ's role as "Jewish". We have seen that van Helmont was imprisoned by the Inquisition as a "judaizer". The same label was attached to Locke, for he was accused of being, and probably was, a Socinian or Arian. The Arian Jesus is far more like the Kabbalah's *Adam Kadmon* than the Christian Christ. He is the first among creatures and the mediator between God and man, but not in any way equal or consubstantial with the Father.

Van Helmont offers an example on the contribution made by heterodox and esoteric thinkers to ideas that became the hallmark of Enlightenment thought, namely a belief in scientific progress and a commitment to religious toleration. Van Helmont's published work advocates an ideal of toleration that makes inspiring reading to this day, especially towards the Jews. His philosemitism was unique because he accepted Jews as Jews and not simply as potential Christians converts. Through the process of *tikkun* anyone could and would be saved, whatever his faith. Furthermore, human beings were responsible for restoring the world to its prelapsarian perfection. Experimental science was therefore a laudable occupation and the key to progress.

 AND ALCHEMY

1. LIFE

Joan Baptista van Helmont was the youngest child of Marie de Stassart and Christian van Helmont, who died one year after his son's birth. Van Helmont's education was considered of prime importance. At an early age he began his studies in philosophy and classics at the University of Leuven, but both the academic climate and the subjects taught left him deeply disappointed. Frustrated, he turned to astronomy, algebra and Euclidean geometry, hoping to find more truth than in scholastic logic. His enthusiasm waned when he discovered that the Ptolemaic worldview was less accurate than the Copernican; certainty concerning the world system seemed unobtainable. Van Helmont claimed that he finished his philosophical studies at the age of fourteen, but refused the title *magister artium* to express his contempt for the curriculum. He was offered a well-endowed canonry on the condition that he would read theology, but he declined on the grounds that a servant of the church should be poor. By then, the Jesuit order in Leuven had developed an alternative philosophy curriculum and van Helmont decided to take several courses. He studied with the renowned Martinus del Rio (1551-1608), who lectured on → magic and authored the *Disquisitionem magicarum*, a monumental work on → witchcraft and the occult [→ occult / occultism] in all its forms. But van Helmont could not identify with the Jesuits either and turned to Stoicism, aspiring to the strict lifestyle of silence and obedience characteristic of the Pythagoreans. Then, he had a spiritual experience; through a vision, he realized that he had taken the wrong path and, while apparently modest, had become arrogant. This episode marks the beginning of his life as a Christian mystic. He began to study the works of Thomas à Kempis and Johannes Tauler. Influenced by these writers, he yearned for God to impart the ultimate truth to him. In the same period, he developed an interest in medicinal herbals. After reading Matthioli and Dioscorides, he concluded that since late antiquity no progress had been made in the field – there had only been speculation upon the

“grades” and “qualities” of herbs. He then briefly studied law, but lost interest when he discovered that human law is always subject to change. Driven by altruism and the desire to know nature, he again turned to medicine. He read Fuchs, Fernel, and other contemporary authors. He studied the complete works of Hippocrates and → Avicenna, and read Galenus twice. By his own account, he read and took notes on six hundred books on the subject. At the age of seventeen he was offered a lectureship in surgery, but after a couple of months he realized he was ill-equipped for the task – he had neither the necessary education nor the research facilities. In 1599 he earned his doctorate in medicine, but he was so disillusioned by the academic world that he abandoned it permanently. Upon graduation he started to practice a form of chemical medicine. From 1599 to 1605 he toured Europe. He visited Switzerland and Italy from 1600 to 1602, and France and England from 1602 to 1605. The ignorance and pedantry he encountered on his travels left him disappointed yet again. He rejected offers of private employment by people of influence, such as Ernest of Bavaria and Emperor → Rudolf II. In 1609 he married Margarite van Ranst, a relative of the Merode family, and retreated to their country estate in Vilvorde on the outskirts of Brussels. From 1609 to 1616 he dedicated himself to meditation and experimental research. Van Helmont was fascinated with *pyrotechnia*, which he hoped could penetrate the nature of things, and called himself *Philosophus per ignem*. To him, *pyrotechnia* specified chemical research conducted within a broad and modernized alchemistic conceptual framework. In studying the works of → Paracelsus he believed he was on the right path – but he also believed he needed divine enlightenment to discern the falsehoods in → Paracelsus' writings. Seven years later van Helmont had another mystical experience, after which he considered himself initiated as an *adeptus naturae*. By that time he had fathered four daughters, and a son who would follow in his footsteps. Believing that he had succeeded in getting gold from mercury, he baptized his son Mercurius in 1618 [→ Franciscus Mercurius van Helmont].

In 1617 van Helmont wrote a treatise that would have a dramatic impact on his life. *De magnetica vulnerum curatione* concentrated on the controversy between Rudolphus Goclenius, a protestant professor of philosophy and medicine from Germany, and Jean Roberti, a Belgian Jesuit. In his works, Goclenius had championed a magnetic weapon-salve said to cure wounds from

a distance when applied to the weapon that had inflicted the wound. The cure was based on the pseudo-Paracelsic writing *Archidoxis magica*. In 1617 Roberti attacked Goclenius and accused him of idolatry, blasphemy and black magic. A number of learned men, including van Helmont, joined the discussion. Although in his treatise van Helmont declared himself both a Paracelsist and a fervent Catholic, he nevertheless found fault with both parties. He attacked Goclenius on the basis of factual evidence, Roberti for his theological approach of the matter: theologians do not know about medicine and therefore should not concern themselves with medical questions. The argument was punctuated with venomous remarks against the Jesuits. In 1621 the treatise, which until then had been distributed in small circles only, appeared in print in Paris, most likely without van Helmont's permission. Roberti reacted and the incident resulted in van Helmont's formal indictment by the Inquisition. He confessed in 1627 and 1630, and recanted, but was nevertheless arrested in 1634. His works were confiscated, and he was temporarily incarcerated and placed under house arrest until 1636. Despite his public renunciation, his letters to Marin Mersenne (written between 1630 and 1631) show clearly that his convictions had not changed significantly since 1621. This would suggest that van Helmont's most innovative works were written during the last ten years of his life. Until that he remained rather faithful to the ideas of Paracelsus. It is only in his final years, when he wrote his *Opus Magnum* that, for various reasons, he clearly distanced himself from his predecessor in the pyrotechnical art.

Van Helmont did not receive an ecclesiastical imprimatur for his work on fevers until 1642, the final year of legal procedures against him. He died in 1644. Two years after his death, his widow obtained official vindication of her late husband. Van Helmont's principal work, the *Ortus medicinae*, and the collected *Opuscula medica inaudita* were published posthumously in Amsterdam in 1648 by his son, Franciscus Mercurius van Helmont, and received wide international acclaim.

2. PSYCHOLOGY AND EPISTEMOLOGY

Van Helmont's psychology is integral to his theory of knowledge and was firmly rooted in the neoplatonic tradition [→ Neoplatonism]. Man alone was created in the image of God. Contrary to angels, man has a physical body, but while angels are an image of the image of God, man

is *imago Dei*. Distinguishable but not separable from the immortal *mens* is the knowing part of the highest soul, the *intellectus*. From Paracelsus, van Helmont adopted the concept of the *archeus* as the vital principle. Man is governed by the *archeus influens* situated in the *duumvirate* (stomach and spleen). The *archeus influens* moves freely through the body; the *archei institi* are secondary and govern the individual organs. Before the Fall, the human body's *archei* were governed directly by the *mens-intellectus*. After having eaten from the tree of knowledge – interpreted as a cryptic reference to sexual intercourse – the immortal mind was left in a state of shock. Then, disgusted by the animal urge to procreate, it obeyed both nature and the divine will, and withdrew into one locus, the *archeus* of the stomach, located in the cardiac orifice (*in ore stomachi*). There it curled up in the center of the sensitive soul, which took control of the body. Van Helmont believes that since the Fall man is condemned from the moment of conception: in accordance with the rest of nature, he must spend his time on earth in a “middle-life” (*media vita*), a state of reduced vitality in which the *archei* ultimately get exhausted, especially by digestion and disease. When they have finished their inner cycles they end in “ultimate life” (*ultima vita*). The lower mortal soul, which man shares with animals, is no more than a vague reflection of the *mens-intellectus* from which it receives its light. The cognitive faculty of this *anima sensitiva* is the *ratio*. The sensitive soul is governed by the *duumvirate* (the stomach and the spleen), while the light of the immortal soul radiates via the heart up to the head. Conform neoplatonic thought, the highest form and its light become less distinctive as they distance themselves from the center. (i.e.: the rational brain is less enlightened).

The sensitive soul's faculty of thought is guided by the *imaginatio* [→ Imagination]. Given that this process leads to uncertain knowledge, van Helmont opposes scholastic exaltation of the *ratio*: scholasticism should never have adopted the heathen, Aristotelian definition of man as an *animal rationale*. Traditional Aristotelian logic, expanded upon by scholasticism, provokes van Helmont to a radical, hermetically inspired skepticism. True knowledge is only obtainable through divine enlightenment of the *mens-intellectus*, and this enlightenment is only bestowed on elect Christians. God touches all forms, but only in a state of ecstasy can man reflect the light he receives back to God. Then, for a moment, Adamic knowledge is restored, and man compre-

hends the essence of things in God and in himself. To this end, man must practice a “spiritual Paternoster”. Van Helmont explains this practice by referring to the Pseudo-Dionysian [→ Pseudo-Dionysius Areopagita] method of *unknowing* as elaborated in *De mystica theologia*, a method by which thought is gradually separated from the world of the senses. In this context, van Helmont refutes the warnings issued by both rabbis and schools of → mysticism that ecstasy should be avoided because of its harmful consequences. It should be noted that van Helmont’s concept of divine enlightenment does not imply that it will lead to full knowledge; it only steers the pyrotechnician’s investigations of nature in the right direction. Van Helmont constantly emphasizes the value of experimental research, but also considers dreams and visions of prime importance in the quest for knowledge. The method he employed himself was to visualize the object of research and enter into imaginative conversation with it. Subsequently, he would fall asleep and experience a meaningful dream containing the answer to his questions. Late in life, for example, he envisioned the immortal soul of man as having no gender traits and as therefore androgynous.

Van Helmont states that research into nature should always serve true medicine. God has given doctors the role of mediator; they are meant to cure people of diseases He justly inflicts upon them as punishment for their sins. Although Hippocrates was a heathen, van Helmont considers him an enlightened spirit whom he values over → Hermes Trismegistus, and often refers to his ideas. Van Helmont refutes mainstream medicine as taught by the scholastics, who based their theories on Galenus and his Arab commentators, particularly Avicenna. Like all Paracelsists, he exaggerates scholastic conservatism for the sake of controversy. On the other hand, he strives to correct several misguided opinions of Paracelsus. Van Helmont himself was to be the first to explain the foundations of true medicine, which he claims were revealed to him by God.

3. NATURE

Van Helmont rejects the doctrine of the four elements and their qualities, which had dominated western thought since Empedocles. He bases his own doctrine of the elements on the biblical Creation story. Water, heaven and earth pre-existed the first day of creation. God separated the higher from the lower waters by creating the firmament and ordained that the firmament would separate the waters for as long as the world existed. There

are two original elements: water and air. The bible does not mention their creation; both are referred to cryptically by the word “heaven”. Water and air are original elements because it is impossible to convert one into the other, as van Helmont claims to have proven through experiment. Earth to him was no element. God created earth simultaneously with water and air, but because earth can be made fluid *per ignem*, it is essentially water. Given that the elements were created before God created the sun on the fourth day, they are cold by nature. The creation of fire is not mentioned in Genesis and fire is therefore not an element. In fact, van Helmont considers this a heathen opinion. Fire can only turn the elements inside out, so to speak, so that objects are reduced to their smallest components. According to van Helmont, Aristotle was mistaken in postulating the non-existence of *vacua* in nature. Van Helmont lacked the proper experimental framework to prove the existence of a vacuum, but given the fact that air can be compressed, he argues that there are many empty spaces in air which together constitute a whole, the *Magnale magnum*. This *Magnale magnum* functions as the soul of the world. It is not a *lumen* but a *forma adsistens*: not a constituent of air, but co-existing with it.

The primary reason for van Helmont’s lasting reputation as a scientist is his introduction of the term *gas*, which he most likely derived from the word *chaos*. He identified fifteen different gases, including (the one, now known as) carbon dioxide, and was the first to articulate the difference between air, water-vapour and *gas*. Gases are object-specific: they embody objects in their finest material form. *Gas* equals the *archeus*, which is partly spiritual and partly material although its kernel is predominantly spiritual.

In conjunction with the concept *gas* van Helmont invented the concept of *blas*, a term derived from the Dutch word *blazen* (to blow). Together they form a duality in van Helmont’s philosophy of nature. *Blas* is astral in origin and functions as the general principle of movement. Van Helmont associates it with the Hippocratic *enhormon*. *Blas* exists in various forms: *blas motivum*, for example, spurs things into motion and *blas alterativum* catalyzes change. Van Helmont proposes his concept of *blas* as an alternative to Aristotle’s doctrine of movement, considered by him a heathen doctrine since the concept of God as the “unmoved mover” curtails God’s omnipotence. Instead, he postulates that God implanted all forms of *blas* in the original *semina*, out of which all things come into being. This theory would explain the

possibility of “action at distance” in the Paracelsic worldview, which is dominated by the concept of *sympathia*. All of nature is animated by a certain *sensus*. Together, the planets emanate a *blas astrorum*, which, through the *Magnale*, can spread through the whole world. Its influence, however, is limited.

Van Helmont explicitly rejects traditional → astrology: the planets do not control the movements of animals and plants, and certainly not those of men; and neither do they determine the future. They can, however, predict it, because God has preordained their movements for all eternity in conjunction with events on earth. Therefore the *blas humanum* follows the *blas stellarum*, but without the causality assumed in traditional astrology. Thus, van Helmont also rejects the analogy between macrocosm and microcosm in the Paracelsian sense. In this context, van Helmont repeatedly cites Psalm 19:2: ‘The heavens declare the glory of God; and the firmament sheweth his handywork’. Knowledge of the future is primarily a question of revelation, he claims, citing Acts 2:17: ‘... and your sons and your daughters shall prophesy, and your young men shall see visions, and your old men shall dream dreams’. Here, the spleen, connected with both the *mens-intellectus* and the *anima sensitiva-ratio*, plays a crucial role. Despite his profound criticism of Aristotle, however, van Helmont maintains the entelechic principle and thinks in a wholly vitalistic way.

4. MEDICINE

Van Helmont rejects the view held by Galenic medicine that the digestive system is threefold. He describes it as sixfold, with a specific fermentation process occurring at every stage. According to van Helmont, fermentation takes place everywhere in nature and in man, and is in close connection with the *archaeus*. He derives his definition from the fermentation concept used in alchemy, though the two are not identical. After the first stage of digestion, when the acids of the spleen are blown into the stomach, the food is converted into a white gastric juice called *chylum*. In subsequent digestions (in the small intestine, the mesentery veins, and the left ventricle) the venous blood becomes more subtle. In line with the Galenic view that the heart partition is porous, van Helmont states that the venous blood is pumped from the right to the left ventricle. There, a local *fermentum* transforms it to arterial blood and it becomes spiritualized. The final digestion of the blood takes place in the individual organs. If diges-

tion processes are disrupted, various diseases can occur. It is, for instance, harmful for the gastric juice to pass the first digestion. Strangely, nothing in van Helmont’s works indicates that he was familiar with Harvey’s views on blood circulation. Van Helmont rejects Galenist physiology and pathology, which are based on the doctrine of the humours (blood, slime, yellow bile and black bile), and hold that an excess of any of these humours causes disease. Van Helmont considers this doctrine a malicious fiction. Van Helmont’s own pathology, which he himself calls “Platonic”, maintains that disease is caused by local chemical changes. Every disorder has its own form. Disease is a light that develops into an *archeus* and penetrates the body. This hostile *archeus* then attacks a vital *archeus* and tries to overpower it. Part of the vital *archeus* is subsumed, while another part continues to resist. Eventually this leads to inflammation of a larger or smaller part of the physical body. Using various anatomical, physiological and logical arguments, van Helmont tries to refute the ancient doctrine of the catarrh once and for all. The catarrh doctrine stipulated that disease occurs when food fumes rise from the stomach to the head, condense and subsequently pour throughout the body. Notwithstanding the connection with his own concept of local *semina*, van Helmont criticizes the Paracelsic idea of *Tartarus* as a catalyst of disease for being too materialistic. And he believes Paracelsus is again mistaken when explaining disease as linked to the *Tria prima* (sal, sulphur and mercury), as he does in his widely read *Archidoxis*. In accordance with his rejection of the paracelsian system of → correspondences between the macro- and microcosm, he also rejects the doctrine of signatures.

5. PHARMACOLOGY AND ALCHEMY

Adam and Solomon are believed to have been acquainted with the medicinal properties of herbs, stones and words. From the work of Flavius Josephus, van Helmont concludes that Solomon wrote many books on the power of herbs and plants; they were lost during the reign of his son Rehabiam, when a prophet ordered these books to be burned out of fear that the Jews would forget their God. Van Helmont believes that through initiation and experimentation the medicinal qualities of these herbs can be rediscovered, although the secret knowledge will only be truly revealed with the coming of Elias Artista (the mysterious “Messiah of Nature” first mentioned by Paracelsus). Van Helmont has not written an extensive Pharmacopoeia, as one might have

expected. He does, however, emphasize that the medicinal qualities of naturally poisonous herbs and metals can be restored through *pyrotechnia*. Purified metals have especially powerful medicinal properties because, contrary to herbs, they are immutable. He also believes in the use of medicinal minerals, and in the therapeutic effect of words and texts. In this respect, he does not refer to *kabalah*, but to certain incantations used by the catholic church.

Van Helmont's discourse on "Butler's Stone" reflects his interest in → alchemy. The treatise concerns an Irish nobleman, Butler, who for some time was detained as a prisoner at van Helmonts estate at Vilvorde. Butler had in his possession a stone with which he seemed to be able to swiftly cure all illnesses; van Helmont had read about such cures in Paracelsus but had never before witnessed one in reality. After Butler had dipped the stone in a bottle of olive oil, van Helmont found that the oil indeed cured several of his patients, although they suffered from different kinds of illness. After some time, however, the olive oil lost its healing power, and Butler refused to reveal the secret of his stone. After several years of experimentation, van Helmont was convinced he was able to reproduce the stone; he called it "Drif", and his treatise contains almost the complete formula. This universal medicine he believed reflected the unity of the immortal *mens-intellectus*.

In his work on the fountain of Spa, of 1624, van Helmont had described an important experiment which disproved the natural transmutation of metals: he demonstrated that iron could not be converted into copper by adding copper sulphate. Later, he claimed that although he could not produce the Philosophers' Stone himself, an initiated visitor had given him a piece of it. For him, there was no contradiction: while he remained convinced that the transmutation of metals was not possible by natural chemical reactions, he believed it could take place as a supernatural process, similar to what took place in the eucharist. In the presence of witnesses, van Helmont demonstrated this by bringing about a transmutation.

As a Paracelsist, however, he was far more interested in the elixir of life, which could be produced from the tree of life. After extensive research, van Helmont had a vision in which he experienced himself in a "timeless state". He saw the Cedars of the Lebanon, which, as he concludes in retrospect, had existed since the beginning of the world. The wood is the basic ingredient for the elixir; this "tree of life" (as he calls the Cedar) can prolong

human life for up to 120 years. The key to the formula, however, was in the liquor *Alkahest*, the universal solvent, which would lead to numerous speculations well into the 18th century. Van Helmont indicated that revealing the secret would be like casting pearls before swine, and therefore withheld the formula.

Van Helmont is a transitional figure in the history of chemistry: while theories and terminologies associated with traditional alchemy are present in his work, his methodologies have more in common with those of the modern chemist. In fact, he is considered to be one of the founders of iatrochemistry, a discipline that employs chemistry for medical purposes. He is also considered the most important and original representative of the second generation of Paracelsists. While clearly taking his distance from Paracelsus in various respects, he critically developed the latter's method and concepts. Paracelsus is praised by him mostly for his pyrotechnical abilities and his arcana, but van Helmont believes to be superior to his predecessor even in these domains. It is important that van Helmont's (al)chemical, scientific experiments and his philosophical speculations be seen in the context emphasized by himself: they are parts of a new kind of medicine. Traditional school medicine is satanically inspired and based upon an uncritical copying of the heathenish Galen. Among the Christians, God has elected a small group of people to introduce a new medicine, and it has fallen to van Helmont to establish its foundations. By doing so, he opens a new era in the history of humanity.

Standard edition: *Ortus medicinae. Id est, initia physicae inaudita. Progressus medicae novus, in morborum ultionem, ad vitam longam . . . Hermes Trismegistus I: Antiquity

1. THOT AND HERMES 2. HERMES TRISMEGISTUS 3. THE GENEALOGY OF HERMES 4. HERMETIC DISCIPLES AND TEACHERS

1. THOT AND HERMES

In the later Graeco-Roman world Hermes Trismegistus was seen as an Egyptian sage of remote antiquity whose knowledge of both the material and the spiritual world and their interrelationship were of great help to get some control of the vicissitudes of life and to bring the soul into harmony with its divine origin. Though his name shows that the Greeks saw some correspondences between this sage and their own god Hermes, the figure of Hermes Trismegistus was in reality firmly rooted in the religious soil of Egypt. Already in the 5th century B.C., Herodotus identified the Greek Hermes with the Egyptian god Thot, and most probably he was not the first to do so: without any comment he called the cult-centre of Thot "Hermopolis" (later Hermopolis Magna) and mentioned the existence of a temple of Hermes at Boubastis (*Histories*, II, 67 and 138, resp.). Hermes Trismegistus originated as the Greek interpretation of the god Thot (*interpretatio graeca*), just as on the Jewish side Thot was identified with → Moses (*interpretatio judaica*).

The career of the moon god Thot in the Egyptian pantheon and his complex relationship with many other gods is well known (Boylan, Kurth). His most characteristic feature, which in some way determined most of his other qualities, was that he was considered the inventor of count-

ing and writing. He was represented as an ibis or a baboon and as an ibis-headed or baboon-headed man. Since the moon receives its light from the sun, he was considered the latter's nightly representative and as such he often appears with the sun god in the solar bark, as the "Scribe of Re". At the same time, he was also the protector and healer of the moon: its waning and reappearance was associated with the stolen or damaged Eye of Horus, which on the day of the full moon was retrieved or healed by Thot, who thus became the restorer of cosmic order. As a god of the moon, Thot became the chief measurer of time, who distinguished seasons, months and years and also determined the regnal years of the pharaohs. Under this aspect, he became the ordering principle of civil and religious life in general, the "Lord of laws". The institutions of temple-worship and the plans of the temples were ascribed to him. He was the "Lord of the divine words", i.e. of the sacred formulae of ritual and cult, including the invocations of the gods in magical practices, but he was also the one who spoke for the gods. His wisdom concerning things divine made him the magician *par excellence*, the one "great in magic", to whom a great number of charms and spells were attributed. As the "One who knows", the "All-knowing", he was considered the inventor of script, language and literature and of all kinds of sciences, and even, especially in the Ptolemaic period, the creator, who had made the world by thought and speech. Thot was also an important god of the dead: from the earliest times to the Greek period, he was seen as psychopompus, the one who brought the dead to the other world, where he also played a part in the judgment ceremony. Just as he had done in the case of Osirus, he reconstructed the corpse of the deceased and opened his mouth in order to give him the breath of life. In the 4th century B.C., the main characteristics of Thot were already known to the Greeks. Plato, who calls him Theuth, knew that he was an Egyptian God, to whom the ibis was sacred and who had invented numbers and counting, geometry and astronomy, draughts and gambling, and in particular the art of writing (the usefulness of which was questioned by king Thamus, who is the humanized Egyptian god Ammon; *Phaedrus*, 274c-275b).

Thot's function as psychopompus may have been one of the reasons that prompted the Greeks to identify him with their god Hermes. According to the *Homeric Hymn on Hermes*, 19, he was the son of Zeus and Maia, born on Mount Cyllene. The name Hermes derived from the heaps of

stones (*herma*, *hermaion*) that served as landmarks. From the earliest times Hermes had been the god who guided and protected the wayfarer. Originally a squared ithyphallic pillar with a head, his image became gradually more anthropomorphic, which resulted in his most well-known representation, with winged sandals, a staff, and his characteristic traveller's hat. Herms were *inter alia* set up at crossroads, on market places, at the gateways of cities and the borders of estates. As god of the road he also became the god who guided the dead to the underworld, which became a popular literary motif but had firm roots in ordinary life. Because of his inventiveness he was called "cleverest of the gods", even "crafty", and so he also became the god of merchants and thieves. Having made the lyre and played it on the first day of his life (*Homeric Hymn to Hermes*, 17, 39-61), he became the patron of → music and the musicians. He was the eloquent messenger of the gods (cf. also Acts 14:11-12), the interpreter (*hermēneus*) of their will, which led Plato to a more philosophical interpretation of Hermes as expressing both the positive and the negative power of speech (*Cratylus*, 407e-408b). This view was further developed in the later philosophical, especially Stoic, tradition, in which Hermes became identical with the Logos and so even became the creator of the world. The anti-gnostic writer Hippolytus (ca. 225) says of the Greeks, and the gnostic → Naassenes, that they honour Hermes as the Logos, 'because he is the interpreter (*hermēneus*) and creator (*dēmiourgos*) of everything that has come into being, that comes into being and that will come into being' (*Refutatio* V, 7, 29; cf. IV, 48, 2: 'The Logos is called Hermes by the Greeks'). These Hellenistic philosophical speculations did not yet exist when the Greeks began to identify their Hermes with the Egyptian Thot, but they certainly facilitated the emergence of Hermes Trismegistus in the centuries around the beginning of our era. In the Hellenistic period Hermes also became a god of → magic, but it seems most likely that this was primarily due to his merging with Thot. The two gods came from completely different cultural and religious backgrounds, and, in fact, their identification was only based on a superficial resemblance. The common features that led to their identification may have been their role as guides to the underworld, as messengers of the gods, and as inventors of arts and crafts.

2. HERMES TRISMEGISTUS

It would be wrong to see in Hermes Trismegistus no more than Thot in Greek disguise.

This even holds for the magical papyri, as can be seen from the prayers that are sometimes addressed to Hermes (Trismegistus), though it is in these papyri that the continuity between the Egyptian Thot and the Hellenistic Thot-Hermes is most clearly visible (Festugière, *Révélation*, I, 283-308). Nevertheless, even in the later period there remained authors who liked to describe Hermes Trismegistus with almost all the characteristic features of the Egyptian Thot, as, for instance, appears from a hermetic text quoted by Cyril of Alexandria, *Contra Julianum* I, 41. The hermetist, the same who composed 15 hermetic book in Athens, declared that Hermes, *inter alia*, had measured the land of Egypt and divided it into nomes and smaller units, had cut the irrigation canals, and that he was the maker of contracts and the inventor of all kinds of sciences and arts.

The name Trismegistus also reflects Egyptian usage. It is first attested in the late 2nd century A.D., in Athenagoras, *Legatio*, 28, 6, who says that Hermes, 'who is called Trismegistus', just like Alexander the Great linked his family with the gods (Fowden, 216-217). The closing line of the Roman satirist Martial's epigram on the gladiator Hermes (*Epigrammata*, V, 24, 15), 'Hermes, the only one who is all things, the thrice-one' (*Hermes omnia solus ter unus*), cannot be taken as proof of the existence of the term Trismegistus in the last decades of the 1st century A.D. (Versnel). In Egyptian the superlative was expressed by repeating the positive two or three times, and this was taken over in literal Greek translations: "great (*meegas*) and great (*meegas*) (and great [*meegas*])" means "very great" or "greatest". Probably because of a Greek misunderstanding of the Egyptian writing of the superlative, already the Raffia decree of 217 B.C. calls Hermes 'the greatest (*megistos*) and the greatest (*megistos*)'. In an oracle text from Saqqara which dates from 168-164 B.C., mention is made three times of "the greatest (*megistos*) and greatest (*megistos*) and great (*meegas*) god Hermes". It seems quite certain that we have here a Greek combination of two well-known divine epithets: "the greatest and the greatest" and "the great god" (Versnel, Quaegebeur). However, there existed demotic forms as "great, great, great" with an adverb indicating the superlative = "three times very great" (first attested in an inscription of 105 B.C.; in the Roman period even the title "five times very great" was used for Thot), which, in fact, simply means "the greatest" (Quaegebeur). The Greek form "greatest and greatest and greatest", which would be the exact equivalent of Trismegistus, has

not been found so far and may have never existed, but there is little doubt that the demotic expression has given rise to the Greek epithet. From its Egyptian background it should have been translated as *megistos*, "the greatest" or as *trismegas*, "the thrice-great" (which occurs in a 3rd century papyrus). However, similar abundant superlatives with the prefix *tris-* were not uncommon in later Greek: the form *trismakaristos* ("thrice-most blest" = *trismakar(ios)*, "thrice-blest"), is found in the 2nd-century writer Lucian, i.e. contemporarily with the first attestation of the epithet Trismegistus in Athenagoras.

3. THE GENEALOGY OF HERMES

There was an important difference between the Egyptian and the Greek views of Thot/Hermes: the Egyptians always considered Thot a god, whereas the Greeks mostly saw him as a human being, a teacher of divine wisdom. The latter view is predominant in the philosophical Hermetica, though there are some treatises in which Hermes distinctly appears as a god, e.g. in the *Korē Kosmou*, or suddenly becomes identical with the divine Mind, as in the *Discourse on the Ogdoad and the Ennead* (for both, see → Hermetic Literature I). Already Plato left it undecided whether Thot (Theuth) was a god or a divine man (*Philebus*, 18b), and in the discussion between Thot and king Thamus, reported in the *Phaedrus* and mentioned above, he has the king argue as if Thot, 'the father of writing', was one of his subjects. The humanization of Thot was certainly furthered by the Hellenistic theory of Euhemerism, which implied that the gods were in fact deified kings. Athenagoras, who, as we saw above, said that Alexander the Great and Hermes Trismegistus had linked their own family with the gods, as many others had done, concluded from this that 'there is no longer any reason left to doubt that they were regarded as gods because they were kings'. This euhemerist explanation became part of the more general criticism of traditional religion by the Sceptics, as can be seen in the third book of Cicero's *De natura deorum*. There the Sceptic Cotta attacks the Stoic view of religion in a long exposition, in which he *inter alia* gives a long list of gods who have the same name but according to tradition were born from different parents (e.g. three different Jupiters, III, 53). There are even five gods with the name Hermes (Mercurius), of whom the third is Hermes the son of the third Jupiter and Maia and the fifth is the Egyptian Theyt (Thot), who had fled to Egypt after the murder of Argus and had given laws and the art

of writing to the Egyptians (III, 56). Lactantius adopted this identification of Trismegistus and Cicero's fifth Hermes, but he also explicitly expressed the euhemerist view that this Hermes originally had been a man, who long ago had been deified (*Divinae Institutiones*, I, 6, 1-3). It seems that the Greek hermetists tried to counter the devastating effects of this criticism by introducing the idea of a lineage of Hermes. In the *Asclepius*, 37, Hermes Trismegistus says that his grandfather, called Hermes too, resides (i.e. has been buried) in his natal city that is named after him, where 'he gives aid and protection to mortals who come to him from everywhere'. → Augustine, in a discussion of the superiority and priority of Hebrew culture even with respect to that of the Egyptians, adopted this genealogy from the *Asclepius*, but made the first Hermes the son of Jupiter and Maia. He argued, in his *City of God*, XVIII, 39, that Hermes, 'who is called Trismegistus', taught philosophy in Egypt long before the Greek philosophers, 'and yet after Abraham, Isaac, Jacob, and Joseph, and, in fact, Moses himself'. Atlas, 'the maternal grandfather of the elder Mercury', lived in the time of Moses, which implies that his grandson, 'this Mercury Trismegistus', lived three generations after Moses. It has often been suggested that Augustine transmits here information he had found in the Roman writer Varro (1st century B.C.). This might be possible, but it seems more probable that he has adapted the information he found in the *Asclepius* for apologetic reasons. Notwithstanding Augustine's authority, the idea that Hermes Trismegistus was a contemporary of Moses, or even had lived before him, prevailed in the later medieval tradition (cf. the floor mosaic in the cathedral of Siena: 'Mercurius Trismegistus contemporaneus Moysi'). That Thot was 'the first Hermes' is explicitly stated in an interesting text of uncertain date, which is preserved in the Byzantine chronograph Georgius Syncellus († ca. 810) and attributed to the Egyptian historian Manetho (ca. 280 B.C.). The text is slightly corrupt, but less than is usually assumed (Fowden, 30-31; Copenhagen, xv-xvi). According to Pseudo-Manetho, Thot, the first Hermes, had engraved his wisdom on steles in the 'sacred language' and in hieroglyphs. After the Flood, 'the second Hermes', who was the son of Agathodaimon and the father of Tat, translated these texts from the sacred language into Greek and deposited them in books in the inner sanctuaries (*adyta*) of Egyptian temples (Syncellus, *Chronographia*, I, 72, ed. Dindorf; Scott, III, 491-492, with many emendations). According to *Korē Kosmou*, 5-6, which

makes no difference between a first and a second Hermes, Hermes had already engraved everything he knew on steles before the creation of the world, and left it to Tat, his son and successor, Asclepius and others to explain his teachings. However, there are authors who tell another story about how the Egyptian texts of Hermes Trismegistus had been translated into Greek. Iamblichus, *De mysteriis*, VIII, 5 and X, 7, mentions the prophet Bitys as the one who found hieroglyphic texts of Hermes in Egyptian temples and translated them into Greek, and he also aptly explains the Greek philosophical elements in the Hermetica by saying that those who made these translations were skilled in Greek philosophy (VIII, 4).

The separation between Thot, the god of Her-mopolis, and Hermes Trismegistus made it easier, on the one hand, to explain how the original hermetic writings had been translated from the Egyptian into Greek and, on the other, to consider Hermes as a divine man, a teacher of divine wisdom from remote antiquity.

4. HERMETIC DISCIPLES AND TEACHERS

A curious result of the separation of Thot and Hermes Trismegistus was the re-emergence of Thot in the figure of *Tat*, as the son, pupil and successor of Hermes, to whom many tractates are addressed. The hermetic authors were apparently completely unaware of the fact that both personalities originally had been identical. In C.H. XVII it is Tat himself who instructs an unnamed king, probably Ammon.

Asclepius was another important pupil of Hermes Trismegistus. The *Perfect Discourse/Asclepius* was devoted to him, but he also acted as a teacher himself, as appears from the title of C.H. XVI, *Definitions of Asclepius to King Ammon*. In Hellenistic Egypt, the cult of the Greek god Asclepius merged with that of the Egyptian Imhotep, especially in Memphis and Thebes. The two gods had in common that they were gods of healing and medicine and had both started their career as deified men. Nevertheless, they were rarely completely identified, because Imhotep's healing capacity was only one of his qualities. In fact, he had many features in common with Thot and was seen as the personification of wisdom. In Greek literary texts he retained an independent existence as Imouthes. This state of affairs is reflected in the *Asclepius*, 37, where the two gods are clearly distinguished: Imhotep is said to be Asclepius' grandfather, just as Thot is the grandfather of Hermes Trismegistus.

King *Ammon* is a much less important hermetic figure. He is no other than the euhemerist version of the Egyptian god Amun, who was called Zeus-Ammon by the Greeks and had a great reputation as oracle god. In Plato's *Phaedrus*, 274de, already mentioned above, it is Thot himself who discusses with King Thamus, i.e. the humanized Ammon, all kinds of sciences, in particular the art of writing. Whereas C.H. XVI makes him a disciple of Asclepius, he participates, as Hammon, with Asclepius and Tat in the discussions of the *Asclepius*, and it was for him that, according to Iamblichus, the prophet Bithys had translated the teachings of Hermes into Greek (see above). This *Bithys* remains a mysterious personality, but from Iamblichus and → Zosimus we know that he was a theurgical authority (Fowden, 150-153).

The goddess *Isis* was also seen as a teacher of hermetic doctrines. In the Hellenistic and Roman period she was identified with almost every Egyptian, Greek and Oriental goddess, 'you are the One who is everything' (*una quae es omnia*). In Greek aretalogies, hymns of praise, she was hailed as 'educated by Hermes' and, *inter alia*, as having invented, together with Hermes, the hieroglyphic and demotic scripts (Bergman). She was said to have taught the medical, mantic and alchemical arts [→ Alchemy] to her son Horus (Festugière, in NF III, CXXVI-CXXVII). In Stobaeus, *Fragm.* XXIII-XXVII, she acts as the hermetic teacher of Horus, while she is supposed to have been instructed herself by Hermes Trismegistus. This is explicitly stated in Stobaeus, *Fragm.* XXIII (*Korē Kosmou*), though this writing also has another tradition about Kamephis as intermediary between Hermes and Isis (see below).

Agathodaimon (*Agathos Daimōn*), who according to Pseudo-Manetho was the father of Hermes Trismegistus, plays an unimportant part in the philosophical Hermetica, but his role in ancient magic and alchemy is all the more important and equals that of Hermes. Having started in Greece as a rather vague domestic god of luck and prosperity, he finally became associated with a variety of Greek deities and, in Hellenistic Egypt, with the Egyptian snake-god Kneph (Knephis, Chnoubis) in particular, but also with Amon, Thot, Isis, Horus, and others (Ganschinetz, 51; Copenhaver, 164-165). In *Korē Kosmou*, 32, Isis pretends to transmit to her son Horus 'a secret doctrine that my ancestor Kamephis learned from Hermes, the recorder of everything, and I from Kamephis, who is older than all of us'. It seems that Kamephis is none other than the late Egyptian god Kematef,

who was identified with Kneph and Agathodaimon (Barta; but see Festugière, NF III, CLXII-CLXVIII). Sayings of Agathodaimon are quoted in C.H. XII, 1, 8 and 13, though in the second passage Hermes deplors that Agathodaimon has not given it out in writing. Cyril of Alexandria, *Contra Julianum*, II, 30 (NF IV, 136-140, *Fragm.* 31 and 32; Ferguson, in Scott IV, 213-214), knew a *Discourse to Asclepius*, in which Hermes quotes some teachings of Agathodaimon to Osiris about the origin of the earth and the sun. It remains unclear, however, whether this information was actually found in a philosophical or alchemical treatise under the name of Agathodaimon or is simply a case of literary fiction.

Hermes Trismegistus II: Middle Ages

Throughout the Middle Ages the figure of Hermes Trismegistus is portrayed in a discordant manner because of disagreements over the Hermetic “revelation” among the varying interpreters within Latin culture. These disagreements concern, first, the *Asclepius*, the only philosophical-religious Hermetic text translated into Latin; second, during the 12th-13th centuries, they concern the vast technical-operational Hermetic literature (→ astrology, medicine and natural → magic, divination [→ Divinatory Arts], necromancy); and, third, the relations between philosophical concepts and operational knowledge.

But before examining the judgments concerning Hermes, in both their contrasts and their continuities, it is necessary to recall that the mythology of the *Asclepius* makes a distinction between Hermes the god, who dwells in the temples of Hermopolis and grants aid and salvation to all mortals, and his grandson Hermes Trismegistus who in his books unveils the secrets of divine wisdom. This duplication of Hermes is accepted by the first Christian writers: Lactantius in his *Divinae institutiones* and a century later → Augustine in book VIII of *De civitate Dei*. Reference is made to the two figures of Hermes by Hermann of Carinthia in his *De essentiis*, by → Daniel of Morley in his *Liber de naturis inferiorum et superiorum* in the 12th century, and by other scholars later on.

In the Christian era the figure of Hermes Trismegistus (or Mercurius) is drawn in opposing profiles by Lactantius and Augustine. In his *Divinae institutiones* (304-313) Lactantius sees Hermes as an ancient prophet of Christian revelation, who in some mysterious way, perhaps by evoking the great spirits of the past, rose to an understanding of almost the whole truth, *veritatem paene universam*, and learned the mysteries on the Father and the Son. In the pages Lactantius devotes to him, the great Egyptian seer heralds the Holy Scriptures: the eternal and ineffable divine nature, the birth of the Son, the creation of the world, providence, the creation of man, the nature of angels and devils, religious worship, the contemplation of God, and the final descent of the Son for the salvation of the righteous. But in book VIII (415-417) of *De civitate Dei* Augustine unmasks the demonic origin of Hermetic theurgy (referring to the statues that dwell in temples among men, granting good and decreeing evil) and Hermes’ words are transformed, in his tirade, into the voice of evil demons: the ancestors of Hermes Trismegistus are the founders of all idola-

trous cults. The “Christian” interpretation of Lactantius would nevertheless prevail over Augustine’s invectives: a sermon of Quodvultdeus, bishop of Carthage, which simplifies Lactantius’ perspective and brings it still closer to Christian sensibilities, was inserted in the North African collection of Augustine’s *Sermons* and under his unquestioned authority came to influence the entire Middle Ages.

In the 12th century Hermes’ presence becomes deeply entrenched in intellectual discussion, and the foundations are laid for a new and more complex portrayal of him. This change occurs for various reasons: due to the fragments of “Augustine” and the wide circulation of the *Asclepius* Hermes is credited with a superior wisdom not ignorant of Christian truths; the text of a famous pseudo-epigraph like the *Liber viginti quattuor philosophorum* (attributed to Hermes in many manuscripts and by the almost unanimous opinion of philosophers and theologians) places him in the perspective of the purest Christian → Neoplatonism and attributes to him an awareness of the mystery of the Trinity; the text of another apocryphal work, the *Liber de sex rerum principiis*, contains a systematic treatment of divine and natural causality, and traces this back to Hermes’ philosophy; the new translations from the Greek and Arabic present him as the first inventor of both “natural” and “necromantic” → magic. If we add to all this the fact that Albumasar’s *Introductorium maius*, translated by John of Seville (1133) and later by Hermann of Carinthia (1140), credits Asclepius and Hermes with a prophecy of the birth of “Jesus”, we can well understand the varieties and contradictions the portrayal of Hermes will acquire in the next centuries. But in the 12th century there still persists the single powerful image of an ancient sage who by inner revelation anticipated parts of Christian teaching: the most distinguished examples are the great *magistri* of the period, Abelard and Theodoric of Chartres, → Bernard Silvester and Alain of Lille.

A very significant testimony comes from the *Glosae super Trismegistum*, written at the turn of the 13th century, perhaps a work of Alan of Lille or a disciple of his. Hermes, one reads in the prologue, is the greatest philosopher of the pagans, and we know that he composed many volumes on the supreme artificer of all things: in a book which Augustine calls *Logos tileos* (that is, in the fragments cited by Quodvultdeus) he exceeded others and himself, since in treating of the Father and the Son he seems to elevate himself to our theology (*ad nostram videtur aspirare theologiam*). In

another book entitled *Trimegistrus* (namely the *Asclepius*) not only did he speak of the Creator and the creation, but in discussing the “uncreated Spirit” he did not omit the mysteries of theology: his purpose was to confute the ancient philosophers by affirming the unity of the Creator, his power, knowledge and goodness.

In the 13th century we encounter some harshly contrasting views of Hermes. While the *Asclepius* and the *Liber viginti quattuor philosophorum* enjoyed an almost universal respect, and the texts on astrology and “natural” magic received attention and respect consistent with official doctrine, the “necromantic” books (Hermes, Belenus, Toz the Greek, Germa the Babylonian) led to renewed accusations, formerly levelled by Augustine, of idolatry and trafficking with evil demons.

This debate on Hermes begins toward 1230 and lasts until the end of the century. The first to pose the problem in radical terms clearly deriving from Augustine is the bishop of Paris → William of Auvergne, who in his *De legibus* (1228) traces to Hermes the ‘philosopher and sorcerer’ all the idolatrous cults that are praised in the books of necromancy. This criticism of Hermetism proceeds with emphatic harshness, uniting in a single condemnation both the philosophical and the magical-astrological strands of Hermetism: in William’s tirade the *Asclepius*, which had inspired and moved the philosophers of the 12th century, is transformed into an impious vehicle of errors, illusions and deceits induced by diabolical spirits. That Mercurius is the prophet of diabolical operations, seduced by “evil spirits”, finds confirmation in ancient Egyptian idolatry: Egypt is in fact the country which more than any other was familiar with the cult of idols and the presence of hellish spirits, and Hermes himself calls his land *templum mundi* since all demons were worshipped there.

During the same years → Michael Scot – translator, astrologer, sorcerer – in his *Liber introductorius* (1231-1236) does not hesitate to present Hermes and other *nigromanti* as the origin of a secret knowledge that exalts man and enables his body to sense paradise. Of course, the Church condemns writings of this kind, but magical doctrine and operations, even if forbidden, are nevertheless real and possible, since they have a scientific statute and constitute a true “ars”. Scot confesses that he has himself carried out magical operations for himself and his friends, and has experimented with their truth and effectiveness by applying the teachings of the Hermetic *Liber imaginum Lunae*. And moreover, despite ecclesi-

astical prohibitions Michael reproduces two texts in their entirety: the *Liber imaginum Lunae* by Belenus, ‘secundum Hermetem’, which sets forth the magical-astrological effectiveness of the lunar mansions; and the *De viginti quattuor horis* by Belenus, with the names of the hours of the day and night, and the operations that can be performed with images, characters and invocations.

But a new showdown of “Hermes the magus” was near at hand. First, → Roger Bacon, while recognizing in Hermes one of the first “moral” philosophers of antiquity and the author of doctrines concordant with Christian truth, rejected the necromantic texts. He declared that these *libri pessimi*, composed by demons and corrupt men, had been falsely attributed to great personalities – Adam and → Moses, Solomon, Aristotle and Hermes – to seduce the human spirit. Hermes, the author of the *Asclepius*, is thus not responsible for the books on sorcery that bear his name. Toward 1260-1265 an extremely violent condemnation was pronounced in the *Speculum astronomiae*, attributed by many to → Albertus Magnus. As part of its project of salvaging true astrology, which is defended as being in accordance with Aristotelian-Ptolemaic cosmology and Christian ethics, the text denounces the idolatrous nature of necromancy: that is to say, that part of the “science of images” which, while being associated with astrology, fashions talismans and evokes demons by means of religious rituals. The science of images based upon Hermes, Belenus, Toz the Greek and Germa the Babylonian (that is the whole Hermetic necromantic corpus), which calls for suffumigations and invocations, is *abominabilis* because idolatrous, and induces man to pay to earthly creatures the homage he owes God. Before listing them, the author recalls having read on previous occasions many necromantic books; while reading them he had experienced horror, and his mind had fled from them with dread. Thus, once again, after the accusations of Augustine and of William of Auvergne, Hermes is considered the first and the most impious of idolaters.

At this point the portrayal of Hermes, depicted as it is with such incongruous features, seems to have divided into two directions: that of the prophet of Christian truths, and that of the diabolical sorcerer. How could the author who had risen to the peaks of trinitarian contemplation have plunged into the abysses of idolatrous perdition? The *Asclepius* and the *Liber viginti quattuor philosophorum* on the one hand, and the body of necromantic writings on the other, create a split

which seems irreparable. Which one is the true Hermes? How can the admiration of celebrated theologians (Alain de Lille and William of Auxerre, Alexander of Hales and Bonaventure) for the *Liber viginti quattuor philosophorum* and the unanimous respect for the *Asclepius* be reconciled with the invectives of William of Auvergne and of the *Speculum astronomiae*? Is it possible to find an interpretation that can transcend such radical oppositions?

A response to this challenge, although not without inconsistencies, is provided in the long and balanced reflection of Albertus Magnus, the medieval author who was most familiar with the full extent of the Hermetic writings. Hermes is the *primus philosophus*, who lived in Egypt in very ancient times: chief among the Greek, Egyptian, Chaldaean and Indian sages, inspirer of Pythagoras and Empedocles, Socrates and Plato, he is the prophet and forerunner of all philosophers. The most admirable aspect of Albertus' analysis is his critical attitude. He is the only one who, faced with the universal admiration for the theological maxims of the *Liber viginti quattuor philosophorum*, shows some reservation, for philological and philosophical reasons: he declares that he has never read this book, but that if in the maxim of the "generating monad" Hermes spoke of God in triadic terms, he could not have been announcing the divine Trinity and certainly meant something else. Even with respect to the *Asclepius* Albertus takes a very guarded position. Hermes has expressed great truths: the omnipotence and causality of God, His unity and ineffability, the ideal forms and the flux of forms from the first cause to being created by causation, and man in the image of God and the link between God and the world. There are open expressions of agreement: Hermes statements on fate are concordant 'with us in the same truth' and it is not difficult to trace the sayings of Trismegistus to the doctrine of Aristotle. But in his reading of the *Liber de sex rerum principiis* and of the *Asclepius* Albertus does not hesitate to identify conceptual errors: in the former the thesis of a hypostatic universal nature *non placet Aristoteli*, and in the latter the affirmation that the first principle penetrates all things and is the being in itself of all things is a *pessimus error*. In Albertus' pages, therefore, Hermes emerges as endowed with the powers of a great philosopher, but as operating within the limits of human reason. There still remained the problem of Hermes' magical writings. In his *De mineralibus*, written at a time when Albertus was not yet very familiar with talismanic literature, he

deals with necromantic images and indicates, *propter bonitatem doctrinae*, the first inventors: Toz the Greek, Germa the Babylonian and Hermes the Egyptian. At first sight this text seems to be a re-evaluation of the Hermetic science of images, contrasting with the judgment of the *Speculum astronomiae*. Actually Albertus is dealing with "astronomic" images, that is to say, with those images, produced by nature or fashioned by man, which channel the influx of the stars and acquire a marvellous power. When, later on, in his *Summa theologiae*, Albertus becomes aware of his error, he does not hesitate to condemn necromantic images, recalls that someone has associated them with idolatry, and proclaims the illusory nature of necromancy, a craft carried on by demons and wicked persons and in antiquity made popular by 'Achoth Graeco et Grema Babylónico et Hermete Egyptio'. Still, even in this later judgment Hermes is not portrayed with the features of idolatry; in fact, shortly afterwards he is reaffirmed as the exponent of a pure monotheism. The result is a Hermes who did not write the *Liber viginti quattuor philosophorum*, who in the *Asclepius* proclaimed many truths and upheld some errors, who was deceived by necromantic images, but who never repudiated a philosophical and religious monotheism. A more critical and mature interpretation of Hermes Trismegistus was not possible in the Middle Ages.

The perspective opened by Albertus Magnus would inspire later investigations, which made explicit what Albertus merely implied. In the 14th century Thomas Bradwardine opens his *De causa Dei* (ca. 1335-1344) by calling attention to Hermes, who in the *Asclepius* proclaims the perfection, sanctity and eternity of God. Praised and venerated by the Greeks, master of Plato and Aristotle, Hermes, by his wisdom which was not ignorant of the Holy Spirit, is invoked along with the Prophets and Christians. Thomas Bradwardine could nevertheless not ignore the polemic about Hermetic theurgy. Like Albertus Magnus, he observes that in many pages Hermes has defined the only God in all His power, wisdom and goodness, and he adds that hence there is no point in affirming in the *Asclepius* the existence of 'other gods or another god' and in consecrating idols to evil spirits. This is reason for Thomas to rebuke Hermes for the fault of imprudence and inconsistency, but not – as opposed to Augustine, William of Auvergne and the *Speculum astronomiae* – for the sin of idolatry.

Shortly afterwards Berthold of Moosburg concludes his imposing commentary on Proclus'

Elements of Theology (ca. 1340-1360). In Berthold, too, the figure of Hermes is delineated in all its grandeur, as representing a substantial concordance between the Platonic tradition and Christian theology. The many references to the *Logos teleios*, the *Asclepius* and the *Liber viginti quattuor philosophorum*, from the Prologue throughout the commentary, confer on Hermes an unquestioned authority. However, Berthold, too, must confront the problem of the polytheistic theurgy of the *Asclepius*. His answer is founded – as previously, although with different nuances, in Albert and in Thomas Bradwardine – on the authenticity of Hermes' monotheism. Such a wise and prudent man, who stated profound truths on God, the first causes, the world and man, was deluded and is not to be believed when he glorifies idols consecrated with chants and liturgies. Hermes' polytheism is "superstitious" because it fashions idols considered to be gods through the infusion of a divine force. And yet, when Berthold describes "non-superstitious" polytheism, as found in Plato and the Platonists, he still makes reference to Hermes for the concept of "gods by participation", that conforms with the truth.

With → Nicholas of Cusa the long voyage of Hermes through the Latin Middle Ages draws to a close. An interest in the Hermetic writings runs through all his works, from *Sermo I* (1430) to *De ludo globi* (1463): the knowledge of the divine Word, the doctrine of divine names, and the concept of matter, world and man are taken from the *Asclepius*. Illustrative of his interest are the numerous glosses as well as textual corrections in Nicholas' own hand, found in the margins of the most ancient manuscript of the *Asclepius* (Brussels, Bibliothèque Royale, 10054-10056). On the matter of Hermetic polytheism he offers prudent and moderate considerations. If in *De pace fidei* (1453) he cannot avoid, for ecclesiastical reasons, condemning the consecrated idols which threaten man's salvation, philosophical reasons lead him in *De docta ignorantia* (1440) to absolve Hermes of any accusation of idolatry: the ancient philosophers conceived the traditional plurality of the gods as a personification of divine attributes, "explications" of the One, and so Hermes explicates in the figures of Cupid and Venus the creative force of divine causality.

Following the contrasts between Augustine and Lactantius, which express the two different responses of Christian culture to the figure of Hermes, we see how his presence became ever more complex and indecipherable over the centuries. The appearance of celebrated apocryphal

works, the translations from Greek and Arabic, and the harsh conflicts over sorcery, tended to rend the image of the Egyptian sage apart, making him into an ambiguous figure between good and evil, at once divine philosopher and idolatrous sorcerer. If William of Auvergne saw Hermes as combining the philosopher and the sorcerer, and if the *Speculum astronomiae* attacks the Hermetic science of images, Albertus Magnus arrives at an honest and critical judgment which privileges the speculative wealth of the *Asclepius* and rejects, even while condemning necromantic practice, the accusation of idolatry. This path was also trodden, with different premises and conclusions, by Thomas Bradwardine and Berthold of Moosburg. At the end of the 14th century, Hermes is once again the great philosopher of antiquity, father and forerunner of all philosophers: he committed errors, of course, but these seem more due to imprudence or inconsistency than to wickedness of spirit. Along this path, taken also by Nicholas of Cusa, the history of Hermes Trismegistus in the Middle Ages and up to the threshold of the modern era comes to an end.

PAOLO LUCENTINI

Hermes Trismegistus III: Modernity

The fictional personage of Hermes Trismegistus did not disappear after the end of the Middle Ages, but remained very much alive throughout the following centuries. As early as the end of the 15th century he began to enjoy a great vogue. Indeed, within the general context of a renewed interest for ancient mythology in the Renaissance, he profited from the craze for Hermes Mercurius (Mercury). Both figures were often blended together, with the result that “Hermes” entered the cultural imagination under these two forms – Hermes Mercurius and Hermes Trismegistus – to the point of serving as a sort of catch-all name.

But apart from his proximity with Hermes Mercurius, the new interest in Hermes Trismegistus had much to do, of course, with → Ficino's translation of the *Corpus Hermeticum* published in 1471 and his commentaries on it [→ Hermetic Literature IV]. Ficino gave a genealogy of Hermes Trismegistus slightly different from those proposed by authors of late Antiquity such as Lactantius and → Augustine, and by medieval authors. But like them, he held that he had lived after the time of → Moses, and considered him a major link in a chain of great philosophers. Ficino and → Giovanni Pico della Mirandola considered “Hermes” as one of the “first theologians” (for Ficino, only Zoroaster was earlier); and whereas Ficino believed Hermes to have lived after Moses, → Lodovico Lazzarelli

even concluded (from Diodorus Siculus, *Bibliotheca Historica* I, 13ff.) that Hermes lived far before Moses. Regardless of such differences, Renaissance adherents of the *prisca theologia* concurred in giving Hermes an important place in their genealogies of wisdom, consisting of lists such as e.g. Enoch – Abraham – Noah – Zoroaster – Moses – Hermes Trismegistus – Orpheus – Pythagoras – Plato – the Sybils.

Already in the Middle Ages Hermes Trismegistus had been represented in pictures, albeit rarely (for example, in an illuminated text of Augustine in the 14th century), but as of the 15th century such representations became more frequent. Thus he appears in Bacchio Baldini's *Florentine Picture Chronicle* as well as in several alchemical treatises (like *Aurora Consurgens*, and Thomas Norton's *Ordinall of Alchymy*). At that time and as late as the 16th century he, or sometimes Apollonius instead, is represented as a sage seated in a crypt, tomb, pyramid or temple, holding the *Emerald Tablet* in his hands. In Botticelli's *Primavera* (1482), the god Hermes is represented as looking upwards and playing with clouds, touching them lightly as if they were beneficent veils through which transcendent truths might reach the beholder; therefore, a connection could be established between that representation and Hermes Trismegistus (Wind, 122-124). Six years later, an artist inlaid the pavement of Siena Cathedral with a panel representing Hermes Trismegistus as a tall and venerable bearded man, dressed in a robe and cloak, wearing a brimmed mitre and in the company of two personages (Moses and Plato?), with the inscription “Hermes Mercurius Trismegistus Contemporaneus Moysi”. Not long after, Pope Alexander VI, the protector of Pico della Mirandola, commanded Pinturicchio to paint a great fresco in the Borgia Apartments of the Vatican. It abounds with hermetic symbols and zodiacal signs, and there we see Hermes Trismegistus, young and beardless, in the company of Isis and Moses. Around 1500 he was painted on a wall of the church Sint-Walburgis in Zutphen in the Low Countries, in the company of Maria, the newly-born Jesus, angels and sibyls. On a pilaster of a Sistine room in the Biblioteca Vaticana, a painting (1587) shows him with attributes of Mercurius; the caption informs us that he is “Mercurius-Thoth, inventor of the alphabets”. Other examples of his presence in Roman-Catholic buildings could be adduced.

Hermes Trismegistus occasionally served as a figure within fictional narratives, as in François Rabelais, the author of *Gargantua and Pantagruel*

(1532/1564). Rabelais not only evinces a good knowledge of traditions related to Hermes Mercurius, but also gives Panurge, one of the main heroes of the story, many traits of Hermes Trismegistus. Panurge refers to the latter when he claims having a “thrice greatest” codpiece and being fond of the “thrice greatest Bottle” (of wine, obviously). Through his medical knowledge, Panurge claims to possess the Philosopher’s Stone; he is not only connected to the tradition of “hermetic” magic, but has also something of the Humanist Hermes, i.e. the ideal figure of the Renaissance savant.

Quite a few other commentators dealt with the figure of Hermes Trismegistus in the 16th century, not least → Francesco Patrizi, whose *Discussiones peripateticæ* (1581, see vol. IV) abounds in references to him. But already in Patrizi’s time – beginning in 1567 with Gilbert Genebrard – his great “antiquity”, and by the same token that of the hermetic writings, had been seriously called into question; what followed was an agonizing process of reappraisal, culminating in Isaac Casaubon’s demonstration, in 1614, that these writings could not have been written prior to the 2nd-3rd centuries A.D. (see Mulsow 2002, correcting Frances Yates, who had presented Casaubon as the first protagonist in the dating debate). In spite of this outcome, interest in Hermes Trismegistus did not disappear; but it occasionally took on additional forms, not least political ones. In the Elisabethan period, the figures of Hermes Trismegistus and Mercury were utilized with a view to justifying the pretension of realizing an ideal Empire. The idea that a “magical” or “Mercurian” monarch could achieve an ideal kingdom or empire seems to have first appeared in English literature with Edmund Spenser’s *The Faerie Queen* (1590-1596, see Book V), written under the reign of Queen Elisabeth. Spenser identified monarchy and → magic through the figure of Mercury, more specifically of Hermes Trismegistus – considered as a channel of divine influence. Elisabeth, herself interested in magic (she consulted → John Dee), was presented therein as the sovereign who would restore the Golden Age and undo the ravages wrought by the Fall of man. Elisabeth’s Protestantism was thus seen metaphorically as a return to the old “Egyptian” religion, as opposed to Catholic imperialism, understood as a perversion, to the true religion of Isis and Hermes Trismegistus. Likewise and much later, in his *Penseroso* (1645), in which Hermes is the central character, John Milton would link poetry, hermeticism and Protestant reform (see Brooks-Davies 1983). Later, in Germany, one

sees Hermes Trismegistus playing a similar role in W.Chr. Kriegsmann’s *Conjectaneorum de Germanicæ gentis origine, ac Conditore, Hermete Trismegisto* (1684), where he appears not as a benefactor of humanity in general, but only as the patron of the “German race”. Kriegsmann resorted to weighty philological demonstrations aimed at proving he had been the founder of the German people; he associated the Egyptian Thoth with “Theut” (by the same token, Hermes Trismegistus) and “Teutonic”.

Hermes Trismegistus continued to play a positive role as one of the guardians or representatives of true wisdom. For example, in Heinrich Nollius’ novel *Parergi philosophici speculum* (1623), which stands in the wake of early rosicrucian literature [→ Rosicrucianism], the hero, Philarethes, goes to Egypt in order to meet Hermes Trismegistus, who has been put in charge by God of instructing human beings about how to find the *arx fortunæ*. Likewise, the learned Jesuit → Athanasius Kircher (notably in his *Oedipus Aegyptiacus*, 1652) saw in him the inventor of the hieroglyphs and of the truths inscribed on the stone obelisks. Alchemical treatises (e.g. → Michael Maier’s *Symbola aurea mensa duodecim nationum*, 1617) occasionally devote an entire, laudatory chapter to him. Besides, many such books of the 17th century are rich in pictures on which Hermes Trismegistus appears, usually on the front page, either alone or in the company of personages such as Hippocrates, Galen, Aristotle, Geber, → Paracelsus.

At the dawn of the Enlightenment, in 1700, the Jesuit Joachim Bouvet, a mathematician and musician who was corresponding with Leibniz about the *I Ching*, wrote to him that this Chinese document ‘is like a symbol invented by some extraordinary genius of Antiquity, such as Mercury Trismegistus, to render visible the most abstract principles of all the sciences’. According to Bouvet, Fo-Hi (the supposed inventor of the *I Ching*) is the same as Enoch, who is the same as Hermes Trismegistus; and both are prototypes of Christ. He further claimed that Enoch/Fo-Hi/Hermes taught the mathematical symbols of that divinatory instrument to men endowed with superior intelligence. We also encounter him in Michel de Ramsay’s novel *Les Voyages de Cyrus* (1727). There, we learn through the discourse of a pontiff in Thebes that after a shipwreck Hermes Trismegistus’ mother gave birth to him on a desert island, but died shortly after. Then a goat fed him with its milk. He passed his early years in the desert eating dates. Eventually he was gratified with an apparition of ‘the First Hermes, or Mercury’, who taught him and gave him the name

“Trismegistus”. From that time on, he was called upon to become himself a great teacher in symbols and mysteries.

Many authors in alchemical literature followed in the footsteps of earlier ones, granting Hermes Trismegistus a distinguished place in their works. Editions of alchemical books in German show him decked out in Rococo style and decor (for example, Friedrich Roth-Scholz's *Deutsches Theatrum Chemicum*, 1728; F.J.W. Schröder's *Neue alchymistische Bibliothek*, 1772). Nicholas Langlet-Dufresnoy (*Histoire de la philosophie hermétique*, 1742) presented him as identical with King Siphos who reigned around 1900 B.C. In 1733 another alchemist, Ehrd de Naxagoras (*Aurum Vellus oder Guldenes Vliess*, 1733), claimed that ‘a plaque of precious emerald engraved with inscriptions was made for him after his death and discovered in his tomb by a woman named Zora, in the Valley of Hebron’. → Hermann Fictuld, in one of his alchemical/theosophical books (*Turba Philosophorum*, 1763), gave a long narrative halfway between mythical history and literary fiction. It opens with a scene representing Hermes, the Egyptian priest, strolling between the Elysian Fields and the Great World Ocean. This passage is designed to introduce a dialogue between Hermes and a few other fictitious persons and is partly inspired by Michael Maier's book (see above). Such examples are all the less surprising since “hermetic science” had come to be frequently used to qualify “alchemy”, with “Hermes” or “Hermes Trismegistus” designating the tutelary figure of that science.

Outside the pale of alchemy, Johann Gottfried Herder, in *Über die Älteste Urkunde der Menschheit* (About the Most Ancient Document of Mankind, 1774), presents Hermes Trismegistus and/or Thoth as the founder and inventor of numbers, letters, languages, etc., and hence as the great benefactor of humanity. In addition, in 1801 he wrote for his journal *Adrastea* a long poetical dialogue titled “Hermes and Pymander” (the two figures who appear in *Corpus Hermeticum* I). Shortly after, in his *Manière de se Récréer avec le Jeu de Cartes Nommées Tarot* (1783), → Etteilla (ps. of Jean-Baptiste Alliette) claimed that the Book of Thoth (i.e., the deck of Marseilles) had been devised by a committee of Sages presided over by Hermes Trismegistus himself in the 171st year after the Flood. Etteilla's book was to be newly edited and reprinted several times, and played an important role in encouraging further discourses about Hermes Trismegistus.

Also in the same period, he came to be identified with Hiram, mentioned in the Bible and present

in the Masonic degree of Master mason. Such is the case in a German or French fringe-masonic Rite established around 1790, the “Magi of Memphis”. The instructions of this Rite contain a series of drawings, one of which represents Hermes Trismegistus (instead of Hiram proper) rising from the grave and giving a statement ending with these words: ‘Remember me. My true name is Mercurius for the Egyptians, Thoth for the Phoenicians, Hermes Trismegistus for the Greeks, and all over the earth I am Hiram’. Prior to that picture, and besides others on paper, there survives a coloured painting on wood panel (63 × 142 cms.), anonymous and probably made around 1740, now in the Museum of Pharmacy in Basel; it depicts Hermes Trismegistus standing alone, carrying the armillary sphere and a scroll containing the first verse of the *Emerald Tablet* (see commentary in Neugebauer-Wölk 2001).

In the Romantic period, the figure of Hermes Trismegistus receded to the background, replaced as it was by other ones, Orpheus in particular. But later, in the period of the Occultist current, → Edouard Schuré, in his influential and heavily syncretistic book *Les Grand Initiés* (1889), devoted to “Hermes” – here again, a blending of Mercurius and Hermes Trismegistus – a long chapter, which is a vibrant homage. The other chapters deal with Rama, Krishna, Moses, Orpheus, Pythagoras, Plato and Jesus — therefore, what we have here is a chain of initiates comparable to that which had flourished in the Renaissance, but now extended to include Eastern traditions.

At the same time the personage also inspired the American writer Henry W. Longfellow, whose strong interest in esoteric traditions is well documented. His drama *The Golden Legend* (1851) contains a passage of twenty-four verses in which the Nile, Geber's alchemy, and Hephaistos, are evoked in a blend of Egyptian and Arabian wisdom. His poem “Hermes Trismegistos” (written around 1881) evokes in eighty verses the existence of a forlorn Tradition to be recovered thanks to Hermes Trismegistus, with whom the author identifies himself.

The American esotericist → Manly P. Hall ranges among the authors of the 20th century who were most influential in continuing to spread Hermes Trismegistus' image, not least through his book *The Encyclopedic Outline of Masonic, Hermetic, Qabbalistic and Rosicrucian Philosophy* (1928, in fol., several new editions). Not only does it contain a chapter and many other passages devoted to him, but it also presents what seems to be the latest noteworthy “portrait”. It is in colour, and shows Hermes-Thoth with his foot upon the back of

Typhon. The caption informs us that he is ‘the personification of Universal Wisdom’. He wears ‘the ancient Egyptian Masonic apron’, and is surrounded by other symbols (like dog, caduceus, scarab).

It is evident from these examples that Hermes Trismegistus as imagined and represented since the Renaissance has served many purposes. Often considered to have been a real person, he has thus been holding an intermediate position between Olympus and Earth, which contributed to make him an axial figure of the philosophical history of mankind, notably whenever he was seen as the representative par excellence of a perennial philosophy. In this respect, his enduring existence has been fostered by the production of a neo-alexandrian hermetic literature until the present time. He also appears to have been the patron of alchemy, a welcome symbol for egyptophilian settings, a kind of logo accompanying the titles of books, a name used to legitimate political aims, and occasionally an inspirational personage for novelists and poets. The existence of Hermes Mercurius, sometimes his twin or even siamese brother, as it were, may partly account for the variety of these roles. Indeed, Hermes Trismegistus possesses several of the essential attributes of Hermes Mercurius: mobility and mutability (an eclectic figure, Hermes Trismegistus easily adapts himself to various religious creeds); a liking for discourse and interpretation (he is the “inspirer” of the variegated forms of neo-alexandrian hermeneutics); and not least, his position at crossroads (as exemplified by the irenicism of neo-alexandrian authors).

ANTOINE FAIVRE

Hermetic Brotherhood of Luxor

A short-lived secret organization devoted to practical occult work, active in England, France and the United States in the mid-1880s but possessing an influence far greater than its size and duration might suggest. It came to public notice in late 1884 in the form of a notice appended to Robert H. Fryar’s republication of *The Divine Pyramider*, that advised searchers after the truth and Theosophists disillusioned with “Hindoo Mahatmas” willingness to dispense wisdom, to contact “Theon” in care of Fryar. The public propaganda continued in the pages of a journal published by the order, *The Occult Magazine* of Glasgow (February 1885-October 1886), and at that point the H.B. of L. already had corresponding members as far afield as Russia, France and the United States. The editor of the journal and Provisional Grand Master of the North (of Great Britain) was a Scotsman, Peter Davidson (1837-1915), a cabinet- and violin-maker and visionary with an interest in secret brotherhoods, Rosicrucians [→ Rosicrucianism] and magic mirrors. Associated with him in governing the H.B. of L. was Thomas Henry Burgoyne (born Thomas Henry Dalton; c. 1855-c. 1895), and beyond both of these, as Grand Master of the Exterior Circle, was → “Max Theon” (Louis Maximilian Bimstein; ca. 1848-1927), a Polish or Russian Jew. According to its own mythology (later adopted by → René Guénon and other advocates of the so-called “Hidden Hand” theory of history), the H.B. of L. was the outward manifestation of the Western branch of the Great Brotherhood of initiates and adepts, which differed from the Eastern branch (exemplified by the → Theosophical Society) in denying → reincarnation on this earth and in advocating active, practical magical and ritual work to gain individual spiritual advancement

(clairvoyance and astral travel). It was this magical practice, based almost exclusively on the sexual magical teachings of → Paschal Beverly Randolph, that primarily sets the H.B. of L. apart. The order's doctrinal and practical teachings were circulated to the scattered members by mail. The H.B. of L. recruited members largely from the ranks of the Theosophical Society and for a period can be said to have constituted a practical order within the T.S. composed of most of its leading lights: W.A. Ayton, → F.-Ch. Barlet (ps. of Albert Faucheux), A. Chaboseau, → Papus (ps. of G. Encausse), J.D. Buck, T.M. Johnson, Elliott Coues, and Eliot B. Page, among others.

The order came to naught when, in October 1885, it began touting and then raising subscriptions for a Colony Scheme – a project which promised to buy a large section of land in America where the members of the order could participate in the restored mysteries of antiquity. Ayton's name was used in the promotional material without his consent. When he discovered the deception, he made enquiries, found out that Burgoyne was actually Dalton, who had been convicted of a petty fraud in 1883, and hastily wrote to all concerned to denounce the imposture. Davidson and Burgoyne then fled to America. Davidson settled down in Georgia, near the place chosen for the colony, where he instituted a new Order of the Cross and Serpent, published a journal, *The Morning Star*, and continued to be active in various French occult groups around Papus. Burgoyne settled in Colorado and then California, making his living by writing and selling lessons on occult → astrology (published as *The Light of Egypt*) and continuing to initiate groups in the western United States into the mysteries of the H.B. of L. His work survives today in the form of the Church and Order of Light, which traces its origins back to “C.C. Zain” (Elbert Benjamin). At least some portion of the secret sexual teachings of the H.B. of L. also found their way, via Sylvester Clark Gould († 1909), into the Hermetic Brotherhood of Light and through it into the → Ordo Templi Orientis, and into the Societas Rosicruciana in America of George Winslow Plummer (“Khei”). Theon and his wife moved to Tlemcen, Algeria, where they continued the work of the H.B. of L. under the name *Tradition Cosmique* and trained, among others, Mirra Alfassa, who went on to become “the Mother” in Sri Aurobindo's ashram at Pondicherry.

Hermetic Literature I: Antiquity

I. INTRODUCTION 2. TECHNICAL HERMETICA 3. PHILOSOPHICAL HERMETICA (A. CORPUS HERMETICUM B. SOME TREATISES OF THE CORPUS HERMETICUM C. GREEK AND LATIN FRAGMENTS D. THE ASCLEPIUS E. COPTIC TEXTS F. THE ARMENIAN DEFINITIONS) 4. “GENERAL” AND “DETAILED” DISCOURSES 5. DATE AND PLACE OF ORIGIN OF THE PHILOSOPHICAL HERMETICA

I. INTRODUCTION

The literary works attributed to → Hermes Trismegistus reflect the various activities he was thought to have deployed. In accordance with his function as a teacher of → magic, → astrology, → alchemy and philosophically coloured religious knowledge, there are under his name magical spells, astrological and alchemical treatises and religious-philosophical discourses. In recent scholarship, there has been much discussion about the relationship between the “occult” magical, astrological and alchemical works on the one hand and the more philosophical religious tracts on the other. The two great scholars who worked on the Hermetica in the 20th century, Walter Scott and André-Jean Festugière, made an almost complete separation between the two kinds of literature. Festugière's distinction between “popular Hermetism” (*hermétisme populaire*) and “learned” or “philosophical” Hermetism (*hermétisme savant/philosophique*) became almost universally accepted. In recent research, however, the more neutral term of “technical Hermetica”

has become current for the magical, astrological and alchemical texts that go under the name of Hermes. This term indeed fits these texts better than the word “popular”, since they present primarily techniques to achieve personal objectives. The second kind of hermetic writings is still mostly called “philosophical”, and sometimes “theoretical”. The latter term should be avoided since it suggests that these works provide a theoretical basis for the technical, more practical Hermetica, which is by no means certain. In the first centuries of our era, Greek philosophy became increasingly religious and thinking about religion became more and more philosophical. To find confirmation of their ideas on ultimate reality, philosophers turned to divine revelation, and religious thinkers liked to express their beliefs in terms of Greek philosophy. Therefore, the term “philosophical Hermetica” is acceptable for almost all the works that are usually covered by that name, since they are strongly influenced by Greek philosophical ideas, especially those of Platonism and Stoicism. It would be wrong, however, to consider them as primarily philosophical works. On the contrary, they are essentially religious tracts, which make free use of Greek philosophical ideas to express their views on religious knowledge and individual salvation. As a matter of fact, the word “theosophical” would provide a better term, if it could be stripped of its modern connotations.

In recent research, the sharp distinction between technical and philosophical hermetic texts has been questioned. Scott and Festugière were convinced that the authors and audiences of the two kinds of hermetic literature were almost completely different. However, Garth Fowden has convincingly argued that both the technical and the philosophical hermetic writings emanated from the same cultural and religious milieu, namely that of Graeco-Roman Egypt in the centuries around the beginning of our era. According to Fowden, the technical and the philosophical Hermetica corresponded to successive stages on ‘the way of Hermes’, but there is no decisive proof for this contention. In some hermetic treatises initiation into the hermetic mysteries is attended by magic and astrology, but that does not imply that all magical or astrological texts ascribed to Hermes presuppose the typical ideas about knowledge and salvation that characterize the philosophical Hermetica.

Unfortunately, an edition of all the technical Hermetica in one or more volumes does not exist, but there are two editions of the Greek and Latin philosophical Hermetica. Walter Scott made an

edition in four volumes (1924-1936), with English translations and notes (the fourth volume, containing *testimonia* and fragments, was published by A.S. Ferguson). Though Scott’s works remains very valuable because of its wealth of information, the text edition itself is generally considered a failure, because of its hypercritical character, which resulted into a great number of unwarranted textual emendations. The standard edition of the Greek and Latin Hermetica, also in four volumes, has become the one published by A.D. Nock and A.-J. Festugière (1946-1954).

2. TECHNICAL HERMETICA

The basic idea behind the technical Hermetica, and the philosophical as well, is the notion that all things that exist, both in the spiritual and in the material world, in some way or another are interconnected. This universal coherence or *sympatheia* could be the basis for quite different practices. It enabled the magician to bend gods or daemons to his will if he knew the appropriate divine names and the required materials to make a spell, but it also enabled the astrologer to foretell which days would be auspicious or inauspicious to take certain actions, because of the unalterable course of the heavenly bodies (*fatum*). The art of alchemy was based on two fundamental assumptions. The first is that there is a material substratum, some kind of “first matter”, which forms the basis of ordinary matter, and the second that all precious metals derive from lead and therefore can be made from it by performing the right alchemical procedure. In the first volume of his *Révélation*, Festugière has collected, translated and thoroughly studied a great number of astrological, magical and alchemical texts and fragments in Greek and Latin that are ascribed to Hermes. Though most of these texts date from the first centuries of the present era, there is little doubt that similar texts already circulated in the Hellenistic (Ptolemaic) period. In his *Stromateis*, VI, 35-37, → Clement of Alexandria describes a procession of Egyptian priests, possibly derived from the Egyptian priest and Stoic philosopher Chaeremon (1st century A.D.), who each carry the symbols and books that mark their position in the hierarchy. Clement mentions forty-two books, which he all attributes to Hermes, i.e. Thot. Among them are books containing hymns and instructions concerning the cult of the gods, but also four astrological books, ten hieroglyphic books on cosmography and geography, Egypt, the Nile, the construction of temples etc., and six medical books. Similar books

are mentioned in a catalogue of books, inscribed on the walls of the library of the temple of Edfu. The library, which dates from 140-124 B.C., contained, *inter alia*, magical and astrological books, such as *Spells for the averting of the evil eye*, *Knowledge of the recurrence of the two stars* (i.e. sun and moon) and *Control over the recurrence of the stars* (cf. Fowden, 57-59). Hellenistic astrology owed only a little to earlier Egyptian observations of the celestial phenomena, even though its invention was ascribed to Thot/Hermes, but the Greek magical texts continued the early Egyptian magical literature under the name of Thot, even though they show unmistakable Hellenistic features.

3. PHILOSOPHICAL HERMETICA

A. THE *CORPUS HERMETICUM*

The standard edition by Nock and Festugière has the comprehensive title *Corpus Hermeticum* on the front-page of each of the four volumes. As a matter of fact, all the hermetic philosophical texts preserved from Antiquity could indeed be said to constitute one great hermetic Corpus, for they all have the same literary structure, that of a dialogue, and the same kind of teaching. However, the title *Corpus Hermeticum* (C.H.) usually refers to a specific Byzantine collection of 17 hermetic texts, and it is in that sense that also Nock and Festugière take the term in their introductions and notes. The Byzantine scholar Michael Psellus (11th century) seems to have known the C.H. proper in roughly its present form, but there are no witnesses that attest its existence in earlier centuries. Stobaeus (5th century, see below) cited parts of C.H. II, IV, and IX in his *Anthology*, but he apparently did not yet know the C.H. as a collection. Nevertheless, the Vienna hermetic fragments, published by Mahé, show that such collections already existed at an early date. These fragments, which date from the late second or early 3rd century, were apparently part of a collection of at least 10 numbered treatises, for fragment B contains the end of treatise number 9 and the beginning of number 10. Bishop Cyril of Alexandria [ca. 440] also knew a collection of 15 books, called *Hermaika*, which had been composed by someone in Athens (*Contra Julianum* I, 41), but his quotations show that he had not the present C.H. before him. This evidence proves that the C.H. as a collection may be much older than the 11th century.

The C.H. became known in the West through → Marsilio Ficino's Latin translation (1463; pub-

lished 1471) of a Greek manuscript that had been brought to Florence by the monk Leonardo of Pistoia, who presented it to Cosimo de Medici in 1460. This manuscript of the 15th century contains only the treatises I-XIV (Biblioteca Medicea Laurenziana, Plut. 71, 33, ff. 123^r-145^r; Gentile & Gilly, 41-43). Ficino apparently did not know that the Greek cardinal Bessarion, already in 1458 and also in Florence, had acquired a more complete 14th century manuscript of the C.H., which also contained the tractates XVI-XVIII (Biblioteca Nazionale Marciana [Venice], Cod. Marc. Gr. Z. 242 [= 993]; Gilly & Van Heertum, II, 15-16). Treatise XV has never existed. Adrien Turnèbe, the first editor of the Greek text (Paris 1554; Gentile & Gilly, 126-128), made a fifteenth tractate from some hermetic excerpts by Stobaeus. This artificial treatise was left out again by later editors, who, however, retained Turnèbe's numbering, so that the C.H. contains the treatises I-XIV and XVI-XVIII. Ficino gave his 14 treatises the collective title of *Pimander* (later editors wrote *Poemander*), after the title of the first tractate, *Poimandres*. However, the writings of the C.H. are not chapters of one and the same work, as Ficino thought, but completely independent compositions. The criterion that determined their selection into one collection is unknown. It has been suggested that Byzantine scholars selected them because of their relatively pure philosophical and religious contents; according to another view, they may have expurgated them of suspicious magical and astrological elements. As a matter of fact, the Coptic treatise *On the Ogdoad and the Ennead* (see below) gives these elements a prominent place in its description of an inner religious experience, whereas they are lacking in the otherwise closely related C.H. XIII. The *Asclepius* (see below) has in chapter 37 a famous passage about the theurgical conjuration of divine powers into the statues of the gods (a related idea is expressed in C.H. XVII), but the book as a whole is an excellent summary of hermetic religious philosophy. In view of the fact that magic and astrology were integral parts of the spiritual world in which the Hermetica originated, it may be assumed that magical and astrological elements appeared in many hermetic philosophical treatises. With respect to the C.H. we can only say that some cleansing by Byzantine editors cannot be excluded, but the *Asclepius* shows that there is no need to assume that this has happened on a large scale. It is not the place here to discuss the importance of the C.H. for our knowledge of classical → Hermetism, but some of its tractates deserve a closer examination.

B. SOME TREATISES OF THE
CORPUS HERMETICUM

C.H. I, the first tractate of the C.H., entitled *Poimandres*, is the most well-known and one of the most important hermetic writings, but at the same time it is singular because of its strongly mythological character. It is not a first-hand teaching of Hermes Trismegistus to a pupil but a report of an unnamed person about a revelation received from a divine being, who introduces himself as 'I am Poimandres, the intelligence (*nous*) of the supreme authority'. The recipient of this revelation was later identified with Hermes Trismegistus, as appears, *inter alia*, from the title in the manuscripts and C.H. XIII, 15. The idea that the divine *Nous* instructs Hermes is also found in C.H. XI. The name Poimandres has often been interpreted as "Shepherd (*poimèn*) of men (*andres*)", both in the later hermetic tradition and by modern scholars, but this is linguistically impossible. Peter Kingsley has convincingly argued that the name is a Greek form of the Egyptian *p-eime nte-rē*, 'the intelligence (or understanding) of Re', and that the rest of the introductory formula, 'the intelligence of the supreme authority (*tēs authentias nous*)', simply is a Greek translation of the name Poimandres.

After the introduction, the *Poimandres* presents, in the form of a vision, a cosmological, anthropological and eschatological myth, followed by the command to preach the hermetic message, and a final hymn. The *Poimandres* teaches a dualism between light and darkness, spirit and matter, but not an absolute dualism. Primeval matter was a watery substance that came into existence within the darkness, which somehow had originated out of the light. The light was the divine Intelligence or Mind (*nous*), and out of it appeared the Word (*logos*), which is the 'Son of God'. From this, the author immediately draws an anthropological consequence by establishing a distinct parallelism between God and man: 'That what sees and hears within you is the word of the Lord, and your mind is God the Father; they are not separate from one another, for their union is life' (I, 6). In the process of creation, the Word separated the elements, so that fire and air went on high, whereas water and earth remained below. The divine Mind, 'being androgynous and existing as light and life', gave birth to two other divine beings: a second Mind (*nous*), a craftsman, who created the seven planets 'whose government is called fate', and Man (*Anthropos*), who had his father's image and was loved by him as his own form and received from him the dominion over everything that had been made (I, 9-13). The heavenly Anthropos looked through the cosmic

framework and displayed the form of God to lower nature. Nature saw his shape in the water and his shadow on the earth, and she smiled with love (similar ideas on the Anthropos in → Gnosticism). When the divine Man saw the reflection of his image, he loved it and wanted to be united with it, and nature 'enfolded him completely and they united, for they loved each other'. For this reason, man is a double being: 'mortal because of the body, immortal because of the real Man' (I, 14-15). After a period of seven androgynous generations the human beings became male and female, for which no reason is given, and they were commanded to increase and multiply. This command is clearly influenced by Gen. 1:28, but it has some negative overtones, for the dissolution of androgyny entailed sexuality, procreation, birth and death. By all this, human beings run the risk of forgetting their divine descent, and, therefore, the injunction to increase and multiply is followed by the warning not to lose sight of one's origin: 'Let him who is endowed with mind (*nous*) recognize that he himself is immortal and that sexual desire is the cause of death, and let he so know all that exists' (I, 18). Who has understood himself comes to God (I, 21), which is the basic idea of hermetic salvation. In ascending to its origin the soul leaves its characteristic (mostly bad) features to the planets from which it had received them at its descent, and then, stripped of the astral influences, its real self enters the eighth sphere and joins the hymns sung by those who are there. Finally, they all ascend to the heaven above the eighth sphere, become powers and are merged in God: 'This is the final good for those who have received knowledge (*gnosis*): to become God' (I, 26).

After the command to preach the hermetic gospel, a short description of its contents and the reaction it received (I, 26-29), the *Poimandres* concludes with a hymn of nine lines, which might be called a triple Trishagion since all lines begin with "Holy": "Holy is God" (3x) and "Holy are you" (6x). The hymn passes into a prayer in prose, in which "Hermes" bears witness to his salvation: 'I go to life and light. You are blessed, Father' (I, 32). This hymn has also had an independent circulation and was even included in a Christian hymn book of the 3rd century, but most probably it was part of the *Poimandres* from the beginning. The hymn and the *Poimandres* as a whole are permeated with Jewish ideas, which suggest that this writing originated in a milieu in which Jews played an important part (Dodd, Philonenko, Pearson). Other elements can be best explained from an Egyptian background, which points to

Alexandria as its place of origin. Since the large Jewish community in Alexandria was almost completely extirpated during the revolt of A.D. 117-119, it seems probable that the *Poimandres* dates from the 1st century or the beginning of the second, which would make it one of the earliest hermetic writings. It has some central themes in common with the Gospel of John, e.g. God as life and light, but there is no indication of a direct Christian influence, let alone that it would represent a "paganization" of original Christian ideas (Büchli).

– C.H. IV has a double title: *The mixing bowl (Crater) or the Monad*, which refers to the two parts of this "Discourse of Hermes to Tat". The first part (IV, 1-10) argues, contrary to the whole Greek philosophical tradition, that intelligence or mind (*nous*) is not the possession of every human being, but a heavenly gift which may be added to his reasoning capacity (*logos*). As a result the text distinguishes between two classes of men, the 'reasonable people' (*logikoi*) and those who have received *nous*. Closely related ideas are found among the Valentinian Gnostics [→ Valentinus and Valentinians]. As a matter of fact, the *nous* of this treatise identifies with the *pneuma* that characterizes the Gnostic. Though being a gift of God, the *nous* is in this treatise at the same time a prize, in the form of a mixing bowl, which has to be won in the contest of life. The crater is presented as a kind of baptismal font, in which the souls of the *logikoi* that make use of their *logos* have to immerse themselves. It has often been suggested that this passage alludes to a hermetic initiatory rite or "sacrament", which implied the drinking from a crater, as in the Greek mystery religions. The second part of this treatise, which deals with God as a Monad, the origin and root of everything, remains within the framework of Greek philosophy.

– C.H. V is also a discourse of Hermes to Tat, entitled: *God is invisible and entirely visible*. It argues that God can be known from the contemplation of his works, which in itself is a common Stoic idea. According to the author, however, this is not a "natural" knowledge of God, for God is unknowable; it is a divine gift, an act of divine grace: 'Ask him the grace to enable you to understand so great a God, to permit even one of his rays to illuminate your thinking' (IV, 2).

– C.H. VI has often been used to demonstrate that in Antiquity there existed a radical negative form of Hermetism, alongside a more positive one. Starting from the common idea that the Good is in fact identical with God, the author draws a conclusion that would have been subscribed by radical

Gnostics only. It is aptly expressed in the title of the treatise: *The Good is alone in God and nowhere else*. For that reason, 'the cosmos is the plenitude (*pleroma*) of evil, as God is the plenitude of the good, or the good of God' (VI, 4).

– C.H. VII, entitled *Ignorance concerning God is the greatest evil*, is a hermetic sermon, an incitement to leave the drunkenness of ignorance behind and to seek the way to the 'gate of knowledge', where the pure light is and nobody gets drunk but all are sober and look with the heart at Him who wants to be seen, but who can only be seen by the *nous* and the heart. The human body is in the strongest terms described as an impediment to see the beauty of truth and the Good.

– C.H. X, entitled *The Key*, is a discussion of some basic hermetic tenets: God the Father as the supreme Good, the contemplation of God as a divine gift, ignorance as the greatest evil for the soul, the immortal Cosmos as the second level of being and mortal man as the third. This treatise is interesting in particular because of its doctrine of the soul and its fate after death (X, 13-25). The mind (*nous*) is enclosed within reason (*logos*), reason within the soul (*psychè*), the soul within the astral body (*pneuma*), which passes through veins, arteries and the blood and moves the living carnal body. At death the *nous* of a pious soul puts on its own garment of fire and becomes pure *Nous*, but the impious soul has to reincarnate in a new human body.

– C.H. XIII is one of the most important hermetic writings. It is a 'discourse of Hermes Trismegistus to his son Tat', entitled *A Secret Discourse on the Mountain about Rebirth and the Promise to be Silent*. As a matter of fact, it is a dialogue that is said to have taken place after Hermes and Tat had come down from a mountain. Hermes says about his own rebirth that he has come out of his former self into an immortal body, which has no colour and cannot be touched or measured; he is re-born in the divine *Nous* (XIII, 3). Tat is exhorted to turn into himself and to cleanse himself from the twelve tormenting spirits of the material world, which are somehow connected with the twelve signs of the Zodiac: ignorance, sorrow, intemperance, lust, injustice, greed, deceit, envy, treachery, anger, recklessness, and malice. They withdraw one by one from the one who receives God's mercy: 'This is the manner and meaning of rebirth' (XIII, 7 and 12). Spiritual rebirth is actualised by the arrival of ten good 'spirits': knowledge of God, joy, self-control, steadfastness, justice, generosity, truth, the good, life and light. Whoever has attained divine birth by God's mercy 'knows himself as constituted of these

powers and he rejoices' (XIII, 8-10). Within the exposition of the twelve bad and the ten good powers, the tractate somewhat unexpectedly describes a spiritual experience by Tat, which apparently is the effect of his own rebirth. This experience, in which he falls together with the whole cosmos (XIII, 11), differs from that of the ascent to the ninth sphere as described in the *Poimandres* and in the *Ogdoad and the Ennead*, which shows that initiation into the hermetic mysteries could lead to quite different mystical experiences. Through his rebirth Tat has been born a god, a child of the One, and he wants to hear the hymn of praise that according to the *Poimandres* was sung in the Ogdoad (I, 26). This song, the hymn of rebirth, can be heard in silence only; it cannot be taught; it is a secret kept in silence. Then follows, after some instructions, a beautiful hymn, which celebrates the beauty of the cosmos and the glory of its creator. It is indicated in the manuscripts as 'Secret Hymn Book, Song 4', which suggest that once it was part of a collection of hymns and may have had an independent circulation. Whether this is true or not cannot be established with any certainty, but it is by no means impossible, for also the hymns at the end of both the *Poimandres* and the *Asclepius* were transmitted independent of the texts to which they now belong. C.H. XIII concludes its report of a spiritual enlightenment with the words: 'Now you have come to spiritual knowledge of both yourself and our Father'.

– Whether the last three writings (XVI-XVIII) were part of the C.H. from the beginning or were added at a later date is difficult to decide, but they certainly stand a little apart from the rest of the collection. Not Hermes Trismegistus, or the Nous through Hermes, is the teacher but Asclepius (XVI), Tat (XVII, a fragment, in which a king is exhorted to honour the statues of the gods), and an unknown panegyrist, who hardly can be called a hermetist at all (XVIII).

C.H. XVI, which presents itself as a letter of Asclepius to king Ammon, is a distinct hermetic writing. It pretends to have been written in the Egyptian language, 'which preserves the (magical) power of the words', and urges the king not to have it translated, 'in order that these mysteries do not reach the Greeks' (XVI, 1-2). In this treatise, the Creator is identified with the Sun, whose energy gives life to the whole cosmos (XVI, 5-9). The role of daemons, who are subjected to the planets, is extensively discussed: they are not only responsible for natural catastrophes, such as earthquakes and volcanic eruptions, but also for the evil deeds of human beings, while at the same time they serve to

punish them for these deeds (XVI, 10-17). The tractate concludes with a summary of a hymnal character (XVI, 18-19). It praises God the Father and the Sun as the creator of everything: 'All things are parts of God, but if all things are parts of God, then everything is God. Therefore, in making all things, he makes himself'.

C. GREEK AND LATIN FRAGMENTS

The great number of quotations of now lost hermetic texts in authors of the 4th and 5th centuries shows that in late Antiquity many more hermetic philosophical treatises were in circulation than have been preserved today. The earliest quotation of a hermetic writing is found in Tertullian (ca. A.D. 200), *De anima*, 33, 2 (Nock & Festugière, IV, 104). Forty fragments have been preserved in the *Anthology* that John of Stobi, usually called Stobaeus, composed in the first decades of the 5th century for the instruction of his son Septimius. Ten of them derive from C.H. II, IV and IX and one from the *Asclepius*; they are valuable since they represent an earlier and better textual tradition than the preserved complete manuscripts. The other 29 fragments of Stobaeus were taken from hermetic writings that are now lost. Most of them deal with the central themes of hermetic philosophy, God, cosmos and man, but there are some remarkable exceptions. In *Fragm.* VI (NF III, 34-39), for instance, Hermes explains to his son Tat the activity of the 36 decans and their relationship with the other celestial bodies, which shows that astrology and philosophical Hermetism did not belong to completely separate areas. A very interesting fragment is Stobaeus' large excerpt from 'a holy book of Hermes Trismegistus' called *Daughter (or Pupil) of the World*, mostly indicated by its Greek title *Korē kosmou (Fragm. XXIII, NF III, 1-50)*. In this writing, the teacher is not Hermes but Isis, who instructs her son Horus after herself having been instructed by Hermes. 'All-knowing Hermes' is said to have written down all the cosmic mysteries before the creation of the world and to have hidden the books near the secret symbols of Osiris, with a prayer and magical formulas (XXIII, 1-8). Then follows an artificial myth about the creation of the cosmos: first God made Nature, then 60 different kinds of souls of diminishing grades of purity, and the bodies of birds, fish and quadrupeds. The human body was made to imprison and punish disobedient souls (XXIII, 9-52). Ignorance reigned on earth, but Osiris and Isis, 'instructed by Hermes of the secret ordinances of God' were appointed to regulate life on earth by giving laws and teaching crafts and sciences (XXIII, 53-70).

The author has apparently used a lost hermetic treatise as one of his sources, which explains the inconsistencies that can be observed in this work (Festugière, in NF III, CXXXIII-CLXVIII).

A considerable number of important fragments have been preserved in the Christian writers Lactantius and Cyril of Alexandria. Lactantius, who was born and educated in Africa, became a professor of Latin rhetoric in Nicomedia in Bythina by special request of the emperor Diocletian (284-304). Since he had become a Christian, he had to resign his chair in 303, when the Great Persecution began. About 317, the emperor Constantine the Great summoned him to Treves in Gaul to become the teacher of his son Crispus. In his most important work, the *Divinae Institutiones* in seven volumes, written between 304 and 314, he frequently invokes Hermes Trismegistus as a pre-Christian witness to Christ. The work contains a great number of hermetic quotations (Wlosok, 261-262), of which 13 are unknown from other sources (NF IV, 106-114). Some quotations are in Greek, which is sometimes very helpful to recover the original text, especially in the case of the Latin *Asclepius*. Lactantius himself composed an *Epitome* of his principal work, which has some value of its own, since he used the opportunity to make corrections and additions that sometimes affect his hermetic quotations.

Cyril of Alexandria, who occupied the Alexandrian see from 412-444, appealed 13 times to Hermes Trismegistus in his *Apology against Julian* (*Contra Julianum*), which was directed to emperor Julian's *Against the Galilaeans*. Cyril wrote this work between 430 and 440, when vehement polemics against Nestorius and the Nestorians, about God and man in Christ, monopolized his attention almost completely. That he nevertheless felt himself compelled to write this enormous work of at least 20 volumes, of which the first ten books have been preserved and fragments of books 11-20 exist (books 20-30 were probably never written), about 80 years after the death of Julian "the Apostat" (363), shows how dangerous he even then still considered Julian's attack on the Christians. Cyril did not embrace Hermes as wholeheartedly as Lactantius had done, but he adduced his testimony as a pre-Christian prophecy of the coming of Christ and even of the doctrine of the Trinity. Though he seems to have had a direct knowledge of hermetic sources, in some cases Cyril apparently borrowed his hermetic passages, and their interpretation as well, from a work on the Trinity, *De trinitate*, which by tradition and also by most modern scholars is ascribed to Didymus

the Blind (313-398), the last head of the famous Alexandrian School. In *Contra Julianum* I, 47, Cyril presents an alleged testimony of the Trinity by Plato and two hermetic fragments (nrs. 23 and 24, NF IV, 126-129), which, together with their interpretation, are already found in Didymus' *De trinitate*, II, 27, though not in the same order (Scott, IV, 171-173).

After the publication of the then known Greek and Latin fragments by Scott and Nock & Festugière some new material has come to light: the Greek Vienna fragments, published by Mahé (see above), and some Greek extracts, in the Bodleian Library, Oxford, published by Paramelle and Mahé, of which some derive from an otherwise unknown treatise *On the Soul* and others from a work called *Definitions*, which has been preserved in Armenian (see below). Another hermetic fragment, quoted by C. Iulius Romanus (3rd century) and preserved in Charisius (4th century), *Ars grammatica* II, 239, was noticed by I.G. Taifacos (Fowden, xvii).

D. ASCLEPIUS

The largest preserved hermetic treatise is the *Asclepius*, which has always had an independent existence. Its original Greek title was *Logos Teleios* (*Perfect Discourse* or *Perfect Revelation*), but the Greek text has been lost, except for a few fragments in later writers. Though some scholars prefer an earlier date, it was most probably written in the second half of the 3rd century. Augustine is the first to quote the Latin *Asclepius*, in his *City of God* (between 410 and 426), whereas Lactantius does not seem to know it, which might be an indication that the Latin translation dates from the 4th century. It survived among the works of Apuleius (ca. 150), who can hardly have been the translator of the Greek text, as has been suggested (Hunink), and it became the only known complete hermetic treatise in the West until the Renaissance.

The Latin *Asclepius* appears to be a rather free translation of the Greek *Logos Teleios*. That became apparent after the discovery of a Coptic translation of *Asclepius*, 21-29, which *inter alia* contains the famous "Hermetic Apocalypse" (24-26), in Codex VI of the Nag Hammadi Library. Comparison between the Latin and Coptic translations shows that the Latin translator took the liberty to abridge or expand the Greek original. A good example of the abridgement is offered by the description of the desolate state of the land of Egypt after the gods' withdrawal from the earth to heaven. Having said that in those days the Egyptians will be prohibited from worshipping God and even punished if they do so, the Latin text simply

says, in chapter 24: 'Then this most holy land, seat of shrines and temples, will be completely filled with tombs and corpses'. The Coptic translation, however, presents this prophecy in a more elaborate form, NHC IV, 70, 30-36: 'On that day, the country that was more *pious* than all (other) countries will become *impious*. No longer will it be full of *temples* but it will be full of *tombs*, neither will it be full of *gods* but (it will be full of) *corpses*.' The Latin translator has obviously suppressed the distinct antithetic parallelism of the original (pious/impious, temples/tombs, gods/corpses); the gods are even not mentioned at all. That the Coptic translation represents the original text is confirmed by Augustine's polemics against a pagan interpretation of this prophecy, in his *City of God*, VIII, 23-27 (van den Broek [1]). The discovery of the Coptic translation has also made an end to the widespread scholarly opinion that between Lactantius and Augustine the Latin "Hermetic Apocalypse" had been interpolated with allusions to the Christian persecution of paganism. These "allusions" were already to be found in the Greek text that underlies the Coptic translation and must necessarily have been written down before the persecution of pagan religions began. As a matter of fact, the idea that strangers will occupy the land and destroy the traditional religious institutions of Egypt is one of the stock themes of ancient Egyptian prophetic and apocalyptic texts (Mahé 1982, II, 68-113).

Of the original Greek text of the *Asclepius* only a few fragments are left. Two of them deserve to be mentioned here separately: a very influential quotation by Lactantius and the Greek version of the final hymn of the *Asclepius*. In his *Divinae Institutiones* IV, 6, 4, Lactantius cites the Greek text of the beginning of *Asclepius* 8, about the creation of the second god, which he interprets in a Christian sense as referring to the generation of the Son by the Father. The passage was translated into Latin by Quodvultdeus († ca. 453) in his *Adversus quinque haereses*, III, 4, a work that later gained great authority because of its attribution to Augustine. In a somewhat abbreviated and occasionally Christianized form the passage became one of the most cited hermetic texts in medieval theological literature. Its best-known variant is found in the famous representation of Hermes Mercurius in the Siena floor mosaic by Giovanni di Stefano (1488; van den Broek [2], 135).

The final hymn of the *Asclepius*, in chapter 41, has had an independent circulation. The somewhat lacunal Greek text is found in a magical papyrus in Paris, the so-called Papyrus Mimaut (Pap. Louvre, N. 2391), where it is part of a longer prayer. A Cop-

tic translation of the Greek text, usually called the *Prayer of Thanksgiving*, is found in Codex VI, 7 of the Nag Hammadi Library, where it immediately follows the *Discourse on the Ogdoad and the Ennead* (see below). Scholarly opinion is divided about the question of whether the hymn was part of the *Asclepius* from the beginning and afterwards started its independent circulation or that the process went the other way round. On the basis of the Latin, Coptic and Greek texts it has been possible to reconstruct the original Greek text to a high degree of probability. It is a beautiful hymn of thanksgiving for the gift of Gnosis, which glorifies the androgyne nature of the supreme God in such a bold language that the Latin translator thought it wise to mitigate it: 'We know you, O spiritual Light, O Life of our life. We know you, O Womb of every creature. We know you, O Womb that is pregnant by the member (*physis*) of the Father. We know you, O begetting Father who eternally exists' (NHC VI, 64, 22-29 par.).

It is impossible to detect a detailed structure in the *Asclepius*: the subjects discussed are only loosely connected, mostly by association, and often interrupted by the insertion of other material. But that does not diminish its importance, for it is an extensive compendium of ancient Hermetism, most probably based on existing hermetic treatises, which the author extracted and abridged 'without much intelligence' (Ferguson, in Scott, IV, x-xxxiii). It has the form of a discussion between Hermes, Asclepius, Tat and Ammon, situated in the *adyton*, the inner sanctuary, of an Egyptian temple. Already before Tat and Ammon have arrived, Hermes discloses to Asclepius a fundamental hermetic idea: 'All things are part of the One, or the One is all things' (*omnia unius esse aut unum esse omnia*). In the following discussion about the structure of the universe, matter and soul, gods and demons, the position of the human being receives special attention (ch. 6-12). The section begins with what might be the most renowned statement of the *Asclepius*, which had such a great influence on the Renaissance concept of man (→ Pico della Mirandola): 'Man is a great wonder, a living being to be worshipped and honoured' (*magnum miraculum est homo, animal adorandum et honorandum*). A special human faculty, which according to the *Asclepius* shows the greatness of man, is his power to create the earthly gods by conjuring heavenly powers into their statues (37, 38, cf. 24). This view has aroused the interest, and the opposition as well, of many later writers; it shows beyond doubt that the philosophical hermetists did not shun theurgical practices.

E. COPTIC HERMETIC TEXTS

The Nag Hammadi Library presented the scholarly world with three Coptic Hermetic texts and a scribal note about other hermetic texts in his possession. The Coptic translations of two important parts of the *Asclepius*, namely chapters 21-29 (NHC VI, 65, 15-78, 43; with the “Hermetic Apocalypse”), and chapter 41 (NHC VI, 63, 33-65, 7; the “Prayer of Thanksgiving”) have already been discussed in the preceding section. Between these two texts there is a note (NHC VI, 65, 8-14) in which the scribe directly addresses those who had commissioned him, declaring that he has only copied ‘this one discourse’ of the very great number of treatises that he had at his disposal, because he did not know whether his addressees already had them in their possession. It is improbable that this note was taken over from the Greek manuscript upon which the translator based his translation, but it remains undecided whether ‘this one discourse’ refers to the preceding hermetic text or to the subsequent translation of *Asclepius* 21-29. In any case, it shows that in the 4th century there existed much more Coptic translations of hermetic texts than the three that are extant in NHC VI. The discovery of the first of these three texts, preserved in NHC VI, 52-63, was a surprise, for it was not only completely unknown previously, but it also proved to be of great importance. It has lost its original title, but on the basis of its contents it is usually called the *Discourse on the Eighth and the Ninth (Sphere)* or *On the Ogdoad and the Ennead*. Interspersed with didactic explanations, it describes the mystical experience of a pupil who is initiated into the hermetic mystery. The first part of the treatise explains that the elevation of the pupil’s mind into the eighth and the ninth sphere is not only a personal experience but at the same time the adoption into the brotherhood of the hermetic community, which makes him a son of Hermes Trismegistus. The initiate’s future brothers, all sons of Hermes Trismegistus, join his prayers during the initiation (VI, 52, 1-54, 22). The vision of the eighth and the ninth spheres concludes a way of spiritual progress, which comprised a study of hermetic books (VI, 54, 6-32) and a pious life. This was apparently compared to a journey through the seven planetary spheres, VI, 56, 27-32: ‘We have already advanced to the seventh sphere (the Hebdomad), since we are pious and walk in your law and always fulfil your will’. After a prayer to the supreme God, ‘to whom one speaks in silence’ (VI, 56, 11-12), Hermes and his pupil embrace each other (VI, 57, 26-27) and then experience the coming down of the divine Light-power. In this experi-

ence, the initiator, Hermes, somehow becomes identical with the supreme Mind that reveals itself, and the initiate attains an ecstatic state of mind: ‘I see myself. I want to speak. Fear restrains me. . . . I see a fountain bubbling with life! . . . I have seen!’ (VI, 58, 8-14). Language is of no use any more; to sing a hymn in silence is the only way to adore the divine Mind [-> Hymns and Prayers], just like the souls and the angels do in the Ogdoad (VI, 58, 17-21; 59, 28-32). A discussion of the importance of singing spiritual hymns in silence, with some examples of this form of mystic prayer, concludes the description of the initiation proper (VI, 58, 17-61, 17). Moreover, the initiate is exhorted to keep silence about his experience: ‘Do not speak about the vision from now on. It is proper to sing a hymn to the Father until the day to quit the body’ (VI, 60, 3-5). It is of interest to note that the author speaks about prayer in words that betray a distinct biblical influence. In VI, 55, 10-14, Hermes says that it is fitting ‘to pray to God with all our mind and all our heart and our soul’, and in 57, 18-23, he calls the hermetic prayers spiritual sacrifices, ‘which we send to you with all our heart and our soul and all our strength’. It will be clear that this phraseology is strongly coloured by one of the basic texts of Judaism, Deuteronomy 6:5: ‘You must love the Lord your God with all your heart and all your soul and all your strength’ (cf. Mark 12:29 par.).

One of the most interesting features of *The Ogdoad and the Ennead* is its use of magical and astrological elements. The supreme God is addressed by the same enumeration of the seven vowels that is often used in magical papyri to express the deity’s hidden name. In VI, 56, 17-22, the series of vowels is preceded and followed by the magical names *Zōxathazō* and *Zōzazōth*. Each vowel is followed by a series of omegas (with scribal mistakes after the vowels *i* and *ō*): ‘*Zōxathazō*. a *ōō*, ee *ōōō*, ēēē *ōōōō*, iiiii *ōōōōō*, ooooo *ōōōōōō*, uuuuuu *ōōōōōōō*, *ōōōōōōōō* *ōōōōōōōōō*. *Zōzazōth*’. A similar but not identical series is found in the prayer at VI, 61, 8-15 (with three scribal mistakes): ‘I praise you. I call your name that is hidden within me: a *ō*, ee *ōō*, ēēē *ōōō*, iiiii *ōōōō*, ooooo *ōōōōō*, uuuuuu *ōōōōōō*, *ōōōōōōō* *ōōōōōōōō*’. Immediately after this prayer, Hermes instructs the initiate to write down what had happened on turquoise steles in hieroglyphic characters and to place them in his sanctuary at Diospolis (most probably Diospolis Magna, Thebes, which possessed a temple of Thot). The steles should be guarded by the sun and eight guardians, those on the right being male and frog-faced, those on the left female and cat-faced. They have to be placed

there at an astrologically important moment, when the sun is in the first half of the day and the planet Mercury (Hermes) is in the Sign of the Virgin and has passed 15 degrees, i.e. when the influence of Hermes' planet is most strongly felt (VI, 61, 18-62, 20; Mahé [1978] I, 129-130). The treatise ends with an oath to be sworn by everyone who reads the book: he has to swear by the four elements, the seven rulers of being and their creating spirit, and 'the unbegotten God and the self-begotten one and him who has been begotten'. Who keeps this oath will be reconciled with God and the deities mentioned, but who violates it will experience their wrath (VI, 22-63, 30). All this shows again that hermetic authors who described highly spiritual experiences felt no hesitation to make use of magical and astrological ideas and practices: it all belonged to their world.

F. THE ARMENIAN DEFINITIONS

The Coptic *Discourse on the Eighth and the Ninth Sphere* and the Armenian *Definitions of Hermes Trismegistus to Asclepius* are the most important hermetic texts discovered in the 20th century. The Armenian translation of the original Greek text most likely dates from the second half of the 6th century. It was first edited with a Russian translation in 1956, but it was only through Mahé's magisterial edition, translation and commentary (1982, II) that its basic importance for the study of Hermetism became clear. Some Greek fragments of the *Definitions* have been discovered in the Bodleian Library, Oxford (Mahé & Paramele, 1990-1991), which have been integrated into Mahé's English translation of the Armenian text (1999). The *Definitions* do not have the usual form of a dialogue; they are a collection of short, often aphoristic summaries of the main points of hermetic doctrine. A similar collection has been preserved in Stobaeus' *Fragm.* XI. In C.H. XIV, 1, Hermes seems to refer to such collections, when he writes to Asclepius that he will send him a summary of the most important points (*kephalaia*) he had discussed with Tat. These short sentences apparently had a mnemonic function (Stobaeus, *Fragm.* XI, 1), which explains that, with variations, they turn up through the whole of ancient hermetic literature. At the same time, they are meant to be the object of silent meditation: 'When you keep silent, you understand; when you talk, you just talk' (*Def.* 5, 2). The *Definitions* 'as a whole can be regarded as a general outline of hermetic spiritual exercises aimed at developing individual *nous* and making the disciple worthy of undergoing mystic initiation' (Mahé 1999, 103). They deal with the three great themes of hermetic thought – God,

world and man –, which can be distinguished from one another but not completely separated: 'God is within himself, the world is in God, and man is in the world' (7, 5). The *Definitions* predominantly deal with the world (2-3) and man (4-10), but the relationship of these 'images of God' to each other and, above all, to God himself is never lost sight of.

The aphoristic nature of Stobaeus' *Fragm.* XI and the *Definitions* has led Mahé to an interesting theory about the development of hermetic literature, not in a pure chronological but in a more ideal-typical sense. According to him, the earliest form of hermetic literature was a series of independent sentences expressing the basic ideas of hermetic religious philosophy, such as still found in Stobaeus' *Fragm.* XI. The next step was the grouping together of related sentences into chapters, as in the *Definitions*. In the third stage, the sentences were linked together into a coherent treatise, which might be interspersed with reflections and didactic expositions. Even in such mythological texts as the *Poimandres* (C.H. I) the hermetic maxims appear at the key points of the myth, determining both its structure and the arrangement of the mythic elements borrowed from older sources (Mahé 1982, II, 408-436). Moreover, based on the observation that the *Poimandres* reflects a considerable number of sentences of the *Definitions*, Mahé dated the original Greek version of the latter work to the 1st century A.D. Moreover, he also tried to establish a direct link with the earlier Egyptian wisdom literature (also Mahé 1999). These views have met with strong opposition from Fowden (71-72). It should be observed, however, that the development from hermetic sentence to hermetic treatise, as described by Mahé, has a distinct and undisputed parallel in Greek gnomic literature, as can be seen from an analysis of the sententious structure of Porphyry's *Letter to Marcella* and, on the Christian side, the *Teachings of Silvanus*. Though the Egyptian connection is not to be excluded completely, it seems quite certain that the literary forms and contents of the hermetic sentences and treatises are more closely related to the Greek gnomic tradition than to Egyptian wisdom literature.

4. "GENERAL" AND "DETAILED" DISCOURSES

In the hermetic literature itself, a distinction is made between "general" and "detailed" discourses. This may be no more than a literary device, reflecting the usual practice in philosophical school teaching (Festugière, *Révélation*, II, 34-40), for there are no hermetic treatises that explicitly designate themselves as general or detailed discourses. Hermes (C.H. X, 1 and 7;

Stobaeus, *Fragm.* III, 1; Vienna, *Fragm.* B, 6; *Ogdoad and Ennead*, NHC VI, 63, 2) or his pupils (C.H. XIII, 1; Stobaeus, *Fragm.* VI, 1) often refer to the “General Discourses” (*genikoi logoi*), which Hermes had delivered previously. C.H. X presents itself as a summary of the general lectures Hermes had given to Tat the preceding day. The second category of hermetic discourses is mentioned by Cyril of Alexandria (*Contra Julianum*, I, 46; NF IV, 135/6, *Fragm.* 30), who quotes a teaching of Hermes from ‘the first of the Detailed Discourses (*diexodikoi logoi*) to Tat’. The word *exodikos*, a shorter form of *diexodikos* and also meaning “detailed”, most probably appears in *Asclepius* 1, when Hermes says that he has written many *physica* and *exotica* for his son Tat. Here the word *physica* seems to refer to the technical Hermetica and the word *exotica* to the “detailed discourses”. An interesting passage of the Coptic *Discourse on the Ogdoad and the Ennead*, mentions both kinds of hermetic instruction, NHC VI, 62, 33-63, 8: ‘And he who will not first be begotten by God should stick to the general (*genikos*) and detailed (*exōdikos*, corruption of *exodikos*) discourses. He will not be able to read what has been written in this book, although his conscience is pure within him . . . Rather by stages he advances and enters into the way of immortality’. Most of the preserved hermetic treatises can be assigned to these two types of hermetic instruction, though it is often impossible to distinguish them clearly. They suggest that the aspirant initiate was first instructed on an elementary level and then in a more detailed and fundamental manner, as succeeding stages on the way to initiation. The initiation itself, the direct vision of God, is a personal experience, which is not described but only hinted at in the hermetic oral or written instruction. This idea is clearly expressed in the opening sentence of C.H. XIII: ‘In the general lectures, O Father, you spoke in riddles and not openly about the divine nature. You have not revealed anything, saying that nobody can be saved before rebirth’. The only works that describe the initiation proper, though interspersed with didactic expositions, are C.H. XIII and the *Discourse on the Ogdoad and the Ennead*, but the quotation of the latter work, cited above, shows that the real meaning of these works can only be understood if one has been ‘begotten by God’, i.e. after the initiation.

5. DATE AND PLACE OF ORIGIN OF THE PHILOSOPHICAL HERMETICA

Since Hermes was thought to have lived in remote Egyptian antiquity, his works were also generally dated to a time that long preceded

Graeco-Roman civilization. The hermetic writings sometimes explicitly claimed to have been translated from the Egyptian (see about C.H. XVI above), but implicitly this was suggested by all of them. The idea of the extreme old age of the hermetic literature held the field until the beginning of the 17th century. That Luther had already declared the *Asclepius* a fraud in the thirties of the preceding century remained widely unnoticed. In his *Disputations* (ed. Hermelink, Weimarer Ausgabe, 39, 1, 179-180), he argues that the Greek philosophers did not know anything about God the Creator and man made of the dust of earth. He refers briefly to Augustine, who in his *Confessiones* VII, 13-14, had said that in the books of the Platonists he had found the same ideas about the Word of God that are also to be found in the first chapter of the Gospel of John, with one exception: that the Word became flesh. Then Luther continues: ‘But Hermegistus (*sic*) composed that book of Plato and stole everything from the Gospel of John. That book then came into the hands of Augustine and by its persuasive force he was deceived’. The suggestion is that Augustine’s Platonists did not teach similar ideas as John in his Gospel, but that they were dependent on it. It seems that Luther with ‘that book of Plato’ meant the *Asclepius*, which was extensively discussed by Augustine in his *City of God*, and not only in a negative sense. But the final blow to the idea that the Hermetica were authentic writings of the Egyptian sage Hermes Trismegistus came from Isaac Casaubon (1559-1614). He was not the first to put the authenticity of the Hermetica, or at least of some parts of it, in doubt (Purnell; Mulsow), but his criticism proved to be decisive, even in the eyes of those who adhered, and continued to adhere, to the hermetic world view (Grafton). In 1614 Casaubon published his *De rebus sacris et ecclesiasticis exercitationes XVI*, in which he attacked Cardinal Cesare Baronio’s *Annales ecclesiastici* (12 vols., 1588-1607). He shared with Baronio the common view that Hermes was a historical person, who had lived in Egypt before Moses and had invented the art of writing and all kinds of sciences. What provoked his reaction was Baronio’s passing remark that there had been pre-Christian pagan prophets, such as Hermes Trismegistus, Hydaspes and the Sibyls, who had predicted the coming of Christ. Against this view Casaubon’s main arguments were: 1) that the book *Poemander*, i.e. what we now call the C.H., was completely unknown to pre-Christian authors, which leaves little doubt about its pseudographic character, 2) that it could not have been written by Hermes, because it is inconceivable that God had already revealed the coming of Christ to a

pagan before the Law was given to Moses, 3) that the hermetic writings ‘do not contain the Egyptian doctrines of Mercurius, but ideas which are partly Greek, taken from the books of Plato and the Platonists and often with the same words, partly Christian, drawn from the Sacred Scriptures’. In his discussion of these groups of texts, Casaubon showed his great philological skill and vast knowledge. He pointed out that the style and vocabulary of the Hermetica are typical for the late Greek and Christian period, without any indication that they had been translated from the Egyptian. He found a strong Christian influence especially in the treatises I, IV and XIII of the C.H. Casaubon’s criticism, especially his philological arguments, convinced all serious philologists and historians. After him, it became an established fact of classical scholarship that the Hermetic writings date from the first centuries of our era and betray a strong influence of later Platonism and Stoicism. The great hermetic studies published by Scott and Festugière in the 20th century, with their wealth of philosophical parallels, marked the culmination and the completion of the philological tradition that was inaugurated by Casaubon. These scholars, however, did not share his argument about the Christian inspiration of at least some of the hermetic writings, though this idea has been revived in more recent scholarship, without much success (Büchli). There is no need to doubt that the seemingly Christian elements were current in the spiritual milieu the Hermetica came from, whereas the obvious biblical expressions and ideas are due to a direct or indirect Jewish influence. After Scott and Festugière, scholars have become more sensitive to the possible and actual presence of original Egyptian elements in the Hermetica (Mahé, Fowden). There is a general scholarly consensus that the treatises that abound in biblical expressions and ideas, such as C.H. I and VII, belong to the oldest layers of Hermetic literature, probably dating from the first or the beginning of the 2nd century. There are also good reasons to date the *Asclepius* to the 3rd century, but for the bulk of the hermetic writings it is virtually impossible to go any further than to ascribe them to the first three centuries of our era.

The spiritual climate that pervades the Hermetica points to Alexandria in Egypt as the place of origin of the hermetic world-view. For that reason it is mostly assumed that the hermetic treatises were written in Egypt too. For some of them, for instance the *Poimandres* and the *Discourse on the Ogdoad and the Ennead*, an Alexandrian origin is indeed very likely, but it is quite possible

that elsewhere in the Roman world adepts of the “way of Hermes” set themselves down to compose hermetic treatises as well. There is no reason to assume that the man in Athens, who according to Cyril of Alexandria composed a work called *Hermaika* in 15 books, was an exception.

- C. LATIN ORIGINALS
2. CEREMONIAL MAGIC
3. THE FORTUNE OF HERMETIC CEREMONIAL MAGIC IN LATIN: TRANSLATIONS AND DISPUTES

A. PHILOSOPHICAL-RELIGIOUS HERMETISM

The Hermetic literature in Latin of the Middle Ages inherited from ancient → Hermetism (known just partially from Greek and Arabic versions) ambiguities and problems which would characterize it for centuries: the unresolved differences between philosophical-religious doctrines and operational techniques (→ magic, → astrology, →

alchemy); the inner tensions of the *Asclepius*, suspended in a cultural *koiné* that combines late Platonism and Stoicism with a ceremonial theurgy of Egyptian origin; and the mythological origin of → Hermes Trismegistus (Mercurius in Latin), seen as a primal source of wisdom, who appears at times as a prophet of monotheism and at times as the founder of idolatry, a source of spiritual truths and inventor of demonic liturgies. But beyond the difficulties inherited from ancient Hermetism, the Middle Ages had to face still others in its attempt to achieve a consistent exegesis: the formation of a Hermetic tradition in the Arab world; the cross-circulation of texts in different linguistic areas (Latin, Hebrew, Arabic) with complicated transitions from one area to another; and the emergence of pseudo-epigraphs and the attribution to Hermes of works by different authors, which credit him with doctrines extraneous to his tradition. And yet the most complex problem for the historian lies in the diachronic character of medieval Hermetism: while in fact the *Asclepius* was already known and commented on in late antiquity, other works were translated only in the 12th and 13th centuries, and eventually they all merged, together with famous pseudo-epigraphs – such as the *Liber viginti quattuor philosophorum* and the *Liber de sex rerum principiis* – and disparate attestations, into an ensemble, the outlines of which are confused and undefinable.

For these reasons we consider it appropriate to describe the evolution of medieval Hermetism and the reactions it produced by following a differentiated route. Up to the 12th century we will examine the entry of the *Asclepius* into Latin culture; thereafter the works that were erroneously ascribed to Hermes and the translations of the technical-operational texts in the 12th and 13th centuries; lastly, the relationships of the *Asclepius* to Hermes' other writings in the interpretations of the great medieval masters up to → Nicholas of Cusa.

1. THE ASCLEPIUS IN LATIN PATRISTICS

The historical precedents, that open the way for a Christian interpretation of philosophical Hermetism and condition that interpretation for centuries to come, originate in the 4th and 5th centuries. Lactantius and Quodvultdeus, on the one hand, and → Augustine, on the other, offer two opposing paradigms of response to the *Asclepius* and to the few Hermetic fragments passed down by Christian writers (Tertullian, pseudo-Justin, Arnobius and Philastrius of Brescia). It may safely be said that the long trail of philosophical Hermetism in the Middle Ages begins with Lactantius. In his

Divinae institutiones (304-313) he cites numerous fragments, which largely derive from the original Greek of the Latin *Asclepius*, known under the title of *Logos Teleios*. Hermes Trismegistus, writes Lactantius, proclaims the majesty of the supreme and only God, whom he, like the Christians, calls Lord and Father. Unbegotten, God created the universe and rules it with eternal providence; and without a name because of His unity (names are necessary only in the multiple), He is unintelligible to the mind. Man was created *ad imaginem Dei*, and if he raises his intellect up towards a knowledge of the divine he escapes the laws of fate and the power of evil demons. The “baptism” which Lactantius thus bestows on Hermes culminates in an interpretation of the universe – the “second god” of the Hermetic triad (God, world, man) – as a prophetic proclamation of the Word made flesh. The *deus sensibilis* of the *Asclepius* becomes the God made man of the Christian revelation: first-born son of the supreme God, brimming with the greatest power, He has by His wisdom been operative in the creation of the world. And in the famous “Apocalypse” of the *Asclepius*, where Hermes describes the “aging of the world” and the approaching empire of evil, he announces the dispatching of the Son onto the earth for the sake of the world's renewal and the salvation of the righteous.

A century later, in book VIII of *De civitate Dei* (415-417), Augustine proposes to the Christian conscience a different interpretation of the *Asclepius*, which had been translated into Latin toward the end of the 4th century. After having condemned the doctrine of Apuleius – who regarded demons as necessary mediators between gods and men and did not distinguish their cult from true religion – Augustine turns the arrows of his criticism against the theurgy of the *Asclepius*. Hermes the Egyptian distinguishes between the gods created by God, who animate heaven, and the “earthly gods” created by man, that is the spirits who through hymns and incantations are induced to dwell in temple statues so as to grant prayers and work good and evil. But it is ridiculous to believe that the gods, evoked and, by unknown procedures, shut inside the simulacra built by man, have a power greater than that of man, who was created in God's image. And in the Hermetic “Apocalypse”, which foretells the disappearance of religion in Egypt, Hermes bewails the future triumph of Christ and the coming to grief of demons. I do not understand, writes Augustine, by what obfuscation of the heart a sage, who said many truths concerning the only and true God, the creator of the world, could be plunged into distress by the incumbent defeat of the wicked

angels. Hermes, indeed, not only confesses that the art of fashioning the earthly gods was invented by his ancestors because they lived in error and ignorance of God, but despairs in view of the future disappearance of the idolatrous rites and gives voice to the terror-stricken dismay of the demonic spirits.

It is striking how the conflicting readings of Lactantius and Augustine appear to be supported by exegetic misunderstandings (just how “innocent”, we do not know) of a philological and philosophical nature. On the one hand, Augustine attributes to Hermes the confession that the cult of holy statues was born from the religious ignorance of his ancestors; on the other, Lactantius interprets the created world, the second god of the Hermetic hierarchy, as the Word made flesh. The fact remains however that, although the interpretation of the *Asclepius* would continue to produce conflicting judgments in Christian culture, from the very onset these interpretations are marked by a forced and ideological position. Two such differing interpretations of Hermetism came about, in African Christianity toward the end of antiquity, because of opposing needs. Lactantius, an illustrious pagan rhetorician prior to his conversion, wanted to demonstrate the concordance of ancient wisdom with revealed truth; Augustine, a bishop and shepherd of souls, aspired to demolish the persistent forms of idolatry and superstition among the population of the faithful. If the unquestioned authority of Augustine did not prevail in Christian reflection, this did not depend on the force of his arguments, but on a literary event which originated in the preaching of Quodvultdeus, bishop of Carthage at the time of the Vandalic invasion and later exiled in 439 to Campania, by King Genseric. In his *Tractatus adversus quinque haereses* Quodvultdeus accepts the exegesis of Lactantius, simplifies it, and emphasizes the knowledge of the Son of God evident in the words of a pagan like Hermes. The Greek title *Logos teleios* is translated as *Verbum perfectum*, the divine Word, and Hermes’ comments on the ineffable perfection of the Son and the immense joy of the Father are related to the Gospel of St. John and the Old Testament *Proverbs*. Thus refuting the unbelieving pagan, Quodvultdeus exclaims: ‘I will not expound my authors to you, Mercurius is yours . . . Heed him, let him convince and vanquish you so that in being defeated you may yield to him and so believe me’. The *Tractatus* perhaps would never have had a decisive role in the encounter of Christian theology with Hermetic thought if his homilies had not come to be included in the African collections attributed to Augustine and placed under the high authority

of his name. So it happened that the vehement invective of the *De civitate Dei* against Hermes’ demonic simulacra was countered and neutralized by the enthusiastic plea for a concordance between Hermetism and Christianity found in the *Tractatus* attributed to Augustine.

2. THE ASCLEPIUS IN THE 12TH CENTURY

In the many centuries that pass between the dissolution of the Roman Empire and the Renaissance of the 12th century, Hermetism seems to disappear from the scene of Latin culture. Its rare occurrences are limited to the erudite citations of Fulgentius in the 5th-6th century, a new translation of Greek fragments (mentioned by Lactantius) by Sedulius Scot in the 9th century, and lastly, in the 11th century, the criticisms by the poet Warnerius of Basel in his *Paraclitus* and above all by Adalbold of Utrecht in his commentary on Boethius: Hermes and Plato, devoid of faith and too ingrained in philosophical thinking, did not know about the generation of Wisdom which governs the universe.

It is only in the 12th century that we witness a revival of the *Asclepius*, in the wake of pseudo-Augustine’s (Quodvultdeus’) concordizing interpretation, and as a result of direct reading of the Hermetic dialogue. With respect to the former aspect, some authors see in the *Tractatus adversus quinque haereses* the authoritative declaration of an agreement between the *Logos Teleios* (*Logos Teleios*) and the Christian revelation of the Son: this is the case with Abelard, John of Salisbury and Robert of Melun, Alan of Lille and the *Liber Alcidi de immortalitate animae*. Abelard in particular, engaged in demonstrating the natural revelation of the trinitarian dogma, in many of his writings examines the words of the *Tractatus* and with linguistic-semantic sapience absolves Hermes regarding his lexical imprecisions: even the Scriptures, the Fathers and Boethius, he writes, sometimes spoke improperly of the eternal generation of the Word.

But it is the authors who themselves read the codices of the *Asclepius* who supply the first responses of medieval thought to the Hermetic text. Theodoric of Chartres, perhaps the subtlest thinker of the 12th century, derives from it the theme of the spirit which governs the universe (identified with the Platonic *anima mundi* and with the Holy Ghost of the Christians), the concept of destiny as causality within created order, and the hope of deification. Still more profound is the dialectical relationship he establishes between the Hermetic idea of an ineffable God and the doctrine of *unus-omnia*, between the solitary transcendence of God and His ordering presence in

creation. Bernardus Silvester in his *Cosmographia* (a philosophical poem in prose and verse, which describes by means of imaginative allegories the birth of the universe and the formation of man) peoples the astral scenario of the cosmogonic myth with the *dei intelligibiles* of the *Asclepius* (Imarmene, Pantomorphos, Usiarchi). The Hermetic glorification of man, *magnum miraculum*, composed of eternal and mortal substance and placed at the center of the world to worship God and govern the earth, inspires Bernard to a bold and unusual vision of man: dweller of the upper and the lower regions, god and earth together, man is destined to love the gods and to perfect creation, to learn the secret reasons of things, and to dominate the universe as sovereign and pontifex. And with a sensitivity akin to the *Asclepius* but altogether rare in medieval consciousness, Bernard places the natural and joyous fecundity of the sexes in the earthly regality of man. Subsequently, in Alan of Lille we find a frequent use of and intimate adhesion to Hermetic theology and cosmology. In his *Summa Quoniam homines* and *Contra haereticos* Alan appeals to the Egyptian sage, mentioned among the great philosophers of the past, with respect to numerous questions: the unity of God, His omnipotent, incomprehensible and ineffable nature, the rejection of Manichaean doctrines, the denial of eternal void, the creation of man, and the immortality of the soul. But his exegesis becomes boldest and most contentious when he ascribes to the *Asclepius* (23: 'god created the eternal gods') a prophetic awareness of the trinitarian dogma: "God" designates the Father; "the eternal gods", the Son and the Holy Ghost. As Abelard had already observed elsewhere, even in the book of *Ecclesiastices* the word "create" is synonymous with "beget". In this interpretation we encounter the attempt, common in the 12th century, to perceive in the pagan authors traces of revealed truth, in line with the unequivocal message of "Augustine" in the *Tractatus adversus quinque haereses*.

An identical perspective guides the *Glosae super Trismegistum*, a lengthy commentary on the *Asclepius* (which unfortunately has survived only in part) composed around the turn of the 13th century. Considering its style, language, topics and doctrinal conclusions, the work can be attributed, if not to Alan of Lille himself, then to one of his disciples or to a *magister* of his circle. The commentary, which in the surviving manuscript treats the first four chapters, must have been quite long. The picture of Mercurius in the prologue defines the exegetic project: 'Mercurius precedes all the pagan philosophers. We know that he wrote many

volumes on the supreme creator of things, and since more than the others he reflected on the mysteries of the heavenly realities, not only was he very honored in life by the philosophers, but even after his death it is said that they honored him with a divine cult. Of his published volumes on the heavenly realities, one, as Augustine testifies, is entitled *Logos Tileos*: in this, after having surpassed all in his other volumes, he surpassed even himself, and in his speculations on the Father and the Son seems to come close to our theology. There is also another of his works, now in our possession, which is entitled *Trismegistus* or *Mercurius*'. Describing the text according to the traditional model of the *accessus*, the author illustrates its aim, subject and the reason why he wrote it. Its aim is to treat the three main causes of the world – God, the archetypal world and primordial matter – by demonstrating the harmony of the world and the relationship between creator and creature. The subject is the philosophy of nature and mathematics; but when Hermes expounds his doctrine on created spirits and the uncreated Spirit, he does not abandon the mysteries of theology. He wrote it in order to counter the materialist concepts of his time (eternity of the world, plurality of first principles, fortuitousness of reality) with the affirmation of a single God, the creator of the universe, who in His potency, wisdom and goodness brings all things into being, orders them and preserves them with His love. Therefore, merged together in the prologue and developed in a lengthy commentary are the central motifs which in the 12th century determine the fortune of Hermes, regarded as the pagan perhaps closest to Biblical revelation. And like Alan of Lille, the *Glosae* draws a distinction between *Logos Tileos* and the *Asclepius*: to the former it ascribes the knowledge of the Father and the Son, to the latter the doctrine of the Holy Ghost. In fact, in commenting on the passage 'genus ergo deorum ex se deorum facit species' (*Ascl.* 4), the author writes that by "species deorum" Mercurius means the three persons and by "genus deorum" the divine essence.

Toward the end of the 12th century → Daniel de Morley, in his *Liber de naturis inferiorum et superiorum*, likewise refers to the *Asclepius* on theological and philosophical themes: the hierarchy of being, the divine and human origin of man, intellect and deification, time and eternity.

3. APOCRYPHA AND TRANSLATIONS IN 12TH AND 13TH CENTURIES

The *Glosae super Trismegistum* concludes an epoch in the history of Hermetism which had com-

menced with the Latin Fathers and had witnessed a Renaissance in the 12th century. This intense flowering was manifested by the widespread circulation of the *Asclepius*, in the wake of Lactantius' *Divinae institutiones* and of Quodvultdeus' *Tractatus adversus quinque haereses*, supported by Abelard's criticism of language, nurtured at Chartres and Paris by the faith in reason and by a sort of "perennis theologia" which discovered the light of eternal truth in the sages of antiquity.

But already toward the end of the 12th century the overall physiognomy of Hermetism has profoundly changed: the appearance of theological and cosmological pseudo-epigraphs, attributed to the authoritative name of Trismegistus, and of translations from the Arabic and Greek, mark the appearance of another type of Hermetic literature, characterized by a wealth of operational knowledge (astrology, botany, medicine, magic, divination [→ Divinatory Arts] and alchemy). The new texts stimulate a variety of reflections, now full of admiration, now full of dismay. But with the sole exception of → William of Auvergne, the two "Hermetisms" never enter into conflict: they ignore one another or take separate paths. The research that would make possible a thorough diachronic reconstruction of Hermetism still needs to be done. We can, however, follow a simpler route: trace the history of "philosophical" Hermeticism as represented by its main texts, identify connections, and mention the Hermetism of an "operational" content only where necessary, while treating the latter separately elsewhere. Let us first sketch a general picture of the new documents attributed to the Egyptian sage.

(a) The *Liber viginti quattuor philosophorum* (Book of the Twenty-four Philosophers). This new writing reinforces the myth of a Hermes inwardly inspired by God or instructed by His prophets; in many codices it is attributed to Hermes Trismegistus. As the prologue explains, the book contains a summary of definitions of God, as formulated by twenty-four sages who meet in a holy convocation. Their maxims are accompanied by brief commentaries which seem to belong to the original redaction; some manuscripts, dating perhaps from the beginning of the 14th century, add a second and more extensive commentary, while others present only the maxims. The traditional line of interpretation, from C. Baeumker to M.-T. d'Alverny, saw in the text the work of a Neoplatonic Christian of the second half of the 12th century, who combined themes of late Platonism with doctrinal elements developed by the school of Chartres and by Gilbert Porreta. Recently, however, F. Hudry has suggested

a different reconstruction, which dates the work's speculative content back to the 3rd century; it is seen as having appeared in the wake of Aristotelian theology and belonging to the history of the philosophical schools of Harran and Alexandria, its philosophical perspective being characterized by the "rationalistic" pretence of knowing the divine essence. However, the fine and well-documented edition by F. Hudry itself, offering a full and coherent text, nevertheless tends – through its structural, conceptual and lexical analysis of the dicta and the first commentary – to confirm the earlier hypothesis.

The structure of the work reveals strong analogies with the writings which, in the second half of the 12th century, introduced into theology the axiomatic method, which expressed a theological concept formally based upon the enunciation of intuitive truths; these truths were accepted on the basis of their evidence and exposed in an argumental form. In the first place the work repeatedly expounds – using "rational" language in the maxims and "theological" terminology in the commentary – the Christian formulation of the trinitarian dogma. If, in fact, in its definitions the life of God is expressed by triads (for example: mind-word-connection, principle-process-end, power-being-goodness, potency-wisdom-will, unity-truth-goodness) which assign common attributes to the whole divine nature and could have been intuited even by the "philosophers", the commentary resorts openly to the traditional "theological" lexicon: the dynamism of the Divine Being constitutes itself eternally in the relationship between the Progenitor, the Begotten, and the Spirit, and there was also an explicit affirmation of equal dignity among the three Persons. The hypothesis of a Christian origin gains probability by still other elements: references to the doctrine of creation *ex nihilo*, allusions to Scripture and to the dogmatic tradition, and near-verbatim quotations of writers from late antiquity and the Middle Ages. The basic theses bear the tangible mark of Christian → Neoplatonism according to a tradition which goes from Augustine to Boethius, and from → Pseudo-Dionysius Areopagita to → John Scottus Eriugena: see e.g. the themes of divine infinity, the identity of one and being, God as thought of Himself, the circularity of trinitarian motion, eternal processions and creative processions, the idea of a continuous creation, the illumination of ideal forms, negative theology, and the *vera ignorantia*. If then we consider that certain triads of the maxims are attested only from the 12th century, that the first textual quotations appear in

Alan of Lille in the years 1165-1180, and that throughout this period the axiomatic method takes shape in theology, we are allowed to conclude that the *Liber viginti quattuor philosophorum* is the work of a Christian thinker engaged in demonstrating the agreement of Neoplatonic “reason” with Biblical “revelation”. The Hermetic attribution of the text, subsequent to its original composition, is certainly due to the prestige Trismegistus had gained among Christian theologians because of the *Logos Tileos* and the *Asclepius*.

(b) The *Liber de sex rerum principiis* is a pseudonymous cosmological text composed certainly after 1147, and probably before 1175. Its origin is again uncertain, but its lengthy verbatim quotations of authors such as William of Conches and Bernardus Silvester, as well as the Platonic character of its cosmology, link it with the school of Chartres. The attribution to Hermes derives mainly from the preface, which contains a mythical history known as the “Legend of the Three Hermes”, also present in different versions in other Hermetic texts. In the legend the figure of Hermes is identified with Enoch, Noah, and Mercurius Triplex, the last of whom is credited with the discovery of many occult sciences. While the legend seems to have no clear relation to the contents of the treatise, it is certain that it does not constitute a later addition: its citations of the *Virga aurea*, *Liber longitudinis et latitudinis*, *Liber electionis*, and *Liber Ezich*, which are unique to this version, are also cited periodically within the body of the treatise, as if the author were trying to reestablish his connection with the history behind the legend itself.

In our exposition we follow the clear in-depth analysis and conclusions of Mark Delp. The text begins with a metaphysical exposition of the three most important principles of things: Cause, Reason, and Nature. In subsequent chapters it develops a systematic cosmology based on the three other derivative principles: World, Mechanism of World, and Time. Although Hermes describes the metaphysical principles of the cosmos in terms of an emanative generation, Reason being produced by Cause, and Nature being produced from both – the trinitarian character of their relations constituting the only hint of the text’s “Christianity” –, he does not explain the genesis of the cosmos but, rather, describes the perpetual principles of its motions and forms. The most important element in the systematic cosmology, and the one that has attracted most scholarly attention, is quality. Nature itself, emerging from Cause and Reason, is said to ‘mutably obtain successive general and

specific qualities’. The general quality of nature is described as the form of heaven from which earthly phenomena receive their dynamic elemental characters, whereas the specific quality is called the operational force which constitutes the particular qualitative form and motion of things here below. Thus, considered as the universally active power in the stars and planets, the quality of nature is that of “crafter”, and considered as the immanent life principle of things it is “operational”. The resulting cosmic vision of the text is of a perpetual, dynamic flow of qualities from things above to things below, the whole deriving its being and ordered motion from the law of the stars, which is Reason itself. Although Nature is clearly the most important principle of things in terms of the concrete operations of the cosmos, the metaphysical principles Cause and Reason are integral to the overall system as simultaneously transcendent and immanent powers granting existence, order and motion to the world as a whole. Combining Platonic and Stoic elements, Reason is at once the transcendent Divine Mind of the cosmos, the immanent source of the “same” and “different” motions of the stars and planets respectively, as well as the subtle material spirit penetrating all things. Furthermore, by incorporating the immanent operations of Reason into the descriptions of all the lower principles of things, and by conceiving of every existing form as a variation upon the “vigor” of Nature, itself an emanation from divine Cause and Reason, Hermes effectively envisions all things as essentially qualifications of divinity.

In order to address the question of this text’s place in the greater Hermetic tradition, scholars must look at the Legend of the Three Hermes in the preface. Considered together with the author’s systematic omission of any direct reference to Christian doctrine, his extensive quotations from Arab and Jewish astrologers and Firmicus Maternus, and his focus upon the occult operations of nature in its celestial and earthly forms, the Legend of the Three Hermes can be seen to set the tone for a scientific/occult work appealing to a perennial truth comparable to what is found in the books listed in the legend as composed by Hermes himself. This presentation of the legend in the preface gives the impression of an author perceiving himself as belonging to a tradition at once more ancient and more authoritative than the one into which he has been born. The name of Hermes becomes at once a sign of separation from the theological and political structures of the time, and a sign of union with a secret and more ancient society of philosophers.

(c) A brief Hermetic fragment is quoted in *De septem septenis*, a work attributed to John of Salisbury. Other philosophical fragments of uncertain origin are present in the *Liber de naturis inferiorum et superiorum* of Daniel of Morley, who attributes them to “Magnus Hermes” or “Magnus Mercurius”, author of a *Liber eternorum* and ancestor of Hermes Trismegistus: the former affirms the unity, eternity and immutability of the Principle in itself, as source of universal creation, while the latter expresses a contrast between divine eternity and the temporal transience of the world.

4. THE INTERPRETATION OF THE ASCLEPIUS FROM WILLIAM OF AUVERGNE TO NICHOLAS OF CUSA

At the start of the 13th century, then, there emerges a much more complex picture of philosophical and religious Hermetism. To the *Asclepius* – read from the perspective indicated by Lactantius and Quodvultdeus – were added two new texts composed in Christian environments: the *Liber viginti quattuor philosophorum*, rooted in Catholic dogma and in the Neoplatonic tradition, and only later attributed to Hermes, and the *Liber de sex rerum principiis*, a systematic work on divine and natural causality, which establishes a concord between the Platonic tradition and Arab sources. Nor must it be forgotten – even if it was ignored in mediaeval discussions of Hermetism – that toward the middle of the century, at the court of Alphonse X the Wise, there was made a translation into Castilian, under the title *Bocados de Oro*, of the *Mokbtār el Hikam* (Selected Thoughts) written in 1050 by the Arab Emir, physician and philosopher, Abu'l Wefa Mubeschschir ben Fatik. The work includes the moral and spiritual maxims of twenty-two sages and ends with an anthology of other sayings; the second and third chapters are dedicated to Hermes and Tac (Thot). In the last decades of the century the Castilian version was translated into Latin, perhaps by Giovanni da Procida, under the title *Liber philosophorum moralium antiquorum* (in turn translated into French as *Livre des philosophes*, by Guillaume de Tignonville toward the end of the 14th century, and from French into English by Stebyn Scrope Squyer in 1450 and by Count Ryvers in 1474-1477).

We will trace the presence of the single Hermetic texts – ancient and modern – in medieval philosophy and theology. But we have to bear in mind the complex and contradictory lineaments taken on by Hermetism after the appearance of the operative writings. Medieval scholars often considered philosophical-religious as well as operative Hermetic

texts as belonging to the same tradition. The encyclopedic works will not be examined here, even though they often contain interesting references to Hermes: Henry de Bate de Malines, for example, in his *Speculum divinorum et quorundam naturalium* (1281-1302) mentions the *Asclepius*, the *Liber viginti quattuor philosophorum* and the *Liber de sex rerum principiis*.

(a) *William of Auvergne*. In the 13th century, one of the most tormented periods of medieval history, the first theologian who confronts Hermetic thought in its new complexity is William of Auvergne, bishop of Paris (1228-1249). A very curious and well-read man, William is familiar with the texts that have flown in from Greece and Islam, and with inexhaustible energy he fights against astrological, magical and divinatory forms of knowledge. It is certainly no accident that the severest condemnation of Hermes since Augustine comes from another bishop, shepherd of souls and strict keeper of tradition. Already in his *Tractatus secundus de bono et malo*, one of his first works, William contrasts the hidden forces of nature with the prodigies of demons and wizards, and associates idolatry with the “dei facticii” of the *Asclepius*. His overall approach derives, with wider-ranging and more closely argued criticisms, from Augustine’s *De civitate Dei*: Mercurius is the primary inspirer of pagan idolatry. The broad discussion undertaken in *De legibus* (1228) begins with a classification of the “sacred” images of ancient paganism. The first type includes the portraits of historical personages, that is, mere images in memory. The second consists of the religious simulacra which demons, seduced by sacrifices and honours, have adopted in order to give responses, and which men have thought could be transformed into sacred abodes of the gods by means of impious rites. The third consists of the “dei facticii”: statues produced in accordance with the astral configurations, animated with a sort of divine power by the heavenly spirits or by the heavens and the stars, and worshipped by idolaters with use of fumigations, invocations and chants ‘ac si veri Dii essent’. This last invention, as William goes on to confirm by several quotations, is the work of Hermes, who erroneously perceives the glory and power of God not only in images made by ceremonial magic and astrological observations, but also in the stars and their symbols. The idolatrous cults listed and described by William thus seem to have their origin in the impious theurgy described in the *Asclepius*. The religion of the stars is nevertheless traced not only to Mercurius, who defines the world as a “deus sensibilis”, but also to the philosophers from

Plato to Aristotle and from Boethius to Avicenna who consider the heavens and the stars as “animalia divina” – nobler and more powerful than mortals, wise keepers and governors of human life, worthy of divine honours and religious sacrifices. William ceaselessly fires confutations against the idols of the *Asclepius* and their progeny in order to show, often taking recourse to Aristotle’s philosophy, the inconsistency and falsity of Hermetic doctrine. The attack leveled against Mercurius, *philosophus et magus*, is all the stronger for its emphasis on the link between philosophical and magical Hermetism. Again in *De universo* (1231-1236), an imposing treatise on natural philosophy, William relates the religious cantos of the *Asclepius* to the “mournful chants” intoned in the consecration of a magical ring of Saturn. It is perhaps true that, for example, the peony puts demons to flight by means of its natural virtues, but there is no analogy with the demoniac use of herbs in fashioning idols, since, as he already proved in *De legibus*, the Egyptian was deceived by evil spirits. Lastly, on another page William attacks the Hermetic doctrine of “imarmene” (fate, *heimarmene*), the ‘concatenated connection of causes’ which seems to refer to an order of necessity that denies the freedom of the creator and of rational spirits. Certainly, scattered throughout *De universo*, *De virtutibus et vitiis* and *De anima* there are some positive references to Hermetism, but they are rare and perfunctory, and cover themes of ancient religious thought widely embraced by Christianity: the resistance of the body which diverts the soul from the sublime and intelligible good, and the shaping of the soul in God’s image.

(b) *Michael Scot, Roger Bacon*. In the same period the circulation of the *Asclepius* is attested to by → Michael Scot in his *Liber introductorius* (1228-1235) and in his commentary on John of Sacrobosco’s *De sphaera*. Toward the middle of the 13th century → Roger Bacon in his *Opus maius* and in his *Metaphysica*, both completed in 1267, gives proof of a careful reading of the *Asclepius*. Bacon refers to the Hermetic text – called *Liber de divinitate* or *Liber de natura divina* or *Liber de divinis* – on themes of metaphysics and theology. In his doctrine of the creation and ideal forms Hermes is associated, as previously in Theodoric of Chartres, with St. John’s Gospel; the soul is immortal and man must reject the seductions of the wicked angels, who lead him to sin and vice, and thus to the sufferings of hell; after the separation from the body, the soul is subject to the supreme judgment which assigns the pious and righteous spirits to the place of beatitude; and Hermes’ prayer, which con-

cludes the *Asclepius*, is the highest example of a solemn prayer also for Christians.

(c) *Thomas of York*. An author who more extensively discusses the *Asclepius* is the English Franciscan Thomas of York in the *Sapientiale*, the first metaphysical “summa” of the 13th century, perhaps composed between the years 1250-1256. The text is still unpublished, but its focus on Hermetism has been examined in a recent contribution (Porreca 2000). Thomas’ attitude is characterised by a deep respect towards Hermes’ pagan wisdom, even if it is often invoked – together with other authorities – regarding problems that Thomas leaves unsolved and suspended. For example, in the discussion about the soul of the world Thomas examines the doctrines of the ancient philosophers, that appear to him obscure and blundering because sometimes they identify the soul of the world with God, while elsewhere they consider it a creature: Hermes too, according to Thomas, advocates the two opposite arguments. In Thomas’ opinion this happens also because of the doctrine of the principles, or causes of the world, a doctrine that Hermes follows when he states that the first principles are two (divine will and matter); Thomas thinks that Hermes sometimes contradicts this theory when he proclaims God as the sole principle of reality. Generally, the *Asclepius* is one of the most authoritative sources of the *Sapientiale*. When it comes to theology, cosmology, morality and eschatology, Hermes’ wisdom converges with Christian doctrine about main issues such as the nature and the characteristics of God, the eternal ideas, providence and fate, the harmony and beauty of creation, matter and evil, the immortality of the soul and life after death. This is not an easy concordism, because the difficulties of interpretation concerning the *Asclepius* are not eluded but confronted and discussed. The Hermetic text is even invoked, in one passage, to solve a seeming obscurity in the Scriptures, where the book of *Wisdom* seems to hint at a movement in God (*Sap.* 8:1 ‘Attingit ergo a fine usque ad finem fortiter’); Thomas writes that it is true that the biblical text seems to contradict divine motionlessness, but Hermes would reply that mobility is not related to God as he exists in itself, but only to his effects. The *Asclepius* is only criticised for the cult of the statues, worshipped by pagans. Thomas (following Augustine’s *De Civitate Dei*) considers the cult of the statues consecrated with ceremonies and rituals inside Egyptian temples idolatrous, but seems to see it as an isolated mistake, an internal contradiction within the text that does not express the true Hermetic theology based on a unique and sovereign God. The *Ascle-*

pious' final prayer – preceded by Hermes' rejection of the use of incense 'as a sacrilege' – is therefore presented as a testimony of the true divine cult, the inner one, as opposed to the exterior cult of Aristotle's *Ethica*.

(d) *Albertus Magnus*. But it is with → Albertus Magnus that a different and more mature analysis takes shape, with the aim both of delving into the philosophical elements of the *Asclepius* and of bringing them into concord with the image of Hermes the "magus", who has unveiled the secrets of nature and affirmed the astrological correspondence between heaven and earth.

The *Asclepius* – referred to by varied titles, as *De natura deorum*, *De distinctione deorum et causarum*, *De natura dei et veneratione*, *Dehlera ad Asclepium*, *De causis* – offers, firstly, a conception of God which Albert traces in various writings to the tenets of Christian theology and considers to have been transmitted by Hermetic thought to the Platonic tradition: God is omnipotent, the Lord of gods, ineffable and incomprehensible; the paternal Intellect begets the Word, and the Word encompasses the ideal forms of all things, which Socrates and Plato will call "forms" and Dionysius the Areopagite "divine processions". Hermes is therefore credited with the creation of metaphysical idealism, the origin of a speculative tradition that goes from Socrates and Plato to Augustine's exemplarism and to the Christian Neoplatonism of Dionysius the Areopagite. Hermes, writes Albert in his *Summa theologiae* (begun after 1272 and left incomplete), declares that 'God the prince of gods is in everything', and this doctrine – like similar theories of great Greek, Christian and Islamic philosophers – encompasses the Catholic faith. To the accusation of idolatry, leveled at Hermes by 'some' (maybe William of Auvergne is intended) because of his theurgic concept, Albert replies by affirming Hermes' pure monotheism. Hermes and other philosophers who asserted a plurality of "gods and goddesses", in reality believed in a sole God: 'And they considered Him as one, since He alone is God by His essence, and of Him Plato and Trismegistus say that the human mind, when it is freed from the body, is barely able to understand what He is and is infinitely'.

In his *De causis et processu universitatis* (1263-1267) Albert adopts Hermes' opinion on the causative flux: all things overflow with the spirit, which infuses every being with the divine forms and virtues. But right after this, he points out that the first philosophers, 'Trismegistus et Apollo et Hermes Aegyptius et Asclepius' erred in their conception of the "mode" of influx, by maintaining in

fact that the First principle penetrates all things and is the being in itself of all things. Hermes thus upholds that 'God is all that is', and this is a serious error, because it destroys all the ontological gradations between beings. This is the gravest accusation formulated by Albert, worried as he is by a theory which identifies the ontological foundation of beings in a first and universal being: a metaphysical pantheism which sees in God the embodied form of everything and thus obliterates the hierarchical order of the gradations of being. Subsequently, in his *Summa theologiae*, Albert, in order to refute the immanentist doctrine of God as world soul, nevertheless cites a celebrated page of the *Asclepius*, in which God's nature is proclaimed as one, eternal, infinite, perfect, stable and immutable, the center and mainstay of the universe. Even fate or the *heimarmene* of the Hermetic dialogue is the object of a long reflection. In his *Physica* (1250) Albert traces to Hermes the definition of fate as 'connection of causes dependent on the providence of the first cause', while bending the Hermetic text (which actually combines in an ambiguous manner the Platonic concept that fate is the second god with the Stoic concept that fate is the highest god) into the direction of Christian theology: in this doctrine the sayings of Trismegistus and of other philosophers, Albert proceeds, 'concur with us in the same truth'. In his *De caelo* he returns to the Hermetic triad fate-necessity-order; in his *De fato* he analyses the definition of fate as 'form of the order of being and of life in inferior beings caused by the cyclical motion of the celestial spheres'; and in his *De causis et processu universitatis* he proclaims that it is not hard to trace Hermes' words back to Aristotle. Finally, in his *Summa theologiae*, after having distinguished providence and fate as *exemplar et exemplatum*, the influencing cause and the influenced cause, Albert states that Hermes and Plato describe the world as derived from the divine exemplar and as almost a second god shaped by the God of gods: 'And there is nothing erroneous in defining fate in this manner'. The justification of Hermes is thus complete; his teaching is put in concord by Albert with Plato, Aristotle and Christian theology, while being distinguished from the opinions of Egyptians and Chaldaeans, who had an idea of fate characterized by astral determinism. Finally, the *Asclepius* seems not only to sustain but to promote Albert's reflections on the concept of man as microcosm and link between God and the world. In many of his writings Albert borrows from Hermes, for example when he declares that to gain superior sight, prophecy and divination, it is necessary to purify oneself by isolation and asceticism,

and that only in detachment from the body the intellect can achieve certain knowledge of God. In his *Liber de intellectu et intelligibili* (ca. 1260) Albert introduces the theme of man as *nexus dei et mundi*, attributing this formulation to Hermes: man is the nexus between God and the world, in that the assimilative intellect unites him to God, while other intellects result merely in cognition of the sensible and intelligible world. In his *De animalibus* (ca. 1260), still drawing from Hermes, Albert repeats that man unites God and the world because he encloses in himself a divine intellect which in its ascent draws after it the body and the universe, subjugates matter, transforms things and appears to perform miracles; even in his terrestrial nature man dominates the world as “governor”, and performs transmutations, spells, and enchantments. Man is in fact two men, he writes again in his *Ethica* (1262-1263): he is as though suspended, he affirms in his *Metaphysica* (1263-67), between the world and God. Man is above the world thanks to the power of his mathematical and physical knowledge, and he is close to God because he contemplates His inner beauties with the light of pure intellect.

(e) *Thomas Bradwardine*. In the first half of the 14th century, in a profoundly altered cultural milieu, Thomas Bradwardine, great mathematician and theologian of Merton College, Oxford, proves himself to be an assiduous reader of the *Asclepius*. Bradwardine is the author of *De causa Dei* (1335-1344), a theological treatise constructed “more geometrico”, which rejects Aristotelian philosophy and returns to the Augustinian roots of Christian thought. He begins his reflection with a thesis, ‘God is supremely perfect and good’, which he confirms and substantiates in the course of a lengthy “corollary” divided into forty sections. The first authority invoked is the father of philosophers, Hermes, who in his *De verbo aeterno* (the title given to the *Asclepius*) proclaims God to be complete, perfect, holy, incorruptible, eternal. But in the corollary “Against the idolaters” Bradwardine cannot forget the terrible accusations which Augustine in *De civitate Dei* had levelled against Hermetic theurgy and the cult of the “dei facticii”. Bradwardine’s responds curtly: if Hermes attributes the same nature to God and to the gods, it is not hard to refute him; if instead he distinguishes them, then there is nothing to worry about, since ‘it is pointless, once the truth is known, to quibble over names’. Nevertheless, Bradwardine proceeds to frame a skillful statement of accusation. Since Trismegistus affirms in many places that the one God is supremely wise, good, pious, clement,

immense, powerful and present, it makes no sense, he says reproachfully, to imagine ‘other gods or another god’, to confer the honour of divinity on statues, to consecrate idols to demons and evil spirits, and to lavish on creatures the worship due to God, who is the ultimate cause of every being. Arguments and confutations proceed, in this imaginary dialogue, with great dialectical and rhetorical effectiveness, but the conclusion is not, as in Augustine and in William of Auvergne, the accusation of idolatry, but censure for lack of prudence and consistency: evil demons, even if they know the future and perform wonders, must not for that reason be worshipped but must be feared as fatal enemies and shrewd seducers. In Bradwardine’s treatise Hermes is respected as the highest authority of the pagan tradition, and invoked (along with many others) on several themes and issues, always in agreement with true philosophy and true theology. Divine nature is incomprehensible to natural reason; happiness resides in knowledge of God; the resurrection of the flesh is followed by eternal rewards or punishment; true philosophy consists in respect and gratitude for divine works; the world and man were created in time; at the end of time the universe will attain a state of glory; all things flow from God who preserves them in being and is the first shape of reality ‘ex ipso, in ipso, per ipsum’; divine will or goodness (habitually associated with the Holy Spirit) proceeds from God, and even Hermes at times calls it “Spirit” in accordance with the many testimonies of Judaeo-Christian Revelation; the unitary order of the universe is the archetypal and intelligible world; God – efficient cause, *primum mobile* of created being, immutable stability and perfection – has a distinct consciousness of all things, events and human actions, and His will, the origin of everything, is the source of grace granted to men; all things, eternally present in the divine conscience and prescience, come about through fate (*famen divinum*), understood as an immutable, indissoluble, necessitating law which realizes the knowledge and will of God; fate, order and necessity, which govern the world, obey eternal reason, which is immobile and indissoluble. Lastly, in the *Sermo Epinicius* (1346) attributed to Bradwardine, a reference appears to Hermes’ *De verbo aeterno* on the emergence of fate from God. This list certainly fails to do justice to the extent and variety of his references to the *Asclepius*, often combined with the *Liber de sex rerum principiiis* and the *Liber viginti quattuor philosophorum*, nor does it provide an evaluation of Bradwardine’s complex interpretation, but it does allow us to understand how themes that are central to his sys-

tem are based on the ancient wisdom of the “father of philosophers”.

(f) The first disciples of Albertus Magnus do not seem to take up their master’s reflection on the *Asclepius*; only Ulrich of Strasbourg, in his *Summa de Summo Bono*, takes from Albert some Hermetic references, such as the doctrine of man as “nexus dei et mundi” and the comparison of Hermes with the Stoic school. But in Berthold of Moosburg, the last exponent of Albert’s school and author of the *Expositio super Elementationem theologicam Procli* (an imposing commentary, composed in 1340–1360), the study of the *Asclepius*, often called *De Deo deorum*, energetically fosters the exegesis of Proclus’ theology, presented in the framework of a constant comparison and association between Hermetic thought, the Platonic tradition and Christian theology. Already in the Prologue, dedicated to a famous passage of the *Letter to the Romans* (1:20 ‘The invisible perfections of God, since the creation of the world, are understood through His works’), Berthold, in order to explain the concept of “world”, chooses as his guide the *Asclepius*. After having distinguished the macrocosm and the microcosm, the universe and man, Berthold constructs his exegesis, confirming it with Christian and pagan authorities, on the basis of two Hermetic definitions, taken as paradigms and commented at length, word for word. The first is authentic: ‘the universe is the immutable work of God, a glorious construction, a good made out of a multiform variety of aspects, instrument of the will of God who sustains His work without envy’ (*Ascl.* 25); the second, also attributed to Hermes, is actually taken from a page of Albertus Magnus on man as “nexus dei et mundi”, governor of the world through the power conferred by physical and mathematical research and subject to God because He contemplates His inner beauties with pure intellect (*Metaphysica* I, 1,1). Berthold’s recognition of Hermes’ authority could not be more solemn. In the course of his *Expositio*, many and substantial quotations confirm and deepen, in diverse theoretical contexts, the value of the *Asclepius*. (i) The Hermetic text offers an extraordinary variety of doctrines and formulations which Berthold applies to Proclus’ system, not without strains and at times with subtle shifts from cosmology to metaphysics. God is one, in Himself perfect and transcendent, ineffable and unknowable, the ungenerated cause and supreme end of all things, beginning without beginning and end without end. Brimming with fecundity, He freely produces in an eternal instant the chain of intelligible and sensible beings. The universe, eternally present in the cre-

ative thought, has a causal order subject to divine reason, pervaded with consonance and harmony, and manifests a triadic structure in the macrocosm (destiny, necessity, order) and in the microcosm (sense, reason, intellect). As an instrument of the divine will, begotten in the image of archetypal ideas, it is permeated, vivified and enshrouded by the spirit, the *anima mundi* shaped by God. As repository and place for all species, it returns perennially to the gods who constitute intelligible being and produce sensible being, and to the One who transcends being, by virtue of whom all things constitute a single unity. (ii) In his attempt to trace the trinitarian truth of the One in pagan thought, Berthold does not hesitate to perceive in Hermes’ maxims, with reference to the *Logos Teleios* as well as the *Liber viginti quattuor philosophorum*, the ‘plurality of the divine persons’. The begetting of *voluntas* from divine *consilium* (*Ascl.* 26) expresses the eternal birth of the Word from the Father, and the *spiritus* which animates all things and nurtures souls (*Ascl.* 6, 14, 18) is the Holy Spirit. (iii) Concerning the difficult problem of polytheism and Hermetic theurgy, which had already provoked the radical condemnation of William of Auvergne and the reproaches of Thomas Bradwardine, Berthold’s position is at once clearcut and problematic. The many references to one God in the *Asclepius* support Berthold’s certainty of Hermes’ monotheistic authenticity; but the textual evidence of the theory of the “dei facticii” meets with his severe disapproval. The claim of a plurality of gods indeed may or may not be “superstitious”: it is erroneous when, as in Hermes, fashioned idols are considered to be gods due to the infusion of a sacred power; but it is in conformity with truth (and superstitious only in name) when, as in Plato and in the Platonic philosophers, they are considered gods only in so far as they participate in the only true God. In Prop. 115 Berthold’s censure is clearcut: the error of Hermes, this extremely prudent man – he quotes lengthy passages from the *Asclepius* – who was wise in many things but was here deluded beyond all measure, must not be believed. And yet Berthold visibly strives to limit the extent of the ancient Egyptian’s error. A few pages earlier he writes that Hermes and Plato affirm that the “God of gods” is unknowable, and when he condemns Hermes’ error and contrasts it with the theology of Plato (Prop. 114 and 120), he also traces the Platonic concept of “gods by participation” back to the *Asclepius*: ‘Hermes affirms that many are said to be gods by participation with the supreme God, the God of gods. His book in fact is called *De Deo deorum*’.

(g) In the 15th century even the works of Nicholas of Cusa show a direct knowledge of the Hermetic dialogue. His first reference to Hermes is found in his *Sermo I* (1430): his oldest surviving work, in which Cusanus, inspired by Lactantius, credits Hermes with knowledge of the divine Word. His “Christian” interpretation of Hermetism is confirmed by numerous autographic glosses placed in the margins of the *Asclepius* (MS Bruxelles, Bibliothèque Royale 10054-56), which testify to a deeply attentive reading, probably prior to 1140. In his *De docta ignorantia* (1440) Cusanus returns on several occasions to the Hermetic doctrine of God as “one and everything”, nameless (*innominis*), and at the same time expressible by all names (*omninominis*). Since He is One, God is ineffable, as names are instituted by reason to distinguish individual beings, or, since He is All, He can be designated by the names of all things and all things by His name (*Ascl.* 20). The reflection on divine names, which also occurs in subsequent writings, is probably inspired by a page of Theodoric of Chartres, but at the same time it reveals a direct awareness of the Hermetic text, which also reappears in other contexts. Again in his *De docta ignorantia* Cusanus takes from Hermes the concept of *hyle* or universal matter as *nutrix generationum*, the substratum of forms which “nourishes” all material beings; in his *De dato patris luminum* (1445-1446), the definition of the world as “sensible god”; in his *De beryllo* (1458), the idea of man as “second god”, the creative and provident imitator of the divine intellect; in his *De ludo globi* (1463), the theory that the spherical totality of the world is in itself invisible and only the forms molded in matter are perceptible. Lastly, on the question of Hermetic theurgy – an obligate subject after the judgments of William of Auvergne, Albertus Magnus, Thomas Bradwardine and Berthold of Moosburg – Cusanus’ considerations are prudent and moderate. According to his *De pace fidei* (1453) the statues and simulacra that are worshipped, as if ‘something divine’ inhabited their stone and were lodged within the idol, should be destroyed because they distract from the worship of God and the truth: their responses, ambiguous or false, are the work of the evil spirit, the enemy of human salvation. Cusanus clearly has in mind the pages of the *Asclepius* on divine statues and his condemnation of magical practices is radical. But in *De docta ignorantia*, like Albertus Magnus before him, he dissociates magic from Hermetic polytheism, which he interprets as a personification (typical in the pagan world) of divine attributes: Hermes, he writes, sees in God the cause of all

things, the *complicatio* which includes both the male and female gender, the creative force which is manifested (*explicata*) in the divine figures of Amor and Venus. The names given to God by the pagans ‘are expressions of the single ineffable name which implies all names’.

(h) Along with the *Asclepius*, there circulate in the 13th and 14th centuries Hermetic fragments translated by Lactantius and reworked by Quodvultdeus. Almost all are drawn from the *Asclepius* and are gathered under the title of *Logos Teleios*, considered from the 12th century on – precisely because of his distinct Christian bias – to be another and separate work of Hermes, who by divine inspiration had come to know the mystery of the eternal Word. Acclaimed as authentic by “Augustine’s” authority, the declarations of the *Logos Teleios* give credit to the image of a Hermes tending, as is written in the *Glosae super Trismegistum*, ‘ad nostram theologiam’, and help to reinforce the attempt to bring the *Asclepius* in line with Christian doctrine. Just a few examples of these are the quotations in *De septem septenis*, in William of Auvergne, Gilbert of Tournai, Albertus Magnus, Thomas Aquinas, Ulrich of Strasbourg, Thomas Bradwardine, Berthold of Moosburg and Nicholas of Cusa.

5. THE DIFFUSION OF THE *LIBER VIGINTI QUATTUOR PHILOSOPHORUM*

The history of the *Liber viginti quattuor philosophorum* in the philosophical and literary culture of the Middle Ages is like a long road, partly straight, partly meandering and intricate. Undoubtedly the text encountered resistance and incomprehension. Precise textual and documentary data attest to this. In the 13th century the Franciscan Thomas of York in his *Sapientiale* (1250-1256) begins a lengthy commentary which is interrupted at the third maxim. In a manuscript of the first half of the 14th century the *Liber* was violently crossed out, like the writings of the Pseudo-Aristotle, Alfarabi, → Avicenna and Adalard of Bath are also mutilated or effaced. Finally, in another codex the Parisian theologian Etienne Gaudet placed in the margins a series of highly critical notations. These interventions, self-censuring (as perhaps in the case of Thomas of York) or external, are all traceable to individual initiatives, and there is no record of official censure. Of these elements there have developed two radically divergent interpretations: some see in them the rejection of a conception closely related to an intense Neoplatonic inspiration and a radical apophatism, while others, on the contrary, see in them the rejection

of a rationalistic thought which claims to reach the divine essence, the “quid est” of God by mere reason. If we wish to simplify the philosophical trajectory of the *Liber*, we may distinguish – beyond the presence and the peregrinations of the manuscripts in the libraries – two different aspects: the circulation of the text in its entirety and the autonomous circulation of the first two maxims – the most celebrated ones – which state ‘God is a monad which begets a monad and in himself reflects a sole fire of love’ (I) and ‘God is an infinite sphere whose center is everywhere and whose circumference is nowhere’ (II).

The text is mentioned for the first time in its original form (maxims and first commentary) by Thomas of York. At the beginning of the 14th century it is commented a second time, perhaps by the Dominican Nicholas Triveth. Subsequently other authors, united by a lively opposition against Christian Aristotelianism, draw from the *Liber* reflections of a philosophical and theological kind; this is the case with Meister Eckhart, Thomas Bradwardine, Berthold of Moosburg. The most intense phase of this development is the speculation of Nicholas of Cusa, who in his *De docta ignorantia* is inspired by the *Liber* to confirm or elaborate on themes of a metaphysical order, to found the method of symbolic knowledge, and to express the ontological reasons for his new cosmology. The first two maxims were more widely circulated in the 12th-15th centuries, and knew a much better fortune. Commented on by the greatest theologians and philosophers of the Middle Ages and attributed most of the time to Hermes, the “images” (as they are defined in the first commentary) of the generating monad and the infinite sphere for centuries represented one of the most favored references for discussing and reflecting upon two central themes of theology: the problem of the natural knowledge of revealed mysteries and the concept of divine infinity.

The interpretation of the generating monad seems to pass through three stages, sometimes not following upon one another chronologically. In the first stage (12th and beginning of 13th century), Alan of Lille and Alexander Nequam read the first maxim as an extraordinary testimony of an awareness of the trinitarian God among the ancient pagans. Subsequently, on the basis of the principles affirmed in Pietro Lombardo’s *Sententiae* (1155-1157), the intellect was denied the possibility of such knowledge except through revelation as handed down by the sacred Books or through inner inspiration: this is the position we find, with different premises, forms and outcomes, in William of

Auxerre, Alexander of Hales, Albertus Magnus, Thomas Aquinas, John of Ripa and still others. With the advent (second half of 13th century) of a marked reaction to Christian Aristotelianism, in thinkers or mystics who turn to Augustinian and Neoplatonic sources, the image of the generating, generated and reflected monad is once again seen as manifesting a real awareness of the inner life of God, as in the writings of Marghereta Porete, Meister Eckhart, Thomas Bradwardine and Berthold of Moosburg.

In theological and cosmological meditations on the “infinite” or “intelligible” sphere, four phases can be delineated. The first commentators, Alan of Lille and Michael Scot, perceive in the constituent elements of the geometric figure – the point and the circumference – the likeness of God and of the world, but in reversed terms. Alan sees in the circumference the supreme immensity which encompasses and sustains every created point, while Michael sees in the center the immutable source of divine operation and in the circumference the created universe. The Franciscans Alexander of Hales and Bonaventura of Bagnoregio, with a language that anticipates both Meister Eckhart and Nicholas of Cusa, unify the center and the circumference in the divine nature: the circumference metaphor expresses simultaneously God’s absolute simplicity and His absolute infinity, Being which is one and all, the transcendent minimum and maximum. Subsequently, Eckhart further develops the idea of the identity of the center and the circumference, projects it (with his theory of the “essential” emanation) into the uncreated “depth of the soul”, while designating it as the symbol and paradigm of religious experience and the moral life, and seems finally to extend it to the totality of creation, as God’s Being is the true being of finite beings. Toward the middle of the 15th century Cusanus explicitly draws from the “infinite sphere” the conceptual structure of his symbolic method: conceiving a geometric figure with its properties (and the sphere is the noblest of all), extending it to infinity, and then applying it to God. At the same time, however, another exegesis of the second maxim is taking shape, which transposes it onto the cosmological plane. So it happens that Thomas Bradwardine adopts it as a symbol of infinite space, neither created nor uncreated, a metaphysical condition of the act of creation, and Nicholas of Cusa uses it as the foundation of a new cosmology, which subverts the Aristotelian-Ptolemaic system and presents the image of a universe in total motion, ‘like a wheel inside a wheel and a sphere inside a sphere’, which has no motionless center, no hierarchies, no finitude.

6. THE *LIBER DE SEX RERUM PRINCIPIIS*
IN MEDIEVAL THOUGHT

Other than with the *Asclepius* and the *Liber viginti quattuor philosophorum*, systematic inquiry into the spread of the *Liber de sex rerum principiis* in medieval philosophy has not yet been carried out. It is possible, however, to give a few indications.

(a) A few years after the publication of the text, its presence is attested in the *De septem septenis* attributed to John of Salisbury. The seventh *septena* attributes to “Hermes Mercurius Triplex” the description of human progress, perfected when the first sages discovered theology for the soul’s salvation and physic for the health of the body; but John omits the conception, elaborated in the *Sex rerum principia*, that the spiritual development of man imitates the generation of the world carried out in the conjunctions of the Moon with the five planets and is subject to the cyclical phases of birth, progress and dissolution. He then summarizes, partly shifting and subverting – not without relevant implications – the system’s original principles and hierarchy, the six “principles of things”. Cause – the substantial principle which, unrelated to necessity, precedes its effect – is identified with the trinitarian God. The primordial causes are four principles: the Law of heavenly bodies or Reason, Nature (which Plato calls the soul of the world, others fate, still others divine order), the World and the Mechanism of the world. In the *De septem septenis*, then, the six principles of things are expanded to seven: three transcendent (Cause which unfolds in the Father, the Son and the Spirit) and four primordial. In this re-elaboration the author resolves the ambiguity of the “Hermetic” text and separates the transcendent triune principle from the primordial principles which mediate between the divine being and worldly being.

(b) In the 13th century the *Sex rerum principia* is quoted by Thomas of York in his *Sapientiale* (1250-1256). Thomas, when he writes about the uniqueness of the first principle of reality, rejects the distinction between the three “superior” principles (*causa-ratio-natura*); in the same way, when he comments on the *Asclepius*, he criticizes the affirmation of the two principles (divine will and matter). Since in the pseudo-Hermetic text the relations between the three principles are presented according to the model of the Christian trinity (‘Ratio ex causa, et ex utraque natura’), Thomas rejects the use of the term “nature” for the Holy Ghost, and accuses the author of contradicting himself. The principle of the creative causality of God, and the theory of the archetypal ideas in the

Word, are accepted, together with other cosmological doctrines: the distinction between operating nature and operated nature (that is, the power of the stars regulated by divine providence and the effects that are produced in the world), the harmony of the elements, the division of creatures in relation to matter, the union of the accidental forms with the beings, and finally, always in agreement with the Christians, the beauty and the order of the world.

The profoundest discussion dates back to Albertus Magnus who in his *Physica* (1250) refutes the thesis – attributed to the Pythagoreans, Plato and Hermes – of a “universal nature” which precedes the particular natures and divides itself into them. Hermes in particular supposedly stated that nature is a force which proceeds from the First cause by way of the movement of the heavens, and then becomes incorporated and diversified in particular beings, nobler and more effective the nearer they are to the First cause, less noble and effective the further they move away from it. But if this were so, says Albert, then it would not be a force, but ‘a substance which divides itself’, its universal nature would have a being constituted ‘before single beings’ and would not be distinct from the being of particular nature: ‘Aristotle does not approve of this’. The accusation, inspired by Aristotelian metaphysics, is therefore aimed against a hypostatic and substantialist conception of nature, against the idea of a substance which precedes and is the foundation of particular substances. Albert does not mention the Hermetic text by name, but the theory contested is couched in terms taken directly from the *Sex rerum principia*. Still in the 13th century, the pseudo-Hermetic text is quoted by some writers and by the author of the *De investigatione creatoris per creaturas* (a Franciscan identified erroneously as Bertram of Ahlen).

(c) At the beginning of the next century, *Le Roman de Fauvel* by Gervais du Bus mentions ‘L’auctour de Sex Principes’, who described the similarity between macrocosm and microcosm, the operations of elementary qualities in the universe, and the workings of Nature in the genesis of the four human temperaments. But only Thomas Bradwardine and Berthold of Moosburg give evidence of a thorough and attentive reading of the *Sex rerum principia*. Thomas Bradwardine, who calls it *De mundo et caelo* (even though he knows the real title), in his *De causa Dei* draws from it numerous motifs, always in line with Christian tradition. All peoples, prophets and theologians, poets and philosophers before Aristotle have always affirmed that the world has had a temporal beginning: like-

wise also Hermes, when he writes that ‘the world began from eternity and will resolve itself into eternity’, that the temporal world is in relation to eternity as a circle to its center, that the motions of heaven are stable and immutable since it was formed by the reason of the divine mind, and that it is not easy to understand or explain the origin of a world which cyclically dies and is reborn. And as everything is produced by an active cause, Hermes proclaims that all things (genera, species and individuals, matter, world and time) originate from the divine Cause and Reason: the three supreme principles – Cause, Reason and Nature – represent the trinitarian life, the origin and eternal model of created being. Later Bradwardine returns several times to these themes of the *Sex rerum principia*, to prove the absolute predestination of man, the unfaltering order of fate, the necessity of contingent futures and divine prescience (which does not contradict but agrees with freedom of action), the motionless infinite of eternity and the mobile flow of time. In his *Sermo Epinicius* (1346) Bradwardine once again cites the *De mundo et caelo* and the *De verbo aeterno* to reaffirm that the series of fate descends from God and that his ‘worthy sons’ Plato and Aristotle also thought so.

In Berthold of Moosburg the *Sex rerum principia* is an important source for his commentary on Proclus: the pages on the three first principles – Cause, Reason, Nature – are widely cited in support of the reflection on the One, the intelligible world and sensible effects. The human intellect, shaped in the image of divine life and ordained to have knowledge of the intelligible world, investigates into the first cause – creator of all things, fullness of thought, foundation of worldly being, place of archetypal ideas – and into the sensible effects of divine causes. The doctrine of the three superior principles, which occurs again and again in Berthold’s work, inspires his analysis of the concept of *nature* referred to in the “triple principle” (Cause, Reason, Nature), and the distinction of Nature in two different cosmological aspects: “operative” nature, which proceeds from Cause and Reason, is incorporated in the forces of heaven and is the immanent principle of life, while “operated” nature consists in worldly qualities produced by the astral constellations. The sensible world, animated by a perennial motion, encompasses the being of all things, and for this reason, Berthold concludes, it is excellent and is governed by a transcendent principle. The ideal form of the universe is “written” in Reason and is of an absolute simplicity, but the single primordial causes, which proceed from the principal form, are in themselves mani-

fold: in this representation Hermes inspires pagan and Christian Platonism, and Berthold can thus confirm Proclus’ thesis on the substantial nature, one and manifold, of intelligible species.

B. TECHNICAL AND OPERATIVE HERMETISM

In the 12th and 13th centuries, initially in Italy and Spain, generations of translators introduced into libraries and Latin culture most of the philosophical and scientific knowledge of the ancient world and of Arab civilization. Among the works translated (such as Aristotle, Proclus, Euclid, Ptolemy, → al-Kindī, Abū Ma’shar, → Avicenna, Averröes) were also the technical and operative works originally written in Greek under the names of → Hermes Trismegistus and of mythical or historical figures linked to the tale of his revelation, as well as a large stream of Hermetic writings handed down by Islamic scientists and philosophers or passed down to the Arab world from the Sabaeans of Harran. For an understanding of the value and significance of this tradition, the textual extent and content of the technical-operative works attributed to Hermes must first be examined.

I. ASTROLOGY, MEDICINE AND NATURAL MAGIC, DIVINATION

A. TRANSLATIONS FROM THE GREEK

Among the first translations from the Greek were writings on natural magic, believed to operate through the occult properties [→ occult / occultism] of things. It was probably the cleric Paschalis Romanus who, in Constantinople in 1169, translated into Latin the *Kyranides*, an ample treatise on the medicinal and magical virtues of animals, plants and stones. This work, defined by the translator as a ‘*liber medicinalis*’, is entitled *Liber physicalium virtutum, compassionum et curationum* and is made up of two books: the “Kyranis”, which Hermes revealed to King Kyranus of Persia (rewritten by Harpocraton of Alexandria in the 4th century), and the “Short medicinal book of Hermes to Asclepius”. The Latin translation is based on the complete re-elaboration of these two works compiled by a Byzantine editor between the 5th and the 8th century. The first Kyranis, given to mankind by Hermes Trismegistus and carved in Syriac characters on an iron pillar, deals with twenty-four stones, herbs, fish and birds arranged in the order of the Greek alphabet: their powers, united and mixed together for the cure and pleasure of the human body, are a prodigy of nature revealed by the wisdom of almighty God. The “Short medicinal book”

consists of three bestiaries – which describe birds, animals of the land, and fish – and gives instructions on how to prepare products with medical and magical powers. The Byzantine editor arranged the three bestiaries in alphabetical order and entitled them *Kyranides* II-IV.

In the preface to his translation, Paschalis Romanus refers to two Greek books on astrological botany, which he perhaps translated into Latin as well: the Book of Alexander the Great on planetary herbs, *De septem herbis*, and the Book of Thessalos on zodiacal and planetary herbs, *Liber Thessali de virtutibus herbarum*. In the Greek tradition the *De septem herbis*, which deals with the medical-magical virtues of planetary plants, exists in two slightly different editions: the first is anonymous or attributed to Hermes and was not translated into Latin; the second is attributed to Alexander the Great and was translated into Latin. The *Liber Thessali* is the revelation of the god Asclepius to the physician Thessalos, identifiable according to some scholars as the famous Thessalos of Thralles of the 1st century. Disappointed with the teaching of Nechepsos and Petosirides, Thessalos had engaged the help of an Egyptian priest to invoke Asclepius in a temple near Thebes; after purification rituals and prayers, Asclepius indeed made his appearance, and revealed to Thessalos the medical-magical virtues of zodiacal and planetary plants. Of all the technical texts the *Liber Thessali* is the one most marked by a profound religious sentiment. The Greek original had two editions: the first and older one, attributed to Thessalos, was translated twice during the Middle Ages, and once again in 1528; the other one is attributed to Hermes, who instructs Asclepius in the wonderful properties of plants.

The *Compendium aureum* is the Latin translation of a lost Greek original. In his dedicatory letter, the author, ‘Flaccus Africanus discipulus Belbenis Claudio Atheniensi epilogistico’, describes his rediscovery – in Troy, among the bones of the first King Kyranus – of the tract, taken from the *Kyranides*. Actually, as to their content there is no relationship between the *Compendium aureum* and the *Kyranides*. Belbenus designates Apollonius of Tyana, called by the Arab equivalent (Balīnūs, in the Latin versions referred to as Balenus, Belenus and other variants). In the manuscripts the title, taken from the text itself, is *Tractatus de septem herbis septem planetis attributis*, but actually the names of the planets are not mentioned. Each herb is linked to a month, proceeding backwards from June to December, to a number and to a metal, but the metals do not have the traditional correspon-

dances with the planets. For the most part prodigious medical-therapeutic properties are described and only in a few cases virtues which are in a proper sense magical.

The lost original of the *Liber de triginta sex decanis*, probably translated between the 12th and the 13th century, is the main text of Hermetic astrology and among the most ancient ones of Greek astrology. It reached the Latin world in a long summary composed in the 8th century. The work, which contains astronomical elements dating from the time of Hypparchus, has some very interesting features: a long account of the *sphaera barbarica*, carefully examined in comparison with other ancient documentation; the two stellar catalogues of the *sphaera graeca*, each independent of the other and edited centuries apart; astronomical observations of successive periods; and different, even contradictory, astrological doctrines and methods juxtaposed together, to which the astrological vulgate in general and the Hermetic vulgate in particular refer. The work constitutes valuable testimony of the extent to which the astronomical and astrological materials were scrutinized, first in the Byzantine period (edition of the original) and then in the Middle Ages (Latin translation), and of the abundant repertoires available.

The *Iatromathematica*, an astrological text on medicine, has come down to us in two slightly different Greek editions and was translated only in the 16th century. The author follows the astrological notion of “melotesia”, according to which each organ is presided over by a planet, and the conditions of the human body derive from the fortunate or unfortunate position of the planet in the zodiacal circle at the moment of conception and birth. The text examines the pathologies that occur when the Moon is in the twelve zodiacal signs in particular relationships with other planets, and proposes appropriate therapies. The medical theory is not homeopathic (as affirmed by Festugière 1944), but allopathic: *refrigerantia* substances heal illnesses originating from heat and *calefacientia* substances heal those originating from cold. Two Latin translations were made from the second Greek edition: one by David Hoeschelius (1555), and the other, anonymous and dating from before 1489, was published by Johannes Stadius as his own (1556).

A few years later the translation of a poem on earthquakes concludes the inflow of Greek *Hermetica* into Latin culture. The original of this text dates from before the Byzantine era and is attributed in the manuscript tradition both to Hermes and to Orpheus. It describes monthly omens and the meaning of earthquakes; the author traces

the position of the Sun in the signs of the zodiac, starting with Aries (April). The work, translated into Latin by J.A. Baifius with the title *Orpheus seu Mercurius ter maximus, Prognostica a terrae motibus*, was published in 1586.

B. TRANSLATIONS FROM THE ARABIC

Toward the middle of the 12th century Hugo of Santalla translated from the Arabic two texts: the *Liber de spatula* and the *De secretis naturae* by pseudo-Apollonius. In the Arabic literature on scapulimancy (divination by examining the scapula of sacrificed animals), a single fragment, of North African origin, is attributed to Hermes, and seems to be the oldest document. From this fragment and from a work attributed to al-Kindī, who refers to the teachings of ‘Hermes the wise and of other Greek philosophers’, two translations were made: the first, with the title *Liber de spatula*, is dedicated by Hugo of Santalla to Bishop Michael of Tarragon (1119-1151); the second, entitled *Liber alius de eadem*, presents many of the same elements but is different in form and partly in content. The *Liber de secretis naturae* is the translation of an Arab work, *Kitāb sirr al-ḥaliqa* (Book of the secret of creation) attributed to Balīnūs (Apollonius of Tyana), who narrates the discovery of the text and of the *Tabula smaragdina* in Hermes’ crypt. The origin of the *Sirr al-ḥaliqa* is still uncertain – according to some scholars, it is the translation of a Greek text, according to others, it is an apocryphal Arab work –, but there is general agreement concerning the attribution of the Arab edition to the reign of al-Ma’mūn in the 9th century. Several different traditions flow into the work: Greek and Syriac, Islamic and pre-Islamic, philosophical and alchemical. A discussion of the nature and names of God is followed in the treatise by a description of the birth of the cosmos and the formation of minerals and stones, vegetable and animal life, and finally man. The books closes with the *Tabula smaragdina*, the most inspired and famous of alchemical texts.

The 12th and 13th centuries see the appearance of several translations of an astrological treatise, the *Liber de stellis beibeniis*, which through various reworkings and vagaries had traveled from Greek astrology to Arab science and lastly to the Latin world. The term *stella beibenia* means fixed star, and the text describes the qualities of persons born under the influence of certain fixed stars linked to the “temperaments” or “complexions” of the planets when they are in their Ascendant or in Mid-Heaven. The Greek original is a fragment of the lost work of an Egyptian astrologer who wrote it in 379 A.D., but the doctrine of the “Thirty fixed

stars” goes back to older sources. The text was then revived by an anonymous Greek astrologer, in an edition since lost, at the beginning of the 6th century (ca. 505 A.D.). A corrupt copy of it seems to be the inspiration of Rhetorius Alexandrinus in the 7th century and the source of translations into Middle-Persian (Pahlavi) as well as, perhaps, into Neo-Persian and, finally, Arabic. The Arabic version, only partly conserved today, is attributed to Hermes. In the 8th century it is included in an abridged version in a treatise attributed to Māshā’allāh, which was translated into Latin by Hermann of Carinthia in 1141-1151 under the title *Liber Aristotilis de ducentis quinquaginta quinque Indorum voluminibus*. The original Arabic version (or a derivation of it) was translated in Toledo by Salio of Padua toward 1218, under the title *Liber de stellis beibeniis*. A Hebrew version from the Arabic also survives.

In the 12th or 13th century a translation was also made of the *Liber de quindecim stellis et de quindecim lapidibus et de quindecim herbis et de quindecim figuris*, attributed to Hermes Abhaydimon ‘father of philosophers and most antique sage’. The text seems to derive from the Arab version of a Greek original, completed and reworked by the astrologer Māshā’allāh. The treatise has very interesting astronomical and astrological features and is divided, after a brief prologue by Māshā’allāh, into four sections, dedicated to fifteen fixed stars (following the order of the zodiacal signs), fifteen stones, fifteen plants, and fifteen talismans for magical operations; in some manuscripts these sections are followed by a brief appendix entitled *Dicta Messaballa*. At the same time or shortly thereafter appeared an Arabic reworking of the text, shorter than the original and attributed to the prophet Enoch, which contains in fifteen chapters the same data about the single stars, stones, plants and talismans. Lastly, Thābit ibn Qurra (9th century) is the author of yet another compendium, translated into Latin with the title *Tractatus de proprietatibus quarundam stellarum*: according to the last note of a manuscript which dates the “rectification” of the stellar coordinates, the translation is from 1360.

Possibly between the 7th and 8th centuries, a translation is made of the *Liber Antimaquis* (“This is the book of Aristotle’s spiritual works and it is the *Liber Antimaquis* which is the book of the secrets of Hermes”), which derives from an ample body of Hermetic magic, with different titles and contents in the Arab manuscripts, and in which Aristotle reveals to Alexander the Great the secret knowledge of Hermes. Of the complex Arab tradition, the Latin text reproduces only a brief

selection which omits the cosmic and mythological chronology and concentrates on the parts essential to the practice of magic; it conserves the passage which exalts the greatness of man and his power over all things, but its content is mainly of a practical kind. In the second part (devoted to the names of the astral “spirits” and their dominion over earthly substances) the *Liber Antimaquis* corresponds more evidently with the Arab tradition. It is not possible to establish whether the Latin edition is a direct translation or a later adaptation of a preceding version. Another translation of a brief section is conserved under the title *De amicitia vel inimicitia planetarum* and perhaps derives from a Jewish translation.

From the early 13th century (or perhaps even earlier) we have a translation of the *Liber de quatuor confectionibus ad omnia genera animalium capienda*, a short treatise which takes the form of a dialogue between Hermes and Aristoas (Aristotle). Hermes describes four different recipes, *confectiones*, made up of animal and vegetable substances; a suffumigation ritual and a prayer to the “spirit” of animals, intended to capture and dominate various types of wolves, wild beasts, birds and reptiles. The revelation is derived, according to Hermes, from a book ‘with the secrets of the occult sciences’ which Arod (i.e. the archangel Gabriel) taught to Ismenus (i.e. Adam).

The *Centiloquium*, together with the *Asclepius* and the *Tabula smaragdina* the most widespread work of Hermetic literature in the Latin Middle Ages, is an anthology of a hundred astrological aphorisms. The text has the form of an acrostichon, which allows us to identify the author, Stephen of Messina, and the dedicatee, King Manfred of Sicily (1258-1266). According to David Pingree, the collection – which does not follow an orderly plan and covers different areas of astrological science (birth, elections, transitions, iatromathematics, meteorology) – is taken partly or entirely from the unpublished *Liber rememorationum* by Sadan, also known as *Albumasar in Sadan*, who transmits many sayings of Abū Maʿshar gathered by his disciple.

The *Liber de accidentibus* is a collection of astrological sayings, exemplifying in a concrete form the terrestrial effects corresponding to the celestial motions described by Ptolemy in the second book of the *Tetrabiblos*. The text dates from the commentary to the *Tetrabiblos* written by ‘Alī ben Riḍwān (a physician and philosopher of the 11th century), who in his last comment to Book 2 states that it is useful to add ‘the sayings by Hermes in his Book on events that happen, which can help us in

our universal prognostications’. Ptolemy’s *Tetrabiblos*, in the Arab redaction and with a commentary by ‘Alī ben Riḍwān, was translated in 1271-1275 by Aegidius of Parma, with the help of an Arabic-Castilian version (possibly the work of Jehuda ben Moses), and dedicated to Alphonso X the Wise. The *Liber de accidentibus* is simply the literal transcription of the Hermetic anthology taken from a manuscript of Aegidius’ version and transmitted in the form of an autonomous text.

C. LATIN ORIGINALS

Also part of the Hermetic tradition, along with translations from the Greek and Arabic, are various writings on astrological medicine and geomancy probably originally written in Latin, and placed under the authority of Hermes. A brief text on astrological medicine, the *Liber duodecim formarum*, attributed to Hermes/Enoch, describes twelve therapeutic images linked to signs of the zodiac and, in some cases, to their “decani”. The image that must be carved on metal does not always correspond to the classic zodiacal portrait, nor does the subdivision of the parts of the body always reflect the traditional melotesia. The list of twelve talismans is sometimes preceded by the description of an image of the Leo talisman against kidney stones, which is different from that of the talisman described in the orderly series. This “extravagant” image became extraordinarily popular, and at times appears independently. From ca. 1300 the writing was interpolated under the title of *De ymaginibus ad calculum* in the Latin translation of the *Picatrix*. The existence of a Jewish version of the *Liber duodecim formarum*, its mention of Hermes/Enoch, and its circulation among the Jewish physicians of Montpellier suggest a Jewish origin.

The *De arbore borissa* is a brief chapter dedicated to the amazing alchemical, medical and magical virtues of a plant called “Borissa” or “Lunaria”, placed under the influence of the Moon. Some of the properties described are found in later authors and texts: Joseph Flavius, Elian, the herbarium attributed to Solomon, the Hermetic texts *De septem herbis* and *Liber Thessali de virtutibus herbarum*. The *De arbore borissa*, which has come down to us from manuscripts no earlier than the 14th century, revives these traditions and adds further elements related to alchemical properties. The vagueness of the description does not allow certain and unmistakable botanical identification; but even at the time of its widest circulation (in the last centuries of the Middle Ages and during the Renaissance) numerous plants were

ascribed, often by analogy, to the ever-expanding group of Lunary herbs.

The *Lectura geomantiae* is the only geomantic text attributed to Hermes. According to the brief prologue, Hermes ‘the philosopher and first inventor’, wishing to know whether his son far from home was dead, climbed to the top of a mountain, where an angel revealed to him the divinatory art of geomancy. The *Lectura* is a compilation, and does not enable the beginner to practice geomancy since it illustrates only the first phase of the outline of the “geomantic theme” and the definition of the first figures, without indicating how to arrive at the others and how to arrange them for a complete interpretation. The work has the appearance of a set of notes on the principal notions useful to a geomancer and has neither the structure nor the pretensions of a real treatise.

The *Tractatus de iudicio urinae* (or *Liber de iudiciis urinae sine visione eiusdem urinae*), published in a small number of manuscripts of varying length, is sometimes anonymous and sometimes attributed to Hermes, perhaps because a maxim of Hermes is quoted just at the beginning. Knowledge of the zodiacal configuration and the planetary hour makes it possible to establish the properties of a patient’s urine and to proceed to a diagnosis.

2. CEREMONIAL MAGIC

(a) From the end of the 11th century to the first half of the 12th, magical literature begins to enter the West by way of Sicily and Spain. This process can be considered complete by the first half of the 13th century. Among the copious and varied materials in this domain, the most substantial part is the corpus of ceremonial writings of Arab origin attributed to Hermes or to authors linked to him: his pupil Belenus (Apollonius of Tyana), Toz the Greek and Germa the Babylonian, as well as Aristotle himself as circulator of Hermes’ doctrines. Hermetic ceremonial writings present themselves in the form of mere collections of precepts, which state their theoretical basis of reference only in general terms, and conserve but few traces of their presumed dependence on Hermes’ revelation. And yet, despite its shabby literary vestments, this hodgepodge of texts exerted an irresistible attraction upon Latin culture. Evidence of this are the often quite early translations signed by authoritative translators, and in some cases subjected to later revisions, in an attempt to utilize every bit of this “divine” doctrine and its “stupendous” precepts. The magic in question certainly appears stupendous in its claimed capacity to satisfy man’s most disparate wishes: it caters not only to his elemen-

tary needs (nutrition, health, protection of his environment) and promises to fulfil his individual and interpersonal expectations (mastery of science, success in love, in business, or in pursuing political and social ambitions), but also makes even more unusual and extravagant claims (communication at distance, opening of locks, and optical illusions). Like all learned magic, Hermetic magic has its institutional basis in → astrology. The direct relationship between the motion of the stars and sublunary events, the existence of a specific influence of each celestial body on given aspects of worldly life, and hence the possibility of establishing causal links by calculable laws, are the theoretical assumptions borrowed by magic from astrology. Yet magic is not a mere acknowledgement of the natural relationship between heaven and earth but applies it in a practical way and bends it to its own advantage. Magic does not predict events but determines them. Thanks to this ability to transform knowledge into power, the theoretical subordination of magic to astrology does not devalue this art, which ‘exalts man among the mighty’ and enables him materially to get ‘almost a foretaste of heaven’, as written by → Michael Scot.

Nevertheless, the intense activity of translation, which in a short time makes available the entire literature of Hermetic ceremonial magic, immediately brings up the difficulty of integrating within a Christian framework a subject matter that is so radically alien and antithetical to it. The texts in fact include operative rituals such as prayers, suffumigations, and the pronunciation and writing of mysterious names. In most cases we are dealing with a liturgy calling on intelligent spiritual essences linked to the planets, who are different from the angels of Christianity and who are invoked in shapes and for ends quite different from those allowed by the Christian religion. Within the timeframe of one century, this fundamental incompatibility led to the definitive banishment of the Hermetic ceremonial tradition from the official horizon of Latin culture. The texts survived and were handed down by wayward subterranean paths, in manuscripts subjected to manipulations, abbreviations and contaminations according to the specialization and particular interests of whatever scholar was transcribing them.

(b) According to David Pingree, most of the Hermetic ceremonial texts that reached the West from the Moslem world can be traced back to the authorship of one or more Arab writers. He claims that these authors autonomously produced a pseudo-Hermetic magical literature by mixing the Greek heritage with cultural traditions of Indian

and Iranian origin, as well as with local materials. According to Pingree, these falsifications have their origin in the Sabaeen circles of Harran, in the period between the 9th and the 10th centuries A.D., that is to say, from the period immediately following the visit of the Caliph al-Ma'mūn to the city of Harran (around 830 A.D.). The attempt of Harranians at preserving their ancient pagan religion by adapting it to the requirements of the religions tolerated by Islam could also have led them to re-elaborate their astral magic along the lines of the Neoplatonic tradition of late antiquity, and place it under the lofty aegis of Hermes. Pingree's persuasive hypothesis finds ample confirmation in the texts, which refer mainly to the planets, attributing special importance to the Moon and utilizing spiritual essences as intermediaries and executors of magical operations. It is well-known that in the declaration of their religious credo, the Harranians had proclaimed the existence of God as transcendent and inscrutable creator who becomes pluralized in epiphanic figures of a spiritual nature. These essences of pure light, which the philosophers call intelligences and the holy law angels, are the only spiritual beings with whom man can enter into contact. The angels par excellence are those who govern the seven planets, in which they have their visible temples. It is thus necessary to turn to the star, assuming its nature in one's dress and gestures, places, astrological times, rites and requests, in order to address its angel, who in his turn will serve as mediator with God for man's material and spiritual expectations.

This quite blatant syncretism of religious, magical and astrological elements constitutes (with few exceptions) the distinctive feature of the ceremonial magical literature of Arab origin which circulates in Latin under the direct or indirect aegis of Hermes. Nevertheless, despite this basic homogeneity, Pingree suggests a generic classification, distinguishing the texts on the basis of the means used to achieve the effect: thus, there is a division between magic which makes use of amulets, on the one hand, and magic which makes use of talismans, on the other.

An amulet is a stone, usually a gem, naturally endowed with occult virtues, that is capable on its own of producing specific physical or spiritual effects. This special power originates in the planet to which the stone corresponds and can be amplified by operating at the astrological time in which the stellar position provides the greatest output of the influence desired. The principle of classifying sublunary objects (animals, plants, stones) into "sets" is of Neoplatonic derivation. Originally

it was assumed that every being possesses the essential virtue of a divine higher principle, whose imprint is only weakly present in each element but can be activated by appealing to the sympathies among all the links in the chain of beings that share the same virtue. But already in the magic of late antiquity, the stars as such had replaced the classic gods, and the sets had become entirely astrological. In its simplest form, magic which makes use of amulets can be considered strictly "natural" since it is limited to using the extraordinary powers present in sublunary beings only. A unique example of this "zero degree" magic in the corpus of Hermetic literature is the *De lapidibus Veneris*. This text lists ten stones belonging to the domain of Venus, endowed with occult medical properties (in the widest sense of the term). The virtues inherent in stones can be heightened or modified by mixing them with other ingredients, chosen by means of the principle of analogy. The *De lapidibus Veneris* is attributed to Toz the Greek, a mysterious figure whose name appears in different versions in manuscripts and in indirect testimonies. His identification with the Egyptian god Toth has recently been questioned by Pingree, who sees in it a pseudonym (Ta'us, the peacock). It serves as a *nom de plume* for one or more authors who specialized in describing operations connected to the influence of the planet Venus. That Toz belongs to the Hermetic domain is confirmed by other works, in which he appears in company with Germa the Babylonian, that is Hermes the Babylonian of the genealogy of Abū Ma'shar. And it is not improbable that Latin readers spontaneously associated Toz with Tat, the pupil of Hermes in the *Asclepius*. Because of its total absence of astrological, ritual and figurative elements, the *De lapidibus Veneris* is an anomalous text in the Hermetic magical tradition. Usually, amuletic magic also involves the engraving of a picture of the planet on the stone. As the studies of Fritz Saxl and Jean Seznec have shown, these images are connected to the iconography of the ancient stellar gods, whose survival in the West was guaranteed by the magical texts. In the *De imaginibus sive annulis septem planetarum*, attributed to or at any rate associated with Hermes, there is a description of the different planetary images that must be engraved at the suitable astrological time on gems appropriate to each planet, which will then be set in rings made of metal pertaining to the same sympathetic domain. The effectiveness of the ring in traditional activities connected to the planet depends upon the observance of certain prohibitions, which in some cases suggest religious taboos, while in other cases their

intention seems to be simply to prevent mistakes in respecting the boundaries of the sympathetic domain. In the *De duodecim annulis*, which introduces Toz the Greek and Germa the Babylonian as authorities, there is a description of twelve gems to be engraved at precise astrological moments, and then set in rings, which can be worn or used as seals. The first four stones belong to the domain of Venus, confirming that this was the authors' specialization; the remaining ones are linked to the other planets, with the exception of Mars. Writing or invoking the names of God, the angels and the hours is required for all the rings; only in one case does the prescription mention merely the writing down of what is intended. The *De duodecim annulis* also contains dietary, lustral and sexual prohibitions, which are as detailed as they are far-fetched. The presence of religious elements becomes more evident in some texts of amuletic magic which include an actual sacred ceremony. In the *Liber Mercurii Hermetis* the engraving of two different images of Mercury must be preceded by a staged procession, which requires participation of the magus and a young assistant, and by a long peroration whose aim is to invoke the planetary spirit by means of listing his attributes. The fashioning of two rings is accompanied by suffumigations, invocations, songs and chants, a sacrifice and a ritual meal. An analogous ceremony is to be found in the *Liber Saturni* attributed to Hermes, translated perhaps in Chaldaean by Apollonius, "philosopher of Egypt", and from there into Latin by an otherwise unknown Theodosius archbishop "Sardiensis". The presence of planetary prayers is not at all uncommon in the magic of late antiquity; but it is interesting to note the similarity of these orations to the descriptions, known to us from other sources, of the ceremonies of the Harranians, which often coincide in gestural details and in the planet and angel names invoked. A very detailed planetary liturgy is described in the *Liber orationum planetarum septem*. Even if the *Liber* is not attributed to Hermes, its close textual affinities with Arab accounts give evidence of its belonging to the Hermetic Harranian tradition.

In talismanic magic, as distinct from amuletic magic, an image is molded or carved in metal, or in rare cases modelled in wax or clay. The material used does not contribute to the success of the operation, since it has no particular occult property and at most must respect the planet's sympathetic domain. The image, too, is hardly of influence, since it does not stand in relation to the planetary iconography but merely "represents" the pursued aim. The elements which in amuletic magic are

merely added to the natural property of the stones and the planetary depictions, become pre-eminent in talismanic magic, that is to say: the choice of the astrological time and the elaborate ritual which takes place around the image (pronouncement of names, engraving of characters or symbols with appropriate types of ink, recital of a prayer, and use of suffumigations). At the end of this complex ceremony, the image must be either worn or buried with an appropriate exorcism. The words and names to be pronounced can merely be epithets of the star in various languages, or simple statements expressing the magician's wish, or, far more frequently, actual prayers of a persuasive kind which aim at attracting the spiritual force of the planet and obliging it to flow into the talisman and, through it, exert an influence on the place or the person.

An interesting collection of talismanic magic with the title of *Liber septem planetarum ex scientia Abel* spread very rapidly in the Latin world. The Arab original, which remains unidentified, was translated twice, first by Adelard of Bath and then by → Robert of Chester (after 1144). The collection consists of seven books, one for each planet, according to the sequence Moon-Sun-Mercury-Venus-Mars-Jupiter-Saturn; but Adelard's translation has come down to us with the third and fourth books missing. The first treatise, *Liber Lunae*, has an interesting prologue which reproduces, with some meaningful variants, the genealogy of the three Heremeses narrated by Abū Ma'shar. The ancient philosophers, who had foreseen the imminent flood, had carved the precepts of the sciences and the arts on marble pillars as a record for posterity. After the flood, Hermes Triplex had gone to Hebron, the city of Adam, of his son Abel, and of most of the antediluvian sages. Here he had retrieved almost all the tablets buried by the ancient philosophers; among these had come to light the stones on which Abel had relied for the survival of his talismanic doctrine, *praestigiorum scientia*, the first and most perfect of all. Hermes had tested one of the talismans, confirmed its effectiveness, and hence had decided to transcribe Abel's precepts. The effectiveness of the talismans, made of different metals, depends on the positions of the planets, on the names or symbols which are engraved on various parts of the image, on the words (specific for each talisman) which are pronounced, on suffumigations, and on the prayers which must be recited, during the various phases of the operation, to God, the zodiacal angels and the planet dominating the talisman. The operative prescriptions are preceded by highly detailed

preparatory recommendations: a period of purification with daily baths, prayers, observance of daily fasting and a nightly meal with bread of wheat crushed by one's own hands and water likewise personally drawn. The physical preparation must contribute to creating a proper psychological attitude in the operator, of whom perfect moral qualities are also required.

This operative procedure is a constant feature in the texts on talismanic magic, even if certain details may vary. In Belenus' *De imaginibus septem planetarum*, the preparation of the images involves all the elements listed in the *Liber planetarum* (writing of the planet's name and seal, suffumigation and prayer to the spirits, burial), but it makes no mention of pronouncing names proper to the specific purpose, whereas it does prescribe the use of a metal appropriate to the planet. The *De imaginibus et horis*, attributed by some manuscripts to Hermes, does not talk of suffumigations and prayers, but of the need to pronounce the name of the interested party, the name of the planet, and the aim to be achieved, while the names of the day, the hour and the planet's characters have to be written on the image. The ritual dedicated to Venus in Toz's *Liber de stationibus ad cultum Veneris* and in Toz-Germa's *Liber Veneris* must have been particularly complex. Only a small fragment of *De stationibus* survives, from which can be conjectured only that the ceremony included at least five stations; but a lost manuscript divided the text into fifty chapters (therefore does this mean that there were fifty stations?). By contrast, the content of the *Liber Veneris* can be reconstructed, although it remains confused, from three manuscripts – all of which are unfortunately incomplete – corresponding to three different translations, one of which is attributed to John of Seville. Despite numerous discrepancies, it seems possible to identify three magical operations: the construction of talismans, the fashioning of rings (some coinciding with those of the *De duodecim annulis*) and the preparation of four magical mirrors (*De quattuor speculis*). All the operations involve preparatory purification rituals, determining the astrological time, choosing the material, writing the names of planets and angels, suffumigations, and invocations. As regards talismans, which predict the future and induce the angels of Venus to appear before the magus, two manuscripts speak of a three-dimensional image which must be dressed in garments of five colors. But the third manuscript refers to the fashioning of a head, *caput*. The mention of a prophetic "caput" is interesting since it seems to confirm the link between the *Liber Veneris* and the Harranian tradition

and, in particular, one of the most macabre legends of human sacrifice practised by the inhabitants of Harran. Arab historical sources report with obsessive regularity the Harranian custom of immersing a man up to his neck in a mixture of oil and spices until his head came off, which was then supposed to pronounce prophecies. In his recent study on the religion of the Harranians, Jan Hjärpe insists on the lack of neutrality of these testimonies and hypothesizes that such charges, apart from being customary in religious polemic, resulted from a malevolent and distorted interpretation of practices which were actually alchemical or magical. The *Liber Veneris* would seem to bear this out, even if the question of where the sources got the other details of the story still needs to be clarified. It should also be noted that in one of the manuscripts the list of the names of the angels of Venus and of the planets is preceded by a warning that 'these are the names of the Greek Sabaeans of Harran', that is the Harranian Neoplatonists.

Also linked to talismanic magic is the text which in the West had the greatest fortune of all, the *Liber imaginum Lunae*, available in Latin at least from the first decades of the 13th century and then widely circulated in two different translations. The *Liber imaginum Lunae* attributes the actual composing of the text to Belenus, after the doctrine of his master Hermes, and lists the talismans to be fashioned when the Moon is in one of its twenty-eight mansions (that is to say, in the star or group of stars in which the Moon appears or "makes station" each night of its monthly course). The list of lunar mansions specifies neither what image to write nor what material to use, but limits itself to indicating the name of the mansion, its color (an element referring back to Babylonian tradition), its favorable or unfavorable quality, the name of the planet which dominates it, and lastly, the aims which can be achieved by each talisman. This Hermetic list coincides with an exclusively astrological list contained in other manuscripts, which also marks the Moon's location in the Zodiac and the design of the stars that make up the station, but contains no indication as to what initiatives should be undertaken and as to Hermes' authorship. This would suggest an Arabic adaptation of a more ancient and merely astrological doctrine derived from Indian tradition, which made use of the lunar mansions for divinatory purposes from the middle of the second millennium B.C. In some Latin manuscripts the text on mansions is preceded by a brief prologue, which gathers together all the elements typical of Greek revelation literature as analysed by Festugière. In his tireless research Hermes discov-

ered this wondrous book hidden inside a set of coffers, each more precious than the last; he decided to translate the work into Arabic to make it available to sages, while at the same time cautioning them to keep the content secret since its extraordinary power would make it dangerous in the hands of the ignorant. In a fair number of the Latin manuscripts the list of lunar mansions is followed by two writings by Belenus, the *De viginti quattuor horis* and the *De imaginibus diei et noctis*. The first relies on an Arab reworking of a Greek original attributed to Apollonius of Tyana, which probably dates from the 3rd century and also has a Syrian parallel by the title *Testament of Adam*. The text lists the names of the twenty-four hours and specifies the classes of beings which at that hour turn their prayers to God. These elements are supplemented in the Arab translation and then in the Latin one by the indication of the talismans to fashion at each hour. The *De imaginibus diei et noctis* is an elaboration of Arab origin of Apollonius' doctrine of hours; in fact it contains precepts for fashioning the talismans of the twenty-four hours (time and purpose, material, size, weight, figure, names of hours, God and angels, suffumigations). Some talismans are purported to have been fashioned and used by Apollonius himself; these stories are similar to those found in numerous Greek writings from the 5th century on. Four other talismans, not linked to the hours, are described in a sort of brief appendix, the *De quattuor imaginibus magnis*. In the oldest Latin manuscripts the Hermetic list of lunar mansions and the two texts by Belenus are presented as a single whole. The link probably dates back to the Arab originals and seems to be confirmed by the operative introduction to the *Liber imaginum Lunae*: the consecration ritual of the talisman in fact involves elements which were traceable only in the two texts attributed to Belenus. The Greek original of the *De viginti quattuor horis* also contains the names of the seven days and of the seasons, the names of the sun and the moon, the earth, the heavens and the sea in each of the four seasons. In Latin this section is preserved with the title of *De sigillis Mercurii* or *De discretione operis differentia ex iudiciis Hermetis de intentione huius operis*, attributed to Belenus, and in some manuscripts it is placed after the three texts mentioned above.

3. THE FORTUNE OF HERMETIC CEREMONIAL MAGIC IN LATIN: TRANSLATIONS AND DISPUTES

A fascination with knowledge which is also power is evident throughout Adelard of Bath's career as a translator. In his *Quaestiones Naturales*

Adelard (ca. 1080-1155) unhesitatingly acknowledges his interest in magic and tells us how he took lessons from an aged expert in magical operations. He is a true pioneer in exploring works on magic, and has the deliberate cultural objective of introducing this "useful" and "puissant" art into the scientific curriculum and legitimizing it as the operative branch of astrology (which he and other translators strive to establish as a science as well). In addition to his translation of Abū Ma'shar's *Isagogē minor* and of the first thirty-nine aphorisms of the pseudo-Ptolemaic *Centiloquium*, Adelard puts the *Liber planetarum ex scientia Abel* into Latin. Stylistic and terminological affinities suggest he has also had a hand in translating Belenus' *Liber de imaginibus septem planetarum*. Furthermore he translates the *Liber praestigiorum Elbidis secundum Hermetem et Ptolomaeum*, a text attributed to Thābit ibn Qurra, interpolating Hermetic elements into it.

In his *De essentiis* (1143), Herman of Carinthia generically refers to Iorma the Babylonian and Tuz the Ionian as "operators of talismans", *thelematici*. But the references get more and more precise when the texts of the two authors are available in the translation of John of Seville. → Daniel of Morley's *Liber de naturis inferiorum et superiorum* cites Toz's 'great and universal *Liber Veneris*' as a fundamental text of the 'science of images'. The circulation of texts on magic may have aroused some reaction on the part of theologians, since John of Seville's preface to his translation of Thabit's *De Imaginibus Astrologicis* alludes to objections advanced in the name of the faith, *sub praetextu religionis*, concerning the propriety of spreading a morally reprehensible (*infamis*) doctrine. But this does not stop the circulation of Hermetic texts, all of which are probably available by the first decades of the 13th century (given the fact that the authors who discuss them from 1230 on state that they read them 'in their youth', 'long ago').

The Hermetic ceremonial texts were destined, for various reasons, to play a central role in the broad theological and scholarly debate which developed, between 1230 and the end of the century, about astrology and the operative techniques linked to it. First, they constitute a true *corpus*, quantitatively substantial, homogeneous in content and conceptually consistent with the theory of magic as expounded in the *Asclepius*. Second, they are associated with the mythical figure of Hermes Trismegistus: the progenitor of all magicians and father of idolatry according to Augustine, but also, in the interpretation of Lactantius and Quodvultdeus, a philosopher divinely inspired in his

presentiment of the mysteries of the Christian God. Finally, thanks to their “extreme” operative nature, they make it possible to develop very different argumentative strategies in the general discussion of astrological magic. Taken as a prototype of *all* magic, they made it possible for some authors to radicalize their condemnation and to extend it to any kind of magical operation; taken instead as only *one* of its possible modes, they made it possible for other authors to set up a distinction between different kinds of magical operation and to utilize the condemnation of Hermetic magic in the interest of legitimizing other modes.

Pastoral concerns are behind the categorical condemnation by William of Auvergne, Bishop of Paris from 1228 to 1249, of all magical material and the very figure of Hermes Trismegistus. His goal is to cut away at its very base, *gladio et igne*, all interest in magical literature, ‘which has been written either by men deceived by demons and having become in turn deceivers of other men, or directly by demons’. The Hermetic citations contained in his *De fide et legibus* (1228-30) and *De universo* (1231-36) testify to William’s updatedness: they refer to Hermes’ *Liber septem planetarum ex scientia Abel*, *De imaginibus et horis* and *Liber Saturni*, Belenus’ *Liber imaginum Lunae* and *De viginti quattuor horis*, Toz’s *De stationibus ad cultum Veneris*, *Liber Veneris* and *De quattuor speculis*. His detailed textual references accord with the works we possess today. Only one quotation remains unidentified; the story of the angels Haroc and Maros is not found in the *Liber Veneris* of the *Liber septem planetarum*; and the distinction of three kinds of magnets attributed to Hermes is in Toz’s *De lapidibus Veneris*. In his *De universo* William makes a sharp distinction between two kinds of magic: on the one hand there is natural magic, which is limited to using the occult properties of physical beings, and which was bestowed by divine Providence so that men might employ it for noble ends; on the other hand, there is necromantic magic, which uses operative techniques such as images, characters and incomprehensible words. The astrological images and the figures that old women carve for evil purposes, *invultuationes vetularum*, do not act from their own intelligence or will, or from their own natural virtue, or from some specific celestial virtue captured in the moment of its making and absorbed inside the talisman. Their effectiveness therefore depends on the action of demons, who seduce men in order to lead them toward astral idolatry. William thus connects Augustine’s picture of Hermes the false prophet and false philosopher with the Hermes mentioned

as author of texts on amulets and talismans: small-scale reproductions of the statues animated by demons as described in the *Asclepius*. William’s overall analysis is important because of his lexical and conceptual specification of the notion of *necromantia*, which in the usage of many Latin translators and thinkers takes on the broad generic sense of “magic”. The distinction between natural magic and necromantic magic, as put forth by William, was to contribute to the slow but progressive development of the latter term towards a notion of “demonic magic” in the full sense of the word.

A contemporary of William, → Michael Scot, court astrologer of Frederick II, confronts the problem of Hermetic magic from a very different stance. His *Liber Introductorius* (1228-1235), an encyclopedic manual in three books written at the request of Frederick, is an introduction into astrology, but opens with discussions of cosmology, meteorology, geography, physics and medicine. According to Scot, astrology is the noblest of the seven liberal arts because of its ‘necessary veracity’; it is inferior only to the science of theology and forms the basis of numerous other branches of knowledge, among which is magic. It goes without saying that given this relationship to astrology, magic can only be judged by Scot as being true (*verax*) and highly useful. Scot repeatedly insists on the validity of its techniques and on the real, non-illusory character of the operations of the astral spirits. The stellar bodies and their ruling angels are instruments of the divine will and signs of the order which governs natural and human actions. The reduction of talismanic science to astrology makes possible a ‘necromantia secundum physicam’, that is an operative non-demonic technique, which is a simple practical application of the knowledge of the relationships between the stars and the events of the sublunary world. Scot writes that he has personally and successfully carried out operations of astrological magic following Hermes’ *Liber imaginum Lunae*, which because of its proven utility is reproduced in its entirety in the *Liber introductorius*, together with Belenus’ *De viginti quattuor horis*. But, apart from the historical value of this testimony, Scot’s knowledge in the area of Hermetic magic does not seem to have been very wide. On the other hand, the ethical problem which these techniques present to the good Christian is quite evident to him. Divinatory science is ‘abominable’ and prohibited by the Church: not because of its content, which is true because it is founded on astrology, but rather because of the ‘malice’ it teaches. Magic is not included in the philosophical curriculum because of its ethi-

cally reprehensible aims, *magistra omnis iniquitatis*. Scot's position, halfway between recognition on the scientific level and condemnation on the religious one, reflects the difficulty of absorbing the new magical material into the traditional cultural framework.

→ Albertus Magnus' judgment of the literature of Hermetic magic is marked by a profound evolution in his thinking. In his *De mineralibus* (datable from 1255-1262 according to some, from before 1250-1252 according to others), his adherence to Hermes' magical and alchemical doctrines is far-reaching and consistent with his acceptance, in other works, of the cosmology and anthropology of the *Asclepius*. The theme of the carving of images and seals is extensively treated, even though the discussion is presented almost as a digression, meant to satisfy the curiosity of 'socii'. Albert in fact specifies that the explanation of the effects of images and seals is not the province of physics but of that 'sort of necromancy which is subordinate to astronomy', since the proof is derived from the principles of astronomy (observation of stellar configurations and movements, that is, astrology), of magic (knowledge of the occult properties inherent in a stone, that is, natural magic as William of Auvergne understands it) and of "necromantic science" (understood generically as a technique for utilizing the astrological correspondances between heaven and earth, or astrological magic). Actually, the discussion of images is not at all marginal for Albert, who is in fact very much interested in legitimizing it 'propter bonitatem doctrinae' in the context of his vision of natural causality. Admitting the relationship of obedience according to which sublunary bodies are subject to the stars, Albert explains the power of artificially carved stones in perfect analogy with the power of stones found already carved in nature, such as a marble he has seen in Venice which bore the image of a crowned king with a long beard. In both cases the figure determines the introduction of a special astral influence, a modification of the form (*forma substantialis*) of the stone, and hence the acquisition of a particular occult virtue. But while in the images carved by nature the imprint of the celestial influence is direct, in the case of artificial images it is the operator who acts as the instrument mediating between the stars and the stone. The *scientia imaginum* is therefore legitimate, since it fits into the context of normal natural causality. Albert cites Toz the Greek, Germa the Babylonian and Hermes the Egyptian as the first 'praeceptores et professores' of this discipline, which was then passed down to Ptolemy and Geber and reached its

perfection in Thabit. Toz and Hermes are most likely intended in his generic reference to the 'two great books of Venus', mentioned without any indication of authorship. But Albert's approbation of Hermetic magic requires some clarifications. The magical procedure described by *De mineralibus* mentions only three elements: the astrological phase, the figure to be engraved, and the material used (mostly gems, although he alludes in passing to the use of metal). What is being dealt with therefore is a type of amuletic and talismanic magic which cannot be strictly defined as Hermetic since there appear in it none of the ritual elements that characterize almost all the texts on Hermetic ceremonial magic. Among the Hermetic writings which have survived, only *De septem annulis septem planetarum* corresponds to the operative type outlined by Albert; but the planetary images described in *De Mineralibus* certainly do not derive from it. On the other hand, Albert explicitly rejects recourse to 'incantationes, impetrationes sive adiurationes, characteres', that is to say, to those elements which are an integral part of Toz's *Liber Veneris*. In short, the references of *De Mineralibus* do not prove with certainty that, at this time, Albert was directly familiar with the works of Hermes, Toz and Germa, but they do suggest generic information mediated from other sources, which Albert fits into his interpretation of Hermetism as an extremely ancient and primal philosophy. By contrast, in his *Summa theologiae* (begun after 1272 and left incomplete) Albert's judgment is very different. *Necromantia*, understood here in its full sense of demonic magic, is traced (at least dubitantly, *secundum quosdam*) directly to the teachings of Achot the Greek, Germa the Babylonian and Hermes the Egyptian. The authors who in *De mineralibus* were cited as initiators of a natural legitimate science are now linked to necromantic texts 'de imaginibus et annulis et speculis Veneris et sigillis daemonum'. It is hard to understand the reasons for this shift in perspective toward the Hermetic texts. Albert's later perspective may have been influenced, at least in part, by the urgency of the contemporary debate on astrology and magic; and perhaps also by the *Speculum astronomiae*, which condemns Hermes' talismanic magic without appeal (see below). But it is possible that this new judgment of Albert also depends on his direct reading of the Hermetic texts, from which he could have concluded that there is a basic incompatibility between the ritual magic contained therein, and the "natural" explanation of astrological images which he sustained in *De mineralibus* and still intended to defend.

In the *Speculum astronomiae* (ca. 1255-1260), the attribution of which is still an object of debate, the bibliographical acquisitions from the Arabic are subjected to a careful adjustment which is of great philosophical and documentary interest. The aim of the *Speculum* is establishing the scientific basis of astrology, demonstrating its agreement with Aristotelian science and with Christian theology, and distinguishing it from doctrines and practices incorrectly confounded with it. After having described the various aspects of the science of the stars (astronomy and astrology, subdivided into theory and practice), in chapter 11 the anonymous author addresses the problem of the science of images, which he subdivides into three categories. The necromantic images described by the Hermetic texts are considered abominable. They adopt generic references to astrology but actually their effectiveness is based upon a religious liturgy that is different from that of Christianity and therefore idolatrous. The necromantic images described in the texts of Solomon and the Hebrew authors are less dangerous but equally detestable. They do not resort to actual ceremonies but present inscriptions of characters that are unknown and therefore suspect, since they may conceal acts contrary to the sanctity of the Christian religion. The third and last category is that of the properly astrological images described in Thābit ibn Qurra's *De imaginibus astrologicis*. These images, fashioned at an auspicious astrological time, are fully licit, since they limit themselves to utilizing stellar influxes without resorting to idolatrous rituals. Thus the classification of images rests on the analysis of the role which the single operative elements play in producing their effect. Prayers, the engraving of characters and the pronouncement of unknown words, typical of Hermetic and Solomonic necromantic magic, identify a supernatural agent as object of veneration and are therefore demonic practices. By contrast, the engraving of intelligible words – such as *amor*, *destructio* – and the pronouncement of the name of the thing and of the planet, which Thabit makes use of in his astrological images, refer to a natural agent, that is to say, the stellar influx. The presence of magical formulas (“may this talisman produce this effect”) is not in itself suspect, since it is a mere enunciation of intent, addressed to beings of the sublunary sphere, and does not constitute an act of idolatry. Although it proceeds from William of Auvergne's distinction between natural magic and necromancy, the *Speculum* significantly modifies that distinction, broadening the notion of natural magic to the point of fully including in it astrological influence. This

interpretation of magic is very close to Albertus' in *De mineralibus*, but is based on a profound knowledge of the texts. The Hermetic literature cited by the *Speculum* is nearly the same as William's: Tozgerma's *Liber Veneris*, *De stationibus ad cultum Veneris*, *De quattuor speculis*; Hermes-Belenus' *Liber imaginum Lunae*; Belenus' *De imaginibus diei et noctis* and *De quattuor imaginibus magnis*; Hermes' *De sigillis Mercurii* (described as part of a larger collection, unknown to us, called *Liber imaginum Mercurii*), *Liber Martis*, *Liber Iovis* and *Liber Saturni* (that is, the last three books of the *Liber planetarum ex scientia Abel*), a text unknown to us, which would have followed the Abel series (*Tractatus octavus in magisterio imaginum*), *De imaginibus et horis*, *Liber Veneris* (whose incipit does not correspond to those of the surviving texts), and the *Liber praestigiorum* (actually the translation, altered by Adelard, of Thabit's text on images). The author of the *Speculum* justifies the possible gaps and lack of precision in his bibliographical references by the fact that he read these books a long time ago and by the horror caused in him by that reading, *quoniam eos abhorruui, non extat mihi perfecta memoria*. But as far as the Hermetic texts on amuletic and talismatic magic are concerned, his memory is very exact, in that he cites and condemns almost all of them. Nonetheless, if it is true that the bibliographical updating is from a fairly remote period, it is hard to accept the attribution of the *Speculum* to the Albertus Magnus who, at the time of the *De mineralibus*, i.e. not many years earlier, does not seem to have had direct knowledge of the Hermetic texts.

With the *Speculum*, the project of integrating the magus Hermes into the scientific curriculum can be considered to have failed. In his *Tractatus brevis et utilis* (1268-1270), Roger Bacon denies the authenticity of the texts on magic which circulate under Hermes' name. The whole of magical necromantic literature is written by demons or by men inspired by demons, and it has been attributed to Adam, → Moses, Solomon, Aristotle and Hermes so as to better deceive and seduce ‘not only youths, but even mature adults and authoritative persons, as we unfortunately witness in our day’. Thomas Aquinas' *Summa contra Gentiles* (1269-73) and his *Summa theologiae* (begun in 1269 and left incomplete) reassert Augustine's condemnation of Hermes, who in the *Asclepius* taught the cult of statues, *imagines*, animated by demons. But in his discussion of astrological images Aquinas does not even mention Hermes. His polemical objection is to the theory of astrological magic found in Albertus' *De mineralibus* and in the *Speculum*. Arti-

ficial images acquire no special virtues by human operation, other than the natural one impressed on them by celestial bodies. Therefore their extraordinary effects do not depend on their respective substantial forms, but must be considered the work of demons. The distinction between “astrological” and “necromantic” images, carefully traced in the *Speculum*, is reduced for Aquinas to a mere distinction of the ways in which demons are invoked. While in the necromantic images the prayers and the pronouncement of names represent ‘*expressa pacta cum daemonibus inita*’, in the astronomical images the pact remains a tacit one, understood through the use of characters and figures.

Paradoxically, a treatise *De essentiis essentialium*, with the full recognition it grants to Hermes’ necromantic images, circulated as a work of Thomas Aquinas himself. The author, a Dominican Thomas who seems to have written it prior to 1309, aims at demonstrating that celestial bodies do not derive their influences from souls but from the Intelligences that govern them. To prove his thesis, he tells of having used the *Liber planetarum ex scientia Abel* to fashion a talisman inscribed with the names of the planet and its Intelligence.

In the first quarter of 14th century at the latest, the *Liber de imaginibus Lunae* was briefly commented upon by an anonymous scholar. The *Glosulae super librum imaginum Lunae*, which are preserved in an unique manuscript, explain why sympathetic rules must be respected and discuss the meaning of characters according to three different interpretations. A broad extract from Adelard’s translation of the *Liber planetarum ex scientia Abel* and some shorter excerpts from Solomonic magical literature are also inserted.

→ Peter of Abano’s fame as magus and necromancer derives from the attribution to him of pseudoepigraphic works close to the Judaeo-Christian magical tradition, *Heptameron seu Elementa magica* and *De annulis secundum viginti octo mansiones Lunae*, but this fame does not find confirmation in the texts of certified authorship. In his *Lucidator dubitabilium astronomiae* (1302-1310) Peter of Abano associates himself with the interpretive line of the *Speculum* and sanctions the scientific validity of astrology by distinguishing it from the vain and superstitious practices of demonic magic. He also seems to have drawn from the *Speculum* the traditional distinction between “strictly” astronomical images and necromantic images, and the customary condemnation of Hermetic literature, rather generically referred to (‘*imagines . . . Hermetis, Belenuz, Thozz greci, Germath Babylonensis, Liber Lune Liberque*

Veneris et aliorum planetarum . . . libri satis obsceni ac intellectus depravativi’). On the other hand, Peter also reintroduces the legend of Hermes as inventor of all the sciences and identifies him with the biblical Enoch, thus presenting the figure of Hermes under two profoundly different identities: ‘Hermes Enoch seu Mercurius’, who gave rise to the scientific tradition of observation and representation of celestial images; and Hermes the necromancer, inventor of an “evil and detestable” art, dangerous to religion and rightly condemned. The invocation of spirits is heresy, declares Peter in his *Conciliator differentiarum philosophorum et praecipue medicorum* (1302-1310); but his intent is to explain the physical effectiveness of the *incantationes* as a result of the psychosomatic transitive force of the → imagination. Astronomical images do not address themselves to spiritual entities but reproduce stellar configurations, capturing the eminently physical influence determined by the various clusterings of celestial bodies, median causes, instruments of divine action and principles of motion. Upholding the validity of the astronomical images described by Ptolemy and by Thābit ibn Qurra, Peter describes how, in order to cure a case of kidney stones, he used a lion figure carved in gold under the domain of the zodiacal sign (that is, a seal described at the beginning of the *Liber formarum duodecim signorum*). But Peter does not recall the Hermetic origin of this talisman.

At the beginning of the 14th century, the Leo seal described by the *Liber formarum* is now part of a tradition of disparate attributions (Hermes, John of Seville, Andreas Cordubensis, Arnau de Vilanova) and is a commonly prescribed remedy in the Jewish medical milieu of Montpellier. In effect, in his *Speculum medicinae* Arnau de Vilanova recalls the Leo seal ‘described by Hermes’ and in his *Aphorismi particulares* he describes the virtues of the Pisces seal as a remedy against gout. Perhaps for these reasons the manuscript tradition often associates the *Liber formarum* with Arnau’s name, indicating him as the author of the entire text or at any rate as the one responsible for the additions to the original Hermetic work. The Christian adaptation of the *Liber formarum duodecim signorum*, which was printed among Arnau’s works under the title *De sigillis*, is, however, apparently not his. A *Glosa super imagines duodecim signorum Hermetis* was composed by the doctor of arts and medicine Antonius de Monte Ulmi, who flourished at Bologna between 1384 and 1390. Antonius says that he tested some Hermetic images and that they always fulfilled his expectations. But, according to the *Glosa*, their effectiveness should be increased

by adding a suffumigation, inscribing the name of the zodiacal angel and pronouncing a prayer (more or less Christian in tone) to the spirits. The procedure is identical to the one which Antonius expounds in his *De occultis et manifestis artium et medicinae* or *Liber intelligentiarum*, where he gives evidence of being quite familiar with Solomonic and Hermetic ceremonial literature.

The actual contribution of Hermetism is much more difficult to determine in the case of some authors traditionally interested in demonology. We do not know the reasons for the condemnation of Cecco of Ascoli (Francesco Stabili), burnt at the stake in Florence in 1327. It was influenced possibly by the rash digressions which run throughout his comments on two canonical texts on astrology, the *Sphere* by Sacrobosco and the *Liber introductorius* by Alcabitius. In his *Commentary on the Sphere*, astrology is defined as 'glory of our mind and divinity of human nature, to be desired more than the glory of divine things, as Hermes states'. But Hermes is in fact remembered only as a writer on astrology, while there are repeated and lengthy quotations of theurgic authors and texts, not always identifiable but linked to Solomonic and Jewish magic. The hodge-podge of news and anecdotes, found in this work, never arranges itself into a systematic and theoretical exposition of necromantic magic; rather, it seems to be a pretext for expounding, while attributing them to others, heretical interpretations of important aspects of the Christian doctrine (the birth of Christ from the union of the Virgin with a demon, the eclipse which occurred during the Passion as the magical effect of the use of the heliotrope, and the horoscope of religions). In his *Commentary* on Alcabitius's text Cecco confronts the problem of astronomical images by giving them a strictly physical explanation. The astral position, *aspectus modalis*, under which the metal is melted and engraved, enables the material to gain the correct proportion of elements from which the effectiveness of the talisman derives. The example cited by Cecco (a tin talisman fashioned while Venus is in Pisces or in Taurus) recalls Toz-Germa's *De quattuor speculis*; but Cecco makes no mention of the engraving of angel names or invocations. Instead, 'Zot graecus et Germa Babilonensis' are cited, together with Evax, King of the Arabs, only with regard to the natural properties of the carbuncle; the reference is to Toz's *De lapidibus Veneris*.

As a result of its subterranean and semi-clandestine circulation, Hermetic ceremonial literature lost much of its theoretical specificity, and found itself relegated to the vague and confused realm of

necromantic practice. Further research is necessary in order to provide a complete and clear picture of textual borrowings and the paths of transmission of medieval Hermetic texts as well as of the ways in which they intertwine and overlap with those belonging to other traditions.

The Hermetic texts, their commentaries and the critical bibliography are indicated in section A (Philosophical-religious Hermetism) and in section B (Technical and Operative Hermetism). The sequence of the texts is as a rule the one followed in the essay. It is preceded by a short general bibliography on the manuscripts and the latin editions. The critical editions and, in their absence, the *editio princeps*, are indicated. The following abbreviations are used: CTC = *Catalogus Translationum et Commentariorum: Mediaeval and Renaissance Latin Translations and Commentaries*, Washington: The Catholic University of America Press, 1960 (I), 1971 (II), 1976 (III); CCCM = *Corpus Christianorum: Continuatio Mediaevalis*, Turnhout: Brepols. For a summary presentation of the texts and of the manuscripts, see Paolo Lucentini & Vittoria Perrone Compagni, *I testi e i codici di Ermete nel Medioevo* (Appendice: Paolo Lucentini & Antonella Sannino, *Le stampe ermetiche*), Firenze: Polistampa, 2001 (hereafter: Lucentini & Perrone Compagni).

PAOLO LUCENTINI (A & B1) &
VITTORIA PERRONE COMPAGNI (B2-3)

Hermetic Literature III: Arab

After the Arab armies conquered the largest part of the Middle East, including Egypt, Syria, and Mesopotamia, between 634 and 660 A.D., the muslim elites came into contact with a large array of religious and doctrinal trends within Christianity and Judaism, but also with remains of pagan thought and mysticism. They became progressively

interested in several ancient disciplines, in the domains of astronomy and medicine, and also in philosophy and esotericism. Local scholars were invited at the caliph’s and governor’s courts, treatises were translated into Arabic during the 9th and 10th centuries – in some cases even earlier –, and these found a vast readership. Among the huge amount of translated Greek, Coptic or Syriac texts that were put into circulation, it is clear that those concerned with the so-called “occult sciences” aroused the earliest interest. It is not certain that we may trust our data about the Arabic translation of an alchemical treatise of → Zosimos in 658 (Sezgin 1971, 19ff.), or other translations ordered by the omeyyad prince Khâlid ibn Yazîd (d. 704) – the king Calid filius Jazichi appearing in the Latin treatise *Liber de compositione alchemiae*, and to whom the *Liber secretorum alchemiae* and the *Liber triorum verborum* are attributed (Ruska 1924; Ullmann 1978) – but they at least demonstrate the very early curiosity of Arabs towards these kinds of speculation and practice. We know that the hermetic literature composed in Egypt during late Antiquity comprises some doctrinal treatises (“hermétisme savant”, according to Festugière’s terminology), as well as others dealing with occult sciences such as → astrology, → alchemy and → magic (“hermétisme populaire”). The latter form of hermetism apparently aroused much more interest than the former one.

How exactly the hermetic literature in the Arabic language developed remains a puzzling question. The community of the Sabians of Harrân, with their star cult, must have played a key role in this transmission (Green 1997; Tardieu 1986). This pagan community of northern Mesopotamia, which practised a complex religion in which astrology played an important part, considered Hermes as one of their gods and as the inventor of sacred sciences and rituals. They obviously fascinated several muslim scholars who suspected the existence of a real wisdom behind the outward paganism of this community. The muslim philosopher → al-Kindî (d. 866) was supposed to have read ‘a book in which these people believe, being the dialogue between Hermes and his son on theology [lit.: on God’s oneness]. It was theologically so right that a philosopher, if he made an effort, could only adhere to it and profess it’ (Ibn al-Nadîm, 385). The high level of their astronomers and mathematicians led some eminent personalities of their community to settle in Baghdad near to the caliphal court. There, in the political and cultural capital city of the empire, they may have made known the twofold

function of Hermes, part god and part prophet, in which they believed. But the precise roads taken in the spread of hermetic conceptions remain obscure. To clarify them, we will first describe the extant remnants of this literature; and then analyse what the Arab hermetists took from the Greek literature, and how they understood it.

The Arabs never collected something like a *Corpus Hermeticum* in Arabic. The various fragments attributed to Hermes remain scattered among a large amount of treatises devoted to occult sciences, and deprived of unity. But first of all, who was Hermes according to the moslem scholars? Some considered him the inspired inventor of many arts. According to the most common version, first exposed by the astronomer Abû Ma'shar († 886) in his *Books of Thousands*, and then adopted with several changes of detail by bio-bibliographs like Ibn Juljul († 994), Sâ'id al-Andalusî († 1070), Mubashshir ibn Fâtik (11th century), Ibn Abî Usaybî'a († 1270), and others, there had actually existed three Hermeses. The oldest one, living in Egypt before the Flood, was supposed to have developed astronomy and → astrology as well as medicine and poetry. He was considered identical with the biblical Enoch and the koranic Idrîs. Foreseeing the Flood, he built the pyramids (Arabic: *haram*, etymologically associated by some authors with the name "Hermes") after having engraved in them the secrets of the sciences he had discovered. A second – Babylonian – Hermes was supposed to have restored the old sciences and developed medicine, mathematics and philosophy. A third "Hirmis" living in Egypt had practised and fostered the hidden sciences and especially alchemy and related disciplines in his country, and had been the master of Asklepios. Hence the name of "thrice great" (literally: "thrice wise", *al-muthallath bi-al-hikma*, among other titles. See Ullmann 1972 371-373; Plessner 1954). Among these authors, the Christian historian Ibn al-Ibrî (Barhebraeus, † 1286) mentioned in his *Summary of the History of States* a link between the third Hermes and the inspirer of the *Corpus Hermeticum*. Of course, the belief in the existence of several figures called "Hermes" had been mentioned before in Greek literature. But in moslem culture, this myth acquired a new dimension. Since the ante-diluvian Hermes was often identified with the prophet Enoch (Ukhnûkh)/Idrîs, twice mentioned in the Koran (XIX 56-57 and XXI 85), the various teachings attributed to Hermes (concerning alchemy, astrology, magic, but also mathematics, medicine etc.) acquired a more orthodox status, almost of revealed sciences. As Louis Massignon put it, 'it

is thanks to Hermes-Idrîs that the hellenistic tradition reclaimed droit de cité in Islam, whereas the syllogistic method and the metaphysics of Aristotle were not yet accepted' (Massignon 1950, 385). In most hermetic texts in Arabic, the teachings of Hermes appear like a kind of revelations with a transcendent origin. In this respect, they follow the tradition of the Greek texts of the *Corpus Hermeticum* and we may rightly consider them as "hermetic literature" in the full sense of the word, even if they happen to be moulded into the framework of islamic prophetology. In this respect, Massignon went too far by listing as "hermetic" many philosophical or mystical treatises not referring expressly to Hermes nor presented as revelation (Plessner 1954). But the ancient literary context of a revelation by a Hermes (god or wise man) is often to be found in Arabic texts. In the *Book of the Secrets of Creation*, Apollonius of Tyana (Balînâs) finds the text of the *Tabula Smaragdina* in an underground place, in front of the wise Hermes himself. More dramatically, the *Book of Alexander's Treasure* was supposed to have been hidden by Hermes in an underground place, and then discovered by Apollonius, transmitted to Aristotle and from there passed on to Alexander. The Arab armies conquering the city of Amorium in 838 were believed to have finally discovered it again in a chest.

The hermetic texts in arabic language are dealing with several occult sciences, and generally mix them up. Magic and theurgy as well as alchemy are based on astrological conceptions, on the idea of the general correspondence between things, and on the theory of four elements and four qualities. We can nevertheless distinguish three main strands:

(1) Alchemy. The hermetica in Greek dealing with alchemy are rather scarce. Hence the importance of the texts which have reached us in Arabic. The role of Hermes as initiator into alchemy was known at least during the 3th/9th centuries. Ibn al-Nadîm, the famous librarian of Baghdad, reported in his *Catalogue* (finished in 987; Ibn al-Nadîm, 417-418) that people considered Hermes of Babel the first founder of alchemy, about which he had written on the walls of the pyramids after settling down in Egypt. Apparently, Ibn al-Nadîm believed that there was only one historical Hermes, and did not identify him with Enoch. In this account, quite different therefore from that of Abû Ma'shar mentioned *supra*, we notice the fundamental relationship established between the figure of Hermes and alchemy. Ibn al-Nadîm gives a list of thirteen Arabic texts by Hermes in his chapter on alchemy. But the extant works are far more numerous. Fuat

Sezgin (1971, 39-41) lists 18 known manuscripts. Of paramount importance are the *Great Treatise of the Sphere* and the *Treatise of the Secret*. The first is presented as a text by Hermes of Dendera, taught by the high priest Uwîrûs (Osiris), about the links between spirits and bodies and the transformation of metals; the second as an exchange of letters between Amnûthîsyâ (Theosebia) and the high priest Hermes Bûdashîr on the alchemical “weddings” needed for the preparation of the Stone. Both have been edited, translated into German and commented by Ingolf Vereno. We may also mention the *Book of the Sun and the Moon*, another interesting example: the sage Krates meets Hermes in a vision and discovers the secrets of the alchemical Art in a book placed in his hand. The text has been edited and translated into French by O. Houdas (Berthelot 1893, III). Ruska has suggested that it might have been written in the 9th or 10th century. In all these texts, the environment and background are clearly ancient, Greco-Egyptian, but framed in islamic formulas and ideas. The most famous of hermetic texts on alchemy is doubtless the *Tabula Smaragdina* (Ruska 1926; Plessner 1927). The question whether this short but fundamental summary of hermetic philosophy was translated from a Greek original or not is still under discussion. In any case, it was quoted by several Arab authors (Ullmann 1972, 171 gives 7 references). But the more complete and perhaps oldest mention of this text is to be found in *The Secrets of Creation* or *Book of Causes* attributed to Apollonius of Tyana (arabic: Balînâs). As said before, Hermes was supposed to have given it to Balînâs in a secret underground cave (complete edition by U. Weisser 1979). Generally speaking, Hermes plays the role of an inspirer of several other alchemical texts in Arabic, like those by Apollonius-Balînâs, Agathodaimon, “Artefius”, and al-Habîb (Sezgin 1971; Ullmann 1972 index), and he is quoted by the most famous alchemical works of the time such as those ascribed to Jâbir ibn Hayyân (see Kraus 1942 chapters I, 4 and V, 5), Khâlid ibn Yazîd, Ibn Umayl, the *Turba Philosophorum*, and the great works of Aydamor Jaldakî (14th century; see Corbin 1983, 71f.).

(2) Astrology. Hermes plays a decisive role in the Arabic astrological tradition as well. As in the case of alchemy, he is often considered the founder of this science. The Jewish astrologer Mâshâ’ Allâh († after 809) supposedly knew 24 treatises by Hermes on several astrological topics (Ullmann, 289). Ibn al-Nadîm (1988, 327) quotes five titles. Fuat Sezgin has recorded 23 titles of extant hermetic manuscripts on astrology (Sezgin 1971, 41-43).

Hermes’ mastery of astrology is probably to be understood against the background of the koranic verses XIX, 56-57 where God says of Idrîs ‘And mention in the Book Idrîs; he was a true man, a Prophet. We raised him up to a high place’; hence several legends circulated that described Hermes / Idrîs’ travels through the heavens, where he stayed for several long years and could get acquainted with all the secrets of the influences of the planets and stars on the lower bodies. As the philosophical and scientific encyclopaedia *Epistles of the Brethren of Purity* (10th century) puts it: ‘It is said that Hermes Trismegistus – who is Idrîs the prophet, peace be upon him – ascended to the sphere of Saturn where he turned during thirty years, until he had observed all the positions of the sphere. Afterwards he came down to earth and taught astrology to mankind. God the Exalted said: We raised him up to a high place’.

(3) Magic. Ibn al-Nadîm (373) records four treatises devoted specifically to magic. The books called *al-Istamâkbîs*, *al-Istamâtîs*, *al-Ustûtât* or the important *Alexander’s Treasure* for example are all dealing with the secret properties and influences of minerals, vegetals or animals upon other things, and with the manufacture of talismans. Other treatises are devoted to magic squares and the mystical science of letters (see Ullmann 1972, 374f.). With the exception of a few fragments, they remain unpublished, and their precise content and relation to hermetism therefore still needs to be analyzed. Hermetic themes are also present in the encyclopaedia of magic *The Purpose of the wise* (arabic: *Ghâyat al-hakîm*, latin: *Picatrix*), based on astrology and on the theory of → correspondences. In one passage, an interesting ritual for meeting one’s “Perfect Nature”, giving him guidance about the role of wisdom, and teaching him the truth of the secret sciences, is attributed to Hermes (*Ghâyat al-hakîm* 187f.; Corbin 1983, 51f.). But it must be noticed that the practice of magic in Islam distanced itself more and more from ancient pagan principles – found in the *Purpose of the wise*, for instance – and gradually came to focus more on literary aspects (such as words, letters, verses from the Koran).

Treatises similar in content to the Greek texts of the *Corpus Hermeticum* are scarce in arabic. This may be explained by the strong anti-pagan context of islamic spirituality. Neoplatonic [→ Neoplatonism], stoic or hermetic ideas were actually studied by numerous muslim philosophers and theologians, and many of them were adopted, but within the framework of koranic monotheism and everything that this entailed. In islamic mysticism

(Sufism) we find ideas like the correspondences between microcosmos and macrocosmos, or the contact with the inner master. But no explicit relationship is made with ancient hermetism. The case of the “illuminative philosophy” of Suhrawardī (executed in 1191), who claimed an initiatic inspiration going back to Hermes, → Zoroaster, and Plato (Corbin 1972, II and 1983, 49f.) is rather exceptional. Similarly, the andalusian mystic Ibn Sabʿīn (m. 1270) presented his spiritual teaching as related to that of several hellenistic sages, with Hermes as the greatest among them; his disciple Shushtarī (d. 1269) describes his own initiatic chain as starting with Hermes and ending with Suhrawardī and Ibn Sabʿīn. The *Epistles of the Brethren of Purity* (10th century) likewise mention Hermes as one of the great figures of ancient science and spirituality; and so do several other thinkers, notably the shīʿite philosophers of Iran like Mulla Sadra (17th century), studied by H. Corbin. But generally speaking, the hermetic influence remained implicit (sometimes linked with stories about the prophet Idrīs in sufi literature). Still, there remain some hermetic texts, the most famous of them being the treatise on the *Punishment of the Soul*, which circulated in Arabic and was even translated into Persian by Afzal al-dīn Kāshānī (13th century). It also came to be translated into Latin (*De castigatione animae*) and evoked renewed interest by Western scholars since the 18th century. This long exhortation to the human soul to take its leave from earthly desires and illusions and turn towards her own heavenly nature could have a hermetic origin; but some manuscripts attribute it to Plato or Aristotle, and its content could be acceptable to readers belonging to different philosophical trends. It must be noted that apart from these different treatises, numerous fragments attributed to Hermes, in all domains of human thought and science, are scattered through various texts of Arabic literature. See for the fragments related to alchemy Ullmann 1972, 169-170; for astrology *ibid.*, 292-293, for magic *ibid.*, 377; and for mysticism and philosophy *ibid.*, 378.

Now, all the above points towards a difficult and much-debated question: are all these texts attributed to Hermes translations of older Greek treatises – or must we see them as belonging to a huge corpus of pseudepigraphical literature? J. Ruska was among the defenders of the former interpretation. The almost complete absence of Greek parallels to the Arabic texts was, for him, proof that the latter had been written during the

islamic era after the occult sciences had become popular among Muslims. But other research could lead one to the conclusion that the name of Hermes as an author on occult science was known much earlier. The hermetic treatises on *The Breadth of the Key of the Secrets of Stars* and *The Length of the Key of the Secrets of Stars* for instance were translated in 743, according to one manuscript. Besides, the discovery of the Nag Hammadi collection has adduced new material: some ideas of the Greek hermetic tradition were found in Coptic manuscripts belonging to this ancient library (→ Hermetic Literature I), and may later have passed through an Arabic translation (Plessner 1954). Fuat Sezgin has tried to sum up these several points in a dense synthesis (1971, 31-38). Particularly interesting for our concerns are the first two alchemical texts ascribed to Hermes and written in Arabic, *The Great Treatise on the Sphere* (dated 832, year of the visit of caliph al-Maʿmūn to Egypt) and the *Treatise of the Secret* (beginning of the 10th century or earlier) studied by Ingolf Vereno and mentioned *supra*. They present an obviously ancient kind of material (maybe from the 3th century): they contain details of pagan rituals, images and concepts – the date of an eclipse even refers to hellenistic Egypt. The spiritual dimension of the alchemical *opus* therefore corresponds to hellenistic alchemy (Vereno 1992, 337-339). But all these alchemical teachings are surely not translations (Vereno 1992, 332-333) but re-writings (‘Bearbeitungen’) by Arab authors aiming at an Arabic readership. They provide good illustrations of the transformation of the Greek hermetica during the ca. six centuries of islamic transition preceding their translation into Latin.

The conclusion of all this is that the relationship between Arabic culture and the hermetic tradition is a very strange one. It can hardly be seen as similar to the interest the Arab scholars displayed for medicine, astronomy, or philosophy. While “officially recognized” philosophers like al-Kindī, Fārābī, or → Avicenna discussed, for instance, the ideas of Plato by comparing them to the aristotelian corpus, and tried to work out a synthesis of both, nothing like this happened in the case of hermetism. The role played by Hermes was and remained that of a source of inspiration, giver of an authoritative speech, if not a revelation; the reader is placed in the position of an (ignorant but clever) disciple trying to grasp the mysteries taught to him. The very fact of Hermes’ presence in a moslem milieu, where these books were read and commented – in spite of the fact that Muhammad’s

words were considered the final authoritative teaching in history, abrogating earlier doctrines –, seems quite revolutionary in and for itself.

PIERRE LORY

Hermetic Literature IV: Renaissance – Present

1. THE GOLDEN AGE (CA. 1471-1614)
2. REAPPRAISALS AND EXTENSIONS (1614-1706)
3. TESTIMONIES AT THE TIME OF THE ENLIGHTENMENT AND IN THE PRE-ROMANTIC PERIOD
4. THE OCCULTIST CONTEXT
5. SURVIVALS AND DEBATES (SECOND HALF OF THE 20TH CENTURY) & GENERAL CONSIDERATIONS

1. THE GOLDEN AGE (CA. 1471-1614)

Around the year 1450, in Florence, Cosimo de' Medici the Elder entrusted → Marsilio Ficino with the creation of a Platonic Academy. One of their intentions was to have the available writings of Plato translated into Latin. Then, ca. 1460, a collection of Greek manuscripts was brought to Florence by Leonardo da Pistoia, a monk returning from Macedonia. These texts or treatises, on which the title *Corpus Hermeticum* (now dated 2nd-3rd century A.D., henceforth referred to as C.H.) was later bestowed, belong to the genre of the so-called *Hermetica* [→ Hermetic Literature I] attributed to or related to → Hermes Trismegistus, and had been lost since Late Antiquity. Cosimo insisted that Ficino temporarily set aside his Latin translation of Platonic texts. Ficino's translation of the fourteen treatises (C.H. I-XIV) was finished in 1463 and printed at Treviso in 1471 under the title *Mercurii Trismegisti Pimander Liber de potestate et sapientia Dei*, or *Pimander*, together with a prefatory argument (*Argumentum*) by Ficino himself.

In his *Argumentum*, Ficino also called attention to another, related text: the *Asclepius*, considered by him as 'the most divine' in this kind of literature (an edition had just been printed in Rome in 1469, inserted into Apuleius's *Opera*). Unlike the C.H. proper, the *Asclepius* (originally known in Greek as *Logos Teleios*), had survived in an ancient Latin

translation only (the original Greek version has never been found; a large part of it in Coptic translation surfaced only as late as the 20th century, in the Nag Hammadi Library). As of 1505 (see below), the C.H. and the *Asclepius* were combined in a great number of editions. Later, a series of other hermetic texts, from the so-called *Stobaei Anthologium* (compiled ca. 500 A.D. by Johannes Stobaeus of Macedonia) was added to that corpus (the *Anthologium* was published partly in Venice [1536], another part in Zurich [1543], the rest in Antwerp [1575]). The C.H. (often published under the title of the first treatise, *Poimandres*, rendered as *Pimander* since Ficino's 1471 translation) and the *Asclepius* enjoyed a considerable success. Up to 1641, no fewer than twenty-four editions of the C.H. appeared, not counting partial ones or translations into other European languages. They became a central element in Renaissance culture (on the presence of Hermetism in Renaissance art, see → Hermes Trismegistus III) and were most popular among the learned and prominent members of society. Throughout the Renaissance and in the following centuries they have been the subject of a great many commentaries.

Furthermore, as had already been the case prior to that period, the Hermetic treatises were considered the expression of a philosophy that had supposedly been transmitted over the sweep of centuries. Ficino called it *prisca theologia*. Later, it was also to be called, albeit in a slightly different sense, *philosophia perennis*. The latter term was introduced by an Italian Augustinian and Vatican librarian, Agostino Steuco (*De perenni philosophia*, Lyon 1540, new ed. 1590). Although staunchly attached to the Church's magisterium, he too tried to reconstruct the ancient philosophy as a foundation for restoring Christian unity (see → Tradition). The C.H., the *Asclepius*, and Hermes Trismegistus, were thus thought to belong to a far distant past: to the age of → Moses, or even earlier (on some variations in chronology, see → Tradition). Although they were of a pagan nature, they were considered to foreshadow Christian truths and be of a nature to give new depth to the Christian revelation. In his *Argumentum*, Ficino describes a "genealogy of wisdom" – explicitly referred to as *prisca theologia* – consisting of six main figures: Mercurius (Hermes) Trismegistus, Orpheus, Aglaophemus (an Orphic teacher of Pythagoras), Pythagoras, Philolaus, Plato. That list was later to undergo various changes depending on the various authors who presented it.

At the time of Ficino, → Giovanni Pico della Mirandola, whose *Oratio de hominis dignitate*

(1486) begins with a reference to the "Magnum, O Asclepi, miraculum" passage of the *Asclepius* (*Ascl.* 6), made a compound that included not only the traditions to which Ficino held, but also the kabbalah [→ Jewish Influences], which Pico believed had been entrusted to Moses on Mount Sinai. The same quest for origins prevailed in other esoteric currents. Indeed, the corpus of writings directly inspired by the C.H. and the *Asclepius* from the Renaissance until the present time itself constitutes one of these currents; it may be called Neo-alexandrian Hermetism, or Alexandrian Neo-Hermetism, but for convenience it will here be abbreviated as Hermetism (*stricto sensu*, i.e. as a term to be distinguished from "Hermeticism" [→ Hermeticism and Hermetic Societies], a much vaguer term whose connotations may refer to → alchemy, or even to esotericism in general). During these centuries, Hermetism was present in several countries, especially Italy, France, Germany and England.

Anthony Woodville's English translation of a few hermetic texts in the anthology *The dyctes or sayengis of the philosophers* (Westminster 1477, the first dated book in the history of English printing), published by William Caxton, bears witness to an early, albeit discreet presence of the C.H. in England. Woodville's anthology was later incorporated into other ones. In Italy, more than ten years before Giovanni Nesi's *Oraculum de novo saeculo* (Florence 1497), which belongs to the genre of hermetic literature, → Giovanni da Correggio had fiercely and loudly promoted a Hermetic Reformation of Christianity. He had caused sensation by appearing clad in symbolic garments in the streets of Rome in 1484, attended by servants similarly accoutered and claiming to be 'Giovanni Mercurio da Correggio, the Angel of Wisdom Pimander'.

→ Lodovico Lazzarelli, who saw in Correggio a new and divine prophet and considered him his mentor, has left us a vivid description of this event in a manifesto entitled *Epistola Enoch*, published probably in Milan ca. 1490. Another text of Lazzarelli, *Crater Hermetis* (complete title: "A Dialogue on the Supreme Dignity of Man, entitled the Way of Christ and the Mixing-Bowl of Hermes"), which he wrote probably between 1492 and 1494 (it remained unpublished until → Lefèvre d'Étaples edited it in 1505) is a fictitious conversation (very much in the form of the dialogues contained in the C.H.) between Lazzarelli himself, who plays the role of the initiator, and two other historical personalities, Ferdinand I of Aragon, king of Naples and Sicily, and his prime minister Giovanni Pontano, who are cast in the role of pupils. The *Crater*

Hermetis may be among the most interesting examples of Hermetic-Christian syncretism written during the Renaissance. It is certainly one of the most important hermetic texts of its time, if not for its direct influence, then at least with regard to the depth and originality of its contents. Furthermore, convinced of the equality of the Bible and the hermetic writings, in 1482 Lazzarelli dedicated to Correggio a manuscript in his own hand, which he had just completed. It consisted in three parts, each one opening with a dedicatory preface. The first contained Marsilio Ficino's translation of the *Pimander* (1471, i.e., *Corpus Hermeticum* I-XIV). The second contained the *Asclepius*. And the third contained the first Latin translation, by himself, of C.H. XVI-XVIII, i.e., three extra treatises which he had apparently discovered in a separate manuscript (unfortunately not preserved). He entitled this text *Diffinitiones Asclepii ad regem Ammonem*. In sum, far more even than Ficino and Pico, Lazzarelli appears to be a pure example of a "Christian hermetist" in the Renaissance (in addition to being one of the first noteworthy authors instrumental in the early development of a Christian kabbalah [→ Jewish Influences III]). Strangely enough, he was almost completely passed over in silence by Frances A. Yates in her ground-breaking books since 1964, and not until recently has justice been done to him (in particular by Claudio Moreschini and Wouter J. Hanegraaff).

Jacques Lefèvre d'Étaples' first edition of the *Pimander* (Paris 1494) contains, besides Ficino's translation, a series of commentaries (*Argumenta*) of his own (long attributed to Ficino). The second edition (Paris 1505) was augmented with both the *Asclepius* and Lazzarelli's *Crater Hermetis* (but in an abridged version). Interestingly, it was the first time that the *Asclepius* had been published together with the C.H. As for → Symphorien Champier's *Liber de quadruplici vita: Theologia Asclepii Hermetis Trismegisti discipuli cum commentariis* . . . (Lyon, 1507), it contains Lazzarelli's translation of the *Diffinitiones Asclepii*, among other texts, but Champier substituted a commentary of his own for Lazzarelli's prefaces. He also goes as far as to include into the tradition of *prisca theologia* the doctrines of the Druids and elements drawn from the kabbalah.

As exemplified by Lefèvre and Champier, the French were generally much more cautious than their Italian or German counterparts regarding the "magical" elements of the C.H. All adherents of *prisca theologia* dealt with Hermetism from a perspective of Christian apologetics. This is reflected, for instance, in Gabriel du Préau's *Mercurius Tris-*

mégiste ancien Theologien & excellent Philosophe, de la puissance & sapience de Dieu . . . Auec' un Dialogue de Loys Lazzarel poëte chrestien intitulé le Bassin d'Hermès (Paris 1549; new ed. 1557), the first edition in French of C.H. I-XIV, of the *Asclepius* and (as the title indicates) of Lazzarelli's *Crater Hermetis*. Du Préau's book also contains abundant commentaries of his own, some of which were designed to establish parallels between the narrative of creation according to Moses and that of C.H. I.

In the wake of new scholarly publications, like the first edition of the original Greek C.H. by the French Catholic scholar Adrien Turnèbe (Paris 1554, with a preface by Angelos Vegerius), → François Foix-Candale, Bishop of Aire, near Bordeaux, published another in 1574 (C.H. I-XIV, accompanied by some other hermetic texts), and five years later produced very extensive commentaries of his own in French, in his *Le Pimandre de Mercure Trismégiste: de la Philosophie Chrestienne, Cognoissance du Verbe Divin* . . . (Bordeaux 1579, new ed. Paris 1587). In the latter book, the hermetic texts serve as supports of meditation on a great variety of questions, like those pertaining to the Soul of the World, the spirits of the elements, celestial bodies, etc. Among various sources, Foix drew on the *philosophia occulta* [→ occult/occultism] of the Renaissance, and his book foreshadows some of the themes which → Christian Theosophy was to develop from the 17th century onward. The Huguenot Protestant Philippe du Plessis-Mornay, surnamed "the Pope of the Huguenots", who contrary to Foix gave chronological precedence to the Books of Moses over the C.H., did not proffer any passages of the latter, but wrote a number of laudatory, albeit not uncritical commentaries in his *De la vérité de la religion chrestienne* . . . (Antwerp 1581; English translation by Sir Philip Sidney, 1587). This work was published several times in a Latin translation and proved to be influential in the development of Protestantism in France.

Along with Foix, some 16th-century authors of importance, like → Giorgio, → Bruno and → Agrippa, must be counted amongst the most influential ones in later Hermetism in particular, and esoteric literature in general. → Francesco Giorgio (or Zorzi), who belonged to the Order of Friars Minor, was the author of *De Harmonia Mundi totius Cantica tria* (Venice 1525; Paris 1545, 1546; French translation by Guy Lefèvre de la Boderie, Paris 1578), and *In Sacram Scripturam Problemata* (Venice 1536; Paris 1622). These two works represent an original construction aimed at

making the Ficinian hermetic *prisca theologia* coincide with → neoplatonism, kabbalah, and not least astrological [→ Astrology] and even alchemical elements. *De Harmonia mundi* was to enjoy a lasting success in several milieus, in particular among the representatives of most esoteric currents (see below). Heinrich Cornelius Agrippa and → Guillaume Postel were later to be among his enthusiastic followers. → Giordano Bruno makes frequent use of the Hermetic texts (notably in *Spaccio della bestia triomphante*, 1584). Not a Christian, unlike most other hermeticists of his time, he was all the less prone to share the hope nursed by others that a religious reconciliation might be effected by a general acceptance of Hermetism. He did not desire a reformed Christendom, but rather a return to the cults or beliefs of ancient Egypt as described in the *Hermetica*, and particularly in the *Asclepius*.

In Germany, some of Sebastian Frank's works attest to an interest in Hermetism. His *Die Güldin Arch* (Augsburg 1538) presents itself as a collection of biblical sayings and paraphrases, together with extracts from 'illuminated pagans and philosophers' like Hermes Trismegistus. In Basel (1542), Frank also made a German translation of both the *Asclepius* and C.H. I-XIV, completed by long commentaries dealing mostly with commonalities between the Bible and Nature (it remains unpublished; the manuscript is preserved in the Stadtbibliothek Augsburg). Much more esoterically oriented was another German, Cornelius Agrippa. Several writings of his are devoted to a hermeneutics of the C.H., particularly its third treatise: *Oratio in praelectionem Hermetis Trismegisti de Potestate et Sapientia Dei* (Cologne, 1535; an "oratio" given at the University of Pavia in 1515); *Liber de triplici ratione cognoscendi Dei* (1516); and *Dehortatio gentiles theologiae* (ca. 1526, a text in which, contrarily to the other two, Agrippa distances himself from Hermetism).

Not until the last two decades of the 16th century do we find two other authors of importance. First, the Italian Capuchin Hannibal Rossel, whose *Pymander Mercurii Trismegisti*, swollen to six volumes (Cracovia 1585-1590), is not so much a commentary on the C.H. as an encyclopaedic roll-call of a variety of philosophical themes, along with a presentation of C.H. I-VII and the *Asclepius*. This work was popular enough to require a second issue (in one vol., Cologne 1630). Second, → Francesco Patrizi, whose collection of hermetic texts is most extensive. His *Nova de universis philosophia* (Ferrara 1591) contains C.H. I-XIV, the *Asclepius*, and C.H. XVI-XVIII (*Diffinitiones Asclepii*), along

with the medieval so-called *Theologia Aristotelis*. Extracts were reissued under the title *Magia Philosophica* (Hamburg 1593). In the dedicatory preface, Patrizi asks Pope Gregorius XIV to place the C.H. on the academic curriculum as an alternative philosophy. Indeed, he subjected the Aristotelian philosophy to sharp criticism and wanted it to be ousted from Jesuit-run colleges. In 1592 he was appointed to the chair of Platonic philosophy at the University La Sapienza in Rom, but his attempts met with dire failure and his book was placed on the Index. Alongside such reforming plans as Patrizi's, other works continued to appear, like Mutius Pansa's *De Osculo, seu consensus ethnicae et Christianae philosophiae tractatus* (Marburg, 1605) – the "kiss" mentioned in the title being that which Hermetism and Christianity are supposed to exchange.

Any overview of modern Hermetism must also give attention to a very short text which, along with the foundational Greek texts mentioned above, pertains to the *Hermetica* and has been the object of innumerable discussions and esoteric commentaries until the present time. This is the famous *Tabula Smaragdina* (*The Emerald Tablet*, or *The Smaragdine Table of Hermes*, henceforth referred to as T.S.) Originally written in Greek (the original version is lost), its earliest known version (934 A.D.) is in Arabic, set within a small alchemical and philosophical treatise entitled *The Book of the Secrets of Creation*. A Latin translation circulated as early as the 12th century. The first printed edition, also in Latin, appeared in a compilation of alchemical texts, *De Alchemia* (Nurnberg 1541). Its brevity permits us to quote it here in full: 'True it is, without falsehood, certain and most true. That which is above is like to that which is below, and that which is below is like to that which is above, to accomplish the miracles of one thing. /And as all things were by contemplation of one, so all things arose from this one thing by a single act of adaptation./The father thereof is the Sun, the mother the Moon,/The wind carried it in its womb, the earth is the nurse thereof./It is he father of all works of wonder throughout the whole world./The power thereof is perfect./If it be cast on to the earth, it will separate the element of earth from that of fire, the subtle from the gross./With great sagacity it doth ascend gently from earth to heaven./Again it doth descent to earth, and uniteth in itself the force from things superior and things inferior./Thus thou wilt possess the glory of the brightness of the whole word, and all obscurity will fly far from thee./This thing is the strong fortitude of all strength, for it overcometh every subtle thing and doth penetrate

every solid substance./Thus was this world created./Hence will there be marvellous adaptations achieved, of which the manner is this./For this reason I am called Hermes Trismegistus, because I hold three parts of the wisdom of the whole world. That which I had to say about the operation of Sol is completed' (transl. According to Linden 2003, 27-28).

In the 16th century, fostered by the edition of 1541 (but earlier than that already), this rather enigmatic prose poem has caused torrents of hermetic, alchemical, and theosophical ink to flow (see Faivre, *Annuaire* . . . , 1985-1997). To mention only a few remarkable commentaries in the esoteric literature of that time, what might be called the "T.S. tradition" was illustrated and enriched by such authors as → Johannes Trithemius (see his correspondence with Germain de Ganay in 1505); Gérard Dorn (*Artificii chymistici*, 1569; often reedited as *Physica Trismegisti*, it is one of the works of that time which foreshadows the advent of the theosophical current); Jacques Nuysement (*Traictez . . . du Vray Sel*, 1621), and not least → Athanasius Kircher (in his *Oedipus Aegyptiacus*, 1653, see vol. II; see also *Mundus Subterraneus*, 1664-1665). What is known as the first German translation (by Johan Schaubert) of the T.S. had appeared in 1600.

2. REAPPRAISALS AND EXTENSIONS (1614-1706)

Isaac Casaubon, a Protestant minister in Geneva, set out to prove (in a chapter of his *De rebus sacris ecclesiasticis exercitationes XVI*, London 1614) that the C.H. had not been written prior to the 2nd or 3rd centuries A.D., and was therefore a forgery of the early Christian Era. Although Casaubon's name has long been attached to that new dating, recent research (see especially Purnell 1976; Mulsow 2002) has shown that similar "discoveries" had already been made by other philologists as early as the 1560s. Nonetheless, the claim that the C.H. had been erroneously dated could only deal a heavy blow to its authority, since the authority of a text, even at that time, was highly dependent upon its age. But hermetism did not disappear for all that; indeed, from then until now, many esoterically-oriented authors and readers have preferred to ignore or to downplay the significance of the new dating of the Hermetic writings.

One of the first highly sympathetic exegetes of the C.H. in early 17th-century Germany was Heinrich Noll (*Theoria Philosophiae Hermeticae, septem tractatibus*, Hanover 1617; *Theoria Philosophiae Hermeticae*, Copenhagen 1617; and *Pan-*

ergii Philosophici Speculum, 1623, an initiatic novel). Noteworthy too is, in Italy, Livius Galante, who authored *Christianae theologiae cum platonica comparatio* (Bologna 1627). Furthermore, a number of translations of the C.H. into European languages appeared. A few extracts were presented in German in "Verba Hermetis in Pimandro" (a section set within the anonymous *Occulta Philosophia*, vol. II, Frankfurt 1613). More importantly, Abraham Willemsz van Beyerland gave under the title *Sestien boecken . . .* (Amsterdam 1643; new ed. 1652) a Dutch version of sixteen treatises of the C.H., based on Patrizi's text. Van Beyerland, who was also a translator of → Jacob Boehme and himself a theosopher, added long, strongly theosophically oriented commentaries of his own. His translation was used by the first translator into German (1706, cf. below).

The first version of the C.H. in English (*The Divine Pymander of Hermes Mercurius Trismegistus, in XVII Books. Translated formerly out of the Arabick into Greek . . .*, London 1650; new ed. 1657) was made by John Everard. This Anglican minister, a preacher at Kensington, had already produced in 1640 a detailed commentary (preserved at the Bodleian Library in Oxford) of the T.S. He also authored short translations from similar texts and some works of his own (see his *Some Golden Treasures*, London 1653). The title, and the preface signed J.F., attest to the ignorance of the publishers, not least because they claim that these books were originally in Arabic. The preface deals mostly with the legendary figure of Hermes Trismegistus. Everard's book has proved to be very influential in the development of Hermetism in England (see below).

Along with → Paracelsianism, Hermetism became part of a medical debate principally illustrated by one of its proponents, the Dane Olaus Borrichius (Olaf Borch), who composed a vibrant apology for Hermetism and → alchemy (*Hermetis Aegyptiorum, et chemicorum sapientia . . .*, Copenhagen 1674; see also his *De Ortu et progressio chemiae* Copenhagen 1688, which contains a detailed history of alchemical literature). This was meant as a counter-attack against the German Hermann Conring, in whose *De Hermetica Aegyptiorum vetere et paracelsicorum nova medicina* (Helmstedt 1648, new ed. 1699) Hermetism and Paracelsianism had come in for their share of harsh criticism. In Conring's line, Johann Heinrich Ursinus also tried (in *De Zoroastre bactriano, Hermete Trismegisto, Sanchoniatone Phoenicio, eorumque scriptis, et aliis, contra Mosaicae scripturae antiquitatem*, Nürnberg 1661) to demonstrate that the

C.H. was merely a collection of texts plagiarized from Christian sources. Both Conring's and Borrichius's works are of a particular interest here because they do not depend only on Paracelsianism and Hermetism, but also on alchemical literature. Nevertheless, the C.H. is rarely the object of commentaries in the alchemical discourses of the 17th century, although Hermes Trismegistus often appears therein as the tutelary figure of that science, for instance in → Michael Maier's *Symbola Aureae Mensae Duodecim Nationum* (Frankfurt 1617). Notwithstanding, the T.S. continued to trigger a lot of alchemical commentaries, for example those by → Isaac Newton are much developed. They are extant in the great quantity of alchemical manuscripts he had left to posterity (King's College, Cambridge), and which have recently been the object of a number of scholarly studies. Besides, Wilhelm Christoph Kriegsmann produced a most original, albeit fantastic "philological" commentary (*Hermetis Trismegisti . . . Tabula Smaragdina*, 1657).

Indeed, throughout the period, and ever after, the tendency was strong in Hermetic literature to blend Hermetism not only with alchemy, but also with Jewish or Christian Kabbalah, → Rosicrucianism, and generally with the *philosophia occulta* inherited from the Renaissance. Among Rosicrucian productions this tendency is instanced by Stellatus's (i.e. Christoph Hirsch's) *Pegasus Firmamenti, sive introductio brevis in Veterum Sapientiam . . .* (n.p., 1618), which associates Rosicrucianism with Hermetism, Paracelsianism, pansophy and alchemy. Opponents of Hermetism also often grouped these currents together. Two examples may serve to illustrate this. First, one year after the publication of Zorzi's (Giorgio's, see above) *Problemata*, the famous Catholic Priest Marin Mersenne, very much bent on orthodoxy and a famous opponent of such orientations, published his *Observationes et emendationes ad Francisci Giorgii Veneti Problemata* (Paris 1623), directed against Giorgio's work, but also Hermetism, Rosicrucianism, Robert Fludd (see below), etc. The other characteristic example is the Lutheran minister Ehregott Daniel Colberg. In his voluminous *Das Platonisch-Hermetisches [sic] Christenthum . . .* (Leipzig, 2 vols., 1690 and 1691, new ed. 1710), he settles scores with the C.H. as well as with Rosicrucianism, Theosophy, → mysticism, etc., reproaching them mainly for fostering a self-divinization of Man.

Within the pale of esotericism proper, → Robert Fludd, particularly in *Utriusque cosmi . . . historia* (Oppenheim 1617-1621), was instrumental in

propagating the "magical" tradition which had been represented by such people as → Paracelsus, Agrippa, → John Dee, or the Rosicrucian manifestoes. He drew heavily on the hermetic writings: nearly every page of his works contains a quotation from Ficino's translation. Fludd also makes use of the *Asclepius* and of other hermetic writings, for instance in presenting his views on the creation of the world, of which he gives a "chemical" description that draws on the *Pimander* (C.H. I) as much as on the Bible and the first verses of the Gospel of John. Later on, among the so-called Cambridge platonists, → Ralph Cudworth was the one who dealt most extensively with the C.H. (even more so than → Henry More). His *The True Intellectual System of the Universe* (London 1678) contains a lengthy commentary on its treatises, with a particular emphasis on cosmogony. As against Casaubon, Cudworth stressed the presence of Egyptian elements. He also considered that treating the C.H. as one single text (whereas it is actually a collection) entails that the arguments liable to discredit the great age of some treatises do not need to discredit the rest of them (and least of all the *Asclepius*). Moreover, Hermetism had already made its way into English culture in general, with Woodville (see above), Edmund Spencer (many relevant passages in *The Fairie Queene*, London 1590-1596), and others. This process continued well into the English 17th century, as documented by works of celebrated authors who do not belong to this orientation but give it a place, albeit a modest one, like Richard Burton (*The Anatomy of Melancholy*, Oxford 1621), Sir Thomas Browne (*Religio Medici*, 1643), Sir Walter Raleigh (*History of the World*, 1614), John Milton (*Il Penseroso*, London 1645), etc. (see Shumaker, 1972, 236-247; and 1988).

As was already the case in the preceding century, but even more so now, the *Hermetica* had become part and parcel of many discourses marked by → Egyptomania. Typical of that trend are works of the Jesuit → Athanasius Kircher, notably *Oedipus Aegyptiacus* (Rome 1652-1654; but see also *Prodromus coptus*, Rome 1636), which uses the C.H., among other ingredients, to make Catholicism palatable, with a view to deterring his readers from Protestantism and/or incredulity. Kircher, however, was not a great admirer of the hermetic literature and regarded e.g. Paracelsus, the Rosicrucians, or Robert Fludd with great suspicion.

Interestingly, the French Jesuits and theologians involved in missionary activities in the Far East, particularly in China, shared a project similar to Kircher's, though hardly at all from an Egyptophile

perspective. Apart from Rapine (see below), these Catholic priests were not interested in Hermetism itself, but used it as a tool for converting people to Catholicism. It was a matter of demonstrating that Confucius's teachings, for example, as well as those of Western pagan philosophers – primarily Plato and Hermes Trismegistus – were compatible with monotheism. This missionary program, often strongly hermetically tinged, is exemplified by Paschal Rapine's *Le Christianisme naissant dans la gentilité* (Paris 1655-1659), Paul Beurrier's *Perpetuitas fidei, ab origine mundi . . .* (Paris 1666; French ed. 1680); Daniel Huet's *Demonstratio evangelica* (Paris 1678; several re-eds.); Philippe Couplet's *Confucius Sinarum philosophus* (1687), and several writings by Joachim Bouvet around 1700, notably his correspondence with Leibniz.

3. TESTIMONIES AT THE TIME OF THE ENLIGHTENMENT AND IN THE PRE-ROMANTIC PERIOD

Like Everard's English version, the first complete German translation of the seventeen treatises of the C.H. became influential on later esoteric literature. Its author, who had had at his disposal the editions of Patrizi and van Beyerland, signed himself Aleophilus (perhaps a pen name for Wolf Metternich) and entitled it *Hermetis Trismegisti Erkenntnüss der Natur und des darin sich offenbarenden Grossen Gottes . . .* (Hamburg 1706; reed. 1855, see below). His long introduction to the book, in which he shows himself to be a Paracelsian, is noteworthy. He endorses the main legends surrounding the C.H. and tries to marry Hermetism with alchemy, extolling the Egyptian elements of the text over the Greek ones. The T.S. is very present in Aleophilus' book and, not surprisingly, in numerous other alchemical treatises of the period. Three works in German stand out in that context, namely Ehrd de Naxagoras' *Aureum Vellus* (Frankfurt 1731-1733, 2 vols.); the anonymous *Vernünftige Erklärung der Smaragdenen Tafel . . .* (s.l. 1760); and above all → Hermann Fictuld's *Turba Philosophorum* (s.l. 1763), one of the most important works in the history of the T.S. tradition, and in which alchemy and theosophical outlooks are blended together.

The period of the Enlightenment saw new German translations of the C.H. First, Dietrich Tiedeman's (C.H. I-XVIII), entitled *Poemander, oder von der göttlichen Macht und Weisheit* (Berlin & Stettin 1781). It was published three years after the first German translation of the *Asclepius*, at the Press of Friedrich Nicolai, one of the most celebrated representatives of the *Aufklärung*. Indeed,

Tiedeman's commentaries are reflective of the intellectual orientation of the Enlightenment. They are also replete with comparisons between the C.H., Plato, → Gnosticism and Jewish Kabbalah.

Alongside these translations there appeared further erudite studies. Some were of a more or less hermetic orientation, like Hermann van der Hardt's "Poemander" (inserted in his book *Antiquitatis Gloria*, Helmstedt 1737), a long paraphrase of C.H. I, in which, for example, Jacob's dream (Gen. 28) is compared to Hermes's vision in C.H. I, 1. Other studies were definitely more scholarly oriented. Two of them stand out. First, *Bibliotheca Graeca*, by Johann Albrecht Fabricius (Hamburg 1705-1728, see vol. I, 1708, lib 1, chapters VII-XII; new, enlarged ed. 1790). Second, Jacob Brucker's *Kurze Fragen aus der philosophischen Historie* (Ulm 1730-1736) and *Historia critica philosophiae* (Leipzig 1743; see vol. I, chapters I-IV), which provided a wealth of information on theosophical, alchemical and Rosicrucian literature, not least on the C.H. and whatever Brucker knew about the *Hermetica* in general (see notably *ibid.*, vol. I, liber 3). Brucker goes as far as to deal with works appearing as late as the beginning of the 18th century. Certainly, he was not a proponent of any of these currents, but his very detailed – albeit not always unprejudiced – presentation would ensure a knowledge about them for a long time, all the more so since the book of 1743 quickly became essential to most good libraries all over Europe.

Toward the end of the 18th century, Hermetism started at the top rung of the literary ladder in Germany with two texts written by Johann Gottfried Herder. First, *Über die älteste Urkunde des Menschengeschlechts* (Riga 1774), in which he claimed to have found in ancient traditions, notably in Hermes Trismegistus, keys capable of unlocking a number of mysteries and retrieving a long lost knowledge. Second, "Hermes und Pymander" (in the journal *Adrastea*, 1801), a dialogue (inspired by C.H. I) between Pymander and his disciple, which deals with the new scientific discoveries (not least those by Isaac Newton) as well as with spiritual and material light, the Soul of the World, etc.

In Italy, although Hermetism as an esoteric current had all but ceased to manifest its presence, it was still occasionally the object of publications; see for instance a reprint in Bologna (1820) of an edition of the C.H. which C. Lenzoni had published in 1584. In the United States, Ralph Waldo Emerson's *The Dial* (see in particular the issues published from 1842 to 1844), a journal expressing the views of the Transcendentalist movement in the United

States, published (in vol. IV) a number of “ethnic Scriptures” – as it called them –, including extracts from Everard’s translation of the C.H. Hermetism also seems to have left its imprint, albeit a mostly indirect one, on a number of authors of pre-Romantic and Romantic literature in England and the United States (see E.L. Tuveson 1982). The middle of the 19th century was also the time of new studies in pure scholarship (like B.J. Hilgers’ *De Hermetis Trismegisti Poimandro commentario*, Bonn 1855, and particularly Gustav Parthey’s *Hermetis Trismegisti Poemander* [the Greek text], Berlin 1854). Noteworthy too is the importance of the T.S. almost throughout → Franz von Baader’s theosophical works (notably from 1809 to 1839). Not very interested in alchemy, nor in Hermetism for that matter, he nonetheless made a frequent use of some verses of the T.S., commenting on them and merging them with his theosophical outlooks.

4. THE OCCULTIST CONTEXT

The so-called occultist current [→ Occult/occultism] flourished from ca. 1850 to ca. 1920, and drew upon a great variety of elements pertaining to the esoteric literature of earlier centuries. Certainly, Hermetism is part of the referential corpus of the so-called occultists, for example in fringe-masonic literature. Thus → Marie Ragon de Bettignies’s widely disseminated *Maçonnerie occulte, suivie de l’Initiation hermétique* (1853) is a blend of masonic symbolism, alchemy, mythology and Hermetism. But the presence of Hermetism within the occultist current appears to be very limited, except in England (see below). In France, for instance, such important representatives of occultism as → Stanislas de Guaita or → Papus hardly referred to Hermetism. They did, however, devote many pages to their understanding of the T.S., which they, like so many other representatives of the current, took to be one of the most essential referential documents in Western esotericism (see for example → Stanislas de Guaita’s *Le Serpent de la Genèse*, Book II, Paris 1897). And in Italy, for example, the occultist → Giuliano Kremmerz authored a long series of commentaries entitled “Commento alla Tvola di Smeraldo” (in *Commentarium per le Academia Ermetice* . . ., Bari 1910).

With regard to esotericism in Germany, the new edition of Aletophilus’s translation of the C.H. (1706, see above) is noteworthy, along with its introduction. It appeared as *Hermetis Trismegisti Einleitung ins höchste Wissen* (Stuttgart 1855) in the semi-popular series “Das Kloster” directed by J. Scheible, which from 1849 to 1860 offered new German editions of texts by Agrippa, →

Trithemius, Paracelsus, → J.B. Van Helmont, → Eliphas Lévi, Catherine Crowe, Nostradamus et al. As for Louis Ménard’s *Hermès Trismégiste: Traduction complète précédée d’une étude sur l’origine des livres hermétiques* (Paris 1866, several re-eds.), its influence should not be underestimated. It is a new French translation of C.H. I-XIV (relying on Parthey’s Greek edition, see above), *Asclepius, Korè Kosmou* (“The Virgin of the World”, part of Stobaeus’ *Anthologium*), and the *Diffinitiones Asclepii* (C.H. XVI-XVIII) after Patrizi’s text. The book also contains a long but sober introduction of 112 pages, in which Ménard places these texts in the perspective of a comparative approach of religions which shows him to be slightly inspired by the idea of a perennial philosophy. Triggered in part by Ménard’s book, a flurry of new English editions of hermetic treatises appeared, mostly in England and in the United States, accompanied by esoterically oriented presentations and/or commentaries. Most of them have little scholarly value, but in various ways they are representative of occultism, especially since many were produced by people with a reputation in that current.

The first on this list is a reprinting of Everard’s translation at the Rosicrucian Publishing Co. in Boston (*Hermes Trismegistus: His Divine Pymanter. Also, the Asiatic Mystery. The Smaragdine Tablet, and the Song of Brahm*, repr. Toledo [Ohio] 1889). Its editor was the famous Rosicrucian → Paschal Beverly Randolph. The strongly Rosicrucian-oriented “Prefatory Note” is signed by Alfred E. Giles and Flora Russell (who also gives there a reprinted version of the *Asiatic Mystery*; one of Randolph’s Rosicrucian manifestoes). The “Song of Brahm” is a poem by R.W. Emerson.

There followed a new reprint of Everard’s translation by the Rosicrucian → Hargrave Jennings (Madras 1884, “Secret Doctrine Reference series”), who devoted his own prefatory text mostly to the personage Hermes Trismegistus and alchemical literature. Prompted by the former one, this book turns out to contain the first public mention of the esoteric Society called → The Hermetic Brotherhood of Luxor. Almost at the same time, there appeared in the same series one of the most influential books of that publishing enterprise, namely *The Virgin of the World of Hermes Mercurius Trismegistus* (London [and Madras] 1885), edited by → Anna Bonus Kingsford and Edward Maitland, which contains an English version of *Korè Kosmou*, “A treatise on initiations” (in fact, a new translation of the *Asclepius*), “The Definitions of Asclepius” (i.e., C.H. XVI-XVIII), plus further

extracts from Stobaeus's *Anthologium*. In their translation and long introductions, Kingsford and Maitland drew heavily on Ménard's book. They saw in the Hermetic texts a survival of ancient Egypt and believed in a coincidence between them and Christianity, it being understood that Christianity itself represents, as they say, 'a development from or reformulation of a doctrine long pre-existent'. Along these lines, they considered their edition to be part of 'the revival of Occult Science and Mystical, or Esoteric, philosophy'. A new edition of Kingsford and Maitland's anthology soon followed (Bath 1886), with an appendix pertaining to alchemy and taken from Mary Anne Atwood's *A Suggestive Inquiry into the Hermetic Mystery* (1850). The appendix was introduced by the famous John Yarker, author of many works in such domains, particularly esoteric → Freemasonry.

Given the number of such books, it is hardly surprising that Hermetism also entered esoteric periodicals. For example, we find *Koré Kosmou* again (presented anonymously and in a different translation) in *The Occult Magazine* (Glasgow, see issues of 1885-1886). In 1894, → William Wynn Westcott, who along with → MacGregor Mathers had created the fringe-masonic → Hermetic Order of the Golden Dawn in 1887, inserted into the second volume of his series *Collectanea Hermetica* (1893-1896) the Everard version of the C.H., here titled *The Pyramander of Hermes, with a Preface by the editor* (London, Theosophical Publishing Society). Westcott's preface, more enthusiastic than critical, emphasizes the commonalities between Hermetism, Freemasonry and Christianity.

On the scholarly side, *The Theological and Philological Work of Hermes Trismegistus, Christian Neoplatonist, Divine Pyramander and other writings of Hermes Trismegistus* (Edinburgh 1882), edited by John D. Chambers, reflects a new scientific approach. But it was mostly → George R.S. Mead's enterprise that paved the way for deeper and more extensive scholarly researches. Three years before breaking with the Theosophical Society, of which he was a prominent member, he published his *Thrice Greatest Hermes: Studies in Hellenistic Theosophy and Gnosis* (London & Benares, Theosophical Publishing Society, 3 vols. 1906; German version Leipzig 1909). Never before, indeed, had such a virtually complete ensemble of *Hermetica* been gathered together, accompanied by copious notes, excerpts from *testimonia* of the Fathers, serious historical studies, etc. Mead distanced himself markedly from the aforementioned English-speaking occultists by displaying a great deal of objectivity in dealing with his material. That said, he did not

disguise the fact that he was an esotericist too ('to translate "Hermes" in Greek', he writes in the introduction, 'requires not only a good knowledge of Greek, but also a Knowledge of . . . gnosis'). Indeed, not unlike → Arthur E. Waite in the same period, Mead was both a scholar and a fully-fledged esotericist. Nevertheless, his work, even more than Chambers's, heralds the development of 20th century critical research as represented by such distinguished historians and philologists as Richard Reitzenstein, Walter Scott, A.D. Nock, A.J. Festugière, Gilles Quispel, Roelof van den Broek, Jean-Pierre Mahé, Brian P. Copenhaver et al.

The last decades of occultism saw further hermetically oriented publications, of which a few examples follow. *The Shepherd of Men: An Official Commentary on the Sermon of Hermes Trismegistos* (San Francisco, Hermetic Publishing Company 1916) is by A.D. Raleigh, who called himself "Hierophant of the Mysteries of Isis". Although the title of his book implicitly refers to the famous text of Late Antiquity, *The Shepherd of Hermas*, Raleigh's discourse is pervaded by the idea of a perennial tradition and is blended with a fantastic history of human races, echoing some of the Theosophical Society's teachings. More situated within "classical" Hermetism is the thin volume *The Divine Pyramander of Hermes Trismegistus* (n.p. [London?] 1923, no publisher's name), which presents a short selection drawn from the Everard, Chambers and Mead editions, along with some commentaries. It is in fact one of the "Manuals" published by The Shrine of Wisdom, which was a ritual Order, a publishing house and a journal. The Shrine of Wisdom was largely inspired by the works of the Platonist Thomas Taylor.

In closing, we should mention → Manly Palmer Hall's oversized folio *An Encyclopaedic Outline of Masonic, Hermetic, Qabbalistic and Rosicrucian Philosophy* (Los Angeles, Philosophical Research Society 1928), another product of late occultism and one of the most popular *summae* of Western esoteric traditions. Hermetism is almost ubiquitous in that strange encyclopaedia.

5. SURVIVALS AND DEBATES (SECOND HALF OF THE 20TH CENTURY) & GENERAL CONSIDERATIONS

Most of the above editions and commentaries of the C.H. which saw the light in the period of the occultist current were reprinted in the second half of the 20th century. The latter has not been lacking in original publications, although they seem to have been decreasing in number. Among them are

The Gospel of Hermes, edited and translated from the Greek and Latin Hermetica, introduced by Duncan Greenless and published in 1949 by the Theosophical Publishing Company. More famous is → Jan van Rijckenborgh's *De Egyptische oergnosis en haar roep in het Eeuwige Nú . . .* (Haarlem 1960-1965), an interpretation of the C.H. in the light of the teachings of an initiatory Order (the Lectorium Rosicrucianum) of which he was the founder. Here, ancient Gnosticism, → Neo-Catharism, Paracelsianism and Boehmism are blended together in an original way. Since its first publication, van Rijckenborgh's book has gone through countless reprints and translations, fostered worldwide by the Lectorium Rosicrucianum. Noteworthy therein is the long development he devotes to the T.S. He uses the text to support the tenets of his own teachings and does not hesitate to claim that it was written ten thousand years ago.

One of the prominent members of the Lectorium Rosicrucianum in the Netherlands, Joost R. Ritman, has founded a library in Amsterdam, the *Bibliotheca Philosophica Hermetica* (open to the public since 1984), which is the richest in the world in terms of esoteric literature, including manuscripts and incunables, from the early Renaissance to the present, not to mention a wealth of more ancient materials. This remarkable institution is especially noteworthy here because Hermetic literature in the proper sense represents its most fundamental core, as demonstrated not only by its holdings, but also by the exhibitions it organizes and by its publications. Its Editorial board includes such reputable scholars as Frans A. Janssen and Carlos Gilly.

Hermetism as a specific esoteric current all but became extinct after the 17th century, having merged with so many other currents. It cannot be said to have merged with the perennialist current [→ Tradition], whose representatives are not prone to extol the interest it may present (or of that of other Western esoteric currents, for that matter). But interestingly enough, the T.S. occasionally finds entrance into the perennialist current, most likely because this short text can be read without any reference to Hermetism proper, and easily lends itself to multiple exploitations. Titus Burckhardt, an author of the perennialist persuasion, has produced one of the best known contemporary commentaries of the T.S. (in his *Alchemie – Sinn und Weltbild*, Olten/Freiburg 1960).

That said, even outside the pale of esotericism proper, Hermetism has never entirely ceased to trigger the interest of people from various orientations. Occasionally it has been revived by philoso-

phers who see in the C.H. the paradigm of an alternative philosophy able to enrich the mainstream with new insights, or to replace it. For example, Ralph Liedtke's book *Die Hermetik: Traditionelle Philosophie der Differenz* (Paderborn 1996), purports to foster a return to other modes of thinking, among which the author considers the contents of the C.H. to be one of the best possible introductions to a desirable and drastic reappraisal with regard to mainstream contemporary trends in philosophy. Just as Renaissance Hermetism served to bring about reforms within the Churches, so now it has occasionally become a means of "reforming" philosophy. Similarly, efforts have been and are still made to extol it as a method for the fruitful completion or enrichment of psychology. For example, Lietaert Pierbolte (*Poimandres . . . vertaald met een transpersonalistische beschouwing*, Deventer 1974) presents C.H. I in Dutch and comments on it by explaining why it should be used as a method for practising the kind of transpersonal psychology that he advocates. Similarly, and along perspectives not very far from those of the → New Age movement, the T.S. is occasionally interpreted and commented as a practical guide to spiritual growth. For instance, Dennis William Hauck's *The Emerald Tablet: Alchemy for Personal Transformation* (Harmondsworth [UK] 1999) throughout expresses such a tendency.

In the post-war period, more particularly since the 1960s, most discourses on Hermetism have been of a scholarly character. Frances A. Yates' *Giordano Bruno and the Hermetic Tradition*, published in 1964, has been highly instrumental in calling attention to its importance and significance in the history of the Renaissance. Although not without forbears, Yates's work was a watershed. Many scholars whose work is dedicated to Renaissance Hermetism in general, or to one particular author, stand in its wake; even if they do not necessarily endorse Yates's views, they are directly or indirectly indebted to her writings. By the same token, Yates's work has paved the way for an ongoing academic recognition, even institutionalization, of modern Western esoteric currents as a specialty in its own right. In addition to that, it has caused a flurry of debates, first over what Robert S. Westman (1977) called the "Yates Thesis" (concerning the relation between Hermetism and the scientific revolution), and more recently over what Wouter J. Hanegraaff (2001) has referred to as "the Yates paradigm". As pointed out by the latter, Yates's works have created a "grand narrative", as it were, based on two main assumptions. First, the existence of what she calls "the Hermetic Tradition" understood as a

more or less autonomous tradition based upon a covert reaction against both Christianity and the rise of scientific world-views. Secondly, and however paradoxical it may seem, the claim that the essential tradition of “magic” – which she sees as essentially non-progressive – has been an important factor in the development of the scientific revolution (i.e., the “Yates thesis”, see above). Even if neither of these two tenets has proved resistant to close scrutiny, the opinions implicit in the “Yates paradigm” still causes ink to flow.

Be that as it may, such debates around Yates’s work concern the early modern period. Their relevance to the later periods is of secondary importance. Indeed, Neo-Alexandrian Hermetism taken as a whole, i.e. over the sweep of a little over five centuries, is of great interest to the historian of ideas (and of literature) not least because it reflects the various contexts in which it has taken on ever-changing aspects. This is all the more so since it would not be possible to define Hermetism as a set of fixed, unchangeable beliefs. Rather, its manifold manifestations evince a spiritual attitude which contains in itself a principle of constant readjustment. Not surprisingly, it has flourished mostly in times and countries hospitable to religious tolerance. Although its representatives have been people desiring to “reform” religious systems, the reforms they had in mind were not dogmatic in character, and very rarely designed to overthrow established Churches. They rather tended to enrich the latter by prompting them to return *ad fontes*, i.e., both to ancient foundational texts and to specific forms of meditation. Indeed, far from stressing a war between Good and Evil, Light and Darkness, as is often the case in Christian thought, their discourses have expressed a generally optimistic conception of the inborn powers of Man, understood as a being able to liberate and expand his consciousness and develop his inborn powers.

As one of the several esoteric currents in modernity (i.e., from the Renaissance until the present time), Hermetism has naturally found itself historically intertwined with the others. In this respect, it is interesting to see how far and in which directions these relationships have been operating. We note, for example, that despite their commonalities, Hermetism and Christian Theosophy (which appeared later, at the beginning of the 17th century) have had few contacts and have hardly influenced each other. One of the reasons is that Hermetism, originally a branch of Humanism, always remained dependent upon ancient sources, notably Greek, whereas Theosophy is rooted,

rather, in Paracelsus and Jacob Boehme, who represent a German, “barbaric” trend all but devoid of erudite leanings. It is therefore hardly surprising that even long after the Renaissance, the foremost representatives of Theosophy, like → Louis-Claude de Saint-Martin or → Franz von Baader, practically never drew on the Hermetic writings.

ANTOINE FAIVRE

Hermetic Order of the Golden Dawn

The foremost esoteric, and later magical, initiatic Order of the late 19th and early 20th centuries. It was founded in March 1888 but its roots lie in the plethora of fringe masonic Orders and quasi-masonic societies that flourished from the 1860s onwards. Both the administrative structure of the Order and the form of its ceremonies were masonic, but the symbolism and doctrinal content of the rituals were drawn almost exclusively from Western esoteric sources, and in its essentials the Golden Dawn conformed to the definition of an esoteric Order given by → Dion Fortune: a fraternity ‘wherein a secret wisdom, unknown to the generality of mankind might be learnt, and to which admission was obtained by means of an initiation in which tests and ritual played their part’ (*The Esoteric Orders and their Work*, 1928, ix).

The immediate inspiration for the Golden Dawn was a masonic Rosicrucian body, the Societas Rosicruciana in Anglia, that had been established in 1867. This society worked simple rituals of initiation through its system of Grades and encouraged its members to study ‘the Kabbalah and the doctrines of Hermes Trismegistus’. Each member also chose a motto, usually a Latin tag, which would – in theory – become his official name within the society. Such a combination of quasi-masonic ritual, ostensible secrecy and academic discussion was more than adequate for most of the society’s members, but for some it was not enough. They wanted prescribed courses of study in various forms of occultism [→ occult/occultism] and, above all, they wished to practise → magic. They also realised that none of this could take place within the S.R.I.A. and that a new and practical body must be founded – but it was not until 1883 that the first attempt at such a foundation was made.

It was the brainchild of Frederick Holland, an industrial chemist who joined the S.R.I.A. in April 1882. Within a year he had set up his “Society of Eight” and drawn in a number of prominent masonic Rosicrucians, including Kenneth Mackenzie who described the new society as ‘practical and not visionary’ and as standing for ‘work and not play’. But the Society of Eight was only a stepping-stone. It had no ritual structure and no systematic teaching; for these Mackenzie and his fellows had to look elsewhere – to a minuscule, fringe masonic body, the Royal Oriental Order of Sikha and the Sat B’hai. Mackenzie had joined the Sat B’hai in 1875 and had helped to develop its rituals. It was not, in any sense, a magical Order, but it did have a curriculum of ‘subjects for investigation’ that covered virtually every aspect of both eastern and western occultism, and it admitted women as members. This factor was clearly very important for Mackenzie who, having completed the Sat B’hai rituals, began to construct a new series of ritual texts for a wholly new initiatic Order: androgynous, disciplined and designed to inculcate the essence of Western esotericism. This new Order was, however, only one among Mackenzie’s many esoteric activities, and at the time of his death, on 3 July 1886, the ritual texts existed only in outline form in manuscript – and in cipher. Shortly afterwards these outline texts were discovered by another member of the S.R.I.A., provided with a false pedigree and transformed into the rituals of the Hermetic Order of the Golden Dawn.

The discovery was made by chance. Upon Mackenzie’s death → William Wynn Westcott, a London coroner and prominent member of the S.R.I.A., took over the post of Grand Secretary of yet another small masonic body, the Swedenborgian Rite, together with his predecessor’s papers. Among them he found the incomplete rituals, identified the source of the cipher (the *Polygraphiae* of → Trithemius), and translated the text. He also recognised their enormous potential and began to develop them into a complete, working system. At what point Westcott determined to launch this new Order upon the world is unknown, but his decision was probably precipitated by the closure of the Hermetic Society [→ Hermeticism and Hermetic Societies]. This was a lecture society, founded in 1884 by → Anna Kingsford and Edward Maitland with the intention of propagating the Western esoteric tradition, which they perceived as being deliberately ignored and rejected within the → Theosophical Society. Both Westcott and → Samuel Liddell Mathers, one of his closest colleagues in the S.R.I.A., were frequent lecturers at the Hermetic

Society, and when its activities ceased after Anna Kingsford’s death in 1887 they felt keenly the loss of a public platform.

In October 1887 Westcott wrote to Mathers asking for his help in writing up the rituals ‘with all your erudition’ from the now completed translation of the cipher manuscripts. He did not, however, reveal their source to Mathers; rather, he claimed to have received them from a masonic historian, the Rev. A.F.A. Woodford who, conveniently for Westcott, had died two months later. Westcott also inserted his own note, in the Trithemius cipher, among Mackenzie’s manuscripts. This confirmed the contents of a letter from Woodford to Westcott (but known only from a copy in Westcott’s hand), and directed the reader to a Fräulein Sprengel, otherwise Soror Sapiens dominabitur astris – ‘a chief among the members of die goldene dammerung’, at an accommodation address in Stuttgart. Having created his continental adept Westcott next began a correspondence with her, producing a series of five letters that provided a spurious history of the Golden Dawn; gave him authority to found a new Temple; and authorised him to sign her motto on her behalf. Later, in August 1890, he would kill her off, but for the present he needed her alive – and invisible. It is probable that Westcott based her on Anna Kingsford, for he would have found the motto, Sapiens dominabitur astris, on the title-page of one of her last works (an edition, 1886, of → Valentin Weigel’s *Astrology Theologized*) and he later gave Fräulein Sprengel the name Anna.

Westcott also created a spurious history for his Order, claiming descent from a hybrid body that conflated a genuine masonic lodge at Frankfurt with a fictitious Rosicrucian Society, and listing a number of prominent, but deceased, occultists as members. Whether or not Mathers believed, at this time, in either Anna Sprengel or the spurious history is unknown, but he acted as if he did so and willingly became a co-creator with Westcott of the Hermetic Order of the Golden Dawn. With the all-important “history” in place (Westcott was a member of the → Theosophical Society and thus was fully aware of the value to an esoteric Order of an august pedigree), and the rituals complete, all that was needed was a third Chief for the projected Temple. This was necessary not only because Soror S.D.A. required it, but because the S.R.I.A. – on which the structure of the Golden Dawn was closely modelled – also had three Chiefs.

The obvious, and willing, candidate was Dr. William Robert Woodman, Supreme Magus of the S.R.I.A., an excellent Hebraist and a learned

kabbalist. Possessed between them of ritual genius, a wealth of esoteric knowledge, and a breathtaking creative imagination the three Chiefs were ready to launch their Order. On 1 March 1888, at Mark Masons' Hall in London, the Fratres Magna est Veritas (Woodman), Sapere Aude (Westcott), and 'S Rioghail Mo Dhream (Mathers) constituted and consecrated 'the Isis-Urania Temple No. 3, of the Order of the G.D. in the Outer'. By the end of the month seven members, four men and three women, had been initiated as Neophytes of the Order.

The Order was constructed in a graduated form, the Neophyte ceremony being the first in a progressive series based upon a symbolic entry into and ascent of the kabbalistic Tree of Life. It was impressive, as were the rest of the series, and followed the standard pattern of ceremonies of initiation, albeit utilising an eclectic mix of symbols drawn from both Eastern and Western esotericism. Much of this was called for in the cipher manuscripts, but the language employed and the ceremonial embellishments are evidence of Mathers's flair for the dramatic. Each stage, or Grade, of the initiate's ceremonial progress was related to one of the Sephiroth of the Tree of Life, the nature, qualities and correspondences of which were symbolically presented and explained. Each Grade was also given a specific name and number, derived, for the most part, from the structure of an 18th Century German quasi-masonic Order, the *Gold- und Rosenkreuz*. The Grade of Neophyte, in the course of which the candidate took an Obligation to maintain strict secrecy as to the affairs of the Order, stood below the Sephiroth and was thus numbered 0=0. The succeeding Grades were as follows: Zelator, 1=10 (Malkuth); Theoricus, 2=9 (Yesod); Practicus, 3=8 (Hod), and Philosophus, 4=7 (Netzach). At this point the Outer Order ended and the initiate – who might have taken several years to reach the Grade of Philosophus, as advancement through the Grades demanded proficiency in the prescribed courses of study – came to a stop. Beyond it lay the Second, or Inner Order of the Adepts, although the ceremonies for this were not constructed in detail until 1891.

Westcott and his co-chiefs were fully aware that such a complex system required sound administration and they had established an effective hierarchical structure at the outset. Ultimate authority in the Golden Dawn, at least in the material world, rested in the hands of the three founding Chiefs, while each Temple had its own Chiefs who acted as senior administrative officers. These were the Emperor, who 'compell[ed] the obedience of the Temple to the *commands* issued by the Second

Order'; the Praemonstrator, who instructed the members and superintended the working of the Temple; and the Cancellarius, the Recorder, Secretary and Archivist of the Temple.

The direction of the Order ceremonies was in the hands of seven officers, who took their titles from those of functionaries of the Eleusinian Mysteries, although their roles were clearly modelled on those of the officers of a masonic Lodge. They, and their masonic parallels, were as follows: Hierophant (Worshipful Master); Hiereus (Senior Warden); Hegemon (Junior Warden); Kerux (Inner Guard); Stolistes (Senior Deacon); Dadouchos (Junior Deacon); and Sentinel (Tyler). Each officer wore distinctive robes and insignia, but the Order differed from → Freemasonry in that every office was open to both men and women.

Within twelve months of its foundation the Golden Dawn had attained a membership of sixty persons: fifty-one men and nine women. Almost two-thirds of this total were members of the Isis-Urania Temple in London, the remainder being almost equally divided between two additional Temples that had been founded in October 1888: Osiris Temple No. 4, at Weston-Super-Mare, in Somerset; and Horus Temple No. 5, at Bradford in Yorkshire. The siting of these Temples reflects the sources from which members were drawn. Weston-super-Mare was the home of the former Bristol College of the S.R.I.A., of which all of the Osiris initiates had been members, while Bradford had a thriving lodge of the Theosophical Society and was close to the headquarters of the York College of the S.R.I.A. Throughout its history very few members of the Golden Dawn would be other than theosophists or masonic Rosicrucians.

Not all theosophists approved of the Order, however, and early in 1889 → Madame Blavatsky forbade members of the Esoteric Section of the Theosophical Society from belonging to other occult orders. Westcott was soon able to allay her suspicions of the Golden Dawn, but growth was temporarily slowed – by May 1890 only another twelve men and seven women entered the Order. Thereafter expansion was steady and after ten years of active existence two further Temples of the Golden Dawn had been established – the Amen Ra Temple No. 6 at Edinburgh, in 1893, and the Ahathoor Temple No. 7, at Paris, in 1894 – and 331 men and women had entered the Order, in a ratio of approximately three to two. Not all, however, remained active: death, resignation and exclusion accounted for almost 25% of those initiated.

For those who remained there were, in addition

to the ceremonial activities of the Order, extensive, if eclectic, courses of study. The subjects to be studied were presented to the initiate in the form of “Knowledge Lectures” that became progressively more complex as he or she advanced from the Grade of Neophyte to that of Philosophus. As initiates progressed, so they were expected to become increasingly familiar with the Hebrew alphabet, the meaning of kabbalistic [→ Jewish Influences], alchemical [→ Alchemy] and → tarot symbolism, the technicalities of → astrology and other forms of divination [→ Divinatory Arts], and the names and natures of the Elemental Beings – in all of which areas of study they were duly examined. In addition, they were required to meditate and to become proficient in the Rituals of the Pentagram, but this was the sole activity that could possibly be construed as magical, everything else provided for members of the Golden Dawn in the Outer being a part of traditional Western esotericism. The study and practice of magic was the exclusive preserve of the Adepts: members of the Second, or Inner Order, the “Rosae Rubeae et Aureae Crucis”.

In theory a Second Order had always existed, although its membership was confined at first to the three Chiefs, who issued the Charters (under different mottoes: *Vincit Omnia Veritas* for Woodman; *Non Omnis Moriar* for Westcott; and *Deo Duce Comite Ferro* for Mathers) and permitted the Temples of the Golden Dawn to function. This Order comprised the three Adept Grades that corresponded to the three sephiroth in the kabbalistic World of Briah. These were the 5=6 Grade of Adeptus Minor, corresponding to the sephira Tiphereth; the 6=5 Grade of Adeptus Major, corresponding to Geburah; and the 7=4 Grade of Adeptus Exemptus, corresponding to Chesed. Philosophi who pursued their studies successfully, proved to be able ritualists, and who showed an aptitude for teaching both the theory and practice of occultism, were encouraged to progress to the Second Order.

Technically, entrance to the Second Order began with admission to the Portal Grade that preceded the Grade of Adeptus Minor. It corresponded to the lower aspect of the sephira Tiphereth, and attaining it symbolised the initiate’s parting of the veil of Paroketh (which, on the kabbalistic Tree of Life, separates the worlds of Yetzirah and Briah). In the early years of the Order, however, attainment of both the Portal and Adeptus Minor Grades was solely by way of examinations to establish the initiate’s competence as an occultist. Between 1888 and 1891 sixteen prominent members of the Golden Dawn entered the Second Order in this

way: ceremonial admission to the Adept Grades did not begin until December, 1891.

Neither Westcott nor Woodman had shown any great enthusiasm for a working Second Order, but Mathers was eager to develop rituals for the Adept Grades and to construct a “Vault of the Adepts” around and within which the ceremonies could be worked. The rituals, and indeed the whole ethos, of the effectively separate *Ordo Rosae Rubeae et Aureae Crucis* were based upon the legend of the discovery of the tomb of Christian Rosencreutz and the symbolism associated with the tomb. The ceremonies were loosely derived from those of the Adept Grades of the S.R.I.A., but Mathers was a ritualist of genius and in the Golden Dawn system they were transformed into spectacular dramas of death and resurrection, worked within a Vault that he designed and constructed.

As its name indicates, the Portal ceremony, which followed logically from those of the First Order, took place outside the Vault, and the candidate was not aware of its existence. The working of the next Grade – of Adeptus Minor – was far more dramatic and of a very different nature. It consisted of three “Points” or stages, in the first of which the candidate took a second Obligation to the Order while bound symbolically upon the “Cross of Suffering”, subsequently being made aware of the Vault while the legend of Christian Rosencreutz was related. During the Second Point the candidate entered the Vault and discovered its symbolism, while being addressed by the entombed Chief Adept. For the Third Point the Vault was re-entered and the candidate found the now resurrected Chief Adept, in full regalia, who completed the explanation of the symbolism and received him (or her) as a true Adeptus Minor.

The ceremony of initiation into the Adeptus Minor Grade of the R.R. et A.C. inevitably had a powerful and often transformative effect upon the candidate – a necessary condition for his or her self-perception as a magician – but it marked only the beginning of the Adept’s magical progress. The 5=6 Grade of Adeptus Minor consisted of two sub-Grades: Zelator Adeptus Minor and Theoricus Adeptus Minor, and to progress from the first to the second required two years of intensive application to the theory and practice of magic. In addition to learning and practising the various prescribed rituals, the Adept was required to study the thirty-six instructional texts known as “Flying Rolls”; to make and consecrate a personal Rose Cross lamen (the badge of the R.R. et A.C.), a magical sword, a lotus wand, and the four elemental implements; and to pass a series of examinations that would

demonstrate proficiency in all of these activities. Comparatively few Adepts succeeded in attaining the second sub-Grade, but all of those who entered the Second Order considered themselves to be magicians in a meaningful sense.

By 1898 the Golden Dawn had a notional active membership of almost 250 persons, of whom about one hundred had progressed to the Second Order. But whereas the ratio of men to women in the Outer Order was two to one, the sexes were evenly divided in the R.R. et A.C. Almost all of the women had been ceremonially admitted as Adepti Minores, many of them within a comparatively short time after their initiation as Neophytes. Their success within the Golden Dawn was a reflection of both their status in society, and the social structure of the Order itself.

The founders and the earliest members had come to the Order as experienced occultists, but as public awareness of the Golden Dawn grew – carefully orchestrated by Westcott, who placed cryptic comments and letters in appropriate journals – so an increasing number of initiates proved to be enthusiastic novices. Some were drawn from aristocratic circles, although few of these remained for long, but the majority were either from the professional class or from the literary and artistic *avant garde* of the 1890s.

The first of these, chronologically, was Mina Bergson, a young art student and sister of the philosopher Henri Bergson, who was initiated in the Isis-Urania Temple in March 1888 and who became, eighteen months later, the first member of that Temple (other than the three Chiefs) to enter the Second Order. In June 1890 she further consolidated her position in the Golden Dawn by marrying Mathers. By this time there were some eighty members of the Order, but only three others who would play any significant role in its affairs: Annie Horniman, the daughter of a tea magnate; the actress Florence Farr; and the poet → W.B. Yeats. Most of the other members who entered the Order during the 1890s and who were destined to determine its history were drawn from the professional classes: lawyers (J.W. Brodie Innes, and Percy Bullock); scientists (W.F. Kirby, the entomologist, and William Peck, City Astronomer for Edinburgh); and a number of medical doctors (E.W. Berridge, George Dickson, R.W. Felkin, Henry Pullen Bury, and R.M. Theobald). Others who played decisive roles were → A.E. Waite; the Egyptologist M.W. Blackden; and the magician and *farceur* → Aleister Crowley.

At the end of 1891 Dr. Woodman died, and control of the Order was jointly maintained by his

co-Chiefs, with the Outer Order effectively in Westcott's hands and Mathers in charge of the R.R. et A.C. For the most part matters progressed smoothly for some years, although there were disputes within the Horus Temple and the Osiris Temple was virtually moribund (it closed down in 1895), and new Temples were founded. Mathers and his wife had moved to Paris in 1892 and set up a sub-branch of Isis Urania, which was elevated to the status of an independent Temple, Ahathoor No. 7, in January 1894 – just over two weeks after the consecration of the Amen-Ra Temple No. 6 at Edinburgh.

By this time it was clear to the members that the real work of the Golden Dawn lay in the R.R. et A.C. Technically, those in the Outer Order were supposed to be ignorant of even the existence of an Inner Order, and the Adepti were assiduous in keeping secret its rituals and magical activities. In practice, however, all members knew that the Grade of Philosophus was not their final goal and increasing numbers sought and attained admission to the Adept Grades. Once within the Second Order they had access to the vault for their ritual work, and to an excellent library to aid them in their studies. Inevitably, their increasing knowledge and magical proficiency led them not only into the senior offices of their Temples, but also to question both the authority and wisdom of their nominal Chiefs. To Mathers, who was rigidly authoritarian, such independence was anathema and he reacted strongly against it.

In 1893 he had suspended, and later expelled, Theresa O'Connell, one of the earliest initiates of the Order, over a minor dispute, while Westcott attempted (probably at Mathers's instigation and ultimately without success) to limit the activities of female adepts in the Isis-Urania Vault. These attempts to impose discipline were followed by a more serious affair that brought to light signs of real discontent among the adepts.

Annie Horniman, who had been providing regular funds for Mathers and his wife, expressed increasing unease at both the unorthodox sexual doctrines of a fellow adept, Dr. Berridge, and his behaviour towards the lady adepts. But when, in 1896, she complained of this to Mathers he reproved her and accused her of mental imbalance, later adding accusations of insubordination and incompetence. Miss Horniman then resigned as Sub-Praemonstrator of Isis-Urania, and also ceased her funding of Mathers. He promptly expelled her from the Order and justified his action in a long and bizarre letter to the Adepti that sought their submission to his authority – which he obtained,

but at the price of increasing dissension. This was further inflamed in 1897 by the sudden withdrawal of Westcott from any active role in the Golden Dawn in response to pressure from the civil authorities, who objected to a Crown official (Westcott was a coroner) being involved in a magical Order.

During the next two years resentments within the Order grew. There was increased opposition to Mathers's autocracy in both the Isis-Urania and Amen-Ra Temples, while the Horus Temple resented 'dogmatic control' from London. By 1900 some members of Isis-Urania had grown so disenchanted with the confusion that resulted from Mathers's eccentric direction of affairs that they wished to close down the Temple. Mathers's response, in a letter of March 1900 to Florence Farr, was to deny their request and to make an extraordinary claim about Westcott that undermined the integrity of the Golden Dawn and threatened to destroy the Order. Mathers claimed that he alone had ever been in communication with the Secret Chiefs and that Westcott had forged the original correspondence with Anna Sprengel. What he seems to have failed to recognise is that if the members of the Order believed him then they would realise that the Golden Dawn was an utter sham, based upon forgery and deceit.

Their immediate reaction was to demand proof from Mathers and to confront Westcott with the charges made against him. Mathers refused to offer any evidence and Westcott was evasive in the extreme. Later documents – which members of the Order never saw – give strong support to Mathers's claim about Westcott, but his own actions at the time led the Adepts from simple mistrust to an outright rejection of his authority. He had made the mistake of trusting Aleister Crowley and of admitting him to the Second Order in Paris, even though Crowley had been denied such advancement in London. In April 1900, Crowley arrived in London as Mathers's representative, charged with reclaiming the Order for its erstwhile Chief. His mission failed, partly because of his bizarre behaviour, and the Adepts in London promptly expelled Mathers and advised members of the Golden Dawn that 'a Revolution has taken place.'

Government of the Order reverted to the old system of three Chiefs, supported by a Council of ten, but the Golden Dawn faced further problems that would prove to be highly damaging. The immediate cause of Mathers's disastrous letter to Florence Farr was his conviction that he had finally met the real Anna Sprengel in the guise of one Madame Horos. He soon discovered, however, that she was a charlatan and criminal who stole copies of the

Golden Dawn rituals and decamped to London, where she set up a spurious version of the Order and aided her husband in criminal fraud and rape. Eventually, in December 1901, both husband and wife were arrested, tried, found guilty and gaoled for their crimes. But the trial was disastrous for the Golden Dawn: the Obligation and the Neophyte ritual were made public and derided by the press. With their reputations under threat many members of the Order left it in haste and those who remained were divided by long-standing factional quarrels. The most significant of these involved both the structure of the Golden Dawn and the working of the Second Order. Some, notably Florence Farr, wished to work unofficial magical ceremonies within small groups of adepts, while others – Yeats and the now reinstated Annie Horniman especially – were vehemently opposed to such groups and wished to maintain also the rigid examination structure for advancement in the Order. No compromise was achieved and in 1903 the Golden Dawn finally disintegrated.

By the beginning of that year Westcott and Yeats were inactive, and both Florence Farr and Annie Horniman had resigned. The major protagonists were now A.E. Waite, J.W. Brodie-Innes, and R.W. Felkin. After a failed attempt by Brodie-Innes to be accepted as Chief of the Order, Waite gained the support of those who looked upon the Golden Dawn as mystical rather than magical, took control of the Isis Urania Temple, and on 8 July 1903 instituted the "Independent and Rectified Rite" of the Golden Dawn (in public the name Golden Dawn was no longer used, having been altered to the German "Morgen Röthe" in the aftermath of the Horos affair). The new Rite was also avowedly Christian and, as a consequence, it was able to draw in those, such as Evelyn Underhill, who would have utterly rejected magic.

The magical faction continued under R.W. Felkin and Brodie-Innes, renaming their branch of the Order the → Stella Matutina, and establishing a new Temple, named Amoun, in London. Both men produced new rituals and new teaching which they believed to be derived from supernatural beings known as the Sun Masters. In addition Felkin had convinced himself that he was in contact with the true Anna Sprengel and that he would be able to find the real Secret Chiefs. On a more practical level they recognised the need for harmony and arrived at a concordat with Waite's Order. It did not last.

Mathers had continued to work the Golden Dawn at Paris in his Ahathoor Temple, and maintained a presence in London with the aid of Dr. Berridge and a few others who sided with him.

Their branch of the old Order took the name of Alpha et Omega, with a new Temple, named Isis. Eventually Mathers obtained further support from Brodie-Innes who had distanced himself from Felkin and, by 1910, re-founded the Amen-Ra Temple at Edinburgh. It is probable that Brodie-Innes saw himself as a potential successor, but when Mathers died, in 1918, Mina Mathers took charge of the Alpha et Omega and Brodie-Innes remained loyal to her until his own death in 1923. Her management of the Order was no less idiosyncratic and authoritarian and she alienated the most able members, among them most of her American followers and the young → Dion Fortune, who left to found the Fraternity of the Inner Light.

Felkin was rather more successful. In 1916 he emigrated to New Zealand and settled at Havelock North, Hawkes Bay, where he had founded the Smaragdum Thalasses Temple during a visit four years earlier. The Temple had a custom built vault (which still exists) in the basement of Felkin's house, Whare Ra, and this became the focal point for the work of the Stella Matutina for the next fifty years. In England the Order remained active through the Amoun Temple in London and the Hermes Temple at Bristol, despite the vitriolic attacks in print of Miss C.M. Stoddart, a former Chief of Amoun Temple who had become convinced that the Order was simply a vehicle for forces of supernatural evil.

At the other end of the esoteric spectrum Waite's Independent and Rectified Rite also had problems. The Concordat with the Stella Matutina had resulted in an uneasy harmony (in 1910 a Neophyte ritual was printed for the use of both Orders) but disputes over the interpretation of its terms brought the Concordat to an end in 1912. Waite was also becoming increasingly sceptical about the contents of the cipher manuscripts, and when Blackden, Waite's co-Chief, supported by a majority of the members, insisted that the cipher rituals were of ancient Egyptian origin, he found himself in an impossible position. Waite withdrew his own rituals and, in 1914, dissolved the Rite. Within twelve months he had created a new Order, the Fellowship of the Rosy Cross, but it was in no sense a continuation of the Golden Dawn.

The traditional Golden Dawn did survive, and still does, as a result of the actions of an errant member of the Stella Matutina: Francis Israel Regardie, who had entered the Hermes Temple in 1933 following an earlier initiation into the Societas Rosicruciana in America (a quasi-masonic body that had borrowed the Outer Order rituals of the Golden Dawn). Regardie firmly believed that the teaching and rituals of the Order should be

available to all and over a four year period, from 1937 to 1940, he published the greater part of them. There was little immediate reaction, but following the reprinting of Regardie's texts in 1969, new Temples appeared claiming descent from the original body. Many of these were short-lived but a few that were authorised by Regardie himself are working at the present time. Having survived for more than a century the Golden Dawn seems destined to continue indefinitely.

But what did the Order achieve? It undoubtedly influenced the work of W.B. Yeats and it gave rise to a new, if minor, genre of fiction – that of the psychic detective. Whether it exercised any significant artistic or literary influence beyond this is doubtful, but in one area of culture it has been of great importance. The Hermetic Order of the Golden Dawn has been responsible, more than any other esoteric body, for ensuring the survival of much of Western esotericism into the 21st Century.

Hermetic Society → Hermeticism and Hermetic Societies

Hermeticism and Hermetic Societies

1. HERMETICISM 2. THE KINGSFORD-MAITLAND HERMETIC SOCIETY (1884-1887) 3. THE DUBLIN HERMETIC SOCIETIES (1885-1939)

1. HERMETICISM

By the 18th century, Hermeticism had expanded well beyond its Renaissance focus on → Hermes Trismegistus and his revelation of a *prisca theologia* [→ Tradition]. Contemporary interest in ency-

clopaedias, universal histories, and comparative mythology created an eclectic current in which “Hermetic” denoted a wider field including → Egyptomany, Orphic mysteries, Pythagoreanism, Kabbalah [→ Jewish Influences], → Paracelsianism, → alchemy, and → Rosicrucianism. Several Enlightenment historians included an account of Hermes Trismegistus or Thoth and Hermeticism in their accounts of ancient history and religion, including Johann Jakob Brucker, *Historia critica philosophiae* (1742-67), Johann Gottfried Herder, *Die älteste Urkunde des Menschengeschlechtes* (1774) and Antoine Court de Gébelin, *Le Monde Primitif* (1773-82). This Enlightenment eclecticism, alongside the development of → Pietism, led to Hermetic imports in philosophy, medicine, and → Freemasonry. In Britain, the heritage of → Robert Fludd (1574-1637), → Elias Ashmole (1617-1692), and → Thomas Vaughan (1622-1666) chiefly passed into Freemasonry, regulated after 1717 by the English Grand Lodge. But in Germany, Pietism created a religious subculture favourable to sectarian developments, with later ramifications in a subculture of lodges, secret societies, and irregular Masonic lodges, especially among court officials and the non-commercial middle class. As early as 1690, the Lutheran theologian Ehregott Daniel Colberg had written *Das Platonisch-Hermetisches* [sic] *Christenthum* as a polemic against the pietist-enthusiastic sects mushrooming among Paracelsians, Weigelians, Behmenists, Quakers, Labadists and Quietists. From 1700 onwards a handful of philosophers and theologians emerged from sectarian isolation to articulate Hermetic ideas within the syncretic Enlightenment. Samuel Richter’s *Theo-Philosophia Theoretico-Practica* (1711) exemplifies a systematic Hermeticism of theosophical provenance. Johann Konrad Dippel (1673-1734) progressed from radical Pietism to Hermetic and alchemical speculations and scientific experiment. Hermetic elements appear in the thought of Hermann Boerhaave (1668-1738), the Dutch scientist, and Friedrich Joseph Wilhelm Schröder (1733-1778), professor of medicine at Marburg and a Rosicrucian. Johann Salomo Semler (1725-1791), professor of theology at Halle and → Friedrich Christoph Oetinger (1702-1782) both embraced Hermeticism. Alchemico-hermetic writers such as Anton Joseph Kirchweger, → Georg von Welling (1652-1727), and the physician Johann Friedrich Metz (1720-1782) influenced the young Johann Wolfgang Goethe, further evidence of this widespread Hermetic subculture in Germany during the late Enlightenment.

Lodge discourse rapidly assimilated these ideas. Baron Tschoudy’s *Hermetic Catechism* (1766) and

the Hermetic Rite of Montpellier (c. 1770), traceable to → Antoine-Joseph Pernety and Boileau, likewise the → Illuminées d’Avignon founded in 1785, are examples of an “Hermetic” Freemasonry. The alchemico-Hermetic culture of the *Gold- und Rosenkreuzer* found its ultimate expression in the beautiful and complex coloured illustrations of the *Geheime Figuren der Rosenkreuzer* printed at Altona in 1785-1788.

The use of the adjective “Hermetic” to describe a society dates only from the modern period. The first Hermetic Society was founded in 1796 at Dortmund for the purpose of practical alchemy by Carl Arnold Kortum (1745-1824) and Friedrich Bährens (1765-1831). Kortum was born into a family of apothecaries, qualified as a physician, authored the famous comic epic poem *Jobsiade* (1786), and wrote regularly for the *Westphälischer Anzeiger*, the leading journal of Westphalia and the Rhineland. He was also associated with the radical pietistic movement of Gerhard Tersteegen (1697-1769). Bährens was the Lutheran pastor at nearby Schwerte and also a physician. The Hermetic Society continued its work on practical alchemy until 1819, attracting controversy among the new generation of post-Lavoisier chemists as the era of German Romantic → Naturphilosophie drew to a close.

In the first half of the 19th century, esoteric subjects and societies favoured the label “Rosicrucian” rather than “Hermetic” for several reasons. Rosicrucianism had connoted alchemy among 18th-century *Gold- und Rosenkreuzer*. However, once linked with Templarism [→ Neo-Templar Traditions], as in many high-degree Masonic rites, Rosicrucianism also signified a Christian, medieval, and chivalrous world, whose Orient was Jerusalem and the Holy Land. Rosicrucianism was linked with mediaevalism in Gothic literature, e.g. Percy Shelley, *St Irvyne or The Rosicrucian* (1801), Sir → Edward Bulwer-Lytton, *Zanoni: A Rosicrucian Tale* (1842). By contrast, Hermetic references signified a *philosophia perennis*, where Christianity was a single strand in a universal pansophy sometimes aligned with neo-pagan, anti-clerical Enlightenment interests. “Hermeticism” still pointed to an Orient represented by ancient Egypt, polytheism and mystery-religions. Hermeticism even combined with the cosmopolitan, Enlightenment critique of the *ancien regime* and Church before the advent of Napoleon, but its irenic vision was unsuited to German nationalism. In any case, the age of reaction or *Vormärz* period (1815-1848/67) with its conservative suppression of nationalist and democratic currents on the Continent witnessed a general decline in the

numbers of initiatory high-degree rites and secret societies with some notable exceptions, e.g. Rites of Memphis and Misraim, the Ancient and Accepted Scottish Rite.

A “Rosicrucian” heritage, based on the memorials of the *Gold- und Rosenkreuzer* and Gothic references, characterised the para-masonic societies in England, which fostered esotericism from the 1850s onwards, e.g. Knights of the Red Cross of Rome and Constantine, est. 1865; Societas Rosicruciana in Anglia (Soc. Ros.), est. 1866; the Ordo Rosae Rubrae et Aureae Crucis (Second Order of the Golden Dawn), est. 1892. It is also notable that → Paschal Beverly Randolph and → Hargrave Jennings (1817-1890), major publicists of Rosicrucian mysteries in the United States and England during the 1850-1870 period, used Rosicrucianism as a portfolio term for esotericism. They both had a powerful influence on → Helena Petrovna Blavatsky.

Hermeticism subsequently entered 19th-century Masonic discourse in England with reference to Egypt, just as it had a century earlier in 18th-century France and Germany. Kenneth Robert Henderson Mackenzie (1833-1886) became the English expert on high-degree Freemasonry and para-masonic societies, documented in his *Royal Masonic Cyclopaedia* (1875-77). Largely educated on the Continent, familiar with Austria and France, Mackenzie published a translation of the *Discoveries in Egypt, Ethiopia and the Peninsula of Sinaï* (1852) by K.R. Lepsius, Professor of Egyptology at the University of Berlin. After visiting → Eliphas Lévi at Paris in 1861, Mackenzie helped establish the Soc. Ros. He referred to a Hermetic Order of Egypt as early as 1874, linking it with Lévi. Mackenzie’s inspiration for such paramasonic orders associated with an “Egyptian” Orient was again evident in his Order of Ishmael (est. 1872). Given his access to old *Gold- und Rosenkreuzer* sources, Mackenzie may have posthumously supplied the grade-system for the → Hermetic Order of the Golden Dawn (earliest documents, 1886).

The 1870s thus witnessed a certain revival in the use of Hermeticism as a collective term for the Western esoteric traditions with regard to their Egyptian (Hellenistic) origins. In her articles of 1874-1875, Blavatsky had discussed Kabbalah and Rosicrucianism to distinguish occultism from → spiritualism. By September 1875, however, when writing her first book *Isis Unveiled* (1877), she gave much greater prominence to Hermeticism, → Neoplatonism, and Kabbalah than Rosicrucianism in her presentation of the Western esoteric tradi-

tion. Her early travels and inspiration in Egypt and the Middle East during the 1850s led to an “Egyptian” theme in the early → Theosophical Society (TS). Her first masters, Serapis Bey and Tuitit Bey, were members of a Brotherhood of Luxor. “Hermetic”, “Egyptological” and “Rosicrucian” were among the names proposed for the new Theosophical Society in September 1875. Its actual adopted name was proposed by Charles Sotheran (1847-1902), an English Freemason, U.S. representative of the Swedenborgian Rite (est. 1859), and author of a biography of → Cagliostro, the founder of Egyptian Freemasonry. Blavatsky responded to Sotheran’s “Egyptian” references as more suited to her new revelation than the Christian overtones of Rosicrucianism.

2. THE KINGSFORD-MAITLAND

HERMETIC SOCIETY (1884-1887)

The term “Hermetic” later served as a means of emphasising Western esoteric traditions in the vicinity of the Theosophical Society with its later, post-1880 interest in India and a revelation by Masters (*Mahatmas*) of an ancient wisdom-religion descended through Tibetan Buddhism. The first such Hermetic Society was founded in 1884 under the presidency of → Anna Bonus Kingsford (1846-1888). The origins of this Hermetic Society in Anna Kingsford’s own vocation throw much light on its representation of Greek and Christian esoteric traditions.

Dr Anna Kingsford, the young wife of an Anglican clergyman, had converted to Roman Catholicism in 1870, become an outspoken advocate of vegetarianism and anti-vivisection, and went in 1874 to study medicine in Paris, as the Sorbonne had recently opened its doors to women students. Anna Kingsford was an extraordinarily beautiful woman, highly intelligent and a fluent public speaker. While residing in Paris together with her colleague, Edward Maitland (1824-1897), she had begun to have prophetic dreams in 1875-1876, later progressing in 1877 to inner illuminations and celestial visions. These illuminations, published posthumously as “*Clothed with the Sun*” (1889) involved the Graeco-Egyptian and Christian mysteries, hymns to Hermes, the Adonai, and elemental divinities, revelations regarding the meaning of sin, death, and redemption, the esoteric significance of the Creed and the Lord’s Prayer, and an ecstatic cosmological vision. Kingsford learned from her illuminators that Christianity had existed among the ancients as a hidden, esoteric doctrine and thus complemented rather than supplanted pagan religions. It is noteworthy that Eliphas Lévi’s

literary revival of → magic (after 1856) had created in Paris a new interest in the Hermetic tradition based on Judaeo-Christian traditions, and also made French esotericists possibly less receptive later on to the Eastern wisdom of Anglo-Indian Theosophy. Marie, Countess of Caithness (1830-1895), an aristocratic supporter of spiritualism, befriended Anna Kingsford and Edward Maitland in Paris and encouraged them to read books by → Jacob Boehme and Eliphas Lévi.

Back in London, Kingsford and Maitland gave a series of private lectures in May-June 1881 on Esoteric Christianity, published anonymously as *The Perfect Way, or the Finding of Christ* (1882). Their purpose was “the restoration of the esoteric philosophy or Theosophy of the West, and the interpretation thereby of the Christian and kindred religions”. Kabbalah began to feature in Kingsford’s revelation: in July 1881 she had a vision of kabbalistic doctrine, soon authenticated by subsequent study of → Knorr von Rosenroth’s *Kabbala Denudata*. Another friend in France, Baron Guiseppe Spedalieri, the literary heir of Lévi, also confirmed the kabbalistic nature of *The Perfect Way*.

Among their audiences were some members of the British Theosophical Society, founded in London on 27 June 1878 as a branch of the New York society. These included its chief organizer and first president, Charles Carleton Massey (1838-1905), also among the founders of the New York society; Dr George Wyld (1821-1906), an eminent medical homeopath with an interest in phrenology and → Mesmerism; the Hon. Roden Noel (1834-1894), and Isabel de Steiger (1836-1927), who had studied the Hermetic tradition with Mrs Mary Anne Atwood, *née* South (1817-1910), an elderly lady long immersed in → Christian Theosophy and author of *A Suggestive Enquiry into the Hermetic Mystery* (1850).

Friction soon developed between Kingsford and Maitland, and the (Adyar) Theosophists. In March 1881 Alfred Percy Sinnett (1840-1921) was back from India to publish his account of the Theosophists, Blavatsky’s phenomena, and the mysterious Masters, as *The Occult World* (1881). Maitland thought Sinnett’s initiation into (Eastern) Theosophy rather rudimentary, noting that he dilated more on mediumship than spiritual vision, and even denied → reincarnation (on the basis of *Isis Unveiled*). Kingsford and Maitland upheld the doctrine of reincarnation and thereby unleashed some confusion among the London Theosophists in the course of their 1882 lectures. Divergences of interest between their views and those of the

Theosophists in India were apparent in an ambiguous review of *The Perfect Way* in *The Theosophist* (May 1882), written either by Sinnett or Subba Row. Meanwhile, Anna Kingsford’s charismatic lectures and inspired letters were winning her more friends among the English and French Theosophists. In August 1882 Maitland received a letter from Gerard Finch, a member of the British Theosophical Society, suggesting he and Kingsford play a more prominent role in the Society, as it was now languishing. After some correspondence with Massey, now president, Anna Kingsford was elected president, and Maitland vice-president, of the British Theosophical Society on 7 January 1883, which, on her suggestion, was afterwards designated the London Lodge of the Theosophical Society.

Her first public appearance as president at a reception on 17 July 1883 was attended by Sinnett, who was again over from India, this time to publish his new book, *Esoteric Buddhism* (1883), on (Eastern) Theosophical doctrine. Sinnett adhered to his exclusive revelation through a secret lodge of Himalayan adepts, an attractive marvel to many Theosophists, while Maitland and Kingsford emphasised universal access to theosophy offered by visionary experience, and were offended by the evident hostility of the Indian Theosophists towards Christianity. By November 1883, Kingsford wrote to Madame de Steiger that Sinnett sought to silence ‘every other voice but that of the “Mahatmas”’. A outright schism soon developed in the London Lodge between members interested in the Kingsford-Maitland revelation of Western mysteries and those impressed by Sinnett’s dogmatic insistence on the sole authority of the Himalayan Masters. At a meeting of the London Lodge on 7 April 1884, chaired by Olcott, Kingsford and Maitland were initially deposed, with Finch and Sinnett taking their respective offices. In an atmosphere charged with conflict, Blavatsky unexpectedly arrived from Paris to settle matters and took charge of the disorderly meeting. Blavatsky’s Masters had already, in letters of December 1883 and January 1884, welcomed Anna Kingsford’s presidency, approving of her views on animal vivisection and vegetarianism, and recognising the additional appeal of her Western mysteries to English audiences. With Blavatsky’s timely intervention, it was thus agreed that Kingsford should form a new group called the Hermetic Lodge, Theosophical Society to accommodate her numerous supporters, while the London Lodge should continue. However, many members of the two lodges still wished to attend each other’s meetings. As dual

lodge membership had been ruled out by Olcott, the Hermetic Lodge charter was returned and Kingsford and Maitland founded an independent, extramural Hermetic Society on 9 May 1884, which any TS members were entitled to attend. Others cultivating the Western esoteric tradition also joined, including → Samuel Liddell MacGregor Mathers (1854-1918), a young Freemason, member of the Soc. Ros. since 1882, and a student of the Kabbalah. Both he and → William W. Westcott (1848-1925), subsequent co-founders of the Golden Dawn, gave lectures and became honorary members of the Hermetic Society. Its secretary, W.F. Kirby, also later joined the Golden Dawn.

The name was chosen with regard to Hermes [Trismegistus] as ‘the supreme initiator into the Sacred Mysteries of existence . . .’. Its chief aim was ‘to promote the comparative study of the philosophical and religious systems of the East and the West; especially of the Greek Mysteries and the Hermetic Gnosis, and its allied schools, the Kabbalistic, Pythagorean, Platonic, and Alexandrian, – these being inclusive of Christianity, – with a view to the elucidation of their original esoteric and real doctrine, and the adaption of its expression to modern requirements’. Kingsford and Maitland’s lecture programme focused on Hermeticism, Kabbalah, and Christian mysteries. The summer session of June and July 1884 comprised weekly lectures on the correspondence of the Christian Creed to the ancient sacred mysteries. Around this time, she expanded her commentary on the Kabbalah with complex glyphs representing the body and soul, male and female, and spiritual regeneration, based on the Seal of Solomon and the Tree of Life. In September 1884 she received a further illumination of ‘The Mysteries of the Kingdoms of the Seven Spheres’, which matched the verses of the Creed to correspondences with seven archangels, planets, rays, colours and Graeco-Egyptian gods. In 1885 the weekly meetings of the Hermetic Society resumed from April to July with lectures from Kingsford and Maitland on the Hermetic fragment *Kore Kosmou*, the symbology of the Old Testament, interpretations of the Gospels and the Communion of Saints. The third session ran from April to July 1886 with Kingsford lecturing on Bible Hermeneutics and Maitland on the “Higher Alchemy”, their Hermetic view of regeneration and resurrection. In June 1886 Mathers lectured on the Kabbalah. Many lectures of the Hermetic Society were later published as *The Credo of Christendom* (1916). The lectures were read by the elderly Mrs Atwood, the mentor of Isabelle de Steiger, whose opinion as a Christian Hermeticist was

especially valued by Maitland and Kingsford. Kingsford and Maitland pursued further Hermetic researches, publishing a translation of some Trismegistic treatises known as *The Virgin of the World* (1885) and a new edition of *Astrology Theologized* (1886) originally written by → Valentin Weigel. Both works carried lengthy introductions by their editors, placing them in the Hermetic-Christian tradition. Anna Kingsford fell ill in September 1886 and sought recovery and convalescence abroad. Her health continued to deteriorate and the session was abandoned for 1887. Following her death in February 1888, the Hermetic Society fell into abeyance. Edward Maitland devoted the rest of his life to writing *The Life of Anna Kingsford* (1896) and otherwise seeking to proclaim their ‘new gospel of interpretation’.

Despite its brief life, the Hermetic Society highlighted the Theosophical Society’s need to accommodate Hellenistic, kabbalistic, and Christian theosophy together with Oriental religions, in order to appeal to Europeans. Interest in Kabbalah had already revived among esotericists, once Blavatsky herself had drawn attention to the Kabbalah in *Isis Unveiled*. Mathers discussed Kabbalah with Blavatsky and was already using her book in 1883 to compile his own translation of the *Sephir Zohar*, published as *The Kabbalah Unveiled* (1887), tellingly dedicated to Kingsford and Maitland. Blavatsky and her Masters evidently recognised a risk of sectarian isolation if the Theosophical Society was identified exclusively with Oriental religion by Sinnett and other enthusiastic converts.

After the demise of the Hermetic Society, the → Hermetic Brotherhood of Luxor (est. 1884) and the Hermetic Order of the Golden Dawn (est. 1888) became the chief vehicles for Western esoteric traditions in Britain, America, and France, concentrating on practical ceremonial magic, Kabbalah, and the Hermetic sciences of → astrology and alchemy. Blavatsky founded her Esoteric Section and Inner Group to pursue studies in Eastern metaphysics and macro-microcosmic correspondences until her death in May 1891. Under the presidency of → Annie Besant, Indian (Adyar and London) Theosophy became more identified with Oriental religion, especially after its discovery of Krishnamurti as the coming messiah. Secessions by leading Theosophists from Adyar such as → George Robert Stow Mead (1909), → Rudolf Steiner (1912) and → Dion Fortune (1928) all reflect the resurgent interest in Western esoteric traditions in the Theosophical Society, thus echoing the earlier schism of the Hermetic Society.

By 1890 the word “Hermetic” was well re-launched into esoteric discourse, frequently appearing in the titles of books, editions, and articles by Westcott, Mead, and → Arthur Edward Waite, the leading author and editor of the modern occult revival. Between the two World Wars, Hermeticism continued to feature as a cognate term for alchemy, astrology, Kabbalah, and magic among Golden Dawn derivative groups and in the works of → Manley Palmer Hall. In the 1960s its usage expanded in the scholarly community following the seminal researches into Renaissance culture by Frances Yates and her students at the Warburg Institute, London. Besides its scholarly currency, “Hermeticism” presently serves to distinguish magico-esoteric traditions of Graeco-Egyptian (Hellenistic) origin from neo-pagan, nativist traditions derived from the ancient Celts, Teutons, and extra-European peoples, more current among “New Age” groups.

3. THE DUBLIN HERMETIC SOCIETIES (1885-1939)

Two further foundations also took the name Hermetic Society, both associated with Blavatskian Theosophy in Ireland in the period 1885-1935. Their principal figures played a leading role as poets, scholars, and artists in the Irish Renaissance of the 1890s, namely the literary revival, the founding of the Irish National Theatre and Abbey Theatre, and a quickening interest in early Irish history, the great Celtic myths, folklore and the supernatural. The first (Dublin) Hermetic Society arose from the interests of the budding poet → William Butler Yeats (1865-1939) and his friend Charles Johnston (1867-1931). Johnston had been first introduced to Theosophy by reading A.P. Sinnett's *The Occult World* in November 1884 and *Esoteric Buddhism* the following spring. Another account relates that shortly after Yeats had left Erasmus Smith High School, Dublin in December 1883, he loaned his friend a copy of *Esoteric Buddhism*, which both Professor Edward Dowson of Trinity College and then his London aunt Isabella Pollexfen Varley had drawn to his attention in 1884. The son of a distinguished Irish MP, Johnston was a brilliant classical scholar. His headmaster was dismayed at this enthusiasm for Theosophy and asked Yeats to discourage this interest. However, Johnston had been completely convinced of the truth of Blavatsky's message, of the reality of the Masters, and of her position as Messenger of the Great Lodge. Yeats and Johnston now read ever more widely on esoteric subjects, including Baron von Reichenbach's Odic force and Theosophical litera-

ture. On 15 June 1885 they founded the Hermetic Society in Dublin ‘to discover the wonders of Eastern Philosophy’. Other members included the 18-year old Claude Falls Wright, Charles Weekes, Hamilton Malcolm Magee, and Alaud Alihad. They conducted experiments and read papers at their York Street premises on the Vedas, the Upanishads, the Neoplatonists, and modern mystics and spiritualists. A professor of Oriental Languages at Trinity College lectured on “magicians of the East”. In the spring 1885 Johnston visited the Theosophists in London, meeting both Sinnett and Mohini Chatterji (1858-1936), a personal pupil of Master Koot Hoomi and one of the most brilliant Hindu members of the early Theosophical Society. Johnson made a vigorous public defense of Blavatsky following the defamatory SPR Report on her activities in India, which had only increased his zeal for Theosophy.

In April 1886 he and several friends founded an official Dublin Lodge of the Theosophical Society, which effectively succeeded his and Yeats' Hermetic Society. Charter members included Charles Johnston, his brother L.A.M. Johnston, F.J. Gregg, Hamilton Malcolm Magee, E.A. Seale, W.F. Smeeth, and R.A. Potterton. They invited Mohini Chatterji to stay in Dublin and address the Society. Abandoning earlier plans to become a missionary, Johnston studied Sanskrit at Trinity College Dublin and took the examinations for the Indian Civil Service (ICS) in London, where he first visited Blavatsky in early 1887. Yeats left Dublin in May 1887 to live in London, and was introduced by Johnston to Blavatsky. Yeats soon joined the Blavatsky Lodge of the Theosophical Society in London, then became her personal student in the Esoteric Section, where he proposed empirical experiments involving her *Esoteric Instructions*, based on correspondences of sound, number and color. However, Yeats' interest in applied esotericism alienated the more metaphysically-minded members of the Esoteric Section, though not Blavatsky. He subsequently found more scope for his interests in the magical ceremonies of the Golden Dawn, which he joined in March 1890.

Already in 1885 Johnston had met the young painter and poet George William Russell (1867-1935), later known as → AE (derived from “Æon”, a Gnostic term for the spiritual offspring of the Deity), another leading member of the Irish Renaissance. Russell had already been attracted to the sacred literature of India before meeting Johnston. Less scholarly than either Yeats or Johnston, Russell did not immediately join the Dublin Lodge on its formation, but he and Johnston shared an

exploration of the Upanishads and the Bhagavad Gita over three years before Johnston passed his final ICS examinations and left for India in October 1888, after marrying Blavatsky's niece. Johnston crowned his short career in the Bengali Civil Service with literary accolades. He became president of the Irish Literary Society with several works, including translations of *The Upanishads* (1896) and *The Yoga Sutras of Patanjali* (1912). Russell had met Mohini Chatterji on his Dublin visit and was greatly impressed, but he also pondered Gnostic revelations and the inner illumination of Hellenistic theosophy in the formation of his own myth of mystical and artistic creation. By 1887 he had read *Light on the Path* and *The Idyll of the White Lotus*, both by Mabel Collins, a leading Theosophist in London, and then proceeded to study Blavatsky's *Isis Unveiled*, Mohini Chatterji and Laura C. Holloway, *Man: Fragments of a Forgotten History* and Sinnett's *Esoteric Buddhism*, which he considered only partly authentic. Only in December 1890 did he finally join the Dublin Lodge.

In April 1891 the Scottish engineer, Frederick J. Dick and his wife Annie rented a row of Georgian terrace houses on Upper Ely Place which they put at the disposal of the Dublin Lodge of the Theosophical Society and a residential community of young disciples, which became known as the "Household". Members of this community included Russell, who lived there happily for the next six years, Edmund King, Daniel Nicol Dunlop, Hamilton Malcolm Magee, Arthur Dwyer, James Nolan, and Charles Johnston's sister Georgie. Though Yeats was no longer involved with the reorganized Hermetic Society, nor even with the Theosophical Society in London, he and Russell painted several symbolic murals in summer 1892 upon the walls of the new Lodge, which were signed "GWR, WBY". Irish-born William Quan Judge, President of the American Section of the Theosophical Society, was visiting Dublin at the time and wrote in his American Section journal, *The Path*: 'Bro. Russell has begun to illuminate the walls of the place with wonderful paintings symbolizing the journey of the pilgrim soul'. Russell's and Yeats' paths gradually diverged with his pursuit of → mysticism and Theosophy, and the latter's focus on magic, myth, and artistic power. Violet North, a young English Theosophist with literary and psychic gifts, and James Pryse, an American Theosophist who had run Blavatsky's printing press in London, joined the Household in early 1895. Russell and Pryse collaborated in producing the *Irish Theosophist* (1892-97), until the latter's return to the United States in December to con-

duct the affairs of the American Theosophical Society as Judge was seriously ill. Violet subsequently took over Pryse's work on the journal, romance blossomed and she and Russell married in June 1898. In 1896 the Dublin Theosophists expected the Celtic Avatar, based on prophecies of divine incarnations of a Ray of the Logos, another instance of the mutual influence of literary, esoteric and political ideas in the Irish Renaissance.

Meanwhile Annie Besant's and Olcott's dispute with William Quan Judge, running since December 1893 over allegations that the latter had forged Mahatma letters to himself, climaxed with the secession of the American Theosophists and their election of Judge as their permanent president in April 1895. At the 4 July 1895 meeting of the European Section in London, the majority of the English Theosophists supported Mrs Besant, while the Irish delegates withdrew, proclaimed themselves the Theosophical Society in Europe and also elected Judge as their president. The Irish contingent then elected its own national officers with Dunlop as president, Russell vice-president, and Dick secretary. After Judge's death, the Dublin Lodge affiliated with the American Theosophists under Katherine Tingley, but in March 1898 Russell fell out with her after she disapproved of one of his articles and he resigned from her Universal Brotherhood and Theosophical Society.

Russell then founded the (second) Hermetic Society for members of the old Dublin Lodge, a group which met weekly first at his home, after May 1900 at its own premises in Dawson Chambers, to discuss Blavatsky's teachings and certain mystical classics. While still living in the Household, Russell had read much esoteric literature besides Theosophy, including Plato, the Hermetic writings, the Chaldaean Oracles, Lao Tzu, Sufi poetry, and modern texts of psychical research such as Carl Du Prel's *Philosophy of Mysticism*. His Theosophy left plenty of room for admiration of the Psalms and Prophets, and he venerated St John, St Paul and Origen. The Hermetic Society reflected this breadth of vision and attracted budding and some later renowned poets, including James Joyce, Padraic Colum, James Starkey (pseud. Seumas O'Sullivan) (1879-1958), and an overlapping membership with George Moore's literary circle. The second Hermetic Society fulfilled the promise of the first Dublin foundation, demonstrating the important imaginal contribution Hermeticism and Theosophy made to the Irish Renaissance. A copy of *The Secret Doctrine* was kept in the room, where Russell regularly spoke on the common wellsprings of literature and mysticism. The Hermetic Society came to an end in

late 1904, when Russell and many of his disciples joined the Adyar Theosophical Society. On 20 October 1904, Olcott issued a charter for the revived Dublin Lodge, whose members included George and Violet Russell, James Starkey (Seumas O'Sullivan), and H.F. Norman. In 1909 Russell left the Theosophical Society again, dismayed at the leadership of Annie Besant and → Charles Leadbeater, and refounded the Hermetic Society. Its Thursday evening meetings resumed in the Leinster School of Music on Harcourt Street. The room was unadorned save for one of Russell's visionary paintings and Blavatsky's book. Russell's teachings were in fact closely based on those of *The Secret Doctrine*, illustrated with a rich fund of literary and esoteric commentaries. His political work and American lecture tours brought him an international public but he was still running the Hermetic Society until he sold his Dublin home and left for London in July 1933.

Russell entrusted the leadership of the Hermetic Society to Captain P.G. Bowen (1882-1940), whom he had first met after the latter's return to Ireland after First World War. At Russell's request, Bowen published a remarkable book on the inner life, *The Occult Way* (1933), later followed by *The Sayings of the Ancient One* (1935), based on initiation into a source of the wisdom-tradition he had discovered while working in South Africa. Bowen also published a "Back-to-Blavatsky" piece *Madame Blavatsky on How to Study Theosophy* (1932), attributed to his father Robert Bowen, allegedly a member of her circle in London. Bowen dissolved the Society at the outbreak of war.

NICHOLAS GOODRICK-CLARKE

Hermetism

1. THE UNITY OF THE UNIVERSE
2. GOD
3. THE COSMOS
4. MANKIND
5. INITIATION
6. RELIGIOUS PRACTICES IN HERMETIC COMMUNITIES?
7. THE CRUCIBLE OF ALEXANDRIA: GREEK PHILOSOPHY, EGYPTIAN RELIGION, JUDAISM
8. HERMETISM AND CHRISTIAN BELIEF

I. THE UNITY OF THE UNIVERSE

The term “Hermetism” is used here to indicate the specific religious worldview of the so-called philosophical Hermetica [→ Hermetic literature I]. Its most characteristic feature is the idea of an indissoluble interrelationship between God, the cosmos and man, which implies the unity of the universe. Its final aim is to lead its adepts to the worship of the supreme God as the source of being and eventually to union with him. However, the hermetic writings show a great divergence with respect to the philosophical and religious ideas that were used to argue in favour of these fundamental tenets. Hermetism never knew a coherent doctrinal system, as will become abundantly clear from the following exposition.

It was a firm hermetic conviction that everything that exists, both in the material and the spiritual world, is fundamentally one, because it derives from *the One*, God. Hermes in the first chapters of the *Asclepius* that ‘all things are part of the One, or the One is all things’; before the creation everything existed in the creator, who alone is everything. The same idea is expressed in the hymn that concludes C.H. V: ‘You are everything, and there is nothing else; what is not, you are as well. You are all that has come to be; you are what has not come to be’ (V, 11). And, to give one more example, Asclepius writes in his letter to king Ammon, in C.H. XVI, 19: ‘If all things are parts of God, then everything is God. Therefore, in making all things, he makes himself’.

The view that all things have their unity in God was based on the fundamental idea of a close interrelationship between God, the cosmos and man. According to the Armenian *Definitions* 7, 5: ‘God is within himself, the world is in God, and man in the world’. And Hermes says in *Asclepius* 10: ‘God, the Lord of eternity, is the first, the world is second, man is third’ (also in Stobaeus, *Fragm.* XI, 6; cf. Armenian *Definitions* 1, 1). God is the father of the cosmos; and the cosmos is the father of everything it contains (C.H. IX, 8), and is, therefore, called the second god (C.H. VIII, 2, 5). Man is called ‘the third living being’ but he is not explicitly said to be the third God. According to C.H. X, 14, man is the son of the son of God: ‘So there are three levels of being: God the father and the good, the cosmos, and man. God holds the cosmos and the cosmos the human being. And in this way the cosmos becomes the son of God and man the son of the cosmos – a grandson of God, as it were’. A similar figure of speech occurs in the Middleplatonist and Neopythagorean philosopher Numenius (Dillon, 367). Through the intermediary of these

two all things exist, but the One is their final cause (C.H. X, 25). The cosmos and man are also called images of God: ‘the second god is made by the first god in his image’, and ‘man, the third living being, came to be in the image of the cosmos’ (C.H. VIII, 2 and 5). But as such he is himself also the image of God: the human being reveres the first image, the cosmos, ‘but he is not unaware that he is himself in the image of God too, for there are two images of God, the world and man’ (*Asclepius* 10). In a passage that was to have a long-lasting influence (see below, section 8), the author of the *Asclepius* says that the human being was primarily created in order to contemplate the beautiful cosmos, which the Lord of the universe loved as his own child (8).

This idea of the indissoluble interrelationship between God, cosmos and man dominates the hermetic worldview and its piety. But within this general structure of the universe the hermetists sometimes introduced subordinate divisions of the divine and the material world that were borrowed from Greek philosophy or Judaism. The idea that the world is an image of God presupposes the Middle Platonist view that the ideas, i.e. the forms after which Plato’s Demiurge created the world, are enclosed in the mind (*nous*) of the supreme God, as his thoughts. All earthly things are images, reflections, of their eternal forms within God, and in this sense the world as a whole is an image of God, just as the species man is an image of the idea of mankind (*Asclepius* 4). The Middle Platonists usually made a distinction between the supreme God, called the Good and One, who was considered the (first) Mind (*Nous*), and his active mind, which contains the ideas, called the second god or second *Nous* or the *Logos* and identified with Plato’s Demiurge (Dillon). This distinction is also made in the *Poimandres* (C.H. I), 9: ‘The Mind who is God . . . gave birth to a second Mind, a craftsman’. In the *Asclepius* this second god is called Aiōn, i.e. living and life-giving Eternity, which always stands still along with the supreme God, ‘holding within it a world that had not come to be’ (30-32). According to C.H. XI, 15, Eternity (Aiōn) is the image of God, and the cosmos that of Eternity (and the sun is the image of the cosmos, and man of the sun). The hermetists could obviously adhere to different views concerning the structure of being. The *Asclepius* attributes the creative activity to a third mind, that of the cosmos, which leads the author, in 32, to distinguish between four kinds of minds: (1) God, (2) the absolute mind, Aiōn, resembling divinity and containing the archetypes of the visible world, (3) the

mind of the cosmos, the receptacle of all visible forms, and (4) the human mind. This fourfold hierarchical structure of mind in the universe stands alone in hermetic literature, but it was also propagated by the *virii novi* ("modernists"), a group of hermetic Platonists with gnostic inclinations that was criticized by Arnobius of Sicca (ca. 300). They said that the rational human soul 'holds the fourth place after God, the source of everything, and after the two minds (*mentes geminas*)' (*Adversus nationes*, II, 25; cf. Festugière 1967, 260-312). The idea that there are three divine hypostases is not uncommon in Middle- and Neoplatonism (Festugière 1967, 123-125), but that they are all called "mind" is exceptional. The *virii novi* need not have been dependent on the Latin *Asclepius*, which expresses itself not very clearly on this point. Most probably both the *virii novi* and the author of the *Asclepius* borrowed this idea from an existing hermetic or platonist source. The *Asclepius* is a composite work, which explains that it also contains ideas that do not concur with those just mentioned. In chapter 14, the author repeats a common Stoic doctrine, though combined with platonist ideas, about the two principles of the universe, God and matter, of which the latter is pervaded by the divine spirit (*pneuma*). But in his wording the influence of the first verses of Genesis 1, about the spirit of God moving above the primeval chaos, is unmistakable. He says that in the beginning 'there was God and there was matter. And the spirit was with matter, or rather it was in matter, but not in the way it was in God or the principles from which the world derives were in God'. Here and also in his view, mentioned above, that man is created 'in the image of God' (Gen. 1:26), the author shows himself to be directly or indirectly influenced by a Jewish source. Scott considered the mention of the spirit a later interpolation, but that assumption is not necessary, for we know from Cyril of Alexandria that there were hermetic writings that contained speculations about the divine *pneuma* (see below).

2. GOD

The hermetists could not and would not avoid expressing their ideas about God in the philosophical language of their time, but at the same time this rather abstract language proved insufficient for giving voice to their religious feelings. A good example of this insufficiency is C.H. V, entitled *God is invisible and entirely visible*, in which the author impressively argues that the visible world reveals the greatness of the invisible God. At first sight this seems no more than the common Stoic argument

for the existence of God based on the perfection of the created world. But the author explicitly states that one cannot know this God of one's own accord. On the contrary, one has to implore him for the grace of enlightenment, 'if only by one of his rays' (V, 2). It was a profound hermetic conviction that true Gnosis was only possible through divine illumination (C.H. VI, 4; *Asclepius* 32). Adopting a term coined by Plato, the hermetist of C.H. V calls God 'the Father of All', and he adds that the creator alone fully deserves this title, because his essence exists in eternally creating everything, without which he even would not be eternal himself (cf. also C.H. II, 14-17: the only appropriate names for God are 'the Good One' and 'Father'). 'If forced to say something still more daring', the author is prepared to declare that 'God's essence is to be pregnant of all things and to produce them', which is a veiled reference to his androgyny (V, 9). That God is androgynous is repeatedly stated in the *Poimandres* (C.H. I, 9 and 15). According to the *Asclepius*, 20, God is 'completely filled with the fecundity of both sexes' (*utraque sexus fecunditate plenissimus*), which then, however, is explained in a more philosophical way: since he is 'ever pregnant with his own will, he always begets whatever he wishes to procreate'. But in the final hymn of the *Asclepius*, in its original version as preserved in the Coptic *Prayer of Thanksgiving* (NHC VI, 7), the bisexual language of procreation comes to the surface in plain terms: 'We know you, O Womb of every creature, We know you, O Womb that is pregnant by the member (*physis* = phallus) of the Father. We know you, O begetting Father who eternally exists' (VI, 25-29). In Greece, the idea of divine androgyny played a role in the Orphic theogony, according to which Phanes/Erikepaios came forth from the primordial egg as an androgynous being, but outside Orphism the idea of an androgynous deity was unknown in Greek religion. Lactantius correctly observed that Hermes and Orpheus were in agreement with respect to the bisexuality of God (*Divinae Institutiones*, IV, 8, 3ff.). He could have added that this idea also played an important role in → Gnosticism. It seems certain that we have to look to Egypt for the origin of the hermetic idea of God's androgyny, for this idea, and its expression in bold sexual terms as well, was very common in Egyptian religion. At this point and also with respect to the idea of divine self-generation, the hermetists apparently continued an ancient Egyptian tradition (Daumas, 17-20; Zandee, 120-125; Scott III, 135-138). The notion of the supreme God's androgyny led to the idea of his being born out of himself. The *Asclepius*

says that God's nature has been wholly born out of itself (*Asclepius* 14: *ex se tota*), and that he is 'in himself, by himself and wholly enclosing himself' (30: *in se est et a se est et circum se totus est*). The idea of divine self-generation is also expressed in C.H. IV, 10; VIII, 2 ('if he came to be, it was by himself') and in *Korē Kosmou* 58 (Stobaeus, *Fragm.* XXIII; NF, IV, 19). That the supreme principle, or God, was "unoriginated" (*agenētos*) or "unbegotten/unborn" (*agennētos*) was a philosophical commonplace, shared by Greek philosophers and Christian theologians alike. It was a way to express the transcendence of the first principle of the universe, as was also, for instance, the assertion that God has no name or all names (C.H. V, 10; *Asclepius* 20). The terms for "self-generated/self-begotten" (*autogenēs*, *autogen(n)ētos*, *autogonos*, *autogenethlos*, *et al.*) were less common for the supreme God, but they were often applied to the second level of divine being, not only in Hermetism and Gnosticism, but in → Neoplatonism as well. In the *Discourse on the Ogdoad and the Ennead* (NHC VI, 57, 13-18 and 63, 21-23), the author distinguishes between three levels of being: the Unbegotten (*agennētos*) God, the Self-begotten (*autogenētos*) One, and the Begotten (*ge[n]nēton*), of which the second most probably is identical with the heavenly Anthropos of the *Poimandres* and several Gnostic systems. Lactantius repeatedly says that → Hermes Trismegistus called God 'without father' (*apatōr*) and 'without mother' (*amētōr*), 'since he was out of himself and by himself' (*Divinae Institutiones* I, 7, 2; IV, 13, 2; *Epitome* 4, 4, NF IV, 106-107; Augustine explicitly denied this, *De Trinitate* I, 1). The hermetic idea of the self-generation of the supreme God most probably derives from the Egyptian view on the origin of the primeval gods (Daumas, 18-20; Zandee, 123-124). A hieroglyphic text from the Persian period says of Amon-Re: 'There was no father who begot him, no mother who was pregnant by his seed', and a hymn from a Theban tomb of the 19th dynasty says of the same god that he is the one who 'spontaneously came into being, who brought forth his mother and begot his father'. Another Theban hymn to the sun-god uses the same bold language as found in the hermetic *Prayer of Thanksgiving* quoted above, but now in a negative sense: 'no vulva has brought him forth, no phallus begot him'. Also Thot, as primeval god, is called the one 'who brought himself forth'.

Of course, the hermetists did not completely reject the traditional gods and demons of Greek and Egyptian religion, but these divine beings did not play a part of any importance in hermetic piety,

which was wholly directed at the mystic union with the supreme God. The role of the heavenly and earthly gods and demons will be discussed in the subsequent sections on the cosmos and mankind.

3. THE COSMOS

According to the general hermetic view, the cosmos is the second living being or the second god, who incessantly produces everything that exists. But within this general scheme, the hermetic writings show a great variety with respect to the manner in which the creation actually takes place. A few of these ideas may be mentioned here. The creation story could be told in the form of a myth, as in the *Poimandres* (C.H. I), which in its turn, together with the creation story of Genesis, apparently strongly influenced the description in C.H. III (cf. Dodd, 210-234). But at the same time, the latter treatise combined this with the view that it was the gods of the planets and the fixed stars that created plants, animals and human beings. The human soul was created 'through the course of the cycling gods', i.e. the planets (III, 3; cf. I, 19). But according to C.H. XVI it is the sun that through its energies creates and transforms all existing things. It drives the chariot of the cosmos and in order to prevent the cosmos going out of control it holds fast the reins, 'which are life and soul and spirit and immortality and becoming'. The *Asclepius*, 2-3, gives a more philosophical explanation through the introduction of the World-soul and Nature: soul and matter, embraced by Nature, reproduce the images, i.e. the ideas, into an infinite number of sensible forms. Nature imprints these forms on matter by means of the four elements and leads the whole series of beings up to the vault of heaven, 'so that they will be pleasing in the sight of God' (cf. *Genesis* 1:31). Borrowing from another source, the *Asclepius*, in chapter 19, presents a hierarchy of beings that control everything that exists. A distinction is made between hypercosmic, intelligible gods (*theoi noētoi*), who are called *ousiarchai*, and cosmic, sensible gods (*theoi aisthētoi*), i.e. the celestial bodies. The *ousiarchs* are gods who rule over divine entities of a secondary order (Festugière 1967, 121-130). Zeus/Jupiter is the *ousiarch* of the heaven of the fixed stars, through which he gives life to all beings; Light is the *ousiarch* of the sun, through which we receive the good gift of light; the *ousiarch* of the 36 decans of the zodiac is called Pantomorphus or Omiform, because he gives the various classes of being their own form; Fate (*heimarmenē*) is the *ousiarch* of the seven spheres of the planets, through which all changes occur by the immutable law of nature, etc. In this way, all

things are connected and comply with the Master of the universe, God, in whom they are in fact one. The gods have lost any religious meaning here; they are mere forces that steer the creation and course of the world.

This variety of ideas shows that there was not one specific hermetic doctrine on these points. As a matter of fact, the hermetists' primary concern was the ultimate cause of the universe, God, and therefore the aim of all their discussions of cosmology and creation was to bring the reader or listener through admiration of the cosmos to the adoration of and mystical union with the supreme God. In the *Asclepius*, 12-13, Hermes even goes so far as to attach merely a relative value to the traditional sciences: they are useful only in so far as they lead us to contemplation and adoration of the godhead. In his view the sophistic scholars have corrupted true philosophy by the 'unashamed curiosity of their mind', and, therefore, he prophesizes that 'after us there will no longer be any sincere love for philosophy, which solely consists in the desire to know the deity by frequent contemplation and holy piety'.

In the first half of the 20th century it became an established scholarly opinion that in ancient Hermetism there had been two quite different currents, which adhered to two irreconcilable hermetic doctrines. According to one of them, represented by C.H. V, VIII, and IX, the world is good and beautiful, enclosed in and permeated by God, who can be attained and experienced through the contemplation of the cosmos. According to the other view, represented by C.H. I, IV, VI, VII, and XIII, the world is fundamentally bad, and for that reason cannot be the product of the completely transcendent God but must have been created by a second god. The only way to attain the supreme God and become united with him is by renouncing the world in which the enlightened man knows himself to be a stranger. Accordingly, Festugière distinguished between two kinds of Hermetism. The first, represented by C.H. I, IV, VII and XIII, knew a more or less coherent doctrine of salvation, dominated by the pessimistic world-view. The other, represented by most of the other hermetic treatises, was characterized by a general pious attitude, which tended to bring the participants in a hermetic discussion to spiritual and moral elevation and to worship of the Creator of this beautiful world (1967, 39). There is no doubt that these observations are correct in so far as the C.H. does contain quite different statements about the status of evil in the world and man. However, reading the hermetic treatises more closely, it becomes evident that the problem of evil was a serious concern for

the more "optimistic" writers too (see below). Hermetism presents itself not as a coherent set of doctrines that should be believed in, but as a way of moral and spiritual progress that leads to an ever better understanding of the world we live in and to knowledge of, and even union with, the transcendent God who is its final cause. Admiration of the beauty of the cosmos is an indispensable first step on the way of Hermes, but the more one advances on this way the more it becomes clear that the world and worldly things tend to lead the human being astray, so that he no longer strives to attain knowledge of God. This experience may lead to such strong expressions as the one found in C.H. VI, 4: 'The cosmos is the plenitude of evil, as God is the plenitude of the good'. Moreover, because Hermetism was not a coherent doctrinal system and human beings are simply not all equally optimistic or pessimistic, it is only to be expected that the force of evil in the world was variously appreciated.

4. MANKIND

The glory and tragedy of the human condition is that, of all living beings, man alone has a twofold nature, earthly and mortal on the one hand and divine and immortal on the other. This basic idea of hermetic anthropology underlies all discussions of the position of the human being in the created world. The explanation of this singular status of man could be given in the form of a myth or more philosophically. The mythological explanation is to be found in the *Poimandres*, though even there philosophical and "scientific" explanations are clearly discernible. According to the myth, the heavenly Man (*Anthrōpos*) and unreasoning lower Nature fell in love with each other and as a result of their union brought forth the human being: 'For this reason, of all living beings on earth, man alone is twofold, mortal because of the body, immortal because of the real Man' (15; also e.g. *Asclepius* 7 and 20; Armenian *Definitions* 6, 1). This human being is called (16) 'a wonder most wondrous' (*thauma thaumasiōtaton*), which means that man is an extremely amazing being, not 'a great miracle'. This expression must be the background of that most famous statement in the *Asclepius*, 6: 'For that reason, Asclepius, man is a great wonder (*magnum miraculum est homo*), a living being to be worshipped and honoured'. The apposition to *homo* shows that, here too, *magnum miraculum* does not mean 'great miracle' but 'something extremely amazing' (also Armenian *Definitions* 9, 6: 'God is worthy of worship, man is worthy of admiration'). In the *Poimandres*, this most wondrous wonder of the human being is presented as

‘a mystery that has been kept hidden to the present day’, which seems to be that from the union of Man and Nature sprang seven androgynous and upright-going beings, made by Nature after the form (*eidōs*) of Man. Here, the later platonist view that man is an image of the idea of Man is obviously in the background: the life and light of the divine Anthropos respectively became the soul and mind in the human body, which was made out of the four material elements. The seven human beings most probably derive from another source. The author says that they and all other living beings remained in their primal androgynous state ‘until the end of a cycle and the beginning of ages’ (17). A new era began when they were sundered into two parts, one male and one female, and were ordered: ‘Increase in increasing and multiply in multitude’ (cf. Genesis 1:28). The author has apparently made use of a Jewish source, which has also left its traces in the Pseudo-Clementine *Recognitions*, I, 29. This text says that the first seven generations of the human race lived the sinless and sexless life of the angels and that the eighth generation, seduced by the beauty of the women, introduced intercourse and procreation, which led to the birth of giants and, finally, to the Flood (cf. Genesis 6). Similarly, the *Poimandres* emphasizes that the focus on sexuality and procreation, though necessary for the continuation of the human race, contains the danger of forgetting one’s divine descent. Therefore the injunction to increase and multiply is accompanied by the following warning: ‘Let him who is endowed with mind (*nous*) recognize that he himself is immortal and that sexual desire is the cause of death, let him thus know all that exists’ (18). That the corporeal component of man can be a danger to its spiritual counterpart is stated explicitly: ‘he who loves the body, which is born from the error of desire, remains wandering in the dark and sensibly suffers the effects of death’ (19).

The author of the *Asclepius* subscribed to a more optimistic view of the human condition, but for him evil was a great problem too. According to him, the human being occupies a middle position between the gods and earthly things: he combines divinity and corporeality (6). He is so shaped that he can answer to his twofold vocation, ‘wondering at heavenly beings and worshipping them, tending earthly beings and governing them’ (*Asclepius* 8). Though he cares for and cherishes those who are beneath him, he ‘despises the part of him that is human nature, having put his trust in the divinity of his other part’ (6). Man and all living beings live through the spirit that pervades the universe, but in addition, only the human being has received a reasoning mind (*sensus* = *logos* and *nous*). Accord-

ing to C.H. IV, 2, man surpasses even the cosmos and the gods by his reason and mind (cf. also VIII, 5; XII, 12; *Asclepius* 22). Therefore, he may be called an ornament (*kosmos*) of the universe (*kosmos*), a well-ordered world in itself, a microcosm (*Asclepius* 10).

However, it is a fact of experience that many people evince unreasonable and impious behaviour. That observation led the hermetists to the view that not everybody has *nous*: rather, it is a divine grace bestowed on only a few people (e.g. *Asclepius* 7 and 18; C.H. I, 22; IV, 3). It should be realized that *nous*, mostly translated as “mind”, is not the discursive, analytical human faculty of reason (*logos*), but the intuitive, all-embracing vision by which one understands the sense and coherence of the whole of reality. The question why apparently not all human beings have *nous*, i.e. the problem of evil, was a point of much concern for the hermetists. There was a general consensus that the cause of evil was to be sought in the lower material component of the world and man. According to the *Asclepius*, 22 (= *NHC* VI, 67, 12ff.), there is an important difference between the star gods and human beings: the former ‘have been made from the purest part of nature (fire) and, therefore, they need not have understanding (*epistēmē*) or knowledge (*gnōsis*), for the immortality of the gods is for them understanding and knowledge’. Man, on the other hand, who was made from the lower material elements and, therefore, became subject to the passions and evil inclinations that are inherent in them, has been given the possibility of overcoming these vices through the gifts of understanding and gnosis. From this perspective, one might say that God created man as good and immortal! But that statement is based on man’s ultimate potentiality, which proves to be unrealizable for most people. It can only be effectuated if man is led by his divine *nous*, lives a pious life and despises his corporeality. The hatred of the body is not only recommended in such “pessimistic” treatises as *CHI*, IV (6), VI and VII, but also in more optimistic writings like the *Asclepius*, which says that ‘the malice that begrudges immortality prevents the soul from acknowledging its divine part’ (12). That immortality can only be reached if the soul, led by the divine *nous*, devotes itself to an ascetic way of life, found a succinct expression in the Armenian *Definitions* 9, 5 (of which the Greek text has been preserved in the Oxford fragments): ‘Whoever behaves well towards his body, behaves badly towards himself. Just as the body, without a soul, is a corpse, likewise soul, without *Nous*, is inert’. It was this gloomy view of the dangers to which the soul is exposed that led some hermetists to very

negative descriptions of mankind and the world in general. Strictly speaking, nothing in our world can be called good; even what is called good by ordinary speech is in fact not good at all; God is the only one who is actually good (CH VI). According to the *Asclepius*, 16, however, it is an impious question to ask ‘Was God not able to put an end to evil and banish it from nature?’ As a matter of fact, we read here, the Creator has endowed man with mind (*sensus = nous*), knowledge (*disciplina = gnosis*) and understanding (*intellegentia = epistēmē*), which enable him ‘to avoid the tricks, snares and vices of evil’ (cf. C.H. XII, 12: the gifts of *nous* and *logos* are of equal value as immortality). The same idea is expressed in the final hymn of the *Asclepius*, 41 (= the *Prayer of Thanksgiving* in NHC, VI, 64, 8-14), in which the hermetic believers say that God’s goodness has ‘graciously given us *nous*, *logos* and *gnosis*: *nous* to understand you, *logos* to interpret you, and *gnosis* to know you. We rejoice that we have been illuminated by your *gnosis*’. However, there were also hermetists who preferred another, more mythical explanation of the origin of good or evil in man. According to C.H. IX, 3-4, the cosmos is full of *daimones*, i.e. good or bad spiritual, → intermediary beings, who sow the seeds of virtue or malice in the human mind (here used in a neutral sense, not as a divine gift of grace). A similar idea is found in C.H. XIII, 8-10, where Tat at his spiritual rebirth is cleansed from twelve tormenting spirits of the material world and filled by ten good spirits.

The good and bad *daimones* played an important role in the hermetic view of the world. The *Asclepius* contains some notorious passages about the presence of demons in the statues of the gods (23 and 37-38). The greatness of man is demonstrated by his capacity of making the gods that are worshipped in the temples (23). Originally the human beings did not even know that there were gods. They realised their existence when they discovered the art of making images, and added a magic power from the cosmos to the material from which they made the statues. Then they conjured the souls of *daimones* into the statues, which in that way received the power to be beneficent or harmful (37-38). Another important aspect of the *daimones* is that they punish the sinners and help the pious after the separation of soul and body at death. In C.H. X, it is connected with the idea of a telescopic construction of the human person: the carnal body encloses the astral body (*pneuma*, which makes it alive and moving), the soul (*psychè*) is enclosed within the astral body, reason (*logos*) within the soul, and mind (*nous*) within reason (X, 13). This

view is determined by the conviction that the divine *nous* cannot be in direct contact with the body (X, 17). At death the *nous* puts on its original garment of fire and also the pious soul becomes wholly *nous* (X, 18-19), which means that they become demons. At death the bad souls are sent back to another existence in a human body. There they are punished by the demons, who, on the other hand, lead the good ones to the ‘light of knowledge’ (X, 21). The Latin *Asclepius*, 28, speaks about one chief demon in the air who weighs and judges the soul’s merits, allowing those of the righteous to go to places that suit them while severely punishing those of evil people. But since the Latin and Coptic translations show considerable differences concerning these punishments, especially in chapter 29, the original Greek version cannot be established with certainty. John Lydus († ca. 555), *De mensibus* IV, 32 and 149, reports that ‘the Egyptian Hermes in his *Perfect Discourse*’ mentioned three classes of demons: (1) ‘avenging demons’, who are present in matter and already punish criminals on earth, (2) ‘cleansing demons’, who live in the air and purify the bad souls that after death try to ascend, and (3) ‘saving demons’, who live on the moon and save the souls of the righteous. We may assume that concerning this point as well, there was not one single hermetic doctrine about the fate of the soul after death but, rather, that the hermetists could adhere to quite different ideas. However, they all shared the conviction that only the soul of the pious, who had come to knowledge of himself and of God, could escape the bonds of matter and return to its previous divine status (*Asclepius* 11).

5. INITIATION

Whether the hermetic writers subscribed to a more positive or negative evaluation of the world and man, their unanimous aim was to bring the reader to the praise and worship of the supreme God, who is ‘not visible [i.e. knowable], but evident within the visible’ (Armenian *Definitions* 1, 2). The authors of C.H. I (*Poimandres*), XI and XIII and NHC VI, 6 (*Discourse on the Ogdoad and the Ennead*) go even further and describe ecstatic experiences in which the hermetist leaves his earthly state behind and feels himself united with the supreme God or the universe. In C.H. XIII and NHC VI the experience is connected with a direct initiation into the hermetic mysteries. This has raised the much-debated question of whether there existed actual hermetic communities in the late antique world, in which such initiations and other religious rites were practised. This question will

receive due attention in the next section; here we confine ourselves to the descriptions as given in the texts mentioned. The authors apparently wanted to bring the reader to a re-enactment of the mystic experience they described. In this sense, the hermetic mystery indeed was a 'reading mystery' (*Lese-Mysterium*), as Reitzenstein has characterized it (1927, 52; also, 64: 'literarische Mysterien').

In the *Poimandres*, 25-26, the union with God is described as a *post mortem* event: the soul of the deceased ascends through the seven planetary spheres and in each sphere leaves behind the bad qualities which it has received from that planet during its descent to earth. Then, stripped of the astral influences, the soul enters the eighth sphere 'with its own power', i.e. with its proper self. Singing hymns to the Father, he becomes like the blessed in the eighth sphere and hears the hymns that the powers above the eighth sphere sing to the praise of God. Then they all ascend to the Father and, becoming powers themselves, they are merged in God: 'This is the final good for those who have received knowledge (*gnosis*): to be made god'. Though the *Poimandres* describes this as occurring after death, later hermetists interpreted it as an ecstatic experience of Hermes himself, which could happen to every hermetist. In C.H. XIII, 15, Tat asks his father Hermes to reveal the hymn that the powers sang when he was in the Ogdoad (C.H. I, 26). Hermes agrees, 'just as Poimandres revealed the eighth sphere to me', and recites the fourth song of the Secret Hymn Book (17-20).

However, apart from this reference to the Ogdoad in the *Poimandres*, the mystic experience described in C.H. XIII is quite different from that in C.H. I (see below). The *Discourse on the Ogdoad and the Ennead* actually presents the ascent to the eighth and the ninth heavens as an ecstatic event that can be experienced during one's lifetime. The *Discourse* suggests that the initiation proper was preceded by a preparatory initiation consisting of seven grades, apparently corresponding to the seven planetary spheres, which included the study of hermetic books and required a pious way of life. After a prayer to 'the One who rules over the kingdom of Power' (NHC VI, 55, 24-26), who is addressed by magical names, Hermes and the pupil embrace each other and then experience the descent of the divine Light-power. They both get into an ecstatic state of mind and the pupil exclaims: 'I see the one that moves me through an ecstasy. You give me power. I see myself. I want to speak. Fear restrains me. I have found the origin of power that is above all powers and does not have an origin itself. I see a fountain bubbling with

life . . . I have seen! Language is not able to reveal this' (58, 6-17). After some instruction by Hermes about the Ogdoad and the hymns that the angels sing there in silence, the initiate also sings a silent hymn and then exclaims again: 'Father Trismegistus! What shall I say? We have received this light. And I myself see this same vision in you. And I see the Ogdoad and the souls that are in it and the angels singing a hymn to the Ennead and its powers. And I see him who has the power of them all, creating spiritually' (59, 24-60,1). The initiate sees himself and the Ogdoad in Hermes, which means that during the initiation Hermes changes from mystagogue into a manifestation of the divine Mind (*Nous*) itself. In the mixture of didactic instruction and ecstatic experience characteristic of this tractate and C.H. XIII, Hermes repeatedly says to the initiate: 'I am Mind' (58, 4; 14-15; 21-22; 27). He becomes the mirror, as it were, in which the initiate sees the godhead and the divine world. An exclamation similar to expressions found in the *Discourse* ('I see myself' and 'I see this vision in you'), but without the identification of Hermes with the divine Mind, is made by Tat in C.H. XIII, 13: 'Father, I see the universe and myself in *nous*', i.e. in my own mind, which participates in the divine Mind.

C.H. XIII presents another kind of initiation. At the beginning of this treatise, Hermes describes the effects of his own rebirth: he has come out of his former self into an immortal body, and in that state he is no longer what he was before, because he has been born again in the divine *Nous*. He is now without colour and cannot be touched or measured. Tat can see him, but what he really is cannot be seen with corporeal eyes. It may be assumed that it was in a form like this that the initiate of the Coptic *Discourse* saw Hermes during his ecstasy. Hermes explains that the actual rebirth is effectuated when Tat is cleansed from the twelve evil powers and is filled with the ten good powers: 'Whoever, then, by God's mercy attains a divine birth is freed from the bodily senses and knows himself, namely that he has been made whole by these powers, and he rejoices' (10). Thereupon, without any transition, Tat exclaims: 'I have been made steadfast by God; I no longer picture things with the sight of my eyes but with the mental energy that comes through the powers. I am in heaven, in earth, in water, in air; I am in animals and plants, in the womb, before the womb, after the womb; everywhere' (11). What is described here is the experience of falling together with the whole creation, a cosmic omnipresence. It was a philosophical commonplace to say that man through his mind (*nous*) was able to be present

everywhere, but in the hermetic adaptation of this idea the original mental activity became a mystic experience. This is clearly demonstrated in C.H. XI, 19-20, where the divine Nous instructs Hermes about the unlimited reach of the human mind. The first part of this instruction remains within the boundaries of Greek philosophy, but then Hermes is exhorted to make himself equal to God, for like is only understood by like. Then nothing will be impossible for him: 'Conceive yourself to be in all places at the same time: in earth, in the sea, in heaven; that you are not yet born, within the womb, young, old, dead, beyond death. And when you have understood all these things at the same time – times, places, things, qualities and quantities – then you can understand God.' What started as a mental exercise becomes the revelation of the true essence of God. The same idea is expressed in the secret hymn of C.H. XIII, 20: 'O spirit-bearer, O craftsman, you are God! Your man shouts this through fire, through air, through earth, through water, through spirit, through your creatures'. Also in C.H. XIII, Tat comes to know the universe, himself and God. He exclaims that he sees the All and himself in *nous* (13, see above). His mind has been illuminated (21), so that Hermes can conclude at the end of the treatise (22): 'Now you know both yourself and our Father in a spiritual way'.

The articulations of hermetic mysticism show considerable differences, but they all have in common that the hermetist comes to an intuitive knowledge of himself, the universe and God – a knowledge that transcends the ordinary human mental faculties and is experienced as a unification with the ground of being, God.

6. RELIGIOUS PRACTICES IN HERMETIC COMMUNITIES?

There is no scholarly consensus about the existence of hermetic communities in the Graeco-Roman world. Festugière, for example, totally rejected the idea of a 'confraternity of initiates'. Because of his great influence on hermetic scholarship, it is worthwhile to quote him literally: 'In hermetic literature, there is no trace of particular ceremonies for the alleged faithful of Hermes, nothing resembling the sacraments of gnostic sects: neither baptism nor communion nor confession of sins nor laying-on of hands to ordain cult officials. There is no clergy: no evidence whatsoever of hierarchical organization or degrees of initiation' (1967, 38; 1950-1954, I, 83). This characterization is so strongly determined by the Christian view of what religious practices are that it is no wonder that Festugière did not find them in the *Hermetica*.

The strongest argument that can be adduced against the existence of religious rituals in Hermetism is found in chapter 41 of the *Asclepius*, where Hermes and his pupils are about to say a prayer and Asclepius suggests that they should also burn frankincense and spices. Hermes is disturbed by this suggestion and calls burning incense at prayer a kind of sacrilege. God wants nothing, because he is himself all things or all things are in him: 'rather let us worship him by giving thanks, for God finds mortal gratitude to be the best incense'. This testifies to a purely spiritual concept of God; but we saw already that elsewhere in the *Asclepius*, the author, who uses a variety of hermetic sources, defends the idea that through theurgic rites man is able to conjure divine powers into the images of the earthly gods. This at least shows that, on this point too, the hermetists could adhere to opposed views. If there were hermetic communities, their members certainly also participated in other civil and religious associations, in which rituals that involved the burning of incense were quite common. 'A religious community had to have at least a minimal set of common ideas, even if it were only the fact of honouring some god or of following the teaching of some teacher' (Belayche, 18). It seems possible that there did exist hermetic communities that answered to this minimal definition of a religious association, just as there were philosophical schools that practised religious rites to honour their founder and studied and further developed his teachings.

The hymns and prayers found in the hermetic texts, such as the final hymns of the *Poimandres* and the *Asclepius* and the fourth song of the Secret Hymn Book in C.H. XIII, 17-20, may have played a role in the gatherings of such communities. In the *Discourse on the Ogdoad and the Ennead* and also in the Coptic *Prayer of Thanksgiving*, mention is made of an embrace or kiss after prayer (NHC VI, 57, 26-28 and 65, 3-7, respectively). The only parallel to this usage is the embrace or kiss (*aspasmos*) that the early Christians also gave each other after prayer (e.g. Justin Martyr, *Apology* I, 65, 1; Tertullian, *On Prayer*, 18, 1 and 3). Since the rest of the *Discourse* does not show any Christian influence, there is no reason to assume that this particular feature reflects a Christian practice.

Another religiously inspired practice among the hermetists may have been the vegetarian meal, which is mentioned in *Asclepius* 41 ('Wishing these things, we turn to a pure meal without flesh of animals') and the corresponding passage in NHC VI, 65, 3-7 ('When they had said these things in prayer, they embraced each other and they went to eat their

holy food, which had no blood in it'). Of course, this can be taken as being no more than a literary motif. On the other hand, we know that sacred meals were quite usual in all kinds of religious communities and even in secular associations, so that it would have been very strange if such a meal had been unknown among like-minded people such as the hermetists. A much-discussed text in this connection is that of C.H. IV, 4 about the mixing-bowl (*krater*) filled with *nous*, i.e. intuitive knowledge. The 'human hearts' are exhorted to immerse themselves in it, if they believe to rise up again to the One who gives *nous* and if they realise why they have come into being. Those who have merged with *nous* partake of higher knowledge and become perfect, but the others only have reason, not *nous*. This passage does not point to some kind of hermetic baptism, since it is impossible to be baptized in a mixing-bowl (for an attempt to explain it, see Festugière 1967, 100-112). It has to be read in the light of the Greek translation of Proverbs 9:1-6, about Lady Wisdom who has mixed her wine in a *krater* and invites the fools to taste it and to grow in understanding. The participation in spiritual knowledge and wisdom was often compared to drinking wine or water. It is possible that C.H. IV, 4 refers to a hermetic ritual of drinking from a mixing-bowl as an image of the imparting of knowledge and the initiation into the hermetic mystery – a ritual that is also known from the Hellenistic mystery religions. But it is also possible that the whole passage is no more than an awkwardly constructed figure of speech, which intended to emphasize that spiritual insight (*nous*) is not a common human capacity but a divine gift.

The discovery of the *Discourse on the Ogdoad and the Ennead* has given a new impetus to the debate on the existence of hermetic communities and rituals. It contains hymns and prayers, speaks about a hermetic confraternity, knows of at least eight grades of initiation and describes an initiation into the Ogdoad, which because of its stammering language of ecstasy gives the impression of authenticity (see above). As it now stands, the text is indeed a "Lese-Mysterium", a literary mystery, but there are no compelling reasons to assume that such initiations did not exist in reality. In view of the general tendency in the ancient world of forming associations of people with the same interests, it would be strange if the hermetists had not come together in meetings to discuss the way of Hermes, collectively celebrate the individual experience of initiation, send up hymns and prayers, and share a vegetarian meal. Of course, we should not assume the existence of a fixed hermetic

liturgy, comparable to that of the great cultic religions of the time, including Christianity. There may even have been hermetic groups in which the initiation did not play a role of any importance, but as a whole there is no reason to assume that it did not exist in real life.

7. THE CRUCIBLE OF ALEXANDRIA: GREEK PHILOSOPHY, EGYPTIAN RELIGION, JUDAISM

There is a general scholarly consensus that Hermetism originated in Alexandria. The combination of Egyptian, Jewish and Greek religious and philosophical elements that characterizes the hermetic writings can best be explained from an Alexandrian background. Founded by Alexander the Great in 332/31 B.C., in the 3rd and 2nd centuries Alexandria became the economic and cultural centre of the Greek world. Ptolemy I Soter (323-283) founded the Mouseion, which attracted the greatest scholars of the period and contained an enormous, continually expanding library. Another great library was founded in the temple of Sarapis: the Sarapeion, which was built under Ptolemy III Euergetes (246-222). In the Mouseion, not only all Greek literature was collected and studied but in addition translations were made of important works of Egyptian, Hebrew and Mesopotamian origin. The Alexandrian scholars devoted themselves primarily to philology and the mathematical, medical and natural sciences. They were less interested in philosophy and the disputes between the philosophical schools, and if they turned to philosophy they showed a preference for an eclectic approach. This also holds for the first Alexandrian philosopher whose work became of lasting importance, Eudorus. He was a Platonist who combined ideas of Plato with Aristotelian and Stoic elements and gave the whole a strong Neopythagorean colouring (Dillon, 114-135). He exerted a great influence on the Jewish religious philosopher Philo of Alexandria (born about 20 B.C.) and undoubtedly also on the equally eclectic religious philosophy of Hermetism.

Alexandria was a Greek city – only a small minority of its citizens was Egyptian – but the Ptolemies sought to combine the Egyptian and Greek religious traditions, which, *inter alia*, resulted in the cult of Sarapis. Scholars of Egyptian descent like Manetho (3rd century B.C.) and Charemon (1st century A.D.) did much to make the history and religious culture of Egypt known to the Greek-speaking world (Fowden, 52-57). Together with material goods from all parts of the world, there also arrived in Alexandria reliable

information about the *spiritual* goods of remote peoples, for instance about Buddhism in India (Buddha was first mentioned by Clement of Alexandria, *Stromateis*, I, 71, 6).

Hermetism was one of the interesting religious phenomena that took shape in the crucible of Alexandria. The presence of Greek philosophy in the *Hermetica* needs no demonstration; their contents are for the greater part a mixture of Platonism and Stoicism, of the Eudorian type. The Jewish influence is undisputed, though scholars have different opinions about how far it went. Until A.D. 117, there was a very large Jewish community in Alexandria, which was mainly concentrated in two of the five districts of the city and numbered in the hundreds of thousands (Pearson, 145-151). The writings of Philo show that there were (1) Jews who strictly adhered to the religious convictions and lifestyle of their forefathers, (2) those who stuck to the observance of the Jewish law but gave an allegorical Greek interpretation to their traditional religion, and (3) others who abandoned both the observance of the Law and the Jewish religion as a whole or combined this religion so strongly with Greek or Oriental elements that the essence of Judaism was lost. Philo himself belonged to the second category, and it seems that Jews from the third group were involved in the origin and development of Hermetism (and Gnosticism as well). Hermetic writings like C.H. I and III can only have been written in a milieu that was strongly influenced by Jewish ideas and traditions (Dodd). If there ever existed some kind of a hermetic lodge in Alexandria – which is quite possible –, it must have counted some Jews among its most influential members.

The Egyptian component of Hermetism has long been a controversial topic of scholarly research. Classicists with a vast knowledge of Greek philosophy always tended to minimize the Egyptian influence. Thus, according to Festugière, Hermetism simply represents a set of popularized Greek philosophical notions with strong religious overtones, whereas the “Egyptian” elements are widespread commonplaces about Egypt: no more than a literary device, intended to suggest that Hermetism had ancient and foreign origins. Egyptologists, on the other hand, have always argued that under the Greek surface a great number of Egyptian religious ideas can be observed. A major difficulty, mostly neglected by classicists, is that the Egyptians never developed an abstract philosophical language but expressed comparable ideas in religious myths and images. In recent research, Egyptologists have presented a great number of

Egyptian religious ideas that have their counterpart in Hermetism (Derchain, Daumas, Iversen, Zandee). The fact alone that the names Trismegistus and Poimandres have their etymological origins in the Egyptian language and that some typical hermetic ideas, such as the androgyny of the supreme God, have their closest parallels in Egyptian religion, shows that Festugière’s position has to be abandoned or at least qualified. The Egyptian influence must be ascribed to Hellenized Egyptians who knew their own religious traditions quite well. Perhaps there is some truth, after all, in Iamblichus’ contention (*De mysteriis*, VIII, 4) that the Egyptians who, according to him, ‘translated’ the hermetic writings from Egyptian into Greek were skilled in Greek philosophy. What is urgently needed is an interdisciplinary study by classicists and Egyptologists of all the Egyptian parallels that have been suggested in recent research. Less problematic is the relationship between hermetic and gnostic ideas (→ Gnosticism).

8. HERMETISM AND CHRISTIAN BELIEF

The Christian doctrine of God, as developed by Christian theologians from the 2nd century onward, owed much to Platonism and, for that reason, also had much in common with Hermetism. This agreement did not escape the attention of early Christian writers who wanted to show that Christianity was not a recent religion – something that the outside world generally considered a negative point – but, rather, that its essential doctrines had already been taught in remote antiquity by the ancient Egyptian sage Hermes Trismegistus, as well as by the Sibyls, Orpheus and others (van den Broek). The authors that have to be discussed in this connection are Lactantius, Didymus the Blind and Cyril of Alexandria. → Augustine is much more critical, although even he is able to make a positive remark on Hermes.

Lactantius says of Trismegistus that he ‘has investigated virtually the entire truth, I do not know how’ (*Divinae Institutiones* IV, 9, 3). He is a witness of Christianity, ‘who agrees with us, that is to say with the prophets whom we follow, both as to substance and verbatim’ (*Div. Inst.* VI, 25, 10). Hermes has ‘said about God the Father everything and about the Son much which is contained in the divine secrets (i.e. the Holy Scriptures)’ (*Div. Inst.* IV, 27, 20). For Lactantius, the view that Hermes had taught the Christian doctrine of God was more than an apologetic device: it was his sincere conviction. The hermetically coloured Platonism in which he was steeped before his conversion

to Christianity apparently kept its validity after that event.

If there was some justification in Lactantius' claim that Hermes and the Christians taught the same doctrine of the supreme God, his idea that Hermes had also already spoken of the Son of God, Christ, was certainly mistaken. From the *Logos Teleios*, the Greek original of the Latin *Asclepius*, he quotes in Greek the passage to be found in *Asclepius* 8: 'When the Lord and Maker of all things, whom we are used to call God, had made the second God who is visible and sensible . . .; when he, then, had made this God as the first and only and sole one, he seemed beautiful to him and entirely full of all good things, and he rejoiced and loved him very much as his own son' (*Div. Inst.* IV, 6, 4). Through the intermediary of Quodvultdeus' *Adversus quinque haereses*, III, 4, a somewhat abbreviated and occasionally more Christianized form of this text was to have a great history in the Middle Ages (→ Hermetic Literature II). However, as was already pointed out above, the passage speaks in fact about the creation of the cosmos as the first son of God. In defence of Lactantius, it might be said that his "exegesis" of this hermetic text is in no way different from the Christological reading of the Old Testament that was usual in the 4th century.

Didymus the Blind and Cyril of Alexandria found the entire doctrine of the Trinity in the works of Hermes Trismegistus. Cyril was partly dependent on Didymus, but he also had access to hermetic sources that were not used by the latter. Cyril had a low esteem of Greek philosophy and Greek culture in general, but for apologetic reasons quoted Orpheus, Pythagoras, Plato and Hermes with approval. In his view, Hermes, Pythagoras and Plato owed their doctrine of God to → Moses, who had always remained in great esteem in Egypt. Pythagoras and Plato had become acquainted with Moses' teachings when they studied with Egyptian sages. Hermes was a native Egyptian who always lived in the temples of the idols, Cyril says, but nevertheless he knew the Mosaic doctrine of God – not wholly correctly and impeccably, but at least partly.

According to Didymus and Cyril, the hermetic writings also contained clear references to the Christian doctrine of the Son and even to that of the Holy Spirit. Independent of Didymus, Cyril quotes some texts discussing the 'creative Logos of the Lord of the All', who is *inter alia* 'the first-born of the All-Perfect, his perfect, fertile Son' (*Contra Julianum* I, 46; NF IV, 132-136). The nature of this 'spiritual Logos' is called 'generating and creating', which makes it probable that for the hermetist it was the creative force in the universe,

which according to the *Poimandres* (10-11) was of the same substance (*homousios*) as the divine Nous. Didymus (*De trinitate* II, 27) and Cyril (*Contra Julianum* I, 47), who in this case depends on the former, also quote and discuss a hermetic text that in their view proved that Hermes had already spoken about the Holy Spirit. In a rather obscure language this text says that there is 'one single, eternal spiritual light, existing before the spiritual light, the light-mind (*nous*) of the mind (*nous*). And nothing else existed but the unity of this mind. It is always contained within itself and always comprises all things with its own mind (*nous*) and light and spirit (*pneuma*)'. Didymus and Cyril interpreted the 'light-mind of the mind' as 'mind from mind', i.e. the Son, who also was 'light from light', as the Nicene and Constantinopolitan Creeds of 325 and 381 put it. In their view, Hermes' remark on the spirit that comprises all things referred to the Holy Spirit. In the same connection, but in reversed order, Didymus and Cyril also quote another hermetic text, which reads *inter alia*: 'All things are in need of this spirit (*pneuma*), of which I have already often spoken. It carries everything and makes everything as much as is needed and feeds it. It is dependent on the holy source and is the helper of the spirits and the generator of life to all, even though he is still one'. There is little doubt that the hermetist conceived of this spirit as the divine creative force in the cosmos, but according to Cyril the text showed that Hermes already knew the Spirit 'as an independent hypostasis', who comes forth from God the Father by nature and takes care of creation through the mediation of the Son' (*Contra Julianum* I, 49).

Augustine did not have much to say in favour of Hermes Trismegistus; he quotes him almost exclusively in order to refute him. In *De civitate dei*, VIII, 23-26, he presents a vigorous attack on the notorious passages in the *Asclepius* (23 and 37-38) about man as the creator of the gods who are worshipped in the temples (see above). But in the same context, he also states that Hermes had much to say 'about the one true God, the creator of the world, which corresponds to the teaching of the truth' (VIII, 23). In his polemics with Faustus the Manichee, Augustine also admitted that pagan prophets such as the Sibyls, Hermes and Orpheus 'had made truthful predictions – or are said to have done so – about the Son of God and God the Father', but he warned against investing these pagans with authority (*Contra Faustum*, XIII, 15). Augustine rejected the appeal to pagan prophets as pre-Christian witnesses to the truth of Christianity, but even his great authority was unable to erase this idea from the minds of later theologians.

Heydon, John (Eugenius Theodidactus),
* 1626 England, † ca. 1665 London?

Under this name, some of the most luminous prose of late Renaissance Hermeticism was published. Passages worthy of English writers like → Elias Ashmole, → Francis Bacon, → Henry More, Walter Raleigh, and → Thomas Vaughan and of Continental masters like → Agrippa, → Ficino, → Paracelsus, and even → Hermes Trismegistus appeared under Heydon’s name or his pseudonym Eugenius Theodidactus (i.e., a gentleman taught by God) between 1655 and 1665. Indeed, the passages were first published in England under those other names, and were only then gathered into the series of “guides” that Heydon issued under the general rubric of “Rosicrucian” [→ Rosicrucianism]. Heydon’s motives are hard to guess. His personal comments are usually efforts to conceal his plagiarism; he claims to have kept his works in manuscript for years and condemns his often indignant sources as plagiarists themselves. He does seek publicity, though, and encourages readers to consult him as an astrologer and as a “physician” dispensing herbal and other remedies. He also does everything possible to make a profit; he takes the same manuscripts to different publishers, under different titles, and recycles unsold sheets of an old book under a new title (all told, his books exceed six thousand pages). He is a forerunner of today’s gurus and popularizers, and his ethics bode ill for the lot. The prolific occultist → A.E. Waite (1857-1942), who suffered repeated piracy in the United States, once described Heydon as ‘the prototypical thief of English occult literature’.

By his own account, Heydon was born in 1629, was educated in Oxford, and became a London barrister by the age of twenty-five. A lifelong student, he added medicine to law and theology to medicine, writing on all of them. He was jailed under two governments, the Protectorate of Oliver Cromwell and the restored monarchy of Charles I, for having published subversive comments. Though he often denied it, Heydon married Alice Culpeper, the widow of the upstart physician and medical translator Nicholas Culpeper (1616-1654). His books began to appear in 1655. His first prose tract was, ironically, a book of moral instruction for Culpeper’s daughter. His first specifically Rosicrucian tract was later exposed as his fantasia on a manuscript from Culpeper’s library. In the exposé, Elias Ashmole described Heydon as ‘an ignoramus and a cheat’. The term stuck, and Heydon was later portrayed on the stage as the main

character in John Wilson's comedy *The Cheats*. His main speech in the play is plagiarized from Hermes Trismegistus. Heydon swore off writing when he experienced a religious conversion, after the death of a sister, and then he insisted that he was only an editor. The excuse seems feeble, even in the days before copyright law. Nevertheless, Heydon did a great deal to popularize the term "Rosicrucian" and to suggest in what ways Bacon's *New Atlantis* or Agrippa's *Occult Philosophy* is "Rosicrucian". Frances Yates found Heydon's reworking of Bacon, with interpolations from the Rosicrucian manifestos of 1614 and 1615, an essential text for Bacon's subsequent reputation and for her own theme of a "Rosicrucian Enlightenment".

THOMAS WILLARD

Hildegard of Bingen, * 1098 Bermersheim bei Alzey, † 17.9.1179 Rupertsberg, Bingen-am-Rhein

German Benedictine nun, founder and head of two monasteries for women, the Rupertsberg (destroyed in the Thirty Years' War) and the present-day Abbey of St. Hildegard, Eibingen. Visionary, prophet, composer, and prolific author of theological and scientific books. The tenth child of a noble family, Hildegard made her profession of virginity at 14 under the tutelage of Jutta of Sponheim, a recluse at the monastery of Disibodenberg, and in 1136 was elected mistress of the nuns there. In 1141 she received a prophetic call to 'cry out and write' what God revealed to her in the visions she had experienced from childhood, and in 1151 pub-

lished her first book, *Scivias* (Know the Ways of the Lord). Structured around a cycle of illustrated visions, the work includes extensive allegories, biblical exegesis, and liturgical lyrics. Meanwhile Hildegard felt called to leave the Disibodenberg and found her own nunnery at Mount St. Rupert (1148-1150). Other books followed: the *Liber vite meritorum* (Book of Life's Merits, 1158-1163), *Liber divinorum operum* (Book of Divine Works, 1163-1174), *Liber epistolarum* (Book of Letters), two saints' lives, a medical and scientific encyclopedia (*Physica*), and a handbook of practical and theoretical medicine (*Causae et curae* or *Causes and Cures*). Her musical compositions include 70 liturgical chants with original texts, assembled in the collection *Symphonia armonie celestium revelationum* (Symphony of the Harmony of Heavenly Revelations), and a music drama, the *Ordo virtutum* (Play of the Virtues). Known as a healer, exorcist, and apocalyptic prophet, Hildegard had a wide circle of correspondents that included powerful bishops and nobles. In her later years she travelled extensively on preaching tours, speaking at monasteries and sometimes in cathedral squares – the only medieval woman to have done so.

Orthodox in her dogmatic and sacramental theology, Hildegard developed a complex cosmology based on ideas that were current among 12th-century Platonists, but soon afterwards fell from general favor and remained central only within esoteric systems of thought. Her visionary worldview is built around a series of feminine theophanies, the *Virtutes*, who represent creative energies active in the natural world and especially in souls that willingly cooperate with God. Chief among these are Caritas (Divine Love) and Sapientia (Divine Wisdom), who function almost interchangeably as manifestations of God. Hildegard teaches the absolute predestination of Christ, i.e. the doctrine that the incarnation of the Word in human form was the original purpose of God's creation, not just a remedy for original sin. In the *Liber divinorum operum* she develops an elaborate system of → correspondences between macrocosm and microcosm, correlating celestial bodies and elemental forces with parts of the human body as well as spiritual and moral states. Speculations on the unfallen Adam and Eve underlie Hildegard's medicine, which is based on an unconventional version of humoral theory and aims to restore the physical and spiritual equilibrium lost in the Fall. Hildegard also developed an esoteric theology of → music, comparing the melody of chant to the divinity of Christ and the words to his humanity. Musical instruments, she asserts, were invented by

the prophets to compensate for the lost resonance that Adam's voice had possessed in paradise.

Hildegard's style was notably obscure, in part because she lacked formal training in Latin grammar and rhetoric, but also because she was imitating the manner of the biblical prophets. Her apocalyptic prophecies, which appear in the final visions of the *Scivias* and *Liber divinatorum operum* and in her letters and sermons, were couched in a deliberately vague and grandiloquent style to mask their potentially dangerous political content. These prophecies, widely studied and anthologized, kept Hildegard's reputation alive in later medieval centuries, when she was remembered as "Sibyl of the Rhine" for her speculations on the Antichrist and events of the eschaton. Her most strictly esoteric work is the *Lingua ignota* (Unknown Language), composed of about 900 words, which she may have devised to create the aura of an initiated sisterhood among her elite nuns. The *Lingua* is accompanied by an 'unknown alphabet' (*Litterae ignotae*) of 23 characters. Because of their cryptic style, Hildegard's prophecies have been diversely interpreted: she has been credited with predicting phenomena as disparate as the 13th-century fraternal orders, the Protestant Reformation, and the French Revolution. Her other works were not widely read after her lifetime, but several Renaissance esotericists took an interest in her, including → Trithemius of Sponheim and → Jacques Lefèvre d'Étaples, who published the *editio princeps* of her *Scivias*.

In the late 20th century Hildegard enjoyed a sudden surge in popularity. Most of her works were critically edited and translated into German and English, and her music has been recorded by numerous vocalists. Popularized by Matthew Fox and his movement for "creation-centered spirituality", Hildegard is now revered by adherents of → New Age spiritualities as well as traditional and feminist Catholics. Her medicine has undergone a revival among holistic health practitioners, and "Hildegard practices" have opened in a number of European and North American cities.

Human Potential Movement

1. INTELLECTUAL TRADITIONS AND FOUNDERS
2. THERAPEUTIC PREDECESSORS
3. SOCIAL SETTING
4. PRACTICES
5. AT THE FRINGES
6. THE FATE OF THE HUMAN POTENTIAL MOVEMENT

The term Human Potential Movement (HPM) arose in the 1960s as referring to a highly eclectic mix of therapies, many of which were poised on the border between a psychological and a religious framework. They must be regarded as belonging to the history of gnosis and Western esotericism both for historical reasons and because of doctrinal similarities: historically, since by mediation of the mind cure or → New Thought movements, the

intellectual foundations of the HPM may be found in the psychologization of → Mesmerism during the 19th century; doctrinally, since the religious aspects of the HPM to a considerable extent can be characterized as the search for an existential experience of the “real self” and its essential divinity – a search for what traditionally is known as “gnosis”. This search finds expression, however, in a quintessentially modern framework that emphasizes individualism to an extent unknown in traditional esoteric contexts.

1. INTELLECTUAL TRADITIONS AND FOUNDERS

The Human Potential Movement comprises a variety of methods centered on a shared vision of the human condition. Mainstream therapies up to and including the 1950s typically saw the human predicament in pessimistic and largely deterministic terms. Thus, orthodox psychoanalysis builds on the idea that humans are forced to sublimate their basic drives in order to be able to live in organized societies. The result is said to be the widespread occurrence of neuroses. Psychoanalytic practice therefore saw the aim of therapy as enabling the patient to function once more in society, especially in the family and at work. Humanistic psychology arose as an alternative view both of personhood and of the goals of therapy. It presented a view of human beings as constrained and alienated by negative social forces, living far below their natural capacities. Humanistic psychology also carried the seeds of a psychological utopia. If individual people were to find the ability to truly love, create and fulfil their potentials, society would be transformed almost beyond recognition. Social change basically required a consciousness revolution.

The fundamental idea that we in our normal mode of existence remain unaware of vast inner potentials can be traced back to the period of → Romanticism (see e.g. the somnambulant patients investigated by → Justinus Kerner). The specific perspectives of the HPM, however, have their more immediate roots in the “mind cure” or → New Thought philosophies of the 19th century. Inspired by the gulf between our everyday existence and the apparently supernatural abilities evinced by people in mesmeric trance, Phineas Parkhurst Quimby (1802-1866) and his successors suggested that we were normally constrained by our false beliefs.

In a more academic mode, somewhat similar ideas were being developed around the turn of the 20th century by a number of American psychologists of religion. Edwin Starbuck (1866-1947), James Leuba (1868-1946) and others emphasized the inner potentialities of the individual, his or her

capacity for growth and development, and the importance of spiritual elements in that process. However, none of these writers had an enduring popularity to match that of William James (1842-1910). James firmly joined religion and psychology by understanding the subconscious mind as a link to a spiritual realm. Exploring one’s own mind was ultimately the pathway to the divine. While optimistic, humanistic and spiritually-oriented psychologies continued to be formulated throughout the first half of the 20th century, James’ vast influence on the American cultural landscape provided the principal link of continuity between the optimistic post-mesmerist esotericism of the mid-to late 19th century and the development of the humanistic psychologies proper, beginning in the late 1950s.

Rollo May (1909-1994) is one of the most important figures in the development of humanistic psychology. May, who studied theology and philosophy as well as psychology, was critical of Freudian thought and preferred to draw inspiration from psychologists such as Alfred Adler (1870-1937) and → Carl Gustav Jung. His background in theology, particularly the influence of the existential theologian Paul Tillich (1886-1965), was a major impetus for his desire to pursue a study of the human condition informed by existentialist philosophy. Carl Rogers (1902-1987) contributed to the movement by formulating client-centered therapy. Rogers suggested that clients in therapy strive of their own accord towards self-actualization, and that the therapist’s primary role is to facilitate this process by accepting clients as they are. Perhaps the most overtly Jamesian of the founding fathers of humanistic psychology was Abraham Maslow (1908-1970). He believed that each individual possesses a true, inner nature, and that psychological health came through a quest for this core self. Maslow, like James before him, used case studies to support his theory of personality. By studying exceptionally creative, “self-actualizing” individuals, he concluded that these people had gone through a number of peak experiences, i.e. moments of full awareness and bliss.

Whereas the HPM was rooted in specific psychotherapeutic doctrines and methods, a considerable sector of the movement from the late 1960s and onwards gradually shifted focus towards a more distinctly religious point of view. Abraham Maslow was a central figure in the emergence of this new direction. Maslow described peak experiences in overtly religionist terms, understanding mystical experience to be the highest form. He came to believe that a psychology rooted in such experiences could provide a spiritual value system

and a philosophy that was essentially identical to the core of the major world religions. Maslow and Stanislav Grof (b. 1931) jointly coined the term transpersonal psychology for this new view.

Transpersonal psychology became an established concept with the foundation in 1969 of the *Journal of Transpersonal Psychology*. The editor of this journal, Anthony Sutich, programmatically positioned the new school as a fourth force beside the three forces of classical psychoanalytic theory, behaviorism and humanistic psychology. In a frequently quoted formulation, he presented the aim of the new psychological schools as the empirically scientific study of, among other things, 'transpersonal process, values and states, unitive consciousness, meta-needs, peak experiences, ecstasy, mystical experience, being, essence, bliss, awe, wonder, transcendence of the self, spirit, sacralization of everyday life, oneness, cosmic awareness, cosmic play, individual and species-wide synergy, the theories and practices of meditation, spiritual paths, compassion, transpersonal cooperation, transpersonal realization and actualization; and related concepts, experiences and activities'. This list is surely at least as imbued with modern religious values as with psychology. That mystical experience was presented in the singular is also symptomatic of the apologetic and essentialist tenor of much transpersonal psychology.

The most influential contemporary spokesperson of transpersonal psychology, Ken Wilber (b. 1948), has further accentuated this spiritualizing trend. Different modes of consciousness are placed within an overarching hierarchical and evolutionary scheme, in which mystical states represent the highest levels. Wilber presents a vision of the human predicament as the gradual evolution of Spirit, in which individuals as well as entire cultures can gradually come to access transpersonal reaches of consciousness that go far beyond self-actualization as described by Maslow.

Humanistic and transpersonal psychology as developed by these and other psychologists largely emerged as intellectual movements. The Human Potential Movement *sensu stricto* developed a variety of practical methods devised to bring out the full capacities of the human being: not in order to elevate pathologically malfunctioning individuals to normality, but to raise normal individuals to realize their full human potential. This ambition gave the Human Potential Movement its name.

2. THERAPEUTIC PREDECESSORS

Mainstream therapies, with psychoanalysis as a paradigmatic example, typically employ conversa-

tion as the privileged therapeutic tool. Commonly, the verbal interchange between psychotherapist and patient is carried out in numerous sessions spread over a long period of time, involves relatively low levels of intervention from the therapist and is aimed, through the process of transference, at making patients increasingly aware of the structural similarities between situations and emotions experienced in their everyday lives and the interchange in the therapeutic setting. The Human Potential Movement would form a radically different view of praxis, and found inspiration in several unorthodox therapies developed from the 1920s and onward. These alternative practices often privileged bodily expression over verbalization, were emotionally powerful and required the therapist to play a considerably more active role in the therapeutic process. Two schools that particularly contributed to the development of HPM therapies were psychodrama and Reichian bodywork.

Psychodrama was developed by Jacob L. Moreno (1890-1974). Moreno was born in Bucharest, Romania, and moved to Vienna to study medicine. The beginnings of psychodrama were developed during his last years there, before his emigration to America in 1925. Moreno opened a psychodrama school in 1925, but worked in relative obscurity until the emerging HPM – in search for methodologies and historical roots – found inspiration in his work. The fundamental idea of psychodrama is to choose an emotionally intense episode from one's life and act it out together with a group of people. The role of the leader of the psychodrama group is to guide the process by suggesting ways to act out the dramatic aspects of the situation: the scene, the roles to play, ways of enhancing the emotional tenor of the interaction. The director can also suggest that members of the group switch roles with each other, or intervene to interpret the lines and actions of a protagonist.

A perhaps even more important influence on the HPM was the work of Wilhelm Reich (1897-1957). Reich's point of departure was the idea that there existed a form of vital force, orgone energy, which in a neurosis-free individual flows unhindered through the body. However, forbidden impulses or painful traumas create blocks both in the person's psyche (in Reichian terminology, the character armor) and in the body (the muscular armor). Character structure and such somatic symptoms as muscular rigidity, posture and bodily movements are thus intimately linked. By working on the physical manifestations of blocked energy, character structure could be changed and the patient would be made more capable of experienc-

ing pleasure, especially in the form of sexuality. Among the techniques used by Reich and his followers were manipulation of the body through touch and pressure as well as controlled breathing.

3. SOCIAL SETTING

The 1960s were a period of social experimentation. This innovative mood influenced sectors of the psychotherapeutic community, and led to the development and spread of an eclectic set of new therapies, based on the generally shared vision of bringing out the hidden potential of the individual. A vital element in transforming a number of historically distinct ideas and therapies into a consolidated movement was the creation of a social setting in which practitioners of various persuasions could join forces. The paradigmatic location for the various alternative therapies was the growth center, typically a place where clients could board and lodge for a relatively short period of time while sampling a number of different methods.

One of the very first, and arguably the most influential, was Esalen Institute, at Big Sur, California. Esalen Institute (which for its first three years was known as Big Sur Hot Springs) was founded by Michael Murphy and Richard Price in 1962, as a seminar center for lectures on a variety of ideas that might appeal to the budding California counterculture. The topics discussed included mysticism, philosophy, religion, the occult [→ occult / occultism], humanistic psychology, psychedelics and Oriental cultures. Through active networking, a large number of luminaries of the 1960s spiritual counterculture agreed to appear at Esalen. Thus, famous writers and thinkers such as Gregory Bateson, Kenneth Rexroth, Abraham Maslow and Aldous Huxley endorsed the project or became actively involved in it. To sum up the vast variety of subjects addressed at the meetings, the term Human Potentiality was created. Out of the mix of elements, some were soon given a privileged place. The interest in the paranormal, in Eastern philosophies, in altered states of consciousness and in other elements of the 1960s cultic milieu gave Esalen a distinct touch of alternative religiosity. Thus, one of the first and most prominent speakers at Esalen was Alan Watts (1915-1973), a onetime clergyman, flamboyant popularizer of Zen Buddhism, philosophical entertainer and advocate of the psychedelic experience.

Esalen Institute remained a site dedicated to intellectual discussion for a year or two. By then, a gradual but profound change in direction had taken place. Rather than merely talking about the development of human potential, Esalen would

now be devoted to experiential sessions designed to actively bringing out the hidden capacities of its visitors. Since Esalen was privately run, therapists were free to experiment with a variety of unorthodox methods. The most prevalent practices developed at Esalen can be roughly divided into three groups: gestalt therapy, encounter groups and body therapies.

4. PRACTICES

Gestalt therapy is primarily associated with the work of the German-American psychologist Frederick ("Fritz") Perls (1893-1970). Rather than going back to e.g. childhood memories, as would be done in many other methods, gestalt therapy emphasizes the here and now of the therapeutic setting. In particular, Perls would interpret the quality of voice, the gestures and body language of his clients, and draw their attention to any discrepancies between these cues and the overt message of what they were saying. Awareness of such subtle discrepancies was one key to a psychological breakthrough. Among the material Perls would take up in such sessions were clients' dreams and the emotionally intense issues of their everyday lives. These would be drawn into the therapeutic setting by being reenacted in the here and now. Thus, clients would not only talk about their dreams, but also act the various characters appearing in them.

Gestalt therapy shared with many other HPM therapies the insistence on the responsibility of the individual for every aspect of their lives. This method is thus based on an existential philosophy that focuses on our own active role in shaping our lives. Part of Perls' credo was that we inflict symptoms on ourselves; progress in therapy involves understanding that nobody but ourselves burdens us with our neuroses.

Perls, who became part of Esalen's resident staff, had the curious role of practicing one of the most publicized methods of Human Potential Movement, yet in a sense also one of the least representative of the direction in which the HPM was headed. Whereas other therapists were increasingly prone to invoke religious motifs in their theories and practices, Perls remained intensely skeptical of anything that was labeled "spiritual". His basic attitude was that spirituality was a refuge for people who were unwilling to take responsibility for the real issues of their lives.

The history of *encounter groups* has been traced to the philosophy of dialogue of Martin Buber (1878-1965), as well as the research on the effects of self-disclosure carried out by Sidney Jourard

(1926-1974). There have been several different versions of the encounter group. An immediate precursor of the HPM encounter group is derived from the work of Carl Rogers. Here people would sit in a circle, usually on chairs, and interact almost entirely at a verbal level. The role of the leader was simply to facilitate whatever process was taking place, and to encourage people to be more honest and more self-disclosing.

The form of encounter which would become emblematic of much of the HPM, however, was a considerably more intense form developed by William Schutz. In this version, a group of perhaps six to fifteen people would sit in a circle, usually on cushions because furniture might hamper physical action. There was much more emphasis on the body and on the emotions than on any intellectual or verbal expression. As in Gestalt, the here-and-now was considered paramount. The injunction was not to talk about one's emotions but show them. And as in so many HPM therapies, participants were strongly encouraged to accept responsibility for their own actions and feelings. Among the basic rules of the encounter group were to speak only for oneself, to speak and act directly to whatever other participant elicits an emotion, and to be specific in doing so. The basic role of the leader was to choose among an eclectic set of methods to move the group in the direction where the emotional intensity was greatest. Thus, if the group leader sensed that a technique from gestalt therapy, psychodrama, breath control, guided imagery or bodywork might enable a person to go deeper into an emotionally intense experience, he or she would initiate such an action. Encounter groups could range from a few hours to marathon sessions of several days, which would significantly lower the defenses of the participants and, it was hoped, facilitate growth through direct and uninhibited communication.

Although originally aimed at producing emotional and social rather than spiritual transformation, the encounter group would later be adopted for religious purposes. One of the most successful of these attempts was made by Bhagwan Shree Rajneesh (1931-1990), founder of a new religious movement that is today known as the Osho Movement (q.v. below).

Although *body therapies* generally build on Reich's general approach, his praxis was to be modified in a number of ways by later practitioners. One of the main schools where this has been done is bioenergetics, developed in the 1950s and 1960s by one of Reich's students, Alexander Lowen (b. 1910). Lowen believed that different

character types manifest in various forms of muscle tone, breathing, posture, and so forth. Each character type can be diagnosed by paying close attention to such somatic manifestations. Bioenergetics could, in turn, help to redress the various problems typically associated with each character type. Thus, bioenergetics lays particular emphasis on the concept of grounding, with various methods concerned with making better contact with our legs and feet. Such bodily processes were often interpreted metaphorically: being physically more aware of the lower half of our body was interpreted as making one more "grounded" also in a psychological sense.

Another visible component of the HPM scene was Rolfing, a technique named after founder Ida Rolf (1896-1979). Rolfing involves a forceful and at times painful manipulation of deep-lying muscles. The theory behind the method states that memories of physical as well as emotional traumas can be activated in the process.

Although not all body therapists saw their work in spiritual terms, several assumptions contributed to giving at least some of these practices a religious tinge. Firstly, there was a widespread understanding that some form of life force was released as therapeutic effects could be observed. Secondly, the holistic emphasis on body/mind interconnections led a number of therapists and their clients to assume that some form of spiritual attunement was also possible through manipulation of the body. Thirdly, the common interest in various forms of Eastern philosophy made it tempting to find similarities between yogic techniques and body therapies.

5. AT THE FRINGES

Many of the spokespersons of the HPM and the leaders of various growth centers were highly eclectic in their approaches. Several independent methods were in time incorporated under the general Human Potential umbrella. The success and high profile of places such as the Esalen Institute inspired others to develop new practices, some of which received considerable publicity.

Among these one could include psychosynthesis, developed by Roberto Assagioli (1888-1974). Assagioli was one of the first psychologists to introduce Freud's theories in Italy, but he was also a disciple of → Alice Bailey. He combined the two influences by attempting to devise a set of therapeutic methods to bring his clients in touch with what he understood to be their higher selves. Another parallel development was that of the Arica Method, a set of exercises inspired by the teach-

ings of → Gurdjieff and created by Oscar Ichazo (b. 1931). Ichazo's contention was that the true self was hidden behind the false ego, which manifested in one of nine overriding drives that in his and Gurdjieff's view constitute our personalities. The attraction of these two methods for the mainstream of the 1960s HPM may have been the fact that both combined the idea that humanity lived well below its full abilities, with the conviction that the necessary awakening included a strong spiritual component with discernible roots in esoteric thought.

If the HPM generally built on the intellectual and philosophical underpinnings of humanistic psychology, a number of other therapies with similar aims of raising the individual to new levels of awareness were constructed on more speculative bases. Such therapies could, at least from a sociological point of view, be characterized as the fringe of the HPM. Some remained at the fringe because they managed to transgress even the very liberal mores of the 1960s; among these one might count nude encounter groups. Some, e.g. large group programs such as *est*, became controversial due to their strictly regimented and authoritarian ethos. Others, such as primal therapy, did so because they built on theories that were perceived by many as highly speculative.

Nude encounter groups were a short-lived radical extension of the then prevalent (clothed) encounter sessions. By stripping, it was assumed that one's defenses would come down quicker. Nude encounter groups remained marginal to the Human Potential Movement, but did cause considerable negative publicity for the entire movement by being prominently depicted in a 1968 issue of *Life* magazine.

Equally controversial, but of considerably more lasting impact, were large group programs, personal development training programs in which dozens to hundreds of people would participate in a few hours to several days of intense experiential sessions. These were aimed at helping participants begin to discover what was hindering them from achieving their full potential and living more satisfied lives. Werner Erhard's *est* – an abbreviation of Erhard Seminar Training as well as Latin for “it is” – was the most widely publicized of these programs.

Although not overtly spiritual in aim, *est* resonated with some of the mind cure-inspired tenets that would also enter the → New Age movement. Taking responsibility for your life, in the *est* world view, included assuming responsibility for every event that one is part of. Even poverty, illness and personal tragedies were thus included in the sphere

of personal responsibility. As do many New Age texts, *est* claimed that each of us creates our own reality. The path to accepting the *est* philosophy – of “getting it”, to use the jargon of the movement – was to submit to a strictly scripted event that included considerable verbal abuse from the leaders as well as physical hardship.

Primal therapy rests on the belief that problems in the present can be traced back to the intense, traumatic sensory stimulation supposedly occurring at birth. This belief can be traced back to the theories of Freud's pupil Otto Rank (1884-1939), who developed the concept of the birth trauma in the 1920s. Generally speaking, psychoanalysts never accorded Rank's theory any greater credibility. It was, however, revived by the founding father of primal therapy, Arthur Janov (b. 1924). The concept of the birth trauma was in Janov's book *The Primal Scream* (1970) linked to a therapeutic method based on abreaction.

6. THE FATE OF THE HUMAN POTENTIAL MOVEMENT

The HPM proper lost much of its credibility with mainstream society after a period of almost faddish general interest in the late 1960s and early 1970s. Part of this disaffection with the HPM had to do with the growing critique against the movement. To judge whether this critique was justified or not is a normative exercise that will not be attempted here. It may suffice to note that the criticism typically followed a few lines of attack.

(1) One common objection to the aims of the HPM was that it fostered a narcissistic attitude. HPM therapies were accused of privileging short-term experience over long-term goals, individual indulgence over social concerns, and so forth. To counter such negative assessments, spokespersons for the HPM pointed e.g. at the attempts to create interracial encounter groups. (2) Another perceived problem had to do with the clients attracted by the often emotionally highly intense methods. Although aimed at improving the healthy rather than curing the ill, some of those who attended sessions at growth centers were too psychologically fragile to go through emotionally intense encounter groups or Gestalt therapy. Thus, several suicides took place at Esalen and other growth centers, generating serious doubts about the methods employed. (3) Related to this last theme were the misgivings concerning forms of bodywork, voiced by more traditional therapists. The emphasis on touch and emotionality thus raised concerns regarding the risk of creating overly strong bonds of transference and countertransference. It was

suggested that these bonds could be psychologically harmful. (4) The eclectic and academically unaffiliated nature of much of the HPM led to the proliferation of methods, some of which were highly unorthodox. Part of the critique of the HPM concerned this “anything goes” atmosphere, which was said to attract unqualified people to take on the role of therapist. A related criticism targeted the lack of clinical and experimental validation of many of the therapies on offer. (5) The perhaps most common criticism was that HPM therapies resulted in cathartic experiences and feelings of emotional breakthrough, the effects of which largely vanished once clients returned to their everyday lives.

Despite the massive critique against the perceived ills of the HPM, some of its manifestations have survived well. Certain aspects of the HPM have approached the norms of more traditional psychotherapeutic work. Modern gestalt therapy tends to focus on individual rather than group sessions, and has adopted methods that are less emotionally challenging to clients and therefore less focused on catharsis. Encounter groups are rarer, while their ideological ancestor, psychodrama, has fragmented into several different forms. Body therapies have proliferated, and have partly become more professionally established.

Arguably, however, the very fact that much of the HPM came under such heavy attack from the media and from academic psychologists led to its affiliation with countercultural and/or spiritual concerns rather than with more traditional forms of psychotherapy. The transpersonal elements of the movement were increasingly emphasized in the mid-1970s and beyond. Furthermore, certain facets of the HPM, especially in this radicalized and spiritualized form, came to share goals and ideas with the emerging New Age movement. Health was defined by the HPM in ways that prefigure a number of contemporary systems of complementary medicine. Rather than implying freedom from disease, as standard biomedical conceptions would do, health involves a broad spectrum of positive values such as creativity, vitality and spirituality. The focus of much of the New Age on radical personal transformation also has its precursor in the ideology of the HPM. The belief in the integration of mind and body, as well as the primacy of non-intellectual means of achieving this holistic vision, also unite the HPM and the New Age.

The specific methods of the HPM have also had their successors with appeal to the New Age milieu. The body therapy techniques developed by Reich and Lowen and their followers, and

described above, could involve emotionally and physically intense activities, including hitting, kicking, screaming, hyperventilation and painful manipulation of the muscles. In contrast to this approach are the considerably gentler methods of bodywork popular among New Agers, such as body harmony. Similar aims of contacting buried traumas through memories supposedly encoded in the muscular tissue are achieved through much milder forms of bodily manipulation.

Perhaps most visible in the New Age milieu are offshoots of the radical fringe of the HPM. Although largely discredited, primal therapy inspired a popular component of the New Age scene, rebirthing, a method of controlled breathing that is claimed by its practitioners to resolve physical and mental traumas, and even prevent aging. The manipulation of the physical body prevalent in the HPM has its radicalized counterparts in New Age theories that attempt to manipulate non-physical aspects of the body, be it the chakras or the aura. The regression therapies of the HPM are radicalized in New Age techniques that attempt to go back beyond birth to purported past lives.

Many later developments of various HPM methods have increasingly embraced religious themes. There have even been attempts to integrate the decidedly anti-spiritual Gestalt therapy of Fritz Perls with religious concerns. It is, perhaps, only fitting that one of the most direct heirs of the 1960s HPM is a religious organization, the Osho movement mentioned above. The movement's main center in Koregaon Park, an affluent suburb of Pune, India, resembles a 1960s and 1970s growth center. Visitors can combine their own palette of experiential workshops, including neo-Reichian therapies and sessions that are replicas of 1960s encounter groups.

Finally, it can be noted that some of the ideas of the HPM have managed to enter the cultural mainstream. A number of facets of contemporary culture, ranging from best-selling self-help books to business management training seminars, are at times based on ideals drawn from the positive view of our hidden potential and the practices typical of the HPM.

OLAV HAMMER

Huysmans, Joris-Karl (Charles-Marie-Georges),

* 5.2.1848 Paris, † 12.5.1904 Paris

One of the most celebrated novelists of the 19th century, Huysmans was baptized with the names Charles-Marie-Georges, but later in life adopted "Joris-Karl" as his christian name in acknowledgement of his father's Dutch origins. A civil servant, in the 1870s he publishes his first novels, abandons his family's Roman Catholicism and becomes a protégé of Emile Zola (1840-1902), the patriarch of French literary positivism. In 1884, Huysmans publishes his most famous novel, *À rebours*, and breaks with Zola. Regarded as the master of "decadentism", a neo-romantic, anti-positivistic literary school of the time, Huysmans is also interested in → spiritualism, → occultism, and the apocalyptic Roman Catholicism of his friend and fellow novelist Léon Bloy (1846-1917).

Another friend and novelist, Remy de Gourmont (1858-1915), has a lover called Berthe Courrière (1852-1917), who becomes Huysmans's guide into Paris' occult underground. Berthe tells Huysmans of her contacts with Father Louis Van Haecke (1864-1912), a Belgian priest whom she accuses of being the leader of an international Satanist ring. Huysmans decides to write a novel about → Satanism, and interviews among others journalist Jules Bois (1868-1943) and defrocked Lyon priest Joseph-Antoine Boullan (1824-1893). The latter was the leader of one among several rival branches of the Œuvre de la Miséricorde, a new religious movement founded by Bayeux visionary Eugène Vintras (1807-1875). Boullan's controversial rituals were a curious blend of Catholicism, sex magic and occultism; Huysmans regarded him as reliable, however, and echoes of Boullan's worldview are evident in Huysmans's best-selling novel *Là-bas*, a vivid portrait of French-speaking Satanism published in 1891.

Là-bas includes what was to become the standard literary depiction of a Black Mass, based on combined material Huysmans had received from Berthe Courrière, Bois, and Boullan. Paradoxically, this section of *Là-bas* (a novel intended to expose Satanism as evil) would be read as an how-to manual by later Satanists. It would also be used by Léo Taxil (pseudonym used by Marie-Joseph-Antoine-Gabriel Jogand-Pagès, 1854-1907), an imposter who would falsely claim to have evidence that Freemasons [→ Freemasonry] actually worship Satan in their lodges. Taxil would enjoy a certain popularity among Roman Catholics and other critics of Freemasonry until confessing his fraud in 1897.

It is *Là-bas* and his correspondence with Boullan and other characters of the occult fringe, that ensures Huysmans a place in the history of esotericism. This period of his life ends, however, in 1891, when Boullan dies and Berthe Courrière introduces Huysmans to Father Arthur Mugnier (1879-1939), who completes the novelist's subsequent conversion to mainstream Roman Catholicism. In later years, Huysmans would rarely speak about occult issues, and his subsequent itinerary would ultimately bring him into the field of French Catholic literature.

Huysmans defended *Là-bas*, however, as a novel that, although written by a non-Christian, could also be read both as a reliable documentary account of Satanism, and as a moral meditation on the power of evil. The assessment of the first claim depends on whether Huysmans's sources are regarded as reliable. Whether Father Van Haecke was in fact a Satanist, or a victim of libelous accusations by local enemies, or whether Berthe Courrière actually gave Huysmans real accounts of Satanic rituals or merely figments or her own imagination, are questions widely debated among Huysmans's biographers, and unlikely ever to be finally resolved. As for the second claim, there were those in the Catholic camp (including Léon Bloy) who finally accused Huysmans of exploiting spiritual themes for the sole purpose of producing best-selling novels. Others, however, including right-wing English author Robert Hugh Benson (1871-1914), claimed that they owed their conversion to Catholicism to *Là-bas*.

Be that as it may, the scarcity of sources about both 19th century Satanism in continental Europe and the Boullan movement makes Huysmans' novels and correspondence important references on these topics, although he was clearly writing as a novelist rather than as an historian.

COMMUNITIES?) 4. CONCLUSION

1. INTRODUCTION

In Gnostic [→ Gnosticism] and Hermetic [→ Hermetism; → Hermetic Literature] documents there are passages which can be classified as hymns and prayers, either directly (that is, quoted as such within the documents) or indirectly (that is through allusions to celestial and earthly beings praying or singing hymns). The tendency, both Gnostic and Hermetic, to appropriate and re-use traditional material of this type, is well documented. It can also be noted that, generally speaking, even the Gnostic and Hermetic "production" of hymns and prayers, when not actually drawn from earlier sources, seems in any case to be strongly influenced by other contexts. If, then, there is a tendency to depend on forms and sometimes even on content taken from other traditions, it is characteristic of Gnostics and Hermetists to be absolutely original in re-elaborating the borrowed material. They inserted it into their own religious perspectives, with meanings and functions that are completely idiosyncratic. This process is especially evident in cases where prayers or formulae of Gnostic and Hermetic literature are also attested unequivocally in other religious traditions: their re-use involves a radical re-reading and change of function within the typically Gnostic and Hermetic concepts of the relationships between the human and super-human realms.

It must be considered highly likely that an extensive and organised repertoire of prayers, hymns, invocations, litany formulae or specific expressions circulated to some extent in late antiquity. From time to time, this repertoire was appealed to in various religious contexts, which were undeniably similar in a series of aspects but still presented their specific ideological and traditional frameworks as well: from Gnosticism to Hermetism, from the complex ideology underlying magical papyri to Jewish and Christian circles. We are dealing here with a dynamic and fluid process in which adoption of common liturgical formulae did not necessarily imply the acquisition or acceptance of the same doctrinal horizons. Adapting these elements to a new context was in fact an effective means for Gnostics and Hermetists of distancing themselves from others and affirming their own originality.

In the light of all this, it will be clear that also in Gnostic and Hermetic studies, any attempt at an accurate identification and classification of prayers and hymns meets with many difficulties, since from the perspectives of terminology and form, sources of varying provenance were used; this is true for the formulation of the hymns and prayers and for the reflections on them. On the other hand, a specific aspect of the milieu discussed here can be noted: these prayers seem in fact to form a functional part of the experience of knowledge of gnosis which, in different forms, marks both the Gnostic and the Hermetic system.

2. GNOSTICISM

Both the direct Gnostic documentation provided by the Nag Hammadi Library and the documentation which has reached us through Christian heresiologists, are rich in expressions and images with respect to doxology, eulogy and hymns. These elements are sometimes so closely intertwined with the rest of the respective documents that it is difficult to determine whether they really are hymns or simply passages of "poetic prose". Serious research is hampered by the very nature of the documents, which are not conditioned by the need to set out a doctrine in a systematic way and, in particular, almost never provide explicit ritual elements and religious practices. In most cases, when prayers or hymns can be identified, we find them partially or completely without an adequate context. One is therefore forced to reconstruct the picture as a whole indirectly (and even this is possible only in a few privileged cases), and with results which, for that very reason, cannot claim to be either certain or unambiguous.

Historians of religions have thoroughly studied the phenomenon of prayer, for which they have

proposed various formal classifications. These are based, for example, on the dynamics of the relationship between speakers, or on the structure and nature of the communication (who is praying, what is being prayed for, how does one pray, where does one pray, why does one pray, etc.). Due to the nature and limitations of our evidence, it is difficult to apply such a classification to Gnostic and Hermetic material. Sometimes it is possible, however, to perceive well-known formal and functional distinctions, which we will attempt to document here. This is true, for example, in the case of some texts in which prayer is closely linked with the dimension of “repentance”: in such cases one can speak of prayers of petition.

A. PRAYERS OF PETITION

In the case of Gnosticism, this type of prayer is closely linked to the existential condition of the “pneumatic seed”, that is of that divine spark imprisoned in man which longs to return to the divine plane from which it fell and therefore invokes the supreme god to come and save it. In our documentation, the prayer of petition of the Gnostic (that is, of the one who is aware of living in this world but of belonging ontologically, in respect of his true “self”, to the divine plane) is projected into a mythological dimension which is its foundation and at the same time its prototype. This is the case in the *Exegesis of the Soul* (NHC II, 6) which relates the events of the prototypical soul that has moved away from the Father and, after experiencing every kind of abuse and sexual violence in the material world, repents and invokes him to set it free from that slavery. This document belongs to a “primeval” Gnosticism which reflects the passage from a Platonizing psychology to a full Gnostic religiosity. The prayer of petition comprises three parts: the invocation of the Father, the recalling and confession of the fall, and the final entreaty for salvation. To the same category (although inevitably with some disparities) belongs the prayer of Sophia, who also repents of her rebellion against the Father, to whom she turns to be set free from the material world and its evil demiurges (cf. *Apocryphon of John*, II, 13, 32-14, 6 and parallels; Irenaeus, *Adv. haer.* I, 2, 3-4; Hippolytus, *Ref.* VI, 30-32; *Pistis Sophia* I, 32-67). Moving from myth to anthropology, the Gnostic prayer of petition seems to be very closely connected to the moment of consciousness, that is to say, the moment when the Gnostic becomes fully aware of his own real essence. This becoming conscious is also marked by the rejection of material reality and the entrance into the “current” of salvation (cf. *The Book of Thomas*, NHC II, 138, 1; 145, 19). It should be

observed that the same prayer, even if formulated and recited in the dimension of reality, does not really belong there: it is inner prayer, completely spiritual and recited by the spirit which, in the view of the Gnostics, is ontologically the same as the divine plane. Thus, for the person praying, the prayer of petition is the expression of his break with the material world and of his own aspiration for salvation.

B. PRAYERS/HYMNS OF THANKSGIVING

Besides the prayer of petition there is another type which can be defined as prayer or hymn of thanksgiving: an expression of joy about the gnosis obtained and the salvation reached as a result (cf. *Exegesis of the Soul*, NHC II, 134, 15-25; *Gospel of the Egyptians*, NHC III, 66, 22-67, 22 = NHC IV, 79, 3-80, 8; *Pistis Sophia* II, 68-76). This type of prayer occurs in various ways in our documentation. In the enthusiastic situation of praise, even heavenly beings can sing hymns and prayers: in the *Apocryphon of James* (NHC I, 15, 5-23), in the context of an ascension, James and Peter hear the prayers of praise and the hymns of rejoicing of the angels; in *On the Origin of the World* (NHC II, 105, 20-106, 3) there is a reference to an angelic church in perpetual prayer of praise; the *Letter of Peter to Philip* (NHC VIII, 136, 1-7) mentions the cosmic powers which, by mistake since they do not know the supreme god, send their prayer to the Autohades; in the *Trimorphic protemma* (NHC XIII, 38, 22-30) the prayer of praise of the celestial Aeons is quoted. It is very likely that in all these references to a heavenly liturgy there is a projection to the extra-human level of the actual community of Gnostics who, just like the angels and superior powers, send prayers to the heavenly beings and to the supreme god.

C. HYMNS OF SELF-PROCLAMATION

In the Gnostic hymns the celebration of a particular character can occur in the form of self-proclamation, according to a model which to a high degree concurs with that of the “pagan” aretalogies, in which the god introduced himself enumerating his different attributes and numerous functions. The *Apocryphon of John* (NHC II, 30, 11-31, 27 and the parallel version NHC IV, 46, 23-49, 9) presents a self-proclamation by Pronoia who describes her repeated interventions to bring gnosis into the material world. A hymn on Eve, recited in the first person, is documented in *On the Origin of the World* (NHC II, 114, 7-15), whereas a hymn of Jesus is found in the *Second Apocalypse of James* (NHC V, 4-49, 5-15). The treatise *Thunder, Perfect Mind* (NHC VI, 2) is a complete self-

proclamation of a female being; in the *Trimorphic protenoia* (NHC XIII, 1) the three different forms in which the heavenly redeemer descends are introduced by the same number of self-proclamations. The *Psalm of the Soul* ascribed to the Naassenes by Hippolytus (Hipp., *Ref.* V, 10, 2), certainly belongs to this context. In it the divine intermediary principle, here represented in his saving function and identified with Jesus, implores the Father to send him to earth and set free the soul which has become lost and so is unable to find the way back to the divine. By going down into the material world he will bring to the soul 'the mysteries of the holy way', gnosis in particular, so that it can set itself free. But the hymns can also be used to express through their poetic language visions otherwise ineffable, such as the cosmological picture described in the psalm of Valentinus (Hipp., *Ref.* VI, 37, 6-7).

D. BAPTISMAL AND EUCHARISTIC HYMNS AND PRAYERS

In some cases there is some evidence that prayers and hymns of praise and petition are connected to community-type practices, of which the heavenly liturgy is a projection. More specifically, they seem to be connected with the practice of baptism. In the *Gospel of the Egyptians* the two final hymns refer to this praxis. The first of the two hymns (NHC III, 66, 8-22 // NHC IV, 78, 10-79, 3) is addressed to a pleromatic deity and comprises six invocations alternating with an acclamation, in which there is a large number of vowel sequences interspersed with names and formulae in Greek. The addressee of the hymn is connected with the five seals, which are fundamental to the baptismal praxis. The liturgical nature of the text is emphasised by the fact that it is spoken by a collective "we", indicating that the hymn was recited or sung by a soloist whose acclamations were repeated by the whole assembly. The second hymn (NHC III, 66, 22-68, 1 // NHC IV, 79, 3-80, 15) is recited by an "I" to a "you" (sing.). It seems clear that the person who is praying praises the deity for the state he has attained: it is a praise expressed by an individual who has acquired gnosis and so has attained salvation. The hymn probably had to be recited during a ritual act that marked the individual's entry into the Gnostic community. This ritual act must have been accompanied by certain gestures. Probably the first hymn was sung during or immediately after the baptism, whereas the second was recited by the initiate. In the treatise *Trimorphic protenoia* there is a list of beings recited by Protennoia (NHC XIII, 48, 11-35); although not a hymn in the strict sense, it is close to it in structure. It has five

strophes, with an introduction that connects it with the rest of the document. In each strophe three heavenly functionaries are mentioned by name, followed by a description of the saving act performed by them.

In the treatise known as *Melchizedek* (NHC IX, 1) two hymnal sections can be identified. In the first (14, 15-18, 7) the mythical priest raises a prayer of joy, giving thanks for the salvation obtained through gnosis. The utterance of his name seems to be connected with a baptismal context. It is obviously a litany hymn, but it cannot be determined whether it was recited by the community or by a single initiate. In the second section (5, 24-6, 14) there is, on the other hand, an invocation pronounced by an angel. The hypothesis has been put forward that whereas the one being baptised is identified with Melchizedek, the mystagogue can be identified with the angel. The hymn of praise contained in 16, 16-18, 7 follows a pattern marked by the *trishagion*, followed by the title of the being invoked and its name; this structure is also found in 5, 24-6, 14, but then without the *trishagion*. There is also a *trishagion* in the *Untitled Text* of Codex Brucianus, ch. 7. *Zostrianus* (NHC VIII, 6, 5-30) recites a hymn of praise which the protagonist sends to the powers after the baptism in the name of Autogenes: in this case also there is the pattern of a title followed by a name or a name followed by a title.

In the Sethian Gnostic treatises marked by baptismal praxis the prayer of praise thus assumes peculiar characteristics: it is addressed to pleromatic and non-pleromatic beings all of whom are connected with baptism, it is uttered in the form of a litany, and accompanied by titles and names. At the same time, the content of this litany is firmly connected with the mythology underlying the document or the tradition with which the hymn itself is connected. In fact there is not always a perfect match between the religious system to which the hymn belongs and the system of which the hymn is an expression. The actual structure of the hymns is liable to vary: sometimes they are an expression of praise, sometimes a request, and sometimes a profession of faith. Also, the beings involved are not always the same: only some of them recur with a certain regularity and suggest a specific liturgical tradition, whereas the unsystematic presence of others raises important questions about their origin and role. It is likely that there were lists of them.

The doxological prayers recorded in NHC XI, 2 *On Anointing* and *On the Eucharist* (40, 1-29 and 43, 20-38) derive from a sacramental context of a Valentinian type, whereas the three prayers which

comprise the treatise *Three Steles of Seth* (NHC VII, 5) must be considered as hymns which accompany the three different levels of mystical ascension. In the *Oration of Paul* (NHCI, A, 1-B, 10) the aim of the prayer of invocation is the mystical elevation of the Gnostic, here represented by Paul, who in this way succeeds in penetrating the divine mystery.

E. INVOCATIONS OF HEAVENLY BEINGS

The *epiclesis*, that is, the invocation of the beings by name, has some interesting parallels in primitive Christianity, which also attests the request for help in a baptismal context, in order to place the initiates under the protection of the beings invoked. Also *nomina barbara* and various sequences of vocals belong to this context. The multiplication of the intracosmic and pleromatic heavens in Gnostic cosmology allows the number of beings living in them to be expanded almost to infinity. Whereas the beings of the intracosmic realms, such as the heavenly Archons, are totally aggressive and negative, the pleromatic beings are beneficial, able to assist the Gnostic who starts on the path of faith and to support him during the whole journey of salvation he has to complete. In the *Pistis Sophia* IV, 136, the ritual prayer spoken by Jesus after his resurrection is marked by vocalizations and mysterious names, and occurs in a context in which the spatial orientation of Jesus and his disciples seems to play an important role. On the other hand, the presence of *vores mysticae* and of vocalic sequences in hymns and prayers reveals the interest the Gnostic had in invocations of a “magical” kind. Many of the names invoked, in fact, as well as the series of vowels, are common to the repertoire of the magical papyri. There, access to the deity is permitted only through knowing his “names”: they represent the deity itself and should not be revealed to anyone. Originally only the gods knew these names, and actually they do not belong to human but to divine language. The secret language also uses secret formulae, vocalic sequences, palindromes, combinations of letters and numbers, “foreign” languages, or animal language. Thus in Gnostic circles these elements are evidently appropriated but they are given a new function within a different religious system. Gnosticism undoubtedly shared with the world of religious magic the need for contact with the divine through a “different” language (mysterious words) and a knowledge – to some extent “secret” – of the names of the beings invoked (*nomina mystica*) and of the system of interrelationships between the various cosmic levels (vocalic sequences understood as symbols of the planets).

F. SUMMARY

From this mass of evidence it emerges that Gnostics made wide use of prayers and hymns which were strongly influenced by (if not indeed adopted from) both the Jewish and the Christian world, as well as the “pagan” tradition in the widest sense. The Odes and Psalms of the Old Testament are widely used, as is also the model of the *trishagion*, and the use of a terminology comes very close to Jewish and Christian usage. But equally, prayers and hymns occur which are strongly influenced by magic literature. There are also two syncretistic “pagan” hymns to Attis that in the context of the Naassenes form the starting point for doctrinal speculation (Hipp., *Ref.* V, 9, 8-9). The use of mystery language is not in itself evidence of a doctrine shared with the mystery cults, since this terminology was in fairly common use in the religious languages of late antiquity.

3. HERMETISM

Hermetic prayer shows the same tendency to make use of various sources, and the presence of elements taken from different religious contexts is also evident. As with Gnostic prayer, here too one should consider a special process of reinterpretation of the material used.

As is well known, enlightenment and the resulting rebirth form the centre of Hermetic experience. The acquisition of that state by an individual entails, on the one hand, a complete vision of the divine world and, on the other, a transformation of the initiate, also in ethical and intellectual respects. He is said to attain a state of repose where he dedicates himself to perpetual praise of God. One of the privileged tools to attain Gnosis consists precisely in prayer, through which the *mystes* succeeds in establishing a relationship and communication with God.

A. THE CLOSING PRAYER OF THE POIMANDRES

At the end of the Hermetic treatise known as *Poimandres* (CH I, 30-32) a prayer is recorded which undoubtedly refers to themes presented in the treatise. In terms of structure it comprises a sequence of sayings preceded by the adjective “Holy”, which in turn can be subdivided into three groups of each three praises: in the first, God is addressed in the third person, in the others, in the second. This hymn is followed by the offering of a spiritual sacrifice, a petition, a profession of faith, a blessing and a conclusion. The Jewish inspiration of this prayer is evident in the use of sayings preceded by “holy”, the oldest antecedent of which is the *Sanctus* of Isaiah (*Is.* 6, 3), re-written in an

apocalyptic context, which is attested both in Jewish and early Christian liturgy. In the introduction to the prayer and in the petition there are allusions to the *Shema* (*Deuteronomy* 6, 4-5). Moreover, certain expressions of the Hermetic *Sanctus* have equivalents in the eighteen *berakoth* (blessings that have to be said three times a day), especially the *Yotser* (the morning prayer) of the Jewish liturgy and at the same time form part of the blessings which precede the *Shema*. Other parallels can be identified in the prayers said at morning and evening by the Therapeutae, as attested by Philo (*Vita cont.* 27. 89). In addition, attention has also correctly been drawn to parallels with the “instruction” genre of Egyptian tradition, with Greek philosophical sayings as well as with a series of possible contributions from the Christian liturgy. The invocations stress the generative role of the deity and his connection with man. God carries out his will through the powers whereas gnosis is the qualifying element of the link between God and “his own”. The offer consists of “pure rational (= spiritual) sacrifices” and marks the process of spiritualization of sacrifice, also documented in literary texts and “pagan” philosophers and in Jewish and Christian sources. The petition made is for remaining in the state of gnosis, followed by a profession of faith and finally the blessing and statement of the wish to share with God in the work of sanctification. In CH V 10-11, there is also a prayer at the end of the treatise, which is a celebration of the absolute essence of God.

B. HYMNS OF REBIRTH

The prayer contained in CH XIII 17-19 rehearses the experience of rebirth previously undergone by Tat. In the hymnal section are invoked the various powers which are within the *mystes*, followed by an offering of spiritual sacrifices (a speech offering) and a conclusion. The reference in the document to eulogy as an already codified formula which the *mystes* wishes to know, and the information on the ways in which it has to be recited (orientation, gestures), speak in favour of a ritual defined as and forming part of a type of initiation. Of special interest is the comparison with the morning and evening prayers in Greek religion. The hymn that is spoken at the end of the rebirth is in fact sung by the powers that have penetrated the *mystes*, defined as the instrument through which the *logos* sings. The spiritual sacrifice referred to is the prayer itself which results in the *mystes* finding “repose”, peace.

Other interesting evidence on Hermetic prayer comes from the library of Nag Hammadi. In the *Discourse on the Eight and Ninth* (NHC VI, 52, 1-63, 32), the disciple, who by now is ready to reach

the Ogdoad and the Ennead, is requested by Hermes to pray: they will pray with mind, heart and soul (53, 12). The following prayer by Hermes is characterised by the glorification of God’s power, by vocalic sequences and by the request for vision (55, 4-57, 25). Then the disciple also receives the vision through silent prayer. His vision has to be kept secret, while the *mystes* continues to praise god incessantly for the rest of his days. It is a prayer requesting divine intervention, which has the structure of an invocation to god through his functions, a series of voces mysticae and of vocalic sequences, a petition and finally an offering, which in this case also consists of spiritual sacrifices. Here too there is an allusion to the *Shema*, while mysterious names and sequences of vocals connect the document with the world of the magical papyrus. The idea that the life of the enlightened takes the shape of a continual hymn of praise goes back to Stoicism and Judaism (cf. Epict., *Diss.* 1, 16, 15-21; Philo, *Heres.* 200).

In the *Prayer of Thanksgiving* (NHC VI, 63, 33-65, 7), the persons who are praying thank the deity who has granted them his love and given them some gifts (*nous, logos, gnosis*). It is a prayer of praise for the gnosis obtained, to which those who are praying ask to remain faithful. An intervention by the redactor at the close of the prayer portrays those who are praying as now turned towards pure nourishment without blood. It is interesting to stress that the *Prayer of Thanksgiving* is also found at the end of the *Asclepius* and in the Papyrus Mimaut. Probably this is the result of independent circulation.

C. BACKGROUNDS

The structural similarities that can be discovered between the various prayers (the sequence: offering, petition, profession of faith, conclusion in CH I and CH XIII, or the same sequence of formulae in CH, I 31 and the *Eight and Ninth*, NHC VI, 6 56, 15-17) pose the problem of whether the Hermetists used common sources, not necessarily Hermetic, or whether these similarities derive from making use of the same liturgical model.

As for the parallels with other religious traditions, there is the reference to heavenly hymn singing in the *Eight and Ninth* and CH I. The idea of human singing based on the singing of the heavenly powers is present in Jewish apocalyptic literature and is common in Christian liturgical texts. The theme of “spiritual sacrifice” goes back to Jewish and Christian milieus, an expression that in pagan contexts has an equivalent only in Hermetic texts, in some of which it simply means prayer. Of interest for comparative purposes is

the Egyptian Christian anaphora attested in *P. Strasb. Gr.* 254, one of the oldest occurrences of an anaphora, where spiritual sacrifice does not mean the sacrifice of Christ but the offering of prayers of thanksgiving. When Jewish liturgical material was transferred to the Christian liturgy, it remains difficult to determine from which of the two traditions elements of Hermetic prayers were taken. The life of the enlightened as a continual hymn of praise to the deity is a Jewish and Stoic motif. Hermetism shares with Platonic theurgy the idea that certain cultic acts, including prayer, allow the soul to complete its ascent towards the divine realm. As for the use of formulae, expressions and “mysterious” names widely attested in magical papyrological literature, the same comments apply as for Gnosticism: this material is only used after being reshaped to make it suitable for new religious meanings.

D. HERMETIC COMMUNITIES?

The role of prayer in Hermetism can be understood only in close connection with the problem of whether or not there was a Hermetic community in the strict sense. In other words, whether Hermetic practices actually existed or whether the documentary material is to be considered as a purely literary phenomenon without any ritual background (see also → Hermetism). The question still remains open, and in the past the opinions of scholars have oscillated between two extremes: on the one hand the hypothesis that a Hermetic community did exist, and on the other the hypothesis which denied the existence of Hermetic communities in the strict sense. Recent studies, while accepting that the treatises do not describe a specific historical and sociological reality, are inclined to consider them as a phenomenon which is not exclusively literary. In particular, there emerges from them the picture of one or very few disciples gathering closely around a master who transmits to them his teaching by word of mouth. The transcripts of these lessons have enabled the teachings to pass beyond the confines of these restricted circles. These written documents, which comprise a tradition parallel to the oral tradition of teacher to disciple, were considered “sacred” and therefore were kept secret. Study, instruction, dialogue, prayers, and hymns, all ultimately create a deep bond between master and disciples, who feel themselves to be part of a tradition and in a wide sense of a community. But a situation like this is extremely fluid and tied to the charisma of a single master. On the other hand, the existence of “communities” linked in some way to prayer emerges in allusive form from the documents: in the *Eight and Ninth*, initiation seems to

take on a communal dimension through the reference to “brothers” who welcome the *mystes*. In the *Asclepius* spiritual prayer develops in a temple context and according to specific times and positions; it follows a structure and is recited by several persons, and thus appears to be a complex liturgical act. There is also evidence for cultic practices in CH XIII, where Hermes supplies Tat with certain instructions about the position and orientation regulating recitation of the prayer.

Gnostics and Hermetists connect prayer with enlightenment, either conceived of as a sign of conversion, understood both as “repentance” and as initiation, or considered instead as an expression of joy for the salvation which has now been acquired. However, for neither Gnostics nor Hermetists can one speak of organised churches, and the liturgical practices attested in some documents cannot be applied to all the “communities”, not even to those which seem to be close to each other (among the Gnostics, for example, the Valentinian [→ Valentinus and Valentinians] or Sethian [→ Sethians] circles) since the differences at the doctrinal and liturgical levels make such generalisations difficult. In particular, the link between prayer and baptism, which emerges more or less allusively and only in a few Gnostic documents, has almost no equivalent in Hermetic literature. An exception is CH IV, 4 where, according to Hermes, god says to the human hearts to immerse themselves “in the mixing bowl”. There also exists a letter (4th cent. C.E.) written by a devotee of → Hermes Trismegistus in which he speaks about ‘the inexorable water of the god Hermes who protects’.

It is precisely this lack of specific information concerning the existence and operation of Hermetic circles, due to the very nature of the documents which have reached us, which makes it difficult to reach conclusions about the contexts in which the prayers and hymns were recited. In some cases they seem to be the result of personal devotion, in others they appear to have liturgical functions within circles of devotees. In Hermetism, at the highest levels of the initiation process, oration becomes internal and silent prayer, whereas in Gnosticism in some cases we find the paradox that the devotee, once he has reached the dimension of “perfect”, no longer needs to pray.

4. CONCLUSION

If prayers and hymns seem to be widely documented both in Gnostic and Hermetic sources, a salient fact that is immediately obvious is the extreme variety of documentation. The common elements, which are also present, do not however allow a “typically” original Gnostic or Hermetic

structure to be identified. Rather they seem to be the result of the recovery and reinterpretation of earlier or contemporary models, in terms of both language and theological content and perhaps also with respect to certain cultic acts. These processes of reinterpretation occur in milieus – and this applies to both Gnosticism and Hermetism – which in themselves exhibit extremely fluid outlines. The result of all this is that it is not possible to speak of Gnostic and Hermetic prayers or hymns except in rather general terms. A more correct and fruitful approach is to study, one by one, the references to hymns and prayers documented within each of the texts, with particular attention to the ideology – in form and substance, “original” or received – which they express.

"I AM" Activity

The "I AM" movement was launched by an American couple, Guy Warren Ballard (1878-1939) and Edna Anne Wheeler Ballard (1886-1971). They had both shown a long-time interest toward occult literature. Guy Ballard had become a medium himself even before his marriage in 1916 and apparently 'practiced spiritualism in Chicago for a number of years' (Braden). According to some sources, the Ballards were familiar not only with Theosophical literature, but also with Christian Science, Unity, the Rosicrucian Order A.M.O.R.C. [→ Rosicrucianism III] and some other teachings. While their message reflected the likely influence of some of those teachings, they worked them into a unique synthesis, which in its turn would influence the beliefs and practices of younger movements.

Guy Ballard claimed to have met a representative of the Great White Lodge, the Ascended Master → Saint Germain, in 1930, on the slopes of Mount Shasta in Northern California. Ballard reported his experiences in his first book, *Unveiled Mysteries*, written under the pen name of Godfré Ray King. He presented this meeting as the beginning of a number of extraordinary experiences inside and outside of Ballard's physical body, allowing him to gain knowledge of past incarnations and learn to master "Projected Consciousness". It was explained to Ballard that a group of Highly Evolved Beings 'work ceaselessly helping the humanity of our earth to become Perfected men and women, and enable them to manifest in their outer lives the same great Perfection and Dominion as did Jesus Christ'. Humanity had 'manifested Perfection in every way' in ages past, but subsequently 'man became sense-conscious, instead of God-conscious'. Now is the time of entering a New Dispensation, which will allow more rapid progress. America will be the heart center of the approaching "Golden Age". The movement has a decidedly patriotic orientation, and the special place given to America is reflected by the presence of the American flag in "I AM" places of worship even outside of the United States.

"I AM" is God's Presence within each human being – that component of the human being which was created in the likeness of God. Jesus came upon this earth in order to show the way, and his miracles were nothing more than God's law put into action. Through the power of the "I AM" inside man, humanity is able to find the way. "Ascension" is the goal of every human incarnation. The spread-

ing of the "I AM" teachings is said to allow many more people to make their Ascension than in times past, and these teachings will remain authoritative for the next 10,000 years. The Ballards were chosen as the only "Accredited Messengers", until the time when Jesus and other Masters will visibly manifest themselves. The Ballards, too, became great Cosmic Beings after their own Ascension, once they left their bodies; and already during their lifetime they were presented as reincarnations of such famous figures as George Washington (Guy) and Joan of Arc (Edna).

The Ballards apparently organized their first classes as early as 1930, the messages began to be released in 1932, and the Saint Germain Foundation (the corporate expression of the movement) was created the same year; but the real launching of the movement took place in 1934, when the book *Unveiled Mysteries* was published. The Ballards rapidly awakened a strong interest, and as early as 1935 they were teaching classes in auditoriums seating six thousand people. But they met with opposition as well, and in 1939 this led to the adoption of a system of closed classes instead of public meetings. After World War II, the movement began to spread beyond America; except for a small group already established in Glasgow, it first set foot on the European continent in Switzerland in 1946, and from there spread to other places.

The members of "I AM" do not only study the sacred books of the movement and the numerous dictations from the Masters received by the Ballards. They also have characteristic practices like the repetition of "affirmations" and "decrees". Affirmations are 'sentences that affirm the individual's attunement to God and the blessing due to the person as a result of that attunement' (Melton). Decrees have been described as a 'counterpart of prayer – but its spirit is not that of prayer in its Christian sense. It is not supplication; it is demand – or command' (Braden). According to Melton, the practice of decreeing can be traced at least in part to some practices of → New Thought. There are decrees for all kinds of occasions; they could be seen as involving the members in a kind of spiritual army in the cosmic fight against the black forces. Decreeing is supposed to have power to influence secular developments as well: for instance, it was claimed that the Munich peace agreements in September 1938 had been a result of the collective efforts of "I AM" students, and that the latter were able through their spiritual activity to protect America from war.

Beside Saint Germain and Jesus, there are dozens of other Masters known to "I AM" members, such as Lord Maitreya, Hercules, Archangel Michael, Arcturus, Astrea, Quan Yin, Helios, and Diana. These names reflect the eclecticism typical of "I AM". The role attributed to the Masters is reminiscent of modern Theosophy [→ Theosophical Society](the names of some of the Theosophical Masters also appear in "I AM") as well as of the books written by Baird T. Spalding (1872-1953), who had published the first volume of his *Life and Teachings of the Masters of the Far East* in 1924. Masters Morya and Kuthumi, of Theosophical fame, were familiar to the Ballards, but through them, these masters made statements allegedly confirming that "I AM" offered a much more developed message than → H.P. Blavatsky's. Thus in the 1930s, Morya and Kuthumi explained (according to the Ballards) that 'Our Beloved Saint Germain has accomplished more in three years than We did in the many years of Our humble efforts'. "I AM" has been quite adequately described as 'a thorough [American] indigenization of the Theosophical experience': 'The Masters are found not in faraway Egypt or Tibet, but also in the then romantic American West' (Ellwood).

While the "I AM" Activity was quite careful to keep control over its teachings and maintain orthodoxy, refusing any mixture with other teachings or messages from other sources, its pretensions to exclusivity and purity could not prevent some followers from longing for more "dictations". Other people eventually claimed contact with the Masters, and launched their own movements, such as the Bridge to Freedom (and its several subsequent offshoots) or the Church Universal and Triumphant (→ Summit Lighthouse). Thus, today there exist a number of movements or informal circles derived from the "I AM" lineage. Traces of "I AM" influences can also be found in many contemporary occult publications, often revealed by an emphasis upon the "Violet Flame" or other typical "I AM" themes. In addition, Ballard's reports on his encounters with visitors from Venus have obviously exerted influence on some subsequent UFO groups [→ UFO Traditions], especially those allegedly in touch with the Commander of the fleet of spaceships of the "Galactic Federation", Ashtar Sheran. Despite its lesser impact as an organization compared with what it used to be earlier, the influence of "I AM" should not be underestimated. It appears that several teachings of the movement have become incorporated into the common

mythology of the alternative religious milieu. This means that, even if the movement would continue to decrease, its doctrinal influence would still survive and spread.

The literature of "I AM", such as *Unveiled Mysteries*, *The Magic Presence* and *The "I AM" Discourses*, is published by Saint Germain Press (Chicago).

JEAN-FRANÇOIS MAYER

Iatromathematica

The term Iatromathematica was derived from the title of a Greek Hermetic treatise, well known in medieval latin translations; in a broader sense it refers to "astrological medicine" (i.e. the medical science which subordinates clinic observation and therapeutic praxis to the scrutiny of the stars). The theory of Iatromathematica is founded on several philosophical assumptions. The most obvious one is the so-called "material causalistic" assumption, which is already apparent from the opening words of the *Iatromathematica*: 'The rays of the seven stars are interwoven in the human limbs'. The stellar rays are thought to carry the four Aristotelian qualities of hot, cold, dry and moist, as well as some other quintessential qualities, thereby affecting the human body, either directly or, more rarely, through the air. A much more emblematic assumption is the Platonic one according to which the universe is a "Living Creature" (as in Plato's *Timaeus*) whose limbs move in co-ordination, so that a single movement reflects all the others. According to this assumption, the stars are not to be considered the

cause of sublunar occurrences, but rather a sign of them, as well as a sign of physiopathological processes.

This branch of → astrology makes it possible to approach the unobservable processes that take place inside the human body. A merciful God gave humanity a key to the understanding of these phenomena, i.e. scrutiny of the material world and, in particular, of its noblest part: the heavens. In this way, Christian thought offered a justification to the prelogical intuition which established a correspondence between heavenly movements and phenomena and earthly occurrences, with particular reference to the structure of the human body. On the basis of this conception, postulating the existence of a relationship between macrocosm and microcosm, stars and heaven represent a pattern for the formation of the human body: they are a text of which our body is somehow a translation. In addition to the idea of the stars being either the material cause or the representation of physiological events, “astrological medicine” was founded on yet a third conception, which may seem highly elusive from a metaphysical point of view, but which is indeed crucial for the topic in question. This conception, based both on hermetic works of a religious nature (*Poimandres* and *Asclepius* are the most obvious examples) and on astrological works, states the existence of a so-called “control relation” between the stars and the earth, i.e. the dependence of earthly events on heavenly events, in the same way as in the sphere of politics the subjects’ actions depend on the monarch’s. The events in question are considered to be of a sympathetic nature, in the sense of a subordination to the authority of superior entities.

The language of astrology indeed makes extensive use of political metaphors (such as *ducatus*, *imperium*, *regimen* and the hermetic διοικητής) in order to refer to a relationship of dependence which is neither material causality nor semiologic co-ordination; the latter assumption plays a fundamental role in stating the dependence of various entities (e.g. towns, territories, plants, animals, body organs) on the stars. All the above-mentioned natural-philosophical conceptions result in a confusing medley which may be defined as the “medico-astrological” tradition. While in the Hippocratic collection the (rare) references to astronomical observations concern solely the concomitant rising of stars and pestilential winds, the early medico-astrological treatises (some of which were ascribed to Hermes) already deal with the most typical fea-

tures of this scientific-literary genre. An illuminating example is found in *De decubitu*, a treatise ascribed to Galen and going back to late Antiquity: ‘If someone gets ill while the Moon is in Aries and in configuration with Mars or the Sun, the illness, caused by the heat of the Sun, will start from the head: the patient’s meninges will begin to ache and he will suffer from persistent insomnia and fever. In this case, it will be useful to cool the patient’s body and to draw blood out of it; otherwise he will suffer from delirium and phrenitis’. In this example there is a clear concomitance of analogical factors of symbolical nature linked to the “control relation” theory (such as the connection between Aries and the head), and of causalistic factors (such as the heat of the Sun). The properties of any single season (e.g. spring is hot and humid, summer is hot and dry) were considered to be related to and caused by the stars of the zodiac. Zodiacal signs were therefore thought to influence the environment and consequently the health, as well as control the humours qualitatively related to them: for instance, the blood, humid and hot, was supposed to “explode” (a process called “exaltation” in the language of astrology) in spring. Again, zodiacal signs were also thought to exert a continuous control over the body organs and parts, in conformity with a manifest analogical schema: Aries controls the head, Taurus the back, and so on.

As a consequence, a great number of pathological events typical of springtime were ascribed to a blood-surplus in the head and to the consequent difficulty of refining it – according to the physiology of the time – into a crystal-clear nerval fluid; hence the phenomena of torpor, sopor, and episodes of psychomotoric difficulty. The entire medico-astrological corpus lends itself to an interpretation based on the above-mentioned theory. Some treatises were devoted mainly to diagnosis, others either to therapeutics or to prognosis. As for the latter, any causalistic interpretation was hardly plausible, since the connection between the critical phase of the illness and the heavenly movements (in particular lunar movements) had a statistical basis at best, and a numerological one at its worst. Diagnosis was a more intricate matter, as it was closely related to the scrutiny of the patient’s constitution, which was in turn to be traced mainly from the horoscope: the stars rising at the moment of a child’s birth were thought to “impress” their qualities on the newborn’s body – hence the prevailing temperament, e.g. phlegmatic if cold and moist

were the dominant qualities, melancholic if hot and dry were prevailing. The link between individuals and stars was an continuous one, and as such it did not vanish after the child's birth: the limbs and the organs were to be influenced throughout a person's life by a given zodiacal sign, and this was the case with any person subjected to the influence of the same sign. Even the effectiveness of therapeutical drugs was based upon the atemporal linkage between their botanical components, the stars and the zodiacal constellations: the right moment for the drug-intake was established on the basis of scrutiny of the stars. As for surgery (especially phlebotomy), it could be performed only under favourable astrological conditions, which took into special consideration the influence of the moon on the blood and the other humours.

Iatromathematical treatises of the Middle Ages and the Renaissance were of a technical and practical nature, as they lacked any speculative foundation. On the whole, important medical writers imbued with astrology as → Peter of Abano or → Roger Bacon offer little, if any, scientific elaboration of astrological medicine as such. The only notable exceptions are → Ficino's *De vita libri tres* (1489) – a highly speculative neoplatonic work, the influence of which can hardly be overestimated – and some treatises by → Paracelsus, whose astrological conceptions fit in only partially with the above-mentioned schema. The complex metaphysics of the hermetic movement inspired by Paracelsus (the so-called “chemical philosophy”) overshadowed and sometimes completely dismissed the astrological features of Paracelsian medicine; therefore, astrological medicine has not been affected by this last bulwark of the magic-based idea of nature, which continued to exist even in the age of the scientific revolution. Still, there have been significant attempts to bring Newtonian elements into physiopathology, the most important of which is Richard Mead's, eloquently entitled *De imperio Solis et Lunae in corpora humana* (1704). Mead's estimate of the attraction of human fluids (blood, humours) by the sun and the moon, and its possible pathologic effects, is a conspicuous example (not the last!) of what can be called “neo-astrological” medicine.

The only extant edition is unfortunately highly uncritical and full of errors in Greek: Ἰατρομαθηματικὰ Ἐρμῶ τοῦ Τρισευερίστου πρὸς Ἀμμῶνα Αἰγύπτιον, in: J.L. Ideler (ed.), *Physici et medici Graeci minores*, Leipzig, 1841, vol. 1, 367-396.

Illuminaten

1. SURVEY OF THE ORDER'S HISTORY
2. THE ESOTERIC CONTEXT
3. HISTORY OF THE TRADITION

1. SURVEY OF THE ORDER'S HISTORY

The foundation of the secret society of the Illuminaten is related to the conflict between the Catholic Counter-Reformation and the Enlightenment in Bavaria. Although the suppression of the Jesuit order in 1773 had destroyed the external organisation of the Society of Jesus, the advocates of Enlightenment, above all Adam von Ickstatt (1706-1776), rector of Ingolstadt University, feared the influence of “ex-Jesuits”, who still held important offices in education. In 1773 Ickstatt procured the Chair of Ecclesiastical Law and Practical Philosophy for his student Adam Weishaupt (1748-1830) in pursuance of an anti-Jesuit staffing policy. Here on 1 May 1776 Weishaupt founded a student league, which he first called the Order of the “Most Perfectibles”, later of the “Illuminaten”, to serve as an organisation to defend the reading of Enlightenment literature and related academic doctrine. The members, who assumed cover-names, were bound by oath to keep the existence of the society as well as its activities totally secret.

The Illuminaten outgrew its character as a student circle with few participants, once Weishaupt had admitted his former pupil Franz Xaver Zwackh (1756-1843) as a member in February 1778. Zwackh, a Bavarian privy councillor, won for the first time older and influential men in Munich, Eichstätt and Freising for the Order, among them Hofkammerrat Marchese di Constanzo (1738-after 1800), who undertook a recruiting trip to northern and western Germany in 1779-1780. In Frankfurt am Main he was able to

win Adolph Freiherr Knigge (1752-1796) as a member, who was ultimately responsible for the spread of the Order throughout the whole of Germany. In total, about 2000 persons are said to have belonged to the Illuminaten, including members from elsewhere in Europe; 1510 of these have been identified up to the present time, among them many of the most famous names of the period such as → Goethe, Herder (1744-1803), or Pestalozzi (1746-1827).

As a result of the first internal conflicts, the “Order General” Weishaupt was joined in 1779 by a collective governing council (“Areopagus”). This leading group developed an inner system of direction, which aimed at the education of a “new man” in the Order. It was expected that younger members particularly would be sufficiently impressed, and that they would influence state and society on the basis of the Order’s superior morality. The strategy of this education was a comprehensive observation of oneself and others within the membership. Every single member was to be minutely investigated in terms of character and educational qualities and made susceptible to direction. The concrete means of achieving this was the obligation to send in monthly reports (“*quibuslicet*”), whose information reached from the bottom of the Order through the hierarchy right up to the top and which were answered in the form of reply slips. The basis of this structure were the “minerval churches”, small reading societies of the Order, in which younger and new members were gathered for training at the respective location of an Illuminaten branch. The individual branches were subject to a regional prefecture; several prefectures formed provinces, two to three provinces an inspectorate. Prefects, provincials and inspectors wrote reports preparing basic information for the Order leadership and made suggestions about how to influence individual members. The grand conception of this educational system of surveillance and direction within the Order aimed at creating a “legion of noble ones”, whose moral qualification would be fundamentally higher than the condition of contemporary bourgeois society.

The education of the “new man” was not an end in itself, but was supposed to train staff for a “moral regime”, which was to be secretly introduced within existing states. The political goal of the Illuminaten was thus not open revolution, but rather the hidden infiltration of the various forms of authority and institutions of the Ancien Régime in the age of the late Enlightenment. With a philosophy of history of human perfectibility taken from Rousseau’s triadic model, it was believed that over

generations, indeed centuries, the Order could generate a process of political and social transformation leading to a society of rational citizens, still patriarchal in structure, but free from all other external authority. Any social structure exceeding the authority of the head of the family was regarded as dispensable in the future society of free and enlightened men. The social ideal of the leadership of the Illuminaten Order thus matched concepts of the anarchical utopia of the 18th century.

First steps towards the realisation of this utopia were made in the most diverse fields. As the Order was internally focused on education, it was obvious that the latter would be emphasised in the outside world. The Illuminaten thus played an impressive role in the pedagogic movement of the Enlightenment for establishing model schools, the so-called *Philanthropin*. The Illuminatus Joachim Heinrich Campe (1746-1818) led the *Philanthropin* in Hamburg, for a time together with Ernst Christian Trapp (1745-1818), another member of the Order. Johann Friedrich Simon (1747-1829), also an Illuminatus, was director of the *Philanthropin* in Neuwied; the history of the foundation of the *Philanthropin* in Schnepfenthal near Gotha carries the stamp of the Illuminaten. At a scholarly level, the academies were the focus of Order activity, especially the Bavarian Academy of Sciences in Munich. In 1783 its vice-president as well as two of three class directors were members of the Order. The Illuminatus Carl Theodor von Dalberg (1744-1817), the patron of the Mainz Academy in Erfurt, tried to strengthen the grip of the Order through a targeted policy of appointments. Influence on the literary discourse of the period was achieved by reviewing and publishing. In 1783 the Illuminatus Leopold Friedrich Goeckingk (1748-1828) was a co-founder of the influential *Journal von und für Deutschland*. The enlistment of Friedrich Nicolai (1733-1811), the Berlin publisher and editor of the *Allgemeine Deutsche Bibliothek*, had a multiplier-effect.

However, the strategy of infiltrating the governing colleges and councils of the princes was the centrepiece of Order policy. A textbook success was achieved in the Rhineland Grafschaft of Wied-Neuwied. In the Electorate of Bavaria some ten percent of senior officials belonged to the secret society, among them almost the entire board of censors. Important individual personalities should be named here, the above-mentioned Dalberg, later the last High Chancellor of the Holy Roman Empire, or Johann Philipp Graf Cobenzl (1741-1810), the Austrian vice-chancellor, who in June 1782 became a member. With the recruitment of

Imperial Supreme Court assessor Franz Dietrich von Ditfurth (1738-1813) in 1780, the Illuminaten began the infiltration of the highest court in the land at Wetzlar, whose second senate was finally dominated by Illuminaten. A bitter dispute arose over whether it was advisable to draw even ruling princes into the Order at the beginning of 1783, when Duke Karl August of Saxe-Weimar and Duke Ernst II of Saxe-Coburg were admitted.

The betrayal of the secret society by its own membership was related to the so-called Bavarian-Belgian barter project. Important protagonists of the Order had conspiratorially encouraged the plan of Emperor Joseph II, to win Bavaria for Austria and to compensate the Elector Karl Theodor with territories of the Habsburg Netherlands. The Munich "patriotic party" opposed to the plan withdrew from the Order in December 1783; from the middle of 1784 they began with targeted attacks and publications to accuse the entire order of dangerous dealings against the fatherland. The result was the electoral Illuminaten mandate of 1785 and the start of persecutory measures, especially the dismissal of Illuminaten office-holders. Already in February 1785 Adam Weishaupt had fled from Ingolstadt to the free imperial city of Regensburg, whence he retreated to Gotha in August 1786. In April 1785 the "national superior", Johann Martin Graf zu Stolberg-Roßla (1728-1795), officially suspended the Order's activities in Germany.

The persecution of the Illuminaten in Bavaria and the ostentatious measures to end the Order's activities suggest that the year 1785 marks its end. This is however not the case. The centre of the society shifted rather from Munich, Ingolstadt and Neuwied to Weimar and Gotha, which lay in the protective realm of the two Illuminaten princes. Under the protection of Ernst von Gotha, it was above all Johann Joachim Christoph Bode (1730-1793) who took over the affairs of the Order and, in its final phase, assumed the position previously held by Weishaupt. A reform of the Order system was undertaken, while its activities and contacts were concentrated in northern and western Germany. For the first time, several foreign branches were now founded in Italy, France and Russia. The Order branches in Copenhagen and Jena were still functioning until the beginning of 1788; in general, however, the delivery of prefecture reports and protocols breaks off around the end of 1787. At the turn of the year 1787-1788 the secret society of the Illuminaten expired, without any formal decree of dissolution being documented.

2. THE ESOTERIC CONTEXT

Until now, scholarly research has oscillated in its understanding of the concept "esotericism" between two basic models. One model is narrowly defined and formal, the other model is more extensive in seeking to link the understanding of "esotericism" with specific contents. The narrow concept of esotericism – significantly more widespread – means a school or group, which consciously secludes itself from mainstream society and develops a "higher knowledge", according to a self-understanding accessible only to its members, who are progressively initiated over a period of time into established degrees of increasing understanding. There can be no doubt that the Order of the Illuminaten is an esoteric society in this formal sense.

It is quite another question, whether the Illuminaten Order belongs to the history of early modern esotericism in the sense of its content, i.e. whether its "higher knowledge" can be ascribed to the esoteric corpus (Antoine Faivre), as it developed from the reception of antiquity in the Renaissance and was especially influenced by theosophical-Rosicrucian currents in the course of the 18th century. Research into the Illuminaten has traditionally denied this, without however discussing this question in any depth. The Order of the Illuminaten passes for "rationalist", a position that Helmut Reinalter represents as a paradigm. The contrast between the secret league of the *Gold- und Rosenkreuzer* [→ Rosicrucianism II] is often cited – the Illuminaten represent the Enlightenment, the *Gold- und Rosenkreuzer* the Counter-Enlightenment, or else the older thinking of "enthusiasts". In comparison, the Illuminaten Order is already a manifestation of modernity.

In 1984 Manfred Agethen opposed this traditional interpretation with a highly fruitful counter-argument. Agethen sees the Illuminaten Order not as the beginning of modernity, but as a late offshoot of the chiliastic and utopian sectarian tradition. This interesting new position is open to attack, since Agethen – almost involuntarily given the prevailing state of religious studies – misunderstood this tradition as medieval and "theologically Christian" and went so far as to discern Catholic ecclesiastical patterns in the Order. In a long review essay of 1988 Ernst-Otto Fehn vehemently rejected this – interestingly enough no longer by referring to the purely "rationalist" character of the secret society, but with the demand that the Illuminaten be examined in the context of masonic [→ Freemasonry] and Rosicrucian utopias. The Order was

thereby located, even in terms of its content, in the history of early modern esotericism – without the concept of “esotericism” actually being mentioned. Historical research of a scholarly nature into esotericism did not yet exist during the 1980s (in German-speaking countries).

By 1990 the scholarly controversy could only be resolved by asking different questions, and interpreting sources anew and more precisely. This course was pursued in a historical and philosophical manner. It was evident that the relevant statements and observations required exact dates, that the chronology of the Order was of paramount importance, and that distinctions had to be made between the various groups and individuals in the overall organisation. It is also important to understand Illuminaten viewpoints in the context of the development of Freemasonry and esotericism in the late Enlightenment.

From the outset, the Illuminaten Order evidently regarded itself as a competitor in an esoteric emporium. When Adam Weishaupt conceived of creating an anti-Jesuit student circle at the University of Ingolstadt, he was working under pressure since a rumour was circulating that a representative of the *Gold- und Rosenkreuzer* was already recruiting among the students. In an age of secret societies, a new league required a form and content, capable of attracting and keeping new recruits. Between 1777 and 1779, Weishaupt developed the foundations of a grade-system, initiatory rites, and a language using geographical and historical terminology, which drew abundantly on esoteric traditions while adapted to the goals of his Order.

For this purpose, two texts on the history of religion by the Göttingen professor of philosophy Christoph Meiners (1747-1810) were fundamental, namely *Ueber die Mysterien der Alten, besonders über die Eleusinischen Geheimnisse* (1776) and *De Zoroastris vita, institutis, doctrina et libris Commentatio prior* (1778). Meiners portrayed the ancient mysteries as a double initiation of believers. Superstitious notions were conveyed in the “Lesser Mysteries”, while in the “Greater Mysteries” the veil of superstition was torn away and those few deemed worthy were initiated into the truths of rational understanding of God. Weishaupt accordingly drafted first texts for the Lesser and Greater Mysteries of the Illuminaten – “The religion of reason” as a mystery of an esoteric league –, and this idea was the starting-point of the Illuminaten “order-system”. The presentation of the mystery grades, above all the form of the initiations and the temple, was conceived as an adaptation of the

“fire-worship” of Zarathustra. The worldly struggle of the Illuminaten was related to the dualistic struggle between good and evil as cosmic principles. In June 1778, Weishaupt first dated an Order letter from “Eleusis” rather than “Ingolstadt”; simultaneously he began to use an ancient Persian calendar for dates. In this early phase, when Weishaupt was solely in charge, the secret society of the Illuminaten was conceived as a mystery league on the basis of the Enlightenment’s understanding of the history and criticism of religion.

However, the actual performance of initiations and an internally consistent and structured grade-system remained a piecemeal affair during the first four years of the Order’s existence. This was still the case, when Freiherr Knigge was won to the order in the summer of 1780. Knigge soon noticed that the grade-system existed more in Weishaupt’s mind than in detailed practice. His offer to collaborate in shaping it was gratefully accepted by Weishaupt, because he knew that Knigge – unlike himself – was an experienced Freemason familiar with the masonic systems of the time, especially the higher grades of the Rite of Strict Observance. At the same time, Knigge was disappointed by masonic mysteries and was delighted to have the opportunity of constructing an esoteric society according to his own notions. By 1781 the first mandatory form of the grade-structure (*Rezeß unter den Areopagiten*) arose under Knigge’s management. In this process, the Order of the Illuminaten developed from Weishaupt’s loose-knit mystery society into a high-grade masonic system. At the Wilhelmsbad Convent of the Strict Observance in summer 1782 Knigge recruited disaffected Freemasons, who knew as little what to make of the old Templar legends [→ Neo-Templar Traditions] as of the newly created Martinist system [→ Martinism: First Period] of the → Chevaliers Bienfaisants de la Cité Sainte. Plans now followed for an Illuminaten version of the three basic grades of craft masonry, and the system of the “Eclectic Alliance” introduced by Freiherr von Ditfurth in spring 1783, finally prevailed.

In the history of literature Knigge is regarded as an Enlightenment figure, to some extent a radical one. That he was simultaneously a high-grade esotericist was already noted by Ernst-Otto Fehn in 1984. In Knigge’s view, Hermetic philosophy possessed a rational, scientific character. This combination of a basic Enlightenment attitude with esoteric speculation and the quest for “higher knowledge”, so frequent in the 18th century, was first characterised by Rolf Christian Zimmermann

as “enlightened Hermeticism”. However, there are no definite boundaries between Baroque esotericism on the one hand and the purely rational Enlightenment on the other. There are rather graduated differences and a crucial benchmark was the attitude towards 17th-century theosophy [→ Christian Theosophy]. Knigge publicly polemicised against the rival order of the *Gold- und Rosenkreuzer*, but regarded the original Rosicrucian manifestos as the basis of many reforming ideas and precursors of the Enlightenment (*Ueber Jesuiten, Freymaurer und deutsche Rosenkreutzer*, Leipzig 1781). By contrast, Christoph Meiners, who had been interested in the esoteric garb of rational truths, and on whose understanding of ancient mystery-schools Weishaupt had first constructed the Illuminaten, rejected all theosophy as irrational enthusiasm. When the Areopagus circulated within the Order the text that Knigge had composed for the Scottish Knight grade, the initiation of the “Directing Illuminatus”, there was an open dispute about the character and status of esoteric ideas in the Order.

In this grade-text Knigge had attributed to the Order’s system of observances a theosophical progression from the early Christian-Gnostic communities into a future when man could regain his former divine status. This notion and its mystical language created a scandal, especially in the Göttingen circle of Illuminaten, to which belonged Meiners as a recent recruit, Johann Benjamin Koppe (1750-1791), professor of theology, and Johann Georg Heinrich Feder (1740-1821), professor of philosophy. When Feder complained to Weishaupt about “religious play-acting”, the latter intervened effectively for the first time in the construction of the order-system. He instructed Zwackh to suspend the circulation of the grade-text of the Directing Illuminatus and personally wrote an *Anrede an die neu aufzunehmenden Illuminatos dirigentes*, which was intended to supplant Knigge’s draft and restore Weishaupt’s standing with the Göttingen members. It was vitally important for the professor at the half-Jesuit Bavarian state University of Ingolstadt, that the professors of the famous University of Göttingen remained in the Order and accepted his intellectual leadership.

At the same time it became increasingly obvious that Knigge was by no means the only member of the Illuminaten Order to adopt a theosophical position. His solicitations among the Knights of the Strict Observance had introduced numerous members into the Order, who thought along similar lines, including Ernst Friedrich Hektor Falcke (1751-1809), a Göttingen court councillor, who was also a member of the *Gold- und Rosenkreuzer*, and

Johann Friedrich Kleuker (1749-1827), a teacher in Osnabrück, who later translated and popularised the doctrines of → Saint-Martin in Germany. Weishaupt now wanted to halt this tendency and undertake the task of Enlightenment among existing members of the Order. On the basis of a new publication by Christoph Meiners (*Beytrag zur Geschichte der Denkart der ersten Jahrhunderte nach Christi Geburt*, 1780/82), he composed a new text, *Unterricht für alle Mitglieder, welche zu theosophischen Schwärmereyen geneigt sind*. Weishaupt wanted to dissuade and also to build anew. From the second half of 1782 onwards, he worked on developing Knigge’s Illuminaten system of Freemasonry – now on a higher level than initially – into a secret Enlightenment society.

In the years 1782-1783 Weishaupt finally developed four grades for his new mystery-school. The *Anrede* to the Directing Illuminaten became the first grade of the Lesser Mysteries, the grade of Priest; next came the grade of Regent. The Greater Mysteries completed the whole structure, firstly the grade of Magus or Philosophus, and as the supreme and last revelation of the Order, the grade of Docetist. With this explicit reference to Docetism, the founder of the Illuminaten placed his Order in the tradition of Gnostic heresy [→ Gnosticism]. The text of the supreme mystery-grade shows Weishaupt to be the agent of a rigorously abstract, enlightened form of esotericism. In 1999 Martin Mulso analysed the Docetist grade in terms of the history of philosophy for the first time, placing it in the tradition of Hermetic “left-wing Wolffianism” from an 18th-century vantage-point. Here, on a Sensualist basis, Weishaupt developed the prospect of a higher knowledge after death. The centrepiece was the doctrine of metempsychosis, the notion of the transmigration of souls [→ Reincarnation] as the Pythagorean journey of the dead.

Supported by the founder, the opponents of theosophy won the upper hand in the course of the years 1783-1784. Ditfurth denounced Falcke as a *Gold- und Rosenkreuzer* to the Order leadership; he was thereupon removed as Inspector of the Order provinces of Upper and Lower Saxony. Meiners demanded that the purging of all “magical-hermetic sciences” be made a priority of Order policy. In July 1784 Knigge was driven out of the Order. When Bode travelled to the convention of the Philalethes at Paris in 1787, he handed in a memorandum claiming all secret sciences were only snares the Jesuits had laid for the Freemasons. Hermann Schüttler, in a first investigation of these contacts, has been able to demonstrate that, on the eve of the French Revolution, several Paris lodge

brothers shared with Bode the view that esoteric ideas were no longer valid.

The question concerning the esoteric character of the Illuminaten Order can therefore be answered with some discrimination. There was a strong anti-esoteric potential, but traditional contexts and continuities were still effective in the age of Enlightenment. Even the presence of utopian features in the educational system and goals of the Order suggests that early modern contexts cannot be simply excluded. However, within this Order there was a broad platform for discussion: here theosophists encountered deists, and enthusiastic Freemasons those who regarded masonic rituals as mere child's play. An essential part of the internal conflict was rooted in the dispute concerning the relevance and meaning of esoteric traditions.

3. HISTORY OF THE TRADITION

Secret societies possess and pursue an identity, which is diametrically opposed to the normal generation of source material. The existence of the society itself is supposed to remain hidden, together with its membership and above all its plans and goals. Cover-names for persons and places are intended to prevent the identification of the actors. Given such provisions, it is astonishing how much material has survived and is available to scholarly research.

This transmission of sources has three major causes. Firstly, the written evidence of daily Order life – correspondence, reports, drafts – was by no means destroyed but collected in the private files of leading Illuminaten to whom they were addressed. Secondly, a high percentage of the individual Order branches were located within masonic lodges, so that some material is also found in lodge archives. Thirdly, the betrayal of the Order in the mid-1780s led to a wave of anti- and pro-Illuminaten publications. Adam Weishaupt himself participated especially in this late and involuntary publicity. Naturally, this group of sources may be used only with care – but it also offers authentic material.

In July 1785 the Bavarian priest and Illuminatus Johann Jakob Lanz (1735-1785) was struck by lightning. In his literary estate were Order documents and the first membership list to fall into the hands of the Bavarian government. The hearings of the Illuminatus and Munich court councillor Johann Franz von Mandl a year later finally unleashed the persecutions of the years 1786 and 1787, initially directed against two members of the Areopagus. Franz Xaver Zwackh had just managed to reach the safety of the free imperial city of Augsburg, before his house in Landshut, where he

had left his Order papers, was searched on 11/12th October 1786. In May 1787 a second raid was made at Schloß Sandersdorf near Ingolstadt, the property of Thomas Franz Maria Freiherr von Bassus (1742-1815), who had likewise flown. A selection of the abundant Order documentation found in both searches was published in 1787 by the electoral government (*Einige Originalschriften des Illuminatenordens* and *Nachtrag von weitem Originalschriften*). The entire collection was brought to the Munich Geheimes Hausarchiv and has been lost since the Second World War. The French historian of Freemasonry, René Le Forestier, was still able to work with this material. The same applies to Leopold Engel, an esoteric writer and member of a “new” Illuminaten Order founded in the late 19th century. The latter was a purely theosophical society, which had no actual link with the 18th-century original, but claimed to be following in its tradition.

The publication of Illuminaten grade texts had already begun in 1786 with Weishaupt's decision to make the purely philosophical and esoteric supreme mystery-grade available to the public. This tactic of distracting attention from the more strongly political contents of other grades did not wholly succeed, because a year later the *Originalschriften* contained his *Anrede an die neu aufzunehmenden Illuminatos dirigentes*, that is the text of the Priest grade from the Lesser Mysteries. This was the situation until the definitive cessation of Order activities even outside Bavaria. Not until 1788 did the Illuminatus and Mainzer Hofgerichtsrat Johann Heinrich Faber (1722-1791) publish all lower grade-texts up to that of “Grand Illuminatus”. The conclusion of this publishing process followed in the context of the anti-masonic literature fostered by the French Revolution. In 1794 the former Illuminaten prefect and Gießen privy councillor Ludwig Adolph Christian von Grolman (1741-1809) printed the complete Lesser Mysteries as a study of conspiracy theory; in the same year the theosophical grade of the Directing Illuminatus in Knigge's version appeared. At that time only the first grade of the Greater Mysteries, *Philosophus*, remained unprinted. W. Daniel Wilson edited it in 1994 coincidentally with Hermann Schüttler.

The most important archival collection available today for research is the literary estate of Johann Joachim Christoph Bode. Bode's papers had remained completely untouched by official investigations thanks to the protection of the Duke of Saxe-Weimar. Bode had died in December 1793 and his literary executor, the Illuminatus and

Weimar minister Christian Gottlieb von Voigt (1743-1819), transferred the voluminous masonic-Illuminaten documents in January 1794 to Duke Ernst II of Saxe-Gotha, who had bought the papers for 1500 Thalers while Bode was still alive.

Duke Ernst had Bode's papers sealed and determined in his will that his own masonic estate should be sent after his death to the archive of the Grand National Lodge in Stockholm, where the duke knew the material would be secure against publication. This transfer was effected after his decease in April 1804 through confidential Illuminaten offices. His legal executor was the Altenburg chancellor and Illuminatus Johann Georg Geißler (1760-after 1831). Three large boxes went to Stockholm, one of them containing Bode's papers. Thus arose the term "Swedish Box" for the most significant Illuminaten archive. In 1880, following a request from Gotha, the Swedish Box returned to Germany and was incorporated in the lodge archive. Including the papers of Duke Ernst, the material was collected in twenty uniform volumes. In 1935 it was confiscated in the context of a nationwide suppression of Freemasonry by the National Socialist regime in Germany. After an "Abteilung für Grundlagenforschung" was established in 1939 in the Reich Security Main Office, the Gotha documents were also evaluated from a National Socialist ideological standpoint in the 1941 habilitation thesis of Alfred Roßberg (1904-1943), supervised by Günther Franz (1902-1992), professor of history at Jena, SS historian, and scholarly adviser of the Berlin Forschungsstelle. As the war progressed, the Swedish Box was stored in Silesia, where it was confiscated by the Red Army and transferred to the Soviet Union. In the 1950s the estate of Bode with the masonic materials returned from Moscow to Germany and thus arrived at the Zentrales Staatsarchiv of the German Democratic Republic (This collection comprised volumes 1-9, 11-20 of the Swedish Box; the tenth volume remained in Moscow). In 1975 a start was made in cataloguing the archive in Merseburg, but access to its contents was too restricted for scholarly study.

After the dissolution of the Soviet Union and the partial opening of Russian archives to international research, the tenth volume of the Swedish Box was rediscovered by the Merseburg archivist Renate Endler in the Moscow special archive. As a consequence of German reunification, the Freemasonry archives were transferred in 1994 from Merseburg to the Geheimes Staatsarchiv Preußischer Kulturbesitz Berlin. Here the estate of Bode is available for scholarly use with permission of the

Grand National Mother-Lodge "Zu den drei Weltkugeln".

MONIKA NEUGEBAUER-WÖLK

Illuminés d'Avignon

This group of esotericists has its origins not in Avignon but in Berlin, probably in 1778. Its first members were Prince Henry of Prussia (the brother of king Frederick the Great), Jacques Pernety (older brother of → Dom Antoine-Joseph Pernety), and Claude Etienne le Baud de Nans (an actor). Possi-

bly, they met at Prince Henry's small court of Rheinsberg near Berlin, where Jacques Pernety was a tax inspector, and which was also frequented by Le Baud de Nans. They were soon joined by three more people, who later came to play a dominant role in the group: Louis Joseph Bernard Philibert Guyton de Morveau, called Brumore (1738-1786, librarian of Prince Henry, and a colleague of Jacques Pernety), Dom Antoine-Joseph Pernety (1716-1796), and the Polish count Thaddeus Leszczyc Grabińska (1740-1807), Starost of Liva. They all shared an interest in → alchemy, and it is likely that they first gathered to discuss some alchemical manuscripts by → Nicolas Flamel and Mardochée (a poet at the court of → Rudolf II of Prague, who had been charged by the Emperor with putting alchemical texts into rhyme), which were in the possession of Le Baud de Nans.

Alchemical experiments indeed were, and would remain, one of the Illuminés' major preoccupations. A second one consisted in regular consultation of a mysterious oracle, referred to as “la Sainte Parole” (The Sacred Word). If a member of the group wished to consult this supposed source of supernatural wisdom, he would enter a certain room, write his question on a piece of paper, and leave; on returning to the room later, he would find a written response. The real author of the responses has long remained a mystery, but due to the researches of Reinhard Breymayer (1984; 1995) he can now be identified as Johann Daniel Müller (1716-after 1786): a violin virtuoso, radical pietist, Swedenborgian, alchemist, kabbalist, and millenarian prophet who saw himself as “Elias Artista”, the “messiah of Nature” whose advent had first been predicted by → Paracelsus (Faivre 2002/2003). The connection between Müller and (what would later be known as) the Illuminés d'Avignon was made by Brumore, who shared Müller's Swedenborgian interests and had made his acquaintance in Hamburg in 1784. The Illuminés venerated “Elias Artista” as their “hidden master”, but never got to meet him in person and did not know who hid behind the pseudonym.

If Brumore was the link between the Illuminés and their hidden sources of spiritual authority (“Elias Artista” and La Sainte Parole), Grabińska provided them with their financial resources and acted as ritual leader in the consecrations that came to be prescribed by La Sainte Parole. As for → Dom Pernety, by now 63 years of age, he seems to have acted as a kind of father figure for the others. Extremely well acquainted with all kinds of esoteric literature, especially alchemical, he also

played the role of an expert. He consulted La Sainte Parole more than anyone else: in the manuscript transcript (preserved in the Musée Calvet in Avignon, and published by Meillassoux-Le Cerf in 1992) of the questions and answers posed to and received from La Sainte Parole, 69 pages are needed for Pernety, followed by 21 for Grabianka. Although most of these questions deal with alchemy, all kinds of other questions regarding the functioning of the group are posed by Pernety as well. While modern scholars have often regarded him as the leader of the Illuminés, it is more accurate to assume that he shared leadership with Grabianka and Brumore. In fact, La Sainte Parole referred to Grabianka as the "King of the New Israel", and to Pernety as its "Pontiff".

The group's size has often been exaggerated. Although it has been claimed that hundreds of people were members, for the entire period of its existence only twenty-one consecrated devotees have been identified with certainty (Meillassoux-Le Cerf 1992, 113). This number may be expanded, however, if one includes all people who in one way or another associated themselves with the Illuminés without having been officially consecrated. We then come to a number of circa thirty people during the group's Berlin stage, circa one hundred during its later existence in Avignon. It is significant that many of them belonged to the higher strata of society: wealthy and cultivated people, many of them intellectuals.

It seems to have been as a result of instructions by La Sainte Parole that the Illuminés evolved from a more or less informal group of likeminded people to a more formal initiatic society. Admission had to take place by a ceremony, called the consecration. It should be performed on the top of a hill near Berlin, referred to as "the desert", at the rising of the sun, during nine consecutive days. On the hill-top, each candidate had to prepare an altar of turf, called his "Altar of power", in the centre of a circle of stones; incense had to be burnt on it, and he had to swear to consecrate himself to the service of God, by an alliance with the Eternal One. In return, he could obtain the favour of seeing his angel (e.g. Assadaï for Antoine Pernety, Ajadoth for La Richardière) or receiving a special grace. This alliance was called: "to make a Jehovah" (fair un Jéhovah). It fell to Grabianka to first execute the ceremony, and thereby consecrate himself. He was then commissioned to consecrate Pernety, Brumore and Miss Bruchié (the consort of Brumore). These four were also the ones who most frequently consulted La Sainte Parole and were clearly the most important members of the group.

Among the various people who were subsequently consecrated were Grabianka's wife and his six-years old daughter Annette. They were in Poland when La Sainte Parole ordered them to be consecrated, so Grabianka went there for the occasion, on May 9th 1779. But as soon as he had consecrated his daughter, La Sainte Parole ordered him to "sacrifice" her: Grabianka had to separate from her, and hand her education over to Brumore and Miss Bruchié. Initially unwilling to comply, he and his wife eventually brought Annette to Berlin; and on March 10th, 1780, on the top of the "desert" hill, he handed her over to her new parents, who had never seen her before. In the wake of this event, Grabianka's wife left him and the group. Although La Sainte Parole had ordered a separation of seven years, precisely three years later (on March 10th, 1783) it ordered Annette to be returned to her real parents, whom she had not seen in the meantime.

During the first few years of their existence, the Illuminés concentrated on their alchemical work. We know that, at least according to Antoine Pernety, the aim was to cure mankind of its diseases rather than to make gold. However, the Great Work did not produce the expected results. As early as 1780, La Sainte Parole began to utter mysterious millenarian statements about the advent of 'the new heaven and the new earth', and by 1781 it had become clear that the Illuminés would have to leave Berlin and go to a new but as yet unspecified place where they should establish 'the foundations of the city of his [God's] new people' (Meillassoux-Le Cerf, 365-366). But it took long before the answers from La Sainte Parole became sufficiently clear to act on them. For a long time, the Illuminés did not know more than that the city of the new Sion had to rise up in the south, at the banks of a big river, at four days walking from Berlin.

The Illuminés' early years in Berlin were followed by a period during which the leading figures left the city. In June 1783, Brumore, Grabianka, Ronikier and Miss Bruchié moved to Poland, where they continued their alchemical work. And some months later, on November 10, having obtained permission from king Frederick to quit his job, Antoine Pernety left Berlin on orders of La Sainte Parole. He ended up with his brother Jacques, who had already left Berlin and was now living in Valence. In April 1784, Brumore and miss Bruchié traveled from Poland to Hamburg, where they received from "Elias Artista" two bottles of "prime matter" and the recipe for completing the Work; they traveled on to Strasbourg, where Brumore separated from his consort and left her with her parents. He traveled on to Basel, where, on

october 3, 1784, La Sainte Parole finally revealed to him the name of the place where the group must reunite: Avignon, at that time a very special place because it did not formally belong to France but to the Roman Catholic Church.

Brumore arrived in Avignon the same month, while one of the group's members, the doctor François-Louis la Richardière, went to Valence to inform Pernety. The latter decided to remain in Valence for the time being, but began to visit Avignon frequently. In March 1785 he did move to Avignon, where he consecrated La Richardière as well as Antoine Bouge, and kindled a fire for the new alchemical Work, which was now being pursued under La Richardière's supervision. Grabianka arrived in Avignon in 1785 as well, bringing with him the alchemical materials that had been made by Ronikier and Brumore in Berlin. The entire experiment on which they were working would take no less than 1200 days, i.e. until July 1788.

Most of those who had belonged to the Illuminés in Berlin now came to Avignon as well, and new members joined. Most of them were Freemasons (Esprit Calvet, De Serrière, Blainville, Chaix de Sourcesol, Gasqui, the count of Pasquini-Montreson, Gombault du Vignan, the baron Tardy de Beaufort, the marquis of Montpezat, and the marquis Vernetti-Vaucroze). Very soon, however, the new group began to disintegrate again, as founding members left Avignon. One month after the final recorded communication by La Sainte Parole (april 1785), Brumore left for Rome, where he died not much later, in February 1786. Shortly after, September 1786, the marquis Vernetti-Vaucroze offered Pernety a house close to his castle, in Bédarides, 17 kilometres from Avignon. Pernety called it "Mount Tabor", and turned one room into a temple, one into a meeting-room, and one into a laboratory. Grabianka left for London in 1786, where he visited a Swedenborgian group founded by Hindmarsh. Without much success he tried here to recruit members for his own group in Avignon. To a few, he revealed that the Illuminés d'Avignon's great secret was that God is not a trinity but contains a fourth person: Mary, the Mother of God.

Not long after Brumore's death in 1786, for reasons which have remained unclear but may well have had to do with Grabianka's quaternarian theology, the Illuminés split into several fractions. One group – the "société des Illuminés d'Avignon" – continued under Pernety, while another – "the New Israel" – was led by Grabianka. Moreover, a third group – "the Filial Piety" – emerged, under the leadership of the marquis of Montpezat. Pernety's

group seems to have continued practicing the original ritual and alchemical practices and can be regarded as the most direct continuation of the Illuminés, whereas the two other groups developed into new directions. Confusingly, however, all of them together have frequently been referred to by later authors not by their new names but as the Illuminés d'Avignon.

If one trusts the sources, which are not always reliable, one is led to conclude that Grabianka in fact developed a completely new ritual. It supposedly took place in a temple in the form of a cross, with four altars in its four arms: one for God the Father, one for Jesus Christ, one for the Holy Spirit, and one for the Virgin Mary, Mother of God. His "New Israel" was guided by a council of seven members, including the functions of Pontiff (Alier), Great Mother (Miss Dottini), Prophet (Ottavio Cappelli), Chancellor, and Interpreter of Dreams. Grabianka himself was referred to as the "Infallible King of the New Israel" and all members used to throw themselves to the ground before him. There were four degrees in his system, the last one being presided over by the Great Mother.

A strange visionary, Ottavio Cappelli, joined the "New Israel" in 1786 or 1787. Grabianka was highly impressed by his visionary gifts (his questions were answered by the archangel Raphael), and gave him one of the most exalted positions within his group. But early in 1790, Cappelli was arrested by the Inquisition, charged with being an heretic and a swindler, and threatened with a seven-year prison sentence if he did not revoke his errors. He did so at once, and was released in november 1791, but the reputation of the "Illuminés d'Avignon" (whether this referred to Grabianka's or Pernety's group) had been severely damaged, and one member after the other began to leave.

The medium Brumore was dead, Pernety and Grabianka had become separated, the Prophet Cappelli had been condemned by the Inquisition, the alchemical Work had not brought the hoped-for cure for the diseases of mankind, and the Revolution of 1789 had not brought the expected New Jerusalem: in the wake of all these disappointments, the Illuminés d'Avignon dispersed around 1792, and were completely abolished the year after. They had existed for thirteen years, of which seven in Avignon. Pernety died in 1796. Grabianka had been forced to leave Avignon four years before, in 1792, because of his debts. He fled first to Paris, then in 1799 to London, and finally to Russia. Arrested and imprisoned in St. Petersburg in April 1807, on accusation of espionage, he died on October the 6th before the end of his trial. Cappelli was

hanged in Rome in 1800, probably for political reasons.

Illuminism

1. “CHRISTIANITY OF THE HEART” AND THE LIGHT OF REASON 2. SECRET HISTORY, PROFANE HISTORY 3. THE VEILED TRUTH 4. FORMS OF SOCIABILITY 5. FROM THE MYTH TO THE OPERATIVE PATH 6. THE ORACULAR PATH 7. COMMUNICATION WITH THE BEYOND 8. A UNIVERSAL SCIENCE

The complex intellectual and spiritual movement known as “Illuminism” is an integral part of modern Western esotericism in Europe. Chronologically it covers the last third (or even the second half) of the 18th century and the first third of the 19th. In the history of ideas and of literature, it has

profound affinities with pre-Romanticism and → Romanticism.

The emergence of Illuminism shows that the century of the philosophers of the Enlightenment was in fact a century of contrasts; but nevertheless, it would be a simplification to oppose the two movements too sharply, seeing one as the partisan of reason, and the other as defending the irrational. Criticism of a Cartesian or post-Cartesian reliance on natural intelligence goes together, in the very heart of Illuminism, with a desire to make good use of reason; but far more than a merely natural human capacity, “reason” for them included a spiritual dimension, as formulated by → Karl von Eckartshausen (1752-1803): ‘The inner eye is reason. However, this inner eye must be clarified by the divine light’. What is the nature of this light? Such was the question that inspired the Illuminist movement.

The Illuminists were adventurers of thought: their minds plunged into the ancient treatises of the kabbalah [→ Jewish Influences], → alchemy, the mythologies of the Greeks, or those of the ancient Egyptians. They also questioned the theosophers [→ Christian Theosophy] who had preceded them, in particular → Jacob Boehme (1575-1624), who had become known partly thanks to → William Law (1686-1761) in England and → Johann Georg Gichtel (1638-1710) in Germany, and → Emanuel Swedenborg. As part of their quest, they developed activities in various directions. They invented new rites in order to renovate Christianity; as writers they analyzed the evolution of their soul and scrutinized the history of their time; as orators they enlivened the salons. Attempting to reconcile several intellectual systems, the Illuminists of the 18th century sought to combine ancient myths with modern cosmogonies. Sometimes their thoughts became overheated, so that, taken by millenarian frenzy, they interpreted the events of the present in the light of the Apocalypse. Seeking a faith that would combine reason and mystical élan, they bore witness to a cultural crisis and the attempt to resolve it. Illuminism saw itself confronted with the Church’s condemnations of → mysticism, such as that of Fénelon (1651-1715), and with the hardening of the attitudes of academic scholarship in the 18th century. The question was how to fray a path in all this. The figures we shall discuss here were part of an intense process of cross-fertilization that ended up engendering a modern kind of spirituality. Illuminism touched all of Europe and crossed over to the Anglo-Saxon world. Its complexity matched the problem that the new society had to

resolve: the collapse of Christianity and the emergence of secularism.

1. "CHRISTIANITY OF THE HEART" AND THE LIGHT OF REASON

Illuminism was a movement of transition: in a society moving towards increasing secularization, they carried on the analogical way of thinking typical of the magical [→ Magic] and alchemical practices of the Renaissance. → Mysticism survived in it as well, in the traditions of e.g. Meister Eckhart (1260-1327) and the quietists, → Pierre Poiret (1646-1719) and Madame Guyon (1648-1717). This was not a mysticism of "saints", however, but of believers who were already engaged in projects of religious synthesis. In a Christian world torn apart by the Reforms, the Illuminists wished to find the "inner" Christ beyond denominations.

The Illuminists criticized the excesses of the Enlightenment. They deplored the fact that language had been handed over to the grammarians, and knowledge to the encyclopaedists: for while seeming to respect the "letter", both tended to forget the "spirit". In trying to find alternatives, some Illuminists followed the prudence of the theosopher → Louis-Claude de Saint-Martin (1743-1803), who preached the use of reason guided by divine light and emphasized the prayer of the heart. Others chose the way of power, involving themselves in theurgic operations. While many of them questioned themselves about the forces of will and the functions of reason, all of them were looking for the divine as a living spark provided by intuition and revelation. While reading the *philosophes*, they developed their own personal systems. Finally, Illuminism was also influenced by Rousseau's emphasis on "the heart". Between the extremes of sentimentalism and mystical exaltation, they sought to lay the foundations for a true generosity that should take the form of a communion with God, nature, and humanity; it should lead to a flowering of human potential that would benefit themselves and the whole world.

2. SECRET HISTORY, PROFANE HISTORY

Their reflections on the correct use of human faculties went together with a reflection on history. The Illuminists inherited a concept of sacred Christian history, the eschatology of which unfolded between the text of the Apocalypse and the hope for a kingdom of the Righteous; but they were also disturbed by the events of profane history at the time of the Revolution. As alternative to both, the

Illuminists tended to see history as a process of progressive theophany. They saw themselves as experiencing the end of a society based upon hierarchical order, and interpreted the social upheavals of their times in terms of prophecies, millenarian expressions, and judgments about the end of time.

Some illuminists were resolutely theocratic, such as → Joseph de Maistre (1753-1821) or Saint-Martin. To the latter, the Revolution of 1789 appeared as a divine warning against human excess; and faced with it, he put his confidence in God, 'Far from dooming us to the annihilation of all religion, providence will cause a religion to be born in the heart of Man. It will be purer than the one which the sovereigns allow, and which they make disappear by their very power and human will, but also it will no longer be open to infection by the manipulations of the priesthood and the breath of imposture. . . .' (*Lettre sur la Révolution*, 1791). Other Illuminists allied themselves with the revolution, but interpreted profane history in terms of Providence. For the duchess of Bourbon [→ Bathilde d'Orléans], the Revolution forced people to open themselves to Christian virtues. She received in her salon bishop Pontard, accompanied by the prophet Suzette Labrousse; everything that the latter announced was faithful to the Jacobin spirit of the former. The revolutionary tendency of Illuminism inspired the precursors of the socialist utopias, as in → Nicolas Rétif de la Bretonne (1734-1806), who in his lectures shows as much sympathy for the quietist → Antoinette Bourignon as for Mirabeau; or as in Nicolas de Bonneville (1760-1828), the publisher of Saint-Martin and a supporter of agrarian communism. This revolutionary Illuminism must not be confused with what we find in the order of the → Illuminaten of Bavaria, founded in 1776 by Adam Weishaupt under the appearance of a Masonic order: his goal was a political one, namely the abolition of monarchy.

3. THE VEILED TRUTH

The Illuminists believed in a hidden truth outside the authority of dogmas and established Churches: the secrets of creation and of the other world lay sealed in the mysteries of the ancient traditions [→ Tradition]. Fraternities and lodges became the places where these seekers of truth were at home. The Masonic lodges, expanding quickly in Europe in the first half of the 18th century, often employed the image of the veil or the cloak. God was hiding behind the emblematic order of the universe and in the Scriptures, and invited the "Man of Aspiration" (*l'homme de désir*) to try and find him. For →

Jean-Baptiste Willermoz (1730-1824), founder of “rectified” → Freemasonry, as for Karl von Hund (1722-1776), creator of the Strict Templar Observance, the idea of an ancient lineage of descent, whose guardians they were, went together with a taste for gradual disclosure of the truth in the course of multiple initiations. The ability to uncover such hidden truths presupposed a profound conversion, that took place within the “chivalric sanctuaries” based upon a hierarchy of knowledge, and making good use of the well-known warning attributed to Saint Paul, ‘Noli altum sapere’. The German mystic Thomas a Kempis (1380-1471) had taken recourse to this maxim in his *De imitatione Christi*, a work that was read by most of the Illuminists: ‘Do not let yourself be puffed up with pride in the arts or sciences; instead, fear that which you have been told. But admit your ignorance’.

Such prohibitions against the knowledge of “higher things” had been lifted at the end of the 17th century in the wake of Galileo’s scientific discoveries, when people came to believe themselves capable of knowing the mysteries of nature and the secrets of God. With respect to that development, Illuminism presented a rich array of attitudes. The current influenced by quietism, or the one that remained faithful to the teachings of Boehme, wanted to reject the pride of intelligence and seemed to follow the lesson of the *Imitation*. According to this perspective, the spirit must turn toward the wisdom that inspires it, the “mirror of God” in which the person who surrenders his individual will may contemplate the mysteries. The mysticism of William Law, an Anglican priest, is a good example of this tendency. However, the Illuminists’ quest for deciphering the signs of truth could take a much more active turn as well, leading to the quest for an intimate “experience” of the object sought for. Self-knowledge could be sought by means of analogical thinking, using the macrocosm as a mirror of one’s own microcosm. In the words of → Johann Caspar Lavater (1741-1801), ‘In us is the key of nature, of Scripture, of the divine secrets’. Attention could also be directed to the outer world, where seekers deciphered the mysteries of a “science of God”. In their books, the 18th-century Illuminists constructed entire cosmogonies connected with eschatological visions, for example the one that → Martinès de Pasqually developed in his *Traité de la Réintégration*. From the primordial unity of God, or so we read there, myriads of intelligent creatures have emanated, among which Man has a place of central importance. Evil appeared because the emanated creatures misused their freedom, resulting in the separation of Man from God,

and the creation of matter. The “corporization” of Man meant his exile in the material world, but could be remedied because God had provided paths of “atonement”. The desire of salvation is the magnet, so to speak, that orients the inner work of the initiate, whose task is to bring about the redemption of the whole of nature (which has fallen together with Man). But the “men of aspiration” disagreed among themselves about the means to achieve this. Some emphasized intellectual and spiritual methods: the study of systems of symbolism, Holy Scripture, and the sacred nature of numbers [→ Number Symbolism], combined with prayer of the heart. Others chose the way of magic, with theurgy as an interesting example to which we will return. The arts of the kabbalah and of alchemy were available to aspirants in both directions.

There was yet a third path, prefiguring what was later to be known as → spiritualism: the search for visions, “auricular” perceptions, and automatic writing. A number of Illuminists such as J.C. Lavater, → Johann Heinrich Jung-Stilling (1740-1817), and Jean Frederic Oberlin (1740-1826), became fascinated with such phenomena, later to be known as “métapsychique” in the French-speaking world. This approach was somewhat intermediary between that of Swedenborg, who showed the results of his visionary abilities in his *Arcana Coelestia*, and that of somnambulism in the wake of marquis de Puységur (1751-1825), who applied the magnetic method [→ Animal Magnetism] pioneered by Franz Anton Mesmer (1734-1815). In the wake of Martinès de Pasqually, “spiritualist” magnetism was conceived of as an art that could reinstate the purity of Man before the Fall. This mediumistic path gave Willermoz some moments of enthusiasm. He investigated the trances of Jeanne Rochette, and believed for some time in the “divine writings” received, as early as 1785, by Marie-Louise de Monspey, sister of the Grand Profès of Lyons Alexandre de Monspey, who, guided by the spirit of the Virgin Mary, composed journals filled with esoteric teachings. Saint-Martin copied the most important of them, which seemed to confirm the doctrines of his master Martinès. Later, however, they took an excessively prophetic turn, and the “unknown Agent” believed to be their source came to display an increasingly Roman Catholic orientation; this made Willermoz reticent, and he finally took his distance from this “new” initiation.

4. FORMS OF SOCIABILITY

Illuminist forms of sociability largely retained the spirit of the pietistic “colleges”, within a structure comparable to that of the speculative Lodges.

In the pietistic communities, a single religious sentiment united Christians of all denominations. The most important of them assembled at Herrnhut near Dresden, around Nikolaus Ludwig Zinzendorf (1700-1760), who as early as 1722 had restored the order of the Moravian Brothers. The quietist conventicles of the preceding century (condemned in 1687 by Innocent XI) likewise inspired the Illuminists' taste for Christian fraternities. It is not certain that these quietists were direct heirs to earlier "illuminated" currents such as the Spanish *alumbrados*, condemned in the 16th century and again in 1623. In any case, there was a persistent tendency among the Illuminists to follow a spiritual quest outside and parallel to the Church. In the 18th century it was notably the thinking of Madame Guyon (1648-1717) that guided certain Illuminists, such as → Niklaus Anton Kirchberger (1739-1799), toward the idea of the "rest" of the soul in its surrender to God. The quietists, assembled mainly in the Vaud region, had already developed the concept of an elect group, the members of which were requested not to pass on to others the mysteries revealed to them. Their leaders wrote under divine "dictation", as did Hector de Saint-Georges de Marsais (1688-1755), or they prophesied, as did Fleischbein (1700-1774). At the death of the latter, → Jean-Philippe Dutoit-Membrini (1721-1793) took leadership of the Vaud group and moved its seat to Lausanne. This mystic, a great reader of the biblical commentaries of Madame Guyon, put forth in his *Philosophie divine* (1793) a theory of the "Astral", populated by beings described as 'neither angels nor demons'. Nevertheless, the quietists were averse against a concentration on spiritual "marvels" ('Neither prophecies nor miracles are any proof of adoption or holiness', wrote Dutoit), and "visions" were considered diabolical tricks.

But the scope of Illuminism by no means remained limited to such small circles. The vast network that they formed over the whole of Europe is attested by their voluminous correspondence, in which they sought to exchange their "secrets". In 1782, furthermore, Willermoz opened the Convent of Wilhelmsbad, in order to unite the mystical Masons; and the circle of the Philalethes invited its faithful to a Convent in 1784, in order to found a college of occult sciences. The quest for knowledge went together with an ecumenist élan, for example in Lavater, Eckartshausen, Jung-Stilling, Saint-Martin, and many others.

The Illuminists read one another's works and discussed them, for example in the salons, and these debates sometimes led to conversions. In the home of the duchess of Bourbon (1750-1822),

there was a rivalry in that regard between men of letters, healers, ecclesiastics, and theosophers. Saint-Martin and Lavater crossed paths with → Cagliostro (1743-1795); for personalities of the most different kind visited this magus to make up their own minds about his famous spirit apparitions. In the third quarter of the century, the Illuminist doctrines became a fashion among the educated circles. Around Nicolas Bergasse (1750-1832), co-founder with Mesmer of the first magnetic society, there gravitated Swedenborgians such as the marquis of Vaucroze, theosophers such as Saint-Martin, adepts of magnetism such as the duchess of Bourbon, and quietists such as Julie de Krüdener (1764-1824).

5. FROM MYTH TO THE OPERATIVE PATH

In their writings the Illuminists paid special attention to basic problems on which the official Church took a firm position, such as e.g. the origin of evil, the destiny of souls, and the "great chain of being" leading up to God. In this area their thinking was guided by the theosophers of the second half of the century: Martinès de Pasqually (1714-1774) and Saint-Martin in particular. Their way of thinking drew support from the great Christian myths, among which that of the Fall occupied a prominent place. The myth implied a dramatic concept of human destiny, and its basic themes of loss and return haunted the Illuminists' visions and writings. Martinès de Pasqually's Order of the → Elus-Coëns is entirely based on the idea of Reintegration, the major theme of his great *Traité* (see above). If according to this theosopher we are all born prophets, and each person must cultivate the gift of vision, it is the elect, more in particular, who in their quest are able to distinguish among powers – that is to say, who know the identity of their invisible inspirers, and are able to avoid demonic influences and the lower "intelligences" believed to populate the "Astral" plane.

The theurgic teaching developed by Martinès involved the evocations of angelic entities. After the disappearance of his master Martinès, Willermoz reserved such practice for the circle of the most zealous Masons of Lyons, that of the Grand Profès. Best known among them were → Frédéric de Saltzmann, Bernard and Jean de Turkheim in Strasbourg, → Joseph de Maistre in Chambéry, Prunelle de Lière in Grenoble, and Charles of Hesse-Cassel in North Germany. The testimony of the Profès Duroy d'Hauterive, as described by Kirchberger to Saint-Martin, suggests that Pasqually's teachings involved specific psycho-corporeal techniques; he writes about 'that kind of disorganization in which

he saw his body motionless, as though detached from his soul'. The practices of theurgic may also be seen as reflecting a quest for "proofs": the signature of the evoked entity, in the shape of fiery characters, was considered evidence of the presence of the entity in the chamber of the initiate. While "mystical" Freemasonry, expanding its lodges as far as Russia, under the instigation of → Nicolai Novikov (1744-1818) and → Ivan Vladimir Lopukhin (1756-1816), played an important role in the development of Illuminism, the operative path, supported by Willermoz, remained the adventurous portion. Those who, like Saint-Martin or Kirchner, came to see it as an "inferior science", distanced themselves from it and chose the meditative path.

6. THE ORACULAR PATH

To clarify the different aspects of Illuminism, we must distinguish between the theurgic practices, based on a foundational myth; and practices of the oracular type, that pertain to another approach to the "supernatural". Part of the Illuminists were certainly moved by desire for tangible manifestations. The "School of the North", to give one example, was led by Charles of Hesse-Cassel (1744-1836), brother-in-law of Christian VIII, king of Denmark, and royal governor of the duchies of Schleswig-Holstein. A fervent Christian, he had a fascination for alchemy and retained a lifelong devotion to supernatural manifestations. He was convinced that, by means of special training, he could communicate with the spiritual world. The Illuminists of his School of the North practiced asceticism and prayer to awaken the mystical faculties, and invoked the celestial beings in the course of special rites. In his personal notes, discovered by the historian G. van Rijnberk in the archives of the Grand Lodge of Copenhagen, Charles of Hesse reported the teachings that gave access to the practices. They had been dispensed to him by Hans Heinrich von Ecker-und-Eckhoffen (1750-1790), one of the founders of the → Asiatic Brethren, a para-Masonic society whose seat was in Austria. The initiates learned how to fix their eyes on objects or luminous points, in order to develop a form of clairvoyance. Thus, in the 1790s, Charles of Hesse and his followers used to assemble around an image of Christ, which lit up at the time of the invocations. The initiates interpreted these "phosphoric manifestations" in order to obtain answers to their questions. This example clearly shows to what extent Illuminism foreshadowed the spiritualist phenomena of the 19th century.

Another group of Illuminists devoted to oracular

practices is known as the → Illuminés d'Avignon, around → Antoine-Joseph Pernety (1716-1796) and others. Pernety, a former Benedictine and translator of Swedenborg, wrote in his *Fables égyptiennes et grecques* (1758) that the Egyptian and Greek legends were veiled descriptions of the secrets of alchemical operations; and in fact the Great Work was the main concern of these Illuminists. They received celestial assistance in the form of an oracle named the "Holy Word" (behind which, as we now know, was hiding a specific person, Johann Daniel Müller [1716-after 1786]), which answered questions, and finally caused the group to move from Berlin to Avignon. Willermoz received information about this new oracle both from Baron Friedrich von Tieman, who declared that 'he had never seen anything greater', and from the Profès (Masonic grade of the Rectified Scottish Rite) Perisse-Duluc of Lyons. But Willermoz, made cautious by the affair of the Unknown Agent (see above), did not pursue the matter further.

7. COMMUNICATION WITH THE BEYOND

The Illuminists evinced an "experimental" spirit, but far from having anything to do with that of contemporary science, it augured "research" of the kind that would be pursued in the following century in the movement known as spiritualism. The tendency of "spiritualist magnetism", well represented among the Masons of Lyons, found many followers, who found this new path more effective than that of metaphysical speculations because it promised to give actual demonstrations of the independence of the soul. Abbot Pierre Fournié (1738-1827), secretary to Martinès de Pasqually from 1769 to 1771, was not content with "visions" or "auricular" perceptions that put him in contact with the spirit world. Thus he engaged as early as 1785 in experiments in magnetism, described by him as a 'gift from heaven' (*Ce que nous avons été . . .*, 1801). In such a manner, spiritual magnetism led some people who were inclined to materialism to find the way back to religious faith. Such was the case of Fournié; but Saint-Martin, as well, stated that 'Mesmer . . . has opened the door to perceptible demonstrations of the spirit' (*Oeuvres Posthumes* [Posthumous Works]).

Illuminism also served as a medium of transmission of spiritual techniques. Of the two great founding heroes of Illuminism, Boehme and Swedenborg, only the second one was explicit about the conditions necessary for contact with the other world, and described the intermediary state between sleeping and waking as propitious for reve-

lations. The author of the *Arcana coelestia* claimed that in order to manifest themselves, the angels communicate an “influx” to people, which the latter in their turn may translate according to their own spiritual faculties. The angelic world “corresponds” with the world of humans; the universe is comprised of “discrete degrees” or levels of reality. Within such a framework, Swedenborg developed a physiology of the soul: ‘Just as the sense organs, external or corporeal, are the receptacles of natural things, so the organic substances of the internal senses, of the mental functions, are the receptacles of spiritual things’.

A number of Illuminists, such as Pernetty, attempted to follow this path, even though Swedenborg himself had emphasized that his revelations were unique to him alone. In 1787 a Swedenborgian “Société Exégétique et Philanthropique” was founded, which practiced the art of visions combined with the use of magnetic passes. But the most zealous Swedenborgians were hostile to the theosophers, the followers of Martinès or Saint-Martin. Thus, for example, the marquis of Thomé, the first proselytizer of Swedenborg in France, did not hide his disagreement with Saint-Martin’s book *Des erreurs et de la vérité* (1775). Clearly the heirs of Boehme or Martinès had chosen a path different from Swedenborg’s. If Willermoz retained much esteem for the Swedish visionary, he nevertheless considered him to have been lacking in “discrimination” and believed he had sometimes received instruction from inferior spirits. The theosophers came up with their own systems to parry the failings of Swedenborg’s visions. Mystics such as Dutoit-Membrini found him too confused, but an eclectic searcher such as baron Bourrée de Corberon found inspiration in him: after making the rounds of all the occult sciences, he finally chose, in 1790, to join the Swedenborgians of Avignon.

8. A UNIVERSAL SCIENCE

Illuminism aspired to making all forms of knowledge converge in a single crucible that would include the sciences. The very separation between religion and science, philosophy and poetry, reason and intuition, and aesthetics and politics, was called into question. “Knowing Nature” meant responding to its desire to be unveiled. Inspired by Boehmenist visions, Antoine de la Salle (1754-1829) and → Friedrich Christoph Oetinger (1702-1782) perceived the world as a living body engendered by the dynamics of two opposing forces. In the theories of Eckartshausen on the three reigns of nature, the mission of humanity is to “virginize” the earth and the opaque elements.

Opposed by the academies, Mesmer described, in his thesis of 1766, the influence of the planets on the terrestrial bodies and set out the bases of a universal therapy. In the last decade of the 18th century, we see the vigorous rise of a movement of thought known as “German idealism”. The philosopher → Friedrich Schelling (1775-1854), a major figure of → *Naturphilosophie*, perceived in a flash of intuition the tormented identity of the absolute spirit, incarnated in the flux of history and the life of nature. Within this process of incarnation, human consciousness is the free point in which the organic movements of the divine universe is reflected. Human knowledge is the fruit of God’s self-perception. → Franz von Baader (1765-1841), a reader of Boehme and Saint-Martin, was simultaneously a doctor, theosopher, and mineralogist. In short tracts of a somewhat baroque beauty, he employed strong imagery (lightning, anger, hell) to develop the elements of his mystical naturalism.

From this period of intense cultural renewal in the way of thinking about nature and history, emerged finally the poet → Novalis (1772-1801). He grew up in the pietist community of Wierderstedt, of which he would always retain the contemplative attitude. Novalis read not only Kant, but also Paracelsus, Jacob Boehme, Franz von Baader, and Goethe, pursuing studies in mineralogy and organic chemistry before becoming an engineer. His life took a tragic turn when his fiancée Sophie von Kühn died in 1795. Love prematurely interrupted became the keystone of his mystical quest: ‘this flame consumes little by little that which is earthly in me’, he wrote to his friend Friedrich Schlegel. From then on, his life became rather like an incarnated Illuminist myth, in which the resurrected Christ took on the contours of an alchemical metaphor. To survive death, for Novalis, is possible only by making life divine. Novalis met the German philosopher Fichte, studied under the dramatist Schiller at Jena, and met Schelling at the end of the 1790s. For this universal spirit, knowledge was “one”: in a network of correspondences, poetry, religion, chemistry, and philosophy were combined. To open oneself to the life of absolute knowledge, he suggested one must consider poetry as experience, see that the true knowledge of nature is an art, and that the science of numbers is the very life of the gods.

Imagination

1. CLASSICAL THEORIES

(A. ARISTOTELIANISM B. GALENISM

C. NEOPLATONISM AND HERMETISM)

2. MEDIEVAL THEORIES (A. ARABIC

AUTHORS B. LATIN AUTHORS) 3. THE

RENAISSANCE SYNTHESIS 4. THE CREATIVE

IMAGINATION 5. DEVELOPMENTS IN THE

19TH AND 20TH CENTURIES

According to a tradition derived from Aristotle, the imagination (Greek *phantasia*; Latin: *imaginatio*) is a faculty of knowledge intermediary between the senses and the intellect or rational intelligence.

Together with the "common sense" (*to krinon* or *sensus communis*) and the memory it belongs to the so-called "interior senses"; but one also sometimes encounters it as equivalent to these different senses taken together. Aristotle says that *phantasia* derives from φῶς (light, or glow) and is primarily visually oriented. Its function is to transform sensory impressions into images. The imagination stands under the dominion of reason, which distinguishes man from other creatures. Whenever reason loses its vigilance, for example during illness or sleep, the *phantasmata* can use the opportunity to lead their own life and create disturbing effects.

In the Latin and Arab tradition there has been much speculation about how the imagination can influence a person's own body, but it was sometimes believed to have the power to influence the spirit or body of other persons as well, and in a magical context it could even be the medium by means of which the magus could cause epidemics, heavy rains or other natural disasters. Due to the imagination's power over the spirit or body of other persons, it plays a role in theories of love. And frequent reference was made to the example, which has its origin in Quintilianus (35-96/8), of the influence exerted on the fetus of what the mother was seeing at the time of conception, either in her mind or in reality. For example, if she had been thinking of an Ethiopian, the child would be born black; but if she had been looking at certain images or paintings, the child would be beautiful, even if the father was ugly. The imagination was also believed to have an influence on animals; a frequent example was the story of Jacob, whose cattle produced striped or speckled offspring because he had put patterned rods in the water troughs (Gen. 30:25-43).

Finally, in a mystical and esoteric context the imagination has been believed to give access to levels of reality deeper than those that can be experienced by the senses, and thus to function as a domain of mediation between different ontological planes. As such it enables man to transcend the material world and gain access to the divine. In other words, the imagination could become a bridge between microcosm and macrocosm.

1. CLASSICAL THEORIES

In Greek philosophy and in later Latin traditions, three main currents can be distinguished concerning theories of the imagination: an Aristotelian, a Galenist, and a Neoplatonic one.

A. ARISTOTELIANISM

The Aristotelian current has been most influential. Aristotle limits his treatment of the concept of

phantasia to the part of the soul that is concerned with perception. In his *Parva naturalia* and *De anima* he adds to the five senses a sixth function, called the *sensus communis*, which compares the experiences of the senses with one another and bestows unity on them. Qualities such as time, size, number and movement, which influence more than one sense, belong to the *sensus communis*. To this, Aristotle adds the term *phantasia* (*De Anima* III, 3, 429 a 1-2). On the one hand, it stands for a sense impression which differs from other sense experiences, in that it continues to exist even when the object that caused it is no longer present. On the other hand, it stands for the cognitive power by means of which we can make an image appear in our mind.

Aristotle's most consistent statement about *phantasia* is that it forms a bridge between perception and intellect, because the soul does not think without images (*De Anima* III, 7, 431 a 16). In *De Memoria* he remarks that the memory and the imagination are both connected with the "common sense", and thus with the "primary perceptive power" (*to proton aisthetikon*). The latter is located in the heart, which is the most important organ and the source of all bodily functions. Sensory impressions are led from the senses to the heart by means of the spirit or *pneuma* (*to symphyton pneuma*; *De insomniis*, 3, 461 b 13-25): a vaporous substance consisting of the same matter from which the stars are made. Having arrived in the heart, the messages originating in the five bodily senses are transformed there in such a manner that they can be understood by the soul. This is done by the *phantasia*, which translates the information received from the senses into *phantasmata*.

As for the *pneuma*, it is also the instrument that makes it possible for the soul to communicate with the body, and to cause it to perform all vital activities, including movement. Referred to as *proton organon*, it bridges the gap between the physical and the nonphysical: it is so subtle that it comes close to the immaterial soul but it is nevertheless material, so that it can communicate with the world of the senses. Without the *pneuma*, body and soul would not be aware of one another. Ontologically, the soul has no window towards the material world; and as for the body, it is merely a combination of natural elements that would immediately fall apart without the soul.

Aristotelian concepts of *pneuma* were based upon the medical theories of authors such as Alcmaeon of Croton (ca. 500-450 BC), Empedocles (ca. 450 BC) and Hippocrates (460-377 BC). After Aristotle, the idea that spiritual processes can be explained physiologically was further developed

by the Stoics, and in particular by Zeno of Citium (333-264 BC). The theory of *pneuma* is central to the analogical worldview which provided a foundation for the magic of late antiquity. For the Stoics, the *pneuma* permeates the entire body and governs its activities. The "governing power" (*hegemonikon*) resides in the heart; there it receives the pneumatic currents from all the senses and converts them into *phantasmata* that can be understood by the intellect. The *hegemonikon* organizes the information it receives, and produces impressions in the human soul.

According to Couliano the phantasm has primacy over the word because in terms of classical theory, the soul dominates the body; accordingly, thinking precedes language. It follows that, next to a grammar of spoken language, there must exist a grammar of thought independent of language. Only the intellect is capable of understanding this "phantastic grammar". The attempt to understand this grammar and thus gain access to the hidden powers of the soul would become basic, Couliano concludes, to 'all the phantasmic processes of the Renaissance: Eros, the Art of Memory, theoretical magic, alchemy, and practical magic' (1987, 6).

B. GALENISM

Galenus (129-ca. 201), court physician of Marcus Aurelius, further develops the aristotelian approach. According to him, the power of perception is not located in the heart but in the brain. The brain functions consist of perception, movement and the *hegemonikon*. The latter is threefold, consisting of a phantastic part (*phantastikon*), a rational part (*dianoetikon*) and the memory (*mnemoneutikon*) (*De symptomatum differentiis*, 3). All these brain functions make use of the "spirits" or *pneuma psychikon* as their instrument (*De locis affectis*, III, 9; note that whereas the *pneuma psychikon* is located in the brain, Galenus distinguishes it from the vital *pneuma*, located in the left ventricle of the heart. He believes that through the arteries there flows a mixture of blood and *pneuma*).

For Galenus, the *phantasia* seems to have a function similar to that in Aristotle: it enables the soul to store sensory impressions, and it contains mental images. Like other bodily functions, the *phantasia* is subject to physical disturbances, which in Galenus' theory are almost invariably linked to a disbalance of the bodily fluids: blood, phlegm, and red and black bile. A surplus of black bile, or melancholy, leads to a cold and dry spirit and may cause the imagination to degenerate into hallucinations (*De locis affectis*, III, 10).

Galenus' threefold *hegemonikon* was adopted by later authors, and located in the brain ventricles.

Thus the Syrian bishop Nemesius of Emesa (4th century CE) writes in his *De natura hominis* that the *phantastikon* is located in the brain's front part, the *dianoetikon* in the middle, and the *mnemoneutikon* in the back. This theory was adopted by Johannes Damascenus (670-ca. 753 CE) in his *De fide orthodoxa*, and by early Arabic medical authors.

C. NEOPLATONISM

Neoplatonism assigned a much more important role to the imagination than the Aristotelian and Galenist currents. According to Plotinus, at birth the human soul descends from the intelligible world, that consists of the so-called "three first principles" or *hypostases*: the One, the Intellect (*Nous*) and the (World-)Soul (*Psyche*). All the individual human souls emanate from the *Nous* in order to unite with the lower material world. In death, but also in states of contemplation during life, they can return to the splendour of the intelligible world. Note, however, that according to Plotinus a small part of the human soul always remains in the intelligible world (*Enn.* IV.8.8.1-4; IV.3.12.1-5; I.1).

In Plotinus, the soul's functions are intellect (*dianoia*), reason (*nous*) and the imagination (note that the distinction between reason and intellect is obscured by the fact that sometimes Plotinus uses the word *nous* for both, next to the already mentioned hypostasis *Nous* [Blumenthal 1996, 91]). The lower part of the imagination deals with sensory perception, and is sometimes referred to as "nature" (*physis*); the higher part of the imagination consists of the *phantastikon*. All these functions of the soul are located in the brain, the *phantastikon* being the connecting link between the lower and higher part of the soul. On the one hand it is connected with thinking, but it belongs to the lower part of the soul and cannot be separated from matter, the experiences of the body and the humors that influence the body. The soul as a whole again plays a mediating role between the higher and the lower world.

Although Plotinus speaks of "parts" of the soul, he repeatedly emphasizes its essential unity. According to him, man must submit his imagination to the intellect in order to escape the lures of the body. For only if the imagination is held in check, will the soul be able to leave the material world behind and ascend to the intelligible world.

There is a peculiar ambiguity in Plotinus' descriptions of the soul, which has its background's in Plato. In the *Phaedo* we find the idea that the soul resides in the body as though in a prison, and

is liberated from it at death (*Phaedo* 63-69, 81A); a similar idea is also found in the *Phaedrus*. But later, in the *Timaeus*, Plato is much more positive about the material world, which has been carefully built by the demiurge, in imitation of a prototype in his own spirit (*Timaeus* 29-30). Accordingly, in Plotinus one may find passages according to which the soul is dragged down by matter, as well as others according to which the soul moulds formless matter into a splendid reflection of the higher world.

The Neoplatonists who followed in Plotinus' footsteps developed theurgical practices in order to restore the contact between man and the divine, and here the *phantasia* played an important role. Iamblichus and Proclus identify the "phantastic *pneuma*" of the Aristotelian and Galenist tradition with the ethereal body or *ochêma*, the subtle substance that according to Neoplatonic metaphysics surrounds the soul. Because the ethereal body has a subtle material nature, the *phantasia* that resides in it can react to sensory impressions such as smells, vapours and sounds; accordingly it can be influenced by ritual practices that involve e.g. fasting, incense and spoken formulas. As part of the ethereal body, the *phantasia* continues to exist after the death of the material body.

In *De insomniis* of the bishop Synesius of Cyrene (ca. 373-ca. 414) the imagination gains cosmic importance: even prior to incarnation it has the capacity of storing information that derives from the planetary spheres and the metaphysical realm. Dreams, visions, prophecies and other functions of the *phantasia* are given a key role in philosophical discussion and religious practice. Generally speaking, the Neoplatonists believed that the imagination, being part of the ethereal body, can be influenced by smells, vapours and sounds; these are also capable of attracting powers from the world soul. Plotinus also speaks about attracting the world soul by means of statues, which like a mirror can receive its image (*Enn.* IV, 3, 11). This idea was transmitted by several important Arabic thinkers, and it has also influenced Renaissance philosophers like Ficino. Thus the imagination came to play a functional role in magical practice.

2. MEDIEVAL THEORIES

A. ARABIC THINKERS

The works of Aristotle, Galen and the Neoplatonists were translated into Arabic, and from the 9th century onwards philosophy and the sciences were flourishing in the Islamic world. This created a fertile context for further theories about the imagination and the faculties of the soul.

In → al-Kindi's theory of rays, the imagination plays an important role in explaining magical effects. According to al-Kindi every thing in the *machina mundana* has a center that, like the stars, sends out rays. The human imagination also sends out such rays, by means of which it can imprint forms into matter; as a result, man is able to exert a strong influence on matter.

According to → Avicenna, as well, the soul has significant power over matter, which is subject to it. The soul, if properly cleansed of bodily impurities, can function like a mirror that receives the astral powers and reflect them on to the environment. Whatever is present in the imagination, it can transmit to matter, thereby becoming a *dator formarum*. By virtue of the imagination, the soul can also cure illnesses or produce rain and fertility, as well as natural disasters or epidemics. The magus can use the powers of the soul to act at distance, thus becoming like an earthly god. All this is possible because the soul is related to the formative principles. Avicenna also adopts Aristotelian theories about the powers of the soul, and orders them within a comprehensive hierarchy. Parallel to the five senses of exterior perception, there are five inner senses: the *sensus communis* (common sense), the *imaginatio* (which contains images), the *phantasia* (which combines them), the *vis aestimativa* (which judges them) and the *memoria* (which remembers them). These five functions are located in the three parts of the brain, which is reminiscent of Galen.

Al-Ghazali (ca. 1059-1111) likewise discusses the far-reaching powers of the soul, which is ontologically superior to matter and can imprint forms onto it at will. Just like the astral powers influence the sublunar sphere, the soul can influence the material world. The magus would even be able, or so he claims, to force a camel into a turkish bath. Like other Arabic thinkers, he considers several options to account for these powers of the soul: they might be mediated by vapours, particles, spirits, or rays. Al-Ghazali considers that the imagination is put into action by means of *fascinatio*, which has a power of enchantment like love, and works by means of sympathy and antipathy. The lover seeks to enchant the beloved by whispering sweet words, and the magus works similarly, transmitting by way of his eyes the particles by means of which he submits a weaker mind to his own. Al-Ghazali believes that by means of *fascinatio* one can disturb another person's mind, and even kill him (something which, by the way, was emphatically denied by → Albertus Magnus). The magical imagination has its place within a "holistic" uni-

verse in which influences can move into all directions, whereas the scholastic worldview recognized only an influence of the higher over the lower.

According to Rahman (1964, 168-169), some Arabic thinkers assigned to the imagination an ontological status much more important than what is found in the classical Neoplatonists. For example, Porphyry described how after death the soul leaves the body by means of the *ochêma*, which eventually is left behind as well. Avicenna, however, believed that the soul takes the *imaginatio* with it; it is by means of the imagination that the soul can experience the pains of hell or the state of heavenly bliss. These pains and pleasures are both real and unreal, in a manner comparable to dreams. Al-Suhrawardi (1154-1191) discussed the "realm of suspended images" as a world in between the material and the spiritual, where the soul after death experiences the quasi-physical pleasures of paradise or the pains of hell. The imagination here takes over the role of sensory experiences. Moreover, images from this realm can manifest themselves in the material world as demons or devils.

Finally, the powers of the soul are also discussed in the famous *Picatrix* (*Ghayat al-Hakim fi'l-sibr*). It claims that man has not only a vegetative and an animal soul, but also a "logical soul" that distinguishes him from other creatures (III, 6). The logical soul produces the arts (*artes*), makes what is absent present in thought, and creates images, such as those seen in dreams. The *Picatrix* also presents the *pneuma* as a magical force, referring in that regard to such authorities as → Hermes Trismegistus, and applying it to subjects such as talismans; as is well known, such elements have influenced the thinking of Marsilio Ficino.

B. LATIN AUTHORS

From the end of the 11th century, the major Greek and Arabic works were translated into Latin; and there was a revival of philosophical discussion about the soul and its faculties. Two main periods may be distinguished: one from ca. 1100-1220, largely dominated by Christian Neoplatonism, and one from 1220 on, when Aristotelianism gained the upper hand.

The most influential work on the soul and the imagination from the first period is the *Liber de spiritu et anima*, ascribed to Alcher of Clairvaux. It is a collection of various Christian thinkers, including → Augustine (354-430), Alcuin (ca. 732-804) and Hugh of St. Victor (1096-1141), but Alcher also appears to be familiar with Plotinus. The soul's ascent and liberation from the material world is

presented as the goal that gives meaning to human life; and this is described as a process of interior ascent through the realms of the soul. Along the lines of Boethius (ca. 480-ca. 525), the powers of the soul are presented as sensory perception, imagination, reason, and intellect. Again, the imagination here plays the role of mediator between the material world and the world of the intellect, thereby highlighting man's inner duality. In order to see God, the soul must separate itself from the imagination that binds it to matter; the result is a christianization of Neoplatonic theurgy, which has become an inner mystical ascent by means of contemplation. The *Liber de spiritu et anima* also contains Galenist elements, such as the notion that the imagination is subject to the bodily fluids. To give one example, it is claimed that the dreams of choleric are different from those of melancholics.

During the second period, theories about the imagination take the form of commentaries on Aristotle's *De anima*. → Albertus Magnus provides discussions about the soul with an Aristotelian foundation, referring to authors like Avicenna. He adopts the latter's series of five inner senses (see above). The *imaginatio* makes it possible to perceive the qualities of an image if its original is absent, and it produces a reservoir of images that can be used for thinking, dreams and visions. The *phantasia*'s function is to distinguish such images and re-combine them, thereby creating new images (e.g. that of a centaur). In terms of Aristotelian philosophy of nature, *imaginatio* is preferably "cold and hard", because it must be able to solidly retain the forms (in this context the imagination is frequently compared with wax); *phantasia*, on the other hand, must be "warm and moist" so as to enable the images to flow into one another. Albertus also describes the location of these functions in the brain ventricles: the *sensus communis* and *imaginatio* are in the first ventricle, the *phantasia* and *vis aestimativa* in the second, and the *memoria* in the third. The connecting element is, again, the *pneuma* or *spiritus*, which flows from the last ventricle to the spinal sinews and thus mediates between the brain and the bodily movements. Due to this connection certain physical disturbances may cause hallucinations. Albertus's theory of the inner senses is dependent on classical as well as Arabic thinkers, and may also reflect the influence of Costa ben Luca's (864-923) *De differentia animae et spiritus*. Albertus's model was adopted inter alia by Thomas Aquinas (ca. 1225 - 1274).

The imagination also influenced Franciscus of Assisi's theory about the *stigmata*, as reflected in particular by Jacobus of Voragine (ca. 1230-1298)

and Thomas of Celano (ca. 1200-ca. 1255). Its concomitant physio-pathological theories spread beyond university circles and influenced literary theories about love, for example in Andreas Capellanus (*De amore*, ca. 1185), Guillaume de Lorris and Jean de Meung (*Roman de la Rose*, 1230-1275), and → Dante and the *Dolce Stil Novo* (ca. 1300). In these traditions we find the idea that a woman's *phantasmata* may take possession of her lover's pneumatic system. Complex games may be played with the relation between illusion and reality, and sometimes the literary work is presented as a dream.

3. THE RENAISSANCE SYNTHESIS

Since the 15th century, new translations of ancient authorities and the discovery of previously unknown authors caused the theory of the imagination to develop into new directions. For example, the physician Niccolò Tignosi da Foligno (1402-1474) used a new translation of Aristotle's *De anima* by Johannes Argyropoulos (1410-1487). He remarked that Aristotle in fact mentioned only three inner senses (*sensus communis*, *imaginatio*, *memoria*), since – contrary to Avicenna and Albertus Magnus – he considered the *imaginatio*, the *phantasia* and the *vis aestimativa* as one single function. This point was developed even more pronouncedly by his pupil → Marsilio Ficino, who builds upon Neoplatonic, Aristotelian, Galenist and medieval traditions, but whose ideas about the imagination constitute an important new phase of development. Due to Ficino's translations of Plato, the *Corpus Hermeticum*, → Plotinus, Porphyry, Proclus, Iamblichus, Synesius and → Pseudo-Dionysius Areopagita, Neoplatonic notions came to play a dominant role in his concept of the soul. Ficino discusses the imagination particularly in his *Theologia Platonica* XIII, his commentaries on Priscianus Lydus and on Plato's *Phaedrus*, and his *De vita coelitus comparanda*. A certain ambivalence about the soul and the imagination that we already found in Plotinus can be encountered in Ficino as well.

Ficino's less than positive opinions about the imagination are particularly clear in his *Theologia Platonica* and his commentary on the *Phaedrus*. In the former, Ficino adopts Boethius' powers of the soul (sensory perception, imagination, reason, intellect) and associates them with the steps by means of which the soul can gradually elevate itself to the divine world (see e.g. *Theol. Plat.* XVI, 3). He describes an eternal process of descent and ascent, in which light moves downward from the divine world down to the world of matter and

the soul reversely moves upwards to reunite with the divine light. As emphasized by Michael Allen (1984, 61), this ascent of the soul is primarily a spiritual and internal one. The highest part of the human soul is the intellect, which directly reflects the divine light like a mirror; in relation to it, reason and imagination are like shadows of the intellect. Referring to the *Phaedrus*' famous image of the soul's chariot, Ficino compared the imagination with the bad horse.

However, the imagination and the senses also have more positive functions in Ficino's thought. Since man is created after God's image, his soul contains the images of the basic principles or ideas after which the world has been created. Knowledge of these ideas is therefore potentially present in the soul, and can be actualized by the experience of sensual beauty, as a result of which the soul remembers the beauty of the divine ideas. Thus it is by means of the senses and the imagination that man is reminded of his divine origin. Furthermore, the soul may ascend by means of the so-called *furores* (frenzies): states of ecstasy particularly associated with melancholics, whose high concentration of black bile in the body amplifies their faculty of imagination. Ficino's *De vita coelitus comparanda* (written shortly after his translation of Synesius, who among the Neoplatonists attaches most importance to the power of the imagination) describes how one may attract the astral powers by means of smells, vapours, sounds, and images. If, in such contexts, one merely relies on the → correspondences between materials and their astral counterparts, the effect is less strong than if one adds the power of the imagination. Furthermore, Ficino describes the beneficent effect of making and contemplating an *imago mundi*: an image of the universe. As suggested by Frances A. Yates, such passages may reflect the influence of the *Corpus Hermeticum*, particularly C.H. XI, 18-22, which describes how one should imagine oneself to be present in the entire universe; and she also brings them in connection with the classical art of memory [→ Mnemonics].

Gianfrancesco Pico della Mirandola's (1469-1533) *De imaginatione* is largely Aristotelian, and strongly influenced by Savonarola (1452-1498). In the context of a strongly ascetic type of personal piety, it emphasizes that without divine grace and revelation the human mind is incapable of gaining access to religious truth. Like Ficino, Gianfrancesco Pico adopts Boethius' four powers of the soul, with the imagination as the connecting link between corporeal and incorporeal realities. Because the imagination connects the soul with mat-

ter, it can be seen as "the human faculty as such": it may be used for good as well as for evil (cf. Giovanni Pico della Mirandola's similar emphasis on man as located in the centre of creation, and free to direct himself upwards to the divine or move downwards to the level of beasts). Gianfrancesco Pico was the first to call attention to the shift of meaning that had taken place from the Greek *phantasia*, literally meaning "sense impression", to the Latin translation *imaginatio*, which refers rather to a faculty of the soul. Like Ficino, Gianfrancesco Pico tends to unite all the inner senses under the heading of "*imaginatio*". Our imagination depends on the bodily temperaments, on our perceptions of things, on our faculty of judgment, and on the influence of demons or angels. As regards our faculty of judgment, we can and should allow it to be led by our intellect (*dianoia*) and our reason (*nous*). With reference to the *Enchiridion* of the Stoic author Epictetus (then recently translated from the Greek by Angelo Poliziano [1454-1493]), Gianfrancesco describes how these functions can be used against the irrationality of the imagination. It is through the intellect that man can have access to the angels and pure spirits who serve God.

Gianfrancesco Pico's *De imaginatione* was translated into French by Jean-Antoine de Baif (1532-1589), member of the Pléiade and one of the founders of the *Académie de poesie et de musique*. Influenced by Ficino, the main goal of this academy was to use → music so as to have a beneficent effect on the moral and emotional faculties of the listener. Music could do this by means of the imagination. Ficino had already discussed the imagination in relation with music and poetry; and indeed, already in late antiquity connections with the arts had been drawn by e.g. Quintilianus and Philostratus (ca. 171-ca. 247), who were much read in 15th-century humanist circles. Connections between the imagination and the visual arts began to be drawn in 15th-century Italian art theory, notably with Filarete (ca. 1400-1469) and Leonardo da Vinci (1452-1519), who discussed the imagination as an "inner sense". From the 16th century on, the imagination became a topic in art-theoretical treatises by authors such as Gian Paolo Lomazzo (1538-1600) and Federico Zuccari (1540-1609). Simultaneously, of course, it played a prominent role in the new tradition of Renaissance magic that developed in the wake of Ficino, with → Cornelius Agrippa's *De occulta philosophia* (esp. I, 61-68; III, 43) as a particularly prominent example. In all the authors associated with this trend, traditional notions of the imagination are routinely described as an obvious part of what *magia naturalis* is all about; but

with the notably exception of a new tradition started by → Paracelsus (see below), no important innovations seem to have taken place on the theoretical level.

Gianfrancesco Pico della Mirandola must also be mentioned as an important early representative of the “anti-hermetic reaction” that developed during the 16th century in reaction to the new popularity of *magia naturalis*, and that questioned the alleged “transitive” powers of the imagination (i.e., its ability to influence the external world). Pico’s *De rerum praenotione* (1506-1507) contains a general attack on the magical tradition, with an entire chapter devoted to al-Kindi’s theory, and his *Strix, sive de ludificatione daemonum* (1523) addresses the → witchcraft controversy with frequent references to the imagination. Another crucial author in this context, the protestant Thomas Erastus (1524-1583), strongly refuted belief in the transitive powers of the imagination in the first volume of his *Disputationes de medicina nova Paracelsi* (1571). Alain Godet (1982, 49) emphasizes the political implications: if the natural faculty of the imagination was not capable of influencing the outside world, the magical powers that witches were believed to possess could only be explained by help from the devil. Refutations of *magia naturalis* in the Ficinian tradition could therefore function as legitimation for the witchcraft persecutions. The essentials of Erastus’ criticism of the imagination were repeated by a whole series of later Protestant authors, such as e.g. Georg Gödelmann (*Tractatus de Magis, Veneficis et Lamiis . . .*, 1591) or Otto Casmann (*Angelographia*, 1597); but the transitive powers of the imagination are also rejected by authors in the Roman Catholic camp, such as e.g. Martin del Rio (*Disquisitiones magicae* [1599-1600], I, 3) and, perhaps surprisingly, → Tommaso Campanella (*De sensu rerum et magia* [1620], IV, 2).

4. THE CREATIVE IMAGINATION

The authors discussed so far typically belonged to highly educated intellectual elites, and developed their theories by means of the essentially conservative method of exegetical commentary on earlier authorities. This changes with the visionary rather than exegetical and erudite discourse initiated by Paracelsus, who lay the foundations of what might be called the “creative imagination”. Although traditional perceptions of Paracelsus as a wholly independent creative genius are untenable (and reflective of Third Reich ideologies: Paracelsus as the quintessentially Germanic hero, the “Luther of medicine” uninfluenced by Galenic,

Arabic, or, most of all, Jewish traditions), he is nevertheless at the origin of an innovative discourse of the imagination that can be traced through Christian theosophical authors up to German → Romanticism and beyond. Clearly indebted to Florentine (neo)platonism and the occult philosophies that emanated from it, Paracelsus did inherit the full range of traditional notions of the imagination considered as a cognitive faculty of the soul or as a power that could “magically” influence one’s own body or the external world, and he abundantly used them in his medical work. He went beyond them, however, in presenting the imagination as not just a human faculty but a fundamental cosmic power of creation, crucially connected with will and desire. Using a strongly organic and sexualized language – replete with images of conception, generation, birth and incarnation – Paracelsus describes how the soul, spurned by desire, uses the power of the imagination to create images, which are, quite literally, the “bodily” incarnations of thought. As formulated by Alexandre Koyré (1971, 98): ‘The image is a body in which the thought and the will of the soul are incarnated. The soul that gives birth to thoughts, ideas, and desires, gives them an existence *sui generis* by means of the imagination’. It is likewise by means of the imagination that God’s primal will or desire “magically” created – or rather, gave birth to – the world; and the creation of the macrosmic heaven is mirrored by that of the human microcosm: ‘. . . just like a human being builds earth according to his will and by means of his body, by means of his imagination he also builds heaven in his own *Gestirn* . . . the imagination is confirmed and completed by faith . . . Fantasy is not *Imaginatio*, but a cornerstone of fools . . .’ (Sudhoff ed., X, 474-475). The latter distinction would remain a staple of the imagination discourse in the following centuries: fantasy, according to Paracelsus, merely consists of unconnected images floating around in our mind, which may lead us astray but are devoid of inherent power. The imagination, in sharp contrast, is grounded in the very nature of being; focused and carried by the will, it is the magical power *par excellence* for which almost nothing is impossible.

This amplification of the imagination into a creative power of cosmic proportions, within an organic, sexualized and visionary (rather than exegetical) discourse, is abundantly present in a variety of later Paracelsian authors. For → Joan Baptista van Helmont, for example, the power of the imagination is central to all life processes (generation, birth, and the maintenance of organic life) as well as to the uniquely human power of bringing

forth new creative ideas; and for Oswald Croll, it is due to his “*vis imaginativa*” that the human microcosm has unlimited power to work in the macrocosm (Godet 1982, 90–94). Typical for later paracelsian and related discourses is the strong emphasis on “incarnational” language, suggesting that by means of the imagination the human mind is capable of creating “entities” with a quasi-autonomous existence. Such a notion is, however, certainly not rooted in Paracelsus alone. For example, already Ficino suggested that by means of music one may create ‘a kind of airy and rational animal’ (*De vita coelitus comparanda* 21, 81–85; cf. Allen 1989, ch. 5); he could find support for such notions already in al-Kindi, who wrote that ‘when man, using his imagination, conceives of some corporeal thing, this thing acquires an actual existence according to the species in the imaginative spirit’ (*De radiis* V); and → Lazzarelli believed that the regenerated “new man” is capable of literally creating souls (*Crater Hermetis* 27.1ff). According to later authors such as e.g. Fabio Paolini, ‘feelings and conceptions of our souls can by the force of the imagination be rendered volatile and corporeal, so that, in accordance with their quality, they can be carried up to certain stars and planets [and] will come down again to us and will obey us in whatever we want’ (*Hebdomades*, 1589; see Walker 1958, 136). More research would be needed to trace the precise historical development of such notions, and to determine the relative importance of neoplatonic, kabbalistic and paracelsian notions.

The paracelsian combination of imagination with desire came to full development in → Jacob Boehme’s cosmology. The “birth of God” as described by Boehme begins with the primal desire awakening in the *Ungrund*, that wants to know itself. First, it is by means of the imagination that the *Ungrund* conjures up the image of Wisdom (Sophia), as a mirror in which it can contemplate itself; and next, burning with desire to unite with that image, it takes possession of it and uses the creative power of the imagination to give it concrete form, thereby literally engendering and giving birth to “Eternal Nature” – the manifestation of God as a pleromatic body of light. While originally desire and imagination were inextricably linked, they became separated when the paradisaical unity was broken and desire degenerated into what Boehme calls *Begierde*; as felicitously formulated by Faivre (2000, 106), ‘the original fall was nothing more than a perversion of desire by the imagination’.

Here we see clearly how, mediated by Paracelsus, the imagination has become, first and foremost, the

theogonic and cosmogonic power of creation itself. Diametrically opposed to common present-day notions of “reality versus (mere) imagination”, the (divine) imagination and its products *are* the very essence of reality. This fundamental notion would, eventually, lead to the opposition typical of German Romanticism (paradigmatically in authors such as → Schubert or → Kerner) between “Nature” [Natur] and “Reality” [Wirklichkeit]: the former refers to the deeper spiritual being of the world, to which the human soul has access by means of the imagination, whereas the latter is a limited and artificial illusion created by the blindness of the merely rational mind. Thus the cold and hard light of reason causes reality to petrify into an impoverished caricature of its actual being; but this “daylight perspective” dominated by mere rationality is opposed against the “nightside of nature” (Crowe 1848) dominated by the soul and its deep imaginative powers, that awaken during our sleep and cause us to experience dreams, but are also evident in various “occult” phenomena considered anomalous from a rationalist perspective. The terms *magia* and *imagination* are considered etymologically related, as reflective of their profound interconnection in terms of an “enchanted world”. This Romantic perspective was the outcome of a long development, leading from the time of Boehme through the various representatives of → Christian theosophy of the 17th and 18th centuries, many of whom (e.g. → Jane Lead, → John Pordage or → Johann Georg Gichtel), were primarily visionaries who, one might say, are actually describing the contents and products of their own creative imagination. The theosophical discourse on the imagination was further developed by important 18th- and 19th-century theosophers such as → Louis-Claude de Saint-Martin and → Franz von Baader (see Faivre 2000, esp. 143–149), and continued beyond the Romantic period in various late- and postromantic forms, such as e.g. Baudelaire. The red thread in this complex historical development consists of an emphasis on the human faculty of imagination as safeguarding the possibility of overcoming the effects of the Fall – whether caused by Lucifer’s rebellion or reflected in the *hubris* of mere human reason – and finding the way back to the reintegration with (and of) Eternal Nature, the body of God.

5. DEVELOPMENTS IN THE 19TH AND 20TH CENTURIES

In the wake of the Enlightenment and Romanticism, the theme of the imagination has been taken up by a variety of authors, especially in the field of

literature and literary criticism. It is as yet far from clear to what extent the ideas of e.g. Voltaire (who distinguished between the undisciplined “passive imagination” and the “active imagination” characteristic of genius), Diderot (who denied that the imagination has any creative powers), Coleridge (with his famous distinctions between the primary imagination, secondary imagination, and fancy – distinctions that are commonly, although incorrectly, assumed to have been invented by him), Wordsworth (who criticized Coleridge’s distinction between imagination and fancy), and many others must be seen as re-enactments of positions derived from the traditions outlined above, or as relatively independent new departures. Generally speaking, scholars investigating such authors have tended to concentrate on how they reacted to well-known philosophical debates and authors, notably Hume and Kant. While the great importance of those backgrounds is not in any doubt, the relevance of pre-critical neoplatonic, paracelsian and theosophical traditions has traditionally been underestimated, and requires more research.

In the present context we will have to restrict ourselves to the role of the imagination specifically in esoteric and occultist contexts, but not before having emphasized that such a focus is mostly inspired by pragmatic considerations and is in fact artificial to a considerable degree: the boundaries between Western esotericism and the fields of art and literature in the 19th and 20th centuries are often vague and shifting (with a figure such as → William Blake, in whose personal mythology the imagination is personified by the entity Los and associated with Christ, participating equally in all three domains), and the frequent phenomenon of a migration of ideas and discursive transfers occurring between these various domains is of particular relevance and importance.

The status and powers of the imagination played an important role in the debate around mesmerism [→ Animal Magnetism / Mesmerism] investigated by a French committee in 1784. As explained by Méheust (1999, I, 322-328, 333), the committee members found themselves faced with a dilemma. They rejected Mesmer’s notion of an invisible “fluid”, and hence found themselves incapable of explaining the spectacular paranormal and healing phenomena claimed by him, other than as products of “the imagination”, a term that had obviously negative connotations from their Enlightenment perspective; but ironically, in doing so they ended up attributing to the imagination powers that, from that same perspective, it was not supposed to have. They thus opened up a “pandora’s box” that

made it possible for some mesmerists – referred to as the “imaginationist” current – to argue that the magnetizer’s will had the effect of liberating the powers of the patient’s imagination, which were considered capable of completely re-organizing his/her psycho-organic system (Méheust 1999, I, 138, 330-334).

The close connections that had been drawn, ever since Paracelsus, between the “imagination” and the “will” – the latter being the active agent by means of which the former’s formative and creative powers are focused and concentrated – were taken up and further developed in the context of the mesmerist discourse. This combination came to play a central role in the magical theory of → Éliphas Lévi, whose debt to mesmerism can scarcely be overestimated. According to Lévi, the universe is permeated by an “astral light” (clearly modeled after Mesmer’s invisible fluid, but also strongly influenced by Paracelsus, to whom he often refers in this connection), and it is by means of the imagination coupled with the will that one can establish contact with this hidden dimension of reality. It was only a small step, but an important one, to see this hidden and mysterious but universally present “astral light” not only as an invisible “life force” or psycho-physical agent of mediation (similar to Ficino’s “spiritus”), but associate it with the actual experiential realities to which the imagination gives us access, for example in visions and dreams. Reasoning along those lines, occultist authors came to draw the conclusion that this “world of the imagination” is – like the “nightside of nature” of the German Romantics – superior to and, therefore, somehow more “real” than the mere three-dimensional world of the five senses. The “disenchanted” world of the post-Kantian rationalist, subject to the restrictions of time and space, is more illusionary than the world of the imagination, in which those limitations no longer obtain. Thus the stage was set for the concept, central to all forms of 19th and 20th-century occultism, of a “magical plane” parallel to the every-day world.

A central role in this regard was played by the → Hermetic Order of the Golden Dawn, one of whose most important practices focused on attaining “spirit vision” by means of “astral projection”. According to the Golden Dawn teachings, specific occult and ritual techniques make it possible to project one’s spirit out of the “sphere of sensation” and into the “astral plane” of the reified imagination; and essentially the same approach has become a standard element of occultist magic in the 20th century. As pointed out by its most profound analyst, Tanya Luhrmann, the concept of a “separate-

but-connected” magical plane, existing on a different level of reality parallel to the world of the senses, is crucial for understanding how contemporary magicians legitimate magic in a disenchanted world. Its function ‘lies in keeping unhappy bedfellows apart’ (Luhrmann 1989, 276) and allowing the magician to “live in two worlds” while avoiding cognitive dissonance: the rules that apply in the disenchanted world of the senses simply do not apply in the world of the imagination, and the reverse (cf. Hanegraaff 2003). Moreover, since there is no meta-level with rules that apply to both levels, there is no basis for denying the world of the imagination a “reality” at least equal to that of the world of the senses.

The imagination also plays an important role in various other 20th-century forms of esotericism, but all of them seem to be individual variations on the basic approaches that emerged from the 19th-century Romantic, mesmerist and occultist contexts, and their “para-paracelsian” and Christian-theosophical backgrounds. One example is → Carl Gustav Jung’s concept of the “active imagination”, which plays an important role in his psychotherapeutic system. Another is → Rudolf Steiner’s system for “attaining knowledge of higher worlds”, where the imagination is the lowest in a series of three spiritual faculties (followed by inspiration and intuition). And finally, → Henry Corbin – with primary reference to Islamic esotericism, especially Ibn ‘Arabi (Corbin 1969) – introduced a theory that has become highly influential not only in various esoteric currents, but has also left its mark on scholars of Western esotericism of a “religionist” orientation. The imagination, according to Corbin, is both a means of knowledge and a modality of being, and as such it constitutes a *mundus imaginalis*, a “mesocosm” or intermediary reality between the intelligible sphere and the realm of the senses. Corbin coined the term “imaginal” to distinguish his concept from the merely “imaginary” (yet another variation on Paracelsus’ and Coleridge’s distinction between fantasy and imagination), but its ontological status is predictably ambiguous: the imaginal is neither a place nor a non-place, but although Corbin insists on its “reality”, he remains elusive in referring to it by terms such as ‘le pays du non-ou’ (the land of no-where; see Berger 1986, 146). To what extent Corbin’s *mundus imaginalis* is indebted to the currents outlined above is a question that would require further investigation. In any case, as formulated by Steven M. Wasserstrom (1999, 148), the ‘emphasis on the reality of the imagination’s objects has made Corbin a favorite of theorists of poetics for de-

cadés, culminating in his preeminent influence on James Hillman’s post-Jungian archetypal psychology’. By such channels, the Corbinian imagination entered various “counter-cultural” and even → New Age discourses in the wake of the famous Eranos meetings; as such, it continues to influence popular perceptions of Western esotericism.

WOUTER J. HANEGRAAFF

Intermediary Beings I: Antiquity

1. INTRODUCTION 2. DEMONS (2A. GREECE 2B. ISRAEL, JUDAISM, CHRISTIANITY)
3. ANGELS (3A. GREECE 3B. ISRAEL, JUDAISM, CHRISTIANITY)

1. INTRODUCTION

The belief in angels, demons and other intermediary beings has become an important aspect of Western religious thought and imagination, in mainstream Christianity as well as in esoteric currents. Its emergence was mainly the result of the combination of Greek and Jewish ideas about good and evil spirits that have a direct influence on human life. Sometimes these beings are individually distinguished by name, but often they are thought to operate as nameless members of a distinct group, which as a whole is named after the specific activity it deploys. In a further stage of development, especially in the Jewish and Christian tradition, they were conceived of as tightly organized, like an army, with a commander-in-chief (the archangel Michael or Satan) and lower commanding officers.

Under the influence of Christianity, it has become usual in the West to distinguish the evil and good spiritual beings as “demons” and “angels” respectively. For that reason, some aspects of the enormous corpus of material on intermediary beings that has been assembled (in particular by Colpe et al. and Michl) will be discussed here under those headings. Linguistically, these terms derive from the Greek words *daimōn* and *angelos*; historically, the Christian angels have their origin in Judaism, whereas the demons have their roots in both the classical and the Jewish world. It may be useful, however, to emphasize that the distinction between good angels and bad demons is Jewish and Christian: in Antiquity, demons were thought to be both beneficent and harmful.

Intermediary beings of quite another kind are those that are in fact individualized and personified attributes of the godhead, such as the Jewish Wisdom or the gnostic aeons. They are discussed in connection with → Gnosticism.

2. DEMONS

2A. GREECE

The Greek word *daimōn* originally designated a god or, more vaguely, a divine power. From the latter it evolved into an indication of the undetermined superhuman power that causes the good or bad events of human life, i.e. of fate (*kata tina daimona* = by accident). Another line of development led to the idea that souls become demons after death, – a belief that persisted until the end of the classical period and beyond. Already Hesiod (6th century B.C.) says that the people of the Golden Age became ‘pure demons dwelling on the earth, . . . delivering from harm, and guardians of mortal men’ (*Works and Days*, 121–123). This led to the idea of a personal *daimōn* as a tutelary spirit or genius. Every human being has his own *daimōn*, who is given to him at birth, or whom he chooses himself, as Plato says (*Republic*, X, 617e). In Stoic philosophy the *daimōn* was identified with the divine part in man, his *nous*. Thus the emperor Marcus Aurelius said of the *daimōn* (*Meditations*, V, 27) that ‘Zeus has given a particle of himself as leader and guide to everybody, i.e. his mind (*nous*) and reason (*logos*)’. Though the belief in good and bad spirits primarily belonged to the domain of popular religion, the philosophers could not ignore it and, therefore, gave it a place in their reflections (Zintzen, 640–668). The Stoics held that the oracles and other mantic practices were due to the activity of demons. In his treatise *On the decline of the ora-*

cles, which is of great importance for our knowledge of ancient demonology, Plutarch (ca. A.D. 100) ascribed this decline to the gradual disappearance of the demons, who according to him were long-living but not immortal. The Stoic school-head Chrysippus (3rd century B.C.) taught that the gods punished unholy and unrighteous people through evil demons (Plutarch, *Quaestiones Rom.*, 51). According to the hermetic *Asclepius*, 23, 37–38, the statues of the gods in the temples are beneficent or harmful through the demons that have been conjured into them. The demons, which were thought to live in the air (cf. also Ephesians 6:12), played an important role in the fate of the soul after death, *inter alia* in → Hermetism. The *Asclepius*, 28, knows of a chief demon in the air that weighs and judges the soul’s merits and accordingly has it punished or rewarded (cf. also C.H. X, 21; XVI, 10–17). According to John Lydus, *De mensibus* IV, 32 and 149, the Greek version of the *Asclepius* distinguished between ‘avenging demons’ (on earth), ‘cleansing demons’ (in the air), and ‘saving demons’ (on the moon). The Neoplatonists, Iamblichus and Proclus in particular, developed a whole system of *daimones* or “souls” between heaven and earth. They were strongly influenced by the demonology of the so-called *Chaldaean Oracles* (2nd century A.D.), which, however, made a clear distinction between good and bad intermediary beings, by calling the former “angels” and the latter “demons”. This was in accordance with the increasing tendency of later Antiquity to consider the demons as evil beings, which had already become an established fact in Judaism and Christianity.

2B. ISRAEL, JUDAISM, CHRISTIANITY

The development of Israel’s religion into a strict monotheism often involved the admission of other Near Eastern gods or mythological beings into the royal court of JHWH, as his servants. Biblical examples are the ‘sons of God’ (Job 1:6; 2:1; 38:7) – though these apparently could be inclined to evil (Genesis 6:1–4) – and the adoption of mythological beings such as the cherubs (e.g. 1 Samuel 4:4; Isaiah 37:16) and the seraphs (e.g. Isaiah 6). The idea that each people has its own god was accepted at first, but was later rejected: in Psalm 82 these gods (cf. vs. 6: ‘You are gods, . . . children of the most high’) are judged and condemned to death. In the Septuagint (LXX), the Greek translation of the Hebrew bible, the foreign national gods, said to be idols in Hebrew, become demons, e.g. Psalm 95:5 (LXX): ‘All the gods of the nations are demons’. In

the Old Testament the borderline between evil that comes from punishing angels of God and that which is caused by wicked spirits, is difficult to discern. The latter were mostly conceived of as dangerous animals that live in destroyed and deserted places (cf. Isaiah 34:13ff.). A terrifying assistant of JHWH is 'the Destroyer', who killed the firstborn of Egypt (Genesis 12:23) and many Israelites after David's census (then called 'the Destroying Angel': 2 Samuel 24:16; 1 Chronicles 21:15). A negative development is usually ascribed to the character of Satan (though doubted by Day, 730): from a messenger of God (Numbers 22:22-35) and the unfriendly 'Accuser' of Job at the heavenly court, who is nevertheless subject to God (Job 1), he gradually developed into the arch-enemy of God and man (first clearly visible in 1 Chronicles 21:1). Another name for the Prince of Evil became Belial or Beliar (originally a word meaning "wickedness").

In the post-exilic period, the belief in good and evil spirits increased enormously. According to the *Community Rule* of Qumran, 3, 13-26, God has created two Spirits: the Spirit of Truth (also called the Angel or Prince of Light) and the Spirit of Falsehood (the Angel or Prince of Darkness), and accordingly there are two classes of beings: the Sons of Light and the Sons of Darkness. In another famous Qumran writing, the *War of the Sons of Light against the Sons of Darkness*, the latter are also called 'the Army of Belial'. Whereas in the Old Testament the evil spirits are mostly nameless or identified with dangerous animals, the later development shows a tendency to distinguish individual demons by name (Maier, 679-687: a list of 123 demons in the Talmud). It was in Jewish popular religion in particular that the belief in all kinds of spirits assumed enormous proportions, which explains the occurrence of so many Jewish names in Greek magical texts.

The Christians adopted and combined the various forms of Hellenistic and Jewish demonology. The Gospels show Jesus in continuous confrontation with evil spirits, ejecting them from the possessed and forbidding them to reveal his identity (e.g. Mark 1:32-34). The apostle Paul shared the Jewish idea that the pagan gods are actually demons (1 Corinthians 10:20). In this view, which became generally accepted in the early Church, the gods of the Graeco-Roman world were not neutralized, but remained frightening supernatural beings, whose evil activities had to be averted. The idea that demons could be beneficent was abandoned: exorcism became a common Christian practice and the abjuration of the devil became part of the ritual of baptism.

3. ANGELS

3A. GREECE

The Greek word *angelos* means "messenger". If the gods wanted to send a message, they made use of special messengers, often birds or minor gods. The divine messenger *par excellence* was Hermes, who also functioned as guide of the dead to the underworld (cf. → Hermes Trismegistus). In Near Eastern adaptations of the Greek gods, these are sometimes also called *angelos* (Michl, 55: Zeus Hypsistos as 'good angelos'; *Jupiter angelus*). An Orphic Hymn, preserved in Clement of Alexandria, *Stromateis* V, 125, 3 (fragm. 248 Kern), speaks of "angels" that surround the throne of the deity and care for human affairs. In one of the "theological" oracles from Clarus, the gods describe themselves as "angels" of the transcendent Supreme God: 'only a small part of God are we, his angels' (preserved on a wall in the city Oinoanda, in the Greek *Theosophy*, 13, and Lactantius, *Institutiones divinae*, I, 7, 1). In the Greek magical papyri, mention is often made of angels and archangels, but it seems certain that this is due to Jewish or Christian influence. As a whole, the idea of angelic beings, serving at the heavenly court as servants and messengers of the gods, is not Greek but of Near Eastern origin.

In → Neoplatonism, the term "angels" was used for the various levels of being between heaven and earth, and as such it became equivalent to "demons" and "souls" (as a result, one could speak of "angelic demons"). As said above, the *Chaldaean Oracles* distinguished between good angels and bad demons, and accordingly Porphyry taught that the air was filled with bad demons, whereas the ether was the dwelling-place of the angels (→ Augustine, *City of God*, X, 9). It is difficult to determine to what extent these views have been influenced by Jewish and Christian traditions. This seems, however, almost certainly the case when these angels are presented as whole divisions commanded by "archangels", who in their turn are under the supreme command of the gods (Michl, 58f.).

3B. ISRAEL, JUDAISM, CHRISTIANITY

The Hebrew word *mal'āk* is used to designate both a human and a divine messenger. The term primarily indicates a function, not a heavenly being of a specific nature. In the Old Testament, the term *mal'āk* JHWH can be applied to a prophet (e.g. Haggai 1:13; Malachi 2:7), but mostly it indicates a messenger from God, "an angel (or: the Angel) of the Lord". If written with the definite article, the

Angel of the Lord is mostly a manifestation of JHWH himself, probably introduced to have God less directly involved in human affairs.

Only in the later texts of the Old Testament and in Judaism and Christianity the words *mal'āk* and *angelos* became generic terms for the heavenly servants of God. Then also the cherubs and seraphs could be indicated as “angels”, though they had never been conceived of as divine messengers. In early Judaism and Christianity the angels played an increasingly important role in the religious imagination and experience of believers, as is abundantly testified by the Old Testament Apocrypha and Pseudepigrapha and, for instance, the *Revelation of John* in the New Testament. Then it also became possible to speak of the powers of evil as “Angels of Darkness”. The Old Testament expression “Lord of Hosts” led to the idea of separate classes of angels, which were commanded by the seven Archangels. The first text to refer to them, 1 Enoch, 20:1 and 7, mentions Michael, Gabriel, Raphael, Uriel, Raguel, Sariel, and Remiel. Other groups, often mentioned together in Jewish and Christian writings, are “Thrones”, “Sovereignities”, “Authorities”, “Powers”, etc. (e.g. Colossians 1:16; 1 Corinthians 15:5; Michl, 79-80, 112-114).

The angels were thought to fulfil all kinds of duties with respect to the world and man. A special type of angels, which has to be mentioned here because of the great importance attached to it in Western Christendom, is that of the guardian angel. Just as all peoples have their own special angels, likewise each individual has his personal angel. This view seems influenced by the Pythagorean interpretation of the Greek idea of the personal *daimōn*, discussed above. The Pythagoreans connected it with that of the *eidōlon*, the recognizable unsubstantial shape of the deceased in the underworld, and identified this entity with the pre-existent soul. In the Jewish world this led to the idea that the guardian angel lives in heaven and resembles the person he is assigned to. In the Talmud, the guardian angel is indicated by the Greek loan word *iqonin*, i.e. “image” (*Deut. Rabba* 4, 201d). In Matthew 18:10, Jesus says of the little children that ‘they have their (guardian) angels in heaven, who look continually on the face of my heavenly Father’, and in Acts 12:15, the disciples, who cannot believe that Peter is knocking on the door, assume: ‘It must be his angel’. This idea of a heavenly counterpart of each individual was still held in the 3rd-century Jewish-Christian community in Mesopotamia in which → Mani grew up: he twice received an appearance of his heavenly twin.

In the Christian Church, especially that of the

East, the cult of angels and speculations about their nature and influences on human life flourished enormously, not only among ordinary people, but also among theologians (cf. the catalogue of 269 angels in Michl, 200-239). A typically Christian innovation is the assumption of nine angelic choirs, which is first attested in the 4th century (Michl, 171-174). → Pseudo-Dionysius Areopagita (ca. 500) divided the nine choirs into three groups in ascending order: 1. Angels, Archangels, Principalities, 2. Powers, Dominions, Forces, 3. Thrones, Cherubs, Seraphs. This angelology became generally accepted, not only in the East, but also in the West, especially after → Scottus Eriugena’s translation of the Areopagite’s works.

ROELOF VAN DEN BROEK

Intermediary Beings II: Middle Ages

1. INTERMEDIARY BEINGS WITH A CLEAR RELATION TO LITURGICAL SOURCES

2. INTERMEDIARY BEINGS WITH BACKGROUNDS IN SOURCES OUTSIDE THE LITURGY

Intermediary beings are not separable from their modes of relation to living people, nor from the narratives and ritual processes through which these relations are enacted and interpreted. In the medieval context, the Catholic, institutional and acceptable forms of ritual process through which these relations often took place (such as the exorcism of demons, the conjuring of ghosts, the liturgical invocations of angels and saints in litanies for specific occasions) must be borne in mind when considering more private, extra-institutional ritual processes (such as the invocations of angels

described in texts like the *Ars notoria* or the commanding of demons in necromantic experiments). These extra-institutional practices often derived from liturgical rituals or had a conscious relation to them, as too, in other ways, did the spontaneous visitations of such beings (also extra-institutional in principle) recounted by visionaries like Margery Kempe or Joan of Arc.

In the later middle ages, new strands of intermediary beings begin to become visible with greater frequency in the cosmological tapestry. In some texts, hierarchies of named and categorized demons appear; planetary angels and more ambiguous entities begin to be described, deriving in some cases from Old Testament apocrypha or from newly circulating Hebrew sources, in other cases from translations or adaptations from Arabic works. While the origins of particular named angels or demons are not always clear, all angelic beings with strange names (i.e., names apart from the standard set of archangels, Michael, Gabriel and, though apocryphal, Raphael and sometimes Uriel), stand out as foreign against the more limited set of beings it was normal to invoke in Catholic liturgy. Strange angels tended to be regarded as potentially suspect, not necessarily benign whatever they might claim to the contrary, since it was well known that a demon could appear in the guise of an angel of light.

It must be emphasised, however, that the character of any intermediary being is likely to become ambiguous as soon as it manifests as an apparition to a living person. Whether an individual apparition should be understood as benign or malign was a matter that depended on the context of the apparition and the judgment of the individuals involved. Thus, while there was more than one stock of names to conjure by at the end of the middle ages, and while these stocks of beings are to some extent distinguishable, nevertheless these categories (Catholic, non-Catholic; institutional, extra-institutional) are fluid and permeable ones. For this reason it is not really possible to treat the types of intermediary beings invoked or conjured in more orthodox and public contexts separately from those invoked or conjured in the more private contexts situated most clearly in the history of esoteric thought.

1. INTERMEDIARY BEINGS WITH A CLEAR RELATION TO LITURGICAL SOURCES

The *Liber visionum* of John of Morigny (fl. 1304-1318) offers a case in point of individual and institutional judgements at variance. The *Liber*

visionum offers a ritual system for procuring visions of the Virgin Mary and angels, and attaining knowledge via angelic mediation, understood as divine knowledge, but encapsulated in the form of the seven liberal arts. John, a visionary himself, claimed to have received the prayer system from the Virgin Mary, and believed that it induced genuine communication with angels and the Virgin in the form of true and divine visions. Though his claims were not believed by everybody (the text was burnt as heretical at the University of Paris in 1323), there was little in John's system that was not inspired by, or in some cases directly drawn from, the prayers and divine offices John would have heard and used in daily worship. Within John's system, after a set of preliminary prayers designed to obtain communication with the Virgin Mary, each of the nine orders of angels is invoked (with careful attention to the heavenly hierarchies and correspondences of beings within each hierarchy), to deliver each of the seven liberal arts, philosophy and theology. In several instances certain liberal arts are also associated with certain of the holy and elect souls of the dead dwelling with the angels in the same hierarchy; for example at the level of Rhetoric (Thrones), the Patriarchs, Prophets, Apostles and Evangelists are also called upon; at the level of Astronomy (Principalities), the Martyrs, Confessors, Holy Widows, Monks and Hermits, and at the level of Theology (Seraphim), the Virgin Martyrs.

This list of angels, saints and martyrs works nicely as a synopsis of those heavenly beings whose intercessory powers were commonly invoked in liturgical contexts. The litany of saints invokes a substantially similar set of beings, as also, in somewhat abbreviated form, does the litany in the rite for commending a departing soul to God: 'Holy Mary, pray for him (her). All ye holy angels and archangels, pray, etc. Holy Abel, All ye choirs of the just, Holy Abraham, St. John the Baptist, St. Joseph, All holy patriarchs and prophets, St. Peter, St. Paul, St. Andrew, St. John, All ye holy apostles and evangelists, All ye holy disciples of our Lord, All ye holy Innocents, St. Stephen, St. Lawrence, All ye holy martyrs, St. Sylvester, St. Gregory, St. Augustine, All ye holy bishops and confessors, St. Benedict, St. Francis, St. Camillus, St. John of God, St. Mary Magdalen, St. Lucy, All ye holy monks and hermits, All ye holy virgins and widows, All ye holy men and women, saints of God, make intercession for him (her)' (*Roman Ritual*, vol. I, 407-409).

John's prayer system was designed to enable the

operator to engage in visionary communication with the divine beings whose alliance with the Christian world had long been institutionalized; but the fact that no strange angels were summoned did not put such interactions above suspicion – something which Joan of Arc was also to learn to her cost some hundred years later. There could be no common consensus about the nature of these saints and angels because, though not unorthodox, they were also not theoretical; because they appeared to real people who claimed to have spoken with them, they raised difficult questions which could not be answered by the simple application of theoretical categories of licit and illicit spirits. What could be questioned was the individual's mode of communication with these presences: where the prayers used to summon spirits were novel and extra institutional, the spirits themselves could not (or not always) be seen to be above suspicion.

If celestial beings such as angels, the Virgin, and the souls of the elect could be communicated with both in ways that were institutionally sanctioned and ways that were not, the same is true for other beings, such as demons and the ghosts of the ordinary dead. The similarity between necromantic formulae of conjuration and exorcistic practices by which both demons and ghosts might be commanded has already been noted. There was similarity too in the ways that information passed between demons and living persons through both licit and illicit modes of exorcism. In compilations of necromantic experiments, demons might be called upon for a variety of purposes, but very commonly they were summoned because the conjuror wished to derive information about something hidden, such as the location of stolen goods or buried treasure, or the outcome of some personal matter which was in doubt. While practitioners of legitimate exorcism might not in principle seek to accomplish divination by demons, nevertheless the ritual of exorcising a possessed person would be likely to involve repeated attempts to cast out the demon and some experimentation with formulae to see how the demon responded, so that even where the exorcism did not involve questioning of the demon (as it sometimes might) there would be a flow of information in both directions between demon and exorcist. To exorcise a demon from a possessed person was not thus a simple ritual act of command (as were the standard exorcisms performed during the consecration of holy water, salt, or other liturgical objects, where demons were not really expected to respond) but to some extent also always an act of interpretation of the demon's

behaviour. It is interesting that the instructions for performing an exorcism in the *Roman Ritual* (a 16th-century compilation of earlier materials) preserve the admonition that the exorcist should not digress into chat (*multiloquio*) with the demon, nor ask it curious questions about hidden or future things (*Roman Ritual*, vol. II, 171-173). It seems likely that the temptation to interrogate the demon about matters not pertinent to the exorcism was always strong, and, to judge from these warnings, not always successfully resisted.

In the later Middle Ages there are also recorded accounts of ghosts of the ordinary dead appearing to people they had known in life. Perhaps the most widely circulated account of such an interaction describes the ghost of Gui of Corvo who began to manifest in the form of a disembodied voice to his terrified widow immediately after his death on the sixteenth of December, probably in 1323. A report was written up and submitted to Pope John XXII by Jean Gobi, prior of the Dominicans of Alès, who had been called in by the widow and her friends to deal with the apparition. Concealing a consecrated host on his person to ascertain the non-demonic character of the spirit, the prior entered the widow's house and conjured the ghost to remain and speak with him. After he established that the spirit was a good spirit who had been obliged to perform a portion of his purgatory on earth, the prior's questions became more general: how does the ghost speak without a mouth or tongue? By what works can one best ensure entry into heaven? What are the worst punishments of purgatory? Do demons cluster about dying souls? In every case the ghost answered as best it could, or deferred its silence to the will of God.

Certain ambiguities about this case may be remarked, for in some ways the ghost is handled much like a demon; ritual precautions are taken in its vicinity to protect observers, and the spirit is conjured, just as demons are conjured, to remain until dismissed, and to answer questions truthfully. Clearly it is perceived as a spirit of a kind which it is legitimate and even necessary to command. But the ghost's apparition is also understood to be a miraculous event, and since the spirit is not malign it is also seen to be legitimate and even necessary for the prior to extract information from it. Formally, Jean Gobi's handling of the ghost very much resembles what the necromancer does (and what the exorcist is enjoined *not* to do): he commands a spirit to reveal information about hidden and future things. The difference (if there is one) is that the spirit is understood to be neither infernal

nor celestial, but something at this point still in between.

2. INTERMEDIARY BEINGS WITH BACKGROUNDS IN SOURCES OUTSIDE THE LITURGY

If we look more closely at the necromantic experiments, however, this difference is smaller than it may at first appear, since although the entities conjured are in some cases explicitly infernal, this is not always true. In the case of one necromantic experiment for conjuring a flying ship, for example, it is said that you do not have to worry about the naming of holy things in the conjured vehicle since the spirits responsible for the action are ‘between good and evil, not dwelling in hell nor yet in paradise’ (Kieckhefer, 219; more typically the rider in such vehicles is cautioned not to make the sign of the cross on account of the risk that, with the demons being driven away, the vehicle will vanish in mid-air). In other cases, due to the many strands of cultural influences on such texts, it seems as though the spirits conjured simply haven’t made up their minds what categories they belong to – whether they come from heaven or hell, or somewhere in between.

More important, perhaps, than the spirits’ location when they are at home is the idea of the spiritual hierarchy and earthly correspondences through which these otherworldly entities may be controlled by human beings. The notion that higher spirits have lower spirits in their power tends to be a constant in many genres of texts, whether or not the entities are explicitly described as infernal. In some cases of necromantic conjurations, a cosmological structure in which specific angels are in command of specific demons is implied by the manner of the command, as in the *Book of the Images of the Planets*, where each experiment tells the name of the angels who command the demons, the leading demon (who will perform the requested action), and the names of his minions: ‘the angels who command it to be done are thus – Saliciel, Ycaachel, Harmanel – and the name of the king of demons who commands is the Red Fighter, and his three servants are these: Karmal, Yobial, Yfasue’ (Lidaka, 51). Here there seems to be a clear distinction between the commanding angels and the demons who are commanded, but this is not always the case.

In another medieval list of spirits (a portion of the same list found later in Weyer’s *Pseudomonarchia Daemonum* and the *Goetia* portion of the early modern compilation of magic texts known as the *Lemegeton*), a variety of spirits are named, attributed certain ranks and powers, and described

as having various numbers of legions under them: ‘Barbarus is a great Count and Duke . . . He can open treasure stores not guarded by magic or incantations, and he is from the order of Virtues, and has under him thirty-six legions’ (Kieckhefer, 291). Barbarus is described as being from the angelic order of Virtues, and other spirits in the list are also named with reference to their rank in the nine orders (Virtues, Thrones, Powers etc). Though some of the spirits are described as having a frightening demeanor, others sound quite benevolent, and there is no special effort made by the compiler to clarify whether these spirits still inhabited the angelic orders referred to or were supposed to be fallen angels.

In the “Manual of Astral Magic” compiled in the same book (Kieckhefer, 296ff.), seven angels with names of obvious Hebrew morphology (Raphael, Gabriel, Michael, Anael, Satquiel, Samael and Casziel or Captiel or Caffiel) are aligned with the seven planets, with various legions of sub-spirits being under the control of each. These seven angels in the same alignments with the planetary spheres are witnessed with small variations in other texts, including the medieval *Liber Juratus* and, later on, in the works of → Agrippa, → Trithemius, and others following them. The *Liber Juratus* is explicit that these planetary angels belong to a median category of spirits. The celestial angels are described as being of two kinds ‘those who serve God only and those who serve God, but will also answer to man’ (Mathiesen, 151); the former are the familiar nine orders of angels, the latter are the angels of the planetary spheres.

In the *Book of the Essence of the Spirits* (an anonymous 12th-century work derived from an Arabic source), which also describes spiritual beings inhabiting the planetary spheres, a cosmological approach explicates the hierarchy of spirits in a similar manner and in a way which makes the cosmology specific to magical operations. The highest group, the spirits closest to God, are incorruptible and unbiddable; the spirits ruling each of the spheres of the planets, including Urania, may be subject to human invocation and entreaty. Beneath each of the planetary rulers is a host of more passible spirits who interact with mankind at the bidding of the planetary rulers. These spirits can be persuaded or compelled to enter matter, drawn down by the symmetry and harmony of the matter and spirit as well as by conjurations, in the same manner as the Hebrew planetary angels. The name “angels” is not used in the *Book of the Essence of the Spirits*, but it may be noted that the picture drawn here is not that of astral spirits as “forces”

but, as with the Hebrew planetary angels, conscious entities which can be compelled or entreated and imprisoned in material objects, more in the manner of the god-making passages in the Hermetic *Asclepius* than the resonant astral forces of Al-Kindi's *de Radiis* (or other texts of Arabic image magic).

While this discussion of the spirits or angels of the planetary spheres seems to bring us some distance from the orthodox Catholic saints and angels we started with, it should be noted that schemas with spirits ascending and descending through the planetary spheres also appeared in philosophical and literary contexts whose orthodoxy was never questioned, such as → Bernard Silvester's *Cosmographia* in the 12th century and → Dante's *Divine Comedy* in the fourteenth. Then as now, the difficult questions about intermediary beings tended to concern their actual apparition to and practical manipulation by human beings, not their theoretical hierarchies or attributes.

Intermediary Beings III: Renaissance

1. INTRODUCTION 2. INDIVIDUAL ANGELS & HIERARCHIES 3. ANGELS OF THE TEXT 4. THE SEVEN DIVINE SPIRITS 5. EVIL SPIRITS 6. ELEMENTALS AND DISINCARNATED ENTITIES 7. CONCLUSION

I. INTRODUCTION

Intermediary beings retain a considerable importance during the Renaissance era. As in medieval times, they pertain to different categories, yet share several common features. Their perception is framed within a cultural context which, as remarked long ago by Alexandre Koyré and Lucien Febvre, in principle considers nothing as impossible, on account of the unlimited (and divinely sanctioned) generative faculty attributed to nature; since it is possible for any kind of being (intermediary or otherwise) to exist, it may also manifest itself at will, regardless of circumstances. Correlatively, the notion of "supernatural" is invalidated as well by this all-pervasive conception of nature, and by its overwhelming creativity: as a result, any being may be seen as "natural", belonging to one or another order of an organic universe. Prevalent in humanistic natural philosophy and theology, a multi-layered cosmology adapted from the Greeks extended its reach from the sublunar world to the celestial one, and upwards to the "intelligible" realm itself, next to the divine sphere, thus including the realm of the aristotelian "separate substances" which the Jewish, Christian and Muslim scholastics turned into "angels". The unicity of such a continuous hierarchy of natural planes (outlined, for instance, in → Giovanni Pico della Mirandola's *Commento, Oratio, and Heptaplus*, or in → Ficino's *Platonic Theology*) put emphasis on the ontological familiarity or kinship between all living components of this universe, from the angels on down. Analogically, man himself is perceived as "triple" in structure, that is endowed with a corporeal, animated ("ensouled") and rational nature, parallel to the material, astral and angelic spheres of the macrocosmos. From a slightly different perspective, neoplatonic in origin, embodiment was considered specific to man, passions to the demons, and intellectuality was correlated with the supposedly contemplative angels. Such a *psychocosmia* prevents a perception of clear boundaries between the material and the spiritual and, insofar as it is not restricted to learned circles, is in accordance with a general worldview literally swarming with immaterial creatures of all sorts: it is familiar to and shared by many people in the period under discussion, as shown for example by Ronsard's *Hymne des Daimons* or some works of → Paracelsus. That man should appear to almost constantly find himself in the proximity of such entities comes as no surprise since they are "intermediaries" in more ways than one, being also – mainly, even – considered as messengers, transmitters of knowledge and/or of portents, at the service of humanity or

ready to trap and deceive it, on errand from God or the devil.

2. INDIVIDUAL ANGELS & HIERARCHIES

If, judging for instance from → Trithemius' lists featured in his *Antipalus* (pub. 1605), it would of course be impossible (and quite pointless) to attempt to name them all, two angelic beings of primary importance make a breakthrough in early modern esoteric literature, under the obvious influence of Jewish kabbalah [→ Jewish Influences]: Metatron and Raziel.

Already found in the earlier documents of Jewish → gnosticism, and often referred to as the *Sar ha-Panim* (Prince of the Countenance), that is "head of the angels who stand before the divine Face", Metatron nevertheless possesses an ambiguous status. Sometimes identified with Enoch (Gen. 5:21-24), or with the angel who spoke to Moses on several occasions (Exod. 23: 21), he is occasionally (even in Jewish sources) considered almost identical with the Godhead, as the "lesser Adonai" (in accordance with his name being written with or without a *iod*). Present in the works of most important Christian kabbalists (Pico, → Reuchlin, → Giorgio, Rici, → Postel, → Knorr von Rosenroth), where he is frequently equated with the Active Intellect of medieval scholastics, he appears in his traditional role of guide into the divine presence, being simultaneously perceived as the penultimate rung of the cosmological ladder, and the uppermost spiritual intermediary in the contemplative ascent of the soul. In a way, albeit definitely an angelic being in most respects, he is perhaps even more representative of an exalted function (but a dual one, both cognitive and ontological) than of a singular entity, as stated by Giorgio (*De harmonia mundi*, I, 5, VI).

Raziel is scarcely less important, but much more magically connoted [→ Magic]; indeed, along with the *Picatrix*, the *Sefer ha Razim* (or, more usually, *Sefer Raziel*) is one of the most widespread and appreciated magical textbooks in the Renaissance and many authors, Jewish as well as Christian (Postel, in particular), took for granted the title of the book which mentioned the angel as Adam's teacher in paradise (or Noah's, after the Flood). Thus, if somewhat differently from Metatron, Raziel also serves as spiritual instructor while belonging to the higher angelic ranks, with a status that fluctuates in accordance with the various documents in which he is featured, and with the actual contents of the many differing versions of the magical compilation which bears his name. The numerous angels popu-

lating the seven heavens to which the parts of the book are respectively devoted – in its most extended versions at least – are attributed diverse functions for the most part in strict relation with the nature of the firmament they belong to, and invoked by name to perform all sorts of wonders, natural, divinatory and otherwise. A wide variety of "astrological" angels or spirits is also involved in the *Picatrix* and in the rituals of *ars notoria*, and regarded as important enough to sometimes be represented in the magical diagrams pertaining to these practices.

The necessity of equating the more "esoteric" angelic hierarchies, usually borrowed from hebraic writings, with the dionysian ones of official theology, combined with the requirements of correlative symbolism, led to the appropriation, by several Christian kabbalists, of the order of *Ishim* as the lowest rank of angels and, given its name (derived from *ish*, man), the closest to humanity. It was sometimes simply considered as the ninth one (in obviously deliberate accordance with the global number retained by → Pseudo-Dionysius Areopagita), as Pico wrote for instance in his *900 Theses* (*Concl. Kab.* [1st s.], 2), sometimes explicitly as a tenth one (Reuchlin, Giorgio, → Agrippa, Rici, Postel), in order to establish a direct correspondence between these hierarchies and the ten *sefirot* (divine attributes), interpreted in turn as the fundamental symbolic archetype of the structure of macrocosmic or microcosmic man.

The *macranthropos*, assuming cosmic dimensions and familiar to both the platonic and Jewish traditions, is also frequently considered as a particular angelic being, constituting the perfect "spiritual form" of individual man. Conjunction or *unio* with him is considered a very high – if not the highest – contemplative attainment, and his kinship with the Active Intellect and Metatron is therefore underlined (Rici, Postel). Great, and probably not always resisted, must have been the temptation to acclimatize such speculations with those of the *Picatrix* (III, VI, 5) regarding the possible manifestation of the "universal intellect", more or less identical to one's "perfect nature" in angelic guise, thanks however to an invocation and to joint practical operations seemingly pertaining to astral and talismanic magic. Under clear arabic influences, one might well be confronted here with a peculiar mix of astral and angelic magic that merges the contemplative and ritual attitudes.

A final ambiguity must be briefly signaled here: that which exists between such a supernal entity and the angelic shape or "garment" which Christ himself is sometimes supposed to assume, the more

so since some sort of *unio mystica* (contemplative or otherwise) is sought with both, as already noted in the case of Metatron.

3. ANGELS OF THE TEXT

Angelic names are sometimes envisaged, in kabbalistic thought, as actual components of “secret” divine names, and extracted by mystical hermeneutics from the biblical text itself. Such views have been directly adopted by certain Christian writers, such as Giustiniani, → Galatino or Reuchlin (*De arte*, III), who mention the scriptural verses in question and the manner of extracting from them seventy-two three-letter angelic names, all ultimately depending on the *Tetragrammaton* and making up the “great name” of seventy-two names; Reuchlin insists particularly on the essential role played by these “textual” angelic entities in both cosmological and contemplative issues, a topic still taken up by → Athanasius Kircher around 1650, and which later degenerated in almost unrecognizable magical recipes.

Albeit in a very different manner, the Bible also represents the basic source and model for John Dee’s (1527-1609) angelic magic. The use of his famous *shewstone* (“magic mirror”) is explicitly inspired by the scriptural example of the High Priest’s breast-plate, and the presence of the biblical archangels (see below) is frequently recorded in his magical diaries. Apart from a few cases of angels with a feminine outward appearance (which puzzled him very much at the outset!), Dee’s angels generally conform to their classic, ps-dionysian role as cosmological intermediaries, spiritual tutors and divine messengers; this is unsurprising enough since our man goes out of his way to try and prevent dealing with possibly dubious spirits. Prayer and scrying are the two cornerstones of Dee’s method of communicating with angelic entities, an activity which he understands as a notable part of natural philosophy, and as the most efficient way to attain both natural and divine knowledge. Essential to such conversations is the recovery of the primordial, “divine” or angelic language that was Adam’s prerogative before the Fall, and the privileged expression – insofar as it is accessible to humans – of this superior understanding of God and nature which Dee was so actively seeking. Seen from this perspective, such an intricacy of speech, angelic magic and nature reminds us of certain kabbalistic speculations.

4. THE SEVEN DIVINE SPIRITS

Aside from these “hidden” angels of the Book, and following up on the harmonization of Jewish

esoteric and traditional Christian perspectives on angelology, the biblical passages (Tb. 12:15; Rev. 4:5) pointing to the existence of a septenary of archangels or divine spirits (although three names only are actually mentioned in Scripture, those of Gabriel, Michael and Raphael) who are always in God’s presence and are prime ministers of his will, have no doubt inspired Trithemius’ *De septem secundeis* (1508). In this famous booklet, seven angelic rulers with classic hebrew names are each assigned regency over one planetary sphere, determining a recurrent sevenfold cycle in history according to which social and spiritual transformations intervene. Hebraic sources (such as – hypothetically – the *Pirke R. Eliezer* and *Sefer ha Temunah*) may also have inspired the elaboration of this influential little tract, the actual contents of which resemble a concise *exposé* of astrological cycology, where the “Intelligences” of the title are classically assigned, as secondary causes, to the movement of the planets. Whole sub-hierarchies of angelic beings, multiplied mainly according to astrological symbolism, were subordinated by later writers (Giorgio, Kircher) to the seven “chiefs”.

A more or less identical list of seven angels found its way (independently from Trithemius) into contemporary Catholic worship and liturgy, as the official cult of the seven divine spirits. Stemming first from the private revelations granted to the Blessed Amadeus (João da Silva e Menezes, 1431-1482), and later from the efforts of a sicilian priest, A. Lo Duca (1491-1564), the “recovery” of the names and specific iconography of all seven angels of the Presence led to the renewal of their worship and to the erection of several sanctuaries dedicated to them, most notably that of Santa Maria degli Angeli alle Terme in Rome, completed by Michelangelo in 1561. A proper religious office was even composed to honor the seven archangels, duly sanctioned by the Papacy and published by Lo Duca in Venice in 1543 (1594²). The cult of these seven spirits enjoyed great favour well into the 17th century, and particularly in viceregal Spain, where they were frequently and richly depicted.

In line with these events and the spirit of the Counter Reformation is of course the 16th-17th century spread of the devotion to the “holy guardian angel”, officially sanctioned by the Catholic Church in 1608, and which enjoyed even more durable existence. By establishing and recommending the devotion to spiritual entities such as these, the Roman See nourished the obvious intention (among others) of recuperating the theme of angelic intermediaries, linking them to the renewal of theological speculations about the purgatory and

the *communio sanctorum*, and integrating them within the new outlook on ethics and ecclesiology.

Finally, even though spiritual intermediaries as such, and angel-worship in particular, were never well received in protestant environments, the famous theme of the seven divine forms or spirits in → Jacob Boehme's theogony enjoyed favour in some later pietistic and/or theosophically-inclined circles, not all of them protestant. During the 16th and 17th centuries, angelic beings were sometimes entreated in a specific current of "theosophical medicine", the most well-known *manifesto* of which is A. von Franckenberg's (1593-1652) *Raphael, oder Artzt-Engel* (pub. 1676), with his tripartite medicine: kabbalistic, magical and chemical. Other authors, both catholic and protestant, such as L. Meyssonier (*La Philosophie des anges*, 1648), J. Pistorius Jr (1546-1608), M. Baldit (*Speculum sacro-medicum octogonum*, 1666), have included angelic prayers and interventions in their therapeutic methods.

5. EVIL SPIRITS

The actual mention of evil demons as such is of course unfrequent, unless it is in order to issue the classic warnings and/or disclaimers about intercourse with them. That a whole *corpus* of earlier magical texts devoted to their hierarchies and operations, and discussing ritual invocations of them, did continue to be available and to circulate more or less openly during the Renaissance, is nevertheless not in any doubt. Even though it is necessarily rare for authors to admit explicitly to a positive interest in them, there is absolutely no reason to imagine that such had declined, or that the relevant literature had suddenly and unexpectedly become unavailable. The well-known example of → Giordano Bruno, approvingly quoting in his *De monade* (1591) several passages from Cecco d'Ascoli (?1269-1327)'s necromantic commentary on J. of Holywood's *De sphaera*, would suffice to indicate that some purpose was still attached to the invocation of demons. In this specific case, the entities concerned are clearly and unequivocally diabolic in nature, since they are reputed to be "fallen from grace" with God, and to have formerly belonged to the order of the Cherubim.

Agrippa does discuss demons as well (*De occulta philosophia*, III, XVI), and places them in three categories: *supracaelestes* (more or less akin to *mentes* floating about without a body, and to the Greek *daimôn*), *mundanos* (cosmic, that is mainly zodiacal and planetary entities – such as Bruno's) and *subterranei* (terrestrial, mainly distributed according to the elements). Here as elsewhere, the incon-

sistency of the available vocabulary only serves to make it even more difficult to pin down the exact nature ("good" or "bad") of the beings involved, as well as the hierarchy they purportedly belong to. Naturally, demons may also appear spontaneously, mainly the aerial ones (lower angelic beings, being immaterial, were considered to have the nature of air); they did so sometimes in their own guise, or through meteorologic phenomena they were believed to provoke at will, either as pranks or as means to deceive or terrify humanity. Needless to add, the actual manifestation of the Devil himself was thought to be equally possible, albeit rare; he could appear either of his own will or consciously summoned by the appropriate rites and prayers, for instance to preside over the witches' sabbath [→ Witchcraft].

6. ELEMENTALS AND DESINCARNATED ENTITIES

A last category of intermediary beings is that of the "elemental" spirits, raised to prominence by → Paracelsus' tract *Liber de nymphis, sylphis, pygmaeis, salamandris et de caeteris spiritibus* (1530) but known from time immemorial in European folklore. They strikingly illustrate Paracelsus' important use of "unscientific", popular data, mostly ignored by contemporary scholarship, and his equally strong insistence on "experimentalism": since the existence of such beings is attested by daily experience, reflection must therefore take them into account. One may note, by the way, how much the common religious practice of exorcisms (that of water or salt during the ceremony of baptism, for example, or of a house or a site to be built upon) contributed to confirm people in such beliefs. Elemental spirits (nymphs, elves, gnomes and salamanders) were believed to live each in one of the four elements (water, air, earth, and fire respectively) and consequently share its nature. Their existence is explained by the fact that the material elements, for Paracelsus, are not the real ones but only the outward appearance of the true, immaterial ones. Whereas man is conceived of as a synthesis of the whole universe, these spirits are only related to the element they inhabit; and, being devoid of a soul, so that they have never sinned, unlike man they will neither be granted eternal life nor damnation. Accordingly, following Paracelsus, they have nothing in common with demons (except for a serious taste for practical jokes), who are fallen angels and therefore damned. The next enhancement in the cultural popularity of such entities was Montfaucon de Villars (?1635-1673)' *Le comte de Gabalis* (1670), which enjoyed con-

siderable fame and was to foster a whole occultistic and literary posterity on the subject, all over Europe and up to our day.

Innumerable other immaterial creatures supposedly peopled the “atmosphere” around man, and were able to engage him. Larvæ, incubus and succubus spirits, lemuriæ, penates, wraiths, empuses, ghosts, souls of the recently deceased, *mentes*, “heroes”, etc.: an entire host of “phantoms” of fluid and necessarily uncertain status. They were feared by some as malignant demons, while being held by others to be more or less harmless spirits, causing dreams, bringing portents, conveying divine orders or fiendish temptations, and generally supporting the absence of a conscious frontier between corporeal existence and immaterial life, both coming under the heading of “nature”.

7. CONCLUSION

If a main characteristic of all “intermediary beings” were to be outlined, ambiguity would be a perfect candidate. Not so much, perhaps, as regards theoretical issues – such as types or hierarchies of entities – but most certainly in relation to concrete reality and practical dealings with them. Theory – when it actually exists in this domain, and hampered though it is by the absence of any lexical precision – is obviously more at ease with defined hierarchies, often related to cosmological structure(s), than with coping with the awe engendered by some unexpected appearance of spirits, and the indefinitely varying manifestations of nature. Obviously again, intercourse with such beings is only acceptable to Churches insofar as these are able to retain control over the relevant procedures, and their spiritual authority (and mediation) remains unquestioned. Whether intermediary beings are to be considered as “conscious” entities or as impersonal “forces” is a very ambiguous issue as well – but one of crucial importance, since demons were regarded as “personal” and intelligent beings, endowed with a perverted will, yet capable of understanding invocations and deciphering *characteres*. Ficino made the most of such a distinction, by declaring impersonal (thus, not demonic) the astral *spiritus* and intelligences which he invoked. This very notion of *spiritus* in Ficino is itself extremely ambiguous, since it is both a medium and some sort of an entity, immaterial yet very much linked to physical reality, in between the celestial and the terrestrial.

In fact, one may well ask whether such a seemingly inescapable ambiguity, which appears to be implied in all dealings (whatever their shape and aim) with intermediary beings, and is sometimes

even implied by their intrinsic nature, does not reflect the situation of man himself: the most “intermediary” being of them all, according to Renaissance theology, philosophy, and magic.

JEAN-PIERRE BRACH

Intermediary Beings IV: 18th Century – Present

1. INTRODUCTION 2. SPIRITS
3. HIERARCHIES 4. MASTERS
5. EXTRATERRESTRIALS 6. CHANNELED ENTITIES

1. INTRODUCTION

The ambiguity of "intermediary beings" in esoteric contexts [see → Intermediary Beings III] was amplified by the impact of the new rationalist and materialist worldviews since the 17th and 18th century. In the wake of the Enlightenment, there is often reason to wonder whether the very adjective "intermediary" is still applicable at all. Originally, beings such as angels or demons occupied a place intermediary between the supernatural Divine Being and the natural world of created beings; by the very fact alone that they were not embodied, angels and even demons were somehow closer to the divine (which in the case of demons made their moral depravity all the more serious), while their very multiplicity distanced them from the perfection of the One and made them closer to human embodied creatures. Even if on the basis of the Judaeo-Christian legacy they were theologically considered to be creatures, the alternative perspective originating rather from "pagan" (particularly Platonic and Hermetic) traditions – that saw them as emanations from the divine – remained quite as influential, in Christianity generally and most certainly in its esoteric manifestations.

Since the 18th century, however, the notion of a supernatural divine reality in the strict sense of the word became increasingly alien to religious thought, in esoteric as well as in general religious contexts; for even in many cases where lip-service is being paid to the "supernatural", at closer scrutiny this purportedly "divine" reality actually turns out to be conceived of as perhaps a "higher", but nevertheless a *natural* reality. If invisible intelligent "entities" are still believed to exist in such a context, they may engage in contact with embodied human beings, but in the absence of a supernatural divinity they come to play an autonomous rather than an intermediary role. Much more typical for modern consciousness is the perspective – pro-

grammatically announced already during the Renaissance in → Giovanni Pico della Mirandola's Oratio *De hominis dignitate*, and with roots that may go all the way back to e.g. Plato's famous image of the soul's chariot in the *Phaedrus*, with one horse tending upwards and the other one downwards – that sees Man himself as tragi-comically suspended in a place "intermediary" between his higher and his lower aspirations, as famously expressed by Alexander Pope: 'Plac'd in this isthmus of a middle state,/ a Being darkly wise and rudely great, . . . / He hangs between; in doubt to act or rest;/ In doubt to deem himself a god or beast;/ In doubt his Mind or Body to prefer;/ Born but to die, and reas'ning but to err; . . . Created half to rise, and half to fall, Great lord of all things, yet a prey to all;/ Sole judge of Truth, in endless error hurl'd;/ The glory, jest and riddle of the world' (*An Essay on Man*, epistle II [1733]).

Such an ironic twist on "Man the Great Miracle" has become quite congenial to modern(ist) sensibilities, and places him in a position in which he alone will have to make up his mind about whether to prefer his "lower", merely natural intelligence or, rather, listen to messages and intuitions purportedly conveyed by "higher" spiritual beings or entities. Adherents of esoteric currents in the 19th and 20th century have, of course, chosen the latter option. But in yet another twist on earlier traditions, the "higher entities" have also come to play their traditional function in an entirely new manner: as representing "intermediary" stages not between embodied creature and divine Creator, but between the incarnate personality and the latter's own "higher Self". This option is frequent in psychologized forms of esotericism since the 20th century, usually in a context of → reincarnation understood as a process of spiritual evolution by means of which the soul gradually overcomes the limitations of the personality and realizes its own divine nature. From such a perspective, all "higher entities" may be seen as souls on their way towards "self-realization": intermediary somewhere between the poles of complete ignorance about their own inner divinity and a supreme "gnosis" as knowledge of the Self as divine.

2. SPIRITS

The spirits of the departed typically play an intermediary role between the divine and the human: they come from earth but are now closer to God than those of us who are still in the body, so they are in a good position to give us messages about the after-death state. With respect to modern ideas about the spirits of the deceased as intermediaries,

the writings of → Emanuel Swedenborg have been crucial. Swedenborg denied any essential difference between angels and spirits, claiming that all angels have once lived on earth as human beings. To be precise, he distinguished between spirits, angelic spirits, and angels, and further subdivided each of these into spiritual and celestial (governed by faith and by love respectively, the latter being superior to the former). After death, each human spirit gravitates towards a community in heaven or in hell that is in line with his true inner motivation or “ruling love”; as a result, the structure of Swedenborg’s heaven and hell automatically categorizes human beings into a hierarchical order according to their inner moral condition. Angelic/spiritual and demonic beings are constantly present with embodied human beings, seeking to influence them to use their free will for good or evil; but Swedenborg claimed that only he himself had been granted the privilege of actually seeing them and talking with them, and of freely “traveling” through heaven and hell. Spiritual and angelic beings can perceive only the “internal” realities of embodied human beings but remain as blind to any “external” realities as human beings are to internal ones. As a result, Swedenborg himself is explicitly highlighted as the only true “intermediary” between the internal and the external. Only he has access to both; and as a result, he is unique not only in that he can tell human beings about the realities of heaven and hell, but also in that he can tell spirits and angels about earthly realities.

Swedenborg’s ideas have had an incalculable impact on 19th- and 20th-century esotericism, and on → Spiritualism in particular, as is clear from the writings of its major theologian, → Andrew Jackson Davis. Davis’s worldview was largely modeled on Swedenborg’s, but he gave a progressivist and evolutionary twist to it by emphasizing an optimistic prospect of spiritual growth and development, first through six spiritual spheres surrounding earth, and beyond these through higher spiritual realities. Spirits closest to earth could communicate with human beings by means of mediums, and such claims had two crucial implications. First, they opened the door for a “democratization” of spirit contact: far from being dependent on the authority of a divinely privileged mediator like Swedenborg, everybody could communicate with the spirits and learn from them about the higher life. And second, the fact that these spirits were themselves still in a relatively early stage of post-mortem spiritual development (not yet having progressed very far “from earth”) had the effect of relativizing their spiritual author-

ity: they might be somewhat ahead of us in their spiritual evolution, but still had much to learn themselves.

Thus the spirits of the deceased that supposedly manifested themselves in spiritualist seances could by no means be seen as unproblematically mediating between human ignorance and divine truth. And their limited spiritual authority was, of course, further underlined by the frequent mediocrity of the messages they conveyed by means of mediumship. While some mediums and “their” spirits did set themselves up as teachers of higher truths (cf. “channeling”, below), in many cases the spirits seemed to be content merely to manifest their presence by means of trivial messages or signs.

3. HIERARCHIES

Quite traditional angelic and demonic beings, understood in a sense close to → Gnosticism and → Christian theosophy, were still prominent in 18th-century esoteric currents such as, notably, → Martinès de Pasqually’s theurgic order of the → Élus Coëns and its later developments; and these traditions continued well into the 19th century. The general idea of “hierarchies” of non-human spiritual beings or entities representing various levels of existence, became central to occultism [→ occult / occultism] as it developed during the 19th century. The elaborate number-symbolical tables of angelic and demonic hierarchies provided by → Cornelius Agrippa (esp. *Occ.Phil.* II, 5-14; III, 25), with some of the demons portrayed in bizarre pictures in → Francis Barrett’s *The Magus* of 1801, certainly influenced → Bulwer-Lytton’s famous occult novel *Zanoni* (1842), which assumes a universe full of intelligent beings on all levels of reality.

Such ideas came to full fruition in → Paschal Beverly Randolph, whose *Dealings with the Dead* (1862), described a stream of innumerable “soul monads” emanating from the “Central Sun”, and ordered them according to a sevenfold ascending hierarchy: Spirits-Angels, Seraphs, Arsaphs, Eons, Arsasaphs, Arch-Eons, and Antarphim. By communicating with these beings, the occultist could learn the secrets of existence that would help him in his own process of spiritual evolution. Randolph’s hierarchies were described particularly clearly in “The Mysteries of Eulis” (1874): ‘. . . there are Societies of Beings, invisible by material eyes, who were of earth once, and others who *never knew* material bodies at all – who understand any and everything man can imagine; who cultivate every possible species of knowledge, and who answer the desire and invocation . . . of those of us who take to the same lines of thought and feeling; who

belong to the same category of intelligences or who voluntarily place themselves under the essential conditions of *rapport* or contact’ (cit. in Deveney 1997, 332). The enormous powers of these hierarchies (the ‘arbiters of the destinies of worlds’) was emphasized in the strongest possible terms: there are ‘armies of them! – Potencies, Powers, vast Intelligences . . . before whose awful grasp of mental powers, before whose amazing sweep of mind, the grandest intellect earth ever did or can produce, is as a pebble to a mountain range . . .’ (o.c., 333). Randolph called them the “Neridii”, and referred to their teachings as “the philosophy of Eulis”.

Similar ideas about vast supra-human hierarchies of spiritual beings with god-like powers have become a staple of occultist theory and practice since the later 19th century. As has been demonstrated by scholars such as Godwin, Deveney, Mathiesen and others, they were deliberately put in opposition against what occultists considered the more timid and intellectually inferior perspective of the spiritualists. It is clear that the higher beings had entirely taken over the place formerly reserved for the Christian God. While a single Divine Source is usually mentioned as the ultimate origin of all reality and the final goal of spiritual evolution, this is a non-personal God who does not intervene in human affairs; for all intents and purposes, it is to the spiritual hierarchies that man has to look for any kind of spiritual assistance he may need.

Within the milieu of occultists believing in such spiritual hierarchies, attitudes towards Christianity have varied greatly, from those who saw occultism as the theory necessary to an understanding of true Christianity (see e.g. → Anna Kingsford) to those who developed it into an explicitly anti-Christian religion (see e.g. Aleister Crowley, whose new religion called Thelema was based upon a revelation by a non-human entity called Aiwass). Such differences were made possible by the moral ambiguity of the hierarchies themselves, which could be explained in many ways. In occultist literature one may find ideas about a grand metaphysical battle, behind the scenes of history, between the powers of “light” and “darkness”; but there are also more optimistic perspectives according to which even the so-called evil forces merely play their necessary role in the grand process of spiritual evolution; other authors suggest that the entire process is ultimately beyond good and evil, and our perception of it in terms of “black and white” merely reflects our still limited point of view; and finally, there are those in the domains of → Satanism (e.g. the Temple of Set) who deliberately choose the side of the so-called powers of darkness against those of the light,

claiming that the former represent the truth whereas the latter are merely hypocritical.

4. MASTERS

A typical development in modern Theosophy [→ Theosophical Society] is the idea that members of the occult hierarchy – and especially, in this case, of the “Great White Brotherhood” that supervises spiritual evolution on our earth – may actually be living in our own world. As such they literally embody the theosophical ideal of spiritual perfection: being “in the world but not of it” they can use the body but are not dependent on it, free as they are to manifest themselves wherever they want by means of astral travel. The theosophical “masters” (or “mahatmas”) were believed to live in remote places in the Himalayas, but frequently appeared to theosophists in person, or communicated with them by means of letters transmitted by occult means.

Precedents to the notion of Masters can be found in the “unknown superiors” of the high-degree masonry of the “Strikte Observanz” (18th century), which may in turn be inspired by the Rosicrucian notion of a hidden brotherhood [→ Rosicrucianism]. The idea that certain persons who are leading seemingly unremarkable lives among us are actually powerful “adepts”, whose real business it is to work in secret for the good of humanity (or for its ruin, as the case may be), has become an important motif in occult fiction, from Bulwer-Lytton to → Gustav Meyrink and a variety of more or less successful imitators up to the present.

In theosophical contexts of a more Christian orientation, one also finds the notion of embodied masters interpreted in a relatively traditional “incarnational” sense. → Rudolf Steiner interpreted the incarnation of “the Christ” into the body of Jesus as the crucial turning point in the evolution of humanity. Significantly, Steiner had broken away from the Theosophical Society over the issue of Jiddu Krishnamurti, whose body was expected by theosophists to be “inhabited” by the supreme being called “Maitreya the Christ”, in a kind of Second Coming. In both cases we have the idea of a material “vehicle” – Jesus in the case of Steiner, Krishnamurti in the case of the Theosophists – turned into a Master of Wisdom due to the incarnation of the Christ.

5. EXTRATERRESTRIALS

Incarnated beings from other planets than earth may also play the role of “intermediary beings” in esoteric contexts. Many influential authors, such as

Swedenborg in the 18th century and → Jacob Lorber in the 19th, wrote about their communication with the inhabitants of other planets, and such contacts became a standard component of Spiritualist literature. In modern Theosophy as well, most planets outside our solar system were believed to be inhabited by intelligent beings, and in fact the teachings of Theosophy were believed to have been planted on earth by “adepts” from Venus. This esoteric and occultist mythology became basic to the worldview of → UFO traditions after World War II, and has obviously had a significant impact on popular science fiction as well. Some UFO enthusiasts claim to have physically met the extraterrestrials, while others believe to be in psychic contact with them. Usually the extraterrestrials are seen as representing a higher level of spiritual attainment, which makes it easy for them to be perceived as semi-divine messengers from occult hierarchies such as the Great White Brotherhood, who manifest themselves to warn humanity for impending disasters and assist them in the transition to a new evolutionary level.

6. CHANNELED ENTITIES

The → New Age movement has important roots in such theosophically-oriented UFO cults, but since psychic communication with “higher entities” by no means had to limit itself to extraterrestrials, the latter eventually became only one among many kinds of beings believed to be “channeled” by mediums. The sheer variety of these “entities” is amazing: they include e.g. “ascended masters”, spirit guides, angels, extraterrestrials, various historical personalities (e.g. Jesus, Paul), God or “the Ultimate Source” himself, gods and goddesses from antiquity, the collective unconscious or “Universal Mind”, nature spirits or “devas”, gnomes, fairies, and even animals (dolphins, whales) or plants. One channel even reported communications from “the Committee”, described as a geometrical consciousness comprised of a line, a spiral and a multidimensional triangle! (see Hanegraaff 1996/1998, 23 nt 2)

Of particular interest is the claim that it is possible to channel one’s own “higher self”. Here we encounter a line of development that has important roots in the “communication with the Holy Guardian Angel” highlighted by the → Hermetic Order of the Golden Dawn, where this “Angel” was frequently interpreted as being in fact the operator’s true higher self. Due to the rise of psychology as a powerful hermeneutical framework for understanding psychic experiences, with → Carl Gustav Jung as a major influence, there has been an

increasing trend to see other (perhaps even all) “entities” as inhabitants of the personal or collective unconscious. Usually this is not understood in a reductionist sense, according to which channeled entities, like personalities encountered in dreams, would be “merely” products of one’s own mind. Rather, in the context of a “sacralization of psychology”, the very attempt to differentiate between “real” and “imagined” entities tends to be seen as an example of narrow reductive thinking. From such a perspective, all “entities” are images conjured up in the interior mirror of the mind, which may help the individual on his or her path towards self-realization. Strictly speaking, in such a context of radically psychologized esotericism the only “intermediary” left is the mirror of the mind itself, which makes it possible for the human soul to “create its own reality”.

WOUTER J. HANEGRAAFF

Jennings, Hargrave, * 1817 London?,
† 11.3.1890 London

Writer on Buddhism, Rosicrucians, Phallicism. Jennings is the sole source of biographical information on himself. He states that his family circumstances were ‘not poor, though not overwhelmingly rich’. He grew up in the West End of London, and in 1854 was living in Harewood Square, Regent’s Park. He may have worked as secretary to an opera company manager. He had a brother who lived at Ambassador’s Court, St. James’s Palace; Jennings himself used this address in later life, and died there.

At the age of fifteen, Jennings contributed a series of sea-sketches to the *Metropolitan Magazine*, and

went on to write at least two novels. His treatment of metaphysical and religious matters began with *The Indian Religions, or, Results of the Mysterious Buddhism* (1858). Stated to be ‘by an Indian missionary’, it was written to criticize and correct the lack of understanding of the Orient, especially as shown in an essay on Buddhism by Max Müller (1823-1900) published in the *London Times* (17 and 20.4.1857), and, more generally, in the climate following on the Indian Mutiny of May-September 1857. Jennings had no training or expertise in oriental studies, but he recognized a kinship between the non-rationality of the Buddhist Nirvana, which Müller had abused, and that of some Western mystics. Jennings cites → Cornelius Agrippa, → Paracelsus, → Joan Baptista van Helmont, and → Emanuel Swedenborg, Thomas Taylor’s translation of Plato, recent books on magnetism [→ Animal Magnetism] and → spiritualism, Catherine Crowe’s *The Night Side of Nature* (1850), Joseph Ennemoser’s *History of Magic* (1854), the *Asiatic Journal* and *Asiatic Researches* (1788-), and William Ward’s *The Religion of the Hindoos* (1815).

Jennings’s second book, *Curious Things of the Outside World* (1860) continued his attack on rationalism by forcing attention to the inexplicable. It is a philosophical treatise prefaced by a collection of ghost stories and tales of the supernatural, similar to Crowe’s compilation. Jennings now expounds a world-view based on Hermetic → correspondences and Gnostic cosmology. He sees the destiny of the human being as a dual path, leading either to the dissolution of self in the Pleroma (which he equates to the Buddhist Nirvana), or else to a purifying series of → reincarnations in the world of the diabolical Demiurge, which have the same end-result. *Curious Things*, published under Jennings’s own name, reproduces a large portion of *The Indian Religions*, but his erudition has increased. He now cites → Robert Fludd’s *Mosaical Philosophy*, mentions the Rosicrucian manifestoes [→ Rosicrucianism I] and → Johann Valentin Andreae, and the Rosicrucian Mss. of Dr. Rudd in the British Museum. He gives much disorganized information on these and on the “Fire-Philosophers”, whom he calls a fanatical late 16th-century sect, active in almost all the countries of Europe. Jennings now regards Fire (or Light) as the first principle of all religions and mythologies, and finds its symbols everywhere. He commends a ‘special group of books’ that share this approach to comparative religion: Godfrey Higgins’ *The Celtic Druids* and *Anacalypsis*, and Sir William Drummond’s *Oedipus Judaicus*.

Jennings’s next discovery was of the “phallic theory” of the origin of religions, hinted at by Higgins and expounded in Henry O’Brien’s *The Round Towers of Ireland*. Thus prepared, Jennings wrote his third and (undeservedly) most successful book, *The Rosicrucians* (1870). This tells us almost nothing about the Rosicrucians. Its torrent of information serves to frame the theory that all religions derive from the original worship of mankind, which was of the one primordial energy that brings the universe out of Nirvana. This was symbolized variously as Light, as Fire, as the Sun, and as the procreative power of the male, hence by the phallus or (since these writers preferred the Sanskrit term) the lingam. Jennings also reveals the origin and purpose of the Order of the Garter, founded by Edward III in 1344. The “garter”, he explains in veiled terms, actually secured a lady’s menstrual napkin, and the Order was founded ‘in honour of Woman, and to raise into dignity the expression of the condemned “means” . . . which is her mark and betrayal, but which produced the world in producing Man, and which saved it in the person of the Redeemer . . .’. These were bold thoughts in 1870. Jennings then sees symbols of the phallus and vulva everywhere he looks, especially in church and temple architecture.

Phallicism (1884) was Jennings’s last major work, and his best, gathering most of what was of value in all his preceding ones. He complains that other writers on the subject are destructive to faith and religion, whereas he regards religion as true and the present book as constructive of Christian belief. He writes of the magical qualities of virginity (clairvoyance, and a certain invulnerability) and on the consequences of its loss; yet, he says, when maidenhood is maintained too long it is ‘attended with unutterable mischiefs’, that are Nature’s revenge for the denial of her purposes. In these ‘strange contradictory theosophic speculations’, as he calls them, Jennings strives to express the paradoxical existence of two paths of Gnosis. The first rejects creation, seeing everything manifested as a sham and an evil, and finds its goal in the Non-Being of Nirvana. The second accepts creation as holy and aims at unity with its Creator.

Among Jennings’s other works are books on the history of one of Judas’s thirty pieces of silver, on the symbolism of church candles, on the obelisk known as Cleopatra’s Needle, sea stories, London stories, and (edited and partly authored by Jennings) the “Nature Worship and Mystical Series” (also called the “Phallic Series”) of books privately printed by George Redway (1880-1891). In 1890 he published an expanded fourth edition of *The*

Rosicrucians in two volumes, including in it much from *Phallicism* and his other books.

Jennings was admitted to the Societas Rosicruciana in Anglia (S.R.I.A.) in 1870. In the same year, he wrote a courteous but pathetic letter to → Bulwer-Lytton, hoping for patronage. He seems to have been on the fringes of esoteric circles, but never intimate with them. In a series of letters (1879-1887) to the publisher Robert Fryar, Jennings expresses contempt of almost everyone in the spiritualist, Theosophical [→ Theosophical Society], and occultist [→ occult/occultism] world, while making extravagant claims for his own status and wisdom. Jennings deserves credit for wrestling with the metaphysical questions raised by oriental philosophies, in comparison to which the concerns of most Victorian theologians and philosophers seem rather trivial. His emphasis on sex as the foundation of religion, symbolism, and psychology should have earned him credit as a precursor of Freudian theory. But his works are too obscurely written and disorganized, and his learning too autodidactic, to have gained him academic recognition.

JOSCELYN GODWIN

Jewish Influences I: Antiquity

The nature and extent of contacts between ancient Judaism and the assortment of sources commonly labelled "Gnostic" (or more recently "biblical demiurgical", see Williams) is one of the most fiercely debated issues in Gnostic studies. This, however, is a relatively new phenomenon. The Church Fathers localized the origins of the Gnostic movement in Palestine (→ Simon Magus, Dositheus), but the adherence to a Gnostic sect was

never seen as a relapse to something Jewish. For centuries, → Gnosticism was seen predominantly as a Christian heresy.

Modern research on Gnosticism – still seen as a Christian heresy – started with F. Chr. Baur's *Das manichäische Religionssystem* (1831) and *Die Christliche Gnosis* (1835). Some years later, however, H. Graetz published a short book entitled *Gnosticismus und Judenthum* (1846). With this book he became the first to interpret various stories about dogmatic disputes among the Rabbis as anti-gnostic polemics. Neither Graetz's book, however, nor M. Friedländer's *Der vorchristliche jüdische Gnosticismus*, which was published in 1898, became very influential. The scholarly debate of the first half of the 20th century was dominated by the *religionsgeschichtliche Schule* and its "Iranian hypothesis" which left little room for Judaism. It is significant that an influential work such as H. Jonas's *Gnosis und spätantiker Geist* (1934) could ignore ancient Judaism almost entirely. The Bultmann school assumed that a (largely hypothetical) pre-Christian adaptation of the Iranian redeemer-myth must have existed in ancient Judaism, on which the Christian authors of the New Testament could draw.

It was with the decline of the *religionsgeschichtliche Schule* and the successive publication of the Nag Hammadi texts that Judaism started to assume a more important place in Gnostic studies. Many of the newly-discovered Gnostic texts seemed to rely heavily on Jewish traditions not mediated through Christian channels. Therefore, many scholars took various aspects of ancient Judaism as one of or even as *the* crucial momentum for the development of Gnostic systems.

These approaches imply serious methodological problems due to our lack of adequate sources on the Jewish side: we possess neither first hand evidence of any Jewish-Gnostic system comparable to those preserved in the Nag Hammadi library, nor anything in the Jewish context that could be compared to the attacks the Church fathers launched against their Gnostic enemies. The most important corpus of Jewish texts roughly contemporaneous with Gnosticism is Rabbinic literature, but the Rabbis almost never attack their enemies explicitly, nor do they adopt foreign ideas in a way which makes them easy to discern. Therefore an undeniable gap exists between the Gnostic sources and the Jewish ones. That scholars have nevertheless so fervently scrutinized Jewish sources for Gnostic elements is either because of their assumption that Gnosticism has Jewish origins, or their judgement that a movement which played such a powerful

role in late antiquity must have left traces in Judaism as well.

Elements related to Gnostic sources are to be found in two different layers of Rabbinic literature: firstly, common motifs and ideas in – mainly cosmological – *aggadic midrashim*, and secondly, polemics against opponents and/or polemical interpretations of Biblical verses. The first one to identify traces of Gnostic influence on *aggadic midrashim* (mainly Genesis Rabba) was A. Altman. He analyzed midrashic interpretations of the *Tohu-wa-Bohu* and the idea of the primordial light in the Babylonian Talmud and Midrash Genesis Rabba. He argued that the Rabbinic doctrine of creation was formed in response to Gnosticism as ‘a rabbinic Gnosis of its own’. Most attention, however, was given to ‘the Gnostic background of the Rabbinic Adam legends’ where close parallels can be drawn between the Gnostic myths about the primordial man and Rabbinic cosmology. Recent research, however, questions the importance of Gnostic influence on these legends (e.g. Niditch).

The Rabbis become strikingly imprecise when it comes to discussing opinions held by persons from outside their own circles. One group of persons who held views obviously not shared by the Rabbis were the *minim* (heretics). Many legal regulations were introduced in order to draw clear-cut boundaries between “true Jews” and *minim*, and many dogmatical heresies were attributed to the latter. All attempts, however, to identify the *minim* with either Christians or Gnostics have utterly failed. In Rabbinic literature, *minim* is a generic term which designates not a specific group but different things at different times (cf. Goodman). A kind of sub-category of the *minim* are those who believe that ‘there are two powers in heaven’ (*shete reshuyot ba-shamayim*). It is patent that some of these passages may refer to Gnostic dualism, but also this term is far from being univocal. It may designate philosophical and Christian as well as Gnostic ideas (Segal). Another group of texts often quoted in relation to Gnosticism describe dialogues between the famous Rabbi Jose b. Halafta and a Roman lady (*matrona*). Various scholars subscribe to the opinion that the unnamed *matrona* is the disguised representative of Gnosticism (Gershenzon/Slomovic, Agus); but whereas in some cases the parallels are indeed striking, others are forced. Finally, the Rabbinic arch-heretic, Elisha ben Avuya, alled Aher (the “Other”) is believed to have held Gnostic opinions (*locus classicus* bHag15b), but the allusions to his teachings are difficult to interpret.

In addition to the rather unspecific descriptions of the Rabbi’s opponents and their teachings, another problem for interpreting Gnostic motifs both adopted and refuted by the Rabbi arises: both Gnosticism and Rabbinic Judaism have grown in an epoch when the existence of secondary divine powers, the problem of theodicee and cosmological speculations were part of the general intellectual atmosphere. Therefore almost everything in Rabbinic literature can theoretically be interpreted either as influenced *by*, directed *against* or influential *on* Gnosticism. On the whole, Rabbinic literature thus provides little unambiguous evidence for either a Jewish background of Gnosticism or Gnostic influence on Judaism. The search for Gnostic motifs in Rabbinic literature resembles the gathering of disseminated sparks which reveal their Gnostic origin only if (re)integrated into a Gnostic context.

The assumption that Rabbinic Judaism developed a Gnostic branch in the form of Merkavah-mysticism has influenced the study of ancient Jewish mysticism for some time. The first attempts to single out Gnostic elements in ancient Jewish mysticism were made in 1893 by M. Gaster, who claimed a Gnostic origin and high age for the passages on *Shi’ur Qomah* (lit. “measurement of the body”) which deal with the measures of God’s body. A few years later, H. Odeberg identified Gnostic elements in 3 Enoch. The classic treatment of the subject, however, was provided by G. Scholem. According to his interpretation, the descriptions of the “Body of Truth” (*Sōma Alētheias*) of the Gnostic Markos [→ Marcus the Magician] can be fully understood only if interpreted as an offshoot of the Jewish *Shi’ur Qomah*-speculations which thus have to be dated back well into the 2nd century. Moreover, the descriptions of the heavenly realms correspond to the divine *plērōma* of the Gnostics. The ascent of the mystic through the heavens in order to receive esoteric knowledge can be put in parallel with the heavenly ascent of the soul. The Gnostic demiurge re-appears in Jewish mysticism as *Yozer Bereshit* and the “Little Yao” of the Gnostics can be found in Jewish sources as well. Numerous motifs from the Greek Magical Papyri reappear in Hekhalot-literature. In spite of these similarities, Scholem was aware of some important differences as well: unlike Gnosticism, Merkavah-mysticism does not develop myths and it is neither dualistic nor antinomistic. Merkavah-mysticism as “Jewish Gnosticism” therefore could have developed in the heart of early Rabbinic Judaism. This assumption not only allows Scholem to interpret several Rabbinic texts

as referring to Merkavah-mysticism, but also locates early Jewish mysticism in close chronological proximity to Gnosticism.

Scholem's views, though influential among some of his disciples and among scholars defending a Jewish origin of Gnosticism (Quispel), were sharply criticized by both scholars of Gnosticism (e.g. Jonas, Yamauchi) and of ancient Judaism (e.g. Flusser). Moreover, there is no unanimity among scholars as to Scholem's early dating of Hekhalot-literature and whether they represent a movement at the heart of Rabbinic Judaism rather than at its fringes. Nevertheless, all subsequent studies on Merkavah mysticism (Gruenwald, Halperin, Schäfer) have minimized the importance of Gnosticism. The main point of critique did not so much reflect an over-all denial of the existence of elements reminiscent of Gnostic sources; rather, it was based upon the observation that the general religious outlook is a different one: in addition to the differences mentioned above, it may be pointed out that the mere participation in the celestial liturgy seems to be the mystic's aim (Schäfer). It is indeed striking that at the very climax of the ascent, the mystic of Hekhalot-literature neither gets to see a vision of the divine throne nor receive any other kind of redemptive, secret knowledge. Therefore, seemingly similar liturgical passages in Gnostic and Hermetic texts (NHC I, 15, 5ff.; NHC VI, 59-61, Poimandres 30ff.) have a different function, since there God is praised for the revelation of redemptive truth.

The general survey of Jewish sources roughly contemporary with Gnostic scriptures shows that from what we *positively* know about ancient Judaism, we cannot deduce that "Gnosticism" of any kind played a dominant role among the Jews. The search for Jewish influences on Gnostic sources therefore does not so much arise from the Jewish sources themselves but from a hermeneutical need of the interpretation of Gnostic and Hermetic (*Poimandres*, cf. Holzhausen; *Asclepius*, cf. Philonenko) texts: many of these texts seem to reveal such strong Jewish influences without being predominantly Christian that the question whether Judaism was among those who stood at the cradle of Gnosticism (and Hermetism) is a natural one.

In some cases, the influence of Jewish ideas and motifs led to the far-reaching assumption that Gnosticism as a whole was of Jewish origin. Grant, e.g., argued that the experience of the Jewish defeat in the war against the Romans was a catalyst for Gnosticism, whereas others highlighted dualistic teachings from Qumran as possible predecessors of

similar Gnostic concepts. Moreover, Hellenistic Judaism and the Platonic interpretation of Judaism by Philo contain ideas influential in Gnostic writings, and there can be little doubt that the hypostazation of "wisdom" (*sophia*) in Gnostic literature cannot be separated from its Jewish background (MacRae). The diffusion and further development of such ideas was sometimes located among Jewish baptismal sects, the "Magharians", Therapeutes or Samaritans (Fossum).

The most important impact of Judaism can be detected, however, in the use of the Bible and biblical exegesis. Although the depth of the knowledge of the Bible in Gnostic literature is still a matter of dispute, a strong Gnostic curiosity for certain biblical stories and motifs cannot be denied. These stories and motifs were almost always subjected to heavy exegetical reworking, but some scholars have devoted much endeavor to demonstrating that Gnostic exegesis is strongly dependent on Jewish models known from Rabbinic (*targumim*, *midrashim*) and medieval sources (e.g. Pearson, Stroumsa). The enormous popularity of Jewish apocryphal texts (especially Enoch-traditions) among Gnostics corroborates these observations.

On the other hand, it has to be recognized that the Gnostic interest in Judaism is obviously a rather selective one (mainly cosmological and focused on the mythological chapters of Genesis), and the anti-Jewish attitude displayed in some texts is patent. Moreover, not all the Jewish sources mentioned above (Philo, most apocryphal texts etc.) can be called Gnostic, and scholarship has failed to point out a convincing inner-Jewish factor for a "Gnostic turn". Most important, however, is the fact that the Jewish sources at our disposal today almost never match the evidence extrapolated from Gnostic sources directly. This does not mean that Jewish trends unattested in ancient Jewish literature could not have existed. But due to a lack of adequate sources many scholars resort to more or less plausible hypothetical reconstructions of underlying "Jewish myths", which cannot be positively substantiated from Jewish sources, and implement rather unspecific terms such as "pre-Gnostic", "proto-Gnostic" or "heterodox" Judaism, "semi-Judaism" and certain unattested "Jewish circles".

It can be stated that Gnostics were obviously attracted by Jewish ideas on various levels. However, one should be cautious not to hypostasize this selective curiosity and knowledge displayed in Gnostic texts into a real branch of ancient Judaism. According to the sources available to us today, it remains an open question whether the Jewish

elements adopted and reworked in the Gnostic writings were simply “Jewish”, “heterodox”, “pre-Gnostic” or “proto-Gnostic”, and whether their occurrence reveals an intimate, first-hand knowledge of Jewish traditions or the knowledge of interested “outsiders”. Whereas there is clear evidence for a *use* or even *instrumentalization* of Jewish motifs and ideas in Gnostic thinking, we can speak of Jewish *influence* only in the restricted sense that the active role of Jews and a decisive influence of Jewish concepts in the development of the Gnostic message(s) cannot be firmly established.

In recent years, scholars have called for strict methodological criteria for analyzing mutual “influences” of ancient Jewish mysticism on Gnosticism and *vice versa*. Models of direct borrowing from one side by the other and the assumption of common sources have to be supplemented by models which allow parallel though genealogically independent developments and influences mediated through other sources, such as magical literature (Alexander). Also, a distinction must be made between phenomenological and historical parallels (Dan).

→ Magic has always been seen as an important melting pot for Jewish, Christian, Gnostic and Pagan ideas in late antiquity. Recent studies on Jewish and Greek magical texts have indeed brought to light a number of striking parallels (e.g. Sperber, Veltri, Schäfer/Shaked). Moreover, more and more evidence for close contacts between Jewish and Christian magic comes to light. The specifically Gnostic character of most of the Greek magical texts, however, is no longer generally accepted (cf. Brashear), so that the textual basis for Jewish-Gnostic studies is rather limited here as well. Unambiguous Gnostic motifs in Jewish magical texts exist but are rather rare (Leicht). Close connections between Jews, Christians, → Mandaeans and even Manichaeans [→ Manichaeism] are attested by the magic bowls from late Sassanian Mesopotamia, but the comprehensive historical and philological analysis of these texts is still in its beginning phase.

Jewish Influences II: Middle Ages

The Middle Ages are largely characterized by a process towards a successive domination of public life by Rabbinic Judaism, on the one hand, and Roman Catholic or Orthodox Christianity, on the other. Although "orthodoxy" sometimes set up rather strict rules to impede interreligious contacts, exchange of ideas between Jews and their non-Jewish contemporaries always existed. The different fields of esoteric lore, heretical ideas, → magic and → mysticism were always seen as particularly fertile grounds for such contacts.

Medieval Jewish and non-Jewish esoteric lore is based upon ancient foundations. One of the main sources for the transmission of Jewish esoteric lore in Antiquity were apocryphal and pseudepigraphic writings. The relevance of various apocryphal texts in the development of medieval Christian sects cannot be denied, but a growing number of sources shows that these traditions did not vanish from Judaism with the decline of the Hellenistic Diaspora in the 2nd century C.E. either. The Hebrew Book of Enoch (6th cent. C.E.), e.g., is an adaptation of ancient Enoch-traditions in the spirit of Hekhalot-literature. At different times, too, apocalyptic traditions were revitalized (e.g. Apocalypse of Zerubbabel, 7th cent. C.E.). Therefore, the occurrence of apocryphal traditions in medieval Christian sources can reflect either developments of previously adopted traditions or direct Jewish influences. The latter could be the case with some apocryphal material preserved in Old Slavonic sources (*Palalaia*-literature) probably influential on the "Gnostic" Bogomil movement [→ Bogomilism]. Some of these texts may have been translated directly from Hebrew (Apocalypse of Abraham) and of others, Hebrew versions have been discov-

ered recently (Prayer of Jacob/Ladder of Jacob). Moreover, it is a conspicuous temporal coincidence that apocryphal traditions unknown from Rabbinic sources suddenly re-appear in Jewish midrashic texts in medieval Western Europe (e.g. *Midrash Tadsheh, Chronicle of Ierahmeel, Bereshit Rabbati*), when Christian heretical movements flourished there as well.

The most important revival of ideas and motifs akin to Gnostic thinking in Jewish literature is attested in the writings of early Kabbalah. G. Scholem was the first to interpret central teachings of the Book *Bahir* as repercussions of ancient → Gnosticism: for the first time in Jewish sources, God is theosophically described not merely as a heavenly king but with a pleroma of hypostatized potencies and a cosmic tree as the totality of his powers. M. Idel radicalized this view and argues that the Book *Bahir* reveals fragments of ancient Jewish Gnosticism which predates the ancient non-Jewish Gnostic sources. As a matter of fact, in many respects the Book *Bahir* is much more reminiscent of ancient Gnosticism than Hekhalot-literature, since it contains for the first time a detailed theosophical and mythological account of the creation of the world and of man. The hypothesis that the contemporary Cathar movement [→ Catharism] may have influenced the early Kabbalah could not be substantiated so far (Scholem, Shahar).

Gnostic-dualistic concepts can also be found in 13th-century Castilian Kabbalah (Cohen-brothers) with the concept of the "emanation of the left side" as a satanic realm within the godhead, and in 16th-century Lurianic Kabbalah, which located the origin of evil within God himself and created a myth about the fallen sparks of the souls through the "breaking of the vessels". These traditions were further developed in Sabbatianism (17th cent.) with its "gnostic" concept of a Messiah who has to enter the realm of evil in order to redeem the dispersed divine sparks. In other kabbalistic schools and works like the *Zohar* (13th cent.), "gnostic" motifs play a minor role. It has to be noted, however, that "gnostic" motifs in Jewish mystical systems paradoxically become stronger the more they are historically remote from ancient Gnosticism (Dan).

Kabbalah developed in close geographical vicinity to the medieval centres of Christian intellectual life. Many kabbalists adopted philosophical (mainly neoplatonic [→ Neoplatonism]) and religious ideas current in their Christian environment. In spite of certain resemblances, however, there is almost no evidence that kabbalistic teachings influenced their Christian contemporaries prior

to the beginnings of Christian Kabbalah in the Renaissance. In a time of religious disputations on the Hebrew Bible and the Talmud, kabbalists were not eager to popularize their esoteric teachings among Christians either. Evidence for occasional contacts (cf. Kieckhefer) have to be analyzed carefully with respect to possible sources.

Jews undoubtedly played an important role in the transmission of → astrology, → hermetism, magic and astral magic from the Arabic into the Latin world, just as they did in many other fields of medieval science: astrology and astral magic have strongly influenced the thinking of medieval Jewish philosophers like Yehudah ha-Levi (1085-1145), Abraham bar Hiyyah (died ca. 1136) and in particular the famous exegete Abraham Ibn Ezra (1093-1168), whose scientific astrological works were also translated into many medieval European languages (cf. Levy). Numerous Hebrew translations show that Spanish Jews were active as translators of ancient and medieval treatises from Arabic sources, but also originally Jewish texts written in the spirit of hermetic astral magic seem to have existed. An example in case is the Latin *Sefer Raziel* (which is not always identical with the Hebrew books entitled *Sefer Raziel* and *Sefer ha-Razim*). It was translated in the twelfth century and later revised, together with other presumably Jewish works, under the auspices of Alfonso X Sabio (cf. Steinschneider, Leicht). In these texts, many of the traditions commonly linked with → Hermes Trismegistus or Apollonius of Tyana are attributed to Adam, Enoch or Solomon. However, most of the relevant Hebrew material is still unpublished and requires further investigation. Many other manuscripts do not predate the Renaissance, and therefore a careful investigation is needed in order to isolate medieval Jewish traditions from younger Jewish translations from Latin sources (e.g. *Clavicula Salomonis – Mafteah Shelomoh*).

During the whole Middle Ages, scholars were obsessed by the idea that → alchemy was a science in which Jews were especially active. Although many of the traditions which have grown from this idea are legendary, recent research recognizes a certain Jewish influence on ancient and medieval alchemy and argues that alchemy played a more important role among medieval Jewish scholars than hitherto assumed (Idel, Patai). Already Scholem was able to show, however, that in the classical works of Kabbalah alchemy is occasionally alluded to, but that it forms no constitutive factor in kabbalistic thinking. The great synthesis of alchemy and kabbalistic symbolism did not happen during the Middle Ages but is a Renaissance and post-Renaissance phenomenon.

REIMUND LEICHT

Jewish Influences III: "Christian Kabbalah" in the Renaissance

The term "kabbalah" in the concept "Christian kabbalah" is a misleading one: it suggests a phenomenon much narrower in scope than the works of the thinkers included in it actually present. The group of humanists in Florence at the end of the 15th century and the beginning of the sixteenth who laid the foundations of this important current in European esotericism discovered and adopted into Christian culture the whole wealth of Hebrew post-Biblical creativity: the Talmud and the Midrash, the Jewish prayer-book, medieval Hebrew

biblical commentaries, the writings of Jewish rationalistic philosophy, and non-kabbalistic Jewish mysticism of Antiquity and the Middle Ages. They themselves often used the term "kabbalah" to denote all this vast library, encompassing Hebrew religious traditions extended over nearly a millennium and half; in this they did follow Jewish concepts, which saw the oral torah, including its legal and exegetical material, as the "tradition" (i.e. the literal meaning of *Kabbalah*) which Moses had received on Mount Sinai by oral revelation directly from God and transmitted to the elders of Israel, who in turn had transmitted it to the judges and the prophets and so on, from generation to generation. The narrower meaning of "kabbalah", as relating to the esoteric tradition concerning the secrets of the divine realm which begins in the late 12th century, is a result of the desire on the part of the new medieval esotericists to insist that their ideas concerning the structure and nature of the divine world is part of the more general "kabbalah", or tradition – that is, of the oral torah – and not a medieval innovation. This distinction is important, because it expresses the nature of the Christian interest in this realm: the humanists believed that they had discovered another important layer of divine truth which was preserved in Jewish extra-biblical traditions. The notion that the appearance of the Christian Kabbalah in late-15th century Florence is one of Christian mystics discovering Jewish → mysticism is completely erroneous. The Florentine humanists were not mystics, and what they discovered in the Hebrew sources that they studied was not mysticism. They were looking into many directions in search of ancient secrets: the Egyptian hieroglyphs, the enigmatic Hermetic treatises [→ Hermetic Literature], and many other places, and within this framework they also became interested – sometimes intensely so – in Jewish ancient traditions known as "kabbalah". The emphasis on a particular aspect of this vast tradition – that of the writings of the Jewish kabbalists concerning the divine world – occurred much later, and was never an exclusive one. → Giovanni Pico della Mirandola and his friends and followers extended the Christian sanctification of the Hebrew bible to the totality of Jewish tradition: a courageous and radical theological breakthrough, which stood in opposition to the current Christian attitude of rejection and hatred towards the Talmud and everything descended from it, as well as to the theological insistence that after the appearance of the New Testament Jewish culture was destined to decline and stagnation. This novel approach had a significant impact on Christian esotericism in the following centuries, but was never accepted by Christian

mainstream theology. In fact, even today, most Christian thinkers are closer to Pico's and → Reuchlin's opponents than to the latter's new approach. The main Jewish idea which the "Christian kabbalists" adopted, therefore, is that which denies the novelty of the Talmud and Midrash and much of medieval Jewish culture, and sees them as a continuation of an oral tradition which began in biblical times and was preserved unchanged by Jewish scholars. The term "kabbalah" in the concept "Christian kabbalah" should therefore be understood in the original, general, Hebrew meaning of the term, that is, Tradition.

The material which the early Christian kabbalists derived from the Hebrew sources was, to some extent, just information (for instance, Pico quotes Rabbi Eleazar of Worms's *Wisdom of the Soul* [*Hokhmat ha-Nefesh*] as the authority for the fact that the legs of the cancer can be divided into "hands and feet"): details concerning nature, earthly and celestial, which may be regarded as belonging to the realm of science, and more than that, mainly of a methodological-linguistic kind. The Hebrew sources introduced the humanists to a new concept of language, very different from that which prevailed in Christian culture. This concept, and the exegetical methodologies derived from it, are characteristic of the Jewish midrash, and involves a group of hermeneutical procedures which do not have a counterpart in Christianity. Christian scriptures were studied and interpreted in their translated form, mainly Latin; and therefore the semiotic level of meaning – the only one that is transmitted in translation – was almost the exclusive one. In contrast, Hebrew scriptures were regarded as written in a divine language which preceded the creation and was a means for the physical creation ('And God said let there be light and there was light', Gen. 1:3); it was a part of the infinite divine wisdom, rather than a means for human communication, and therefore its meaning could never be exhausted. The midrash did not seek a definite, final meaning or meanings of the verses, but was open to ever-increasing additional meanings, even when these were different and conflicting. The means of revealing these meanings were not found only on the semantic level; rather, letter, word and verse represented a semiotic entity, conveying messages by means of the shapes of the letters, the vocalization and musical signs (*nikkud*, *te'amim*), their adornments (*tagin*), their numbers and numerical values (*gematria*), acronyms of many kinds, including letter endings (*notarikon*), and the transmutation of letters into others, according to fixed rules (*temurah*). The library of Jewish texts which was available to the Renaissance humanists,

in Latin translation or in the Hebrew originals, included extensive use of these methodologies (especially in the writings of Rabbi Judah the Pious of Regensburg, Rabbi Eleazar of Worms and Rabbi Abraham Abulafia). These methodologies (which are not directly associated with kabbalah in the narrow sense of the term; some kabbalists used them extensively, others very rarely) opened up new vistas of interpretation and the discovery of secrets for Christian scholars; they constituted a fascinating novelty and would remain characteristic of the works of Christian kabbalists in later centuries. One of the most potent ideas in this context was the description of creation by means of the letters of the alphabet, as presented in the *Sefer Yetzirah* (both the original and the various commentaries on it figured prominently in the library of the Christian kabbalists).

The first discovery that attracted the Christian scholars was that of the multiplicity of the names of God, a concept unfamiliar in Christian culture. The ancient translators into Greek of the Hebrew bible translated the Hebrew names of God into words (God, *theos*, the Lord), and thus obscured the fact that God is referred to in the Hebrew bible by different names. The Hebrew tetragrammaton evoked significant Christian interest during the Middle Ages (mainly through the works of Jewish converts to Christianity), but now a whole field of sacred names and their interpretations was opened up. A personal name is that part of language which does not carry any semantic message; it is just a reference to its bearer. Christianity had only one such name, Jesus, while Judaism – including its esoteric and kabbalistic sources – contained an almost infinite treasury of them. The Christian scholars returned to the existing tradition of tetragrammaton interpretations, but this time as a field containing enormous exegetical possibilities. One of the best-known examples is Reuchlin's historical interpretation of the Name: its early version was *Shaddai* (SDY, three letters in Hebrew), which was the name by which God revealed himself to the patriarchs; in the age of the Torah the tetragrammaton (YHWH, four letters) was supreme, and in the age of redemption the name consisted of five letters – YHVSH – which was read as Yehosha, that is, Jesus.

Another meaningful discovery was that of the Hebrew expression of the concept of *harmonia mundi* – macrocosm and microcosm in harmony and symmetry – as expressed in the *Sefer Yetzirah* and its numerous interpretations in the Jewish tradition. The Christian scholars could find expressions and elaborations of these concepts in all

aspects of the Jewish tradition which they read or as it was translated to them, because it served as a fundamental element in the understanding of the structure of the universe, of Man, and of God throughout the teachings of most of the Jewish schools of thought represented in those writings. The *Hasidey Ashkenaz* (the Pietists and Esotericists of medieval Germany) believed and developed it, and it is found as well in the kabbalists of Spain and the writings of Abulafia. As these concepts were central to the world-view of the humanists of the → Ficino school, where they received support from other classical and medieval sources as well, together they formed a powerful body of ideas which had a major impact on the theological and scientific schools in the 16th, 17th and even the 18th centuries in Europe.

It is ironic that those elements in kabbalistic writings according to the narrow meaning of the term, which are usually identified as gnostic in some sense, actually exerted the least impact on the Christian kabbalah. The duality of gender within the godhead – a new, revolutionary concept found for the first time in the book *Bahir* (circa 1185) and which became basic to the erotic myths of the *Zohar* and other kabbalistic writings – did not make much of an impression on the Christian kabbalists, who had a celestial feminine figure of their own in the person of Maria. Likewise, the kabbalistic pleroma of ten divine emanations – the *sefirot* –, though often mentioned and discussed, did not present a novel aspect for speculation for the Christian scholars, probably because they already had at their disposal a vast body of literature and speculation on the trinity, which they believed to find back in the kabbalistic structure. Nor did the dualistic world-view of the *Zohar* and subsequent kabbalistic works, in which the celestial and the human worlds were conceived as battlegrounds between the forces of good and evil, attract their attention, because most of them opposed the dualistic concepts which were gaining ground within Christianity at that time. Expressions of Jewish messianism and apocalypticism were not meaningful to them either, but were often interpreted in a Christological manner.

This pattern was repeated during the second phase of the development of the Christian kabbalah, when the first Lurianic texts were translated into Latin and had a significant impact on European esotericists. From the elaborate, multi-faceted Lurianic myth, which included important new ideas like the primordial catastrophe within the divine world before the creation – the failed attempt of the Godhead to emanate a system of

divine powers, described in Lurianic terminology as "the breaking of the vessels" [*shevirah*], and the on-going process of theurgic correction [*tikkun*] – very little was absorbed by the Christian scholars. This "breaking of the vessels", which caused numerous divine sparks to be scattered, captive of the evil powers and yearning to be saved, is especially reminiscent of ancient gnostic myths. The most influential Lurianic concept which was integrated in European thought was the *zimzum*, the primordial withdrawal of God into Himself before the beginning of the positive processes of emanation and creation. This concept came to be interpreted mainly in a philosophical manner, and the possibilities for speculations of a gnostic type were neglected.

While Pico had around him devoted Jewish teachers of kabbalah like Yohanan Alemanno, and translators like Flavius Mithridates, and → Reuchlin had a teacher like Luanz, there were Jewish scholars who objected to his enterprise. Furthermore, Pico studied the writings of Aristotle with a Jewish scholar, Rabbi Eliyahu del Mediggo, who tried to dissuade the young count from indulging in kabbalah and concentrate on the study of Aristotelian philosophy. When Pico chose the opposite way, Del Mediggo expressed his frustration by writing a theological treatise, published in Hebrew in 1490, which is the first systematic attack on the kabbalah and the first clear statement that the *Zohar* is a medieval composition. There can be little doubt that Pico heard these views from Rabbi Eliyahu, but he apparently rejected them, accepting instead the insistent claim of the kabbalists that their teachings are derived from ancient sources.

Pico and Reuchlin made very little use of the *Zohar* itself; they often relied on secondary sources, like the Torah commentary of Rabbi Menachem Recanati. Other Christian kabbalists did use the *Zohar*, like → Francesco Giorgio (1460-1541) of Venice, whose *De Harmonia Mundi* exerted a significant influence during the Renaissance, and who introduced some keen observations concerning the nature of language (resulting from his experience with the kabbalistic use of language). Less influential, though profound and insightful, was the use of the *Zohar* by the great mystic → Guillaume Postel in Paris; he translated sections of the *Zohar* (as well as the *Sefer Yetzirah*), but these were not printed until the 20th century.

The image of the kabbalah in the history of Christian thought was shaped to a very large extent by the popular work of → Cornelius Agrippa of Nettesheim's *De Occula Philosophia libri tres* (1533). This work became the most important

16th-century textbook of esoteric and occult philosophy, and it presents the kabbalah as a discipline dealing mainly with → magic and numerology [→ Number Symbolism], together with other esoteric traditions of the Renaissance. For nearly five hundred years now the erroneous image of the kabbalah as a fuzzy discipline combining → witchcraft, number mysticism and magic has persisted; it is dominant today even among Hebrew readers in Israel, who have absorbed the European image of this traditional Jewish discipline.

After the great upsurge of attempts to translate and study Hebrew kabbalistic works, later Christian kabbalists, in Scholem's words, 'remained content to speculate in the realm of Christian kabbalah without any firsthand knowledge of the sources. Indeed, in the course of time the knowledge of Jewish sources diminished among the Christian kabbalists, and consequently the Jewish element in their books became progressively slighter, its place being taken by esoteric Christian speculations whose connections with Jewish motifs were remote' (*Kabbalah*, 199). In the second half of the 16th century there began a process of associating the kabbalah with → alchemy, and presenting both as one and the same doctrine, despite the fact that alchemy was rather marginal in the history of Jewish culture in general and the Hebrew kabbalah in particular (this identification of kabbalah and alchemy has been reaffirmed in strong terms in the 20th century, in the writings of → Carl Gustav Jung).

There were, however, exceptions to this general picture, which caused a new resurgence of interest in the Jewish kabbalah during the last decades of the 17th century and the beginning of the 18th. The most prominent among them was the great anthology of kabbalistic texts, *Kabbalah Denudata* (three volumes, 1677-1684), by → Christian Knorr von Rosenroth. In this collection the kabbalah is presented by means of its authentic masterpieces, from the *Zohar* to the Lurianic kabbalah. From these volumes a line of influence was spreading to the heart of Christian creativity during this period. At the end of the *Kabbalah Denudata* is inserted an anonymous treatise, whose author has been identified as one of the most profound writers among the Christian kabbalists: the Flemish scholar → Franciscus Mercurius van Helmont, who wrote several other Christian kabbalistic treatises. His writings had meaningful influence in several directions: on Leibniz (with whom he was closely associated, and who completed one of his works left unfinished at his death) and his school of thought, and, in another direction, on → Henry More, →

Ralph Cudworth and other representatives of the Cambridge Platonists. His impact can be traced among important scientists and philosophers, including → Newton and Locke.

A special case is the relationship between the theosophical mysticism of → Jacob Boehme and the Christian kabbalah. There exists a significant typological proximity between some of Boehme's ideas and those of the kabbalah, yet no direct source of influence has been identified, neither in Hebrew nor among the treatises of the Christian kabbalists. Yet several of Boehme's disciples and interpreters did make use of the Christian kabbalah and intensified the typological connections between the two currents.

Jewish Influences IV: Enlightenment/Romanticism

The interpretation and estimation of Jewish mysticism changed fundamentally in the Enlightenment. Whereas in the Renaissance Kabbalah had passed as the model of a rediscovered original Christian and esoteric knowledge, and even in the late 17th century (e.g. in → Knorr von Rosenroth, Gottfried Wilhelm Leibniz [1646-1716] and →

Athanasius Kircher) it had served as a theological and philosophical paradigm, the Enlightenment situated it firmly outside its more narrowly-drawn frontiers of reason. Immanuel Kant (1724-1804), for example, in his satirical discussion of → Swedenborg's "Geisterlehre" (spirit-teaching), defined reason outright as "Anti-Kabbalah". In the 18th century the magical elements of Christian Kabbalah, especially – those elements known since → Pico della Mirandola (1463-94) as *cabala practica* (practical Kabbalah) and placed by → Agrippa of Nettesheim, in his *Philosophia occulta* (1533), at the very center of an esoteric philosophy – were declared to be a manifestation of "superstition". The same applies to the Jewish Enlightenment, the "Haskalah", and the "*Wissenschaft des Judentums im 19. Jahrhundert*", in which the Kabbalah was no less vigorously rejected. There are examples of this in the chapter on Kabbalah in the well-known *Lebensgeschichte* (1792-1793) by the Kantian Salomon Maimon (1753/54-1800), and in the *Geschichte, Lehre und Meinungen aller bestandenen und noch bestehenden religiösen Sekten der Juden und der Geheimplahre oder Kabbalah* (History, Doctrines and Opinions of all Past and Still Existing Religious Sects of the Jews and the Secret Doctrine or Kabbalah; 1822/23) by Peter Beer (1758-1838). In non-Jewish circles, the criticism of "practical Kabbalah" was often combined with anti-Semitic arguments. The thesis of the Jews as magicians and of Hebrew as a language of sorcery appears in the 18th century in this hostile spirit, for instance in *Entdecktes Judentum* (Jewry Unveiled; 1700) of Johann Andreas Eisenmenger (1654-1704) and in *Jüdische Merckwürdigkeiten* (Jewish Curiosa; 1714-17) by Johann Jacob Schudt. The lasting influence of these two texts can still be detected in later Romantic writers, such as Clemens Brentano (1778-1842), Jacob Grimm (1785-1836), Achim von Arnim (1781-1831), and Joseph von Görres (1776-1848), who in his *Christliche Mystik* (Christian Mysticism; 1836-1842) classed "Jewish sorcery" as "demonic mysticism".

But the Enlightenment was not only "anti-Kabbalah". Simultaneously with these rejections, the 18th century brought a multitude of positive perceptions, adoptions, and "rescuings" of Kabbalah and the Hermetic tradition. The Enlightenment had two possible ways of rescuing the Kabbalah. First, one could think of a philosophical and unhistorical transformation of Hermeticism and Kabbalah, in the course of which their historical, "positive" manifestation was understood as "pre-rational" allegorical language and symbolism that could be translated into rational notions. This

strategy allowed a rational re-formulation of Hermeticism within the project of a “natural religion of reason”. It claimed that reason could be distilled, like the hidden quintessence, out of a traditional pre-rational context, thereby saving Hermeticism and Kabbalah for the project of the Enlightenment. This approach can be perceived in attempts to qualify Kabbalah in the histories of philosophy (from Jacob Brucker to Dietrich Tiedemann) and the encyclopedic lexica of the Enlightenment (like the *Encyclopédie*), in which long chapters or articles on Kabbalah repeatedly tried – for all their criticism of “practical Kabbalah” understood as → magic – to recast at least some elements of its metaphysics in philosophical terms. A leading issue in this was the debate over Spinoza’s pantheism, which ever since *Spinozismus im Judenthumb* (Spinozism in Jewry; 1699) by Johann Georg Wachter (1663-1757) had been repeatedly explained as a philosophical reformulation of the Kabbalistic concept of nature and God. Of course, → Friedrich Christoph Oetinger (1702-1782) expected much more from a philosophical rescue of the Kabbalah. In his explanation for the *Öffentliches Denkmahl der Lehr-Tafel der Prinzessin Antonia* (Public Monument of the Didactic Tablet of the Princess Antonia; 1763), in the context of a ‘juxtaposition of Hebrew with contemporary philosophy’, he ascribed to the ‘philosophia sacra cabbalistica’ the decisive function of mediating between revelation and reason. Oetinger’s Kabbalah was thus part of a Christian theology of the 18th century which attempted to set forth ‘die Grund-Begriffe Jesu Christi nicht nur ex fide, sondern auch ex ratione für raisonnable’ (the basic concepts of Jesus Christ as reasonably, not only from the perspective of faith, but also from that of reason).

The second possibility for a rescue of Jewish mysticism was to place it on an esoteric plane of discourse and explain it as an arcanum, which is what happened in the secret society culture of the Enlightenment. There the esoteric realm of the arcanum appeared as a possible residue of esotericism and Kabbalah, but within a discourse that fundamentally excluded them. Kabbalah, even if understood literally as a secret, oral teaching, made its appearance as the founding myth of a → Freemasonry aware of its esoteric elements and reaching back explicitly to the Kabbalah for the explanation of its symbols. Even more clearly this is the case in esoteric Freemasonry, especially the Orders of the Gold- und Rosenkruz and the → Asiatic Brethren, which included in their programs elements of early modern nature-mysticism, as well as Kabbalah.

A direct line leads from this esoteric Freema-

sonry to the rehabilitation of Kabbalah in the Romantic era. Around 1800, in fact, one can even speak of a reintegration of Kabbalah as it had been understood in the early modern era, also in non-Jewish circles, and had been excluded from the discourse of reason in the Enlightenment. This occurred within philosophy on the one hand, and within literature on the other. For the former, → Friedrich Wilhelm Joseph Schelling (1755-1845), → Franz von Baader (1765-1841) and their circle are notable for their integration of Jewish esotericism in a religious-philosophical sense. Baader occupied himself with Kabbalah from 1796: he saw it primarily as post-Enlightenment religious philosophy, as an anti-Kantianism, which he sought especially in the esoteric Freemasonry launched by → Saint-Martin. Schelling, again, considered Kabbalah within a philosophy of mythology, as in his lecture of 1815, *Ueber die Gottheiten von Samothrake*. He presents it there not merely as an ancient “Jewish philosophy”, but as the branch of ‘that primordial system that is the key to all religious systems’, thereby making an impressive plea for further research into it. Initial attempts at taking up this challenge can be seen in the Protestant theologian Johann Friedrich von Meyer (1772-1849) – i.e. in his periodical *Blätter für höhere Wahrheit* (1819-1832) and his German translation of the *Sefer Jezirah* (1830) – and in particular the Catholic private scholar Franz Joseph Molitor (1779-1860) in his four-volume *Philosophie der Geschichte* (1827-1854). Collaborating with Jewish scholars like the Freemason Ephraim Joseph Hirschfeld (1755-1820), and basing himself on the religious-philosophical terminology of Schelling and Baader, from ca. 1810-1860 Molitor spent decades studying original texts in view of making the Kabbalah available again on the basis of its original sources, and of rehabilitating it from a philosophical and theological point of view. The subtitle of his work clarifies the actually Kabbalistic program of this monumental undertaking in the philosophy of history: *Oder über die Tradition in dem alten Bunde und ihre Beziehung zur Kirche des neuen Bundes. Mit vorzüglicher Rücksicht auf die Kabbalah* (or: On the tradition in the old covenant and its relation to the church of the new covenant. With particular reference to the Kabbalah)

Quite distinct from this religious-philosophical treatment of the Kabbalah, the Romantic era witnessed an aesthetic program, especially in the work of → Novalis (1772-1801) and Friedrich Schlegel (1772-1829). Following in the steps of Johann Georg Hamann’s (1730-1788) reevaluation of language as such as the “organon of reason”, the

aesthetic Romantics paid most attention to the Kabbalah's theory of language. Their program was summarized in Friedrich Schlegel's programmatic saying of December 1802: 'The true aesthetic is the Kabbalah'. The philological basis for this configuration of Kabbalah and aesthetics did not lie in any direct knowledge of the Jewish sources, and only selectively in the Christian Kabbalah of the Renaissance. Knowledge of the Kabbalah came from secondary sources such as the Enlightenment's histories of philosophy and encyclopaedias, but also from the writings of → Giordano Bruno, → Paracelsus, → Robert Fludd, and → Jakob Boehme. The aesthetic paradigm of the Kabbalah in Romanticism was a secular reinterpretation of the language-theory of early modern Kabbalah. The older theological, philosophical, and nature-mystical language-theorems of Christian Kabbalah were understood as aesthetic parameters. The language of the Kabbalah was no longer seen as a metaphysical model, but as the paradigm and metaphor of a poetical language. The Kabbalah that was thus mediated, translated, and reinterpreted can be characterized under three aspects: hermeneutics, language-mysticism, and language-magic. The Kabbalistic concept of hermeneutics, as developed in the literature of Christian Kabbalah, became (as in Hamann and Schlegel) a stylistics of writing. The early modern projects of a sacred, natural, mathematical language of Kabbalah came to be seen as manifestations of a poetic concept of language and knowledge (as in Novalis and Schlegel). And experiments in language-magic were transposed (in Novalis, Schlegel, and E.T.A. Hoffmann) to a theory of the magical function of poetical language. This aestheticized Kabbalah of Romantic aesthetics found considerable resonance in the poetry of the modern aesthetic movement. Elements of it are found in the poetry of French Symbolism, also in many German-Jewish authors circa 1900-1933, and again after 1970 in post-structuralist literary theory.

ANDREAS B. KILCHER

Jewish Influences V: Occultist Kabbalah

The history of kabbalistic influences on 19th- and 20th-century occultism [→ occult / occultism]

has been neglected by scholars, with the argument that what passes as "kabbalah" in this context is in fact a "pseudo-kabbalah" unrelated to its original meaning in Jewish culture. Gershom Scholem, in particular, has lent his authority to this approach by dismissing the occultist "kabbalah" of → Eliphas Lévi as 'brilliant misunderstandings and misrepresentations', that of → Aleister Crowley as 'highly coloured humbug', and the whole of occultist interpretations as 'supreme charlatanism' (Scholem 1946, 2; 1974, 202-203; 1984, 20). While the term "charlatanism" is unfortunate, as it suggests a policy of deliberate deception, it is certainly true that occultist "kabbalah" has only the most superficial of connections to original Jewish kabbalah. However, from a historical perspective this is not sufficient reason to exclude the phenomenon from historical scrutiny. Scholem himself emphasized "misunderstandings" as an important factor of religious innovation in any period (1946, 24-25); and the role of "kabbalah" in non-Jewish contexts from the Renaissance up to → Romanticism has been seriously studied in spite of the fact that already the Christian kabbalah can hardly be considered "authentic" from a Jewish point of view, not to mention the thoroughly non-Jewish "esthetic kabbalah" of the Romantics.

The general pattern that characterizes the periods of Enlightenment and Romanticism is continued in the 19th century: occultist ideas about "kabbalah" reflect no familiarity with Jewish sources but are entirely dependent on second-hand materials passed on via Christian kabbalistic channels. An exemplary early case is Francis Barrett's *The Magus, or Celestial Intelligencer* (1801), whose main sources are → Cornelius Agrippa's *De occulta philosophia libri tres*, pseudo-Agrippa's *Fourth Book of Occult Philosophy*, and pseudo-Abano's [→ Peter of Abano] *Heptameron*. "Cabala", understood entirely along Agrippian lines, plays a central role in the book, which established for the 19th and 20th centuries a second pattern that would continue to dominate occultist "kabbalah": its almost exclusive association with → magic.

As far as the domain of Western esotericism is concerned, the main exception to both patterns is the French philosopher Adolphe Franck (1809-1893). His *La Kabbalah ou la Philosophie Religieuse des Hébreux* (1843) was a pioneering synthesis based upon serious study of the original sources. It was widely read and translated, and its influence can be discerned not only in the early academic study of kabbalah, but also in masonic and occultist authors such as Albert Pike, → Manly P. Hall, and → H.P. Blavatsky. This occultist reception

was no doubt facilitated by the fact that Franck (who also published about → alchemy and → Saint-Martin, and a letter of whom to → Papus is published in the latter's *La Kabbale* of 1892) discussed the Christian kabbalists in some detail, investigated the possible relations of kabbalah with → Neoplatonism, → gnosticism, and the Chaldaeans and Persians, and concluded – wrongly, of course – that it had very ancient origins traceable to the Zoroastrianism of the Persian magi. All this could serve to confirm occultist perceptions of kabbalah as a mysterious “ancient wisdom” that held the key to magic and the occult.

Éliphas Lévi was the first to develop such a perspective at length, in all the major works of his occultist period (but for a short summary, see his “Elements of the kabbalah in ten lessons”, published in *Le livre des splendeurs* and several times reprinted, *inter alia* by Papus in the second edition of his book quoted above). He was almost completely ignorant of Hebrew, resulting in spectacular blunders (Secret 1988), and his ideas about kabbalah are wildly fantastic; but the important point is that they were taken seriously by generations of occultists after him. Taking his cue from → Court de Gébelin and → Etteila, Lévi closely associates the kabbalah with the → Tarot, arguing that its twenty-two “great arcana” correspond with the twenty-two letters of the Hebrew alphabet and the twenty-two “paths” linking the sefirot in the “tree of life” diagram; to these are added the numbers one to ten that are basic in traditional → Number Symbolism and are associated with the ten sefirot. The result is a system of → correspondences based upon thirty-two “paths”, presented by Lévi as a universal system of classification that contains the totality of human knowledge. Specific insights can be deduced from this system, or so it is claimed, by means of the kabbalistic methods (actually standard methods of exegesis in Judaism) of gematria and temurah. It might be added that Lévi sees not only the great ancient and oriental religions, but Roman Catholicism as well, as ‘completely kabbalistic’; but the priests have lost the key that could unlock the true nature of their cult.

Lévi's ideas have had a great influence on the later development of French occultism, as reflected e.g. in the foundation of organizations with titles such as “Rose-Croix kabbalistique” (founded in 1887 by → Stanislas de Guäita and → Joséphin Péladan). Fully characteristic for the later French perspective is the book by Papus, already mentioned above, which appeared in 1892 and was republished in 1903 in a much expanded edition (with new contributions by Lenain [author of a *Sci-*

ence cabalistique published as early as 1828], Lévi, de Guäita, Marc Haven, → Sédir, J. Jacob, Saïr and Chevalier Drach, and containing a complete translation of the *Sefer Yetzirah*). Papus' ‘methodical presentation of the kabbalah’ is conspicuous for its complete absence of any reference to Jewish sources; instead, we find all the great names of Christian kabbalah [→ Jewish Influences III] combined with other esoteric and occultist authors including → John Dee, → Fabre d'Olivet, → Saint-Martin, → Lacuria, → Hoëné Wronski, → Ragon de Bettignies, → Saint-Yves d'Alveydre, → Barlet, and → de Guäita.

The ideas of French occultist kabbalah were made available to an English readership originally by fringe-masonic authors such as Albert Pike and Kenneth Mackenzie. Pike's *Morals and Dogmas of the Ancient and Accepted Scottish Rite of Freemasonry* (1871) is full of references to kabbalah, dependent on Franck, Lévi (whose writings are plundered without acknowledgement) and → Knorr von Rosenroth's *Kabbalah Denudata*. Mackenzie is likewise strongly dependent on Lévi, whom he had visited in Paris; in his famous *Royal Masonic Cyclopaedia* (1875-1877) he devoted a long article to kabbalah and a shorter one to the *Sefer Yetzirah*, thus forging another link in the occultist-kabbalistic chain.

→ H.P. Blavatsky refers to kabbalah in many parts of her writings, and once again her interpretations are shot through with errors and misunderstandings. Important is her reference on the very first page of *Isis Unveiled* to a mysterious ‘old Book’ of which only one copy has survived, and from which ‘the most ancient Hebrew document on occult learning – the *Siphra Dzeniouta*’ is said to be compiled. Vol. II, ch. V is devoted to “Mysteries of the Kabala” and further confirms that Blavatsky saw the kabbalah as dependent on more ancient traditions, Hinduism in particular; indeed, she states quite bluntly that ‘The ten Sephiroth are copies taken from the ten Prâdjapatis created by Viradj’ (*Isis* II, 215). Apart from earlier French occultist authors, Blavatsky seems to have been dependent mostly on Knorr von Rosenroth's *Kabbalah denudata*, which contains the *Sifra Di-Tseniuta* alluded to on her first page (see Scholem 1946, 398-399 nt 2; Hanegraaff 1996/1998, 453). In her chapter on kabbalah she is interested mostly in the concept of En-Soph and the system of the sefirot, and most of her references are to the *Zohar*; but most conspicuous about the chapter is the fact that, in spite of its title, large parts are not actually about kabbalah but about the ancient and oriental religions from which its fundamental ideas

are said to be derived. It ends, not surprisingly, with one of her vehement polemics against Christian theologians.

Of particular importance for the development of occultist kabbalah is the → Hermetic Order of the Golden Dawn. Two of its founders were instrumental in “translating” kabbalistic texts into English and writing popular books about the subject. → William Wynn Westcott’s *Sefer Yetzirah* (1887) was derived from Pistorius’ edition (*Artes Cabalisticæ*, 1587), and in 1894 he also published a translation of an alchemical-kabbalistic text called *Aesch Metzareff*, taken from Knorr von Rosenroth’s *Kabbalah denudata*. → Samuel MacGregor Mathers’ *Kabbalah Unveiled* (1887) contains some parts of the *Zohar*: the *Sifra DiTseniuta* already referred to by Blavatsky (see above), the *Idra Rabba* and the *Idra Sutha*. These annotated translations and discussions, questionable though they are from a scholarly point of view, are essential to occultist kabbalah as it developed into the 20th century. A central role in the Golden Dawn tradition in this regard is played by the sefirotic “tree of life”, understood as a system of correspondences that can be used not only to understand the structure of the universe but also as a basic tool for magical/spiritual practice. One typical ritual, for example, as transmitted by Israel Regardie in his edition of the Golden Dawn rituals, requires the operator to stand in front of a man-high picture of the tree, and imagine how ‘the universal energy’ flows down from sefirot to sefirot and thus through all the corresponding parts of his own body; this practice can be expanded e.g. by making use of the sounds and colours that are believed to correspond to each of the sefirot. One sees here how the sefirotic system is put to entirely new uses in the context of a strongly psychologized spirituality. Typical of the Golden Dawn approach and its later derivations is that “kabbalah” is almost completely reduced to the symbolism of the Tree.

All forms of “kabbalistic magic” in the 20th-century are heavily dependent on the foundational writings of Westcott and Mathers, but each of the important authors in the tradition have their own emphases. → Arthur Edward Waite, with his *Doctrine and Literature of the Kabbalah* (1902) and *The Secret Doctrine in Israel* (1913; combined in *The Holy Kabbalah* published in 1929), must be mentioned in this context, although his comparatively scholarly and historical approach – which earned him the respect even of Gershom Scholem – makes him a case apart. Scholem deplores his uncritical attitude towards facts of history and

philology, and his ignorance of Hebrew and Aramaic, but states that he is nevertheless one of the few contemporary authors whose work is ‘distinguished by real insight into the world of Kabbalism’ (Scholem 1946, 2, 212).

No such thing could be said about the kabbalism of two other central authors in the Golden Dawn lineage, → Aleister Crowley and → Dion Fortune. Crowley’s *Liber 777* is presented by his editor Israel Regardie as ‘a qabalistic dictionary of ceremonial magic, oriental mysticism, comparative mysticism and symbology’; it consists largely of long tables of correspondences, many of which make heavy use of Hebrew and kabbalistic terms. Crowley’s other kabbalistic writings, published in his journal *Equinox* and re-edited by Regardie together with *Liber 777*, confirm that for him the term kabbalah was more or less synonymous with “tabulation of knowledge” as such. Hence it should not surprise that as the ‘principal sources’ of his tables he does not mention any Jewish or even Christian kabbalistic author at all, but instead lists ‘Pietro di Abano, Lilly, Eliphaz Levi, Sir R. Burton, Swami Vivekananda, the Hindu Buddhist, and Chinese Classics, the Qúran and its commentators, the Book of the Dead, and, in particular, original research’ (Regardie 1977, Book Two, xi).

Dion Fortune’s *The Mystical Qabalah* (1935) is a classic of 20th-century occultism, and one of the clearest overviews of what kabbalah means in that context. Fortune is well aware of how strongly her system differs from Jewish kabbalah: ‘I do not say, This is the teaching of the ancient Rabbis; rather do I say, This is the practice of the modern Qabalists’ (Fortune 1984, 2, 20). It may well be that ‘the ancient Rabbis knew nothing of some of the concepts here set forth’, but although Fortune welcomes corrections regarding historical accuracy, in the end, she says, ‘I do not care a jot for the authority of tradition if it hampers the free development of a system of such practical value as the Holy Qabalah’ (o.c., 9-20): a pragmatic attitude that makes her book perfect for the modern spiritual market in a → New Age context. Fortune’s modern kabbalah is presented as ‘the Yoga of the West’, and focuses entirely on the kabbalistic “Tree of Life”: ‘the best meditation-symbol we possess’ (o.c., 2). In elucidating the Tree as a ‘compendium of science, psychology, philosophy, and theology’, she explicitly places herself in the tradition of Crowley, Westcott, Mathers and Waite (o.c., 13, 22). *The Mystical Qabalah* discusses in detail each of the ten sefirot and its correspondences, with their practical applications for meditation and spir-

itual development, on the basis of Crowley's 777. Again Fortune is quite clear about her Western-esoteric and occultist rather than Jewish sources: she mentions Plotinus, Dee, Agrippa, → Llull, Peter of Abano, Knorr von Rosenroth, Westcott, Lévi, Mary Anne Atwood, Blavatsky, → Anna Kingsford, Mabel Collins, Papus, Saint-Martin, Gerald Massey, → G.R.S. Mead, but also James Frazer, Wallis Budge, → Carl Gustav Jung, Sigmund Freud, the Sacred Books of the East series, the Loeb classical library and, finally, the Bible and the Soncino Press edition of the Zohar (o.c., 104-105). Fortune's work can indeed be seen as the culmination of a trend that could already be perceived in Lévi: the understanding of "kabbalah" as a cross-cultural analytical tool on esoteric and occultist foundations. As such, it perfectly exemplifies Godwin's analysis of occultism as a species of "comparative religion" (Godwin 1994).

This comparative-religions approach to kabbalah is also evident in some other popular authors who do not directly represent the Golden Dawn tradition, such as Charles Poncé and Leo Schaya. Poncé is an author with strong Jungian leanings [→ Jungism]; referring to scholars like Scholem and Tishby as well as to the well-known occultist authors discussed above, he compares Jewish kabbalah with oriental religious systems such as Yoga, Tibetan Buddhism and Tantra. Schaya approaches kabbalah from the perspective of Traditionalism [→ Tradition]: he believes that the premises of kabbalah 'are those of esotericism or metaphysics in general' and points out that in his book he 'has undertaken to rediscover in Judaism the *philosophia perennis* that he learned through the Hindu, Buddhist and Sufi traditions' (1971, 7, 10).

In the wake of the central authors discussed above, a plethora of popular books have been published during the later 20th century that embroider upon their basic ideas and approaches and cater to the magical-occultist subculture within a general "New Age" framework. Among the many authors in this context some of the better known are Israel Regardie, Frater Achad (Charles Stansfield Jones), Pat Zalewski, and John Michael Greer, but any such selection is somewhat arbitrary since new books rehashing the same basic approaches keep appearing. All of them share the basic perspectives outlined above: they espouse a universalist rather than specifically Jewish or Christian understanding of kabbalah, interpreted as a system of correspondences according to the model of the sefirotic "Tree of Life", and are focused on practical "magical" application – which often means a

kind of applied psychology. That magical practice in this context has increasingly come to be understood in psychological terms as focused on spiritual self-development is a fact that makes occultist kabbalah congenial to the popular New Age market.

1. BIOGRAPHICAL SKETCH

The Swiss psychiatrist and psychologist Jung, son of a Zwinglian pastor, grew up in an environment profoundly marked by religion. After medical studies at the University of Basle and a doctoral thesis in psychiatry devoted to the psychology and pathology of occult phenomena (1902), he practiced psychiatry at the Burghölzli Clinic (Zurich) as assistant to Eugen Bleuler (1857-1939). He discovered the early theories of Freud (1856-1939), of whom he became one of the closest disciples from 1907 until 1913, when he left Freud to found his own development of psychoanalysis, Analytical Psychology. The scope of his work and the extent of his knowledge make Jung one of the greatest figures of Western esotericism in the 20th century; and he also had, by his own account, a personal experience of occult [→ occult / occultism] and paranormal phenomena. He relates some of these experiences, including the most impressive ones, in the account of his life, *Erinnerungen, Träume, Gedanken* (Memories, dreams, reflections, 1961). This “interior autobiography” reveals the importance of the esoteric paradigm for his life and work; it ascribes capital importance to all the paranormal phenomena, as well as to dreams, notably in their premonitory dimension. Settled beside Lake Zürich, where he headed a school with the collaboration of several disciples, mostly women (Jolande Jacobi, Aniela Jaffé, Marie-Louise von Franz), Jung divided his time between therapeutic work and the writing of long books on the psychology of the individual, that of cultures, and the hermeneutics of religions – all subjects in which the relation to esotericism was decisive for him. The paintings he made on the walls of his second home, the “Tower” at Bollingen, where he retired with increasing frequency from 1923 onwards, bear witness to the place occupied by esotericism in Jung’s personal imagination. A great traveler, between 1920 and 1940 he explored various non-European civilizations (North Africa, New Mexico, Central

Africa, Egypt, India, Ceylon), and acted as a cultural mediator, thanks to his excellent knowledge of Asiatic philosophies and religions (Hinduism, Buddhism, Taoism), which he helped to make known in Europe – for which he was rewarded by honorary doctorates by three Indian universities. His correspondence with men and women all over the world, specialists in various fields or unknown, on psychological, cultural, or topical subjects shows the lively character of a mind in ceaseless evolution and constantly seeking engagement with its own time. The intercultural openness of his work – contemporaneous with the great theories of modern ethnology, whose discoveries it took into account – determined Jung’s concepts as he sought to show the existence of links between all civilizations through study of their myths and images. Open to dialogue with the most varied disciplines – he participated regularly at the meetings of the Eranos circle from 1933 onwards – Jung was also one of the founders of transdisciplinary thought.

2. TRADITIONS AND CONTEXTS

Jung was interested in all forms of the mystical, gnostic, and esoteric tradition, whether historical or contemporary, European or non-European, and this interest profoundly marked his thought and his anthropology. His first works arose in the context of the infatuation with the occult sciences in Europe and the United States at the end of the 19th and beginning of the 20th century, as it manifested both in the writings of esotericists and Theosophists (→ H.P. Blavatsky, → Rudolf Steiner) – from whom Jung, incidentally, tried to dissociate himself – and in literature (→ Gustav Meyrink, Hermann Hesse [1877-1962], Robert Musil [1880-1942]). Whereas Freud had based his approach to the psyche on the rejection of the “muddy tide of occultism”, Jung accepted the challenge of the irrational up to the limit, and conceived of his own approach as the prolongation of that tradition. He came to know it partly through his lifelong reading of esoteric texts of all ages and cultures, and partly in second-hand fashion as handed on in → Goethe’s work (principally in *Faust*) and in German Romantic psychology (→ Gotthilf Heinrich Schubert, Carl Gustav Carus [1789-1869]), which had already integrated elements of → Paracelsianism and Boehmian theosophy [→ Jacob Boehme; → Christian Theosophy]. Jung’s entire oeuvre, from his first researches into → spiritualism at the turn of the century up to the writings of the 1940s and 1950s on → gnosticism, → alchemy, and oriental religions, related directly to the problems treated by esotericism. In his doctoral thesis (1902), devoted

to paranormal events and more especially to mediumism, Jung interpreted the spiritualist phenomena as exteriorizations of autonomous complexes of the unconscious. Towards the end of his life he authored many essays on the psychological significance of various occult sciences (→ astrology, alchemy) and of divinatory phenomena (such as the *I-Ching*). References to the texts of various esoteric traditions are scattered throughout his works. This interest continually lighted on new objects, with the result that Jung's work touched on almost all the fields and all the epochs of the esoteric tradition. His correspondence, as well as the many volumes of his seminars (e.g. those devoted to a series of visions from one of his patients, or to Nietzsche's *Zarathustra*), bear witness to the same preoccupation.

3. SEVEN SERMONS TO THE DEAD (1916)

One of Jung's first works that displays most vividly his privileged relationship with esotericism is *Septem sermones ad mortuos* (Seven sermons to the dead, 1916), a text of poetic character that borrows the language of gnosticism (the principal speaker is → Basilides of Alexandria). This text-program, unique in its genre among the published works of Jung, sets forth an esoteric anthropology, cosmology, and theology, and calls upon various gnostic images (the Pleroma, the god Abraxas as demiurge), but also on elements borrowed from different oriental and European traditions, notably from Jacob Boehme's thought, such as the myth of Sophia and the status of the principle of evil (Lucifer). Typical of Jung's eclecticism, the Sermons present in cryptic form the ensemble of themes which would structure both his clinical work and his religious thought. In the same vein were his private journals written during these years (the "Black Book" and the "Red Book", 1913-1916), to which he consigned his inner experience, notably the dialogue with his "inner master" whom he christened Philemon. These texts from the first period of Jung's work constituted the esoteric facet of his thought, of which the clinical and hermeneutic works were therefore the exotericism.

4. DEPTH PSYCHOLOGY AND INITIATION

Jung's first post-Freudian work, *Transformations and Symbols of the Libido* (1911-1912) drew on mythological images to comment on and interpret the fantasies of a young schizophrenic, called Miss Miller. The idea was sketched out there that psychological evolution is structured as a process

of initiation, which may succeed or fail. *Psychological Types* (1921) develops the ideas of polarity and quaternity which would be at the base of all Jung's later work, as well as those of unity and totality, from which he made categories for the description of the psyche. Thereafter Jung's clinical work appealed ever more explicitly to notions borrowed from esoteric traditions, to the extent of devoting some of his studies to one or another of these, such as alchemy. He developed a model of the psyche which conceived of it as a polarity, making room for a spiritual pole as well as an impulsive pole. The originality of Jung's views appears above all in his theory of the archetypes, developed during the 1920s-1940s, which also explains his concept of the unconscious. The latter was first based on a rupture with the Freudian view that the unconscious is a product of repression: for Jung, the unconscious, like the "poetic" universe of the German Romantics, possessed a reality that is autonomous and anterior to consciousness. Following the romantic concepts of the unconscious (such as Carl Gustav Carus expounded) and the "philosophy of the unconscious" of Eduard von Hartmann (1842-1906), Jung held that the unconscious psyche is "collective", common to all humanity or at least to some of its groupings. Its contents are structured in "primordial images" (the "archetypes", a notion which he owed to Plato, to → Augustine, and also to Kant), which appear in dreams and in the products of the imagination, and also find resonances in individual existence by way of the major existential experiences. The experience of the unconscious leads the subject to live through the confrontation with evil, with his own interior negativity (archetype of the "shadow"), that of the Other in its gendered dimension ("animus" for the woman, "anima" for the man), and finally – as a consequence of the preceding – that of the potential totality of the individual subject (archetype of the "Self"). This model of the unconscious also modifies the status granted to dreams. A dream does not merely reveal desire, but brings to light the other face of the dreamer's conscious situation, thus taking on a compensatory value, even a prospective one heralding evolutions to come. The question posed is thus no longer that of the *origin* of the dream, but that of its *function*, the unconscious intention that it reveals: Jung substituted for a causal interpretation of dreams a final or teleological interpretation. He moreover distinguished a category of dreams that do not refer to an individual situation alone, but to the collective plane, and which thus have a "prophetic" status (such as those which he himself had at the eve of World War I).

Jung's anchoring in an esoteric tradition is equally evident in the status he accorded to the products of the → imagination. Unlike Freud, for whom the phantasy always has a sexual significance, Jung conceived of a *creative imagination*, a mediating faculty between man and the sense-world (the divine world of the Hermetic tradition). He developed the therapeutic method of "active imagination", which posits that the patient, through creative work on the symbols brought up by his unconscious, can work the transmutation of the latter's contents, thus increasing his consciousness and arriving at a cure. The cure of neurosis, defined as the "suffering of a soul which has not found its destination", is presented as a process of initiation, in the course of which the subject stops identifying himself unilaterally with conscious positions and comes little by little to integrate unconscious elements. This process, which Jung styled "individuation" or "self-becoming" (*Selbstwerdung*), is a modern equivalent of the initiatic path, and Jung himself called it "mystical". Coherently with these ideas, Jung offered a view of the subject derived from mystical concepts, and conceived, beside the I (*Ich*, ego), of another pole of the subject, the Self (*Selbst*), which is the potential totality of the subject who has integrated the unconscious. This representation of the Self, thus named after the *âtman* of the *Upanishads*, to which Jung explicitly referred, is one of the proofs that, however important his anchorage in the Western tradition, his ideas were nonetheless profoundly indebted to Eastern models.

Jung's psychology thus expounded all the themes of an esoteric anthropology. But his work went beyond the plane of mere individual psychology to offer, from the 1940s onward, a vision of reality just as firmly founded on esoteric concepts. His hypothesis of *synchronicity* (1952) examined the phenomena of coincidence, apparently due to chance, and explained them through the action of a principle of acausal relationship, which gives a meaning to this chance. This theory, which may be considered a modern version of the doctrine of → correspondences, sees an analogical relationship between the human microcosm and the macrocosm of the universe, thanks to which such manifestations of the unconscious are possible in the objective sphere. Such "significant chances" are thought to be produced spontaneously in situations with a strong emotional charge, capable of allowing the contents of the unconscious to emerge. They are also at the base of the phenomena of divination [→ Divinatory Arts], as also of astrological prediction,

on which Jung was one of the first to conduct a statistical inquest. His study on the *I-Ching* (1950) sought to explain the functioning of divination by basing it on the interaction between the psyche of the person questioning the oracle and the objective situation. Jung's last great works (including *Mysterium coniunctionis*, 1955/1956) developed these concepts within a vaster framework, postulating a unity of the world, an *unus mundus* whose different levels of reality are articulated with one another and, due to the "psychoïd" character of the universe, able to intercommunicate. Jung thus tried to bring about a meeting between the Hermetic world view and that of the scientific revolutions of his time. His fruitful dialogue with Wolfgang Pauli (1900-1958), Nobel prizewinner in physics, with whom he published *The Interpretation of Nature and the Psyche* (1950), allowed him to integrate into his vision of man and the world the new perspectives offered by quantum mechanics.

Thus, if one follows the criteria established by Antoine Faivre (*Access to Western Esotericism*, 1994) to judge whether an oeuvre belongs to the field of esotericism, one must admit that the work of Jung satisfies several of the requisite criteria: it is based on the idea of "correspondence" between the great and small world; on that of a mediation through the imagination, the creative faculty; on that of "transmutation" or the transformation of the individual through work on the *materia prima* of the unconscious contents; one may add the idea of a "second birth" of the person, attaining a new identity at the close of an initiatic process. Jung, to be sure, established a special relationship with this tradition that was not merely allegiance to one of its forms, but an integrating synthesis, seeking the connection between its different and particular forms. Moreover, through his rooting in a scientific discipline – psychology and psychiatry – he offered an interpretative viewpoint on the discourse between the various forms of traditional knowledge.

5. JUNG, INTERPRETER OF THE WESTERN ESOTERIC TRADITION

Parallel with this building of psychological theories on esoteric foundations, Jung also worked as a cultural interpreter, suggesting interpretations of various currents of Western esotericism that he wanted to restore to their former place in European cultural history. Without completely abandoning the territory of occultism and spiritualism, he devoted studies to gnosticism (*Aion*, 1951), to astrology and alchemy, and to their relationship with modern science. His project was thus to sug-

gest a reading of the hidden face of Western culture, at the same time as discovering his own presuppositions in history.

Within the body of esoteric learning entered on by Jung, it was alchemy that held the most important place. Jung devoted several thousand pages to the Western alchemical tradition and to some of its principal representatives (→ Paracelsus, → Gérard Dorn), and wrote detailed commentaries on some of them, such as the *Rosarium philosophorum*. An initial study on a Chinese alchemical text (*Commentary on the Secret of the Golden Flower*, 1929) was followed by an essay on the psychological interpretation of alchemy (*Psychology and Alchemy*, 1944), then by a group of studies of a central symbol of the alchemical tradition, the *coniunctio* (*Mysterium coniunctionis*, 1955/1956). Among the numerous alchemists whose texts Jung commented on, Paracelsus held the first place. Jung devoted to him and his disciple Gérard Dorn two long studies (1940 and 1942), which contributed to making known the work of the Swiss physician-philosopher: there are expounded the bases of Paracelsian thought; his philosophy of nature; the theory of the two “lights”, that of nature and that of the Holy Spirit; the elements and principles at work in nature and in transformation, like the *archaeus*. Jung saw in Paracelsus’s work the implicit formulation of a discourse on the unconscious, and this decisive encounter with one of the prime representatives of Hermeticism and the philosophy of nature led Jung on to an interest in alchemy as a para-scientific discourse, as a spiritual phenomenon, and as a religious discourse. These studies allowed Jung to shed light on the representations of one of the most enigmatic disciples of arcana, and to illuminate certain processes at work in the psyche by analyzing them through alchemical representations. The three principles (sulfur, mercury, salt) and the phases of the *opus* (*nigredo*, *albedo*, *rubedo*) are interpreted as states of the psyche, or as moments of confrontation between consciousness and the unconscious. As for the philosophers’ stone, it is a symbol of the Self, the realized state of the subject after transmutation. The alchemists, Jung maintained, sought by working on matter to give expression to modifications of consciousness, and to the tendency of the psyche towards the state of wholeness. The recourse to alchemy as a metaphorical discourse allowed Jung to formulate the final state of his theory and to explain precisely his concept of the analytic cure and the phenomenon of transference (*Psychology of the Transference*, 1946), postulating that in the

transferential situation, the analyst and the patient find themselves in the position of the adept and the *soror mystica* working together at the realization of the *opus*, i.e. to the extension of consciousness and the realization of the Self.

6. ESOTERICISM AND PSYCHOLOGY OF RELIGION

This project of the hermeneutics of culture caused Jung to have a lifelong interest in religious phenomena and to seek out dialogue with theologians, both Protestant and Catholic, and with historians of religion. The stature he accorded to religious people makes of his oeuvre one of the major works of the 20th-century psychology of religion. Going beyond the projective character of every representation of the divine, as conceived by Feuerbach (1804-1872), beyond Nietzsche’s “death of God”, and the idea of a “self-destruction of Christianity” as announced by Eduard von Hartmann, Jung proposed an approach to the religious phenomenon that assumed a position beyond both its devaluation and the unconditional embrace of dogma. Convinced of the existence of a “religious impulse” in the human psyche, he wrote many studies on religious subjects and underlined the importance of heterodox currents, from gnosticism to → mysticism. Carefully distinguishing “confession” from “religion”, he proposed a definition of the religious attitude as ‘scrupulous attention paid to the manifestations of the irrational’ (*Psychology and Religion*, 1940), and urged the necessity of a “symbolic” life that takes the “numinous” factors (Rudolf Otto’s term) into account as bearers of meaning, and restores the dimension of the sacred to individual existence.

Although he recognized the importance of the Christian roots of Western civilization, Jung, as a great reader of Meister Eckhart and → Jacob Boehme, undertook a critical revision of certain Christian dogmas in the light of mystical and esoteric ideas. His essay on the dogma of the Trinity (1940) reflected on the exclusion of the feminine from the Christian representation of the divine, and juxtaposed this with a group of heterodox doctrines which, from the Gnostics to Boehme, sanctioned the reintegration of the feminine. As a parallel to the mother archetype (of which the Virgin and Divine Mother is an aspect), Jung placed the figure of Sophia or Divine Wisdom, archetype of feminine spirituality. These studies on the religious representations of the feminine went together with a validation of the feminine on the psychological and cultural levels. Referring to Joachim of

Fiori († 1201) and his tripartite vision of history, Jung went further by conceiving of the Trinity on a progressive model: the Holy Spirit here corresponds to the third stage of the manifestation of the divine, in which the opposites constituted by the reigns of the Father and the Son reunite in a *coniunctio*.

Jung's work in religious psychology also included a reflection on the question of evil and its origin, expressed mainly in his correspondence with the Jesuit Victor White. *Answer to Job* (1952), containing Jung's debate with the Judeo-Christian conception of God, was his most important contribution to this problem. Commenting on the Book of Job, Jung pointed out the ambivalence inherent in the divine *imago* of the Old Testament and the problem of the "divine unconscious". He questioned the identification of God with goodness, and reintegrated evil within the divine sphere. Jung saw in the 20th century the end of a world and the passage to a new stage of religious evolution, which he called a "new aeon". In view of this visionary dimension, and in view of the theme of a spiritualization of matter (alchemy!), Jung's religious thought might be seen as comparable with that of his contemporary Pierre Teilhard de Chardin (1881-1955). Jung saw the great currents of Christian esotericism as being in a compensatory relationship to institutional Christianity and its dogmatism. His interest in gnosticism, present ever since the *Seven Sermons to the Dead*, reappeared in his works of the 1950s (*Aion*, 1951), especially with commentaries on → Zosimos of Panopolis. Jung's oeuvre equally made room for oriental esotericism, with his studies on Chinese alchemy (1929), the *Tibetan Book of the Dead* (1935), the *Tibetan Book of the Great Liberation* (1955) and the *I-Ching* (1950). In these studies, conceived as "psychological commentaries", Jung attempted to demonstrate both the differences and the similarities of archetypal representations in the East and the West, thus posing on a fresh basis the question of a universal esotericism and its invariable features. His own oeuvre, heir to both Eastern and Western influences, was largely founded on the idea of a synthesis between the two traditions, or at least on that of their dialogue.

7. ESOTERICISM AND CRITICISM OF MODERNITY

One part of Jung's work was dedicated to collective psychic phenomena and their repercussions in the political sphere and in social life, thus to fanaticism and mass-movements in contemporary societies as they manifested in phenomena such as

National Socialism (*Wotan*, 1936). The originality of his analysis lay in seeking the origin of these phenomena in the collective unconscious. The critical view of modernity, often present in the writings of esotericists at the beginning of the 20th century (thus, in very different ways, in both → Rudolf Steiner and → René Guénon), was no less so in the work of Jung, who warned that the danger of mass-movements increases as secularization grows, if outdated religious values are not replaced by other forms of access to meaning. The solution to this conflict is possible, Jung thought, through "individuation", in which the evolution of the subject towards greater consciousness allows him to acquire personal convictions about the meaning of existence, and enables him to resist contamination by "psychic epidemics".

8. RECEPTION AND POSTERITY

For all these reasons, Jung's oeuvre holds an eminent and unique place in the field of 20th-century esotericism. At the same time, it marks a turning-point in the history of esoteric doctrines, insofar as it offers an innovative approach to them limited neither to pure erudite study, nor to the adhesion to some institutionalized current. This position earned Jung criticism both from the detractors of esotericism and from its adepts. Although contested by the perennialists [→ Tradition], who are often opposed to psychoanalysis, Jung was still one of the contemporary authors who possessed the widest knowledge of esoteric currents of the modern West. His work contributed to the bringing to light of a Western "path" and its specific nature. Beyond the various trends of analytical psychology and the post-Jungian currents that developed after his death, he was of capital importance for the field of researches into the imagination and the mythic in culture and society (G. Durand, M. Maffesoli, J.J. Wunenburger), for the dialogue between religions (M. Eliade), and for studies of the "two cultures", that of the humanities and that of the exact sciences, and their integration within a transdisciplinary perspective (E. Morin, B. Nicolescu). In its popular form, Jung's thought is also claimed as a foundation of the → New Age movement.

CHRISTINE MAILLARD

Jungism

The impact of → Carl Gustav Jung's ideas in contemporary society has been both considerable and selective. To mention just a few areas, there are modes of therapeutic intervention, psychological tests, forms of myth analysis, branches of Christian theology as well as a host of literary and artistic products that betray the influence of Jungian thought.

Specifically for the domain of religion, Wulff

(1997) distinguishes six areas in which Jung's influence is particularly strong. Jung's critique of mainstream forms of Christianity has inspired theological perspectives that incorporate key concepts from Jung's work. Certain forms of feminism have incorporated Jung's ideas on the specificity of, and the differences between, the male and female psyches. There are forms of Biblical interpretation that attempt to read Scriptural narratives as myth and to decode these myths by means of a Jungian hermeneutic framework. In the phenomenology of religion there have been efforts to ground the presumed universality of certain religious elements, such as hero myths, in Jung's archetypes. A number of writers attempt to make various Eastern religious traditions relevant to a contemporary Western audience by explaining these traditions in a Jungian, psychologizing framework, e.g. as dealing with individuation and the quest for the Self. Finally, a genre of Christian spiritual literature has attempted to use Jung's concepts as a resource for spiritual growth.

In the context of this Dictionary, it is of particular interest to note how themes prevalent in earlier esoteric currents, such as the concept of archetypes and specific symbolic methods of interpreting myth, have entered contemporary culture through the mediation of Carl Gustav Jung. Whereas most manifestations of Jungism included in Wulff's review arguably belong to "high culture", there are forms of more popular Jungism that have largely been left uncharted in the scholarly literature but are highly relevant to understanding the historical vicissitudes of present-day esotericism. In this sense, Jungism denotes the variety of forms in which certain of Jung's key concepts have been adopted by the cultic milieu and have been integrated into a popularized esoteric world view that hovers between the psychological and the religious.

The incorporation of Jungism into modern unchurched religiosity in general, and into → New Age discourse in particular, is hardly surprising, considering that Jung was deeply interested in a variety of beliefs and practices that have later come to interest many individuals and groups in the cultic milieu. As is well known, Jung wrote on topics such as mediumistic trance phenomena, the divinatory techniques of → astrology and the *I Ching*, on UFO's, on the astrological ages and on → correspondences (under the guise of synchronicity). He adapted such esoteric motifs to the requirements of a psychologizing and scientific epoch. However, Jung's oeuvre is vast and diverse, and popular Jungism as defined here represents a selective appropriation and recasting of this corpus.

The precise genealogies that lead from Jung's own work to the popularizations and reinterpretations found in the cultic milieu have to date not been traced in any scholarly work, and only the outlines of the process can be given here. Perhaps the most important single line of transmission of Jung's ideas into a broader Jungian religiosity have been the Eranos conferences. Beginning in 1933, Jungian speakers, including Jung himself, were invited to hold lectures on a variety of topics in the history of religions. These lectures were recorded in a series of highly influential yearbooks. Due to this distinct Jungian emphasis, Eranos became a forum for the dissemination of a specific interpretation of Western esoteric thought, primarily to an intellectual audience.

Whereas the Eranos conferences were conducted in a cerebral and elitist format, Jungism entered the mainstream of popular culture in America and Western Europe not least due to the influence of Joseph Campbell (1904-1987). Campbell popularized Jungian ways of approaching myth, and disseminated them widely through popular books and through his many appearances in the media. His book *The Hero with a Thousand Faces* (1949) has thus been one of the most successful Jungian books on myth ever to be published.

Beside the specific influence of Eranos and of Joseph Campbell, Jungism is also a loosely bounded form of discourse created by a host of separate individuals and groups. To name a few examples, there are Jungian modes of astrology, Jungian → tarot interpretations and Jungian readings of myth that have been created by people operating independently both of the Eranos movement and of each other.

Four themes in Jung's work have resonated especially well with the concerns of later Jungian spirituality. Firstly, myths are read for their potential to enrich the lives of their contemporary readers with spiritual and psychological insight. An especially influential sub-genre, represented by authors such as Jean Shinoda Bolen (*Goddesses in Everywoman*, 1985) and Robert Bly (*Iron John*, 1990), is directed at exploring one's masculinity or femininity through myths. Secondly, the concept of archetypes is ubiquitous in Jungian attempts to explain the inner meaning of myths, of dreams and of certain powerful experiences. Jungian astrologers and Jungian tarot readers thus commonly understand the symbols of the birth chart and of the tarot deck as representing archetypal experiences. Thirdly, synchronicity, the purported connection between causally unrelated events that have a feel of significance, is a topic explored by many Jungian writ-

ers. The belief that an enhanced awareness of synchronicities can enrich one's life is found in a wide range of literature, from James Redfield's → New Age best-seller *The Celestine Prophecy* (1995) to a host of contemporary management texts. Fourthly, the Jungian concept of individuation, i.e. of psychological and spiritual development as teleologically directed toward the goal of wholeness, is a recurrent theme. Jungian astrologers can thus understand transits, i.e. the celestial events said to correspond with events in a person's life, as parts of a vast cycle of development that potentially leads to psychological as well as spiritual integration.

A feature that is common to these popular esoteric manifestations of Jungism is the more or less extensive reinterpretation of Jung's own thought. Seven main differences between the corpus of Jung's writings and the uses made of it by later Jungians can be singled out: (1) Jung saw religious experience as a form of personal experience, albeit an important one, not as an unproblematic reflex of a spiritual reality. Jungian beliefs that religious experiences point at some part of the mind being linked to the divine are not readily compatible with Jung's own perspective. (2) Jung explored and modified his concepts repeatedly throughout a career that spanned 65 years, and often changed his opinion or contradicted himself. Jungism tends to be far more homogenizing, a propensity that may be due to Jung's often arcane references and obscure style and the concomitant temptation for Jungians to be largely reliant on secondary literature. (3) The aspects of Jung's work that are the least "spiritual" are among those that have been tacitly dropped. This applies especially to experimental, psychological research on word associations and on complexes, in which Jung reveals a positivistic side that one rarely if ever sees a trace of in later Jungian literature. (4) Jung is prone to seeing the human psyche as the locus of overpowering, even destructive forces, a view that is fundamentally at odds with the generally optimistic outlook of much later Jungism. Whereas Jung repeatedly warns of the dangers of being swamped by archetypal forces, Jungian literature can invite readers to identify with or draw power from archetypes. (5) Jung was also fundamentally elitist, believing that only a minority of people has reached the spiritual maturity needed to understand and accept his ideas. The egalitarian ideal of much of contemporary Western society is at odds with such a view. (6) Jung was highly critical of the attempts by Westerners to adopt Eastern doctrines or to practice rituals of Indian origin such as yoga. Modern Jungians, on the other hand, are apt to eagerly embrace

the Orient as a positive Other. Conversely, Jung was also heir to a nationalist or *völkisch* stream of thought, seeing certain spiritual practices as more suitable to one's own "race" or people. This is a topic explored at length by critics but generally passed by in silence in Jungian texts. (7) Finally, Jungian concepts are readily applied to domains in which Jung himself had only a marginal interest. A prime example is the tarot. Jung mentions the tarot only in passing, whereas the 1980's and 1990's have seen the emergence of an entire genre of Jungian exegeses of the tarot.

Jung's ideas have thus been received in a way analogous to that of many canonical scriptures. They are referred to with great respect by Jungians as constituting a fund of spiritual wisdom, but are nevertheless in practice used as a pool of cultural resources from which one can freely pick, choose and reinterpret various elements.

OLAV HAMMER

Jung-Stilling, Johann Heinrich (Johann Heinrich Jung), * 12.9.1740 Hilchenbach, † 2.4.1817 Karlsruhe

Raised in a pietistic family, Jung soon distinguished himself by his intellectual gifts, his sensitivity and his lively imagination. Having worked in various teaching positions, he left his natal home in 1762 to escape his father's rule and exercised various occupations while leading a hard life of wandering. Following an illumination, he decided 'to ally himself with God and let himself be guided by him', considering adversity a necessary purifying fire. A patron made it possible for him to broaden his culture, introduced him to the art of medicine, and ultimately oriented him toward the treatment of eye diseases. He went to Strasbourg to study medicine, where he befriended → Goethe and Herder and through them discovered the literary movement of German pre-Romanticism. In 1774, he gave the first part of his *Lebensgeschichte* to

Goethe, who published it anonymously without the author's knowledge. In 1778, he was named professor of political economy at Kaiserslauten. His first wife having died, he remarried. An Aulic Councilor in 1784, he was named professor at the University of Marburg in 1786. Simultaneously with his teaching activities, he undertook many cataract operations, many of them successful. His major concern remained nevertheless to write works to the glory of the Christian religion. This activity and its success excited the envy and criticism of his university colleagues. To his professional worries was added the pain of losing his second wife. He married a third time, with an accomplished woman who was able to bring harmony to his disordered lifestyle. Having finally entered into the service of prince Friedrich von Baden, who freed him from material worry, he was able to write and publish at his leisure, producing many religious writings of eschatological and prophetic content. He devoted himself to this zealously until his death in 1817.

Prior to becoming a reputed economist and a famous surgeon, Jung had known literary glory owing to his autobiography. The first three volumes are marked by a sensitive tone and style, simultaneously colored by piety, freshness, and naivety, that found an enthusiastic response in pre-Romantic literary circles. In the fourth and fifth volumes this charm is missing because the author relies too much on the intervention of divine providence. His edifying and didactic side henceforth becomes all the more tiresome as his style suffers from obvious carelessness.

The tireless zeal he displays in glorifying and deepening religion has often caused Jung to be perceived as a Pietist, but such a judgment is questionable. Jung appreciated the pietistic conventicles and even strove to minimize their divergences, but he did not adhere to any of them. Moreover, he showed no reserve in criticizing certain extremist separatist movements. Partisan of a fusion of Catholicism and Protestantism, he was much more a precursor of the ecumenical spirit than he was a sectarian Pietist.

In his *Lebensgeschichte*, he wanted to show that human destiny is not subject to blind determinism, but that a divine plan can be read in it, which does not deprive one of free will and the power to change individual destiny. As far as Jung was concerned, he considered his own desire to work for Jesus Christ as having been inspired "from outside", that is, by God, for his sensual nature worked against it. On all the crucial moments of his life, he relied on God's guidance.

Jung's system is not much different from that of

the other Christian theosophers. We find in it the theory of the double fall, first of Lucifer and his cohorts, then of Man, who lets himself be tempted by the fallen angels and sees himself punished by being deprived of the divine Light and plunged in a world of opaque matter. To remedy such a dramatic situation, nothing less is needed than a good and compassionate God sacrificing his only Son for the love of humanity.

The troubled events of the era, notably the French Revolution and the abominations of the Reign of Terror, pushed Jung to favor, in his work, the eschatological aspect of theosophy at the expense of cosmogony and cosmology. From 1779 to 1783 appeared three educational novels in which the hero, like the author, has to undergo a "trial by fire" before divine providence assures his triumph and salvation. His novel *Theobald oder die Schwärmer* (Theobald or the Enthusiasts; 1783-1785) denounces the errors of the separatists and other exalted dreamers. His anonymous little work entitled *Blicke in die Geheimnisse der Naturweisheit* (Glances into the Secrets of the Wisdom of Nature; 1787) develops a mystico-kabbalistic system where all the themes dear to the Christian theosophers are found again. His roman à clef *Das Heimweh* (Nostalgia; 1794-1796) is a long initiatory and symbolic story that plunges the reader into a prophetic and eschatological atmosphere. Later, exposed to criticism from intellectual circles, the author turned toward the concerns of the common people and published several reviews of popular edification, of which the most important remains *Der Graue Mann* (The Grey Man; 1795 to 1816). Criticism and gibes did not prevent the intrepid philosopher from scrutinizing the secrets of the intermediary world of the invisible spirits in his *Scenen aus dem Geisterreich* (Scenes from the Spirit Realm; 1795-1801) and in his *Theorie der Geisterkunde* (Theory of the Science of Spirits; 1808-1809).

To this indefatigable worker we furthermore owe, besides his theosophical publications and an enormous correspondence, eleven works on political economy, without forgetting two thousand cataract operations. However, it is especially for his tireless zeal in announcing the kingdom of God and for his intense quest for a position midway between an arid rationalism and an equally deadening religious fanaticism that the theosopher from Siegerland deserves a place among the greatest.

JACQUES FABRY

Justin the Gnostic, 2nd cent.

Justin was a 2nd-century Gnostic of whose life nothing is known, but whose ideas have been preserved in a rather extensive report by Hippolytus, *Refutatio* V, 23-27 (summary in X, 15, 1-7). Hippolytus' report was based on Justin's most famous book, called *Baruch*, but it cannot be decided with certainty whether he knew the work directly or only through an intermediary source.

According to Justin, there are three eternal principles of the universe, called the Good One, Elohim and Edem. The first two are male, the third one is female. Only the Good One has the foreknowledge of everything, the two others are without foreknowledge. The Good One is obviously the unknown and unknowable first principle that is found in many Gnostic systems. Elohim is called 'the Father of all things created'. As already indicated by his name, he has a strong resemblance with the Jewish Creator God. Edem is said to be 'irascible, double-minded and double-bodied'; she is also called Israel and Earth. She has apparently borrowed her name from the Garden of Eden

(Genesis 2:8ff.), but since she is the mythical personification of Earth there must also be an association with the Hebrew word *'adamah*, "earth". She is called "double-bodied" because she is a half-maiden, a virgin above and a viper below.

According to Justin, the material world is not bad, nor is marriage. From the mutual sexual desire of Elohim and Edem sprang twelve paternal and twelve maternal angels, who together formed the Paradise in Eden; they are allegorically called "trees". The third paternal angel, Baruch (= Hebr. "the Blessed One"), is identified with the Tree of Life, the third maternal angel, Naas (= Hebr. "Snake"), with the Tree of Knowledge. The angels of Elohim created Adam by taking some of the most excellent earth, i.e. from the upper, anthropoid parts of Edem, whereas the animals and other living beings were created from her lower, animal parts. Adam received his spirit (*pneuma*) from Elohim and his soul (*psychè*) from Edem, and the same happened to Eve after her creation. 'And man became a kind of seal and memorial of their love and an eternal symbol of the marriage of Edem and Elohim' (V, 26, 8). Every human marriage is an image of the archetypal marriage of Elohim and Edem, i.e. of Heaven and Earth.

After the creation of the cosmos, 'as a result of their joint pleasure' (V, 26, 14), Elohim ascended to the highest parts of heaven in order to see whether there was any deficiency in the created world. There he saw a light far superior to that which he himself had created and by that he discovered the existence of the Good One, who said to him: 'Sit on my right hand' (Psalm 110:1). When Edem realised that Elohim would not return, she became angry and commanded her first angel, Babel, i.e. Venus, to cause adultery and dissolution of marriages among men, so that they might undergo the same suffering she endured from Elohim's departure. She also ordered Naas, her third angel, to chastise the spirit of man, so that Elohim might be punished through the suffering of the spirit he had given. Naas seduced Eve and also had a homosexual relationship with Adam, 'whence have arisen adultery and homosexuality'. In Justin's view, the origin of evil was ultimately due to the fact that both Elohim and Edem were without foreknowledge, so that Elohim could not foresee what was to happen when he did not return to Edem after his discovery of the Good One. It is even said that vice and virtue arose 'from one single source – that of the Father' (V, 26, 23-24).

In order to save the spirit of man, Elohim sent his third angel, Baruch, to Adam, to Moses and to the prophets, inciting the spirit to desert Edem and to

turn to the Good One, just as Elohim had done himself. But Naas, through the soul in man, seduced them not to follow the words of Baruch. Even an uncircumcised "prophet", Heracles, was sent by Elohim to prevail over the twelve angels of Edem (his twelve labours), but he failed too. Finally, Baruch was sent to Nazareth, and there he found Jesus, the twelve-year-old son of Joseph and Mary, who was tending sheep. He was sent to explain what had happened in the beginning and to tell the people about the Father Elohim and the Good One. As Naas failed to beguile Jesus too and for that reason caused him to be crucified, Jesus gave his body and soul back to Edem, commended his spirit to Elohim, and ascended to the Good One.

In Justin's system, Jesus is the first person who listened to Baruch's exhortation to leave Edem and to ascend to the Father and the Good One. The initiates of Justin's sect follow his example. Before the mysteries were disclosed to them they had to swear 'not to divulge them to anyone and not to relapse from the Good One to the creation'. Then they ascended to the Good One and saw 'what eye has not seen, nor ear heard, nor has entered into the heart of man' (V, 27, 2). They also drank from life-giving water, which they interpreted as a bath in the water above the firmament, 'in which spiritual and living men are washed' (V, 27, 3).

Since nothing of Justin's life and career is known, it is only on the basis of his ideas that some suggestions about his background can be made. Many of his ideas are reminiscent of those fostered by the Jewish Christians, by the Elkesaites [→ Elchasai], by the → Mandaeans and the Manichaeans [→ Mani; → Manichaeism]. In addition to the general Jewish outlook of Justin's myth, the following may be mentioned: Jesus' instruction by Baruch at the age of twelve, that of the *bar mitswäh* (Jewish; cf. Luke 2:42, but also Mani's first encounter with his Twin); Jesus as the natural son of Joseph and Mary (Jewish Christians); the emphasis on marriage and procreation and the severe rejection of sexual sins (Jewish Christians, Elkesaites, Mandaeans); the successive missions of Baruch to Adam, → Moses, the prophets, Hercules, and Jesus, corresponding to those of the "True Prophet" (Jewish Christians), of Elchasai and the revealers of truth before Mani; the corruption of the Law and the prophets (Jewish Christians, Elchasai). On the basis of all this, it seems most likely that Justin had a Jewish-Christian background. He retained the basic Jewish and Christian idea that the Creator and the creation are good and he stuck to the Jewish-Christian belief that Jesus, the prophet from Nazareth, had

brought the final revelation, but his Gnostic inclinations apparently compelled him to a radical reinterpretation of Jewish religious history.

ROELOF VAN DEN BROEK

Kabbalah → Jewish Influences

Kardec, Allen (ps. of Denizard
Hippolyte Léon Rivail), * 3.10.1804
Lyons, † 31.3.1869 Paris

Léon Rivail was born at 76 Rue Sala in Lyons. His father, a jurist in that city, sent him to study, from the age of ten, in Yverdon (Switzerland), in one of the most famous institutions of the era, directed by Rousseau's disciple Jean Henri Pestalozzi. Pestalozzi put the pedagogy of *Emile*

into practice and offered his pupils, who came from every country in Europe, an original method that he called "mutual instruction". The older children taught the younger; mutual aid rather than competition was encouraged. Rivail was to retain the hallmark of this environment, in which a sense of order, personal discipline, and respect for differences were basic values.

When he was twenty, he moved to Paris and soon established a private school (Institut Rivail) in Rue de Sèvres, based upon Pestalozzi's pedagogical method. The young teacher soon published his first book, *Cours pratique et théorique d'arithmétique* (Practical and Theoretical Course of Arithmetic). Convinced of the need to reform educational methods in France, he believed that pedagogy had to become a precisely defined science. In 1828 he published his *Plan pour l'amélioration de l'Éducation Publique* (Plan for the Improvement of Public Education) in which he emphasized that public instruction should give much attention to morality. A reader of Fourier, Rivail was sensitive to the goals of peaceful social reform inspired by Republican values. He was a member of several learned societies, notably the Royal Society of Arras, which in 1831 awarded him a prize for his essay on the question "Which system of study is most in harmony with the needs of our times?" Fascinated with science, he was for many years secretary of the Phrenological Society of Paris and took part in the activities of the Society of Magnetism, leading investigations into the phenomena of somnambulism. In 1832 he married Amélie Boudet, a schoolteacher who shared his passion for education. However, in 1835 they had to close the school because of financial difficulties. Rivail, who subsequently taught at the Lévy-Alvarès School, continued to publish teaching manuals, including the *Catéchisme grammatical de la langue française* (Grammatical Catechism of the French Language), published in 1848. Most of his works were adopted by the University and brought him sufficient income to live comfortably.

Kardec had established a reputation as a sensible educator when, in 1854, he heard about the spiritualist practice of "table-turning". According to his biographers he remained skeptical at first, but the following year, having attended a few séances, he turned to experimenting himself. He joined a group of friends who were communicating with the spirits in the manner imported from the United States, typtology (a spiritualist technique of communicating with spirits by means of rapping with various codes, arranged for the purpose). The group recognized the dramatist Victorien Sardou

as their best medium, and Camille Flammarion soon became active in the séances as well. Rivail confidentially received some fifty notebooks of written “communications” obtained within the group a few months earlier; they included several thousand messages dealing with a great variety of subjects. From 1856 on, he worked on categorizing and ordering the material in these notebooks, which seemed to him to contain a coherent teaching. A spirit then revealed to him one of his previous lives: he had been a Druid in Gaul, and his name had been Allan Kardec. Rivail now definitively assumed this identity as his own.

During the course of new séances, Kardec questioned the spirits in view of perfecting what he considered their doctrine. His group would prepare the questions; and the mediums would take down the messages dictated by the spirits. Soon aided by “the spirit of Truth”, Kardec then transcribed it all at home in his apartment on Rue des Martyrs. The “spirit of Truth” now revealed his mission to him: to establish spiritism and propagate the doctrine delivered during the séances. In 1857, Kardec published *Le livre des esprits* (The Spirits’ Book), which was an instantaneous success. Reprinted several times in about a decade, it came to be recognized as the bible of communication with the hereafter. A practical, moral, and spiritual guide, it contained many messages supposed to have come from the famous departed: Socrates, Plato, and St. → Augustine, but also → Swedenborg and other philosophers, as well as scholars and poets.

This was the starting point of a new religion, called spiritism, and organized by Kardec as a universal school. In 1861, he wrote the code of conduct for mediums, *The Mediums’ Book*, which established a typology of spirits’ modes of communication with humans (e.g. writing mediums, clairaudient ones, others who “embody” the spirits and lend them the use of their voices and faces, and so on). Despite the general outcry that these practices provoked in Catholic circles, Kardec continued to spread the doctrine. In a few years, almost one hundred spiritist centers sprang up, about fifteen of them in Lyons. Many who had lost their social position, their roots, or their loved ones, or were suffering from illness, came to adopt this new religion in which the belief in spirits went along with a quest for “proofs”: for Kardec saw spiritism as a scientific religion, with a calling to critically study mediumistic “phenomena”. In 1858, he founded the *Revue Spirite* in Paris, which contained exchanges of testimonies and articles about the study of such phenomena.

Kardec developed a “pedagogy of suffering”,

according to which the soul keeps evolving even after death, following a cycle of reincarnations. Progress for him was the eternal law of humanity, and his fundamental values were Work and Reason. Within spiritist circles Kardec opened libraries, established fellowship funds, and organized collections for the needy. His spiritist associations were open to women and even children; they were devoted to prayer for the dead and dispensing free magnetic therapies. Kardec wished them to be meeting-places for people belonging to all social strata, including the working classes as well as the gentry. Rejecting the inevitability of evil and the idea of degeneration, he fought against child labor. Spiritism thus took on new dimensions by getting associated with social causes such as educational reform and the improvement of the position of the proletariat. In a century when the Christian socialists identified the proletariat with the suffering Christ, spiritism encouraged a working class Messianism. An anti-clerical social reformer, Kardec wanted to reconcile faith and reason: ‘It is not enough to believe’, he said, ‘one has to understand’.

Kardec’s spiritism has enjoyed much success abroad, traveling even as far as Asia (notably to Viet-Nam, where it gave birth to the “Caodaist” movement). However, it is first and foremost in Brazil that it has become a full-fledged religion, extremely active and well-represented today in the middle classes. Its influence, as a syncretic development, on Afro-Brazilian religions (Candomblé, Umbanda) greatly fascinates contemporary ethnographers. In other countries of Latin America, new forms of spiritism are currently developing in the direction of neo-shamanism. Such developments demonstrate the continuing international vitality of Kardec’s spiritist movement.

Kerner, Justinus Andreas Christian,
 * 18.9.1786 Ludwigsburg, † 21.2.1862
 Weinsberg

German Romantic poet and writer, physician, and early investigator of occult phenomena. Born as the sixth and youngest child of a county commissioner and civil servant, Kerner was originally trained for a business career. At the age of twelve he was healed of a nervous ailment by the practitioner of → animal magnetism Eberhard Gmelin (1751-1809): his first contact with a method of treatment he would himself practice in his later medical career. From 1804 to 1808 he studied medicine in Tübingen, where he got involved in a circle of poets and began to write poems himself. After completing his studies he traveled to Hamburg, where he worked in a hospital run by his brother and expanded his contacts in literary circles. In 1809 he went on to Vienna, where he met Friedrich Schlegel and Ludwig van Beethoven. Having returned to his native Württemberg in 1810, he worked as a physician in several villages, until being appointed in January 1819 as town physician of Weinsberg, where he would remain for the rest of his life. His house in Weinsberg, built in 1822 and nowadays a museum devoted to his life and work, became a major meeting place for poets and thinkers. On top of the hill “Weibertreu” near Weinsberg one can still find the signatures of major Romantic poets and philosophers written on the walls of the ruins.

In Kerner’s literary work – notably his story “Die Heimatlosen” (The Homeless) – one finds many traces of the theosophically-oriented *Naturphilosophie* typical of German → Romanticism, including a strong interest in the “occult phenomena” associated with the “Nightside of Nature”. Of major importance for Kerner’s development in this regard were → Johann Heinrich Jung-Stilling’s *Theorie der Geister-Kunde* and → Gotthilf Heinrich von Schubert’s *Ansichten von der Nachtseite der Naturwissenschaft*, both published in 1808. Kerner, who had been fascinated by stories about spirits and ghosts from an early age, read the first book while still a student in Tübingen and the second in the summer of 1812, and his later work as an investigator of the occult is decisively influenced by them.

Kerner’s daily practice as a physician brought him in contact with the medical condition associated with “somnambulism”, which was frequent in Württemberg. Somnambulant patients – mostly women – typically suffered from severe cramps and sweats, accompanied by a variety of trance states in which they saw ghosts and visions, displayed

extreme sensitivity to certain external influences (such as e.g. the presence of cats, iron nails, music), made clairvoyant predictions and prescriptions for (self-)healing, and were the focus of sometimes spectacular “paranormal” phenomena. Sometimes they also developed complex and highly individual linguistic and numerological systems (“inner language”; “inner arithmetic”). In studying such phenomena, and interpreting them as manifestations of the “magical” power of Nature, Kerner was fighting a battle on two fronts. Against traditional religious supernaturalism he emphasized that somnambulant powers were not “miraculous” but entirely natural; but against the new natural science he emphasized that the hidden, occult forces of nature could not be understood from the merely rationalist perspective of ‘those who, enclosed in the isolating glass tablet (tabula vitrea) of their skull, have no idea of a sympathy of things and a higher spiritual life’ (Kerner 1824, VI). In all his writings about “occult phenomena”, Kerner’s goal was to provide “empirical facts” that might undermine the ideologies of Enlightenment rationalists and adherents of mechanistic science, and prove the truth of an “enchanted” spiritual worldview on pantheist foundations. → Animal magnetism was central to that project, and Kerner was in fact the first author to make a systematic attempt at investigating Franz Anton Mesmer’s life and documents.

In 1824 Kerner published his first book on occult phenomena: *Geschichte zweyer Somnambulen* (History of Two Somnambules). It was later overshadowed by his famous book on the Seeress of Prevorst, but is actually a very interesting case study of two young girls from Weinsberg who were successfully treated by Kerner. The first patient, Christiane Käßlinger (the second is known only as Caroline St.), is particularly interesting not only because of her lively visions of heaven and hell (reminiscent of → Swedenborg) but also because she later became a religious writer in her own right, with a book that she claimed was “dictated” to her from a spiritual source (*Beschreibungen über das Wesen der Gottheit, der menschlichen Natur und der christlichen Religion* [Descriptions about the Essence of the Deity, Human Nature and the Christian Religion], Kronstadt: Römer & Kammer, 1881).

Two years later (November 1826), Kerner was introduced to the somnambulant patient who would inspire his most famous book: Friederike Hauffe (1801-1829), later known as “the Seeress of Prevorst”. Hauffe arrived in Weinsberg as a very sick patient, but during the last three years of her life she came to assume the public role of an inspired

visionary whose trances allowed her to be in daily contact with the spiritual world and its inhabitants. Among those who visited her sickbed were such great names as → F. von Baader, J. von Görres, J.K. Passavant, → F.W.J. Schelling, F. Schleiermacher, G.H. von Schubert, and D.F. Strauss. Once having given up the hope of curing her, Kerner felt free to concentrate on studying her symptoms and supra-normal abilities; and the result was published in the year of her death. *Die Seherin von Prevorst* is one of the earliest attempts at an empirical study of paranormal phenomena, but is also interesting for its philosophy of illness and bodily desintegration as a condition necessary for experiencing spiritual realities.

In the following years, Kerner's focus of interest came to include the phenomenon of possession. In his *Geschichten Besessener neuerer Zeit* (Stories of recent possession cases, 1834) he describes several cases of spirit possession, concentrating on the case of Magdalena Grombach, "the girl of Orlach". Grombach was possessed by a "black man" who claimed to be the spirit of a medieval monk. The spirit could not find eternal rest because he had seduced and murdered a number of women, whose bodies now lied buried under the foundations of Grombach's family house. He wanted Magdalena's father to break down the house, find the skeletons, and give them a Christian burial. This was finally done, and human bones were actually discovered; after the reburial, the possession came to an end.

Cases like these, and stories of ghosts and hauntings generally, kept fascinating Kerner until the end of his life. This interest led him to publish two successive journals, both of which are of great importance for the early history of psychical research and Romantic → *Naturphilosophie* in the German domain: the *Blätter aus Prevorst* (1831-1833) and *Magikon* (1840-1853). Apart from Kerner himself, they contain contributions by e.g. the philosopher Adolph Karl August von Eschenmayer (1768-1852; also responsible for many of the theoretical discussions in *Die Seherin von Prevorst*), → Johann Friedrich von Meyer (1772-1849), and Franz von Baader.

As a late reflection of Kerner's fascination with the "Nightside of Nature" we have his series of *Kleksographien*, which date from the 1850s but were published only in 1890. These bizarre symmetrical shapes were created by folding a piece of paper over an inkblot, and may have influenced Hermann Rorschach's psychological tests (1921). To Kerner's imagination they suggested the shapes of spirits from the Hades (the protestant version of purgatory, first introduced by Jung-Stilling and fur-

ther developed by von Meyer) and from hell, and by adding extra pencilstrokes he indeed turned them into weird demonic or semi-demonic figures. They were accompanied by poems that reflected Kerner's increasing preoccupation with death and the afterlife. Kerner died of the flu in 1862. By that time, his book about Friederike Hauffe had already been translated into English (by Catherine Crowe, 1845), and his works enjoyed increasingly popularity in the decades before and after 1900.

WOUTER J. HANEGRAAF

Ketton, Robert of → Robert of Chester

Khunrath, Heinrich (ps.: Ricensus Thrasibulus), * 1560 Leipzig, † 1605 Leipzig or Dresden

Physician and alchemist, “Philo-Theosophus” and theo-alchemical author. After graduating as Dr. med. at the the University of Basle (1588), Khunrath initially made a living as the physician of the Bohemian magnate Wilhelm von Rosenberg in Bohemia (1591), then chiefly in North and Central Germany, namely Berlin (1601), Magdeburg (1603) and Gera (1604). He became acquainted with → John Dee (at Bremen in 1589) and Johann Grasse (at Hamburg in 1596), corresponded with Johann Arndt and counted Count Albrecht VII von Schwarzburg-Rudolstadt (Thüringia) among his patients.

Apart from his doctoral dissertation (*De signatura rerum naturalium*, Basle 1588), an edition of Zebel (Prague 1592) and a treatise *Von . . . Curation Tartari* (ed. Johann Thurnmüntzer, Hof 1611) Khunrath wrote numerous alchemical works (among them autographs neglected by scholarship). Khunrath’s work best known today is his *Amphitheatrum sapientiae aeternae solius verae*, which first appeared in an abridged version (n.p. 1595), then in an unabridged one, posthumously published by Erasmus Wolfart (Hanau 1609). Thanks to its complex illustrated plates, drawn by Jan Vredeman de Vries and engraved by Paul van der Doort, this work occupies a special place in alchemical literature [→ Alchemy]. It is erratic testimony of the early period of alchemical and theosophical literature in the tradition later represented by the author of *Wasserstein der Weisen* (1619), Johann Philipp Maullius, → Georg von Welling or → Friedrich Christoph Oetinger. The work is characterised by the theo-alchemical principle that a symbolical counterpart and a natural, incarnate image of the supernatural and spiritual panacea

(Jesus Christ) may be glimpsed in the alchemical panacea (*Lapis philosophorum*). Khunrath’s chemical Christianity found its most striking expression in one of the *Amphitheatrum* engravings, which shows an alchemist praying in a laboratory-cum-atory. The singular character of the *Amphitheatrum* rests on an intricate mixture of various teachings, which Khunrath derived from the Bible, → alchemy, Kabbalah [→ Jewish Influences], → magic, medicine and history. Khunrath’s associative manner of linking the most varied traditions results in ambiguous and obscure texts and sequences of images, which lead into both spiritual and natural realms, serving as edification for the heterodox pious as well as textbooks for alchemists with an understanding of allegory.

The *Amphitheatrum* was highly regarded among the early Rosicrucians [→ Rosicrucianism] (Johann Friedrich Jung, Benedictus Figulus, → Johann Valentin Andreae) and provoked an international uproar, discernible by its censure by the university theologian Claude Griset (Paris 1625). While Khunrath’s other works were reprinted into the 18th century, the *Amphitheatrum* was not republished after its edition at Frankfurt am Main in 1653. However, it has remained a treasured text among alchemically inclined pietists, theosophers, and the nature-mystical followers of → Paracelsus and → Boehme in the 17th and 18th centuries, especially as a commentary by Johann Arndt on four *Amphitheatrum* plates was in circulation. Khunrath was branded by German Enlightenment writers as a ‘madman acting in defiance of healthy reason’ and a ‘philosophical fiend’ (Adelung, 1787). The *Amphitheatrum* found many commentators, however, in the wake of the occult revival in France around 1900 (→ Eliphas Lévi, → Stanislas de Guaita, → Papus, Marc Haven), and translators as well (É. Grillot de Givry). It ranks as one of the most important and authoritative works of occult, theosophical and alchemical literature among 20th-century esotericists. Khunrath appears as a literary figure in Umberto Eco’s *Foucault’s Pendulum* (1988).

JOACHIM TELLE

Kingsford, Anna Bonus, * 16.9.1846
Stratford (Essex), † 22.2.1888 London

Christian occultist [→ occult / occultism] and animal rights activist. Anna Kingsford's father, John Bonus, was a wealthy city merchant of Italian descent; her mother had a combined German and Irish ancestry. Anna was the youngest of a family of twelve children. Since her health left much to be desired – she suffered from asthma – she spent much of her childhood in her father's library, where she read the classics and books on religion and mythology. Already as a child she was reputed to have psychic gifts and claimed to have kinship with fairies who visited her during her sleep. She liked writing: at the age of nine she published a poem in a religious journal, and at thirteen she published her first book, *Beatrice: A Tale of the Early Christians*. Around that time, Annie, as she used to be called, was sent to a "finishing school" at Brighton. Back home, she continued to write stories.

When she was sixteen, her father died, leaving his daughter a small annual income. Her cousin, Reverend Algernon Godfrey Kingsford, an Anglican clergyman, proposed to her, and they got engaged. Being involved at this time in the debate about women's rights, linked to the issue of the position of married women, she asked her cousin to promise her she could keep her freedom and her own money after marriage. He agreed, and in 1867 they did marry. Notwithstanding, after two days Anna panicked, having realized that she was unable to meet her husband's expectations. She returned to her mother's house, where she stayed until the birth of her daughter, Eadith. But she also discovered she did not feel like raising a child, and left hers in the care of her mother. In 1870 she became a Roman Catholic and was bestowed the name Anna Mary Magdalen Maria Johanna. From 1868 to 1870 she wrote stories in the *Penny Post*.

Kingsford did not want her life to be restricted to the private sphere, as was expected of mothers. Wishing to play a public role, she purchased and edited the periodical *Lady's Own Paper*, in which

she strenuously supported feminism, vegetarianism, and the anti-vivisection movement. Throughout her life, love for animals would be a major theme, always closely linked to feminism, religion and spirituality. For her, animals stood for Christ-like goodness, purity and innocence. She personally identified with them, and claimed she loved them more than children. Anyone hurting these almost holy creatures was evil and a servant of Satan, if not Satan himself. Cruelty to animals deserved to be punished; and whoever was guilty of this worst of all crimes should be destroyed, for being as immoral as those who had crucified Christ. Kingsford thus entered upon a vigorous crusade against the supreme evil of vivisection. Having realized that writing articles was not sufficient, she went as far as offering her own body to the most important physiologists of her time; they could perform their medical experiments on her, in exchange for liberation of the animals in their laboratories. Since her offer was not taken seriously, she decided to fight the practice on an intellectual level, arguing that the prevailing materialistic, positivistic and male-dominated medical science should be transformed into a genuine spiritual art of healing. In 1873 she went to Paris to study medicine, since in England women could not qualify as doctors at the time. Her goal was to prove that it was possible to take an M.D. (Medical Degree) without sacrificing animals.

During her stay in Paris, from 1874 on she lived together with her “twin soul”, Edward Maitland (1824-1897), author of a novel titled *By and By: an Historical Romance of the Future* (1873). He was a widower and a distant relative of Anna’s husband, who did not object to his wife’s friendship (a platonic one, for that matter). In 1880 Kingsford took her M.D. degree, with a doctoral thesis which was published in English in 1881; it was titled *The Perfect in Diet*, and dealt with vegetarianism and health. Together with Maitland, she then returned to England, where she practiced as a physician in London, and had mostly women among her clients.

Kingsford’s friendship with Maitland became more and more important to her, and it was in collaboration with him that she developed her religious and spiritual ideas, and began to explore Theosophy. Kingsford was attracted to the → Theosophical Society because she was looking for a religion that combined → mysticism and science, a blend she had not found in the Roman Catholic Church. In September 1882 Kingsford and Maitland both joined the Theosophical Society, and in the same year they wrote and published their book *The Perfect Way, or the Finding of Christ*. It pres-

ents itself as a defense of the idea of → reincarnation and karma, but is primarily a Christian esoteric work – unlike most theosophical publications, which drew rather on Hinduism and/or Buddhism. Like → H.P. Blavatsky, Kingsford claimed that her writings were inspired by higher entities. The relationship between Kingsford, the young and beautiful seer, and the aristocratic grand old lady of Theosophy was tinged with coldness and punctuated by squabbles. But even more than Blavatsky, Alfred P. Sinnett, another prominent member of the Theosophical Society, became a strong opponent of Kingsford. Not surprisingly, given his anti-Christian orientation and his focus on Eastern Wisdom, he wrote a harshly critical review of *The Perfect Way*.

On January 7, 1883, Anna was elected President, and Maitland Vice-President, of the British Lodge of the Theosophical Society (renamed by Kingsford as “London Lodge of the Theosophical Society”), a position which they held until April 6, 1884. Indeed, over that short period Kingsford and Maitland had become more and more worried about the Theosophical Society’s move away from western Hermetic traditions and towards “Eastern occult teachings”. After a heated conflict, and a failed attempt at mediation by → Henry Steel Olcott and (allegedly) Mahatma Koot Hoomi, Kingsford and Maitland resigned from the London Lodge of the T.S. On May 9, 1884, they founded the Hermetic Society [→ Hermeticism and Hermetic Societies], devoted to the study of Platonism, → Gnosticism and → Hermetism; they did so with the help of → W.W. Westcott and → S.L. Mac-Gregor Mathers, who would later, in 1888, found the → Hermetic Order of the Golden Dawn. The same year, Kingsford and Maitland edited extracts from the hermetic writings, under the title *The Virgin of the World*. Maitland’s prefatory essay, “The Hermetic System and the Significance of its Present Revival”, displays their strongly western esoteric leanings and belongs to their most interesting texts.

The purpose of the Hermetic Society, Kingsford claimed, was to investigate the nature and constitution of the human being, and to present a system of thought, along with a rule of life, which would enable everyone to develop his/her higher intellectual and spiritual potentialities. She stated that mysticism is science based on reason, and Christianity is one of the most important mystery religions, not least because it teaches that truth is only accessible through the illumination by the Divine Spirit dwelling within each human being’s own soul. Part of this wisdom was revealed to Anna by her spiritual guides (or “illuminations”, as she

called them), whom only she was able to see and hear, often during her sleep. Drawing upon the messages she thus received, she lectured on ancient philosophy, hermetic gnosis, Zoroastrianism, Osirisism, Judaism and Christianity.

Kingsford's reliance on such spiritual guidance eventually resulted in a disastrous end to her life. The guides told her that she had been chosen to be the savior of animals; and Kingsford came to believe that she was able, by magical means, to harm and kill the medical scientists and physiologists who were experimenting on animals – Paul Bert, Claude Bernard and Louis Pasteur in particular. She set out devoting much of her time to the task of killing these men by the power of her thought. And since Bert and Bernard actually died around that time, she was confident she had succeeded. In 1887 she went to Paris in order to concentrate her efforts on Pasteur, in the belief that physical proximity would make her efforts more effective. But the many hours she spent in the rain near the Pasteur Institute in Paris caused her to catch a cold which developed into pulmonary consumption. An attempt at recovering at the Riviera proved fruitless and she returned to London, where she died in 1888, with Edward Maitland at her bedside. In her last hour she admitted being smitten with remorse about the murders she believed she had committed.

Maitland has authored a voluminous biography of Kingsford, which he set out writing at the beginning of the 1890s and whose final version in two big volumes (*Anna Kingsford: Her Life, Letters, Diary and Work*) appeared in 1913, along with an illuminating preface by Samuel H. Hart. This book contains a wealth of information not on Kingsford only, but more generally on the occultist movement in the second half of the 19th century.

AMANDA KLUVELD

Kirchberger, Niklaus Anton, Baron von Liebisdorf, * 13.1.1739 Bern, † 27.9.1799 Bern

Member of the Grand Council of Bern from 1776 until his death and simultaneously officer in the Swiss army. Member of several academic societies and Government Committees. Well-read in classical and contemporary philosophy and literature, in science (mostly agriculture), and particularly in spirituality and western esoteric traditions. Theosophical essays of his, notably on → Jacob Boehme, originally meant for publication, are no longer extant but documented by mention made in his letters. Apart from a historical discourse on the civic courage displayed by the Swiss people (1771) and a treatise on the use of gypsum (plaster) in agriculture (1771), he did not publish anything. His notoriety is due mainly to his correspondence and to his role of go-between in the illuminist milieu.

For some time Kirchberger was a friend of Jean-Jacques Rousseau (1712-1778), with whom he exchanged letters (1762/65), and of the Swiss “femme de lettres” Julie Bondeli (1731-1778) whose spiritual-literary circle flourished in the 1760s and 1770s. In 1779 he got acquainted with → Goethe. Around 1764 began a long friendship with → Johann Caspar Lavater. Kirchberger never met → Karl von Eckartshausen nor → Louis-Claude de Saint-Martin, but the bulk of his correspondence is with these two theosophers – from 1790 with the former and from 1792 with the latter, and in both cases continuing until Kirchberger's death. Among other Illuminists, Kirchberger was also on friendly terms with Louis de Divonne 1765-1838), → Johann Heinrich Jung-Stilling and some disciples

of → Cagliostro, such as Jacob Sarasin (1742-1802) and his friends.

Some of the first testimonies of Kirchberger's interest in spirituality and esotericism (which go back as early as 1764), are exchanges of ideas with Johann Caspar Lavater on topics such as → animal magnetism, physiognomy, and the state of the soul after death. Indeed throughout his life he would prove to be a man of an inquisitive turn of mind, conversant with the facts and phenomena of animal magnetism, and more generally with all kinds of spiritual manifestations which at that time of mystery-mongering were engaging attention in Europe. But at the same time, he was on the lookout for clues to the nature of their underlying laws. This is why, in the 1780s, he gradually moved away from Lavater and increasingly turned his attention to → theosophy. He fell under the spell of Boehme and steeped himself in the works of theosophers such as → John Pordage, → Jane Leade and → Johann Georg Gichtel.

His most arresting theosophic writings, often blended with arithmosophic [→ Number Symbolism] and millenarian speculations, are centered on the Divine Sophia. This strong emphasis brings him closer to the Christianity of the Orthodox Church than a standard adherence to Protestantism would have it. These writings sometimes have an aroma of quietism – he was an avid reader of Mme Guyon (1648-1717) too. Indeed, while formally belonging to the Reformed Church, he really considered himself a Christian of the so-called “inner Church”, a most common trait in people with theosophic leanings, along with that of political and religious tolerance. Characteristic in this respect are his activities in championing political tolerance, while remaining sturdily engaged in combating the radically anti-religious wing of the *Aufklärung*.

In his later years he experienced spiritual illuminations. Of these he has left us some brief but powerful accounts, which he gave in his commentaries to his extensive readings. In these descriptions he appears to stand in the wake of Boehme but they do not present any the less a certain originality. On account of his epistolary activity and his gift for bringing kindred souls into contact with one another, Kirchberger gained the honour of being hailed as a catalyst in the theosophic milieu of his time. He has remained one of the most attractive figures of the Illuminist current.

ANTOINE FAIVRE

Kircher, Athanasius, * 2.5.1602 Geisa/Röhn, † 27.11.1680 Rome

Kircher was one of the great universal scholars of the 17th century. His life is well documented in early biographies. His comprehensive education began with his theologian father's homeschooling in music, Latin, geography and mathematics. From his tenth year, Kircher attended a series of Jesuit schools, firstly in Fulda, where he learnt Hebrew from a rabbi, then in Mainz. In 1618 he entered the Jesuit order as a novice in Paderborn, where he chiefly studied philosophy and physics. Owing to the Thirty Years War, he continued his studies in 1621-1622 at Cologne. Following the completion of his studies, Kircher worked as a teacher of Greek language and literature, initially at the Jesuit college in Coblenz, then at the “Humaniora” in Heiligenstadt, and finally teaching mechanics at the Aschaffenburg court of the Elector of Mainz, for whom he also conducted cartographical surveys. In 1625 Kircher began the prescribed four-year study of theology at the Mainz college, where he simultaneously acted as professor of Greek. After his consecration as priest in 1628, and a third probationary year as a Jesuit in Speyer, he was appointed professor of ethics, mathematics, Hebrew and Syriac at Würzburg in 1629. His simultaneous application to be a missionary to China – his first choice – was unsuccessful. Two years later the Jesuits had to flee Würzburg due to the advance of Swedish troops. Travelling via Mainz, Speyer und Lyon, Kircher reached Avignon where he taught the same subjects at the local Jesuit college, while pursuing scientific researches in astronomy and mathematics. Here he met his most important patrons, the Provençal astronomer Nicolas Claude Fabri de Peiresc and Cardinal Francesco Barberini. These two also ensured that in 1633 Kircher was not called to succeed Kepler as Court Mathematician at Vienna but

was appointed professor at the Collegium Romanum, founded by Ignatius of Loyola in 1551. Kircher taught mathematics, physics and oriental studies at Rome, which he would not leave for the rest of his life, save for an extended stay on Malta in 1637 and shorter journeys (as to Florence in 1659). From here he corresponded with scholars throughout Europe – some 763 correspondents are known – and received numerous visits. After eight years Kircher was relieved of his teaching duties and could henceforth devote himself entirely to his researches and collections, though more often with commissions from spiritual and secular lords rather than independently.

Kircher developed his claim to polyhistorical knowledge in numerous and versatile writings, publishing a total of 32 Latin folios, mostly extensive and richly illustrated. These works range from the natural sciences (mathematics, magnetism, astronomy, acoustics, optics, medicine) through the cultural history of mankind (with reference to such monuments as Noah's Ark or the Tower of Babel), geography and geology, to philological and etymological works (the decipherment of hieroglyphs, translation of Syrian and Coptic texts, Kabbalah). The diversity of these works is unified by a pansophical logic, whereby everything in the world and therefore all departments of knowledge are related to each other. In this respect, Kircher was influenced by, among others, → Ramon Llull's concept of a combinatory *Scientia generalis*, which he displayed in his *Ars magna sciendi sive combinatoria* (1669/71). This pansophic initiative, on which Kircher's correspondent Leibniz was also working since his dissertation *De arte combinatoria* (1666), consists in the construction of a totality of knowledge by relating a specific number of basic components according to combinatory and analogical principles. This cosmological and encyclopaedic logic rests on the assumption that everything is linked to everything (*omnia in omnibus*) according to the principles of the unity of disparates (*concordia discors*) and the chain of things (*catena rerum*). The polymathic diversity of Kircher's works must be understood as an inclusive project within the encyclopaedic spirit of the Baroque. This Baroque scholarship is typified by Kircher's use of theoretical and applied forms of knowledge, alongside their speculative and empirical, rational and esoteric counterparts. In consequence, Kircher's stance with respect to esoteric sciences remains ambivalent. All attempts to recruit him for or against an esoteric viewpoint are in vain. On the one hand, Kircher appears critical towards those 16th-century sciences which understood nature as con-

stituted by a magical relation between the "lower" and "higher" realms, especially → alchemy, Paracelsian medicine (e.g. → Paracelsus and → Fludd) and → magic (e.g. → Agrippa von Nettesheim). On the other hand, he describes in his works a series of esoteric sciences and traditions. He furthermore bases his pansophy as a prelude to modern science and technology on a theological concept of nature with evident esoteric presuppositions such as the cosmological connection of all things.

Magnetism was an early field of Kircher's scientific enquiry. His first publication, composed in Würzburg, *Ars magnesia* (1631), investigates the "nature", "powers" and "effects" of the magnet (*de effectibus magnetis*) in an empirical and speculative manner, following William Gilbert's *De magnetete* (1600) und Niccolo Cabaeo's *Philosophia magnetica* (1629). Kircher recognises in the magnet a universal principle of inorganic and organic nature, comparable to → Marsilio Ficino's *magia naturalis*, a bipolar duality of attraction and repulsion. According to Kircher, all things and creatures are subject to this principle, and so he investigates the universal effect of the magnetism of the earth, the planets and the sun, the elements, plants and creatures (Kircher already speaks of *magnetismus animalium* [→ Animal Magnetism] like Franz Anton Mesmer at the end of the 18th century), and its application in medicine, → music and love. Kircher thereby relates the universal effect of magnetism to God, whom he understands as the magnet of all things. God holds everything together in harmony through his magnetic power. On the basis of this theological and speculative view, Kircher achieved by experimental means a series of practical results and applications, for example in geomagnetism.

Kircher wrote further books on magnetism, such as *Magnes sive de arte magnetica* (1641, 1643, 1654) and *Magneticum naturae regnum* (1667), and extended his method to optics (*Ars magna lucis et umbrae*, 1646), acoustics and music (*Musurgia universalis*, 1650; *Phonurgia nova*, 1673). In the field of optics, he identified the bipolar principle in the duality of light and shadow and in the doctrine of colours and rays, whereby the principle of reflection (described in his "Catoptrics") acquired a central importance. Here too Kircher achieved numerous applications, notably in astronomy and microscopy, by developing instruments such as the telescope, microscope and magic lantern. Kircher's works on acoustics and music ran along similar lines in his identification of the bipolar principle of universal harmony with the relationship of consonance and dissonance. By means of a mathematical

cosmology based on numerical relations, witness his work *Arithmologia* (1665), Kircher saw musical harmony realised on three planes: the heavenly plane of *musica coelestis*, the terrestrial of *musica mundana* and the technical of *musica instrumentalis*. Accordingly, Kircher described the Creation as a world organ upon which God plays as upon an instrument, an idea previously advanced by Kepler. Again, Kircher found practical applications in this field, such as the development of auditory and communication devices, hearing aids, musical instruments and not least a renowned composition machine, which he presented to Duke August of Wolfenbüttel.

A second field of scholarly research opened up for Kircher after he encountered a manuscript on Egyptian hieroglyphics at Speyer in 1628. He was particularly encouraged by Peiresc and Barberini to attempt the decipherment of hieroglyphics. His first written works on this subject were *Prodromus coptus sive Aegyptiacus* (1636) and *Lingua Aegyptiaca restituta* (1643). When Pope Innocent X decided to erect an obelisk in the famous fountain of the Piazza Navona, Kircher was engaged as a consultant, which gave a fresh impetus to his decipherment of hieroglyphics. The results were his works *Obeliscus Pamphili* (1650) and more importantly, *Oedipus Aegyptiacus* in four volumes (1652-1654), a comprehensive account of the arts, sciences, culture, religion and language of ancient Egypt with comparative appendices on other oriental cultures such as the Jewish and Chinese. Long before Jean François Champollion's decipherment of the hieroglyphs in 1822, but rather in the spirit of Iamblichus' *De mysteriis Aegyptiorum* or Marsilio Ficino's und → Giordano Bruno's mythologisation of Egyptian wisdom into a primordial wisdom, Kircher understood the hieroglyphs as encoded symbols or signs which concealed hidden mysteries, as 'enigmatic chimera of an ancient wisdom' (*Oedipus Aegyptiacus*). On this premise, Kircher first attempted to decipher the hieroglyphs in their relation to the Coptic and Greek alphabets. *Oedipus Aegyptiacus* develops a comparative linguistics, involving Hebrew, Syrian and Chinese among other languages. From the perspective of subsequent Egyptology, Kircher laboured under the fundamental error of interpreting the hieroglyphs as natural signs and thereby as symbols, rather than as phonetic values. Kircher's interest in the hieroglyphs must be understood as a function of his pansophic quest, which led him to see in them a primordial universal language, from which all later languages and cultures derived.

This explains why *Oedipus Aegyptiacus* was concerned with much more than the decipherment of hieroglyphs. Its four volumes attempt a complete presentation of all so-called "Oriental wisdoms". The title of the first volume mentions, besides Egyptian wisdom, also Phoenician theology, Chaldaean → astrology, Hebrew Kabbalah, Persian magic, Pythagorean mathematics, Greek theosophy, Arab alchemy, and latin philology. The title of the second volume reiterates this comprehensive project of an "Encyclopaedia Aegyptiorum" as an account of all "ancient Oriental wisdoms", that is of the "Veterum Hebraeorum, Chaldaeorum, Aegyptiorum, Graecorum". It is no coincidence that Hebrew wisdom is the first topic and clarifies Kircher's understanding of the Kabbalah, to which he devotes an extensive chapter in this volume of *Oedipus Aegyptiacus*, and later in *Arithmologia* (1665). Kircher thereby not only entered the hermeneutical tradition of Renaissance Christian Kabbalah [→ Jewish Influences III] but also transcended the 16th-century Jesuit interpretation of the Kabbalah, in which his student, colleague and friend Kaspar Schott would follow him in *Technica curiosa* (1664). Like his Jesuit predecessors, Kircher displayed ambivalence towards Jewish mysticism, dismissing its magical elements as superstition, and emphasising its theological and mystical elements as positive aspects. Kircher recognised a close relationship between the hieroglyphs and the Hebrew characters, as understood in the Kabbalah. This led him to conjecture that "Hebrew wisdom" preceded "Egyptian wisdom", and was absorbed by the Egyptians: 'This Kabbalah was initially taken over by the first Egyptian patriarchs. Just as the Hebrews used letters and names, so the latter made concealed references by various transformations of animals . . . Just as the first kabbalists expressed themselves in a concealed and symbolical fashion through letters, the Egyptians cultivated this art through hieroglyphic pictures'. Kircher understood the Hebrew letters as coded symbols, whose mysteries must be decoded. For this purpose, the Kabbalah offered three decoding procedures: 1) *Gematria* (the calculation of the numerical value of the letters); 2) *Notarikon* (understanding the words as a secret script or shorthand); 3) *Temurah* (the combination of letters). These were allegorical and exegetical procedures for 'penetrating the hidden mysteries of Holy Scripture' (*in Sacra Scriptura arcana latentia*). Kircher devoted most attention to the combination of letters, specifically because this corresponded to the Lullian method of universal knowledge. What

Kircher here established as a kabbalistic procedure, he would later develop as an encyclopaedic method in *Ars magna sciendi* (1669). Already by using the Kabbalah, he demonstrated the speculative construction of a universal language through the combination of the 22 Hebrew characters. Kircher calculated 1.124.000.727.777.607.680.000 possible permutations and explained this number as the sum not only of all possible words, but as the sum of all things, and thus the aggregate of knowledge: 'As many creatures are created by God, as there are combinations of these 22 letters'. In Kircher's view the Kabbalah was a model for his polyglot and encyclopaedic projects, as in *Polygraphia* (1663) and especially *Ars magna sciendi* (1669). In this work the *ars combinatoria* is extended into a method of *scientia universalis*, an encyclopaedia of all arts and sciences (*artium et scientiarum encyclopaedia*). With its combinatorial method, the Kabbalah recognises the elementary, hidden design of the world, the *mundus combinatus*. But by then, Kircher was no longer operating with the 22 letters of the Hebrew alphabet, but with an artificial alphabet of 3×9 (= 27) elements, derived from Lull's nine *dignitates*, whose combination yielded the totality of knowledge.

Kircher's works on magnetism, hieroglyphics and Kabbalah clearly show how he blended esoteric and theological thought with practical and technical questions into an encyclopaedic plan. This integrative approach also characterises Kircher's astronomical, geographical and geological works, for instance *Itinerarium exstaticum* (1656/57 and 1671) and *Mundus subterraneus* (1665). Scientific knowledge about the solar system as well as the earth and its interior (botany, zoology, geography, mining engineering, geology, mineralogy, vulcanism etc) are based on theological and speculative premises. They are also presented by means of a narrative fiction: in *Itinerarium exstaticum* Kircher (as Theodidactus) is conducted by the angel Cosmiel in a dream across the solar system. Here Kircher follows Tycho Brahe in presenting a geocentric world-picture, which he defends with ostensibly scientific arguments against Galileo, Copernicus and Kepler. According to Kircher, all the divine powers of the universe have condensed in the planet Earth. The interior of the earth consists of water and fire; Kircher abseiled into the crater of Vesuvius in 1638, in order to confirm the flaming and fluid condition of the interior. Inspired by imaginary travel accounts, he held that the earth's interior was inhabited by salamander-like creatures. Alongside these speculative and fabulous ideas, Kircher also

reached progressive, scientific conclusions, such as the increase of the earth's temperature towards its centre.

Kircher realised his polymathic endeavour not only through his large folio books, but also through an extensive collection of natural specimens and cultural artefacts, the Museum Kircherianum of the Collegium Romanum – thereby following a Baroque tradition in the presentation of knowledge. It is principally composed of Alphonso Donnini's collection of antiquities, donated in 1651, excavated Egyptian artefacts from the collection of Peiresc (partly illustrated in *Obeliscus pampilius*) as well as Chinese exhibits, donated by the China missionary Martino Martin and which, together with travel accounts, enabled Kircher to write a book on China (*China illustrata*, 1667) without having visited the country himself. Kircher became curator of this museum, which he expanded with gifts from Jesuit brothers all over the world and with instruments he himself had devised. The Museum Kircherianum became famous throughout Europe, not least thanks to Kircher's guided tours. In 1915 its contents were dispersed to other museums in Rome.

A complete index of Kircher's books can be found in Gerhard Dünnhaupt, *Personalbibliographien zu den Drucken des Barock*, 2nd ed., vol. 3, Stuttgart, 1991, 2326-2350 ♦ Hieronymus Ambrosius Langenmantel, *Fasciculus epistolarum ad. ANDREAS B. KILCHER

Knorr von Rosenroth, Christian,
 * 15/16.7.1636 Alt-Raudten/Schlesien,
 † 4/8.5.1689 Groß-Albershof bei
 Sulzbach

Knorr von Rosenroth studied theology, philosophy, medicine, classical and modern languages at the University of Leipzig, from 1655 to 1660. In 1659 he joined the "Deutschgesinnte Genossenschaft" of Philipp von Zesen (1619-1689). From 1663 to 1666 he made an educational journey through the Netherlands, France, and England. In April 1663 he enrolled at the University of Leiden as a student of theology, and was later in Amsterdam and England, returning to Germany in 1666. From 1667 onwards he lived in Sulzbach, near Nuremberg, where he entered the service of the Pfalzgraf Christian August (1622-1708). He remained there until his death, working on numerous works of natural philosophy and theology (e.g. *Erklärung über die Gesichter der Offenbarung S. Johannis*, 1670) and translations (e.g. Boethius, *De consolatione philosophiae*, 1667; Giovanni Battista della Porta, *Magia Naturalis*, 1680; and Thomas Browne, *Pseudodoxia epidemica*, 1680). From Sulzbach he corresponded with many important European savants: in Germany these included the Orientalist Johann Christoph Wagenseil (1633-1705) and the philosopher Gottfried Wilhelm Leibniz (1646-1716), and in England, the philosopher → Henry More (1614-1687), the Hebraist John Lightfoot (1602-1675), and the Quaker George Keith (circa 1639-1716).

Knorr von Rosenroth's stay in Amsterdam was the decisive event for his intellectual biography. He made there a number of important acquaintances who set him on his decades-long investigation of → alchemy, nature-mysticism, and the kabbalah [→ Jewish Influences]. This formed the basis for his major work, *Kabbala Denudata* (2 vols., 1677-1684, hereafter *KD*). In Amsterdam he began by meeting many Jewish and Christian experts on Kabbalah. There is a tradition that Knorr von Rosenroth studied Kabbalah with, among others, the Marranos Thomas de Pinedo (1614-1679) and Isaac de Rocamora (1601-1684), as well as with Meir Stern († 1679), the Chief Rabbi first of Fulda,

then of Amsterdam, and that with their help he collected the manuscripts and printed works that constituted the *KD*. Amsterdam was not only an important center for printing and marketing the literature of the so-called Lurianic Kabbalah, which arose in Palestine in the 16th century and whose main exponents were Isaak Luria (1534-72) and his pupil Chaiim Vital (1542-1620), but also a center of information on Sabbatianism, the messianic movement of 1665/66 that was based on this type of Kabbalah. Sabbatai Zwi (1626-76) was recognized as the Messiah by this movement, which was also taken up enthusiastically in Amsterdam's circles of Christian millenarianists. Knorr von Rosenroth was certainly in contact with the Chiliasist Petrus Serrarius (1600-1669), the most prominent of the Christian Sabbatians, who proclaimed the new Messiah in Holland and England.

Knorr von Rosenroth was probably still in Amsterdam when he met → Franciscus Mercurius van Helmont (1614-1689), the son of the Paracelsian physician → Joan Baptista van Helmont (1579-1644), whose *Artzney-Kunst* Knorr von Rosenroth translated in 1683. Van Helmont introduced Knorr von Rosenroth in 1667 to Christian August in Sulzbach, and was the most important collaborator on the project of the *KD*, writing as its last part *Adumbratio kabbalae christianae* (1684). As early as 1667, their common interest in the Kabbalah led to the *Natur-Alphabet der Heiligen Sprache* (1667), an introduction to a language for the dumb derived from Kabbala, to which Knorr von Rosenroth wrote the Introduction. It was not by chance that the philo-Semitic Pfalzgraf Christian August, a convert to Catholicism in 1655, summoned to his court first a Catholic with Quaker leanings (Franciscus Mercurius van Helmont), and then a Lutheran Hebraist (Knorr von Rosenroth), making the latter a privy counselor and chancery director. It is clear from the project of the *KD* that the Kabbalah was seen, in contrast to confessional differences, as a mythical primordial and foundational doctrine that equally embraced the Jews and the Christian sects; the Jewish Kabbalists had always known it, but, as Knorr von Rosenroth complains, it was 'until now almost completely ignored by the Christians'. As a document from the Jewish-Christian era and therefore as *prisca theologia*, the Kabbalah's "restitution" was to override all confessional divisions and establish the harmony of religions.

The *KD* is not simply a book, but rather the title of an entire library of Kabbalistic literature, which includes texts as different as a lexicon of basic Kabbalistic concepts, translations from both older and

current literature of the Hebrew Kabbalah, and documents of a contemporary debate over this literature from the Christian theological point of view. Knorr von Rosenroth's understanding of the concept of Kabbalah rested especially on the *Sefer ha-Sohar* (Book of Splendor). It has a central role in the "library" of the *KD*, even to such an extent that the first volume of the work is subtitled "apparatus in libri sohar", and the second volume "restitutio libri sohar". With his concentration on the *Sohar*, Knorr von Rosenroth reached beyond the Christian Kabbalists of the Renaissance – from → Pico della Mirandola (1463-94) to Johannes Pistorius (1546-1608) – and made a direct connection with the type of Kabbalah whose literature he had acquired in Amsterdam: the Lurianic and Sabbatian Kabbalah. In these texts, Knorr von Rosenroth found the *Sohar* sanctified as the mythical "Urtext" of the Kabbala, for instance in Chaiim Vital's *Ez Chaiim*, or in *Emek ha-Melech* (Valley of the King, printed in Amsterdam, 1648) by Naphtali Bacharach (first half of the 17th century), which are copiously cited or translated in *KD*. For Knorr von Rosenroth and van Helmont, the *Sohar* was equally the Urtext of the Christian religion. Not unconnected with Knorr von Rosenroth's plan for the restitution of the *Sohar* was the printing of the entire Hebrew text in 1684: a significant philological enterprise which Knorr von Rosenroth completed together with Jewish scholars.

Many of the texts in *KD* have played a large role in the philosophy and esotericism of the 18th and 19th centuries. In philosophy, it was especially *Sha'ar ha-Shamaiim* (Gate of Heaven) by Abraham Cohen Herreras (circa 1570-1635/39), translated by Knorr von Rosenroth, that was drawn into the debate over Spinoza's pantheism. In esotericism, among other things the three *Sohar* extracts translated in *KD* (*Sifra de-Zniuta* [Book of the Concealed], *Idra Rabba* [Great Assembly], and *Idra Zuta* [Lesser Assembly]) were translated by → MacGregor Mathers (1854-1918) and published in 1887 under the title *The Kabbalah Unveiled*, playing a major role in esoteric → Freemasonry. The same applies to the remarkable alchemical treatise *Esch mezaref* (Purifying Fire), a combination of the Kabbalistic doctrine of the Sefirot with → alchemy and → astrology, whose Hebrew original is lost and which only survives in the Latin quotations in *KD*. The text was translated from this source into English in 1714 "by a lover of Philaletes", and reappeared to play a role in the esoteric Freemasonic circle around → William Wynn Westcott (1848-1925), who republished the translation in 1894.

Krebs, Niklaus → Cusa, Nicholas of

Kremmerz, Giuliano (ps. of **Ciro Formisano**), * 8.4.1861 Portici (Naples, Italy), † 7.4.1930 Beausoleil (France)

Ciro Formisano was born in Portici, near Naples, in 1861. While working as a high school teacher and left-wing journalist, he became involved in the important occult [→ occult / occultism] and Martinist [→ Martinism: Second Period] underground of Naples and was befriended by the older occult teacher Giustiniano Lebano (1832-1909). Through Lebano, Formisano then met Leone Caetani (1869-1935), a well-known scholar of Islam and a member of the Italian parliament, who was also the leader of a quasi-masonic Egyptian Order, and a neo-pagan critic of Christianity.

After travels in France and elsewhere, Formisano became a full-time occult teacher in 1896, under the pseudonym of Giuliano Kremmerz. He also edited the occult magazines *Il mondo segreto* (The Secret World, 1897-98), *La Medicina Ermetica* (The Hermetic Medicine, 1899-1900); and later *Commentarium* (1910-1911). In 1896 Kremmerz established an occult order of his own, known as the Fraternity of Miriam (or Myriam), and placed it initially under the authority of Caetani's Egyptian Order, and later (after Caetani broke with Kremmerz and left Italy for Canada) of other mysterious "Egyptian" secret Masters, whose actual existence has never been proved. While the

Fraternity ostensibly devoted itself exclusively to a system of magical healing (“Isis magic”), its inner circle was also instructed in a different system of “Osiris magic”.

Divisions within Kremmerz’s school started during his own lifetime; he withdrew gradually from public teaching in the 1910s and, disappointed with his disciples whom he still occasionally met, passed the last two decades of his life firstly on the Italian Riviera, and later in Beausoleil, France. A dozen contemporary rival organizations still claim Kremmerz’s heritage.

Most of Kremmerz’s writings were published posthumously. There are no quarrels about his “Isis magic”, a magical healing system which identifies the Virgin Mary with the Minerva Medica and other healing goddesses. Spirit, according to Isis magic, is divine and immortal; all human problems come from matter, and can only be solved when spirit again becomes independent from it. Kremmerz was familiar with → New Thought and Christian Science, and his denial of matter echoed the latter, while the use of magnetic healing techniques was drawn largely from the former. He added an occult explanation of illness, however, derived from his mentor Lebano, claiming that a plethora of malicious spirits and demons steal from humans the vital fluid which is essential for their health. Putting together the power of several initiates in a magical brotherhood, as well as invoking angels, benevolent spirits and gods, is regarded as essential if the fluid stolen by the dark forces is to be recovered.

What exactly “Osiris magic” was is less clear. Documents have been circulating privately for decades, and some were published in the 1970s and 1990s within the framework of the ongoing quarrels between rival groups claiming Kremmerz’s heritage. Other groups have denied that these texts represent Kremmerz’s original teachings, and the present status of scholarly research does not allow for a precise reconstruction of what he taught on these matters. If one believes the texts published and the practice of most (although not all) contemporary groups claiming some sort of “apostolic succession” from Kremmerz’s immediate disciples, “Osiris magic” includes two branches, “avatar magic” and a technique of internal alchemy known as “separation”.

“Avatar magic” teaches how to substitute one soul for another in the same human body. “Separation” teaches how to separate and purify the solar body from the other three human elements (physical, astral, and mental). In order to achieve the “separation”, a number of sex magic operations

(centering on a whole system of spermatophagy) have to be performed at dates carefully selected according to an astrological chart and preceded by periods of strict fasting.

Although such techniques (and their endless variations in contemporary groups) may appear paradoxical, in the systems based on Kremmerz’s thinking (unlike the → Aleister Crowley counterparts) there is no libertinism. In fact, the strictest chastity is required between one “operation” and the other, and the need to consider astrological conditions makes the performance of the “operations” a not too frequent event. The aim of these lifetime efforts is, ultimately, to achieve true immortality. An immortal soul, according to Kremmerz, is not granted to everybody, but can only be painfully achieved by applying appropriate techniques.

MASSIMO INTROVIGNE

Labrunie, Gérard → Nerval, Gérard de

Lacuria, Abbé Paul-François-Gaspard, * 6.1.1806 Lyon (Rhône), † 3.3.1890 Oullins (Rhône)

The third of six children of a couple of goldsmithery and jewelry workers, Paul was educated at the seminary of Oullins. He enrolled in 1826, in the company of Charles Ozanam (1804-1888?), at the moment when death struck the majority of his family. After teaching in the “experimental” colleges of Saint-Nizier and Oullins, near Lyon, of

which Lacuria was co-founder, he was ordained priest in 1836. While at the seminary, whose discipline he found irksome, the future priest was enthused by Lamennais' (1782-1854) project for reforming the Church, and was one of the chief supporters in Lyon of liberal Catholicism. Through the agency of his brother Louis, a painter, he tried to obtain drawings by Ingres (1780-1867) for the journal *L'Avenir*, founded in 1830. The experience of this journal was decisive in forming Abbé Lacuria's social philosophy, aspiring to unite God and liberty within modern societies; he was also influenced by the first socialists, Saint-Simon (1760-1825) and Fourier (1772-1838), who had tried to restore the lost unity of society in union with the spiritual life. The responsible behavior of the Lyon workers during the revolution of 1831 confirmed Lacuria in his choices. He dreamed of a social body kept in equilibrium by the inner regeneration of its members, and thenceforth began the writing of his life's work, *Les harmonies de l'Être exprimées par les nombres* (The Harmonies of Being expressed by Numbers). As the title indicates, it is the analogies suggested by the symbolic relationships between the three first numbers in the Trinity that form the basis for a real understanding of the cosmos, made perceptible through the corresponding geometrical figures (circle, ellipse, cone), thus allowing a bridge to be built between science (the laws of mathematical progression) and faith (the revelation of the Trinity). Lacuria's approach moved, in particular, towards the inverse analogy of the Greek Fathers' "apophatic" theology. The subtitle further reveals his intentions: 'the laws of ontology, psychology, ethics, aesthetics, and physics, explained through one another and reduced to a single principle'. The work, presented in 1844 under the pseudonym of "Abbé Gaspard", was quite poorly received by the clerical world to which it was addressed. Two years later the College of Oullins was dissolved, and the second edition of *Harmonies . . .*, signed P. F. G. Lacuria, appeared in 1847 from the Comptoir des Imprimeurs in Paris. Here the Abbé settled, making a scant living from lessons but surrounded by a circle of Lyonnais artists and thinkers, among whom the dominant personality was the painter Chenavard (1808-1895). A few years after the death of the "new Pythagoras", René Philipon (1869-1936), who published the collection "Bibliothèque Rosicrucienne" with Chacornac, recognized in a photograph of Lacuria an old man who had appeared to him in a dream. Philipon obtained a manuscript of *Harmonies . . .* which the Abbé had corrected over the years in response to criticisms, and published it in

1899. Lacuria's appearance, like an ancient sage with a long white beard, inspired a lithograph of Odilon Redon (1840-1916), *Le Liseur*.

Les harmonies de l'Être exprimées par les nombres: Les lois de l'ontologie, de la psychologie, de l'éthique, de l'esthétique et de la physique expliquées les unes par les autres et ramenées à un seul principe, Paris: Comptoir des imprimeurs, 1847, 2 vols.; new ed. by René Philipon, Paris: Chacornac, 1899.

JEAN-PIERRE LAURANT

Lanz, Adolf Josef → Lanz von Liebenfels, Jörg

Lanz von Liebenfels, Jörg (Adolf Josef Lanz), * 19.7.1874 Vienna, † 22.4.1954 Vienna

Cistercian monk, journalist and author, creator of a racial-esoteric doctrine known as → Ariosophy, and founder of the Ordo Novi Templi (ONT), a Christian gnostic order based on a cult of Aryan race. Born Adolf Josef Lanz, the son of a Viennese schoolmaster, he developed a fascination for religious and chivalrous orders at an early age. In 1893 he entered the noviciate at Heiligenkreuz Abbey near Vienna as Frater Georg. In 1897 he took solemn vows, and in 1898 he became seminary teacher. From 1894 to 1899 he published numerous articles on the history of the abbey and the Cistercian order. Lanz interpreted a tombstone relief showing a nobleman treading upon a beast as an allegory of the dualistic struggle of good and evil and developed heterodox ideas concerning the bestial origin of evil. In 1899 he left the abbey and abandoned the noviciate. From 1900 to 1905 he published polemical writings against the Jesuit influence in the Catholic church; he took up contact with nationalist Pan-German and Social Darwinist circles (cf. contributions to Theodor Fritsch's *Hammer* and Ludwig Woltmann's *Politisch-Anthropologische Revue*); he undertook studies and published journal articles on anthropology,

archaeology and ancient history relating to the Aryan race. In 1902 he assumed a doctoral title and hyphenated "Liebenfels" (a noble Swiss family) to his name (later, in 1910, Lanz adopted the style "Lanz von Liebenfels").

In 1905, Lanz combined his theological training with the new life sciences to articulate his religious doctrine of "theozoology". This variety of euhemerism held that the ancestors of the Aryan race were gods. As earlier, superior forms of life (*Theozoa*), these god-men were quite distinct from the race of beast-men (*Anthropozoa*), descended from a pygmy called Adam. The Fall consisted in the miscegenation of these god-men with the beast-men, leading to the atrophy of their marvellous powers and the development of the mixed races of historical times. Lanz attributed all sin and suffering in the world to this racial interbreeding, allegedly institutionalized in bestial sex-cults in the ancient world. He claimed that Christ, an Aryan god-man, had come to proclaim the cult of pure race but was opposed by racial inferiors resisting the revival of the cult of racial purity. Lanz von Liebenfels saw the Arian heresy as the original racial doctrine of Christianity and declared that Wulfila's Gothic Bible contained the key to "Ario-Christianity". He further claimed that the history of the medieval Church recorded the struggle of reformers (chiefly the monastic and military orders of Benedictines, Cistercians, Templars and Teutonic Knights) to revive the cult, while the modern world traced the political triumph of racial inferiors. Lanz von Liebenfels claimed that a universal program of segregation, eugenic selection and genocide could restore the Aryans to their original divine status. He also borrowed esoteric racial ideas from *The Secret Doctrine* of → Helena Blavatsky, incorporating them in his own dualist interpretation of holy scripture: *Bibeldokumente I-III* (1907-1908). This exegesis is later elaborated in his monumental fifteen-volume *Bibliomystikon* (1930-1935).

Lanz von Liebenfels launched his own magazine *Ostara* (1905-1918), as a "racial-economic" magazine to apply anthropological findings in order to combat the revolt of inferiors and protect the noble European race. Addressing the ascendancy of subject nationalities in the Habsburg empire, *Ostara* opposed liberalism and parliamentary government, and championed male rights against women's emancipation. Already in 1900 Lanz von Liebenfels had founded his own religious order, the Ordo Novi Templi (ONT), to propagate his racial religion based on this gnostic dualism between the blond Aryan-Germanic races of divine origin and

the dark races of bestial origin. The ONT adopted Cistercian forms of liturgy, dress and hierarchy and was open to all males subject to Aryan racial qualification. Its purpose was to act as a mutual benefit society for racially conscious Austrian Germans, promote Aryan beauty and healthy lifestyles, and encourage rural and overseas colonisation. In 1907 Lanz von Liebenfels acquired Burg Werfenstein, a picturesque castle on the River Danube near Grein, Upper Austria, as the archpriory of the order. Before the outbreak of the First World War, members were drawn from the armed forces, civil service and professions.

Lanz von Liebenfels elaborated a full ONT liturgy with an order rule, order of service, hymns, prayers and psalms for his racial religion of "Ario-Christianity". Divine office and mass were held at Werfenstein, and wealthy followers founded new ONT houses. On 9.2.1914, a second ONT priory was founded at Hollenberg near Aachen. In 1918, Lanz von Liebenfels moved to Hungary; in 1919 he was twice captured by communist insurgents but escaped with his life; and in 1921 he was deported from Germany. On 15.10.1925 he acquired the Marienkamp-Szt. Balázs ONT archpriory near Lake Balaton with the aid of Hungarian ONT brothers. On 31.12.1927 he founded the Staufen ONT priory at Dietfurt near Sigmaringen; on 8.11.1928 the Hertesburg ONT presbytery near Prerow, Germany on the Baltic coast; on 4.9.1937 the Szt. Kereszt ONT presbytery near Pilisszentkereszt in northern Hungary; and on 4.9.1938 the Petena ONT archpriory near Waging in Bavaria was founded by Georg Hauerstein junior. The order received some 300-400 brothers from its foundation until the 1930s.

Lanz von Liebenfels assimilated many esoteric ideas into his manichaeic-dualist interpretation of Christianity, coining the term Ariosophy for his doctrine by 1915. He was attracted to the Monism of Ernst Haeckel and speculated on the esoteric tradition of → *Naturphilosophie*, describing the neo-Platonic world-soul and its manifestation as energy in all matter. Lanz von Liebenfels saw Aryan blood as a metaphysical force, whose ennoblement could be assisted by eugenic breeding and the ONT sacraments. During the First World War, he used → astrology and millenarian prophecy (Joachim of Fiore) to predict the outcome of the war. During the 1920s he adopted astrological ideas (Platonic year) to periodize history: from 480-1210 society was ruled by spiritual and chivalrous orders; the rise of the masses characterized the period 1210-1920 with the spread of towns, capitalism, democracy, nationalism and communism; the next period

1920-2640 would witness the revival of hierarchies. Lanz von Liebenfels hailed the right-wing dictatorships in Spain, Italy and Hungary during the 1920s as precursors of this global transformation.

By 1925 Lanz von Liebenfels summarized Ariosophy as a doctrine of “pan-psychic” energy, identical with God, which animated the whole universe but found its highest manifestation in the blond-haired, blue-eyed Aryan. Ariosophy used such esoteric sciences as palmistry, astrology, heraldry, name-kabbalism and numerology to study the spiritual and physical differences between the “blonds” and “darks”. Borrowing ideas of → Guido von List, Lanz von Liebenfels regarded coats of arms and names as symbolic hieroglyphs recording the karma of Aryan families through the centuries. Between 1925 and 1933 Lanz von Liebenfels collaborated with the publisher Herbert Reichstein (1892-1944) to present Ariosophy as a popular occult science of racial characterology and personal divination. Reichstein’s monthly periodical *Zeitschrift für Menschenkenntnis und Menschen-schicksal* (later *Ariosophie*) published articles by a wide circle of German occultists, including Ernst Issberner-Haldane (1886-1966), a Berlin palmist; Frodi Ingolfson Wehrmann (1889-1945), an astrologer; Robert H. Brotz, a graphologist; Rudolf John Gorsleben (1883-1930), the author of books on “Aryan mysteries”; and Gregor Schwartz-Bostunitsch (1883-?), an anti-Semitic and antimasonic conspiracy theorist. This publishing activity was supported by courses, public lectures and summer schools, while Lanz von Liebenfels retained the spiritual leadership of the ONT, and reissued a new series of *Ostara* magazine from 1927 to 1931 (including a new, serialized edition of *Theozoologie*). From 1933, Lanz von Liebenfels published a major series of pamphlets (*Ariomantische Bücherei*, *Luzerner Briefe*, *Briefe an meine Freunde*), intended only for ONT circulation. His historical survey of “ario-Christian” mysticism attempted to recruit many major figures in the esoteric tradition, including → Hildegard of Bingen, Gertrude the Great, Mechtilde of Magdeburg, Meister Eckhart, Jan van Ruysbroeck, Thomas à Kempis, → Jacob Boehme, Angelus Silesius, Nikolaus von Zinzendorf, → Emanuel Swedenborg, J.B. Kerning, Carl von Reichenbach, → Eliphas Lévi and Helena Blavatsky. Lanz von Liebenfels also dedicated a special study to the Austrian medium and Christian visionary → Jakob Lorber (1800-1864).

Initially enthusiastic at Hitler’s seizure of power in Germany, Lanz von Liebenfels was soon disappointed by the plebeian and demagogic aspects of

National Socialism. He continued writing his liturgical and doctrinal books for the ONT, first in Hungary, then in Switzerland, returning by 1938 to Austria where he remained throughout the Second World War. With the suppression of religious sects during the Third Reich, the ONT was dissolved. From 1947 to 1952 Lanz von Liebenfels resumed limited ONT activity and publishing, receiving the sacraments of the Catholic church before his death in 1954.

NICHOLAS GOODRICK-CLARKE

Lavater, Johann Caspar, * 15.11.1741
Zürich, † 2.1.1801 Zürich

A Swiss Lutheran minister and theologian, Lavater is mostly known as the founder of the “modern” science of physiognomy. As a poet he acquired some notoriety by his *Schweizer Lieder* (1767). A prolific author, he wrote nearly 130 works (mostly religious books, sermons, canticles, a diary, and Christian handbooks with moral advice). His correspondence amounts to more than 11,000 letters exchanged with people belonging to practically all social milieus, from simple workers up to sovereigns in Europe (most of that correspondence is accessible at the Zentralbibliothek of Zurich). He was, among other people of great fame, a friend of → Goethe, who contributed a

chapter on the skulls of animals to his book on physiognomy (see further below). Lavater had a taste for religious polemics. He took up contact with enlightened thinkers of all kinds, without any distinction of religious or intellectual tendencies – pietists, Moravian Brothers, rationalists, mystics, Illuminists, theosophers – but he refused to be counted as a member of any movement, school or sectarian association. Because of his eclecticism, his interest in science and religion, and his search for a synthesis between faith and reason, Lavater can be considered a representative of the cultural cosmopolitanism typical of the 18th century. He contributed more than anyone else in his period to the diffusion of a kind of Christian → mysticism strongly tinged with theosophy. As a matter of fact, he can be considered one of the main popularizers of the general movement known as → Illuminism.

Lavater's faith, blended with → pietism and tolerance towards other confessions, put Christ in the foreground as the archetype of humankind and Mediator between God and Man. That emphasis gave rise to an uncompromising Christ-centered conception of mankind. Although a Protestant, he had some Catholic leanings and was oftentimes suspected by people of his Church of practicing a kind of crypto-catholicism. His ideas about the unity of the cosmos and his belief in universal symbolism brought him close to the Christian theosophers. Preoccupied with messianic expectations, he envisaged the millenium as a theological reality and awaited the manifestation of a mystical Christianity which would present itself as an “inner Church”. Lavater's apologetics, his proselytism, and his militant Christosophy, oftentimes caused him to become estranged from his friends – including Goethe.

Like many of his contemporaries, Lavater was eager for miracles, strongly interested in theurgy and felt a loathing for mere abstract speculation. He was always prone to complement his pietistic Christianity with mystical elements. Convinced that the human soul had a power of precognition and divination, he also frequented some thaumaturgists of the time like Johann Joseph Gassner, Graf Joseph von Thun, Karl von Hessen-Kassel and – not least – → Cagliostro, whom he met two or three times in Strasbourg, between 1781 and 1783.

Around 1784, Lavater became interested in the → animal magnetism of Franz Anton Mesmer. He exchanged ideas on this topic with his friend → Kirchner and many other people. In Lavater's opinion, magnetism was closely linked to the “sixth sense” with which the prophets of the Old Testament had been endowed. Lavater himself suc-

cessfully cured his wife by means of magnetism. He went as far as to believe in the possibility of a magnetic rapport with God Himself.

In 1793 Lavater came under the influence of the Illuminists of the so-called “Northern School” of Copenhagen (in particular of their leader Prince Karl von Hessen-Kassel), who practised a form of Christian theurgy. That year he went to Copenhagen and took part in their practices. Under their influence, he even became for some time inclined to believe in metempsychosis [→ Reincarnation]. His interest in all kinds of spiritual manifestations and materialisations of the spiritual increased over the years. For example, he believed that the Apostle John had never died, and during the year 1794 Lavater thought that John might possibly visit him in Zurich, which caused him to become the victim of some impostors (like Rudolf Hermann).

In Strasburg, where he was invited by Cagliostro in 1781, at the same occasion he got in touch with → Freemasonry, thereby becoming acquainted with a number of freemasons (of Strasburg and elsewhere) with strong esoteric leanings, such as → Willermoz and → Saltzmann. Freemasonry contributed to opening him up to a great number of other theosophers outside the pale of Freemasonry proper, such as → Jung-Stilling, → Eckartshausen, Kirchner, → Saint-Martin, and to the works of → Swedenborg. His brother Diethelm, and by the same token he himself, albeit indirectly, participated as an observer in the Convent of Wilhelmshausen (1782), aimed at defining the aims and organization of European Freemasonry. But he never joined any lodge, because the very principle of a secret society seemed to him to be incompatible with the principles of Christianity as he saw them. And it is not surprising that he took up arms against the Bavarian → Illuminaten of Adam Weishaupt as soon as he became aware of what their actual plans were all about.

Among the most successful works of Lavater is his series of essays entitled *Aussichten in die Ewigkeit* (Prospects for Eternity; 1768-1778), in which he tried to foray into the mysteries of the destiny of mankind and of afterdeath life. His most famous one, a presentation of and a plea for the science of physiognomy, is *Physiognomische Fragmente zur Beförderung der Menschenkenntnis und Menschenliebe* (Physiognomic Fragments, to foster Knowledge and Love of Human Beings; 1775-1778). The art of judging the human character and of foretelling a person's fate from the features of the face had long been part and parcel of the so-called occult sciences. In accord with the idea of → correspondences between microcosm and macrocosm,

physiognomy is based upon the idea that the very material form of any being is already, in itself, a “language”: the expression of what this being is in its innermost core. The *Physiognomische Fragmente* assured Lavater an ever growing European audience. For him it was not just a psychological tool, but also a kind of hymn to God’s glory, because correspondences as he understood them were necessarily reflective of a universal web in which God, man and nature intertwine. Not surprisingly, that work came in for its share of criticism from people (e.g. the psychologist Georg Christoph Lichtenberg) prone to see in Lavater merely a kind of magician or visionary with a free-wheeling imagination.

When Zürich was invaded by the French, Lavater was arrested and deported to Basel. Upon his return to Zürich, he was wounded by a bullet shot by a drunken French soldier and died after nearly two years of suffering. Such a death stirred a vivid emotion all over Europe. Even after his lifetime, Lavater remained a source of fascination for his contemporaries, enemies and friends, opponents and admirers alike; and he remains one of the most attractive figures of Illuminism.

Physiognomische Fragmente, zur Beförderung der Menschenkenntniss und Menschenliebe (illustrated), Leipzig/Winterthur: Weidmann/H. Steiner, 1775-1778; Among several new ed., see the German one by Christoph Siegrist, Stuttgart: Reclam (Universal-Bibliothek, 150-155), 1984, and the reprint (Frankfurt/Main, 1991), of the original ed.; First complete translation into English: London, 1790-1798 ♦ William Tegg published several epitomes of Lavater’s works under the title: *Physiognomy; or, the Corresponding Analogy Between the Conformation of the Features and the Ruling Passions . . .*, 1865 and 1867 (287 pages and 7 plates); For details on the English editions see John Graham, “Lavater’s Physiognomy in England”, *Journal of the History of Ideas* 22 (1961), 561-572; For a complete listing, his “Lavater’s Physiognomy: a checklist”, in: *Bibliographic Society of America* 55 (1961), 297 ♦ *Aussichten in die Ewigkeit, in Briefen an Herrn Joh. Georg Zimmermann, königl. Großbritannischen Leibarzt in Hannover*, Zurich: Orell, Geßner, und Comp., 1768-1778; Part 1, 1768 (contains the plan for all 25 letters, and also Letters nos. I-X); Part 2, 1769 (contains Letters XI & XII); Part 3, 1773 (contains Letters XIII-XXV); Part 4, 1778 (contains Supplements, Notes and Corrections to the first three volumes) ♦ *Nathanaël. Law, William, * 1686 King’s Cliffe,
† 9.4.1761 King’s Cliffe

Law was educated at Emmanuel College, Cambridge, of which he became a fellow in 1711. His personal history is somewhat parallel to that of → John Pordage. Like Pordage, Law refused to take the oath of allegiance to, in Law’s case, King George I in 1714, making him a Nonjuror, forcing him to resign his college position, and disallowing him other public positions as well. Law then lived in Putney, near London, at the home of Edward Gibbon from 1727 to 1737, where he tutored the historian Gibbon’s father. In about 1740, Law moved back to King’s Cliffe, where until his death in 1761 he lived a celibate and quiet life shared with Hester Gibbon, the historian’s aunt, and Mrs. Hutcheson, a rich, pious widow. His later years were spent studying → Boehme and writing in relative seclusion.

Law's community, at King's Cliffe, was renowned for its generous charity. Law and an anonymous patron established a poorhouse for young girls, teaching them to read, knit, sew, study the Bible, and attend church; they gave clothes, money, and food to the poor through almshouses they established. Mrs Hutcheson had a substantial income, but she and Law gave away all but a tenth of their income to the poor. They all led an abstemious life, with prayers morning, noon, and night, Law himself arising at five a.m., and spending much of his day reading in his large library of mystical authors, writing, and praying.

Law's *A Serious Call to a Devout and Holy Life* (1728) was referred to by Caroline Spurge as the most influential religious text of the 18th century, and does not reveal any trace of theosophy [→ Christian Theosophy]. Law discovered Boehme between 1733 and 1736, and studied Dionysius Andreas Freher's works from 1737 onward, but did not publicly acknowledge their influence on him. Consequently, as C.A. Muses points out, most scholars have ignored the influence of Freher on Law; this includes Stephen Hobhouse, in whose anthology of Law's selected writings Freher's name does not even appear in the index. But Law himself did not ever cite Freher, and probably would not have cited Boehme himself openly (even though some of his works are chiefly paraphrasings of Boehme's works) if he had not been publicly accused of plagiarism by a Dr. Trapp. Only after this charge did Law openly refer to Boehme.

Scholars have commonly repeated that Law is England's greatest interpreter of Boehme, but in fact Law is simply England's most well-known Boehmean author. Without doubt, Britain's greatest Boehmean is Pordage, whose work is both more complex and more extensive. But Law is a fine stylist, whose devotional writings are at once eloquent and simple. Of course, Boehme himself had an eloquent and simply devotional side, manifested in such works as *Christosophia: The Way to Christ*. Yet as anyone knows who has tried to make his way through some of Boehme's more cosmological writing, his work can be extraordinarily dense and difficult. These deeper aspects of theosophy are by and large missing from Law's work.

Still, Law was influenced by theosophy. Boehme was given on occasion to the dialogue form, whose antecedents are found in works like those of → Giordano Bruno, earlier in → John Scotus Eriugena, earlier still in the *Corpus Hermeticum*, and earlier still in the works of Plato. In his most Boehmean later works, like *The Spirit of Love*,

Law likewise uses the dialogue form, developing his theses through conversations between Theophilus, a master theosopher, Theogones, and Eusebius. It is in these dialogues that we find references to 'Behmen' as the 'chosen instrument of God'.

In fact, *The Spirit of Love* largely consists in explication of theosophical premises. Law, through the mouth of Theophilus, explains the seven spirits of God, the nature of wrath, evil, the fall of man and Lucifer, redemption, and numerous other topics. Although sometimes awkward in phrasing, and never possessing the scope of Pordage's works, Law's dialogues demonstrate how deeply he had gone into theosophy.

His later works also demonstrate Law's correspondences with the Philadelphians. While Law does not quite directly teach the doctrine of *apocatastasis* like → Jane Lead, Law does insist that in God Himself, there is neither wrath nor any anger at all. God is pure, boundless love. Wrath only came into being when Lucifer fell and created nature fell into materiality; and so 'God can no more begin to have any wrath, rage, or anger in Himself after nature and creature are in a fallen state than He could have been infinite wrath and boundless rage everywhere and from all eternity' (*Spirit*, 392). Wrath is simply a result of fallen creatures being separated from the Divine will to love. Thus – and this point is critical – all creation, good or evil, exists 'to turn temporal evil into eternal good', for through creation 'the supernatural Deity wills and seeks the restoration of fallen nature and creature to their first perfection' (*Spirit*, 429). Elsewhere, Law's prose seems very close to Pordage's writing on eternal nature, and suggests that Law and Pordage were much more akin than Law would publicly acknowledge.

It is true that Law was a Boehmean theosopher, but his theosophy was so shorn of references to its antecedents that it was not nearly so threatening to more conventional Christians as the extraordinary revelations of Pordage or Lead. Thus it is not surprising to find that Charles Williams could write of Law's works that they form 'perhaps one of the best statements of the pure Christian religion that have ever been issued', and Rufus Jones could term Law a "saint" and a "prophet". One is hard pressed to find praise like this for the visionaries Pordage or Lead.

Law's later works perched between a broader audience and the theosophy that he was interpreting to that audience. They form an introduction to the theosophical tradition, and if they do not reflect the visionary insights of a Pordage, or the extraor-

inary breadth of Boehme's books, still his aphoristic gift, and his ability to make theosophical insights accessible to many earn him a place in the history of theosophy.

ARTHUR VERSLUIS

Lazzarelli, Lodovico, * 4.2.1447 San Severino, † 23.6.1500 San Severino

Italian humanist, poet, Christian hermetist, and pioneer of Christian kabbalah [→ Jewish Influences III]. Lazzarelli was born the youngest son of a physician, Alessandro Lazzarelli, in San Severino. His father died soon after his birth, and his mother moved with her children to Campli, where Lodovico began his studies under a certain Cristoforo da Montone. Introduced by the latter to a typical humanist curriculum, he turned out to be a talented and ambitious child, with an early calling for poetry. A poem about the battle of San Flaviano, as early as 1460, is said to have been received with admiration by members of the victorious party, King Ferdinand I of Aragon (known as Ferrante) and Alessandro Sforza: somehow the Lazzarelli family must have had access to these high political circles. From an early age, Lazzarelli found employment as a private tutor in the households of various wealthy families. From Atri, where he taught the eldest son of Matteo di Capua, he moved on to the household of the bishop of Teramo, Giovanni Antonio (Giannantonio) Campano. This well-known orator, poet and philosopher seems to have been an important formative influence on Lazzarelli's poetic development. From Teramo Lazzarelli moved on to Venice, which would remain his main place of residence for several years. Here he perfected his Latin and Greek under the humanist Giorgio Merula, and got acquainted with the poet Elisio Calenzio.

The year 1468 marks Lazzarelli's maturation as a poet, as shown by his "Hymn to Prometheus" and an heroic poem about a tournament in Padua, that earned him considerable fame. In the same year occurred one of the highlights of his life, when he was given an audience by the Emperor Frederick III, who was in Italy to visit Pope Paul II. He recited an oration in praise of poetry, and the Emperor decided to crown him with laurels. To the end of his life, Lazzarelli and his family would remain proud of his status as "Poet Laureate". In the following years Lazzarelli kept devoting himself to orations and poetry, including a work called *De gentiliū deorum imaginibus* (On the images of the heathen gods) inspired by the Tarocchi of Mantegna, but also to the study of theology and astronomy. At one point – the precise year is unclear – he appears to have moved from Venice to Camerino, where he joined the household of the city's ruler, Giulio Cesare da Varano, as tutor of his nephew Fabrizio. In Pioraca, where the Varano family resided for

some time to escape the plague, Lazzarelli began what would become his most important poetic work: the *Fasti christiani religionis* (The holy days of the Christian religion). Conceived as a Christian counterpart to Ovid's *Fasti*, it is a large chronicle of the feasts of the liturgical year, prefaced by an account of the life and passion of Christ and the early history of the Church.

Probably in 1473 Lazzarelli briefly entered the service of Lorenzo Zane, future Patriarch of Antioch, and accompanied him to Rome. Here he joined Pomponio Leto's reformed Roman Academy: a club of humanists enchanted with the cultural splendor of ancient Rome, who had been persecuted under Pope Paul II but now enjoyed the protection of the ruling Pope, Sixtus IV. In this congenial atmosphere Lazzarelli continued working on his *Fasti*. He claimed to have completed it in 1480, but in fact the manuscript evidence shows that he was still working on it between 1482 and 1484, and many further corrections were added up to a period as late as 1495. This is important because the *Fasti* contain a few explicit references to the → Hermetic literature; they are most plausibly explained as late additions, reflecting his discovery of the Hermetic writings in 1481 or 1482.

It is in 1481 that Lazzarelli met the strange apocalyptic prophet → Giovanni da Correggio (ca. 1451?-after 1503): an event that proved decisive for the rest of his life. While the cardinals were gathering for a consistory meeting, Correggio appeared on the stairs of the papal palace, proclaiming the apocalypse and calling for repentance. Lazzarelli was among the bystanders, and was deeply impressed: he writes how, in response to Correggio's call, he 'left the Parnassian hills and everything else, and right away followed him to Mount Zion – the first of his pupils'. It has often been assumed that Lazzarelli's conversion from profane poetry to divine wisdom – elsewhere referred to as a turn 'from the Helicon to Mount Zion' – meant a conversion to hermetism. However, there is no evidence that Correggio's Christian-apocalyptic message already contained hermetic elements in 1481; it is more likely that his pupil Lazzarelli, with his superior humanistic culture, first introduced the prophet to the *Corpus Hermeticum* and the *Asclepius*.

In 1482 Lazzarelli produced a beautiful manuscript containing the complete "philosophical" hermetica in Latin, and offered it as a gift to his beloved teacher. Its first part contained → Marsilio Ficino's *Pimander* (1471), that is to say, *Corpus Hermeticum* I-XIV. The second part contained the *Asclepius*. The third part contained a Latin

translation of the remaining three tracts of the *Corpus Hermeticum* (nowadays known as C.H. XVI-XVIII), which Lazzarelli had discovered in a manuscript different from the one used by Ficino, and which had not been translated into Latin before. All three translations were preceded by dedicatory prefaces (the second in the form of a poem). These texts show how deep an impression the hermetic writings had made on Lazzarelli, who addresses Correggio as Hermes Trismegistus's spiritual son, and concludes that since Correggio is his spiritual father, he himself is therefore Hermes's "grandson". Lazzarelli's translation of C.H. XVI-XVIII, referred to by him as the "Diffinitiones Asclepii", remained in Correggio's possession until 1501, when the prophet was received by king Louis XII of France and gave Lazzarelli's hermetic manuscript away as a gift to an ambassador. At the same occasion Correggio met → Symphorien Champier, who published the "Diffinitiones Asclepii" in 1507.

A manuscript "Epistola Enoch", anonymous but certainly written by Lazzarelli, contains a detailed account of Correggio's sensational public appearance in Rome on Palm Sunday 1484, when he entered the city dressed like Christ and seated on a white ass. The prophet's message and presentation was now permeated by hermetic references: he called himself "Mercurio" and God's or Jesus's chosen servant Pimander. Although the "Epistola Enoch" makes no mention of it, it is probably at this occasion that Correggio was arrested and thrown into prison, and Lazzarelli must have been among the friends with whom he is said to have escaped.

Almost nothing is known about Lazzarelli's movements in the following years. In 1486 he fell ill and returned to his family in San Severino. It is probably from there that he moved on to Naples, where he was employed for some time by Francesco Colocci as tutor of his younger cousin Angelo. He managed to get an audience with king Ferrante and present him with a copy of his *Fasti*; but the king seems to have shown little interest. Around this same time Lazzarelli must have given the final redaction to one of his best known poems, the "Opusculum de Bombyce". The central part gives a matter-of-fact description of the cultivation of silkworms; but in the opening and closing sections, the transformation of the silkworm is discussed as an image of how the soul may imitate Christ in achieving immortality by a process of palingenetic regeneration. In an embryonic form the poem foreshadows several teachings that would come to full development in Lazzarelli's most important hermetic work, the *Crater Hermetis*.

It is probably during his years in Naples that Lazzarelli began to gain some reputation as an exorcist who could heal the sick by casting out demons. He was convinced that, thanks to Correggio, he had been regenerated and reborn as a “true man”; and the power of exorcism was implied by this new spiritual status. Lazzarelli’s concept of spiritual regeneration is described in his most important hermetic work, called “A Dialogue on the Supreme Dignity of Man, entitled the Way of Christ and the Mixing-Bowl of Hermes”. Mostly referred to as the *Crater Hermetis*, and written probably between 1492 and 1494, it is one of the purest examples of hermetic-Christian syncretism known to us. The *Crater* is closely modeled on the authentic hermetic dialogues, but Lazzarelli casts himself in the role of the hermetic teacher, and his pupils are king Ferrante himself and his Secretary of State, the well-known poet Giovanni Pontano. There is no evidence that either of the two ever read the *Crater*, or became aware of the role they played in it.

At the very beginning of the *Crater* we find a unique and extremely bold assertion: the great being Poimandres, who appears to Hermes in a vision described in C.H. I, was no one else but Christ himself, who would later incarnate in Jesus. Poimandres-Christ has now taken residence in Lazzarelli and has illumined his mind. Under that authority he is about to explain to his pupils the nature of true felicity, which can only be obtained by self-knowledge. Partly in response to questions by Ferrante and Pontano, Lazzarelli embarks on an allegorical exegesis of various biblical passages (he discusses the true meaning of the paradise trees, the women in Proverbs, the “daughters of men”, and the Fall). During the course of the discussion, which is full of implicit and explicit references to the hermetic writings, the pupils are gradually moved to a state of ecstasy, until they are ready for the final revelation of the great mystery. Very remarkably, this mystery is explained with reference to the most controversial passages of the entire hermetic literature: the so-called “god-making” passages in the *Asclepius*, about the animation of statues (23-24, 37-38). Precisely in this most unlikely of all places – their idolatrous nature had been a matter of concern for Christians since → Augustine – the deepest secret is to be found. Lazzarelli implicitly admits that Hermes Trismegistus did lapse into idolatry because, as a pagan living before the Incarnation, he could not but misconstrue the message that Poimandres/Christ revealed to him. The Egyptians attracted souls into their statues because they did not know how to create them themselves. The *Christian* hermetist, how-

ever, is able to attain perfect knowledge of God, and thereby participates even in God’s “fertility”, that is to say, in his very powers of creation. As a result, he can create souls. Lazzarelli explains this hermetic mystery of soul-creating not only with reference to the *Asclepius* but also by means of an allegorical interpretation of a Jewish prescription for creating a golem or artificial man. The passage is taken from Eleazar of Worms’ commentary on the *Sefer Yetzirah*, which Lazzarelli probably found in one of the writings of → Giovanni Pico della Mirandola’s Jewish teacher Yohanan Alemanno. There is abundant reason to assume (although there is no direct and conclusive evidence) that the whole of Lazzarelli’s central doctrine of “making souls” is derived from similar doctrines found in the kabbalistic school of Abraham Abulafia, transmitted to Lazzarelli by mediation of Alemanno. It is from this perspective that he must have seen the god-making passages of the *Asclepius* in a new light. Lazzarelli’s integration of Jewish kabbalistic elements in a Christian-hermetic treatise makes him into one of the earliest pioneers of Christian kabbalah after Pico della Mirandola.

Contrary to what has been argued by earlier generations of scholars, Lazzarelli’s doctrine contains no trace of → magic, astral or otherwise. He is concerned with a process of spiritual transformation by means of which man can attain true self-knowledge and be reunited with God. The doctrine is remarkably original in several respects, particularly in the way it handles the notoriously problematic question of hermetic idolatry. In line with the *prisca theologia* tradition, Lazzarelli presents Hermes Trismegistus as divinely inspired; but unlike other Christian hermetists, he confronts Hermes’ idolatry head-on by suggesting that his ability to understand the revelation was limited by the fact that he was and remained a pagan living before the Incarnation. Only Christians can really understand the hermetic message and achieve true spiritual regeneration. Although Giovanni “Mercurio” da Correggio is never mentioned in the *Crater*, he is clearly present behind the scenes as the culmination of a progressive hermetic-Christian development: having first inspired Hermes as Poimandres, the second person of the trinity then incarnated as Christ, and now he has returned as Correggio, who had entered Rome as the “Hermetic Christ”.

The spiritual philosophy of the *Crater* is certainly the center of Lazzarelli’s Christian hermetism, but by 1495 his interests seem to have expanded to include alchemy. In this year he met an otherwise unknown Burgundian alchemist,

Johannes Rigaud de Branchiis, who was believed to have produced the elixir of life and who became his teacher. Several texts by Lazzarelli reflect this new course of study, most importantly a transcription of Petrus Bonus' *Pretiosa Margarita Novella* with an attached epigram, and a transcription of pseudo-Lullian materials preceded by an introduction, referred to as the "Vade Mecum". Lazzarelli found in pseudo-Lull the concept of a general transformation and restoration of man and the cosmos, and some references to special divine revelations and initiatory bonds between master and disciple; it was therefore natural for him to see these alchemical texts as on a continuum with the philosophy of the *Crater*. Like the later Correggio, who likewise developed an interest in alchemy, Lazzarelli seems to have believed that a universal alchemical remedy might convert the enemies of the Catholic faith to Christianity and thus promote the return of the golden age.

Early in 1494 Lazzarelli left Naples, which was in a state of political instability and unrest following the death of king Ferrante in January. He may have gone to Rome, and from there to Correggio's home town Bologna, and possibly wandered further up north. But he eventually returned to San Severino. Filippo Lazzarelli, in his biography of his brother, emphasizes his exemplary piety and saintliness during the last years of his life: Lodovico was 'wholly dissolved into spirit' and 'always thought and spoke of God'. He seems to have continued curing the sick by casting out demons, and correctly foresaw the death of his older brother Gerolamo and himself in a dream. Lazzarelli died of pleurisy at the age of fifty-three. His body lies buried in the church of San Lorenzo in his place of birth.

Lazzarelli is important as the first Latin translator of the three final tractates of the *Corpus Hermeticum*, as one of the earliest and purest examples of Christian hermeticism, and as a pioneer of Christian kabbalah. His influence during his lifetime remained limited: only the "Epistola Enoch" and the "Opusculum de Bombyce" made it into print. In 1505 → Lefèvre d'Étaples included an abridged and sanitized version of the *Crater* in his important edition of the authentic philosophical hermetica, and Gabriel du Preau published a French translation in 1549. We know that the *Crater* had an impact on → Cornelius Agrippa, but neither this nor later lines of influence have been studied in any detail. It remains that the *Crater Hermetis* is one of the pearls of Renaissance hermetic literature, commanding respect for the beauty of its formal

structure and presentation, and intriguing by the originality and occasional brilliance of its ideas.

WOUTER J. HANEGRAAFF

Lead(e), Jane, * 1623 Norfolk,
† 19.8.1704 London

Lead was born as Jane Ward in – according to her own account – a reasonably wealthy upper-class family. She and her family lived a good life, and she received a fine education. When she was fifteen, on a Christmas eve, she was dancing and celebrating with her family and friends, but heard a voice that told her ‘Cease from this, I have another Dance to lead thee in, for this is Vanity’. For three years she lived in melancholy isolation, occasionally reading books and almost always staying apart from people; despite the counsel of her father, Schildknapp Ward, and a chaplain, she felt the sins of the world upon her, and believed that because she had once told a lie, she would not be allowed into the New Jerusalem. But at the age of eighteen, she ‘was so richly favoured by her dear and blessed Mediator, as to receive at that time the Seal of her Absolution and Assurance, in a manner very special, there being presented to her in a Vision, the form of a Pardon with a Seal to it’ (Thune, 68-69).

Soon after this time, she went to London, chiefly in order to find a religious context for and deepening of her visionary experience. But although she attended numerous meetings, she was disappointed until she met a Dr Crisp, a well known clergyman who had been ousted from his pastorate in Brinkworth in 1642, and had come to London just at the time Lead was there. He was able to resolve all her doubts and give her a much clearer understanding of what had happened to her; but unfortunately he died in February, 1643.

When she became interested in marrying one of her religiously inclined friends in London, who apparently was not of her social class, her parents brought her back to Norfolk in an attempt to marry her off properly, which she refused, since she did not want to marry merely for earthly reasons. At twenty, she married William Lead, a merchant, with whom she lived happily for twenty-seven more years. With him she had four daughters, two of whom died, and two of whom reached maturity and themselves were married. Apparently she and her husband shared spiritual concerns.

But in February, 1670, her husband died, and the man to whom his money was entrusted absconded with it, leaving Lead destitute. What could have been a catastrophe, however, she regarded as in

another sense her good fortune, for like → Gichtel and many other theologians, she took this as a sign that she should throw herself wholly on the mercy of God.

Lead had met → John Pordage as early as 1663, a meeting about which she wrote in her preface to his *Theologia Mystica*, and at which she was profoundly impressed by what she saw as his spiritual ‘anointing’. She soon became a member of his circle, but it was not until after her husband’s death that she was able to devote herself wholly to theology. She and Pordage eventually lived in the same house, along with several others, the better to devote themselves to prayer and mutual religious understanding. During this time, while Lead slowly assumed leadership of the group, Pordage wrote his most important works.

After Pordage’s death in 1681, the responsibility for continuing their theosophical work fell to Lead. By 1683, she had had one of his more important treatises published, as well as some of her own, including *The Heavenly Cloud Now Breaking* (1681) and *The Revelation of Revelations* (1683). Upon reading the latter book, a wealthy widow offered her and her group the use of her home for their meetings, an arrangement that lasted until her death, at which the group was forced to find another place to meet nearer to London. By 1692, however, the theosophical circle had diminished, and it languished only until 1694.

As Lead’s name and works began to circulate in Germany and the Netherlands, they became known to Francis Lee, who was to play an important role in making her name more widely known. Born in 1660, this brilliant young man had been fellow of St Johns College, Oxford, but had to leave because he refused to swear allegiance to the new king. Having left the college, he first worked as a tutor to several noblemen, but eventually travelled to Italy, where in Padua he took his medical degree, and practiced medicine in Venice for two years. Returning to England via the Netherlands, he was given a copy of *The Heavenly Cloud Now Breaking* and was deeply impressed. Lee returned to England and, with two unnamed ‘students of divinity’, met with Lead herself, acting as interpreter for the others. Lee realized the extraordinary significance of this elderly woman and her ‘loose papers . . . occasionally penned for her own private memory’. Due to his help as a scholar and amanuensis to Lead, her group, known as the Philadelphians, became more public and hence more controversial, abandoning the seclusion that Pordage’s circle had enjoyed. At the turn of the 17th century, the Philadelphians even attempted a rapprochement

with the Continental theosophers, but this effort came to nothing.

Lead's health had been weak since 1700, when she already had premonitions of her impending death. Indeed, in 1702, she wrote "A Living Funeral Testimony"; and although by the spring of 1704 she felt somewhat better, she was stricken again by fever and severe pain, and this continued until her death in the same year. Her painful and protracted death was taken as a sign by Gichtel and others that some of her doctrines were false, and she was suffering because of them – but however one interprets such difficulties, it seems that she endured her trial with a patient, graceful, and illuminated countenance.

Lead's funeral oration was given by Richard Roach, who later – after receiving a vision of her appearing from Heaven like a globe of light – assumed leadership of the Philadelphian society itself. But under Roach's leadership, the society took on a distinctly more private aspect. The society returned to essentially what it had been under Pordage: a small circle meeting at Baldwin Gardens, where the Philadelphians had met in 1697 before going public.

The late 1690s were the period of greatest activity for the Philadelphian society, since not only did the society publish its monthly periodical *Theosophical Transactions*, but Lead and Lee published many of Lead's most important works as well. Lead's writings are visionary and prophetic, with a millennialist inclination. Nearly all of her work consists in accounts of visionary experiences; in this respect, she was much more explicit than → Boehme or even Pordage. While Boehme exhorts his readers in *Christosophia* to "woo" Sophia, Lead outlines her visionary encounters with Sophia in such works as *The Laws of Paradise*. She strongly believed that she was the prophetic vehicle chosen to reveal a new spiritual era for humanity, and saw herself as a prophet through whom God spoke, chiefly through visions.

Gichtel was skeptical of Lead's visionary emphasis, and eventually rejected her adherence to universal restoration, or apocatastasis, for which she is perhaps best known. Among the Church Fathers, Origen upheld this doctrine very early in the Christian era, and such noted Christian writers as → Johannes Scottus Eriugena in the 9th century A.D. also concluded that universal restoration – the doctrine that ultimately all creatures created by God are destined for spiritual restoration and salvation – was only reasonable. Initially, Lead did not countenance the doctrine of universal restoration: in her *A Revelation of the Everlasting Gospel Message*

she wrote that 'albeit I had heard of such a Notion, I did altogether disregard it; and would not entertain any belief concerning such a latitude as this, that should extend so far, as to recover the whole lapsed Creation, till I had an apparent Vision opened unto me'. While admitting that Boehme's work did not directly refer to apocatastasis or universal restoration, she eventually came to hold that her own revelation represented a gift of grace special to her own era and that such an exceptional revelation was not yet to be revealed through Boehme himself. It was to be kept for a later generation – her own. In fact, Lead's doctrine of apocatastasis seems to derive from a very powerful illumination, and an overwhelming sense of divine compassion. It seems that her experience of light at that occasion was so strong that there was no longer any place in it for evil or demons. In *The Enochian Walks with God* (1694) she writes of how wonderful is the 'Everlasting-Age that shall swallow up all those ages wherein sin and death have reigned, with all those miserable effects that have been ever since the creation of this world'. She also writes prophetically in words attributed to God Himself: 'I will make all things new, the End shall return to its original-primary-being, let none grudge that the grace of God of this latitude is, as to make a complete restoration; for as there was neither sin, nor centre to it, so it must be again, when the hour of God's judgment shall come'. The doctrine of *apocatastasis* assumes a precise equivalence between the prior harmony and unity in God before creation, and the restoration *after* time of the fundamental harmony that the Fall of man rent asunder.

In brief, then, Lead is an important theosophic figure. Her work does not have the scope or encyclopedic nature of Pordage's, but she left behind a substantial legacy not only by having been instrumental in the development of the Philadelphian Society, but also by having published many visionary theosophic treatises and having introduced the doctrine of universal restoration. While not influential on subsequent mainstream religious or literary figures, Lead's work was rediscovered by a handful of evangelical Christians in the Southern United States during the late 20th century and republished in pamphlet form during this period as prophetic works. Major discussions of her work are found in Gibbons (1996), Hutin (1960), Thune (1948), and Versluis (1999).

ARTHUR VERSLUIS

Leadbeater, Charles Webster,

* 16.2.1854 Stockport (England),

† 1.3.1934 Perth (Australia)

Prime ideologue of the → Theosophical Society following the death of → Helena Petrovna Blavatsky, and author of over 40 Theosophical books, many of which have remained in print. Second Presiding Bishop of the Liberal Catholic Church and 33° Co-Mason. Introduced adventist expectation into the Theosophical Society in the figure of Jiddu Krishnamurti (1895-1986), acknowledged by Leadbeater as the 'Vehicle for the Coming of the World-Teacher'.

Born in Stockport, England, Leadbeater was ordained to the Anglican priesthood before encountering Theosophy in 1883. He soon left his curacy and travelled to the Society's headquarters on the Adyar river near Madras, India. Soon thereafter, Leadbeater began to assert he was in contact with several of the same Theosophical Masters whose beneficence had originally been bestowed upon Blavatsky. Leadbeater claimed that his ardu-

ous apprenticeship under the Masters had resulted in a series of initiations which had opened his psychic faculties and proffered upon him supranormal insight. At this time Leadbeater also began to engineer for himself a rather fanciful history, and encouraged the belief that he had been born in 1847 – the same year as → Annie Besant, the second President of the Theosophical Society and his life-long supporter.

Leadbeater's clairvoyantly-generated revelations extended the synoptic template of Blavatskian Theosophy by removing its reliance on textual hermeneutics. As a consequence Leadbeater felt capable of applying his "astral perception" to previously non-Theosophical domains, a task sanctioned by his close professional partnership with Besant. Together, Leadbeater and Besant traced the past lives of Society members, mapped the rise and fall of continents, explored the geography of space, and investigated the atomic and sub-atomic worlds – all by means of applied clairvoyance. For Leadbeater, clairvoyance did not supplant the deductions of empirical science, but perfected them, for the psychic adept had planes of perception available to him beyond the ken of the mundane scientist.

Leadbeater's rise to prominence within the Society during the late 1890s led to the departure of several disaffected members who resented the changes made to the Blavatskian ethos. This problem was compounded in 1906 when Leadbeater was accused by several Society members of having encouraged their boys in habits of sexual "self-abuse". Leadbeater admitted the truth of the allegations, even suggesting he may have provided "indicative action", but argued the practice was permissible on occult grounds. Such allegations were to be brought against Leadbeater for much of the remainder of his career.

From 1909 Leadbeater began to assert that a young Brahmin boy from the Adyar estate, Jiddu Krishnamurti, was to be the physical "Vehicle" for the World-Teacher, a highly-evolved entity otherwise known as the Bodhisattva Maitreya or Christ. The World-Teacher, whose province in the Great White Brotherhood (of Masters) was "Minister of Education and Religion", was to return to Earth in order to inculcate a new age of spiritualized theurgy. The era of the Seventh Ray to be ushered in by the World-Teacher would see the replacement of outmoded piety with an energized occultism, capable of bringing about a self-actualized evolutionism. Indeed, one of the first signs of the new era would be the emergence of a new racial type: the denizens of the "sixth sub-race".

To encourage this great evolutionary leap, Leadbeater incorporated three projects into his rather idiosyncratic Theosophical millenarianism. The first was Universal Co-Freemasonry which had been inaugurated in France in the 1890s. The English section, under Besant's governance, soon became an arm of the Theosophical Society with Leadbeater enshrined as its primary apologist and ritualist. Leadbeater averred that Co-Masonic initiations, under the provenance of "the Master the Count [de → Saint Germain]", were innately efficacious in conferring elevated evolutionary status, and would prepare the ground for the Coming. Leadbeater's second project, the Order of the Star in the East, was instigated in 1911 as a propagandistic tool for the dissemination of information relating to the imminent Coming, and boasted an international membership in the tens of thousands. The third project, the Liberal Catholic Church (henceforth LCC), allowed Leadbeater to combine adventism with his passions for clairvoyance and Christian ceremonial. A fellow Theosophist, James Ingall Wedgwood (1883-1951), had in 1913 secured priestly ordination from an *episcopus vagans*, Arnold Harris Mathew (1852-1919), whose episcopal orders derived from the Utrecht Union of Old Catholics. After a break with Mathew, Wedgwood and other Theosophists inaugurated their own Church, the LCC, premised on thoroughly Theosophical principles. Leadbeater, following his LCC episcopal consecration in 1916, wrote extensively for the new body. According to him, the Lord Maitreya or World-Teacher (not to be confused with the Master Jesus who was another figure altogether) had particular oversight of the LCC, and employed the power it generated through sacramental rites to assist in the inauguration of the "New Age" which would finally dawn with his overshadowing of the young Krishnamurti.

Leadbeater's preparations for the Coming were compromised when, in 1929, Krishnamurti closed down the Order of the Star in the East and disavowed his quasi-messianic rôle, leading to a mass attrition in membership of the Society. Nevertheless, Leadbeater continued resolutely in his occult training of Theosophical youth (particularly at The Manor in Sydney, Australia) and in inaugurating new theurgic enterprises. He promoted the existence of a previously unknown member of the Theosophical Masters hierarchy, the World Mother, and installed a quasi-priesthood in her service: "the Seven Virgins of Java". His last endeavour, the Egyptian Rite of the Ancient Mysteries, was the logical culmination of his Theosophical career as it promised guaranteed entry – *via* initiation –

into the Great White Brotherhood itself. Leadbeater died in Perth, Australia, on 1 March 1934.

Leadbeater's influence on 20th century occultism has been immense. Aside from popularizing such notions as the aura and the chakras, his abiding contribution has been to sanction the occultist belief that the meta-empirical domain is governed entirely by physical laws. Thus, according to Leadbeater's clairvoyant vision, the dynamics of divine power are only comprehensible in terms germane to physics and engineering: the Christian eucharistic service, for instance, is nothing other than 'the construction and utilization of a magnificent machine for the liberation of force' (*Science*, 16). So, too, the Coming could be humanly engineered through the rites of various theurgic enterprises, each designed to assist in potentiating the elevation of Krishnamurti to the status of World-Teacher. Leadbeater's rationalistic exegesis of theurgy is thus a prime example of occultism's reassessment of esotericism in the light of modern scientific and secular paradigms.

BRENDAN FRENCH

Leene, Jan → Rijckenborgh, Jan van

Le Fèvre de La Boderie, Guy, * 9.8.1541 Falaise, † 10.6.1598 Falaise

Le Fèvre received his education in Caen, then in Paris, where he learned Hebrew, Arabic and Syriac. He became a disciple of → Guillaume Postel and a familiar of the duke of Alençon, brother of Henri III. His first important work was a Latin version of

the Syriac New Testament, made in 1560 (Antwerp: Plantin 1571). In view of the interest that this work had raised, in 1568 Le Fèvre was invited by Arius Montanus to assist in the production of the Antwerp Polyglot. He went to Antwerp with his brother Nicolas who was also an Orientalist. Into his famous *Biblia Polyglotta*, he inserted a *Dictionarium syro-chaldaicum*. In 1571, he published *L'Encyclye des secrets de l'Eternité*: a long poem of Roman Catholic apologetics, with references to → Neoplatonism and Christian kabbalah [→ Jewish Influences III]. In 1572 he returned to France where he was appointed as secretary and interpreter in the service of the Duke of Alençon. This position brought him into contact with men like Baïf, Dorat, Ronsard, Vauquelin de La Fresnaye, etc.

Between 1578 and 1582 new translations followed: of three treatises by → Ficino (*De la Religion chrestienne*, *Discours de l'honneste amour*, *Trois livres de la vie*), of two by → Giovanni Pico della Mirandola (*De la dignité de l'homme*, *Commentaire sur la chanson d'amour de Jérôme Benivieni*), of one by Cicero (*De la nature des dieux*) and of one by → Francesco Giorgi da Veneto (*L'Harmonie du monde*). This latter translation was instrumental in spreading Giorgi's book (originally published in Latin as *De Harmonia Mundi*, 1525), one of the most important ones in Renaissance esotericism. In the same volume is also the translation, made by Le Fèvre's brother Nicolas, of Pico's *Heptaplus*. In 1578, Le Fèvre published several *Hymnes ecclésiastiques* and *La Galliade*, a long poem (8384 alexandrine lines) divided in five "cercles". It is more than likely that Le Fèvre was a member of the Family of Love. He spent the last fifteen years of his life in Falaise, busying himself with new publications of his works.

In *L'Encyclye* and *La Galliade*, his main personal poems, Le Fèvre devoted himself mainly to a project of Christian apologetics which draws its arguments not only from the theologians (→ Pseudo-Dionysius the Areopagite, → Augustine, Eusebius of Cesarea, Lactantius) and the neoplatonic current [→ Neoplatonism] (already made famous by Ficino and Pico), but also from the *prisca theologia* [→ Tradition], which he understood as a corpus comprised of writings by → Clement of Alexandria, Eusebius of Cesarea (esp. texts attributed to Pythagoras, Orpheus, → Zoroaster and Plato) and from the kabbalah. In addition to the works of commentators – such as Bahya ben Asher (end of 13th cent.) concerning the Jews, → Pietro Galatino (c. 1460-1540), → Johannes Reuchlin (1455-1522) and Paul Rici († 1541) concerning the Christians – Le Fèvre owned a Latin

translation of the *Zohar* and read this treatise in the first edition issued in Mantua in 1558. In *La Galliade*, he develops a political vision based on a mystical conception of history. This epic poem is a kind of spiritual history of the French nation. Le Fèvre claims that the Nordic bards of ancient Gaul, under their King Bardus, were the fountainhead of all arts and philosophy, and especially of the knowledge of cosmic harmony. Much later, that tradition was supposedly passed on to Orpheus and Plato. Placing himself in the tradition of Annius of Viterbo (ca. 1432-1502), Le Fèvre's purpose was to reveal God's plans concerning the Gallic people, elected to be the pinnacle of the human adventure and eventually to return to the East, the origin of the *translatio imperii et studii* (passed on, after the Hebrews, by the way of the Egyptians, the Greeks, the Romans and the Italians). Le Fèvre compared himself to David and Orpheus, and considered himself a poet as well as a priest. His political, apologetical and theological concepts are based upon a poetic theology with mystical ambitions.

FRANÇOIS ROUDAUT

Lefèvre d'Étapes, Jacques (Jacobus Faber Stapulensis), * ca. 1455 Étapes, † 1536 Nérac

French theologian and humanist. Having completed his studies in Paris, he lectured in philosophy there. He visited Italy three times: in 1491-1492 (during which trip he met with → Ficino and → Pico della Mirandola), in 1499-1500, and in 1507. From 1507 on, Lefèvre was in the service of his maecenas Guillaume Briçonnet Junior. Because of religious repression by the Faculty of Theology of the Sorbonne, he spent some years in Meaux (1521-1526), where his maecenas had become Bishop ("Cercle de Meaux"). From 1526-1530, he was in the service of François I in Paris, and from 1530 on, he served Margaret of Navarra at Nérac.

Lefèvre's first published works of the 1490s

already display the two major currents underlying his work: as a Christian-humanist, he was concerned with the Classics and with the Bible but, unlike Erasmus, he also showed great interest for the Hermetica and → mysticism. From 1492 a series of editions of existing Latin translations of Aristotle appeared, which he supplied with his own commentaries. Later he turned his interest to the Bible: his *Quincuplex Psalterium* (1509 and 1513) and *S. Pauli Epistolae* (1512 and 1515) contain, besides the traditional Latin versions, a new translation emended by Lefèvre, again with extensive commentaries. As a philologist, Lefèvre is a forerunner of Erasmus (the latter's edition of the New Testament came out in 1516); like the humanist from Rotterdam, he judged the word of God to be the basis of existence, although it appears from his commentaries that, unlike Erasmus, he read the Bible from a mystical perspective. Theology for him is not a *scientia* but a *sapientia*. Influenced by the *Devotio Moderna*, he showed himself an advocate of a reformation of religious life and of the dissemination of the Bible in the vernacular; but like Erasmus, this precursor of the Reformation did not break with Rome, not even after having been attacked by the Sorbonne because of his translations of parts of the Bible in Latin and in French, and because of his commentaries.

The Hermetic-mystical current in Lefèvre's work is strongly influenced by Ficino, Pico and → Nicholas of Cusa. He published the *Corpus Hermeticum* in Ficino's translation (1494 and 1505, sixth and ninth editions resp.), adding the *Asclepius* in the edition of 1505 together with a contemporary text (→ Lazzarelli's *Crater Hermetis*, in which Hermetic texts are interpreted in a Christian sense). In his own commentary, attributed to Ficino well into the 20th century, he added "lapsus Hermetis" ("an error of Hermes") in the margin next to the famous passage in the *Asclepius* about the animation of statues. → Augustine had already condemned this passage; and apparently, Lefèvre the humanist and admirer of Hermetic philosophy was here being censored by Lefèvre the Christian and follower of the *Devotio Moderna*. Furthermore, in his comments Lefèvre continually points to the parallels between the works of → Hermes Trismegistus and the Bible: he condones the *Corpus Hermeticum* and the *Asclepius*, renders Hermes acceptable to Christianity, and presents him as a pagan prophet of the Christian revelation – thus placing himself in the tradition (going back to the first centuries of the Christian Church) which considered the Hermetic writings to be part of the divine revelation. Lefèvre, who – like others inter-

ested in Hermetic philosophy – called Hermes 'the most ancient theologian', advocated a moderate, Christian variant of Hermetic philosophy.

The step towards mysticism was taken by means of editions of Latin translations of → Lull (1499, 1505 and 1516) and of → pseudo-Dionysius Areopagita (1498-1499 and 1515), to whom Ficino had drawn his attention. In the latter's works, to which he gave the title *Theologia vivificans* (life-giving theology) and whose authorship he did not doubt, he saw a source of early Christianity. Where Luther rejected Dionysius for 'thinking like a Platonist rather than a Christian', Lefèvre put these works, which he calls 'highly sacred' and 'highly divine', immediately after the Bible in importance. Furthermore, Lefèvre produced – sometimes in collaboration with his pupil Josse Clichthove – a series of Latin editions of medieval mystics, occasionally supplied with a commentary. Often these are *editiones principes*; among them one finds the works of Hugh and Richard of Saint-Victor (1506, 1510, 1517), Jean Mombaer (1510), Johannes Ruusbroec (1512) and three female mystics: → Hildegard of Bingen, Mechthild of Hackeborn and Elisabeth of Schönau (1513). Ruusbroec's *De ornatu spiritualium nuptiarum* (originally written in Dutch) was the first work by the Brussels mystic ever to be printed. In his "Introduction", Lefèvre defends Ruusbroec's work against the criticism of Jean Gerson, who rejected the idea of a mystical union between man and God. The edition of the *Opera omnia* of Nicolas of Cusa (1514) is in line with these proclivities; Lefèvre followed Cusa's idea that man is a human god (related to 'the human is a mortal god', in *Corpus Hermeticum* X). Also related to Cusa, whom he venerated, is Lefèvre's notion that unknowing (*ignorantia*) must be esteemed above knowing (*scientia*).

Lefèvre's lasting importance lies with his editions of texts and his accompanying commentaries and prefatory epistles. He did, however, write one hermetically coloured text: *De magia naturali*. This work, composed ca. 1493 (that is just after his first trip to Italy and under the obvious influence of both Ficino and Pico), contains as yet insufficiently studied speculations on → astrology, kabbalah [→ Jewish Influences], → alchemy and Pythagorean → number symbolism. However, Lefèvre never published this text, and his own personal interests soon veered away from natural → magic.

FRANS A. JANSSEN

Lévi, Éliphas (ps. of Alphonse Louis Constant), * 8.2.1810 Paris, † 31.5.1875 Paris

The founder, and one of the most influential authors, of French occultism. The son of an artisan of the Saint-Sulpice quarter of Paris, and having lost his father at an early age, Constant was admitted to the seminary on a scholarship, his mother hoping to give him access to a good social position through the Catholic Church. His education at Saint-Sulpice deeply affected him, notably the teaching of the Abbé Frère-Colonna (1776-1858), a specialist of → animal magnetism and author of a synthetic history of mankind based on a cyclical concept of time. After Constant had been ordained deacon, his ordination to the priesthood was deferred in 1836 because of a love affair with a cataphumen, Adèle Allenbach, which caused his

mother to die of chagrin. Despite a difficult interview with the Archbishop of Paris, Mgr. Affre (1793-1848), Constant did not definitively break with the ecclesiastic institution. The young deacon was employed first as a supervisor at the Collège de Juilly, then by the Bishop of Beauvais, who had him paint a fresco in a chapel, and finally as a preacher in the parishes around the Benedictine abbey of Solesmes.

During a retreat in 1839, Constant discovered the writings of Madame Guyon (1648-1717), which initiated him into feminine → mysticism. Returning to the capital, he developed a taste for salon journalism, writing reports on *Les belles femmes de Paris* (The beautiful women of Paris). At the same time he also began to attend circles of socialist revolutionaries, especially inspired by the ideas of Charles Fourier (1772-1837), and feminist militants. Among his relations of this period we may mention Alphonse Esquiros (1810-1874) and Flora Tristan (1803-1844, the grandmother of Gauguin), who saved him from despair after his personal crisis of 1836. This first, tumultuous period of his life concluded with the abandonment of a pregnant fiancée, followed by his marriage with a young girl, Noémie Cadiot (1832-1888; she would become a sculptress, then a writer under the name of Claude Vignon). Constant was, however, able to transform his weakness for the daughters of Eve into mystical flights of inspiration, paying exalted devotion to the Virgin Mary. In *Le rosier de mai ou la guirlande de Marie* (The rose-bush of May or Mary's garland), presented as a commentary on the Litanies of the Virgin, the sufferings of woman in soul and body are described to the point of eroticism: Mary, crowned with thorns and with pierced hands, is crucified like her son. But the linkages between Constant's life, his mystical aspirations, and his revolutionary hopes appeared most clearly in the partly autobiographical work *L'Assomption de la femme* (The assumption of woman). He claims here to have discovered at Solesmes, through reading *Spiridion* by George Sand (1804-1876) and texts of Madame Guyon, the mystical meaning of the sufferings of the people since the Terror and the revolutionary wars. His search for the meaning of history and his expectation of the Kingdom of God are blended in an ultimate revelation, concerning the advent of the Era of Woman: '... she comes to us all wounded and bleeding from the undeserved treatment she has endured for us; she appears as once did Christ . . . , and they say to us: "Behold the woman . . . ! Oh, poor victim of the world! Consummate your divine sacrifice, die on the cross! You will be resurrected in glory"'.

The figure of the Virgin Mary, as co-redemptrix by “assimilation” to the life of Christ and his sacrifice, played a central role in Constant’s mind; as mother of humanity, she herself was identified with the woman of the end of time. Constant’s *La Mère de Dieu* (The mother of God), three years later, takes up the same themes, with a vision of the dying Christ entrusting humanity, represented by St. John, to his mother. The words ‘Behold your son’ are interpreted as ‘sealing the prophecy’, being addressed to a St. John understood as an ‘initiate’ into the mysteries of the sacred heart of Jesus and the ‘most sacred heart of Mary’. Since then, it has taken eighteen centuries to “engender” humanity. Although mankind is not yet ‘initiated into the secrets of the mother’s love’ – secrets which concern the coming of the Holy Spirit – we are now close to the time of the final revelation which will ‘consummate humanity in God’ (note that the dogma of the Immaculate Conception was promulgated in 1854). In this regard, Constant was a representative of popular Romantic and post-Romantic culture, fed by an apocryphal literature that modeled Mary’s life after that of Jesus.

The first phase of Constant’s life and career concluded with *L’Evangile du peuple* (The gospel of the people, 1840) and *La Bible de la liberté* (The bible of liberty, 1841). The latter book earned him a prison sentence, in company with Esquiros and a famous priest, Félicité de Lamennais (1782-1854). It is probably around this period that he developed an interest for esoteric authors of the past, such as → Swedenborg, → Postel, and → Agrippa. Shortly before the Revolution of 1848 he published the notes of his friend Flora Tristan, which he had collected: *L’émancipation de la femme ou le testament de la paria* (The emancipation of woman, or the pariah’s testament, 1846). Finally, the Abbé Migne (1800-1875) took him on as a collaborator for the *Dictionnaire de littérature chrétienne* (Dictionary of Christian literature, 1851: vol. 7 of Migne’s gigantic *Nouvelle encyclopédie théologique* [New theological encyclopedia]).

Constant was active in the revolutionary clubs of the period, and together with Esquiros published a revolutionary journal, *Le Montagne de la fraternité* (The mountain of brotherhood). But he was discouraged by the electoral defeat of April 1848 and by the failure of the European revolutions shortly after. Compounded by trouble in his private life, with the departure of Noémie, this precipitated his transformation into a magus and founding father of “occultism” [→ occult / occultism]. In this process an important role was also played by his acquaintance with the Polish scientist and poly-

math → Hoëne Wronski, who thought he had discovered a universal key for the understanding of all physical and metaphysical mysteries. The expectation of an impending apocalypse was eventually replaced in Constant’s work by the proclamation of a gnosis based on ‘the harmony of the world’, but nonetheless explained within a historical framework. Thinking in terms of the parallel functions of the Assumption and the Ascension, Constant now proclaimed the birth of a new consciousness, fashioned by a new knowledge. Occultism, for him, provided the key to the hidden meaning of the Scriptures at a time when the sciences seemed to be stuck in the impasse of materialism.

From this point on he ceased signing as “Abbé Constant” and began to publish, under the name of Eliphas Lévi Zahed (supposedly the translation of his name into Hebrew), his *Dogme et rituel de la haute magie* (Dogma and ritual of high magic, 1856). Claiming the status of a positive science, Lévi’s occultism presented itself as the vast spectacle of a hidden universal history, unfolding in parallel to the history described by the new historical criticism. It was based on the theory of the occult sciences expounded by the learned archivist Ferdinand Denis (1798-1890) between 1830 and 1840. These sciences were supposedly subject to the same criteria of rationality that applied to mainstream science, but had been covered by a veil of symbolism or allegory because, having been discovered too early in history, they had not been understood by the majority and had thus experienced opposition, if not downright persecution. They had been transmitted under the veil of → secrecy, initiation being required for gaining access to this exclusive magical knowledge which contained the synthesis of past human knowledge in the form of disciplines as different as the → Tarot, → alchemy, and the Kabbalah. The Enlightenment, in Lévi’s view, had made the mistake of placing its faith in reason alone while ignoring these fruits of ancient experience.

The new magus became a Freemason, even though in *Le catéchisme de la paix* (The catechism of peace, posthumous edition 1896) he had expressed reservations about → Freemasonry and had described it as a society in decay that merely ‘claimed to have mysteries’. The domain of individual inner experience, however, always seems to have remained more important to him than allegiance to external organizations. A crucial experience took place during an “initiatic voyage” to London, in July 1854. Lévi, invited by a friend of → Edward Bulwer-Lytton, reports to have evoked the shade of Apollonius of Tyana through the power of

the “pantagramme” (see his *Dogme et rituel*, chapter on “Necromancy”). If one credits the statements of → Arthur E. Waite, based on memories confided to him by Madame Gebhardt, a German occultist who had been looking after Lévi during his last years, this evocation was in fact only one of many that were practiced by him during his later life. According to this testimony, Lévi had always been the beneficiary of visions, another example of which may be the apparition of a mysterious monk during his retreat at Solesmes.

Lévi’s understanding of Kabbalah is based on speculations on the Tetragram, the name of Mary in Hebrew, and the relation of the number two to unity. But his sources were always second-hand; his knowledge of Hebrew was limited to a few rudiments (he even confused the letters of the alphabet); and most of his proofs rested on the mere accumulation of witnesses, just as in the Catholic traditionalism of the Romantic era. This is also the approach characteristic of his *L’Histoire de la magie* (History of magic, 1860). Even his speculations on numbers, which might seem particularly suited for rational expression, took the shape in *La clef des grands mystères* (Key to the great mysteries, 1861) of a ‘prophetic theology of numbers’ [→ Number Symbolism]. His eschatological and progressivist vision finally deferred the proclamation of the new era, after the fashion of → Joseph de Maistre, and applied Joachim da Fiore’s (ca. 1132-ca. 1202) exegeses on the Second Coming to the 19th century. The important role accorded by him to the “femme-peuple” (woman-people, associated with the Holy Spirit or with a fourth person of the Trinity), in view of the coming reign of the “celestial dove”, enjoyed considerable success in the wake of the Marian devotion then dominating Catholic religious sentiments and the reaction against bourgeois and masculine society that had already inspired the Saint-Simonians in the 1830s. Lévi’s influence on the spiritualist feminism of the last quarter of the 19th century is noteworthy, and he was considered a master by the occultists of the fin de siècle, both in France and in England, where → Waite, his main English translator, spread his influence widely. He was also a respected name in masonic circles, notably in the United States through the intermediary of Albert Pike (1809-1891), who plagiarized him. Finally, it must be noted that his influence went well beyond the restricted circles of occultism and fin-de-siècle spiritualism, and reached, perhaps in a more discreet way, literary figures as famous and respected as Victor Hugo (1802-1885) and Charles Baudelaire (1821-1867). More generally, the French symbolist

movement found in Lévi’s writings a treasure trove of images and poetic inspiration. Lévi’s works have been regularly reprinted to the present day.

JEAN-PIERRE LAURANT

Lewis, Harvey Spencer, * 25.II.1883
 Frenchtown (New Jersey), † 2.8.1939,
 San Jose (California)

Of both Welsh and German descent, Lewis was raised in Protestantism. Gifted with a fertile imagination and motivated by a boundless ambition, he devoted most of his life to promoting various Rosicrucian societies [→ Rosicrucianism].

Having accompanied his father in 1909 on a business trip to France, he devised a first legend. Perhaps influenced by the “Society of the Tower” in Goethe’s novel *Wilhelm Meisters Lehrjahre* (Wilhelm Meister’s Apprenticeship), but more probably in reference to the Tower of Olympus in the *Chemical Wedding of Christian Rosenkreutz*, he imagined a meeting with a venerable hierophant living in an old dungeon in Toulouse. This hierophant had initiated him into the Ordo Rosae Crucis, had him participate in an *Illuminati* meeting and put him in charge of spreading the Rosy Cross in America. This Order, which according to Lewis was ‘the most powerful organization in the world’, had allegedly counted kings of France and emperors of Germany among its members, and several kings of England had been its Grand Masters. The jurisdiction of Aquitaine had been created by Charlemagne, and → Martinès de Pasqually has supposedly been part of it in the 18th century.

Another version has Lewis benefit from numerous reincarnations that would explain his great esoteric knowledge, and claims that, under the cover of a psychoanalytic practice in New York, he had reassembled the members of a Society of Rosicrucian Studies, some of whom had been initiated in France between 1900 and 1909. In 1905, Lewis had supposedly been named Supreme Dignitary of the Ordo Rosae Crucis.

In fact, a Rosicrucian society did not appear in America until 1915, and it included only very few people. It was at this time, according to Lewis, that the denomination Ancient and Mystical Ordo Rosae Crucis (AMORC) had been chosen. In May 1915, this first active Rosicrucian lodge met in New York. During the sessions, Lewis is said to have revealed unprecedented knowledge in physics,

chemistry, psychology, biology, and so on. Moreover, to increase his prestige, he affirmed that The Grand Council of the Ordre Rose Croix of France had named him supreme dignitary of the Order for North America. The document that he produced to this effect, strangely entitled *Pronunziamento*, was soon followed by other texts. These stated that the Order went back to pharaoh Tutmosis III, that is, to the 16th century BCE, and that in 1916 Memphis was the world center of AMORC, while another document dating from the same year had the supreme chief of the Order residing in Tibet.

In 1918, Lewis gave rise to questioning and doubt among the members of his organization when he issued gold bonds for the construction of a Rosicrucian temple in New York. Lewis was put under examination for misappropriation of funds, but charges against him were soon dropped due to lack of evidence, and the legend continued to follow its course. He was presented as the one chosen to reveal that Christian Rosenkreutz’s coffin had been transported, at the end of the 17th century, to the Pacific coast of the United States, to a secret location, known to Lewis, who had supposedly discovered the intact body of the founder of the Society.

Lewis then set himself up in San Francisco where, through the subsidies of a rich executive and the support of an Episcopalian pastor, he organized the Pristine Church of Rosicruciae of which he made himself bishop, and where he ordained priests, organized a Rosicrucian liturgy, and set up a university as well as a radio transmitter. As for AMORC, Lewis had himself proclaimed its Emperor for North America, and he mentioned the existence of foreign branches in Egypt, India, France, and Germany. Influenced by the → Hermetic Order of the Golden Dawn, to which → A.E. Waite seems to have given a strong impetus, Lewis was also very interested in the Societas Rosicruciana In Anglia (S.R.I.A.) founded in 1866 and reserved for Master Masons. This European brotherhood incited Sylvester Gould to constitute in 1908 a Societas Rosicruciana In America, and at his death in 1909, Lewis instituted himself as his spiritual heir. He also called himself “Illustrious Knight (Templar) of the Order of Kadosch, and Companion of the Holy Grail”. This title corresponded to the VI° grade of the → Ordo Templi Orientis (O.T.O.), which appeared in 1912, its Grand Masters being → Aleister Crowley in England and Theodor Reuss in Germany. Always in search of new titles, Lewis had himself admitted in 1920 to The Great White Brotherhood Lodge of Buddhist and Tibetan inspiration. Having proclaimed himself “Emperor Rex

of the AMORC throughout the World”, he established the seat of his association in San Jose, California.

Toward 1930, Lewis felt a desire to return to sources in Germany, where the Rosicrucian myth had appeared toward 1610. Once again, he displayed his fertile imagination in composing a new *Fama Fraternitatis* and writing: ‘The C.R.C. of Germany, that was so famous in the 17th century, was one of the descendants of the first C.R.C. and . . . our Emperor in America has . . . received a direct transfusion of his blood’. In 1934, Lewis participated in the creation, in Brussels, of the *Federatio Universalis Dirigens Ordines Societasque Initiationis (FUDOSI)* that gave new momentum to AMORC in America. Lewis had research laboratories built in San Jose in the Rosicrucian Park of California, thus tending to materialize an ideal city aligned with the utopian ideas of → Francis Bacon’s New Atlantis. After a tour through Egypt and various European countries, Harvey Spencer Lewis died in 1939 in his vast Californian foundation.

ROLAND EDIGHOFFER

List, Guido Karl Anton (von),

* 5.10.1848 Vienna, † 17.5.1919 Berlin

Journalist, novelist, dramatist and folklorist with emphasis on Germanic mythology, religion and prehistory. List was associated with the Austrian Pan-German movement and *völkisch* nationalism at Vienna from 1890. In 1878 he married Helene Förster-Peters († 1890), and in 1899 Anna Wittek. While temporarily blind in 1902, List had an illumination concerning the secret meaning of the runes, which led him to assimilate esoteric ideas from 1903 on. List was the first writer to combine German nationalism with Theosophy [→ Theosophical Society], → Freemasonry and occultism [→ occult / occultism] in his studies of ancient

Aryan religion. In 1908 he founded the List Society in Vienna, supported by many prominent German nationalists and Theosophists, to sponsor his Ario-Germanic researches into the priesthood of the ancient Germans and its secret heritage. In 1911 he founded the Hoher Armanen-Orden (HAO), a modern revival of the ancient Armanist priesthood. Between 1908 and 1914 appeared a major series of Ario-Germanic research publications. List exerted influence on the secret, quasi-masonic nationalist Germanenorden (founded 1912), a forerunner of the National Socialist (Nazi) Party. He was a major inspiration for studies of occult nationalist heritage among followers of → Ariosophy. Weakened by wartime shortages, List died in Berlin while traveling to recuperate on an estate in North Germany.

The son of a Vienna leather-goods dealer, List early developed a love of nature and the Austrian countryside. From 1877 List devoted himself to freelance journalism, writing articles for German nationalist newspapers on localities and landscape coloured by a pagan interpretation of place-names, folklore and legends, later anthologised in his book *Deutsch-mythologische Landschaftsbilder* (1891). List achieved modest acclaim as a nationalist author with his two-volume historical novel *Carnuntum* (1888). The novel takes as its background the attack of the local Germanic tribes of the Quadi and Marcomanni against the Roman legionary town of Carnuntum near Vienna in 375, regarded by List as the prelude to the sack of Rome. This nationalist mythology recommended List to the Austrian Pan-German movement of Ritter Georg von Schönerer (1842-1921), which was agitated by the Slav challenge to German dominance in the multi-national Austrian state. During the 1890s List wrote two further historical novels and hundreds of articles on Germanic folklore and tradition for *Ostdeutsche Rundschau*, a leading Pan-German journal. He became a literary celebrity in this milieu with plays and epics devoted to ancient German mythology, performed at festivals of various Pan-German and *völkisch* organizations.

List’s interest in Germanic prehistory focused especially on the religious culture and spirituality of ancient Germany. Following his discovery of the secret meaning of the runes during an eleven-month period of blindness (cataracts) in 1902, List’s writings increasingly embraced the esoteric tradition. He assimilated the ideas of → Helena Petrovna Blavatsky’s Theosophical Society, meanwhile established in Germany and Austria, to reconstruct the esoteric doctrine of his ancient Germanic priesthood. *Das Geheimnis der Runen* (1908) interpreted the runes in the light of a religion of

self-knowledge, magical powers, racial purity, the immortality of the soul and → reincarnation. The Wotanist priesthood, about which he had lectured as early as 1892, was transformed into an exalted gnostic elite of initiates called the *Armanenschaft*. *Die Rita der Ario-Germanen* (1908) and *Die Bilderschrift der Ario-Germanen* (1910) recapitulated substantial parts of an emanationist cosmogony according to Theosophy, including the unmanifest and manifest deities, the three Logoi and ensuing “rounds” of fire, air, water and earth, with the Ario-Germans representing the fifth and current dominant race in the present “round”. List identified the runes, swastika and other glyphs as ancient Aryan symbols.

List also used the materials of the Western esoteric tradition in order to posit the existence of the *Armanenschaft* governing an ancient theocracy in the Germanic world and its occult survival up until the present. He claimed the lodge hierarchy and ritual of Freemasonry (List was a freemason for a time as a young man) was the model for initiation into the ancient guilds of the *Armanenschaft*. Once suppressed by Christianity, the ancient initiate gnosis had been passed on secretly through medieval guilds of skalds, heralds and masons, and officers of the Holy Vehm, a system of imperial courts. These cryptic survivals explained why Armanist gnosis could be deciphered in Minnesang poetry, coats-of-arms, Gothic architecture, and legal antiquities. List also found widespread evidence of the Armanist gnosis in prehistoric sites, place-names, local customs, legends and folk-tales throughout Austria. List recruited the Renaissance neoplatonists → Pico della Mirandola, → Giordano Bruno, → Johannes Trithemius, → Johannes Reuchlin and → Cornelius Agrippa von Nettesheim as heirs and transmitters of the secret Armanist tradition. He considered the Kabbalah [→ Jewish Influences] as an Armanist heritage, which the persecuted Germanic priests had entrusted to the Jews for safekeeping at the beginning of the Christian era. → Rosicrucianism, Freemasonry and its combination with Templarism [→ Neo-Templar Movement] were further adduced by List as Armanist survivals in the hostile Christian era.

In 1905 the wealthy industrialist Friedrich Wannick, his son Friedrich Oskar Wannick, → Jörg Lanz von Liebenfels and some fifty other individuals proposed the founding of a List Society at Vienna to sponsor the publication of List's researches on ancient Ario-Germanic culture and its occult survival. Members included Karl Lueger, the anti-Semitic mayor of Vienna, numerous representatives of German nationalist organizations in the

German Reich and Habsburg Austria, and leading German Theosophists, including → Franz Hartmann, Hugo Göring, Arthur Weber and General Blasius von Schemua. In 1911 List founded the Hoher Armanen-Orden (HAO) as a secret inner order of the List Society. Its structure was modelled on the ten-grade Kabbalistic Tree of Life used by Rosicrucian and quasi-masonic orders in the 18th and 19th centuries. Members of the List Society were instrumental in introducing List's ideas to the Reichshammerbund and the Germanenorden, radical nationalist secret societies in the German Reich before 1914, whose influence ultimately carried through to the early National Socialist (Nazi) Party. List's ideas of a secret occult national heritage were taken up by other writers involved in Ariosophy during the 1920s and 1930s.

NICHOLAS GOODRICK-CLARKE

Llull, Ramon (Raymundus Lullus),

* ca. 1232/3 Palma de Mallorca,

† ca. 1316 Tunis or Palma

Only two or three years before Llull's birth, his father, a member of the urban patriciate of Barcelona, had come to Mallorca as part of the army with which James I of Aragon conquered the island from the Muslims. Llull thus grew up in a multicultural society, with a large Muslim popula-

tion (comprising perhaps a third of the entire population) and an important Jewish minority. At the age of thirty a repeated vision of the crucified Christ induced him to abandon his family and courtly life to dedicate himself to the propagation of the faith. This decision was followed by nine years of preparation, during which he studied languages – Latin and Arabic – and the basic university subjects of his day – theology, philosophy, law, and medicine. Almost all of this he seems to have done on his own; the exception being Arabic, which he learned with the help of a slave. At the end of this period he wrote two works: an adaptation of al-Ghazzali's logic, and the immense *Llibre de contemplació / Liber contemplationis magnus* (The Book of Contemplation). Then, in what is calculated as the year 1274, he had a divine illumination in which he was given 'the form and method' for writing a book 'against the errors of the unbelievers'. The illumination was therefore one of method, not of content, and it permitted him to organize the mass of material he had presented in the *Book of Contemplation* in a more formalized system which he called his Art. In a rush of fervor, he wrote the *Ars compendiosa inveniendi veritatem*, which embodied this system; and this was followed by several commentaries on it, along with applications to theology, philosophy, law and medicine, as well as his most successful apologetic work, the *Llibre del gentil e dels tres savis / Liber de gentili et tribus sapientibus* (The Book of the Gentile and the Three Wise Men). He also, during this first period, wrote a didactic novel, *Blaquerna*, which contains his most famous mystical work, the *Llibre d'amic e amat / Liber de amico et amato* (The Book of the Lover and the Beloved). In 1283 he wrote the *Ars demonstrativa*, a minor reformulation of his system aimed at greater order and clarity of presentation; and this work he likewise accompanied by commentaries and applications. Four years later he made his first trip outside the Kingdom of Mallorca, first to the Papal court in Rome, and then to Paris. But as a result of an unhappy teaching experience in the latter city, where the unusual nature of his Art seems to have caused serious problems, he reformed his system drastically in the *Ars inventiva veritatis* (1290). Establishing his base in Montpellier, in the ensuing years he journeyed to Rome (1292), Genoa and then Tunis (1293), Naples (1294, where he finished a new version of the Art, the *Tabula general / Tabula generalis*), Rome again (1295; where he wrote the *Desconhort* and the *Arbre de ciència / Arbor scientiae* [The Tree of Science]), Paris again (1297-1299; where he wrote the *Arbre de filosofia d'amor /*

Arbor philosophiae amoris [The Tree of the Philosophy of Love], as well as treatises on astronomy and geometry), Cyprus (1301-1302; where he wrote the *Rhetorica nova*), Bougie – in present-day Algeria – where he was stoned by angry crowds and imprisoned for six months (1306), and Pisa, after a shipwreck on the return journey (1307-1308, where he finished the crowning work of the Art, the *Ars generalis ultima*, along with its abbreviated version, the *Ars Brevis*). This was followed by his last stay in Paris (1309-1311), where he finally received official university approval of his Art, and dictated an account of his life, the *Vita coetania*. Next he went to the Council of Vienne (1311), where some of his projects for language schools for missionaries received ecclesiastical approval. At the age of approximately eighty, Llull returned to Mallorca (1311-1312), where he wrote a cycle of 182 sermons, then he went on to Sicily (1313-1314), where he unsuccessfully tried to interest Frederick III in his missionary projects, and finally to Tunis again (1314-1315). In December of this last year he wrote his last works, and he probably died at the beginning of 1316 in Tunis, on the voyage home, or in Palma upon returning. The idea that he was stoned to death is a pious legend propagated to help his canonization as a martyr. He is buried in the church of Saint Francis in Palma.

Llull's Art, on which his thought centers and to which he constantly refers his readers, is a generative system based on a small set of concepts acceptable to all three religions – one God who has a series of positive attributes (He is good, great, eternal, etc.), the three Augustinian powers of the soul (memory, intellect, and will), and the world picture inherited from Greek science (four elements, seven planets, etc.). He then sets out rules and methods for combining and comparing these concepts so as to be able to produce demonstrations (see below). The foundational concepts and relational methods of his Art were almost always presented with graphical methods in the form of wheels and charts. This unusual system permitted him to produce proofs of the Articles of the Faith, which he hoped might be capable of persuading Muslims and Jews without taking away the *meritum fidei* (a point which had to be taken into account, in order to avoid ecclesiastical censure). The inventive nature of his Art made it suitable to tackling all kinds of other topics as well, making it into "a science general to sciences", as Llull proclaims at the beginning of the *Ars generalis ultima*. This aspect of the Art permitted him to reformulate other sciences of his time – such as logic, metaphysics,

rhetoric, etc. – in terms of the system of the Art. By writing works with titles such as *Logica nova*, *Metaphysica nova*, *Rhetorica nova*, *Tractatus novus de astronomia*, *Liber de geometria nova*, and so on, he was proclaiming his intention of providing alternative methods in all these fields.

Llull's hope of disarming ecclesiastical – and especially Dominican – opposition proved over-optimistic. Sixty years after his death, in 1376, the Church censured his works; and in 1390 the Parisian Faculty of Theology prohibited the teaching of his doctrines. These condemnations as well as the fact that the Art was presented explicitly as an alternative system of knowledge, made Llull attractive to what nowadays would be called alternative intellectual movements. The very generality of the Art made it applicable to fields which its author had never envisaged, or even to some which he had condemned. For example, while Llull had rejected → alchemy, some of his followers argued that this had been only a device to throw his pursuers off the scent. Moreover due to the strange visual aspect of the Art, with its charts and wheels, it seems to have struck some as involving magical procedures [→ magic]. Such misperceptions of Llull's system are demonstrated, for example, by the fact that only three years after his death, in 1319, part of the testimony brought against the Franciscan spiritual Bernard Délicieux, in his trial for allegedly having attempted to poison the pope, was that in his possession was found a book of Llull's containing the *Tabula generalis* along with other equally suspicious works. In 1356 another Franciscan spiritual, John of Rupescissa [→ Jean de Roquetaillade], who was also an alchemist, inquired whether 'the bearded philosopher, as he is called in Paris, that is to say Ramon Llull of Mallorca, who, although he was a layman and almost unlettered, had arrived at the summit of philosophy' might not be the new Minerva whom the oracle had predicted would come to 'reveal his science and secrets confirmed by art'.

Very soon after this event of 1356, alchemical works written in Llull's name began to circulate. What started as a trickle, by the 16th century became a flood, with the number of pseudo-Lullian alchemical works (published mostly in German lands) far outweighing the number of genuine works. Moreover, in the late 15th century there appeared a pseudo-lullian work called *De auditu cabbalístico*, pretending to adapt the Art to the Kabbalah [→ Jewish Influences], in accord with → Pico della Mirandola's suggestions about the existence of similarities between that science and

the *ars Raymundi*. These various currents were brought together by the Strasbourg publisher, Lazarus Zetzner. He not only published, in 1598, an anthology of Llull's works, along with the *De auditu cabbalística*, together with commentaries by → Agrippa von Nettesheim and → Giordano Bruno, which was to have wide circulation (it was reprinted in 1609, 1617, and 1651), but he also published four pseudo-Lullian alchemical works in his famous *Theatrum chemicum*, and two others in a little anthology of 1616. As representative of this vision of our author, it is worth noting that → Isaac Newton's library contained eight volumes of Llull, one of the *Ars generalis ultima*, one of the Zetzner edition, and six of the spurious alchemical works.

Of Llull's approximately 265 works, the principal collected editions are, in Latin: *Raimundi Lulli Opera Latina* (Friedrich Stegmüller et al., eds.), Palma, 1959-1967, and Turnhout, 1978- (in course of publication; 29 vols. so far appeared) ♦ *Raimundus Lullus, Opera. Reprint of the Strasbourg 1651 edition* (2 vols.), Stuttgart, Bad Cannstatt: Frommann-Holzboog, 1996 ♦ In Catalan: *Obres de Ramon Lull* (Salvador Galmés, ed.; 21 vols.) Palma: Comissió Editora Lulliana, 1906-1950 ♦ *Nova edició de les obres de Ramon Lull*, Palma: Patronat Ramon Lull, 1991- (in course of publication; 6 vols. appeared so far) ♦ Translated anthologies: *Selected Works of Ramon Lull (1232-1316)* (Anthony Bonner, trans.; 2 vols.), Princeton: Princeton University Press, 1985 ♦ An abbreviated version of this anthology, with a new translation of the *Book of the Lover and the Beloved* by Eve Bonner, appeared as *Doctor Illuminatus: A Ramon Lull Reader*, Princeton: Princeton University Press, 1993 ♦ *Lulle, L'Arbre de Philosophie d'Amour, Le Livre de l'Ami et de l'Aimé, et Choix de textes philosophiques et mystiques* (Louis Sala-Molins, trans.), Paris: Aubier-Montaigne, 1967.

Lit.: For a general overview and bibliography of earlier studies, see Lola Badia & Anthony Bonner, *Vida, pensamiento y obra literaria*, Barcelona: Sirmio Quaderns Crema, 1993 ♦ To this should be added Wilhelm Schmidt-Biggemann, *Topica universalis: Eine Modellgeschichte humanistischer und barocker Wissenschaft*, Hamburg: Felix Meiner, 1983 ♦ Further information can be found in the journal *Estudios Lulianos*, Palma, 1957-1990, renamed *Studia Lulliana*, Palma, 1991- ♦ Important for an understanding of Llull's relation to the Kabbalah is Harvey J. Hames, *The Art of Conversion: Christianity and Kabbalah in the Thirteenth Century*, Leiden: Brill, 2000 ♦ For pseudo-Lullian alchemy, the fundamental work is Michela Pereira, *The Alchemical Corpus Attributed to Raymond Lull*, London: The Warburg Institute, 1989.

Lopukhin (also Lopuchin, or Lopushin), Ivan Vladimirovich, * 24.2.1756
Retjashi (Orel, Russia), † 22.6.1816
Retjashi

After a short military career in the Russian army, Lopukhin retired as early as 1782 with the rank of colonel. He was appointed at the Criminal Court of Moscow, becoming its President in 1785, and served in the military criminal courts under Katherine II, Paul I (who made him a State Secretary and Senator), and Alexander I. Socially and politically, he is remembered as a philanthropist – first, for his activities in creating and organizing institutions fostering education, such as schools for children, and second, for his efforts to mitigate the cruelties of Russian legislation. His behaviour after having been deputized in 1801 by the Imperial government to gather information concerning the Dukhobor religious sect (founded by the peasant Siluan Kolesnikov) is characteristic: he contributed to alleviating the sanctions the government had imposed on the members of this revival movement. After investigating their cruel persecution, he successfully petitioned Alexander I on their behalf, arranging for a place where they could settle apart from the Orthodox Russians.

Although interested in → Freemasonry from very early on, Lopukhin did not enter the Order until 1782, upon retiring from the army. More of a theoretician in theosophical and mystical speculations than a Brother really devoted to rituals, he was at first not keenly interested in practising higher grades. Beginning in 1784, however, he did begin to be interested in the latter, and from that time on he became a very active Mason. Two reasons can be adduced to account for his new attitude toward the initiatory practices. First, 1784 had been a critical year in European Freemasonry, and Lopukhin thought he might play a positive role in the movement's reorganisation. Second, the masonic Order of the Gold- und Rosenkruz (Gold and Rosy Cross, or G.R.C.), i.e. of the so-called Neorosicrucians [→ Rosicrucianism], whose philosophy he shared, was gaining a foothold in Russia, which had just been declared the VIIIth Province of the Obedience called Strict Observance. The main seat of the Strict Observance was Berlin. Lopukhin had hardly entered the G.R.C. when, by decision of the Grand Superiors of the latter, he became himself a kind of hidden, albeit most important, Superior or "Observer" of both his Russian and Berliner Brethren. Furthermore, Lopukhin was trusted enough to be appointed as director of the Russian G.R.C.

archives, a position that he kept nearly until his death. In addition, he created specific rituals. These were, for the most part, adaptations from the already very complex rituals within the degrees of the G.R.C. At the end of 1785, Katharina II decided to conduct inquiries on Freemasonry, particularly with respect to its degree of congruence with Orthodoxy. This resulted in a period of hardship for Russian Freemasons, but things took a turn for the better under the reign of Paul I, and even more so (after 1801) under the sovereignty of Alexander I, with whom Lopukhin was in close contact.

The importance of Neorosicrucianism in Lopukhin's activities and thought is to be understood within the broader context of his esoteric leanings, to which his personal life bears witness. For example, he bestowed the name "Jung Island" (after → Johann Heinrich Jung-Stilling's name) on the island in a pond near Moscow, on which he laid out a garden congenial to his tastes. Visitors could see a cross with Masonic symbols and other allegories reminiscent of those of → Jacob Boehme. Near the pond Lopukhin had erected two monuments, one in honor of → Karl von Eckartshausen, the other – more unexpectedly – dedicated to Jean-Jacques Rousseau. There was also an urn of marmor dedicated to Fénelon, adorned with portraits of Madame Guyon and Rousseau. On one wall of the garden one could read a Rosicrucian inscription. Such choices corresponded to Lopukhin's preference for esoteric philosophic speculation rather than practical → "magic". With regard to the latter, he was interested only in → alchemy, which he studied both theoretically and practically; a choice that was congruent with the general orientation of the European Neorosicrucians.

Closely linked to these interests and activities were his editorial ones. In 1783 he created a Lopuchin Free Press, designed to publish Masonic, alchemical, mystical and theosophical books, mostly in Russian. → N.I. Novikov had created a similar Press in 1779. In 1784, both companies gave birth to the Typographical Society, co-directed by Lopukhin along with Nicholas Novikov, A.M. Kutuzov, and I.P. Turgieneiv. In 1791 all three Presses were closed by an edict of Katharina II, but in the meantime they had published a great number of books. Lopukhin himself had edited works like J.A. Starck's *Apologie der Freimaurerei* (1784); Kutosov's Russian translation of a book on → Paracelsus (also 1784); a translation by P. Strachov of → Louis-Claude de Saint-Martin's *Des Erreurs et de la Vérité* (1785); and a translation of →

Khunrath's *Amphitheatrum* (1786). During just the years 1779-1784, the editorial output of Lopukhin, Novikov, and their close associates represents nearly 30% of all books published in Russia between 1779 and 1792.

Lopukhin was not only important as a translator and publisher who spread mystical and hermetic literature. He also wrote works of his own. A prevailing purpose runs through most of them, which consists in trying to link together the Church (mainly the Orthodox one), to Freemasonry, as well as the service due to Russia. Such a trait differentiates Lopukhin's Neorosicrucian circle from Western European Freemasonry, which was more cosmopolitan in character and not as prone to see in the history of mankind and of Freemasonry mere chapters of the history of the Church. In collaboration with Prince N. Repnin, he wrote a little book in French, *Les Fruits de la Grâce* (The fruits of grace; 1790), in which he equated the religious Freemasons with the true Christians. This was followed, in 1790 and 1800, by two writings of his in Russian, a *Moral Catechism for the True Freemasons* and *The Spiritual Knight or Seeker after the Truth*. From 1807 to 1816 he collaborated with *The Messenger of Zion*, founded in 1806 by his friend and Masonic Brother A.F. Labsin. This monthly journal in Russian dealt with a variety of Jewish, mystical, and theosophical themes. Lopukhin's book of memoirs (*Zapiskee*), first published in 1809, is not the least important work that he produced.

From 1783 to 1791 he worked at what was to become his most famous book. Titled *Some Characteristics of the Interior Church . . .* (in Russian, first ed. 1798), it went through several translations and new editions. Rather short (ca. 140 pages), this compendium is written in an attractive style, and easy to read. On the surface it seems to be no more than a collection of his Christian meditations, but actually it is more than that: the meditations are linked to a specific notion, the "interior Church", on the one hand, and to theosophical considerations, on the other. "Interior Church" is a notion and a term of which Lopukhin seems to have been the first proponent. Regarding this idea, Lopukhin drew part of his inspiration from a German Christian Neorosicrucian, → Christian August Haugwitz, who had never used the term but had claimed in his book *Hirten-Brief an die wahren und ächten Freimäurer alten Systems* (Leipzig, 1785) that 'the main purpose of Freemasonry is the very purpose of True Christianity'. Lopukhin often quoted Haugwitz in other works of his, and made *Hirten-*

Brief compulsory reading for the Russian and Berliner Neorosicrucians in his charge.

In Lopukhinian parlance, "interior Church" does not only designate the fact that basic commonalities invisibly unite all "true Christians" with one another, independently from any one Church in particular. Much more specifically, in *Some Characteristics* as in many of his other works, it means that Christian Freemasonry, understood as a theosophically oriented organization, is the genuine preserver of a tradition that the historical Christian Churches do not entirely possess. Among the traditional churches, Lopukhin gave priority to the Orthodox Church. But he also advocated the necessity of grafting Freemasonry (at least his theosophically oriented version of it) onto the Orthodox Church. The result of that transplant would be a very specific new Church, the "interior" one, which Lopukhin felt committed to bringing into existence. Such an endeavour is rather original not only in the history of Freemasonry, but also in the history of → Christian Theosophy, since for all their mystical leanings, the theosophers (Boehme, Saint-Martin, etc.) had never spoken of an "interior Church", nor proposed such a synthesis of Church, theosophy, and initiatory organization.

In *Some Characteristics*, Lopukhin is lavish in advice and specific prescriptions toward achieving one's own personal "regeneration". Although the idea of being born again is very common among Quietists, Pietists [→ Pietism], Protestant separatists, etc., the theme is interwoven here with many speculations of a theosophical kind. He claims to teach 'the knowledge that true Theosophy and the contemplation of Nature provide'. Regeneration of Man and Nature must go together. Man's duty is to discover the incarnated Word within creatures. Lopukhin deals, therefore, with such themes as the narrative of the Fall, the tripartition of Man (body, soul, spirit), and the relation between Sophia and the "material prima". Many of these reflections are visibly inspired by his readings of Johannes Arndt, Jacob Boehme, Karl von Eckartshausen, and Louis-Claude de Saint-Martin.

Lopukhin's book strongly influenced Eckartshausen's own most famous work *Die Wolke über dem Heiligthum* (The Cloud upon the Sanctuary, 1802). Eckartshausen, however, understands "interior Church" in a sense that is different from Lopukhin's perspective. For Eckartshausen, the expression means both the image of God present within Man and a true, eternally preserved Christianity that is never really at home within the visible Churches. For Lopukhin the interior Church is,

at bottom, the ideal of a Christian Freemasonry organized in a Church-like form. Nevertheless, when Eckartshausen read the first French edition of *Some Characteristics* (1801), he saw in it a ‘precious book full of the true wisdom’ and exchanged several letters with Lopukhin on this topic. Eckartshausen had decided to translate the book into German, but he died (1802) too early to carry out that task – which would soon after be undertaken and completed by the German J.L. Ewald. Almost at the same time the enthused Jung-Stilling, one of Lopukhin’s idols, decided to make German and Latin translations, which he probably never finished.

It would seem that the attempt of Lopukhin and his Neorosicrucian circle at synthesizing Freemasonry into a kind of ecclesial organization without breaking from official Orthodoxy had never been made before, and also that it was hardly continued after Lopukhin’s death. Neither did Lopukhin’s program of linking Freemasonry to religious practice contribute to alleviating the ever-growing conflict between European Freemasonry and Churches in 19th century Russia, let alone the rest of Europe. With regard to Lopukhin’s works in general, their influence outside Russia hardly went beyond translations of *Some Characteristics*, generally read without a proper understanding of that book’s specific context. But within Russia, the reception of his *oeuvre* has a history that continues through the whole of that century. It had a strong impact (Danilov 256-271) upon the Masonic writings of Alexei S. Chomiakov, the literary works of the Russian romantics W.A. Schukowsky and Alexander Pushkin, and the historical studies of N.M. Karamzin. Moreover, the notion of “interior Church” as a program conducted by the Russian Neorosicrucians in the Masonic circle around Lopukhin is one of the origins of the religious thought of modern Russians like the philosopher Vladimir Soloviev and of reformers like L.N. Tolstoi. But as early as the beginning of the 19th century and even more so later, the term “interior Church” took on several divergent meanings. Eventually it fell into oblivion.

For a more detailed bibliography of Lopukhin’s works, see Danilov 24-27, 282-283 ♦ Lopukhin in collaboration with Prince N. ANTOINE FAIVRE

Lorber, Jakob, * 22.7.1800 Kanischa,
† 24.8.1864 Graz

Musician and teacher. Received revelations through the “Inner Word”, which continue to attract readers today, and are translated into an increasing number of languages. They have become a model for other *Neuoffenbarungen* (new revelations) in the German-speaking world.

Lorber was born in a village of Lower Styria, not far from Maribor (today in Slovenia). At an early age he developed musical gifts and learned to play various instruments. He decided to study for becoming a school teacher, and for some time also considered training for the priesthood, while

continuing to cultivate his musical skills. In 1824, he moved to the city of Graz, where he would spend most of his life. After some time, he gave up his studies and found a position as a house teacher in a family. Lorber had the privilege of meeting the famous violinist Niccolò Paganini (1782-1840) during the latter's successful stay in Vienna in 1828, and even took a few violin lessons with him; throughout Lorber's life, Paganini would remain his musical ideal. In 1829 Lorber resumed his training for becoming a school teacher, and he received his diploma; but he gave up the prospect of a teaching career after his first application for a position was turned down in 1830. From then on, he devoted all his energies to music; among other things, he composed pieces in a decidedly Romantic style.

Lorber had read works by → Boehme, → Jung-Stilling and → Justinus Kerner, as well as some writings of → Swedenborg then available in German. He also used to read the Bible, but not on a daily basis. In addition, he had a strong interest for astronomy. On March 15, 1840, on the point of leaving for Trieste, where he had been offered a position at the opera, he had his initial spiritual experience. Early in the morning, while still lying in bed, he heard a voice close to his heart telling him: 'Get up, take your pen and write down!' He obeyed and undertook to write what was dictated to him. Those first pages eventually developed into a three volume work published under the title *Die Haushaltung Gottes* (The Household of God), which deals with the origins of mankind in a much more detailed way than the Biblical book of Genesis. Since then, Lorber continued to devote much time to writing down the revelations dictated to him. From 1844 to 1846, however, he joined his two brothers who had called him to assist them in their business in Carinthia; and in 1857 he spent a few months on a tour with two other musicians. Otherwise, in order to earn his livelihood, he continued to devote part of his time to teaching music.

Eight volumes of revelations received by Lorber were published during his lifetime. Two short works were first published by Kerner in 1851, after one of Lorber's friends had sent to him some of the musician's writings. In 1852, three books were published in Stuttgart, but *Die Jugend Jesu* (The Childhood of Jesus) was confiscated and destroyed. Nevertheless, Lorber's works (which he did not consider his own, but saw as dictations received from the Lord) did not attract much interest at this time. Lorber passed away in 1864, before he was able to finish *Das Große Evangelium Johannes*; the final (eleventh) volume would later

be dictated to Leopold Engel (1858-1931). Similar to Swedenborg, Lorber never broke with the Church in which he had been born, and he received the last sacraments from a Roman Catholic priest.

Catalogues of Lorber's works divide them into five main categories: (1) *Das Große Evangelium Johannes* claims to be a much more detailed explanation of Jesus' life and teachings, directly dictated by Christ himself; (2) *Die Haushaltung Gottes* offers a presentation, much more detailed than the first chapters of the Bible, of the origins of mankind up to the flood; (3) several works, like *Die Jugend Jesu* (supposedly the *Gospel of James*), the *Briefwechsel Jesu mit Abgarus Ukkama in Edessa* or *Paulus' Brief an die Gemeinde in Laodizea*, are allegedly the restitution through the Inner Word of original, subsequently lost writings of Primitive Christianity; (4) there are several works about the created universe, including revelations regarding the planets (not unlike Swedenborg's *Earths in the Universe*); (5) works about the hereafter, in which Lorber describes what happens to people after they have passed away (again not unlike Swedenborg, although the way Lorber claimed to have received the information is quite different: he does not report having personally explored the spiritual world).

According to these teachings, the material world is the result of Lucifer's fall and has emerged through a process of progressive densification. It is a school of purification for the lost spirits on their way of returning to God. Once this world had become mature enough to receive the highest revelation of God's love, God himself came as Jesus Christ. Lorber's revelations accept the doctrine of the Trinity, but not as three persons: the Father, the Son and the Holy Spirit are three aspects of God, all three united in Christ (again like Swedenborg). Jesus taught the fundamental law of love in order to allow human beings to evolve toward true children of God. Usually a human soul lives only one life on earth: after physical death, one's journey continues in the spheres of the hereafter, where the majority of the deceased are received into the great Middle Kingdom between Heaven and Hell. God does not condemn anybody: everybody judges him- or herself. There is no such thing as eternal damnation: everybody will return to God (*apocatastasis*). Millenarian beliefs are also present in Lorber's message.

Although Lorber's admirers claim that he had only superficial knowledge of Swedenborg's writings as well as of the writings of other authors already mentioned, one cannot help noticing similarities on several points. Therefore it is not surprising that today there is much contact between

Swedenborgian and Lorberian audiences in German-speaking countries. Lorber's readers never created a separate church, but there are Lorberian associations or study circles and – most important – a publishing house (“Lorber Verlag” in Bietigheim, Württemberg), which has been printing Lorber's volumes in German for many decades. A Lorber Society (“Lorber Gesellschaft” in Hausham, Upper Bavaria) is quite active in spreading teachings received by Lorber not only in German-speaking countries, but increasingly in other parts of the world as well. Lorber has become a prototype for a number of subsequent new revelations through the Inner Word.

Lorber's books mentioned in this entry as well as most of the other ones continue to be reprinted in German by Lorber Verlag, Bietigheim; several of the books are available in other languages as well (including English). – Several musical works of Lorber were recorded for the first time in 1990: *Kompositionen von Jakob Lorber*, CD K-CL 9001.

Macrohistory

1. INTRODUCTION 2. ANCIENT Gnostic MYTH-HISTORY 3. OTHER RELATED MYTH-HISTORIES OF LATE ANTIQUITY 4. MEDIAEVAL BACKGROUND TO MACROHISTORIES IN WESTERN ESOTERICISM

5. PATTERNS OF EARLY MODERN WESTERN ESOTERIC MACROHISTORY 6. FROM ROMANTICISM TO THE PRESENT 7. CONCLUDING REMARKS

1. INTRODUCTION

Macrohistory is the representation of history as a whole, “in the mind's eye”. It comprises all general(ized) visions of human destiny, whether as great stages or a procession of cycles through time, as an overall progress or regress, or as an encasement of the known order between determinative primordial events and some extraordinary eschaton. Macrohistory encompasses but is not limited to metahistory (the past explained by such metaphysical principles as providence or nature) nor to ambitious historiographical projects (a Gibbon tracing Rome's long decline, for instance, or a Toynbee paralleling the contours of many civilizations). Macrohistory must also take in any broad prospectus of change that is decidedly imaginal, or highly speculative. Indeed, when any such envisagement of “the whole past” is palpably mythic in character one can refer to “myth-history”, or mythological [macro-]history, and when it is imbedded in a cosmology one may talk of a “cosmo-historical” picturing.

In → gnosticism and Western esotericism there lies a common concern to unlock the mystery of time, and present a truer account of humanity's purpose in the cosmos than the narrations of outward events in popularly approved history-writing. Together, gnostic and esoteric macrohistories present radically alternative reviews of the past, because they seek to locate and bring to attention overlooked (*prima facie* concealed) events and patterns, and disclose outworkings of truth across the ages not noticed in “establishment” or standard historiographical exercises. These unusual options allow imaginal, oneiric, mythic or “myth-like” features, bearing some comparison to the symbolic images of great transformations in apocalyptic literature (as well as more mainstream histories later affected by it). And if gnostics and Western esotericists did in their different ways appropriate convenient schemata of history (Creation to cosmic Resolution, for example, recurring Ages or catastrophic punctuations, and great figures as markers of periods), they worked with their own characteristic macro-vision nonetheless. They envisaged a descent of being from the divine into the material world, and then disclosed the process by which ascent back to the true Source could occur – in what may be called a cosmic looping or the fundamental U-curve of time. What happens to each

human, through the descent of spirits and/or souls into matter, reflects microcosmically what transpires in a total cosmic process (or all-embracing *mythos*). As shall be shown, too, it is very typical of Western esoteric histories that the past is read in terms of bearers of the same deep wisdom through the ages – the wisdom that teaches the un- and unfolding of the divine. These histories also often connect with theories of → correspondences in which all things originate in one and all things in turn flow and return to one.

Such envisagements of cosmic process and temporal Moments can be interpreted as reacting to unsatisfying yet more widely received *Weltanschauungen*. Because the comforts of enshrouding myth seemed threatened by new impetuses of historical thinking in Antiquity, and because further processes of de-mythicization and computed time occurred later on in the West (especially from early modern times), gnostic and esoteric reactions often appear to hark back to mythic foundations to resecure the satisfying effect of an awesome primordium that explains all time, or for the comforts of a “recurring sameness”. Hence distinct concentrations on the great preface to history that we find in “classic” → gnosticism or with such a key Western esoterist as → Jacob Boehme. Hence also interest in great stages of history or in lost (even supra-material) civilizations long preceding ours [e.g. → Steiner; Churchward; → Cayce]. Certainly gnosticizing and esoteric approaches to temporality resist ordinary chronicling, focus on mystical meanings to event sequences, and in modern times their protagonists despise naturalistic interpretations and cannot imagine the truth of history being so banal as to be what outwardly (or in the common-or-garden sense “actually”) happened. Such reactivity called for the different, virtually para[lllel]-histories of Western esoterics who wrote of inner relations and journeys of the soul that corresponded with the way the whole cosmos unraveled *ab profundis*. Theirs had to be an overall story, of a “golden” (even secret-associated) thread holding everything together, without deferring to stereotypical forms of documentation (such as biographies, or accounts of wars and other particular socio-economic changes).

2. ANCIENT GNOSTIC MYTH-HISTORY

In ancient gnosticisms, it is well known, historical facts were utterly subordinated to cosmologic ones. The key strategy of those disclosing *gnôsis* was to uncover the prefatorial cosmic events before

the aberration of our world occurred, so that the true knowers on earth could get back to the original Perfection after death. In this light some scholars hold that one purpose of the gnostics was to “deny history”, maintaining that wisdom was only found in the eternal, never the changeable. As a foil to this view, however, one should appreciate, if the Christian Gnostic codices of Nag Hammadi are a good indication, that the story of Christ as discloser of the divine mystery on earth had to be placed in the scheme of things.

During the first three centuries C.E. accounts of who the Christ was, and what he said and did, were increasingly received and interpreted by those who had not shared the Jewish historiographical inheritance. In late Hellenistic times, however, any engagement in history was not expected from participants in formal religious cults, or from initiates in the mysteries or schools of wisdom. Myths were carefully relayed, and the correct sequencing of rites made known, yet the “truth” was so projected as eternal, that history – a matter for elite specialization – was almost always foreign to it. Outside Judaism, indeed, efforts at developing a sense of historical time-depth were not integral to public knowledge. In this light, then, early Christian missionaries have been said to be the “evangelists of history”, because they purveyed the history of Israel to put the coming of the Messiah into context. This new pressure for historicity, however, seeped in unevenly across various cultures. In the case of the ancient Gnostic Christians (of non-Jewish quarters in Egypt and the Eastern Mediterranean), the ancient Hebrew past was lacking in immediate connection to the new salvific message. It is arguable that this disjunction arose because the Old Testament Jehovah, already foreign among Gentiles, was imaged by the Gnostics as an alien deity, responsible for an undesirable material creation. On the other hand, approaches to history in ancient gnostic sources may be read as “unacculturated”, by writers not seeing the point of a factual “baggage” unrelated to their contexts; and so it makes as much sense to infer that the past was *unconsciously* mythicized in them as to maintain it was deliberately spurned.

Paramount in Christian-influenced gnostic views is the *mythos* of Christ as the cosmic Redeemer, who is sent out of the Depths of the Ultimate to compensate for the mistakes of the lower aeonic or archontic powers (as illustrated by the arrogant Sophia in the Valentinian system) and the evil conditions of matter they spawned. However, while there is an interest in Christ (who usually takes only

the guise of the man Jesus), gnostic literature is strikingly lacking in references to Old Testament history. Where some attention is actually given, the key personages dominating the scene are from the primeval history of Genesis 1-11 – Adam and Eve, Seth, and Noah. Admittedly there is an interesting line of figures – running from Adam as far as John the Baptist – presented in *The Second Treatise of the Great Seth* (NHC VII.62-3); and in other Sethian [→ Sethians] treatises we find tripartite stages of salvation. There are three “missions” of the divine Barbelo – to enlighten Adam; impart the saving “seed” to Seth so as to help Noah during the Flood; and to appear in the resurrected Christ to reveal “Sethian macrohistory” as a saving revelation (*Apocr. Ion.*, NHC II.30); and we find that three attempts by the “ignorant creator” Sakla to enslave Seth’s seed – in Adam’s time, at the Flood, and at the time of “the reign of fire and brimstone” – are foiled by divine luminaries (*Apoc. Adam.*; *Evang. Aeg.*). But these interests, which are more concerned with archetypes than with historicity in any case, do not show up in other Sethian texts. They constitute an exception in classic Gnosticism as a whole, considering that single allusions to such “greats” of Israel as Abraham, David, Elijah, etc. are very scattered and somewhat vacuous. Such highlighted primal persons as Adam, Eve and Seth, moreover, become more decidedly mythicized into an *Urzeit* than they already were, interpretations of them deviating from traditional readings. In “Ophite” [→ Ophites] gnoseology, for instance, the serpent is the true God’s agent of secret wisdom to subvert the errors of the matter-engendering Demiurge (*Test. Verit.*, NHC IX, 45; 47-8), and thus the standard Judaeo-Christian deprecations of the primal pair’s disobedience, and the memorializing of the Israelite past coming after them, are taken as illusory. In *On the Origin of the World* (NHC II), the true “spiritual” Adam and Eve escape the Fall faced by their material counterparts (115-8), a view reflecting other ancient gnostic works treating Adam[as] as a cosmic Anthropos, one prototypical of terrestrial mortals to come and far more crucial than any corporeal human for one’s cosmic destiny.

There is little sense of time depth in the treatment of all these figures; they function as archetypes enclosing the mythic plenum that surrounds present temporality rather than being agents in a history. Insofar as classic gnostics narrate a cosmic slide towards unwanted conditions of *hylê*, however, they describe stages, a process, and thus implicitly temporal alterations, and they have to face up to temporality when humans are consid-

ered. Christ has to penetrate the mundane level of time in order to speak the salvific words of *gnôsis*. Here we may speak of the gnostic Moment as a myth-history, for Christ’s descent is followed by his ascent; and the “spirituals”, those who know he bears the truth because sparks of the Divine have remained in them, will follow him up to their true Home, while having to name and bypass the formidable Powers in an upward passage between bodily existence and heavenly Destination. The Jewish inheritance of a detailed history between a (deviantly read) Beginning and such a redemptive End served no clear purpose.

Ancient gnostic teaching was *esoterikos* in its own right because it stressed inner knowledge which was not preached publicly (cf., e.g., Hippolytus, *Refut.*, 6.36), and often imparted as a set of cosmic secrets (in books entitled apocrypha, cf. also *Ev. Thom.*, Log. 62). Such suggestions of *mysterion* could be readily connected with acclaimedly “ancient” arcana, especially those of Egypt, with its age-old monuments, hieroglyphs and priestly lore.

→ Hermetism lent to Gnosticism and other theosophical trajectories a mytho-historical awareness of great if vague time depth, and intimated that lost primordial truth, older than the well known philosophers, could be reclaimed in the future. Notice how the Hermetic treatise *Asclepius* laments over the loss of Egypt’s old mirroring of eternity [24-5]), yet looks to its revitalization in a new *Gnôsis* and magical reanimating of idols (23; 26; 37). Gnostics also sometimes shared an interest in schools highlighting such a recondite sage as Pythagoras (*apud* Hippolytus, 1.2), who was supposed to have accessed archaic, veiled truths from Chaldaic, Egyptian or Orphic sources (e.g., Plutarch, *De Isid. et Osir.* 354D-E). Notions of a *fons sapientiae* was readily associated with the myth of the perfect (and even reappearing) Golden Age or with belief in the return of the Great (astronomic) Year (e.g., Cicero, *Somn. Scip.* 7.24; Constantine, *Orat. ad Sanct.*). It was an obligation felt by learned Hellenistic Jews (such as Philo and Josephus), and Christian apologists after them (e.g., Clement of Alexandria and Eusebius of Caesarea), to dispute exaggerated claims of the pagans that their philosophies had long-distant pasts, and to stress instead the temporal primacy of → Moses over Plato and any of his Gentile predecessors. Various Gentile seers, however, such as → Hermes Trismegistus, Orpheus and Plato, were taken by different Christians as imparters of truth about the one true God outside Israel’s fold (e.g., Justin,

Apol. 59-60; pseud.-Justin, *De monarch.* 2; Lactantius, *Div. Inst.* 7.15).

3. OTHER RELATED MYTH-HISTORIES OF LATE ANTIQUITY

The content of these Hellenistic debates was to sow seeds for later macrohistories of preserved wisdom in early modern esoteric writing. However, in these later developments notions from the Semitic environment gave historical time-depth an increasing importance – through positing “formularized” chains. Among the Samaritans, whose scriptural canon stopped at Joshua, there developed the notion of a *shalshaloth* (or chain) of prophets, from Adam, through Noah and Moses, to Eleazar and Phineas (*Mem. Marq.*, 1.9). The Mandaean [→ Mandaeans] version of Gnostic thinking also reveals the stringing of such significant figures, Adam, Seth, Noah, Shem, and the three *Nuraithas* being precursory to John the Baptist as Bearer of Light, but Abraham, Moses and Jesus serving *Ruah* (Spirit), a dangerous force opposing good (see *Ginza Rba*). The Jewish-Christian → Elchasai taught that Jesus recurrently took human form whenever he wished (Ambrosiaster, *Comm. Gal.*, *prolog.*), and → Mani, a Mesopotamian Elchasite by birth (not an Indo-European Persian), introduced the concept of the recurrent messengers/apostles. After a sacred lineage running from Seth to Shem via Enoch (*Lib. gigant.*), the same teaching reached from east to west through the messengers Zarathustra [→ Zoroaster], Buddha, the Prophets, and Jesus, and the last messenger being Mani himself (*Kephala*. 1). Mani’s Syrian near-contemporary Bardesanes actually came to wed Gnostic emanationism to a grand macrohistorical framework – of six thousand-year periods that made up a Great Year astrally (*Coniunct. astr.*).

Some of these incipiently macrohistorical insights seem absorbed by Islam (*Qur’an*, e.g., 2.285), which emerged as a tradition also stressing truth’s temporal priority. Quite apart from the recognition of a not-so-fallen Adam as prophet, much attention is given in the Muslim Holy Book to Abraham, “grandfather” of the Arabs (cf. Gen. 16-17), a true submitter to Allah before the Mosaic law (*Qur.*, e.g., 3.77-9, cf. NT Rom. 4), and a man with mysterious connections to the pious wisdom of the Sabaeans around Haran (*Qur.* 5.73, yet cf. Gen. 11-12; Isa. 45:14). Insofar as these chains of figures in late antique paganism, marginal Semitic and unorthodox thought serve to resist the triumphal expansion of Christianity in the Romano-Hellenistic world during the first six centuries C.E., they

take on the aspect of the esoteric in disclosing the “alternative” (“neglected-if-true”) trajectory of revealed teachings. They were alternative to frameworks of long periods and millennia that paid greater homage to Biblical chronology in mainstream ecclesiastical macrohistory. Both to bolster Biblical veracity and encourage ahistorical societies to acquire a sense of time depth, standardized frameworks of Ages (from Adam, to Noah, to Moses, to David, to the Exile, to Jesus, to the present) held sway in orthodox Christianity, these stages usually represented hexamerally as a “Great Week”. Intriguingly, this model derived from the 2nd-century Epistle of [pseudo-]Barnabus (15.3-8), whose author was perhaps the first to maintain that the Old Testament should be interpreted esoterically. Islam, becoming itself a new “religious establishment” in the course of time, also adopted a model of successive periods marked by prophets warning of the Judgement (as first suggested by the sextad Adam, Idris [Enoch], Noah, Abraham, Moses, Mary in the *Qur’an* 19.30, 53, 57-9), as well as teaching the waxing and waning of great civilizations. In reaction, the last known late antique expression of Gnosticism, that of the Ophite-looking Yezidis, almost inevitably came to incorporate a dissident macrohistory: Allah created the world but was not its guardian, for it was the angel Melek Tâ’ûs instead who was lord over seven thousand-year periods, or “vessels”, until the End.

The fact that all such chains of disclosures tend towards finality links them to ancient apocalypses, highly symbolic and usually “underground” tracts that “revealed secrets” about the way time was proceeding on the grandest scale. At their very creation, significantly, such apocalypses were already alternativist and esoteric in character for depending on myth-historical orientations that countered established political rules and their legitimating histories. These macrohistorical frames were typically set up in terms of Ages, the election of unusual figures (who, like Enoch, Baruch or Daniel are enabled to foresee eventualities in time), and the sequence of world monarchies (cf. Dan. 10-12). A consummation arrives at the last with a final judgement or cosmic *dénouement*. This eschatological component or sense of time revolving into God’s hands has Jewish, Samaritan, late-Babylonian, Christian and Sassanian expressions, and also appears in Islam. In the course of time, these original impetuses of ideological resistance, as in rabbinic Judaism and ecclesiastical Christianity, were absorbed into orthodoxies, with new counter-cultural recastings of them nonetheless sprouting as a result. Whatever their context, one substantive

aspect in these orthodoxies has important implications for both gnosticisms and Western esotericism: this is the motif of a great cosmic Moment from Creation, through human eventualities, back to Re-Creation. As a conceptual structure this is analogous to the descent and ascent of the gnostic cosmic Redeemer out of and back into the primordium.

4. MEDIAEVAL BACKGROUND TO MACROHISTORIES IN WESTERN ESOTERICISM

Macrohistories of the Western esoteric tradition have a mediaeval, not only an ancient background. Their forms cannot be explained without attention to adjustments made to ancient gnosticisms and apocalypticism within mediaeval Islam, Jewry and Byzantium.

In Islamic gnoseology and Jewish Kabbalah [→ Jewish Influences] we find speculation concerning emanations from the Divine that result in the material Creation, but in these cases materiality is now being honoured as good (rather than marred, even evil, as in “classic” gnosticisms). In the spiritual praxis of Jews and Muslims, moreover, the realization of God’s presence in bodily existence was (and remains) a necessary, *acceptable* part of the Moment that points the devout back toward God. Plotinus had already advised contemplation of the emanations of the One in their downward course to the beauty of the physical world, with purified souls then ascending back to the Divine One (and Neoplatonists [→ Neoplatonism], although they wrote of the soul’s possible entrapment in untold cosmic cycles [e.g., Plotinus, *Enn.* iv.9], poured scorn on those ancient gnostic speculations that denigrated matter out of hand). In what we may call “*neo-gnostic*” (or theosophic) developments within mediaeval Islamic and Jewish speculation, a macrocosmic process of emanation and reabsorption gave a positive place to the whole human course of things on earth in its grand looping. In spiritual life the macrocosmic unfolding paralleled microcosmic experience and praxis – the divine descent into the soul, the (re)discovery of the soul’s true celestial origins, and responses to the One who draws all thing back to Himself. By extension human history in its broadest purport also mirrored the divine purposes.

In Shiite and related systems – as with Imami (“Twelver”) gnosticism (mainly of Persia), Isma’ilism and Druzism (both originating in the 11th century Fatimid Egypt of Caliph Al-Hâkim) – the emanations from Allah (such as Intelligence, Light, Word, Wisdom, Soul) are connected to chains of spiritual leadership affecting terrestrial affairs, to

express divine providence in the macrocosm before all eventualities are gathered up into God at the End. The Imamis and Isma’ilis locate this leadership in chains of imams, starting from ‘Ali as first Caliph (according to Shia ideology). This imamology, expressed as a continuation of the divine work beyond that of the primal emanations and the prophets, is a macrohistorical frame of reference – what → Henri Corbin calls a “para-history”, or template by which all time can be comprehended. The leadership is conceived as inner and spiritual (even in special occultation, as the Persian Twelvers hold), and acts as a foil against the claimed externalities of Sunni Islam, whose Caliphs and “external histories” are rejected.

Again, alongside formal Muslim theological categorization of the six major prophets (cf. *Qur.* 19; 21-2), there arose Sufi speculation about the lineage of the wise, based on “the law of [the antediluvian] Idris” (Ukhnûkh; Enoch, cf. *Qur.* 19.57) as distinct from that of Muhammad (thus the 12th century Ibn al-‘Arabî, *Fusûs al-Hikâm*). The claimed rôle of Idris, as founder of the arts, sciences and wisdom, allowed for the accommodation of philosophy, and thus the use of non-Arab teachers, as proper to religion. Since prophets appeared periodically, so could these other propagators of wisdom, the Sabaeans, Hermes Trismegistus, Pythagoras (Fithaghûras – as founder of philosophy, → alchemy, numerology [→ Number Symbolism] and → music [Anon., *Chrysis epê*; Ibn al-Sîd, *Kitab*]), Plato and Aristotle. At times Zarathustra (Zoroaster) received respect as a monotheist and seer (and one whom Aristotle, popular in mediaeval Islamic philosophy, had extolled as Plato’s long-distant prefigurement. The sense of a theosophic current running over a long time, with Egyptian, Orphic and Babylonian mysteries lying behind Pythagoras and unveiled by Plato, is clearest in the work of Ibn Sinâ (early 11th century).

Over and above macrohistories demarcated with reference to “leading lights”, complex theories of Ages (great stages or cycles) made their appearance in the mediaeval Middle East – in Druzism of the Levant, in a Persian Zoroastrianism that survived Islamization, even in Kabbalistic Judaism. These schemata show that Indo-European cosmo-historical ideas comparable to Indian *kalpa* theory was persisting in spite of Islam.

The Druzes kept to themselves a secret, anti-Islamic tradition about a huge stretch of aeons covering 343 million years from the Cosmic Perfection, via a slow degeneration, toward a cataclysmic End. Complex patterns of → reincarnation occurred through each aeon (*d’âhr*) to allow for the

interplay of the Light and Shadow of the divine Truth, and time enough for each soul's choices. The present Age is formally expressed both hexamerally and as increasing deterioration, with its line of those "revealing the outward religious message" – Adam, Noah, Abraham, Moses, Jesus, Muhammad, and the culminating figure of the Fatimid 'Al-Hâkim (who warns of and "inaugurates" the Grand Resurrection). Behind creation and history, however, are the five *hudûd* (Christ and the Four Evangelists) whose continual presence is reflected in a lineage of 159 Masters (*sadatnas*). These Masters have their pre-historical places in the emanation process but they later manifest in alternating cycles of occultation and of personal human forms – Hermes, Orpheus, Plato, Aristotle and Plotinus being crucial among them. The final state involves a return to the primal sense of the divine immediacy, and a condition of complete religious de-institutionalization (in which the *shari'ah*, for instance, would be abolished) (esp. Taqiyiyedi'în Abdulgaffâr, *Majrâ z-Zamân*, and *Kitâb alnogat Waldawâir*). With their views kept inaccessible to the public gaze until 1985, the Druze vision has been most responsible for associating the esoteric with secrecy.

In the tradition of → Zoroaster (who has no place in Druze models), we find another countervailing macrohistorical paradigm preserved, that of four tri-millennial Ages from Creation to the General Resurrection (cf. *Bundahishn*). 10th century north Iranian Shiite Abû Hâtim Râzî (*Kitâb A'lâm al-Obuwat*) was even prepared to accommodate Zoroastrian proclivities in his vision of a grand cosmic cycle (*dawr a'zam*). It coupled a cosmic devolution downwards (via a universal pre-historical Adam) to the terrestrial order and then a rising back again through periodic resurrections in angelic orders to the final home of the true spiritual knowers. This takes place over seven Ages, each with its Enunciator, and all monitored by the one occult archangelic Imam. As for developing Jewish Kabbalism, speculations about the cosmologic emanations out of the Infinite (*En-Sof*), contemplated in divine numbers and letters, were eventually supplemented by models of great Ages, decreasing in length over time like the Indian *yugas*, each being numerologically weighted, and the whole process tending towards the need for a messianic fulfilment (*Sef. ha-Temuna*) and a Great Peace (as in Maimonides, *Hil. Melach U'milch. 12.1*).

Certain Byzantine schools possessed affinities with these Middle Eastern visualizations. Although ascetics had a virtual monopoly over what was *esoterikon*, *gnostikon*, *mustikon* and *aporrêton* (secret), or over the whole practised spirituality of

the inner being, not all relevant speculative activity was so sociologically confined. The connection of Plato and a Gentile lineage of the wise was quite a common fixture in Byzantine philosophy and spirituality, through knowledge of Proclus, and the pious fiction that → Dionysius the Areopagite's cosmic hierarchism hailed from New Testament times (when it was actually designed to take a leaf out of Proclus' Neoplatonic frames of reference in the Pagan-Christian debates of the 5th century). Byzantine eschatologists, moreover, generally took earthly time as running down, yet towards Christ's Second Coming, the Resurrection and consummate Kingdom of God, final events that were most often conceived as terrestrial. The Kingdom's everlasting peace, which some saw prefigured by a chosen emperor, was to be the fulfilment of both the empire and the divine liturgy (with its angelic music).

These currents of thought only touched Latin Christendom in pockets – in Spain and the western Mediterranean. After more than a millennium of Christian history, however, and the dominance of four world monarchy and hexameral Great Week age theory, an alternative macrohistorical envisagement appeared in the West. Calabrian Cistercian monk Joachim of Fiore (or Joachim of Flora, † 1202) innovatively reconstrued the whole temporal order into three great Stages – of the Father (the Old Testament events), the Son (Christ and the time of the Church), and the Holy Spirit (the emergent time of contemplation, perfection, and the dismantling of ecclesiastical structures, soon to be realized terrestrially while still bearing eschatological import). In this picturing Jesus now came to be placed in the centre of historical time, and, most significantly, the model was one of humanity's spiritual progress.

Joachim travelled through Byzantine territory and the Near East and his writing reflects a reactivity toward macrohistorical cross-currents at the time. His triadic procession recalls the "economic" Trinitarianism of Marcellus of Ancyra, who saw Creation expressing the sequential activity of Father, Son, and Spirit (and whose orthodoxy was conceded by the Western church in 340). Joachim's stages have (imam-like) Enunciators – Isaiah (and king Uzziah) in the Age of the Father heralding Christ, for example, and Benedict in the Age of the Son fore-announcing the *ordo contemplativus* – reminiscent of Middle Eastern speculations, The Age of the Holy Spirit, devoid of typical apocalyptic trials, looks much more like a Maimonidean Great Peace or Druze *Endzeit* of de-institutionalization (*Concord. Nov. Vet. Test. II*) than a crowning empire. We can note here a comparable cosmic

processionalism involving history with mediaeval Balkan neo-Manichaeism, the Bogomiles [→ Bogomilism] believing themselves especially left on earth with the Holy Spirit, to escape matter in ethereal bodies at death. If Joachim creatively responded to an arena of competing macrohistories, however, his innovation lies in an optimism that surpassed both the Western resignation toward human vicissitudes through the ages and notions of general degeneration favoured in the East.

For projecting a great spiritual Stage without ecclesiastical structures Joachim's theology came under official (post-mortem) criticism in 1215 (at a time when his beliefs would be unfairly associated with heresies of the western "Manichees" [→ Catharism] in southern France). Thereafter his method of marking time's mysteries was deployed, elaborated upon, and readjusted by the "alternative" tradition of the Spiritual Franciscans (*Fraticelli*), who criticized the wealth of the visible Church. Joachimism became more pessimistic and catastrophist, and affected by hopes in some last and "spiritual" emperor (e.g., Charlemagne *redivivus*). Overall, though, an accentuation of mystically-charged symbols, a special interest in crucial reincarnations (Elijah as John the Baptist), and the quest to unlock the mysteries of time and the Apocalypse make the inspirations of Joachim(ism) very appealing to modern Western esotericists.

Other special expressions of macrohistorical interest in the mediaeval arena may be mentioned to complete the background. The understanding that Noah was the first inheritor of the moral truths held in common by the traditions discussed above, and that the effect of his teaching had lasted so long in human affairs (see Gen. 9:8-9; *Qur.* 71; *Bab. Talm., Sanhed.* 56a-b), suggested the need to persist with *rapprochement* through the years – and ply a subterranean, "non-establishment" route – because these monotheistic groups had to deal with each other. Coming into this story are → Ramon Llull from the Balearic Isles, with dialogical methods (*Lib. Gent.*), and the mobile Knights Templar, who evoked an ideal of the temple at Jerusalem as if it were the mysterious centre-piece of both time and space (an approach in "conversation" with Jewish messianic hopes and Druze speculative ideas about Solomon). Old notions of the "Zodiacal Man", that conceive the human being not only as a mini-cosmos or geography (see the Naassenes; Macrobius) but as reflecting temporal phases that could be charted astrologically (see → Al-Kindi and Ma'ashar), were passed down among the alchemists, scholastics and courtiers of the mediaeval West. These concerns, and the the general pictures

of temporality that went with them, were to be absorbed and reinvented in different ways as a more distinctly Western esoteric *aire de famille* that intensified through modern times.

5. PATTERNS OF EARLY MODERN

WESTERN ESOTERIC MACROHISTORY

Modern Western esotericists have dealt with this large inheritance in different, if related ways. To make sense of the complex material, a general chronological sequencing of the main patterns is to be preferred here.

Italian high Renaissance thinkers are well known for their interest in an ancient stream of wisdom. Stimulating this was the fact that newly accessed Greek texts of Plato came with the *Corpus Hermeticum* [→ Hermetic Literature] and the *Oracula Chaldaïca* virtually attached to them, in an arrangement fostered by such Byzantines as Michael Psellos and Gemistus Plethon (with the latter innovatively, if incorrectly, ascribing the Oracles to Zoroaster). When the founder of the Florentine Academy → Marsilio Ficino translated and expounded Plato (1462-1484), he justified his attentions by writing of six "ancient (*prisici*) doctors in religion" that reflected the influence of Moses among the Gentiles (e.g., *Theol. Platon.* 17.1). The six were placed in *a strict succession* or direct line of transmission running (after Moses) from Zoroaster, through Hermes, Orpheus, Aglaophemus (cf. Iamblichus. *Vit. Pythag.* 146) and Pythagoras, to Plato. Plato, already taken to acknowledge Orpheus and Pythagoras as his own heralds (cf., *Phaed.*; *Resp.* 363C-364E; 600A-B), was thus heir to a long tradition of truth, and one with Biblical foundations. Ficino's associate → Pico della Mirandola added to the *prisca theologia* the Kabbalah, which he saw as Christian mysteries delivered to the few in the wilderness at the time of Torah long before the Incarnation (*Homin. dign.* [1486]). While this step could be taken as a supplement to the succession model, however (so that not long after → Johann Reuchlin was also linking Pythagorean and kabbalistic insights), Pico potentially broke open the "biographical chain". The "perennial fountain" of truth might be accessed *not in one line but at various points* – in the ideals of Solon the legislator, even in the Qur'an, Muslim philosophy and mediaeval scholastics –, a view recalling → Nicolaus of Cusa, who, made a cardinal 40 years earlier, had been in search for a universal religion that gathered up all essential truths shared between the Bible and Gentiles.

Thus, while the *imago* of a special (macro-)history of extra-Biblical founts of divine disclosures

famously crystallized in the Renaissance, it could be taken in quite different directions. It could be added to, filled out in terms of world history; and interpreted further in terms of veiled mysteries. Thus French Renaissance Kabbalist → Guy Lefèvre de la Boderie added the ancient Druids to the lineage, and, after Plato, “Dionysius-St. Deny” (the Areopagite); he took the ancient theologians to have geographical responsibilities – Zoroaster bearing truth to the Bactrians, Hermes to Egypt, Orpheus to Thrace, Pythagoras to Magna Graecia, the Druids to Gaul – but all deliberately veiled “the secret sciences” in obscurity (*Galliade*). As with Pico, there are chronological breaks in the sequencing, and for this reason we can talk more of “stepping stones” or recurrent instantiations of Wisdom’s expressions through time.

The most famous Renaissance exponent of this “pagan trajectory of Truth” was bishop Agostino Steuco, whose book on the “perennial philosophy” was published in 1540. But Steuco set the *prisca theologi* in a wider history of both continuity and degradation from a “golden time”. A single Truth, or a single Wisdom, has been constantly available to all periods, but not equally accessed; in the first Adamic period it was known perfectly and immediately; then in the second it dissipates and loses unity; and finally in the third it falls forgotten and obscured (and thus in need of such seers as Hermes and Orpheus, whom Steuco believed to have a partial understanding of the Trinity; *De peren. philos.*, esp. I,1-2). Here the classical model of a Golden Age (and later ones of baser metals) has some effect (cf. Hesiod, *Erga*), yet, unlike some Renaissance thinkers, Steuco does not imagine the Age of Gold returning and is the very opposite of a theorist of progress.

Honouring pagan philosophy in this interpretative mode was risky (Pico and Steuco, for two, ran into trouble with the religious establishment), and thus one may speak already here of a developing alternative approach to history. Steuco, indeed, as with some Hermetists (such as Hannibal Rosselli) before him, took the adventurous step of placing Hermes chronologically prior to Moses, even if only slightly, and at one point gave Hermes equal status to Moses in passing down the truth of monotheism (*Per. philos.* IV,1). This opened up the possibility of the “stepping-stones” of truth independently of Mosaic foundations, indeed in disconnection from the Incarnation (because Ficino, Pico, Steuco and their like all read *prisca theologia* as pointing towards Christ and the Christian revelation). Something left hanging in Steuco’s idiom, moreover, was the prospect of a genuine

restoration of the “the true philosophy” in contemporary times.

The strikingly dissident voice of the wandering Neapolitan → Giordano Bruno took up these implications in the 1580s. He deployed the pagan lineage of truth to justify his idiosyncratic, pantheistic-looking cosmology. Appealing to Atomists (e.g., Democritus) and other pre-Socratics (e.g., Heraclitus), he taught that humans constantly “come and go, pass and repass” in an unprecedentedly wide universe, amid mutations with no apparent Beginning or End (*Cena*, V). Bruno’s macrocosmos, animated by a vast host of “intelligible beings”, and with matter possessing its own principles of movement, operated in complex correspondence with human purposes and affairs. An intellectual genealogy of the wise was claimed to have transmitted this world-picture down through the ages – from a Golden time in Egypt and Chaldaea, through the Persian Zoroaster, the Indian gymnosophists, the Thracian Orpheus, the Greek pre-Socratics, and the Latin (atomistic) Lucretius. It was based on a *prisca theologia* as old as Moses, found in the divinely inspired Hermes, who was concerned with the animations of matter (including theurgy). To cap off this history, Bruno took the Hermetic vision to be heliocentric, so that his own time was witnessing a *decisive restoration* of Egyptianism, with what had been veiled over many ages now re-establishing itself at last with the new heliocentric cosmology of Copernicus.

Significantly, key features of pagan metaphysics glossed by preceding perennialists as non-Christian lapses into uncertainty are now taken very seriously in Bruno’s macrohistory. The cosmos is eternal and animated by the divine; souls have pre-existence, immortality and undergo metempsychosis (although for Bruno only in terms of constant rearrangements of cosmic components, as taught by the Atomists and Heraclitus). Thus the universal Truth is no longer distinctly Christian, nor does the perennial philosophy obviously point to Christ. Most of Bruno’s chief concerns were admittedly already found among his predecessors – considering Ficino’s belief in astrological influences and his interest in the soul’s immortality and spiritual magic shared with Pico. Bruno’s speculations about cosmic correspondences, further, have their background in mediaeval alchemy and more recent Renaissance mystical philosophies of nature (e.g., → Paracelsus). But the perennialist macrohistory is disengaged from normative theology, made more “alternative”, and more associated with an occult thread of Knowledge.

Aside from Bruno’s version of it (which received

a very temporary revival during the 1720s in John Toland's anti-Newtonian physics), the idea of *philosophia perennis* was widely aired up until the Enlightenment period. → Leibniz deferred to it in upholding the unity of truth and a "philosophy of concord". As we shall see, this perennialist mode was transformed almost beyond recognition in the world of "secret societies", but it was revived in the 20th century (when of course the rich variegations of the world's religious life were better known). A cluster of intellectuals calling themselves "traditionalists" (→ Frithjof Schuon, Ananda Coomaraswamy, Titus Burckhardt, Seyyed Hossein Nasr, etc., who were all affected by Sufism), took the *philosophia perennis* as the inner wisdom lying at the heart of outwardly divergent religions. They distinguished themselves from such "perennialists" as Aldous Huxley, however, by insisting on greater attention to the particulars in each tradition.

None of the afore-mentioned Renaissance macrohistories assume an overall progress in history (as distinct from recurrence or regress). The prospect of a reabsorption of history's changeable terrestrialities back into the Eternal (as we have spotted them in earlier non-Western currents) remained present – with Ficino describing the cosmic process of Beginning (Beauty), Emanation (Love) and Returning (Pleasure) as a "circle" (*Comm. Symp.* 2.2) – but this U-curve was disengaged from the newly favoured "macrohistory of the Ancient Theology". Possibilities for a vision of progress (and a reconjunction of major schemae) are provided in the West through the difficult mystical writings of → Jakob Boehme, who pitched his theologically innovative insights against literalist and institutionalist tendencies in the Reformation (making him suspect among German Lutherans by 1620). There are difficulties in reading Boehme macrohistorically, although we can affirm that he taught a processional cosmology. For out of the impenetrable *Ungrund* (Groundlessness, cf. *En-Sof*), the creation arises from wrath (the Father), light and love (the Son), and expands (with the nurturing Holy Spirit as Matrix, and an unfolding of its tendencies and forms through seven emanation-looking *Quellgeister* or fountain-spirits). The sense of necessary materialization is strongly present in this vision (even though souls have to experience the terrible immanence of hell and darkness along with love and light), and, in a neo-gnostic Moment, humanity's possible complete regeneration into the primordial selfless state "within God" is contemplated. In all this, though, where is history to be placed? Boehme conceives all phenomal existence as a wheeling of reaction and counteraction, but what

of historical affairs? We can only, unfortunately, speak of Boehmian implications.

In his approach to nature, Boehme's illuminations point towards a vision of *progress* (rather than teaching a chain of wisdom, or an overall regress). Indeed, Boehme's complex system of correspondences, revealing how the emergence of vegetative and animal life, not just humans, express the divine Unfolding, was a seedbed for developmentalist and evolutionary theories to come. The term "evolution", however, strictly spiritual in purport, first referred only to the process of humanity's reintegration to make up for the Fall of (the angelic, Androgynous) Adam into the material world (thus the Boehmian → Friedrich Christoph Oetinger). Later, in the hands of Charles Bonnet, all species are seen ascending, in ever-increasing complexity, towards their intended perfection, a view also mediated by Hegel, but soon to be overlooked by the plainly empiricist and "scientific" Charles Darwin and his like. Another implication is the triumph of spirit over letter, and mystical over institutional.

As for history as human affairs, although Boehme avoids reference to it, by using the idioms of the nettle, the rose, and the lily, he apparently alludes to the triadic Joachite framework of macrohistory as a corollary of his Trinitarian cosmogeny (cf. also *Sechs myst. Punc.*). Something of the Joachite "scaffolding" seems assumed in esotericisms inspired by Boehme (as in the the → Christian Theosophy of the Philadelphians and → Karl von Eckartshausen during the 18th century). Despite qualifying stresses on recurrence, it remains discernable in Quakerism (after interaction between "Behmenists" in the 1670s) and in select German Pietists [→ Pietism] such as → Gottfried Arnold. The frame then gets more overtly transmitted under the rubric of "the Last Times of the Third Age" among French *illuminés*, a view affecting → Emanuel Swedenborg very slightly (*Apoc. Revel.* 1766) and directly inspiring → Eliphas Lévi, who by the 1820s was announcing "the Age of the Paraclete" (which became for him a "reign of Light" in which the science of magic would be revealed).

The stronger component of recurrence in Quaker triadic macrohistory, as expounded by George Fox and Isaac Pennington, arises through the notion of the golden Edenic age being re-enacted in the middle of time (through Christ) and in the latter days (through the [Society of] Friends). Thus history's three great positive Moments are the Age of the Christian Adam (begun in perfection and almost millennium-long in its timing, cf. Gen. 5:5 on his 930 years); the Days of Jesus, the Second Adam,

and his Apostles; and the present times, when these earlier perfections are beginning to be recovered – by reenactment – as the life of the Spirit is embraced. In contrast, the time of the Old Testament and its post-Adamic times is that of the first covenant, which was *outward*, at least forming the antetype of the covenant lived *inwardly*, with Christ, the early disciples, and now the Friends being imbued with the ‘true Light that lighteth every man’ (AV Jn 1:9) and not fettered by “the Letter” and ecclesiastical institutions. In the Age of the Church, though, between the Apostles’ days and the Moment of the new breakthrough, there is a long period of sad apostasy, whereby Christendom was ‘built up . . . with blood and iniquity’, and religious conformity maintained by fallible ‘doctrines, . . . creeds, and ordinances, and canons, by force of carnal weapons’. This overall view of the past, one can already sense, heralds the claims of an overall progress towards “Enlightenment”, even if the vision was to be radically secularized (cf. Voltaire’s essay *Sur les Quakers*).

By 1700 Gottfried Arnold had combined a synoptic study of history with the Boehmian dream that ‘all creatures will be brought back into that original and blessed oneness . . . of eternal love’ as was meant to pertain in Adam’s time (*Unparteiische Kirchen- und Ketzerhistorie*, vol. 1). Arnold’s outright conclusion, however, is that illumination belongs only to a few genuine believers: history is just a sea of repeated follies and corruptions. The Eternal Light shone brightest in Christ, and brightly in the young Luther and his forerunners, but after each case comes predictable degeneration. Arnold is impelled to draw the subversive conclusion, in fact, that the illumined few might be found among (wrongly imputed) heretics, and cannot even be limited to adherents of the Christian religion. This pessimism, we note, does not issue either in a steady regress or stepping-stone model of wisdom. It stands in stark contrast, too, to late Renaissance (especially earlier 17th century) utopianisms looking to some extraordinary socio-spiritual rebirth.

Some of the dreams of reappropriating neglected wisdom had been decidedly utopic (→ Francis Bacon; → Tommaso Campanella); some proclaimed the disclosure of the truth upon which all affairs rested or could be adjudged (Jean Bodin on the Ten Commandments; Faustus Socinus on Jesus’ special receipt of *arcana* in his lifetime [cf. Jn. 3; 13]). Others invoked the probability of a returning Golden Age. → Johannes Comenius and others at the enigmatic court of → Rudolph II in Prague heralded a great rediscovery of “pansophic”

knowledge. Works by Lutheran → Johann Valentin Andreae in the 1610s triggered off fascination with the abstruse message that the fabulous Christian Rosenkreutz had tapped the mystery of the Ages (being learned in Eastern – especially Arab and Egyptian – wisdom, founding a secret society to study Nature’s hidden things, and imparting an anti-Catholic esoteric Christianity). → Rosicrucianism was early linked to political dreams of a returned Golden Age in the form of a Protestant Holy Roman Emperor Fredererick V Palatine. Most of these figures and developments, we should note, reflect a yearning to transcend prevailing orthodoxies.

The tensions between hopes for some extraordinary breakthrough in knowledge and reaction against orthodoxies show up in the macrohistories of two great scientific minds of the 18th century: → Isaac Newton and → Emanuel Swedenborg. Another figure of interest, (the ostensibly orthodox Catholic) Giambattista Vico, earlier toyed with notion of a transmission of wisdom to explain Latin-Italian learning, and even if he later disposed of this paradigm, his newer ideas came to affect Romantic “historiosophies” of a distinctly esoteric kind. Each of these three has distinctive components in their macrohistorical frameworks.

Newton held that the fundamental principles of all knowledge relevant to our present order were divinely granted to Noah after the Flood. This knowledge springs from the “true religion” of Noah who received seven precepts from God (prohibiting idolatry, blasphemy, fornication, murder and theft; and enjoining care of animals, and the setting up of governments [cf. Talmud, *Sanhredr.*]). In Biblico-Christian terms this religion was expanded in the Mosaic decalogue, reaffirmed by the prophets, distilled by Jesus (love God and your fellow human), used as a guide by the early Church (cf. Acts 15:20, 29), and discreetly embraced by Newton himself as the self-inscribed champion of *vera religio* in the Last Times. But it was relayed to the Gentiles – the Sabaeans, Confucius, the Brahmins (who owed their name to Abraham), and Pythagoras all passing on the Noachian “basics of civilization”. Thus a stepping-stone model of recurrent reinstantiation is suggested, but different from the preventing one of the *philosophia perennis*. The new understanding places a primary stress on the (misunderstood) transmission of moral principles. It also sets great store by Noah (a not unprecedented move, since the Jesuit → Guillaume Postel had voiced a similar prioritization), and put more weight on Jewish and Islamic preconceptions about the custodianship and history of truth (in

Islam Noah and Moses, for instance, carry almost as much weight as Jesus, and it is held, as Newton also did, that there was a “falling away” after each great disclosure of the Light).

Noah’s religion was enmeshed with natural philosophy. Thus Newton’s own work on the spectrum of light was connected back to the post-diluvian rainbow; and mathematics derived from the proportions of the Ark and the cubit unit of measure used for it. Gentiles had their place in mediating this *prisca scientia*. The Phoenicians through Hiram of Tyre, for instance, helped with the building of Jerusalem’s holy temple (using cubits) before even the pyramids were erected; when Orpheus and Chiron the Centaur voyaged as Argonauts (Apollonius Rhodius, *Argon.*), the latter possessed an astronomer’s sphere; when Pythagoras brought mathematics to the Greeks, he also bore the Noachian rules and taught God as Light and Father (cf. Pseudo-Justin mart., *Hort.ad Graec.* 19). The true religion, however, could be terribly corrupted; Egypt was a major culprit, earlier responsible for rampant polytheism, idolatry and magic; and later for gnosticism (including the hermetic philosophy, that was now critically redated to Hellenistic times). Out of Egypt, moreover, there arose the idolatrous Trinitarianism that marred the subsequent history of Christianity. As a Socinian-Arian, Newton’s agenda was to reinstate “true” non-Trinitarian religion and the sacred foundations of science at the same time. His connections with early 18th century → Freemasonry require investigation, for the appeal to a tolerating outlook across the borders of the major monotheisms, and evocations of both Noah’s precepts (as against the seven [pagan] virtues) and the symbolic importance of Solomon’s temple (including Hiram as facilitator) pertain to pre-Andersonian masonic rites.

Swedenborg’s most settled macrohistorical structuring was more formalistic, and links with his rôle as titular founder of the New Church. He favoured a theory of periods that turn out to be more four-than threefold in series – devolving around four “Churches” (thus “Ages”, cf. Dan. 2:31-5). The first and “Most Ancient” is called Adam (thus positing a “Golden” Adamic Age, as Boehmians, Quakers, etc. taught before him, but a celestial one [cf. Sulpicius Severus, *Chron.* 1.2]). This is the first appearance of an early etheric stage of history in modern Western esotericism in which the first humans lie outside ordinary earthly conditions. The second, “Ancient” and “Silver” (and first terrestrial) Age is called Noah (with “love of neighbour” being paramount, as Newton had also taught); while the third, brazen age is of the

“Israelite Church”, and the fourth, of iron, the Christian one. The decline is from original innocence and true love to a mere knowledge of natural and literal truth, and is reminiscent of Steuco’s pejorism clothed in a Hesiodic “outer garb”. Since this degeneration fairly screeches for a New Jerusalem or “the New Church” to solve the cosmo-historical problem, however, its downward course amounts in the end to a providential work of redemption: the New Church recovers the Edenic blessings and possibility of a return to the heavens. In the whole temporal process geographical shifts of influence around the points of the compass were detected, beginning in the East and ending with it in a circle. Appropriate worlds of heaven and hell were called into being *en route* as well, so that a “new heaven” is formed for “the simple good” with the arrival of the New Church, and a new hell for the Christian hypocrites (*inter alia* locked in a Trinitarianism that, like Newton, Swedenborg spurned). The future would now only hold “a progression of youth and spring” back towards God, “as it was in heaven”, with the final stage completing a neo-gnostic-looking loop when innumerable angelic, celestial societies constitute the *maximus homo* or “the greatest [cosmic] Man” (esp. *Arc. Cael.*). Considering the first Age, this consummation is highly significant: for the first time in human thought history as such is celestialized at both its beginning and end. Intriguingly, moreover, the esoteric U-curve has woven into it motifs of degeneration, recurrence, progress and millennialism.

The macrohistories of both Newton and Swedenborg hark back to pre-existing structures and modify them. Vico’s model for a “new science” of historical “coursing” and “recoursing”, however, marks a radical breakthrough, being more flexible and dynamic. Human consciousness developed through the Ages of the Gods (with a sense of the divine as immediately present), of Heroes (with great “barbaric” leaders embodying divine, albeit arbitrary power), on to that of Humans (with the triumph of rationality and applied abstract principles). Decline inevitably comes, yet, after a great civilization (such as Rome’s) collapses, affairs then “re-course” via a new barbarism to a still higher level (*Scienza nuova* [esp. 1744 edn.]). Here, despite the strong cyclical element, the suggestion is of history as overall spiraling upwards.

Vico’s modelling subverted the notion of an unchanging Ancient Theology, or a stable “house of wisdom” unaffected by the enormous changes of consciousness he described. Yet, even though his influence on mainstream thought took a long time

coming, his work had an impact on “esotericizing” (especially anti-rationalist, Romantic) thinkers between the 18th and 19th centuries. → Goethe, who had the *New Science* secreted to him while a traveller at Naples (1787), was first in explicitly construing history as ever-widening and higher cycloids. Significantly, he described the whole process as a spiral (*Spirale*), paralleling the human story to processes in plant and zoological life and taking in the idea of necessary decay before new growth was possible. Romantic *Naturphilosophie*, with Goethe its key inspirer, is crucial for a shift from a more static to a “temporalist” view of cosmic unfolding. Instead of the traditional (basically Platonic) conception of “the fullness of creation” and its orders being “perfect and complete unfoldment” from the divine, now there is conceived a ‘programme of nature that is being carried out gradually and exceedingly slowly in the cosmic history’ (A.O. Lovejoy; W. Hanegraaff).

6. FROM ROMANTICISM TO THE PRESENT

In Romantic thought [→ Romanticism] concentrated on the human past, the spiral image informs the works of such French “historiosophists” as → Louis-Claude de Saint-Martin in the 1790s and → Pierre-Simon Ballanche in the 1820s. While Saint-Martin is not interested in standard histories he visualizes human progress through recurrent crises, each making greater the possibility of humanity’s reintegration into the divine. The worst known crisis, that of the French Revolution, opens up the epoch of a new *magisme* (a magical participation in the divine creativity) through which humanity can be corporately regenerated. If this group of *hommes-esprit* hinted at Vico’s providential “Age of Humans”, Saint-Martin envisages an apocalyptic “Sabbatic reign” of God (alluding to the Great Week schema) – the utter low-point of the Revolution being interpreted as a proleptic miniature of the Last Judgement, the defeat of the Fall, and the suspension of ordinary time. As for Ballanche, inspired by Boehme, Vico, and more recently by spiritual evolutionist Bonnet, Ballanche maintained that accession to wisdom increased through such great initiators as Noah and Orpheus, and the transmission of their wisdom sets in train a social evolution that can overcome the Fall. Using the Vichian account of Rome’s constitutional developments, Ballanche saw social initiators in “heroic times” to be patrician, but a widening of spiritual maturity comes after the time when the plebeians slowly acquire responsibility (*Palingénésie sociale*, prolog.).

He thus addressed the spiral effect towards democratization so evident in his own day, which makes his esoteric historiosophy politically engaged.

The East, particularly India, had taken on increasing significance in Western speculative thought by the end of the 18th century. It figures in Romantic reactions against rationalistic and mechanistic explanations of the world. With the uncovering, first, of a version of the Upanishads (*Oupnek’hat*), India is proclaimed as the foundation-point of all ancient wisdom in a new, “Oriental” Renaissance (that upgrades the European one, with formerly honoured ancient theologies deriving from this freshly uncovered source). Thus for such savants as Friedrich von Schlegel and → Friedrich von Schelling the now recovered wisdom of India initiates the perennial religion, that (in Schelling’s version) moves to Egypt, Eleusis and then to an esoteric Gospel known to Sts John and Paul. In its inception this unveiling was a matter of public discussion and affected mainstream thought. In the 1810s, according to the macrohistory of Hegel (with its triadic frames affected by Bohemian, Vichian and Romantic impetuses), India preceded the Bible in expressing the first religious and philosophical universalism. By mid-century the titular founder of comparative religion, Friedrich Max Müller, deployed the Indian experience as a coping-stone for explaining religious history more generally – as passing through stages that are natural, then anthropological (or anthropomorphizing), and finally psychological (or theosophic). Texts from Sumer and the ancient Near East had barely surfaced to make any difference. Even when they did, India would remain crucial in distinctly esoteric currents of thought. Freemasonry and the → Theosophical Society are obvious cases in point.

The importance of the initiatic becomes more systematically expressed in 19th century Freemasonry. Thus, in the macrohistory of Albert Pyke (the most celebrated Masonic systematizer in the English-speaking world), the most crucial aspect of history is the transmission of “the exact knowledge of the Initiate”, the great ones being “Masters”. Pyke shows much interest in the general contours of history – the collapse of empires through greed, the overall advancement of freedom (sometimes through revolutions), the temporal priority of symbolic over moral and dogmatic expressions of truth (*Morals and Dogma*, 1871, chs. 3, 23) – but his key interest is in the passing down of the Mysteries. By now public fascinations in comparative religion, including better studied Indian traditions, have had an effect. Thus for Pyke India becomes the new font

of Wisdom, first through “Christna”, then the Buddha, who is described as “the first Masonic Legislator”. In turn the (Jain) Gymnosophists planted the mysteries in Ireland (so generating the round architecture there and affecting the course of Celtic Druidism). In the Middle East the Phoenician cosmogeny, held by Hiram (the true architect of the Solomonic temple) derives from the Sabaeans, who provide the seedbed of Kabbalah that is mediated via Zoroaster. Pythagoras, ‘the great divulger of the philosophy of numbers’, is indeed ‘a Master and Revealer’ for being initiated into the Kabbalah in Judaea and into the Egyptian (essentially Hermetic) mysteries. In masonic circles, these among other special stories were “institutional secrets”, and the symbolic forms used in initiations were viewed as the means of handing down the most ancient signs and symbols through which diverse peoples communicated in their first impetuses to find both common ground and the “divine light”. Thus Pyke’s macrohistory reflects an eclectic garnishing of prior esoteric currents, accommodating *philosophia perennis*, a better-known world of non-Biblical traditions, and Enlightenment concerns for Nature’s laws and its numerological basis (as well as for both progress and revolution).

As for the modern Theosophical movement, it would be impossible to account for its emergence and popularity without this new enthusiasm for non-Western spiritualities, especially those of India. But Theosophy also amounted to a reaction against the threat of de-spiritualizing tendencies in evolutionary thought. From 1859 Darwin based his theory of biological evolution on the purely secular principle of “natural selection”. His Social Darwinian successors (e.g., Spencer, Lubbock, Tylor) construed the whole human journey as a progress from animal-like savagery and primitive ignorance into the graded experiences of different “races”, while the most popular evolutionary cosmologist, Ernst Haeckel, espoused an Epicurean-looking materialism (from 1867).

→ Helena Petrovna Blavatsky, founder of the → Theosophical Society (1875), boldly responded to these contemporary currents with a grand cosmo- (or myth-)history. Her self-conscious systematization of esoterica was presented in *The Secret Doctrine* (1888) as a complex “revelation” about cosmic processes – based on lost Akashic records that had been mediated by spirit Masters out of the ether. Whether justifiably or not, Blavatsky put herself in a line of prior seekers – Boehmians, Masons, Swedenborgians, Spiritualists, interpreters of the East – although her disclosures were meant to dis-

til and surpass all former glimmerings in a system of final Truth. Insofar as she garnished many former insights to bolster her position, she was crucial (together with such contemporaries as → Hargrave Jennings) for “inventing” a “grand tradition” of esotericism – an act of macrohistorical reflection in its own right.

In Blavatsky esoteric macrohistory reaches its greatest degree of eclecticism and combinative intricacy. Her own synoptic view of temporal processes combines three major features. It clearly reflects the newer preoccupations with India, for she invoked *kalpa* theory to project endless rounds of cosmic ages and reincarnations. Despite this, though, her primary model still turns out to be a grand U-shaped “[neo-]gnostic Moment” of cosmic becoming through descent and ascent. In the construction of her vision a novel solution to the threat of materialist evolutionism is provided by Root Race theory, or the descending order of increasingly corporealized spiritual beings – from the Lunar Ancestors, through Hyperboreans, Lemurians, Atlanteans, down to the Aryans of the present cycle. As this descent proceeds, it is met by an ascent in the natural biotic order, highest with the Anthropoid Ape, with the phenomenon of “lower races” occurring because Lemurians and Atlanteans mated with them. The law of karma is taught as meting out justice – especially via reincarnations – through countless aeons, but advanced souls pass beyond what is, after all, a necessary materialization, and ascend back to forms of (influential) spirithood above. Key spirit Masters mediate the eternal truth via the religious great ones or “revealers” through the centuries, through Enoch, the “first Son of Man”, at the close of the third (Lemurian) Root Race, for instance, and through Jesus [or Jeshu], who was but the innocent vehicle of *Vâch*, the cosmic “Mystical Voice”, yet a fundamental mediator of Truth, like Krishna and Buddha, for the fifth Race. The eclecticism thus entails a wedding of cosmo-evolutionary history with the history of known human conditions and documentable human (especially spiritual) thoughts. The whole picture of enormous processes and such hidden masters has affinities with the speculations of the Druzes, from whom Blavatsky claimed initiation. *Avatar* theology and emanationist thought among the Hindus (e.g., *Sri Brahm. Samb.* 5) are hardly without their influence, though, and logically her gigantic “Rounds” of time go on unceasingly as in Indic conceptions. Even within the Round we now experience ‘our present continents have, like “Lemuria” and

“Atlantis”, been several times already submerged and had the time to reappear again’ (*Mahatma Letter* 23B [to A. Sinnett]).

Post-Blavatskian macrohistories amount to various kinds of readaptions of, or reactions against, her system (and against her free-floating selectivity procedures, that owe much to Louis Jacolliot). *Inter alia* → Annie Besant and → Alice Bailey show more interest than Blavatsky in the function of nations. For Besant each nation represents a temperamental aspect of the microcosm (India and Ireland possessing a resilience in the face of continual conquest, for example); yet if this recalls ancient astrological notions (Ptolemy, *Tetrabib.* 2.3.), Besant is more interested in the pendulum swing between western and eastern conquests, and in the Masters as “angel-kings” monitoring the nations’ rôles. → Rudolf Steiner, who left Theosophy (in 1913) and founded → Anthroposophy, sought to give back to Christ a centrality that the Blavatskian system disallowed, while he retained and readapted the Root Race theory, and wrote of an instructive “tension between East and West” through history. → René Guénon also reacted against Theosophy, but turned Indian *kalpa* theory into a veritable dogma (though excluding reincarnation). He had an extreme distaste for Western theories of process, especially evolutionism, yet, like Steiner, he drew on cosmological ideas of a necessary materialization even if it brought on a lamentable *Reign of Quantity* (1945) from which the spiritual elite must escape.

The list of neo- and para-theosophic macrohistorical inventions could go on, in a diversifying world of 20th-century esotericisms and “occult” systems. One thinks of → Aleister Crowley’s Ages of the Mother, Father and Child; of → William Butler Yeats (1937) “Vision” of gyrations of history in which will, mask, creative mind, and the body of fate predominate in turns; and of → P.D. Ouspensky’s thesis that *Man’s Possible Evolution* (1950) had declined from a higher spiritual and knowing state. The frequent evaluative displacement of the centrality of Middle Eastern monotheisms derived from a combination of early Theosophy’s preference for Buddhism and the fact that the modern study of comparative religion seemed virtually born from Indology. Thus, in the words of R.W. Hall, “the East” (basically India) was looked to as “the Cradle of all Religion” and “the divine Mysteries” (fairly waiting to become the location of Jesus’ education and death in New Age imaging). The modern attraction of the East for the West was viewed by → Carl Gustav Jung as “a compensation

in the unconscious”, making up for the swamping of religion by science in the collective psyche, and thus obeying an historical law of the conservation of psychic energy.

The → New Age macrohistorical ideas are too many to summarize, but a number of significant developments are worth noting. Common is an interest in cosmic catastrophes resulting in lost civilizations. Thus instead of the modern Theosophical vision of a descent of Root Races from ethereal realms, the focus is more on “secular-scientific” possibilities: that Atlantis, before it was inundated, was the basis for all Edenic myths (going back to Ignatius Donnelly); that a comet hit the earth to produce the Flood and destroy former civilizations (Donnelly, W.C. Beaumont); that the earth shifts sharply on its axis every 7000 years and destroys civilizations (H.A. Brown); that civilization was only made possible by extra- (or intra-)terrestrial visitation (B. le Poer Trench, etc.); and so on.

We may note that the New Age phenomenon of Channeling can entail macrohistorical views. Long-lost truths are believed available to be learnt, then, through the psychic memory of an → Edgar Cayce reaching back to Atlantis; or by adepts who can tap into etheric Masters, show how to reconstruct past lives, or prepare others for a returned Golden Age that the present New Age portends. Sometimes psychics’ contacts appear to be with chains of truth-bearers, reflective of the *philosophia perennis* and comparable frames (as with the Polish psychic Stefan Ossowiecki’s apparitions of Orpheus, Krishna, Buddha, Moses and Muhammad). Already most of the theorists just mentioned had trouble with Blavatskian views about the Masters, who were taken to be the true founders of the great religions and paths of wisdom “behind the scenes” (and who were only contactable by leaders of the Theosophical Society in its “Esoteric Section”). Instead New Age thought favours the competing, more straightforward paradigm that has humanity’s long spiritual journey guided by its actual great spiritual leaders, or those “initiates” into the supreme Truth who founded the known major religious traditions and appeared when meant to on the stepping-stones of time. Such ideas already permeated Eastern Sufi schools and Bahai’ism, before being expressed more systematically in the West by → Edouard Schuré (*Les grands initiés* [1889]). In general terms, Schuré’s picturing, spiced by schools of thought we may call “Traditionalism” (sometimes “Perennialism”) stemming from Coomaraswamy, Guénon, etc., has come to be the most popular one in New Age discourse.

7. CONCLUDING REMARKS

Varied as they may be, all the afore-discussed thinkers from the last two centuries proffered large *specula historiae* that appeared more and more distinctively “esoteric” because their framers now often self-consciously identified with an/the esoteric tradition. In spurning the more commonly accepted ways of reading the past (whether naturalistic, historicist, empiricist), they held the true story to be “missed” by the majority. Their approach here compares with the 20th-century theological distinction between a *Heilsgeschichte* (a salvation history grasped by believers) and “classic” *Historie*, and this is because it derives from traditional ways of understanding long-term temporal changes within spiritually-charged schemata. For esotericists what may be termed “hierohistory” takes absolute precedence over the mundane details typical histories cover (A. Versluis). But theirs is a distinctive preoccupation with “the inner mysteries” of change, not the *mêlée* of outward relations and transient visibilities. They are often connected with a search for a “third cosmos” parallel to microcosm and macrocosm, the final alchemical revelation (Al-Jabir [or Geber], *Summ. perf.*). Eventually, over the last hundred years, it has become an issue for esotericists themselves what the true “whole” history of the esoteric quest might be (Jung, E. Benz, P.A. Riffard, etc.).

To conclude, we may warn that there are many sub-themes in the world of esoteric macrohistory. The rôle of special, apparently marginal “mystery-figures” must first be noted. Consider the strange mythical figure of “Elias Artista”, who was invoked as a hidden Master from Paracelsus’ time, being a kind of saviour figure who could work wonders in the domain of alchemy. Another curiosity is the Count → Saint-Germain, said to be the same person unexpectedly reappearing at times of important esoteric disclosures (especially during the 18th century). This case connects with ideas about the → reincarnation of the same spiritual being in religious “greats” (as with the Theosophic Masters, or the notion of “Melchizedek – Christ – the man who was never born and will never die” (like the mystic Joel Goldsmith), but it has stronger associations with the undreading Dr. Faustus, who was prepared to make a pact with the Devil to attain all-knowledge. In Goethe’s *Faust* (1808–1832), which can be read as a “neo-gnostic” play, this mediaeval malapert becomes a hero: he is redeemed rather than damned for wanting to acquire forbidden knowledge and experiences beyond traditional learning and normative morality.

Such intruders into prohibited places, of course, were to be secularized in exoteric thought. For Friedrich Nietzsche Faustian consciousness suggested a longing for humanity to move *Beyond Good and Evil* (1886); and by his time Prometheus would symbolize that humanity itself, as against any divine gift-bearer, was quite capable of ‘unlocking the sciences, the secret of all memory, . . . and every occult art’ (cf. Aeschylus, *Prom. Desm.* 459–516).

Other sub-themes of interest concern the origin and antiquity of particular esoteric preoccupations. This may be illustrated from the case of → alchemy, traditionally traced to Hermes; and there is a tendency in alchemical writings to reinforce the mysterious aura of its past, with a given author’s avoiding claims of innovation and deliberately attributing his writings to someone greater. Yet again, there is the curious issue as to whether such a figure as Nostradamus (of some interest to esotericists) could have visioned events of future world history from the 16th century on; and there are even stranger questions surrounding the antiquity, ubiquity and “return” of were-wolves and vampires, → witchcraft and sorcery.

GARRY W. TROMPF

Magic I: Introduction

When contemporary academics discuss "magic", in most cases the assumptions which guide their understanding of it are variations on a few influential theories. First, there is the "intellectualist" understanding of magic linked to the names of E.B. Tylor and J.G. Frazer. Tylor, in his foundational *Primitive Culture* of 1871, defined magic as based upon 'the error of mistaking ideal analogy for real connexion' (Tylor 1771, I, 116). Tylor's assumption was that primitive man, 'having come to associate in thought those things which he found by experience to be connected in fact, proceeded erroneously to invert this action, and to conclude that association in thought must involve similar connexion in reality. He thus attempted to discover, to foretell, and to cause events by means of processes which we can now see to have only an ideal significance' (o.c., 104-105). It is clear from this definition that, for Tylor, not religion (based on animism, 'the belief in spiritual beings') but science should be the primary reference point for understanding the nature of magic; and this is confirmed by the fact that, throughout his discussions, he used it as synonymous with "occult science". Tylor's description of magic as something unrelated to animism/religion proved impossible to maintain,

however. Although at first he strenuously insisted that magic and religion were 'separate in their nature and origin' (1876, 1), in a large article on magic in the *Encyclopaedia Britannica* (ignored by all Tylor specialists ever since) he completely reversed his position and admitted that 'a large proportion' of magic actually belonged 'properly to the general theory of religion, inasmuch as their efficacy is ascribed to the intervention of spiritual beings'; other parts of magic, however, depend not on spiritual beings but 'on imagined powers and correspondences in nature' (Tylor 1883, 199; see discussion in Hanegraaff 1998). This about-face was not adopted by J.G. Frazer, who, instead, simplified Tylor's approach into his famous evolutionist triad: "magic" as the earliest and most primitive stage of development, followed by "religion" as a higher level, which is finally superseded by the third and final stage of "science". Magic in Frazer's usage actually means *sympathetic* magic (and therefore excludes spiritual beings), understood along the lines of Tylor's original position; it is based upon magicians' assumption 'that things act on each other at a distance through a secret sympathy', often explained in terms of 'an invisible ether' (Frazer 1951, I, 54). Frazer, furthermore, famously divided magic into "homeopathic (imitative, mimetic)" and "contagious" magic: a distinction that was probably taken straight from Tylor (see 1865, 119ff., 129ff.), who in turn could have found it in → Cornelius Agrippa's *De occulta philosophia* (I, 15-16), to which he frequently referred. This is a particularly clear example of how academic theories of magic may have unacknowledged roots in magical currents in Western esotericism.

A second highly influential approach to magic is the "functionalist" one, linked to the names of Marcel Mauss and Emil Durkheim. Mauss in 1902-1903 rejected Frazer's reduction of magic to sympathetic magic only, and concluded that in fact no tenable scholarly theory of magic as yet existed. As an alternative to the "intellectualist" approach focused on ideas, he proposed a functionalist approach focused on ritual action, defining a "magical rite" as 'any rite that is not part of an organized cult: a rite that is private, secret, mysterious, and ultimately tending towards one that is forbidden' (1950, 16). Essentially the same approach was adopted by Durkheim in his famous *Formes élémentaires de la vie religieuse* of 1912. On the basis of circular reasoning of a surprisingly elementary kind (see Hanegraaff 1999, 341-345) he assumed a 'marked repugnance of religion for magic and the hostility of magic to religion in return' and concluded that 'there is something inherently anti-reli-

gious about the maneuvers of the magician' (1912, 59-60). Against this background he defined religious beliefs as shared by, and constitutive of, a social group, referred to as a 'Church'; magicians, in contrast, have merely an individual clientele: 'There is no Church of magic' (1912, 61; emphasis in the original). In brief: religion is a social phenomenon, whereas magic is inherently non-social. Close study of Mauss's original discussion, from which Durkheim's was derived, shows that the assumptions basic to his theory are in fact derived entirely from the traditional categories of Christian heresiology: paranoid perceptions of magic as the practices of the unsocialized "other" are thus adopted, quite uncritically, as the foundation for a purportedly academic study of what magic is all about.

A third approach derives from Lucien Lévy-Bruhl's theory of participation – remarkably, given the fact that this author in fact did not intend it as a theory of magic. Lévy-Bruhl attempted over several decades to come to grips with what he originally called the "pre-logical" thinking or mentality supposedly prominent in "primitive" cultures: instead of a worldview based upon "instrumental causality" (i.e. one that assumes the presence of secondary causes or intervening mechanisms that mediate between causes and effects), typical of modern culture, primitives seemed to have a worldview based upon "participation" (where causes and effects could be seen as associated to the point of identity and consubstantiality, without assuming the presence of intermediary links). Lévy-Bruhl eventually came to recognize that participation constituted a primary and irreducible human constant, present in *any* society, whether primitive or modern. Later authors, most of whom had not carefully read Lévy-Bruhl himself but relied on caricatures of his thinking as found in e.g. Bronislaw Malinowski (1948, 25), assumed that participation and magic were equivalent; as a result, various theories have come into existence that interpret magic as based upon a "different kind of rationality" (see e.g. Robin Horton, and critical overview of the "rationality debate" in Luhrmann 1989, 345-356). There is a certain legitimacy to this, since theoretical frameworks alternative to "instrumental causality" (e.g. non-causal → correspondences on the one hand, and "occult causality" [→ occult/occultism] on the other) are in fact basic to much that has been understood as "magic", at least in Western culture since antiquity and up to the 18th century. Arguably such frameworks can, furthermore, be understood in terms of "participation". The fact that much magic is based upon such

frameworks does not logically imply, however, that those frameworks can in turn be called magic; the fact that such implications have nevertheless been drawn has contributed considerably to confusion about the term "magic".

The theoretical approaches originating in Tylor, Mauss and Lévy-Bruhl have been mixed and combined in various more or less interesting ways; but practically without exception this has been done *within* a general context that is more basic than the theories themselves, and the validity of which has usually remained unexamined: the triad "magic – religion – science", which may be linked mostly to Frazer's name but is in fact implied in some form by almost all participants in the debate about magic. Its point of departure is that "religion" (however defined) is clearly something different from modern science and rationality. That relatively unproblematic distinction once having been made, it is followed by the observation that there exists a certain class of phenomena in human culture and history which are likewise quite clearly different from modern science and rationality, but which somehow do not quite seem to fit the model of "religion" either. This third category is then referred to by a variety of names, the very abundance of which already demonstrates that it is in fact a waste-basket filled with left-overs: "magic", "the occult" (resp. "occultism", "occult science"), "superstition", "mysticism", "esotericism", "the irrational", "primitive thought" (cf. "fetishism", "idolatry"), and so on.

Tacitly assuming such a triad, scholars of religion have usually tended to be in favour of "science and rationality", respectful at least towards "religion", and negative about "magic and the occult". It is important to recognize that the very insistence on distinguishing between the last two categories (religion and magic) does not have its origin in any critical scholarly argumentation but means a simple continuation of the historical usage long known to western Christian culture. Religion meant "true (i.e., theologically correct) Christianity" while magic meant demonic worship and pagan idolatry. The discussion became more complicated since the 12th/13th century, with the emergence of the idea of *magia naturalis*: magic understood as "occult science" based on the hidden (i.e. occult) forces of nature, and therefore easier to legitimate theologically. As a result of this double heritage, with the emergence of modern science since the 17th century *magia naturalis* found itself open to attack from all sides: the protestant Reformation had given a revived sense of urgency to anti-magical arguments, many theological critics failed to be convinced about natural magic being non-demonic

and continued to accuse practitioners and theoreticians of the occult sciences of trafficking with the devil, and they were now joined by modern scientists and philosophers who accused them of obscurantism and irrationality. This last line of attack was taken over by the Enlightenment tradition, adopted by Tylor, and continued by scholars throughout much of the 20th century.

Most academic theories of magic since Tylor have continued to make a sharp distinction between religion and magic, in spite of the fact that this distinction properly belongs to the domain of theological polemics internal to Christianity, and cannot claim any scholarly foundation. The lack of such a foundation has not sufficiently bothered scholars of religion. After a purely theological notion had come to be uncritically adopted, it eventually ended up assuming the role of an unexamined guiding intuition in scholarly discussions: an assumption too basic even to be perceived, and too self-evident to be in need of arguments.

Political and social factors have played a significant role in this process as well, for the perception of “magic” and “the occult” as something sharply different from religion came to play an important role in the colonial enterprise. To the extent that the vestiges of true “religion” were encountered among primitive peoples in the form of “animism”, these could be redeemed and purified by being channeled towards Christianity. For the “magic” of the primitives, however (branded by Tylor [1871, I, 112-113] as a ‘contemptible superstition’ and as ‘one of the most pernicious delusions that ever vexed mankind’), such redemption was neither wished-for nor needed: it had to be rooted out by education or use of force. In its – ultimately fruitless – attempts to do so, the colonialist missionary enterprise essentially repeated the early Christian missionary attempt to free Europe from pagan superstition. In sum: scholarly theory about magic served as theoretical justification for converting non-European peoples from primitive magic to Christianity and an Enlightened worldview; but this theory itself was merely a reformulation of Christian-theological polemics against paganism.

In the post-colonial period Western scholars have become more sensitive about issues of ethnocentrism and Eurocentric arrogance, but the logical step of discarding the category of “magic” has not been taken. Many authors opt for half-way solutions such as speaking about “magic” while admitting that is a form of “religion”, but without explaining in what then relies its specificity. Others use adjectives such as “magico-religious”, but again without specifying in what respect this category is

different from “religion” pure and simple. A more consistent and historically more fruitful approach would be to start by recognizing the religious pluralism that has in fact always characterized Western culture, and analyze magic as a largely polemical concept that has been used by various religious interest groups either to describe their own religious beliefs and practices or – more frequently – to discredit those of others. If any etic concept of magic is still considered necessary at all, it might be used as the common denominator of ‘a discursive field, in which different Occidental definitions of deluded or illusory beliefs were accompanied by doubts about the extent to which they were deluded, illusory, backward, or irrational’ (Pels 2003, 16).

B. LITERATURE

1. INTRODUCTION 2. EVIDENCE FOR MAGICAL BOOKS
3. THE POPYRI GRAECAE MAGICAE 4. HELLENISTIC ANTECEDENTS

A. HISTORY

1. TERMINOLOGY

The modern term "magic" and its cognates derive, through Latin intermediates (*magia*), from the Greek *magikḗ*, "the art of the *mágoi*", the Persian priests (*magus* in ancient Persian). The Greeks used this word to designate a ritual practitioner occupied with private rites whose legitimacy was contested and often, at least in later times, marginalised and forbidden. The exact nature of these rites varies and comprises mystery cults (Heraclitus, frg. 14 DK), binding spells (*defixiones*) and certain forms of divination [→ Divinatory Arts]; what mattered more than a specific content was the opposition to legitimate and overt religious practice – magic, that is, was always seen as noxious. Other terms for the practitioners were the Greek *góes* (orig. the "wailer", a specialist for the communication with the dead), whence *goeteía*, "sorcery" (in later texts with a more negative connotation than *mageía*), and, as a specialist, *pharmakeútria*, a "woman using herbs and drugs" (like Medea). Latin equivalents are *saga*, "witch", *veneficus*, "poisoner" and, in later texts, *maleficus*, "evildoer"; a specialist for undoing binding-spells was, in 5th century Athens, an *analútes*, "unbinder". The Near-Eastern association of sorcery expressed in the term *mágos/magus* appears also in the designation of "magicians" as *Chaldaíoi/Chaldaei* (lit. an inhabitant of Chaldaea, a region in southern Mesopotamia) that appears from Hellenistic times onwards and might have its root in the actual presence of Near Eastern specialists in the Graeco-Roman west.

2. ANCIENT THEORIES

Thus, the general Greek and Roman assumption was that magic originated with the Persians. This

view is as old as the perception of "magic" as something different from other cultic activities; both go back to the late 6th century B.C. The alternative view held by Pindar in the fourth *Pythian Ode* (a. 462 B.C.) was already dated at that time and never became popular: according to his narration, Aphrodite taught erotic magic to Jason in order to seduce Medea. In this mythical account, then, (erotic) magic is understood as a cultural technique that can be taught, like agriculture or writing.

The dominant view in antiquity, however, marginalizes magic much stronger by removing its invention in place and time. It is uniformly said to come from the Persian sage → Zoroaster whom most ancient authors date well before the Trojan War. According to Pliny (*Natural History*, bk. 30), who reports the general opinion but challenges an early date, magic developed out of healing, was very early influenced by → astrology, and was in Persia such a respectable art that Pythagoras, Empedocles, Democritus and Plato went to Persia to be taught in it. This reflects an alternative evaluation of barbarian wisdom that makes non-Greeks into retainers of supreme knowledge (Momigliano 1975). From early on, it was debated whether the Persian *magoi* were philosophers or wizards (in Persian itself, *magús* could have a negative connotation as well). The positive ("ethnographical") reading of the term (from Herodot onwards, with Plato, *Alcibiades Maior* 122b, as the most influential passage and a lost Pseudo-Aristotelian dialogue as its most thorough exposition) competed with the negative ("Greek") understanding (Bidez and Cumont 1938). Another early magical culture was perceived in Judaism, with → Moses as its inventor; this reflects the high esteem Jewish magic enjoyed in Hellenistic and Imperial times. Egypt, on the other hand, was rarely regarded as the origin of magic, despite its indigenous tradition that made Isis into, among other things, a powerful magician and that had in the goddess Hekate a divine exponent of ritual power. Homer makes it the homeland of 'potions, some helpful when mixed, but most harmful' (*Odyssey* 4, 228); later, it is important only in the Graeco-Roman texts that directly fed on the Egyptian tradition, like the work of the Egyptian writing in Greek Bolus of Mendes (first half of the 2nd century B.C.), the Hermetic tradition, especially the *Asclepius* (2nd century A.D.), or the so-called magical papyri (3rd-5th century A.D., with earlier antecedents).

Other ancient theories concerned not the origin of magic but the way it was functioning. The general view, most succinctly presented by Apuleius (*Apologia* 22) was that the magician had superhuman

powers granted to him because he could directly talk to the gods ('*communio loquendi cum dis*'). This puts an emphasis on the power of spells and prayers that goes well beyond the sphere of magic (Baeumer 1984), but is confirmed by the actual rituals and their aim to make the ritual word as durable as possible (see below). This is less rooted in a belief in an inherent power of the ritual word than in the assumption that the magician's direct access to a supreme divinity grants him power over the lesser demons he is using for his purpose. This demonological understanding of magic is the general view of later antiquity as found e.g. both in the Magical Papyri and the actual ritual spells, and it is, in a semiotic theory of speech, the basis for → Augustine's refusal of magic: since the meaning of words is arbitrary and results from an agreement between the speaking parties, magic loses its power when the Christians cancel this agreement between themselves and the demons and thus make language unintelligible to them (*De doctrina Christiana* 2, 36-38 [Markus 1994]). Well before these later theories, Plato formulated in his *Laws* a social and psychological theory of magic that dispensed with any metaphysical entities. Magic, seen only in the widespread reality of binding spells with the help of magical dolls, is a special instance of poisoning (*pharmakeía*), performed both by specialists and by laymen; its use for personal aims results from the moral decay of society, and its success lies in the fear it creates (Plato, *Laws* 11,932f.). Ideally, these fears should be allayed by persuasion, but in the actual state of society, severe punishment of its use was the only possible remedy.

3. RITUALS

The main use magic ritual was put to in Graeco-Roman society was for binding spells (*defixiones*). Text of such spells, written on thin sheets of lead, date back to the later 6th century B.C. (Sicily, Southern Italy); in the later 5th century, they begin to be more numerous in mainland Greece as well, especially Athens. The early texts typically invoke divinities of the underworld (Persephone, Hermes Chthonios) and 'dedicate' (*anatithèmi*, Lat. *devo-veo*) or bind down (*katadeo*) to them one or several individuals; the texts were usually rolled or folded together and deposited in graves or wells. From the late 5th century onwards, these lead texts could be accompanied by a statuette of a person whose arms were tied to the back (in an iconography that goes back to Egyptian rituals to keep away enemies from the borders [Ritner 1993]). These statuettes represented the victims of the spell and were often inscribed with their names. Outside Egypt, only

lead statuettes are preserved, while Egyptian graves also preserved some wax statuettes; the use of wax for statuettes and of waxen or wooden tablets or of papyrus for the texts is attested in literature. The texts themselves were often pierced with a nail, and 'nailing down' (*katapassaleo*) is another term for the ritual activity, used in Attic Greek. If the rituals described in the much later Graeco-Egyptian papyri can be used as a guide for these earlier rituals (and the rites seem to show some uniformity and stability), one has to assume that the spells written on the lead tablets were recited at the time they were written and in the place where the tablets then were hidden. The written texts thus preserved the powerful ritual word, and the spell was broken only when the tablet was found and destroyed, as at least one later text and the papyri confirm. The existence of a professional "unbinder", an *analútes*, in 4th-century Athens, however, points to other ritual means of undoing the spell that elude our knowledge, while an oracle from Apollo in Klaros (about 166 AD) prescribes a fire ritual to melt down the waxen magical images that caused a plague (*Zeitschrift für Papyrologie und Epigraphik* 92, 1992, 276-78).

Binding spells were used in situations of crisis created by contest and rivalry; they served to defuse an uncertain and therefore frightening situation. They might concern the conquest of an erotic partner (mostly by males, and usually as a spouse rather than for an amorous adventure), victory in court or in an athletic contest, or success over a rival businessman or craftsman. Binding spells against one's adversaries in court were very prominent in 5th and 4th century Athens, but not confined to this place and time; an interesting case concerns a lawsuit brought against a priest of Sarapis in early Hellenistic Delos (Engelmann 1975). During the imperial epoch, athletic spells usually concerned chariot races where the social stakes were very high (see Jerome, *Life of Hilarion* 11). While earlier binding spells ordinarily aimed at temporally incapacitating an adversary (which did not exclude accidental death e.g. through a badly administered love potion), the spells from the imperial epoch often threaten the death of their victims. Therefore, the Sullan *Lex Cornelia de sicariis et veneficis* (82 B.C.) was extended to cover magical attacks as well.

In early Rome, another area of magical action was thought to be the transfer of harvests and crops from one field unto another with the means of spells (*perlicere* or *incantare messes*). The XII tablets provide capital punishment for this form of illegitimate gain, and historians preserve one instance of a trial under this rubric, held in the early

2nd century B.C. (Pliny, *Natural History* 18, 41-43); later, it became a purely literary motif (Virgil, *Bucolics* 8, 99).

During the imperial epoch, private forms of divinations began to become another field whose rituals were thought of as magical (Graf 1996). The Graeco-Egyptian papyri contain many recipes that prescribe rites for the sending of dreams (a private form of divination), for screening (lecanomancy) and, less often, for necromancy. Several laws by the Christian emperors of the 4th century ban divination together with other magical practices (esp. *Codex Theodosianus* 9,16,3-7. 9), and already Apuleius, in his defense against the accusation of magic, mentioned ecstatic divination induced by magical means (Apuleius, *Apologia* 42). This extension of the field of what ancient cultures viewed as magic is less due to the rise of divination outside the official divinatory sanctuaries (there was always informal divination as well, although we lack data to its extent in archaic and classical times) than to the monopoly of the emperor and, in the Christian 4th century, the bishops on access to knowledge about the future (Fögen 1993).

The status of ritual healing (a sphere that modern definitions of magic often subsume under this category) in Greek and Roman culture is less easily determined. Homer is aware of the stanching of blood with the help of spells (*Odyssee* 19,457), but avoids any term that could connect it with magic. The professional doctor, however, who wrote, at about 400 B.C., the Hippocratic treatise *On the Sacred Disease*, ascribes the ritual healing of epilepsy to quacks, cathartic priests and sorcerers, turning magic polemically into the opposite of medical science (Lloyd 1979); a similar dichotomy appears, much later, in Apuleius' treatment of epilepsy (*Apologia* 48f.). Varro and Pliny report cures with, among other things, the help of spells but refrain from labeling them magical, while the Graeco-Roman papyri contain several recipes for the treatment of otherwise untreatable ailments – headache, toothache, and similar minor problems. Only Christian teaching was confronted with the problem that in some cases healing was a miracle due to divine intervention while other cures, performed by some marginal old woman, were viewed as magic and sorcery.

4. MAGIC AND PHILOSOPHY

While magic, before the imperial epoch, was a straightforward albeit mostly illegitimate type of ritual behaviour, it gained a new dimension in learned speculation and popular imagination of the imperial period. On the one hand, in popular per-

ception the borderline between philosopher, charismatic miracle worker and sorcerer began to break down. In about 158 CE, in his defense against magic, the Platonic philosopher Apuleius carefully tried to establish such a distinction (Apuleius, *Apologia*). Some six decennia later, Philostratus gives an account of the 1st century Neo-Pythagorean Apollonius of Tyana that deals also with the accusation of magic brought forward against him by Domitian (Philostratus, *Life of Apollonius of Tyana*). Such accusations persisted well into a Christianized empire (trial and execution of Boethius in 524 A.D., inter alia because of magic).

The corollary of this perception is the “theological turn” of late antique philosophy, starting with Middle Platonism. Already before that, Neo-Pythagoreanism came close: in 28 B.C., Augustus expelled the Neo-Pythagorean philosopher and magician Anaxilaus of Larissa (Jerome, *Chronicle*). Taking their clue from Plato's demonology (esp. in the *Phaedrus*), Platonist philosophers constructed a cosmology in which a more and more complex hierarchy of superhuman beings was active; at the same time, the demonological interpretation of magic became all-pervasive. Plotinus, who clearly marked the distance between philosophy and magic (*Enneads* IV, 43), was believed to be able to ward off magical attacks by an adversary with the help of his superior guardian divinity (Porphyry, *Life of Plotinus* 10). Later, Maximus of Ephesus, the teacher of the emperor Julian, protected a pupil against an erotic binding spell (Eunapius, *Life of the Sophists* 6.9), and Proclus, the last head of the Athenian Academy, was believed to have performed weather magic (as had already, about a millennium earlier, Empocles of Acragas) with the help of a traditional magical instrument, the iynx (Marinus, *Life of Proclus* 28).

The decisive step towards blending magical and philosophical traditions was made by the creation of theurgy, as expressed in the *Chaldaen Oracles*; its creators were Julian father (“the Chaldaean”) and son (“the theurgist”) in the later 2nd century A.D. (Johnston 1997). Literally ‘working the divine’, theurgy was a ritual technique that performed the ascent towards the supreme god as the source of pure knowledge (*nous*). Since the ecstatic ascent was sought for by the philosophers (Plotinus was said to have several such experiences), it could have purely cognitive aims, but it also could serve divinatory purposes (an ascent ritual as a means for divination is described in *PGM* IV, the so-called “Mithras Liturgy”). Plotinus' pupil Iamblichus defended theurgy as a philosophical technique against the accusations of his fellow pupil Porphyry

(*On the Mysteries of Egypt*, directed against Porphyry's *Letter to Anebo*) and projected it well into the far past of Egypt, and theurgical techniques were used and defended as late as Proclus (*Theologia Platonica* 1.29). Together with the praise of Egyptian "magic" in the Hermetic *Asclepius*, this prepared the ground for Renaissance magic.

B. LITERATURE

1. INTRODUCTION

With the exception of the so-called "Greek Magical Papyri" from Roman Egypt and texts related to them that all follow an Egyptian tradition of ritual texts, albeit partly in Greek form, Greek and Roman society had no collections of texts that were used in magical rites. Theurgical, astrological and Hermetic texts form separate, although related traditions with some overlaps. This scarcity of texts distinguishes these societies from those of the Near East and Egypt where collections of ritual instructions used in apotropaic rites of magic and comparable contexts played an important role, but it goes together with the lack of written ritual manuals in Greek and in most parts of Roman culture – with the exception of the so-called *Etrusca disciplina*, a Latin version of the corpus of Etruscan religious writing on esp. divinatory and cathartic ritual that was connected with the haruspices (*libri rituales, haruspicipini, fulgurales*). There were, however, numerous pseudepigraphical collections of hexametrical texts used in mystery cults and divination (Orphic poetry, oracles of Bakis and of the Sibyls). Among these books, the *Chaldaean Oracles* (*Oracula Chaldaica*) that contained the essence of theurgy can be regarded as belonging to magical literature as well.

2. EVIDENCE FOR MAGICAL BOOKS

The existence of magical books is attested through the entire imperial epoch and in many places, especially in the Greek East. When preaching in Ephesus, Paul moved those 'who formerly practised magic' (esp. exorcism) to burn a considerable number of their books (Acts 19, 19). Around 400 A.D., the compiler of the *Sentences of Paul* (*Pauli Sententiae*), a collection of commentaries on earlier laws, states that 'nobody shall possess books about the magical craft (*libros magicae artis*)', lest he risk their public burning, the confiscation of his fortune and exile or death (5, 23, 17). When, in about 490 A.D., Egyptian students at the law school of Beirut dabbled in magic, one of them at least had secret books with 'drawings of perverse demons, barbaric names and harmful . . .

commands' that were said to go back in part to Zoroaster or Ostanes, Persian founders of magic (Zacharias, *Vita Severi*, 61). The authorities had the books burned. The burning of secret books that were viewed as deviant or dangerous has a long history in Roman culture that precedes the Christian emperors. On his accession as pontifex maximus in 13 B.C., Augustus had burnt about 2000 oracular books that rivalled the Sibylline books (Suetonius, *Life of Augustus*, 31, 1), and already in 181 B.C., the Senate ordered the burning of (Pythagorean) books by Numa that were found in a grave (Livy, 40, 29) (Speyer 1980).

There is no evidence for magical books before imperial times. Binding spells written on lead tablets, however, go back to the late 6th century B.C. in Sicily and Southern Italy, to the later 5th century B.C. in Athens and other parts of the Greek mainland. These texts are short (often simple lists of names) and in prose, with a stereotypical vocabulary that is specific to the region they come from. Nothing necessitates the assumption that these texts derive from ritual books (as in the case of the much more elaborate and more uniform hexametrical texts on the so-called "Orphic" tablets). Although they were, in part at least, executed by specialists of whose existence Plato knows (*Republic* 364 bd), an oral transmission is more likely, as it is certain for much older texts, e.g. the incantation for stanching blood mentioned in *Odyssey* 19, 457.

3. THE POPYRI GRAECAE MAGICAE

The only extant magical books are part of the collection of the *Papyri Graecae Magicae* (Greek Magical Papyri, PGM). The name and the collection are modern; it was edited by Karl Preisendanz (with the help of colleagues) after the First World War (vol. 1: 1928; vol. 2: 1931; vol. 3, with the indexes, fell victim to the Second War). The collection contains, besides the magical books proper (i.e. collections of instructions for magical rituals), magical formularies (i.e. the instruction for one specific rite written on a small scroll or piece of papyrus), and actual applied magical texts written on papyrus or lead [→ Amulets]. Its name is insofar a misnomer as some of the books contain substantial parts written in Egyptian (in demotic script), sometimes with glosses in Old Coptic (Brashear 1995). Since the publication, new texts have been found; some of them have been added in the second edition (1973/74) and the English translation (1986) of PGM, others are collected, with ample commentaries, in the *Supplementum Magicum* (2 vols., 1990 and 1992).

The books in question are large collections of ritual prescriptions, written between the third and the 5th century A.D. The *PGM* edits thirteen books of different length, and about 20 shorter formularies (mostly for one or very few single rites) have been published since then. Six of the books come from the same cache in Egyptian Thebes (the so-called Anastasi cache, after the Alexandrian merchant who bought them in 1828) that contained also two alchemical papyri. They represent a library ‘designed for study rather than for the practical use’ (Fowden 1986) and demonstrate the close relationship between magic, hermetic, and alchemical texts.

The books as well as the short formularies all contain instructions for the performance of rituals, with detailed indications of the necessary ingredients for the rite and its place and time, and with often long accompanying spells (*logos*) and hymns. In the Greek texts, these spoken parts contain also non-Greek parts – either series of vowels and consonants or seemingly abstruse words. These latter are the “barbarian names” that are prominent in descriptions of magical rites: in the performer’s opinion, they represent the true name of a divinity or demon. Often, they sound vaguely Egyptian or Hebrew, and scholars have tried to analyze them with the help of these languages. The results are not always convincing, and it often seems that the authors of the texts themselves aimed at an Egyptian or Hebrew name, but, given their lack of linguistic knowledge, were content with a vague resemblance. Underlying is the theory that Egyptian (and Assyrian) were the oldest human languages and as such very close to the language of the gods, which made the use of Assyrian and Egyptian most welcome and effectful to them (Iamblichus, *Mysteria*, 15). This also explains the occurrence of the name of the Sumerian goddess of the underworld, Ereshkigal, in some texts. The texts are all written in a general prescriptive style; personal names of victims that would have to be written and spoken during the actual performance are replaced by a general reference to ‘NN son/daughter of NN’.

The single papyrus books are not uniform as to their content. Most of them contain a loosely arranged sequence of single, self-contained instructions for a single specific ritual: to acquire a demonic assistant (indispensable for becoming a magician), to obtain divine revelation awake or in a dream, to perform a binding spell, or to make an amulet. Only one papyrus (no. VII, London, British Museum) contains also a significant number of instructions for healing rituals for minor ailments. The books are thus loose collections of instructions

for single rites like the ones preserved in the formularies, assembled over time according to the taste of the single collector. Thus, they shed an important light on the existence and form of earlier magical literature. Once, the source is a ‘holy book’ (*PGM* III, 424) or a book found in Aphrodite’s sanctuary in Aphroditopolis (*PGM* VII, 852). Some texts have the form of letters (e.g. from a certain Nephotes = Nefer-hotep to king Psammetichos, with instructions for ‘procuring a holy power’ and bowl divination, *PGM* IV, 154-285; or from ‘Jeu the Hieroglyphist’ to gain power over the demons, *PGM* V, 96-171). In a few cases, more substantial older texts that have been incorporated into the extant collection are discernible. The most important are:

- the detailed description of a theurgic ascension rite, the so-called “Mithras Liturgy” (*PGM* IV, 475-829, a 4th century book from the Anastasi cache, now in Paris, Bibliothèque Nationale);
- an elaborate erotic binding spell, the “Sword of Dardanos” (*PGM* IV, 1716-1870; “sword” refers to a specific type of formula, as in the “Sword of Moses”);
- three versions of a necromantic ritual ascribed to one Pitys the Thessalian (*PGM* IV, 1918-2005; 2006-2125; 2140-2144);
- three version of the *Eighth Book of Moses*, also called *Monas*, with references to a commentary on it, the *Key* (*PGM* XIII, 1-734, another 4th-century book from the Anastasi cache, now in the Rijksmuseum van Oudheden, Leiden).

4. HELLENISTIC ANTECEDENTS

These and other texts preserved in the collections (e.g. the *Diadem of Moses*, *PGM* VI, 619, a 2nd or 3rd century book in the British Museum) shed some light on the vast lost production of ritual instruction in Graeco-Roman Egypt that followed earlier, indigenous examples and might thus go back to Hellenistic times (Smith 1984). The main author whom Greek and Roman sources connect with magical literature is the Egyptian Bolus of Mendes (2nd century B.C.). His *Cheirosecta*, written under the name of the pre-Socratic philosopher Democritus, is the first compilation of magical material of which we hear (Dickie 1999). Democritus, like Pythagoras and Plato, was thought to have learned secret Egyptian wisdom when travelling in the East, and he is connected with a variety of magical rituals (see the medico-astrological text in *PGM* XII 351-64, the dream ritual *ibid.* VII 795-845, or the entertaining tricks *ibid.* VII 168-85). The book is lost, and its character and influence is debated, but one has to assume considerably more

coherence and a less loose and haphazard form than the one of the extant magical books. A somewhat later author is Anaxilaus of Larisa, magician and Pythagorean who was expelled by Augustus in 28 BC (Jerome, *Chronicle*). He is known as the author of *Paignia*, magical tricks for entertainment rather than “serious” magic, although this dichotomy is not necessarily relevant for an imperial culture where tricks and divination were both performed by market place magicians, and where the magical books of the PGM contain some such tricks as well.

B. LITERATURE

1. GENERAL DIVISIONS 2. CHANGES OVER TIME 3. TRANSMISSION AND SURVIVAL 4. GENRES (A. DIVINATION B. EXPERIMENTS, BOOKS OF SECRETS, AND RECIPES C. CHARMS D. ASTROLOGICAL OR ASTRAL MAGIC E. RITUAL MAGIC)

A. HISTORY

While “magic” was used as a term of opprobrium from antiquity, by the later middle ages it begins to be possible for intellectuals to argue in a limited fashion for the positive benefits of some types of theory and practice that are connected to the idea of magic (though the word “magic” might still be avoided by some writers interested in

praxis, and negative uses of the word continued as before). In what follows we will trace the basic contours of the anti-magical arguments of the early middle ages and outline the intellectual developments that led to the beginning of the positivization of certain ideas connected to magic in the 12th and 13th centuries.

It should be taken as axiomatic that in any era alongside any positivized view of magic there will be found negative views, and that positive and negative views, varyingly configured, can coexist in the same time period, the same social circles, and even in the same person. Thus in the early modern period, when arguments for positivized forms of magic were more common than they had been before, the condemnation of magic (as “maleficium”) was also harsher than it had been before: in the writings of the Abbot → Trithemius both poles of the opposition are voiced with equal rhetorical extremity, and the *Malleus Maleficarum* itself is careful to define forms of “natural magic” not counted as → witchcraft. In outlining the “positivization” of magic in the later middle ages, we will thus be describing the recasting of an old problem, not its elimination. If the voice of condemnation is often the loudest voice heard, the intellectual climate in the later middle ages nevertheless undergoes an alteration in its attitude to magic on a deeper level, recuperating from Arabic and Hebrew sources some of the bases on which the syntheses of magic with philosophy and theology are constructed in the early modern period.

I. EARLY MEDIEVAL CONSTRUCTIONS OF MAGIC

For the Christian middle ages the primary touchstones of anti-magical argument were the writings of the Church Fathers, particularly Tertullian and → Augustine. In early patristic writings anti-magical polemic is typically connected to invective against paganism. It may be noted that these condemnations of paganism had a strong intellectualist bias, and Patristic writers could often be seen carving out a space for the admirable aspects of pagan literature and philosophy while taking to task pagan ritual practices described in the same texts. The primary concern of the Christian writers in this period was less over the continuance of pagan religion as such than over the possibility of heterodoxy, manifested as worry that unacceptable forms of “pagan” practice might be introduced or adapted into Christian contexts, or taint texts that Christians were likely to read and take seriously. This worry was not without foundation, since alongside these attempts to purify Christianity of

“pagan” superstition, there is evident a considerable syncretism of ritual practice (of the sort manifested e.g. in the Coptic texts collected in Meyer & Smith), not comforting to the Christian theologian because it introduced the names of Christ, apostles and saints into charms, spells, and → amulets.

Augustine was perhaps the most powerful early exponent of anti-magical ideas, and while many loci in his writings get drawn into discussions of magic by later writers, two have particular importance for the present discussion. In *De civitate Dei*, Book X, Augustine makes an extended attack on theurgy, condemning it as no better than a disguised form of necromancy. His argument upholds Neoplatonic thought [→ Neoplatonism] in general as the form of pagan wisdom closest to the divine truth of Christianity, but he takes to task Porphyry’s vacillation on the topic of theurgy, shoring up anti-theurgic portions of Porphyry’s writings with his own arguments and ultimately objecting to theurgy as inconsistent with both Christian practice and Neoplatonic thought. In the *De doctrina christiana* Augustine similarly concerns himself with the discernment of truth in pagan literature. A discussion of the need for Christian education in pagan philosophy (on the principle that wherever the truth is manifest, it is God’s) leads to the topic of superstition; under this heading he eschews magic, → astrology, the use of ligatures in medicine, and a detailed list of superstitious practices. Magic is linked to idolatry and demonolatry through sign theory: because of its use of ambiguously directed voluntary signs, which demons may manipulate and use to deceive humans, magic may be seen as a kind of language which humans and demons have in common. This locus became an important touchstone for later writers right through the early modern period, not only for distinguishing what constituted a superstitious or magical practice for the purpose of condemning it, but also in distinguishing what constituted “natural” magic (a concept alien to Augustine himself) from the demonic kind which involved voluntary signs.

Other treatments of magic condemn it in a way that is more colorful, literary and mythic. Early medieval encyclopedic texts, whose discussions of magic mostly derive with variations from the entry on *Magi* in the *Etymologies* of Isidore of Seville (ca. 560–636), are in accord that magic arts were delivered to human beings by bad angels; their first human exponent is → Zoroaster. Isidore’s entry on “magi” includes a catalogue of magical arts which would remain a standard topos in medieval writings long after many of the practices listed had ceased to be used or had changed meaning: these

include necromancy, hydromancy, pyromancy, aeromancy, geomancy, various other methods of classical divination [→ Divinatory Arts], and astrology. Isidore's list is compiled from a variety of classical writers (Virgil, Lucan, Varro), as well as the Bible and Patristic sources; he quotes Augustine's prohibition on the use of ligatures in medicine, equating the effect of such ligatures, as Augustine does, but more literally, with demonic activity. On the whole his negative view of magic tends to concretize and mythologize much that remained metaphorical, theoretical and abstract in Augustine's writing.

Other sources for the condemnation of magic include legal tracts and penitentials which manifest a more immediate concern for folk practices continuing through this period. These add little to the theoretical grounds either for the suppression and exclusion of practices identified as magical, or for the inclusion of certain specific forms of magic as lawful, though it has been argued by Valerie Flint that many such practices were in fact deliberately adopted and adapted, made over into a "Christian magic" without which the Church could not successfully have competed with pagan religions. However, the adoptions of new forms of ritual were not defended as "magic" by their Christian exponents and there is as yet no basis for the use of the term "magic" or its cognates in the positivized sense implicit in the notion of "natural magic".

2. LATE MEDIEVAL CONSTRUCTIONS OF MAGIC: NATURAL PHILOSOPHY

Riding in on the wave of Latin translations of Arabic philosophy in the 12th and 13th centuries came a number of texts with a magical orientation, including works of astrology, → alchemy, and image magic. Connected to the interest in these areas there also appeared classifications or schemes of learning, likewise deriving from Arabic sources, which tentatively included magical arts among the standard divisions of knowledge. Dominic Gundisalvus (fl. mid-12th century) composed a work, *De divisione scienciarum*, where the subdivision of physics (drawn from Alfarabi [?-950], whose works he translated) includes judicial astrology, medicine, natural necromancy, image magic, agriculture, navigation, alchemy, and optics. This attempt to include magical arts among legitimate sciences hardly went unopposed; in the same time period, Hugh of St. Victor (?-1142) wrote about magic only to exclude it vehemently from the domain of legitimate knowledge as a type of false knowledge.

Despite the opposition of Hugh of St Victor and

other theologians to the idea that any type of magic should be included in the curriculum of legitimate learning, the influence of Arabic treatises in natural philosophy provided an entry point for the locution "natural magic" into learned discourse. There is evident, in this period, a more subtle attention to distinctions between individual practices that might once simply have been classified as magical (and illicit) without qualification. → Michael Scot divided astrology and magic into permissible and impermissible categories, as did the author of the *Speculum Astronomiae*, focusing on specific texts in circulation and drawing careful distinctions between them, defending as licit a few types of image magic and geomancy, which seemed to work only by occult natural powers. Albertus Magnus, → Roger Bacon, and others express concern over the fact that the large number of demonic or corrupt works in circulation might have caused some authorities to accuse other books of containing illicit demonic magic as well, while in fact they contain legitimate and useful natural knowledge – an argument which is already a kind of rhetorical set-piece, and emerges in many early modern apologies for magic as well. Even the more conservatively Augustinian Thomas Aquinas (1225-1274), in the process of condemning talismanic magic in general in the *Summa contra gentiles* (III, 105), makes an allowance for figures which may acquire power from the stars, provided that they do not include letters or characters. In his ban on characters he shows a concern for the strictures against demonic communication laid out in Augustine's *De doctrina christiana*; but in his allowance for artificial forms without writing on them he shows both a heightened sensitivity to the idea of stellar influence and a looser notion of what might constitute a sign than Augustine does.

In fact there were close connections between the developing interest in astrological theory and the loosened notion of what might (or might not) constitute a sign. The treatise *De radiis stellarum* by the Arabic philosopher → Al-Kindi, widely circulated in Latin translation from the 13th century on, exercised a strong though mostly unacknowledged influence on the ideas of what constituted natural magic. Al-Kindi argued that words as well as characters and images were infused with the power of the stars just as all other natural and artificial objects were. For most late-medieval readers there were philosophical difficulties in countenancing the claims for verbal power made by Al-Kindi because of the very direct connection drawn by him between the power and meaning of words and signs, which fell afoul of Augustine in one direction

and Aristotle in another. However the idea that words or sounds might nevertheless carry occult virtue had support in other branches of philosophy. Roger Bacon himself argues for the power of words (without at any point mentioning Al-Kindi's treatise, though he is clearly familiar with it), relying on ideas current in medicine, optics and more reputable branches of astrology to buttress his statements.

Though the notion that words and characters might have a "natural" power was always carefully qualified in the most philosophically rigorous texts, by the end of the 14th century the number of practices that might be included relatively unproblematically under the heading "natural magic" had grown considerably larger. In the late 14th century *Confessio Amantis* of John Gower (ca. 1330-1408) the four divinatory modes listed in Isidore's catalogue as hydromancy, pyromancy, aeromancy and geomancy, are classified as "natural" and acceptable, although all of these had been excluded from legitimate knowledge by Hugh of St Victor and, of the four, only geomancy had been given limited acceptance as "natural" by Albertus Magnus. This loosening and expanding of ideas that might fall into the category "natural magic" was in part due to the increasing popularity and vernacular dissemination of books like the pseudo-Aristotelian *Secret of Secrets*, which were never theologically questionable in the same way that the *De radiis* was, but relied implicitly on related ideas of astral influence, → correspondences, and the power of human intention, and became a frequent resource of popular writers and encyclopedists. In the late 14th century "magic" was more heatedly condemned than ever, but a quantity of esoteric knowledge had now become mainstream.

3. MORE LATE MEDIEVAL CONSTRUCTIONS: RITUAL MAGIC

In addition to the expansion of ideas categorized as natural magic, the later middle ages saw an increased circulation of texts of ritual magic. These included both experiments in which demons were summoned and bound, and rituals of a *prima facie* more credibly Christian character like the *Ars notoria* and the *Sworn Book of Honorius*, relying on the invocation of angels and other divine entities. Some of these show filiations with Hebrew texts like the *Liber Rasiel* and probably derive from Jewish paradigms (as argued by Kieckhefer [1998]); others show an array of Arabic Neoplatonic and Hermetic strands [→ Hermetic Literature]. Clearly no type of ritual involving overt conjuring or invocation of spirits had any hope of

being included in the medieval category of "natural" magic. Nevertheless, ritual magic texts had a strong influence (though again largely unacknowledged) on the developing idea of what magic was.

It must be remembered that the strong concern with the *distinction* of licit from illicit books and of occult natural powers from demons so evident in texts like the *Speculum Astronomiae* is largely a result of the fact that the texts under examination made no such distinctions themselves. "Necromantic" books might contain a broad variety of experiments shading in one direction into innocuous astrological magic and in the other into technical recipes or party tricks. Ritual texts of all types might open with claims that they transmitted divine secrets, the ancient wisdom of Hermes, or angelic knowledge; or they might introduce injunctions to purity and secrecy suggesting the possibility of corruption of their contents by demonic agency or human carelessness. These topoi are echoed in the suspicion of philosophers that some of these texts contained legitimate knowledge and that they were sometimes condemned without reason. Indeed the widespread condemnation of many practices, texts, and individuals which became increasingly common through the 13th and 14th centuries (often with motives that were clearly political or self-serving), had the effect of making individuals more reliant on their own judgment in spiritual matters than they might otherwise have been. A combination of factors thus conspired to make the copying and use of such texts, and the discernment of their natural, divine and demonic elements, very much a matter of individual judgement.

In angelic magic, perhaps, we come closest to the kind of radical positivization of magic characteristic of early modern texts, though without any attempt to justify the operations in them as "natural." In the proem to the *Sworn Book of Honorius*, magic is defended against the libelous charges of bishops and prelates, whom the author suggests have been diabolically inspired. But what is meant by "magic" here has nothing to do with occult natural power, but rather with the magician's power of binding and loosing spirits. Defending magic as a high and ancient wisdom, the writer of the *Sworn Book* argues that spirits are constrained only by clean men, not wicked ones. In the theurgic operations of the *Ars notoria* by contrast the word "magic" is not used at all; though the work is widely characterized as sorcerous by theologians, it represents itself as a set of holy prayers delivered to Solomon by an angel allowing the user to obtain infused knowledge of the liberal arts, philosophy

and theology. In the *Liber visionum* of John of Morigny (fl. 1304-1318), we are able to trace some of the ambiguities of the medieval operator's perspective on this text. John describes a developing relation to the *Ars notoria*; he begins by accepting the view articulated by the text itself that the prayers are holy and without danger of any sin but through a series of visions comes to see that the text has been corrupted by demons. Recognizing that the knowledge the *Ars notoria* claims to transmit is nevertheless necessary for salvation, John sets out to recuperate its divine aspects in a new art, the *Liber visionum*, which is delivered to him at his request by the Virgin Mary. The *Liber visionum* characterizes itself as magical no more than the *Ars notoria* does, but it may be noted that within its prayers even the exceptive (or magical) arts are transmitted by the Cherubim in the penultimate part of the ritual for the deliverance of philosophy. What is made explicit in the *Sworn Book* is implicit here too: the magic arts in their purified form represent not merely innocuous natural knowledge, but a holy wisdom whose earthly form only has been corrupted.

While the radical positivization of magical ideas found in texts like the *Sworn Book* could hardly be expected to find orthodox acceptance, the very fact that ritual magic texts exist in numerous manuscript copies constitutes evidence that the late medieval idea of magic had come some distance from the tightly restricted Augustinian definition. Though there was as yet no grand unified theory drawing together the varied strands of positivized magic (of the sort → Agrippa and others were later to provide), the essential elements for such a synthesis were already in place. By the 14th century there is a generally more open acknowledgment of the importance of astrological theory and the system of → correspondences based in it (in formal natural philosophy as well as more arcane sources); there is increasing acknowledgment and acceptance of the existence of a variety of forms of natural magic (as well as increased argument over what these consist of); and there is an evident increase in experimentation with theurgic practices, as well as theories and technologies involving hierarchies of angels, demons, planetary spirits and the like. It is against this background that the subsequent emergence of the large scale magical syntheses in the early modern period must be seen.

B. LITERATURE

Medieval magical literature was the product of authors with some level of book learning. In large measure it was preserved and transmitted in

monastic or clerical contexts, although courts and universities were also important centres of transmission. Much of it was written in Latin rather than vernacular languages until the 15th century when an increasingly literate laity began to transmit it as well. In principle it was a practical literature to bring about physical effects or to acquire otherwise hidden information. In various ways, medieval magical literature blended traditions and beliefs native to the Latin West with those imported from Arabic, Jewish, and a variety of other ancient sources.

1. GENERAL DIVISIONS

In the literature of magic, a workable division can be made between magical texts assumed to draw on natural forces (usually astrological), and those deriving magical efficacy from ritual acts or the numinous power of Christian faith. In general scribes were interested in one or the other, and the two groups of texts tended to be transmitted in different ways. Within these two categories a wide spectrum of texts may be found, running from those deemed acceptable by some intellectual authorities to those well outside the bounds of legitimacy by almost any standard. For example, amongst the more inoffensive ritual magical practices are charms which employ standard ritual acts such as the reciting of the Lord's Prayer for the cure of toothaches or the staunching of blood. At the other extreme, necromantic manuals claim the power to control demonic forces through the use of rituals developed from liturgical sources, particularly exorcism. Texts recording the occult properties of stones or animals and their uses stood at one end of the spectrum of natural magic. At the other, texts like the *Liber lune* or *Picatrix* justified a range of practices highly suspect in Christian terms such as the carving of images, incantation, and suffumigation as natural. This latter group and the notion of natural magic became very significant with the influx of the corpus of Arabic learning.

2. CHANGES OVER TIME

The Latin West inherited a rich tradition of magical literature from antiquity as well as from native, non-Christian sources. But the most significant producer of a written literature was the church itself, not least because, prior to the 12th century, the major centres of learning were religious institutions, principally monasteries. The surviving literature from the 4th through the 12th century is substantially more limited than material dating from the later middle ages. Although this is partially related to the lower survival rate of manu-

scripts and a relatively smaller learned community, it may also be that prior to the influx of Arabic material the body of magical literature was, even in relative terms, smaller. Charms may be frequently found in manuscripts dating to before the 12th century. They commonly employ Christian formulae for the cure of a variety of ailments. Prognostic devices also commonly occur. Continuity with the magic of the ancient world may be most simply demonstrated by the continued appearance of the SATOR AREPO magic square.

Magical literature was profoundly influenced by the influx of learning in the 12th and 13th centuries. The Arabic philosophical and astrological corpus provided a theoretical framework well suited to justifying numerous forms of magical practice. It also contained a significant magical literature most of which claimed to function through astrological mechanisms. Although the literature of necromancy (the manipulation of demonic forces through exorcism-like practices) can only be dated to the period after the 12th century, its close relation to the liturgy suggests that the practice has its roots as much in the Latin West as in the rich confluence of Arabic, Jewish, and Christian traditions in such centres as Toledo. Divinatory practices and prognostics also pre-date the Arabic influx as do texts recording the occult properties of stones or creatures, although both of these forms were also supplemented by comparable Arabic literature.

3. TRANSMISSION AND SURVIVAL

The survival of a magical literature depended in large measure upon the survival of the manuscripts in which it was transmitted. The principal institutional centres of transmission were universities (particularly medical faculties), the lower levels of the secular church, and monasteries. The professions commonly responsible for manuscript copies of magic texts were lower level clerics, monks, and medical practitioners. This had two principal results. First, the perspective of magical texts tended to be learned and frequently religious. Second, proscriptive literature and the central intellectual currents of the day profoundly influenced the manner in which texts were authored, presented on the page, translated, edited, and transmitted (for specific examples see the individual genres below). Magical learning was also preserved in non-magical settings. Encyclopaedic literature sometimes incorporated sections of magical texts as examples of natural wonders. Finally, the spread of literacy in the later middle ages also meant that a growing portion of magical literature, especially

recipes, charms, and prognostics were preserved by secular and non-academic scribes in vernacular texts such as commonplace books.

Magical manuscripts were also vulnerable to destruction on the one hand because they could be regarded as theologically problematic and on the other because they were often cheaply and hastily prepared and hence evidently of small value to anyone besides their immediate owners. The surviving pool of evidence for medieval magical literature was shaped by these forces, and so to reconstruct the original contours of medieval literature, we must know why manuscripts survived. Some no doubt were passed from one occult practitioner to another; the institutions where such practitioners tended to cluster were thus very important. But the likelihood of a manuscript surviving purely by this means (i.e. an unbroken chain of students and teachers) is infinitesimally small and other reasons account for all known survivals. Most magical texts were short and made up only a small part of the larger codices which contained them. Their survival thus depended more upon the general (and usually more legitimate) contents of the codex which contained them. Larger texts, such as works of ritual magic, tended to survive by being collected by bibliophiles or in large libraries. They might also survive purely by accident, as novelties, or in rare cases as fine manuscripts. In general however – and particularly in the case of ritual magic – the original number of magical manuscripts was much higher than the numbers of surviving manuscripts suggest.

4. GENRES

Subtypes of magical Literature defy precise classification. However, workable divisions may be derived from the treatment of magical texts within the medieval library or book. As such these divisions should not be understood as deriving from the technical features of the magic they contain, but rather as akin to a literary genre with certain common forms, interests, contexts, and emphases.

A. *Divination*. All types of divination typically employ some form of randomization of form or symbol, subsequently interpreted in order to discover hidden information of a specific kind. As a result divination crosses over with a great number of magical genres (e.g. where ritual or astrological magic seek specific kinds of information). It is also one of the most common forms of medieval magical literature. If a magical text does not contain divinatory techniques, a work of divination may often be found among the other texts which accompany it in a codex.

Although terms for divination or diviners (e.g. *sortes* or *sortilegi*) were frequently used to describe all forms of magic, divinatory practices tended to be condemned less often and less severely in theological sources. Among the more significant forms of medieval divination are chiromancy, spatulamancy, oneiromancy, and geomancy: chiromancy examined lines on the palm, spatulamancy employed the shoulder blade of sheep, oneiromancy sought to interpret dreams, and geomancy associated randomized patterns in points or stones and associated them with astrological principles. A range of prognostic devices employing charts, moving wheels, and other textual devices were also common, especially those used for medical purposes. Some of the techniques such as the casting of nativities, various forms of medical prognostics, and even techniques for determining the location of stolen goods employed astrological principles. Finally, many of the practices of ritual magic involving demons or angels could also be regarded as divinatory in the sense that they sought information rather than a concrete magical effect. In this context, the most common techniques were the pursuit of dream visions or the use of a young boy as a medium.

B. *Experiments, Books of Secrets, and Recipes.* Books of experiments, secrets, and recipes may be said to occupy a position on the fringes of magical practice in the sense that much of their contents are devoted to practical matters such as the making of ink or beer. The terms *experimenta* and *secreta* were used to describe processes with a marvellous or magical effect; the term *recipe* is simply the first word in instructions for making some kind of concoction. At the same time, the authors and scribes of this literature considered the contents, which include a significant amount of magical material, as a coherent set of practices. Magical features might include means of determining the fidelity of a spouse with a magnet, magical tricks, medical talismans, or even demonic or angelic magic. They also reflected certain characteristics of magical texts such as the aura of secrecy they invoke. These texts are in large measure instructional manuals. A typical experiment, recipe, or secret would be expressed in a single paragraph and a typical collection could consist of anywhere from a dozen to hundreds of these. Since scribes freely deleted and added information the contents of this literature tended to be relatively fluid although in some cases, such as the *Secretum secretorum*, a textual tradition may be traced. A large proportion were written or translated into the vernacular.

C. *Charms.* Charms are perhaps the most ubiquitous genre of magical literature. They are also the

shortest. Usually occupying only a few lines of text, these formulae populate margins, pastedowns, and blank spaces of medieval manuscripts. They commonly employ Christian words of power, prayers, or gesture against illness and injury.

D. *Astrological or Astral Magic.* This form of magic may be attributed almost entirely to the influx of Arabic sources in the 12th and 13th centuries. The principle that astrological influences could be manipulated through the use of physical objects was a standard part of Arabic astrological and medical literature. As a result the accompanying texts of astrological magic came to be regarded as a potentially legitimate portion of natural philosophy. Arabic astrological magic usually employed rings or talismans to focus or direct astrological influences for certain kinds of effects. The magical object, whose material was related to the desired influence (e.g. Sun-gold, Mars-Copper, etc.), was to be prepared under the correct astrological conditions, often with accompanying ritual practices, prayers, or suffumigations. In some circumstances a planetary deity would be invoked.

As they were transmitted to a Christian context, the ritual features tended to be muted, transformed into Christian forms, or removed. The *Speculum Astronomiae* usually attributed to Albertus Magnus, for example, condemned all but two texts of astrological image magic as clearly containing demonic elements: the use of invocations, suffumigations, and astral deities. By far the most commonly copied versions were those, such as Thabit ibn Qurra's *De imaginibus*, in which these kinds of elements were removed. At the same time, although in much smaller numbers, other texts such as the *Picatrix* or *Liber lune* were copied including all of these more dubious elements. Yet even these more dubious texts tended to be regarded as related to astrology and natural philosophy by their scribes and collectors.

E. *Ritual Magic.* Texts of ritual magic rely principally upon Christian religious texts and practice for their structure and justification. Drawing heavily upon the bible and liturgical sources (in particular exorcism), their practices elaborate assumptions commonplace in the Judaeo-Christian tradition: the possibility of mystical enlightenment, the power of ritual action, prayer and moral purity, and the accessibility of angels and demons. Charms might thus be considered a form of ritual magic, but the term is generally used to designate much longer texts and ones considered far more problematic in theological terms. Common sub-categorizations are angelic, astral, theurgic, and demonic magic. Yet these terms must be used with caution

since collections of ritual magic practices compiled by single individuals frequently combine these elements. Ritual magic collections tend to take on two forms, magic which almost entirely involves angelic powers (e.g. *Ars notoria*, *Liber sacer*, and *Liber Rasielis*) and magic which involves demonic and angelic powers, usually referred to as necromancy (i.e., *necromantia* or *nigromantia*).

Necromantic manuals typically focus on the conjuring and deploying of demons for purposes ranging from the manipulation of people for sexual purposes, to treasure hunting, to the acquisition of general knowledge. The power of the operator derives from strict religious discipline (at least during the magical exercises), including abstinence, prayer, confession, communication, and penance. Ritual performances, also derived from the liturgy, are understood to have inherent power as well. The operations, loosely based upon exorcism, summon and bind demons through the power of the duly prepared Christian operator and his invocation of Christ or God, often identified by a long series of mystical names. Common also are the use of suffumigations, magical equipment such as rings, magical images or circles, and ritual gesture. The time of operation might be restricted to certain days, hours, or astrological and atmospheric conditions. Necromantic texts also commonly include petitions (as opposed to demands) for angelic assistance in discerning truth or for direct illumination. This angelic magic is a common enough part of the literature to be regarded as one of its inherent features. Astrological magic, sometimes reworked to include binding rituals, sometimes entirely innocent of demonic or angelic forces may also be sometimes found in these collections. Characterized by a high level of textual fluidity, necromantic collections were rarely copied as a whole but were usually compilations of extracts from other manuals, adaptations from liturgical or magical sources, and new material written by the collector.

Angelic powers occupy a central position in the other major form of ritual magic from the later middle ages. The most significant medieval text is the notory art, which claims to provide a method for acquiring spiritual or intellectual gifts from the Holy Spirit through angelic intermediaries. A related text, the *Sworn Book of Honorius*, claims to provide a twenty-eight day ritual which will result in no less than the beatific vision. How the gifts may be infused or the visions take place is not always clear, although both waking and dream visions are common contexts. These manuals rely on a combination of ascetic and religious observances, prayer, and in the case of the notory art,

contemplative exercises using complex figures (*notae*) or common devotional images. In general, the prayers directly address God, although they may also address individual members of the trinity, Mary, Angels, or the Saints. They are also so orthodox in flavour that manuscripts of the notory art have been mistaken for prayer formularies. Although the texts seem to imply an automatic response, they assiduously maintain the supplicatory status of the operator.

Magic IV: Renaissance-17th Century

1. INTRODUCTION 2. DEIFICATIO
3. THE NATURAL WAY 4. THE MAIN
TEXTBOOKS 5. THE MAGIC OF
QUANTITY 6. CONCLUSION

1. INTRODUCTION

The contribution of the early modern period to the perception of "magic" consists essentially of a number of more or less famous attempts at theorizing and systematizing it; indeed, it may well be asserted that one of the tasks assumed by Renaissance philosophy has been that of providing western culture with a hitherto absent "general theory of magic". But the business of picking up and combining the various existing threads of magical traditions, besides being no easy task, obviously

implied that they had already acquired some degree of acceptance. It must be realized, however, that even during the *acme* of Humanism, the measured acceptance enjoyed by magic never turned to overall legitimacy, as readily shown by the choice examples of Simon de Phares being condemned by the Sorbonne (1494; an event likely to have deterred → Jacques Lefèvre d'Étaples from publishing his *De magia naturali*), or of → Giovanni Pico della Mirandola (1487) and → Marsilio Ficino (1489), each hastily composing an *Apologia* in order to atone for their explicit recourse to, and positivization of, magic.

On the whole, the distinction between natural and ritual magic (seldom so neatly outlined in the texts themselves) was still countenanced by most Renaissance philosophers and *magi*, even though the elaboration of a synthetic approach had, in many cases, the not-so-paradoxical effect of partially blurring the basic differences that were assumed to exist between them.

With respect to natural magic, essentially the ancient *topos* (which eventually goes back to Aristotle) of a complementary opposition between Art and Nature remains at the root of a conception of magical action as consisting of strictly natural operations, in which human industry has the role of a steward, merely assisting the occult [→ occult / occultism] natural powers, which it helps combine, harmonize and interweave. Needless to say, such views necessarily imply the theories of cosmic and human analogy, of universal signs and → correspondences, and of astral influences which are at the basis of (antique and) medieval “natural philosophy”. The debate, hotly pursued during the entire Renaissance, over the exact nature and *modus operandi* of astrological influences [→ astrology], and consequently over the magical ones as well, and the consequences of such a debate on contemporary discussions of causality, is significant not only in determining the epistemological status of magic *per se*; these discussions were also central to humanistic conceptions of “nature” and ontology, both of them bearing on contemporary logic and philosophy of knowledge.

Something similar can be said about ritual magic, which was considered a highly questionable endeavour but one that nevertheless raised important issues. Among them are the intrinsic nature of the beings invoked (demons and/or angels, or “divine” entities), and their link to (and dominion over) the celestial spheres and varied natural substances/elements; the “evocative” power of language and its theological assessment; the impact of moral intention(s) on the practical efficiency of

knowledge; and the status of the human → imagination and the faculties of the soul (both cosmic and individual).

Thus, considered from an overall perspective, the study of magic in the early modern period entails scrutinizing the multiple interactions of natural philosophy with theology and anthropology, seen against the general background of the christianization of neoplatonic [→ Neoplatonism], hermetic [→ Hermetism], Jewish [→ Jewish Influences] and arabic doctrines and symbolic practices.

2. DEIFICATIO

Even though it has been held (rightly, in our opinion) that magic, like astrology or → alchemy, does not so much depend on any single philosophical framework, as that it mainly functions according to a certain world picture (*vision du monde*) and, for this reason, can in fact be subjected to a variety of theoretical approaches, it has been vindicated by Renaissance thinkers from several philosophical perspectives. Most important and influential is, of course, that of Marsilio Ficino (1433-1499), which P. Zambelli has shown to be consistently grounded in Plato's doctrine of “participation”, ever since the Florentine's 1469 commentary to the *Symposium*. In a fashion roughly similar to the later stoic *sympatheia*, “platonic love” is here taken to represent the universal bond which exists between all parts of the living cosmos, and makes it an organic being; magic has its foundation in the resulting universal pattern of mutual attraction and repulsion. The “wholeness” and unity of the universal structure is understood as the expression, on a larger scale, of that of the human body; moreover, to complete the classic analogy, both man and the universe are endowed with an animating soul, which ensures the presence of life in them, and serves as ontological intermediary between man and the higher, intellectual (angelic) principles, which in turn are in contact with the divine sphere.

Thus, the ficinian *spiritus*, considered either on the astral or human level (both aspects being of course hierarchically related), mediates between rational soul and body and is fundamental in linking them and maintaining their ontological cohesion. Taking into account the dual side of this immaterial entity (which is more bodily than the soul, but more soul-like than the body), a connection is readily established with astrology, and also with the various kinds of planetary spirits, angels or demons populating (ever since the *Epinomis*) the celestial spheres, as well as the terrestrial elements. Quite obviously, such a connection makes it

difficult to draw the line between what purportedly pertains to “natural” and to ritual magic respectively, and the more so since Ficino blends a medical with a “spiritual” purpose in his *De vita coelitus comparanda* (1489). To a strictly metaphysical process of deification, sought through the assumed power of intellectual contemplation to induce an actual transformation in man, are associated magical traditions about how to carry out the soul’s ascension (and/or healing), making use of the complete hierarchy of cosmological intermediaries. One must note that *both* these approaches (the first philosophico-theological, the second “theurgic”) have “pagan” as well as Christian antecedents, all of them present and blended in various ways in Ficino’s presentation. Ficino’s relatively novel combination of a metaphysics of light (divine, solar, angelic and intellectual) and of knowledge, on the one hand, with the influence of celestial spheres and spirits, astral powers and the world soul, as well as human souls, on the other (not to mention his references to artefacts such as talismans and invocations), would exert a durable influence on almost all notable later Renaissance *magi*, such as → Agrippa, → Dee, → Bruno and → Campanella.

Following the impetus of Giovanni Pico della Mirandola, Renaissance magic furthermore comes to be closely associated (at times even identified) with kabbalah [→ Jewish Influences]. If Pico relates magic and astrology, assigning to the first the practice of handling both heavenly and terrestrial powers (*virtutes*), nowhere does he attempt to lay out a comprehensive or synthetic exposition of magic as such, although he stresses the licit character of “natural magic” as the ‘practical’ and ‘most noble part of *scientia naturalis*’ (*Concl. Mag.* [II s.], 1-4). To the underlying idea, referred to above, of magic as essentially an illustration of Art complementing the work of Nature, “wedding” heaven and earth by uniting and actualizing their potential virtues (*ibid.*, 5 & 10-11, 13), he adds that magical efficiency is in any case dependent on the addition, to the *operatio magica* proper, of an *opus cabalæ* (*ibid.*, 15). In several passages of the so-called *Discourse on the Dignity of Man* and of his *Apology*, Pico in turn equates kabbalah (at least according to some of the manifold understandings of it that are to be found in his works) with the science of the powers of celestial bodies, with the superior part of “natural magic”, with the metaphysics of intelligible and angelic forms, and with a theology of the Godhead, but wavers (except in the last case) as regards its divine (revealed) or merely human status. Thus covering not only astrology and magic as

parts of natural philosophy, but the angelic realm as well – and notwithstanding the unsystematic nature of Pico’s *exposé* –, such a conception of kabbalah ran the risk of again blurring the borderline between ritual and natural magic; and the more so since the use and efficacy of *voces et verba in magico opere* were explicitly advocated (*Concl. Mag.*, 19-22), although Pico referred to the *vox Dei* as their ultimate source.

This performative power of words and names is central to the theories of Christian kabbalists preoccupied with magic, such as Pico and his follower → Johann Reuchlin (1455-1522), who relies heavily on the *vis verborum* imparted by God’s Word to the angels and to the Hebrew language. Man is supposed to dominate sublunary nature, and be reunited with Christ, essentially through the correct enunciation of the angelic and divine names, which all ultimately derive from the supernatural *Logos*. In Reuchlin’s 1494 *De verbo mirifico*, this particular form of Christian theurgy is presented as heavily dependent on the union of natures in the Incarnation, on the eternal presence of God’s Word within man and on the miracle-working, almighty pentagrammatic name of Jesus, which holds power over the whole creation. In his 1517 *De arte cabalistica*, however, a notable shift occurs, by which the theurgic (“sonic”) use of names is assigned a role heavily subordinate to a type of intellectualistic, inner approach to the contemplative ascent and *deificatio* of the mind (akin to what we already found in Ficino, who of course did not ignore this question of the “essential” derivation of “divine names”, which he compared either to the animation of the body by the soul [*Theol. plat.* X, 7], or to that of the hermetic statues [*In Cratylum*]).

It is only in a later context that kabbalah (“gabalial”) will come to be understood as almost synonymous with magic and/or alchemy, mainstays of “nature mysticism” within Paracelsian [→ Paracelsianism] and Rosicrucian [→ Rosicrucianism] discourses. For instance, the anonymous commentary (traditionally ascribed to J. Arndt [1555-1621], and published in 1602) on the four engravings illustrating the original edition (1595) of → Heinrich Khunrath’s famous *Amphitheatrum æternæ sapientiæ*, equates magic and kabbalah with, respectively, natural and supernatural or angelic light.

Akin in many respects to those outlined above, the magical efforts of the benedictine abbot → J. Trithemius were essentially concerned with providing a positive defense of magic, as a spiritually commendable branch of Christian theology. Instructed by his master, Libanius Gallus (himself an

avowed former student of *ars notoria*), to imitate Pico in closely discriminating between natural and demonic types of magical achievements, the learned abbot also blends greek and kabbalistic materials (which he owed to Reuchlin) into his overall theory of magic. Here again, kabbalah is related to the angelic realm; and the network of heavenly and terrestrial correspondences, which it governs through the active power of words, is universally accounted for by the combined resources of astrology, → number symbolism, alchemy and “natural” magic. Concurrently, true magic is endowed with an illuminative virtue, which brings about internal transformation(s) within the human soul, in narrow correlation to its external effects on the world. Arising out of faith, allied with virtue, knowledge and love ensure – apart from real wonder-working – the magical cleansing and ascent of the *mens* towards occult wisdom, and its reunification with the Trinity.

Contradictory statements by Trithemius make it difficult to decide whether cryptography, another of his major pursuits, was actually supposed to be based upon “natural” or angelic mediation; but it is certain that his treatises on the subject (the famous *Steganographia* and *Polygraphia*, both posthumously printed) helped foster the later, abusive conflation of the same topic with magic and kabbalah.

On the matter of demonology, to which he devoted many works, our abbot stood firmly by the position of 15th century inquisitorial textbooks, such as the famous *Malleus Maleficarum* (1486). His uncompromising rejection of demonic magic is in fact perfectly consistent with his determined Christianization of magical practices, either in the theurgical or in the theological and contemplative slant. Demons are believed to be capable of manipulating the hidden and manifest forces and elements of nature, so well indeed that their power may appear nothing short of miraculous to the unwary, whereas it is actually confined within the intrinsic boundaries of nature (which, none the less, are beyond the scope of ordinary human knowledge). But even though Trithemius is clearly dependent, as we have seen, on the “Italian tradition” of the Renaissance magical revival, the bold and imaginative distinctions introduced by Ficino between “personal” demons (who are assumed to intentionally respond to characters and invocations), and “impersonal” spirits (drawn to objects and substances by a purely ontological *connexio* and, as such, of licit intercourse), are likely to have seemed suspicious to the benedictine monk, and to

his propensity to equate magic with a particular variety of Christian mysticism.

Heinrich Cornelius Agrippa, who actually visited Trithemius in his Würzburg cloister in 1509 and, the following year, dedicated to him the first draft of his famous *De occulta philosophia* (printed in 1533), unsurprisingly belongs to the same current. Drawing, too, on Pico and Ficino, Agrippa adds to these sources the writings of several major Christian kabbalists, such as Reuchlin (on whose *De verbo* he publicly lectured in the same year 1509), → Francesco Giorgio, and P. Rici (?-1541). Several of these writers he even downright plagiarized in his encyclopedic compilation, explicitly laid out according to a threefold division of the art in “natural”, “celestial” and “ceremonial”, obviously correlated with the three classic hierarchical realms – terrestrial, astral, angelic. More in the nature of a philosophical and symbolic recapitulation than a practical manual, despite its early-gained reputation, Agrippa’s systematization mainly aims at presenting magic in general as subservient to “evangelical” imperatives and to the power of Christ, and as a mystic ladder for the soul *en route* towards divine transformation. External, more common branches of learning are subsumed under the central, “inner” light of sanctified occult knowledge, which supposedly commands all others in a manner very much in line with Pico’s perspective: mastery “within oneself” over the network of cosmic sympathies/antipathies and correspondences, eventually exteriorized as the linking of heaven and earth, is the true mystic accomplishment of magical studies.

3. THE NATURAL WAY

The idea of a specific “light of nature” was given wide circulation by → Paracelsus, as an intermediary between the divine sphere and the human soul, where the “signatures” (his own brand of correspondences) are mirrored and examined. For Paracelsus, magic reaches above human reason and experience and guides them, tapping, through a God-given revelation, the occult powers hidden by the creator in the “book of nature”. Duly purified by moral virtue(s), study and empirical field-work, the soul is simultaneously carried upwards and rendered capable of manifesting its illumination in actual practice, whether medical, astrological or otherwise. Underlined is also the important complementarity between the natural and divine planes: by revealing the hidden influences at work within nature, the *magus* operates “naturally” what the saint effects “spiritually” (through God’s

agency), so that the organic intermediary between the Godhead and the universe, as its living “expression”, is in fact man and his soul. Such conceptions would later become mainstays of the paracelsian current(s), and more precisely of the variegated mixture of prophetism, → Christian theosophy, eschatology, alchemy, nature mysticism, magic and kabbalah aptly christened, by Carlos Gilly, *Theophrastia sancta*.

However, partly under the influence of the so-called “school of Padua” (from → Peter of Abano [?-1315] to Pomponazzi [1462-1524] and others), these views of magic and natural philosophy were gradually confronted with an increasing “naturalization” of Western thought, in which a strong revival of aristotelian physics played a major role, as a means of eschewing, as much as feasible, a theological bias in the study of nature. According to such perspectives, the stress was henceforth put on the notion of strictly natural causes, among which prevail, in peripatetic philosophy, the celestial influences on the sublunar realm. If, thus, terrestrial phenomena and changes are essentially due to the movements of heavenly spheres, “immaterial” explanations of them – in terms of demonic agency, *spiritus* or angelic rulers à la Trithemius – become expendable. Magical or otherwise, theories about nature must first be grounded within nature itself; and as a result, the doctrinal frames applied to magic bear the brunt of an important epistemological revisitation. It is not so much the intrinsic value of magic *per se* which is being questioned, but the description and analysis of its workings. Correlatively, more interest is also devoted to its links with technical recipes and the practical procedures of different craftmanships, and with the quantitative (and not just the symbolical) side of mathematics.

In this respect as well as in others, the English scientist and *magus* John Dee (1527-1608) is a case in point. If he concurs with most of the above-mentioned authors (whose works were all comprised in his famous library) in viewing magic, in its higher form (referred to as *archemastrie*), as the supreme synthesis of intellectual activity and as a spiritual vehicle for achieving proximity with God, he also upholds most branches of mundane knowledge as valuable inroads for inquiry into the mysteries of nature. Natural philosophy, for him, comprises under its umbrella astrology and alchemy, cryptography and kabbalah, and even the communication with angels. Desperate to find truth, divine and/or natural, and – by his own admission – disappointed even with occult learning, he turned to “scrying” and angelic invocations, in the hope of

reaping superior insights from such an exalted source. His approach presents few original magical features and is most anxious to only have dealings with “good angels”; but by being essentially concerned with the search for a higher, truly operative knowledge, it also partakes, up to a point, of the progressive “naturalization” of magic, typical of the second half of the 16th century. Defusing, in fact, its “religious”, spiritual or demonic garb(s), magic is increasingly perceived as just another tool for obtaining knowledge (mostly of the “natural” kind), almost on a par with other, apparently more commonplace methods of learning.

This aspect of magic is not absent either in → Giordano Bruno’s use of it, although his goals are also religious and reformatory. Ranging from simple collections of extracts from earlier magical literature (*De magia mathematica*), to more extensive and original discussions, blended with considerations about mathematics, kabbalah, geometrical seals and the art of memory [→ Mnemonics] (*De umbris idearum*, 1582; *De monade*, 1591), his texts aim at laying the foundations for an ambitious religious and epistemological reform, of partly hermetic inspiration, in a complex and novel synthesis of metaphysics and cosmology. Here also, magic is but one of the strands of a vast system of learning, which aims at expanding the *magus’* intellectual and practical powers to the dimensions of an ever-changing universe, using the active imagination as a lever for the communication between individual soul and matter.

4. THE MAIN TEXTBOOKS

The printed production of magical treatises in the late 15th and during the 16th centuries was quite important, yet in no way did it lessen (in fact, it even increased somehow) the habit of fabricating, for private use, manuscript copies or digests of previously published (as well as unpublished) material. As confirmed by Frank Klaassen’s researches (Klaassen 2003), Renaissance interest in magic did not turn away from the main forms it had assumed in medieval times – contrary to what was suggested by certain earlier scholars, according to whom the “enlightened” Humanists considered them as degraded practices, worthy only of contempt. On the contrary, it would seem, from Klaassen’s parallel scrutiny of printed matter and manuscript collections, that the traditions of medieval ritual magic continued to flower with renewed fervour well into the 16th century, having in the process gradually assimilated most of those pertaining to talismanic/astral magic. One may

remark in passing that the progressive shift (already noted by Klaassen), within late medieval ritual magic, towards inner illumination and the quest for divine revelation(s), is in fact perfectly consistent with the rather “mystical”, interiorized attitude to magic exhibited by most of our Renaissance practitioners (yet, they could already find some support for this in the *Picatrix*).

The continued favour, indeed the prestige, awarded to the (Latin) *Picatrix* during the Renaissance clearly testifies to the penetration of medieval magic into the humanist era. However, the constant mingling, within the text itself, of considerations pertaining to natural purposes, talismanic images, astral magic and spirit invocations, seems a warning against the possible temptation of overemphasizing the distinction between so-called “image magic” and its ritual counterpart. Somewhat later on in the Renaissance, some degree of blending between magical genres is often found in texts (and manuscripts) belonging to the *Clavis Solomonis* family (and also to the *Almadel* one); such a blending may, hypothetically, be interpreted as reflecting a ritualization of previous astral/talismanic images into diagrams, geometrical figures and seals adapted to angelic/demonic magic. The obvious Jewish origin of some of their components contributed to the growing assimilation of magic to kabbalah (and vice versa), as did the earlier Latin versions of *Sefer Raziel*, which mainly deal with angelic invocations and insist on the importance of magical names and hierarchies.

Ficino’s *De vita cœlitis comparanda* is, of course, essentially concerned with astral magic, and with drawing down celestial influences (stellar, zodiacal, planetary) into images and natural substances, so that the human soul and body may receive spiritual and medical care from heaven. The tract is mainly philosophical, indeed it is partly a loose commentary on some Plotinian doctrines, lacking in any sort of practical details.

About Agrippa’s *De occulta philosophia*, not much needs to be added here to what has already been stated above, except for the important fact that its mainly “theoretical” and symbolic character probably accounts for the frequent addition to it, in numerous late 16th- and 17th-century editions (from 1567 on), of a spurious “4th book”, which purports to lay out more practical instructions about ceremonial magic (consecration of instruments, names, shapes and characters of good and evil spirits, strong biblical overtones). Along with other, similar materials allegedly excerpted from Peter of Abano (who in fact did not believe in the very existence of spirits or demons!), Gerard of

Cremona, or Trithemius (sometimes one even finds an *ars notoria!*), this pseudo-4th book certainly influenced later magical belief and experimentation, up to 19th- and 20th-century occultism, and undoubtedly enhanced Agrippa’s posthumous (and thoroughly undeserved) reputation as a nefarious necromancer.

Among these additions to the *De occulta philosophia* is also sometimes found the *Arbatel, de magia veterum* (1st ed. 1575), a widely read, succinct exposition of angelic magic in the form of nine series of seven “aphorisms”, in which natural wisdom is presented as an image of the divine one, which is in turn equated with *vera magia*; it features quite an amount of general spiritual counseling, as well as interesting reflections about the natural abilities of the individual *magus* being dependent on predestination much more than on actual learning and practice of his art. Divine grace, allied to commendable ethics on the practitioner’s part, lead the heavenly (or elemental) creatures to reveal the contents, both visible and invisible, of the entire universe. Of course, to some extent such a “spiritualized” approach to magic represents an extreme case; in any case, it did not prevent this tract from being frequently lauded in later literature, even though its practical side is conspicuously restricted to a description of the *characteres* of the seven “governors” or planetary angels.

Many more such *characteres* (and much less preaching) are to be found in the spurious *Archidoxis magica* attributed to Paracelsus. Famous not least because of its supposed author, this *exposé* of natural and angelic magic was, again, influential even in modern occultism (having been translated into several vernacular languages).

5. THE MAGIC OF QUANTITY

The gradual substitution, within Western natural philosophy and cosmology during the late 16th and the 17th centuries, of a metaphysical paradigm by a mathematical one, by no means led to the elimination of magic. As with the influential Giambattista della Porta (1538-1615), (natural) magic becomes the practical part of natural philosophy. Such an assertion may well remind us of Pico (see his statements referred to above), but even though Porta’s *Magia Naturalis* (1558; enlarged ed. 1589) largely retains the conceptual framework of Pico or Agrippa, as Paola Zambelli has demonstrated, its scope and intent are somewhat different. The magician’s ambition is no longer solely to assist and perfect the work of nature, by resorting to mainly qualitative and symbolic elements and procedures; rather, through the parallel (at first still

rather tentative) use of applied mathematics and “technique”, his aim is also to analyze and try to imitate natural processes.

Although at one time he dabbled – mainly for political reasons – in astrology and angelic invocations, the dominican → Tommaso Campanella (1568-1639) mainly emphasized the natural side of magic in his complex philosophy of nature, illustrated for instance by mechanics, which he calls “real artificial magic”; its practical effects, he thinks, are conveyed by physical contact and/or a “structural sympathy” (as with the magnet and steel), but cannot influence the human soul. As in Porta’s case, notable is his upholding of a dual perspective on magic, for the angelic side of which he is indebted to Ficino.

A similar attitude is present in → Robert Fludd, for whom the knowledge of the *magus* and his own brand of “experimentalism” are in fact rooted in the same worldview, based on a unified conception of theology, philosophy, science and medicine, within a christian neoplatonic frame; and – *mutatis mutandis*, of course – in the great jesuitic encyclopedias of → Athanasius Kircher and K. Schott (1606-1666), where magic finds itself equated with mechanical devices, optics, and magnetism.

Within this evolution, the stress is henceforth on the practical usefulness of magic: its relevance for the investigation of natural forces. It is in this respect that a → Francis Bacon retains it, as the science pertaining to the concrete application of the loosely defined “forms” which constitute one of the objects of metaphysics (P. Rossi). Even though the power of the imagination and of the individual *spiritus* are still preserved as well, in fact we are dealing with a novel, more strictly rational and utilitarian conception of causality, in which cause and effect must be contiguous and proportionate to each other.

6. CONCLUSION

As is well-known, the advent of “modern science” in the 17th century tends to gradually mechanize the image of nature and mathematize the language and methods of philosophical investigation. If natural causes may still appear derivative or secondary, they nonetheless come to be considered as constituting the proper framework and limitation of scientific inquiry, whereas the study of the primary or “divine” causes is seen as pertaining only to theology. Nature is known inasmuch as its functionalities are under scrutiny, and is thus reduced to the field of human activity. Structural comparisons and affinities, elucidated by quantitative and logical procedures, tend to replace the

traditional explanations of natural interactions, which rested on the doctrine of universal sympathy and correspondences. Simultaneously, the idea of an organic universe, central to the earlier magical approach, loses its relevance insofar as its structure is no longer perceived as an image of man and as the material expression of its living essence. In other words, natural knowledge is progressively separated from ontology, just as natural causes are no longer understood as transcending their effects but as homogenous with them, if not in direct physical contact with them. Such changes ended up disrupting the underlying theory, inherited from antiquity, of the unicity of nature, embracing all its levels (including angels and man) and extending in a universal continuity (ontological and epistemological) up to the divine sphere.

JEAN-PIERRE BRACH

Magic V: 18th-20th Century

1. THE ENLIGHTENMENT AND MAGIC
 2. STRATEGIES OF LEGITIMATION AND THE SECULARIZATION OF MAGIC
 3. MAGIC AS AN ENCHANTED WORLDVIEW
 4. MAGIC AS ANCIENT TRADITION, AS SCIENCE, AND AS KNOWLEDGE
 5. RITUAL MAGIC AND PSYCHOLOGIZATION
 6. ATTEMPTS AT RE-ENCHANTMENT

1. THE ENLIGHTENMENT AND MAGIC

The 18th century inherited a variety of traditional notions concerning magic; but to a large

extent the philosophical, theological, cosmological and social frameworks within which those notions had once been at home were no longer self-evident, and they became progressively less so during the 19th and 20th centuries. This has not caused magic to continue merely as a stale and archaic “survival” doomed to extinction, as suggested by E.B. Tylor in the 1870s and as has long been assumed by many scholars under the sway of the secularization thesis; but it did mean that magic was forced to adapt to new worldviews and was thereby transformed into new, modernized or “secularized” forms.

The notion of *magia* as the religious wisdom of the ancients, traditionally linked to the name of → Zoroaster, still finds a strong echo in the article about magic in Diderot & d’Alembert’s *Encyclopédie* (1751-1772; vol. IX, 852-854), strongly influenced by De Saint-André’s *Lettres au sujet de la magie* (1725). “Divine magic” is described as ‘nothing else but that special knowledge of the plans and the perspectives of the sovereign wisdom such as God gracefully reveals to feeble men animated by his spirit – that supernatural power he grants them to predict the future, to perform miracles, & to read, so to speak, the hearts of those with whom they have dealings’. Such gifts must once have existed, according to the *Encyclopédie*, but one may doubt whether they still do. This general idea of magic as a supreme religious wisdom of the ancients has survived up to the present day, albeit without the explicit theistic trappings, even though the notion of *prisca theologia* [→ Tradition] on which it had originally been founded had been under attack since the 16th and increasingly the 17th century.

The notion of magic as “*magia naturalis*” based strictly on the working of secondary causes – which had emerged in the high middle ages and had been given a high profile by Renaissance defenders of magic, not least in view of the necessity to legitimize the practice as non-demonic (see below) – had evolved during the 17th century into increasingly “naturalist” directions, so that the distinction between magic and science could at times become quite hazy. This notion is recognized by the *Encyclopédie* as well, as ‘a somewhat more profound study of nature, and of the admirable secrets discovered there’. Natural magic is praised as having been highly advantageous to humanity, as witnessed by many examples in physics, astronomy, medicine, agriculture, navigation, mechanics, even eloquence; and it seems to be associated mostly with mechanical “marvels” produced by natural means. But the conflict between traditional philosophical and cosmological frameworks, on the one hand, and those of the new science and rational

philosophies, on the other, is evident in the fact that large parts of *magia naturalis* are transferred in the *Encyclopédie* article to a third, negative category called “supernatural magic”. The result of ignorance and a lack of philosophy, it is nothing but a ‘confused mass of principles that are obscure, uncertain and undemonstrated, and of largely arbitrary and puerile practices, the inefficacy of which follows from the very nature of things’. A primary example is → Agrippa’s celestial magic, based upon the ‘ridiculous system’ of → astrology. Such traditional notions of natural magic, too, have had an interesting development from the 18th century to the present, in the context of new kinds of occult philosophy that rejected the worldviews suggested by mainstream science as too limited, but saw magic as a “higher science” based upon knowledge of the “occult forces”.

And finally, there is the traditional notion of magic as based upon contact with intelligent beings, notably demons or angels. This one likewise survived into the 18th century and on through the 19th and 20th, but increasingly divorced from Christian contexts. The *Encyclopédie* discusses it with reference to Agrippa’s “ceremonial magic”, described as the most odious of all the vain sciences. This detestable practice consists in evocations of demons, pacts with infernal spirits, pretended procedures for harming one’s enemies and the production of evil and malicious effects; and it falls into several subcategories, including kabbalah [→ Jewish Influences], sorcery, incantations, necromancy, discovery of hidden treasures and great secrets, divination [→ Divinatory arts], the gift of prophecy, healing by mysterious practices, and participation in the witch’s sabbath. Fortunately, Philosophy has now finally opened the eyes of humanity about ‘these humiliating chimaeras’ of superstition. Such typical Enlightenment rhetoric did not succeed, however, in deterring quite some contemporaries and their successors from engaging in such practices, and developing worldviews devised to accommodate → “intermediary beings” together with new scientific (notably psychological) perspectives.

2. STRATEGIES OF LEGITIMATION AND THE SECULARIZATION OF MAGIC

The article in the *Encyclopédie* (which defines “magic” as an ‘occult science or art that teaches how to do things that seem beyond human power’) may be seen as a touchstone for analyzing the complex destiny of magic since the Enlightenment. The uneasy cohabitation, fraught with confusion and conflict, between the three main notions of magic

distinguished above (magic as “ancient wisdom”, as an applied philosophy of nature, and as an art based upon contact with intermediary beings) goes back to medieval times, flows into the 18th century, and has continued to the present day. However, defenders and practitioners of magic in pre- and post-Enlightenment periods operated under very different social and cultural conditions, with far-reaching implications for how they came to understand magic.

Renaissance defenders of magic were forced to try and legitimate their beliefs and practices by convincing not only real and potential critics, but themselves as well, that magic – or at least *their* magic – worked on the basis of natural laws and principles (→ correspondences, sympathies and antipathies, signatures, occult qualities in nature etc.), and did not rely on the help of demons. To do so was extremely difficult – in fact, it was impossible. The very nature of their underlying cosmologies tended to assign a certain degree of personal agency to e.g. the stars and planets, which could therefore be suspected by critics of being demons in disguise; demons, of course, were notorious for deceiving human beings by appearing as angels of light, so that any reference to the assistance of divine angels was a dangerous strategy that might backfire any moment; the very notion of magic as the religious wisdom of the ancients did not sit very well, to say the least, with the concept of a religiously neutral *magia naturalis*; and finally, the notion of magic as the “ancient worship of the gods” brought up the obvious question whether those pagan gods worshiped by e.g. Zoroaster or Hermes Trismegistus had not in fact been demons as well.

Defenders and practitioners of magic in pre-Enlightenment periods were operating, in short, in a religious context where the existence and active agency of non-human intermediary beings was generally accepted by all parties. This situation changed as a result of the “disenchantment of the world” since the 18th century. If contemporary magicians are sometimes still accused of contact with demonic beings, the criticism comes from evangelical or fundamentalist Christians who have inherited traditional perceptions of magic as pagan worship and idolatry; but although magicians may be forced to defend themselves against attacks from this side, this no longer requires them to *legitimate* their practice in terms of a worldview of generally accepted claims. This is different when it comes to suspicions of criminal activity (notably ritual abuse) linked to popular confusions between magic and → satanism (Hanegraaff 1995); but although such associations have their historical basis in early modern notions of → witchcraft as

based upon a combination of magic and the worship of (really existing) demonic beings, magicians now merely have to legitimate their practices as not including criminal acts – whether or not they believe to be in contact with “higher beings”, and whether those beings are angels or demons, is not a concern of any court of law.

In either case, magicians have to legitimate themselves as non-demonic or as non-criminal only if and when they happen to find themselves under accusation. Far more crucial, however, is how they legitimate the very practice of magic *to themselves*: for this is something that no modern or contemporary magician can avoid doing, and it is in this respect that magicians find themselves in a position structurally similar to that of their early modern predecessors. Renaissance magi like Ficino or Agrippa were Christians who believed in the metaphysical existence of evil; contemporary magicians, in contrast, are living in a secular society and tend to believe in science and psychology. This latter situation is the result of gradual and complex historical and social processes that have their roots already in early modernity and carried on far into the 19th and 20th centuries; but although sharp dividing lines do not exist in history, it is certainly in the period that saw the Enlightenment and the French revolution that the balance began to shift decisively from an earlier culture of “accepted claims” to a new one.

The strategies of legitimation by means of which contemporary magicians “make sense” of magic in a disenchanted world have been analyzed exhaustively in a groundbreaking study by Tanya Luhrmann (1989; cf. Hanegraaff 2003, 369–371), culminating in her theory of “interpretive drift”, which explains what happens during the process of being trained as a specialist in occultist magic. Crucial to modern and contemporary strategies for the legitimation of magic is the concept of a separate-but-connected “magical plane”, seen as parallel to the mundane plane of every-day existence but existing on a different level of reality, and that can be accessed by means of the → imagination. On this plane, the things of the imagination are believed to be as real as tables and chairs are real in the everyday world. Somewhat similar to the relation between a computer programming language and the texts or pictures that it conjures on the screen, magicians believe that by “working” on the level of the imagination, it is possible to influence events in the everyday world. The crucial point here is that processes of secularization and disenchantment, although real on the mundane plane, simply have no bearing on the magical plane, and hence do not

affect the credibility of magic. As observed by Luhrmann (1989, 276), the purpose of the concept ‘lies in keeping unhappy bedfellows apart’. The dissipation of mystery in the “disenchanted” reality of everyday life, where the imagination has no power, is thus compensated for by a separate magical world of the reified imagination, where the rules of science and rationality do not apply. This makes it possible for modern and contemporary magicians to “live in two worlds”: they can function like any other well-adapted citizen within the disenchanted reality of everyday life, ruled by canons of science and logic, but in their private lives they partake in an additional enchanted reality, ruled by the very different logic of ritual and the imagination. This compensatory function is somewhat similar to the “escape” offered by the creation of “imaginary worlds” in e.g. contemporary virtual reality and roleplaying games; but contrary to the latter, it is taken with full seriousness as a religious worldview.

The transformation of magic since the 18th century – inevitable for adherents and practitioners in order to preserve the legitimacy of magical practice in the context of new, secularized realities – can be traced on the level of theory as well as practice. In a pre-Enlightenment context where the world was believed to have been created by God, symbolic correspondences and signatures were seen as objectively present signs that could be deciphered by man so as to discover their magical uses; in post-Enlightenment contexts predicated on an autonomous rather than divinely created natural world, and particularly under the influence of modern psychology, correspondences have come to be seen in the 20th century as conventional and individualized tools for training the creative imagination. Likewise, concepts of *spiritus* as intermediary between the mortal body and the immortal soul (and therefore not material; see e.g. Ficino or Agrippa) have made place for concepts of “subtle matter” intermediary between psyche and matter. And although magicians believe that it can have real effects in the world, magic has been interpreted increasingly as a series of psychological techniques for learning how to use the hidden forces of the psyche and exalting individual consciousness to (ideally) a level of god-like omnipotence.

3. MAGIC AS AN ENCHANTED WORLDVIEW

Tracing the history of magic from the 18th century to the present is considerably complicated by problems of terminology. In pre-Enlightenment contexts the term magic was still understood rela-

tively clearly as referring to either one of the three categories distinguished above (or combinations of them); but in the context – essentially created by the Enlightenment in the wake of the scientific revolution – of an increasing polarization between “religion” and “science”, it has progressively become a mere label for a conceptual wastebasket filled with anything that did not seem to fit those alternatives (e.g. while natural magic might be seen as closer to science, it was not “real” science but something tainted with superstition; demonic worship was closer to religion, but it was “false” religion; and from the perspective of scientific progress, ancient wisdom could only be an outdated and superseded pseudo-wisdom). In other words, “magic” has come to be conflated with equally vaguely used concepts such as e.g. “the occult” (resp. “occultism”, “occult science”), “superstition”, “mysticism”, “esotericism”, “the irrational”, “primitive thought” (cf. “fetishism”, “idolatry”), and so on.

To further complicate matters, this was done not only by the detractors of magic, but by defenders as well. Thus, for example, → Georg von Welling’s famous *Opus mago-cabbalisticum et theosophicum* (first ed. 1719) has a theosophical content [→ Christian Theosophy] but contains nothing about magic or kabbalah; and the term magic became quite prominent in the context of pre-Romantic and Romantic → *Naturphilosophie*, where it came to stand for theosophical worldviews based upon → animal magnetism and the “theology of electricity” (see e.g. → Oetinger’s *Magia Naturalis* [1765], discussed in Faivre 1996, 181–217). We are dealing here with conscious and deliberate reactions against what has rightly been called the “disenchantment of the world” under the impact of the rise of materialist and mechanistic worldviews: “magic” now means the opinion that the world cannot be reduced to impersonal processes of instrumental causality, because it is in fact held together by mysterious occult forces and → correspondences (the former being conceptualized as an invisible medium between causes and effects, resulting in what may be called “occult causality”, whereas the latter does not strictly require causality at all but may be seen in terms of a pre-established harmony). It should be noted that this is in fact a *new* meaning of “magic”, which could not possibly have existed in earlier periods, precisely because it is elaborated in reaction to the “disenchantment of the world”. “Magic” now comes to be used, innovatively, as a rhetorical term that stands for the entirety of the traditional worldviews of Western → esotericism, whose very founda-

tions are now under decisive attack. The “form of thought” on which these worldviews were based has been famously defined by Antoine Faivre in terms that are all-revealing in this respect: correspondences, living nature, imagination/mediations, and transmutation (Faivre 1994, 10–15). The first three of these in particular (arguably even the fourth one) all stand for the very things that were logically incompatible with the new scientific perspectives, which replaced non-causal correspondences by instrumental causality, an organic worldview by a mechanistic one, and the neoplatonic multi-leveled cosmos by one that should be reducible to only matter in motion.

This does not mean that an overview of “magic” from the 18th century to the present is synonymous with an overview of Western esotericism in that period. For although “magic” has become largely equivalent to such an enchanted worldview in the *rhetoric* of many esoteric currents (and their critics) since the Enlightenment, frequently these currents *in fact* no longer exemplify the worldviews they purport to defend. The profoundest irony of the history of Western esotericism is that its 19th and 20th-century representatives are largely so deeply influenced by the very worldviews to which they object, that what they present as enchanted alternatives turn out to be in fact *products* of the secularization process.

The kind of “holistic” worldview consistently based on correspondences, living nature and imagination/mediations did flourish, however, in pre-Romantic theosophical and illuminist currents (see notably Viatte 1979) and is basic to the very phenomenon of → Romanticism as such (see Hanegraaff 1998). It is explicitly referred to as “magic” by e.g. → Justinus Kerner (see notably his journal *Magikon*) and → Novalis, with his concept of “magical idealism”. As a worldview it continued to find its adherents after the Romantic period, but although the term “magic” is relatively frequent in such contexts, it could of course be referred to by other names as well. A notably example is → Carl Gustav Jung, whose concept of “synchronicity” (explicitly presented as an alternative to a worldview of instrumental causality) is rooted in Western esoteric and more specifically German Romantic/Naturphilosophical traditions, restated by him in psychological terminology.

4. MAGIC AS ANCIENT TRADITION, AS SCIENCE, AND AS KNOWLEDGE

All magical currents since the 18th century have been influenced by the emergence of this new usage of magic as a rhetorical concept equivalent to an

“enchanted” worldview, and polemically opposed (whether explicitly or implicitly) against processes of disenchantment. This is perhaps most clear in the case of those authors who continued the traditional understanding of magic as “the wisdom of the ancients” and who, exemplifying the new historicist focus typical of the 19th century, began to present grand narratives of its development from the earliest times to the present. To the extent that “magic” is understood as equivalent to an “enchanted” worldview as such, such narratives tend to be in fact attempts at writing the history of Western esotericism. It is not at all surprising, therefore, that one of the major representatives of this trend, → Eliphas Lévi, was also one of the most important early popularizers of the term “esotericism”. Lévi’s *Histoire de la magie* (1859) is in fact a history – confused and ill-founded though it may be – of Western esotericism as perceived by an author deeply influenced by Romanticism. The case is much less clear with another major representative, → H.P. Blavatsky. In her works she certainly sees magic as equivalent to the “secret doctrine” that was already known to the ancients, but she tends to prefer other labels, such as “occultism” and “theosophy”, over that of “magic”. For the second half of the 19th century and throughout the 20th, it has remained the case that attempts at writing the history of Western esotericism tend to freely use various terms from the “conceptual wastebasket” referred to earlier (e.g. histories of “magic and the occult”, “mystery and magic”, “magic and mysticism” and so on).
