The traditional understanding of magic as an applied philosophy of nature (*magia naturalis*) was attractive, for obvious reasons, to authors with an agenda of fighting against the dominance of the new philosophical and scientific worldviews. In these discussions as well, it was inevitable that magic would come to be treated as largely equivalent to Western esotericism, albeit with a strong emphasis on the “occult sciences”. One result was that the latter were no longer seen as subdivided into → astrology, → alchemy and magic; rather, it increasingly tends to be “magic” that is used as the umbrella term, so that alchemy and astrology become manifestations of magic (in fact: of an integrated magical or “enchanted” worldview, also referred to as “occult philosophy”). The rhetorical opposition “science or magic” has remained an extremely popular topos in alternative and esoteric literature throughout the 19th and 20th centuries: the popular quest for a unification of science and religion often results in “magic” being presented as the synthesis between both. Again, the term

“occult philosophy” may be used as a synonym, and the term “occult science” makes the point even more explicitly. A major representative of this approach is, again, H.P. Blavatsky, whose vehement polemics against modern science are particularly prominent in the first volume (“science”) of her *Isis Unveiled* of 1877.

Before moving on to the third traditional category (contact with intermediary beings) it should be added that, already in authors like Eliphas Lévi (and increasingly in the magic of e.g. the → Hermetic Order of the Golden Dawn, → Aleister Crowley or → Dion Fortune) magic becomes associated with “kabbalah” [→ Jewish Influences V] to such an extent that the two tend to be used as equivalents as well. As a result, magic can come to be associated to a large extent with the intellectual exercise of using “kabbalistic” tables of correspondences as a universal tool for interpreting things and events in the world. This means that the magician is considered the person who “knows”: he perceives the real pattern of hidden connections and the fundamental laws that underly reality, which of course also makes it possible for him to act more effectively and apply these laws and connections for achieving his ends.

5. RITUAL MAGIC AND PSYCHOLOGIZATION

Interestingly, as far as the three main traditional currents are concerned, the understanding of magic as based on rituals that enable contact and communication with “intermediary beings” seems to have emerged as the most prominent one in magical currents since the 18th century. Thus the theurgy practiced in illuminist sects like, notably, → Martinès de Pasqually’s → Ordre des Elus Coëns was focused on “manifestations” of higher intelligences, in the context of a worldview swarming with angelic and demonic beings; Eliphas Lévi famously claimed to have evoked the spirit of Apollonius of Tyana in London; and the system of the Hermetic Order of the Golden Dawn has a crucial background in the medieval grimoires studied by → MacGregor Mathers, resulting notably in his editions of *The Key of Solomon the King (Clavicula Salomonis)* (1889) and *The Book of the Secret Magic of Abra-Melin the Mage* (1898). Although never part of the official teachings of the Golden Dawn, they have exerted a very strong influence on the tradition, and the same goes for the “Enochian magic” based upon → John Dee’s conjurations of angels. All these are examples of ritual magic: a current that flourished already in the middle ages (see → Magic III) and was continued into the

Renaissance by e.g. → Trithemius, Agrippa, and Dee. We are dealing here not with hostile perceptions of magic as demon-worship, but with texts and authors who are themselves involved in, or at least are positive about, ritual invocations of intermediary beings within a private religious setting.

If one asks oneself why it is that the members of the Golden Dawn and similar magical orders put so much time and effort in their elaborate rituals and initiations, one explanation certainly has to do with the psychological satisfaction provided by ritual as such. While advancing from one degree to the next, the adept is introduced to new and progressively “deeper” knowledge (the initiations require much study of various occult symbolical systems), and can interpret this process as marking his own inner, spiritual development towards a superior gnosis. In fact, the single most important innovation in magic since the late 19th century is its increasing understanding as, essentially, a series of spiritual techniques for “self-development”. This phenomenon is inseparable from the emergence of psychology (academic as well as popular) during the same period: the new interpretation of magic in terms of spiritual self-development inevitably turned magic into an applied psychology. This is demonstrated most clearly by how the invocation of intermediary beings, traditionally central to ritual magic, has come to be interpreted. Mathers’ edition of the Abra-Melin rituals highlight the importance of the “knowledge and conversation of the Holy Guardian Angel” as a major goal of ritual praxis; but already in the early decades of the 20th century, and possibly earlier, many magicians no longer understood this Holy Guardian Angel as an independent metaphysical entity but, rather, as the operator’s own “higher self”. To be sure, this interpretation is contested, with e.g. Aleister Crowley reverting to a more traditional perspective later in his career; but there can be no doubt that for a large part – probably the majority – of modern magicians, the goal of magic is personal spiritual development.

The same, we should add, can be said – although in a different context and starting from different foundations – about another, somewhat less widely influential but significant current of modern magic: the one that is linked to the name of → Julius Evola (see Hakl 2001). Evola and this “Gruppo di Ur” are important for modern magic not only for their *Introduzione alla Magia quale Scienza dell’Io* (orig. 1927–1929, published in 1955 and 1971), but also for their involvement in yet another significant 19th/20th century innovation, likewise focused on “personal spiritual development”: sex-

ual magic. An esoteric interest in, indeed worship of, the male and female “generative powers” can be traced back as far as the 18th century (Godwin 1994), and led various occultist authors – notably → P.B. Randolph – to explore the connections between sex and spirituality. An understanding of magic as based on working with “sexual energies” (often referring, with or without justification, to tantric influences) became basic to e.g. Theodor Reuss and → Aleister Crowley, their → Ordo Templi Orientis, and offshoots such as the → Fraternitas Saturni. Likewise it is important in Italian magical circles, with authors such as → Kremmerz or Evola (*The Metaphysics of Sex*, 1958).

6. ATTEMPTS AT RE-ENCHANTMENT

The psychologization of magic as a practice of spiritual development is likewise central to how it functions within the rapidly growing cultic milieu referred to as → Neopaganism, itself heavily influenced by ritual magic in the Golden Dawn tradition (understood here as including influential authors such as Crowley and Fortune), and interacting or overlapping in a complex way with the → New Age movement. The psychologization of ritual magic as a tool for spiritual self-development is prominently visible here, but additional characteristics give it a special place in the development of magic since the Enlightenment. Different from the ritual magic in the Golden Dawn tradition, neopagan magic is a very strong example of what was highlighted above as a new development since the 18th century: the understanding of magic as equivalent with an “enchanted worldview”, defined by its very opposition to the disenchanted world implied by mainstream science. Neopaganism is grounded in a Romantic *Naturphilosophie*, espousing a holistic worldview of correspondences, organicism and “many levels of reality”. But under the impact of popular psychology, neopagans tend to take a very pragmatic attitude towards the question of whether those levels, and the “entities” (gods, goddesses, angels etc.) by which they are inhabited, exist only in the mind or “in reality”. In line with assumptions typical of New Age thinking generally, it is doubted whether such dualisms are helpful at all: if mind and matter are intimately interrelated, it becomes difficult and perhaps pointless to distinguish the invocation of “higher beings” from exploring the contents of the psyche (whether personal or collective). Such opinions illustrate, perhaps clearer than anything else, the gulf that yawns between ancient, medieval and early modern notions of magic, on the one hand, and their modern and contemporary counterparts, on the other.

WOUTER J. HANEGRAAFF

Magical Instruments

There is little evidence of magical instruments from the Middle Ages, owing to the prohibitions by the doctrinal authorities of those centuries. The testimonies are indirect and derive from works of Greco-Roman paganism and medieval Arab culture that passed sporadically into medieval Latin literature. Thus the available sources are preponderantly classical and Renaissance; in the Middle Ages they were obscured, known only through

citations of forbidden texts. They re-emerged in the Renaissance when the most important manual of medieval magic, *Picatrix*, hitherto almost unknown, resumed circulation. In general, magical instruments may be classified under two types: (1) As tools for operations such as spells, invocations, and divinations; (2) As objects for protection, such as sigils and → amulets.

Tools for magical operations. Since Antiquity, a magical instrument has often been associated in its application with the presence of herbal concoctions, endowed with particular powers which have been revealed by a god or a magus. Circe was considered to be the initiator of this magical practice: she touched some of Ulysses’ companions with her magic wand, whilst he defended himself from her thanks to an antidote made from a magic herb, secretly revealed to him by a hidden god. The magic wand is considered the instrument of command *par excellence*, and the methods of its construction are always minutely described. Usually it is made from a young hazel tree, whose branch has been cut with a single stroke while murmuring a formula of invocation. Other tools for making magical invocations are the dagger, associated with the planet Mars because it is an offensive weapon, and the sword, also associated with Mars but considered a defensive weapon. In order to function, these instruments must be consecrated according to various rituals which confer on them the charge of energy necessary for accomplishing the magical operations decreed by the magus. The use of a magical instrument therefore does not take place in isolation, but is connected with ceremonies, *formulae*, potions and unguents taken from animals or even from human bones, together with invocations and litanies. The first description of magical objects is found in Apuleius’s *Golden Ass* (also known as *Metamorphoses*), III, 21–28, when Pamphile transforms herself into an owl. There is a small box containing jars of ointment with which Pamphile smears her entire body, and an oil lamp with which she speaks secretly, by means of which the spell works.

In the tradition of Egyptian magic there are many indications of magical practices with relevant objects, especially to do with love-spells: laurel branches for burning, and red wool wound around the container of the love-potion or philter are the principal ingredients. A detailed description of them can be found in the *Idylls* or *The Enchanters* (2) of Theocritus. The philters must be prepared while the full moon is shining and under the protection of Hecate; one must repeat nine four-line strophes, sighing (*sussurrus magicus*) three times, and one must whirl a bull-roarer of wood or metal,

whose low vibrations protect the magus' operation. Certain animals are also used in love-magic, such as the salamander, killed in the instant of copulation, whose tail, worn as an amulet, is meant to favour erotic activities.

Beside the salamander, there are certain animals, particularly the fish and the cat, whose parts or whole bodies were considered instruments for powerful spells. A magical ointment that was very effective in love-magic was obtained from fish (Apuleius was accused of its use: see his *Apologia*, III, 25-27). Cats, represented as living or dead, were considered as very powerful instruments for obtaining the object of one's desire, as in certain Egyptian magical practices (see the *Greek Magical Papyri*, 3, 1-25), or the spell described in Oscar Wilde's *The Picture of Dorian Gray*. The belief in cats' fear of water probably derives from the tradition, described in the *Magical Papyri* (*loc. cit.*), of drowning a cat in water: in that moment Osiris, the god with a cat's face, must be invoked to realize the magus' desire.

These magical techniques were transmitted through the ages in the practices of love-magic and in death-spells (*facturae*, from *facturus*, that which will happen in the future), described in certain medieval treatises or compilations that are still unpublished and are known as *Experimenta*. These spells are performed through various operations. For love-spells it is most important to make a simulacrum (a wax or clay doll, or a statuette representing the subject to be compelled or destroyed), in which should be placed a little heart of copper, bound with a metal thread. The various manuals of love-magic describe the other paraphernalia needed for the spell, such as magical herbs corresponding to the astrological sign of the subject and object, a red candle, and so on. *Picatrix*, the most important magical grimoire of the 11th-13th centuries, states that the chains of love are efficacious under the influence of special astrological images or figures, especially the moon in good aspect with Venus. The good or bad configurations, invoked through *formulae* of spells and incense, are considered most potent instruments in love-magic.

Astrological images, characters engraved on pebbles, crystals, gems, and precious stones are essential tools in the necromantic magic described in *Picatrix* and developed over later centuries by → Agrippa, → Paracelsus, and → Trithemius, right up to the present day. Agrippa in *De occulta philosophia* (I, 40, 159) repeats these practices from *Picatrix* and calls them *ligamenta*. He also gives an interesting classification of the tools by which the spell of *ligamentum* or *vinculum* is achieved, devel-

oping the themes of *Picatrix*'s medieval Hermetic magic.

Both stones and plants are considered magical instruments, following the different classes that depend on various planetary and astral influences. Plants and stones are primarily distinguished according to the seven planets: sun: diamond, yellow sapphire, gold, topaz; moon: crystal, selenite, silver; Mars: ruby, garnet, hematite, iron, magnetite; Venus: emerald, beryl, chrysolite, copper, lapis lazuli; Jupiter: blue sapphire, chalcedony, tin; Saturn: amethyst, pearl, onyx, obsidian, lead; Mercury: opal, orange sapphire, coral, electrum. A magical use is attributed to every stone. The diamond, for example, is considered a protection against the evil eye, and said to favor lucid dreams and purify the thoughts.

The magic mirror is of the highest importance in the whole magical tradition. It is used for spells, evocations of spirits of the dead, invocations of demons and necromantic operations – the latter understood as divinatory operations for foretelling the future by means of communication with the dead via the mirror. In the *Picatrix*, necromancy has a broader significance than solely the evocation of the dead: it is considered to be the noblest kind of wisdom, and consists of a great variety of magical operations, both terrestrial and celestial, aimed at uniting the operator with the universal divine spirit (I, II, p.5). The evocation of the dead by means of the mirror is only one particular technique of necromancy (the name of which derives from *necros*, understood on the one hand as “dead”, and on the other as something “black” and obscure).

All the tools mentioned hitherto are absolutely indispensable for necromancy. However, according to the *Picatrix*, the mirror is the primary magical instrument by virtue of its special nature: it is particularly disposed to receiving (reflecting) the magical operation, of which it is the root (*radix*) (I, IV, 32, p.14). In particular, it is a magical attribute of the planetary divinities, such as the two luminaries sun and moon, which are imprisoned in the mirror without impoverishment of their light (III, VII, p. 113). Burning-glasses also possess special virtues: they can repel storms and dominate winds, men, and demons, and have special powers in the pharmacopia (*Picatrix*, IV, 7). More specifically, the mirror is not only a tool of magical operations, but also of real divination, which may be natural, i.e., employing natural mirrors such as water (used in Antiquity in vases and basins) which is stared at by a child in trance, or air (clouds, vapors). Metals, too, can be used as divinatory mirrors, as in the bronze, gold, or silver shields of warriors. The

sun itself can even serve as a mirror, while the reflected moon represents the most excellent of celestial mirrors.

In the work of → Peter of Abano called *Lucidator dubitabilium astronomiae* is found a famous classification of divination *per specula*, which Peter knew through the transmission of the *Antiquitates rerum humanarum et divinarum* by Varro (116-127 CE). In the first chapter he condemns all the magical arts and books on magic known in his time. Mirrors come under the practice that he classifies as “exterior divination” or aeromancy. Such operations can be done during the night, using any type of mirror. This magical practice was condemned in the notorious Bull *Super illius specula* of John XXII (Avignon, 1326-1327), in which all operations and evocations *per specula* are condemned. The mirror is also an instrument for evoking the dead, the living, angels, or demons, by means of formulae and ceremonies during which compound substances are burned. In *Picatrix* (VI, VII) there is a useful recipe for constructing the magic mirror, which must be of gold or silver and decorated by engravings of the figures of the seven planets, the twelve signs of the zodiac, and the names of certain special constellations. This magic mirror confers on whoever uses it immense powers of command. A different recipe for making a mirror of evocation appears in the *Grimorium verum*, a Hebrew manual of magic, which teaches how to make the mirror of Solomon, through which it is possible to evoke the angel Anael during the new moon: he will appear in the guise of a young child. → Michael Scot (12th-13th century) also speaks of the evocation of the demon Floraget in the mirror. And Luther believed in the existence of the mirror of Mercury, which supposedly made certain false images appear, all works of the Devil.

Another type of divination and magical evocation, connected with the optical phenomena of mirrors, is crystallo-mancy. This is a very ancient practice in which originally a special stone was used: the beryl, transparent and in different colors, from bright green to bright blue, yellow, and white. One variety of transparent green beryl is the emerald. In modern times, these stones have been replaced by crystal balls made from transparent glass. → Nicholas of Cusa writes of the powers of the beryl in *De berillo*. He who looks through it, says Nicholas, will succeed in seeing invisible realities with the naked eye, and all the arcane and secret mysteries. In ancient times, divination by means of mirrors was considered a type of oracular activity, through which the god or the demon spoke.

One magical instrument, finally, used through the centuries up to the present day is the horn of coral or some other material: in Italy it is thought to protect against the evil eye. In the Middle Ages there was talk of the extraordinary power of the ivory horn belonging to the knight Roland, whose sound caused avalanches in the mountains and shook the earth like an earthquake. Some miniatures of the 13th century testify to this tradition. Finally, all the manuals of magic (grimoires), whether black or white, may be considered absolutely extraordinary magical instruments.

Objects for Protection. The magical objects used for protection include seals, amulets, talismans, and all the drawings, images, engraved figures and characters which are described in great detail in the occult manuals of magic (grimoires).

The magic circle or Circle of the Art has the function of delimiting a “closed space”, protecting it from external influences and rendering the magus invulnerable within the circle. Among specific instruments are the rings and pentacles that derive from medieval Arab magic: they are figures traced after the numerical value of the Arabic letters, so as to form squares that are influenced by the universal force that protects the person for whom the pentacle has been designed. These are considered magical tools of protection, as are all amulets, which are protective objects that are very easy to prepare. They may be divided into three types, following the material from which they are made: animal, vegetable, and mineral. They often have the form of animals and are colored, perfumed, and prepared under a particular astral configuration which influences the operation. They are considered less efficacious than talismans, because they do not contain occult forces, but work through analogy only. A detailed description of talismanic figures is found in *Picatrix* (IV), which provides a description of the *formulae* and methods of preparation of mixed substances to be burned, according to the seven different images corresponding to the seven planets.

The talisman derives its name perhaps from the Arabic *tilasm*, “magical image”, or from the Greek *telesma*, “religious ritual”. Its basis is the belief in the operative, magical power of the talismanic object, which derives from the idea of the analogical process of correspondence between the talisman and the planets. In this sense, all the sigils that imprison the spirits of the corresponding planets may be considered talismans. A still unpublished text of medieval talismanic magic is the *Liber prestigiorum Abel*, translated into Latin in the 12th century perhaps by Adelard of Bath or → Robert of Chester. In the Middle Ages some treatises called

De sigillis were compiled, attributed to → Arnau de Vilanova, which deal with sigils with special therapeutic properties, including those of the twelve zodiac signs, of which Leo and Scorpio were much favored in the Middle Ages (from → Albertus Magnus and → Peter of Abano to → Marsilio Ficino). Invocations of saints and verses of the Psalms are inscribed on these seals, in the metal corresponding to the sign (e.g., in gold for the sign of Leo), and while they are being made, special invocations must be spoken (a typical instruction is e.g. ‘Arise O Lion from the tribe of Judah and hear my judgment, O my God, in my cause; afterwards say the Psalm’), while e.g. on one side is incised “Thael Sanctus Iacobus”, on the other “David alleluia”, and in the center “Heloy Saday”. This particular description refers to the seal of Leo (see description in Arnau de Vilanova, *Sigillum Leonis*, London, Wellcome Library, ms. 560), which is to be worn on the kidneys and is supposed to protect one from renal ailments, menstrual problems, all troubles of the stomach, shoulders and back, and fevers. One of the first works that demonstrates the belief in the medicinal-magical potency of these seals for wearing or hanging on one is *De physicis ligaturis* by Costa ben Luqua, translated by Arnau de Vilanova. In this type of treatise of Christian or Jewish magic, it was commonly supposed that the spirits of saints were captured in the astrological sigils, thus rendering these talismanic instruments effective.

GRAZIELLA FEDERICI VESCOVINI

Maier, Count Michael, * 1569 in the vicinity of Kiel, † 1622 Magdeburg

Alchemist and Rosicrucian apologist, named Count Palatine (*Pfalzgraf*) by Emperor → Rudolf II (1552-1612) and appointed *Medicus und Chymicus von Hauß aus* by Moritz “the Learned” of Hessen-Kassel (1572-1632); known chiefly for his early baroque book of alchemical emblems, the *Atalanta Fugiens*, and for his prominent position in the Rosicrucian affair [→ Rosicrucianism]. The Lutheran Maier gained his Masters degree at Frankfurt an der Oder in 1592 and his doctorate at the University of Basel in 1596; he also underwent medical training at the University of Padua, where he acquired the title of Poet Laureate. An early patron and inspiration for Maier’s pseudo-Egyptianism appears to have been Heinrich Rantzau

(1526-1598), Governor of Schleswig-Holstein. Following a long *peregrinatio academica*, Maier first developed an interest in → alchemy in 1599 whilst in Königsberg, where he witnessed the healing of a chronically ill man through the application of an English iatrochemical remedy. He completed his first alchemical experiment at Easter of 1604 in his hometown in Holstein; at some time in 1608 he moved to Prague, where he became personal physician to Rudolf II and entered the hereditary peerage on September 29, 1609. Prior to Rudolf's usurpation in 1612 Maier left the imperial court and made his way to England, where he became a close acquaintance of Francis Anthony (1550-1623) and defended the Englishman's "drinkable gold" in print; at this time he also made translations of alchemical tracts by Thomas Norton of Bristol and the pseudonymous "Abbot Cremer of Westminster". According to → Elias Ashmole, Maier's entertainment in England 'was too coarse for so deserving a scholar'; in 1616 he returned to Germany and attended a wealthy nobleman by the name of von Riedesel in the environs of Frankfurt am Main. Despite earlier attempts to secure the patronage of Moritz of Hessen-Kassel, Maier gained an extra-mural position at the Hessian court only in mid-1618, and it seems this had been revoked by 1621. Maier died on the return journey to his native Holstein after some fourteen years' absence, apparently from chronic illness.

The majority of Maier's works were printed in the years following his return from England by the Frankfurt publishers Lucas Jennis and Johann Theodor de Bry; according to Maier's testimony many were composed whilst the author was lying ill with the quartan. Maier's varied corpus displays an admixture of late Renaissance humanist learning, pre-Paracelsian iatrochemical conceptions and a heterodox Lutheran → mysticism; a pervasive motif is his alchemical interpretation of the symbolism of Egyptian and Greek mythology, which was definitively formulated in the *Arcana Arcanissima* (1614). Further elaboration on the *prisca sapientia* doctrine appeared in the work that is often considered to be Maier's *magnum opus*, the *Symbola Aureae Mensae* (1617), which traces the lineage of alchemical adepts from twelve nations. An elegant statement of Maier's Hermetic natural philosophy is to be found in the *Septimana Philosophica* (1620); tendencies towards *Reichspatriotismus* and a militant Protestantism are present above all in his *Verum Inventum* (1619); whilst the early *Hymnosophia* (c. 1610) displays overtly gnostic motifs and the alchemical solar mysticism

that was a cornerstone of his Work. The *De Circulo Physico, Quadrato* (1616) deals with the hidden bonds uniting God, the sun, gold and the human heart, and discusses the means of extracting the medicinal kernel lying under the hard shell of gold, whilst the Galenic principles of Maier's physic are extensively illustrated in the *Civitas Corporis Humani* (1621) – a work whose exorbitant claims for the cure of various ills *quasi in una hora* testify to Maier's life-long difficulties with the securing of patronage. The finest example of Maier's skills with Latin verse composition are probably the *Cantilenae Intellectuales* (1622); they also evince the author's neo-Pythagorean sensibilities, as do the fugues written by Maier for his *Atalanta Fugiens* (1617). This latter work of multimedia presents the reader with fifty copperplate emblems from the engraver Matthias Merian, illustrating various alchemical axioms and accompanied by short discourses and the aforementioned fugues; it counts as the most innovative and beautiful expression of pansophic alchemical thought from the German late Renaissance. In his *Ulysses* (1624), a short, posthumously published ethical tract, Maier presents Homer's hero as the image of the ideal man, unwavering in the face of misfortune and a life spent in foreign lands.

Maier's involvement with the early Rosicrucian phenomenon has been the subject of a great deal of unfounded speculation through the centuries. Contrary to the thesis of Frances Yates (*The Rosicrucian Enlightenment*, 1972) Maier's first encounter with the Rosicrucian manifestos was at the autumnal Frankfurt Book Fair of 1616; thus Maier played no role in the construction of a "Rosicrucian" Anglo-Bohemian axis whilst in England. Nor was he on good terms with the English Rosicrucian apologist → Robert Fludd, with whom he has erroneously been linked as the progenitor of a lineage leading from Rosicrucianism to English → Freemasonry. Perhaps the most prevalent myth involving Maier concerns his "Leipzig manuscript", which – far from providing evidence for 16th century origins of the Gold- und Rosenkreuz – is in fact a rough draft for the author's *Arcana Arcanissima*. → Arthur Edward Waite's suggestion in his *Brotherhood of the Rosy Cross* (1924) that Maier entered the Rosicrucian Fraternity 'ere he died' stems from certain remarks mischievously inserted by Lucas Jennis into his translation of the *Colloquium Rhodo-Stauroticum* (1624), which state that Maier was 'rewarded' by the Brotherhood of the Rosy Cross prior to his death. That Jennis was aware of the strictly virtual nature of the Fraternity is clear

from his description of Maier as a *Regni Christi frater*, i.e. a Brother of the Kingdom of Christ. Like other Rosicrucian apologists, Maier utilised the frenzy of publishing activity provoked by the Rosicrucian manifestos as an arena for the furtherance of his own worldview, influentially portraying the Brethren in his *Silentium post Clamores* (1617) and *Themis Aurea* (1618) as pious investigators into the secrets of alchemy and readers of divine signs in Nature. Thus for Maier the initials R.C. are “hieroglyphs” veiling the many levels of significance of the alchemical work. The perception of such signs, or *insignia impressa*, constitutes an act of gnosis: hence Maier proclaims in his *Hymnosophia* that the phoenix may be seen beyond the land of Egypt, provided that we look about with ‘the little eye of the soul’. Here he refers to a universal law of death and resurrection, reflected not only in the processes within the alchemical vessel and the cathartic action of the mercurial medicine, but also in the trials of earthly existence by which a finer spirit is distilled. Maier’s “spiritual alchemy” achieved its greatest influence through the periodic re-publication of the *Allegoria Bella*, an alchemical allegory concerning his quest for the phoenix which originally constituted the final chapter of the *Symbola Aureae Mensae*.

Michael Maier, *Atalanta Fugiens, hoc est, Emblemata nova de secretis naturae chymica*, Oppenheim: Johann Theodor de Bry, 1617; a helpful modern edition with extensive commentary and an English translation of the discourses is to be found in: H.M.E. de Jong, *Michael Maier's Atalanta Fugiens: Sources of an Alchemical Book of Emblems*, Leiden: E.J. Brill, 1969, York Beach: repr. Nicholas Hays, 2002; see also Joscelyn Godwin (ed.), *Atalanta Fugiens: An Edition of the Fugues, Emblems and Epigrams*, Grand Rapids, Mi.: Phanes Press, 1989 ♦ Michael Maier, *Symbola Aureae Mensae Duodecim Nationum*, Frankfurt am Main: Lucas Jen- nis, 1617; Graz Verlag produced a good facsimile edition of this work in 1972, and the *Allegoria Bella* appears in English translation as “A Subtle Allegory concerning the Secrets of Alchemy”, in: *The Hermetic Museum, Restored and Enlarged* (Arthur Edward Waite, trans.), London: J. Elliott and Co., 1893, 199-233 ♦ Michael Maier, *Cantilenae Intellectuales, in Triadas 9. distinctae, De Phoenix Redivivo*, Rostock: Mauritii Saxonis, 1622; a limited edition of this work in English translation appeared as *Intellectual Cantilenae in Nine Triads upon the Resurrection of the Phoenix* (Mike Dickman, trans.), Glasgow: Magnum Opus Hermetic Source- works, 1997 ♦ Erik Leibenguth, *Hermetische Poesie des Frühbarock: Die 'Cantilenae intellectuales' Michael Maiers*, Tübingen: Max Niemeyer Verlag, 2002, offers not only a fine German edition of the *Cantilenae intel- lectuales* but also a detailed and insightful account of Maier's life and worldview.

HEREWARD TILTON

**Maistre, Joseph de, * 1.4.1753
Chambéry, † 26.2.1821 Turin**

Educated by the Jesuits, de Maistre became a member of the Savoy Senate in 1787. After Napoleon's invasion of Savoy, de Maistre went into exile in Switzerland. In 1803 he was appointed envoy to St. Petersburg by the King of Sardinia. He remained in Russia for fourteen years. Upon his recall, he served as magistrate and minister of state of the Sardinian Kingdom.

The scholarship of Georges Goyau, Emile Der- menghem, and François Vermales in the 1910s to 1930s established that the Savoyard Catholic Tra- ditionalist de Maistre belonged to Masonic lodges [→ Freemasonry], maintained a life-long interest in → Illuminism, and that esoteric themes are integral to his thought.

From 1774 to 1790 de Maistre belonged suc- cessively to two masonic obediences. He first joined the Chambéry lodge *Saint-Jean des Trois Mortiers*, affiliated with the Grand Lodge of London. After five years he left the *Trois Mortiers* to join *La Sincérité*, where he ascended rapidly through the grades. *La Sincérité* was also a Chambéry lodge, but it was under the patronage of the Rectified Scottish Rite Masonry of Lyon, which, under the direction of → Jean-Baptiste Willermoz, was an esoteric masonry whose grades and rituals drew on the theosophic teachings of → Martinès de Pasqually. De Maistre's interest in esoteric masonry, and Illu- minism in general, predates his entrance into *La Sincérité*; two years before he had travelled to Lyon where he received, under the name Josephus a Floribus, the rank of Chevalier in the Order of the *Stricte Observance Templière* from Willermoz.

At *La Sincérité*, de Maistre associated himself with those working for the regeneration of the tem- plar obedience. De Maistre expressed his ideas for

reform most fully in a document written in response to the invitation, in preparation for the Convent of Wilhelmsbad, to comment on the state of masonry extended to the brotherhood by Duke Ferdinand of Brunswick, Grand Master of the *Stricte Observance Templière*. In his *Mémoire au duc de Brunswick* (1782), de Maistre argues that Masonry should drop its pretence of a chivalric past and establish itself as a new Christian Order. Devoted to a spiritual and mystical end, and governed by inspired sages for whom the highest grade will be reserved, Masonry should become an intermediate power between Church and State, without ever usurping the place of either one. De Maistre's *Mémoire* was ignored at Wilhelmsbad.

De Maistre was always a practicing Catholic. In the years during which he belonged to the *Trois Mortiers* and *La Sincérité*, de Maistre was also a member of two Christian brotherhoods: the Pénitents Noirs and the Jesuit-directed Grande Congrégation Notre Dame de l'Assomption. De Maistre saw in the Illuminist doctrines of Rectified Scottish Rite Masonry a providential counter-force to the rationalism and irreligion of the 18th century. He understood esoteric initiation to be religious in essence and an excellent means of deepening Christianity. In considering that esoteric Masonry, far from opposing Catholicism, would be the agent of its revival, de Maistre was not unique. There was little conflict at this place and time between Catholicism and Masonry, although the French Revolution brought an abrupt end to this harmonious situation. Similarly, the lodges were places for an ambitious young man to make friends useful for advancement and to discuss political reforms. Nevertheless, de Maistre's masonic activities appear to have delayed his rise through the ranks of the Savoy judicature, and upon the outbreak of the Revolution he was suspected by the authorities of participating in Jacobin conspiracies in Savoy. De Maistre abandoned the lodges in 1790, but never broke with his theosopher friends, nor with Illuminist themes.

Around 1810, however, and coincident with his writing of *Du Pape*, with its theme of obedience to papal authority, de Maistre experienced a crisis of suspicion of Illuminism. He denounced individualist tendencies within Illuminism and condemned the revolutionary agitation and opposition to legitimate authority of some Illuminist groups. If Catholic commentators have sometimes downplayed de Maistre's ties to Illuminism, those on the Illuminist side have sometimes overlooked de Maistre's criticisms of these aspects of it. By 1816 de Maistre had arrived at his final position on Illu-

minism, which is set out in the private letters of the period and in dialogues X and XI of *Les Soirées de Saint-Pétersbourg*. While he continued to insist that Illuminism, in relation to Catholicism, compromises the question of authority, he points out that Illuminism works to overcome the disunion of the Churches caused and perpetuated by Protestantism. He urges that Illuminism be seen as an agent of the unification of Christianity in all countries separated from Rome. De Maistre also makes a point of distinguishing between Illuminisms. While Illuminism can refer to 'these guilty men in Germany who have dared in our time to conceive and even to organize, by the most criminal association, the frightful project of stamping out Christianity and sovereignty in Europe' (the Illuminaten of Bavaria), 'the same name is given to the virtuous disciples of → Saint-Martin, who not only profess Christianity, but work to raise themselves to the most sublime heights of this divine law' (*Soirées*, dialogue XI).

These same dialogues of *Les Soirées de Saint-Pétersbourg* display the Illuminist themes retained, as de Maistre freely admitted, in his mature thought. (1) The conviction that humanity is able to lift the veil separating it from its Creator and, by thereby discovering the providential order within history, to clarify a little the mystery of the human condition. (2) The interpretation of St. Paul's description of this world as 'a system of invisible things visibly manifested' (Heb. 11: 3) as referring to a network of → correspondences between that which is above and that which is below, linking analogically the visible and invisible levels of reality. (3) The defense of divinatory intuition, or immediate participation in the thought of God on which truth rests (these last two are the grounds for the Catholic charge that de Maistre confused the natural and supernatural realms). (4) The allegorical interpretation of Scripture in order to render intelligible passages otherwise unintelligible. (5) The metaphysics of numbers [→ Number Symbolism] as a proof of the supreme intelligence. (6) The hope for a reunification of Christian churches. (7) The conviction that prophecy is always present among humanity, and will soon lead to a new and glorious efflorescence of Christianity. (8) The expectation of a third revelation that will complete and supersede the Old and New Testaments.

ARTHUR MCCALLA

Mandaeans

1. NAME 2. LITERATURE 3. ORIGIN AND HISTORY 4. DOCTRINE 5. RITUAL

1. NAME

The Mandaeans are an ancient religious community living traditionally in several settlements in southern Iraq (Basra, Baghdad, Amarah, Nasiriya, Suq esh-Shuyukh) and in Iranian Khuzistan (Ahwaz, Disful, Shushtar), but after the Gulf wars (1980-1986 and 1990-1991) also in Europe (e.g. Sweden, Denmark), the USA and Australia. They are thought to consist of ca. 40.000 members. For centuries, most of them seem to have been silver- and iron-smiths, boat-builders and bridge-constructors, but today they are also practising other modern professions. What they do not have in common with the surrounding peoples is their religious tradition or faith, and their traditional literature, which is written in an unique Semitic (East-Aramaic) dialect and script (both are called "Mandaic" by Semitists). Nowadays, with the exception of their priests, only very few Mandaeans still know their traditional language and writing. In some of the Iranian settlements, several kinds of "Modern Mandaic" have been preserved.

According to the Mandaean sources, the earliest self-designations are: "elect of righteousness" (*bhiria zidqa*) and "guardians" or "possessors" (*našuraiyi*), i.e. of secret rites and knowledge. "Mandaeans" (*mandayi*) refers back to the ancient term for "knowledge", Gnosis (*manda*), and therefore means "Gnostics"; but today it denotes the

"laymen" in distinction from the "priests" (*tarmidi*, originally "disciples") and "initiates" (*našuraiyi*). Portuguese Catholic missionaries of the 17th century called them "disciples of John the Baptist" and thus they were known in European literature until the 19th century under this name or that of "John-Christians" (true is only that they consider John the Baptist to be one of their former priests or disciples). The Muslims gave them the name "Sabians" (in modern dialect: *Šubba*), known from the Qur'an and early Arabic literature ("Sabians of Marshes"); it enabled them to be considered "people of the book", and thus to be tolerated by Islam. Probably the original meaning of the word is "baptists, those who baptize" (from the Aramaic root ŠBA "to immerse, baptize, wash").

2. LITERATURE

Over many centuries, the Mandaeans have produced extensive and diverse forms of literature: ritual books (liturgies, prayers, hymns) and commentaries, theological/mythical tractates, illustrated scrolls, legends, and magical texts. Since we do not know the names and dates of the authors, editors or compilers, it is very difficult to give exact information about the origins and the age of this literature. Often the nature of the writings creates a problem of interpretation, because early and late materials are interwoven. Surely the collection of many writings into "books" (*sidria*) had already started before the invasion of Islam into the Mandaean settlements in Mesopotamia (635). Apart from these, other texts have been transmitted in the older form of scrolls; when they are illustrated (in a peculiar style), they are called "Diwans". The oldest magical texts (bowls and lead scrolls) can be dated to the 3rd and 4th centuries C.E. All the texts have been copied by hand until our times; but in 1998 the first computer print of Mandaean manuscripts was published by Mandaeans in Australia, based on a newly-created font of Mandaean letters.

Modern investigations of the records of the text copyists (colophons) and comparisons of the special terminology, style, and phrases with non-Mandaean literature (Gnostic and Manichaeism [→ Manichaeism]) have shown that the liturgical and poetic writings must be postulated to have existed already in the 3rd century C.E. The script of the texts was probably developed in the 2nd century or earlier, using late-Mesopotamian Aramaic alphabets, in order to preserve the more ancient religious tradition which originated in Palestine and Syria and was brought to Mesopotamia by oral tradition.

The more important Mandaean works are the

following: the *Treasure (Ginza)* or the *Great Book (sidra rba)* is the most complete collection of writings; it consists of two parts, the larger *Right Ginza (ginza yamina)* and the smaller *Left Ginza (ginza smala)*. The first one is a collection of eighteen (according to Lidzbarski) tractates with predominantly cosmological (mythological), theological, and didactic contents, while the other one deals only with the ascent of the soul to the realm of light, which is why it is also called *Book of the Souls (sidra dnišmata)*. There exists only one edition based on ancient manuscripts (Petermann 1867); a more recent one is based on three manuscripts of the 19th century (al-Mubaraki 1998).

The *Book of John (draša dyahya)* or *Book of the Kings* (i.e. Angels, *drašia dmalkia*) is a collection of mixed contents. The main parts deal with the “sermons” of John the Baptist, the “discourses” of Shum (Shem), the appearance of Anosh (Enosh) in Jerusalem and the story of the conversion of Mary (*Miryai*) from Judaism to Mandaism. The liturgical hymns, prayers, and ritual instructions are collected in the *Canonical Prayer-book*, in Mandaic called *Qolasta* (“praise” or generally “collection of hymns”). The first two parts of the book contain the liturgy for the baptism (*mašbuta*) and the mass for the dead (*masiqta*); both are still used today by the priests. A series of other ritual texts or scrolls have been published only in recent times, e.g. the wedding ritual, a ritual for the ordination (“crowning”) of priests, a ritual for a polluted priest. Other, similar texts are still unpublished. A large collection of writings for priestly use only is the so-called *1012 Questions (alf trisar šuialia)*.

Some of the scrolls are illustrated, like the interesting *Diwan Abathur*, which deals with the ascent of the soul through the heavenly purgatories, or the *Diwan of the Rivers (diwan nabrawata)*, which gives an impression of the traditional (geographical) world view of the Mandaean. The only historical information on early periods of the Mandaean is given by the (fragmentary) *Diwan of the Great Revelation called Haran Gawaita* (i.e. interior Haran). Two scrolls include speculative interpretations of rituals for the ascending soul, the *Great First World (alma rišaia rba)* and the *Small First World (alma rišaia zuta)*, published by Lady Drower in 1963. Another one describes and explains the “coronation” of a priest, called *Diwan of Exalted Kingship (diwan malkuta 'laita)*. The *Book of the Signs of the Zodiac (sfar malwašia)* serves the priests for horoscopes and for giving the secret (religious) names to the Mandaean, the so-called “Malwashi names”.

3. ORIGIN AND HISTORY

In spite of the extensive literature of the Mandaean it is very difficult to give an exact and complete history of their origins and development. There is only one short text of more or less historical value, the *Haran Gawaita* mentioned above. Not much more is to be gained from passages of some other texts, e.g. the *Right Ginza* or the *Book of John*. Non-Mandaean sources are very rare, especially concerning the pre-Islamic period. Therefore we mainly have to base ourselves on investigations of relevant texts, rituals, doctrines, and terminology in order to reconstruct the roots and early history of the community. According to the Mandaean tradition, the former “Našoraean” had been expelled from Jerusalem (*urašlam*) by the Jews (*yabuṭaiia*). The destruction of Jerusalem (70 C.E.) is seen as punishment for this act. In the same context it is told that John the Baptist (*yuhana, yahya*) as a “disciple” or “priest” (*tarmida*) of the Nasoraean was an opponent of Jesus Christ (*šumšiba*), who was baptized by him, but then apostatized in order to establish his own community. For the Mandaean John the Baptist is not the founder of their religion but only one of their prominent representatives – particularly over against the Muslims he is their “prophet”. Until now, there is no strict proof that the Mandaean were originally followers of John the Baptist. The only testimony for such a relationship is their central rite, baptism (*mašbuta*), which can not be performed without a priest, who, like John, is witness and performer of baptism. Without any doubt the significant water ceremonies (lustrations) go back to the area of the so-called Jewish baptist sects that flourished between the 2nd century B.C. and the 2nd century C.E.

Some linguistic arguments based on special Mandaic terms (e.g. Jordan/ *Yardna, manda, kušta, yu* – beings, *našuraia, mašbuta*) refer to the west-Aramaic (or old-Aramaic) period. There are also several similarities in style and phraseology between Mandaic and early-Syriac/Christian literature (*Gospel of John, Odes of Solomon, Acts of Thomas*). Significant for an early stage of the Mandaean religion is the impact of → Gnosticism on its ideology (see below). This can be shown by the strict dualistic world view with its two opposite principles of light and darkness and by many parallels to Gnostic sources (e.g. in the domains of cosmogony and anthropogony), especially to some of the Nag Hammadi texts (e.g. *Apocalypse of Adam, Apocryphon of John, Hypostasis of the Archons, Origin of the World*). Probably Mandaism has its origin in the early history of Jewish

religion before the consolidation of rabbinic orthodoxy. The polemics against Judaism (→ Moses being presented as the prophet of the bad “spirit”, *Ruħa*), and Christianity (Jesus being presented as the false messiah and a manifestation of the bad planet Nbu-Mercury) have to be seen as elements of the preservation process of a new religion based on Jewish and Gnostic ideas and baptist rituals, which were documented in a special tradition and literature.

In the successive history, the exodus from Jewish Palestine to the East is connected with the “Median Hills” (*tura dmadai*) or the “Interior Harran” (*haran gawaita*): legendary names of places of the East, and with one of the Iranian king *Ardban* (either Artabanus III or IV). It is said that the Nasoraean settled in Mesopotamia, where they suffered oppression by the Sassanian kings (since 224). This can be confirmed by one of the inscriptions of the Zoroastrian high-priest Kirtir (end of 3rd century), which, among several persecuted communities, also mentions “Baptists” (“washers”) and “Našoraean”. At the same time, → Mani (217-274) grew up in a Mesopotamian branch of the → Elchasai, a Jewish-Christian baptist sect. We know his later polemic against this community and other similar groups, among them presumably the early Mandaeans or Nasoraean. There are some common traits between Manichaean and Mandaean terminology, mainly in the poetry or hymn books (e.g. *Psalm of Thomas*). Much of the Mandaean history can thus be traced back to the first centuries of the Christian era in the Near East. After the Islamic conquest (635) the situation of the Mandaeans did not change completely, because they were accepted as adherents of a “religion of the book” and identified with the Sabians (*aš-Šabi’un*) mentioned in the Qur’an (2, 62; 5, 69; 22, 17). In later Arabic sources they are also called “Sabians of the Marshes”, as distinct from the Harranians or Sabians; these were heresiological designations for special religious groups of pre-Islamic times, and eventually for paganism in general. In spite of the toleration, by Islam, of the Mandaeans as Sabians, their circumstances remained difficult. The transmission texts (colophons) are filled with news about local pogroms. This changed only with the British rule of Mesopotamia (1918) and after the founding of the Republic of Iraq (1958).

4. DOCTRINE

It is not very easy to present a coherent picture of the beliefs of the Mandaeans, particularly concerning the origin, growth and development of the traditions. No scholarly consensus has yet been

reached with regard to source analysis and redaction. Solid results of such investigations would undoubtedly enable scholars to isolate early traditions and thus to trace their development throughout the extensive and diverse Mandaean literature. Here only a brief summary of the main lines of Mandaean thought can be presented.

The cosmology is marked by a strict (Gnostic) dualism between a “world of light” (*alma dnhura*) and a “world of darkness” (*alma dhšuka*). The world of light is ruled by a sublime being who bears different names: “Life” (*hiia*, resp. *haiyi*), “Great Life” (*hiia rbia*), “First Life” (*hiia qadmaia*), “Lord of Greatness” (*mara drabuta*), “Great Mind” (*mana rabba*), “King of Light” (*malka dnhura*). He, or It, is surrounded by countless beings of light, called “wealth” (*uthria*) or “kings” (*malkia*), living in dwellings (*škinata*) or “worlds” (*almia*), performing cultic acts and praising the “Life”. The world of light came into being from the “First Life” by way of descending emanations or creations, which are called “Second”, “Third”, and “Fourth” Life; they also bear personal names, such as *Yoshamin*, *Abathur*, and *Ptahil*. The last one is later on the creator of the world (earth).

The “World of Darkness” is governed by the “King of Darkness” (*malka dhšuka*) and arose from the “Dark waters” (chaos). Its main powers are a giant, monster or dragon, with the name *Ur* (i.e. probably a polemic transformation of Hebr. *ur* ‘light’) and the bad (female) “Spirit” (*Ruħa*). Their offsprings are demonic beings (*daiuia*; *devs*) and “angels” (*malakia*). To them belong also the “Seven” (*šuba*) or Planets (*šibiahia*) and the “Twelve” (*trisar*) signs of the Zodiac.

The hostile relations between light and darkness, life and death, good and evil leads to the creation of the world (*tibil*) by the demiurge *Ptahil* with the help of the dark powers, mainly the planets. In this process, the body (*pagra*) of the first man, Adam, is created by the same beings, but the “animating essence” is derived from the World of Light. This “substance of light” in Adam is called “inner (hidden) Adam” (*adam kasya*, *adakas*) and represents the “soul” (*nišimta*, *nišma*) or “mind” (*mana*) in humans, which has to be saved or rescued from the dark, evil body or world by heavenly beings of light. The salvation of these “souls” is the main concern of the Mandaean religion. One of its central creeds is the belief in several “messengers” (*parwanqa*), “helpers” (*saruia*), or “redeemers” (*paruqa*), sent by the “Life” in order to inform the people by their “call” and to save the souls. The dominant figure of these envoys of light is the “Knowledge of Life” (*Manda dHiia*,

resp. *deHaiyi*), who is also called “Son of Life” (*Barhiia*, resp. *Barhaiyi*) or “Counterpart of Life” (*Dmuthiia*, resp. *Dmuthaiyi*). Beside him stand the three heavenly Adamites, *Hibil* (Abel), *Šitil* (Seth), and *Anoš* (Enosh). Actually the Mandaeans know no “historical” redeemers but only “mythological” ones appearing throughout the different ages of the history of the world as a repetition of the first revelation to Adam. Only after the confrontation with early Christianity did they develop the story that one of their messengers (*Anoš* or *Manda dHaiyi*) appeared in Jerusalem as an antagonist of Jesus Christ (*šū mšiba*), in order to expose him as a liar. In this connection John the Baptist played the role of a true Mandaean “disciple” or “priest” (*tarmida*), not as a redeemer or founder of the Mandaean religion. For the Mandaeans, death is the “day of salvation” (*yum purqana*), because the soul is ready to leave the body (three days after the burial) and to start with the long journey to the worlds of light through the purgatories of the demonic powers, which try to catch the soul; only the pious are able to reach the Life and its realm, with the help of some rituals (see below) and of the heavenly redeemers. There is also the idea of the end of the world, called “day of end” (*yuma dsuf*) or “day of the last judgement” (*yuma ddina*), when the earth (*tibil*) and the bad and dark powers will be destroyed by fire. Some later texts speak about resurrection and a Mandaean reign of freedom after the realm of the false Messiah (Christ).

The behaviour of the Mandaeans is mainly based on some ethical standards similar to those of the Jews and Christians. A collection of laws – a kind of a Mandaean Torah – is preserved in the first two books of the *Right Ginza* (I, § 77-180; II, 1, § 12-116 Lidzbarski). In spite of the strict distinction between body and soul and the idea of the darkness of the world, marriage is a duty for the Mandaeans; marriages are mostly monogamous, but in earlier times, under the influence of Islam, they could also be polygamous (but this practice was mainly restricted to priestly families). The Mandaeans do not perform circumcision. A multitude of purification rules, primarily by washing, are very important for the life of the pious; these involve food and meals, slaughter (especially ritual slaughter of chicken and sheep) and kitchen utensils (e.g. pots). Unique is the rejection of → music, due to the belief that the demons and bad powers are making noise by playing instruments in order to catch the souls (today this belief has become less usual). Frequently the texts polemicize against the veneration of foreign gods, devils, demons, pictures etc. Religious benefits (primarily for a good ascent of the

soul) can be earned by giving alms, being merciful, obeying father and mother, and taking part in the ceremonies and prayers. According to different traditions and influences, the times of the daily prayers vary between three, five and seven. Like the Christians, the Mandaeans honour the Sunday, or in Mandaic the “first day of the week” (*habšaba*). The religious calendar follows the sun and has six festivals: the New Year (*Dibba rba* or *Nauruz rba*), the Little New Year (*Nauruz zuṭa*), the Little Feast (*Dibba hnina* or *Dibba tirma*), the *Ashuriya*, the *Pansha* or *Parwanaiya* (the five intercalary days or *Epagomenae*; the main feast at the end of the year), and the Baptismal Feast (*Dibba daimana*).

5. RITUAL

The centre of the Mandaean religion is its cult. For centuries the traditional cultic locations (*mandi*) have been the principal centres of the local communities. They consist – probably we have to say consisted – of a small hut (*maškna*, *bit manda*, *bimanda*) made of mud and reed. In front of it lies the pool or “Jordan” (*yardna*) with flowing water; therefore the sanctuaries are always situated next to rivers or channels. Besides the Mandi the rituals were performed on the banks of rivers or creeks close to the residence of the community. Since the mid-1970s the Mandaeans have changed the traditional location of their cultic areas in order to avoid polluted streams and rivers. Modern cultic houses are built of bricks and the ritual font is made of stone and connected with the public water system. But at present there is again a trend of going back to the traditional pattern of performing the baptism in rivers; this also has to be done outside of Iraq and Iran, i.e. in the communities of the Mandaean refugees.

The most important and oldest ceremonies are the “Baptism” (*mašbuta*) and the “Ascent of the Soul” (*masiqta*). The baptism, or “immersion”, is performed every Sunday (*habšaba*) in flowing water (*yardna*; Jordan) and can only be done by a priest. It consists of two main parts. The first one is the actual baptismal rite including a threefold immersion (the participants dressed in sacral white garments), a threefold “signing” (*rušma*) of the forehead with water, a threefold gulp of water, the “crowning” with a small myrtle wreath (*klila*), and the laying on of hands by the priest. The second part takes place on the banks of the stream and consists of the anointing with oil (*šušma*, sesame), the communion of bread (*pihta*) and water (*mambuha*), and the “sealing” of the neophyte against evil spirits. Both parts are finished by the ritual

handclasp or *Kušta* (“truth”). The purpose and meaning of the baptism is not only a “purification” of sins and trespasses but also a special kind of communion (*laufa*) with the world of light, because it is believed that all “Jordans” or “living waters” originate in the upper world of “Life”. There is no doubt that the basic constituent features of the water ceremonies are derived from baptismal practices (lustrations) of early Judaism in the pre-Christian period (see above). Apart from this “full baptism” ritual, there exist two lesser water rites, which can be performed without a priest but always in flowing water.

The other chief ceremony is a kind of mass for the dead, or rather for the soul of the dead, called “Ascent” (*masiqta*). It is performed at the death of a Mandaean and supports the “rise” of his soul to the world of Light and Life. It consists of lustrations with flowing water, anointing with oil, and crowning with a myrtle wreath. The main ritual starts three days after death, respectively burial, when the soul is released from the body and begins its forty-five-day “ascent” through the heavenly purgatories (*maṭarata*) until it reaches the “home of Life”. Recitations from the *Left Ginza* and ceremonial meals serve the ascending soul (including its symbolic nourishment, rebirth, and creation of a spiritual body). The roots of these ceremonies and the idea of “meals in memory of the dead” probably go back to Iranian-Zoroastrian soil, but they are shaped by the Gnostic background of the Mandaean religion.

The Mandaeans have many more rituals, such as the ordination of a priest and a bishop or “treasurer” (*ganzibra*), the end-of-year-ceremony (*Parwanaiya* or *Pansha*), the cleansing of the cult-hut or temple (*maškna*), the marriage ceremony (which includes baptism), and several kinds of funeral and commemorative meals, called “Communion” (*lofani*) and “Blessed Oblation (of alms)” (*zidqa brikha*).

Characteristic of the Mandaean religion is the close connection between rituals and gnostic ideas. It is not only “knowledge” (*manda, madihta, yada*) that brings salvation but also the ceremonies: primarily baptism and the “offices for the soul”, which are indispensable means for the soul’s release. One may indeed say that gnosis has been implanted here into the ancient stock of a cultic ceremony of probably Jewish origin; but from this connection, an authentic and even typical Mandaean-Nasoraean offspring was created.

KURT RUDOLPH

Mani,* 14.4.216 near Seleucia-Ctesiphon, † 26.2.277 Beth-Lapat (Gundeshapur)

Mani, the founder of the gnostic [→ Gnosticism] world religion of → Manichaeism, was born near the southern Mesopotamian town of Seleucia-Ctesiphon on the Tigris. More or less trustworthy original Manichaean sources on his life are relatively late and scanty. It now seems certain that his father's name was Pattīg or Pattēg (Greek: Patikios; Latin: Patticius; Arabic: Futtuq); the name of his mother was probably Maryam or Miryam. It may be questioned whether his mother had close ties with the then still ruling house of the Arsacids: more likely these and other claims of noble birth are only pious legends. A recently re-established fact, however, is the narrative already handed down by the 10th century Muslim writer Ibn an-Nadīm in his *Fihrist* or Catalogue that from his early youth onwards Mani grew up in a community of Mugtasilah, that is: 'those who wash (or: baptize) themselves'. The *Cologne Mani Codex* (e.g. CMC 94-97) confirms that the members of this sect

of 'Baptists' were (a group within the) → Elchasai. According to the CMC, these Jewish Christians practised daily ablutions of their bodies and food; referred to their religion as the Law; emphasized the keeping of the Sabbath; referred repeatedly to ancestral traditions; but also acknowledged Jesus as the Saviour.

The bare fact of this descent from the Jewish-Christian milieu of the Elchasai may explain Mani's connections with gnostic Christianity. Here, one can also find the initial sources for his strict asceticism and his eschatology that, to a far-reaching extent, was determined by Jewish-Christian and Encratite (strongly ascetic) ideas. The notion, attributed to Elchasai, of the earth being 'the flesh and blood of my Lord' (CMC 97, 9-10) can be treated as the basis of the Manichaean doctrine of Jesus as the one who suffers in the whole cosmos (*Jesus patibilis*). Evidently, it was also the Jewish-Christian concept of the true prophet revealing himself anew in various periods of history that was accepted by Mani and his early disciples (cf. CMC 47, 1-72, 7). Besides, it seems to be most likely that already in this sect Mani had become acquainted with astrological speculations [→ Astrology] such as are particularly present in his cosmology.

The *Cologne Mani Codex* demonstrates that, initially, Mani tried to be the prophetic reformer of the Elchasai. From his earliest youth he received revelations. A special revelation by his Syzygos or heavenly Twin was imparted to him at the beginning of his 25th year (CMC 17, 8ff.; 73, 5f.). Because of the fragmentary status of its quires, it remains unclear whether or not the CMC mentions a major revelation at the end of Mani's twelfth year. Both the Coptic Manichaean *Kephalaia* (14, 31) and the Arabic writer al-Biruni († 1048) also explicitly mention such a major revelation at the end of his twelfth year; it may remind one of Jewish (bar mitswah) as well as Christian legacy (cf. the twelve-year-old Jesus in the temple). The traditions about such a revelation seem to reach back to accounts given by Mani himself in his *Shābuhragān*.

A clear identification of Mani's Syzygos or Twin with the promised Paraclete (e.g. *Kephalaia* 14, 32ff. & 15, 22f.) may well have been derived from traditions in the Aramaic Christian Church of Mesopotamia that equated the Holy Spirit (which is given at baptism) with one's guardian angel. By adopting the title of Paraclete (cf. Gospel of John 14, 16) for himself, Mani indicated that he would follow in Jesus' footsteps. Yet the Manichaeans not only identified Mani with the Paraclete, but also

considered him to be the new Jesus (e.g. Coptic Manichaean *Psalm-Book* 9, 3-7; 12, 28-32; etc.). Thus Mani would be, at the final judgment, both the Judge and the peace giving Paraclete (e.g. *Psalm-Book* 20, 19ff.). Apart from these and other appropriations of genuine Jewish and Jewish-Christian heritage, the various but fragmentary sources of his life also testify to Mani's conscious imitation of the apostle Paul. The recurrent designation of Mani as 'apostle of Jesus Christ' is a clear manifestation of this *imitatio Pauli* (e.g. CMC 66,4-5), as is the emphatic mention of Paul in the series of those who received the true revelation (CMC 60-62). This concentration on a gnostic tailored Paul, a process in which → Marcion and Bardesanes (the Syrian Christian "heretic" Bardaisan, 154-222, a native of Edessa who, apart from docetism, probably taught a kind of astrological fatalism) seem to have played a role, led to Mani's break with the sect of his youth. After he had heard the Call from the heavenly world through the inspiration of his "Syzygos", or "Companion", Mani went out: 'I am a grateful hearer / who was born in the land of Babylon. / I was born in the land of Babylon / and I am set up at the gate of the truth. / I am a singer, a hearer, / who has come from the land of Babylon. / I have come from the land of Babylon / to send forth a call in the world' (Turfan fragment M 4).

Immediately after his vocation, Mani started his missionary journeys inside and outside Iran, at first only accompanied by his father and two other members of the sect. While missionaries like Addā were sent to the Western, Roman, provinces, in 241 Mani sailed by boat to India and subsequently journeyed up the Indus valley to Turan, where he won over the king for himself. Soon after the accession of Shapur I (242-273) as the sole King of Kings, Mani returned to Babylonia. He probably delivered his only Middle Persian writing, the Shābuhragān, to the new Shahanshah on 9 April 243. His admittance into Shapur's entourage (*comitatus*), together with the permission to propagate his new syncretistic religion, accorded him unique opportunities. After Shapur's death, Mani also found a willing ear with Shapur's son and successor Hormizd (Ohrmazd, 272-273). However, at the beginning of the second year of the reign of Bahrām I (274-276/7), this benevolent attitude disappeared: Kardēr, the head of the Magi whose aim was a thorough reform of the Zoroastrian church, began to persuade the Great King to take action against the prophet from Babylon. Mani was summoned before Bahrām, duly accused, put in chains, and tortured. After 26 days in prison he died, in all

probability on 26.2.277. In several Manichaean sources his death is described as a crucifixion. His gnostic-theosophic doctrinal system, however, which was well-described in a number of canonical works, soon spread from Mesopotamia to the Atlantic in the West and, finally, as far as the Pacific in the East. On Mani's missionary activities, doctrinal system, Canon, ecclesiastical organization, etc., see → Manichaeism.

7. ORIGINS

I. HISTORY OF RESEARCH

Manichaeism is the gnostic world religion which was named after → Mani. Although this self-styled gnostic prophet and "apostle of Jesus Christ" flourished in the 3rd century C.E., it was not before the beginning of the 18th century that his religion became the object of serious historical and theological research.

During many centuries, the term “Manichaeism” was in use in the West, but mainly as a label falsely applied when rejecting any dissenting opinion. In the course of the Middle Ages, both in the Church and the State, the label “Manichaeism” was used increasingly, even if opinions to which it was applied had nothing to do with the religion in question. Thus dissenters from established social and theological opinions were routinely labeled Manichaeans (examples are the Paulicians and the Bogomils [→ Bogomilism] and particularly the Cathars [→ Catharism] in Southern France and some regions of Northern Italy). In the 16th century, Luther and other Protestants like Matthias Flacius Illyricus were accused of Manichaeism, and in this respect not only biased theologians played a part, but even an irenic scholar such as Erasmus could not restrain himself. Because of such accusations, it was in protestant circles that Mani and his religion first became the objects of serious study. In order to defend his friend Matthias Flacius, Cyriacus Spangenberg wrote his brief *Historia Manichaeorum* (Ursel 1578). Another early but still rather speculative attempt was made by the notorious dissident → Gottfried Arnold in his *Unparteyische Kirchen- und Ketzer-Historie* (Frankfort 1699-1700). Against all current opinions, this German Pietist tried to understand and even to justify the Manichaeans. He particularly stressed the cruelties perpetrated by the Catholics against them. The first genuinely scholarly study, and the foundation of all future research into Manichaeism, was written by the Huguenot Isaac de Beausobre. His monumental *Histoire critique de Manichée et du Manichéisme* was published in two substantial folio volumes in Amsterdam in 1734 and 1739. Although apologetics was an important motive (De Beausobre tried to vindicate the Protestant Reformation, and in his efforts he sometimes even depicted Manichaeism as Protestantism *avant la lettre*), subsequent studies have been able to build upon several of his profound insights. The originality of De Beausobre’s analyses can be detected in, for instance, his observations about the importance of the *Gospel of Thomas* to the Manichaeans and their use of Jewish Enochic lore. Not until the discoveries at Nag Hammadi and Qumran has it been possible to properly evaluate his remarkably prescient insights.

For almost a century after De Beausobre, virtually no progress was made. Studies were usually entrenched in anti-Manichaean polemics. A fresh treatment of the subject had to wait until 1831, when the theologian Ferdinand Christian Baur from Tübingen published his book *Das manichäische*

Religionssystem nach den Quellen neu untersucht und entwickelt. Although Baur attached too much importance to Buddhism as a formative element in Mani’s religion, his study is of lasting value because of its meticulous analysis of the traditions preserved by the Church Fathers, → Augustine in particular. After the ground-breaking work of Baur, the 19th century also saw the publication of new Oriental source material by scholars like G. Flügel (*Mani, seine Lehre und seine Schriften*, Leipzig 1862; *An-Nadīm, Fibrist al-ʿUlūm*, Leipzig 1871-1872); E. Sachau (*Al-Bīrūnī, Chronologie orientalischer Völker*, Leipzig 1878); K. Kessler (*Mani: Forschungen über die manichäische Religion*, Berlin 1889); and H. Pognon (*Inscriptions mandaites des coupes de Khouabir*, Paris 1898). This new information, together with the material already known from Greek and Latin sources, provided a solid basis for subsequent studies.

2. ORIGINAL SOURCES

Still, all this research was based upon materials that had been collected mainly from Christian opponents of Manichaeism such as [Ps.] Athanasius, Epiphanius, Hegemonius, Cyril of Jerusalem, Ephraem the Syrian, Serapion of Thmuis, Didymus the Blind, Titus of Bostra, Augustine, Theodor bar Kōnī, Severus of Antioch; from pagans such as Alexander of Lycopolis and the 6th century Neoplatonist Simplicius; and from Muslims such as Ibn an-Nadīm, al-Bīrūnī, aš-Šahrastānī and Ibn al-Murtadā. Genuine Manichaean texts began to be discovered from the beginning of the 20th century on. Between 1902-1914, Prussian archaeological expeditions, first led by A. Grünwedel and then by the more successful A. von Le Coq, brought back to Berlin several thousand fragments of Manichaean texts mainly originating from the sites of Turfan in Sinkiang (China) along the famous Silk Road. These texts were written in some seventeen (then partly unknown) languages and dialects such as Tokharian, Middle Persian, Parthian, Sogdian, Uighur, “Bactrian”, New Persian and also Chinese. The year 1905 brought the news of Sir Aurel Stein’s discovery of a large hoard of Buddhist and Manichaean manuscripts in Tun-huang (Dunhuang) in Chinese Central Asia. Here, shortly afterwards, the French scholar Paul Pelliot was also successful, as were some Chinese expeditions which followed him. Among the documents discovered at Turfan were a Manichaean *Confessional for the Hearers* in Uighur (usually called the *X^uāstvānīft*); among the documents from Tun-huang were a lengthy doctrinal tractate in Chinese (usually known as the *Traité*), the *Compendium of the Doctrines and*

Styles of the Teaching of Mani, the Buddha of Light (conserved in London; a supplementary part, known as the *Fragment Pelliot*, is in Paris), and the Chinese *Hymnscroll*.

Subsequently, an important series of discoveries followed in the West. As early as 1918, leaves of a Manichaean codex in Latin were found near Tébessa in Algeria (*Codex Thevestinus* or *Fragmenta Tabestina*), which seem to be part of a letter written by a Manichaean Elect to justify the lifestyle of the Elect through a skilful use of Biblical texts. At about the same time, a number of fragments from Egypt in Syriac (but in an Estrangela script peculiar to Manichaean texts found in Central Asia) were discovered. The texts were originally published in a number of journals; afterwards they were collected together and republished by F.C. Burkitt (*The Religion of the Manichees*, Cambridge 1925, 111-119). In November 1929 a large number of Coptic Manichaean texts, the importance of which cannot easily be overestimated, was first made known by antique dealers to the Danish Egyptologist H.O. Lange and then, in 1930, to the Berlin scholar Carl Schmidt during a visit to Cairo. Eventually the greater part of these manuscripts ended up Berlin; the other part was acquired by the Irish-American collector Sir Chester Beatty for his famous collection of manuscripts in London (now housed in Dublin). As is generally assumed, all these Coptic texts, although they were found in Medinet Madi in the Egyptian Fayoum, did not originate there but probably in the region of Assiut (ancient Lycopolis) in Upper Egypt. They are generally dated about 350-400 C.E., and seem to be translations of Syriac originals that reach back to Mani himself or to the first generations of his Church. Now accessible in (facsimile) edition are the lion's share of the *Kephalaia*, the *Psalm-Book*, and the *Homilies*. Unfortunately, the bulk of three codices (among them a historical work that gave reports on Mani's death and the early history of his Church, and a collection of *Letters* of Mani) seem to have been lost in the aftermath of the Second World War. A great surprise was the publication in 1970 of another document from Egypt, i.e. the now famous Greek Cologne Mani Codex. The *Codex Manichaicus Coloniensis* (CMC) contains a unique biography of Mani's youth and first missionary journeys based upon the eyewitness accounts of his closest disciples. Through this Codex, the argument for early Manichaeism to be studied as a manifestation of Jewish Christianity has received a decisive impulse. The Cologne Mani Codex demonstrated that Mani grew up in a Jewish-Christian baptising sect in Southern Mesopotamia.

This descent explains his deep familiarity with Christian scriptures like the Gospels and the Pauline corpus. The Codex has opened a wide-ranging debate on the Jewish and Christian origins of Mani's world religion. Most recent research (e.g. John C. Reeves) even depicts essential elements in Mani's religion as stemming from Jewish sources: Jewish concepts have functioned as a point of departure, or even as a basic principle, in the development of Manichaean concepts.

Since 1991, other Manichaean texts have been discovered at the site of Ismant el-Kharab (Ismant the Ruined), ancient Kellis, in the Egyptian Dakhleh-Oasis. This site was submerged in sand towards the end of the 4th century C.E. Apart from about 3000 Greek and Coptic fragments on papyrus, the ongoing excavations uncovered, among others, a palimpsest wooden board containing a complete cycle of Manichaean anaphoric prayers in Greek, some bilingual (Syriac-Coptic) Manichaean texts, and fragments in "Manichaean" Syriac. The new texts from Kellis are in the process of being edited, while archaeological work still continues on the site. An important part of the Coptic personal letters was written by Manichaeans: this provides the unique opportunity to study a Manichaean community. Amongst the literary texts, fragments from Mani's own canonical works have been found. Some of the Kellis psalms parallel and even pre-date those from the Medinet Madi *Psalm-Book*. There are also Coptic-Syriac glossaries of technical Manichaean terms. It is expected that, in the foreseeable future, and after preliminary editions elsewhere, these documents will be published as a separate *Series Dachlaica* in the new and, so it is hoped, comprehensive series *Corpus Fontium Manichaeorum* (Turnhout 1996ff.).

Notwithstanding the startling discovery of the Cologne Mani Codex as an eyewitness account of Mani's youth and first missionary journeys, our knowledge of his life and deeds is still relatively scanty. The same goes for his own adherents in previous centuries. In his compendium of heresies, the Church Father Augustine characteristically begins his description of Manichaeism as follows: 'The Manichaeans sprang from a certain Persian called Manes, but when his mad doctrine began to be preached in Greece, his disciples chose to call him Manichaeus to avoid the word for "madness". For the same reason some of them, somewhat more learned and therefore more deceitful, called him Mannichaeus, doubling the letter "n", as if he were one who pours out manna' (*De haeresibus* 46,1). In this passage, it is actually not so much Augustine's

derision of Mani's name by suggesting a connection with madness (Greek: *manía*) that is conspicuous. Such a pun was obvious and used by many. It is more characteristic that in regard to the person of Mani, Augustine, who had been an auditor of the sect for some ten years, confines himself to the statement that he was a Persian (*Persa quidam*). This profile matches the then current view and even applied to members of the inner circle of Mani's Church: the words and doctrines of the master had to be considered important, but about his descent one was usually badly informed. Besides, in this passage the simple (and in fact misleading) designation of Mani as a Persian had a fatal ring to Roman ears because Persia was Rome's hereditary enemy. But highly noteworthy and very accurate is Augustine's record that Mani's name designates 'the one who pours out manna'. The Cologne Mani Codex has confirmed that Mani styled himself the new Johannine Christ 'to scatter the bread on my people' (CMC 107, 18-20). It is thanks to this Codex and several other authentic sources (particularly those from Turfan and Medinet Madi, apart from some remarkably accurate Arabic writers) that we have precise information about Mani's descent.

3. MISSION

Already during his lifetime, the Babylonian prophet had dispatched several missions headed by his chief disciples: as far as Egypt came Addā or Addai (Greek Addas, Chinese A-to; mentioned by Augustine according to a Hellenised version of his name as Adimantus) and the missionaries Papos and Thomas; as far as Chorasan and the Sogdiana came Mar Ammo. Even before 277, a widespread Church had developed within and even outside the Persian Empire. Mani could legitimately say: 'I have [sown] the corn of life . . . from East to West; as you see [my] hope [has] gone towards the East of the world and [all] the regions of the globe (i.e. the West), to the direction of the North and the [South]. None of the apostles has ever done this . . .' (Coptic Manichaean *Kephalaia* p. 16). After his death, however, the Manichaean Church endured some difficult times because of persecutions and schisms. In particular the persecutions under Bahrām II (277-293) and Hormizd (Ohrmazd) II (303-310) are reflected in the Manichaean sources. There was a long-term interregnum immediately after Mani's death, which even led to a temporary schism. Sisinnios, Mani's first successor as *archègos* (Head of the Church), seems to have assumed office only after a vacancy of five years (cf. Coptic Manichaean *Homilies* 83, 13, where it is stated that he

was in office for ten years). He was executed apparently fifteen years after Mani's death and was succeeded by Innaios (*Hom.* 83, 21).

In the Graeco-Roman world, the Manichaean Church expanded into Syria, Palestine, Arabia, Asia Minor, the Balkans (in 1906 a unique tombstone of a Manichaean *electa* named Bassa was discovered at Salona, near modern Split, in Dalmatia), Roman Africa, Spain, Italy and Gaul. In the East, Manichaeism was made the State religion among the Uighurs of Turkestan, by Bögü Qan in A.D. 762-763. In the centuries which followed, this highly syncretistic but in essence still gnostic religion spread as far as the Indian Ocean and the China Sea.

Although Mani had failed to make his revelation the official religion of Iran, he succeeded in what he really intended: the establishment of a new world religion. Due to the Manichaeans' missionary zeal, their new Church soon became the dreaded competitor of the official Christian Church both in the Roman Empire and elsewhere. Its firm organization guaranteed a strong unity. Thanks to its organization and a system of teachings that could easily be adapted, Manichaeism was a success already within the Graeco-Roman world.

4. ORGANIZATION

The interior organization of Mani's religion was a hierarchical one, headed by Mani's deputy (*archègos*), who had his residence in Babylon until the beginning of the 10th century, when it was moved to Samarkand. The worldwide unity of this Church may be illustrated by the fact that, even in the 8th century, a North-African is said to have been its leader (An-Nadīm, *Fihrist*, transl. Dodge, 793). Immediately following the *archègos* or *princeps* there were three subsequent ranks: 12 apostles or teachers, 72 bishops, and 360 presbyters. The fourth rank of this gnostic Church was constituted by the *electi*, both men and women. The many scribes, illuminators of books and, for example, Church musicians will have belonged to these Elect. An official fifth rank consisted of the many male and female auditors (*auditores*, a term which e.g. in Syriac Christianity denoted the catechumens).

The numbers 12 and 72 seem to be rooted in the tradition of the Christian Church; the number 360 will stem from astrological lore which, as a rule, was highly valued in gnostic circles. The number 12 reminds us of the example of Jesus' 12 apostles, but perhaps this also goes for the number 72: in a typically Jewish-Christian writing like the *Pseudo-Clementines*, in the *Acts of Thomas* which were

well-known among the Manichaeans and also transmitted archaic Jewish-Christian traditions, and particularly in Tatian's *Diatessaron*, it is said that Jesus sent out 72 (and not 70) missionaries.

5. DOCTRINE

Mani laid down his teaching in various books that were to gain canonical status throughout his Church. He himself took great pains to ensure that his teachings would be handed down in writing, in order to prevent what had already happened to other founders of religions, such as the Buddha, Zarathustra and Jesus: the development of disputes as a result of the fact that they did not record their doctrines in writing. Apart from the *Šābuhragān* (which seems not to have been an official part of his sevenfold Canon, although it was a widely-read classic among the Manichaeans in Persia and Central Asia), Mani composed all his writings in his East Aramaic (Syriac) mother tongue and used a variant of the Palmyrene script. The names of these writings are usually given as follows: 1. *The Living (or Great) Gospel*; 2. *The Treasure of Life*; 3. *The Pragmateia (or Treatise or Essay)*; 4. *The Book of Mysteries (Secrets)*; 5. *The Book of the Giants*; 6. *The Letters*; 7. *The Psalms and Prayers*. All of them survive only in fragmentary form. The non-canonical literature included the *Kephalaia* (Coptic), the *Homilies* (Coptic) as well as several hymn collections (e.g. the Coptic *Psalter*) and the *Image* (Greek: *Eikōn*; Persian/Parthian: *Ārdahang*), a painted picture-book illustrating the most important aspects of the doctrine.

Manichaeism should be seen as a form of → Gnosticism. The heart of this religion was Mani's own speculative version of the gnostic myth of cosmic exile and salvation. As a religious system, Manichaeism offered the promise of a salvation through the revealed knowledge (gnosis) of transcendent realities, including the divine nature of the soul, and of what needs to be known about the way to eternal life.

All this is expressed in a detailed and very complicated myth. Any account of this myth inevitably tends towards an artificial synthesis. In several Manichaean and other sources we find important elements of Mani's doctrinal tenets which turn out to be carefully adapted and tailored to the needs of those addressed. This is particularly the case in works like the Coptic *Kephalaia*, the Middle Persian *Šābuhragān*, and in the Chinese *Traité, Compendium* and *Hymnscroll*. However, in documents such as the *Cologne Mani Codex*, the *Tebessa Codex* and the Coptic Manichaean *Psalter*, the mythical elements can only be detected as a kind of

substratum underlying the present text. The same turns out to be case with the new Kellis finds: at first glance these texts are "ordinary" Christian. Thus more than once there appears to be little knowledge of or interest in the many gods and demons among the Manichaeans; nor do we always find much interest in the intricacies of cosmogony and cosmology.

Nevertheless, Mani and his followers taught a cosmogony of a definitely dualistic kind: evil is an eternal cosmic force, not the result of a fall. Two realms or kingdoms, the realm of light and the realm of darkness, good and evil, God and matter, oppose each other implacably. It should be noted that this is not the Hellenistic dualism of spirit and matter, but one of two substances: the divine light is a visible, spatial and quantifiable element, as is the evil substance of darkness, the active principle of lust, the 'thought (reflection, idea: *enthymēsis*) of death'.

In the kingdom of light the Father of Greatness rules, and this kingdom is in fact an extension of himself. It has four divine attributes (purity, light, power, and wisdom) and the Father resides in his five intellectual powers or limbs (reason, mind, intelligence, thought, and understanding, which are otherwise substantially detailed as the five elements of living air, light, wind, water, and fire). Surrounding the Father are the twelve aeons, equally distributed towards the four directions of heaven, and refracted also into myriads of 'aeons of the aeons'.

Opposed to this kingdom of light is the realm of the King of Darkness, a kingdom that is essentially the domain of evil matter. It is disorderly and dominated by the "Prince of Darkness", who is the product of (and even identified with) evil matter. This dark realm likewise consists of five areas or worlds (dark reason, dark mind, and so on), which are also referred to as the five dark elements of smoke, fire, wind, water(s), and darkness. In this area countless demons are actively present; they fight and devour each other.

Because there was an accidental shift of these disorganized and senseless movements, the Prince of Darkness (in fact a collective personification of the five evil archons "ruling" the five worlds of darkness), having once reached the upper limit of his territory, glimpses the radiance of light, desires to possess its life, and therefore attacks the kingdom of light.

In the ensuing struggle, the Father of Light calls forth the Mother of Life, who in turn evokes the First Man. This is the first series of emanations or creations. It may be remarked in passing that, with

regard to the emergence of new gods and godly powers, the Manichaeans strictly avoid any suggestion of generation and thus of evil sexuality. Instead, they speak of “calling out” or “calling forth”. Accordingly the First Man, the “first born” Son of God, was also called forth and, being equipped with the five powers of light that appear personified as either his “sons” or his “arms”, went out into battle. But the Primal Man was defeated, and his fivefold armour that constitutes the Living Soul or Living Self was devoured by the powers of evil. To say it in Mani’s own words as quoted by the Nestorian bishop Theodore bar Kōnī (8th cent.): ‘Then the Primal Man gave himself and his five sons to be consumed by the five sons of darkness, like a man who has an enemy and mixes a deadly poison into a cake and gives it’ (*Lib. Schol.* XI).

This having happened, the divine Soul (also termed the Living Self that is suspended on the Cross of Light and particularly in the West personified as the suffering Jesus, *Jesus patibilis*) is mixed with the dark elements of matter and is therefore henceforth in need of redemption. The First Man, being vanquished, lays unconscious in the depths. In order to redeem him, the Father of Light calls forth a second series of emanations: a new divine trinity. First, the Father sends forth the Beloved of the Lights; from him comes the Great Builder; and he in turn produces the Living Spirit who, like Primal Man, has five sons: the King of Splendour; the King of Honour; the Adamas of Light; the King of Glory; and Atlas. The Living Spirit (also termed the Father of Life) sends his Call from the lowest boundary of the world of light to the First Man lying in the depths. By this Call, the First Man is aroused from his unconscious state and he responds by an Answer. Then the Living Spirit, together with its five sons and the Mother of Life, descends to the First Man and leads him up to the world of light. To rescue the light still captured through the compound of the divine Soul with evil matter, the Living Spirit constructs with the help of its sons ten heavens and eight earths. It is noteworthy that this act of creation is performed by a god of light, not by an evil demiurge. Thus, in the gnosis of Manichaeism, the structure of the universe is divinely devised. In order to create the cosmos, however, it is necessary to use material of a mixed substance (light and darkness). The sun and the moon are vessels of pure light, being made from the particles of light completely unaffected by darkness. The planets and stars, however, are evil rulers, because they are created from material contaminated with darkness.

The world being thus constructed as a well-

ordered prison for the forces of darkness and also as a place where the divine Soul is captured, the process of salvation can begin. To this end a third evocation of deities occurs. The Father of Greatness calls forth the Third Messenger, or Ambassador, who is charged to extract and purify the light still retained by the powers of darkness and contained in their bodies. By taking advantage of the innate lust of the male and female archons who are chained in the heavens, this *Tertius Legatus* and his female double the Virgin of Light (also represented as the Twelve Maidens, each corresponding to a sign of the Zodiac) make them relinquish the light they have devoured and still retain. It is concentrated, in particular, in their semen and in their wombs. The “sins” of the male archons fall upon the earth when they see the beautiful Maiden(s); out of that part of their semen that has fallen into the water a monster arises; but this fearful beast is subjugated by the Adamas of Light. From the semen that has fallen on the dry ground, five trees spring up, and from them all other forms of plant-life originate. When the female archons, impregnated by their own evil nature, see the naked form of the Third Messenger they are also agitated, and their foetuses fall down upon the earth. These abortions not only survive their premature birth, but also devour the fruits of the trees that have grown out of the semen of the male archons. Driven by sexual lust, they unite with each other and give birth to the innumerable species of animals as we know them. The light that is not yet saved is thus transferred to the earth where it is scattered and bound in plants and, to a lesser degree, in the bodies of animals.

This well-known episode in the Manichaean myth (referred to, ever since François Cumont, as “the seduction of the archons”) is a pivotal one. Through recent research (e.g. Reeves) it has become increasingly clear that, apart from its origins in a variety of earlier traditions, several details in this multifarious account are drawn from Jewish lore.

The next episodes of the Manichaean myth can be summarized succinctly. In order to continue the liberation of the light, the Third Messenger calls forth the Column of Glory (also referred to as the New or Perfect Man; cf. *Ephesians* 4, 12-13) and sets in motion the work of “the ships of light” (i.e. sun and moon) in order to transport the light to the New Paradise which was built by the Great Builder. This process frightens the powers of darkness and, in a desperate attempt to preserve some of the captive particles of light, they create the first human couple: Adam and Eve. Hence man was made by the demons. He was created, however, after the

image of the Third Messenger (and so ultimately after the image of God!) which the demons had seen on high. Man is thus rooted in two worlds, but at first he is unconscious of his high descent, because the necessary *gnosis* is still missing. This explains why the work of the redemption of light must be concentrated on man. Thus Jesus the Luminous descends to Adam to bring him the saving knowledge. In Manichaeism, this revelation is the archetype of all future human redemption. Gradually the liberation will be achieved. In order to bring about the redemption of light, Jesus evokes the Light Mind or Nous (Intelligence); and this Nous, in turn, summons forth the Apostle of Light who becomes incarnate in the great religious leaders throughout world history, such as the Buddha, Zoroaster, and Jesus the Messiah.

The final stage of world history is introduced by the Great War between the forces of good and evil. Through the practice of the laws of the true religion, light is liberated. When the Church of the righteous ones triumphs, every soul will be judged, and those of the chosen will rise to heaven. After that, the world will be destroyed and purified by a fire lasting 1468 years. All, or most, of the light particles will be saved; evil matter, in all its manifestations and with its victims (the damned), will be forever imprisoned in a globe (*Bôlos*, *globus*) inside a gigantic pit covered with a huge stone. Then the separation of light and darkness will have been accomplished for all eternity.

This is a necessarily brief and – inevitably – eclectic account of the complicated myth. The most coherent description of Manichaean cosmogony can be found in Theodore bar Kōnī's already cited *Book of Scholia*, but his account ends with the creation of Adam and Eve. Many other cosmological and cosmogonic tenets have been preserved in the surviving works of the Manichaeans and in the writings of opponents such as Augustine. The latter also includes very interesting passages from Mani's *Treasure of Life* in Latin translation (cf. *Contra Felicem* II, 5 and *De natura boni* 44; this *Thesaurus* appears to have circulated in Gaul and Spain as well).

However complex and arcane the various ramifications of the Manichaean myth became during the course of its distribution through many countries and centuries, its essential elements remained the same from the Atlantic to the Pacific. It is Mani's doctrine that there are two principles (or roots or kingdoms or realms or cities) and three "moments": the time before the commingling and the struggle, when the two kingdoms of light and darkness were still separated; the time of the com-

mingling, being the present world time; and future time in which the two kingdoms will again (and now definitively) be separated. In essence this message of salvation is typically gnostic: the Nous (the heavenly revelation) rescues the Psyche (the divine spark of light in man) from Hyle (evil matter).

6. SALVATION AND ETHICS

On the basis of its complicated myth alone, it would be difficult to understand the success of Mani's religion. In fact, the elaborate myth was only of minor importance to Manichaeans and its relevance was sometimes even played down. What really interested both the Hearers and the Elect was the microcosmic significance of the macrocosmic drama. Indeed, the long-term imprisonment of light by matter in the physical universe had important practical consequences for those who had been illuminated by the Nous. Their duty was to be instruments for the liberation of the divine light.

Carrying out this liberation required from the individual both a conscious effort to promote virtue, and the avoidance of any action which might harm the light or prolong its captivity. The Manichaean Elect were therefore expected to observe "the five commandments": 1. truthfulness, 2. non-injury, 3. chastity, 4. purity of the mouth, and 5. poverty. From Augustine and from Iranian and Turkish sources as well, it is known that the Manichaean ethic which was binding upon the Elect was more generally summarized as the "three seals" (*tria signacula*): the seal of the mouth; the seal of the hands; and the seal of the bosom. For the Hearers, there were ten commandments which have not been preserved uniformly, but which encompassed in any case the prohibition of killing, lying, false accusations, an unchaste life, stealing, and black → magic.

From this it can be inferred that the catechumens were allowed to marry and to carry out normal daily activities. Their main obligation, however, was what is termed in Middle Persian *ruwānāgān*, "soul-service". This service consisted of providing food, shelter and any other required sustenance for the Elect, and was the condition for the Hearers' own redemption: they would be rescued and purified according to their works. Although in very exceptional cases a catechumen (like an Elect) may be directly saved by his or her conduct, as a rule salvation will only take place through a series of reincarnations in e.g. luminous fruits and, finally, into an Elect. In the *Fragmenta Tabestina*, the vital place of the Hearer in the Manichaean Church is illustrated by the New Testament story of Martha and Mary (Luke 10, 38-42): like these two sisters,

the two classes of Elect and Hearers both perform indispensable and complementary tasks in order to ensure the liberation of light.

The Elect received the Hearers' daily offerings: in particular, fruit and bread at "the table". This sacred meal, probably the only real sacrament in Manichaeism, was opened by the Elect with "an apology to the bread". Of special importance was the yearly Bema festival to commemorate Mani's martyrdom. A judgement seat (*Bèma, tribunal*) was raised in the middle of the worshipping congregation upon which stood an icon of Mani to celebrate his continuing presence in the community of the Elect, and to symbolize his role as Jesus' representative until the last judgment. This feast of the Bema was preceded by a month of fasting. Other fast days were Sunday (for the Hearers and the Elect) and Monday (for the Elect). Fasting was also practised at other times and periods, e.g. during the five nocturnal festivals, each of which encompassed a day and a night. Ritual prayer had its place within these fasts, as well as during the daily services, together with hymns, reading of scripture and, for instance, sermons and catechetical lessons. The ritual greetings and blessings that Mani introduced into his Church were seen as reenactments of divine archetypes: the "peace" (the first greeting), the giving of the right hand, the kiss, the "salutation" (*proskynèsis*), and the laying on of hands.

7. ORIGINS

The origins of Manichaeism are still open to question. For centuries this religion was assumed to be a Christian heresy. As we have seen, Augustine called Mani a 'Persian', and until recently it has been common in the history of religions to treat Manichaeism primarily as part of the religious history of Iran. This view seemed to be corroborated by the finds at Turfan and Tun-huang. However, with the discovery of original Manichaean texts in Coptic, the scholarly consensus concerning the general character of Manichaeism has changed. Manichaeism now appears to have firm roots in a Gnostic type of Christianity. This view has been convincingly demonstrated by the *Cologne Mani Codex*. According to this Codex, some of the Jewish-Christian Elchasaites among whom the young Mani lived regarded him as a prophet, and some even said that the Living Word spoke through him (CMC 86). There is reason for the assumption that at that time Mani shared their Jewish-Christian convictions and believed that he was the new incarnation of the true prophet.

In recent research, several other tenets of Manichaeism have been re-interpreted against this

Jewish and Jewish-Christian background. Indeed, any unprejudiced reader of the CMC will be struck by its Jewish and (Jewish-)Christian elements. This does not, however, exclude the probability that Iranian or other religious and philosophical components may well have influenced both the origin and the subsequent developments of Mani's religious system. Iranian and perhaps even specifically Zoroastrian elements may be identified in his concept of history as the Three Times, in certain particular traits of his mythology, in terms such as "the Great War", in the Daēnā-concept, or in the designation of the highest God as "the One with four faces". As regards the last two concepts, however, reference can be made to Christian and Jewish parallels as well. That Mani's concept of the Nous ought to be derived from the Iranian *Vohu manah* (as argued by Geo Widengren) seems unlikely in view of its many substantial equivalents in Hellenistic thinking. From Buddhism, Mani may have received impulses resulting in the radical division of his Church into Elect and Hearers and to his doctrine of metempsychosis. Besides these possible "sources", much influence was doubtlessly exerted by the radical gnostic → Marcion. Major formative elements of Mani's system, particularly of his cosmology, may well have been inspired by Bardesanes († 222). If the latter is to be treated not so much as a gnostic, but as a typical representative of pluralistic Syriac Christianity, then this again indicates certain backgrounds of Mani in Edessene Christendom. Apart from these and other possible "sources", however, Mani has to be evaluated first and foremost as the founder of an independent and unique gnostic world religion.

JOHANNES VAN OORT

Marcion,* ca 85 Pontus, † ca. 160 place unknown

Marcion was a shipowner and maritime merchant from Pontus (according to Epiphanius, *Panarion*, 42, 1, 3, from Sinope on the Black Sea coast) and the most successful Christian heretic of the 2nd century. He founded a counterchurch for which he claimed divine truth and catholicity against the emerging “great church”. The Marcionite community survived until the 3rd century in the West, the 4th century in most of the East, and for a still longer period in Syria. It was a dangerous rival for orthodox Christianity until the middle of the 3rd century.

According to our best sources Marcion came to Rome about 140, probably not yet baptized, joined the Christian congregation there and gave it as a present the large sum of 200.000 sesterii, perhaps the proceeds from selling his ship. A few years of bitter quarrels about the right understanding of the Christian message must have followed. When the majority of the Roman Christians turned against Marcion, he broke away and founded his own church (about 144). He immediately started a powerful missionary campaign. It led towards a serious crisis of the Catholic Church, which it took some 50 years to overcome. Another tradition (Epiphanius, *Panarion* 42, 1, 4–7, and later authors) tells us that Marcion was excommunicated by his own father, who was bishop of Sinope, for seducing a virgin, and was already rebuked for his teaching in Asia Minor before he came to Rome. These are obviously antiheretical legends.

The heart of Marcion's teaching is his assumption of two gods, existing alongside each other. It is not a dualism of equal balance. Firstly, there is the good god who is described as the absolute, perfect and almighty god of ancient philosophy, who is also the god of life and mercy. He is unknown to the other god and to the world, until he decides to reveal himself in Christ. The other god is the Demiurge, the creator god of the Old Testament with all his anthropomorphic features of wrath, remorse and self-contradiction, ‘a judge, fierce and warlike’ (Tertullian, *Adversus Marcionem*, I, 6, 1). He has created the world and the human race, both reflecting the imperfection of their maker in their own nature. Out of weakness humanity fell into sin and was from now on threatened by the Demiurge with

his relentless law of vengeance. The assumption of two gods of different standing and power is common Gnostic teaching. Marcion, however, juxtaposes his gods as having coexisted with the beginning. The good god is not the principle of being, difficult though this may be to accept. The antagonism of Marcion's gods explains the dualism of his whole doctrine. Although there is no link whatever connecting him with the creator's realm, the good god out of mere love and mercy for humankind suffering under the regime of the creator sends Christ into the world to save all those who believe in him (Tertullian, *Adv. Marc.*, I, 14, 17).

Marcion is a strict docetist: Christ is not born from a woman but comes down from the heaven of the good god as an adult person in the 15th year of the emperor Tiberius (29 A.D.). The substance of his body resembles that of the angels. He preaches the gospel of the good god to all human beings, offering redemption from the creator's law and judgment to all who believe in him and his father. Christ gives his own life to the Demiurge as the price for liberation of the believers (Marcion is the first Christian theologian to hold a "ransom" theory of redemption). He takes their souls up into the heaven of his father; the material bodies cannot enter the heavenly realm. The doctrine of Christ's descent to the underworld is of particular importance for Marcion: as the good god did not reveal himself before the coming of Christ, his preaching to the souls of the dead is the unique chance for them to hear the gospel and to believe. Indeed, the pagans and the sinners of the Old Testament follow him immediately, while the holy persons of the Hebrew bible, who belong to the Demiurge, do not trust Christ and stay behind (Irenaeus, *Adversus Haereses*, I, 27, 3).

The Demiurge will also send his son, the Messiah of the Old Testament. He has not yet come. He will be a warrior and reestablish the kingdom of the Jews (Tertullian, *Adv. Marc.* III, 21–24). The period between the resurrection of Christ and his second coming is a time of suffering for the Christian believers because they are hated and persecuted by the creator god. When Christ comes again, he will not judge the sinners himself, but will hand them over to the creator to judge and punish them. (Tertullian, *Adv. Marc.*, I, 27, 6–28, 1; II, 11, 3). Perhaps after this has happened the creator with his adherents and with his whole world will perish in his own fire (Harnack, 140f.).

Marcion's dualistic teaching can be understood as radical → Gnosticism, including influence from contemporary philosophy. His view of Christian

tradition is a new achievement. Marcion denies that the Old Testament is to be understood as a Christian book: it is a true book in a historical sense, but a book in which the Demiurge addresses the Jews. Christological interpretation is rejected. Having lost the Old Testament basis for his theology, Marcion had to look for Christian sources for his teaching. He discovered that both oral and written tradition had suffered judaizing interpolations in the church since the time of the apostles. General appeals to tradition were no longer sufficient. Marcion had to find written documents the origin of which could be traced. He eventually found such evidence in the Gospel of Luke and in the Pauline corpus, which was circulating in several collections. From the beginning of the letter to the Galatians Marcion learned that Paul was the only apostle who had remained steadfast in the truth and had never forsaken Christ (Gal. 2, 11–14). And when Paul mentioned the one gospel he had received from Christ, Marcion referred this to Luke. Even the Pauline corpus and the Gospel were not free from judaizing additions. Marcion had to eliminate them in order to produce reliable texts. Marcion opened a new era in the history of the biblical canon: his abandoning of the Old Testament forced him to create a canon of New Testament-writings. The Catholic Church reacted to this with its twofold Bible, which keeps the Old Testament and contains a greater number of New Testament books. We know about four works written or revised by Marcion: 1. the *Gospel*, 2. the *Apostolicon*, 3. a letter in which he admitted that he had once been a member of the Catholic Church (Tertullian, *De carne Christi*, 2, 4; *Adv. Marc.*, I, 1, 6; IV, 4, 3) and 4. the *Antithesis*, which presented Marcion's theology; the opposing statements of law and gospel were to show the diversity of the gods. What is the attitude of Marcion towards Gnosticism and esotericism? It has been said above that Marcion's teaching of the two gods and the resulting dualism appear very Gnostic. Concerning the understanding of tradition and esotericism however, there is a sharp contrast. Gnosticism is intrinsically an esoteric movement. Its teaching is not addressed to the pagans or ordinary Christians in a general way: it is directed to the elect, to those who participate in the heavenly spirit (pneuma) without knowing. Those who believe in the Gnostic myth hereby prove to be elected, which the unbelievers are obviously not. A favorite literary form for communicating esoteric lore is the preaching of Christ after his resurrection to a select group of disciples. The secret teaching could also be said to be transmitted by little known

teachers of the past (cf. Hippolytus, *Refutatio* VII, 20, 1) or even claimed to be “apostolic tradition” (Ptolemy, *Epistula ad Floram*, in Epiphanius, *Panarion*, 33, 7, 9). Marcion dismissed oral tradition and never referred to apocryphal writings; he did not distinguish classes of Christians according to their spiritual progress either. For him faith was the only condition of salvation. He preached the one truth of the gospel to everybody, not only to an advanced spiritual elite. Marcion is the least esoteric Christian thinker of his time. The Marcionite church was a well-organized body with bishops, presbyters and deacons. Members called themselves *Markiônistai*. Marcion was highly honoured in his church. He was said to sit on the left of Christ in heaven with Paul sitting on the right (Origen, *Hom. in Luc.* 25 [ed. Rauer, 162, 6f.]), and he was called “the bishop” (Adamantius, *De recta in deum fide*, I, 8 [ed. van de Sande Bakhuyzen, 16, 34]).

After Marcion’s death theological schools developed in western Marcionitism. They discussed the number and nature of the principles of being (*archai*). Two, three and four principles were assumed. It seems to have been a deliberate attempt at reaching a deeper philosophical understanding of Marcion’s doctrine. Similar ways of thought were pursued outside Marcionitism as well. Disputes took place both within Marcionite circles and with teachers from outside (cf. Rhodon, in: Eusebius, *Historia Ecclesiastica*, V 13; Hippolytus, *Refutatio*, X, 19, 1-3). The most important pupil of Marcion was Apelles, (ca. 120-ca. 185), head of a school in Rome. In contrast to his teacher he taught one absolute god of perfect goodness. This god created angelic powers. The first angel created the world with an imperfect result. A second angel turned away from the supreme god and persuaded the preexistent souls to come down to the lower world to put on flesh. The next angel is fury (like a demon), he is the god of the Jews who spoke to → Moses from the burning bush. This angel inspired the Old Testament, which is a book full of lies and contradictions. Apelles dedicated a voluminous work, called *Syllogisms*, to this topic. On the request of the creator-angel the supreme god sent Christ to the world to save the human souls. For his appearance on earth Christ needed a body. There are two descriptions of its making. The first is that when Christ descended through the celestial spheres he weaved for himself a body out of the elements of the stars (Tertullian, *De carne Christi*, 6, 1-3, 8); the second is that Christ fabricated his body on earth out of the terrestrial matter (Hippolytus, *Refutatio*, VII, 38, 3-5; Epiphanius, *Panarion*, 44,

2, 2f.). Both versions show that Apelles and his school tried to come closer to the catholic doctrine of the true body of Christ. On earth Christ suffered and died; after his resurrection he returned to his father, giving back the elements of his body during the ascent.

In Rome Apelles was connected with a prophetess, Filumene. He put her sayings together in a book *Phaneroiseis* (“Manifestations”). Perhaps Apelles added these revelations to the Marcionite canon. This would explain a certain distance between Marcionites and Apelleians. Rhodon, a catholic writer of the late 2nd century, tells us that Apelles as an old man declared that for a Christian nothing matters but faith in the crucified Christ and good works (Eusebius, *Hist. Eccl.*, V, 13, 5). One must beware not to understand this statement in modern terms of subjective faith. Apelles is still quoted and criticized in the 4th century. His school had vanished much earlier.

GERHARD MAY

Marconis de Nègre, Jacques-Étienne,*
30.1.1795 Montauban (Tarn et
Garonne), † 21.11.1868 Paris

The founder of the "Egyptian" masonic rite of Memphis (1838) was also one of the first theoreticians and employers of the word *ésotérisme* (→ esotericism). His family seems to have been marked by the double origin reflected in his name; his father Gabriel-Matthieu Marconis is said to have been an Italian officer in Napoleon's army in Egypt, while the patronym "de Nègre" is current in South/West France. This was the region where Marconis Sr., together with a certain "Brother" Honis of Cairo, founded, on April 30, 1815 in Montauban, a Grand Egyptian Lodge called "Les Disciples de Memphis". Since this rite was duplicated by that of Misraïm, of which Gabriel-Matthieu was Grand Master, the lodge was "put to sleep" in the following year and not reawakened until 1838 by his son. Jacques-Étienne soon became its "Grand Hierophant", a new grade (the 96th!) created on this occasion. He was an excellent connoisseur of masonic rituals, and worked a synthesis of Misraïm with the Ancient and Accepted Scottish Rite, explaining and justifying it in two works: *L'Hiérophante, développements complets des mystères maçonniques* (The hierophant, complete expositions of the masonic mysteries, 1839) and *Le Sanctuaire de Memphis ou Hermès* (The sanctuary of Memphis or Hermes, 1849). Especially in the latter, he underlined the concordances with ancient masonic initiations such as the Primitive Rite of Narbonne, and clarified and simplified the rituals of Misraïm, a rite established in Paris in 1814-1815 by the Bédarride

brothers. Marconis had belonged in 1833 to a Parisian Misraïm lodge, where a conflict with other members caused his expulsion. Nevertheless, in 1836 a certain "Monsieur de Nègre" was able to open a new lodge in Lyon, "La Bienveillance", armed with an authentic patent from the Parisian authorities, until the discovery in 1838 of his true identity and of the irregularity of the rituals he was practicing caused a fresh expulsion. It was in these contentious circumstances that he founded his own organization in the same year, and carried on an endless polemic with the Bédarrides.

Mistrust of public authorities and of the forms of Freemasonry recognized by them accentuated the secret character of both Memphis and Misraïm, justifying their insistence on mythical origins as proof of their legitimacy. The Grand Hierophant appropriated the legend that the Templars had inherited their knowledge from the "Brothers of the Orient", an order founded by the Egyptian sage Ormuz, converted to Christianity by St. Mark, and whose transmission had taken place in secret [→ Neo-Templar Traditions]. All the knowledge of masonry was placed under the auspices of esotericism, a veritable mystery within the mysteries: "That is why the masonic science, the science par excellence, is both esoteric and exoteric, the esotericism being its thought, the exotericism its power . . ." (*Le Sanctuaire . . .*, 17). Marconis nevertheless succeeded in integrating the Grand Orient of France in 1862, at the moment when Marshall Magnan (1791-1865) was attempting to unify all the masonic obediences under his authority; he had taken advantage of the refusal of Misraïm. Memphis had a genuinely international influence. From 1859, French emigrant lodges functioned for a time in London; and Marconis made a voyage in 1856-1857 to New York, where he created a Sovereign Grand Council of which Harry J. Seymour became Grand Master in 1861. In 1863-1864, another one was established in Alexandria, Egypt. It was through the intermediacy of Seymour that the English occultist mason John Yarker re-established a Sovereign Grand Sanctuary in 1872.

JEAN-PIERRE LAURANT

Marcus the Magician, 2nd century

Marcus the Magician was a Gnostic [→ Gnosticism] and a disciple of → Valentinus who claimed a right to correct his teacher. The dates of his birth and death are unknown, but his floruit can conceivably be located between 160 and 180 AD. Probably he was a native of Asia Minor, an ancient centre of diffusion of Christianity, in particular of Gnostic Christianity, and he presumably carried out his propaganda missions in the Rhone valley. A presence of Marcossians – his disciples – is attested in the diocese of Lyons and later in Rome itself (Hippolytus). The treatise *Adversus haereses*, I, 13-16, by Irenaeus, bishop of Lyons, is the direct or indirect source of all the subsequent heresiological information available in the Greek, Latin and Syriac languages, with the partial exception of the ritual of *apolytrosis* (redemption, in this case a second baptism) described by Hippolytus of Rome (*Refutatio*, VI, 41; the reports contained in the Arabic *World History* by Agapius, the Melchite bishop of Hierapolis in Syria, are unreliable and of little consequence).

Marcus placed special emphasis on the ritual aspects of (mainly oriental) Valentinianism. The basic sacrament with which he used to initiate his followers – women, in particular, who flocked to him captivated by his charismatic personality – consisted in the manipulation of wine in cups, by practices that according to Irenaeus (*AH*, I, 13, 2) were nothing but a parody of the Catholic ritual of the Eucharist. White wine changed to red – fertilized by the blood of the superior female aeon Grace (Charis) – or it increased prodigiously in volume thanks to the skills that Marcus – the accomplished alchemist and conjuror – displayed in the presence of an astonished female audience. The second step consisted in inculcating the charisma of prophecy (glossolalia?) in his faithful to allow them to partake of the gifts of Grace, the aeon with which he enjoyed a privileged relationship (“Take Grace from me through me . . . open your mouth and prophesy”). Irenaeus reports that Marcus, to achieve his objective, availed himself of the magical powers of a helping daemon (*paredros*). It is therefore presumable, from an ethnopsychiatric point of

view, that he was endowed with an uncommon hypnotic talent. The “seed of light”, which was also a vehicle for the prophetic spirit (cf. Delphic Pythia, insuflated by Apollo), entered the over-excited aspiring prophetess – who yearned to “restore unity” – through her most natural orifice by a procedure that might be seen as similar to the well-known rituals of left-hand tantrism. Marcus (who identified himself with the *syzygos* angel of the Valentinian Pleroma) and his Gnostic and pneumatic female followers materialized the symbol and drew extreme consequences (a sort of realized eschatology) from the Valentinian sacrament of the bridal chamber (*nymphon*) – a sacrament which gave a (merely symbolical!) foretaste of the copulation (realized in the Pleroma) between the spiritual and his/her angel – thereby restoring the androgynous unity broken by Sophia’s sin. In addition, to have success also with those women who were less easily influenced by his psychic powers, Marcus made use of erotic potions based on well-known recipes taken from the magic papyri. According to heresiologists, of course, the use of magic arts – particularly aphrodisiac potions – was to be imputed to the Gnostic groups that were most suspected of libertine attitudes, i.e. the Simonians (Irenaeus, *AH*, I, 23. 4), the Basilideans (I, 24, 5) and the → Carpocratians (I, 25. 3). Irenaeus testifies, and there is no reason to disbelieve him, that in his own diocese a large number of women had fallen prey to the seductive arguments – religious and erotic – put forward by Marcossian missionaries. The special sacrament they received before dying – the so-called “redemption” (*apolytrosis*), a kind of second baptism or chrism or extreme unction – made them perfect and consequently free from the risks of the afterlife, i.e. the verdict pronounced by the supreme court presided over by the Demiurge (Achamoth’s son) in the lower skies.

In Irenaeus’ and Hippolytus’ opinion, however, the most distinctive feature of the Marcossian sect was its speculation on letters and numbers (in terms of neopythagorean arithmology [→ Number Symbolism] and Graeco-Jewish gematria), reported as a sequence of visionary revelations attributed to various entities of the Pleroma. The first teaching that the Tetrad, in female shape, imparts to Marcus is a meditation on the letters that compose the names of the Father and other members of the Pleroma. The Tetrad’s second speech consists in translating the body of the aeon Truth into the letters of the alphabet: two letters of the Greek alphabet, starting either from alpha or omega, are correlated with each of the limbs. The Tetrad’s

third and longest speech is also the most elaborate: gematric interpretations of the names of Jesus, Christ and other personages of the Pleroma are interspersed with musicological, Christological and cosmological speculations. Only the female components of the Supreme Tetrad (Silence and Truth) show themselves; but since revelation is the work of the Tetrad as a whole, the male aeons (First Father and Intellect) must consequently be regarded as invisibly present. Marcus is the privileged recipient of a visionary revelation issued by a dyad that behaves in a paradoxical fashion, considering that Truth is always silent while Silence talks too much. Similar grammatological and gematric speculations, in theurgic terms, can be found in the treatise *Marsanes* (NHC X. 1), which characteristically presents itself in the form of an apocalypse attributed to Marsanes, a Gnostic prophet and visionary who must have been no stranger to the circles of Valentinus' Marcosian followers.

Rather like his gnostic ancestor → Simon Magus and the contemporary pagan Alexander of Abonutheichos, Marcus is represented as a powerful, charismatic figure, perhaps even a charlatan, with his magic tricks, visionary claims, entrepreneurial usage of syncretism and skill in attracting well-educated religious women. In conclusion, Marcus' heritage can be envisaged immediately in medieval Merkabah literature (esp. *Sh'ur Qomah*: angels as letters that reproduce the structure of the human body) and in perspective in contemporary pseudo-scientific cults founded by personages like Ron Hubbard (→ Scientology), Bhagwan Rajneesh, or Claude Vorilhon called Raël.

GIOVANNI CASADIO

Martinism: First Period

1. THE DOCTRINE 2. THE CULT 3. THE LEGACY

The title of → Papius's work *Martinésisme, Willermosisme, Martinisme et Franc-Maçonnerie* (Martinesism, Willermozism, Martinism, and Freemasonry, 1899) encompasses fairly exactly what modern historiography understands under the name of "Martinism", at least for the period of its origins and early developments (18th-beginning of the 19th century). The expression "Second Martinism" applies to the history of the Martinist Order as "re-awakened", as Papius put it – though in fact he founded it – in 1887 [→ Martinism: Second Period]. The term "Martinism" refers in part to → Louis-Claude de Saint-Martin, but much more to → Martines de Pasqually, the master in matters of thought, action, prayer, and ritual of all those who constitute the type of esotericism thus named. This company, apparently heterogeneous but basically united, is sufficiently profiled to distinguish it from the other currents of thought of the 18th century, even when those currents take on initiatic forms (namely masonic ones), and to arouse contrasting reactions, now as then.

1. THE DOCTRINE

In the beginning was Martines de Pasqually, and above all his doctrine: this is what defines "Martinism". This doctrine is a gnosis, i.e., a "science" in the esoteric sense of the word, on which all Martines' disciples (Saint-Martin, → Willermoz, → de Maistre, among others) are agreed. According to this sense, science is not predicated on the acquisition of learning or knowledge (though that aspect is far from absent), but much more on the transformation of the inner being of the person who devotes himself to it. It is conceived as spiritually active and operative: a transformative science which applies less to objects than to the subject.

This doctrine is all-encompassing. It is a "hierohistory", a sacred History; a history of man and the universe in their mutual relationships and in their relationship to God; a history which is not merely descriptive but dynamic, made of actions and re-

actions (or “counter-actions” as Martines called them) on the part of both man and God. This metahistory is not restricted to reportage, to drawing up a *Natural Table of the Relationships between God, Man, and the Universe* – to cite the title of a well-known work of Saint-Martin – and of their evolution; it is all aimed at the modification of these relationships and, briefly, at their *restoration*. For these relationships have become degraded, and everything depends on re-establishing them in their original *integrity*. The history in question, typical of sacred histories, thus consists of acts of rebellion of man against God, and of God’s interventions for the punishment of man, followed by his reconciliation – his punishment being intended to achieve his reconciliation.

Martines’ doctrine, and the practice that goes with it, thus comprise: 1) a cosmology that is also a cosmogony, opening up onto a cosmosophy; 2) an anthropology that is an anthropogenesis and also an anthroposophy; 3) a theology that is a theosophy; 4) an angelology that is an “angeloduly”: a cult of, and with, the angels, hence a liturgy. All these are placed under the sign of Wisdom, or as Saint-Martin would later call it, Sophia.

At the origin alike of time and of the world there was the Fall, which Martines calls “prevarication” – a term commonly used in the French spiritual school of the classic age. It was a double event: a fall or prevarication first of the angels, then of man. But there was a history before history, a time before time. In that pre-historic, pre-temporal time, the Eternal (a term that underlines the Creator God’s sovereign exemption from all temporal determination) emanates “spirits” in the bosom of what Martines calls the “divine immensity”. Their number is infinite, and this “infinity” is not static but dynamic: ‘the multitude of the inhabitants of the divine immensity increases and will increase ceaselessly and infinitely, without ever reaching a limit’, since the divine fecundity is uninterrupted: God never ceases to create.

To be exact, the term “create” is inappropriate here, for Martines reserves it for the production of material and temporal forms, whereas for the divine productions on the spiritual plane he uses the words “emanate” and “emanation”. The distinction is important, for it leads one to envisage the “divine essence” under two different aspects. The term “essence” is used here following Martines’ best exegete, Robert Amadou, not in the philosophical sense and even less in the theological sense, but rather in the chemical or alchemical sense of “species” or of “active nature”. From this double point of view, this divine essence is “triple”

relative to creation, and “*quatriple*” relative to emanation, the “quatriple” being moreover primary in relation to the triple. A complex numerology and arithmosophy [→ Number Symbolism] derive from this, preserved by all Martines’ disciples. They are found, for example, in the degrees of the Régime Ecossais Rectifié as instituted by Jean-Baptiste Willermoz.

It is important to note that the terms “emanate” and “emanation” have nothing to do with “emanationism”, a form of pantheism found in several variants of → Gnosticism. The classic language to which Martines, for all his awkwardness and idiosyncrasy of expression, pays tribute, implies nothing of the sort. E.g. Furetière in his *Dictionnaire* of 1690 defines emanation as “dependance on a cause, on a superior power”, giving as an example: “The rational soul is an *emanation* of Divinity”.

Martines derives an important significance from this “emanation” in respect to the essence of the “spirits” that are thus perpetually emanated. They certainly do not *belong* to the divine essence, because they emanate from it; but still they *participate* in it, because, as Martines states, ‘they have in themselves a part of the divine domination’. The totality of these spirits constitute the “divine immensity”, which *is not God*. Thus, ‘the fullness of divinity, but not the Deity, [belongs] to the emanated spirits’ (Amadou). This similarity of essence, which *is not identity*, recurs in the Régime Ecossais Rectifié under the dynamically initiatic theme of the “image and resemblance”, Martinian by origin but accommodated to Christianity, in whose tradition it also figures. Martines also calls the “divine immensity” the “divine court”. Like every court, it is hierarchical: the spirits are differentiated in “classes” or “circles” which are ‘distinguished from one another by their virtues, their powers, and their names . . . according to their faculties of divine spiritual operations’. Moreover, although Martines states that ‘this famous divine immensity [is] incomprehensible not only to mortals but to every emanated spirit; this knowledge belongs to the Creator alone’, he himself has given us his observations about the angelic hierarchies such as he has contemplated them.

According to a summary by Willermoz, these circles are four in number: 10. Circle of superior denary spirits: the agents and special ministers of the universal denary power of the Father, creator of all things. 8. Circle of major octonary spirits: immediate agents and ministers of the Word of God, which is the being of double quaternary power. 7. Circle of inferior septenary spirits: direct

agents and ministers of the divine operative Action of divine quaternary power and operating the triple creative essence. 3. Circle of minor ternary spirits: agents of manifestation of the divine quaternary essence’.

Thus the hierarchy of spirits is a hierarchy of functions, which refer to the three Persons of the Holy Trinity. All the same, Martines explicitly rejects the hypostatic distinction (i.e., that of the Three Hypostases or divine Persons) on which Christian theology has rested since the dogmatic formulations of the Council of Nicaea (325). In technical terms, he was what is called a “Unitarian”, or to be absolutely strict, a “modalist”. For him, the distinction between the “three Persons of God” is more symbolic than real, referring to ‘three divine faculties which are Thought, Will, and Action, or in another sense . . . the Intention, the Word, and the Operation’. These three faculties are typified by the Father, the Son, and the Holy Spirit, and also symbolized by Abraham, Isaac, and Jacob. For this reason, these three personages are constantly present in the prayers and degrees of the Order of → Elus Coëns.

This trinitarian theology, which was not so much heterodox as archaic, or as Amadou says, “pre-Nicaean”, was hardly acceptable to Martines’ disciples, all Christians in faith and practice. The paradox was that Martines insisted, as a condition of admission into his Order, on membership of a church, namely the Roman Catholic Church, of which he himself really did not accept one of the two fundamental dogmas, that of the Holy Trinity. The other one was that of the double nature of Christ, which on the contrary he fully embraced. Thus one very soon sees his disciples returning, for example in the *Leçons de Lyon* (Lessons of Lyon, 1774-1776), to a dogmatically orthodox trinitarian theology.

The divine immensity, although in dynamic expansion, was perfect, hence sufficient unto itself. But then a first accident occurred, with the prevarication of perverse spirits who, wanting to equal the Eternal, strove to become first causes as He was, instead of the secondary causes that they were. They wanted to “operate” like Him, i.e., to emanate. Needless to say, this failed, unleashing a cosmic catastrophe in the literal sense of the word. In fact, the Eternal created, or rather ordered the minor spirits who had remained loyal to create, the temporal material universe (this being no longer a matter of *emanation* but rather of *creation*), so as to ‘contain and subject the evil spirits in a state of privation’ in it; in other words, to imprison the “prevaricating spirits” therein. Here we find the

recurrence of an idea common to various forms of → Gnosticism, namely that matter is connoted as evil. Yet there is an important difference, in that for Martines matter is not evil in itself; on the contrary, it is intended to contain evil and prevent it from contaminating everything. Moreover, since evil has not a positive but a negative definition, and consequently has no constituent reality, matter also has none. Matter, just like evil, is destined to disappear and disintegrate. Martines keeps repeating that matter is null and void, that it is only appearance, and that there is no true reality but spiritual reality. This is another legacy of Martinesian doctrine to the Régime Écossais Rectifié, found particularly in the Master’s degree.

Matter is created by the operations of the minor ternary spirits. This is done by setting in motion a whole series of ternaries or triads that have issued by simultaneous or successive combinations from the first ternary, that of the “spirituous essences” (“spirituous” in the chemical or alchemical sense, not to be confused with “spiritual”). These essences themselves have ‘stemmed from the divine imagination’, whereas *spiritual* beings, on the contrary – and the difference is essential – pre-exist in God (see above; there is a similarity here with Origen’s idea of the pre-existence of souls in God). These primitive “spirituous essences”, called Salt, Sulfur, and Mercury as in the alchemical treatises, produce through their mixtures the three elements of Water, Fire, and Earth, then, also by mixture, the three corporeal principles known as “aquatic”, “igneous”, and “solid”. Consequently Martines assigns symbolically a “triangular form” to the earth, explaining that it ‘has only three noteworthy horizons: north, south, and west’. The lodges of the Régime Écossais Rectifié were also heirs to this.

The cosmic catastrophe did not fail to have its effect on the “divine court”. The minor ternary spirits were obliged to leave it, having been delegated by the Eternal first to the creation, then to the conservation (see below) of the temporal material universe. And while at the summit of the angelic hierarchy ‘the divine denary spirits have never left the place they occupy in the divine immensity’, other spirits in their turn were ‘subjected to the temporal, although they were not at all subject to time’ by their own nature: they too are, in effect, delegated outside this immensity in order to ‘perform . . . temporal spiritual actions’, or in other words to ‘act and operate in the supercelestial, the celestial, and the terrestrial’ – the three divisions of the created universe (see below) – because they are ‘destined to accomplish the temporal manifestation of the Creator’s justice and glory’. This delegation

outside the divine immensity is called by Martines “emancipation”, which should in no way be confused with “emanation”. There was, is, and will always be emanation in eternity, or at least in sempiternity. But emancipation has only occurred within time, and that only for reasons of circumstance. Thus all the ternary spirits have been emancipated in order to attend to the material things of the universe, as well as a ‘sufficient number’ of septenary spirits, to ‘perform temporal spiritual actions in the supercelestial’; and some of them, to this end, have been ‘endowed with a denary power’, because the denary spirits have remained in their place.

A gap would thus seem to have occurred in the divine immensity, caused by the departure of the ternary spirits; but such a gap is intrinsically impossible, since ‘there cannot be any void next to the Creator or in his immensity’. Thus this place was occupied by a new production, a particularly eminent and glorious one: the “minor quaternary spiritual” – quaternary in the image of the Divinity –, namely Man. He was an emanation directly from the Eternal Himself, just as had been the case with the other spiritual beings; there was no cooperation, as was the case with the temporal creation entrusted to the ternary spirits. Man was then the object of a double emancipation. First, the totality of spiritual beings constituting his class was emancipated in the “supercelestial”. Then a portion of this class was emancipated in the “celestial”, this portion being known by the name of “Adam” or “Réau”: a name that is both collective and individual, but more consistently applied to a unique being containing potentially within itself all of its spiritual posterity. We are told that this name is a pseudonym referring to the nature or state of him who bears it. For ‘this man-God, in his state of glory, had his proper name directly attached to his spiritual being’. Now, in all traditions name is power. The power of Adam, like his glory, was pre-eminent. ‘He received [from the Creator] the august name of man-God of the universal earth’, he was ‘the chosen god of the earth’. Man, the last to arrive of the emanated spiritual beings, was set above them all for two reasons, which were really only one. First, ‘to contain in privation’ the perverse spirits, to ‘molest’ them, ‘to manifest the divine glory and justice against the prevaricating spirits’; then in order to reconcile them. Their chastisement was not for the sake of punishment, but for repentance. Here Martines, again like Origen, holds firmly to the idea of apocatastasis.

‘Created in the image and resemblance of the Omnipotent Being’ and placed ‘in the sight of

the Divinity’, Adam ‘in his first state of glory was the veritable rival of the Creator. As pure spirit, he openly read the divine thoughts and operations’. The Creator caused him to perform three operations through which he received the Law, then the Precept, and finally the Commandment. After that, the Eternal left him to his free will. Thereupon Adam “prevaricated”, in imitation and at the instigation of the perverse spirits. The latter whispered that he could operate ‘the power of divine creation’ inherent in himself. And he in turn found himself, like them, captive in the material prison of which he should have been the jailer. He who should have worked to “reconcile” them would henceforth be at pains to reconcile *himself*. This possibility had been offered him thanks to the help which which God, in his tireless mercy, supplied him: namely, by ascetic and religious practice. Adam’s place, left vacant in the center of the supercelestial, awaits the moment when he will return to be enthroned there: ‘it is in this holy place that Adam’s minor spiritual posterity must needs be reintegrated’.

There remains the fate reserved for another category of spirits, the “octonary” ones. This class, being the second in the angelic hierarchy, does not remain in the divine immensity, nor is it emancipated in a specific region. These spirits are assigned to ‘go and operate [the Creator’s] justice and glory in the different immensities without distinction’. They are as it were the *missi dominici* (divine envoys) charged to bring help to the deserving: ‘the doubly strong spirit is with you when you deserve it, and it departs from you when you make yourself unworthy of its doubly powerful action’. Their task is to work for reconciliation: in fact, this class of spirits ‘will have to work its powerful faculties eternally in the different classes wherein are placed the first and the last reconciled ones’.

It is necessary to take a closer look at the “three immensities” mentioned above. The indispensable traveler’s guide – the ‘road-map of the Elus Coëns’ (Ama-dou) – is the famous *figure universelle*, otherwise called *tableau universel*, of which several representations exist (Amadou having published in 1974, 1995, and 1999 the only ones conforming with the sources). Martines calls it a ‘universal figure, in which the whole of the spiritual nature – major, minor, and inferior – operates’. Equally valuable is the descriptive commentary provided by Willermoz (published by Amadou as Preface to the *Leçons de Lyon*, 43-45). A summary follows.

The “*divine immensity*” is ‘this place where the most perfect spiritual beings cannot penetrate, if it is not indeed God himself’ – and, we might add, the spiritual beings which he permanently

emanates. Next comes the “*universal creation*” – the cosmos –, composed of the three immensities, or worlds, already mentioned: supercelestial, celestial, and terrestrial. The *supercelestial*, which abuts and touches the divine immensity, although it is “limited” whereas the latter is infinite, is nevertheless ‘the semblance of it’: ‘the same faculties of spiritual power are found in both immensities’. Four circles are also found therein, just as in the divine immensity. At the top: 1) that of the *superior denary spirits* (in fact, as we have seen, ‘major spirits . . . clothed with a denary power’); its center is ‘the type and figure of the Divinity whence all emanation and all creation proceeds’. On either side are: 2) the circle of *superior septenary spirits*, guardians of the divine Law; and 3) the circle of *inferior ternary spirits*, guardians of the divine spiritual Precept. Lastly and lowest: 4) the circle of *minor quaternary spirits*, where Man was in the first place emancipated ‘in the sight of God’ and where he will finally be reintegrated when his reconciliation is perfect. Then come the two worlds or immensities that compose the universal creation in the strict sense, which will be discussed below. This creation is material and temporal, that is, constituted of matter and subject to time, matter and time having begun simultaneously after the first prevarication, that of the perverse spirits.

The *universal creation* is circumscribed by a mysterious reality called ‘*the central fire axis*’, which is ‘simultaneously the envelope, the support, and the center of creation’. It is ‘the principle of material life’: it animates and vivifies it. We recall that matter is the result of the combination of three “spirituous essences”: ‘in the same way as the three spirituous essences are the principle of all corporisation, likewise the central fire axis is that of all animation’ (Amadou). It is the principle of individuation and life in all created bodies: ‘without [it] no being can have life and movement’. The reason is that it is ‘the organ of the inferior spirits who inhabit it and who operate in it on the principle of apparent corporeal matter’. These inferior spirits (see above) are the ternary spirits, emancipated for this purpose, who provide for every corporeal being a ‘vehicle of central fire’ (this notion has its counterpart in the theme of the “temple”: ‘all is temple’, writes Martines). Thus ‘no body can exist without having within itself a vehicle of the central fire, on which the inhabitants of this axis operate, as having proceeded from themselves’. It is clearly specified that these vehicles ‘are by no means spiritual beings. They are beings of passive life, destined simply for the preservation of forms. The produc-

tions or emanations of the spirits of the axis can only be temporal and momentary’.

As for the universal creation, thus enveloped by the vivifying central fire axis, it is composed of two immensities or worlds: celestial and terrestrial. The *celestial* – symbolized by Mount Sinai – is in turn susceptible to two divisions, into which the “seven heavens” are distributed: one ternary, and the other septenary. The *ternary* division is composed of: 1) the “rational circle” which is ‘adherent to the super-celestial’ via the central fire axis, under the sign of Saturn; 2) the “visual circle”, under the sign of the Sun; 3) the “sensible circle”, under the conjoined signs of Mercury, Mars, Jupiter, Venus, and the Moon. The *septenary* division, which is superimposed on the preceding one, is the ‘seven planetary circles which contain the seven principal agents of universal nature’, which ‘operate for the conservation and the sustenance of this universe’. These latter are also charged with suppressing the ‘evil spiritual beings’, imprisoned in the material universe (as explained above), who ‘combat the faculties of good influential actions which the good planetary spirits are charged to spread around the whole world’. Tossed from one to the other, the minor-man has to choose. One can see here how the principles of traditional → astrology are incorporated in an active angelology, which one might call an “angelomachy” – a battle of good and evil angels –, itself ordered in the eschatological perspective of a sacred History.

Finally, just as the four supercelestial circles reflect the ordering of the divine immensity, so the four major celestial circles (those of Saturn, the Sun, Mercury, and Mars) reflect the same ordering. The three other circles, those of Jupiter, Venus, and the Moon, or rather the spirits attached to them, serve to “substantiate” the ‘general terrestrial body’, also called ‘*general creation*’. From the latter ‘emanate all the nutrients needed to substantiate the particular’, or ‘*particular creation*’, namely ‘all the inhabitants of the celestial and terrestrial bodies’. Both the general and the particular creation are “triangular” or “ternary” in constitution (see above). It is the same for the “body of matter” of present-day man, which is far different from his primitive “body of glory”.

Nonetheless – and this is fundamental – Martines tells us insistently ‘not to consider these three circles [sensible, visual, and rational] only materially’. For in reality, the ascent represented by their traversal symbolizes the successive stages of *reconciliation* of minor-men, at the end of which the latter will be *reintegrated* in the quaternary

supercelestial circle which is waiting for them to repossess it: 'it is in this holy place that Adam's minor spiritual posterity is to be reintegrated'. The "great matter" is in fact the 'Reintegration of beings in their primitive properties, virtues, and divine spiritual powers' – to quote the title of the *Traité*. This reintegration requires the disintegration of man's body of matter, which is his prison, so as to allow his original body of glory to reappear in all its splendor. This great matter, which is that of 'the mercy of the divine Father towards his creature', is the universal reconciliation. It is realized progressively, each time a little more completely, at each stage of the sacred History already described. This occurs by means of the operations that the 'universal Reconciler . . . , the Christ' – who according to Martines is himself present and active during this whole History under the guise of "types" – 'had to perform among men for the manifestation of the divine glory, for the salvation of men, and for the molestation of demons. These three operations are: first, that which was done for the reconciliation of Adam; the second, for the reconciliation of the human race, in the year of the world 4000' – (i.e., with Noah at the time of the Flood, according to traditional chronology); 'and the third, which shall appear at the end of time and which repeats the first reconciliation of Adam, by reconciling his whole posterity with the Creator'.

2. THE CULT

This doctrine, which forms a whole and includes everything from God down to man and the material universe, does not exist primarily for theory, but is meant to be put into practice. For every minor-man, it is a question of entering into possession of all the arguments of the case in order to effect this reconciliation and reintegration, first for his own sake but also for the sake of universal creation. This reintegration, as the etymology shows, will be the return to the original integrity, the primal unity. This is the goal that Martines set for his Order, first called "Ordre des Élus Coëns de Josué", then "Ordre des Chevaliers Maçons Élus Coëns de l'Univers". It appeared to be a masonic and chivalric Order, but this was merely for practical purposes, so as to offer to seekers unsatisfied by other Systems a real spiritual goal, capable of obtaining (as Willermoz wrote when this goal was revealed to him) 'that inner peace of the soul, the most precious possession of humanity, relatively to his being and his principle'. However, the attempt to implant the Order in the field of French masonry

was, as we know, a failure, because the foundation was so different from the appearances.

Martines expounded the final goal of the Order thus, replying in 1769 to Willermoz's questionings: 'The Order contains a true science, it is founded on truth pure and simple, it is impossible for sophistry to reign or for charlatanry to preside there. On the contrary, error lasts but a moment, it flees and truth remains'. And further on: 'I swear to you that you will not have to ask me much more to be convinced that the Order contains for the minor of this lowly world things that are most necessary and essential for his advantage; so the Order seeks *the man of desire*, and when he lets himself be led, he is content' (Van Rijnberk, vol. II, 120). Earlier, in 1768, Martines had declared to Willermoz: 'I am only a feeble instrument which God wishes to use, unworthy as I am, to recall men, my fellows, to their first masonic state, *which spiritually means man or soul*, so as to make them see truly that they are really man-God, being created in the image and semblance of this all-powerful Being' (*ibid.* II 89). This was far from the 'amiable sociability' enjoyed by many of the masonic lodges of the time!

The two terms in the title of the Order should be noted. "Élu" (chosen, elect) is only superficially reminiscent of the innumerable degrees of "élués" invented at the time. The term refers in fact to the spiritual phenomenon of "divine election", through which the Eternal chooses and sets apart a man, or a people, in view of a mission which He assigns to it. This choice is sovereign, gratuitous, and often incomprehensible to men, but God is not accountable to anyone. Just as in sacred History there is a "chosen people", so there is a long line of chosen ones: Noah, Abraham, Isaac, Jacob, → Moses, the prophets (including Elijah and John the Baptist), right up to the apostle Paul. It is easy to see why they all figure in the ceremonies of the Order. Martines in fact claimed for the latter an origin as ancient as the universe, thus far older than masonry: 'Remember, Lord, this Society that Thou hast formed and possessed *from the beginning*', says a ritual invocation. The other essential term is "coën", which means "priest". But a priest of what religion? Certainly the word is Hebrew, but a Coën is not a *Cohen*, the Coëns are not *Cohanim*, the priests of the Mosaic religion formerly celebrated in the Temple of Jerusalem, and which disappeared at the same time as the Temple, to be replaced by the ceremonies of the synagogues. If one believes the Gospel – and the Coëns did so – this disappearance was final. The cult celebrated by the Élus Coëns is quite different. It is the 'primitive cult

confided by the Eternal to Adam and perpetuated by the minor elect until our day in the Ordre des Coëns, which is identified with the Ordre des Élus de l'Éternel [Order of the Elect of the Eternal] or to the High and Holy Order of which Jean-Baptiste Willermoz speaks in the *Instructions* which have nothing *secret* but their name' (Laurent Morlet). As is taught in the 99th Leçon de Lyon: 'The true ceremonial cult was taught to Adam after his fall by the reconciling Angel; it was piously performed by his son Abel in his presence, re-established by Enoch who taught new disciples, then forgotten by the whole earth and restored by Noah and his children; again renovated by Moses, David, Solomon, and Zorobabel, and brought to final perfection by Christ in the midst of his twelve Apostles at the Last Supper'. As one can see, Solomon and Zorobabel, figures well known to masons, are here inserted from a radically different perspective.

In truth, 'the Order is sacerdotal' (Amadou). Its raison d'être is to perform this cult which was originally entrusted to man, and which has not been taken from him; it is just that its procedures, especially the ceremonial ones, have changed. This cult is "quatriple" or quadruple, consisting of: 1) *sanctification*, corresponding to the divine Thought or to the *Father*; 2) *reconciliation*, corresponding to the divine Will or to the *Word*; 3) *purification*, corresponding to the divine Action or to the *Holy Spirit*; 4) *expiation*, corresponding to the divine Operation or to *Man*. However, 'Man in his first state only had to perform a cult of sanctification and praise. He was the agent through which the spirits whom he was supposed to retrieve' – the perverse, prevaricating spirits – 'were to perform the three others. Having fallen, he had to perform them for himself'.

Since the Order was sacerdotal, the receptions into the various degrees are not "initiations", like those found in the masonic systems, but rather "ordinations". As Serge Caillet explains it, each of these ordinations impresses on him who receives it 'a spiritual seal, the characteristic mark of divine election, which makes the Coën a priest of this original cult'. And it is the spirits who confer on the recipient the reality of his ordination, each according to its class: denary, octonary, or septenary, corresponding (cf. above) to the Father, the Son, and the Holy Spirit. Through them, the Coën is conjoined, or one might say put in communion, with the Chosen One of the Eternal, whether patriarch or prophet, who presides over the class into which he is admitted. It is from this Chosen One 'that he receives the name, the spiritual influx, the seal of his own election' (L. Morlet). Each of the elections successively received within the Order is in fact

placed under the active and efficacious patronage of one of these Chosen Ones of the Eternal: Adam, Abraham, Moses, Zorababel, Jesus Christ. This Chosen One, with whom the Élu Coën is conjoined, will henceforth cooperate "sympathetically" with him in the ceremonial operations, as long as the latter fulfill the exacting conditions that are required; but this cooperation will always take place through the mediation or intercession of the spirits – angels – who are the vehicles of the divine influxes or energies.

This is the source of the "passes", so famous but so often misunderstood. These "luminous glyphs", said to appear during the ritual, were by no means the object of the Coëns' ceremonies, contrarily to what has often been thought. The aim of these ceremonies is to pierce through the phenomenal plane to reach and transform the being of man, so as to set in motion his reconciliation, and at the same time that of the universe. In this perspective, the "passes" are believed to be the sensible marks of the divine favor, confirming that the procedure is true, that "the man of desire" is desiring aright. Thus they are not phenomena that one can produce at will or on demand. They are favors given by grace, as Martines reminded Willermoz in the letter cited above, from 1768: 'Do not be impatient, bide your time. This sort of thing is not at the disposal of man alone, but rather at that of the Most High and Omnipotent Eternal' (Van Rijnberk, op. cit. 89).

The active and beneficent divine reality which thus epiphanizes itself was mysteriously known by Martines, and after him by his disciples, as *La Chose* (the Thing). What is the Thing? Much has been written about it, and much erroneously. According to Amadou, 'the Thing is not the person of Jesus Christ . . . , the Thing is not Jesus Christ, it is the *presence of Jesus Christ*, as the *Shekinah* was the presence of God in the Holy of Holies'. What has scarcely been noticed, as pointed out by Laurent Morlet, is that the Hebrew word for "thing" is DaBaR, which primarily signifies "word", secondarily "thing", and thirdly "cause". It appears from this that the Thing is nothing less than the Creator Word, that Word which the Coëns' Instructions also qualified as Mediator: in short, Christ Jesus. It was certainly not for nothing that the Order was originally called the Ordre des Elus Coëns de *Josué*, for in Hebrew Joshua and Jesus are the same name. Thus the Coën is 'a partisan of the true Wisdom', as Martines proclaims, asserting unequivocally that this same Wisdom has 'dictated . . . the knowledge [that he] professes'. This Wisdom, which Saint-Martin would celebrate without any diver-

gence from his master's thought under its traditional name of *Sophia*, thus presides over the Order and all its works. That is why these are, as has been said, theosophy, anthroposophy, cosmosophy, chronosophy, and sophianic liturgy. Moreover, in the Christian tradition to which Martines' disciples belonged who gathered on the occasion of the *Leçons de Lyon*, Wisdom typifies the Creator Word.

The "passes" have another purpose: they are signals, even signatures, of the spirits who "activate" in cooperation with the celebrant. The latter is provided with a collection of 2400 diagrams and as many names of angels (in Hebrew) – brought to light by Robert Amadou and published by him under the appropriate title of *Angéliques* – diagrams permitting the identification of the angels who are at work. In short, the Coën ceremonial is a liturgy that is truly co-celebrated by angels and men.

This liturgy should in no way be identified or even compared with a liturgy of the ecclesiastical type. What is believed to be operative in it is the primitive cosmic priesthood with which Adam, the first Man, was endowed. The Coën is devoted to the "primitive cult" aiming at the reconciliation of man and of the creation – of man with God, man with the creation, and the creation with God. And in order to do this, the Réau-Croix, identified both with the first, fallen Adam, and with Christ, the new Adam, universal Redeemer and Repairer, recapitulates in and through himself the stage of fall and "privation". The Coën cult thus does not rival that of the Church, does not substitute for it or surpass it: it presupposes it and harmonizes with it. This is the reason why Martines obliged the Coëns to practice the ceremonies and receive the sacraments of the Church.

Moreover, just as the Church's priests, beside the ceremonies of their cult, must also devote themselves to personal prayer, both spontaneous and regulated, that is, in rhythm dictated by rule (the offices of the monastic or canonical Hours, reading the Breviary and the Holy Scriptures), likewise these priests of a particular kind who are the Coëns are obliged every six hours to say prayers modeled (with adaptations) on those same offices, not to mention various other offices to be celebrated following the calendar (days of the week, phases of the moon, seasons . . .). In addition, they must follow rules of diet (fasting) and practice a real moral and mental asceticism. In sum, the Coën is a priest and the Coën rule of life is an asceticism. And the Coën doctrine, which can truly be called a theosophy and an anthroposophy, is ordered to this end: to make

the Coën, in his accomplished state which is that of Réau-Croix, fully capable of working for the universal reconciliation.

3. THE LEGACY

The destinies of the Ordre des Elus Coëns, apparently fairly unfruitful, are described elsewhere [→ Pasqually; → Elus Coëns]. The Order contained few members, and suffered a kind of official ostracism. Nonetheless, it continued to arouse curiosity, as on the occasion of the Convent des Philalèthes (1785 and 1787). Also significant is the interest, lasting if sporadic, on the part of Bacon de la Chevalerie, a highly placed Mason in the Grand Orient de France, whom Martines had named as his universal Substitute. Willermoz, who by common consent was the real preserver of the Order, was assailed by indiscreet requests which he could not always reject.

Willermoz in fact managed to preserve for a time the legacy of the master to whom he remained faithful until his death. He preserved it in a way that the latter would surely have disapproved of. Convinced that this System, which was more crypto-masonic than masonic, was doomed as such, he concealed it within the hybrid System, both masonic and chivalric, that he himself invented, namely the Régime Ecossais Rectifié. We must make clear that the Ordre des Elus Coëns de l'Univers is not part of the Régime Ecossais Rectifié; but it is nevertheless at the heart of the latter, and even *is* its "heart" (Amadou). The Régime teaches the same doctrine, the same "science of man", but without practicing any liturgical ceremony, and does not even speak of it except in covert terms to the Grands Profès (the highest degree of the R.E.R.). 'The Régime Ecossais Rectifié lives only by the doctrine of reintegration and for reintegration, like the Ordre des Elus Coëns. Between the two of them, the *modus operandi* differs' (Amadou). In the Régime, only Masons and Knights appear. If there are Coëns present, it is not in that capacity, but incognito.

This creation of Willermoz was of capital importance for Martinism. It was in the bosom of the Régime Ecossais Rectifié that its survival was assured, at least in its doctrinal form, after the disintegration of the Ordre Coën. All the "instructions" officially dispensed, from that of Apprentice up to Grand Profès, taught Martines' doctrine step by step, in an increasingly overt fashion. Willermoz declared it explicitly in a letter of 1812: 'The initiation of the Grands Profès instructs the tested mason, the man of desire, about the origin and formation of the physical universe, its destination and

the occasional cause of its creation at a certain moment and at no other; the emanation and emancipation of man in a glorious form, and his sublime destination at the center of created things; his prevarication, his fall, the benefit and absolute necessity of the Incarnation of the Word itself for the Redemption, etc.’

Even so, the most outstanding disciples of Martinès, namely → Louis-Claude de Saint-Martin and Jean-Jacques Du Roy d’Hauterive, who organized the *Leçons de Lyon* with Willermoz himself from 1774 to 1776, did not hold to his System for very long. Hauterive withdrew to his little Coën group in Toulouse, and “de-masonized” the ceremonies to simplify them and reduce them to the purest spiritual → alchemy. Saint-Martin, for his part, chose a purely internal path, known since Papus under the odd name of the “cardiac way”, otherwise the “way of the heart”, where prayer takes precedence over all ceremonial forms as a method of spiritual realization. Already while he was with Martinès, Saint-Martin had a certain suspicion of the rituals, hence his well-known question: ‘Master, does it really take all these forms to pray to the good God?’ The reply is less well known, and gives food for thought: ‘One should be content with what one has’. Later, in *Ecce Homo*, Saint-Martin would severely denounce the ‘outer manifestations or movements’, declaring: ‘The works that result from them are, so to speak, the shadows of works, works of the surface, and consequently not sufficiently enlivening to link with the plan of God’s great work, which is to recall us to our inner center where God is to be found, instead of dividing ourselves into centers that are external, fragile, obscure, or corrupt, where God is not to be found’. For all that, Saint-Martin remained convinced all his life, if not of the utility of Martinès’ practices then at least of the truth of his doctrine, which he continued to deepen even after his discovery from 1788 onwards of → Jacob Boehme, who opened new horizons to him. He then set himself to “marry” his two masters, as he put it. He made himself the efficient and constant propagator of this doctrine, performing this task as co-author, in the function of secretary, of the *Traité sur la Réintégration*, as well as in the many documents, rituals, and instructions needed for the life of the Order; also by putting out many of the *Leçons de Lyon*; by publishing (under the pseudonym of *Philosophe Inconnu* [Unknown Philosopher]) the books *Des erreurs et de la vérité* (On Errors and Truth, 1775) and *Tableau naturel des rapports qui existent entre Dieu, l’homme et l’univers* (Natural Table of the Relationships that Exist between God, Man, and

the Universe, 1782), which are quasi-official expositions of the doctrine. Even afterwards, this continued to inspire all his works right up to his death: *L’Homme de désir* (The Man of Desire, 1790), *Ecce Homo* (Behold the Man, 1792), *Le Nouvel Homme* (The New Man, 1792), and *Le Ministère de l’Homme-Esprit* (The Ministry of the Spirit-Man, 1802). His thought is fundamentally the reflection of Martinès’: a faithful reflection, although enriched by his own personality as well as by a theosophy in which the role of theurgy is much reduced, even absent, or else totally interiorized and spiritualized. Without a doubt, his literary work has been an efficient vehicle for the diffusion of the doctrine. It is principally thanks to Saint-Martin’s interpretations that Martinèsian concepts found a ready response among the French Romantic writers: Chateaubriand (on whom, however, they made little impression), much more → Ballanche, and equally Balzac (who “married” Saint-Martin to → Swedenborg), Lamennais, Sainte-Beuve, Hugo, and → Nerval; and also in German writers: → Schelling, Zacharias Werner, and the Schlegel brother. On the sidelines we might also list Sébastien Mercier, author in the *Tableaux de Paris* (Pictures of Paris, 1783) of the first report on the “Martinists”; also Madame de Staël with her *De l’Allemagne* (On Germany, 1813); and lastly, though more subservient to literary fashion, → Cazotte, Charles Nodier, George Sand, and Alexandre Dumas. → Joseph de Maistre occupies a place to himself: for all that he was a Roman Catholic and a papist, he presented in his *Soirées de Saint-Petersbourg* (Saint Petersburg Evenings, 1821), under the guise of a controversy for and against → “illumination”, an excellent defence and illustration of Martinist ideas. He never abjured them, to the point (as Jean-Marc Vivenza has recently shown, op. cit., 64-67) of regularly performing the “operations” of the Order at the propitious calendrical moments, even in the heat of the Revolution. So it was through Willermoz and Saint-Martin, or their joint influence, that the doctrine of reintegration and all that goes with it has been perpetuated up to the present day. Thus, for example, in Russia at the end of the 18th and beginning of the 19th century the noun “Martinism” and the adjective “Martinist” carried several meanings, serving to designate: 1) the Régime Ecossais Rectifié, introduced into that country after the Convent of Wilhelmsbad (1782); 2) the theosophy of Martinès; 3) the theosophy of Saint-Martin (some of his works having been published in Russian thanks to → Novikov and → Lopukhin); 4) in a vague but current manner, all these three senses at once.

It should be added that all forms of Martinism then suffered a long eclipse. The works of Saint-Martin lacked a readership until they were brought back to light at the end of the 19th century by → Papus; the *Traité de la réintégration* (Treatise on Reintegration), which up to then had only circulated in manuscript form, was first published only in 1899; it was not until 1926 that the *Instructions secrètes aux Profès* (Secret Instructions for the Profès) were rediscovered and published by Paul Vuillaud; and in 1970, the *Instructions secrètes aux Grands Profès* (Secret Instructions for the Grands Profès) by Antoine Faivre. But since then, the four components of Papus's title cited at the beginning, "Martinesism, Willermozism, Martinism, and Freemasonry", have met with increasing success, which goes to show that to study this question does not imply a merely antiquarian and documentary interest, and that the doctrine of reintegration offers to a number of men of our time a "spiritual goal" as much appreciated by them as it was by Willermoz.

Martinism: second period

→ Louis-Claude de Saint-Martin created neither an Order nor a society. Whether or not an “apostolic succession”, originating from him, reached into the late 19th century, remains a matter of some debate. In the 1880s, two well-known figures in the Paris esoteric milieu, namely magnetist Henri Delaage (1825-1882) and librarian Augustin Chaboseau (1868-1946), claimed independently to have received such a succession, through an unbroken lineage of “Unknown Superiors” (Supérieurs Inconnus) dating back to Saint-Martin himself. No evidence confirming (or definitely disproving) their claims has ever surfaced.

Both Delaage and Chaboseau were friends of → Papus (Gérard Encausse, 1865-1916), a key character in the development of contemporary Martinism. Papus claimed to have been initiated by Delaage in 1882, and exchanged initiations with Chaboseau in 1888. That same year, Papus created his journal, *L'Initiation*, which was published until 1914. In 1891, Papus and Chaboseau founded a Martinist Order, which included some of the most well-known figures of the Paris esoteric underground, such as → Stanislas de Guaita (1861-1897) and → Joséphin Péladan (1858-1918). The Order was probably the most successful among the many founded or led by Papus. It became a matter of course for everybody interested in esotericism to become initiated into the Martinist Order; even → René Guénon (1886-1951) was one of them, before breaking with Papus and leaving the Order in 1909. As was usual then, most Martinists were, at the same time, members of one or other Rosicrucian, neo-Templar, or neo-Gnostic body. Most, but by no means all, were Freemasons [→ Freemasonry], and members of the “Egyptian” Rites of Memphis and Misraim in particular.

The success of Papus’ Martinism was also noteworthy for its international character. In 1891, a branch was created in the United States, and by 1900 the Order had been implanted in most Latin American countries, thanks, among others, to Viscount Albert-Raymond Costet de Mascheville (1872-1943), a French pupil of Papus who emigrated firstly to Argentina and later to Brazil. In 1949 his son, Viscount Léo Costet de Mascheville (1901-1970), founded under the name Sri Sevananda an independent “Mystical Association of the West” (Association Mystique de l’Occident: AMO), devoted to a “mystical Martinism” and to the ideas of the Lyon healer → Anthelme Nizier Philippe, “Maître Philippe” (1849-1905), one of Papus’s closest associates. In the United

States the Martinist Order split in 1902 after a bitter debate on whether or not non-Freemasons (and women) could receive the Martinist initiation. Whilst Papus’ answer was in the affirmative, some American Martinists preferred to grant solely to Freemasons membership into the Order, and it was the latter who later established a separate “Rectified American Martinist Order”.

Whether non-Freemasons and women should be initiated is just one of the questions plaguing modern Martinism, as well as being the cause of several schisms throughout its history. Another contentious question is: in the event of an obvious contrast emerging between the respective teachings of → Martinez de Pasqually and Saint-Martin, should the former or the latter prevail? The “Saint-Martinist” wing would often regard the acknowledgement of Jesus Christ’s divinity as a central Martinist tenet (a stand not regarded as incompatible with a certain anticlericalism), whilst the “Martinezist” faction would, in certain cases, also initiate non-Christians. “Saint-Martinism” is more concerned with Saint-Martin’s “way of the heart”, whilst Martinezism focuses on occult techniques.

A third source of conflict concerns the relationship between Martinism and the Gnostic Churches. In 1911, Papus signed a “Treaty” with Jean Bricaud (1882-1934), thereby making the latter’s → Gnostic Church the “official church” of Martinism. Not everybody agreed, however, and the seed of further schism was sown. Papus thought it was entirely possible for the same Order to include both a Saint-Martinist and a Martinezist wing. During the last years of his life, Papus even considered the possibility of incorporating a third wing into the Order, which he called “Willermozist” (after the name of → Jean-Baptiste Willermoz), and which took the shape of a “Martinist Grand Chapter” open only to Freemasons.

It was Papus’ own charismatic personality, however, that kept the different wings together, and when he died in 1916, mid-way through World War I, schism immediately followed. Most Martinists recognized Charles Déteré (“Téder”, 1850-1918) as Papus’ successor, but he died only two years after Papus. Notwithstanding the opposition of Téder’s widow, a majority of French Martinists, in their turn, acknowledged Jean Bricaud as his successor. Bricaud was at the same time the patriarch of the → Gnostic Church allied with Martinism under the 1911 “Treaty”. Both Téder and Bricaud tended to neglect the Saint-Martinist wing in favour of the other two, Martinezist and Willermozist. Bricaud claimed a (fairly doubtful) apostolic succession from Martinez de Pasqually

himself, and also tried to exclude non-Freemasons and women from Martinist initiation.

The Saint-Martinist reaction was led by Victor Blanchard (1878-1953) who, on January 3, 1921, founded the independent Martinist and Synarchist Order. The term "Synarchist" was a reference to the Marquis → Joseph-Alexandre Saint-Yves d'Alveydre (1842-1910), recognized by Papus as his "intellectual master" (his "mystical master" being Maître Philippe). Blanchard was a member of several esoteric orders and brotherhoods, and was also a Gnostic bishop, having been consecrated by Bricaud in 1920. Shortly after this consecration, however, Bricaud and Blanchard quarrelled, and the latter went on to promote, in addition to his Martinist and Synarchist Order, both Rosicrucian and Gnostic organizations to rival those led by Bricaud.

There was some degree of interaction between → Rosicrucianism and Martinism during the 1920s and 1930s, however. In fact, Martinist divisions also reflected different attitudes towards the Rosicrucian order AMORC, and the activities of its leader → Harvey Spencer Lewis (1883-1939). In 1934, Lewis promoted the creation of the FUDOSI (Universal Federation of Orders and Societies of Initiation), which was regarded by his critics as an attempt to impose AMORC hegemony in Europe. Blanchard was one of the founding members of the FUDOSI, although he was later expelled from it (in 1939) following Rosicrucian quarrels with Lewis (but was readmitted in 1946, shortly before the FUDOSI ceased to exist in 1951). While Papus' old companion, Chaboseau, sided with Blanchard (and would later replace him as a FUDOSI member), the "Lyon group" (so named after it moved the Martinist Order headquarters to Lyon), led by Bricaud, did not support Lewis and eventually joined the rival international FUDOSI federation, a creation of Lewis' American arch-rival Reuben Swinburne Clymer (1878-1966).

In 1937, Blanchard granted Lewis "full authority" to confer Martinist initiations in the United States. After he broke with FUDOSI, Blanchard also granted some sort of Martinist succession to several independent Martinist organizations in the United States, Canada, and Europe. Quarrels about the FUDOSI also led to a (temporary) division between Blanchard and Chaboseau, the latter going on to establish yet another Martinist body, known as the "Traditional Martinist Order" and co-founded by Victor-Émile Michelet (1861-1938). Notwithstanding further schisms, this Order continued to operate within the AMORC.

Today, any would-be member of the Traditional

Martinist Order (O.M.T.) is expected to be an AMORC member in good standing and with at least a First Temple Degree initiation. The O.M.T. has three degrees, in fact, and its curriculum includes seventy-two monographs to be studied over a period of six years. Initiations are conferred in an O.M.T. temple, normally located at the premises of an AMORC facility. After the first six years, the initiate may join the Circle of Unknown Superiors (the higher echelon of the Order). The hierarchy of the Traditional Martinist Order largely coincides with AMORC's.

Blanchard and the AMORC notwithstanding, it was the Lyon branch of Bricaud which attracted the largest number of French Martinists in the 1930s and 1940s. Bricaud died in 1934; his successor, Constant Chevillon (1880-1944), renamed the organization "Martinist Martinezist Order" in order to emphasize the Martinez connection (as distinct from the more purely Saint-Martinist group led by Blanchard). Chevillon was assassinated in 1944 by French Nazi collaborators, and was succeeded by Henri-Charles Dupont (1877-1960), who in turn emphasized the Masonic connection, in line with the Willermoz tradition. A more Martinezist group, less interested in Willermoz and more interested in theurgical "operations", had in the meantime been established in Paris, in 1942, by Robert Ambelain (1907-1997), under the name of "Martinist Order of the Élus Cohens". In 1952, the Saint-Martinist wing generated, in turn, a new organization when Papus' son, Philippe Encausse (1906-1984), revived a "Martinist Order" in 1952, keeping as loyal as possible to his father's style, emphasizing Saint-Martin's mysticism and open to both non-Freemasons and women. On the other hand, he invited Ambelain to contribute to his journal *L'Initiation* (published from 1953 until the present time, a revival of Papus' journal, now edited by Yves-Fred Boisset and Michel Léger), and thus proving that co-operative efforts between the different wings were not impossible.

Ostensibly, in the first decades after World War II, the three wings were clearly separated (Martinezist under Ambelain, Saint-Martinist under Encausse, Willermozist under Dupont) but, in reality, things were more complicated than that. Dupont, for example, claimed to have been initiated into the highest Martinezist degree by Chevillon himself, and he in turn initiated Encausse shortly before his death in 1960. In 1962, Encausse's and Ambelain's orders merged into a single organization, which included an external circle (Saint-Martinist) and an internal one (Martinezist).

It was not easy, however, to keep within the same fold those who were interested in Martinez' theurgy and those who preferred to follow the Christian mysticism of Maître Philippe (Encausse's own godfather). In retrospect, a split was inevitable, and in 1967 Ambelain's Martinezist wing went its separate way. After Philippe Encausse's death in 1984, the Martinist Order continued its activities (his successor, since 1979 until the present time, is Emilio Lorenzo), while Ambelain went on to pursue other interests and his followers split into a dozen different Martinezist groups.

It may be that the largest number of Martinists in a single country has been, and still is, concentrated in Italy. The concept of a "Neapolitan Martinism" has been used by several historians to designate an esoteric milieu in the tradition of → Raimondo di Sangro di San Severo (1710-1771) and → Cagliostro (1743?-1795), the key figure in the late 19th century being Giustiniano Lebano (1832-1909). Since → Giuliano Kremmerz (pseudonym used by Ciro Formisano, 1861-1930) was a pupil of Lebano, the Kremmerz movement (including the Brotherhood of Myriam and other organizations) has sometimes been seen as an offshoot of Martinism. Interactions between the two wings are frequent in Italy, and extend far beyond the small and recently established "Kremmerzian Martinist Order", led by psychiatrist Mario Betti.

There is, in fact, no historical evidence of a continuum between the presence of followers of Martinez de Pasqually in the esoteric milieu of Naples in the first decades of the 19th century, and of Martinists in 20th century Italy. Papus' Martinist Order soon expanded into Italy, and counted among its initiates such well-known figures as neo-Pagan esotericist → Arturo Reghini (1876-1946) as well as poet laureate Gabriele d'Annunzio (1863-1938). Reghini, however, later regarded both Papus and Saint-Martin as too Christian, and became a vocal critic of Martinism in general. After Papus' death, French schisms spread to Italy: the Martinezist wing loyal to Bricaud and his Gnostic Church kept the name "Martinist Order", while a Saint-Martinist wing reorganized itself under the name "Supreme Council of the Martinist Order".

The Fascist regime persecuted both groups for their supposed connection to the then banned Italian Freemasonry, and it was not until 1951 that an "Italian Council of the Martinist Order" (including both a Martinezist and a Saint-Martinist wing) was able to reorganize itself, albeit for only three years. The real success of Martinism in Italy came in the 1960s, however, thanks to the efforts of

two key figures in the world of Italian esoteric orders, namely Gastone Ventura (1906-1981) and Francesco Brunelli (1927-1982). These two leaders represent, respectively, the Saint-Martinist and the Martinezist wing. Brunelli was also instrumental in maintaining a relationship between Martinism and an Italian Gnostic Church in which he served as a bishop, while Ventura did his best to keep his branch 'independent from any church, including the Gnostic one'.

As was the case in France, the two branches made efforts to merge in 1962 and again in 1982, although the resulting united orders proved to be short-lived. Not only did the Ventura (Saint-Martinist) and the Brunelli (Martinezist) branches go their separate ways, but after the two leaders died in the early 1980s, each group was plagued by disputes about their succession, and eventually broke up into several different independent branches. The largest organizations are currently the "Martinist Order" (led by Sebastiano Caracciolo) in the Ventura tradition, and the "Ancient and Traditional Martinist Order" (OMAT) in the Brunelli tradition, although at least half a dozen other branches can lay claim to a national following in present-day Italy. It is as true in Italy as it was in France, that the division between a Martinezist and a Saint-Martinist wing is only indicative of a general trend and is far from clear-cut. Ventura was interested in theurgy, and several members of the Brunelli branch wrote about Saint-Martin.

It is true, however, that Brunelli's interest in ritual → magic led him to promote closer co-operation between his Martinist Order and several branches of Kremmerz' Brotherhood of Myriam. Brunelli's association with Luigi Petriccione (1928-1995), who was both a Martinist and a Kremmerzian, contributed to the development, in Brunelli's branch, of a number of detailed, confidential books of instructions on "internal" → alchemy and sexual magic, which, in turn, caused even greater divisions between his form of Martinism and that of the more Saint-Martinist wings. Brunelli was a great ritualist, quite apart from his interest in sexual magic; his (Martinezist) rituals for consecrating water, salt, ashes and fire, for blessing ritual dresses and frankincense, and for evoking elementals and nature spirits, are widely used in international Martinist circles and beyond, even today.

AMORC's Traditional Martinist Order is also quite active in Italy, with some two hundred members. In addition to France and Italy, the largest Martinist groups are found in other French-speaking countries (Belgium and Africa), in the Caribbean region (Barbados, Bahamas), and in

Latin America. A Martinism independent of the Traditional Martinist Order and AMORC has existed in the United States almost from its start, although its constituency has remained quite small. A large majority of English-speaking Martinists in general are members of the Traditional Martinist Order, a membership they regard as ancillary to their AMORC membership.

MASSIMO INTROVIGNE

Mathers, Samuel Liddell “MacGregor”,
* 8.I.1854 Hackney (East London),
† 20.II.1918 Paris

Together with → William Wynn Westcott, Mathers played a fundamental role in the history of English occultism as the co-founder of the → Hermetic Order of the Golden Dawn and as one of the leading intellectual forces behind the development of its teachings and ritual system. Little is known about his early life. He probably received some classical education at Bedford Grammar School, but the first definite date on record (after his date of birth) is his initiation into Craft → Freemasonry in 1877. He was then living in Bournemouth with his widowed mother, working as a clerk, and would remain there until 1885, when he moved to London. Around that time he started to add the name “MacGregor” (from a traditional Scottish clan) to his own, and to use the title “Comte de Glenstrae”. This was connected to his lifelong passion for Celtic lore, but it is unlikely that his claims to an aristocratic lineage had any concrete ground. In 1882 he joined the Societas Rosicruciana In Anglia (S.R.I.A.), a group composed entirely of Master masons and devoted to the study of Western esoteric traditions. In that period Mathers made the acquaintance of W.W. Westcott, also a recent member of the S.R.I.A., who was evidently impressed by his enthusiasm for occult matters. Westcott decided to help him financially while he was engaged in

producing an English edition of some parts of the *Zohar*, using → Knorr von Rosenroth's Latin version as his main source. This was published in 1887 as *The Kabbalah Unveiled*, and was to remain the most important and influential publication Mathers ever produced. During this early period in London he also made the acquaintance of → Helena Petrovna Blavatsky and → Anna Kingsford, attending and lecturing at meetings of the → Theosophical Society and the Hermetic Society [→ Hermeticism and Hermetic Societies]. Around 1887 he was invited by Westcott to collaborate in the writing of rituals and teachings for an occult Order on the basis of a cipher manuscript, very probably composed by the occultist and polymath Kenneth R.H. Mackenzie (1833-1886), that Westcott seems to have obtained after Mackenzie's death. This led to the eventful foundation of the Hermetic Order of the Golden Dawn, of which Mathers was to be a leader, together with Westcott and the head of the S.R.I.A. William Robert Woodman (1828-1891). His mottoes (i.e. initiatic aliases) in the Order were Deo Duce Comite Ferro (from Latin: “With God as leader, and the sword as companion”), and S'Rioghail Mo Dhream (from Gaelic: “Royal is my tribe”). In 1890 he married the sister of the philosopher Henri Bergson (1859-1941), Mina (later Moina) Bergson (1865-1928), who also joined the Order.

It is evident today that it was from Westcott that the idea of the Golden Dawn originated, and that he contributed at least as much as Mathers to the elaboration of its system of teachings. But when an Inner Order (the Ordo Rosae Rubeae et Aureae Crucis) was added to the Outer one (the Golden Dawn *stricto sensu*), it was Mathers more than anyone else who came to produce its rituals and the bulk of the new teachings. As time went by the Order met with considerable success, and Mathers felt less and less inclined to share his authority with Westcott. In 1892 Mathers and Moina moved to Paris, opening there a new Temple of the Order (the Ahathoor Temple No. 7), and his distance from the headquarters in London probably made him feel more and more uneasy about Westcott's role in the Order. It seems likely that Mathers eventually came to see him as a potentially dangerous rival in the leadership. A rather drastic solution to the problem produced itself when Westcott's occult activities became known to his superiors in office. He was forced to resign from the Order, leaving Mathers as the only leader (Woodman having died in 1891). While in Paris, Mathers pursued his occult researches and especially studied manuscripts of old magical grimoires in the main libraries of

the French capital, some of which he was able to edit and publish. One such edition, *The Key of Solomon the King* (1889), based on manuscripts in the British Library, had already been published in the early days of the Golden Dawn, while he was still in London. The publication of another important text, edited from a manuscript in the Bibliothèque de l'Arsenal, took place during his time in Paris: *The Book of the Secret Magic of Abra-Melin the Mage* (1898). Another edition of a medieval magical text, *The Grimoire of Armadel* (1980) was published only many years after his death. It must be noted that, if these texts never became, as such, part of the official teachings of the Golden Dawn, they nevertheless served as an important source of inspiration, and had a wide impact on contemporary occultism even beyond Golden Dawn circles. In Paris Mathers, who sometimes used to present himself as an Egyptologist, also attempted to "revive" a cult of Isis, not directly related to the Golden Dawn, and consisting of sacred representations (performed firstly at his house and later on stage in a theatre) which aroused some interest in the press and gave him some notoriety. In this period Mathers's passion for Celtic culture and traditions, which was shared by other members of the Order such as → W.B. Yeats and J.W. Brodie-Innes (1848-1923), became more and more prominent as well. Mathers seems also to have been involved in some anti-English political activities, which were not infrequent in the more extreme fringes of the so-called "Celtic Revival". This, together with his authoritative manners in dealing with the problems of the Order, provoked a feeling of uneasiness and dissatisfaction among the members of Second Order in London. The situation exploded in 1900. Mathers's decision to reveal that some of the claims about the origins of the Order were untrue and to use the young → Aleister Crowley, then a junior member of the Order, to restore his authority, caused things to precipitate. A revolt erupted in London and a majority of the Second Order members decided to impeach and expel Mathers from the Order. A schism ensued which may be considered the end of the "golden age" of the Order. While the "rebel" faction underwent another schism in 1903, the "loyalist" one continued its activities under the new name of Alpha et Omega, now having its headquarters in Paris. In addition to this dramatic turn of events, there was the unfortunate "Horos affair", in which Mathers was involved. Mathers was deceived by a couple of swindlers, Frank and Editha Jackson (posing as a Mr and Mrs Horos), who persuaded him to give them some documents of the Order. Later they used

these for their frauds, but they were eventually arrested. This made the name of the Order, whose very existence was supposed to be handled as discreetly as possible, appear in the yellow press in a very bad light. Consequently, a certain number of members felt obliged to resign.

Little is known about the Mathers' activities in Paris after 1900. Apart from ephemeral contributions to some English occultist journals, such as *Anubis* (1902-1903), Mathers did not publish much in the following years, although he continued directing his branch of the Order. In 1910 he went back to London to try to prevent, by taking legal action, the publication of the rituals of the Order undertaken by his former pupil and friend Aleister Crowley in the pages of the latter's periodical *The Equinox*. The legal action and the court hearings were highlighted in the press, but Mathers's attempt was unsuccessful and the rituals were eventually published. After his death in 1918, Moina took over the leadership of the Alpha et Omega.

Undoubtedly Mathers must be considered one of the key-figures in English occultism, even if he has published comparatively little. While most of his output consists of translations and editions of ancient texts more than original contributions, his written production did not end there. In fact, much of the teachings and of the rituals of the original Golden Dawn must be credited to him, together with Westcott. Were it only for this reason, his influence on the evolution of English occultism should be considered fundamental. Moreover, the impact of his partial version of Knorr von Rosenroth's *Kabbala Denudata*, although unsatisfactory by modern standards of scholarship, remained for a long time the only means for English readers to gain access to the texts of the *Zohar*, touching therefore a much larger readership than the mere occultist one. Finally, Mathers was instrumental, particularly by his rediscovery and publication of ancient grimoires, in the reevaluation of magic as a legitimate spiritual pursuit, thus opening the way for later authors such as → Aleister Crowley, → Dion Fortune and Israel Regardie.

MARCO PASI

Mead, George Robert Stowe,

*22.3.1863 Nuneaton, †29.9.1933
London

Theosophist and writer on → Gnosticism, → Hermetism, and Christian origins. Son of Robert Mead (Colonel in the Ordnance) and his wife Mary. Educated at Rochester Cathedral School and St. John's College, Cambridge (B.A., 1884; M.A., 1926), reading first Mathematics, then Classics. Upon graduating, Mead joined the → Theosophical Society. He studied Oriental philosophy in Oxford (but not as a University member) and visited the University of Clermont-Ferrand to research → spiritualism. His first employment was teaching in a public school. From May 1887 onwards he spent his vacations with → H.P. Blavatsky, and in 1889 gave up teaching to become her private secretary. This involved answering her correspondence, sub-editing the monthly magazine *Lucifer*, editing or re-editing Blavatsky's later writings (including many articles, *The Voice of the Silence*, and *The Key to Theosophy*), and, as General Secretary for Europe, helping in the development of the Society abroad.

Mead gave the address at Blavatsky's cremation on 10.5.1891. He continued to work for the Theosophical Society, editing *Lucifer* with → Annie Besant (1847-1933), then from 1898 editing it alone under the new title *The Theosophical Review*. From 1891-1897 he also edited *The Vâhan*, a monthly journal for Theosophical notes & queries. He was responsible for the revised edition of Blavatsky's *The Secret Doctrine* (2 vols., 1893), and for the publication of the formerly secret instructions of the Society's "Esoteric Section" as part of "Vol. III" of that work.

During the 1890s Mead established himself as

the Theosophical Society's principal scholar, first ranging over the field of comparative religion but increasingly concentrating on the Greco-Roman period. Mead's books, and his translations with their extensive commentaries, revealed to English readers a virtually unknown sector of religious history, in which Hermetism, the various Gnostic schools, → Neoplatonism, the mystery religions of Mithras and Orpheus, and early Christianity had shared a common metaphysical ground.

In 1899 Mead married Laura Mary Cooper († 1924), daughter of Henry Cooper, C.B., a prominent member of the Bengal Civil Service. Laura and her sister Isabel Cooper-Oakley (1854-1914) had long been helpers and companions of Mme. Blavatsky. The Meads had no children.

As General Secretary of the Theosophical Society, Mead had to deal with the furore in 1894-1895 caused by the claim of William Quan Judge (1851-1896) to have received letters from the "Mahatmas". This ended with the departure of most of the American members. A second scandal was caused by → C.W. Leadbeater, who had resigned from the Society when his pedophile activity became known. The Society's President, Annie Besant, was infatuated with Leadbeater's occult powers, and in 1909 reinstated him over the protests of Mead and others. Mead then resigned, along with over 700 English members. Mead's reactions to these events were marked, respectively, by skepticism regarding the hidden Masters who were believed by many to be controlling the Theosophical Society, and by an uncompromising moral code.

Mead and some ex-Theosophists now founded the Quest Society. Mead was the first president, the vice-president being → A.E. Waite. In 1920 the presidency was assumed by Sir William Barrett, F.R.S. (1844-1925), the physicist and psychical researcher. A journal was also founded, *The Quest* (1909-1930), which attracted a distinguished body of academic and literary contributors. These included the Tantric scholar Arthur Avalon (= Sir John Woodroffe, 1865-1936), Mgr. Robert Hugh Benson (1871-1914), Martin Buber (1874-1965), A.K. Coomaraswamy (1877-1947), Sir Sarvepalli Radhakrishnan (1888-1975), and the Islamicist Reynold A. Nicholson (1868-1945); also literary and artistic figures such as → Gustav Meyrink, Gustav Holst (1874-1934), and → W.B. Yeats. The death of Laura Mead in 1924 was a hard blow to Mead, but after sittings with Eileen Garrett (1893-1970) and other mediums, he was convinced that he had contacted his wife's spirit. The world-wide economic crisis caused the demise of *The Quest*, but at the time of his death Mead was active in a

new “Society for Promoting the Study of Religions”. His last public appearance was to give a lecture on the → Mandaeans at the Royal Asiatic Society, of which he had been elected a member.

Mead’s life’s work is best understood as springing from his commitment to the “Perennial Philosophy” [→ Tradition], of which he first became aware through Blavatsky and the Theosophical Society. From the beginning he showed little interest in the glamor of the Mahatmas, the claims of occult powers, or the minutiae of karma and → reincarnation. He understood the term “Theosophy” in the sense that others would use “esotericism”: as the basis for the deepening and reconciliation of all religions. Mead’s substantial body of writings is a monument to his brave attempt to cross-fertilize the esoteric and the academic approaches. However, his early involvement with the Theosophists, and especially his approving references to Leadbeater’s occult “revelations” in *Did Jesus Live 100 B.C.?* stifled Mead’s potential academic reputation. A virtual conspiracy of silence covered his work, broken only by sneering references (e.g. in Walter Scott’s edition of the *Hermetica*). Mead’s insistence on scholarly standards coupled with a respect for the spiritual reality behind religious traditions found its fulfilment in the Eranos Conferences, which likewise sprang from Theosophical roots. Mead was invited to Eranos in 1931, and although he did not attend, Robert Eisler, a frequent contributor to *The Quest*, formed a link between the two movements.

JOSCELYN GODWIN

Menander, ca. 80

According to the Christian heresiologists, Menander was an early Gnostic [→ Gnosticism] magician and teacher, a pupil of → Simon Magus. He came from Cappadocia in Samaria and worked in Antioch, where he, ‘inspired by the demons, deceived many by his tricks of magic’. Justin Martyr (ca. 150), our first source about Menander, to whom we owe this information, adds that ‘he even convinced his followers that they would never die, and there are some alive today who, inspired by him, still believe this’ (*Apology*, I, 26). Irenaeus of Lyons (ca. 180), *Adversus Haereses*, I, 23, 5, has more to say about his teachings. According to him, Menander called the highest and completely unknown divine principle “the First Power”, and claimed that he himself had been sent down by the

“Invisible Powers” for the salvation of mankind. Just like Simon Magus, he taught that the creation of the world was due to the angels, who had been brought forth by Ennoia, the First Thought. These angels were apparently seen as evil beings, responsible for the death of man. They could be overcome by making use of what Irenaeus calls Menander’s → “magic”, but which in fact seems to have been no more than a special kind of baptism. Menander taught that by being baptized “in him” (“in eum baptisma”) his followers immediately received the resurrection: ‘they can no longer die, are imperishable, eternally young and immortal’. Tertullian, *De resurrectione carnis*, 5, explicitly says that according to Menander the human body was a creation of the angels, an idea which is found in several Gnostic systems. However, his remark might be no more than an inference from Irenaeus’ report. In *De anima*, 50, 2, Tertullian also refers to Menander’s doctrine of immortality by baptism, but here he is evidently dependent on Irenaeus, and the same holds for all later authors who speak about Menander.

The relationship between Menander and Simon Magus is difficult to assess, if it did exist at all. As a Samaritan, Simonian and more or less heterodox Jewish ideas about the structure of the divine world and the creation may have influenced him, but he seems to have developed a salvation doctrine of his own. He did not, like Simon, claim to be the incarnation of the Great Power himself but said that he was sent by the heavenly powers to bring salvation to the world. Though the Church Fathers considered him the second link in the chain of Gnostic teachers which began with Simon Magus, it may be doubted whether he should be called a Gnostic at all. He certainly was not a Christian Gnostic, for there is no indication that the person of Jesus played a role of any importance in his system. Most likely, he came from or was influenced by one of the baptismal movements in 1st-century Palestine. The idea of an instant eternal life is reminiscent of the Johannine view of the effect of belief in Christ: ‘the believer possesses eternal life’ (John 6:47), he ‘has already passed from death to life’ (5:24; cf. *int. al.* 10:28; 17:3). That Menander’s followers were baptized “in Menander” has a parallel in Paul’s frequent expression of baptism “in Christ” (e.g. Rom. 6:3). Baptism as immediately providing the resurrection status in this earthly life was also taught by the 2nd-century Encratites in Alexandria (Clement of Alexandria, *Stromateis*, III, 48, 1).

ROELOF VAN DEN BROEK

Mesmerism → Animal Magnetism/
Mesmerism

Meyer, Gustav → Meyrink, Gustav

Meyer, Johann Friedrich von,
* 12.9.1772 Frankfurt am Main,
† 27.1.1849 Frankfurt am Main

Trained in law, von Meyer was successively a lawyer in his native city, counselor at the Court of Appeals in Mannheim, senator in 1816, president of the Court of Appeals and the Court of Assizes in 1827, ambassador of the free towns in the federal Diet and thrice mayor of Frankfurt, that is, head of the government of the free town. Keenly interested in literature, as early as 1794 he published a novel, *Kallias*, and wrote many literary essays that would appear in the *Teutscher Merkur*, Christoph Martin Wieland’s review. In 1803 he assumed the directorship of the Frankfurt theater and was responsible there for the first performances of plays by → Goethe and Schiller. In 1801, an inner illumination led to his conversion: the young aesthete discovered the immense richness of the Holy Scriptures. In 1806, translations of Cicero’s works still attested to his taste for classical Antiquity, but starting from this period his theosophical publications began to succeed one another at an accelerated rhythm: *Der Lichtbote* (The Herald of Light, 1806), *Hades* (1810), a contribution to → Jung-Stilling’s theory of spirits, *Bibeldeutungen* (1812), a work of biblical exegesis. From 1811 to 1818 he published reviews in the *Heidelbergische Jahrbücher*, notably one about *Dichtung und Wahrheit*

by Goethe, which met with great success. In 1819 he published an annotated translation of the Bible, intended to correct Luther's text. It went through several reprints. From 1818 to 1832, the eleven volumes of his *Blätter für höhere Wahrheit* (Papers for Higher Truth), which contain the essentials of his theosophical teaching, came out in the bookshops. His work *Inbegriff der christlichen Glaubenslehre* (Compendium of the Christian Creed, 1832) summarizes the whole. In 1830, he was the first to translate and publish in the German language the celebrated *Sepher Jezira*, considered the most ancient document of the Jewish Kabbalah [→ Jewish Influences]. Von Meyer's text was reprinted in 1993. In 1833, his *Schlüssel zur Offenbarung St. Johannis* (Key to the Revelation of St. John) bears witness to his taste for apocalyptic and eschatological studies. The *Hesperiden* (1836) assembles the majority of his poems. Up until his death, he continued to contribute more than one hundred and forty articles to → Justinus Kerner's *Blätter aus Prevorst* (1831-1839) and *Magikon* (1840-1851), two reviews dedicated to paranormal phenomena. Besides a gigantic correspondence, he left many manuscripts dedicated to somnambulism, → alchemy, → astrology, Kabbalah [→ Jewish Influences], → Freemasonry, physiognomy, → *Naturphilosophie*, theology, → Christian theosophy, etc. Two unpublished volumes on the "alchemical Kabbalah" (*Cabala magica et theosophica*) are the key items in this precious manuscript estate.

If von Meyer's surest reference always remains the Bible, he never restricts himself to the letter of the Scriptures. Considering the language of the Bible to be primarily a pictorial language (*Bildersprache*), a set of hieroglyphs that must be decrypted in order to apprehend its infinite richness, he integrates it into a vast symbolic system that is believed to give the Christian myth its full dimension. He develops in his work a typology that places high value on the Kabbalah, alchemy, arithmosophy [→ Number Symbolism], astrology and all the traditional esoteric "arts", in which he sees reflections, albeit often deformed, of the Revelation that God has never ceased communicating to humanity. At the same time one finds in him a *Naturphilosophie* that owes as much to → Paracelsus, → Agrippa and → Schelling as it does to Luther. As an alternative to the doctrine of *sola fides* – a little too monolithic and dogmatic to his taste – he erects his own theosophical temple, the two central columns of which are connected, in a subtle play of reciprocal interactions, by the intermediary force of the Spirit, as a "third term" deemed indis-

pensable to the return to unity. His system both takes into account and surpasses a dualism that presides, at the level of the macrocosm as well as of the microcosm, over all the manifestations of creation. Centered on the themes of fall and reintegration, his thought does not disregard any one of the three panels of the theosophical triptych: cosmogony, cosmology and eschatology are cemented by a profound christology, or rather, christosophy, that makes von Meyer one of the most representative Christian theosophers of the German 19th century.

Hades: Ein Beitrag zur Theorie der Geisterkunde, Frankfurt: Hermann, 1810 ♦ *Bibeldeutungen*, Frankfurt: Hermann, 1812 ♦ *Die Heilige Schrift in richtiger Uebersetzung mit kurzen Anmerkungen*, Frankfurt: Hermann, 1819-1823 ♦ *Blätter für höhere Wahrheit*, in 12 issues, Frankfurt: Brönnner, then Frankfurt: Hermann; then Berlin: Oemigke, 1818-1832 (and see *Blätter für höhere Wahrheit: Auswahl in zwei Bänden*, Stuttgart: Steinkopf, 1853) ♦ *Wahrnehmungen einer Seherin*, 2 vols., Hamburg: Perthes, 1827-1828 ♦ *Das Buch Jezira*, Leipzig: Reclam, 1830 ♦ *Schlüssel zur Offenbarung St. Johannis*, Karlsruhe: G. Braun, 1833.

JACQUES FABRY

Meyrink, Gustav (Gustav Meyer),
* 19.1.1868 Vienna, † 4.12.1932
Starnberg (Bavaria)

Meyrink's reputation is rooted in literature as well as in the occult [→ occult / occultism]. Representatives of both camps have often been tempted to take from his work only what suited them best and claim the exclusive right to interpreting it according to their perspective. It will therefore be necessary here to critically reappraise some one-sided ideas about Meyrink.

The illegitimate son of a senior Minister of State in Württemberg, Baron Karl von Varnhübler, and an actress from Hamburg, Mary Meyer, the very circumstances of Meyrink's birth may have introduced him to his central theme of a quest for identity. His childhood and youth were spent in the various capital cities where his mother had a brilliant career: first Munich, then Hamburg and finally, from 1883 onwards, Prague. A little less than two years later she abandoned Meyrink there,

henceforth showing a total lack of concern for him. Meyrink completed his studies at secondary school, then attended classes at the Academy of Trade, before setting up the “Meyer & Morgens-tern” Bank. Meanwhile he was leading a chaotic love life, marked by the eccentricities of a dandy lifestyle. It was during this period that what he called his “occult mania” started, characterized by the intermingling of a genuine spiritual quest and a taste for provocation. In this field he left no road untravelled, no stone unturned: → spiritualism, theosophy [→ Theosophical Society], → alchemy, and yoga are among the more prominent subjects he explored. In his personal pantheon we find William Crookes along with → Helena P. Blavatsky, Camille Flammarion and → Swedenborg, along with many others. His interests were not restricted to books, but led him to try out all kinds of spiritual techniques among his friends, in addition to establishing personal connections with some of the spiritual guides of his time – see, in this regard, his correspondence with Alois Mailänder, → Annie Besant, → Bô Yin Râ – and joining a large number of paramasonic [→ Freemasonry] and rosicrucian [→ Rosicrucianism] movements (including the Prague Theosophical Lodge, founded by K. Weinfurter). As the years went by, the banker G. Meyer, a regular customer at the *Continental* and the *Ungelt*, two cafés with a reputation as meeting-places for eccentric artists and authors, gained notoriety among the Prague bourgeoisie for his outrageous lifestyle. In 1901, a scandal on account of a duel with a garrison officer was used as pretext for a violent smear campaign against him, which even caused him to be thrown into prison for a few days and ruined his career.

At this precise moment he started writing: his first scathing texts he sent to the famous Munich satirical review *Simplicissimus*. Due to their provocative power and stylistic originality, these short stories – later published in one volume under the title *Des deutschen Spiessers Wunderhorn* (1913) – written in the genre of the *grotesque* and violently denouncing philistine and chauvinistic attitudes, were an immediate success. They attracted the attention of critics like Max Brod, Thomas Mann, Kurt Tucholsky and Hermann Hesse. In 1904 Meyrink was forced to leave Prague and decided to settle for some time in Vienna, where he was seen with Fritz Eckstein and his set. Here he became editor-in-chief of the review *Der liebe Augustin*. After that enterprise failed, in 1907, he went to Munich, where he settled permanently and at last led a serene family life (after the divorce of his first wife, Hedwig Aloisa Certl, in

1905 he married Philomena Bernt, which whom he had two children, Sibylle and Harro).

If his mania for secret rites had hitherto been, for the most part, a way to *épater le bourgeois*, Meyrink now deliberately turned towards esoteric doctrine; he saw in it a mode of addressing the basic questions of life, particularly relevant in the context of the impending world conflict. This new stage in his career drew him away from the *Simplicissimus* mindset, and he became known as an eccentric character in Munich literary circles, where he mixed with Franz Wedekind, Erich Mühsam and Heinrich Mann, among others. His first novel, *Der Golem* (1915), was highly successful and brought him a certain financial security; he used the opportunity to withdraw from society to his property near Lake Starnberg. Several other novels followed: *Das grüne Gesicht* (The Green Face, 1916) and *Walpurgisnacht* (1917). Meyrink's fame increased as the World War progressed, but the writer now stayed away from the agitation and fashions of contemporary literary life and assumed the role of an initiate, ‘light years away from what priggish pedants of all kinds understand art and literature to be’. He kept writing novels after the World War, notably *Der weisse Dominikaner* (The White Dominican, 1921) and *Der Engel vom westlichen Fenster* (The Angel of the Western Window, 1927). On December the 4th, 1932, a few days after the death of his son, he serenely took leave of his relatives and retired to his bedroom. Sitting in front of the open window, stripped to the waist in spite of the cold, he died at dawn as he had predicted, with his eyes fixed on the rising sun.

Apart from a few autobiographical writings, which are not without a certain amount of self-derision (see e.g. *Fakine*, 1907; *Wie ich in Prag Gold machen wollte*, 1928; *Telephonverbindung mit dem Traumland*, 1928), Meyrink's occult ideas may be discerned most clearly below the surface in his fictional works, and must be seen as one of the foundations of his characteristic approach to fantasy literature. In all his great novels born from the cataclysmic experience of World War I, the fantastic element in the plot takes its starting point in a legend that becomes reality. Each one of the legends used by the author tells the story of an irruption of violence, an outbreak of destructive fury: the mad Golem who roams the narrow streets of the Prague ghetto every thirty-three years (*Der Golem*), an apocalyptic cataclysm punctuated by the recurring appearances of Ahasverus the wandering Jew (*Das grüne Gesicht*), or the bloody figure of the Hussite leader Jan Zizka returning again and again to his old haunts (*Walpurgisnacht*). As he retells the leg-

end, confirming its historicity, the author provides a mythical explanation for outbreaks of violence in history. This procedure provides comfort since it gives meaning to what might seem meaningless; but it is disconcerting as well, because the explanation tends to present the individual as merely the plaything of dark forces. This is where the occult theme comes in. On the symbolic level, the novelist introduces a specific doctrinal structure (with a kabbalistic tinge in *Der Golem*, yoga in *Das grüne Gesicht*, the Vedas in *Walpurgisnacht*). A wide range of symbols and forms of diction are used, but the message is always the same: the individual, while faced with the violence of history that may well rob him of his own identity, can still aspire to a spiritual awakening which will in the end allow him to save that identity. What we have here is a patient conquest of salvation through a form of self-knowledge, which is attained by means of an encounter with one's Double, and culminates in the magical union of ideal love (represented in the above-mentioned novels by the couples Pernath-Mirjam, Hauberrisser-Eva, and Flugbeil-Liesel respectively): the perfection of a *Mysterium conjunctionis*, reflecting a nostalgia for the androgynous life of the hermaphrodite, or Baphomet. This occult concept is the basic source of inspiration and provides the underlying structure for each journey of initiation in Meyrink's novels. While the hero meets various wise men during his adventurous journey (under the guise of archivists and scholars), ultimately his crowning glory or spiritual rebirth will be due to his own efforts. Accordingly it is just as inappropriate to try and reduce these novels to the doctrines they teach, as some commentators have done, as it is to dismiss these doctrines as obsolete artefacts. It is more correct to speak here of an occult discourse set in narrative form. This procedure was sometimes less successful from a literary point of view, as in *Der weisse Dominikaner*, with its taoist background; but it could also lead to the masterly, breathtaking construction of Meyrink's last novel, *Der Engel vom westlichen Fenster* (1927). Thanks to its narrative structure based on a mirror effect – we read the autobiographical works of John Dee at the same time as the narrator, who receives them as a legacy –, a whole network of coincidences linking past and present, legend and reality, appears. This causes the protagonist, who is deciphering his grandfather's manuscript, to have trouble working out whether he is really himself or whether he is his grandfather, whether he is still alive or already dead, 'whether the present is nothing else but the sum of past instants, in a moment of

lucidity', and whether 'each person is not both his own ancestor and his own heir'.

It seems too simplistic to maintain (as many commentators have done) a strict division between Meyrink the satirist, who wrote for *Simplicissimus*, and Meyrink the esoteric novelist, the author of *Der Golem*, and then minimize the importance of the former. Those who decide, peremptorily, to establish this division often make it part of a value judgment and an ideological estimation. Yet the division appears unfounded in the light of the essay *An der Grenze des Jenseits* (On the Border of the Beyond, 1923), in which Meyrink reveals some of his deepest convictions. In his opinion the occult, regardless of the specific tradition from which it is approached, has always provided a way of thinking which is simultaneously subversive and liberating. The notion of "suprasensitivity", as he understands it, can only be defined by facing a double challenge: that of positivism, on the one hand, and of theological vision on the other (in all their various forms). Meyrink suggests that – on the condition that we understand this double challenge of positivism and theological vision on his part, and keep an open eye with respect to all the counterfeits and trickery of "pseudo-prophets" who hide their secret thirst for power behind a flood of words of wisdom – the occult entails a set of doctrines which alone make it possible to envision genuine personal development: 'the occult feeds on the instinctive desire for liberty which is at the heart of every man'.

JEAN-JACQUES POLLET

Michael Scot, * before 1198 place unknown, † after 1236 place unknown

An eminent astrologer, Michael Scot’s activity is documented from 1198 to 1216, and from 1221 to 1224, years in which he was translating the various books of Aristotle’s *De animalibus* and perhaps *De anima* and other works of the philosopher. In 1224 Pope Honorius III elected him Archbishop of Cashel in Ireland, but he declined the position. He was definitely active at the court of Frederick II from 1227 to 1236. Michael Scot is known as the translator of works by Arab scientists, including Alfarabi’s *De ortu scientiarum*, Alpetragio’s *De motibus coelorum*, which he finished translating at Toledo probably on August 12, 1217, and some philosophical works such as the Commentary on the *Sphaera* of Sacrobosco. He also authored an important encyclopedic “Introduction to Astrology” (*Liber introductorius maior in astrologiam*), in which he collected all the encyclopedic knowledge of his time, and was strongly influenced by Greek philosophy as well as by Jewish, Arab, and Christian thought. Many spurious works have been attributed to him. → Dante places him among the Magi, considering him the man who ‘delle magiche frodi seppe il gioco’ (knew how to play magical tricks).

Michael Scot’s *Liber introductorius in astrologiam* is directed at any beginner who wants to learn the astronomical art. His intention is to treat many arguments about the celestial and terrestrial worlds, which are the secrets of the philosophers and concern the astronomical art. The *Liber introductorius* contains two further sections: the *Liber particularis* (including *De mirabilibus mundi*) and the *Physiognomica*. His *Introductorium maius in astrologiam* is characterized by a Christian-Arab-Jewish syncretism, connected to the tradition of 12th century Toledo and to the compilations of translators such as Herman of Carinthia, John Ispalense, and Gerard of Cremona. This type of

thought is extremely eclectic and does not yet follow the rules of philosophy, theology, and science as set down by Christian Scholasticism. In Michael’s text, → astrology is considered to be the practical science of the philosopher through which he resembles a magus; for astrology is the art or science that offers infallible tools for mastering the celestial powers that govern the world.

Astrology is the ‘wisdom in man’ (*sapientia in homine*): a type of knowledge produced by the influx from the sun and moon – ‘those are indeed the two bodies that illuminate the souls of men and turn them towards their cause; they are the road to truth’. Thus the principles of the science and of the doctrine of wisdom ‘are acquired through revelation from the immutable spirit, received from the sun’, and actually represent the divine wisdom. Furthermore, ‘infallible wisdom is acquired through the sun’, while ‘through the moon is acquired the virtue of wisdom or the knowledge of good and evil’.

In this context astronomy or astrology becomes the philosophical science *par excellence*, which permits us to acquire the marvelous divine wisdom that manifests in creation, because astrology teaches us how to master this cosmic influence. Michael speaks of this concept of astronomy-astrology as a philosophical and religious science in a passage of the *Introductorium maius*: it is the foundation of all the other sciences because it furnishes them with their common basis (*subiectum commune*) which is the *ens* (being). He presents a classification of the speculative sciences, among which astronomy, together with astrology as its practical aspect, occupies a privileged position, because it is considered the universal science of the motion of the celestial intelligences, from which every type of influence derives.

Michael Scot’s definition makes it clear that he considers astronomy to be the same as astrology; but there are also differences, and some very curious details. Astronomy takes its name from “astrum”, which is a great star – or so he writes – and from “nomos”, which signifies “science”, i.e., rule. In the same way, astronomy is the law of the stars (*lex astrorum*), or even the science from the stars (*de astris*); whereas astrology is the discourse (*sermo*) about the stars, so that it is a *sermocinatio de astris*. It is also called thus because of “astrum”, star, and “logos”, which means a discourse or sermon about the stars. Moreover, there are two terms that derive from astronomy: “astronomus”, the man who knows the art, and “astronomista”, the man who imitates the art of astronomy (*idest homo*

imitans artem astronomiae). Two terms also derive from astrology: “astrologus”, the man capable of mastering this art (*homo utens haberi artem*), and “astrologista”, the man who copies its vestiges as best he can (*hic astrologista idest imitans vestigia ipsius artis suo posse*). The astrologer is the man who uses instruments such as the astrolabe, which is ‘that round tablet resembling the sky, through which it is possible to identify the position of the sun, the ascending and descending signs of the other planets, and the ruling hour’.

Necromancy is included within astronomy, being an operation based on the invocation of the spirits of demons, contained in the hierarchy of the 48 celestial images (the 12 signs of the zodiac, plus the 36 constellations of the northern and southern hemispheres). But Michael Scot, a believer in this matter, distinguishes the multitude of spirits that reside in the 48 images from the divine sphere that is supersensible, incorporeal, and immobile, inasmuch as the images are natural, physical, terrestrial, and controlled by the sun and moon. Moreover, he writes: ‘The multitude and order of the angels differs from the multitude of the stars; their greatness differs from the greatness of heaven, sun, and earth. For the former are mobile, the latter immobile’. The mobile either moves by itself (*per se*), and is the angel or soul, or else it moves by means of another (*per aliud*), like the natural beings compounded of body and spirit; stone on the other hand is immobile.

Michael’s idea of wisdom is that it is a revelation within man (*sapientia in homine*) which derives through procession from the celestial spirit, via the intermediate hierarchies. His *Liber introductorius* and *Liber particularis*, with their colorful demonology and angelology, are a kind of encyclopedia of → magic, astrology, and demonology, with a structure that is at the same time Neoplatonic [→ Neoplatonism], Platonic, patristic, Christian, and Gnostic [→ Gnosticism], influenced by → Augustine and by Hermetic [→ Hermetic Literature], Arab, and Jewish sources. The philosophers and theologians of the second half of the 13th century were probably reacting against it when they developed a different adaptation of astrology to philosophy and theology, as for instance in the *Speculum astronomiae* attributed to → Albertus Magnus, and later → Peter of Abano (1250–1315) in his *Lucidator dubitabilium astronomiae* or *astrologiae*.

GRAZIELLA FEDERICI VESCOVINI

Milosz, Oscar Vladislav, * 28.5.1877
Czercia, Lithuania (15.5 according to the Julian calendar then in use), † 2.3.1939
Fontainebleau (Seine et Marne)

On his father’s side Milosz belonged to the Baltic landed aristocracy, the family property being situated in a region annexed by Russia. His father, violent and unbalanced in character, had led an adventurous life culminating in marriage with a Polish Jew, Marie Rosalie Rosenthal, who was rejected out of anti-Semitism by the entire family and locality. His mother came from a cultivated background which had produced several rabbis, but she became isolated in her unhappiness and left the young and emotional Oscar to his solitude, at the side of a father who terrified him. Oscar lived at the château until he was twelve, then left to study at the Lycée Janson de Sailly in Paris. He had no contact with his mother’s people until 1906, after his father’s death. The maternal milieu soon disillusioned him, but he remained fascinated by Jewish culture, and the Bible in Hebrew remained his bedside book. Familiar with the literary and social life of Paris, he wrote poetry and plays, participating in the foundation of the “Société des artistes polonais” (Society of Polish artists, 1911). In 1916 he was drafted into the Russian troops fighting in France and attached to the Ministry of Foreign Affairs, where his concern for Lithuania developed. He represented that country as a diplomat until his French naturalization in 1936. Milosz’s political testament is found in *Deux messianismes politiques* (Two political messianisms, 1927), which also contains memoirs of his youth in the Parisian occultist world; but soon the loss of all his property in the Russian Revolution precipitated a spiritual revelation, described in the “Epistle to Storge” (*Revue de Hollande*, January 1917). This profound

transformation took place in a heightened state of prayer and meditation on religious texts such as *The Imitation of Christ* or on esoteric ones such as → Swedenborg's. Milosz's *Ars Magna* (The great art, 1924) and *Arcanes* (Arcana, 1927) contain the essence of his message, before he condemned himself to silence a few years later. It presents itself as a both metaphysical and poetic speculation on traditional symbolic themes, especially the symbolism of numbers [→ Number Symbolism] and the Kabbalah [→ Jewish Influences]. By means of the method developed here, he believed he could decipher the sacred texts, as in *Clefs pour l'Apocalypse* (Keys for the Apocalypse, printed at his own expense in 1938). Milosz's "literary" mission was complemented by social action: in 1919 he founded Catholic "apostolic groups", hierarchical models of a society regenerated on traditional principles, and for several years he participated in the secret society of the "Veilleurs".

JEAN-PIERRE LAURANT

Mnemonics

1. MEMORY IN THE CLASSICAL WORLD 2. THE MEDIEVAL TRADITION: RHETORIC, ETHICS AND SPIRITUALITY 3. MEMORY AND THE SEARCH FOR UNIVERSAL KNOWLEDGE

1. MEMORY IN THE CLASSICAL WORLD

In Greek mythology Memory – *Mnemosyne* – was a goddess beloved of Zeus who gave birth to the Muses, the divinities who would preside over poets and their art. Mnemosyne was the guardian not only of the secrets of beauty, but also those of knowledge, since in her hands she held the threads of the past, the present and the future. The poet's inspiration was believed to come directly from the Muses, and hence he was considered akin to the oracular priestess through whom the deities spoke or the king responsible for dispensing justice. Indeed, to the ancient Greeks it was obvious that

the divinities – as well as the abstract concepts – of Justice, Truth and Memory were very closely related. *Aletheia*, or Truth, was the "absence of oblivion" and therefore *Aletheia* was she who, with the help of Mnemosyne, brought to life once again the glorious acts of gods and heroes, in this way saving them from oblivion.

The myth of Mnemosyne captures the central importance of memory in a society which relied upon the oral transmission of knowledge, for where there is no written language, memory becomes essential, indeed sacred. The function of memory was to hand down knowledge and a precise set of values from one generation to the next; by thus preserving the sense of identity of its members, it assured the survival of the community. Poetry was uniquely suited to this purpose, for a poem could be recited or sung in such a way that the words, together with the → music and the movements of the body which accompanied them, would be imprinted indelibly – almost magically – upon the mind of the listener. During his recitation the poet was in direct communication with the Muses, the daughters of Mnemosyne, both because he was drawing exclusively upon memory and because the subject of his verses was not of his making but had been transmitted to him from the past, and his role was to merely reinterpret and re-elaborate the words for his listeners.

This situation changed with the spread of written language and the birth of the *polis*, the Greek city. The obvious advantages of writing tended to diminish the importance – and therefore the sacred nature – of memory. Nevertheless the need to remember survived and indeed assumed a new importance in the life of the city, where the orator and the poet had to recite their speeches and poems in public in an effective manner and without reading them. Thus, memory became an art which could be taught and practised.

According to classical tradition the inventor of the art of memory was Simonides of Ceos, a lyric poet from the pre-Socratic age (556-568 BC). Legend recounts that Simonides was summoned by Scopas, a nobleman of Thessaly, to entertain his guests at a banquet by reciting his poetry. In the eulogy dedicated to his host, Simonides inserted some lines in praise of the gods Castor and Pollux. Scopas was intensely irritated by this digression and paid the poet only one half of the agreed-upon sum for his troubles, suggesting that he ask Castor and Pollux for the remainder since he had praised them so well. At this point a servant came to tell Simonides that two young gentlemen were waiting for him at the door. The poet left the banquet hall

but to his surprise found no one outside. At this very moment the roof of the banquet hall collapsed, killing everyone inside. The bodies recovered from the ruins were so horrendously mutilated that they could only be identified by Simonides based upon where they had been found; thanks to the art of memory, he was able to remember the exact *order* in which the guests had been sitting around the banquet table.

Tradition also affirms that Simonides was the first poet in history to ask to be paid for his verses, and the first to draw an analogy between poetry and painting. According to Plutarch, Simonides defined painting as silent poetry and poetry as a speaking picture (*De gloria Atheniensium*, 3). This tradition sheds important light on the nature of the art of memory, which is based not only on an ordered disposition but also on the creation of mental images. In likening poetry to painting, it is clear that the Greeks had already recognised that the two arts both involved the creation of images, and one of the fundamental techniques of the art of memory would be to associate words with images, translating one into the other and back again.

Naturally, remnants of the archaic origins of poetry lingered for many centuries, with poets continuing to invoke the Muses, Apollo and Mnemosyne for inspiration. Orpheus, the musician-poet who descended into Hades to free his beloved Eurydice, would become the prototype of the magical, life-giving force of poetry, of the cosmic powers which found expression in its rhythm and which could draw animals and even lifeless stones in its dancing wake. The music, rhyme, gestures and movements that accompanied song continued to be recognised as powerful instruments of memory even after the invention of writing and, later, of the printing press.

The spread of writing also profoundly influenced the way in which the mind, and therefore memory, was perceived. Parallels were soon drawn between the practice of mnemonics and the acts of reading and writing. The scribe, following an orderly sequence of lines, engraves on the wax tablet the signs or letters that form words. After a lapse of time the tablet would restore to him the message that it had been entrusted with. In the same way the art of memory taught the user how to fix in his mind an orderly itinerary of *loci* where *imagines agentes* were to be placed, images that were associated with specific objects or words that one wished to remember. It should be possible to revisit these *loci* later and retrieve from each one the images that had been placed there; each image would then surrender the memories that had been entrusted to it.

Indeed the mind, and in particular the memory, began to be conceived as a space divided into niches where tangible images could be cached, either temporarily or permanently. Thence sprang the metaphors which would forever afterwards be associated with memory – the treasure trove of knowledge, the bottomless cupboard or knapsack of remembrances. The very nature of writing provided the masters of memory with an example of a combinatorial art of remarkable efficacy. They pointed out how with a finite and indeed relatively small number of signs it was possible to write all the words of a language, and suggested that by the same principle any number of memories could be fixed in the mind based on combinations of a limited number of images.

Places, images and a fixed order were the components that formed the basis of the art of memory. The techniques themselves sprang from a careful observation of the way in which memory spontaneously functioned: the art of memory or *memoria localis* or artificial memory consisted of a set of techniques designed to reinforce the natural powers of memory and the mind. Next to these mental elements, we find in many treatises on the art of memory instructions of a medical nature on how the memory might be improved. Based on the principle that the functioning of memory took place in a precise location in the brain but that its effects could be felt throughout the body – a corollary to the system of humours whose proportions determined a person's health and temperament – prescriptions for herbs and drugs, as well as advice on the best way to eat, sleep, wash and make love, could be found.

Thus the complex practices of the art of memory were suspended between two poles, the mental and the corporeal – at one end the fashioning of mental images and at the other the use of medicine and diet. The art of memory was situated in a borderline territory – its procedures were based in part on universal laws concerning the functioning of the mind, and in part on the idiosyncratic responses of the individual mind. The art of memory acted at the confines between spontaneity, automatism and conscious action. Mastery of the body through the medical arts and mastery of the mind through the *imagines agentes*, the art of memory vouchsafed passage into an unmarked territory where the body and psyche could meet and interact in a mysterious symbiosis.

The art of memory sought to exploit the power of the emotions and passions as well. Since it was based on the use of arresting *imagines agentes* – images capable of striking the imagination and

arousing sentiments and desires – the authors of treatises on memory suggested using the images of persons who were the objects of intense love or desire or hate; the stronger their emotional impact, the greater their mnemonic power. Another category of memorable images, and one which came to be widely used in the second half of the 16th century, was that of the grotesque or cruel. In mnemonic practices, therefore, the rational and controlled part of the mind interacted with its darker, emotional side.

Furthermore, *imagines agentes* signified images wearing masks, just like the actors in a theatre. As such they could help to conserve memories, but by assuming a disguise and presenting themselves in another form. Thus, from its very origins the art of the theatre exerted a considerable influence on the techniques of memory. The mind could be thought of as a stage on which a play was being presented, and indeed one of the techniques most frequently used to aid the memory was the construction of dialogues.

The Greeks did not only recognise memory as one of the human arts; they sought to understand how it functioned, deciphering its modalities and laws, and thus discovering its close relationship to the world of dreams as well as that of artistic creativity. Aristotle was profoundly interested in the nature of memory. In *De memoria et reminiscencia* (451b) he considered by what spontaneous process the mind managed to recall those things that it had half forgotten. It involved, he decided, a chain of associations. One memory would evoke another and the image of one thing would summon another, if between the two there was a relationship of either similarity or opposition or contiguity. These three laws of association could therefore be used to enhance the natural capacity of one's memory. In *De insomniis* (458b) he noted that a similar process was responsible for the visions that one saw in dreams.

The art of memory would utilise these three laws to construct images capable of giving rise to a chain of associations, thereby allowing the mind to retrieve the memories to which they had been attached. The three laws of association which Aristotle recognised as essential for memory are very similar to the two types of associations identified by the linguist Roman Jakobson (in his work *Essais de linguistique générale*, Les Editions de Minuit: Paris 1964) as governing the two fundamental figures of speech, i.e. metaphor and metonymy. Jakobson observed that associations based on similarity or opposition underlie the metaphor, while associations based on contiguity produce metonymy.

In fact, the art of memory allowed space for the

free play of the → imagination in the construction of its images. Mnemonic techniques were not limited to the passive filing of intact memories. They often involved an ample measure of creativity, for the human mind is capable not only of storing, but also of transforming its memories in an infinite number of ways.

While Aristotle linked memory to the experience of the senses, Plato incorporated it into his metaphysical vision of the world. Before descending to earth and binding itself to a sentient body, the soul was immersed in the contemplation of the world of pure ideas. Retrieving memories of that ideal world was the task of the philosopher, but in order to do so he had to battle against the darkening effects of oblivion, retracing the universals that lay beyond the mortal world and its bewildering multiplicity of particulars, seeking beauty and light beyond the obscurity of the material. According to Plato remembrance was the practice of *anamnesis*, a journey backwards that would eventually bring the philosopher into contact with the original – and divine – component of human nature. The teachings of Plato and the Neoplatonists would have an important influence on the mnemonic tradition, particularly during the 16th century.

2. THE MEDIEVAL TRADITION: RHETORIC, ETHICS AND SPIRITUALITY

The fundamental principles of mnemonics developed by the Greeks were preserved and transmitted through the texts of the great masters of rhetoric: Cicero, Quintilian, and above all the anonymous author of the treatise *Ad Caium Herennium*, long identified (albeit mistakenly) as Cicero himself. This philological error had important repercussions during the Middle Ages because it provided theoretical support for a gradual shift in emphasis from memory as handmaiden to the rhetorical arts to memory as a process with an ethical significance.

This shift arose out of a medieval reinterpretation of the classical tenets of rhetoric. In *De inventione* Cicero wrote that memory, intelligence and foresight (*memoria, intelligentia, providentia*) were the essential components of the virtue Prudence (*prudentia*). The wise man was he who, steeped in knowledge of the past, could understand the present and make prudent provisions for the future. Medieval philosophers referred to *De inventione* as Cicero's First Rhetoric and the treatise *Ad Herennium*, which appeared to be its obvious sequel, was known as Cicero's Second Rhetoric. Since the First Rhetoric clearly assigned an ethical valence to memory, declaring it to be a part of

Prudence, by reasonable extension the practices of artificial memory described in the Second Rhetoric could be considered exercises in the virtue of Prudence.

Such great medieval philosophers as → Albertus Magnus and Thomas Aquinas discussed at length the concepts of *loci*, order and *imagines agentes* in this new ethical context, in the part of their works dedicated to the cardinal virtue of Prudence. Since in medieval philosophy rhetoric and ethics were so closely tied, the arguments used to defend the figures of rhetoric (metaphor, allegory, poetic fables) from the accusation that they were mere devices of deception were the same as those used to justify the use of *imagines agentes* in the art of memory. Man is weak, the moral philosophers sustained, and generally incapable of understanding and remembering abstract concepts. Metaphors, allegories and *imagines agentes* were instruments that could be used to help him overcome this weakness since they lent concrete form to the abstract principles which he needed to embrace in order to gain eternal salvation. It was for this reason, St Thomas wrote in *Summa theologica* (I, 1, 9 and II IIae, 9.49 to 2m), that God chose to express himself in the form of parables and metaphors in the Bible.

The classical art of memory was thus grafted onto a tradition that gradually evolved within the enclaves of the monasteries of Europe, a tradition in which the functions and properties of memory were assigned an important moral dimension. The techniques of memory in turn influenced the way in which classical and biblical texts were read, assimilated, transformed and finally incorporated into the reader's personal repository of knowledge, to be drawn upon later as needed to produce new texts or to arrive at decisions in the moral sphere. Regarded in this light a literary text was not a closed and static entity, but rather an open-ended work which would never be definitively finished: it was a *res* (object) which would pass across times and generations, and function as an *auctoritas* – an authoritative text and also one that could be broken up into fragments, digested and re-combined into other forms and other models of behaviour.

This process of re-elaboration drew upon both corporeal and spiritual elements. Texts were in fact read aloud, dictated to scribes and copyists, and even sung on liturgical occasions. Furthermore, in accordance with the most widespread medical and philosophical theories of the period, both the images which the external world left imprinted on the mind and those that were created by means of the imagination and the techniques of memory

were *phantasmata* – images which had not only a mental but also a material consistency.

Finally, in the Middle Ages techniques of memory were closely linked to the techniques of meditation that were used to develop a particular “force of thought”. This force was used to build structures in the mind – temples, tabernacles, palaces, gardens, trees, stairways – which could then be used to design a spiritual itinerary. Each stopping place along this itinerary represented an advance in knowledge and a step forward in a gradual moral transformation which would culminate in the mystical experience of a union with God. In the ecstasy of this moment the images themselves would cease to function, evaporating like mist because they are tied to the material world, to the specific condition of human nature and therefore to its limits.

→ Dante Alighieri's *Divine Comedy* may be seen as a wonderful representation of this metaphysical process. In it the author recounts his journey as a pilgrim through the hereafter, where he meets a series of figures embodying all of the vices and virtues of man. As he makes his way through Hell, Purgatory and Paradise he gradually becomes morally purified and achieves a clearer understanding of the divine order governing the cosmos. When he finally reaches the end of his journey, he is rewarded with a dazzling vision of the Holy Trinity and writes: ‘Da quinci innanzi il mio veder fu maggio / che ‘l parlar nostro, ch’a tal vista cede, / e cede la memoria a tanto oltraggio (From that moment onwards my vision was greater/than human speech, which was overwhelmed by this vision/ and memory too was overwhelmed by this so great force; *Paradiso*, XXXIII, 55-57). From this passage we see that, for Dante, the use of places and images to give concrete form to spiritual experience was essential, both in order to describe and recount and to remember it. Writing and memory were together used to construct the itinerary of the pilgrim. The crisis provoked by his final vision of God clearly illustrates both the power and the limitations of words and memory.

In short, the Christian world inherited the classical tradition of the art of memory and re-elaborated it to reflect the new doctrine of the Church. The issue of memory had an importance that extended far beyond the principles and practices of mnemonics, however, for it permeated the mass, the liturgy and the private life of the believer. To remember the sacrifice of Christ, the terrible punishments of Hell and the infinite delights of Paradise, to remember one's sins in order to be able to confess them and be absolved, to remember at least a handful of prayers and the basic tenets of the

faith, were all decisive in determining one's eternal salvation or damnation.

As it was for the classical orator, the art of memory became an indispensable tool for the Christian preacher. Given the fact that the preacher would continue for several centuries to address a public that was in large part illiterate, the importance not only of remembering what he wished to say, but also of impressing it upon the minds of his listeners so that they would remember it, becomes evident.

3. MEMORY AND THE SEARCH FOR UNIVERSAL KNOWLEDGE

Between the 15th and 16th centuries the art of memory became the target of criticism and satire by humanists such as Erasmus, Melancthon, → Agrippa and Rabelais. The masters of memory were derided for the useless exercises that they inflicted upon their disciples, the "by rote" nature of their techniques, and their absurd claims regarding the rapidity with which vast stores of knowledge based upon words rather than substance could be imparted. The diffusion of the printed book further contributed to diminish the importance of the ability to remember; the book, the dictionary and the catalogue seemed to furnish the reader with all of the tools he needed to broaden his learning and, should he wish, to create new works.

Nevertheless, it was against this background of criticism and radical change that the art of memory experienced not merely a renaissance, but its period of greatest splendour. The explanation for this paradoxical situation lies in the felicitous meeting of the art of memory with the principal elements of the culture of the period, from the extraordinary flowering of the arts and letters to a revived interest in → hermetism, → Neoplatonism, and Lullism to → magic, → astrology and kabbalism [→ Jewish Influences]. The workings of the human mind, in particular its capacity to formulate mental pictures, were no longer interpreted as a sign of weakness but rather as proof of its creative capabilities and therefore of its divine nature. The Aristotelean notion of the imagination as a mediator between the soul and the body, between feelings and the intellect, thus acquired new significance.

In this period the imagination also became a point of contact between man and the cosmos, between the particular and the universal. For example, → Marsilio Ficino (1433-1499) borrowed a traditional syncretic process with roots in the distant past and re-worked it into a new and enormously successful formula, in which the Aristotelean concept of the imagination was combined with the Neoplatonic and hermetic traditions of

the *pneuma*, the *spiritus phantasticus*. According to this formula, in man there was a *spiritus* which was responsible for the creation of the images or *phantasmata*; this *spiritus* constituted the raw material of dreams, prophecies, enchantments and love. The cosmos was animated by this same principle, which acted as the intermediary between base matter and the soul of the universe, just as in man it permitted the soul to communicate with the body and the reason with the sentiments. In mnemonic practices influenced by Neoplatonism the construction of images meant the mastery of procedures based upon the secret order of the universe. Unlimited possibilities thus opened up before the philosopher who learned to place himself in syntony with the profound order of the cosmos; he had access to universal knowledge and could approach God in his omnipotence because to know, to remember and to be able to operate upon things represented different facets of the same mental process.

The classical theory attributed to Simonides, the inventor of the art of memory, of *ut pictura poesis* or the similitude between painting and poetry found expression in an extraordinary variety of ways during the course of the 16th century – in emblems, devices, mottos, rebuses and figured poems where linguistic and pictorial expression came together in an ingenious interchange. The hieroglyphs of ancient Egypt exerted a particular fascination; the mysterious symbols were considered to be a repository of antique knowledge written in a language approaching that of the gods, which could be deciphered only by a select few. In 1422 the Florentine traveller Cristoforo Buondelmonti brought back with him from the Greek island of Andros a manuscript allegedly written by an Egyptian priest, Horapollus, which claimed to explain the secrets of the hieroglyphs. The popularity of this work spread rapidly, especially after the humanist Pierio Valeriano (pseudonym of Giovan Pietro delle Fosse) published an edition in 58 books with an extensive commentary entitled *Hieroglyphica*, which was published in Basel in 1556. This obsession with the secret language of ancient Egypt was destined to endure, and inspired – among other things – the search for a universal language made up entirely of images.

The art of memory borrowed liberally from contemporary emblems, devices, hieroglyphics, images of classical gods and heroes, and from iconological tradition in order to create striking *imagines agentes*. Indeed a process of mutual borrowing was initiated in which it is not always easy to establish the original source of an image and the exact

sequence of its successive applications. For example, the immense catalogue *Iconologia* published by Cesare Ripa in 1593 was a favourite source of images among practitioners of the art of memory (as was Valeriano's *Hieroglyphica*). For his catalogue, however, Ripa drew not only upon the vast repertoires of images used by poets and artists, but also from the tradition of the art of memory. In fact the authors of mnemonic treatises facing the challenge of vesting abstract concepts with concrete form often included an iconographic glossary *ante litteram* for the convenience of their readers.

A typical exponent of the Renaissance revival of the art of memory was the philosopher → Giulio Camillo. The memory system which he describes in his work *Idea del teatro*, published posthumously in 1550, is both profoundly traditional and highly innovative. In conformity with classical ideals the author promises to provide his readers with all the words and rhetorical devices needed to imitate the great authors of the past, from Cicero to Virgil, and from Petrarch to Boccaccio. Camillo's theatre encompassed not only the *memoria verborum* (the memory of words), but also the *memoria rerum* (the memory of things). He claimed that his techniques could be used to imprint upon the mind a body of universal knowledge embracing all the arts and sciences.

In his works Camillo explained the basic presuppositions which underlay the working of his memory system: first, the existence of a unitary cosmos in which the different levels of reality corresponded with one another and therefore words and things could be assumed to faithfully mirror one another; and secondly the premise that it was possible to construct a memory system whose *loci* and *imagines* were not arbitrary but real – that is, capable of reproducing the first principles, the hidden structures which constituted the foundations of reality. It was precisely for these reasons, he assures us, that the order, places and images which governed his theatre were so magically effective; they represented the secret nexus between all things, capturing that which linked the divine world with the heavenly world and the heavenly world with the terrestrial world.

The theatre contained within itself many different meanings, some of which were comprehensible only to a few initiates. Camillo describes an imposing structure, probably inspired by the amphitheatres of ancient Rome, supported by seven columns which on the most obvious level correspond with the seven planets and their associated divinities, while on a deeper level they refer the reader back to the seven days of Creation, to the secret names of

the Godhead contained in the Kabbala, and to the first principles established by Pythagorean and hermetic tradition. The philosopher who mastered the entire structure of the theatre, according to Camillo, could transform his mind into a universal intellect capable of working upon and manipulating words (through the art of eloquence), things (through the science of → alchemy) and also himself, thus recovering all of the divine elements contained in his nature.

The dream which inspired the theatre of Camillo – his attempt to contain the whole of reality within a structure based upon combinations of a fixed number of elements – was shared by most of the memory systems that were developed during the 16th and 17th centuries in the principal intellectual centres of Europe. A key role was played in these systems by the revival, at the beginning of the 16th century, of the works of the great Catalan mystic → Ramon Llull (ca. 1235-1316); both his actual writings and those attributed to him were reprinted in new editions by the most prestigious publishing houses of Paris, Lyon and Cologne.

Lullism was fascinating to 16th century philosophers because it appeared to offer a *clavis universalis* (universal key) to reality. According to Llull, once philosophy had identified the first principles of the universe, these could be codified very simply using letters of the alphabet inserted into a combinatory system made up of concentric wheels which, as they turned, would produce all of the possible associations in the universe. In this way one would have before one's eyes – and could thus control and reproduce – the logic underlying all reality.

These first principles could be found at every level of being; in God they are transcendent attributes; in the natural world they become relative principles; at the level of consciousness these principles in various combinations constitute the various systems of knowledge, which could be represented through the trees of science. The system of concentric wheels, the trees of knowledge, the letters of the alphabet, all assumed in Lullian thought the same function as the *imagines agentes* in the art of memory because they had the same purpose. Lullian philosophers believed that in this way it was possible both to store memories and to generate new knowledge, because they were convinced that the first principles of being were identical with the principles of knowledge and of remembering.

Intellectuals were intrigued by many other aspects of Llull's universal key. For example, they were fascinated by its intermingling of the metaphysical with the artificial-mechanical. Since it was based on divine principles, the wheels constituted a

guide to meditation and spiritual elevation. At the same time, however, they permitted the user to set in motion, like the interlocking parts of a watch, all the components of his knowledge. This mechanism could then, like a machine, “generate” or lead to the acquisition of a universal knowledge.

In addition, philosophers were greatly attracted by the nexus that Lull established between this new, universal method of acquiring knowledge and the ideal of universal peace. According to Lull, the very fact that his art worked, demonstrated the truth of its principles, and it was these same principles which formed the basis of the different systems of philosophy and religion. His art could therefore perform an ecumenical function by converting all men to the true faith and eventually leading them to universal peace. One may readily understand why the teachings of Lull were so popular in intellectual circles during the 16th and 17th centuries; in a period lacerated by war and divided by political, religious and social conflict, the search for an encyclopaedic art of memory could be linked to the ideals of universal peace and a profound moral and intellectual renewal.

Among the authors who were influenced by Lull was the philosopher → Giordano Bruno. The tragic end of this highly original thinker, who was burned at the stake as a heretic by the Roman Inquisition, and his lengthy involvement with the themes of memory, can be taken as symbolic of the seriousness and complexity of the questions connected with memory. In his work *De umbris idearum* Bruno adopted a device similar to Lull’s concentric wheels to generate all the possible words and to restore the occult powers of the magical and astrological images of the decans (vestiges of ancient Oriental rites). The art of memory therefore was directly linked to metaphysics, and through its practice the user’s knowledge, memory and powers of mind could be developed and enhanced. As Bruno pointed out, however, the procedures for constructing and using images were anything but arbitrary as they involved one in a continual search for the shadows which eternal ideas have left upon the world, the traces which the metaphysical principle of Unity has left impressed upon the plurality of visible and imperfect things. The exercise of the art of memory signified in the end a magical, almost divine capacity to impose order upon things and apprehend the ways in which things could be changed or conserved. The masters of the art of memory could detect the eternal forms that lay within and beyond the chaotic and multiform reality of the material world. In this context Giordano Bruno reinterpreted in contemporary terms the

classical nexus between the art of memory and the poetic and figurative arts. The *compositio imaginum* was in fact for him a philosophical exercise that united the activities of the philosopher with those of the master of memory in a creative effort similar to that of the poet or the painter.

The art of memory also played an important role in the 16th and 17th century utopian tradition. In his masterpiece *Città del Sole*, written in 1602, the philosopher, poet, and visionary → Tommaso Campanella describes a city whose layout mirrored the order of the cosmos. The City of the Sun is surrounded by seven circular walls and access may be gained by four gates corresponding to the four cardinal points. The citizens of the city are governed by a priest-prince whom Campanella referred to as *Sole* (Sun) or *Metafisico* (Metaphysician), assisted by three other priest-princes corresponding to the three principal elements of metaphysics – *Sapienza*, *Potenza* and *Amore* (Knowledge, Power, and Love). The children of the city would learn in part while playing and in part by observing the images that were painted in orderly succession along the walls of the city and which illustrated all the branches of knowledge. The constellations were instead painted on the walls of the circular temple that stood atop a hill in the very centre of the city. Thus Campanella united the art of memory with the latest pedagogic theories and the revived traditions of astrology, magic and metaphysics to show how right knowledge could ensure a more just and happy civic life.

The influence of *Città del Sole* can be seen in the work *Orbis sensualis pictus* (1658), an immensely popular textbook written by the Czech religious leader and educational reformer Jan Amos Komenský (→ Comenius). In it Komenský describes a system of images which would permit the reader to make his way to a universal land located beyond the plurality of languages, and at the same time to ascend from the *orbis sensualis* to the *orbis intellectualis*, or to a unitary vision of reality.

During the 16th and 17th centuries, therefore, in its quest for universal knowledge the art of memory bound itself inextricably with the arts of magic, physiognomy, chiromancy, and the occult. Its practitioners explored the secret network of analogies, signs and → correspondences which they believed linked the different levels of reality. The Aristotelean laws of association once used for the construction of images were replaced by associations based on these hidden relationships, which conferred a magical dimension and function on the process of remembrance. In the works of the French masters Pierre Morestel, Lazare Meyssonier

and Jean Belot, for example, the art of memory formed part of a magical and Kabbalistic vision of the world and included various divinatory practices [→ Divinatory Arts].

The Jesuit scholar → Athanasius Kircher adopted Llull's *ars combinatoria* in a complex philosophical construct in which the metaphysics of correspondence were joined to a free experimentation with various ingenious mechanisms. The mental procedures which Kircher describes, the new "alphabets" which he devised, and the complicated diagrams and splendid illustrations which accompanied his texts were intended to reflect – and render visible – the divine order that governed all reality.

Some decades earlier, between 1621 and 1627, the voluminous works of the English philosopher → Robert Fludd appeared in Germany. A learned apologist for the Rosicrucians, he was profoundly influenced by hermetism, neoplatonism and the revival of the Kabbala. The art of memory found its place among the arts of divination in one of the volumes in which he describes the myriad and mysterious correspondences which link the microcosm with the macrocosm, and man with the universe.

Thus, from the 16th to the 17th century, the art of memory celebrates its triumphs and at the same time suffers its crisis. Its encyclopaedic dreams, linked to a unified conception of the world and knowledge, go to pieces when old myths fall, the relations between words and things become once again problematic, and the various arts and sciences develop, separate, and become specialized. Furthermore, it is during the same period that the late 16th century *Wunderkammer* (a collection that in itself combines, almost as if constituting a mirror of the cosmos, the *naturalia*, the *mirabilia* and the *artificialia*, the products of man and his fantasies, along with those of nature) is replaced by the picture gallery, the collection of antiquities, and the museum of the various natural sciences. The theatre of the world is shattered in stages: the theatre of memory can no longer reunify and represent it.

LINA BOLZONI

Monoimus, 2nd cent.

Monoimus was a Gnostic teacher [→ Gnosticism] of whose life and career nothing is known. Hippolytus (ca. 230), who has left us a summary of his teachings, including a fragment of one of his letters (*Refutatio*, VIII, 12-15; X, 17, 5) calls him 'the Arab', which means that he came from the Roman province of Arabia.

According to Monoimus, there is a twofold principle of the All, Man and the Son of Man, of whom the former is unborn and immortal and the latter born, albeit independently of time, will or plan. For just as a fire and the light it produces are inseparable, so Man is unthinkable without the Son of Man. In order to elucidate the essential characteristics of his first principles, Monoimus made use of Greek Pythagorean arithmetical speculations [→ Number Symbolism]. Man and the Son of Man are perfect and their perfection is best illustrated by the image of the letter *iota* (I), the perfect number, both in its Roman and its Greek interpretation. The unity of the All is expressed by the Roman letter I (= 1, interpreted as the Monad), the plurality of the All by the Greek letter I (= 10, interpreted as the Decad). The Son of Man is the ultimate source of

creation, since he possesses everything that is also in his Father. However, only a part of him is actually involved in the creation of the cosmos: 'The very dim beams coming down to this world from the Son maintain and strengthen the change of matter, i.e. the transformation' (VIII, 13, 3). Though Monoimus apparently did not have a positive view of the material world and the human condition, it remains unclear whether or not he ascribed the actual creation to a lower, imperfect Demiurge. It is very unlikely, however, that, as has been suggested (Marcovich, 139-140), Monoimus thought of the imperfect and malevolent Jewish Creator when he said that God 'takes pleasure in the transformation of the created world' (VIII, 14, 8).

In his letter, to a certain Theophrastus, Monoimus argued that to find God, i.e. the Son of Man, and at the same time one's own self, one has only to look at oneself. It is worthwhile to quote the fragment in full: 'If you want to learn to know the All stop searching for God in the creation and similar things: search for him starting from yourself. And learn who is this who had appropriated to himself absolutely everything in yourself, as somebody different from you, by saying my mind, my reason, my soul, my body. And learn what is the cause of your feeling grief or joy, love or hatred; and what is the cause of your being awake against your wish or feeling sleepy against your wish; of your being angry against your wish or feeling affection against your wish. And if you accurately examine all these things you will find him (God) in yourself, the Perfect One coming from the Perfect One, considering everything as his own – both the so-called non-existent things and the existent ones – and being one and many, just as is that "One Stroke" (Iota). And you will find the explanation from yourself' (combination of VIII, 15, 1-2 and X, 17, 5; transl. Marcovich, 141). We do not know the context of this fragment, but Monoimus apparently taught that everything participates in the divine being, and that, therefore, you only have to look at yourself if you want to know God, the All and yourself. These ideas are more Hermetic [→ Hermetism] than typically Gnostic. As a close parallel may only be mentioned here *Hermetic Definitions* IX, 4: 'Whoever knows himself knows everything. Everything is within man'. That raises the question of whether Monoimus was a Gnostic at all. That he called his divine principles Man and the Son of Man points undoubtedly to Gnostic influences. He quotes from the Old and the New Testament and seems to have been aware of the generally Christian identification of the Iota with Jesus, as can be concluded from his quotation of a combination of Colossians 1:19 and

2:9 (VIII, 13, 2). But we do not know whether or not Jesus played a role in Monoimus's doctrine of salvation, if he really had one. That Hippolytus' report does not say anything about it, might be an indication that his source provided him only with a part of Monoimus's system. However, it seems also possible that he adhered to a hermetic world-view, which he expressed in a Christian and more specific Gnostic terminology.

ROELOF VAN DEN BROEK

More, Henry,* October 1614 Grantham, † 1687 Cambridge

More was born in Grantham, Lincolnshire, the son of Alexander More, Alderman and Mayor (1617) of Grantham, and his wife Anne (née Lacy). He was educated at Grantham Grammar School and Eton College. In 1631 he entered Christ's College, in the University of Cambridge, where Robert Gell was his tutor. He graduated BA in 1636 and MA 1639 and was elected fellow of Christ's College in place of Gell in 1641. In the same year he was ordained, and his uncle, Gabriel More, presented him with the advowson of Ingoldsby near Grantham. He remained a fellow of Christ's College for the rest of his life, declining preferment. He died in 1687.

More was, together with → Ralph Cudworth, one of the most important of the group of philosophical divines known now as the Cambridge Platonists. His tolerant religious convictions were formed in reaction against the strict Calvinism of his upbringing and the religious strife of the Civil War period. As well as being considered a founder of the Latitudinarian movement, he came to be regarded as one of the leading English philosophers of his time. He was certainly the most prolific and widely read of the Cambridge Platonists in the 17th century.

More's first published writings were long philosophical poems of Platonist stamp: *Psychodia*

Platonica or a Platonick Song of the Soul (1642) was republished with the further poems in the collection *Philosophical Poems* (1647). There followed, from 1650-1651, a public controversy with the alchemist → Thomas Vaughan, who wrote under the name of Eugenius Philalethes and whom More attacked under the pseudonym Alazonmastic Philalethes. Thereafter More eschewed polemic, preferring to elaborate a measured, philosophical defence of his position. His *Enthusiasmus triumphatus* (1656) insists on the importance of reason as an antidote to what he regarded mistaken beliefs. There followed two important works of apologetics: *An Antidote against Atheisme* (1653) and *The Immortality of the Soul* (1659), in which he developed his philosophical defence of religious belief against perceived atheist philosophers such as Thomas Hobbes. The basic premise of this arguments is that the existence of spirits is logically connected to the existence of God, or as he formulates it in *An Antidote*, 'That saying is no less true in Politicks, *No Bishop No King* than this in metaphysics, *No spirit no God*' (*Antidote*, 3.16.17). To this end he adduced supernatural phenomena, firmly convinced that the appearance of ghosts and instances of → witchcraft constituted evidence of the operation of spirits. In the same cause he edited Joseph Glanvill's, *Sadducismus triumphatus* 1681, a work which consists largely in a compilation of such evidence. His most extensive elaboration of his philosophy of spirit comes in his *Enchiridion metaphysicum* (1671) where he seeks to explain natural and supernatural phenomena by the operations of what he calls his 'hylarchic principle' or Spirit of Nature.

The Apology of Henry More (1664), is a brief but important statement of More's understanding of the role of reason in matters of religion. However, his most important theological work is his *An Explanation of the Grand Mystery of Godliness* (1660), which sets out his broadly tolerant theology as well as his revival of heterodox beliefs, such as the Origenist doctrine of the pre-existence of the soul. In later life, he devoted considerable time to the study of biblical prophecy. Books such as *Paralipomena prophetica* (1685) and *Apocalypsis apocalypseos* (1680) develop the exegetical theories of his mentor, Joseph Mede. He also studied the Jewish kabbalah [→ Jewish Influences], persuaded that the secret traditions of the Jews preserved in symbolic form nuggets of true philosophy. He was put in contact with the German kabbalistic scholar, → Christian Knorr von Rosenroth, by their mutual friend → Francis Mercury van Helmont. As a consequence, More contributed to the first vol-

ume of the *Kabbala denudata* (1679) edited by Knorr.

More's wide-ranging interests in prophecy, kabbalah and witchcraft, on the one hand, as well as theology, philosophy and science, on the other, mean that he cannot be easily classified in modern terms. Neither he, nor his contemporaries for that matter, regarded these interests as mutually incompatible. More's debt to what are now regarded as esoteric writers and writings must be understood in the context of his Renaissance syncretism which viewed religious and philosophical truth as belonging to a tradition of ancient wisdom. This *prisca sapientia* or *philosophia perennis* [→ Tradition] supposedly derived from Moses, and was imparted via a succession of thinkers both ancient (e.g. Plato) and modern (notably Descartes). This understanding of human wisdom was bolstered, in More's case, by his penchant for symbolic readings, by which he sought to unlock the rational content of occulted truth, whether in prophetic visions or → number symbolism. This is best illustrated in More's *Conjectura Cabbalistica* of 1655, which expounds the first book of Genesis as a species of Neopythagoreanism that prefigures aspects of contemporary philosophy, notably Cartesianism (though he subsequently revised his enthusiasm for Cartesianism, out of fears that it might encourage atheism). More achieves his interpretation of Genesis by way of Plotinus and Philo, among others. He attributed his interest in Platonism to his extensive reading of among 'the *Platonick* writers, *Marsilius Ficinus*, *Plotinus* himself, *Mercurius Trismegistus*; and the *Mystical Divines*' (Ward, *Life*, 18) when still a young man. Among these he mentions his special affection for 'that little golden book', *Theologia germanica* attributed to Johann Tauler. He claimed that it was reading these authors which helped to rescue him from a sceptical crisis which engulfed him after he graduated. And he continued to cite → Hermes Trismegistus as an authority, even after Casaubon had demonstrated that Hermetic writings were not as ancient as previously supposed. More took care to set a distance between his own philosophical Platonism and what he regarded as the confused and self-deluding claims of esotericists like Vaughan, → Paracelsus and → Jacob Boehme. His *An Explanation of the Grand Mystery of Godliness* includes an attack on → astrology, later republished as *Tetractys Anti-Astrologica* (1681). He was also deeply interested in the scientific developments of his day and was a fellow of the Royal Society. However, his own overzealous appropriation of the work of Robert Boyle to support his own theories resulted

in censure by Boyle. Controversies such as this notwithstanding, More's writings were widely read in his own day. He summarised his philosophical and religious views for the benefit of more general readers in his popular *Divine Dialogues* (1668) published under the pseudonym Franciscus Evistor Palaeopolitanus. The collected edition of his writings, a *Collection of Several Philosophical Writings* (1662), and the translation of his works into Latin (*Opera omnia*, 1671-1679) ensured him a wide audience among the learned, both at home and overseas.

SARAH HUTTON

Morley, Daniel of, * ca. 1140 Norfolk,
† ca. 1210 place of death unknown

Living one generation after the masters of Chartres and Tours, Daniel demonstrated an interest similar to theirs in naturalistic Platonism. Unfortunately, regarding scientific subjects the Latin philosophers of his time offered him neither clarity nor certainty. Paris was mainly interested in Law and Theology. Daniel therefore went to Toledo to study the "teachings of the Arabs" (*doctrina arabum*) and joined the circle of translators gathered around Gerard of Cremona. Deriving strength from his new knowledge, he composed the tract *Liber de naturis inferiorum et superiorum* (1187) in England.

Daniel drew much inspiration from the Bible and → Augustine. He read Plato, whose disciple he considered himself, through Calcidius, but did not hesitate to criticize the latter's astronomical theories. Despite his claims to the contrary, Daniel was indebted to the Latins: Adelard of Bath, his compatriot, whose example he followed in taking recourse to Arabian science; Guillaume de Conches, annotator of the *Timaeus* and philosopher of nature; Thierry of Chartres, who wrote a commentary on Genesis but renounced the traditional form of the *hexaemeron* inherited from the Fathers; → Bernard Silvester, whose *Cosmography*, nourished by these authors, was permeated with hermetism [→ Hermetic Literature]. Let us mention finally the hermetic sources themselves, such as the *Liber Triplicis Mundi*.

Astronomy, which Daniel did not distinguish from → astrology, was for him a major science. 'He who condemns astronomy', he said, 'necessarily destroys physics'. He argued that if we are ignorant

of the universe and its laws, we cannot know humanity and its destiny; we recognize here the hermetic theme of the relation between macrocosm and microcosm. Basing himself on the masters of Arabian astronomy, Daniel discussed the astrological virtues of the sun. He asserted, moreover, that the heavens had not been formed from a corruptible substance but from a fifth element, the quintessence. On this point he refuted the objections made notably by Guillaume de Conches with regard to the stars, which, not being composed of the four elements, could not have their qualities.

Daniel's terminological innovations, influenced by hermetism, can make his ideas appear more revolutionary than they are. In reality his work reconciled very diverse currents: Pythagoreanism, → Aristotelianism, Platonism, hermetism and Arabian astronomy. In this respect, he is very representative of the new philosophical tendencies that played a transitional role between the golden age of medieval Platonism and the triumph of the Aristotelianism that would supplant it.

MICHEL LEMOINE

Moses

In the syncretistic religious climate of Ptolemaic Alexandria Moses was identified with the Egyptian god Thot-Hermes [→ Hermes Trismegistus]. The only direct source for this equation is the third fragment of a book *On the Jews* written by a certain Artapanus (ca. 100 B.C.E.), preserved in Eusebius, *Praeparatio Evangelica* IX, 27, 1-37. It tells us, mainly in 27, 1-10, that Moses or "Moyses", as Artapanos calls him, invented all kinds of utensils for the Egyptians, such as ships, instruments for hoisting stones, weapons, and inundation and war machines, and that he also introduced philosophy. He divided the country into 36 districts or nomes,

assigned to each of them the cult of its own special god – among these gods there were also cats, dogs and ibises –, allotted land to their priests and even taught them the art of writing. All this he did to preserve the monarchy for his stepfather, pharaoh Chenephres (= most probably Sebekhotep or -Kha'nefer-Re', ca. 1730-ca. 1722), and to prevent civil war. The ordinary people loved him for all this and the priests even deemed him worthy of divine honour, calling him "Hermes" because of his interpretation (*hermēneia*) of the hieroglyphs. His stepfather, however, became jealous and sent him on a campaign against Ethiopia, hoping that he would be killed in battle, for his army consisted of a hundred thousand untrained farmers. In order to have shelter, these men founded the town of Hermupolis and declared the ibis to be its sacred bird, because it kills all kind of vermin harmful to mankind. The end of the campaign and the subsequent events are less important in this connection, but as a result of it the Ethiopians adopted the ritual of circumcision from Moyses, and so did all the (Egyptian) priests.

Though Flavius Josephus does not mention the identification of Moses and Hermes, he does seem to have known Artapanus' story, for he offers a missing link in it. He tells us how Moses on his way to conquer Ethiopia had to cross a region full of snakes. These he overcame by letting loose from papyrus baskets numerous ibises, which attacked these snakes and killed them. In the end he agreed to marry the Ethiopian princess Tharbis, on condition that she would surrender the capital Meroe to him (*Antiquitates Judaicae* II, 238-253). This last detail is, of course, an elaboration on Numbers 12:1 (LXX) where it is stated that he had married an "Ethiopian" woman.

Although it seems strange that a Jew would ascribe to no one less than Moses, who was against all idols, the institution of the Egyptian animal cults, there can be little doubt that Artapanus himself was Jewish, for his writing is clearly apologetic in the sense that it defends the cultural primacy of the Jews. Not even his Persian name is an argument against his Jewish nationality, for there are other instances of Jews bearing Persian names such as Dareios and Arsames, and the very name "Artaphan" is found twice at the Jewish cemetery of Teuchira-Arsinoe in Cyrenaica (*Supplementum Epigraphicum Graecum*, 9, 613; 709). As Artapanus must have preceded Alexander Polyhistor, who quoted him, he may be dated to about 100 B.C.E. (Walter, 123-125). At first sight, he seems to have offered an example of Jewish Euhemerism:

originally, the great god Hermes would have been nothing else than a human being. On the other hand, it is true that in Jewish circles, and likewise in Alexandria, Moses was sometimes deified. Ezekiel Poeta's *Exagoge* (ca. 200 B.C.E.?) portrays Moses as receiving from God His diadem, sceptre and throne, and Philo's *Life of Moses*, I, 158 states in so many words that Moses was called 'God and King of the whole people'. In a way, therefore, the equation of Moses and Hermes is comparable to the well-known identification of two gods from different countries, such as Mars-Ares.

Most of the activities and inventions ascribed by Artapanus to Moysos-Hermes can be paralleled somehow by what the Old Testament tells of Moses and what is known about Thot. As to the technical inventions (except those of ships and weapons): Moses supervised the construction of the Tabernacle (Exod. 39:32ff.), whereas Thot was the architect and decorator of the Egyptian temples (Boylan, 89), and was generally, according to Plato, 'most skilful' (*technikōtatos*; *Phaedrus*, 274 E), as well as the inventor (*heuretēs*) of all technology (Diodorus, *Library*, I, 43, 6). As for philosophy: Moses' connection with law and law-giving needs no illustration; for his wisdom and erudition, reference can be made to the tradition worded in Acts 7:22; Thot was the god of wisdom and law *par excellence* (Boylan, 185; 188; 192; 195; 197f.). The division of Egypt into nomes has its counterpart, of course, in the allotments of land in Transjordan and Canaan to the eleven tribes (Num 32:33ff.; 34:13ff.); to the land of the Egyptian priests one may compare the towns assigned to the Levites (Num. 35:1ff.); according to the Shabaka-stone line 59, Thot was the founder of the towns and districts, and also of the local cults (lines 59-60). That Moses would have established local cults seems strange in view of his reaction to the veneration of the Golden Calf (Exod. 32), but on the other hand he made the brass serpent, to which the Israelites had to look up (Num. 21:4ff.), and which was still, or again, venerated under Hezekiah (2 Kings 18:4). The invention of writing: Moses is the first man mentioned in the OT to have written (Ex 17:14); Thot was the god of language, writing and interpretation (Boylan, 182-194; Diodorus, *Library*, I, 16, 2); for Moses as interpreter of the Law, cf. Deut. 1:4. In addition to these parallels there are some more which have no basis in the text of Artapanus, but may well have supported the equation of Moses and Thot-Hermes (Mussies, 108-118).

Although several Christian authors referred to Hermes in a positive sense, they never identified

him with Moses. The tendency to keep them apart is much less marked in ancient and medieval magical and alchemical literature [→ Magic; → Alchemy]. In the great Leiden Magical Papyrus (*Papyri Graecae Magicae*, XIII, 3; 22), the treatises IV and X of the Corpus Hermeticum [→ Hermetic Literature] are entitled respectively *The Monad or Eighth Book of Moses* and *The Key of Moses*. It is even said that Hermes stole from Moses' *Monad* the exposition of the seven things and materials that can be burnt in magic and inserted this list in his own holy book entitled *The Wing* (PGM XIII, 14). In the alchemical corpus, *Kleidion* (The Little Key) is likewise the title of a book attributed to Hermes (*Collection des Anciens Alchimistes Grecs*, 2, 281/3, 271), and other works and words of Hermes (Trismegistus) are often quoted in the many recipes. The name of Moses, too, is here of frequent occurrence. By the side of many other biblical figures, such as notably king Solomon, Moses' presence in the science of alchemy was especially due to the fact that he had smashed the Golden Calf of the apostatizing Israelites to gold dust and had mixed this dust with their drinking water (Exod. 32:20), and further that he was the supervisor of Bezaleel, the skilled metal worker who built the Tabernacle (Exod. 35:30-33). Moses' so-called *aurum potabile* ("drinkable gold") played a role as late as the beginning of the 18th century, as a kind of Elixir that could prolong life (Bachmann-Hofmeier, 56f.), whereas Bezaleel is mentioned by name in the opening lines of the treatise *Chemistry of Moses*, which paraphrase Exod. 35:30ff., but make a priest of him (CAAG 2, 300-315/3, 287-302). This treatise is also quoted elsewhere in the corpus (CAAG 2, 182f.; 353, 180f.; 338). A famous alchemical recipe attributed to Moses is that of the *Diplosis* (Multiplication), that is of gold, by alloying it, here three parts of gold with one part of copper, in the belief that the end product would become four parts of gold (CAAG 2, 38f./3, 40). Moses' former link with Hermes is here echoed by the title of *Triseumoiros*, which the alchemist Pappos the Philosopher assigns to him (CAAG 2, 28/3, 30), the "Three Times Fortunate"; it certainly matches and continues that of Hermes "Trismegistos" or "Trisaristos".

GERARD MUSSIES

Mouravieff, Boris, * 8.3.1890 Cronstadt (Russia), † 28.9.1969 Geneva

Early in his life, Mouravieff came under the spiritual influence of his great uncle Andrei Mouravieff, the founder of an important orthodox monastery at Mount Athos. He became an officer in the Higher Military School in 1910 and in this capacity served in the Russian Imperial Navy during World War I. After the abdication of the tsar in March 1917, he became part of the Cabinet of Minister Alexandre Kerensky until October 1918. From that time on he began to steep himself in studies of archaeology and history. In 1920 he left Russia for Constantinople, where he attended some lectures given by → Piotr Demianovich Ouspensky, who became his friend and introduced him to → G.I. Gurdjieff. In 1924, Mouravieff arrived in France where he married a Russian, Larissa Bassoff, and worked until 1941 as a consulting engineer for several oil companies, while simultaneously devoting himself to study and writing. Arrested by the Gestapo at the beginning of 1944, he escaped thanks to the help of members of the French Resistance. He and his family fled to Switzerland, where he made a living as a translator for industrial companies. Having enrolled in 1945 as a student at the University of Geneva, he prepared a thesis on the history of the Russian-Turkish Alliance under the reign of Napoleon. He became Privatdozent at that University in 1955, a position which he held until 1963. In addition to teaching history (mostly of Russia), he gave seminars on "esotericism", which became the basis of his main work *Gnosis*, first published in French in 1961-1965.

In 1961 Mouravieff founded the Centre d'Etudes Chrétiennes Esotériques (C.E.C.E.), based in

Geneva, which he directed until his death. The aim of this Association was to contribute to the emergence of the "New Man" during what he called the "transitional period" (i.e., Modernity), a period he considered fraught with perils for the future. From 1962 on he devoted himself to the C.E.C.E., creating many subsidiary branches in various countries, and to the task of supplementing what he had written in *Gnosis*. He titled these additions "Stromates", a term borrowed from → Clement of Alexandria, under the motto "The Art to Overcome". They circulated among a number of his followers from 1966 until his death and thereafter thanks to the initiatives of his widow. The C.E.C.E. disappeared around 1967. Mouravieff's widow deposited the C.E.C.E. archives at the University Library of Geneva. Then she left for Montreal, where she lived until her death in 1989 with their son Boris Vsevolod Volkoff, who remained the only heir to the rights of Mouravieff's works. The Boris Mouravieff Association, whose main purpose is to contribute to the dissemination of *Gnôsis*, was created in Paris in 2000.

By "esotericism" Mouravieff means the ways to become 'conscious of one's real self' ('conscient de son vrai Moi') and develop this true self beyond the deceitful illusions of one's ordinary "Personality". This involves achieving a progressive psychic development that is likely to give access to higher levels of "Consciousness". Mankind is on the threshold of the "Era of the Holy Spirit", a position which is supposed to open up enormous possibilities for human evolution. But if mankind fails to enter this new era, it will be subjected to the deluge of fire mentioned by the Apostle Peter (2nd Epistle, III, 10).

The first volume of *Gnôsis* opens with an introductory note dealing with Piotr Demianovich Ouspensky, whose *In Search of the Miraculous* had been published in 1950. Mouravieff criticizes both the title and the book. The title, because there is no such thing as an "Unknown Teaching" – there is no secrecy, no unknown spiritual legacy, since the latter, he says, has always been accessible to 'those who were seriously interested in such matters'. He criticizes the book, because it is just a conglomerate of "fragments", whereas a really comprehensive presentation of the "Tradition" would have been necessary – a presentation which he, Mouravieff, intends to offer his readers with the three volumes of *Gnôsis*. For him, true "Tradition" is essentially Christian in character. Save for the idea of karma, which he occasionally endorses, he borrows very little from non-Christian eastern religions. Besides, Mouravieff believes that true "Tradition" has been transmitted over the cen-

turies since Jesus Christ through a never-interrupted chain of members of the “Great Esoteric Brotherhood”, whose existence he believes has been described by Paul in Romans (8:28-30).

The referential corpus of *Gnôsis* is comprised first and foremost of the Bible, some Church Fathers, and Christian orthodox mystics or theologians. Apart from these references, Mouraviëff does not quote (even in the many footnotes) any representative esoteric thinkers. In the long bibliographies presented at the end of the first two volumes the names of many esoteric thinkers do appear, such as → Jacob Boehme, → Antoine Fabre d’Olivet, → René Guénon, → Frithjof Schuon, even → C.G. Jung, and of course Ouspensky (George I. Gurdjieff is conspicuous by his absence), but they are not mentioned in the text itself. In fact, it seems far from certain that Mouraviëff was instrumental in the compilation of the bibliography, which is said to have been ‘prepared with the collaboration of Dr. Albert-Jean Lucas’.

Gnôsis is not the work of a theosopher proper. It lacks the visionary inspiration characteristic of classic theosophical works. The practice of the so-called creative → imagination, which is so important in the latter, plays a secondary role here. Mouraviëff’s book is devoid of vivid images (no descriptions of the Fall of angels, of Man, etc.) and consists instead of abstract theological and mathematical symbols. Indeed, Mouraviëff’s work is lavishly illustrated with geometrical diagrams and algebraic formulas aimed at laying out the interconnections between the visible and invisible skeletal structure (he says that “Tradition” calls it the “Great Octave”) of the cosmos on the one hand, and the various levels – material, psychological, spiritual, etc. – of the human being on the other. By means of these diagrams he presents what he thinks to be the → correspondences between the seven/eight parts of the universe (for instance, the Milky Way, the Sun, etc.), the seven musical notes (from A back to A), the various stages of a person’s spiritual development, and/or the tripartition body/soul/spirit. He goes as far as to apply the “Great Octave” to the eight items into which he divides the Paternoster, thereby making each of them correspond to a musical note.

Mouraviëff’s speculations extend to such domains as politics and sexuality. In politics, he is far from being the elitist and pessimist that most proponents of the “Traditionalist School” (Guénon, Schuon, etc.) – to which he obviously did not belong – appear to be. For instance, he endorses the existence of international organizations (like the UNO) and gives advice about how to complement them with spiri-

tual dimensions. As a historian he had ample material at his disposal (mostly related to Russia). On this basis he elaborated propositions about international politics, laid out in *Gnôsis* and other publications (see bibliography). More generally, he remained very open to the scientific achievements of his century – in short, to Modernity. Contrary to the representatives of the “Traditionalist School”, he did not anticipate doom but the positive progress of mankind. The third volume of *Gnôsis* contains long passages devoted to sexual relationships, marriage, and family. Although these latter reflections start from a practical and concrete examination of society as he knew it, he praises the ‘couple of the Knight and of the Dame of his thoughts’ as the true model to be imitated in order to achieve a genuine realization of what love should be all about.

The Christian esotericist Mouraviëff did not want to be typecast as a guru, and indeed he certainly was not one. He did not direct disciples like Gurdjieff did, nor did he offer oracular pronouncements like Guénon. His teachings bear very little resemblance to those of the → Theosophical Society. But his form of thought (not his “doctrine”) displays some kinship with that of both → Rudolf Steiner and Ouspensky, however different these three thinkers otherwise were. Lastly, his disciples are and have always been persons who work individually on the basis of *Gnôsis*, which they use as an initiatic working tool.

Music I: Antiquity

Music was a highly developed art in the ancient world. From very early texts and a number of musical scores, from representations in visual art and actual instruments that have been found in excavations, a whole spectrum of musical practice and theory has been recovered for virtually every ancient culture. Given the aural nature of music, it is almost impossible to reconstruct the sounds of antiquity, but much progress has been made in reconstructing both the technical aspects of ancient musical culture – instruments, tonality and musical theory – and the emotional impact music was thought to have on humans. Music played a pervasive role in many religions of antiquity, in public festivals and temple rituals, in the cultic life of private groups dedicated to the worship of a deity of choice, and as one of the options open to humans to acquire a deeper knowledge of the world or of the divine and thus aid in the goal of releasing the soul from the bonds of matter.

In most religions of the ancient world, music was a prominent element in temple rituals. In this, as in so many other aspects, temple ritual resembled court ritual. In the temple, the house of the god, the god was entertained with food and drink, with prayers and rituals and with music. The gods of Mesopotamia had a small ensemble play for them when they took their meals, just as the god of Israel enjoyed songs sung for him to the accompaniment of the lyre and the harp. The central rite of animal sacrifice in ancient Greece was always accompanied by the playing of flutes and eventually came to be accompanied by the singing of hymns. For most modern readers, these hymns are texts: that is how they have been preserved and how they are published. They are, therefore, sometimes studied as if they were prayers, but this they most certainly were not. They were, rather, cult songs composed, often in competitions in the context of festivals, by professional poets and singers to please the deity and extol his or her virtues, and to memorize the deeds of men of past or present generations. Festivals in ancient Greece, following the cultic calendar of the individual cities, usually consisted of sacrifices and solemn rituals as well as competitions in sports, poetry, and music and the performance of dances, mask plays or mummeries and drama.

Two types of cult hymn stand out in importance: the paeon and the dithyramb. Both probably originated in short, very ancient ritual cries: *ie ie paian* and *thriambe* respectively. The *paeon* was a song of gratitude dedicated to Apollo; the *dithyramb* originally a hymn sung in the context of the cult of

Dionysus. Although they were formalised in an early stage, came to be mixed up and contributed to the development of Greek tragedy, there was a certain tradition ascribing a different impact to these hymns. In the evolved traditions, the contrast between Apollo and Dionysus, one of the favourite subjects of many authors, was also detected in the moods brought about by their specific hymns.

There are many more examples of Greek ideas on the emotional or moral impact and influence of tunes, modes, and musical instruments. Many of these belong to a type of popular psychology, for instance attributing different moods and effects to different instruments. Thus, the lyre was associated with silent inspiration and poetic contemplation, whereas the *aulos*, the instruments of courtesans no less than that of cult musicians, moved men to act. In two different cases, the importance of such ideas was more pervasive.

In the first place, there were types of music and musical instruments that came to be associated chiefly with the non-civic Greek and (later) Roman cults, in particular with the so-called mystery cults. The cult of Cybele or the Mother of the Gods (the Roman Mater Magna) was associated chiefly in Greece with *tympana* and with the loud noise that these drums produced in the rituals of the Mother. Other instruments, cymbals and flutes also were associated with the rites of the Mother, especially in their Roman context, with the cult of Cybele and Attis. These instruments not only recalled the actual use of types of instrumental music in the cult of these deities, but their sound or the instruments themselves seem to have become carriers of meaning. Especially the sound of the *tympanum* was widely held to produce certain psychological or religious transformations, moving worshippers to dance, shout and become enraptured by the goddess.

In the second place, with much more lasting success, from the 5th century B.C.E. onwards, music came to be developed spectacularly as one of the sciences. This development was already in antiquity attributed to Pythagoras and even Orpheus, and it is very well possible that there was a keen interest in music in early Pythagorean and Orphic circles; but the methodical foundations of “Pythagorean” music theory were laid by Aristoxenos, a pupil of Aristotle. In Pythagorean and Platonic doctrine, the creation and order of the cosmos was connected to numbers, and these functioned not only as the symbols of certain concepts (for example, 1 is “mind”, 3 is “whole”, 10 is “perfect”), but also as ratio and mathematical formula [→ Number Symbolism]. Number is “harmony”: the per-

fect harmony with which the cosmos was created. On the basis of the recognition that all musical intervals are determined by numerical ratios, it is also the harmony of earthly music. The harmony or music of the cosmos is further developed in the idea of the “music of the spheres”, the idea that the heavenly bodies resound in a perfect harmony, brought forth by the relations of their distances and speeds.

At the centre of Pythagorean wisdom lies the so-called “tetractys”, or “four-group”, generally visualized as a triangle made up of the numbers 1, 2, 3 and 4, which add up to 10. The most important intervals derived from these numbers are the octave (2:1), the fifth (3:2) and the fourth (4:3). From these, other intervals are derived, such as, for example, the second, which is the difference between the fifth and the fourth (9:8). These mathematical foundations of musical intervals allow of a sheer endless series of speculations and derivations. Thus, in the Greek intellectual tradition music was not only an art, used for entertainment or the creation of a solemn atmosphere, but more importantly a science, and an earthly reflection of higher truths. Plato used music as a cosmological paradigm in the *Timaeus*, the influence of which can hardly be overestimated in Western intellectual culture. Music was thought to have a direct influence on human behaviour, to possess educational functions and play an important role in the development of character. These ideas are connected with the more popular notions of what music does, but were given a completely new foundation in the development of “ancient Greek music theory”, which is the name of a fairly large body of Greek musical writings, that range in date from the 4th century B.C.E. to the 4th-5th century C.E.

Ancient Greek music theory expressly tried to stay as far removed from musical practice as possible. These writings were written neither by, nor for practising musicians, but wanted to serve other, less mundane, purposes. The noetic quality of music lay, chiefly, not in listening to it, but in understanding how it worked and what its (mathematical) foundations revealed about the nature of being. It is almost inevitable that this, in turn, should have given rise to musical adaptations of these new ideas, attempts to put them to practical use, to use music as an instrument of salvation. This may indeed have been the case. There is an often-quoted passage from pseudo-Demetrius, *De Elocutione* 71, on the seven Greek vowels (ΑΕΕΙΟΥΩ), which are commonly encountered in the magical papyri and similar ritual texts from late antiquity. It is well known that the seven vowels

can represent the seven planets, and that the seven planets were thought to be characterised by their own individual tones, producing a heavenly harmony. Demetrius writes that the Egyptian priests chanted the seven vowels “in succession” and his words suggest a musical/tonal adaptation.

This passage is often connected with Hermetic writings. In → Hermetic literature, music is very commonly encountered, in many different appreciations. This seems to be an important difference with Christian Gnostics, for although both Hermetists and Gnostics must have been “singing communities” (witness also the caption “secret song number 4” and the hymn itself in C.H. 13) the use of musical imagery and speculation in Hermetic literature is much more prominent than it is in Gnostic texts. As is the case with their views on the nature of the world, Hermetic appreciations of music seem to have differed. In the *Asclepius*, the heavenly and earthly harmonies are praised (*Ascl.* 9) and the study of music is explicitly recommended as one of the best methods to know how everything is ordered (*Ascl.* 13). In the same passage, however, it is more or less debunked in favour of the “true” philosophy, which makes no use of technical sciences whatsoever. The first part of the treatise C.H. 18 is a fully worked-out metaphor, explaining the works of God, ‘the tireless musician’ in terms of the professional training and activities of a musician. It is particularly in descriptions of the ascent of the soul, through the planetary spheres with their proper sounds, that we may suspect musical imagery. In fact, descriptions of the experience of reaching the supra-cosmic realm (the eighth and the ninth sphere) generally use the language of music: the soul sings hymns to the supreme deity in the eighth sphere with the souls of the blessed and hears even sweeter music from the ninth sphere (C.H. I.26). The most fully worked out ideas on this subject can be found in the *Discourse on the Eighth and the Ninth*, where, however, the supreme music in the eighth sphere is said to be an internal song, sung in silence, without sound. Just before the experience of the Self, the *ego* of the text describes himself in the following words: ‘I am the instrument of your spirit. Mind is your plectrum, and your counsel plucks me’. Thus, from the cult musician pleasing his god to God playing his human instruments, musical imagery, theory and practice have contributed greatly to the systematic development of ideas and belief systems on the relations between the different realms of being.

Music II: Middle Ages

In the medieval worldview, music powerfully reflects the divine order of the cosmos. Through the study of its principles, human beings will come closer to grasping the meaning of creation itself. This view is apparent from medieval treatises on musical theory and philosophical texts that touch on the subject of music, but also from liturgical texts and from poetry or prose in which the miraculous harmony of creation is praised. It is very difficult, however, to point at evidence in the music practice of the time. There are no records of experiments in which the power of music is actually put to the test, and the evidence for a firm belief in it remains restricted to texts.

The whole concept of scientific thinking on the subject of music is essentially classical in nature. The sources of musical thinking of the Middle Ages faithfully reproduce central pieces of classical theory and are firmly rooted in the Pythagorean and Platonic traditions. The myth of Pythagoras, who discovered the basic ratios of musical consonances when passing a blacksmith's shop, figures in many medieval treatises on music, as do speculations on the music of the planetary spheres, and classical myths on the (magical) power of music (e.g. Orpheus and Eurydice, Amphion and Arion). Two themes seem particularly relevant: the role of music in the whole of creation, and its effect on the individual.

The music of the cosmos, *musica mundana* in Boethius' influential treatise *De institutione musica*, was part of the classical heritage: Plato's *Timaeus* (4th century B.C.E.) was translated and commented upon by the 4th-century author Calcidius, the 5th-century author Macrobius wrote a commentary on Cicero's *Somnium Scipionis*. In Augustine of Hippo's *De musica* (387-389), Martianus Capella's *De nuptiis Philologiae et Mercurii* (5th century) and in Boethius' *De institutione musica* (ca. 500-510) the ancient tradition on the theme is well established and handed down to the medieval scholars. At the basis of the ancient tradi-

tion lies the relation between divine creation and number, the idea that the cosmos was created according to mathematical principles. The numerical ratios that created Plato's World Soul are reflected in musical consonances: the numbers one and two form the ratio of the octave, two and three that of the fifth, three and four that of the fourth, eight and nine that of the second. According to the ancient sources, the harmony of the cosmos was musically realised by the eight planetary spheres revolving around the earth. These brought forth a perfect harmony of musical tones that were determined by aspects measured in number: their distances from each other, their velocities or the size of their orbits.

In the Middle Ages, the ancient idea of a sounding cosmos was readily adopted. From Carolingian times onwards, speculations on the actual music of the planets are attested. In the 11th century, when the system of the eight church modes was well established, relations were established between planets and church modes. The numbers of creation, adopted from the classical heritage, were given Christian interpretations, and medieval speculations on the harmony of the heavenly spheres are an intricate mixture of classical and Christian cosmology, theory of harmony and → number symbolism. The earliest examples are found in music treatises such as Aurelian of Réôme's *Musica disciplina* (9th century), and Regino of Prüm's *Epistola de harmonica institutione* (early 10th century). The ideal music of the heavens remained a popular topic throughout the Middle Ages. → Hildegard of Bingen's mystical allusions to the power of music are a well-known example: she is convinced that music and harmony are present in every aspect of God's creation and especially in the human soul itself. Our natural love of music and the human ability to be moved by it can be explained through the craving of mankind to be reunited with its Creator.

The idea that the heavenly planets and the biblical choirs of angels join in a collective and continuous song of praise to honour their Creator is present in the earliest sources of the liturgy of the Western church. Only in the 12th century, however, under the influence of scholasticism, attempts were made to systematically bring ancient and Christian cosmology to a synthesis. In the 12th-century poem *Naturalis concordia vocum cum planetis*, for example, the nine choirs of angels surrounding God's throne are related to notes from the Greek system and to planets.

In the second half of the 13th and in the 14th century, when the Aristotelian influence on Western

thinking grew stronger, the idea of an actually sounding cosmos was viewed with scepticism in certain scholarly circles. In his *Speculum musicae* (1321-1324) Jacobus of Liège, for example, denied the existence of a planetary music. He argued that if the massive planets would bring forth actual sounds, they would be so loud as to have made us deaf. Guido of Saint-Denis (*Tractatus de tonis*, ca. 1300) and Heinricus Helene (*Summula musicae*, ca. 1360) treat the music of the planets as a metaphor, and no longer take the concept literally. But at the end of the Middle Ages, when Aristotelianism was declining and Platonism was flourishing, the concept was again made welcome by scholarly thinking, and received new attention in the theoretical works on music of, for example, Bartolomeo Ramis de Pareja (*Musica practica*, 1482) and Franchinus Gafurius (*Practica musicae*, 1496).

The influence of music on the individual, the *effectus* or *affectus* of music, is a classical topos that kept receiving scholarly attention throughout the Middle Ages. Music was believed to have an effect on the body and mind of human beings. It was able to disturb the inner harmony of body and soul, or to restore it when it was disturbed through illness or emotion. In ancient sources the power of music over individuals is illustrated by anecdotes. Its healing power is illustrated with stories in which madmen are cured from their frenzy, babies are soothed, youth is kept to the straight and narrow path, all by playing them the right kind of music. Its power to inflame is demonstrated in examples of armies triumphing because of the fierceness of their music. In the Patristic and medieval tradition, biblical examples are added to this list: the story of David curing Saul from his madness by playing him music, or of the prophet Elisha, on whom the spirit of the Lord descended after he had summoned a cithar player to perform for him.

From the 11th century onwards, attempts were made to attach ethical characters to concrete musical modes. These were partly modelled after ancient sources, but since the ancient sources themselves were not very consistent, the relations between ancient heritage and medieval renewal are garbled and often only superficial. Guido of Arezzo (*Micrologus*, ca. 1025) was the first to explicitly relate church modes to certain characters, and scholars such as Hermannus of Reichenau (*Musica*, ca. 1050), Frutolf (*Breviarium de musica*, ca. 1100), and Johannes of Afflighem (*De musica*, ca. 1100) followed his example with their own interpretations. In many of these systems the Dorian or first mode, for example, is characterised

as noble, worthy or solemn, the Phrygian or third mode is always associated with excitement, violence and fierceness. Although certain general characterisations are concurrent, the details of each system relating church modes to characters are different.

At the very end of the Middle Ages authors such as Franchinus Gafurius (*Practica musicae*, 1496) and Bartolomeo Ramis de Pareja (*Musica practica*, 1482), designed systems in which modes are related to characters and corresponding planets: the Dorian mode, for example, corresponds to the Sun, the Phrygian to Mars, etc. Building on earlier models Bartolomeo Ramis de Pareja went even further: he related each mode not only to a corresponding planet, but also to a colour and humor (*sanguis, colera, phlegma* and *melancholia*). These speculative models, which reflect the thorough belief in the power of music over the material and immaterial world, over the human body, mind and soul, formed the basis for the 16th- and especially 17th-century musical experiments in the field of → mysticism and → magic.

MARIKEN TEEUWEN

Music III: Renaissance

Scholarly discussion of the relationship between music, → hermetism and → magic in the 16th and 17th centuries still takes its point of departure from the authoritative texts by D.P. Walker, Frances Yates and Jocelyn Godwin. As their work shows, together with the more recent studies of Gary Tomlinson and Penelope Gouk, music played an especially significant role in the “occult philosophy” [→ occult/occultism] that became so fashionable in European culture in the decades around 1600. This fascination not only manifested itself in the philosophical literature which will be reviewed below, but was also expressed through artistic endeavours and practical experiments. Indeed, historians of science have shown that it was the emphasis on experiential knowledge and the magus’s ability to harness occult forces and bring about predictable effects that led 17th century experimental philosophers to appropriate these powerful features of natural magic into their new form of scientific practice. However, most occult experiments involving music will never be recovered, not only because of their inherently secret and dangerous nature, but also because the vocal and instrumental practices involved were never written down.

Music, or more precisely, “harmony” was central to the process in which understandings of “occult” and “scientific” ways of knowing were decisively transformed in the so-called Scientific Revolution. Music’s relevance to early modern esoteric wisdom (scientific, philosophical, religious, or magical) lay in its power to mediate between material and immaterial realms, operating at the threshold between inner and outer worlds, between body, mind and soul. The most popular expression of this magical power during the period was the phenomenon of “sympathy”, or musical resonance. The *locus classicus* for this example of occult “action at

a distance”, was Plotinus’s *Enneads*, a Neoplatonic text [→ Neoplatonism] unknown to medieval scholars that → Ficino published in 1492 and also used as a source for his own *De vita libri tres* (1489), the most influential modern work on musical magic. Plotinus’s image of a universal lyre connecting all levels of being through resonance was now made concrete by using two lutes: a string of one instrument was plucked, which moved the equivalent string of another lute lying on a nearby table.

The linkage between cosmic and human harmony via stringed instruments was long established in Western philosophy, and can be traced back via Plato’s *Timaeus* to the Pythagoreans before him. Pythagoras’s discovery of the numerical proportions governing consonance, leading to his invention of the monochord, was recounted in Boethius’s *De musica*, the standard university text on music, as well as more esoteric sources such as Iamblichus’s *De mysteriis* (ed. Ficino 1497). Yet the idea of actually putting Pythagorean and Neoplatonic mysteries to the test seems to have been a 16th century development. It occurred around the same time that poets and musicians began to make serious attempts to recreate the effects of ancient music.

In tracing this process, musicologists have chiefly focused on the 1570s experiments by Count Bardi’s Florentine camerata and Jean-Antoine de Baïf’s *Académie de Poésie et la Musique* in Paris to revive a lost Greek rhapsodic art. The impact of Neoplatonic doctrine on secular courtly entertainments in the 16th and 17th centuries is well documented. Much less scholarly attention has been paid to attempts at recreating ancient theurgic and magical practices in the context of Reformation and Counter-Reformation struggles over proper modes of public and private worship. There is plenty of early modern *literature* celebrating music’s power as a vehicle for poetic frenzy, spiritual revelation, prophetic madness, and rapture, but there is almost no evidence how or whether these actual *practices*, including incantations for summoning gods and demons (theurgy) actually took place other than in the theatre. → Campanella’s magical activities with Pope Urban VIII during the 1620s may have been exceptional, or just unusual because written evidence for them remains.

During the 16th century several important new works addressing music’s relationship to magic and the occult were published. At the same time new editions and translations of key ancient and medieval texts began to circulate more widely through numerous printed editions. Apart from the

Hermetic corpus and the *Asclepius* (ed. Ficino), the most important ancient sources which explicitly addressed music's powers to communicate with demonic spirits included the *Orphic Hymns* (ed. Ficino 1462), the *Chaldaean Oracles* (ed. Patrizi 1491), the Old Testament *Psalms*, → Augustine's *Confessions*, and the Jewish Kabbalah [→ Jewish Influences] mediated through → Johannes Reuchlin's *De arte cabalistica libri tres* (1517).

This body of theological and mystical literature overlapped with the tradition of speculative harmonics, a discipline dealing with the mathematical and philosophical dimensions of music theory, and especially focusing on the hidden proportions governing the structure of the universe. Among the ancient harmonic texts which received renewed critical attention in the 16th century were Ptolemy's *Harmonics*, Euclid's *Section on the Canon*, and Boethius's *De musica*. Although this latter work was no longer considered useful for teaching the principles of musical practice, Boethius's tripartite structure of *musica instrumentalis*, *musica humana* and *musica mundana*, still proved to be a valuable model for scholars and theologians seeking to discover the secret harmonies in God's Creation (e.g. see Fludd below).

→ Francesco Giordano's *De harmonia mundi totius cantica* (1525) was an important 16th-century contribution to this Boethian tradition of speculative harmonics, which paradoxically led to new practical applications. Thus, for example, the numerical principles that Giordano found in the heavens were incorporated at the same time into the architectural plans of San Francisco della Vigna in Venice. Fifty years later Giordano's Pythagorean, Neoplatonic and Kabbalistic studies received fresh impetus through its translation by → Guy Le Fèvre de la Boderie as *L'harmonie du monde* (1575), a work which had a major impact on French, as well as English, Renaissance literature and philosophy. Le Fèvre de la Boderie also published translations of Ficino's and → Giovanni Pico della Mirandola's works. Together with Pontus de Tyard's *Solitaire première* (1552) and *Solitaire second, ou discours de la musique* (1552), Le Fèvre de la Boderie's learned editions of these Italian Neoplatonist sources provided the intellectual foundations for the French academies of Ronsard and Baïf. These courtly schools sought to effect a proper union of music and poetry as the first stage of ascent towards ultimate union with the divine. In a society rent apart by religious and political upheaval, where Catholics and Protestants alike sought for reconciliation, there was a powerful incentive to restore harmony to mankind by realigning cosmic

and divine influences, as well as recreating the hymns of Orpheus and David.

→ Heinrich Cornelius Agrippa's *De occulta philosophia* (first version completed 1510, published as greatly enlarged edition in 1533), was another early influential 16th-century text which ensured music's prominence in the "occult synthesis" of the late Renaissance. Reprinted in numerous editions down to the 18th century, and translated into many vernacular languages, this text proved to be the main channel for introducing Ficino's controversial music-spirit theory to a wider audience. At the same time it popularised the basic principles of Neoplatonic philosophy and natural magic. Part of Ficino's rules for planetary music, combined with Pico's account of the use of Orphic hymns in magic, are found in Book I, cap. 71 on incantations. According to Agrippa, nothing is more efficacious in natural magic than these hymns, used according to a due harmony. Ignoring the Church's prohibition on magical operations, Agrippa explains how the instrument of enchanter's is 'a most pure harmoniacall spirit, warm, breathing, living', that can be used for compelling and directing planetary angels as well as simply conditioning the operator's own spirit into a suitably receptive state for heavenly influences.

A somewhat less dangerous discussion of instrumental music and the corresponding harmonies in celestial and human bodies is found in Book Two on mathematical magic (caps 24 to 28). This section closes with a celebration of the power of music to attune the soul to the divine, and to drive out demons: 'Hence by the ancient prophets and fathers, who knew these harmonical mysteries, singing and musical sounds were brought into sacred services'. However, towards the end of Book Three on prayers, sacraments and other religious rites (caps 58-64), Agrippa places invocations to God on the same level with pagan or magical incantations. As Walker has observed, although Agrippa's exposition of Ficino's spiritual music gave it a wide diffusion, it may also have frightened people away from it by showing just how dangerous Neoplatonic magic was from a Christian point of view.

The attraction of universal harmony and the occult philosophy reached a peak in the first half of the 17th century. The most comprehensive text to appear on the subject was → Athanasius Kircher's *Musurgia universalis* (Rome, 1650). Like so many of Kircher's voluminous writings, this work continued to be an important source for scholars interested in music, magic and mysticism even into the 20th century. Music played a prominent role

in early 17th-century esotericism because of the importance attached to musical practice at leading centres of occult studies, most notably the courts of → Rudolph II in Prague and Prince Moritz of Hessen (who was a noted musician). Thus although Kircher himself promoted what was meant to be a Catholic Counter-Reformation vision of universal harmony, he nevertheless also drew on important Protestant sources published earlier in the century. Of these texts, Johannes Kepler's *Harmonices mundi libri V* (1619) and → Robert Fludd's *Utriusque cosmi . . . historia* (1617-1619) have attracted the most scholarly interest, because of their disagreement over how to discover the true harmonies governing nature.

The Kepler-Fludd controversy has been significant in defining the boundaries between science and magic, between "true" and "false" philosophy, not just in its own time but also in more recent attempts to distinguish between occult and scientific mentalities. Music played an important role in this debate. Kepler (1571-1630), for example, claimed that his discovery of the correspondence between the harmonies of modern polyphonic practice and the ratios governing the elliptical motions of the six planets was grounded in empirical observation. Therefore a true analogy existed between these planetary and musical systems, both of which derived from the geometric archetypes in the mind of God. Kepler explicitly differentiated this from Fludd's approach to cosmic harmonies, saying that the latter's portrayal of the divine monochord had no other foundation than the imagination. A similar line was taken by the French Minim friar Marin Mersenne (1588-1648) in his *Traité de l'harmonie universelle* (1627) in which he criticised Fludd's schema for having no correspondence with any measurable quantities of the world. Augustine's *De Musica* served as a theoretical basis for Mersenne's own empirical investigations into musical phenomena, while the *Confessions* provided grounds for his vigorous rejection of Fludd's natural magic.

Mersenne's discovery of the mathematical laws governing musical pitch ("Mersenne's laws") rapidly became a cornerstone of the so-called "new experimental philosophy", even while Fludd's system of hidden → correspondences was apparently rejected on the grounds that they were imaginary. Yet despite trenchant criticism of Fludd's allegedly "false" representations of occult harmonies (which are based on a different set of conventions than those privileged by Kepler and modern science), many of the musico-magical principles expressed in his *History of the Macrocosm and Microcosm*

were eventually incorporated into mainstream natural philosophy, most notably through the optical and mathematical treatises of → Isaac Newton. Yet the importance of Fludd's *History* in communicating abstract musical principles to 17th-century scholars (rather than to professional musicians) has been completely overlooked. Because Fludd follows Giorgio's strategy of organising the *History* around Boethius's tripartite classification of music, and privileges the Pythagorean scale, the work has been dismissed as speculative in the pejorative sense of the term.

The chief significance of the *History* lies in its use of powerful visual imagery, realised through engravings by the son of his Oppenheim publisher Theodore de Bry. Another occult classic which these men produced at exactly the same time was → Michael Maier's musical-alchemical emblem book *Atalanta fugiens* (1618). In the context of the present article, the importance of this work lies in the author's belief that the practices of both → alchemy and music rely on the manipulation of the *spiritus mundi*, a view shared by Fludd and one which of course ultimately derives from Ficino. Precisely the same belief is embodied in the famous illustration of the magus-physician's alchemical laboratory from → Heinrich Khunrath's *Amphiteatrum sapientiae aeternae Christiano-Kabalisticum* (1595, 1609). The theosopher himself is shown devoutly at prayer on the left of picture, and the instruments he uses for alchemical investigations into the fundamental secrets of nature are towards the right. Most prominently on display, however, are four stringed musical instruments on the table at the centre foreground (including a harp which is a clear allusion to King David). The inscription beneath translates roughly as 'Sacred music (is) the escape from sadness and evil spirits because the spirit (*spiritus*) rejoices cheerfully in a heart filled with pious joy'. This image provides a rare glimpse of how Ficino's musical magic might be transmuted into a practice that at least outwardly conformed to Protestant reformist sensibilities.

None of these works by Khunrath, Maier and Fludd achieved wide circulation, and it was only in the late 20th century that their images began to be reproduced on a significant scale. Yet the importance of Fludd's work in particular is due to the influence it has exercised on a relatively small number of scholars since first appearing. For example, although Fludd's image of the divine monochord was strongly criticised by Mersenne, he nevertheless copied the idea of using a picture to illustrate this particular manifestation of cosmic harmony. The principal route by which Fludd's concepts

became more widely known, however, was via Kircher, who plagiarized many of Fludd's diagrams for his own purposes.

Like all his lavishly illustrated works, Kircher's *Musurgia universalis* achieved an international circulation through the institutional backing of the Jesuits. By the late 17th century his books had become the most widely disseminated sources available on esoteric and occult wisdom. Thus even as the "Scientific Revolution" gained momentum, the accessibility of the *Musurgia* ensured that natural magic continued to function as a valid descriptive and analytical category for dealing with musical phenomena. Themes raised in the *Musurgia* which continued to attract debate in the Enlightenment include the origins and development of human music and its magical and religious applications; the classification of musical styles and their correspondence to the human passions; and musical devices that relied on hidden sources of power (for which he drew heavily on Fludd). Book 9, which deals explicitly with magical topics, focuses on music's power to affect the mind and body in ways that can be explained in purely "natural" but hidden (i.e. occult) terms. Much of the first part is taken from Mersenne, and deals with the everyday psychological and emotional effects of music. His examples of music's more exceptional and explicitly therapeutic properties are drawn from both ancient and modern literature, the most notable being the cure of Saul's melancholy through David's psalms, the amazing story of a Danish king aroused to frenzy and murder by his courtly musician, and the cure of the Tarantula's bite. A majestic conclusion is reached in Book 10 which situates the work within the broader context of *musica humana* and *musica mundana*. Although Kepler and Fludd were both Protestants, and had taken opposing views about the role of number in understanding the world, this did not prevent Kircher from appropriating their ideas and showing how their thinking could be reconciled in his own eclectic synthesis of universal harmony.

Despite the conventional emphasis placed on the unchanging and secret nature of esoteric wisdom, between 1500 and 1700 some very significant changes took place in music's relationship to this increasingly accessible philosophical tradition. Thus although the sympathetic correspondence between macrocosm and microcosm remained a central feature of occult thinking, the radical changes in musical and scientific practice which took place between early Renaissance and late Baroque ensured that Ficino or Giorgi's conception of "harmony" was quite different from that of

Kircher or Newton. While many of the techniques musicians used to arouse or imitate particular emotional effects seemed truly wondrous in the early 16th century, by the 18th century these were subject to scientific classification and analysis. Similarly, most of the ancient and even modern occult texts 17th-century philosophers had access to were almost completely unavailable in Ficino's lifetime, only becoming more available through the medium of print.

Music IV: 18th Century to the Present

It is questionable whether music in itself can be "esoteric", as distinct from the texts or associations linked to it. Some music might be called esoteric in the sense that it appeals to, or is understood by, a restricted group of people. Such is the more abstract fugal work of Bach, the late string quartets of Beethoven, and the atonal or serial music of Schoenberg and his followers. But the esotericism of such musics, for all their refined emotions and heightened intellectual content, is not necessarily spiritual. For present purposes, esotericism is in question when music is offered and used in a context of conscious spiritual development. The field thus defined excludes merely sacred music, but includes "speculative" music, i.e. the unsounded music that gives insight into cosmological and numerical mysteries.

The century of F. Couperin (1668-1733), Vivaldi (1678-1741), Rameau (1683-1764), J.S. Bach (1685-1750) and his sons, D. Scarlatti (1685-1757), Händel (1685-1759), Gluck (1714-1787), Mozart (1756-1791), Haydn (1732-1809), and the young Beethoven (1770-1827) was a high point in Western music, but from the point of view of esotericism it was an infertile period. Musical esotericism has generally been coupled with the Pythagorean philosophy. While in earlier times this had led to the concepts of a *musica mundana* ("harmony of the spheres") and a *musica humana* of psycho-physical effects, the Enlightenment discarded such notions as irrational. Its musical aesthetic was not spiritually or cosmically based, but rested, like that of the other arts, on the principle of imitation. The primary purpose of music was thought to be the representation of human emotions, and its main resource was expressive melody.

Of the celebrated composers, only two had interests bordering on esotericism. J.S. Bach defied the fashion of his time in continuing to write learned, contrapuntal music in encyclopedic cycles (*Orgelbüchlein*, *Well-tempered Clavier*, *Klavierübungen*, *Musical Offering*, *Art of Fugue*) and in filling his sacred works with numerological significances. Mozart's commitment to → Freemasonry gave birth to the Masonic opera, *The Magic Flute*, which has been the subject of many esoteric interpretations. Two notable esotericists of the 18th century were musically gifted. The Comte de → Saint-Germain (1693/94?-1784) worked in London in the 1740s as a musician and composer. → Louis-Claude de Saint-Martin was a good amateur violinist, and made use of speculative music in his first book, *Des erreurs et de la vérité* (1775).

At the turn of the century, the composer Johann Friedrich Hugo von Dalberg (1760-1812) wrote a series of theoretical and imaginative works (especially *Blicke eines Tonkünstlers in die Musik der Geister*, 1787; *Untersuchung über den Ursprung der Harmonie und ihre allmähliche Ausbildung*, 1800) that treat music as a vehicle by which the soul ascends to higher states, and that approach harmony in a neo-Pythagorean spirit. Dalberg's work heralded the German Romantic movement [→ Romanticism], which would elevate music to the status of a religion. Around 1820, → Antoine Fabre d'Olivet wrote a treatise on music (*La Musique expliquée comme science et comme art*, published posthumously) that shares the same assumptions and interests as Dalberg's. Fabre d'Olivet was the first of many French esotericists whose universal cosmic systems gave an important role to

music. These included Charles Fourier (1772-1837), → Hoëné Wronski, → P.F.G. Lacuria, Louis Lucas (1816-1863), and the *fin-de-siècle* figures → Joséphin Péladan, Charles Henry (1859-1926), Edmond Bailly (dates unknown) and → Saint-Yves d'Alveydre. Bailly, active in the French → Theosophical Society, was an amateur composer in the Romantic idiom, and a friend of Debussy and Satie. His most original work, *Le chant des voyelles* (1912), was a study of the vowel-invocations found in Greek magical papyri, together with a realization for modern instruments and voices. Saint-Yves, reputedly a talented improviser on the piano and organ, gave music a large place in his system of universal knowledge, the *Archéomètre*. The musical supplement to this work, *L'Archéomètre musical* (1909), comprises nearly 200 short piano pieces in a style to which there is no contemporary parallel.

The music dramas of Richard Wagner (1813-1883) have all been interpreted esoterically, especially *The Ring of the Nibelung* and *Parsifal* regarded as an epic of man's history and hopes. As his own librettist and the builder of the temple-like Bayreuth Festival Playhouse, no one did more than Wagner to actualize the Romantic idea of music as a religious or even mystical experience. A cluster of post-Wagnerian composers interested in various forms of esotericism, with an indication of their leanings, includes Gustav Mahler (1860-1911; Theosophy); Claude Debussy (1862-1918; occultism, numerology), Erik Satie (1862-1925; → Rosicrucianism), Jan Sibelius (1865-1957; → Freemasonry), Alexander Scriabin (1871-1915; Theosophy), Gustav Holst (1874-1934; → astrology; → gnosticism); Arnold Schoenberg (1874-1951; → Swedenborg; Kabbalah [→ Jewish Influences]), Cyril Scott (1879-1970; Theosophy), Anton Webern (1883-1945; Swedenborg, German → *Naturphilosophie*). However, the involvement of these early modernist composers with esotericism did not long outlast World War I. One exception is Scott, whose attempt at a spiritual history of music and its effects, *Music, Its Secret Influence Throughout the Ages* (1933), continued to be reprinted up to the end of the century.

The revival of Pythagorean ideas in the 20th century was mainly due to two men. → Rudolf Steiner, though not himself a musician, invented the art of Eurythmy (not to be confused with Jacques-Dalcroze's Eurhythmics) and gave many lectures on the spiritual significance of music. Music consequently plays a large role in → Anthroposophy, especially in Waldorf education. Hans Kayser (1891-1964), inspired by hints given in the extraordinary work

of Albert von Thimus (1806-1878), *Die harmonikale Symbolik des Alterthums* (1868), developed a comprehensive system of world-explanation through application of the harmonic series and the “Pythagorean Table” derived therefrom (*Lehrbuch der Harmonik*, 1950). Kayser’s work was continued by Rudolf Haase (b. 1920) and Werner Schulze (b. 1952) at the Hans-Kayser Institut für harmonikale Grundlagenforschung, Vienna.

In the 1960s, esoteric ideas began to filter back into practical music. They first appeared in the popular field, for instance when the rock-musical *Hair* played with the notion of an imminent “Age of Aquarius”. Superficial themes from oriental philosophy appeared from the Beatles after their encounter with Maharishi Mahesh Yogi; scraps of pseudo-Satanism from the Rolling Stones; Celtic and magical themes from Robin Williamson and the Incredible String Band; Meher Baba’s influence from Pete Townshend and The Who. This trend in popular music was part of a broader movement that included the Hippies and Flower Children, the mind-altering effects of cannabis, LSD, and mescalin, and a renewal of interest in spiritual philosophy, esoteric literature, and divination (→ Tarot, astrology, I Ching).

In the so-called classical field, avant-garde trends were split during the 1950s and 1960s between the increasing use of chance and noise, and the attempt at total control through serialism following Schoenberg and Webern. The leader of the former trend was John Cage (1912-1993), whose music and writings were strongly influenced by Zen Buddhism, and to a lesser extent by the mysticism of Meister Eckhart. The strength and appeal of Cage’s personality affected every one of the arts, holding out the possibility that they might have a spiritual (as distinct from a religious) purpose. This ran counter to the predominant desacralization of the arts that characterized the modernist mainstream.

The two avant-garde trends united in the middle-period work of Karlheinz Stockhausen (b. 1928), already a leader of the serialist school, who began using overtly spiritual references in the text for improvisation *Aus den sieben Tagen* and in the six-voice, harmonically-based *Stimmung* (1968). This tendency culminated in Stockhausen’s *Licht* (1977-), a cycle of seven operas named after the days of the week. The cosmogony of *Licht* revolves around the figures of Michael, Eve, and Lucifer, who are presented in a Gnostic context, specifically influenced by *The Urantia Book*, an anonymous “channeled” work of the 1930s. Stockhausen’s composing methods, derived from serialism, have

a microcosmically-ordered, Hermetic flavor, in which each part reflects the whole. While some critics were repelled by his messianic pretensions, his prestige encouraged a fad among composers of the 1970s and 1980s for giving music a gloss of Hermetic, astrological, alchemical, or mystical references. This was one of several manifestations in music of the → New Age movement. Another is the genre of music simply styled “New Age”, characterized by static, diatonic harmonies, gentle, repetitive rhythms, and folksong-like melodies. New Age music is anti-modernist, diametrically opposed to both rock ‘n’ roll and to the atonality of the “classical” avant-garde. Healing qualities are claimed for it, recalling the use of music in the Pythagorean schools.

The end of the 20th century saw a strong post-modernist trend in serious music. Philip Glass (b. 1937) and John Adams (b. 1947) achieved success by using some of the techniques of New Age music. The compositions of Arvo Pärt (b. 1935) and John Tavener (b. 1944) invite the listener into contemplative states akin to prayer, with explicit links to the Christian Orthodox tradition and the Traditionalist school [→ Tradition]. The same period saw a rediscovery of the songs and personality of → Hildegard von Bingen (1098-1179) and a sudden popularity of Gregorian Chant. Connected to this was the increased use of music for personal development, especially in active methods using the voice, such as overtone singing. In widening circles, music was regarded as a bridge to the sacred, an adjunct to mystical experience, and an agent for the healing of body and soul. The rift between classical and popular genres, so evident in music of the 20th century, has become increasingly irrelevant. These trends seem to hold the promise of a return to certain Pythagorean and Platonic ideals.

JOSELYN GODWIN

Mysticism

'Like the sphinx of old, mysticism remains the point where one meets with an enigma. It can be located but it cannot be categorized' (De Certeau 1977). This is doubtless one reason why the term is so ambiguous, and so often lends itself to confusion with other forms of apprehending reality, such as → esotericism.

Etymologically, the semantic field of mysticism is close to that of esotericism: *mu* refers to the closed mouth, hence *muō*, to be closed (especially the eyes and the mouth); *mustēs* means the "mystes", the initiated one, he who keeps his lips sealed; *mustērion* refers to the initiation cult, hence → secrecy. In Christianity this vocabulary covers, on the one hand, the manifestation of the divine plan of salvation in Jesus Christ, beyond what can be discovered by natural knowledge, but revealed by mystical and allegorical interpretation; and on the other hand, it refers to religious and liturgical elements, especially of a sacramental order. The Latins rendered *mustērion* as *mysterium* as well as *sacramentum*, which was considered equivalent; the latter term is of juridical origin (deposit of guarantee in a trial; oath) and refers less to the pagan mystery cults than is the case with *mustērion*, especially in its plural *mustēria* (or, in Latin, *mysteria*). The adjective *mustikos* thus related first to the initiate and to mystery, and to the communion of the faithful with Christ, prior to becoming a substantive at the turn of the 16th to the 17th century, designating a unitive experience of the intimate presence of God in Man

(*mysticism*) and the person enjoying this experience (*mystic*). This substantivation completed the process inaugurated at the end of the Middle Ages by the autonomization of mystical theology in relation to scholastic and positive theology; and it continued by the separation of mysticism as an experience from theology as rational discourse.

The semantic proximity between mysticism and esotericism has not escaped either the esotericists or its scholars, whether they assimilate the two words or distinguish between them. Historical and conceptual filiations have been established, not without some justification, between esotericism and mysticism; these have been based primarily on the fact that both are linked to experiences of a dimension of reality that escapes natural and common understanding by the senses and by reason. Thus Stroumsa (*Hidden Wisdom*, 1996) has described the process by which the Fathers of the 2nd-3rd century shifted the meaning of *mustērion* from the hidden to the ineffable. He concludes that, in view of the universality claimed by the Christian salvation and the competition with → Gnosticism, the Fathers suppressed any properly esoteric dimension of orthodox Christianity in order to develop, with the aid of esoteric vocabulary, mystical doctrines bearing on the ineffability of God and human interiority.

Other researchers, perhaps as a result of the discredit cast upon the study of esotericism in mainstream academic research, contributed to the confusion by qualifying as "mysticism" domains that would seem to fall, rather, within the province of esotericism. Thus Gershom Scholem, in the English editions of his works, and especially after 1941, used the term mysticism for what he had formerly been ready to refer to by Hebrew terms equivalent to "esotericism". Charles Mopsik has criticized Scholem for having made the expression "Jewish mysticism" an equivalent of "Kabbalah"; to the latter, he argues, the word "mystagogy" would be more appropriate, since its etymology 'simultaneously evokes the idea of secrecy and that of teaching or initiation' as well as transformative wisdom (Mopsik 1993, 24-25). Similarly, when Hans Lewy gives his *Chaldaean Oracles and Theurgy* (1978) the subtitle *Mysticism, Magic and Platonism in the Later Roman Empire*, Pierre Hadot remarks that 'the word "mysticism" is a badly defined term that is mostly used haphazardly' (1978, 718). Its use in the context of → Neoplatonism connects it with theurgy and the ancient mysteries, and not with the unitive experience of the divine that has later come to be attached to it. It therefore seems that, in many cases, the use of the

word “mysticism” to designate esoteric trends reflects a strategy of avoiding the pejorative associations attached to the term esotericism. This strategy is made possible by the polysemy of the term *mustērion* and its derivatives developed in the course of their history, and by the vagueness that is attached to it today.

Some modern esotericists, most often Christian, have not hesitated to identify themselves with mysticism. Examples are → Paul Sédir (Yvon Le Loup) and Louis Charbonneau-Lassay, who generally avoids speaking of esotericism, preferring terms like → hermetism and Christian mysticism. It is especially true of → Valentin Tomberg, who saw in mysticism a basic element of hermeticism and distinguished three forms in it according to the union that each one is considered to make possible: with Nature, with the transcendental human Self, and with a living God. However, esotericists as well as historians of esotericism have sought to differentiate mysticism from esotericism. Thus, among the latter, Antoine Faivre, while recognizing that the terms esotericism and mysticism are often used interchangeably, proposes to distinguish these areas according to the relative importance that their representatives attach to “intermediary realities”: a domain where the esotericist tend to linger, whereas it is a mere stage to pass through and leave behind for the mystic (Faivre 1996, 28).

On the side of the esotericists themselves, the traditionalists in the wake of → René Guénon oppose the initiatory path, seen as properly esoteric, to the mystical path; they emphasize that the etymology connecting mysticism with mystery is no counter-argument, since mysticism has long designated an exclusively religious and therefore exoteric path, which is consequently incompatible with the initiatory path of esotericism. While mysticism takes an attitude of passivity and receptivity to divine influences, whatever they may be, without any doctrinal preparation being required, initiation is a methodical activity that requires the individual’s initiative from the very beginning. Besides, mysticism is confined to the realization of the individual, whereas initiation can go beyond, at least in some cases. → Frithjof Schuon sometimes lets it be understood that the mystical path does include a certain amount of activity and can sometimes anticipate a real union with the divine principle, but he nevertheless maintains a certain distinction between volutaristic mysticism and intellective gnosis. In an approach to the “Christian mystery” that includes the “esoteric perspective”, Jean Borella has sought to refute the Guénonian critique of mysticism. He argues that it neglects, first, that the undeniable but

relative passivity of the mystical path is assumed in a process actively realized by Christ, and second, that by virtue of the hypostatic union, mystical union with Christ is in fact union with divine nature.

Any study of the relationships and differences between esotericism and mysticism is certainly made particularly difficult by the confusion that reigns between these two areas, and that seems to be more or less consciously maintained. This confusion results from a number of factors: their common experiential nature; their related semantic connotations; their frequent historical interferences; a similar independence claimed in relation to scholastic theology and ecclesiastical institutions; the suspicion of heterodoxy associated with it in many modern theologians; and the discredit that rationalist thinking has long cast on both. To this whole set of factors must be added the complex relation, not only between mysticism and esotericism, but also between these two notions and those of → magic and theurgy. Esotericism and mysticism do have similarities: the primacy of experience and inner transformation, the quest for unity, and the claim that the very heart of religion will be revealed only by going beyond rational discursivity. However, the two notions do not come down to the same thing. Even when, especially from the 17th century on, mysticism tends to translate its inexpressible dimension into psychological and corporeal phenomena, almost like a sort of stigmata through which the invisible intrudes into the field of observation, it still maintains the demand for a total union with the divine. In such total union, all intermediaries and phenomena disappear: the body of the modern mystic is a body of pain, subject to a “road of excess” that disfigures and annihilates rather than transfigures it. The esotericist, on the other hand, typically awaits the transmutation of the world and of his own carnal reality; he prefers to sojourn ‘on Jacob’s ladder, where the angels – symbols, mediations – are ascending and descending, rather than venture resolutely beyond” (Faivre 1996, 28).

JÉRÔME ROUSSE-LACORDAIRE

Naassenes

The Naassenes were adherents of a 2nd-century Gnostic sect that is only known through an extensive report by Hippolytus, *Refutatio*, V, 6-11. The greater part of this report consists of an extract from a Naassene document, which is usually called the "Naassene Sermon" (V, 7, 2-9, 9). It is preceded by an introduction (V, 6, 1-7, 1) and followed by a concluding section (V, 9, 10-11, 1), in which Hippolytus provides further information about their beliefs. The whole section is part of Hippolytus' so-called "Sondergut", which is, *inter alia*, characterized by the ascription of similar ideas and images to different Gnostic groups. This complicates the study of the Naassenes to a certain extent, but a more complicating factor is that the author of the Sermon wrote for initiates and, for that reason, took knowledge of the Naassene doctrines and rituals for granted.

The name "Naassenes" derives from the Hebrew word *nāḥāš*, "serpent", which the Naassenes, like other Gnostic groups, venerated (V, 6, 3; 11, 11-12), though it does not play a role of any importance in the Naassene ideas described by Hippolytus. There is no discernible relationship between the Naassenes and the → Ophites, the other Gnostic sect that explicitly derived its name from the serpent (Greek: *ophis*) they worshipped. The Naassenes called themselves "Gnostics", because they claimed to be 'the only ones who knew the depths', i.e. of God (cf. 1 Cor. 2, 10) or of Wisdom (V, 6, 4).

The Naassenes honoured Man (*Anthropos*) and the Son of Man above all other divine beings (V, 6, 4-7, 1), which they have in common with other Gnostic sects [→ Gnosticism]. In the summary of his report, Hippolytus explicitly states that both titles refer to the same divine entity (X, 9, 1), and as a matter of fact, his main report only speaks about "Man", who is also called Adamas. He is described as the androgynous manifestation of the highest God, the intermediary being between the divine realm and the created world. That Man is not the highest, unknown God becomes apparent from the following Naassene statement: 'The beginning of perfection is the knowledge of Man, but the knowledge of God is complete perfection' (V, 6, 6). The ontological and cosmological structure of the universe is rather unexpectedly introduced in V, 7, 9, which mentions three eternal principles: the Pre-existent, the Self-originate and Outpoured Chaos. It seems that the Self-originate and the Heavenly Anthropos are identical, and that he is called "Man" when envisaged as directed to the Pre-existent One and "Son of Man" as turned to the world of matter (Lancellotti, 2000). The whole universe has a tripartite structure. Heavenly Man consists of a rational, a psychic and a material part, which together came down on 'one man, Jesus, the son of Mary'. Through these three elements Jesus spoke to the three classes of being and the three communities ("churches") in the universe, the angelic, the psychic and the earthly, which are respectively named the "chosen", the "called" and the "enslaved". According to Hippolytus, these ideas were the principal points of a great number of teachings that Mariamne would have received from James, the Brother of the Lord (V, 7, 1; a late reflection of this tradition is found in the apocryphal *Acts of Philip*, 94ff., where James and Mariamne together go to the land of the Ophites).

The basic idea of their whole system is that of Adamas, the celestial Anthropos, of whom Scripture says: 'Who shall declare his generation?' (Isaiah 53:8; V, 7, 2). The Naassene "Sermon", which then follows, is in fact no more than an extensive answer to this question. It is not a sermon in the usual sense of the word and its ideas cannot be taken as the shared beliefs of a group. It is a learned Gnostic treatise by an individual, who seeks to illustrate the meaning of the Anthropos and other Naassene tenets by a wealth of "parallels" from Greek and Oriental religions, which he finds corroborated by a great number of biblical texts. The Sermon is largely a Gnostic commentary on two hymns to Attis, the emasculated young god of the mysteries of the Great Mother, which are quoted in

full at the end of the treatise. The first of these hymns equates Attis with, *inter alia*, the deities of the “mysteries” of Syria (Adonis), Egypt (Isis), Samothrace (Adamas), and Greece (the moon god Men, Eleusis). All these deities and the rites connected with their cults and also the many epithets of Attis, mentioned in the first hymn, are applied to the myth of the Naassene Anthropos. There are no compelling arguments to distinguish, with Frickel and other scholars, several layers of successive revisions in the document and to assume that the author has adapted an already existing “pagan” commentary on the Attis hymns to his Naassene beliefs. The author was most probably a Gnostic teacher who had a good knowledge of Greek and Oriental religious traditions, but also of both the Old and the New Testament.

His discussion of the pagan “parallels” reveals some interesting aspects of the Naassene ideas on anthropology and soteriology. The heavenly Anthropos (Adamas) is the prototype of which earthly man (Adam) is the image. The exact relationship between them is difficult to establish: on the one hand, the Son of Man, as the creative force in the universe, gives life to the human mould, on the other hand he is captured by the evil powers and enslaved in the human body. The Naassenes considered this an inexplicable mystery: ‘How and in what way he came down, we do not know’ (V, 8, 13). It is clear that somehow the soul constitutes the link between the divine prototype and its earthly image. The souls, at least those which become enlightened or “reawakened”, come from ‘that blessed being on high, Man or Primal Man or Adamas, from whom they were brought down into this moulded figure of clay to serve the artificer of this creation, Esaldaeus, the fiery god, the fourth in number’ (V, 7, 30). Esaldaeus is the Demiurge, whose name is a Greek form of the biblical divine name El-Shaddai (probably “God of the mountain”). He might have been called “the Fourth”, since he brought order in the “outpoured chaos”, the third eternal principle of the universe, and rules over it together with his powers (Lancellotti, 2000, 115-120). As said above, the three aspects of the heavenly Man came down on Jesus, who became the Gnostic Saviour by revealing the truth to those who are worthy of it. The cosmology and soteriology are in fact aspects of one process of descent and return of both the divine Anthropos and human souls. This process is compared to an ocean, ‘always turning in its ebb and flow, now upwards, now downwards’ (V, 7, 38). In one of his few references to the serpent, the author says that it is the liquid substance, without which nothing can exist,

and he then identifies it with the river that comes out of Eden (Gen. 2, 10ff.). This river in its turn is an image of both earthly man and the heavenly Anthropos, who is also equated with the water above the firmament mentioned by Jesus in John 4, 10 and 14 (V, 9, 13-22). The Naassenes said that they were ‘the spiritual people (*pneumatikoi*), who were chosen as his own possession by this “Living Water” on high . . . for we enter in through the true gate, which is Jesus the blessed one, and out of all men we alone are Christians’ (V, 9, 21-22).

At the end of his report, Hippolytus quotes a Gnostic hymn, ‘through which they suppose they are celebrating all the mysteries of their error’. This hymn, the famous *Psalm of the Naassenes*, starts with a reference to the three basic principles of the universe, here called “First-born Mind (*nous*)”, “Outpoured Chaos”, and “Soul (*psychè*)”. They are probably identical to the principles mentioned in the Sermon: the Pre-existent One, Outpoured Chaos, and the Self-originate as the intermediary divine entity between the two extremes. Thereupon the hymn continues with the fate of the Soul, which finally ‘in her wanderings entered the exitless Labyrinth’, i.e. the world of matter and evil. Then Jesus, who as the Saviour is apparently identified with the heavenly Anthropos, takes action to save the soul. It is worthwhile to quote the rest of the Psalm in conclusion, since it is a beautiful expression of the Gnostic idea of salvation, not only of the Naassenes, but also of the Gnostics in general (Marcovich, 1978): ‘Then Jesus said: “Look, Father:/this prey to evils is wandering away to earth,/far from thy spirit./And she seeks to escape the bitter Chaos,/but knows not how to win through./For that reason send me, Father./Bearing the seals I will descend;/I will pass through all the Aeons;/I will reveal all the mysteries/and show the forms of the gods;/I will transmit the secrets of the holy way,/calling them Gnosis”’.

ROELOF VAN DEN BROEK

Naturphilosophie (end 18th-first half of 19th century)

Not to be confused with "natural philosophy", considered as the pursuit of an objective knowledge of phenomena, several "philosophies of nature" have adopted a more intuitive approach, as followed by thinkers like Gottfried W. Leibniz, Georg W.F. Hegel or Henri Bergson, but also by those who represent the specific current called *Naturphilosophie*, which belongs to the Romantic period [→ Romanticism] *lato sensu* (end of the 18th century and first half of the 19th), particularly in Germany.

Among the precursors of *Naturphilosophie* are, in particular, → Christian Theosophy, "mosaic physics", "physico-theology", the so-called "theology of electricity", the first experiments in → animal magnetism; and also three new orientations which appeared toward the end of the 18th century on the stage of philosophy in general, and will be further explained below.

To begin with Christian Theosophy, an esoteric current which flourished from the beginning of the 17th century onward, one of its prevailing aspects was the search for dynamic → correspondences between Nature, Man and God (or divine entities) through an ongoing, "illuminative" speculation bearing on the complex and dramatic relationships between these three, envisaged as *dramatis personae*. In the 18th century, theosophical discourses dealt more and more with the notion of "higher physics", or "sacred physics", as opposed to a merely rational variety. Such sacred physics opposed the desacralization of the universe result-

ing from the increasing amount of scientific discoveries. It was a matter of resacralizing both science and the world. Theosophy *stricto sensu* starts from a speculation which bears on the Divine, whereas *Naturphilosophie* proper begins with an observation of natural phenomena, which it then tries to integrate into a holistic and spiritual worldview. But since theosophers often transferred to the Spirit or the Divine Itself the proprieties of physics, it is scarcely surprising that in some authors the distinction between *Naturphilosophie* and Theosophy tends to get blurred (see below).

"Mosaic physics" also flourished in the 17th century. The term *physica sacra*, often linked to it, served to designate a reading of the Bible considered as the key to understanding another Book, that of Nature. The contents of both Books were supposed to coincide. → Jan Amos Comenius, for instance, represents this tendency. In the pre-Enlightenment era, at the end of the 17th century, first in England, then in other European countries, there arose a certain physico-theology, which endeavoured to reconcile scientific discoveries with faith (not necessarily with the Bible) as a reaction to mechanistic worldviews and Cartesian rationalism. Physico-theologians (for example, Friedrich Christian Lesser, *Lithotheologie*, 1735) were lavish in descriptions of animals (bees, molluscs, spiders, birds, etc.), plants, and natural phenomena (lightning, storms), to which they attributed symbolic and spiritual, albeit generally static, meanings.

In the context of the later widespread craze for experimentation with electricity and galvanism (1789, experiments of Galvani; 1800, Voltaic pile), the pre-Romantic period witnessed the spread of Franz Anton Mesmer's theories, and the development of animal magnetism by Armand Marie de Puységur and his followers. Another result of the belief in a magnetic fluid pervading Man and the whole universe was the so-called "theology of electricity". The latter was marked by a kind of spiritual realism represented by the theosopher → Friedrich Christoph Oetinger and other figures like Prokop Divisch, Johann Ludwig Fricker, Gottlieb Friedrich Rösler (e.g. their book *Theorie der meteorologischen Elektrizität*, 1765). This "theology" may be considered, at least with regard to Oetinger, as a kind of proto-*Naturphilosophie*.

Besides these three precursors, three further factors pertaining to the history of philosophy proper are also relevant to the appearance of *Naturphilosophie*.

A) The influence of French naturalism. With Georges-Louis de Buffon's theoretical works and Denis Diderot's *Le rêve de d'Alembert* (1769), a

new way of considering physics had begun to emerge. It began as a kind of literary exercise rather than a strictly scientific discourse, but as it became more popular it pervaded the culture of the time. Buffon, in particular, fostered a taste for synthesis (typical of Romantic thought), and promoted the theme of the Soul of the World (*anima mundi*).

B) The philosophies of Imanuel Kant and Johann Gottlieb Fichte. In *Metaphysische Anfangsgründe der Naturwissenschaft* (Metaphysical Foundations of Natural Science, 1786), which discussed the necessity of discovering the *a priori* principles at work behind empirical data, Kant presented as a constitutive characteristic of Nature the two forces of Newtonian physics, attraction and repulsion, at a time when the notion of polarity was already spreading outside esoteric circles and flowing into various domains including medicine. Leaning on some of Kant's ideas, which he extended to the utmost, Fichte proceeded to spread the idea that the world is a product of → Imagination (notably in *Grundlage der gesamten Wissenschaftslehre* [Foundations of the Entire Doctrine of Science, 1794-1795]). Imagination was understood as resulting from a synthetic and spontaneous activity of the Spirit (*i.e.*, the thing in itself and our representation of it are identical).

c) Spinozan philosophy. Having been considered an atheist during most of the 18th century, Spinoza's religious ideas returned to centre stage at the turn of the century, but were now interpreted as those of a man intoxicated with God. His "*Deus sive natura*" was no longer read as a disguised profession of materialistic faith, but as the affirmation that Nature is something divine. At this time, there was a prevailing tendency to conceive of God not as identical with things but as the primordial centre of energy from which the development of organic forms and the entire finite world proceeded. *Naturphilosophie* generally avoids pantheism in favour of this pantheism.

Naturphilosophie proper appeared during the last years of the 18th century, heralded by two groundbreaking works, published almost simultaneously in 1798: → F.J.W. Schelling's *Von der Weltseele* (On the Soul of the World), and → Franz von Baader's *Über das pythagoräische Quadrat in der Natur* (About the Pythagorean Square in Nature). Besides these two, mention must be made of the first writings of the theoretician in animal magnetism Carl August von Eschenmayer (e.g., *Sätze aus der Naturmetaphysik auf chemische und medicinische Gegenstände angewandt* [Elements of Metaphysics of Nature, applied to chemical and medical objects], 1797). Along with Baader, and even more

than Schelling, Eschenmayer combined the data of the pansophic-esoteric legacy with the new spirit of Kantian philosophy.

Among the further representatives of *Naturphilosophie*, the following authors and their representative works stand out: Karl Friedrich Burdach (*Blicke ins Leben* [Glimpses into Life], 1842-1848); Wilhelm Butte (*Arithmetik des menschlichen Lebens* [Arithmetic of Human Life], 1811); Carl Gustav Carus (*Natur und Idee*, 1862); Joseph Ennemoser (*Der Magnetismus im Verhältnis zur Natur und Religion* [Magnetism as related to Nature and Religion], 1842); Gustav Theodor Fechner (*Zend-Avesta*, 1851), Joseph Görres (*Aphorismen über Kunst, als Einleitung zu künftigen Aphorismen über Organonomie, Physik, Psychologie und Anthropologie* [Aphorisms on Art, as an Introduction to Future Aphorisms on Organonomy, Physics, Psychology and Anthropology], 1802); → Justinus Kerner (*Eine Erscheinung aus dem Nachtgebiete der Natur* [A Manifestation from the Night-Side of Nature], 1836); Dietrich Georg Kieser (in particular his contributions of the 1820s to the journal *Archiv für den Thierischen Magnetismus*); Giovanni Malfatti (*Studien über Anarchie und Hierarchie des Wissens* [Studies about Anarchy and Hierarchy of Knowledge], 1843); → Johann Friedrich von Meyer (in particular his contributions to *Blätter für höhere Wahrheit* [Journal for Higher Truth], 1820, 1823, 1827, 1832); Adam Müller (*Lehre vom Gegensatz* [The Contradiction Theory], 1804); → Novalis (ps. of Friedrich von Hardenberg: *Das allgemeine Brouillon: Materialien zur Enzyklopädistik* [The General Draft: Materials for my Encyclopaedic Project], 1798-1799); Hans Christian Oersted (*Der Geist der Natur* [The Spirit of Nature], 1850-1851); Lorenz Oken (*Lehrbuch der Naturphilosophie* [Coursebook on *Naturphilosophie*], 1809); → Johann Wilhelm Ritter (*Fragmente aus der Nachlasse eines jungen Physikers* [Fragments from the Legacy of a Young Physicist], 1810); the painter Philipp Otto Runge (*Farbenkugel* [Ball of Colours], 1810); → Gotthilf Heinrich von Schubert (*Ansichten über die Nachtseite der Naturwissenschaft* [Views on the Night Sides of the Science of Nature], 1808); Henrik Steffens (*Grundzüge der philosophischen Naturwissenschaften* [The Main Traits of the Philosophical Science of Nature], 1806); Gottfried Reinhold Trevisarus (*Die Erscheinungen und Gesetze des organischenn Lebens* [The Manifestations and Laws of Organic Life], 1831-1833); Ignaz Troxler (*Über das Leben und sein Problem* [On Life and Its Problem], 1806); Johann Jakob Wagner (*Organon der menschlichen*

Erkenntniss [Organon of Human Knowledge], 1830). One should also mention, with respect to other cultural fields, such names as → Louis-Claude de Saint-Martin (*L'Esprit des choses* [The Spirit of Things], 1802), William Paley (*Natural Theology*, 1802), or Sir Humphrey Davy (*Consolations in Travel*, 1830).

The theosophical tendency is far from being the rule amongst these figures. It is conspicuous in Baader, Meyer, and Schubert, for example, but almost absent from the works of such authors as Burdach, Oken, and Wagner. However most *Naturphilosophen* share three common tenets, which are explicitly or implicitly present in their discourse, and account for their proximity to esotericism in general, and to theosophy in particular:

First tenet: Nature has a history of a mythical order. This ontological postulate functions as a poetic mainspring for research and speculation. The world is not made of eternal, immutable things but is, like the Spirit, engaged in a process of a highly dramatic character. A quadruple polar structure underlies most of these speculations. The first pole is the undifferentiated chaos, or primordial light. From it, two opposite poles emerge, which are both opposed and complementary to one another and assume various forms, like Fire and Water, Fire and Light, Masculine and Feminine, Attraction and Repulsion. A fourth term then manifests, which reflects the first one and is the common product within which the two opposing terms combine. Such a quaternary is the basic structure from which emerges a mythical narrative, identified by Schelling as ‘the repressed mystery of Christianity’. It is the story of the “Redeemed Redeemer”, *i.e.*, the meta-history of a captive Light awakened by another Light that had remained free. Hence the frequent use of the two notions of light and gravity (rather than darkness), the latter being understood as something by which the primitive energies have been engulfed, but from which they are still likely to re-emerge. In a similar vein, → Jacob Boehme described Nature as a fire whose embers Man should rekindle and which in turn would redeem him.

Second tenet: The identity of Spirit and Nature, first expressed by Schelling. “Spirit” is understood as the universal, even divine One, in His relation to Nature and Man. Ontologically, this identity rests on a mythical conception of the history of Nature (see above), based on an epistemological plane where the negative or destructive opposition of the two is surmounted: Spirit becomes Nature, Nature becomes spiritualized. Oersted wrote, ‘The more you advance toward [the] agreement between

Nature and Spirit . . . , the more perfect you will find it and [the more you will see that] these two Natures are the seeds of one common root’ (*Betrachtungen über die Geschichte der Chemie* [Considerations on the History of Chemistry], 1807). This “philosophy of identity” (*viz.* Schelling) has remained the most suggestive idea of *Naturphilosophie*, because it bears on the perennial metaphysical question of the relationship between Nature and Spirit. By the same token, self-knowledge and knowledge of the world go hand in hand. Both are an initiatory journey and immersion into “the becoming” (*das Werden*). But this *Werden* is dramatic because it implies both order and disorder. The world that surrounds us, and we ourselves, bear witness to an ancient order which has been disrupted. The idea is conspicuous also in Romantic art and literature, which lavishly depict natural landscapes resulting from cataclysmic events, thus reflecting one of the essential themes developed by theosophy, namely the belief in an original Fall of Man and Nature. The interdependence of Man and Nature, including the entire cosmos and the Soul of the World, is the central idea underlying the researches of such *Naturphilosophen* as Baader, Schubert, and Kerner in mesmerism, animal magnetism, and dreams.

Third tenet: Nature as a whole is a living net of correspondences to be deciphered and integrated into a holistic worldview. Nature is to be read as a text replete with symbolic implications, whose meaning lies beyond herself. A Spirit speaks through her. As a consequence, rigorous experimental science is never more than an obligatory first step toward a comprehensive, holistic knowledge encompassing both *natura naturans* and *natura naturata* (*i.e.*, the invisible as well as the visible processes at work within Nature and the whole cosmos). Things always present themselves as symbols which lead back to both the warp and woof of a universal web. Living structures are detected in crystals, celestial constellations, and electrical phenomena. Mechanistic imaginary and the compartmentalization of science into sectors cut off from one another, are replaced by an organic merging of all disciplines. Thus concrete science and metaphysics, or experimentation and meditation, are two sides of the same coin. Almost all representatives of this current were scholars with at least one scientific specialty, like chemistry, physics, geology, mine engineering, or medicine. The fragments of empirical reality required a “second reading”. Once reality had been subjected to scientific analysis, it needed to be deciphered symbolically in order to yield clusters of meaning. Consequently, a sci-

entific fact is perceived as a sign; and signs respond to each other. Concepts borrowed from chemistry are transferred to astronomy or human psychology; notions pertaining to botany are used to describe inorganic processes, and vice versa. It is not surprising that the Romantic image of the wise physician, characteristic of period literature, enjoyed a great success, based as it was on the analogy between medicine and poetry. In literature, such transfers from one domain to another often took the form of aphorisms (e.g. Novalis), a genre generally favoured by German Romanticism. The Romantic writer Friedrich Schlegel claimed that ‘the combinatorial mind is truly prophetic’, and Schelling advocated a form of non-dogmatic polytheism: ‘Monotheism of the mind and of the heart, and polytheism of the imagination and of art, this is what we need’ (*Briefe und Dokumente*, 1962, vol. I, 70).

→ Goethe’s philosophy of Nature is somewhat distinct from the current of *Naturphilosophie*. Admittedly, throughout his life he certainly maintained the notion of a vital universe, and his scientific works, especially those on the metamorphosis of plants and on colours, place him close to some leanings of the *Naturphilosophen*. But he was more interested in trying to grasp eternity in an instant, or infinity in an object (→ William Blake), than in discovering commonalities or correspondences between things, or in what the latter symbolize of the invisible. More generally, he remained aloof from Romanticism.

After about sixty years, the current of *Naturphilosophie* faded away in the 1850s. It was probably the last period in which Man – or, at least, the savants – had felt at home on Earth. Gradually, an estrangement of Man from Nature had made headway. This process had already been smouldering for a few decades, as exemplified by Arthur Schopenhauer’s *Die Welt als Wille und Vorstellung* (The World as Will and Representation, 1819), in which Nature is considered as being outside the categories of understanding. In the second half of the 19th century, *Naturphilosophie* was definitely superseded by the advent of scientific, materialistic worldviews. However, it left numerous legacies. A number of celebrated philosophers in the 20th century, like Ludwig Klages, Hermann Keyserling, and Max Scheler, have reclaimed some of its heritage, but in an essentially speculative manner, since none of them was a chemist, astrophysicist, or physician.

Originally inspired by Goethe, → Rudolf Steiner then followed an orientation more akin to *Naturphilosophie* proper, which has consequently left its

imprint upon the teachings and literature of the Anthroposophical Society [→ Anthroposophy] until the present. Less directly but more importantly, the most obvious survival of *Naturphilosophie* is to be found in the theories of the unconscious. In this respect, works like Schubert’s *Die Symbolik des Traums* (Symbolism of Dreams, 1814), and perhaps even more Carus’s *Psyche: Entwicklungsgeschichte der Seele* (Psyche: The Developmental History of the Soul, 1846), certainly influenced the ideas of late 19th century thinkers like Eduard von Hartmann (*Philosophie des Unbewussten* [Philosophy of the Unconscious], 1869). Even more importantly, these theorists of the unconscious represent the historical origins of psychoanalysis, leading to the theories of Sigmund Freud (for whom the unconscious is monolithic, as it had been for Arthur Schopenhauer) and those of → Carl Gustav Jung, who described the unconscious as a dynamically functioning quaternary. Jung may be considered the last major representative of *Naturphilosophie*. His view of → alchemy, namely that what alchemists saw in their crucible was a constellation of their own unconscious, might well be applied to the *Naturphilosophen* as well. Apart from brilliant exceptions like Ritter and Oersted, the *Naturphilosophen* did not make significant discoveries themselves; but they were keen to find and express truths of a different order, that of the Absolute.

Over the last decades, members of several scientific communities have adopted some conceptions pertaining to *Naturphilosophie*, whether they were aware of this tradition or not. For example, the idea of intelligent matter has been addressed by scientists like Valdemar Axel Firsoff (*Life, Mind and Galaxies*, 1967) and Jean Charon (*L’Homme et l’Univers* [Man and the Universe], 1974). The hypothesis that matter is modelled on the Spirit has been developed in Arthur Koestler’s *The Roots of Coincidence* (1972). Authors like David Bohm (*Wholeness and the Implicate Order*, 1980) and Fritjof Capra (*The Tao of Physics*, 1975) have developed “holistic” interpretations of modern physics, thus fostering a sort of visionary physics that can be interpreted as a new form of *Naturphilosophie* (Hanegraaff 1996/1998, 64-76).

ANTOINE FAIVRE

Neo-Catharism

→ Catharism, the dualistic medieval Christian heresy, disappeared in the early 15th century, and was occasionally remembered only by Church historians until the Enlightenment, when anti-Catholic *philosophes* lionized Cathars as victims of Catholic intolerance. Later, in the 19th century, Romantics linked Catharism to the legend of the Holy → Grail. In 1846, for instance, historian Charles-Claude Fauriel (1772-1844) interpreted the word "Monsalwaesche", the name of the mythical Grail castle in the 13th century *Parzival* written by Wolfram von Eschenbach (1170-1220), as a German version of Montségur, the Pyrenean fortress from which the Cathars organized their last act of resistance in 1244. Fauriel, in his *Histoire de la poésie provençale*, argued that "Montségur" (*Mons Securitatis*) had the same meaning as "Monsalwaesche", i.e. "the Mount of Salvation". Contemporary historians, however, have concluded that, strictly speaking, the Cathars

and the Grail have no mutual relation whatsoever. The alleged connection was popularized by Richard Wagner (1813-1883) in his *Parsifal* (1882), and actually taken for granted by generations of artists and poets.

It was Jules-Benoît Doinel (1842-1902) who first revived Catharism as a living religious faith. Born into a pious Catholic family in Moulins (France) in 1842, as a teenager Doinel experienced mystical visions of St. Stanislas Kostka (1550-1568), a 16th century Jesuit novice celebrated for his chastity. Doinel dreamed of joining the Jesuits, but the latter did not particularly appreciate his visions and mysticism. Disappointed, while achieving national prominence as an archivist and student of medieval documents, he left the Roman Catholic Church altogether and became a spiritualist medium [→ Spiritualism]. After a short return to Catholicism between 1868-1874, he furthermore became an anticlerical Freemason [→ Freemasonry], a Theosophist [→ Theosophical Society], and a Martinist [→ Martinism: Second Period]. In the late 1880s, Doinel became a regular of the Paris circle surrounding Maria Mariátegui, Duchess of Pomar, Lady Caithness by marriage (1830-1895), a key figure in the Paris esoteric milieu of the time. In May 1890, Doinel and the Duchess founded a secret → Gnostic Church. One month later, during a famous spiritualist séance in the Duchess's private chapel, the spirits of no less than 41 "Cathar bishops" appeared and consecrated Doinel as patriarch of a new neo-Cathar Gnostic Church.

Based on this spiritualist consecration Doinel, in turn, proceeded to consecrate as Gnostic bishops some of the most well-known figures of the Paris' occult "underground", including → Papus (Gérard Encausse, 1865-1916) and → Paul Sédir (Yvon Le Loup, 1871-1926). Doinel also claimed that the Cathars of old had had women bishops, and thus went on to consecrate Marie Chauvel de Chauvigny (1842-1927) as yet another bishop in his Gnostic Church, giving her the name of Esclarmonde (after the Cathar heroine, 1250-1300). Between 1890-1894, Doinel devised a full religious ritual, drawing on both ancient → Gnosticism and medieval Catharism. He recreated, in particular, two Cathar sacraments, the "Consolamentum" and "Appareillantum" (a penitential ritual).

In 1895, Doinel announced his re-conversion to Roman Catholicism, and repudiated his neo-Cathar Church by publishing a vitriolic exposé of this and other occult activities and rituals under the title *Lucifer démasqué* (Lucifer Unmasked). Although the scandal generated by this book eventually subsided, it is unclear what Doinel really

thought up to his death in 1902: he had attended both Gnostic and Catholic rituals, and had remained a contradictory and enigmatic figure. Doinel's Gnostic Church continued, and still exists today (although divided by several schisms into a dozen different international branches), but the Cathar connection largely died with him.

Quite apart from the Gnostic Church, a Cathar revival emerged in Southern France (the *pays cathare*, "Cathar country" where Cathars once lived and died) in the 1930s around Déodat Roché (1877-1978) and Antonin Gadal (1877-1962). Their work was largely indebted to the 19th century writer Napoléon Peyrat (1809-1881). Occasionally regarded as the founder of modern neo-Catharism, Peyrat was a Protestant pastor who believed that the real continuation of Catharism was, in fact, Protestantism. Southern French neo-Cathar circles gained some audience in Paris, where they also influenced novelist Maurice Magre (1877-1941), who returned to the Grail connection linking it to the legend of a Cathar treasure hidden somewhere in the hills of Montségur. Roché did much to promote the mythology of Montségur, where he later built a monument, dedicated in 1959. In 1950, he established the Société des Souvenirs et des Études Cathares, and from 1949 edited the journal *Cahiers d'Études Cathares*. Both the Society and the journal still exist, and Roché is still honored in his native village of Arques, although he also had a number of critics unable to share his enthusiasm for the → Anthroposophy of → Rudolf Steiner (1861-1925). In fact, Roché consistently refused to be nicknamed "Pope of (neo-)Catharism", which was a title liberally conferred on him by the local press, and he remained a loyal Anthroposophist throughout most of his life.

Somewhat similar was the itinerary of Antonin Gadal. Born in Tarascon, he worked as a school teacher in Ussat-Ornolac (Ariège) and became a student of the village's Cathar history. Although not everybody was persuaded, he himself believed that Cathars had congregated in the caves near Ussat, and he arranged for them to be opened to tourists (similarly, Roché "catharized" the graffiti found in some caves near Montségur). Gadal tried to reconstruct the Cathar religion (which he called "Maneism", carefully distinguishing it from → Manichaeism), and also regarded Cathars as the direct descendants of a French branch of Gnosticism. After World War II, Gadal met → Jan van Rijckenborgh (Jan Leene, 1896-1968), the founder of the Rosicrucian organization Lectorium Rosicrucianum. In 1957, Gadal founded the French branch of the Lectorium, and faithfully served the

Dutch-based Rosicrucian organization until his death in 1962, linking the Lectorium to the caves and museum in Ussat. While Roché and Gadal did much to revive both local and international interest in Catharism, they ultimately isolated themselves from the larger milieu of Cathar enthusiasts by each joining a specific movement (Anthroposophy for Roché, and the Lectorium for Gadal).

Roché and Gadal's cause also suffered because of its association with Otto Rahn (1904-1939), an SS officer who explored "Cathar country" and the alleged Grail connection in the 1930s, eventually publishing two books on the subject. It is unclear whether Rahn worked alone, or whether his Grail quest was conducted on behalf of the Nazi hierarchy and its Wagnerian aspirations. Nazi interest in Cathar mythology in German-occupied France has been mentioned not only in popular "esoteric" fiction, but also in more reputable literature, including the celebrated *Avignon Quintet* by Lawrence Durrell (1912-1990). Most Catharism buffs did not join any specific movement, but remained secular humanists (in most cases), Protestants, and even Roman Catholics, while at the same time collecting old Cathar documents and promoting tourism to "Cathar country". The latter activity has met with considerable and unexpected success, and "Cathar country" is now visited yearly by millions of tourists. Others, following Otto Rahn (or the rumors and mythology surrounding his visits to Southern France), promoted small neo-Cathar groups which are right-wing politically as well as religiously, and made Catharism the putative "national religion" of Occitania. Some smaller groups are explicitly neo-Nazi, whilst others promote *nationalisme occitan* and Languedoc separatism from France.

Neo-Cathar mythology also played a role in the strange saga of Rennes-le-Château, a small village in the Aude department, in the heart of "Cathar country". In 1885, Berenger Saunière (1852-1917) became the parish priest of Rennes-le-Château. An amateur historian and archeologist, he recovered a number of artifacts dating back to the Middle Ages and built a neo-Gothic home and tower for himself next door to the parish church. Conflicts about the ownership of these buildings, and other matters, led to Saunière being disciplined by his bishop, and in 1910 he was suspended from his priestly office. Rumors and legends abounded about the strange priest, and after his death in 1917 his former maid, Marie Denarnaud (1868-1953), who had inherited Saunière's buildings and was trying to sell them, claimed that the priest had found an ancient treasure on the site, and had re-hidden it there.

Eventually, Denarnaud sold the property to Noel Corbu (1912-1968), who used it to open a restaurant, and spread the treasure story through the local press in the hope of attracting tourists and customers. Corbu was quite successful, precisely because his claims fell on receptive ears among Cathar enthusiasts, who regarded Saunière as having some connection with “the” Cathar treasure.

Pierre Plantard (1920-2000), a well-known participant in Paris’s occult milieu, also became a key character in the Rennes-le-Château saga. He claimed that the treasure found by Saunière included not only material goods and artifacts, but also documents proving that Jesus had married Mary Magdalene, and that their children originated a royal bloodline which ultimately flowed through the throne of France in the veins of the Merovingian dynasty. The Holy Grail, the *Saint Graal* in French, was really the “*Sang Réal*” (Royal Blood), the blood of Jesus Christ himself carried by the Merovingians and their descendants. Plantard ultimately claimed to be a true descendant of the Merovingians, and that Cathars, Knights Templars, and a secret society called Priory of Sion, were all custodians of Jesus’ secret. In fact, a Priory of Sion was legally established by Plantard in 1956 and, even after his death in 2000, it still has members in several countries. In the meantime, the idea that documents proving that Jesus had children by Mary Magdalene are hidden somewhere in Rennes-le-Château, has been popularized in books written by both French (Gérard de Sède) and British journalists (Michael Baigent, Richard Leigh and Henry Lincoln, who also produced a BBC TV series of international fame). Eventually, the idea of a Jesus’ bloodline, and of the Cathars as custodians of this secret in Southern France, made its way into fiction (e.g. Dan Brown, *The Da Vinci Code*, 2003), movies, and even into such internationally popular comics as *Preacher* and *The Magdalena*.

The alleged connection of these claims with the Cathars is understandably regarded with great suspicion by professional historians, but has undoubtedly added to the mystery and fascination of “Cathar country”, to the further benefit of local tourism. Once again, however, this claim has not been immediately translated into a religious neo-Catharism. A General Conference Cathar Church – Assembly of Good Christians, is extremely active on the Internet through its website www.cathar.net but, despite claims of a large worldwide membership, it seems, in fact, to be a fairly small group.

7. BALTIC NEOPAGANISM
8. NEOPAGAN PRACTICE

1. INTRODUCTION

Neopaganism is a complex phenomenon, representing many different traditions, practices and beliefs including neopagan witchcraft, neopagan Druidry, Asatrú/Heathenism, neo-shamanism, “non-aligned” Paganism, and initiatory Wicca. Each has its own starting point and may have multiple founders or originators. Neopaganism is often inspired by the practices of indigenous peoples and the paganisms of the ancient world revealed through archaeology, classics, myth and history. However, practices and beliefs are then revived or recreated in the context of modern-day life in a continual creative process. This occurs to a greater or lesser extent in the different traditions which fall under the term “neopagan”. As a result of these characteristics, in neopaganism, no one belief system can claim to be correct, and each person has the freedom to choose their own religion. Neopaganism has no official doctrines and no central authority.

This rejection of doctrine and authority is evident in definitions of neopaganism as a term covering movements which offer a critique, though not necessarily rejection of, Christianity. According to Hanegraaff (1998, 77), this is ‘based on the conviction that what Christianity has traditionally denounced as idolatry and superstition actually represents/represented a profound and meaningful religious worldview and . . . that a religious practice based on this worldview can and should be revitalized in our modern world’. He goes on to argue that the term “neopaganism” itself contains a ‘polemical thrust’ towards Christianity as the religion which is held responsible for the decline of western paganism and the negative perception of it over the past two thousand years. More recent concerns expressed through feminism and environmentalism tend to be seen in neopaganism as the consequence of the loss of pagan wisdom, which must be recovered, and thus Christianity has done the world a disservice in dismissing such wisdom. Nevertheless many, though by no means all, neopagans recognise an esoteric Christianity existing alongside Christian institutions, and this is regarded as compatible with neopaganism. The attitude of “being neopagan” in opposition to “being Christian” is growing more rare. Rather, neopagans claim to be tolerant and respectful towards other religions and spiritual practices. Much changed in the 1990s, as the influence of historical research permeated neopaganism and historical claims were re-evaluated. Along with this re-evaluation of the past has come a re-evaluation of Christianity. Neopagans are involved in the development of interfaith meetings with members of other religions, and as neopaganism has grown in popularity, and public awareness of it has increased, it has adopted a less reactive posture which no longer requires legitimisation through false histories or hatred of the Christian Church.

2. HISTORICAL ANTECEDENTS

Such a perception of Christian and neopagan co-existence stems from a shared history within the Western Esoteric Tradition. The antecedents of neopaganism can be found in the late 19th century, in academic developments such as Egyptology, the development of tourism to sites of ancient pagan civilisations in Greece and Rome, the rise of occult [→ occult / occultism] and magical societies such as the → Hermetic Order of the Golden Dawn, the eastern emphasis of the → Theosophical Society, and the writings of key figures such as → Aleister Crowley and → Dion Fortune. In addition, many leading occultists regarded as influential to neopa-

ganism were Freemasons [→ Freemasonry] or members of quasi-Masonic fraternities, the rituals and claims of which were carried over and adapted in some forms of neopaganism, particularly Wicca and Druidry.

19th century literature also influenced the development of neopaganism. Throughout the 19th century, the “pagan spirit” of subsequent waves of → Romanticism was developing into a paganism as an attitude of mind which was based on philhellenism and an exploration of nature and the deities of pagan antiquity. Although the beginnings of Romanticism (c. 1790s-1810) were overtly Christian and esoteric, at least as far as → William Blake and Samuel Taylor Coleridge (1772-1834) were concerned, later, under Lord Byron (1788-1824), Percy Bysshe Shelley (1792-1822), and John Keats (1795-1821), it became more “pagan” in its emphasis. All three left England for Greece and Italy for a variety of reasons and the ancient paganisms of the Mediterranean figured strongly in their work – Keats, for example, read the 19th century Lemprière’s [Classical] Dictionary to the point of obsession! Shelley was classically-minded and rebellious, seen as a dreamy lyricist by the Victorians, with a recurrent interest in Prometheus, though loved by the Italians among whom he made his home – his heart was buried in Rome, near the grave of Keats for whom he wrote the elegy *Adonais* which contains the exhortation to ‘go to Rome, which is the sepulchre,/Oh, not of him, but of our joy’ (*Adonais*, XLVIII, 1-2). Of the three, Keats was the most classically minded (and obsessive), mixing Elizabethan literature with classicism and mythologising the ancient world as a dreamy arcadia, an escape from modernity. The 1840s saw Alfred, Lord Tennyson (1809-1892) reviving Keats’ love of ancient Greece, albeit from a liberal Christian perspective, and in the 1850s Matthew Arnold (1822-1888) was drawn to classical themes and characters, as well as Norse and Christian Arthurian legends.

It is with Algernon Charles Swinburne (1839-1909) that “paganism as an attitude of mind” finds its clearest expression. Like Keats and Shelley before him, Swinburne was a philhellenist and much of his poetry is filled with images of classical ancient paganisms, the exuberant paganism of *Atalanta in Calydon* (1865) being a supreme example. He mourned the triumph of Christianity over paganism in his *Hymn to Proserpine*, and in *The Last Oracle* (A.D. 361), recorded the final surrender of paganism: ‘And dying, *Thou hast conquered*, he said,/Galilean; he said it and died . . .’ (*Poems and Ballads, Second Series*, 1878). Such

tension with Christianity later gave way to an expression of the divine spirit in humanity, Swinburne's personal religion, which he expounded in his favourite poem dedicated to the Teutonic goddess *Hertha*.

Swinburne's influence on fellow aesthetes and later poets, such as Walter Pater (1839-1894), was considerable. Pater's *Studies in the History of the Renaissance* (1873) and *Marius the Epicurean* (1885), and Oscar Wilde's *Poems* (1881) were steeped in classicism. Indeed, in the *Fortnightly Review* in 1873, John Morley traced a line of pagan movements from the Oxford Movement, through John Ruskin, the Pre-Raphaelite Brotherhood and William Morris, to Pater's *The Renaissance*. The late 19th century in particular saw a return to Hellenic Paganism as a protest against the 'mechanical and graceless formalism of the modern era' and, according to Walter Pater and Matthew Arnold, to redress the imbalance caused by Judaeo-Christian values, 'where all sides of one's being were sacrificed to the religious side, and where systems of conduct and moral codes threatened to become more important than the spirit which originally inspired them'.

Many of the themes contained within the works mentioned above echo those of ancient paganisms and anticipate neopaganism: ideas of faith not reduced to a creed; the Stoic and the Epicurean as narrative devices in philosophical debate; a stress on feeling; the importance of the individual, indeed an individuality found in feeling, thus a valuing of the emotions; a celebration of plurality; an acknowledgement that different people react differently to, and need, different religions, suited to their own personality; and the conflict between "religion" or "cult" versus institutionalised, established "church".

3. WICCA

Modern neopaganism in the strict sense originated in 1940s Britain in the form of a 'relatively self-contained, England-based occultist religion' (Hanegraaff 1998a, 85) known as Wicca. From this, other neopagan traditions and other varieties of witchcraft have developed. It is largely undisputed that the development of Wicca was initiated by Gerald Brousseau Gardner (1884-1964), under the influence of (among others) Margaret Murray's 1921 publication *The Witch-cult in Western Europe*, Robert Graves, and Aleister Crowley.

Gardner was born in the early years of the *fin de siècle* in Crosby, Liverpool, and became a Freemason, Rosicrucian [→ Rosicrucianism], and member of the → Ordo Templi Orientis and other secret

societies. Having spent most of his adult life working in the Far East, Gardner returned to England in 1936 and two years later retired to the New Forest with his wife, Dorothea, usually known as Donna. Here he became involved with the Fellowship of Crotona, an occult group of Co-Masons established by Mrs. Besant-Scott, a daughter of the theosophist → Annie Besant.

The Fellowship of Crotona allegedly contained a hidden inner group of hereditary witches, who initiated Gardner in 1939; much about the nature of this group remains unclear however. With the permission of the "coven", and under the pseudonym Scire, Gardner included the rituals of witchcraft in a novel called *High Magic's Aid* (1949). However, Gardner was not able to publish more open accounts of witchcraft under his real name until the repeal of the 1736 Witchcraft Act in 1951 and its replacement with the Fraudulent Mediums Act, which gave freedom for individuals to practice witchcraft so long as no harm was done to person or property. No longer threatened by a law which enabled persecution of a person alleged to have magical powers, Gardner wrote *Witchcraft Today* which was published in 1954 and included an introduction by Murray, followed by *The Meaning of Witchcraft* in 1959.

Witchcraft Today vaulted Gardner into the public spotlight, and he made numerous media appearances. Believing witchcraft to be a dying religion, he propelled it into the public domain, initiated many new witches, and encouraged covens to spring up, operating according to the outlines provided in his books. By the mid-1950s, Gardner's love of publicity had drawn the religion to the attention of the public, and in the early 1960s it was exported to North America. Gardner died in 1964, but his tradition of Gardnerian Wicca was firmly established, much to the annoyance of those who practised Traditional and Hereditary witchcraft, which they believed to be a witchcraft religion older than Gardner's Wicca.

Into this stream was injected another current in the 1960s, as Alex Sanders (1926-1988) brought a stronger application of high ritual magic (rooted in 19th century occultism) to his branch of Wicca. Sanders, a resident of Manchester who claimed a witch ancestress from Snowdonia, established his own version of Wicca along with his wife Maxine, which became known as Alexandrian Wicca. He, like Gardner, was a prolific initiator, but did not confine himself to Britain: many covens in Germany, the Netherlands, and elsewhere in Northern Europe sprang from his visits to the continent. Sanders sought publicity from the very beginning,

and by the 1970s had become known as the King of the Witches. He was regarded by many Gardnerian witches as a maverick, seeking sensational publicity in newspapers and on the television (just as Gardner had done!). Over time, however, the Alexandrian stream of Wicca came to be considered as valid as the Gardnerian, and the rifts started to heal. Sanders is now credited with having made Wicca more accessible and bringing about greater public awareness of it.

In September 1970, a small group of Wiccans established The Pagan Front, which held its inaugural meeting in London at Beltane (1st May) 1971. This group had, in 1968, printed an inter-coven newsletter called *The Wiccan*, and the aim of the Front, like the newsletter, was to facilitate networking between covens and act as a point of first contact for those seeking initiation. The organisation grew relatively quickly, from a print run of just twelve for the newsletter in 1968 to a circulation of 250 by 1989 and over 5000 by 2000; it attracted neopagans other than Wiccans, but it was not until 1989 that the organisation changed its name to the Pagan Federation, which even then saw itself as representing Wicca, rather than neopaganism, in the UK. By the end of the 20th century, the Pagan Federation had become not only a representative body for neopagans in the UK, but also for those in Europe, with more or less autonomous branches in France, the Netherlands, Austria, Scandinavia, and elsewhere.

4. FEMINIST WITCHCRAFT

The growing popularity of Wicca from the 1950s onwards thus gave it an enormous amount of influence over the development of neopaganism. From the 1970s, a variety of forms of Wicca, witchcraft and other neopagan traditions developed, many of which derived from Wicca as it became more public. Feminist witchcraft developed out of the feminist consciousness movement, as female witches took part in the Women's Movement and began to influence the nascent Goddess Movement, which despite witchcraft involvement does not associate itself with either occult, magical traditions or with neopaganism. Witchcraft and feminist/Goddess spirituality blend into each other, and in North America Wicca and neopaganism are virtually synonymous. Wicca had been exported to the United States in the 1960s by an initiate of Gardner's, Raymond Buckland, and throughout the late 1970s and 1980s, in North America, neopaganism increasingly became influenced by the emerging → New Age Movement and feminist spirituality. As a result, it was transformed into a very

different kind of religion, with a less formal and hierarchical ritual style, Native American influences such as shamanism and drumming, the increasing use of psychotherapy within Wicca, and Wiccan involvement in political and environmental activism. In particular, Wicca was adapted by the women's spirituality movement, resulting in the development of neopagan Goddess spirituality and feminist witchcraft traditions such as the Reclaiming collective, founded in San Francisco in 1980 by (among others) Starhawk.

5. DRUIDRY

After Wicca, perhaps the most popular form of neopaganism is Druidry. Modern neopagan Druids draw their inspiration from early evidence of Druidry gleaned from the works of writers such as Pliny the Elder and Julius Caesar, as well as from Celtic traditions, since Bardic Colleges in Ireland and Scotland continued until the 16th and 17th centuries respectively. By this time, antiquarian writers such as John Aubrey (1629-1697), John Toland (1670-1722) and William Stukeley (1687-1765) had revived a Christianised form of Druidry as a religious practice in England. The Welsh visionary, poet and charlatan, Edward Williams (1747-1822), better known as Iolo Morganwg, continued this process. He invented rituals for his Gorsedd of the Bards of Britain in 1792 which he claimed were medieval, and which are still performed today as part of the Welsh Royal National Eisteddfod. His writings were published as *The Iolo Manuscripts* (1848) and *Barddas* (1862).

The 19th century revival of interest in Celtic studies provided new impetus to the development of Druidry. In the 20th century, further revision was undertaken through the writings of Lewis Spence, Ross Nichols and others, with present day writers such as John and Caitlín Matthews and Philip Carr-Gomm continuing the development of the tradition. Philip Peter Ross Nichols (1902-1975) joined the Ancient Druid Order in 1954, but on the death of the Chosen Chief, Robert MacGregor Reid in 1964, the Order split and Nichols became founder and chief of a reconstituted Order which developed the three grades of Bard, Ovate and Druid and is thus known as the Order of Bards, Ovates and Druids. Nichols was chief of the Order from 1964-1975, and produced a definitive account of the history and practice of Druidry in *The Book of Druidry* (1990), the manuscript of which was lost for nine years after his death. He is also thought to have developed the cycle of eight festivals which now make up the Wheel of the Year celebrated by most neopagans (the Ancient Druid

Order had celebrated only the equinoxes and the summer solstice). In the 1980s, the Order of Bards, Ovates and Druids developed a correspondence course in Druidry, offering readings, tapes and workbooks which facilitate progress through the three grades. The Bardic level involves studies of the four elements of earth, air, fire and water, the cycle of nature, the Sun, the Earth, the calendar, poetry and developing the artistic self. In the Ovate grade, students work on healing and divinatory skills and study tree-lore, animals and plants, sacred sites, ley-lines, and Arthurian legend. Druids are trained in the opening and organisation of a Druidic group, known as a “grove”.

The emphasis on Celtic, Arthurian, and → Grail mythology is typical of neopagan Druidry, but not all Druid groups are neopagan. For the 19th and much of the 20th centuries, Druidry overlapped with Christianity and many Druid orders operated as social or charitable, rather than religious, bodies. In contemporary Druidry, there remains debate as to whether Druidry is a religion, a philosophy or a science. This is not surprising, given the diversity within contemporary Druidry, which includes neopagan Druids, Christian Druids, Zen Druids and even Hasidic Druids. There are also some more light-hearted versions, such as the Berengaria Order of Druids which draws its inspiration from science fiction series such as *Star Trek* and *Babylon 5*. Many Druids, however, share a vision which is common to neopaganism as a whole in seeking to preserve the ecological balance of the Earth and seeing humankind as an integral part of nature rather than above or in control of nature. It was not until the 1980s that Druid orders which specifically proclaimed themselves neopagan were established, with the foundation of orders such as the British Druid Order (1979), which has a shamanic and Wiccan influence. The British Druid Order was founded by Chosen Chief Philip Shallcrass (“Greywolf”), who was also instrumental in the establishment of the Council of British Druid Orders in 1988 which has developed into an organisation representing around twenty Druid orders. He was later joined as Joint Chief by Emma Restall Orr (“Bobcat”); it is now led solely by the latter, Shallcrass having retired in 2002.

6. HEATHENISM

A third main grouping is that of the Northern Traditions, or Heathenism. The assimilation of Græco-Roman paganism into Christianity in Late Antiquity, including the Mediterranean images of witchcraft, have led to a greater sense of continuity with, and thus a centrality of, a neopaganism

couched in Judaeo-Christian theology. Partly in response to this, Heathenry and Heathen witchcraft – the wiccaeraeft and seidr – have been reconfigured since the 1980s, their attraction being that they are indigenous to northern European lands which were converted to Christianity much later than its homeland around the Mediterranean, and that they provide what are believed to be the only genuine paganisms to exist outside Christian constructs.

Given the Latinisation of the West by Christian hegemony, people and groups who are drawn to Anglo-Saxon, Germanic and Scandinavian traditions and languages prefer to be called Heathen rather than neopagan. The term equates with the Latin “Pagan”, and was coined by the Goths and used throughout the Germanic languages in the Middle Ages to indicate a follower of a non-Christian religion. In some cases, Heathens regard themselves and their traditions as something distinct from neopaganism, whilst others see Heathenism as something distinct *within* neopaganism. Many Heathens are particularly concerned with ecology and conservation, and regard (other kinds of) neopaganism as too removed from the land, which is perceived as the crux of a people’s identity. Some share the eight-fold Wheel of the Year with neopagans, whilst others regard this as too Celtic in its influences and prefer to celebrate festivals (known as *blots*) which they feel are more closely linked with their Anglo-Saxon, Germanic and Scandinavian ancestry, such as Winternights.

Heathens follow the pre-Christian Pagan traditions of Northern Europe, centred around two distinctive groups of Norse divinities, the Aesir sky gods (such as the chief god Odin, Frigga, Thor and Baldur) and the Vanir earth gods (such as Frey and Freya). Some therefore call themselves by a more specific name, such as Asatrú or Odinist. Asatrú was revived in the 20th century and in 1973 was recognised as an official state religion along with Christianity in Iceland, with the right to conduct legally binding weddings and child namings. Meaning “trust in the Aesir”, Asatrú is an Icelandic term used by Heathens to denote their affinity to the Aesir sky-gods of Norse mythology, and is also sometimes generally applied to Heathenism, particularly in North America, where the Asatrú Free Assembly was founded in 1972 by Stephen McNallen. Until 1987, the Assembly published a quarterly journal, *The Runestone*, and held an annual festival called *The Althing*, but the presence of racist and National Socialist adherents caused the assembly to be disbanded.

It was succeeded by the Asatrú Alliance and the

Ring of Troth. The Ring of Troth was founded in 1987 by Edred Thorsson, and functions as a religious institution in which the heritage of the Norse/Germanic religions can be reconstructed. Thorsson laid out the basics of the Ring of Troth in his 1992 book *A Book of Troth*. Rune Guild UK is part of this organisation, and is led by Freya Aswynn. It specialises in the study of the runes, and has three levels of membership in common with old craft Guilds – Apprentice, Fellow/Journeyman, and Master – overseen by the Grandmaster (*Drighiting* or *Drighthen*) and the High Grandmaster (*Yrmin Drighthen*). Asatru has a reputation for being more male-oriented than some neopagan religions, but Asatru groups are led by both men and women and both officiate in religious ceremonies. Women played an important role in Norse-Germanic religion as Volvas and Seidkonas, the priestess-practitioners of → magic and divination, and these roles are being developed along with their associated practices such as the somewhat shamanistic *seidr*, a form of witchcraft once practised widely in northern Europe and described in the Edda, knowledge of which was believed to be imparted by the goddess Freya.

7. BALTIC NEOPAGANISM

The Baltic countries were the last in Europe to be Christianised, converting to Christianity only in the Middle Ages. Baltic pagan practices thus continued until the 14th and 15th centuries, with a few remnants surviving and being celebrated in the latter half of the 20th century – as late as 1960 Midsummer was abolished as a national holiday in Lithuania by the Soviet authorities. Lithuanian neopaganism was formally restored in 1967, repressed by the Soviets in 1971, and has been growing in popularity since 1988.

In general terms, a distinctive Baltic neopaganism has developed since the late 1980s, becoming particularly strong after the collapse of the Soviet Union in 1989. In newly re-emerging countries such as Lithuania, Latvia and Estonia, neopaganism has played an important part in efforts to establish national identities. Reinstated neopagan festivals attract many thousands of people who believe that participating in the rites of their ancestors is an important part of their cultural heritage. Lithuania, for example, established a strong neopagan church and an organisation called Romuva (after the Medieval Lithuanian central pagan temple) which promotes Lithuanian neopaganism and is also active amongst the Lithuanian community in the United States. A similar organisation operates in Latvia, called Dievturiba, after Dievs the sky-god who, along with Laima, goddess of life, is

believed to determine the fate of humans. The Latvian neopagan tradition is known as Dievturi, and its aims are to live in harmony with Nature and other members of society and to follow the will of the Gods.

As in neopaganism generally, Baltic neopaganism considers all of nature to be sacred, the Earth is regarded as the universal mother, and a seasonal cycle of eight festivals are celebrated – the solstices and equinoxes, together with four other festivals important in the local agricultural year.

8. NEOPAGAN PRACTICE

As these brief outlines indicate, neopaganism encompasses a variety of contemporary traditions and practices. They have in common a worldview which reveres nature as sacred, ensouled or alive, and they draw on pagan beliefs and practices of the past, either those of classical civilisations or of indigenous peoples, and thus tend to be polytheistic, pantheistic and/or duotheistic rather than monotheistic, at least to the extent of accepting the divine as both male and female and thus including both gods and goddesses in their pantheons. Neopagan groups take many forms, from Wiccan covens to Druid groves, from Heathen hearths to magical lodges, and entry into them may be by formal rituals of initiation or informal groupings based on friendship. Some groups may practice magic, whilst others do not. Many use ritual, and almost all make use of myth, celebrating eight seasonal festivals which together constitute a mythic-ritual cycle, usually referred to as The Wheel of the Year.

These festivals are the so-called Celtic fire festivals or cross quarter days of Imbolc/Candlemas (c. February 2nd), Beltane (c. April 30th), Lughnasadh/Lammas (c. July 31st), and Samhain/Hallowe'en (c. October 31st), plus the Winter and Summer Solstices (December c. 21st and June c. 21st) and the Spring and Autumn equinoxes (March c. 21st and September c. 21st). These are the traditional dates for each festival, but they are not fixed; many groups often find it easier, for the practical purpose of getting everyone together, to work to a set date (usually the nearest Friday or Saturday to the dates given), whilst smaller groups or individuals working alone may choose to wait for a specific sign of nature (e.g. first snowdrop for Imbolc) and celebrate on that day. In the southern hemisphere, the festivals are reversed in line with the seasons, celebrating the autumnal equinox, for example, whilst northern hemisphere neopagans celebrate the vernal equinox. Rites of passage for the birth of a new child, menarche (the celebration

of a girl's first menstrual period), manhood, marriage, menopause, ageing and death are becoming more popular, as well as initiation rituals and those which celebrate the phases of the moon.

Nevertheless, great diversity remains the norm, and commonalities operate on a somewhat superficial level. Even when celebrating the Spring Equinox, for example, different groups within Wicca, Druidry, Baltic neopaganism, and Heathenism will perform different rites with different deities and mythologies invoked. The lack of any central organisational structure allows for an enormous level of variety, and neopaganism at the beginning of the 21st century looks likely to retain its complexity and differentiate further as research into local ancient pagan practices continues.

JOANNE E. PEARSON

Neoplatonism I: Antiquity

Neoplatonism was a philosophical school based on Platonic doctrines whose founder, Plotinus (205-270 C.E.), claimed only to be an exegete of the teachings of Plato (*Enn.* V.1.8.10-14) and, before him, of the "ancients", including the Pythagoreans. In the more than seven centuries after

Plato, however, several philosophical schools – the Stoics and Aristotelians especially – had attained a powerful influence among thinkers in the Hellenic world, and Plotinus' writings, collected and edited by his student Porphyry (c. 232-c. 305 C.E.), reflect his effort to defend the teachings of Plato and the ancients against the materialism of the Stoics and the biologically limited view of the human soul seen in Aristotle. In this, Plotinus appropriated and reshaped Stoic cosmology and Aristotelian metaphysics into the service of a spiritual Platonism. The Plato that Plotinus championed was the author of mystical doctrines that deified the soul by lifting it into the ineffable erotics of the One. According to Jean Trouillard, the fundamental intuition of the Neoplatonists derived from their reflection on the second part of Plato's *Parmenides*, transforming its dialectics of the One into apophatic initiations. It is this emphasis on the soul's capacity to be unified with the One that marks the distinctive contribution of Plotinus and the later Neoplatonists, yet they claimed that this was not an innovation but a traditional teaching already understood by Plato.

It is precisely as a defender of ancient and Platonic teachings that Plotinus attacked the Gnostics [→ Gnosticism]. Although this term has been misunderstood and misused by contemporary scholars as a label for virtually all dualist and anti-cosmic worldviews in antiquity – thus overlooking the complexity of the various gnostic schools both dualist and monist – Plotinus himself clearly portrayed the Gnostics as anti-cosmic dualists, and his great treatise (*Enn.* III.8; V.8; V.5; II.9) is devoted to refuting their beliefs. Porphyry reports (*VP* 16; cf. *Enn.* II.9.10.3-4) that among the "friends" of Plotinus were those who had previously adopted gnostic revelations of Allogenes and Zostrianos, and it was for their benefit that Plotinus criticized these teachings as distortions of Plato and the ancients. Specifically, Plotinus argued against gnostic anti-cosmicism and the myth of the fall of Sophia as cause for creation and the embodiment of souls. He also characterized their exaltation of the particular soul to the status of World Soul as nothing more than "wishful thinking" (*Enn.* II.9.9.49) and insisted that the human soul should coordinate itself with the order of the visible cosmos rather than trying to escape it. For Plotinus, the soul's deifying contact with the Nous and the One is attained only by first aligning itself with the sensible cosmos, and he maintains that all creation is good and rooted in a mysterious "contemplation" (*theōria*) that pervades the spiritual and material realms (*Enn.* III.8.1). Porphyry reports (*VP* 16) that both he and Plotinus' senior pupil,

Amelius, were encouraged by their master to continue this polemic against the Gnostics and they wrote many treatises, now lost.

Plotinus' positive assessment of the material cosmos and his profound intuition of an active *theōria* creating and sustaining the material cosmos were due, in large part, to his effort to refute the Gnostics' anti-cosmicism and their insistence that *theōria* was removed from the cosmos. Some of Plotinus' most profound insights were forged in the heat of his polemic against the Gnostics and influenced several trajectories of his thought. In response to gnostic views of matter, evil and the soul Plotinus employed Aristotelian terminology to give a positive account of the material world and the soul's capacity for *theōria*. On the other hand, his encounter with the Gnostics left its mark, seen especially in Plotinus' description of the human soul and its embodied experience. Acknowledging his divergence from Platonic tradition on this issue, Plotinus maintained that the human soul does not fully descend into a body but something of it remains in the intelligible world (*Enn.* IV.8.8.1-4; cf. IV.3.12.1-5; I.1). Thus, despite his polemic against the Gnostics, there was an ambiguity in Plotinus on the value of the material world and the status of the embodied soul.

Porphyry's student Iamblichus (c. 240-c. 325 C.E.) criticized Plotinus' doctrine of the undescended human soul for the same reason that Plotinus had criticized the Gnostics: it diverged from the teachings of Plato and the ancients, among whom Iamblichus included Pythagoreans and theurgists. Although Plotinus had argued for the divinity of the world against the Gnostics, he nevertheless characterized sensible matter as 'primal and absolute evil' (*Enn.* I.8.3.38-40). Consequently, salvation for the soul required an escape from material evil by withdrawing into its unfallen essence. The imagery and terms employed by Plotinus to portray the soul's fall into material reality were the same that Gnostics had used to describe the descent of Sophia. The soul's inclination to the body is, for Plotinus, not a genuine descent but only an illumination (*ellampsis*) to what is below while its essence remains above the shadows of the material world (*Enn.* I.1.12.25-29). In the same way, Plotinus says that the gnostic Sophia did not descend into matter 'but only illuminated (*ellampsai*) the darkness. . . .' (*Enn.* II.9.10.25-27). Thus, the dualism Plotinus perceived in the Gnostics remained – at least in residual form – in his own thought, and his view of salvation as the recovery of the soul's unfallen condition might easily be construed as correlate to this. It is significant that

Iamblichus' theory of the completely descended soul was complemented by his view of sensible matter as entirely good, a material expression of the One itself. Iamblichus thus exorcised the residue of Plotinian dualism with a Pythagorean interpretation of matter as rooted in the divine and indefinable dyad, thereby transforming material "obstacles" into icons capable of uniting the soul with the gods. It should be noted that Iamblichus' critique of Plotinus follows a trajectory of thought initiated by Plotinus himself in his polemic against the Gnostics.

Because the Iamblichean soul was fully embodied, it suffered an alienation unexplored by Plotinus. Following the Pythagorean cosmology of the *Timaeus*, Iamblichus maintained that the soul, made up of divinely numbered proportions (*logoi*), collaborates with the Demiurge and projects these *logoi* outside itself during embodiment, sewing itself into the fabric of the material world. Although immortal, the embodied soul becomes mortal, separated from its own divinity and unable to regain its place in the divine hierarchy without the aid of the gods. To recover its divinity, the soul must perform god-empowered rituals using elements from nature that correspond to the divine *logoi* projected in its embodiment. Because of this alienation, the soul's salvation was no longer to be found in *theōria* and withdrawal from the world but in *theourgia*: divine action that transforms both the soul *and* the world. The theurgist possessed practical knowledge of how to bring the soul into resonance with material or immaterial elements proportionate both to the degree of its alienation and to the presence of the god in each element. Among these elements were stones, plants, animals, and aromatics (*DM* V.23) and less material elements such as prayers and chants (*DM* VII.4-5). Because Neoplatonic theurgists employed ritual techniques also used by Gnostics and late antique magicians, modern scholars, until recently, dismissed Iamblichus as irrational and superstitious, representing a decline in Platonic philosophy. Yet Plotinus already had acknowledged that wise men know how to tap the divine powers hidden in stones and plants (*Enn.* IV.4.35), and he, like Iamblichus, praised the Egyptians for building their temples in proportions designed to secure the presence of the gods (*Enn.* IV.3.1). Iamblichean theurgy was a development of this trajectory of Plotinus' thought: a vision of unbroken continuity from the One to sensible matter, and with a more thorough application of Pythagorean teachings to the alienation of the soul combined with his reading of the *Chaldean Oracles*, Iamblichus

worked out its practical consequences. The soul was not to be saved by escaping an evil world but by ritually transforming it in theurgy, thus completing its collaboration with the Demiurge.

Barbarian invocations and unintelligible sounds were used by theurgists to evoke the presence of gods, but these practices were not uncommon in late antiquity and are also evident in both gnostic prayers and magical spells. Plotinus had condemned the Gnostics for trying to manipulate gods with magical invocations and saw no value in such rites (*Enn.* II.9.14), while Porphyry afforded them only the provisional value of purifying the lower soul. Yet for post-Iamblicheans, including Proclus and Damascius, theurgical chants were understood to awaken the divine presence in the soul. Iamblichus' theory explained the function of theurgical invocations, but their presence in gnostic and magical literature was not due to Iamblichus; he simply provided a philosophical rationale. The soul that chants the sacred sounds does not call the god down but is united with the divine activity (*theia energeia*) of the god through its audible expression. Theurgic tokens (*sunthēmata*), from stones to sounds, functioned as portals of the ineffable magnetism of the One, which is why Iamblichus insisted that theurgical rites surpass human understanding.

The Gnostics did not produce an Iamblichus to explain their ritual practices, but his theory might profitably be used to explain the rites of gnostic communities that shared metaphysical tenets with Neoplatonists. An Iamblichean – or Neopythagorean – influence can be discerned in both metaphysical and ritual elements of the late “Sethian” treatise *Marsanes* which presents a remarkably positive view of the material cosmos. Having announced his knowledge of the boundaries of both spiritual and material worlds the prophetic narrator states: ‘in every respect the sense-perceptible world is [worthy] of being saved entirely’ (*NHC X.5.24-26*), a striking description in a gnostic text, possibly reflecting Iamblichus' positive view of matter. As Iamblichus posited an ineffable principle above the One of his predecessors, so *Marsanes* adds an Unknown Silent One above the highest principle of the other “Sethian” texts (*X.4.19-22*), although it is unclear whether these principles functioned in the same way. Perhaps more significantly, the soul's descent into matter – exemplified in *Marsanes*' Self-Begotten One (*Autogenes*) – fulfills a demiurgic function, precisely as described by Iamblichus (*DM VIII.3*), and with similar soteriological consequences: in order to ascend, the soul must learn to descend like *Auto-*

genes or, in Iamblichus' terms, like the demiurgic Nous (cf. *Steles Seth*, 127,20-21). In *Marsanes*, these ascents were effected through the ritual use of seals that functioned like theurgic *sunthēmata*, and *Marsanes*' complex instructions for chanting vowels, diphthongs, and consonants to lift the soul into its original spherical body is explained in the context of a Pythagorean reflection on numbers where ‘the [decad revealed] the whole place’ (*X.25-33.1*). Iamblichus similarly explained that theurgical invocations have affinities with the gods and place the soul in its original spherical body – the “shape of the gods” (*DM IV.2*) – designed by the Demiurge. Despite these similarities, the *De Mysteriis* appeared no earlier than ca. 280 – and Iamblichus' other writings as late as 325 – which leaves little time for a direct influence on *Marsanes* (late 3rd or early 4th century). Yet both reflect a Syrian provenience, and a direct influence is not impossible.

The “Sethian” texts (*Allogenes*, *Zostrianos*, *Three Steles of Seth*, and *Marsanes*) all reflect a strong Platonic influence seen, for example, in the prominence of a triune first principle: Being-Life-Intellect and in the introduction of Power (*dynamis*) as a mediating principle of the One, formulations clearly derived from Middle Platonic, Neopythagorean, and possibly Neoplatonic texts. Michel Tardieu has shown that the author of *Zostrianos* (*NHC VIII, 1*) and Marius Victorinus (*Adversus Arium*) both made use of the same philosophic source, which, he argues, is a Middle Platonic treatise. If gnostic texts such as *Zostrianos* were drawing from the same philosophic sources as Plotinus, it is not surprising that their philosophical concepts and terminology were shared by the Neoplatonists. It is unlikely that Plotinus would have bothered to criticize them otherwise. The presence of Platonic conceptual structures and the virtual exclusion of all the Jewish and Christian elements of the earlier “Sethian” corpus suggest that the later “Sethians” were seeking intellectual credibility among pagan philosophers or, more simply, that they appropriated these teachings as being anagogically effective. The *Chaldaean Oracles*, Neopythagorean and Middle Platonic texts, and the anonymous *Commentary on the Parmenides* have been identified as sources for Sethian metaphysics. The concepts and terms of the *Commentary*, in particular, influenced these texts, but despite recent discoveries and scholarship there remains significant disagreement on the identity of its author. Pierre Hadot has argued for Porphyry, who was trying to harmonize the teachings of Plotinus with the revelations of the

Chaldean Oracles, and consequently, as Ruth Majercik has argued, the *Zostrianos* and *Allogenes* of the Nag Hammadi collection would have to be 4th century *revisions* of the texts criticized by Plotinus. Cogent and persuasive arguments have been marshaled both for and against Hadot's thesis and for different chronologies of influence on the "Sethian" texts; there is, however, agreement among scholars that "Sethian" Gnostics conformed their revelations with the teachings of pagan philosophers. If, as Plotinus and Iamblichus maintained, the Neoplatonists were simply passing on older teachings, elements of which can be seen in Neopythagorean, Middle Platonic, and Hermetic texts, then perhaps these Gnostics were simply drawing from the same sources. Whether they dipped into this traditional wisdom upstream or downstream is a question that has not yet been answered definitively.

GREGORY SHAW

Neoplatonism II: Middle Ages

Platonism is a complex and problematic historiographic category, especially with regard to the Middle Ages. To begin with, only very few original texts by Plato were known to the Latin West: the first part of the *Timaeus*, which was only supplemented by the *Meno*, the *Phaedo* and parts of the *Parmenides* in the middle of the 12th century. The image of Plato cherished by medieval authors was thus to a considerable degree filtered by Middle-Platonic and Neoplatonist lenses. The main channels by which Platonic philosophy was transmitted to the Middle Ages were Calcidius' translation of and commentary on the *Timaeus*, Macrobius' *Commentarius in Somnium Scipionis*, the works of Boethius and Apuleius, Martianus Capella's *De Nuptiis Philologiae et Mercurii*, → Pseudo-Dionysius, Proclus and of course Patristic authors, most importantly → Augustine. The African bishop not only provided extensive quotes and paraphrases of Plato's work, but, together with Boethius and others, inaugurated an interpretation of Platonism as a spiritual philosophy that was essentially in agreement with Christianity. For the Middle Ages the name Plato thus implied a syncretistic blend of pagan and Christian sources, ranging from Aristotelian, Stoic and Neopythagorean to Middle-Platonic and Neo-Platonist currents. An additional complicating factor is that a significant part of medieval Platonism did not go under the name of Plato but under that of his pupil Aristotle. From the middle of the 12th century pseudo-Aristotelian works introduced the Neo-Platonism of thinkers like Proclus (the *Liber de Causis*) and Plotinus (the *Theologia Aristotelis*) under the guise of Aristotle's secret teachings. Finally, medieval Platonism was not a static phenomenon but underwent profound transformations in the course of time. With the advent of Latin translations of Aristotle's works in the West from the 12th century onwards Aristotle's star rose while Plato receded to the background, especially with regard to natural philosophy, where commentaries on Aristotle's *libri naturales* replaced discussions of Plato's *Timaeus*. Nevertheless, the picture of an exclusively Platonic domination of the early Middle Ages and a subsequent Aristotelian domination of the later Middle Ages has proved to be too simplistic, not least because the Aristotelianism that the Latin West inherited from Arab commentators such as → Avicenna was deeply tainted by Neoplatonism. Moreover, late medieval theology and metaphysics, for instance that of Thomas Aquinas, one of the greatest champions of medieval Aristotelianism, were

heavily influenced by Pseudo-Dionysius and other Neoplatonist sources. There are thus a number of serious difficulties standing in the way of an all-encompassing study of the relation between medieval “Platonism” and → Hermetism, itself a multi-dimensional phenomenon. For this reason we have chosen to investigate the ties between Platonic and Hermetic elements in a limited number of authors that represent three different models of dealing with Hermetism, namely a fusion with Platonism without much relation to Aristotelianism (12th century Platonism), a blend of Platonism, Aristotelianism and Hermetism (→ Albertus Magnus), and finally a mixture of Platonism and Hermetism with anti-Aristotelian overtones (Berthold of Moosburg).

The first group has often been referred to as the “Platonists of the 12th century”, comprising authors such as William of Conches (ca. 1080-ca. 1154), Thierry of Chartres (= after 1156), → Bernard Silvester (ca. 1080-1167), and Alan of Lille (ca. 1128-1203). Against the traditional picture of a common Platonic “School of Chartres”, which most of these authors were claimed to be a member of, scholars such as Southern and Marenbon have tried to make a case for the richness and complexity of their philosophy and theology, downplaying the importance of Platonism as a common philosophical ideology. Nevertheless, the fact remains that these authors underwent a considerable influence of Platonic philosophy. The most conspicuous characteristic of their reception of Plato was the fusion between the cosmology and natural philosophy of the *Timaeus* with Christian theology. The leading idea here was that by means of a detailed investigation of the natural world, the philosopher would be able to gather the power, goodness and wisdom of its Creator. The mythical and allegorical elements of Plato’s cosmology were seen as *integumenta* and *involucra*, words that concealed a deeper, hidden meaning that had to be dug up by the philosopher. This hermeneutical programme not only led to a free interpretation of ancient texts but also inspired a range of cosmologies and cosmogonies that themselves had a poetical and allegorical style that was tributary to the Platonic tradition (see e.g. Bernard Sylvester’s *Cosmographia* and Alan of Lille’s *De Planctu Naturae*).

Following Quodvultdeus, Lactantius and other conciliatory sources, 12th century Platonists saw Plato and Hermes [→ Hermes Trismegistus] as protagonists of the same tradition of Oriental-Greek wisdom. Peter Abailard (1079-1142) and Thierry of Chartres, for instance, believed that Plato’s cos-

mological myth adumbrated his prophetic knowledge of the Trinity, in which the Father was the efficient cause of the world, the Son the formal cause and the Holy Spirit the final cause. On the other hand, Alan of Lille attributed the same knowledge to Hermes. Especially in his *Summa Quoniam Homines* and his *Contra Haereticos*, Alan claimed that the *Asclepius* contained *integumenta* referring to the Trinitarian dogma. Thus, against the widespread anti-intellectualism and fideism of the 12th century, authors such as Thierry of Chartres and Alan of Lille saw both Plato and Hermes as paradigms of a natural, rational knowledge of God and central dogmas of Christian faith.

Given this intimate bond between Plato and Hermes, it is no surprise that the 12th century Platonic cosmological-cum-theological framework was permeated by a wealth of Hermetic elements, deriving from the *Asclepius* and apocrypha such as the *Liber viginti quattuor philosophorum* and the *Liber de sex rerum principis*.

First of all, we recognize Hermetic elements in the way these authors elaborated on the three cosmological principles derived from Plato’s *Timaeus*: God, matter (hylè) and the world soul. For instance, In his *Cosmographia* Bernardus Sylvestris describes matter as an unformed entity, the fecundity of which can give rise to both good and bad creations, thus paraphrasing the *Asclepius*. But the most significant presence of Hermes is found in discussions on the world soul. Like Pierre Abailard, Thierry of Chartres identified the Platonic world soul with the Holy Spirit, the third person of the Trinity. This in turn he equated with the *pneuma* or spirit of the *Asclepius*, which guides and determines the world. After the Council of Sens (1140) had forbidden the equation of the (created!) *anima mundi* of the *Timaeus* with the Third Person of the Trinity, most authors became more cautious in the way they dealt with spirit. Bernard Sylvester, for instance, considered the world soul as Nature itself, the force that keeps the world together as an ordered whole. In this respect, the *Asclepius* was again a major source of inspiration, especially with its Stoic connection between spirit and fate, its insistence on the determinate sequence of causes in the universe and its equally Stoic astral determinism, in which the sublunary world is governed and determined by the stars. Another escape route was taken by Alan of Lille who continued to identify world soul and Holy Spirit, but bypassing allusions to Plato, referred to *Asclepius* 23 with its claim that God created eternal Gods. In this fashion, Alan attempted to avoid the fusion of the finite

Platonic world soul and the eternal Third Person of the Trinity.

Another domain in which Platonic and Hermetic elements were combined concerns the relation between God's immanence in the world and His radical transcendence. 12th-century Platonism was heir to the complexities of late Neoplatonism with its tension between the ineffability of the One and its emanative immanence in the world. Again, this Neoplatonist framework was filled with Hermetic elements. Both Thierry of Chartres and Alan of Lille not only explained God's ineffability with the help of Pseudo-Dionysius' doctrine of divine names, but also on the basis of *Asclepius* 20 which states that God bears all names. According to these authors, God's ineffability is not rooted in His transcendence, but precisely in His radical immanence: because God is all being, He bears all names, which is the same as saying that no name can express the divine source of the totality of being. Most 12th-century Platonists made use of the Hermetic notion of *Un'omnia*: the idea that all being participates in the One gives rise to the conclusion that the One is immanent in all being (God is every stone, every tree etc.). The majority of authors expressly tried to avoid simplistic pantheist conclusions, with the exception of David of Dinant (ca. 1160-1200), whose *Quaternuli* were condemned by the Synod of Paris in 1210. Finally, especially in Alan of Lille we find a strong usage of the definitions of the *Liber XXIV Philosophorum* in determining the relation between God and His creation. The image of God as the monad and the circle whose centre is everywhere and circumference nowhere were woven into a basically Neoplatonist metaphysics of unity and participation.

The relation between Platonism and Hermetism underwent substantial change in the works of → Albertus Magnus (1193-1280). The Dominican professor was one of the first to deal with the tide of translations of Aristotle in the 13th century. Hence, most of his work consisted of commentaries on Aristotle's texts. Nevertheless, Albert's Aristotelianism was certainly not uncritical and was combined with a strong Neoplatonist influence mostly derived from Arab and Jewish sources, and, especially in his later life, from the *Liber de Causis*, which Albertus considered to be Aristotelian. In fact, Albertus spoke of three different philosophical schools, the Epicureans, The Stoics, which comprised Plato and the Academy, and the Peripatetics. Hermes was usually grouped with the Stoics and was thus made responsible for inaugurating philosophical idealism. Nevertheless, there are also places in Albert's work, for instance

in *De Causis*, that place the Thrice Great with the "older Peripatetics". In the end, this classification is of small importance, because according to Albert's conciliatory programme true philosophy should reunite Aristotelianism and Platonism. In fact, Albert's "Peripateticism" is largely determined by Averroes, Avicenna, Alfarabi and other authors with a strong Neoplatonist outlook. A number of characteristic Hermetic elements have flown into Albert's mixture of Aristotelianism and Platonism.

First, Hermes is referred to in the context of Albert's metaphysics and theology. Together with Platonism, Hermes is credited by Albertus for inaugurating the idea of a divine *fluxus* in which all forms and all being are derived from the First Cause. Nevertheless, like the Platonists, Hermes errs with respect to the particulars of this process. According to Albertus the causal inflow should not be modelled in terms of an "infusion" of form and being into matter by a higher, intelligent cause. This kind of conception may lead to a dangerous pantheism in which the very ontological hierarchy is abolished, because all things are believed to directly emanate from the highest cause and share in its essence. As an alternative to the Platonic-Hermetic view of causal infusion, Albertus launched his "peripatetic" view of *eductio formarum*: forms are created by Intellects that emanate from the first cause. These Intellects draw the lingering, potential forms out of matter in the sense that they act as a paradigm which is imitated by the created thing that produces a likeness or an image of it. Contrary to what Hermes claims, the *Dator Formarum*, the giver of forms, is thus transcendent to the lower levels of reality and does not directly infuse them with his own being. By stating in the *Asclepius* that all things are full of a spirit which transmits the virtues of the gods, Hermes shows that he has some awareness of this truth, but it remained to the Aristotelians to fill in the details of this conception.

A similar combination of Aristotelian, Platonic and Hermetic elements may be witnessed in the case of Albert's doctrine of the intellect, a central doctrine within his system. Albertus mentions active and possible intellect, impressed species and other Aristotelian jargon, but again inspired by Alfarabi, Avicenna and others he gives a Platonic twist to these terms. According to Albertus the process of philosophical contemplation is a matter of the active intellect joining itself with us, hence creating the *intellecta* in our soul. The possible intellect receives the light of this knowledge and is thus made similar to the intelligible forms. The end result of this process is the *intellectus adeptus*,

which he defines as the presence of the known form within the soul. Philosophical knowledge is thus a kind of contemplation and illumination by means of which the soul gradually unites itself with the One. Again, Albertus introduces Hermetic elements in this Aristotelian-Platonic mixture. First of all, he describes the process of contemplation in terms of asceticism, purification and divination and other concepts derived from the *Asclepius*. Moreover, in his *Liber de intellectu et intelligibili* he adopts the Hermetic image of man as *nexus dei et mundi*. On the one hand, man assimilates himself to God, but by doing so he may also act as the *gubernator* of the lower world. Philosophical → mysticism is thus transfigured into a kind of → magic in which man uses his divine powers in order to rule, transform and purify the lower worlds. In this connection, Albertus also cites the Hermetic trope of man as *imago mundi*, which he interprets in a Platonic sense: by assimilating the intelligible forms within the intellect, the human soul becomes in fact a microcosmos mirroring the macrocosmos.

Albertus was the founder of an alternative philosophical school among Dominicans in the German lands, which not only comprised philosophers such as Ulrich of Strasburg (ca. 1225-1277) and Berthold of Moosburg (= 1361), but also mystics such as Eckhart and Tauler. Insofar as Hermetism is concerned, the most interesting representative of this current is Berthold of Moosburg, who composed a commentary on Proclus, the *Expositio super Elementationem Theologicam Procli* (1340-1360). In contradistinction to Albertus, Berthold did not aim at reconciling Aristotelianism and Platonism, but opposed the Platonism of Proclus to the dominant Aristotelian culture of the schools. Again, however, these labels should be handled with caution: Proclus's *Elementatio* itself is certainly not free from Aristotelianism and also Berthold's own interpretation in no way amounts to "pure Platonism". Nevertheless, he presents an uncompromising anti-Aristotelian programme, which is based on the distinction between the ontology of the Peripatetics, the *sententia peripateticorum* that only deals with the "terrestrial" doctrine of metaphysics as the science of being qua being, and the true metaphysics of the Platonists, the *supersapientialis scientia platonica* that is gained by the soul's mystical *unitio* with the divine forms. Berthold brought about a complete fusion of this Platonism with Hermetism. Unlike Albertus, Berthold dropped the reservations about the *Liber XXIV Philosophorum*, whose definitions of God as *monas* and as circle he happily quoted. Berthold also revived the ancient idea that the

pagan Hermes would have intuitively grasped the attributes of God, which is proved by his words about the generation of the *Logos* from the Father (*Asclepius* 26) and his doctrine of *pneuma*, which Berthold identifies with the Holy Spirit. It is therefore no surprise that we find a substantial number of references to Hermes in Berthold's work. Hermes teaches God's ineffability, His omnipotence and causality, His presence within the created universe, the processes of *exitus*, *mansio* and *reditus* applied to the trinity and man as microcosm. In this fashion, Hermetic doctrines provide important additions to Proclus' "Platonic" philosophical system.

Neoplatonism III: Since the Renaissance

Platonism existed in many guises and at various places in the 13th and 14th centuries, especially in Italy. It was, however, mainly due to one man that Platonism became such a dominant current in the Renaissance: → Marsilio Ficino, who published the first complete translation of Plato in Latin in 1484, outdoing all earlier (partial) translations by Renaissance figures such as Bruni, Filelfo, George of Trebizond and Cardinal Bessarion. Platonism had certainly not been unknown to the Latin West during the Middle Ages [→ Neoplatonism II], but the more than thirty printings of Ficino's *Platonis Opera Omnia* in the 16th century alone gave a new and powerful impetus to the development of the Platonic tradition. In fact, Ficino's translation continued to be read well into the 19th century. Nevertheless, the availability of Plato's complete text did not mean that Ficino and Renaissance Platonists returned to the original and pure Platonism. Byzantine scholars such as Cardinal Bessarion and George of Trebizond not only bequeathed their Greek manuscripts to Italian humanists, but also a set of hermeneutical tools that were employed in reading these texts. Following Bessarion and others, Ficino read (and translated!) Plato through profoundly Neoplatonic lenses. Plato was put into the syncretistic framework of a tradition of *prisca sapientia* and *pia philosophia* [→ Tradition] which was supposed to reach back to → Moses and pagan prophets such as → Zoroaster and → Hermes Trismegistus who had transmitted a sacred wisdom that foreshadowed the advent of Christ. In other words, attention was very much focused on those aspects of Plato's teachings that could be

squared with Christianity. In fact, one of Ficino's key projects was to develop a new kind of scholasticism that would reunite Christian faith with Platonic philosophy as an alternative to what was seen as the heretical and anti-Christian "obscurities" of Averroist and Alexandrist → Aristotelianism. Moreover, since Plato was not seen as an isolated figure but as the head of a unified philosophical tradition, Ficino and others read Neoplatonist philosophy back into Plato's works.

Plotinus in particular was very dear to Ficino's heart. He produced a complete translation of the *Enneads* and considered Plotinus as the interpreter that came closest not only to Plato's meaning but to Christianity as well. During the Renaissance, Ficino's translation of Plato was read together with his renderings of Plotinus, Iamblichus, Proclus and other Neoplatonist philosophers. With the help of Proclus' and Plotinus' complex conceptual structures Plato was thus interpreted in a highly systematic manner, which left no room for the aporetic and open-ended character of many of his dialogues. The Plotinian One or God was placed at a great distance of the Many of this world, and the gap was filled with the celestial hierarchies of → Pseudo-Dionysius Areopagita, who became as popular in the Renaissance as he had been among Medieval thinkers such as Thomas Aquinas. Early Renaissance authors still believed in the myth according to which Dionysius was not only the Areopagite whom St. Paul had converted to Christianity, but also the one that had later become bishop of Paris. Eventually Valla's philological démasqué of this myth in his *In Novum Testamentum Annotationes*, printed in 1505, weakened the authority of the Pseudo-Dionysian writings, but until that time great minds such as Ficino and → Nicolas of Cusa still considered Dionysius one of the greatest theologians of all time. In fact, Dionysian negative theology was a key influence on Cusanus' doctrine of *docta ignorantia*. An even more interesting case of Dionysian influence is → Jacques Lefèvre d'Étaples, who opposes the pure Christianity of Dionysius against the debased philosophies of the Platonists who had supposedly stolen most of his ideas.

On the whole, scholars have come to emphasize the continuities with medieval Platonism, at the expense of the discontinuities that were often stressed by Renaissance thinkers themselves. For one thing, → Augustine remained as important to Ficino as a source of Christian Neoplatonism as he had been to the Middle Ages. Moreover, following 12th-century Platonists, the young Ficino

was excited by the pseudo-Hermetic definitions of God as the monad and as a circle whose circumference is everywhere and centre nowhere (*Liber viginti quattuor philosophorum*, defs. 1-2). He used these doctrines in order to bring the Christian idea of divine creation in concordance with both Hermetism [→ Hermetic Literature] and the Platonic account of the Demiurge in the *Timaeus*, an endeavour which in itself clearly betrays the influence of William of Conches and other 12th-century Platonists. These continuities notwithstanding, the very fact that the entire Platonic corpus was now available did create a powerful new momentum in Renaissance culture. Still, it is important to recognize that although a few special chairs of Platonic philosophy had been created (for example that of → Francesco Patrizi in Rome) and avowed Platonists were present at regular university chairs (for example Francesco Piccolomini at Padua), Neoplatonism remained largely an extra-academic affair. The metaphysical speculations of the Platonists proved to be more attractive to a non-academic public than the strict logic of academic Aristotelianism, inspiring musicians [→ Music], poets and painters as well as statesmen such as Cosimo and Lorenzo de' Medici.

The link between Renaissance Neoplatonism and Hermetism was as potent as it had been in the works of medieval Platonists such as Alanus ab Insulis or Berthold of Moosburg, and this makes it difficult – indeed, artificial to some degree – to discuss Renaissance Neoplatonism separately from Renaissance Hermetism. Following Lactantius and other ancient sources, all Neoplatonists of the Renaissance subscribed to the myth of a *prisca sapientia* and a *pia philosophia* already referred to above: a current of primordial pagan wisdom, culminating in Platonism, which prior and/or parallel to the Mosaic prophesies had paved the way for Christian revelation. Together with Zoroaster, Hermes was usually seen as one of the first of these pagan sages. Thus, the *Corpus Hermeticum*, whose first complete translation into Latin was also produced by Ficino, was considered a source of the most ancient and most venerable wisdom on earth. Nevertheless, although most Neoplatonists shared this image of Hermes as a venerable prophet, the impact of the works attributed to him on the various protagonists of Renaissance Platonism was certainly not univocal. Recent scholarship has therefore become much more cautious than Frances Yates (1964) with her sweeping claims about a unified “Hermetic Tradition”. Just like in the case of the Renaissance’s Platonisms

and Aristotelianisms, we had better speak of the Hermetisms of the Renaissance.

As for the Platonisms of the Renaissance specifically, in what follows we will discuss them at the example of only a few of the most influential authors, and further restrict ourselves to those who clearly present themselves primarily as philosophers. It must be emphasized, however, that the influence of Neoplatonism was much more widespread than can be demonstrated in a short overview. To give only one example, the famous → Heinrich Cornelius Agrippa – primarily a humanist theologian, cultural critic, and author on magic – consistently attacked Aristotelian scholasticism in favour of a broadly Neoplatonic worldview. Among other things, he lectured on Plato’s *Symposium* in 1512, and he rejected scholastic notions of the relation between reason and faith in favour of a fideism strongly inspired by Neoplatonism.

To begin with Ficino: despite his great veneration for Hermes, the impact of specific Hermetic doctrines on his Neoplatonic philosophy is somewhat limited. True, we find in Ficino the same combination of a pessimist perspective on the world as the dark abyss of materiality with the idea that the beauty and order of the natural world reveals the perfection of its Maker. Moreover, Ficino tries to bring the idea of God as the transcendent One in concordance with His immanence in the world He created. But these are rather vague parallels that can also be found in the various strands of (Christian) Neoplatonism, which moreover applied more philosophical rigour to these themes, a fact which certainly appealed to Ficino’s sharp philosophical, if not scholastic, mind. On the whole, it seems that Ficino’s initial enthusiasm for Hermes later gave way to a deep fascination with Neoplatonism, and with Plotinus in particular. Furthermore, although Ficino emphasizes the pre-Trinitarian character of Hermes’ speculations, he never ceased to emphasize that the Egyptian sage had been granted only a glimpse of God. Ficino, himself an ordained priest, never questioned the need for Revelation. The same conclusion also applies to Plato, who just like Hermes had only glimpsed the Trinity and other basic Christian tenets, which can never be perfectly known independent of the Revelation. In the same context, Ficino sharply repudiated later *Platonici*, such as Numenius, Philo, Plotinus, Iamblichus and Proclus for having stolen most of their ideas from the Gospel of St John, St Paul’s Epistles and the Areopagite. Even his great hero Plotinus did not escape this criticism. Despite his

exposure to Christianity, Plotinus had failed to understand the true nature of the Trinity, even to the extent of reverting to the heresy of Arianism by subordinating the second and third hypostases of his system to the first one. Although Ficino took over many important doctrines of Plotinus and his fellow *Platonici* in his campaign for a Christian philosophy, he was never tempted to exalt pagan metaphysics at the expense of Christian theology.

→ Giovanni Pico della Mirandola subscribed to the concordist notion of *prisca sapientia*, which in his case gave rise to the grand project of his *Conclusiones*, that tried to reunite all pagan and Christian learning. However, during his brief life Pico actually limited himself to the less lofty task of harmonizing Aristotelianism and Platonism, with the metaphysics of *De Ente et Uno* (1492) as the first result. Like Ficino, Pico was a strong admirer of Plotinus – in fact, he urged Ficino to complete his translation of the great Neoplatonist. The only point on which Pico disagreed with the Neoplatonists was precisely the relation between “being” and “one” as predicates of God. He thus rejected the Neoplatonist reading of Plato’s *Parmenides*, which was supposed to confirm the Neoplatonic idea that the hypostasis of the “One” or God is above being, *superessentialis* as the Latin translation of Proclus has it. According to Pico, the *Parmenides* was just a dialectical exercise, whereas in all of his other dialogues Plato was in basic agreement with Aristotle’s thesis concerning the convertibility of being and oneness. Both predicates can be assigned to God and thus stand at the same ontological level. It is, furthermore, not insignificant that Pico’s unfinished *Disputationes adversus astrologiam divinatricem* unequivocally condemned Hermetism as an inferior kind of learning and opposed it unfavourably to both Platonism and Aristotelianism. The wisdom of the Egyptians, which includes Hermetism, is here portrayed as a practical discipline of worship and not as theoretical science. Hermetism provides at best a first inadequate sketch of the superior physics and metaphysics of Plato and especially Aristotle, since it lacks the defining characteristic of true science, that is to say, rational argument (*Disputatio adversus astrologiam divinitatrem*, in *Opera Omnia*, Basel 1557 [reprint Hildesheim 1969], 721–722).

The Franciscan friar → Francesco Giorgio da Veneto’s (1453–1540) main work, *De Harmonia Mundi* (1525), is an amazing amalgam of Neoplatonism, Hermetism, kabbalah [→ Jewish Influences III] and Franciscan spirituality. The *Harmonia Mundi* tries to uncover the hidden

unity behind the world’s apparent diversity by means of “musical”, i.e. harmonical, proportions [→ Music III]. Many of these proportions are conceived of in analogical fashion and pertain to → Number Symbolism rather than to mathematics in the strict sense of the word. Giorgio’s key doctrine is that of God as the Hermetic *Monas*, who unfolds His infinite fecundity in the harmonious world He creates. In this connection, he states that both Hermes and Plato beautifully explained the creation of the world, in a way which may help destroy the heresies of Aristotle, Averroes, Epicurus and Alexander of Aphrodisias.

With → Francesco Patrizi (1529–1597) Renaissance concordism changes its character. For Patrizi, the concord is between Hermetism and Neoplatonism on the one hand, and Christianity on the other, excluding the heresies of academic Aristotelianism. Moreover, unlike Ficino, Patrizi attached little importance to Moses and the Hebrew prophets. In fact, contrary to Ficino’s Christian Platonism that sees itself as the culmination of both the Mosaic prophetic current and the Greek philosophical-theological current, Patrizi elaborated a tradition of Hermetic Platonism in which Christian thought appears to play a subordinate part, rather than being its perfection or culmination. Furthermore, unlike Ficino, he did not use the figure of Hermes to legitimize magic. Patrizi was mainly interested in those elements of the *Corpus Hermeticum* that can be squared with Neoplatonist metaphysics, and neglected magical [→ magic] and astrological [→ astrology] doctrines. Patrizi’s threefold Hermetic-Platonic project involved, firstly, a new edition of the *Corpus Hermeticum*, the *Chaldaean Oracles* and other *Hermetica*. Secondly, the *Discussiones Peripateticae* (1581) takes up Ficino’s idea of a philosophical concord and the tradition of *prisca sapientia* in an anti-Aristotelian manner. Thirdly, Patrizi wrote the *Nova de Universis Philosophia* (1591), an all-encompassing philosophical system that tries to explain the Hermetic “revelation” by means of philosophical, especially Platonist, arguments. This work starts from the premise that man by the sole light of his reason can arrive at the understanding of the central “mysteries” of faith, such as the doctrine of the Trinity. Thus, at the centre of Patrizi’s metaphysics we find an exposition of the doctrine of the Trinity which uses Orphic, (pseudo)Zoroastrian and Hermetic teachings as the point of departure, rationally proving the consubstantiality of the three divine persons in a Neoplatonist vein. In this context, Patrizi gave a quite daring interpretation of the

term “fides” (faith). Faith is not the irrational or pre-rational acceptance of certain doctrines on the basis of the authority of the Church; rather, it is the “post-rational”, final “assensio” to divine truth which is bred by rational cognition (“cognitio”). These doctrines make clear that Patrizi’s Hermetic Neoplatonism substantially differed from the Christian Neoplatonism of Ficino and Pico. Patrizi liberated Hermetism from its subordinate role and placed it on the same level as both Christian Revelation and Neoplatonist metaphysics. Hermes is not just used to adorn or legitimize an otherwise Neoplatonist philosophy; instead, Hermetic tenets almost receive the status of articles of faith, that are rationally explained by means of the conceptual apparatus of Neoplatonist metaphysics.

→ Giordano Bruno (1548-1600) gave yet another twist to the concordist tradition. Like Patrizi, he combined a deep mistrust of Aristotelianism with a profound admiration for the pre-Platonic tradition; but unlike his predecessors, he was not in the least interested in the synthesis between old pagan teachings and Christian doctrine. The dignity of *prisca sapientia* does not consist in its having glimpsed the Trinity. The figure of Hermes was far less central to Bruno than has been claimed by Frances Yates in her influential study on Bruno (1964); rather, he put emphasis on the ancient philosophers of his native southern Italy, Pythagoras in particular. (Pseudo-)Pythagorean numerological speculation about the Unity that gives birth to the many is at the heart not only of Bruno’s metaphysics but also of his atomism. He combined this with the typically Neoplatonic dialectics of transcendence and immanence, as found in Plotinus and Proclus. Very importantly, however, he criticized the Neoplatonists for locating the transcendent *Monas* in “another place” beyond this world. Since this world is infinite, there is no spatial “other” to this cosmos. Rather, the One should be sought for in another dimension of reality, in a higher *metaphysical* rather than *physical* realm. Similarly, Bruno grounded the infinity of the world in the Neoplatonist principle of plenitude: the infinite fecundity of the Cause should be reflected in an infinity of effects. But here again, he rejected the idea, found in Patrizi and other Neoplatonists, that infinite space is filled with incorporeal light or ether. Rather, he stressed the physical continuity of this infinite world. In his epistemology, on the other hand, Bruno adopted Neoplatonist speculations concerning the soul’s ascent through the different

grades of reality, ending in adumbrations of the divine intelligence.

The last great representatives of Renaissance Platonism were the so-called Cambridge Platonists, especially → Ralph Cudworth and → Henry More. These philosophers continued to uphold the typical Renaissance idea of *philosophia perennis* and *prisca sapientia*. In this context, they were not too worried about Isaac Casaubon’s dating of the Hermetic writings in 1614, either contesting the conclusions he drew from his arguments (Cudworth) or happily ignoring them (More). These authors again defended a very eclectic mix of Neoplatonism, but tried to distance themselves from an esoteric reading of Plato such as practised by the English hermetic author → Thomas Vaughan. This did not prevent Henry More from defending beliefs in → witchcraft and ghosts. Inspired by Ficino and like-minded Renaissance predecessors, More, Cudworth and the other Cambridge Neoplatonists tried to restore the bond between Christianity on the one hand and philosophy and science on the other, so as to repair the damage done by the materialism and atheism of the modern mechanical philosophy represented by Thomas Hobbes and others. Of crucial importance was their defense of spiritual entities in nature, most notably the “Plastic Nature”, a late descendant of the Platonic *anima mundi*. Thanks to translations of their works, More and Cudworth were especially popular in 18th-century Germany, where Leibniz was one of their most famous admirers. They also influenced Coleridge and, through Thomas Taylor, the English Romantics [→ Romanticism] and American Transcendentalists.

Up to the 18th century, the term “Platonism” generally stood for what was in fact an eclectic mix of Neoplatonism, Hermetism, Christianity and other elements. With a few notable exceptions such as Jacques Lefèvre d’Étaples, most philosophers and theologians did not make a clearcut distinction between Plato and the *Platonici*. This picture started to change in the beginning of the 18th century, with German Lutheran theologians such as Gottfried Olearius and Johann Lorenz von Mosheim. Both authors describe Neoplatonism as an eclectic mix that has little in common with the philosophy of the original founder of the Academy. This did not mean that these theologians had much sympathy for Plato himself. Especially Mosheim repeated the well-known Protestant invective against the pernicious influence of all pagan learning, and Platonism in

particular, on Christianity. In so doing they continued Luther's campaign for a return to the pure and unspoiled evangelical truth. In this sense, both Olearius and Mosheim reiterated the criticism voiced by the anonymous *Le Platonisme dévoilé* of 1700, which stated that all Fathers of the Church had succumbed to Platonism, thus corrupting the true faith. Although Olearius and Mosheim no longer accepted the identification of Platonism and Neoplatonism found in this book, they largely agreed with most of its conclusions. Their attack against Neoplatonism also had a confessional character. Many Protestant authors claimed that the introduction of papal *bizarreries* such as the Transubstantiation had largely resulted from the acceptance by theologians of Platonic and Aristotelian metaphysics. In many cases the onslaught by such Protestant authors on Neoplatonism included an overall rejection of the entire domain nowadays referred to as Western → esotericism: including → alchemy, Paracelsian medicine [→ Paracelsianism], and → magic. The distinction between Plato and Neoplatonism that had been operated by Olearius and Mosheim for theological reasons was adopted by Jacob Brucker in his highly influential *Critical History of Philosophy* (first edition 1742-1744), one of the first modern histories of philosophy. Just like his predecessors, Brucker considered the Neoplatonists as ravingly mad impostors. However, as a historian of philosophy, he not only faithfully described the Neoplatonists' main opinions but also tried to explain their origins, which according to him could be found in Oriental philosophy. Neoplatonist monism, the thesis that all being, including matter, emanates from God, stands in stark contrast to Platonic and Christian dualism. Brucker's epoch-making innovation was to reconstruct Plato's "system" on the basis of his dialogues alone, which he found a difficult task given Plato's notorious obscurity and his poetic style. Although Brucker's reconstruction fails to impress the modern scholar, the very fact that he developed a critical interpretation of Plato independent of Neoplatonist sources is significant in itself. The same project was taken up by Wilhelm Gottlieb Tennemann in his *System der Platonischen Philosophie* (1792-1795), which can be considered the first modern monograph on Plato. Just like Brucker, Tennemann claimed that Plato had elaborated a philosophical system that could be reconstructed on the basis of the Dialogues. He did not, however, agree with Brucker's particular reconstruction of that system; instead, Tenne-

mann's alternative account is heavily influenced by Kant's critical philosophy, which he strongly favoured. Furthermore, Tennemann subscribed to the ancient idea that Plato had had a secret, esoteric doctrine that had only been transmitted orally to his pupils. Fragments of this *Ungeschriebene Lehre* could supposedly be found in Aristotle and in the (fragmentary) writings of the members of the first Academy. Traditionally, the religious and mystical elements of Plato's esoteric doctrine had been seen as the very core of his teaching, of which the Dialogues were but a faint, popularizing echo. In the Introduction to his groundbreaking translation of Plato published in 1804, Friedrich Schleiermacher strongly repudiated this kind of esoteric reading, urging his readers to interpret Plato solely on the basis of his Dialogues. Schleiermacher thus confirmed the decline of the Neoplatonic reading of Plato that had begun almost a century earlier.

From the period of the early 19th century on, it becomes particularly difficult, if not impossible, to trace the continuation of Neoplatonism as a tradition in its own right. Important is the role that was played by Thomas Taylor (1758-1835), nicknamed "the English Platonist", whose translations of Iamblichus, Plotinus, Porphyry and Proclus brought the works of these philosophers to the attention of English readers. Taylor has been held in great esteem by authors associated with esoteric traditions since the 18th century, from the painter and poet → William Blake to the theosophist scholar → G.R.S. Mead and to 20th-century admirers of Neoplatonic philosophy such as – to give one example – the authors contributing to David Fideler's journal *Alexandria: The Journal of the Western Cosmological Traditions*. In the latter context, Neoplatonism tends to be closely associated with Orphic and Pythagorean traditions, and perceived first and foremost as a "sacred cosmology"; it is admired for its harmonious beauty and is seen as a source of inspiration for those who seek alternatives to the worldviews dominant in contemporary Western culture. Not much research has been done so far on the discreet presence since Taylor's times, and independent of academic philosophy, of such spiritually-inclined enthusiasts of Neoplatonism, or on the influence of their networks and publications.

That Neoplatonism is of central importance for understanding → Romanticism has been recognized by historians for a long time, but only more recently has the recognition gained ground that what was covered under that label actually

included much that would nowadays be associated with hermetic philosophy, the occult sciences, and Western esotericism in general (Abrams 1971; Hanegraaff 1998). The broad cultural influence that Romanticism has exerted in many domains outside philosophy proper – art and literature, but esotericism as well – means that, ever since the early 19th century, one may encounter “neoplatonic” motives and associated modes of thinking in so many places that a synthetic overview becomes a practical impossibility. For example, while Neoplatonism is clearly of the greatest importance for understanding a theosophical worldview [→ Theosophical Society] as presented by → H.P. Blavatsky (see e.g. Ellwood 1983), it is mixed up there in a highly complex manner with so many other elements that the result is, rather, something new. The continuing attraction and relevance of “neoplatonism”, but also its increasing elusiveness, is clearly demonstrated by the publications of the International Society for Neoplatonic Studies and the series of collective volumes it has published since 1976: here one finds discussions of Neoplatonism in relation to religions such as Hinduism, Judaism, Christianity, Islam, and → Gnosticism, but also applied to subjects as varied as biology, ecology, democracy, psychology, and aesthetics. Finally, “neoplatonic” frameworks are clearly present in various worldviews associated with the → New Age movement, from channeled books such as *A Course in Miracles* and the “Seth Messages” published by → Jane Roberts, to the transpersonal psychology of Ken Wilber (see e.g. Hanegraaff 1996/1998, 120-127, 246-252).

Neo-Sufism

This term is used to refer to religious movements in the West which describe themselves as “Sufi” but are part of the landscape of Western esotericism more than of Islam. Such a use should be distinguished from the standard use of the term in Islamic studies, where it denotes a particular group of Sufi orders which arose in the Islamic world between the 18th and 19th centuries and which has no important connection with the West.

Persons and groups in the West describing themselves as “Sufi” may be placed into one of three categories: Islamic Sufism, non-Islamic neo-Sufism, and partly Islamic neo-Sufism. Islamic Sufism (which falls beyond the scope of this entry) has been present in one form or another in the Islamic world since the 7th century and in the Christian West since at least the 18th century, at which time branches of mainstream Sufi orders existed in some of the small communities of Arab sailors resident in certain European ports. Since the first quarter of the 20th century, there have also been Sufi groups in the West whose membership is not restricted to particular ethnic or immigrant communities, and which may include converts to Islam from Christianity or Judaism. Despite their location in the West and the pragmatic concessions to Western realities that they may make in some details of belief and practice, such groups are Sufi rather than neo-Sufi.

Neo-Sufism first became important in the West in non-Islamic form, presenting Sufism as a “truth” distinct from Islam (for Islamic Sufis, Sufism is an integral part of Islam). The earliest non-Islamic neo-Sufi was Hazrat Inayat Khan (1882-1927), who was born in Baroda, India, into a family of Indian Muslim musicians, and joined the Chishti order in his youth. He travelled to the United States in 1910, at the age of 28, and lectured initially on Indian music in San Francisco. He soon gathered a small group of followers interested more in his spiritual than his musical teaching. After moving from the United States to London, he published *A Sufi Message of Spiritual Liberty* in 1914, in 1915 started a magazine, *The Sufi*, and in 1916 established a “Sufi Order”. He continued to

write on Indian music and its spiritual significance, but was best known as a “Sufi” teacher. In 1920 he moved from England to France, and he set up a “Sufi Movement” in Geneva in 1923. In 1926 he moved back to India, where he died the following year. His “Sufi Order” and “Sufi Movement” were by then established in the United States, Britain, France and Switzerland.

Inayat Khan defined Sufism as “the religion of the heart”, something both above and beyond established religions: it was ‘the spirit of Islam, as well as the pure essence of all religions and philosophies’. A believer in the essential unity of all major religions, he instituted “Universal Worship” for his followers, to ‘unite the followers of different religions and faiths in wisdom, so that without having to give up their own religion they may strengthen their own faith and focus the true light upon it’. Universal Worship included texts drawn from six religions (Hinduism, Buddhism, Zoroastrianism, Judaism, Christianity, and Islam). Inayat Khan’s followers were also taught various invocations and meditative practices which were sometimes taken from Islamic Sufism, and sometimes from Hinduism or generalized Western spirituality.

After Inayat Khan’s death, his following split between his family in Europe and his two leading followers in the United States, Rabia Martin (?-1947) and Samuel Lewis (1896-1971). Martin and Lewis together led the “Sufi Order” in the United States until 1945, when Martin and some followers left neo-Sufism for the neo-Hindu teachings of Meher Baba (1894-1969), thought to be an *avatar*. This group became known as “Sufism Reoriented”, while the remainder (Lewis’s group) later became known as the “Sufi Islamia Ruhaniat Society” (“Islamia Ruhaniat”, literally “Islamic spirituality”, being translated as ‘the way of peace through the breath’). In the late 1960s, Samuel Lewis added “Dances of Universal Peace” to the practices inherited from Inayat Khan, attracting large numbers of the “love generation”, and the Sufi Islamia Ruhaniat Society later added the Goddess Tradition, Taoism, and “the Native Traditions of the world” to the original six religions recognized during “Universal Worship”.

In Europe, Inayat Khan’s following was led by various members of Inayat Khan’s family until 1958 when, on the death of Muhammad Ali Khan (a cousin), the “Sufi Movement” based in Geneva and the “Sufi Order” based in London became independent of each other. The Sufi Movement tended to emphasize “universal mysticism”, while the Sufi Order tended to emphasize its Sufi, Chishti, credentials. Both groups were led until the start of the 21st

century by descendants of Inayat Khan, and both acquired their own following in the United States, especially on the west coast, as well as in other parts of the Americas, Europe and Australasia.

A second major school of non-Islamic neo-Sufism was established by Idries Shah (1924-1996). Shah’s father was an Afghan Muslim from an important family, but though Shah was born in Simla, India, his mother was a Scot whom his father had met whilst studying medicine in Edinburgh, and Shah himself was educated and lived mostly in England. He was described in his *Daily Telegraph* obituary as ‘in speech and bearing . . . the epitome of Englishness’, and was a Governor of the Royal Humane Society and of the Royal Hospital and Home for Incurables, two eminently “establishment” English bodies. Shah began publishing in 1956 with *Oriental Magic*, followed in 1957 by *The Secret Lore of Magic: Books of the Sorcerers* and *Destination Mecca*. His most important work, *The Sufis*, was published in 1964, with an introduction by the British novelist and poet Robert Graves (1895-1985). Another literary admirer of Shah’s, the British novelist Doris Lessing (b. 1919), described *The Sufis* as ‘the most surprising book I had read, and yet it was as if I had been waiting to read just that book all my life’. In 1965, Shah founded the Institute for Cultural Research ‘to study, educate and publish in the field of human thought’, and then a publishing house, Octagon Press. Octagon published Shah’s books once they had gone out of print with general publishers, as well as a range of translations of major, classic Sufi writers.

Unlike Inayat Khan, Shah never established himself as the leader of a large, formal group of disciples. Although according to some accounts he had joined the Naqshbandi order, Shah laid no stress on receipt of authority from living Sufis. His personal teaching was restricted to periodic “supper sessions” attended by about thirty people at a time, and to an extensive correspondence. His importance lies not so much in his direct disciples as in his books: by the time of Shah’s death in 1996, *The Sufis* and another twenty or so books had sold 15 million copies in twelve languages.

Like Inayat Khan, Shah separated Sufism from Islam, maintaining (in the words of Doris Lessing) that ‘the Sufi truth is at the core of every religion, its heart, and religions are only the outward vestments of an inner reality’. The Islamic Sufi content of his books, however, is far higher than that of the teachings of Inayat Khan. Several of Shah’s books are essentially anthologies of texts chosen from classic Sufi sources (with which he was well

acquainted), supplemented by folk tales which Shah collected from across Asia as a young man, especially the sayings attributed to the mythical Mulla Nasr al-Din. The almost exclusively Islamic content and inspiration of his works might justify the description of Shah as a Sufi writer addressing a Western audience, were it not for Shah's own disavowal of mainstream Islam, the lack of a significant link to an Islamic Sufi order, and the absence of normal Islamic practice from his immediate circle.

Non-Islamic neo-Sufism was also an element in the → Gurdjieff Tradition. Both → George Gurdjieff and → P.D. Ouspensky alluded frequently to their Sufi contacts, as did other Gurdjieff teachers such as the Englishman J.G. Bennett (1897-1974), who visited Sufis in the Islamic world and from 1963-1966 followed Idries Shah, and Oscar Ichazo (1931-), a Chilean follower of Ouspensky who established the Arica Institute in New York in 1971 and was instrumental in the popularization of the Enneagram (often said to have a Sufi origin), first as a technique for personality testing and then in other applications.

Partly Islamic neo-Sufism has always been found in the Islamic world, and emerged in the West only shortly after non-Islamic neo-Sufism. Partly Islamic neo-Sufism is an intermediate category, comprising those groups and individuals which maintain the link between Sufism and Islam, but are nonetheless sectarian in the sense that they have characteristics of belief or practice which would be condemned by the vast majority of Islamic Sufis. Partly Islamic neo-Sufism is often more difficult to identify than non-Islamic neo-Sufism, since partly Islamic neo-Sufis do not declare themselves as such, usually claiming to be part of the Islamic Sufi tradition. A second difficulty is that the difference between partly Islamic neo-Sufism and Islamic Sufism is often one of degree, so that the border between the two is not always clear. In both the Islamic world and the West, Islamic Sufi groups are often accused of beliefs or practices which bring on them general condemnation; some of these groups are really neo-Sufi, and some are not.

The earliest partly Islamic neo-Sufis in the West were individuals who joined Sufi orders in the Islamic world but subsequently used Sufism as one element in a personal amalgam more related to Western esotericism than to Islamic Sufism. Amongst these were Rudolf Freiherr von Sebottendorff (1875-1945) and Ivan Aguéli (1869-1917). Sebottendorff, a German who took Ottoman citizenship and had previously been active in → Freemasonry, joined a Sufi order in Turkey while in

his mid twenties, probably in 1898-1899. On his return to Germany in 1913 he became involved with a variety of esoteric organizations, notably the Germanen Order. He founded the Thule Society in 1917-1918, and in 1918 gave instructions for the establishment of the Deutsche Arbeiterpartei, a political group which in 1919 was joined by Adolf Hitler, who transformed it into the Nazi party. Aguéli, a Swedish painter resident mostly in France who had previously been a member of the → Theosophical Society, joined a very minor branch of the Shadhiliyya order in Egypt in 1907, at the age of 38. On his return to Paris he wrote on aspects of Islam in esotericist journals, and when he admitted → René Guénon into the Shadhiliyya order in 1912 this was more in the spirit of giving an esoteric initiation than in the spirit of Islamic Sufism.

From the time of his emigration from France to Egypt in 1930 at the age of 44, Guénon was a Sufi rather than a neo-Sufi, but both Sufism and partly Islamic neo-Sufism are found amongst the various groups established by adherents of his version of the *Philosophia Perennis* [→ Tradition]. The most important of these groups, the Maryamiyya, is considered by many to display neo-Sufi characteristics. The Maryamiyya was established by → Frithjof Schuon, who joined the Alawiyya order of Ahmad ibn Mustafa al-Alawi (1869-1934) in Algeria in 1932 at the age of 25, and on this basis established a following of his own, principally in Switzerland, France, and the United States. He gradually modified the practice of the Alawiyya and later renamed his own group the "Maryamiyya". Schuon's belief in the "transcendent unity of religions" led to the adoption of concepts and practices from outside Islam, notably Hindu concepts such as *avatar*, Christian imagery such as icons of the Virgin Mary (after whom the Maryamiyya was named), and Native American practices such as the Rite of the Sacred Pipe. Attempts were made to keep these elements separate from the Islamic practice of the Maryamiyya proper, but for at least some of Schuon's followers non-Islamic elements acquired a significance which would justify the appellation of neo-Sufism rather than Sufism. Other followers of Schuon's, many of whom occupied prominent positions in academia and the public eye, have been mainstream Islamic Sufis. Some of these established Sufi groups of their own after breaking with Schuon, among which was the Alawiyya established in France by the Rumanian diplomat Michel Vâlsan (1907-74), a one-time disciple of Schuon's. This group was a model of Islamic orthodoxy.

Later partly Islamic neo-Sufi groups range from

the barely Islamic to the almost Islamic. At one extreme is the Mauritian merchant Paul de Séligny (1903-?), whose small group in Monaco and the south of France followed him during the 1960s through successive incarnations as neo-Sufi *shaykh*, Hindu *guru*, newspaper proprietor and finally reforming educationalist. At the other extreme are groups which remain close to Islamic Sufism even though they explicitly state that their members need not be Muslim. Prominent among these is the Threshold Society, established in California in the early 1990s by Edmund Helminski (1947-) and his wife Camille Adams (1951-), both translators of Jalal al-Din Rumi (1207-1273), the founder of the Mevlevi order and in the 1990s one of America's best-selling poets. Helminski, who is himself Muslim, joined the Mevlevi order in Turkey and was recognized there as a Mevlevi *shaykh* in 1990, but allowed non-Muslims to join his own Mevlevi group in the United States. Unlike non-Islamic neo-Sufis, Helminski recognized the Islamic nature of Sufism, adopting a subtle position which held that a Mevlevi Sufi need not 'embrace the religion of Islam in its outer, sociological form' so long as, for example, he studied the Quran and the *hadith*. The possibility that a Mevlevi might become a Muslim in form as well as "essence" is not excluded, and Helminski describes the Threshold Society as 'a bridge towards Islamic practice'. Similarly close to Islam was the Sri Lankan Tamil Bawa Muhaiyaddeen (c. 1900-1986), who founded the Bawa Muhaiyaddeen Fellowship in Philadelphia after he travelled, already an old man, to the United States in 1971. Bawa maintained that Sufism was a 'path beyond all religions' but followed and led many of his followers in a practice that was essentially Islamic, including for example the five daily prayers and the Ramadan fast. Neither group has important sources of doctrine or practice from outside Islam, and groups such as these are close to Islamic Sufism.

MARK SEDGWICK

Neo-Templar Traditions

If classic historiographical methods are respected, there is no reason to believe that the Order of Templars survived in any fashion after its abolition by Pope Clement V in 1314. The Templars who survived the stake or prison probably joined other knightly or religious orders, or returned to lay status as soldiers or feudal landowners. Absolutely no medieval document suggests even a residual survival of the "Order of the Poor Knights of Christ". It is naturally hazardous to make conjectures about what the Templars' destiny might have been, if it had not been shattered by the joint interests of the pope and the king of France. History cannot be remade! But one may imagine it as being little different from that of similar orders, such as the Hospitallers of Saint John (the Knights of Malta) or the Order of Saint-Lazare. The Order of Malta became in the 17th and 18th centuries what it has remained to this day: an essentially nobiliary and charitable institution. Saint-Lazare was annexed by the French sovereigns and became an order of the King: a national decoration complete with a structure for distributing pensions to his favored subjects. This was what happened to the one and only Templar branch that survived abolition, thanks to the protection of the kings of Portugal. At first only the name changed, but over the centuries the "Order of Christ" was also

transformed into a national decoration. It is nowadays one of the prestigious decorations of the (secular) Portuguese Republic, particularly awarded to foreign dignitaries.

Similarly, for the medievalists there is no document to suggest that the Templars professed anything but the orthodox Catholic faith, for which they had fought hard for two hundred years, and especially no esoteric concepts. The grave accusation of heresy that was first made when they appeared before the tribunals was nothing but the typical trial procedure of the time, in which the accused was condemned in advance. Thus nothing in actual history anticipates the fabulous and legendary destiny that the Order of Knights Templar would enjoy, centuries after their disappearance. The secret survival of the Templars was originally an exclusively masonic myth, but in the course of three hundred years it spread far beyond the world of the lodges. It is a rare example of a masonic legend becoming the direct source of a classic figure of the Western imagination.

The “true” Templars thus disappeared between 1310 and 1320. Chivalry itself, of which they had been among the most illustrious representatives, only survived them for a few decades and gradually faded away during the second half of the 14th century; but the ideal – or to use a neutral term, the imaginary world – of chivalry survived them. This very persistence of the chivalric imagination through the centuries is a most unusual phenomenon in the history of ideas. Whilst the romances of chivalry lost their literary status in the 15th and 16th centuries, they continued to be read, as testified by countless editions up to the 18th century. The other element that illustrates and supports the vitality of chivalry in the French imagination of the 17th and 18th centuries is the steady interest in the military orders and their history, as shown by the copious bibliography of “treatises”. The history of the improbable number of knightly orders, as presented in them, is in fact a unique history: that of the persistent battle waged by certain people throughout the centuries to maintain the ideal of chivalry. If they speak at length about the facts, often epic and sometimes mysterious, which explain the creation of these orders, it is because of what those circumstances teach about the nature of this knight’s battle against human contingencies, the forces of evil or destiny. Another indication of the importance of the symbolic level in these works appears in the long descriptions of coats of arms, chains of office, and costumes attributed to the various orders. In view of the large number of books in this field published up to 1730,

there must have been few 18th-century libraries lacking one or more works on chivalry, whether romances or treatises. Thus one is not surprised to find in the library of the Comte de Clermont, Grand Master of French → Freemasonry from 1743 to 1771, *Amadis de Gaule*, *Histoire du Chevalier du Soleil* (History of the Knight of the Sun), *Histoire de Bertrand du Guesquelin*, and also Abbé Vertot’s *Histoire de Malte* (History of Malta), of whose four large volumes more than one is devoted to the Templars.

Modern speculative Freemasonry, formed in London from 1717 onwards, took root in France around 1725. It probably worked the two degrees inherited from the operative masonry of Scotland, Entered Apprentice and Fellow-Craft, adding in the 1730s a third grade called Master Mason. Between this time and 1760, the French freemasons discovered other degrees and put them into practice. The three first degrees (Apprentice, Fellow-Craft or *Compagnon*, and Master) are called “blue” or “symbolic” in the French masonic tradition, and “craft” degrees in British masonry. The other degrees have become known in France as “hauts-grades” or “écossisme” (“Scottish”), and as “side degrees” in Great Britain – names which are incorrect in the literal sense, but firmly established by usage. These other degrees became one of the favorite forms of expression in the spiritualist and esoteric currents which developed during the 18th century. Souls in quest of the chivalric ideal, Hermetic secrets, or divine mysteries turned to these rituals with their alluring names such as “Perfect Master”, “Elect”, “Knight of the Orient”, “Rose-Croix”, and of course “Knight of the Temple”. The emergence and nature of these masonic high degrees is one of the most obscure and surprising aspects of the Age of Reason’s hidden side. The high degrees thus became the route by which the chivalric imagination, and consequently the Templar legend, invaded Freemasonry.

In France, the first high degrees probably appeared during the 1730s, from which time some took Freemasonry itself to be a knightly order. Ramsay, in his celebrated *Discourse* of 1736, explained that masons are the descendants of the Crusaders. From the moment that Freemasonry was associated with chivalry, especially if this was the chivalry of the Crusades, the Templars were not far off. In 1737 we read in a gazette: ‘A new Order has been founded in Paris which comes from England and is called . . . Free-Masons. Those of this Order take an oath of fidelity . . . and it is somewhat like the Order of the Templars’. In 1746, *L’Examen de la Société des Francs-Maçons* . . . (Examination

of the Society of Freemasons) explained that ‘The Free-Masons, like the Templars, have points that are so essential and secret between them that they would rather die than reveal them’. In another example of 1752, *Les vrais jugemens sur la société des Francs-Maçons* . . . (The True Judgments about the Society of Freemasons), we read that ‘in considering the last state of [the sect of] the Templars, it seems that it has revived completely in that of the Masons’. Thus from the 1740s onwards, public opinion forged a link between the masonic mysteries which were beginning to be the talk of the town and the Order of the Temple. Lastly, we cite the memoirs of the great archivist of French masonry in the 18th century, → Jean-Baptiste Willermoz: ‘. . . from the year 1752, . . . having been chosen to preside over the [lodge] that had received me, . . . I mysteriously told those on whom I conferred this 4th degree of the [lodge] that they were becoming successors of the Knights T[emplar] and of their knowledge; I repeated it, and have repeated it for ten years, as I heard it from my predecessor, who had heard it himself from an ancient tradition, whose origin he did not know’.

By the 1740s, and perhaps earlier, some masons were claiming a filiation with the Knights Templar, so prestigious and rich in symbolic potential. The appearance of the “Templar” high degrees and the enthusiasm for them on the part of the brethren in turn nourished and amplified the legend. The birth of the Templar degrees is one of the most obscure subjects, on which new information has only just been discovered: it appears that a Templar high degree, the “Ordre Sublime des Chevaliers Elus”, was actually created before 1750 in Stuartist circles. What “rare and precious knowledge” did this archaic ritual of the Knight Kadosh convey? On first reading, the masonic student feels a certain disappointment: far from new revelations, it all has an air of *déjà-vu*. In fact, it is nothing but a ritual of the “Élu des Neuf”, one of the earliest and commonest degrees of the 18th century, which someone has decked out in knightly dress and equipped with a “mysterious ladder” – and a rather curious legend in which the Templars figure. One cannot avoid the feeling that it is a montage, or even cobbled together. But these are the thoughts of a 21st-century analyst. Placed in the masonic context of the 1740s, it is precisely its proximity to the grade of Elu, even in its title, which makes the Ordre Sublime des Chevaliers Elus significant. This ritual then appears as an unveiling, and that is its message and the key to the new perspective that it offers. The grade of Elu is one of the earliest degrees of speculative Freemasonry. It is also closely con-

nected by its symbolic theme to the degree of Master. It was thus known to all masons, perhaps as early as the beginning of the 1730s. Now, the ritual of Knight Kadosh of the Ordre Sublime des Chevaliers Elus gives us something more, revealing a secret part of the degree of Elu: this degree, which everyone in the masonry of the first half of the 18th century thought he knew, is in fact the vestige and the survival of one of the most illustrious orders of chivalry – a Sublime Order, but extinguished through an injustice. On closer examination, the legend of the degree of Chevalier Elu contains several other elements. First, the Chevaliers Elus are the descendants of the Templars who have survived secretly into the 18th century. Secondly, the Order of the Temple was itself nothing but the prolongation of a long line of initiates. The third and most important element is that it was in Scotland, and around the tragic destiny of the House of Stuart, that the Ordre Sublime survived.

This legend reappears in the most famous of the Templar masonic systems of the Enlightenment, the “Templar” Strict Observance which arose in Germany during the 1750s around Baron von Hund (1722-1776), who was its emblematic figure for a quarter of a century. After the three degrees of symbolic Freemasonry, the brethren were invited to join the “Inner Order” with two degrees of Novice and Knight Templar. It was then revealed to them that authentic Freemasonry in fact concealed a survival of the Order of the Temple, governed in an occult manner by “Unknown Superiors”. The Templar Strict Observance enjoyed great success in Germany, where it dominated masonic life during the 1760s and 1770s. Grouped into “provinces”, these new Templars modelled their organization on what they thought they knew of the medieval order’s administration. Thus, interpreting the texts with some freedom, France harbored the Province of Burgundy based at Strasbourg (sic), that of Auvergne at Lyon, and that of Septimanie at Montpellier. The Strict Observance was established in France in 1774, first at Strasbourg, then at Lyon. At the end of the 1770s, the question of the veracity and nature of Templar filiation caused a serious crisis. The Convents of Lyon (1778) and Wilhelmsbad (1782) brought about its mutation into the Régime Ecosais Rectifié. The Inner Order renounced Templar filiation (though in quite ambiguous terms), and the teaching of the system was laid wide open to the theosophic doctrines of the theurgist → Martinès de Pasqually. Nowadays, the ties between the Ordre Sublime des Chevaliers Elus and the Stricte Observance Templière are difficult to discern with precision, but they seem very probable. In any case,

some of those who, like → Johann August Starck, played a role in the turbulent history of the Strict Observance, derived their “Templar” filiation from the Ordre Sublime des Chevaliers Elus. The Grand Priors of the Régime Ecossais Rectifié and the Swedish and Danish masonic orders maintain to this day, in different ways, part of the complicated heritage of the Strict Observance.

The other major masonic current which has claimed descent from the Order of the Temple also issued from the Ordre Sublime des Chevaliers Elus. After an apparent eclipse in the 1750s, the degree of Knight Kadosh became highly successful in Freemasonry during the last third of the 18th century. In 1761, the Conseil Suprême des Grands Inspecteurs Grands Elus, Chevaliers Kadosh constituted the inner circle governing the First Grand Lodge of France. At that time, it crowned a system of twenty-five high degrees which, after many vicissitudes, were increased to thirty-three in 1801. Even today, the Supreme Councils of the Ancient Accepted Scottish Rite rule a masonic system whose most eminent degrees rest on the Templar legend. The Anglo-Saxon countries have a third variation of Templar masonry, attested to since the 18th century. It is very probably of continental origin, although the question of the origins of the “Knight Templar” is nowadays very obscure, and very little studied.

The success and development of the masonic degrees which, in the 18th century, claimed the heritage of the Order of the Temple, brings us to a veritable legendary cycle in the medieval literary sense. Since 1760, based on the accusation of heresy and on an ambiguous phrase of → Cornelius Agrippa, masons have attributed esoteric knowledge to the Templars. Naturally it concerned their alchemical skill, which supposedly lay at the origin of their immense wealth. Since then, the versions of their history have proliferated, each adding to the story some new details about the dire end of the unfortunate knights, the secrets of their survival, and the mysteries of their occult hierarchy. During the second half of the 18th century, one can see a whole imaginary continent arising.

High-degree Freemasonry, established in the 18th century, transmitted the Templar degrees to posterity, degrees which were very popular among Freemasons throughout the 19th century. For example, the practice of the degree of Knight Kadosh never ceased to increase everywhere in Europe. But while the Templar legend remained much in evidence, it was in quite a different mode from that of the 18th century. In the 19th century, the Templars’ heresy and their opposition to the

King of France often caused them to be represented as precursors of anticlericalism and the democratic movements, while the gnosis that they were supposed to have possessed became assimilated to the religion of nature. Following the trend of the age, esotericism and socialism made excellent companions.

The beginning of the 19th century also witnessed an important event in the destiny of the Templar legend. Until 1805, neo-Templarism had been closely associated with Freemasonry, but in that year there appeared, within the framework of the Grand Orient de France, “Les Chevaliers de la Croix”, an “order of the Orient” which, it was revealed to the initiate, was in fact the survival of the Order of the Temple. All of this was very classical, and this new Templar masonic order – organized by → Bernard-Raymond Fabré-Palaprat – differed from its predecessors only by its taste for a very theatrical Templar ceremony in true First Empire style, and by an especially pompous set of titles. But in the months that followed its foundation, perhaps in consequence of quarrels with the Grand Orient, the Templars of the “Chevaliers de la Croix” proclaimed that the true Order of the Temple had nothing to do with Freemasonry. For the first time, a neo-Templar order claimed a secret survival outside of any masonic framework. This order is at the source of a strange and celebrated document (and of course apocryphal): the *Charte de Larménus* (Charter of Larmenius), which describes the lineage of Grand Masters who secretly maintained the order after the execution of Jacques de Molay up to the beginning of the 19th century. Fabré-Palaprat and his disciples attributed to the Templars a whole collection of secret knowledge, notably a (fifth) gospel forgotten by history: the Levitikon. Against the fanaticism and superstition of the Church of Peter in Rome, the Templars were said to have preserved the Church of John and the original Christian faith in all its purity. Beside the Order of the Temple, a “Johannite Church of Primitive Christians” was organized, complete with bishops and liturgy. The Ordre du Temple was highly successful in France during the first half of the 19th century, spreading to Switzerland, Great Britain, and several other countries. After 1840 it went into decline, fading around 1850 and apparently disappearing completely in the second half of the 19th century. Fabré-Palaprat’s Ordre du Temple is at the source – more mythical than real – of several current neo-Templar orders, notably the one directed from Portugal since the 1950s by de Souza-Fontès.

Having been considered as initiates since the

middle of the 18th century, the “Templars” found themselves implicated in the occult revival of the end of the 19th century. The → “Ordo Templi Orientis,” founded by Theodor Reuss and then expanded by → Aleister Crowley, appears to have been the inner circle of a whole series of occultist organizations. For its promoters, the secret of the Templars consisted in nothing less than sexual magic. The young → René Guénon, during his formative years, participated in an effort to revive the Ordre du Temple, as demanded by the “spirit” of Jacques de Molay in the course of a spiritualist séance. Another Order of the Temple, founded in Germany just before World War I by → Lanz von Liebenfels (Adolf Lanz), was organized on the principle of the Roman Catholic hierarchy and recruited those deemed to be “Aryan heroes”. Lanz was one of the primary representatives of the ariosophic current in Germany [→ Ariosophy], racist and proto-fascist in character. Several neo-Templar orders were created in the second half of the 20th century. There was the Order of the Solar Temple, founded by the disciples of Jacques Breyer in 1952 in a context of paranormal phenomena reputedly observed in the Château d’Arginy, near Lyon. In 1970, Christian Bernard, then Grand Master of the Ancient and Mystical Order of the Rose-Croix (AMORC), founded an Ordre Rénové du Temple after meeting a mysterious “Cardinal Blanc”, in a modern version of the mythical “Unknown Superiors.” In the middle of the 1980s, Luc Jouret and Jo di Mambro monopolized two subsidiary branches of these two organizations and, following a terrible sequence of events, led part of the membership to collective suicide.

Today’s neo-Templar organizations are very diverse. A majority of them remains solidly anchored in the masonic body, of which they constitute the high-degree systems. Their neo-Templarism is very mild, consisting mainly in promoting the chivalric ideal, often combined with an interest in gnostic doctrines. Their reference to the Templars is essentially symbolic. Outside Freemasonry, several neo-Templar organizations in fact qualify as fantasy orders of knighthood. Others are attached to the neo-spiritualist movement, or even to the → New Age. Today, outside the esoteric milieu properly so called, belief that the Templars survived by virtue of their secret knowledge is largely sustained in the public mind by popular best-sellers such as *The Temple and the Lodge* (by Michael Baigent and Richard Leigh, London 1989) or *The Hiram Key* (by Christopher Knight and Robert Lomas, London 1995).

The prestige of an illustrious order, and the sup-

posed heresy of knights familiar with the mysterious Orient: these two traits met in the 18th century in an unexpected but historic encounter that made of the Templars the heralds of a reviving gnosis. The Templar degrees of Freemasonry served as the framework and support for this “precious and secret knowledge” which, in the paradox of the century, fascinated the men of the Enlightenment who were critical towards religious institutions but dissatisfied with the emergence of modern rationalism. As the historians say, “A false idea is a real fact”. It matters little whether the survival of the Templars is an invention, or not. On the margin of church orthodoxy and secular history, the Templar legend created an area welcoming the most varied speculations. Since the same causes produce the same effects, the Templars lived on for three centuries in literature and eso-steric movements, protecting beneath the folds of their great mantle, for better or (sometimes) for worse, the “quest” of men who, now as then, feel themselves to be strangers in a world grown too profane.

Nerval, Gérard de (Gérard Labrunie),
 *22.5.1808 Paris, † 26.1.1855 Paris

French poet and writer. He participated in the “battle of *Hernani*” (1830), associated with “Les Jeunes-France”, and was taken with an invincible passion for the actress Jenny Colon (1808-1842). Suffering a complete mental breakdown in 1841, he traveled to the Middle East (1843) and upon his return survived for ten years on minor jobs in publishing and journalism. He had another breakdown in 1853 and never fully recovered; he was hospitalized several times in Doctor Blanche’s mental clinic in Passy. A few moments of lucidity allowed him to write his masterpieces: *Sylvia* (1853), *Les filles du feu* (1854), and *Les Chimères* (1843-1854). On 26 January 1855, just as *Aurélia* was beginning to be published, he was found hanged from the railing of a staircase in rue de la Vieille-Lanterne in Paris.

Nerval, in the first page of *Illuminés* (1852), chapter “La bibliothèque de mon oncle”, traces his taste for the occult back to childhood. It is possible that some works he had discovered very early could have fed his imagination, but he does not give us any titles and we are reduced to conjectures. Similarly, we cannot trace precisely the various stages of his exploration of esotericism. The reading of → Goethe, whose *Faust* he translated (1828), and his discovery of Hoffmann (1776-1822) doubtless introduced him to → mysticism and awakened his thirst for the infinite; he then had a revelation of the secret → correspondences maintained by poetry, dreams and madness, three experiences that led him to explore invisible and ineffable realities. The milieu Jeunes-France, the Petit-Cénacle and the Hotel du Doyenné that he frequented assiduously between 1830 and 1835 were not foreign to such preoccupations; he let himself be influenced little by little by this ambiguous atmosphere where his latent dementia, which would explode in 1841, found sustenance while leading him imperceptibly toward an esoteric and mystical conception of the world. His friend George Bell (1824-1899) characterized his approach very well: ‘Above all he found infinite joy in teaching himself the mysteries of the occult sciences . . . With scraps of the Kabbalah [→ Jewish Influences], the mystical reveries of → Cazotte, some theosophy [→ Christian Theosophy] of → Saint-Martin, the scarce works of → Swedenborg that were almost unknown, he composed his own theories to explain everything that could have surprised him . . .’.

Moreover, Nerval himself, in *Aurélia* (1855), mentioned his favorite readings: ‘an odd assort-

ment of the knowledge of all times, history, travel, religion, Kabbalah, → astrology, to make the shades of → Pico della Mirandola, the sage Meursius and → Nicholas of Cusa rejoice’. Indeed his investigations embraced a wide area, but he surely did not devote himself to the deep study of → Martinès de Pasqually, of → Boehme and of → Marsilio Ficino. He was often content to thumb through compilers and popularizers: → Court de Gébelin, Herbelot (1625-1695), Abbot Villars (1635-1673), Bekker (1634-1698), Collin de Plancy, etc. He drew from the best and the worst, gave his fancy free rein and above all looked for material to stimulate his imagination. He was enchanted by strange words and marveled at the most enigmatic engravings; he thus had a high opinion of *Melencolia* by Dürer (1471-1528), *Modestie* by Lefèvre (1798-1864), the astonishing plates in *Oedipus Aegyptiacus* by → Kircher and the striking figures of the → Tarot. Highly interested in etymology and occult geography, he engaged in kabbalistic calculations concerning dates, his age and all sorts of numbers that came up by chance. He moved in the world of symbols, developed imaginary genealogical trees, and drew composite portraits where for example a woman, a giantess haloed with seven stars, could symbolize at the same time Diana, the Virgin Mary, Artemis, Saint Rosalia and Jenny Colon, the beloved actress. These approaches are situated between playful activity and magical operation without it being possible to favor one attitude over another. However, Nerval was especially fascinated by the symbolic richness of → alchemy and there is an obvious connection between *Les Chimères* (1843-1854) and the *Visions hermétiques* of → Nuysement.

Nevertheless, here again, imagination and non-chalance, deep conviction and authentic belief are curiously blended. Gérard uses for example the *Dictionnaire mytho-hermétique* of → Pernety the way others would a rhyming dictionary, by glean- ing the terms that captivate him in order to introduce them, here and there, in a sonnet: an essentially poetic manner of letting words have the first initiative. Nevertheless, it does not follow from this that alchemy was for him only a glossary of mysterious terms. He connected it with his inner life, and discovered a subtle relationship between his own destiny and that of the philosopher’s stone, whose transmutation, in the image of Christ’s Passion, represented for him the ancient spiritual principle according to which one must die in order to be reborn. In the metamorphoses of the stone, Nerval relived his own drama, as a metaphor of the drama

of the world. Certainly, Nerval was fascinated by → animal magnetism, black magic, → Illuminism, gnosis, arithmosophy [→ Number Symbolism], astrological symbolism and alchemical meanings, but even if he may have been a Mason, his esoteric knowledge did not make of him an adept bound to an immutable doctrine; he was not the faithful disciple of any religion, of any sect, of any obedience, of any theory. The preface of his translation of *Second Faust* (1840), a true spiritual testament, is in this respect very significant; having recourse to illuminist intuitions, he preaches there a syncretism founded on the unity of religious traditions. This quest results in what he calls “modern pantheism”, of which Goethe is for him the purest representative. Gérard then becomes intoxicated with the idea that nothing dies, that eternity concentrates, in a divine synchronism, the whole of universal history, visible through the eyes of the soul. From 1842 until his death, he would not cease to live in a world of mysterious correspondences. His sojourn in the Orient (1843) confirmed him in his convictions by convincing him that they agreed with archetypal realities transcending space and time. Isis, Horus, Antaeus, Prometheus, Pandora, Orpheus, Icarus: all divinities were useful to him, but he retained only what harmonized with his dream, and saw in myth only a tangible expression of the invisible, of which man, intermittently, can perceive the irrefragable presence.

Thus, Nerval borrowed disparate materials from the various secret doctrines. Stimulated by his mental troubles, he retained the most heterogeneous elements and the most varied symbolic systems to develop a resolutely personal myth, whose fulfillment he would pursue until his death. By means of an archetypally Romantic approach, he situated his Self in the heart of his metaphysical concerns and attempted, through the magic of art, to make real his own spiritual accomplishment: a symbol, in his opinion, of universal salvation.

New Age Movement

1. DOCTRINES AND RITUALS
(A. HEALING B. CHANNELING
C. DIVINATION) 2. SOME
SOCIOLOGICAL CHARACTERISTICS
3. ROOTS: THE ESOTERIC
BACKGROUND 4. NEW AGE RELIGION
AND MODERNITY 5. WHITHER THE
NEW AGE?

The New Age has emerged during the 1970s and increasingly during the 1980s as a common denominator for a variety of quite divergent contemporary popular practices and beliefs. Among other things, healing, channeling, the interest in crystals, varieties of positive thinking and several forms of divination [→ Divinatory Arts] have been linked to this term. The New Age also includes various “alternative” interpretations of history and of the sciences.

The term itself originally arose in theosophical literature and in UFO cults [→ UFO Traditions] after World War II in connection with the millennialist belief that the world stands at the brink of a major evolutionary transformation of consciousness, often identified in early New Age literature as the Aquarian Age. Many of those sympathetically involved in the first years of the New Age movement principally saw the various techniques of healing, divination etc. as tools in this transformation. This sense of the term New Age was in the later 1970s and in the 1980s largely superseded by a new and expanded meaning. It no longer refers to a specific movement that expects the coming of a new age, but refers to a wide array of ideas and practices, largely united by historical links, a shared discourse and an *air de famille*. The two uses of the term have been characterized (Hanegraaff 1996, 94-103) as the New Age *sensu stricto* and *sensu lato*.

1. DOCTRINES AND RITUALS

We are frail beings, prey to the fear of an uncertain destiny, the prospect of disease and ultimately death. Questions prompted by such existential concerns are in most forms of folk religiosity answered in an unsystematic fashion, often through a process of bricolage from already available narratives and rituals. Much less commonly, individuals with a systematizing bent will attempt to harmonize the various answers to such questions. In this respect, much of the New Age is indeed a mode of folk religiosity. Illness is

explained by pointing at various doctrines that underlie healing. Astrologers and other diviners attempt to ritualistically foretell the future. Legends of past lives offer the hope that physical death is not the end, but merely a transition to something new and perhaps better. However, the concrete details of various healing systems, the specific views presented by various writers on astrology or the particular theories of → reincarnation found in New Age texts can be left vague, and can differ to the point of being mutually inconsistent. In the New Age culture, attempts have nevertheless been made to construct a coherent whole from these answers. More typically, perhaps, the variety of doctrines and rituals point at an underlying vision that is rarely spelled out in full. An attempt at reconstructing this underlying vision might include the following items:

1. The entire cosmos is not so much a vast set of material objects as a great, interconnected web of meaning.
2. The underlying “stuff” of the cosmos is therefore not matter but something intangible, perhaps identifiable as consciousness or energy.
3. We humans contain a spark of this energy or consciousness within us, a resource that we can tap into in order to change reality and create our own worlds.
4. The human being is thus not only a material body, but also comprises a mind and a spiritual element. When ill, one needs to address all of these elements rather than merely treat isolated physical symptoms.
5. Each of us is embarked on a journey of spiritual development, a development that will not stop at the death of the physical body but will continue over many lives.
6. There are better ways to get to understand the world we live in and our own place in it than via the intellect. Perhaps we can gain spiritual insight in flashes of intuition. Perhaps there are prophetic states in which we can access knowledge from various highly developed beings, or from a divine part of our selves. A variety of techniques such as → astrology or the → tarot can also have this function.
7. Similar insights into the workings of the cosmos and into our own selves were granted to a number of ancient cultures, ranging from Egypt and India to the native Americas.
8. Such insights are confirmed by the most recent developments of Western science, especially quantum mechanics.
9. Spirituality is not a matter of accepting doctrines formulated by others, but rather a highly individual quest, that can (and perhaps should) be based primarily on personal experience.
10. We can either as individuals or collectively change the world into a better place by adopting such a spiritual vision.

Besides comprising a set of doctrinally related

worldviews, the New Age is also an intensely ritualistic form of religion. The belief that body, mind and spirit form a whole and should be treated as such has led to a profusion of systems of holistic ritual healing. The idea that there are states of consciousness in which it is possible to access spiritual knowledge has led to the emergence of ritualized means of reaching such states, generally termed “channeling”. The belief in a plan of spiritual evolution has generated a variety of divinatory techniques to gain insight into this plan. Let us take a brief look at these three aspects of New Age ritual.

A. HEALING

Medical anthropology distinguishes disease (which is definable from a biomedical perspective) from illness (which is defined from within a given local worldview). Although Western forms of complementary medicine certainly also attract clients with biomedically definable diseases, the spiritual aspect of healing within a New Age framework typically implies addressing culturally constructed states of illness. Indeed, New Age conceptions of health can imply such a high level of physical, emotional and spiritual functioning that an entire spectrum of social and existential problems, any perceived lack of vitality or creativity, even the “normality” of everyday life, can be understood in terms of a lack of health that stands in need of treatment. The methods employed in healing vary from the laying on of hands to the use of a broad variety of ritual substances and objects. Reiki and Therapeutic Touch involve the use of the healer’s hands. Crystal healing presupposes that gems and minerals possess healing properties. Color therapies and Aura-Soma therapy assume that colors influence physical and spiritual well-being. Bach Flower Remedies attempt to derive similar effects from plants. These ritual methods rely on specific cosmological doctrines as well as theories about the constitution of the human body. In a kind of epistemological circle, the validity of these doctrinal claims is in turn commonly derived from the pragmatic certitude that the various modalities of ritual healing work. Four such doctrines are common to a diverse set of practices. Firstly, it is generally held that there are normally invisible vital forces (“energies”) that surround and/or pass through the human body, and that the therapist is able to manipulate these energies. Secondly, the body is a holistic system. The body as a whole is mirrored in the feet (reflexology), on the outer ears (as in one modern, Western development of acupuncture), or in the eyes (iridology). Theories of Chinese origin, according to which the vital forces

flow through channels connecting the diverse parts of the body into an integrated whole, have been eagerly embraced by New Age healers. Thirdly, body and spirit are also part of a whole. By treating the body, the spirit can be healed. Conversely, by treating the spirit the body is healed. Fourthly, the body has a hidden anatomy. Thus the human aura, a colored sheath said to enclose the physical body, is held to provide clues to the state of the client's health. The hidden anatomy is often understood to comprise seven or more centers of vital force, the *chakras*.

B. CHANNELING

In traditional cultures throughout the world religious specialists have functioned as links between human beings and what each culture understands to be spiritual reality. The New Age counterpart of this process of prophetic revelation is generally known as channeling. Channeled messages generally convey a synthesis of psychology and religion, a pattern of syncretism that has permeated much Western religious thought in general over the last century. If there were no experience of fear and guilt, or if the spiritual energy were not blocked, or if rationality and materialism were not the obstacles that they are to intuitive thought, human beings would recognize their true, spiritual natures. A second credo that permeates much of the channeled material of the New Age is that we create our own reality. If guilt or fear burdens us, our world will be dark and frightening. If we bring out our divine selves, the world will become filled with seeming miracles. In some sectors of the New Age, these miracles include the creation of affluence through spiritual means. These basic doctrinal elements were at the core of an early series of channeled messages, known as the Seth material. → Jane Roberts' books containing the messages of the discarnate entity Seth spread through the emerging New Age network throughout the late 1960s and early 1970s, and became trend-setting for subsequent channeled messages. They also contain a number of innovative religious ideas and concepts that have been adopted as normative by the wider New Age culture.

A second, very influential channeled text in the contemporary New Age milieu is *A Course in Miracles*. According to the founding legend, this text was received by psychologist Helen Schucman (1909-1981) through dictation from an inner voice. This voice was identified as belonging to Jesus. According to *A Course in Miracles* our everyday image of physical reality is illusory. Our conventional view of the world shows us a place

where human beings are separated from each other and from the divine, and where pain, disease and disharmony exist. However, this worldview is in reality a projection of our frightened egos. *A Course in Miracles* is intended as a manual for people who want to deconstruct this projection.

C. DIVINATION

Astrology, which is widespread in the New Age milieu, obviously predates the emergence of the New Age by many centuries. However, the interpretations of the various symbols of the birth chart have changed considerably, and have become steadily more integrated into the New Age worldview. Beside a more traditional predictive astrology, many contemporary astrologers have given their interpretations a strongly psychological imprint. This new mode of interpretation focuses on astrology as a device for inner, spiritual change. The difficulties encountered in life are explained in terms of lessons to be worked on and absorbed in the individual's present life on earth. Tarot cards are possibly the most popular method of divination within the New Age milieu. The tarot deck consists of two main parts. One part consists of a set of 22 numbered cards with pictures, the Major Arcana. The rest of the set, the Minor Arcana, consists of 56 cards divided into four suits: cups, wands, pentacles and swords. Each card is connected with its specific interpretations; in a spread, a number of cards together are said to give a picture of the client's situation as well as his or her direction of change. Other forms of divination with a following in the New Age milieu include consulting the Chinese *I Ching* or Book of Changes, and the use of runes.

2. SOME SOCIOLOGICAL CHARACTERISTICS

The New Age manifests a number of characteristic splits between emic and etic views of this form of religiosity. Firstly, New Agers can be fascinated by a worldview that to all intents and purposes is religious, but would never accept the term "religion" – associated by them with narrow-minded institutions and dogmatism – for their own belief system. Secondly, they perform rituals without being aware of doing so. Thirdly, many do not understand their own beliefs and practices as part of any wider New Age movement, but see themselves as having embarked on an individual quest. Finally, New Agers will typically understand their own doctrines and rituals as rooted in ancient cultures, although most of these beliefs and practices are demonstrably very recent innovations. Many of

these apparent contradictions can be linked to the basic sociological characteristics of the New Age culture.

How can New Agers practice what to a scholar is so obviously a form of religiosity, yet resist any suggestions that this should be the case? An important reason is the culture critique inherent in the New Age worldview. Much of the New Age was formed by the 1960s counter-culture. For many of the spiritual seekers of those days, the very word religion was hopelessly tainted with what they saw as church authoritarianism. The term "ritual" carried the unpleasant connotation of mere outward appearance and meaningless repetition. Since then a linguistic innovation has set apart more individualistic and fluid beliefs and practices as "spiritual", and the more fixed as "religious".

Other traits can be linked to the fact that the New Age is not an organized body of believers led by a spiritual hierarchy, who have ideally adopted creeds defined by a canon of writings. The loosely adopted New Age beliefs seem to belong to a different kind of religiosity, a cultural "underground" current, named the cultic milieu by Colin Campbell (1972). The cultic milieu consists of all those vast numbers of individuals who have adopted a variety of beliefs that from the majority point of view may seem more or less unorthodox. They have done so with varying degrees of commitment, without expressing them in an organized setting: people who, for instance, believe in the existence of UFOs, but would never consider joining a UFO "cult". Campbell suggested that new religious movements tend to arise out of the cultic milieu and crystallize around some of its ideas. Such movements have their life cycles, are born, thrive for a while and will more often than not pass into oblivion after a few years. The unorthodox ideas of the cultic milieu, however, are considerably more constant.

The cultic milieu can support unrelated and at times even mutually contradictory beliefs, simply because they share certain important characteristics. For instance, the belief in the messages put forth by psychics, in astrology or in the prophecies of Nostradamus constitute minority views, they are ideas that flourish in a society whose institutions take little notice of them, or even attempt to suppress them. Astrology is not taught in publicly funded schools, nor is it applied in health care, enlisted in the process of corporate decision-making or invoked in judiciary procedures. People who want to defend the value of astrology often do so in defiance of the worldview espoused by the majority. Some believers may be tempted to explain their position as the effect of a spiritual awakening that

sets them apart from the more skeptically inclined. Others can accuse a powerful materialistic orthodoxy for suppressing inopportune truths.

People in a minority position may tend to seek each other's support. They find common interests, a social network is built up, and new religious movements may gradually arise around their common views. They also become aware of each other's specialist interests: astrologers meet healers, crystal enthusiasts read texts produced by channelers. Individuals with a firm commitment to these alternative doctrines and a strong creative spirit may then suggest that all of these ideas have something in common. To the extent that an interaction and an ecumenical spirit exist between these groups, creative spokespersons may actively attempt to discover – or invent – common traits uniting their respective interests. This in turn leads to innovative syntheses between previously unrelated ideas from the cultic milieu. Thus, tarot readers and astrologers, crystal healers and aura therapists may well conclude that each of them has found his or her own way to a common goal of spiritual evolution, and will see all paths as more or less equally valid. From there, it is only a small step to creating mixtures between these doctrines and practices. A creative and entrepreneurial New Ager might thus proclaim that the different cards of the tarot correspond to the various signs of the zodiac. Some of these innovations become important new religious trends, while others remain the more or less idiosyncratic products of their originators. Thus ideas, practices and movements are born out of the cultic milieu. Some thrive, while others disappear after a few years to be superseded by new trends.

Since the innovative spokespersons of the New Age are deeply immersed in the cultic milieu, they will rarely build their new doctrines and rituals from nothing. More commonly, available methods of healing, divination or channeling will be reformulated or recombined in new ways. In this fashion, a historical chain of doctrines and their predecessors can be traced back in time. However, New Agers themselves are rarely aware of these historical links. Thus, a lavishly illustrated *Atlas of the New Age* (ed. Garry Maguire Thompson, Hauppauge NY 1999), directed at the New Age market itself, traces contemporary beliefs back to a variety of exotic sources, many of which are entirely spurious. Ironically, the actual chain of events and the existence of a long-standing tradition of alternative religiosity in the West are hardly acknowledged at all. Partly, this can be explained by the importance of constructing a venerable tradition as a source of legitimacy. However, the lack

of historical awareness is also in part due to the characteristics of the cultic milieu. Priests of most Christian denominations will have several years of academic study behind them. They will be reasonably familiar with the historical background of their own faith. Those who practice New Age healing rituals or work as diviners will, on the contrary, typically have no other education in their own field than a few short, privately run courses and varying amounts of practical experience. Legends can flourish in a culture in which there are few established channels of transmission for historically accurate information.

3. ROOTS: THE ESOTERIC BACKGROUND

The emic historiography of the New Age will thus highlight a set of exotic cultures as sources. Typically, Egypt, India, China, Tibet, the Native Americas, or even the fabled continents of Atlantis and Lemuria are claimed to be the ultimate origins of one's own methods and creeds. More scholarly historiographies, on the other hand, tend to see the New Age as an eclectic combination of several strands of Western esotericism, with roots stretching back to the Renaissance (Hanegraaff 1996, esp. Chapter 14). These Renaissance forms of esotericism were, however, radically transformed under the impact of modernization. Much of the present New Age is prefigured by the ideas of individuals crucial to this process of modernization, such as Franz Anton Mesmer and → Emanuel Swedenborg.

From the mid-19th century on, there are several main reference points from which the history of the New Age can be traced. The first reference point would be theosophy [→ Theosophical Society] and its heirs. The second would be the harmonial religions that followed the American mesmerist healer Phineas Parkhurst Quimby (1802-1866). The earliest manifestations of what would emerge as the New Age were an English phenomenon, and were largely influenced by the mystical and speculative elements found in the post-theosophical movements active in the UK. Somewhat later, as these early currents gained a foothold in America, they were integrated with the harmonial religions, leading to an increasing emphasis on personal well-being, prosperity and the idea that we create the world we live in. A third, more recent reference point has been the psychologization of religion. For the purposes of tracing the emergence of the New Age, → Jungism and the → Human Potential Movement are of particular significance.

The syncretism of theosophy, the harmonial reli-

gions and psychology, typical of the New Age movement as such, gave rise to a variety of practices that have shifted in emphasis over time. Roughly, five generations of New Age thought can be correlated with as many decades, beginning with the 1950s. (1) The late 1950s saw the first stirrings within the cultic milieu of a belief in a coming new age. A variety of small movements arose, revolving around revealed messages from beings from outer space and presenting a synthesis of post-theosophical and other esoteric doctrines. (2) These proto-New Age movements might have remained marginal, had it not been for the explosion of the counterculture in the 1960s. The cultic milieu picked up the beliefs of the proto-New Age and eclectically combined them with a variety of other elements, both of Western esoteric provenance and of various Oriental origins. (3) The 1970s were characterized by a increasing self-awareness within the cultic milieu of being a movement with shared goals. With a decade of perspective, journalist Marilyn Ferguson (b. 1938) in her apologetic and highly influential book *The Aquarian Conspiracy* (1980) summed up the New Age as a gentle conspiracy of awakened and transformed individuals. (4) The 1980s saw the increasing dominance of the New Age *sensu lato* over the millennialist New Age *sensu stricto*. Whereas Ferguson's book summed up the hopes and aspirations of the New Age *sensu lato*, the book of the 1980s that indicated where the movement had actually headed was Shirley MacLaine's *Out on a Limb* (1987). Here, the author presents her spiritual quest as a series of encounters with New Age elements such as trance channeling and the belief in reincarnation. (5) The 1990s and beyond have seen a gradual assimilation of at least parts of the New Age *sensu lato* into mainstream culture. Characteristically counter-cultural elements of the first generations of New Age have tacitly been dropped. There has been a shift in the New Age constituency from younger people to a larger age group. Moreover, whereas the first generation of New Age spokespersons used "New Age" as a self-designation, the term has become increasingly understood as a pejorative, even meaningless epithet. At the same time, New Age literature is increasingly sold in mainstream book shops and reaches the best-seller lists, and New Age beliefs and practices are prominently displayed in the popular media. The New Age as a definable *movement* may be on the wane, but the wider New Age discourse, i.e. a doctrinally and historically related group of concepts and rituals, shows no sign of disappearing.

To sum up these changes, techniques once seen as

linked by the common ideological core of a major planetary shift (a New Age *sensu stricto*) became part of an encompassing worldview that emphasized personal rather than global transformation (a New Age *sensu lato*), to finally once again become increasingly compartmentalized into a variety of practices and beliefs, of which some have successfully entered mainstream culture.

4. NEW AGE RELIGION AND MODERNITY

Although New Age sources will point at a variety of ancient and distant Others as the ultimate sources of rituals and doctrines, there are good reasons to see New Age religiosity as a quintessentially modern, Western phenomenon. The processes of modernization can conveniently be summed up in two groups. On the one hand, older elements of Western esotericism have been influenced by important shifts in intellectual culture, giving rise to a more general socio-historical phenomenon that can be etically referred to as occultism [→ occult / occultism]. On the other hand, shifts in the social structures of modernity have more specifically influenced the New Age.

The shifts in intellectual culture can (largely following Hanegraaff 1996, esp. chapter 15) be summed up in four points. Occultism remodeled elements of older esotericism in the image of the natural sciences, not least by phrasing them in terms of mechanical links of cause and effect. The emergence of Orientalist discourse, especially through the emergence of academic disciplines such as history of religion and anthropology, partially reoriented esoteric currents toward the East. Evolutionism, one of the key symbols of 19th and early 20th century discourse, entered esotericism and led to the widespread assumption that we are all embarked on a journey of spiritual progress. The syncretism with certain forms of psychology led to increasingly blurred boundaries between the concepts of psychological insight and spiritual development.

The adaptations of New Age to the structural characteristics of modernity can (loosely following the discussion in Heelas 1996) be summed up in terms such as globalization, individualization, reflexivity, commercialization and commodification. The Orientalism of occultist movements has largely been superseded by an eclectic approach typical of a globalized religious scene. Individual beliefs and practices can be picked from anywhere on the globe, from the Native Americas to Egypt, from China to Polynesia, lifted out of their original con-

texts and radically reinterpreted in order to fit the specific preoccupations of the New Age. The palette of practices that arises in this manner is used as a toolkit from which each individual New Ager can pick and combine elements ad lib. The rationale for encouraging such a mix is the characteristically modern individualistic assumption that our personal opinions are more important than the suggestions of any authority. Since contemporary society offers few tradition-bound answers to the question how we should understand ourselves and our identities, many competing models of selfhood coexist. The New Age offers a self-reflexive discourse that enables individuals to understand the shortcomings of their lives as the failure to realize their full potentials. Thus, it is the contention of self-help texts, manuals of divination as well as channeled texts that there is a true self that needs to be unearthed behind the dross of the false ego. Most of these elements become available through processes that reveal a large-scale adaptation to the forces of the market economy. New Age elements in the form of books, workshops, rituals, and so forth are sold and bought in the same way as any other products. Furthermore, such rituals as affirmations and visualizations can be performed with the explicit goal of attaining affluence. Becoming wealthy is at least by some New Agers perceived as a spiritual goal.

The modernity of the New Age is, however, only partial. Thus, New Age understandings of personal experience are in a sense pre-critical. They usually eschew any discussion of the constructed nature of experience, and typically view spiritual experience as a faithful representation of underlying reality. Furthermore, in a characteristic paradox of New Age religiosity, the notion of an entirely individual spiritual quest can imply participating in rituals scripted by others and adopting explanatory frameworks expounded by authoritative spokespersons.

5. WHITHER THE NEW AGE?

As noted above, a number of concepts associated only a couple of decades ago with the New Age, such as the millennialist aspirations, have practically disappeared. Other beliefs, such as the existence of Atlantis, may become increasingly marginalized due to the difficulties in reconciling such views with elementary scientific literacy. At the same time, other sectors of New Age thinking are becoming increasingly aligned with popular culture. Prominent New Age authors such as Deepak Chopra (b. 1947) and James Redfield (b.

1950) sell millions of copies of their books and become celebrities far beyond the confines of an underground cultic milieu. In some cases, esoteric rituals seem even to attempt to move toward full-scale incorporation into the societal and cultural mainstream.

One example of this process comes from the field of nursing. In the United States and Canada, Therapeutic Touch or TT, a method of ritual healing created by theosophist Dora Kunz and her pupil Dolores Krieger in the early 1970s, has been partly accepted by mainstream institutions. Despite the legitimacy thereby accorded to the practice, Therapeutic Touch builds on a view of the human body that departs radically from any biomedical model, and which is conspicuously similar to that of e.g. mesmerism or Reiki healing, i.e. the assumption that there is a human energy field which extends beyond the boundaries of the physical body. Yet another example is found in the world of management. Courses in such techniques as fire-walking and the enneagram (a technique of personality assessment with spiritual overtones) are widely sold to major companies in Europe and America. Practices that were once part of the cultic milieu have become tools in promoting social bonding among employees. Stripped of their controversial New Age label, several such practices and beliefs that have effectively sprung from the New Age milieu are increasingly perceived as part of mainstream culture.

OLAV HAMMER

New Thought Movement

Originally known under many names – such as Mental Science, Divine Science, Spiritual Science, Religious Science, Christian Science, Unity, Mind Cure, Science of Being, Home of Truth – the popular American self-help psychology known as New Thought began to spread during the 1870s and had secured a mass audience by the end of the century. The term “New Thought” itself was introduced in the 1890s and was eventually adopted by its main organizational body, the International New Thought Alliance (INTA; see Braden 1987, 170-229). In spite of such organizational efforts, New Thought has always been an ‘open, eclectic and easily splintered’ movement (Satter 1999, 6), and its basic tenets are by no means limited to groups and individuals affiliated with the INTA; rather, its basic theories, worldviews and practices can be encountered in many places, not least in the contemporary → New Age movement.

All varieties of New Thought are based upon a radical ideology of “mind over matter”, which claims that we create our own reality according to our beliefs. Any limitation in our personal reality is the direct reflection of limiting beliefs; therefore if we change those beliefs, our reality changes. This principle is applied most famously to health and illness, and implies that any illness is based upon negative patterns of thought and can be cured by positive thinking. But New Thought increasingly came to be applied to other domains of human life as well, including money, work, relationships, and spiritual attainment; some of its adherents – including central figures such as Emma Curtis Hopkins – have even claimed that death is a limiting belief, so that positive thinking can lead to physical immortality. The main technique for “reprogramming” the mind is known as “affirmations”: short, positive statements that are ritually repeated until they take the place of their negative counterparts (for example, “I am perfectly healthy” as a counterpart to the implicit belief that “I am sick”). Originally the use of affirmations was combined with the use of “denials” (for example, “I do not have cancer”), but these have eventually grown less popular, probably because the very mention of the negative condition came to be seen as implying its reality. Since New Thought claims to be using the invisible laws that govern the whole of reality, it has often presented itself as a “science”; but this science was clearly a religious one because it was based upon recognition of our “inner divinity” – the power of our mind is ultimately none other than the very

power that creates the universe. Such a concept of “religious science” is sometimes explained with reference to a personal God, but may as well be explained in terms of an impersonal divine “principle”.

From the perspective of the history of “gnosis and Western esotericism” New Thought might be seen as a boundary case, but there are several reasons to nevertheless discuss it within that context. First, New Thought emerged as a reinterpretation of hypnotism, and is therefore part of the complex reception history of → Animal magnetism. Second, even if the foundational principles of New Thought may be seen as not specific to Western esoteric worldviews, many of its adherents and defenders were in fact active within a broader and more complex “cultic milieu” – referred to as that of the American “metaphysical movements” (Judah 1967) or as “Harmonial Religion” (Ahlstrom 1972) –, the literature of which is permeated by elements from e.g. Emersonian Transcendentalism, → Swedenborgianism, → Spiritualism and modern Theosophy [→ Theosophical Society]. And third, New Thought has exerted an incalculable influence on the 20th-century development of popular Western esotericism; as a major aspect of the “psychologization of esotericism and sacralization of psychology” (Hanegraaff 1996/1998, 482–513) it is essential to the contemporary pop-esotericism known as → New Age.

Although the New Hampshire clockmaker Phineas Pankhurst Quimby (1802–1866) should not strictly be seen as the founder of New Thought (his manuscripts did not become available to the public until 1921; Satter 1999, 59), he was certainly its originator. In 1838 he attended a stage performance by the French mesmerist Charles Poyen, and decided to set up his own practice as a magnetizer. During the 1840s he toured through Maine and New Brunswick with an assistant, Lucius Burkmar, who diagnosed diseases while in a hypnotic trance. But when Quimby discovered that he could also heal his patients by direct psychic influence without a medium, and reflected on the absurd simplicity of some of Burkmar’s cures (e.g. herb tea against advanced cancer), he drew the radical conclusion that all such healing methods were equally successful because of his patients’ *belief* in magnetic or electric currents that influenced their vital fluids, and in the accuracy of the medium’s or the magnetizer’s cures. From there he developed a philosophy of healing based upon the radical claim that the beliefs and expectations of patients are *fully* responsible for their medical condition. Quimby kept believing in the existence of a mag-

netic fluid, but now claimed that a person’s beliefs and expectations were the key to manipulating it.

Mary Baker Eddy (1821–1910), the founder of Christian Science, met Quimby in 1862 and was healed by him of her chronic “neuralgia in the spine and stomach”. She then proceeded to spread the new message; but whereas Quimby had explained his healing method in terms of a religious worldview influenced by ideas from → Swedenborg and → Andrew Jackson Davis, Eddy developed a new religious worldview of her own, in many ways closer to traditional Christianity, called Christian Science and expounded in her *Science and Health with Key to the Scriptures* (1875). It claims that the universe as created by God or the “divine Mind” is entirely spiritual and good, whereas it is the human or “mortal mind” that creates the illusion of a material world and embodied persons. Illness results from the incorrect belief in the reality of these illusions, but we can be saved by recognizing our “divine within” and acknowledging an entirely spiritual reality. Eddy eventually came to sharply oppose her Christian Science against the ideas and practices of other New Thought leaders, but her religion is nonetheless a clear example of the basic New Thought perspective.

Warren Felt Evans (1817–1889), author of the first mind cure study (*The Mental Cure*, 1869), was healed by Quimby of chronic nervous illness in 1863. Originally a Methodist minister, he joined the Swedenborgian New Church in the same year. While based upon Quimby’s ideas, Evans’ philosophy of healing presents them in a context full of references to Swedenborg, German Idealism, and Hindu monism. Other than Eddy, who bitterly opposed his teachings, Evans did not see matter as intrinsically evil or unreal. Matter is an inherently good reality that becomes evil only if it gains dominion over spirit; it is a passive, plastic force that reacts to emotions, which in turn are shaped by thought. And against Eddy’s traditional emphasis on repentance and sin, Evans spoke much more positively of an inner divine spark (called the “Ego”, the “I Am” or the “inner Self”) which made each human being ‘a God, possessed of all the attributes of its parent source, among which are omniscience and omnipresence’ (see discussion in Satter 1999, 70–78).

New Thought originally flourished in New England, particularly in Boston with its congenial Transcendentalist traditions. But in the decade 1885–1895 the focus shifted to the Western states. The central figure with respect to the spread and development of New Thought in that period was Emma Curtis Hopkins (1851–1925), a renegade

student of Eddy's and revered by New Thought leaders as the "teacher of teachers". In 1883 she met Eddy, who told her about Christian Science, after which her student Mary F. Berry cured her of her sickness. Hopkins joined the Christian Science movement and quickly rose to a position of prominence, until she was evicted by Eddy from her Massachusetts Metaphysical College and was forced to resign from the Christian Science Association in 1885. The main reason was an editorial she had written, in which she claimed to have met God "face to face" – a prerogative that Eddy claimed for herself only. Hopkins moved to Chicago, where she founded the successful "Hopkins Metaphysical Association", which within a few years had established branches in cities all over the United States. From 1887 on the association published a journal (*Truth*, quickly followed by a new one, *Christian Science*) and began an "Emma Hopkins College of Christian Science", later renamed as "Christian Science Theological Seminary". Beryl Satter, in a chapter that is the best existing study of Hopkins, emphasizes the prominence of women on all levels of her organization, in contrast to Eddy, who appointed men in positions of power in her church hierarchy (Satter 1999, 83-84). In her teachings, Hopkins adopted an ambiguous middle ground between Eddy and Evans. She opposed Eddy's teachings about sin and adopted Evans' emphasis on the "God-Self" within. Going beyond the domain of illness and health, she claimed that any negative condition, including poverty, could be 'denied out of existence'. Explicitly advocating self-love as something positive, she no less clearly encouraged the "blame-the-victim" attitude which has always been implicit in New Thought: any negative condition is the victim's own fault. Eventually, the inevitable conflict between Hopkins' promise of godlike omnipotence and the less ideal realities of students' daily experience turned her theological seminary into 'a hotbed of bitter infighting and barely repressed emotional chaos' (Satter 1999, 94), as a result of which Hopkins withdrew from her seminary in 1895, and moved to New York City. For the last thirty years of her life she continued receiving students, but remained aloof from the New Thought movement.

That movement had now gained sufficient momentum to continue, under the guidance of new leaders, most of them female. Malinda E. Cramer († 1907) founded the movement called Divine Science, continued after her death by Nona Brooks (1861-1945). Annie Rix Militz (1856-1924) founded the Homes of Truth movement. Both movements collaborated with one another and

with Myrtle and Charles Fillmore's Unity School of Christianity, their "Society of Silent Help" later renamed "Society of Silent Unity", and their journals (*Modern Thought*, *Christian Science Thought*, *Thought*, *Unity*). The Fillmores' enterprises became enormously successful and proved how New Thought could be made profitable from a business point of view. One could join their Society for free, and thereby become part of a network of people who promised to devote some time to meditation at nine o'clock each evening. Members could send in "prayer requests", specifying their troubles; but in order to benefit from the positive energies collectively channeled by the Society's network, they had to purchase *Unity* magazine, where they would find an affirmation written for them, identified by a personal certificate number.

Apart from organizations and their published teachings, New Thought ideas were also spread by popular novels. Helen Van-Anderson (1859-?), a major New Thought missionary on behalf of Hopkins and minister in the Boston "Church of the Higher Life", published many tracts and books, including the novels *The Right Knock* (1889) and *The Journal of a Live Woman* (1895). Ursula Newell Gestefeld (1845-1921) created her own New Thought system ("Science of Being", later renamed "The Church of 'The New Thought'"), wrote numerous tracts about her beliefs, and two novels: *The Woman Who Dares* (1892) and *The Leprosy of Miriam* (1894). And Alice Bunker Stockham (1833-1912), one of the first women in the United States to practice medicine, and internationally famous for her progressive tracts on medicine, sexuality and women's health, wrote *The Koradine Letters* (1893) about a fictional New Thought Utopia called the "Arcadian Institute of Development".

In 1897 appeared Ralph Waldo Trine's *In Tune with the Infinite*, which was an immediate success and became the first New Thought bestseller. The New Thought movement was now firmly established in popular American culture, and received recognition in the media as a significant new spiritual and healing current. Around the turn of the century, the already mentioned trend of applying New Thought principles to the acquisition of wealth became increasingly prominent, leading to the perception among later scholars and critics of New Thought as primarily a "religion of success". A major representative of this trend was Helen Wilmans (1831-1907), another student of Hopkins, creator of yet another New Thought system called "Mental Science", and author of *The Conquest of Poverty* (1899). After many years of

struggle with poverty and hardship, she finally found prosperity when she began to sell her lessons in Mental Science. She subsequently founded journals (*Wilmans Express*, *Freedom*), teaching institutes (“Wilmans Metaphysical College”, “University of Psychical Research”) and a “Mental Science Association”, and made great sums of money with her mail-order business of Mental Science lessons. Wilmans was a major advocate of the New Thought quest for physical immortality, and developed New Thought into an uncompromising social-Darwinist ideology of ruthless competition for wealth and success: the suffering are only getting what they deserve, and poverty is a sign of inferiority.

During the early decades of the 20th century the theological language and high-minded idealism of the early New Thought movement was gradually replaced by a more pragmatic emphasis on the power of thought through meditation and affirmations, increasingly expressed in psychological terminology. From the 1870s through the 1890s a dominant “anti-desire” school of New Thought had emphasized the need to deny material urges, selfhood and desire, whereas a “pro-desire” minority had presented mind and matter as interactive, had emphasized the value of selfhood and had presented desire as good and even divine (Satter 1999, 14 and *passim*). After 1900 the emphasis began to shift towards the latter perspective, so that New Thought increasingly became a brand of pop-psychology catering to consumers’ need for “success” in all fields of life: health, wealth, and happiness in general. As such the movement remained successful, with hundreds of New Thought centers all over the United States, six major journals, a high profile in mainstream periodicals, and a remarkable number of self-help bestsellers. As early as 1902, William James deplored the growing phenomenon of New Thought literature taking the form of ‘insincere stuff, mechanically produced for the market’, and filled with ‘verbiage . . . some of which is so moonstruck with optimism and so vaguely expressed that an academically trained intellect finds it almost impossible to read it at all’ (*Varieties of Religious Experience*, lect. IV-V). This observation would continue to hold true for much New Thought literature throughout the rest of the century.

While many older New Thought churches have continued to flourish throughout the 20th century, new schools kept being founded during its first decades, such as notably Ernest Holmes’ “Religious Science” (founded in 1927); but as to their

basic ideology they were dependent on the authors mentioned earlier, to which they did not add much news. After what seems to have been a decline of popularity during the years of World War II, New Thought made a strong comeback in 1952 with Norman Vincent Peale’s bestseller *The Power of Positive Thinking*. Peale, a minister in the Dutch Reformed Church, sold his message so successfully – also by means of lecture tours, articles in magazines, and appearances on radio and television – that in 1954 he was elected one of the “Twelve Best U.S. Salesmen” (Meyer 1988, 260). In his wake, the book market was once again flooded by popular self-help books in the New Thought tradition, and this production has not remained limited to the United States but has spread to Western Europe as well. Louise L. Hay’s bestseller *You can Heal your Life* (1984) is perhaps one of the most famous titles demonstrating the prominence of New Thought within the New Age movement, but the core ideology of New Thought is also basic to the message of many more overtly religious titles such as, notably, the channeled text *A Course in Miracles* (1975), believed to have been dictated by Jesus. Furthermore, strong influences from the New Thought tradition can be found in many New Age authors whose message as a whole cannot be reduced to New Thought; one representative example is → Jane Roberts’ influential series of books channeled by the discarnate entity Seth, who claims that “we create our own reality” but does so in the context of a complex metaphysics that goes far beyond anything found in standard New Thought literature. Finally, the influence of New Thought is by no means limited to the New Age context. It is also strongly present in the sermons of popular preachers closer to the Christian mainstream, such as Robert Schuller or many ministers in the pentecostal tradition.

WOUTER J. HANEGRAAFF

Newton, Isaac,* 24.12.1642
Woolsthorpe, † 20.3.1727 Kensington

Lucasian Professor of Mathematics at the University of Cambridge. Fellow (1672) and later President (1703) of the Royal Society of London. Member of the Convention Parliament (1689). Warden (1696), then Master (1699) of the Royal Mint. Knighted by Queen Anne (1705). Since Newton’s seminal achievements in science and mathematics are extremely well known, they will not be discussed in the present short entry, which concentrates exclusively on those aspects of his intellectual development that are relevant to the subject of the present Dictionary.

Newton was born at the family estate in Woolsthorpe three months after his father had died. His mother remarried when he was three. Widowed a second time, she placed him as a boarder to attend school in nearby Grantham when he was twelve. During his six-year stay at his lodger’s, an apothecary, Newton acquired and/or developed some of the interests which were to profoundly affect the course of his life: an hypochondriac fascination for the concoction of remedies to cure human illnesses; a tantalizing curiosity for → alchemy (acquired from old books he read in his lodger’s attics); and, through the teachings of a local divine, a visceral engrossment with the Puritanical concept of a dual world consisting of God’s Works (Nature) and God’s Words (the Holy Scriptures).

Newton’s latent interest in alchemy took a decisive turn soon after his enrolment in 1661 at Trinity College, at the University of Cambridge, when he made contact with erudite divines who, among other things, aimed at promoting and “rationalising” alchemy in England. Foremost among them were the leading Cambridge Platonist → Henry More, the Oxford “Great Experimentalist” Robert Boyle (1626-1691), and Isaac Barrow (1630-

1677), Lucasian Professor of Mathematics at Trinity, who soon became his mentor. Over the years, his protectors regularly provided him (covertly) with alchemical manuscripts which he painstakingly copied in his own handwriting before returning them, thereby establishing for himself an extensive library of contemporary alchemical treatises (it included notably → Ashmole’s six-volume *Theatrum Chemicum Britannicum* as well as works by → Maier, → Llull, Sendivogius, and Philalethes [→ Thomas Vaughan]).

Newton’s religious beliefs soon put him to the test. To graduate from Trinity (1665), he had to attest to an acceptance of the Thirty-Nine Articles of the Anglican Church, which ran counter to his Puritanical concept of a religion without an official clergy, as well as his fanatical Arian rejection of the Trinitarian dogma. The problem became acute in 1669 when he inherited the Lucasian chair from Isaac Barrow, who had become King Charles II’s Chaplain. Fortunately for him, six years later (probably on advice from Barrow, who had been appointed Master of Trinity College in the meantime), Charles II granted him exemption from the obligation – normally required of the holder of the Lucasian chair – to take holy orders.

At Trinity, Newton attended few classes, if any. He spent much of his time on his own, reading, developing his seminal scientific and mathematical ideas, as well as practicing alchemy and studying religion, two disciplines he believed to be connected. Indeed, he considered the goal of alchemy to be ‘to glorify God in his wonderful works, & to teach a man how to live well’, and asserted: ‘This philosophy both speculative & active is not only to be found in the volume of nature but also in the sacred scriptures . . .’ (*Keynes MS 33:5v*). In 1673, to carry out this double quest, he established a full-fledged alchemical laboratory in the small wooden shed which stood in a garden attached to the rooms he occupied at E-4 Great Court, close to Trinity’s Great Gate. He equipped it over the years with elaborate apparatus and furnaces which he used to perform numerous experiments, generally aimed at testing recipes copied from alchemical manuscripts. He had a chance to test his ability to prepare ‘true medicines’ when his mother fell ill in 1679. His failure to save her left him deeply affected. His efforts culminated in 1684 when he thought for some time that he had succeeded in “opening” metals to extract from them the long sought-for “Philosophical Mercury”.

Even as he attempted to read into God’s Book of Nature, Newton dutifully studied the Holy

Scriptures, believing that the unravelling of the ‘true past’ (as revealed through a proper understanding of Biblical prophecies) was his ‘duty of the first moment’ (*Yahuda MS 21:2*). He spent a considerable amount of time trying to establish a genuine plan of the Temple King Solomon had built in Jerusalem under the Lord’s guidance: this he saw as an Earthly representation of the universe and a paradigm for the future of the World.

In *Observations upon the Prophecies of Daniel* (published posthumously in 1733), he expresses the opinion (based on his own elaborate calculations) that the Day of Judgement would come in 1948, forty-nine years after the Jews returned to Jerusalem, a date he was to revise later on several occasions. The conviction that in all cases the Great Event would not occur during his lifetime may have contributed to his decision not to divulge the results of his findings.

Newton’s interest in the Solar system with its planets orbiting around a “central fire”, the Sun, relates in part to his belief that the ancient Cult of Vesta, which consisted in keeping ‘a fire for offering sacrifices that burned perpetually in the middle of a sacred place’ (*Yahuda MS 17.3:8-10*), had been the true religion ‘until the nations corrupted it’ (*Yahuda MS 41:7*). Urged by his admirer, the astronomer Edmund Halley, to expound in writing his *System of the World*, Newton invoked More’s Gnostic “hylarchic principle” which the Platonist had forged to explain natural and supernatural phenomena through the intervention of spirits – which Newton called *Powers*, *Virtues* or *Forces* – carrying out the will of God. Disguised under the innocuous-sounding designations of *vis insita* and *vis centripeta*, he placed these “active principles”, rooted in hermetic tradition, at the very foundation of his celebrated *Philosophiae Naturalis Principia Mathematica* (1687).

Newton shared Henry More’s belief that ancient philosophers – one of them having been → Moses – had been the depositors of true knowledge (*philosophia perennis*). Consequently, while writing his great treatise, he rejected the use of modern techniques of algebra, developed notably by Descartes, and chose to formulate the numerous *Problems*, *Propositions*, *Theorems* and *Lemma* found in his treatise by resorting exclusively to the use of the “Theory of proportions” expounded in Book V of Euclid’s *Elements* (which had been translated from Greek to Latin by Isaac Barrow).

Newton successfully kept his alchemical and theological interests secret during his lifetime, fearing possible damaging consequences to himself if they would become known (on this, he followed

More, who detested “Enthusiasts”). He somewhat recanted this cautious approach when he set out to write his second major treatise, *Opticks* (1704), after he had left Cambridge to serve at the Mint in London – and after his arch-rival at the Royal Society, Robert Hooke (1635-1703), who might have contested it, had died. The *Queries* he appended to the end of Book 3 of his treatise divulge some of his alchemical findings. But when his intimate friend Nicolas Fatio de Duillier and his favourite “disciple” and successor at the Lucasian chair, William Whiston, fell into disgrace after revealing their Arianism (in 1707 for the former, in 1710 for the latter), Newton cautiously refrained from coming to their rescue. When a destitute Whiston applied for membership in the Royal Society (1716), Newton threatened to resign from the Society if the nomination was accepted.

A lone and complex figure, Newton never travelled outside a small triangle delimited by Cambridge, London and his native village of Woolsthorpe. Universally known and admired for his outstanding contributions to scientific knowledge, it is nevertheless estimated that over two-thirds of his writings concern problems arising from alchemy and religion. To that extent at least, Newton’s name properly belongs in a dictionary devoted to the study of the history of Western Esotericism.

JEAN-PAUL AUFFRAY

Nicolaitans

A group of deviant Christians denounced in the Book of Revelation in the "letters" to seven churches of Asia Minor written by John the Seer in the name of Jesus Christ (Rev. 2-3). The church at Ephesus is praised for hating the 'works of the Nicolaitans' (2:6). The church at Pergamum is reproved for tolerating the Nicolaitans in its midst, who promote eating food sacrificed to idols (*eidolothuta*) and fornication (2, 14-15). The church at Thyatira is reproved for tolerating a prophetess called Jezebel, who is said to promote fornication and eating food sacrificed to idols (2:20). Probably a Nicolaitan leader, her teaching is also said to include knowledge of the 'deep things of Satan' (2:24).

Various assessments of this information are possible. The eating of meat sacrificed to pagan deities is condemned in the "Apostolic Decree" (Acts 15:20, 29), but regarded as a matter of indifference by Paul (1 Cor. 8), who nevertheless condemns participation in pagan meals and idolatry in general (1 Cor. 10). The "fornication" referred to in Revelation may be taken metaphorically as idolatry, e.g. willing participation in the emperor cult and other civic religious activities, universally condemned in early catholic Christianity. On the other hand, it may refer to sexual license, expressly forbidden in the "Apostolic Decree", and also by Paul (1 Cor. 5-6). The claim to knowledge of the 'deep things (*bathē*) of Satan' may be taken as a claim to protection against the consequences of "Satanic" acts performed by the sectarians. On the other hand, John may have intentionally misrepresented a sectarian claim to knowledge of the 'deep things of God' (cf. 1 Cor. 2, 10).

Nicolaitans are referred to again almost a century later by Irenaeus, in the context of a discussion of

heretics known to him (*Adversus Haereses* I, 26, 3). The Nicolaitans are said to be followers of that Nicolaus who was one of the seven ordained in Jerusalem by the apostles (Acts 6:5). They lead lives of unrestrained indulgence, and are rightly condemned in the Apocalypse of John. In another context (*Adv. Haer.* III, 11, 1) Irenaeus refers to the Nicolaitans as 'an offset of that "knowledge" falsely so called' whose adherents claim that the Father of the Lord is not the Creator. The Creator's son is not the Christ from above; Christ, impassible, descended upon Jesus and then ascended, presumably meaning that Christ did not suffer crucifixion.

For Irenaeus the Nicolaitans are clearly heretics of a Gnostic sort, although he does not expressly claim that Nicolaus himself was a Gnostic. That claim is made by Hippolytus. Relying on Irenaeus' account, Hippolytus points out that there are among the Gnostics diversities of opinion. Nicolaus is singled out as being 'a cause of the widespread combination of these wicked men'. After his appointment by the Apostles, he 'departed from correct doctrine', and promoted licentiousness. His followers were condemned by John in his Apocalypse (*Refutatio* VII, 36).

The author of Pseudo-Tertullian's treatise, *Adversus omnes haereses*, a 3rd-century document possibly based on a lost work of Hippolytus, provides additional information: Nicolaus, one of the seven deacons appointed by the Apostles, taught that Darkness lusted after Light, and there arose as a result various combinations of aeons and other foul beings. His heresy was condemned by John in his Apocalypse (*Haer.* 1). While Ps.-Tertullian's account is brief and somewhat confused, some sort of Gnostic heresy is envisaged.

Tertullian mentions the Nicolaitans three times. In his treatise *Adversus Marcionem* he refers to the Nicolaitans' 'maintenance of lust and luxury' (I, 29). In his *De praescriptione haereticorum* he refers to a contemporary group of Nicolaitans called 'the Caian heresy' who teach a docetic Christology, i.e., who deny that Christ 'has come in the flesh' (1 John 4:2-3; *Praesc.* 33; "Caian" may refer to a sect leader called Gaius; or, perhaps, it is a corruption of "Cainite"). In a discussion of some passages in the Revelation of John dealing with fornication, he refers to the prophetess Jezebel (Rev. 2, 20) as having taught 'what she had learnt from the Nicolaitans' (*De pudicitia* 19).

→ Clement of Alexandria has a different assessment of the traditions relating to the Nicolaitans. He comments on a saying of Nicolaus, 'one must abuse the flesh', which is quoted by those who claim to be followers of this pervert. What Nico-

laus advocated was asceticism, but his supposed followers misinterpret his saying, and abandon themselves to a goat-like licentiousness (*Stromateis* II, 118). Clement here attempts to separate the Nicolaitan beliefs and practices from the “apostolic” Nicolaus. Nevertheless, he does concede a connection between him and the Nicolaitans, even if they are accused of misinterpreting his teachings. Later, Clement expands on these points. He repeats Nicolaus’ saying in the context of a story that his supposed followers tell about Nicolaus and his beautiful wife. After the ascension of Christ, Nicolaus was accused before the apostles of jealousy; so he offered her to anyone who desired to marry her. ‘Those who share his heresy’ (i.e. members of the Nicolaitan sect) interpret Nicolaus’s saying and the story about his wife as a justification for their enormities (*Strom.* III, 25). But, in fact, Nicolaus never had any relations with any woman besides his wife, and his progeny remained virgins to their old age. When he brought his wife before the apostles, on whose account he was jealous, he did so as an act of ‘suppression of passion’. ‘He taught what it meant to “abuse the flesh” by restraining the distracting passions’ (*Strom.* III, 26). Clement is clearly attempting a “whitewash” of traditions relating to the “apostolic” Nicolaus. While he concedes the veracity of the story told about Nicolaus, and the authenticity of the saying attributed to him, he desperately tries to defend Nicolaus by twisting the import of the story of him and his beautiful wife. As for the saying, the Greek verb used (*parachresasthai*) clearly means “abuse”, not “restrain” or “control”.

Clement’s version is followed by Eusebius in his *Historia Ecclesiastica*, III, 29. He states that in apostolic times there existed for a short time the heresy of the Nicolaitans mentioned by the Apocalypse of John. These people claimed to be follows of Nicolaus the deacon. There follows a direct quotation of the passage from book III of Clement’s *Stromateis* already referred to. He concludes this paragraph with a remark that the attempts to subvert the truth in apostolic times were quickly extinguished. Eusebius apparently does not know of any survivors of the Nicolaitan sect in his own time (early 4th century).

Later in the 4th century, however, Epiphanius presents a very extensive account of Nicolaitans and heretics allegedly related to them, expanding on the accounts of Irenaeus, Hippolytus, and Clement of Alexandria. In his *Panarion against Heresies* he first devotes a separate chapter to the Nicolaitans, beginning with Nicolaus the deacon (*Pan.* 25). Although Epiphanius relies on Clement, he does not share Clement’s interpretation of the traditions. Epiphanius’ version of the saying

quoted by Clement is: ‘Unless one copulates every day, one cannot have eternal life’ (*Pan.* 25, 1, 6). He then brings into his account doctrines associated with ‘Gnostics and Phibionites, the so-called disciples of Epiphanes, the Stratiotics, Levitics, Borborites and the rest’ (25, 2, 1), a highly involved mythology featuring Barbelo, Ialdabaoth, Prunicus, etc., all of which is also attributed to Nicolaus. The following lengthy chapter (“Against Gnostics, or Borborites”, *Pan.* 26) goes into great detail in expostulating on the foul deeds ritually committed by these heretics, ‘who sprout from Nicolaus like fruit from a dunghill’ (26, 1, 1). Unfortunately, Epiphanius’ account is so confused and so filled with invective that virtually nothing of historical value can be learned from it, either about Nicolaus or about the sect named after him.

What can be concluded from these accounts? We know from the Book of Revelation that, in the late 1st century, there was a group of Christians called Nicolaitans, whose views regarding pagan associations were rather liberal. They may have traced their beliefs and practices back to Nicolaus, the ‘proselyte of Antioch’ (Acts 6, 5). They may also have claimed a special knowledge of spiritual “deep things”, but whether they were at that time “Gnostics” in the full sense of the term cannot be established with any certainty. By the time of Irenaeus (ca. 185), however, the Nicolaitans’ association with Gnostic heresy has become an established part of the tradition. Although Nicolaus and the Nicolaitans persist in the heresiological catalogs into the 5th century (Theodoret, *Haereticarum fabularum compendium* III, 1), it is not clear how long the sect itself lasted. Eusebius, at least, regards the Nicolaitans as part of a history long past.

BIRGER A. PEARSON

Novalis (ps. of Georg Philipp Friedrich von Hardenberg), * 2.5.1772
Oberwiederstedt, † 25.3.1801
Weissenfels

A jurist, philosopher, mining engineer and famous Romantic poet, von Hardenberg was raised in a large family. His father, having gone through a religious crisis following the death of his first wife in 1769, raised his children in the spirit of Herrnhut → Pietism. From 1790 to 1794 von Hardenberg studied law, philosophy, history and mathematics at the Universities of Jena, where he got into contact with Schiller; Leipzig, where he met his lifelong friend Friedrich Schlegel; and Wittenberg. Two other important meetings were with the philosopher Fichte and the poet Hölderlin, both in 1795. The year before, on 17 november 1794, Hardenberg had met the 12-year old Sophie von Kühn, in whom he saw the love of his life; the two got engaged one year later, but Sophie fell ill and died on March 19, 1797, followed one month later by Friedrich's beloved brother Erasmus. Sophie's death is generally seen as a decisive event in Novalis's development: her idealized image henceforth becomes a major inspiration in his poetic work. Still in 1797 he made the acquaintance of → Schelling in Leipzig; and from the end of the year on he studied at the mining academy of Freiberg. Poems and fragments under the name Novalis now began to be published, and in 1798 he began work on his *Die Lehrlinge zu Saïs* (The Disciples at Saïs). In the summer of the same year he was diagnosed with tuberculosis, but nevertheless he got engaged with Julie von Charpentier in December. In 1799 he worked on his *Geistliche Lieder* (Spiritual Songs, a series of poems), *Die Christenheit oder Europa* (Christendom or Europe, an essay), and his novel *Heinrich von Ofterdingen*. Having completed his studies, in 1799 he was appointed mining engineer at the

Saxon saltworks. The next year saw the publication of his poems *Hymnen an die Nacht* (Hymns to the Night), but von Hardenberg's health condition declined, and his situation was worsened by the suicide of his brother Bernhard on october 28. While still dreaming of new literary projects, he died less than half a year later.

The mining business ran in the family, and von Hardenberg may have had access to chemical and alchemical texts while still living at home (see HKA IV, 32). Among the hermetic, alchemical and theosophical authors and texts with which he is known to have been familiar are Libavius, Thurneisser, G.W. Wedelius, the Rosicrucian *Chymische Hochzeit Christiani Rosenkreuz* [→ Rosicrucianism I], → Robert Fludd, → Joan Baptista van Helmont, → Jacob Boehme, → J.F. von Meyer, → Karl von Eckartshausen, → Franz von Baader, and → Johann Wilhelm Ritter. Quite some information about esoteric traditions he derived at second hand: thus he learned about → Paracelsus, → Paracelsianism, and the doctrine of signatures notably from Kurt Sprengel's *Versuch einer pragmatischen Geschichte der Arzneikunde* (1792-1799), and Dietrich Tiedemann's *Geist der spekulativen Philosophie* (1791-1797) introduced him to such authors as Plotinus, → Llull, → Bruno and → Pordage (in addition to several authors already mentioned above).

Novalis' work can be considered under four broad categories: his aphorisms or fragments, his poetry, his novels, and his essays. In works belonging to the first category the esoteric dimension of his thinking is most explicit. In his *Das Allgemeine Brouillon* (The General Draft, 1798-1799) he speculates about a universal encyclopedia of all knowledge, joining together the scientific, literary, philosophical, and artistic domains into an organic intellectual unity. It was to be based upon a semi-otic *Wechselrepresentationslehre*, i.e. a universal system of → correspondences predicated on the intimate "sympathy" between signifier and signified. Novalis also referred to it as "magic" and as "grammatical mysticism": 'Man does not speak alone – the Universe speaks too – everything speaks – infinite languages/doctrine of signatures' (HKA III, 267f.). Novalis' "magical idealism" was the product of these hermetic influences combined with Fichte's transcendental philosophy. Such a combination made it possible to interpret the concept of macro/microcosm in a radical manner (Novalis at one point described his Beloved as the abbreviation of the Universe and the Universe as the elongation of his Beloved): 'it makes no difference whether I place the World-All in myself, or myself in the World-All' (HKA III, 382). Novalis defended an "esoteric" notion of universal

religion, which would not be a matter of grimly repeated outward observance but of inner “scientific” observation and transformation. The highest aim of spiritual education is to master one’s transcendental self, which is ‘the highest principle of all learning and art’.

When we turn to Novalis’s poetry, we find a similar unifying tendency, and the same quest for self-knowledge or gnosis, notably in his elegy *Kenne dich selbst* (Know Thyself): happy is he who has found the (philosopher’s) ‘Stone of Eternal Wisdom’ in himself, for he is the ‘true adept’ who needs no elixirs to turn everything into ‘life and gold’ because he understands the meaning of the delphic maxim “know thyself”. Many of Novalis’s poems allude to a sense of the fragility of life and the nearness of death. In “Der sterbende Genius” (The dying genius), Novalis writes of returning again to his ancient home, of the ‘gates of the primal world’ opening for him, just as in “Der Fremdling” (The Stranger) he imagines ‘the great day of birth’ in the beyond. The character of “the Stranger” appears again in Novalis’s most famous and influential *Hymnen an die Nacht*, the longest poetic work that he wrote. In this beautiful and mysterious work he begins by celebrating the glittering stones, the tranquil plants and the delightful Light of life. But then he turns to the Night, telling the story of how the Gods were vanquished from human life, so that nature was rendered ‘lonely and lifeless’, ‘bound by harsh numbers / and iron laws’ (‘Mit eiserner Kette band sie die dürre Zahl und das strenge Maß’). The Gods were driven into the Night, where they wait until ‘the dawn of the new age’. Novalis’s two novels – *The Disciples at Saïs* and *Heinrich von Ofterdingen* – represent the more overt expression of his philosophical-religious esotericism in a hybrid form of aphoristic fiction. Of these two works, the more unconventional is *The Disciples at Saïs*, a poetic-prose experiment rather than a novel in any usual sense. Clearly reflecting the doctrine of signatures, it begins by referring to the ‘great manuscript of design’ that we see written upon the clouds and the snow, on rocks and on mountains, and that offers a ‘key to higher things’. The novel tells of a primordial master who understood the conjunction or interrelation of all living things: stars and men, stones and animals, clouds and plants. *Heinrich von Ofterdingen* is much closer to the conventional form of the novel. It tells of a young man named Heinrich who longs to see a ‘blue flower’ (possibly inspired by the blue flower of wisdom described in an anonymous alchemical text *Pandora* [1588]; see Gebelein 2001, 296) spoken of by a traveling stranger who speaks of

dreams rather than of the events of ordinary life. Heinrich eventually meets a mysterious gnomish hermit, and falls in love with a young and beautiful woman, Matilda. Heinrich discovers that ‘the higher world is nearer to us than we usually believe’ and that, indeed, ‘we already live in it’. This may be called the essential poetic observation at the heart of Novalis’s prose fiction, where dreams, poetry, symbols, and stories within stories all embody it. Among the embedded stories is Novalis’ famous *Märchen* (chapter IX of the novel), replete with terms and notions borrowed from the literature of → alchemy, → animal magnetism, and not least theosophy. Also theosophically tinged is “Astralis”, a poetic jewel which opens the second part of the book. The entity Astralis is of an androgynic nature; he/she is an intermediary being who personifies the astral world, situated between the material and the spiritual worlds. Astralis is also the very symbol of poetry as Novalis understands it.

Finally we must turn to Novalis’s famous essay “Die Christenheit oder Europa” (Christendom or Europe), often cited as evidence of a conservative or reactionary political perspective. Novalis waxes nostalgic about the ‘beautiful, splendid’ times when Europe as a whole was still a Catholic Christian land. Europe ‘fell asleep’ under the dead hand of business and outward-directed activity during the age of Protestantism, although Novalis mentions Zinzendorf, → Jacob Boehme, and unspecified “secret societies” as representing very important ‘sparks of life’ within this general process of decline. Furthermore, the “philantropists and encyclopaedists” are invited to join the ‘friedentiftende Loge’ (the peace-making lodge), receive the brethren’s kiss, peel off ‘das graue Netz’ (the grey net) and behold the miracle of Nature, History and Man. Perhaps the closest to Novalis’s vision of a unified and renewed, mystical Christianity is that of → William Blake.

While the (al)chemical dimensions of Novalis’ thought have recently begun to receive attention (see e.g. Gebelein 2001; Liedtke 2003), and various other aspects pertaining to e.g. → Christian theosophy or kabbalah [→ Jewish Influences] have occasionally attracted the attention of scholars, there does not as yet exist a systematic and comprehensive study that clearly situates Novalis in the contexts of Western esotericism. His influence on later developments in that context, such as e.g. → Anthroposophy, would merit study as well.

WOUTER J. HANEGRAAFF & ARTHUR VERSLUIS

Novikov, Nikolay Ivanovich,* 27.4 [8.5, New Style] 1744 Avdotino (Bronnitsky district, near Moscow, Russia), † 31.7 [12.8] 1818 Avdotino

The best-known Russian journalist, book editor and Freemason of the 18th century, Nikolay Ivanovich Novikov was born in a family belonging to the middle-class nobility, and raised in their modest estate, Avdotino, located near Moscow. He received a quite poor education in the French college of Moscow University and was even expelled from it for repeated absence. Following family tradition, he joined the *Izmailovskij* regiment of the Imperial Guards. During his service the regiment took active part in a military putsch that brought Catherine II to the Russian throne in 1762. Appointed as secretary at the *Legal Committee*, formed by Catherine to prepare a liberal legal reform in 1767, he had a unique opportunity to get an overview of the state of the Russian empire and participate in the nation-wide debate about the 18th century's most acute socio-political questions. This experience could probably explain the fact that in 1768 he retired from the guard, with the firm intention of starting his own magazine.

Novikov's satirical magazines of 1769-1774 have exerted an enormous influence over the emerging Russian public opinion. A legendary quarrel between his first magazine *Truten* (Drone; 1769-70) and the official *Vsiakaja Vsiatchina* (All Sorts and Sundries; 1769) edited by Catherine II herself, where Novikov openly criticized imperial initiatives – especially that of "sponsored" French cultural influence on Russian society – marked the

first public clash between Russian intellectuals and the government. These events stood at the beginning of a process in the course of which Russian autocracy would lose its progressive impetus inherited from Peter I (The Great; reigned 1682-1725) and become a restraining and eventually a repressive force.

Novikov's satirical magazines were followed by a series of Masonic periodicals from 1777 to 1785. The best known among them – *Utrennij Svet* (The Morning Light; 1777-1780) – became one of the most widely distributed Russian periodicals of the 18th century. In 1779, thanks to a eminent Russian freemason, M.M. Heraskov (1733-1807), he obtained a 10-year's lease of Moscow University Press. In 1783 Catherine II issued a decree "On the Free Publishing Houses" which allowed Novikov to realize an old dream, expressed already in one of his satirical magazines (*Zhivopisetz* [Painter]; 1772-1773): a private book publishing company. Between 1783 and 1791 Novikov's "Typographic Company" came to control five publishing houses, issuing 950 book titles (i.e., one third of all books published in Russia at that time). The Company was created by the "Friendly Scientific Society" founded a year before by Novikov and I.-G. Schwartz.

From the very beginning, all of these activities were devoted to philanthropic and educational purposes on a large scale, but the "enlightened despot" Catherine II, who intended to keep control over the products of her liberal reforms, could hardly tolerate such a blossoming of private initiative, especially on behalf of Russian Freemasons: if at the beginning of her reign she just considered → Freemasonry a 'childish game', later on she became increasingly suspicious of a Masonic political conspiracy. At several occasions she quite violently countered attempts of Russian freemasons to influence her son Grand Duke Paul (the future Paul I), and she was also concerned about the reports of the secret police revealing far-reaching connections established by Russian lodges with Swedish and, later, Prussian officials. In practice the official attitude was becoming more and more hostile and in 1785 the "Typographic Company" and Novikov's residence were searched by imperial order and several banned titles were requisitioned.

The French Revolution and the execution of Louis XVI, which Catherine II took as a personal threat, seemed to confirm her in her opinion about the political danger represented by Freemasonry. In 1792, the sudden death of the emperor Leopold II of Austria, followed shortly after by the murder of king Gustav III of Sweden, both of which were

attributed by public opinion to the Freemasons, led to a climate close to paranoia at the Russian court. The police reported to Catherine about a secret correspondence of Russian Freemasons with Woellner: at that time a minister of Emperor Friedrich II of Prussia, an enemy of Catherine, and a Freemason. This correspondence revealed that certain Russian lodges were organizationally subordinated to foreign authority. Among the addressees was Novikov, who appeared to hold the key position in Russian Freemasonry during the 1790s.

Novikov and three of his close collaborators were quickly arrested, publishing houses were closed, and books were confiscated. Based on incriminating evidence about secret exchanges with Prussian officials and the Duke of Braunschweig, to whom they had pledged their allegiance, they were convicted for disloyalty towards the Sovereign. They were also found guilty of spreading teachings in conflict with the tradition of the Orthodox Church, and of illegal publication of books prohibited by the Church authorities. Sentenced to fifteen years of imprisonment, Novikov was released four and a half years later by Catherine's successor Paul I, on the first day of his reign. Novikov never resumed his public activity and died in 1818.

The major components of Novikov's personal ideology, which would later determine his specific approach to Freemasonry and the original path charted by him, can already be found in his satirical magazines, as pointed out by Pypin in 1916. Monnier's detailed analysis of Novikov's pre-Masonic period (1981) confirms this conclusion and points out the major components of his complex outlook, the most noticeable characteristic of which is Novikov's violent opposition to the foreign (especially French) influence over Russian society. Against the hedonism and eudemonism of the Enlightenment, Novikov preached the virtues of traditional ethics. The concept of Enlightenment philosophy found in his satirical magazines was somewhat limited, and his passionate antagonism against the *Philosophes* was rather naïve and lacking in solid argumentation. These foreign teachings were, according to Novikov, totally alien to Russian society; assuming a not very subtle nationalist position, he therefore developed an apology of Russian "traditional" ways and Russia's "glorious" past. In order to give a more solid foundation to this perspective, Novikov initiated serious research projects and a series of scientific editions, intended to revalorize traditional Russian culture and national history.

It is in Freemasonry that Novikov found an ally in his struggle against the acculturation of Russia by foreign influences: in 1775, his friends convinced him to become a Freemason, and he joined the “English system” lodge “Urania”. He was looking for instruction and spiritual support for his ideas; and henceforth his itinerary as a Freemason would be marked by a pursuit of knowledge as well as moral and spiritual improvement. However, the Russian version of the “English” system in the 1770s could not really satisfy his needs, and like so many other Freemasons, Novikov embarked on a quest for “true” Freemasonry. Already in 1776 he became Grand Master of the Lantona lodge in St Petersburg, a lodge based upon Reichel’s system, that had been introduced in Russia in 1771. The rite was based on Zinnendorf’s (Ellenberg’s) system, and had four high degrees in addition to the blue ones. Close to the Rite of Strict Observance (a quite popular German rite based upon the Knights Templar filiation), this was a Chivalrous system of a Christian nature; but other than in the case of the Strict Observance, the additional four Chivalric Degrees were clearly marked by an emphasis on the occult, including the use of alchemic symbolism [→ Alchemy] of transmutation and some elements of thaumaturgy. The personality and ideas of George von Reichel (a German Freemason, member the Lodge “To the Three Golden Keys” of Berlin, appointed as teacher at the St. Petersburg Military School, and an important founder of Lodges in Russia) exerted a strong influence on Novikov: in fact, during their first exchange of ideas, both men were moved to tears.

Step by step a so-called “Novikov Circle” formed around Novikov, the members of which were to play a role in most major Masonic activities in Russia at the end of the 18th century. They participated in Novikov’s Masonic periodicals, worked as translators, publishers, editors and commentators. While belonging to different Masonic rites, they were all in search of the “True Freemasonry” and shared a common quest for “real” enlightenment, conceived of as a union between Faith and Reason, science and religion, and as a path towards moral and spiritual self-improvement as human beings, patriots and Christians.

The Lodge *Harmony*, founded in Moscow in 1780 by Novikov, I.-G. Schwartz and N. Troubezkoj, was an attempt at transcending the differences between Masonic rites and finding the essence of the Masonic quest. At this time, Russian Freemasons were seeking more independence from foreign Masonic institutions; and at the Congress in Wilhelmsbad (1782), I.-G. Schwartz, as repre-

sentative of Russian Freemasonry, obtained for Russia the new administrative status of “8th Province” within the existing structure (which divided Europe in Provinces according to the ancient Order of the Temple). This meant not only recognition, but also a certain amount of autonomy in research.

During one of his travels, Schwartz joined the “Rosicrucian Order of the Ancient System” that was rapidly expanding within German Strict Observance loges. At the same occasion he was empowered to promote the Order in Russia and was nominated as its regional supervisor. The membership list of the first Rosicrucian lodge, established in 1782 in Moscow as a result, in fact provides us with the best overview of what can be considered the “Novikov circle”: Novikov himself (he assumed leadership of the new system in 1784, after the death of I.-G. Schwartz), Mihail Heraskov (1733-1807), Piotr Tatischev (1730-1810), Nicolas Troubezkoj (1744-1821), Ivan Tourgenjev (1752-1808), Aleksej Kutuzov (1749-1797), → Ivan Lopukhin (1756-1816), Semion Gamaleja (1743-1822), and Vasilij Chulkov (1746-1807).

Even though the archives contain evidence of disagreements between them, the members of this circle definitely shared a common ideological platform in Novikov’s periodic editions, in which they actively participated: *Utrennij Svet* (The Morning Light, 1777-1780, orig. St. Petersburg; from April 1779 Moscow), *Moskovskoje Ezhemesjachoe Izdanije* (Moscow Monthly Edition, 1781), *Vechern’aja Zarja* (The Sunset, 1782), *Pokojaschijja Troudolubetz* (Resting Worker, 1784-1785). Their specific outlook, as emerging from the set of these publications taken as a whole (they are composed of translations, notes, comments and original texts) still awaits thorough analysis, but even cursory perusal reveals the quite interesting and well-developed esoteric ideology of the members of Novikov’s circle. One of their goals was to make available in Russian the most fundamental writings of Western esotericism (including → Arnold, → Weigel, → Paracelsus, Arndt, → Fludd, and → Boehme), and even to make some of these appear in periodical editions. As emphasized by Novikov in his foreword to *Utrennij svet*, ‘With our work we aspire to touch the very soul of our co-citizens’. Essential to his opposition against the Enlightenment, was his belief that the education of mind and spirit should go along with the transmutation of a person’s entire being.

Novikov’s early nationalism, expressed in his satirical magazines and later shaped by his spiritual

convictions, makes him oppose an idealized “traditional Russian society” of the past to the “corrupted modernity” of the 18th century. But in the course of his spiritual evolution he does not fall under the spell of apocalyptic eschatology and chooses a more optimistic theosophical path. Nowadays his position would be characterized as evolutionist. Novikov and his friends were in fact the major factor in an atmosphere of cultural Renaissance which became evident in 18th century Russia. The arts and sciences were among their primary interests: Novikov’s periodicals also published works by Gellert, Wieland, Young, von Kleist, Gessner, Bacon, Erasmus, and Montesquieu as well as classics such as Plato, Plutarch and Seneca.

Of particular interest in Novikov’s legacy is a fifty-volume collection compiled mostly by Novikov and Gamaleja during the 1810’s and labelled as *Library containing some hermetic, kabbalistic, magical and other books; as well as writings of the true Freemasons of the ancient systems. Collected and compiled in Russian from various translations*. This “library” represents an original perspective by Russian humanists and Freemasons on the basic referential corpus of modern esotericism. Among other things, it contains Russian translations of the *Corpus Hermeticum*, Angelus Silesius, → von Haugwitz, Hirsch, Kirchweger, → Llull, Retzel, and → Saint-Martin, followed by numerous original writings by Gamaleja, Novikov, Lopukhin, Scovoroda (1722-1794), and I. Turgenev. Novikov’s life was a practical confirmation of his ideas. While consciously “working on themselves” (which was understood as a form of esoteric *praxis*), Novikov and his friends deeply transformed Russian citizens and society, and thus lay foundations for the blossoming of Russian culture in the 19th century.

A full re-edition of Novikov’s satirical magazines is available in: *Satiricheskiye zhurnaly N.I. Novikova / Satirical magazines of N.I. Novikov*, Moscow – Leningrad: Institut Russkoj Literatry, 1951 ♦ *Utrennij Svet, ezhemesjachnoje izdanie / Morning Light, monthly*, St Petersburg: printed in Land Forces Corps, 1777-1780 (from April 1779: Moscow, University Press of N. Novikov) ♦ *Moskovskoje Ezhemesjachoe Izdanije / Moscow Monthly Edition*, Moscow: University Press of N. Novikov, 1781 ♦ *Vecherniaja Zaria / The Sunset*, Moscow: University Press of N. ALEX LAZAR-OVTCHINNIKOV

Number Symbolism

1. PYTHAGOREANISM 2. PLATO AND PLATONISM 3. AUGUSTINE
4. MIDDLE AGES 5. RENAISSANCE
6. FROM THE 18TH CENTURY ON

Number symbolism, also known as the qualitative approach to number and mathematical objects in general, constitutes a universal cultural phenomenon and has existed from time immemorial. As such, it must be envisaged strictly apart from the so-called “numerology” which has emerged as its contemporary offshoot and is really, at best, an illegitimate child and, moreover, a mere waste-product of post-modern consumerism.

Within western culture, to which we shall naturally limit ourselves here, open considerations pertaining to “qualitative number” first appear with the Greeks. As a matter of fact, and difficult to explain though it may seem to us, no Egyptian or Babylonian/Assyrian document featuring explicit “number-symbolical” speculations actually survives (assuming any ever existed). Since some authors find this fact hard to adjust to, the book market is continuously flooded with inept claims to the contrary, that is, for instance, to the discovery of the sacred geometrical meaning hidden in the

structure of the Gizeh Pyramids, or some such fantasy. Needless to say – as is the case with e.g. “the number of destiny in your name” – such claims hardly concern us here.

Even taking into account the lack of material evidence mentioned above, there can in fact be little doubt that, in the field of number symbolism as well as in many others, the Greeks are heirs to earlier, middle-eastern civilizations. The kind of correlative thinking which mathematical symbolism mainly depends on, with its full-fledged use of analogy and its conception of the universe as a multi-layered living organism, corresponding – in terms of structure – to individual human beings and laid out according to a continuous cognitive/ontological scale, pertains to a type of “wisdom” which most certainly predates the era of Pythagoras. For it is Pythagoras (around 570-490 B.C.) whose name has become to our day (and already was in ancient Greece) almost synonymous with “number symbolism” (along with vegetarianism and metempsychosis [→ Reincarnation]).

I. PYTHAGOREANISM

If the pythagorean school, which is likely to have disappeared as such around the end of the 4th century B.C., is generally well known for its mathematical achievements, it largely owes this reputation to Aristotle’s testimony and to middle- and neoplatonic doxography. It would appear from these sources that the Pythagoreans were in fact mainly concerned with giving a philosophical account of the “first principles”, under numerical guise. But it is frequently impossible to clearly distinguish between the actual origin of certain pythagorean doctrines and the systematic development thereof by later thinkers, just as it is often hard to draw a sharp line between mathematical discoveries proper, in the euclidean or modern sense, and number-symbolical speculations; all the more so since the two were never, for a long time, completely divorced from one another. Moreover, whether such discoveries or tenets corresponded in fact to collective elaborations within the whole school, over a period of time, or rather resulted from the research of individual members, is frequently uncertain. The mixture of “scientific” and symbolic preoccupations which seems to be a trademark of the movement from its inception, resulting in the doctrine of a cosmic harmony based, like the musical one, on a network of numerical → correspondences, is present in both Philolaos of Croton (*fl.* ca 450 B.C.) and Archytas of Tarento (around 430-360 B.C.). These are the two most important figures of the early period, both

quite likely to have influenced Plato. It is in a fragment by Archytas, handed down to us by Porphyry that the arithmetic, geometric and harmonic means are first explicitly treated as relevant to → music. From the notions of Limit/Unlimited, respectively assimilated to the mathematical categories of odd and even, Philolaos derives an entire cosmology in which Nature as a whole (and every single component of it) is merely an aspect of one of these principles, as well as an expression of their mutual complementarity. Both principles are, in fact, viewed as the intelligible manifestation(s) of the supreme and universal One.

According to Proclus (*Commentary on the First Book of Euclid’s Elements*, 24-30), Philolaos also used to establish symbolic correlations between certain olympian deities – three feminine and four masculine – and each respective angle of the square (4) and triangle (3), thus alluding to the sovereignty of the “universal” number twelve (4 × 3), referring to almighty Zeus. Assuming its attribution to Philolaos to be correct, this is perhaps the earliest example known to us of a “geometrical theology” akin, in many respects, to similar speculations elaborated during the hellenistic period. In his classic history of pythagorean literature, A. Delatte underscored the apparent shift from mathematics studied in themselves and with respect to natural phenomena, to the consideration of their mythological transpositions; but whether this shift does correspond to an historical reality, or is merely suggested by the deficient state of our documentation, is difficult to decide. It seems nonetheless hard to imagine a complete absence of such “divine” analogies in the works (most of them lost) of earlier writers of that school, for whom religion and ritual, number theory, ethics, geometry, physics, music and politics were in effect inseparable.

Due to the important focus on cosmology, the most meaningful numbers in this earliest period are, besides the septenary (which represents a basic structural feature) and – possibly – the quinary (see Mattei), the *tetraktys* and the decad, as two levels of expansion from the primordial Unity. Narrowly related (since $1+2+3+4 = 10$), these two respectively correspond to the cosmogonical and synthetic perspectives on Nature, just as they figure the fundamental intervals of the musical scale (1 = tonic, $4/3$ = fourth, $3/2$ = fifth, 2 = octave), i.e. the harmony of the world and its immanent presence within the soul (following the macro-microcosm analogy). Philolaos thus avails himself of such correspondences to elaborate a theory of four-fold anthropological principles, and of the cognitive faculties of the soul-harmony – akin in nature to

the Whole and capable of grasping it through the agency of *logos* – which will exert an influence on Plato.

2. PLATO AND PLATONISM

Ever since Antiquity, Plato's (428/7-387/6 B.C.) philosophy was often dubbed "pythagorean" and understood as imbued with such conceptions. Such associations are fundamentally mistaken, as Plato is in fact concerned with mathematics conceived of as "the language of cosmology" (L. Brisson); a language relying, in his case, not on hackneyed numerical analogies, but on the fact that mathematical entities detain the power of eliciting a rational description of nature. In order to bridge the gap between the immutable realm and the material world, subject to change, Plato introduces, as manifesting an intermediary order of reality, a series of "musical" proportions structuring the world-soul, which is itself a middle-term between the intelligible Forms and the *corpus mundi*. For him, it is a given fact that physical reality can only be understood, up to a point, inasmuch as it "accepts" and retains some kind of mathematical relation(s). Following the same logic, a precise polyhedral shape is ascribed, in the *Timaeus*, to each of the four elements; and each one of these shapes is in turn composed of invisible and indestructible "particles", of a geometrical nature (triangles). Number, geometry and proportion thus represent a certain measure of order, harmony and causality introduced by the world-soul into the fundamental transiency of tangible things; if this were not the case, the latter would remain inaccessible to discursive knowledge. If it is reasonable to assume that the constituent "harmonic" intervals of the universal soul, or the analogy between elements and geometrical bodies, may well represent platonic echoes of "pythagorean" themes (as does the association of proportional means to justice and/or social order [*Gorgias* 508a, *Laws* V 737c; 744b, etc], as well as to different types of political regimes – a *souvenir* from Archytas), the intent is nevertheless quite obviously different. Plato distances himself from his predecessors by trying to apply mathematics to physics with the aim of laying the logical foundations of a general ontology, and of a rational philosophy of knowledge. Even the famous enigma of the "Nuptial Number" (*Rep.* VIII 548b), dealing with the determination of the cycles commanding divine and human generations, fails to refer us to "traditional" pythagorean arithmology.

Merging the platonic and "pythagorean" outlooks on the interplay between mathematics and philosophy was a prominent concern in the early

Academy. Shared for instance by Speusippus and Xenocrates, Plato's two immediate successors, and frequently underlined by Aristotle (who sternly opposed it), this preoccupation made a strong reappearance in the thought of the later, so-called neopythagoreans of the 2nd century A.D. and onward, such as Numenius of Apamea, Nicomachus of Gerasa, Moderatus of Gades, Theon of Smyrna, or Anatolius, not to mention Iamblichus or Proclus. Each of these writers represents, in his own way, a specific blend of middle- or → neoplatonism and neopythagoreanism, typical of the philosophical eclecticism widespread at the time. Both the symbolic, inductive approach to number and the deductive one, along with "scientific" applications, coexist in their writings. But Iamblichus (around 245-325 A.D.) and Proclus (412-485 A.D.) belong to a later period in which neoplatonism, though established as a long-standing school equipped with a structured course of studies, nevertheless tended to become more and more of a theology. On its theurgic, ritual side, numbers serve as one of the mainstays of a "sacramental" approach to Nature, in which each level of being provides a rung sustaining the gradual ascension of the soul towards direct contact with divine entities; concurrently, numbers represent the intellectual offering *par excellence*, something the soul must eventually sacrifice to the higher deities, in order to transmute all cosmological bonds which fetter its essentially spiritual essence. Geometrical figures, considered as having extension according to the three dimensions of space, participate in this process of salvation, which ultimately includes Nature's physical aspects, through the correlative three-dimensional "universalization" of the soul, which coincides with its repatriation into the divine realm. Other practical facets of such an esoteric use of mathematics seem to have enjoyed less widespread favour, like the association (much more familiar in semitic cultures) of number and letter symbolism (i.e. taking into account the numerical value, and sometimes the geometrical shape or alphabetical rank, of letters) emerging in Plutarch's *On the E at Delphi* (ca. 115 A.D.), in some of the extant fragments of Theodore of Asinea (mainly quoted by Iamblichus – who sharply criticizes such methods! – and by Proclus in his *In Timæum*), in the 4th-century *Theology of Arithmetic* or in passages from Damascius (ca. 470-535 A.D.). On the more scholarly side, in order to exactly understand the mathematical tenets contained in Plato's dialogues (an obviously important part of its curriculum), and in order to ascribe to mathematics their correct place within the general hierarchy of

knowledge and, accordingly, assess the objective ontological status of number, the later strands of neoplatonism consciously “pythagorized” the philosophical approach to reality. Within such a shift, the production of manuals and commentaries on earlier scientific textbooks (by Euclid, Nicomachus or Ptolemy) began playing an important role, and a strong emphasis was put concurrently on number as representing both an image of metaphysical principles, and the intimate pattern of physical reality. It is almost impossible to overstate the influence of these views on the patristic, medieval and Renaissance understanding of mathematics and of their symbolic meaning.

3. AUGUSTINE

The general threefold orientation of ancient greek arithmology, consisting of cosmological, ethical and/or theological transpositions of number(s), was retained for the most part by early Christian thought. But obvious adaptations were needed since Scripture, now, above the *rationale* of mathematics or philosophy, had taken over as the novel paradigm of numerical signification. The “divine inspiration” of the books composing the Bible was of course interpreted as implying that the numbers they contained must have a spiritual relevance. Moreover, the inescapable fact that most of these numbers did not by any means remain limited to the primary “Decad”, sacred to the ancient Greeks, meant that the original framework of number symbolism now had to adapt to much broader perspectives and materials. The variety of biblical texts which happen to feature numerical data or measurements (dealing with theology, cosmology, history and chronology, liturgy, eschatology and prophecy), combined with the doctrines of typology and of multi-layered meanings within Scripture, only confirmed the necessity of a wider system of hermeneutics applied to number. To all this should be added the array of different tasks incumbent on the Christian interpreter: catechism, moral edification, preaching, biblical commentary, spiritual teaching or meditations addressing various types of audience.

Even though → Augustine (354-430 A.D.) is obviously not the first example of a strong interest in number symbolism within the Latin Church (one only has to remember Tertullian or Cyprian in Africa, Ambrose of Milan or Jerome in Europe – not to mention some of their Greek predecessors, like → Clement of Alexandria, Origen, or Irenaeus), he offers a remarkable case in point for the new situation outlined above. A bishop first of all, his main goal consists in edifying his brethren

by explaining Scripture and rendering its contents accessible to them; according to his views, nothing may of course be considered superfluous in the sacred text, least of all the numerical passages which, he contends, are essential to a better and deeper grasp of biblical meanings. Based on the triple authority of Scripture itself (as divinely inspired), the Tradition of the Church (which warrants interpretation) and reason (analysis of arithmetical properties), enhanced by his own immense prestige as a preacher and theologian, his exegetical efforts consider number mainly as an interpretative tool, as a *sacramentum* indicative of a subtler, more spiritual significance behind the literal meaning of the Bible. Number-symbolic developments thus appear scattered throughout his many works, generally attuned both to the scriptural context to which they belong and to the particular ends of a specific writing of his. Eventually our man, availing himself of the inexhaustible polysemy of symbols, never hesitates to present several differing explanations of a given number.

One key feature for understanding Augustine’s arithmology is conveyed in the famous sentence: ‘Therefore we cannot say that the number six is perfect because God perfected all his works in six days, but that God perfected his works in six days because the number six is perfect’ (*De Gen. ad litt.*, IV, 7). Another fundamental aspect resides in the frequent trinitarian analogies developed between the Godhead and creation, and exemplified by a well-known quotation from the *Book of Wisdom* (XI, 20): ‘Thou hast disposed all things according to measure, number and weight’. In both cases, the underlying theme is that the participation of creatures in the divine nature implies that a certain order, rhythm, proportion and harmony is imparted to the universe, through the divinely ordained regency of number. Such views are intrinsically not new, as we have seen above. If, seen in this light, the mathematical archetypes are no longer represented by the platonic “Forms and Ideal Numbers”, they become “essences” coexisting within the divine *mens* and, as such, presiding over the creation. However, one may easily observe that, according to both doctrines, numbers nevertheless continue to reflect higher principles, as well as serve as models of the lower levels of reality. Yet, although influenced by neoplatonism like the rest of Augustine’s general thinking, his number-symbolical speculations never depart from an exclusively Christian perspective, structured at least in part around threefold correspondences, and delineated before him by Ambrose in the following way: ‘We do not treat it [i.e. the Septenary]

according to the pythagorean manner or that of the other philosophers, but according to the form and divisions of spiritual grace' (*Ep.* XLIV). Even the classic greek procedure of interpreting numbers by first reducing them to Unity, or at least to one of the digits composing the first decad, is retained, but this reduction is now construed as illustrating both the divine immanence within beings, which warrants their existence, and the eventual final return of these to the Godhead.

Unity, here, is understood not as a number in the quantitative sense but as an immaterial monad, the most perfect entity besides God, its immediate origin; 2 denotes separation and the breaking-up of unity, inherent to both love and knowledge; 3 is of course referred to the Trinity and is, more generally, the heavenly number of the soul, whereas 4 is that of the body and of the material world, a figure of firmness and solidity; 5 illustrates virginity and the five senses, instruments of the soul, and 6 – the first “perfect number” – the accomplishment of creation (by reference to the six “days” of *Genesis*); 7 symbolizes the perfection of creation, imaged by the Sabbath and the gifts of the Holy Ghost; the Kingdom and messianic era are figured by 8, whereas 9 is but the last step before the denary which, as $3+7$, introduces the Decalog and expresses the ultimate achievement of all things; 12 is of course the number of the apostles, of the Elect ($12 \times 12 = 144$) and of the spreading of the Gospel (3 Trinity \times 4 corners of the world); 40, of fasting and penance; 50, of the Jubilee; and so on.

In the *De quantitate animæ*, in an attempt at describing the relations between the animating soul and the body, Augustine explores the symbolism of geometrical figures (circular or rectilinear, as two-dimensional images of the corporeal body) and of their respective characteristics (number and symmetry of angles and sides), to end up reducing them progressively to the properties of the immaterial dot, akin in this respect to the soul, and to a “geometrical monad”, equivalent in its order to the numerical unity.

Augustine's overall conception of arithmology has exerted a deep and sustained influence on most later Christian writers on number symbolism, to the point that many of them, including (as we shall see) some authors well-versed in esotericism proper, merely repeat or closely depend on his interpretations. If his explicit wish of having a lexicon of biblical numbers and their symbolic meanings written down in his own time was not fulfilled, partial attempts at such an endeavour may be recognised in the last chapter of Eucher of Lyon's († ca. 450) *Liber formularum*, or in the

much more important and influential *Liber numerorum* attributed to Isidore of Sevilla († 636) – certainly the main treatise of the kind before the work of Eriugena († ca. 870).

4. MIDDLE AGES

One of the foremost theologians of the latin Church, → Johannes Scottus Eriugena stands at the crossing of all cultural currents of his time. His principal work, the lengthy *Periphyseon* (On Nature), as well as his commentaries, bear the influence of three main strands: the greek theology of → Ps.-Dionysius Areopagita (6th c. AD) and Maxim the Confessor (VIIth c. AD), both of whom he actually translated into latin; the western tradition of Augustine, Isidore and the Carolingians (Alcuin, R. Maurus, Hincmar, Hilduin); and finally that of “latin platonism” (Macrobius, Calcidius, Martianus Capella, Boethius). For him, the relations and properties of numbers, the manner in which they emanate from the original monad (unity), constitute a model of the way in which created things gradually come into being. Within the monad, they retain their intrinsic, eternal nature; as they progress (along with the rest of creation) towards material existence, they take upon themselves a created nature. God himself is the uncreated monad, which the arithmetical one mirrors on a lower plane. Such views obviously reflect a strong Christian-neoplatonic bias, within which number is not just a textual metaphor or an interpretative tool, but an actual entity playing a regulating role in the overall ontological process. Eriugena also develops some remarkable analogies about the cube and the number 8 (*Exp. in Coel. Hierarch.* VI, 165-98), or certain cosmological measures (*Periphyseon* III, inspired by Basil's *Hexaemeron* and M. Capella, whose writings he also commented).

The interplay between cosmology and arithmology which certain treatises belonging to “latin platonism” manifest, whether stemming from pagan (Macrobius, E. Favonius, Calcidius, M. Capella – 4th & 7th c. A.D.) or Christian (Boethius, † 524) authors, has had a considerable influence in the Middle Ages. Put forward and given prominence in these texts are the themes of cosmic harmony and the relation of musical intervals to significant numbers, to which is attributed a positive role in structuring the world-soul, the heavenly spheres, the elementary components of physical reality and/or the fundamental cycles of human life into a general unison. The philosophical tenets and arithmetical data found within such works, classic though they are, did much to extol the importance of cos-

mological speculations, and convince medieval thinkers of the necessity to explore the book of *Genesis* along such lines, as well as take into account the “mysteries of numbers” in the study of the fabric of the universe as revealing divine wisdom.

Scriptural hermeneutics, and the elaboration of what rapidly became known as “natural philosophy”, following the scholarly development of the seven Liberal Arts in the wake of textbooks such as M. Capella’s *Wedding of Mercurius and Philology*, are the principal goal of most medieval schools which make use of mathematical analogies. Physics and arithmetic are frequently subjected to theological transpositions, extending – especially within the school of Chartres – beyond the traditional symbolic use of numbers as, for instance, when elementary operations (like addition or multiplication) are globally taken as reflecting the internal “nature” of the Godhead, or the structure of its relations with created beings.

But here, as in the use of the so-called “platonic” means – within the Victorine and Franciscan schools – to illustrate the links between the Persons of the Trinity, the tie with esotericism is relatively slender and difficult to establish properly. At the same time, and contrary to what one might readily think, detailed arithmological considerations as such are seldom present in medieval magical and/or alchemical treatises; but simple geometrical shapes (like the circle, triangle or square, as in Constantinus or ps.-Llull, studied by B. Obrist) are sometimes taken as organizing the material combinations of the elements and leading to the contemplation of the spiritual principles of the Art.

5. RENAISSANCE

Renaissance esoteric currents, which make an extensive use of number symbolism, often blend the classic qualitative analogies with an insistence on the immaterial character of mathematical entities, supposedly apt to liberate the intellect from earthly preoccupations and help it reach the intelligible realm, thus leaning on both the ontological and cognitive aspects of number. Such an approach, by assimilating the nature of thought processes to that of arithmo-geometrical tools and procedures, entails some kind of “mathematizing” of reality, and of the dialectics on which its mental apprehension rests. As the supreme warrant of the numerical harmony of reality, the divine sphere itself hardly remains immune to this tendency of applying mathematical objects and reasoning to the whole scale of being, and is therefore assimilated to either unity, or the center, or the circle.

Making use, in various degrees, of these two approaches, and belonging all three to the circle of the famous french Humanist → J. Lefèvre d’Etaples (ca. 1455-1536), who touched on the subject himself in book II of his unpublished *De magia naturali* (written around 1493), C. de Bovelles (1479-1567), J. Cliehtove († 1543) and G. Roussel († 1550) published on number symbolism between 1510 and 1521. The first mainly explores a vast array of philosophical and mystical analogies (*Liber de XII numeris*), whereas the second limits himself to an exegesis of numbers found in the biblical text (*De mystica numerorum significatione*), based mostly on authors pertaining to the Christian tradition, and the third adds an arithmological commentary to his new translation of Boethius’ *Arithmetics*. All of them manifest a clear didactic purpose, in the attempt of structuring and harmonizing the spiritual messages which they believe hidden in Christian ontology, in Scripture and in classical thought and cosmology, thanks to the symbolic transpositions of arithmetic.

The major exponents of Renaissance → magic have also put arithmology to an extensive use. From → Marsilio Ficino (1433-1499; *Compendium in Timaeum*, 1496) to → Giordano Bruno (1548-1600; *De monade*, 1591), through → Henricus Cornelius Agrippa (1486-1535; *De occulta philosophia*, 1533), → John Dee (1527-1608; *Preface to Euclid’s “Elements”*, 1570) or Fabio Paolini (*Hebdomades*, 1589), number is shown to sustain a key role in the understanding of the fabric of the universe as an expression of divine wisdom and activity, whether understood in a platonic or a Christian sense. The intermediary character of number on the general scale of being concords with that of the human soul, which is preeminent in magical procedures, just like number itself is a fundamental constituent of ritual music and/or invocations and seals, through its shaping of musical intervals and geometrical figures, and the numerical values attributed to letters. Therefore the magus’ “creative imagination”, and the network of dynamic correspondences linking it to the celestial *spiritus* and to the world-soul, are both activated into a universal consonance by the qualitative aspects of number.

In and out of the Paracelsian movement [→ Paracelsianism], mathematical and musical analogies have been applied to → alchemy, in order to illustrate the supposed correspondences with cosmogony and eschatology evinced by the phases and operations of the Great Work. At the same time, certain measures and weights (of temperature, substances, instruments) were given, by way of the

same symbolism, some analogical significations, and sometimes even paralleled with actual scriptural passages featuring numerical data, or proportioned to the human body. Examples of this may be found in John Dee's *Monas hieroglyphica* (1564) or the writings of → Gérard Dorn († after 1584); including the spurious *Aurora* of 1577. Even the geometrical characteristics of the famous "platonian" bodies have been interpreted in alchemical fashion, mostly by W. Davidson († 1669) in his *Philosophia pyrotechnica* (1635), just as the presence of the three paracelsian "principles" and four traditional elements has triggered diverse arithmological considerations.

With writers such as → Giovanni Pico della Mirandola (1463-1494), → Johannes Reuchlin (1455-1522), → Francesco Giorgio (1466?-1540), → Egidio da Viterbo (1465-1532) or → Guillaume Postel (1510-1581), the affinities between Christian kabbalah [→ Jewish Influences III] and "pythagoreanism" are given a wide display. Even if not all of them go as far as Reuchlin himself, who bluntly declared them identical (*De arte cabbalistica*, 1517), the themes of divine or angelic names, closely associated with letter/numerical permutations, and of their role in the spiritual ascent of the soul and the cleaving of the intellect to God, are everywhere in evidence. Parallels are drawn between Greek and Jewish traditions, for instance between the *tetraktys* and *merkavah* (Chariot) à propos the quaternary, or between the Decad and the ten *sefirot*. Pico (*Conclusiones*, 1486) has done much for the "formal" (qualitative) aspect of number to regain cultural favour, insisting on its importance as regards "natural philosophy" or theology, as well as highlighting its magical and kabbalistic functions. Egidio da Viterbo stresses the interplay of 3 (Trinity) and 10 (*sefirot*), before interpreting the first ten numbers against a vast mosaic of biblical and kabbalistic quotations (*Scechina*, 1530). Francesco Giorgio (*De harmonia mundi*, 1525) builds up a complex metaphysical doctrine, based on divine, cosmic and musical harmony, and on numbers, in which the One communicates itself to the material world through the angelic and celestial spheres, which constitute a universal scale of 27 (3 × 9) spiritual degrees. Guillaume Postel interprets Plato in the light of Jewish mysticism, in showing how the Nuptial Number and the myth of Er (*Republic*, VIII) are explained *via* the kabbalistic theory of metempsychosis, or how the five platonian bodies, associated with the numbers 3, 4 and 5, actually mirror the structure of the messianic "corner-stone" discussed in Scripture and in the *Zohar*.

The idea of three worlds, composing a universal harmony based on 27, and reflecting hierarchically the divine Unity which manifests itself externally through the number 3, structures the theosophical approach to arithmology featured in → Robert Fludd's (1574-1637) *Utriusque cosmi . . . historia* (1617-1624). Knowledge of the divine sphere is obtainable for mankind through that of the macrocosm, and the concept of proportion is central in the deciphering of the musical and mathematical scales which organize the flow of the "life-force" on the different planes.

In 1584-1585 and 1665, respectively, P. Bongo († 1601) and the jesuit → Athanasius Kircher (1602-1680) published two great arithmological "summae", ultimately considered textbooks of this particular *genre*. Under the titles *Numerorum Mysteriorum* and *Arithmologia*, they assert the divinely assigned regency of number upon the creation and examine its manifold applications (exegetical, magical, cryptographic, divinatory, etc.).

6. FROM THE 18TH CENTURY ON

The shift in intellectual and spiritual perspective which affected the European world-view in the aftermath of the "scientific revolution" and during the "pre-Enlightenment" era contributed to the gradual estrangement of number-symbolical speculations from the mainstream of western culture. Its long-standing partnership with esoteric currents resulted in the name and practice of arithmology becoming a near synonym of "magic" and/or "kabbalah", two disciplines henceforth considered as obsolete and reeking of "superstition" and "obscurantism". It is therefore not to be wondered at that "mystical arithmetic" was rather shunned in academic circles and its cultivation mainly restricted to illuministic [→ Illuminism] or pietist [→ Pietism] circles. Perhaps the most telling example of this evolution is J.C. Lange's (1668-1756) *Theologia christiana in numeris* (1702, 21734), a learned esoteric dissertation published, *under a pseudonym*, by a professor of logic and mathematics at the University of Frankfurt. The *Theologia* is in fact an erudite attempt at ordering and interpreting some of the main articles of the Christian faith according to the pythagorean Decad, adorned with symbolic drawings of a declared theosophical nature.

At the same time, and interestingly enough, the bulk of the literary production, in the domain of 18th-century arithmology, no longer comes from the "latin" countries, but belongs predominantly to the German *Sprachraum*. One of its foremost exponents is → Karl von Eckartshausen (1752-

1803; *Aufschlüsse zur Magie* [t. IV], 1792; *Zahlenlehre der Natur*, 1795; *Probeseologie*, 1795), who treats numbers essentially as “traces” of divine wisdom within Nature, with a view to conjoining scientific and theosophical thought, as well as number symbolism and kabbalah, in a dual effort towards illuminating the interplay of “life” and “spirit” which make up the natural manifestations of the creative Word. For → Louis-Claude de Saint-Martin (1743-1803), who resorts to numbers in most of his works (*Des erreurs et de la vérité*, 1775; *De l'Esprit des choses*, 1800; *Des nombres*, 1843), mathematics – scientific as well as theosophical – are linked to order and harmony; but, as such, they only represent a combination of signs, a language which, left to itself, only describes the outer crust of reality and is bound to remain superficial, unless one endeavors to retrieve its original form and actively expand on it. Like bodies, numbers mediate, as it were, between the visible and the invisible and are linked, moreover, to the “life-force”, the productive energy in Nature; this situation enables them (mostly the primary Decad) to express the laws and actions of all living beings. The numerical language is also an aspect of the divine Word and of its expression(s), present as such on all levels of existence, and which requires an active effort of combination(s) and interpretation on the theosopher's part, so as to become a *living* and truly spiritual translation of the cosmic order. In other words, to fulfill their potential as vital intermediaries and theosophical *signs*, numbers must first be “assimilated” by the dynamic process of imagination and then “acted upon”, so to speak, by way of certain privileged mathematical operations, thus paving the way to more than a mere “reading” of the world: to cooperation in its “writing” as well.

From → Martines de Pasqually (1727-1774) or → Cagliostro (1743-1795) to P. de Joux (1752-1825) and many others, masonic authors have not neglected the use of arithmetic. In his *Traité de la réintégration des êtres*, grounded in “kabbalistic” and Christian theosophical doctrines, Pasqually develops a complete and somewhat personal *exposé* of cosmogony, of the Fall of man, and of the path leading to the recovery of Adam's spiritual prerogatives. These are linked to the number 3, as is also the case with the divine “essences” presiding over the production of forms, which are in turn synthesized by 4, 8 and 10, or the plenary expansion of Unity. Biblical themes (Solomon's Temple) and ritual/theurgic considerations interlace and, more often than not, hinge on the symbolic qualities of numbers and geometrical figures, a topic synthesized for instance in P. de Joux's “Exposition

succincte de la valeur symbolique des nombres” (in appendix to his *Ce que c'est que la Franche-Maçonnerie*, 1802).

But unquestionably the most meaningful expression of number symbolism in the same period (and up to our own time) is found in German Romantic → *Naturphilosophie*. Among many examples, J. Malfatti's *Studien über Anarchie und Hierarchie des Wissens* (1845) insists on the dynamic interpenetration of metaphysics and quantitative science, under the guise of a dual denary, divine and manifested, where creation reflects the triune deity and its seven “powers”, symbolized by the first ten numbers. But → Franz von Baader (1765-1841) stands foremost, as he develops in his works some remarkable spiritual intuitions about the decad and the interplay of 3 and 4 within Nature (*Fermenta cognitionis*, 1822-25; commentaries on Martines de Pasqually's *Traité* and Saint-Martin's *Des nombres*). With this eminent thinker and Christian theosopher, we meet with some of the very last, truly original speculative elaborations on the dynamics and interactions of life and spirit in the micro- and macrocosm, reconciled with contemporary scientific and philosophical perspectives through the partial agency of numerical analogies. Seen in this light, Romantic philosophy may also be interpreted as an attempt to override a well-known general tendency of the late 18th and early 19th centuries, which is to extend the concepts of (quantitative) measure and calculus to most areas of knowledge (including ethics, psychology or politics), and counterbalance it with the dynamics of natural sciences, allied to an aesthetic theory of the human perception of signs and qualities.

As for the evolution of number symbolism during the late-19th and 20th centuries, it thoroughly confirms the obliteration of the worldview inherited from the Renaissance, notwithstanding the obstinate persistency of a certain amount of *idées reçues* associated with it, and their more or less substantial transformation by the growing secularization of modern thought. Obviously, in a universe which may no longer be perceived as an organic, animated being, the intellectual plausibility of “living” correspondences and world-harmony – not as mere literary metaphors but as actual epistemologic categories – vanishes for the most part. Consequently, numbers can only with the greatest difficulty remain considered as privileged intermediaries between the essence and structure of reality. Analogy as a valid aspect of causality, and the notion of the “unicity” of Nature, both being reduced to the status of antiquated and naïve views, the capacity hitherto recognised in

mathematical entities to figure actual “signs”, henceforth tends to become meaningless; furthermore, an homogeneity of nature between knowledge and reality being refuted, numbers can no longer represent “formal causes”, or an “expression” of things, but necessarily become mere logical instruments, limited to quantitative uses.

Given this situation, some exponents of our subject do not bother to convey much more than trite *topoi* (A. M. Fax, *Des nombres mystérieux*, 1850; A. l'Esprit, *Histoire des chiffres... au point de vue... occulte*, 1893), occasionally festooned with borrowed occultistic views, whereas others actually publish much more ambitious universal overviews, in which mathematics (including their symbolic side) are naively purported to offer a synthetic, “scientific” key to all available knowledge (M. Etchegoyen [† 1843], *De l'Unité*, 1836-42 [4 vols.], grounded in ontology and metaphysics; → P.-F.-G. Lacuria [† 1890], *Les harmonies de l'Être exprimées par les nombres*, 1847 [2 vol.]). A talented attempt at reviving neoplatonic arithmology is that of Thomas Taylor († 1835; *The Theoretic Arithmetic of the Pythagoreans*, 1816, and reprints), while the Catholic tradition is upheld (amongst others) by Canon Auber (1804-1892) in his *Histoire et théorie du symbolisme religieux*, 1870-72 [4 vol.; reprint 1977]. Masonic and occultistic compilations live on with Rd. G. Oliver († 1875; *The Pythagorean Triangle*, 1875) or → W.W. Westcott (1848-1925; *Numbers: Their Occult Power and Mystic Virtues*, 1890). Apart from giving birth to the inept “numerology” alluded to at the outset of these pages, the 19th century has also – and more interestingly – fostered a series of anglo-saxon and german works dealing with the interpretation of biblical numbers, with more or less esoteric undertones; the most notable representatives of this (still extant) undercurrent, which stretches from the mid-1860's to our time, being – besides E.W. Bullinger's *Number in Scripture* (1894; sev. reprints) – W. Begley's *Biblia cabalística* (1903; rep.), T.S. Lea's and F.B. Bond's *Gematria* (1917, rep.), A.Q. Heller's *Biblische Zahlensymbolik* (1936), and L. Stalnakier's *Mystic Symbolism in Bible Numerals* (1952).

Most of the above trends have continued into the 20th century, giving birth until our day to a relatively steady flow of publications which, however, generally offer but little novelty. Very few contemporary writers dealing with number symbolism actually display any originality at all, moreover allied to a real consistency of thought; they either present “spiritual” overviews of the field (R. Allendy, *Le symbolisme des nombres*,

1921) or apply numbers to other, different purposes (→ R. Schwaller de Lubic's *Etude sur les nombres*, 1917 – to natural cycles; D. Néroman [M. Rougié], *La plaine de vérité*, 1951 – to → astrology), whereas V. Capparelli (*La sapienza di Pitagora*, 1940-1944) tries to retrieve the ultimate spiritual meaning of ancient pythagorean number philosophy. Nowadays, works of this kind increasingly manifest, it must be noted, an attempt at somehow integrating all kinds of scientific and historical data, taken from the various academic fields of research, including scholarly works on the origins and development of number symbolism itself (beginning with the german philological school of H. Usener, W.-H. Röscher, F. Boll, O. Weinreich)! Both the last two centuries have also witnessed the appearance of a strong academic interest in “numerical criticism”, i.e. the mathematical structuring of literary texts and poems (from Virgil to Hermann Hesse, but mainly about medieval documents, with a peak of publications during the 1960s, 1970s and 1980s); but, as with the applications of number (and proportions – e.g. the “Golden Section”) to art in general, music and architecture in particular, or even liturgy, the relation of these speculations to arithmology proper is in fact often problematic (less so, of course, during the Middle Ages and Renaissance), enough at least for us to have left them outside the scope of this article.

JEAN-PIERRE BRACH

Nuysement, Clovis Hesteau de,
* between 1555 and 1560 place
unknown, † after 1624 place unknown

Secretary of the chamber of Henri III (1551-1589) and of the Duke of Anjou (1555-1584), disciple of Jean Dorat (1508-1588) and member of the Academy founded by Antoine de Baif

(1532-1589), Nuysement is first of all a perfect courtly poet of the end of the 16th century. His *Œuvres poétiques* (1578), which essentially consist of love poetry, earned him some notoriety at that time. But as W. Kirsop has shown, emphasizing the court of Valois' sympathy for spagyric doctors and devotees of → Paracelsus, Nuysement soon seems to have developed a solid knowledge in the domain of alchemy as well. Several decisive encounters led him, according to his own statements, on the arduous path of the quest for the philosopher's stone. First there was his meeting with François de Foix, count of Candale [→ Foix-Candale], who initiated him into the Hermetic doctrine. Then there was his meeting with the famous adept Sendigovius (1566-1636), whom he mentions several times in his works. After a long literary eclipse, and while exercising as a protégé of the duke of Lorraine the function of collector general for the county of Ligny-en-Barrois, Nuysement once again took up the pen, this time to put his talents as a writer in the service of alchemy. The result was, successively, a *Traitez du vray sel* (1620), a *Poème philosophic de la vérité de la phisique minerale*, followed by *Stances* and *Visions* (1620), and finally a *Poème sur l'Azoth des philosophes* (1624). These various works are marked by a syncretic philosophy: Nuysement quotes Plato and → Hermes Trismegistus as authorities while subscribing to Aristotelian ideas (the theory of the four elements, matter and form, generation) or stoic ones (the role of the spirit or the *pneuma*). Nuysement's work is also marked by the influence of Paracelsus (he notably takes up his doctrine of the three principles, while insisting on the importance of salt, and develops a primarily medical concept of alchemy). Finally, constantly blending references to Holy Scripture with hermetic arcana, his attempt is to make his art into an instrument in the service of God's glory. This boldness would earn him the wrath of Marin Mersenne (1588-1648) who, in *La Vérité des sciences* (1625), ironically surnamed him "Nuisance". These polemics do refer us to one of the main motivations of this alchemical writer. In an era when Paracelsianism was in open struggle with official science, Nuysement, as his *Poème philosophic* shows explicitly, intended to provide the Hermetic art with a defense and illustration that should definitively reduce its enemies to silence. A few years later this would also be the ambition of Pierre-Jean Fabre (1588-1658) in his *Propugnaculum alchemiae* (1645).

FRANK GREINER

Occult/Occultism

1. OCCULT QUALITIES 2. OCCULT FORCES
3. OCCULT PHILOSOPHY 4. OCCULT SCIENCES
5. OCCULTISM 6. THE OCCULT

Although the various terms and expressions based upon the latin "occultus" ("hidden, secret", from *occulere*, "to cover over, hide, conceal") tend to be used indiscriminately and are often confused in common parlance, they are the reflection of a historical development in the various stages of which they refer to different things. It is of particular importance to distinguish between the original adjective "occult", and the substantive "occultism" that made its first appearance in the 19th century.

1. OCCULT QUALITIES

In the context of the medieval reception of Aristotelian natural philosophy, a distinction was made between the manifest, directly observable qualities of things (such as colors or tastes), and their occult qualities, which were not directly observable and could not be accounted for in terms of the four elementary qualities. Important examples were the force of magnetism, the influences

emanating from the stars, and the curative virtues of herbal, animal and mineral substances. Although their effects could be observed in nature and found out by experimental means, occult qualities could not be understood or explained according to the canons of logic and natural philosophy. For this reason they could not be objects of scientific knowledge as understood from a scholastic medieval perspective; their activity could be known indirectly, but not investigated directly.

In his pharmacological writings, Galen (2nd cent.) wrote that many substances (medical drugs, poisons, → amulets etc.) worked by virtue of ‘undescribable properties’, of which no systematic account could be given and whose manner of working was unknown. Medieval thinkers, including Thomas Aquinas (*De occultis operibus naturae*, written between 1269–1272), came to understand them in terms of Aristotle’s doctrine of form: the occult qualities or virtues of things were based upon their “specific” or “substantial form”. The latter was imperceptible to the senses and could not be reduced to the qualities of the elements or their combination.

In their discussions of occult qualities, the great representatives of Renaissance → neoplatonism and hermetism [→ Hermetic Literature III] remained dependent on scholastic categories. Thus, in describing how certain stones can attract celestial influences, → Marsilio Ficino emphasizes their “occult properties”, which are ‘hidden from our senses, and hence only with difficulty known to our reason’; and he points out that ‘a material power requires much matter if it is to achieve much; but a formal power even with a minimum of matter avails very much’ (*De Vita* III, ch. 12). Likewise → Cornelius Agrippa describes the occult virtues as ‘a sequel of the species and form of this or that thing’ and points out that they have much greater efficacy than elementary qualities precisely because they ‘have much form and little matter’. He explains that they ‘are called occult properties because their causes lie hidden, so that man’s intellect cannot in any way reach and find them out; wherefore philosophers have attained to the greatest part of them by long experience rather than by the search of reason’ (*De occ. phil.* I: 10).

The new philosophies associated with the “scientific revolution” of the 17th century have often been portrayed as rejecting occult qualities; it is more accurate, however, to say that they accepted their reality but sought to account for them in mechanical terms (Hutchison 1982). Whereas the scholastic approach implied that occult qualities fell beyond the scope of science, philosophers and scientists in the wake of Descartes claimed that

occult *and* so-called manifest qualities could both be explained scientifically in terms of an insensible mechanism. In fact, since our sense perceptions never give us a direct picture of reality, *all* qualities were “occult”; but this did not imply, as for the scholastics, that they were unknowable. The ambition of the new science was, precisely, not to restrict itself to the domain of what could be perceived by the senses, but to go deeper and explore the invisible workings of nature. In this respect there is a continuity between the *magia naturalis* of Renaissance philosophers and the new science of the 17th century: although the former remained dependent on scholastic categories while the latter went beyond them, both refused to leave occult qualities in the domain of inscrutable and irrational mysteries and instead approached them as a domain of reality that could be scrutinized by the human mind and put to practical use.

Pejorative statements since the 17th century about the occult qualities as ‘that ill-contrived sanctuary of ignorance’ or ‘that infatuating opium of ignote qualities’ (Walter Charleton) were actually directed not against the reality of occult qualities as such but against the scholastics, who were blamed for using the doctrine as an intellectual refuge that blocked inquiry instead of stimulating it (Hutchison 1982, 245). Eventually, however, the subtleties of the debate were forgotten and any belief in occult qualities came to be perceived as incompatible with science. Nevertheless, even in Diderot & d’Alembert’s *Encyclopédie* the lemma “occulte” still carefully distinguishes between “occult sciences” and “occult qualities”; whereas the former are simply rejected as vain and superstitious, about the latter we read that if the ancient philosophers understood by an occult quality ‘*a cause whose nature and manner of acting is unknown*, one must admit that their philosophy is, in several respects, more sane than ours’ (emphasis in original).

2. OCCULT FORCES

But while the kinds of phenomena traditionally referred to as occult qualities were increasingly demystified in so far as they could be assimilated into “normal science”, their traditional understanding as mysterious and perhaps even divine forces lived on as well. From the 18th century on, those who rejected the hegemonic claims of Enlightenment ideologies increasingly focused on such “occult forces” in their efforts to prove the limitations of the mechanist and materialist science. Moreover, in reaction against the perceived threat of “fragmentation” (implied by a

mechanicist worldview), it was increasingly claimed that there is ultimately only *one* such force, which permeates the world the way an organism is permeated by an invisible life force. Major candidates for this occult force from the 18th century on are “electricity” and “magnetism” [→ animal magnetism], and these were discussed in terms of theoretical frameworks directly rooted in Renaissance *magia naturalis*. Theories of magnetism and of electricity (as well as these very terms) were largely interchangeable – the founder of animal magnetism Franz Anton Mesmer hesitated which term to use for the invisible fluid postulated by his theory – and had their Renaissance origins in the work of Rudolf Goclenius the younger (1572-1621) and → Athanasius Kircher (1602-1680). Goclenius discussed magnetism as a manifestation of the universal forces of sympathy and antipathy; he wrote that *magia naturalis* consists in the investigation of ‘these abstruse properties and forces, deeply hidden in the majesty of Nature’, and presented the entire universe as a living organism. Kircher in his *Magnes sive de arte magnetica opus tripartium* (1643) associated magnetism with the presence of God himself as an ‘all-pervasive, radiant power, which gives life, forms and sustains everything’. On such foundations, a complete “theology of electricity” was later developed by Swabian pietists, notably → Friedrich Christoph Oetinger, Prokop Divisch (1696-1765) and Johann Ludwig Fricker (1729-1766).

Theories along these lines were continued by esoteric thinkers throughout the 19th century and beyond, and easily assimilated other but apparently related concepts, such as “ether” or the “Od”-force of Karl von Reichenbach (1788-1869). Such attempts at syncretizing various theories about a universal occult force found their culmination in → H.P. Blavatsky’s “Fohat”, described in her characteristic style as the ‘occult, electric, vital power’, ‘the personified electric vital power, the transcendental binding Unity of all Cosmic Energies, on the unseen as on the manifested planes’, and ‘the Solar Energy, the electric vital fluid . . . the animal soul of Nature, so to say, or – Electricity’ (*The Secret Doctrine* I, 109-112). The original program of Blavatsky’s → Theosophical Society mentioned as its fourth objective ‘To oppose materialism and theological dogmatism in every possible way, by demonstrating the existence of occult forces unknown to science, in nature, and the presence of psychic and spiritual powers in man’; this objective was later reformulated as ‘To investigate unexplained laws of Nature and the powers latent in man’. The “psychic and spiritual

powers in man” referred primarily to the miraculous human abilities demonstrated by animal magnetism and its follow-ups, hypnosis, → spiritualism and psychical research, all of which were originally explained with reference to the universal occult force of magnetism or its many cognates (although eventually psychological explanations tended to take over). The core idea was and remained that occult forces in man and nature cannot be explained by mainstream materialist science, and therefore furnish empirical proof that the latter should be replaced by a more comprehensive worldview or “occult philosophy”.

3. OCCULT PHILOSOPHY

The notion of an “occult philosophy”, as distinct from *qualitas occulta*, seems to have originated in 1510 with → Agrippa’s first draft of *De occulta philosophia* (followed by the publication in 1531 of book one, and of the complete version in three books in 1533). From his dedicatory letter to → Trithemius and his *Ad lectorem*, it is clear that for Agrippa the term was synonymous with “magic”: he called his book “de occulta philosophia” merely because he hoped that title would be less offensive. But magic, for Agrippa, stood for the sublime religious philosophy of the Ancients, the *prisca theologia* [→ Tradition] which had fallen into disrepute and now needed to be restored. Such a close association between magic and *prisca theologia* was quite logical: → Zoroaster was considered not only the chief of the ancient Persian *magi*, but was also believed to have authored the *Chaldaean Oracles* and was mentioned by Ficino as the very first of the ancient sages, earlier even than → Hermes Trismegistus. The *prisca theologia* therefore had to be equivalent with a *prisca magia*, exemplified by the theurgy of the *Chaldaean Oracles*; and even more so, given the adoration of the Christ child by the “magi”, as found in the gospel.

Characterized by Will-Erich Peuckert as ‘a neoplatonic credo’ (*Pansophie*, 114), Agrippa’s *De occulta philosophia* discusses in detail the elementary, celestial, and intellectual worlds, through the various levels of which man may “rise up” towards the divine as well as “draw down” superior forces. In this context Agrippa discusses the various arts and practices of natural → magic, → number symbolism, → astrology, and (Christian) kabbalah [→ Jewish Influences], the latter pertaining to e.g. theories about spirits, angels and demons, prophecy and religious practice. The term “occult philosophy” therefore stands for the entirety of the “occult sciences” (see below), provided that these are understood not only as practical disciplines but as

integral parts of a comprehensive religious philosophy and cosmology on neoplatonic, hermetic and kabbalistic foundations. This sublime philosophy/cosmology was obviously understood as eminently compatible with the Christian faith.

In later periods, the meaning of the term has not fundamentally changed: adherents as well as critics have used it to indicate a perspective that sees the “occult sciences” not only as practical disciplines but as essential parts of a comprehensive religious philosophy. Since the Enlightenment in particular, any such reference to an “occult philosophy” is loaded with ideological import: modern Theosophists and occultists use it to characterize their own worldview in opposition to materialism, positivism and dogmatic Christianity, whereas for critics it is roughly synonymous with a worldview based upon pre-scientific and irrationalist error and superstition. Since both sides in this debate claim their own philosophy to be “scientific”, it is not surprising that, again since the 18th century, the term “occult science” (in the singular) is often used in exactly the same sense as “occult philosophy”. Such usage must be distinguished from the term “occult sciences” in the plural.

4. OCCULT SCIENCES

The notion of “occult sciences” seems to have originated in the 16th century, around the same time as that of “occult philosophy” (Secret 1988, 7). Usually three main occult sciences are distinguished, i.e. astrology, → alchemy and (natural) magic; but the list can be expanded by seeing e.g. the various → divinatory arts as a separate category instead of subsuming them under that of magic. Although these various “sciences” have mutually influenced one another in various ways and there are clear areas of overlap (such as e.g. astral magic), they have distinct histories and it was not unusual for practitioners of one occult science to reject another one as false. The idea of a “unity of the occult sciences”, suggested by influential scholars such as Keith Thomas and Brian Vickers, is therefore hard to uphold (Newman & Grafton 2001); most probably it reflects a failure to distinguish between occult sciences on the one hand and the synthesizing Renaissance project of an occult philosophy on the other.

It is nevertheless easy to understand why astrology, alchemy and natural magic were grouped together under a common umbrella. Each one of them engaged in systematic investigation of nature and natural processes, in the context of theoretical frameworks that relied heavily on a belief in occult qualities, virtues or forces; this combination makes

the term “occult sciences” an appropriate one. But similar to what happened to the notion of an occult philosophy, and for very much the same reasons, the notion of “occult sciences” became ideologically charged since the Enlightenment; in the wake of what happened to the notion of “occult qualities” (see above), and in a context that insisted on science as a public and demonstrable rather than secret and mysterious knowledge, the very notion of “science” came to be seen as incompatible *ex principio* with anything called “occult”. As a result, any usage of the term “occult science(s)” henceforth implied a conscious and intentional polemic against mainstream or establishment science. Such polemics are typical of occultism in all its forms.

5. OCCULTISM

The substantive “occultism” (*l'occultisme*) seems to have appeared for the first time in Jean-Baptiste Richard de Randonvilliers' *Dictionnaire des mots nouveaux* (1842), in an article by A. de Lestrangé about “Ésotérisme chrétien”. It was used by → Éliphas Lévi in the “Discours préliminaire” of his *Dogme et rituel de la haute magie* (1856), and from there was picked up by many later authors. It seems to have been introduced in the English-speaking world by → H.P. Blavatsky in 1875 (“A Few Questions to ‘Hiraf’”, *Spiritual Scientist*, 15 & 22 July 1875, 217). Mainly in older studies, the term has sometimes been used quite generally as a synonym of → esotericism (for example by Robert Amadou, *L'occultisme* [1950/1980]), or more specifically as equivalent with the occult sciences (see for a prominent example Copenhaver, *Symphorien Champier and the Reception of the Occultist Tradition in Renaissance France*, 1978). The latter approach has also been defended for some time by Antoine Faivre, who described the occult sciences as the practical dimension of esotericism and referred to them as “occultism” (1994, 33-35). In this he seems to have followed the sociologist Edward Tiryakian, who distinguished between occultism as consisting of certain practices, techniques or procedures, and esotericism as the religious/philosophical belief systems on which such practices are based; a distinction that has been rejected as ‘nonexistent’ by Robert Galbreath (Tiryakian 1974, 265; Galbreath 1983, 17-18), and was later dropped by Faivre as well (1998, 8). A different type of distinction between esotericism and occultism derives from the works of → René Guénon, who opposed his own concept of an esoteric metaphysics, to be found at the core of the esoteric religions, against occultism, understood as

a quasi-materialist perversion exemplified by e.g. → spiritualism, the doctrines of the → Theosophical Society and the many secret societies of his day. Such distinctions, which have been adopted by many later authors (see e.g. Serge Hutin, Luc Benoist), are obviously based on Guénon's own Traditionalist convictions [→ Tradition], and cannot be accepted as scholarly valid; but his observation that "occultism" in his sense is deeply influenced by 19th-century materialism is correct and relevant, as will be seen.

In current scholarly usage, in fact, the term occultism tends to be used as referring specifically to 19th-century developments within the general history of Western esotericism, as well as their derivations through the 20th century. In a first, purely descriptive sense, it is used as referring to the specifically French currents in the wake of Éliphas Lévi, flourishing in the "neo-martinist" context of → Papus and related manifestations of fin-de-siècle esotericism. In a second, analytic and typological sense, it can be seen as referring not only to these currents as such, but to the *type* of esotericism that they represent, and that is also characteristic of most other esoteric currents from ca. the mid-19th century on (such as e.g. spiritualism, modern Theosophy, or new magical currents in the lineage of the → Hermetic Order of the Golden Dawn, up to and including such recent developments as the → New Age movement). From such a perspective, occultism has been defined as comprising 'all attempts by esotericists to come to terms with a disenchanted world or, alternatively, by people in general to make sense of esotericism from the perspective of a disenchanted world' (Hanegraaff 1996/1998, 422). Occultism in this sense has its pioneers in 18th-century authors such as, notably, → Emanuel Swedenborg and Franz Anton Mesmer, and covers the great majority of esoteric currents from at least the mid-19th century on.

6. THE OCCULT

Mention should be made, finally, of the term "occult" used as a substantivized adjective. Colin Wilson's 1971 bestseller *The Occult* is undoubtedly a major influence on the popular currency of this usage, particularly among sociologists and journalists. It may well be seen as the example *par excellence* of how a variety of currents and phenomena that do not seem to fit the categories of "science" and "religion" are therefore lumped together in what is best described as an intellectual waste-basket filled with left-overs (Hanegraaff 2004): the popular category of "the occult" seems to contain everything that partakes of "the charisma of the unexplained", from the belief in

spirits or fairies to parapsychological experiments, from UFO-abductions to Oriental mysticism, from vampire legends to channeling, and so on. In this sense, "the occult" can actually be defined as 'rejected knowledge' (Webb 1974, 191). Understood as such, it refers to a field that includes occultism but is much broader than that field according to any of the definitions discussed earlier; and it must not be confused with Western esotericism as understood in modern academic usage.

WOUTER J. HANEGRAAFF

Oetinger, Friedrich Christoph
(pseudonyms: Halatophilus Irenaeus,
Bibliophilus Irenaeus), * 2[?].5.1702
Göppingen, † 10.2.1782 Murrhardt

I. LIFE 2. INTELLECTUAL DEVELOPMENT
AND MAIN WRITINGS 3. OETINGER'S
MATURE THEOSOPHY

I. LIFE

From 1717 to 1720 Oetinger was a pupil at the Monastery School in Blaubeuren, where he came into contact with August Hermann Francke (1663-1727), who visited the town in 1717. He then transferred to the Monastery School in Bebenhausen, near Tübingen (1720-1722). At the University of Tübingen, he was a scholarship student at the "Stift" (Theological Seminary). Here, he first studied liberal arts from 1722 until completing the requirements for the master's degree in 1725, after which he studied theology until 1727. After the completion of his studies, Oetinger first attended to the education of his brothers Wilhelm Ludwig, Johann Christoph und Ferdinand Christoph. During the period from September 1729 to June 1737 he undertook a series of journeys in order to broaden his intellectual horizons, interrupted by employment in Tübingen: he was a tutor ("Repetent") at the Stift from 1731-1733 and 1737-1738, having been given leave from this office in the interim. In 1738 he received his first appointment as a pastor in Hirsau, and on April 22 of the same year married Christiane Dorothea née Linsenmann (1717-1796). In 1743 he became Pastor in Schnaitheim. In 1746 he transferred to Waldorf, near Tübingen. In 1752 he was promoted to the office of superintendent (dean) in Weinsberg, near Heilbronn on the Neckar. This was to be an extremely tumultuous period in his life: the con-

gregation complained about his "abstruse" sermons; a sexton circulated a false rumour to the effect that the piano teacher of Oetinger's daughter had gotten both this daughter and Oetinger's wife pregnant. In 1759 Oetinger transferred in the office of superintendent to Herrenberg, near Tübingen. In 1765 he was named ducal councillor, prelate, and abbot in Murrhardt, and took over his duties there in 1766. Duke Carl II Eugen of Württemberg, who planned to establish a salt-works near Murrhardt, had appointed Oetinger to this office because of his knowledge of chemistry. In 1766-1767 Oetinger's book on Swedenborg was confiscated at the behest of the Duke's Consistory, and in 1767 his publications were placed under the control of the censor – both within and without the borders of the Duchy of Württemberg. Oetinger henceforth evaded this measure by publishing his works anonymously or under other names, by suppressing the name of the printer, or by having his works printed outside Württemberg (e.g. in the free Imperial cities Schwäbisch Hall and Heilbronn), partly withholding the name of the printer here as well. In 1772/1773 Oetinger was governor of the silver mine "Unverhofftes Glück" at Wüstenrot, near Murrhardt. This enterprise failed because he was deceived by the fraudulent machinations of the mining counsellor, Gottlieb Riedel, from Saxony. Towards the middle of 1776 Oetinger, who sympathized with the Freemasons [→ Freemasonry] as well as with the later Rosicrucians [→ Rosicrucianism] (he was particularly venerated by those in Amsterdam and by the group around → Nikolay Ivanovich Novikov [1744-1818] in Moscow), travelled to Nuremberg to visit a group of presumably Rosicrucian-oriented Christians. On April 19, 1778, he gave his last sermon; but he remained in office, assisted by his son, the Vicar Johann Friedrich Oetinger, until his death.

2. INTELLECTUAL DEVELOPMENT
AND MAIN WRITINGS

Already as a child Oetinger had evinced a pronounced religious sensibility. According to his autobiography, at night he often had extremely disturbing dreams concerning the dungeons of the unfortunate after their deaths, and his interest in the spiritual was thus awakened early in life. While at school in Blaubeuren, one of his teachers was Philipp Heinrich Weissensee (1613-1767), a 'deeply mystical theologian'. In Bebenhausen he was influenced by the preceptor Israel Gottlieb Canz (1690-1753), an adherent of the Enlightenment philosopher Christian Wolff (1679-1754). It was during this period that Oetinger also became acquainted with the thought of *Die Inspirierte* (the

Inspired), the followers of Johann Friedrich Rock (1678-1749) from Oberwälden, near Göppingen. During his studies in Tübingen, influenced by the professor of philosophy Georg Bernhard Bilfinger (1693-1754), he was originally an adherent of Leibniz (1646-1716), whose monadology he had encountered quite early in his studies, and of Christian Wolff, but around 1725 a powder maker in Tübingen, Johann Caspar Obenberger (1673-1744), encouraged him to study the writings of → Jacob Boehme. He also studied rabbinical scholars and the Church Fathers. Of the latter, he particularly respected (Pseudo-)Macarius and → Augustine (354-430), whose treatise *De spiritu et littera* he especially valued.

The study of school philosophy, the kabbalah [→ Jewish Influences] and Boehme increasingly led the theologian Oetinger toward what was to become his major philosophical project: the attempt to reconcile epistemology and theology with a sacred philosophy (*philosophia sacra*). In the autumn of the year 1727, after having passed the Konsistorialexamen, Oetinger left the Stift as a *Candidatus ministerii* and took up private lodgings in the town of Tübingen. In 1728 he was a frequent visitor at the home of the alchemist Johann Friedrich Metz, Sr., whom he even lent money. Metz's son, Johann Friedrich Metz, Jr. (1721-1782), was a medical doctor; he established his practice in Frankfurt am Main in 1765, and in 1768 was the personal physician of the young → Goethe.

Three journeys were of importance for Oetinger's further intellectual development. In the course of the first (1729-1730), he met in Frankfurt am Main with Maria Katharina Schütz (1687-1740), the spinster daughter of the separatist lawyer Johann Jakob Schütz (1640-1690). In 1670 this relative of → Johann Valentin Andreae (1586-1654) had founded, together with Philipp Jacob Spener (1635-1705), the *Collegium pietatis* in Frankfurt. Miss Schütz presented Oetinger with a copy of the *Kabbala demudata* by → Christian Knorr von Rosenroth (1636-1689), who had been a friend of her father. This volume contained, among other things, excerpts from the *Zohar*, and had as its purpose a Christian interpretation of the kabbalah. While in Frankfurt, Oetinger also met with the Jewish kabbalistic scholar Koppel Hecht († 1729), who called his attention to the similarities between the teachings of Jacob Boehme and parts of the kabbalah. In Berleburg and in Schwarzenau respectively, Oetinger met with the mystical spiritualists Johann Conrad Dippel (1673-1734) and Charles-Hector de Saint-Georges de Marsay (1688-1753), and in Jena with the Moravian Brother

August Gottlieb Spangenberg (1704-1792). As a lecturer (*magister legens*) at the University of Halle an der Saale, in whose theological Faculty he had matriculated on October 24, 1729, he met Gotthilf August Francke (1696-1769), the son of the previously mentioned theologian A.H. Francke. In Halle, Oetinger furthered his knowledge of Jewish mysticism through instruction received from a Jewish kabbalistic scholar, primarily in the Kabbalah of Isaac Luria (1534-1572) of Safed in Galilee. For his studies, he procured a valuable manuscript of the work *Etz chayyim* (The Tree of Life) by Luria's disciple Chayyim Vital (1543-1620). In 1730, in Herrnhut, he made the acquaintance of Nikolaus Ludwig Count of Zinzendorf (1700-1760), who, to be sure, was also interested in esoterica, but not in Oetinger's interpretation of the totality of the Bible, including the Old Testament. Under the influence of the more conservative exegete Johann Albrecht Bengel (1687-1752), with whom Oetinger had corresponded since 1727, Oetinger later (1736/37) rejected Zinzendorf's idiosyncrasies (criticism and "atomizing" analysis of the Bibel, on-sided Christ-orientation). In Herrnhut, Oetinger wrote his work *Aufmunternde Gründe zu Lesung der Schriften Jacob Boehmens* [An Exhortation to the Perusal of the Works of Jacob Boehme] (1731), which also contained texts by the Silesian lawyer and Boehme-supporter Hans Dietrich von Tschesch (1595-1649). Here already, Oetinger's acceptance of the doctrines of Jacob Boehme and → Isaac Newton, as well as of the kabbalah (primarily in the version according to Luria) becomes apparent. As opposed to Leibniz's doctrine of independent monads, which excludes an interaction between body and soul, Oetinger emphasizes the relatedness, the "oneness" of all things. Like Boehme, Oetinger is of the opinion that all spiritual entities also possess bodies and "figures". In opposition to static knowledge, Oetinger emphasizes dynamic, or "living knowledge". He derived his bipolar chain of reasoning from Boehme and Newton; but wishing to see in Boehme an original prophet, he refused to recognize that the cobbler from Görlitz had also been influenced by Paracelsus and the kabbalah.

During his tenure as a tutor at the Stift, Oetinger completed two more books. In these works he elaborated on suggestions which he had received from his uncle, Elias Camerer (1672-1734), a professor of medicine in Tübingen who also had an interest in mysticism. According to Oetinger, this uncle possessed the gift of *Zentralerkenntnis* (Central Recognition), the direct comprehension of a totality. The high veneration in which the

young Oetinger held Roman Catholic mysticism is evidenced by his interest for the Carmelite Marie de Sainte-Thérèse (also known as Marie de la Rose, 1640-1717); his work *Die Verklärung Jesu* (The Transfiguration of Jesus; 1734) contains excerpts from two books by Charles abbé de Brion (1647-1728): her biography *La vie de la très-sublime contemplative sœur Marie . . .* (Paris 1720), and his edition of her letters: *Lettres spirituelles* (2 vols., Paris 1720). As a counterpart to the above-mentioned work, but this time from the perspective of Protestant mysticism, Oetinger published his *Abriß Der Evangelischen Ordnung zur Wiedergeburt* (1735), which he had contemplated since 1725 and committed to paper in 1733.

Oetinger's second journey (1733-1735) again took him to Herrnhut (1733/34), and over Leiden to Amsterdam; the third (1735-1737) to Halle (1736) and to Homburg vor der Höhe (1737), where he visited the private medical academy of Dr. Johann Philipp Kämpf (1688-1753). Some results of these restless years of travel and study, during which he underwent the most diverse influences, were a renewed dedication to the church of Martin Luther, a renunciation of his perfectionistically inspired separatism, a rehabilitation (since 1736) of fragmentary recognition through reason (as opposed to central recognition), and his decision to marry and take up the duties of a pastor, first in Hirsau, where Zinzendorf visited him in 1739.

In order to have direct and continuous access to the calculations concerning the Apocalypse produced by his friend Bengel, Oetinger moved to Schnaitheim, in his direct vicinity. Bengel was a proponent of a special form of Chiliasm (cf. Revelation 20), the so-called "Dischiliasm": prior to Judgment Day, two periods of one thousand years each were expected to pass. The first of these, the blissful millennium called by Oetinger the *Güldene Zeit* (Golden Age), was to begin, according to Bengel's calculations, in the year 1836.

In Walddorf, Oetinger conducted his famous melisse-experiment: in the oily solution of the melisse-essence which he had prepared, he recognized the shapes of countless melisse leaves, whose "outline and signature" had been preserved in the solution. From this he concluded 'that God must be physically present, but not perceived by earthly beings, in all passive agents and births'. This experiment (which could not be replicated) was for him symbolic of the regeneration (palingenesis) of plants from the ashes, and indeed, of the resurrection of man as a result of the "life-giving power of God". In Walddorf, he received (c. 1748) a visit from the "Chymicus", "Graf St. Germain de

Fonti" (also "Marquis de Fonti de St. Germain"), obviously the famous adventurer the → Count of Saint Germain, who had made a name for himself as an alchemist.

Also in Walddorf he wrote his *Inquisitio in sensum communem et rationem* (1752), which contains in an appendix an essay on musical theory by Oetinger's younger friend, Johann Ludwig Fricker (1729-1766). A version in German for laymen appeared during Oetinger's term of office in Weinsberg as *Die Wahrheit des Sensus Communis* (1753-1754). These two books emphasize the importance of the *Sensus communis* – prerational (intuitive) *common sense* or practical judgement in the quest for ultimate truth – primarily in the rediscovery of forgotten troves of wisdom in the ideas of the Ancients. Christoph Martin Wieland was so impressed by the *Inquisitio* that he expressly mentioned 'the Abbot of Murrhard' in his *Musarion* (1768, 62). While in Weinsberg, Oetinger entered into correspondence with the Moravian premonstratensian Prokop Divisch (1698-1765), who also experimented with electricity – a contact which had been brought about by Fricker when he visited Divisch.

Oetinger's period of office in Herrenberg was for him particularly auspicious. His work *Die Güldene Zeit* (1759-1761) belongs to the genre of the social utopia, and received a natural-philosophical supplement with *Die Philosophie der Alten* (1762). This work advocates a more just social order, which should be based on greater equality, more equitable distribution of property, and liberty; the realization of this goal would not be achieved by means of revolution, but rather through a process of evolution. Its influence remains discernible right up to Friedrich Hölderlin's (1770-1843) *Friedensfeier* (about 1802).

The first draft of an autobiography, *Genealogie der reellen Gedancken eines Gottes-Gelehrten*, dated 1762, covertly quotes the title of an alchemical treatise: Carl Herrmann Gravel (ed.), (Bernardus Trevisanus), *Fontina Bernhardtii revelata . . . worinnen . . . in ganz reellen und zuverlässigen Gedancken über die Bereitung des Steins der Weisen veroffenbaret*, Erlang[en] 1750.

Oetinger's principal work on the subject of the kabbalah is his *Offentliches Denckmahl* (1763), to which both Jakob Friedrich Klemm (1733-1793; from 1782-1793 Hölderlin's dean in Nürtingen), and Karl Friedrich Hartmann (1743-1815; later Friedrich Schiller's professor at the *Karlsschule* in Stuttgart) contributed. Taking as his starting point a colourful emblematic-kabbalistic picture (*Lehrtafel*, i.e., teaching-table), dating from 1663,

which Antonia princess of Württemberg (1613-1679) had donated to the church in Bad Teinach (1673) – a spiritual painting in the form of a triptych, believed to have been influenced by Johann Valentin Andreae's *Ein Geistlich Gemäldt* (1615) – Oetinger presents a kaleidoscopic view of the kabbalah, the natural sciences and the philosophy of his age (Boehme, Newton, Malebranche, Leibniz, Wolff, → Swedenborg, Zinzendorf, Spener, as well as the “Philosopher of Sanssouci”, that is, Frederick the Great). This volume, which was later to be found in the library of Goethe's *schöne Seele*, Susanne Catharina von Klettenberg (1723-1774), was esteemed by Hölderlin's private tutor, Nathanael Köstlin (1744-1826) and by Schelling, as well as by Eduard Mörike (1804-1875) and Hermann Hesse (1877-1962). The edition which had appeared in Stuttgart in 1858 was later found in Hermann Hesse's own library, and in 1934 he depicted the figure of Oetinger in preliminary studies for his *Glasperlenspiel* (Glass Bead Game).

Oetinger's major systematic work is entitled *Theologia ex idea vitae deducta* (1765). Here the universal scholar and theosopher Oetinger, who strove for a leading position in the church hierarchy, attempted, in the form of a dogmatic compendium, to clearly and distinctly demonstrate his Lutheran orthodoxy. This work, which was also to be found in Herder's library, had a profound influence on pietistic thought [→ Pietism] in the immediate vicinity of Hölderlin and Schelling (for example, on J.F. Klemm), as well as on the natural philosophy of → Romanticism (→ Franz von Baader [1765-1841], → Gotthilf Heinrich von Schubert [1780-1860], Julius Hamberger [1801-1885]), and on *Vermittlungstheologie* (Richard Rothe [1799-1867], Isaak August Dorner [1809-1884]).

Swedenborgs und anderer Irrdische und himmlische Philosophie (1765; 2nd ed. Frankfurt am Main 1773), of which Goethe in Weimar had a copy purchased for his own library in 1776, includes, amongst other things, excerpts from Emanuel Swedenborg's *Arcana coelestia*. Here Oetinger comes out quite decidedly, although not without qualifications, in favour of Swedenborg's conception of the reality of the realm of spirits, thereby probably influencing Goethe's *Faust*; later, because of Swedenborg's allegorical Bible interpretations, Oetinger came to disassociate himself from him.

Procopii Divisch Theorie von der meteorologischen Electricite (1765) contains the German translation of the *Magia naturalis* of the above-mentioned Prokop Divisch, from which Oetinger

develops a “theology of electricity”; he interprets the shining light of the metal chashmal (LXX: “elektron”; Vulgata: “electrum”) in Ezekiel's vision (Ez 1,4. 27; 8,2) as electric fire.

Die Eulerische Und Frickerische Philosophie Ueber Die Music (1767) underscores – in adherence to the ideas of Oetinger's friend Johann Ludwig Fricker, and as a reaction against Leonhard Euler (1707-1783) – the importance of discord as opposed to concord in → music, analogous to the concept of struggle (*principium luctae*; cf. *certamen, concert*), seen as a characteristic feature of life.

Die Metaphysic in Connexion mit der Chemie [1770] deals with the close relationship between mind and matter: the book contains not only extensive texts on chemistry, but also on other fields of knowledge, such as medicine, Fricker's theory of music, and philosophy. The influence of → Paracelsianism becomes obvious when one notes that mention is made of the doctrine of signatures of the Paracelsus-follower Oswald Crollius (c. 1560-1609). The work was to be found in the libraries of Susanne Catharina Freiin von Klettenberg (1723-1774), Moses Mendelssohn (1729-1786), Johann Gottfried Herder (1744-1803) and Wolfgang Amadeus Mozart.

In his *Biblisches und Emblematisches Wörterbuch* (1776), partly a reaction against Swedenborg's allegorical exegesis of the Bible and against the rationalists, one may find (p. 407) Oetinger's famous saying *Leiblichkeit ist das Ende der Werke Gottes* (Corporeality is the ultimate goal of God's works). Oetinger emphasizes a realistic exegesis of the Bible, even more consistently than his former mentor Bengel, for example when he interprets images from Revelation literally, and not symbolically.

3. OETINGER'S MATURE THEOSOPHY

Having provided a synopsis of Oetinger's intellectual development, we will now attempt to briefly summarize the theosophy [→ Christian Theosophy] of the mature Oetinger. As a theosopher, Oetinger characteristically strives to coordinate his encyclopedic knowledge: for his *philosophia sacra* he utilizes not only philosophy and theology – including a Christian interpretation of the kabbalah –, but also the natural sciences (primarily alchemy and the physics of Isaac Newton), emblematics (which he uses to construct a *theologia emblematica*), medicine, mathematics, music, and jurisprudence. He seeks to maintain coherence in this encyclopedic multiplicity by means of a principle of bipolar attraction that avoids both a monistic uniformity and a dualistic rift. According to the divine doc-

trine of salvation, all things in the universe are in dynamic interaction: “above” and “below”, heaven and earth, the invisible and the visible, body and soul, the internal and the external, the Word and the works of God, both in nature and in history, the Holy Scriptures (which are to be taken literally according to the Biblical realism of Johann Albrecht Bengel) and the Book of Nature. Nevertheless, God and his Word are given supreme authority (Oetinger uses the French word “supériorité”). God is, like life, indissoluble; and He is the origin of all life, as differentiated from His Creation. Accordingly, the central idea of Oetinger’s *Theologia ex idea vitae deducta* is the eternal life of God, which radiates into six *loci*: the doctrines of God, of man, of law and sin, of grace, of the Church, and of the last things. God in His actions, or as a life-giving entity (*Deus actuosus, vel ut vita vivificans*), is the source of life. He wants to reveal Himself to man as the ‘receptacle of the breath of life’ in the person of Jesus Christ. Sin is alienation from the existence of God; Grace is the promise of new life; the Church is the Society in which the spirit of life is active. The arrival of the “last things” will mean the end and termination of life: the transitory life of the human creature will be changed into eternal life when the unity of body and soul is indestructibly restored as *Geistlichkeit*. At the end of time will come the universal reconciliation through Christ, the “salvation of nature”, in accordance with the doctrine of the “restoration of all”. Oetinger finds fault with Leibniz’s theory of monads because for Leibniz God is the supreme monad, criticizes his concept of harmony as atomistic, and emphasizes that, according to Acts 17:28, life and activity take precedence over mere existence. The *Sensus communis* makes the experiences of daily life in nature and society accessible to interpretation by the Holy Scriptures, and allows us to communicate on the basis of living, clearly evident experiences of faith (dogmas). Oetinger’s emphasis on experience is a heritage of authors like Paracelsus, J.V. Andreae and → Gottfried Arnold.

REINHARD BREYMAYER

Olcott, Henry Steel, * 2.8.1832
Orange, New Jersey, † 17.2.1907
Adyar (India)

President-Founder of the → Theosophical Society, which he helped inaugurate in 1875 and of which he remained President until his death. After distinguishing himself in the field of agricultural reform early in life, Olcott became an assistant editor on the New York *Tribune* in those areas. At the outset of the Civil War he enlisted, eventually becoming an investigator for the War Department. By the time of the founding of the Theosophical Society he was a well-connected New York lawyer. The accounts of his investigation of a family of mediums in rural Vermont, serialized in the New York papers, drew → Helena Petrovna Blavatsky to meet him. Their idea of a Society to investigate the hidden mysteries of nature did not flourish in America, and in 1879 Olcott transferred the headquarters to India where he would spend the rest of his life. Establishing over a hundred branches of the Society throughout the subcontinent during the 1880s, he also agitated for the Buddhists of Ceylon.

While the Theosophical Society became an effective means for the transmission of eastern philosophy to the west, it served the reverse function in Asian countries, being the major means of importing western hermeticism and

occult philosophy [→ occult/occultism]. Olcott was keenly aware of the budding field of psychical research and claimed a number of the pioneers of that movement as personal friends. He was especially interested in → animal magnetism and had considerable success as a healer in India. He translated Adolphe d'Assier's *Posthumous Humanity: A Study of Phantoms* (1887) and was interested in the French psychologist Charcot's work, visiting his laboratory. His great contribution to the field of esoteric literature is his rambling narrative of his life in Theosophy, *Old Diary Leaves*. Originally serialized for over a decade, it contains his meetings with some of the major figures in the 19th century occult revival as well as tales of things witnessed with yogis and swamis of India. Although he had eagerly promoted Mme. Blavatsky at the beginning of their work, he later became critical, though still regarding her as a genuine agent of a secret school.

Olcott remains an important witness for the existence of the Mahatmas, Blavatsky's Indian teachers. He claimed to have met some of them while in India and to have received letters from them independently of Blavatsky. He was suitably impressed by some of these incidents. In 1888 on a trip from India to confront Blavatsky in London about her decision to start an esoteric school in the Society, he received a letter in his cabin from one of the Mahatmas describing his thoughts on deck a few minutes before and advising to take a less combative role with Blavatsky, which he acceded to. He is usually portrayed as a dupe not confederate of Blavatsky's, but he felt that his past record 'proves me to have been neither the one nor the other'.

Under his presidency the position that the Theosophical Society had no dogma or creed was emphasized. When the Vice-President of the Society, William Q. Judge (1851-1896), was charged with circulating letters from the Masters, Olcott adjourned the committee that had convened in 1894 to hear testimony. Although he was convinced about the reality of the Masters, any pronouncement by the organization on such matters would 'violate the most vital spirit of our federal compact, its neutrality in matters of belief'. His insistence on democratic resolutions of the institution's problems has continued to make his Society unique among esoteric groups.

Aside from his part in helping establish modern Theosophy, Olcott is remembered in South Asia as one of the pioneers in the Buddhist revival. He fostered Buddhist unity in Ceylon and encouraged dialogue between their co-religionists in Thailand, Burma and Japan. He traveled throughout the

region getting the different groups to sign a common declaration of Fourteen Fundamental Buddhist Beliefs that they all agreed on. At one point he even contemplated retiring from the presidency of the Theosophical Society to devote all his time to work for a united Buddhist world.

For Olcott Theosophy was not some ‘sort of far-away sunrise that we must try to clutch’, but ‘a lamp to light our feet about the house and in our daily walks’. While he was not a leading theorist for the movement he more than made up with his organizational skills, and his stress on the practical side of theosophical ethics helped impart a staid respectability to the Society. When he died at the age of 74 at the Society’s headquarters at Adyar, Madras, his cremation was attended by representatives from the different regional religions.

MICHAEL GOMES

Ophites

The Ophites, also called “Ophians”, are a group of Gnostic Christians [→ Gnosticism] discussed by several of the church fathers, so named because they honored the “snake” or “serpent” (Greek *ophis*) as a revealer of saving gnosis. Another group of Gnostics has a similar basis for their name, → “Naassenes”, based on the Hebrew word *nahash* (“snake, serpent”). “Ophians” are associated with other heretics called “Cainites” by → Clement of Alexandria (*Stromateis* VIII, 17) and Hippolytus (*Refutatio* VIII, 20), but those writers provide no discussion of the sect’s teachings. The author of Pseudo-Tertullian’s treatise,

Adversus omnes haereses, a 3rd-century document possibly based on a lost work by Hippolytus, is the first to describe a system of teachings explicitly ascribed to the heresy of the “Ophites” (c. 2). In his account he claims, first, that they honor the serpent for providing the knowledge of good and evil (Gen. 3). That serpent was recognized by → Moses in the desert when he made the bronze serpent (Num. 21), and Christ compared himself to the serpent (John 3:14). The author adds that the Ophites introduce this serpent into their eucharistic services. Second, the Ophites’ system of doctrine is laid out: from a single Aeon several others were emanated, to which was opposed another being called Ialdabaoth, who produced seven angelic sons and claimed to be the sole God. The inferior angels made man, who remained powerless and worm-like until he was given a spark from the Aeon above. Ialdabaoth emitted the serpent, who introduced Eve to the forbidden tree, and thus conferred upon humankind the saving gnosis.

The first part of the account in Ps.-Tertullian consists of what appears to be a brief summary of a gnostic midrash (biblical exegesis) on the serpent of Genesis 3, probably of Jewish origin, such as is embedded in the third tractate of Nag Hammadi Codex IX, the *Testimony of Truth* (45, 23-49, 7). The second part is a highly abbreviated summary of a system described in considerable detail by Irenaeus in his *Adversus Haereses* (*Against Heresies*). There Irenaeus adds to his account of the system of the “Gnostics” (*Adv. Haer.* I, 29) related material ascribed to unnamed ‘others’ (I, 30). It is these ‘others’ who are later identified as “Ophites” by Ps.-Tertullian and other heresiologists (e.g., Theodoret, *Haer.* 14: ‘the Sethians, whom some call Ophians or Ophites’). A strict reading, in context, of Irenaeus’ account of these “others” can be taken as referring to a sub-group of the “Gnostics” earlier described by him (*Haer.* I, 29) in an account which was clearly based upon a primary Gnostic text, and which closely corresponds to a passage now found in the *Apocryphon of John* from Nag Hammadi (NHC II, I; III, 1; IV, 1; BG 2).

The system of the ‘others’ described by Irenaeus posits a first Light, Father of all, from whom emanates a series of aeonic beings including Christ and, finally, Sophia-Prunicos. Caught up in the waters of Chaos she produces a son who produces a son who produces a son, etc. These beings add up to a total of seven, each of them ruling over a heaven (i.e., a heavenly sphere). The first is Ialdabaoth (son of Sophia), then come Iao, Sabaoth, Adoneus, Eloeus, Oreus, and Astaphaeus.

Ialdabaoth also produces a snake-like being, associated with all manner of evil. Ialdabaoth claims to be the only God, but is rebuked by his mother. Ialdabaoth and his companions create man, breathing into him the residue of their spiritual power, of which they are now bereft. Adam and Eve, thanks to the snake, eat of the forbidden fruit and achieve knowledge of the Power above. Eventually Christ descends into this world, entering Jesus, who is killed through the machinations of Ialdabaoth and his henchmen. Christ, who has departed from Jesus before the crucifixion, raises Jesus up to a position in the heavens where he gathers the souls of the elect. The end will come when all of the traces of the spirit of light have been gathered.

Epiphanius of Salamis provides another account of the Ophites (*Panarion* 37, 1, 1-7, 6), based on Irenaeus and Pseudo-Tertullian, and spiced with numerous vituperations. Epiphanius adds one interesting detail: they keep an actual snake in a basket. When it is time for their “mysteries” (Eucharist) the snake crawls onto the table and coils up on the loaves (*Panarion* 37, 5, 6). This may be nothing more than a fanciful elaboration of the cryptic statement in Pseudo-Tertullian regarding the role of the serpent in the Ophite Eucharist.

The 2nd-century pagan writer Celsus wrote an attack on Christianity (the *True Doctrine*) which is known only from excerpts and refutations produced by Origen in his treatise *Against Celsus*. In the context of a discussion of the soul’s journey through the seven heavens, Celsus describes a diagram said to be in use by certain Christians in their “Mystery” (Origen, *Cels.* VI, 24-38). Origen informs us that the diagram in question, which he himself has seen, is not that of Christians at all but of the sect of the Ophians (already mentioned at *Cels.* III, 13). The extensive description of the diagram in Origen’s text is partially that of Celsus, and partially that of Origen, who adds details based on his own alleged examination of it.

The diagram ‘contained a drawing of ten circles, which were separated from one another and held together by a single circle, which was said to be the soul of the universe and was called Leviathan’. It also featured another beast called Behemoth, said to be ‘fixed below the lowest circle’. The diagram depicted Leviathan again on the outer circle of the diagram as a snake with its tail in its mouth (VI, 25-26).

Celsus’ description of the diagram was evidently followed by a discussion of the uses to which it was put by the sect that owned it. Celsus mentions

a ritual called “the Seal”, featuring a dialogue in which a leader called “Father” imparts instructions concerning seven ‘angels of light’ and seven ‘archontic angels’. The archontic angel’s chief, identified as the Creator and ‘God of the Jews’ (VI, 27), is said to be accursed ‘because he cursed the serpent which imparted to the first man knowledge of good and evil’ (VI, 28).

Origen returns to a description of the diagram, and identifies the seven archontic angels, who were evidently depicted on the diagram as theriomorphic beings named Michael (lion), Suriel (bull), Raphael (serpent), Gabriel (eagle), Thauthabaoth (bear), Erathaoth (dog), and Thaphabaoth or Onoel (ass) (VI, 30). He then reports what the initiates are taught to say at the ‘gates of the Archons’ in their ascent through the heavens, giving the text of the prayers to be directed to each of the archons. These archons are named: Ialdabaoth (lion-like), Iao, Sabaoth, Adonai, Astaphaeus, Ailoeus, and Horaeus (VI, 31).

There follow in the text further details regarding the diagram, featuring additional circles, a rectangular figure somehow connected with the ‘gates of paradise’, ‘the trees of knowledge and life’, and certain words inscribed (‘Love’, ‘Life’, ‘Wisdom’, ‘Knowledge’ (*gnosis*), etc.).

The complicated diagram described by Celsus and Origen is hard to envisage, though there have been scholarly attempts to reconstruct it with drawings. It was probably inscribed on papyrus or vellum, and the zoomorphic archons and angels were presumably drawn on the diagram. The cosmology reflected in it is closely related to that of the Gnostics described by Irenaeus and the *Apocryphon of John*. Indeed, the names of the seven archons of the Ophite Diagram are the same as those given by Irenaeus in his description of the “other” Gnostics (*Haer.* 1.30). It is clear that the diagram was associated somehow with rituals, especially such as were meant to promote the soul’s safe journey to heaven. The actual function of the diagram itself may have been that of a mandala, an aid to mystic contemplation and meditation.

“Ophite” Gnostics evidently used other artistic talismans as well. Two “Gnostic” gems deserve mention here. The first is an oval pendant of green jasper (No. 188 in the Bonner collection). On its obverse is carved a lion-headed god with the names Ialdabaoth and Ariel (Heb. “lion god”) on the right and left edges respectively (it should be noted that Ialdabaoth and Ariel are equated in the treatise *On the Origin of the World*; NHC II, 100, 23-26). The reverse has an inscription of 8 lines: Ia (undoubtedly an abbreviation of Ialdabaoth), Iao,

Sabaoth, Adonai, Eloi, Oreos, Astapheos, i.e. the names of the seven archons of Irenaeus' "other" Gnostics and of the Ophite Diagram.

The second gem is a pendant of black steatite. On its obverse is carved the figures of Adam and Eve on either side of a tree with a coiled snake. The Hebrew letters *heth* (for *hayyim*, "life") and *daleth* (for *da'at*, "knowledge") also occur. On the reverse is a circular band with 12 sections, each with a boss in it. The band, representing the Zodiac, encircles an "omphalos" around which coils a snake with open mouth. On either side of the band are a crescent moon accompanied by *heth* (for *hodesh*, "moon") and a *shin* (for *shemesh*, "sun"). Below the sun are seven small bosses, presumably representing the planets. These two gems probably functioned as amulets, reminding their wearers that it is gnosis, revealed by the serpent, that enables the elect to traverse the heavenly spheres and finally attain true life.

The evidence thus far considered raises an interesting question: were there actually people in Antiquity who called themselves "Ophites" or "Ophians"? We have seen that the names "Ophite" and "Ophian" were given by the church fathers to certain heretics on the grounds that these heretics honored the knowledge-revealing serpent. But we have also seen that the earliest system actually described in any detail of doctrines later identified as "Ophite" was not so labeled at all by the heresiologist in question, i.e. Irenaeus. Was Irenaeus unaware of the true identity of those "others"?

The matter becomes more complicated when we note the claim made by Origen that these impious heretics take pride in referring to themselves as "Ophians", taking their name from the snake that they revere (*Cels.* VI, 28). He also adds the following interesting detail: 'they boast that a certain Euphrates was the man who taught them their impious doctrines' (*ibid.*). This is interesting because Euphrates is the person who is said by Hippolytus to have been a founder of the sect of the "Peratae" [→ Perates] (*Ref.* V, 13, 9). The system described by Hippolytus is quite different from that described by Irenaeus (*Haer.* I, 30). However, there is one passage in Hippolytus' discussion of the Peratic system (*Ref.* V, 16, 7-14) that contains now familiar material: the 'true perfect serpent' was shown to the Israelites by Moses in the desert (*Num.* 21). This universal serpent is 'the wise word of Eve' (*Gen.* 3) that finally appeared in the form of the Son of Man who, like the bronze serpent in the desert, was to be 'lifted up' (*John* 3, 14). Are the people who according to Hippolytus 'call them-

selves Peratae' (*Ref.* V, 16, 1) really "Ophites" (or "Ophians")? Or are they, simply, "Gnostics"?

To arrive at a satisfactory answer to these questions we turn, finally, to two tractates of the Nag Hammadi library: the *Hypostasis of the Archons* (NHC II, 4) and the treatise *On the Origin of the World* (NHC II, 5). *Hyp. Arch.* is a tractate that is usually included among those labeled by scholars as "Sethian", reflecting a Gnostic system whose most important witness is the *Apocryphon of John*. In one interesting passage paraphrasing and interpreting the biblical paradise narrative (*Gen.* 2-3) it is said that the 'Spiritual Woman' (the heavenly Eve = Sophia) comes into the serpent and gives instruction (*gnosis*) to the fleshly Adam and Eve (II, 89, 30-91, 3). A more expansive parallel is found in *Orig. World*, where the origin of the "Instructor" is discussed. His mother is Eve-Zoe, who is 'the Instructor of Life'. The Instructor himself is referred to by the archontic authorities as the 'beast' (*Gr. therion*), wiser than all others are (*cf. Gen.* 3:1). When the archons command Adam and Eve not to eat of the tree of knowledge, the Instructor advises Eve to eat of it anyway. She eats and instructs Adam to do so as well (II, 113, 21-116, 8). This passage reflects word-plays possible only in Aramaic ("serpent" – "Eve" – "life" – "instruct"). Here we have material of the sort that is attributed by some heresiologists to a supposed "Ophite" or "Ophian" sect.

We can conclude this discussion with the following observation: it might be useful for scholars to refer to an "Ophite" type of Gnosticism when describing material featuring the serpent as revealer. But that kind of Gnosticism is found in texts and testimonies that are not restricted at all to an "Ophite" sect. That Gnosticism was widespread, and may have lasted in Eastern Syria until the end of the 8th century, at least according to the testimony of the Nestorian writer Theodore bar Konai (*Liber Scholiorum*, memra 11).

What is important, finally, is not the heresiological label, but Gnosis itself, whatever the revelatory mediation might be, whether the serpent, Sophia in her various manifestations, Seth and his avatars, or (in Christian Gnosticism) Jesus Christ. There may or may not have been people who called themselves "Ophians" (as claimed by Origen). There certainly were Gnostics, i.e. adherents of that multi-faceted phenomenon called "Gnosticism" or "the Gnostic religion".

BIRGER A. PEARSON

Ordo Templi Orientis

Occultist organisation and initiatic Order, sometimes also spelt as "Order of Oriental Templars". The OTO was founded at the beginning of the 20th century and has remained, up to the present, an important vehicle for the transmission of esoteric ideas and practices. One of its major features is the practice of sexual magic, which is considered the core of its teaching. The role accorded to Eastern doctrines and sexual magic makes the OTO different from several other magically-oriented, occultist societies, and especially from the only one comparable to it in terms of influence and visibility: the → Hermetic Order of the Golden Dawn (GD).

It is extremely difficult to assess the history, struc-

ture, and doctrinal content of the OTO: in fact, practically all the major events in its complex history – and especially its foundation, the succession of its leaders, and the emergence of several offshoots from the original branch – have been a matter of dispute and remain controversial. As is often the case with esoteric organizations, the OTO has produced its own historical account of its origins and development; but unfortunately, much of it is based on scanty or unverifiable evidence. Thorough scholarly research, drawing a clear line between fact and fiction, has started to develop only recently. Given these problems, what follows is an account of this organisation based on what is at present available both in primary and secondary sources, with the qualification that several details may eventually have to be revised if more documents and scholarly research become available.

The origins of the OTO can be traced to the activities of a group of German-speaking occultists, who gathered, by the turn of the 20th century, around three main figures. One was the Austrian citizen, paper chemist and industrialist Carl Kellner (1850-1905). The other two were Germans: the noted theosophist → Franz Hartmann, and the ex-opera singer, radical political activist, and journalist Theodor Reuss (1855-1923). The evidence concerning their relationship and collaboration dates back at least to the 1890s, when it appears that they were all actively involved in the occultist scene then developing in the German-speaking countries, and especially in Vienna. Kellner and Hartmann in particular had a close relationship.

Kellner was a wealthy man, whose business activities caused him to travel widely in Europe and America. Like most of the early protagonists in the history of the OTO, he was a Freemason, and had many interests in what was then loosely defined as the "occult", especially yoga, → alchemy, and high-degree masonry [→ Freemasonry]. In 1896 he published a pamphlet on yoga (*Yoga: Eine Skizze über den psycho-physiologischen Teil der alten indischen Yogalehre*; Yoga: A sketch upon the psycho-physiological part of the ancient Indian Yoga teaching) which focused mainly on *haṭha yoga* practices, and can be considered as one of the earliest essays on the topic by a Westerner from a practitioner's point of view. There is no evidence, although it has sometimes been asserted, that he ever travelled to India or the Far East (unlike Hartmann, who was in India with → H.P. Blavatsky between 1883 and 1885); but it is very likely that his knowledge of yoga was also based on first-

hand sources. In fact, he appears to have come in contact, in the same period, with two Indian gurus, Bheema Sena Pratapa and Mahatma Agamya Paramahansa (who were then touring through several European countries, in search of disciples) and with an Arab fakir, Hadji Soliman ben Aïssa. The evidence concerning these relations is too scant to allow for any definite conclusion concerning their real import, and especially concerning the nature of any spiritual technique that Kellner might have learned through them. Nevertheless, the issue has some importance, because Kellner has traditionally been presented as the original source for the fundamental teaching of the OTO, i.e. sexual magic. However, neither in Kellner's extant papers nor in his published writings are there clear and explicit references to practices involving a sexual element. Indeed the notion itself of "sexual magic" would appear for the first time in Reuss's publications only after Kellner's death.

As for Reuss, already as a young man he was involved in theosophical, Wagnerian and *Lebensreform* circles in Germany and England, and he was a keen supporter of the then burgeoning feminist movement. Even if his interests at that time seem to have been primarily political, it is likely that he became acquainted with the occultist ideas then freely circulating in those milieus. He spent long periods in England, while not residing in Germany, and in 1876 he was initiated into a regular masonic lodge in London. During the 1890s he began to be seriously interested in occultism and fringe masonry. Whatever may have been the role of Kellner and Hartmann in the creation of the OTO, to which we will return below, it is clear that Reuss was the real motor behind the creation of a vast fringe-masonic network, which would prove a fundamental step toward the foundation of the Order. In the years around 1895-1902 he first attempted, together with Leopold Engel (1858-1931), to revive the Order of the → Illuminaten of Adam Weishaupt (1748-1830). However, the relationship with Engel soon came to an abrupt end; in 1902 the two parted ways, and the Order remained under Engel's direction. In the same period Reuss also got acquainted with Gérard Encausse (→ Papus), then a prominent figure in the European esoteric and fringe-masonic scene, who introduced him to his Martinist Order (→ Martinism: Second Period). But the important turning point in Reuss's fringe-masonic career came when he got in contact, around 1901, with two Englishmen, who were the depositories of a large number of fringe-masonic filiations then active in Europe: → William W. Westcott (Supreme Magus, i.e. chief,

of the Societas Rosicruciana in Anglia [SRIA], among other things) and, most importantly, the masonic scholar John Yarker (1833-1913), who had been at the centre of most fringe-masonic activity in Great Britain during the last quarter of the century. From Yarker and Westcott, Reuss obtained charters, between 1901 and 1902, to create German sections of several high-grade masonic rites: first the Rite of Swedenborg (6 degrees), then Cerneau's version of the Ancient and Accepted Rite (33 degrees), and finally Yarker's version of the combined rites of Memphis and Misraim (97-90 degrees). From Westcott alone, furthermore, he obtained a warrant to found a College of the SRIA in Berlin. In the same year Reuss also started to publish his periodical, the *Oriiflamme*, which would serve in the following years as the official organ for all his fringe-masonic and initiatic organizations. At first Reuss's masonic activity met with a certain success. High degree freemasonry had not been particularly active in Germany during the 19th century, and some curiosity was aroused in masonic circles by Reuss's Rites. At its peak, around 1905, Reuss's masonic network in Germany, although "irregular" from the point of view of mainstream masonic obediences, could count on several hundred members and/or affiliates. It appears that both Kellner and Hartmann were actively involved in Reuss's masonic activities, also contributing occasionally to the *Oriiflamme*. The pages of the *Oriiflamme* contain some hints at the existence of an "Inner" or "Occult Circle" within this masonic network, very probably led by Kellner, Hartmann and Reuss (a sort of triumvirate referred to as the "Inner Triangle"); but no further details are given about e.g. the teachings which may have been imparted in this context.

The relationship between Reuss and → Rudolf Steiner also falls in this period. In 1906, Reuss granted Steiner an authorization to form a section of Yarker's Antient and Primitive Rite, called "Mystica Æterna". Steiner, then the leader of the German section of the → Theosophical Society (Adyar), was in fact looking for some traditional ritual setting that he might use to frame the teachings of his inner group, the Esoteric School. He had come to the conclusion that high-grade masonry might provide it. In this context, it has often been assumed that Steiner became a member of the OTO, and that *Mystica Æterna* was indeed but a section of this Order. However, the available evidence suggests otherwise: at the time when Reuss gave this authorization to Steiner, the OTO simply did not exist as an organization proper.

Rare hints to “Oriental Templars” in the pages of the *Oriflamme* (to which we will return), or in the charters Reuss was then delivering, are the only evidence that might have some relation to what will later manifest itself as the OTO. No evidence subsist of a particular, distinct structure, or of specific teachings connected to the “Oriental Templars” label at the time. Nevertheless an important point must be noted: whereas Reuss’s masonic Orders had generally followed, so far, the traditional masonic policy in accepting only male members, Steiner’s section admitted both men and women. This did actually anticipate what would later be one of the main features of the OTO, i.e. mixed membership. It seems that, apart from the charters and the rituals he received from Reuss, Steiner was not otherwise interested in Reuss’s masonic activities or ideas, and there is no evidence of a relationship between the two after 1907.

We now come to one of the turning points in the early history, or rather prehistory, of the Order. Despite Reuss’s initial success, around 1905 the tide suddenly turned. Kellner, who may have been a source of financial support, died; and Reuss’s masonic empire started to crack. Some high ranking members of his lodges became disillusioned with his credentials and claims to masonic regularity, and started to attack him in masonic periodicals. There were also lurid rumours about initiations performed by Reuss that allegedly involved homosexual elements. Whatever the truth behind these allegations (strongly denied by Reuss), he left Germany and moved to London in early 1906. It would appear that, as a result, he lost control of most of the lodges belonging to his masonic network, and relatively few members continued to work under his authority, in Germany or elsewhere. It is interesting that in relation to these events the expression “sexual magic” appears for the first time in the pages of the *Oriflamme* (it would remain the only instance until 1912), but expressly to *deny* that Reuss’s high-grade masonic rites had anything to do with it. The reference was ambiguous in so far as there were also hints that something of the kind was possibly taught and practised in some inner structure, which would of course be the “Occult Circle” already referred to.

But this was not all. The rumours about sexual initiations may have been false, exaggerated, or based upon misunderstandings, but clearly in Reuss’s vision the sexual element was by now explicitly assuming a central role. In the same year 1906, while the rumours were on the way to becoming an utter scandal in the international masonic press, he published a book entitled

Lingam-Yoni. This was actually little more than the German translation of a book by → Hargrave Jennings, *Phallicism* (1884), in which the inner meaning of all religious traditions was explained through, and reduced to, sexual symbolism. It is also in 1906 that the Belgian spiritualist and occultist Georges Le Clément de Saint-Marcq (1865-1956) published his essay *L’Eucharistie*, which would become one of the most important sources for Reuss’s ideas on sexual magic. Moreover, again in 1906, vague allusions to an unspecified Order of “Oriental Templars” appeared in the pages of Reuss’s *Oriflamme*, although totally unrelated to the issue of “sexual magic” or the alleged sexual initiations. But the main reason why 1906 has been considered by some authors to be the actual year of foundation of the OTO, is the existence of two pamphlets dated that year, which contain an English and a German version of the first constitution of the OTO. We come here to one of the many mysteries in the history of the Order. While the problems related to these two publications cannot be discussed here in detail, there are reasons to believe that they were actually published later, probably between 1910 and 1912. In sum: all the – admittedly garbled – evidence seems to point to the possibility that in or around 1906 a project was taking shape in Reuss’s mind, and that this project was aimed at the teaching, in the context of an inner circle of disciples, of ideas strongly connected with sexual symbolism, and possibly also of psycho-physical techniques involving a sexual element. It is also likely that this project came soon to a stop due to the scandalous rumours that began to be spread by the members of his Orders. This would explain why the references to sexual magic (and, incidentally, to the Oriental Templars), disappeared again from Reuss’s publications until 1912. Whether or not such a project ever existed in Reuss’s mind in 1906, it cannot be related in this period to any particular, recognisable structure or organisation calling itself OTO.

In 1908 an international conference of spiritualistic masonic rites was organised by Papus and his group in Paris. Reuss was among the invited masonic dignitaries. This meeting certainly led to another exchange of charters and authorisations, and it was probably at this occasion that Reuss was introduced to Joanny Bricaud’s (1881-1934) Gnostic Catholic Church (Ecclesia Gnostica Catholica, EGC; later renamed by Bricaud Universal Gnostic Church), to which Papus and his close collaborators also belonged. This was an offshoot of the → Gnostic Church, a neo-Gnostic group founded around 1890 by Jules Doinel (1842-1902). It is

important here, because in subsequent years references to → gnosticism would become a common feature of OTO documents, and the Order would often be presented as organically linked to the EGC. Starting from around 1918, this connection would be strengthened further, as some of Reuss's publications seem to refer to an EGC autonomous with respect to Bricaud's Church. From this moment on, the EGC connected to the OTO could be considered a new, independent offshoot, stemming from the branch of neo-Gnostic organizations. Leadership in the OTO would often automatically imply leadership in this branch of the EGC.

Sometime between 1910 and 1912, Reuss, who was then living in London, met → Aleister Crowley, the other figure who would make a fundamental contribution to the birth and the early development of the OTO. According to the traditional history of the Order, based mainly on Reuss's and Crowley's own accounts, Kellner and Reuss would have founded the OTO long before the latter met Crowley. In 1910 Crowley would have met Reuss for the first time, and would have been introduced by him into the Order as a simple member. Then, in 1912, when Reuss would have realised that Crowley had come very close to discovering, on his own, the secret of sexual magic, he would have appointed him head of a newly created section of the Order for Great Britain, called *Mysteria Mystica Maxima* (M.:M.:M.:). However, a reconsideration of the available evidence, and especially of the timing of the events, suggests that some parts of this story may not be accurate. In fact it seems more likely that the decision to (re-)launch his project of the OTO was taken by Reuss only *after* having met Crowley. Reuss probably decided to revive his old project once he realised that he could avail himself of Crowley's enthusiastic collaboration; and if so, the two collaborated on the project right from the start. Reuss evidently found in Crowley a person who might sympathise with most of his radical ideas on religion, society, and politics; who already disposed of a circle of followers and disciples, but for various reasons was looking for another structure beside his own initiatic Order, the A.:A.:; and, finally, who had the intellectual and literary skills to expand Reuss's initial fringe-masonic structure and develop a complete magical doctrine out of Reuss's elementary sexual techniques. The existence of the OTO was announced in the second half of 1912 both in the *Oriflamme* (in the so-called "Jubilee" issue) and in Crowley's own periodical *The Equinox*. At least as far as the organisational aspect is concerned, 1912 may therefore be seen as

the actual year of foundation of the OTO. Hartmann died in the same year, before the announcements appeared. He does not seem to have been particularly involved in Reuss's activities after Kellner's death and he may not have approved of the plans of the former; but officially he had kept his position in his high-grade masonic Orders. Possibly his death was not unrelated to the sudden appearance of the Order.

In the Jubilee issue the name of the Order finally appeared unequivocally as OTO. The very name can perhaps help us understand the nature of Reuss's project. It obviously places the organization in the tradition of neo-templarism (→ Neo-Templar Traditions), but the OTO's reference to the Templar myth may have had a particular meaning less evident in other neo-Templar groups. A certain neo-Templar tradition had come to see the Templars as a revolutionary force opposing both secular and religious institutions. From that perspective, traditional accusations to the effect that the Templars had indulged in magic and in illicit sexual practices, and venerated an exotic idol of unknown origin named Baphomet, could also be seen in a positive light. This "countercultural" image of the Templars was certainly congenial to Reuss's and Crowley's radical ideas concerning social, political, and religious reform. Their project, including of course a major role for sexual and occultist aspects, could therefore find a convenient vehicle in an organization claiming a link with the Templar legacy. As to the "Eastern" component in the Order's name, apart from a possible reference to the traditional, symbolic image of the masonic "Orient", it obviously pointed to the alleged origin of some of the Order's teachings, particularly yoga and/or sexual magic.

In the Manifesto published in the *Oriflamme*, the OTO presented itself as a sort of super-Order that synthesised the structure and the knowledge of a large number of initiatic organizations. Prominent among them were, of course, the high-grade masonic rites in which Reuss had a position of authority. In this sense Reuss called the OTO an "Academia Masonica" (although he attributed the definition to Kellner). However, the Order was not conceived as a mere synthesis of high-grade masonry. Beyond a certain level, the member was supposed to receive a complete course in "hermetic science" (the expression was probably borrowed from Papus), as well as to learn about this mysterious secret of "sexual magic". Reuss of course also offered his version of the history of the Order, and Kellner was referred to as the "spiritual father" of the OTO. The available evidence does not permit

us to conclude that Kellner ever thought of creating an Order like the OTO, but it is not inconceivable that the idea was originally suggested by him, perhaps in the context of the “Occult Circle”. The same remark would also apply to Reuss’s statement concerning Kellner as the original source for the teachings of “sexual magic”.

Another interesting element, which has given rise to much speculation, is Reuss’s reference to a Hermetic Brotherhood of Light with which Kellner had supposedly been in contact, and of which the OTO would merely be the continuation under a new name. The history of this (possibly fictitious) occult fraternity, and its relationship with the → Hermetic Brotherhood of Luxor remain unclear. It has been argued that it might have been an offshoot of → Paschal Beverly Randolph’s Brotherhood of Eulis, and that Kellner might have been in contact with it. The link to Randolph could then be construed as a possible source for Kellner’s supposed notions of sexual magic. But unfortunately there is no evidence in support of this possibility. In any case, the Hermetic Brotherhood of Light (also under its Latin name: *Fraternitas Lucis Hermetica*, FLH) has remained, to this day, an important mythical reference in the literature connected to the OTO. There is, on the other hand, evidence that Yarker himself was in possession of some unpublished writings by Randolph, containing an exposition of his sexual ideas and techniques, and that Randolph’s writings were in fact circulating more widely than has been supposed in English occultist milieus at the turn of the century. Yarker may then have been a possible medium for Randolph’s ideas to influence Reuss, if not directly Kellner.

From the very beginning, Crowley, who significantly took the name “Baphomet” in the Order, put a lot of energy in recruiting new members for his M.:M.:M.: and in developing the system. Women were admitted in his section from the very beginning. He set up a lodge in London and was able to establish some bodies in other countries under his jurisdiction, such as South Africa and, later, Canada and Australia. He also started writing new rituals and re-writing the old ones provided by Reuss. In 1913, during a visit in Moscow, he wrote the “Gnostic Mass”, which was to become one of the most important rituals performed in the Order, and the central ceremony of the EGC. Its sexual symbolism is evident, but, unlike the initiation rituals, it was conceived as a public ceremony, open to non-members.

Apart from writing rituals, Crowley made two main contributions to the OTO. The first one is the development of sexual magic. We have seen that

the concept was already present before Crowley, and he always admitted that its “secret” had been transmitted to him by Reuss. But very little is known about what Reuss really meant by “sexual magic”, and what kind of techniques he taught or practised before meeting Crowley. We know a great deal more, on the other hand, about how Crowley interpreted the idea, which he developed and systematised considerably during the rest of his life. It is no exaggeration to say that, for him, the discovery of sexual magic was a kind of new revelation, which substantially modified his way of understanding and practising magic. In 1914 Crowley started to experiment methodically with it, and soon afterwards he began writing a series of instructions, which have become part of the standard curriculum for the highest degrees in most contemporary OTO filiations. At the basis of OTO’s sexual magic (which differs from Randolph’s) is the idea that the male and female bodily fluids produced during sexual intercourse may be “energised” through a particular kind of mental concentration. During the operation, the mind must remain steadily focused on its goal, be it of a material or spiritual nature. The mixing of semen and female secretions produces an “elixir”, which is ingested by the practitioner or smeared on talismans to produce the desired effect. But it should be noted that, in Crowley’s version, the Order taught also other forms of sexual magic, based on masturbation and anal intercourse. All these forms correspond to degrees of the Order, to which we will return below.

Crowley’s second contribution was, unlike the first one, radically new. It was his own religious message called “Thelema”, based on the text of a revelation he had received in 1904. Crowley, who by 1912 had already convinced himself of his role as the prophet of a new spiritual age, evidently saw the OTO as a convenient tool to spread his religious message. It is interesting to note that in accepting Reuss’s invitation to take a leading position in the OTO, he did not abandon his own Order, the A.:A.:. He saw the aim of the two orders as fundamentally different: while the OTO was meant to be the utopian model of a future society based on the principles of Thelema, the A.:A.: remained an esoteric school which offered the means to attain individual self-realisation, basically along the lines of the Golden Dawn system. Reuss seems to have reacted favourably to Crowley’s suggestions and innovations. Some features of Thelema, such as the rejection of the Christian notion of sin and the advocacy of sexual freedom, certainly appealed to him.

The structure of the Order was defined in several documents published by Reuss and Crowley, especially between 1912 and 1919. While there have been changes and revisions later, the essential elements have remained unaltered. The OTO is based on a scale of ten degrees, indicated by Roman numerals. The first nine degrees are split into three triads. In Reuss's version, the first triad is composed of an outer circle of probationers, and its last degree (III°) is equated with masonic Craft; the second triad is composed of students and lay-brothers, and is considered as equivalent to the combined degrees of those high-grade masonic rites over which Reuss held authority; finally, the third triad is composed of the real initiated members of the OTO, and the implication is that it begins where all other masonic rites end. Subsequently, Crowley added some elements, in particular attributing a name to the different triads (1: Man of Earth, 2: Lover, and 3: Hermit), and attenuated the emphasis on the equation of grades between the OTO system and high-grade masonry. Crowley's additions would be largely adopted during the subsequent history of the OTO, all the more so as the Order increasingly abandoned most of its masonic claims.

Ever since Crowley's involvement in the Order, but possibly even before, the teachings concerning sexual magic have been associated with the VIII° (techniques based on masturbation) and, especially, the IX° degrees. Theoretically, only on attaining this latter degree the central secret of the Order, consisting in the use of the mixture composed of male and female bodily fluids, is revealed completely to a member. Therefore, there appears to be a sort of equivalence between the degree in the Order and the practice of this kind of magic. The final degree (X°) does not correspond to an initiatic advancement, but rather to an administrative office. It is attributed to the Grand Master, or "Supreme King", of a national body of the Order (Crowley in the case of Great Britain, for instance). The whole Order, including all its national bodies, is ruled by an international leader, called "Outer Head of the Order" (OHO, the name was probably borrowed from theosophical parlance). Obviously the first OHO was Reuss himself. Other degrees have been sometimes added to the basic structure of the Order. The most important is the XI° degree: an addition by Crowley, concerned with the knowledge and practice of sexual magic based on anal intercourse (whether homo-, or hetero-sexual). The fact that the XI° numerically follows on the X° does not imply that its holder has greater authority: its attribution is explained not with reference to the degree scale, but with the fact that, in Roman

numerals, XI represents an "inversion" of IX, just as anal intercourse may be seen as an "inversion" of vaginal intercourse.

In the early years, Reuss's masonic network was exploited to promote the new Order. Charters were delivered on that basis to bodies and individuals in various countries, such as Italy and France, with whom Reuss had friendly relations. However, it is unclear to what extent those who received these charters, and who could now claim a degree in the Order, were aware of its inner teachings; and there is scanty evidence that any of them did actually practice its system or rituals. In any case, most of these international relationships were shattered by the storm of World War I. Crowley spent this period in the United States, whereas Reuss, after a first period in Germany, preferred to move to neutral Switzerland. There he joined the progressive community inspired by *Lebensreform* theories, which was then flourishing on Monte Verità, close to Ascona. In 1917 he sponsored there the foundation of an OTO Lodge. The activities of the group of persons associated with Reuss in this period, which included the famous Austrian dancer Rudolf von Laban (1879-1958), then also residing at Monte Verità, are at the origin of one of the branches, still based in Switzerland, that presently claims a direct filiation from the original OTO. In 1920 Reuss was involved in the organization of an international masonic conference, along the lines of the one held in Paris in 1908. Probably he thought he could revive his masonic network of the pre-war period. But the attempt failed, and he was unable to stir the same interest that the Order had enjoyed before the war.

Nevertheless, Reuss was still in contact with several figures of the occultist and fringe-masonic scene who showed an interest in the OTO. The first and most famous of them was → Harvey Spencer Lewis, the founder of the Ancient and Mystical Order Rosae Crucis (AMORC). For some time, Lewis partly based his controversial Rosicrucian claims on the charters he received from Reuss. A second important figure was Arnaldo Krumm-Heller (1876-1949), whom Reuss had already met in 1908 at the Paris masonic conference. Krumm-Heller was German by birth, but spent long periods of his life in Latin American countries, especially in Mexico. He probably received a charter to run a body of the OTO in Latin America, but he does not seem to have ever worked along the lines of the Order. He preferred to found, in 1927, his own organization, the *Fraternitas Rosicruciana Antiqua* (FRA), which he considered as allied to the OTO and the EGC. The FRA is still active

today in many Spanish-speaking and South American countries. Krumm-Heller's initial introduction to the OTO had been through Reuss, but in the early 1930s he met Crowley as well, with whom he collaborated for some time when they were both residing in Berlin. Another important contact of Reuss's in these last years of his life was with the German occultist and bookseller Heinrich Tränker (1880-1956), who was then trying to assemble in Germany a neo-Rosicrucian movement called "Pansophia".

During Crowley's stay in the United States, his collaboration with the pro-German propaganda had a negative effect on the Order in England. The London lodge was raided by the police in 1917, and as a consequence most of the members resigned or dispersed. The OTO would not be able to reconstitute an organized body on English soil again during Crowley's lifetime. Crowley returned to Europe in 1919. He probably did not meet Reuss again, but they initially kept in contact, although their relationship was getting increasingly strained. Perhaps Reuss felt his leadership threatened by Crowley's strong personality and influence, and they finally broke off any further communication. Reuss died in 1923, and it is unclear whether he left any instruction as to who was to succeed him as head of the Order. Crowley later claimed that Reuss had suffered a stroke in 1921 and, unable to take care of the Order's administration, had decided to resign in his favour. But this claim is extremely unlikely: Crowley was never able to produce the alleged document of appointment, and what remains of the Crowley-Reuss correspondence rather indicates that Reuss did not consider Crowley a valid candidate for his succession at all. However this may be, after Reuss's death Crowley appears to have had no serious competitor for his claim. Two of the remaining X^os gave their approval to Crowley's taking the position of OHO. They were Charles Stansfeld Jones (1886-1950), who had been an old disciple of Crowley's but had also been chartered as an X^o for the United States by Reuss, and Heinrich Tränker, X^o for Germany. However, Crowley's claim to leadership had yet to pass another test. During a conference in 1925 in Weida, Germany, some prominent members of Tränker's Pansophic movement, which included the German OTO as well, gathered to discuss the issue in the presence of Crowley himself. Among them was the businessman Karl Germer (1885-1962), who would later become a close collaborator of Crowley's, and play an important role in the subsequent history of the Order. The outcome of the meeting was

not a complete success for Crowley, and the Pansophic movement split into different factions. Some decided to accept Crowley as leader, but others did not, since they refused to adopt the religious message of Thelema. From these events originated the → *Fraternitas Saturni* (FS), which was founded by a former member of the Pansophic movement, Eugen Grosche (1888-1964). Its practices and doctrines are strongly indebted to the OTO, but the FS also stressed from the very beginning its organisational independence from it.

If immediately after the war Reuss had been unable to reconstitute his masonic network, Crowley, during his subsequent leadership, did not even try. His interest for the masonic aspects of the OTO had already been very limited, and was even further reduced after he took over the leadership. During the inter-war period most of his followers were also OTO members. They were concentrated first in Germany and later in the United States, but very few of them, if any, had a masonic background. The political situation, with the spread of totalitarian and authoritarian regimes in many countries all over the European continent, was then less favourable not only to the international relationships between masonic or fringe-masonic bodies, but in some cases to the very existence of these organisations. This is certainly an important factor for understanding the gradual loss of the OTO's masonic character after Reuss's death.

During the last years of Crowley's life, the activities of the Order decreased considerably. The Nazi regime wiped away what remained of the Order in Germany, and, in the last years of Crowley's life, the only functioning body of the OTO was the Agape Lodge, a body established in California under the leadership of Wilfred Talbot Smith (1885-1957), and later of the chemical engineer John Whiteside Parsons (1914-1952). In his will, Crowley named Karl Germer, then living in the United States, to be his successor as OHO. After Crowley's death, and during Germer's leadership, the Order did not develop considerably. It did very little to publicise its existence or to recruit new members. When Germer died, in 1962, the Order was on the brink of extinction. The Agape Lodge had died out in the 1950s, and most of those who had been involved with the Order in the United States were scattered and did not seem interested in furthering its activities. Moreover, Germer had left no clear dispositions as to his succession.

From this point on, it becomes extremely difficult to follow closely the vicissitudes of the Order. Only a short outline will be given here. Four main

branches have claimed an exclusive filiation from the OTO. All of them have been involved in controversies about their respective primacy over the other ones. Without entering into the details of these controversies, it can be said that all four may be considered to represent a legitimate continuation of the ideas and the practices of the original OTO, in so far as they can all claim a more or less direct link with one of the first three OHOs, i.e. Reuss, Crowley, and/or Germer.

The most important and most visible among them is undoubtedly the branch based in the United States and usually referred to as the “Caliphate” OTO. At its origin, we find a direct disciple of Crowley’s, Grady Louis McMurtry (a.k.a. Hymenæus Alpha, 1918-1985), who had met Crowley several times in the 1940s, while he was posted in England as a US officer. Soon after the end of the war the Californian Lodge was experiencing a period of difficulties and turmoil, and Crowley sent McMurtry two letters appointing him as his representative in the United States, under the authority of Germer. After Crowley’s death, McMurtry distanced himself from Germer for several years, due to disagreement about the latter’s policy. As we have seen, Germer died in 1962, but McMurtry only learned about this by the end of the 1960s. He then decided to avail himself of Crowley’s letters to proclaim his authority over what remained of the Order in the United States. He presented himself as “Caliph”, rather than OHO, because in a letter to him Crowley had used the term in relation to his (i.e. Crowley’s) succession, implying an obvious analogy with the notion of “Caliph” in the history of Islam. Helped by some old members of the then defunct Californian Lodge, McMurtry proceeded to re-organise the Order in the United States. The group was incorporated as a religious, non-profit organization in 1979. After McMurtry’s death, in 1985, he was succeeded by William Breeze (Hymenæus Beta, b. 1955), who presently runs this branch of the Order. Under his leadership the organization has developed considerably, creating a large network of new bodies outside of the United States, including Europe. At several occasions this branch’s claim to exclusive ownership of the name OTO (at least in the United States) and of Crowley’s copyright has been confirmed by court judgements. The Caliphate OTO, availing itself of the ownership of Crowley’s copyright, has set as one of its priorities the publication of new editions of Crowley’s works. This branch has by far the largest membership, and is present in many countries all over the world.

Another branch is the so-called “Typhonian”

OTO. It originated from the activities of another direct disciple of Crowley’s, the Englishman Kenneth Grant (b. 1923). He had served as Crowley’s secretary during the last years of his life. Grant, who presently still runs this branch, had received in the early 1950s a charter from Germer to create an OTO Lodge in England. Later, dissension between the two men had arisen, and in 1955 Germer had expelled Grant from the Order. Soon afterwards, Grant, who now denied the validity of the Crowley-Germer succession and consequently the latter’s right to expel him, claimed the position of OHO for himself. In the early 1970s Grant began his career as an independent writer and published the first volumes of a series of three *Typhonian Trilogies* (completed in 2002). In these works Grant has put forward an original interpretation of Crowley’s writings, partly based upon his direct experiences in the workings of his lodge. Unlike the Caliphate OTO, which represents a somewhat “orthodox” wing in the nebula of Crowleyan movements, Grant has added several elements which were absent in earlier OTO traditions. They include the results of communications from “extra-terrestrial entities” (which are also at the basis of his claim of authority), and a renewed emphasis on Eastern doctrines, Tantrism in particular. Grant’s system is also marked by a strong influence from the works of other occultists such as Austin Osman Spare (1886-1956), and sometimes even from literary themes, such as the Cthulhu mythology of Howard Phillips Lovecraft (1890-1937).

A third OTO branch, usually referred to as “Swiss OTO”, is based in Switzerland and may be considered an inheritor of the lodges Reuss had established in that country between the end of the 1910s and the early 1920s. The group was organized in the early 1950s under the leadership of Hermann Joseph Metzger (Paragranus, 1919-1990), who had been in contact with some of Reuss’s old disciples. Metzger was also in contact with Germer during the latter’s leadership, and his group was officially recognised by the OHO at that time. After Germer’s death, Metzger claimed to have been elected as new OHO by the ranking members of his group. One interesting feature of Metzger’s branch is the fact that, in his version, the OTO is tightly linked with the Order of the Illuminati (IO), the other Order revived by Reuss and Engel at the turn of the century. After Metzger’s death, in 1990, the leadership has passed to Annemarie Äschbach (b. 1926).

The fourth branch is perhaps the smallest one, and is the result of the activities of Marcelo Ramos Motta (1931-1987), a Brazilian citizen and former

disciple of Germer's in the 1950s. After Germer's death, Motta claimed the title of OHO, and for some time was supported in this by Germer's widow. Motta and his followers tried to set up a viable organization in Brazil and in the United States, which took the name "Society Ordo Templi Orientis" (SOTO) and started to publish new editions of Crowley's writings with Motta's commentaries. In 1985 the latter's position was challenged by McMurtry's group, which successfully sued him for copyright infringement. Motta died two years later, while several of his ex-disciples had already joined the Caliphate branch. Nevertheless, some of his followers, based mostly in Australia and Brazil, have taken up his legacy and still continue some activity under the SOTO label.

Finally, brief mention should be made here of other groups whose origin is somewhat related to the OTO, but which have developed into new and different directions. We have already encountered Grosche's *Fraternitas Saturni* and Krumm-Heller's FRA. Another significant group is the *Ordo Templi Orientis Antiqua* (OTOA), also called "Franco-Haitian OTO", created and led by Michael Bertiaux (b. 1935). Bertiaux, a well known figure in the contemporary American occultist scene, claims a direct filiation from Reuss's OTO through Papus and a family of Haitian occultists, although no documentary evidence has been offered to back up this claim. His organization, which has also attracted some following outside the US, notably in Spain and Italy, is characterised by an original mixture of Crowleyan magic and voodoo traditions.

MARCO PASI

Orientalism

1. DISCOVERY OF ORIENTAL TRADITIONS
2. ENTHUSIASM FOR ORIENTAL TRADITIONS
3. ECLECTICISM AND SYNTHESIS
4. TRADITIONALISM

In the current acceptance of the term (based on Said 1979), Orientalism is an attitude towards "the Orient" on the part of a self-defined "Occident" which may or may not correspond with realities in the regions in question. This attitude has prevailed in the religious field, where the distinction between Christian and non-Christian has long carried an emotional charge, and, in the minds of missionaries, a responsibility. It also continues to define the academic discipline. However, when viewed from the point of view of esotericism, a contrary tendency emerges in which the commonality of Orient with Occident is more important than their differences.

I. DISCOVERY OF ORIENTAL TRADITIONS

The following survey concentrates on the regions of Asia east of the River Indus. They first entered European consciousness after the Indian campaign of Alexander the Great (327-325 B.C.). An increasing curiosity, especially about the Brahmins, surfaces in the writings of Diodorus Siculus (*Bibl.* ii), Strabo (*Geog.* xv), Arrian (*Indike*), Apuleius (*Florida*), → Clement of Alexandria (*Strom.* i, vi), Philostratus (*Vit. Ap.* ii-iii), Porphyry (*De abst.* iv), and, most extensively, Palladius (*De gentibus Indiae et Bragmanibus*, sometimes attributed to St. Ambrose).

Not much more was known of Oriental philosophy and religion until the epoch of the Jesuit

missionaries (16th-17th cents.). Their reports were collected by → Athanasius Kircher in *China monumentis . . . illustrata* (1667), but Kircher's derivation of all Oriental religions from Egypt distorted his presentation. Further information came from the Protestant missionary Abraham Roger (in B. Picart, *Cérémonies et coutumes religieuses*, 1728, vol. II, i), the travelers François Bernier (1620-1688), John Holwell (1701-1788), Paulinus a Sancto Bartolomeo (1764-1806), Abbé Jean-Antoine Dubois (1765-1848), and the first translator of the Upanishads, Abraham Hyacinthe Anquetil-du Perron (1731-1805).

With the British colonization of Bengal (1765), Oriental studies moved into a more scholarly mode. Sir William Jones (1746-1794) founded the Bengal (later the Royal) Asiatic Society (1784) and the journal *Asiatic Researches* (1788). Sir Charles Wilkins (1750-1836) translated the *Bhagavad-Gita* (1785). In Germany, Johann Gottfried von Herder (1744-1803) prepared the ground for an acceptance of India as a source of wisdom (*Ideen zur Philosophie der Geschichte der Menschheit*, 4 vols., 1784-1791), and his friend Johann Friedrich Hugo von Dalberg (1760-1812) made translations from the English orientalisists. German Sanskrit scholarship was founded by the brothers August Wilhelm von Schlegel (1767-1845; translations of *Bhagavad-Gita*, 1823, *Ramayana*, 1829) and Friedrich von Schlegel (1772-1829; *Über die Sprache und Weisheit der Inder*, 1808).

Accurate knowledge of Buddhism arrived later, especially with B.H. Hodgson on Nepal and Bhutan (*Asiatic Researches* 16, 1828), Alexander Csoma de Korös (1784-1842) on Tibet (*Ibid.*, 20, 1836/39), and the reports of missionaries to China and Japan in the *Journal of the American Oriental Society* (1843-80). The scholars Eugène Burnouf (1801-1852), Max Müller (1823-1900), and Barthélemy Saint-Hilaire (1805-1895) were expert philologists, but uncomprehending of Buddhism. Müller, Professor of Comparative Philology at Oxford, edited the series *Sacred Books of the East* (1875-1901), which for the first time made the Confucian and Taoist classics available in reliable translations.

While Romantic novelists and belle-lettrists found in the newly-discovered Orient an attractive stimulus to their imaginations, they shared the attitudes and assumptions of these early scholars. The Orient might be fascinating, its discovery a great enrichment of knowledge, but it was seen as irrevocably different from the Occident. Any virtues found in Oriental beliefs and practices were a cause for condescending surprise, as if a child had shown unwonted brilliance and maturity.

2. ENTHUSIASM FOR ORIENTAL TRADITIONS

Three events facilitated a transition from curiosity about Oriental religions (whether literary or scholarly) into enthusiasm and admiration for them. The first was the reforming effort of Rammohun Roy (1772-1833), who tried to apprise Hindus of the virtues of (Unitarian) Christianity, and Europeans of that of Vedanta. Rammohun's example and his translations of Hindu works had a strong influence on the American Transcendentalists, especially Ralph Waldo Emerson (1803-1882). The second was the immense success of *The Light of Asia* (1879), by Sir Edward Arnold (1832-1904). This poetic exposition of Buddhism was the first to make it seem attractive to the West, and compatible with a liberal Christianity. The third event was the move of the → Theosophical Society's founders, → H.P. Blavatsky and → H.S. Olcott, to India (1878) and their formally becoming Buddhists. The popular interest in Buddhism due to Arnold's book paved the way for a reputed "esoteric Buddhism" revealed by the Theosophical Society's Mahatmas, supposedly resident in Tibet (A.P. Sinnett, *Esoteric Buddhism*, 1883).

The connections of the 20th-century propagators of Buddhism to the West are instructive. Alexandra David-Neel (1869-1969) was a Theosophist in London and in Paris before she made her intrepid journeys to Tibet that informed her best-selling works. Allan Bennett (1872-1923), was a magical companion of → Aleister Crowley before he became a Buddhist monk in Sri Lanka (1902). Bennett returned to London in 1908 as a missionary for the Hinayana or Theravada School. W.Y. Evans-Wentz (1878-1965), translator of the classics of Tibetan Buddhism for Oxford University Press, emerged from the Theosophically-influenced "Celtic Twilight" (*The Fairy-Faith in Celtic Countries*, 1911). Christmas Humphreys (1901-1983), as a High Court judge and prolific author the most visible of English Buddhists, edited the *Mahatma Letters* (3rd ed., 1962). Nikolai Konstantinovich Roerich (1874-1947), the great painter of Himalayan landscapes and devotee of the Shambhala myth, was married to the Russian translator of *The Secret Doctrine*. In a way, it can be said the Theosophical Society also brought the genuine "esoteric Buddhism" to the West.

After World War II, an interest in Japan brought new visibility to the work of Daisetz Teitaro Suzuki (1870-1966), the preeminent scholar of Zen Buddhism and the Mahayana School. Suzuki had lived in America (1897-1909), and was also an admirer

of the Western mystical and theosophical tradition, particularly Meister Eckhart and → Swedenborg. His work now became the unintended parent of a pseudo-Zen Buddhism among the Beatniks and in the arts. A more significant trend was the importation, from the 1970s onwards, of various schools of Tibetan Buddhism, aided by the prestige of the exiled 14th Dalai Lama (b. 1935). The Karma Dzong community in Boulder, Colorado, led by Chögyam Trungpa (1939-1987), was the first of many such centers.

Among Hindus, Swami Vivekananda (1863-1902) was the first since Rammohun Roy to gain a following in America, which he visited in 1893-1895 and 1899-1900. Jiddu Krishnamurti (1895-1986), who was selected as “World Teacher” by the neo-Theosophists → C.W. Leadbeater and → Annie Besant (1847-1933), declared his independence from them in 1929 and spent the rest of his life as an unattached writer and lecturer. A great number of Indian “gurus” followed in the 1960s and 1970s, many of them finding success in California.

→ C.G. Jung made his own contribution to Orientalism by writing forewords to the *I Ching* and the Taoist *Secret of the Golden Flower*, though he warned that yoga and other Oriental practices were inadvisable for those born in the West. Apart from these works and the *Tao Te King*, the influence of Taoism in the West came less through literature than through martial arts. The national Japanese religion of Shinto also inspires some martial arts, and imparts its aesthetic coloring to Zen Buddhist culture. The influence of the Jain religion entered unawares, via the great admiration felt in the West for Mohandas K. Gandhi (1869-1947), and thus indirectly influenced the peace movements.

3. ECLECTICISM AND SYNTHESIS

Once the traditions of the Orient were made accessible, it was possible to believe that at the esoteric level, East and West shared the same wisdom, both being branches of a primordial trunk. This was but an extension of the Renaissance idea of a *prisca theologia* [→ Tradition]. → Fabre d'Olivet (*Histoire philosophique du genre humain*, 1824) was perhaps the first to include the Orient in an esoteric synthesis, and the notion was taken up at the *fin-de-siècle* by → Saint-Yves d'Alveydre and → René Guénon. It had less success in the German-speaking lands, where Ariosophists [→ Ariosophy] cultivated fantasies of ancient European esotericism, and → Anthroposophy an esoteric Christianity to which other religions were merely preludes. In Italy the main proponent of the esoteric unity of

East and West was → Julius Evola, one of whose earliest works was an edition of the *Tao-Te-King* (1923). Another was Giuseppe Tucci (1894-1984), authority on Tibet, who edited the English-language journal *East and West* (1950-), to which Evola was a frequent contributor.

The impulse to seek the underlying harmony of all esoteric traditions, irrespective of geography, was especially strong in English-speaking lands. Some prominent figures are → G.R.S. Mead and → W.B. Yeats, the inspirational writers Paul Brunton (1898-1981) and → Manly Palmer Hall, the poet and → Blake scholar Kathleen Raine (1908-2003), and many members of Raine's Temenos Academy. For these eclectics, the journey to the Orient, whether literal or only in the mind, was an essential initiation, but it led them away from “Orientalist” attitudes.

In a class of their own were four men whose contribution to scholarly Orientalism was beyond question, yet who made no secret of their own commitment to esoteric doctrines. One, the Zen master D.T. Suzuki, has already been mentioned. Another was the English judge Sir John Woodroffe (1865-1936), who as “Arthur Avalon” translated the major works of Hindu Tantra. Woodroffe was a Shaivite initiate, as was Alain Daniélou (1907-1994), author of *Hindu Polytheism* (1964). As a musicologist, Daniélou was responsible for UNESCO's series of recordings of non-Western music. His work in comparative religion promoted the pre-Vedic, Dravidian civilization of India over the better-known Aryan invaders: he saw the Dravidian god Shiva as equivalent to Dionysus. Ananda Kentish Coomaraswamy (1877-1947) was an Anglo-Indian trained as a geologist, who became a curator at the Boston Museum of Fine Arts. Coomaraswamy's monumental work ranges over Hinduism, Buddhism, Sufism, Christian esotericism, Platonism, and many lesser-known schools and traditions.

4. TRADITIONALISM

Coomaraswamy's name has often been coupled with that of his sometime correspondent René Guénon. Known (by others) as “Traditionalists”, and currently in the USA as “Perennialists” [→ Tradition], they developed a kind of esoteric syncretism which they called “metaphysics”. They found its clearest exposition in the language of Vedanta, which then served as a key, or a touchstone, for all other esoteric philosophies. The Traditionalism of Guénon and his admirers differed in one important regard from the eclecticism of Theosophical inspiration: it held that the life of the

esotericist must be complemented by the practice of an *exoteric* religious tradition. The majority of Traditionalists chose, like Guénon, to become Muslims and to seek initiation in a Sufi lineage. To those who were drawn to Eastern religions, such as the Buddhist traveler and musician Marco Pallis (1895-1989), the claims of revealed religion were of less interest, and their “traditionalism” less strict.

Guénon, Coomaraswamy, and all the later Traditionalists were harshly critical of the modern West, as having renounced its own traditions and infecting the rest of the world with its deviances. Thus they erected another sort of Orientalism, contrasting a “traditional” Orient that now included the Muslim world with a “counter-traditional” Occident. Only, unlike those responsible for forging the original attitudes of Orientalism, they identified themselves with the alien side. → Frithjof Schuon (1907-1998) was probably the last of them to have a truly global outlook, writing with equal facility about Hinduism, Buddhism, Christianity, and Islam, while gravitating, with his later disciples, from Muslim to Native American practices. With the net thrown so wide, the East-West division was irrelevant, and Orientalism no longer at issue. Instead, it was “Tradition” that had come to represent the other realm, exotic and almost unattainable.

JOSCELYN GODWIN

**Orléans, Louise Marie Thérèse Bathilde d', Duchess of Bourbon-Condé,
*9.7.1750 Saint Cloud, † 10.1.1822
Paris**

Bathilde d'Orléans was born in the château of Saint-Cloud just outside Paris. Her father was Louis-Phillipe d'Orléans, Duke of Orléans; her mother, Louise-Henriette de Bourbon, was the daughter of Louis-Armond II, Prince of Conti. She was a cousin of Louis XVI and the aunt of Louis-Philippe, who was to become “Roi des Français” in 1830. Louise-Henriette died when Bathilde was nine. Three years later, the child was sent to school at the Convent de la Magdeleine de Trenel where she remained until 1769. It was there that she began to spend protracted periods in prayer and develop the spiritual tendencies that would characterize the rest of her life. In 1770, her father obtained a papal dispensation enabling her to marry her fourteen-year-old cousin, Louis-Henri-Joseph de Bourbon; thus, Bathilde became Duchess of Bourbon. In 1772, she gave birth to their only child, Louis-Antoine-Henri de Bourbon, the Duke of Enghien. During this period, her husband began a series of indiscreet affairs, some with women from Bathilde's personal entourage. All her attempts to save the marriage failed. The couple was legally separated at the end of 1780, and her husband gained sole custody of their son, although Bathilde managed to retain the right to see him frequently. After the separation, Bathilde went to live with her father and his second wife, Madame de Montesson, in Saint-Assise, but her father soon gave her two residences of her own – the Hotel de Clermont in Paris and a summerhouse in Petitbourg. From this time on, her focus was definitively changed, and she consciously began to forge a new life for herself.

The three most important influences on Bathilde were → Freemasonry, → Christian Theosophy and → animal magnetism. The participation of women from the high nobility in “Adoption Freemasonry” (so called because of its “adoption”, i.e. acceptance, of women as members) was common in this period and Bathilde entered Freemasonry in

1775 at the latest, joining the Masonic lodge Saint-Jean de la Candeur (established in 1775) in Paris. “Lodges of Adoption” had begun to appear in France in the 1740s; their members were therefore both men and women, but they were directed by men. Saint-Jean de la Candeur was one of twelve Lodges of Adoption in Paris, and the foremost among them in terms of aristocratic recruitment (it was comprised mostly of people of high nobility). Bathilde was to be more than only one Sister among others: hardly had she entered Freemasonry when her brother, the Duke of Orléans, in his capacity (since 1771) of Grand Master of the Grande Loge of France, made her “Grande Maîtresse” of all the French lodges of Adoption. Once separated from her husband, she became an active Freemason, and at the same time, began to assemble a highly eclectic, sometimes politically controversial circle around herself.

The great Christian theosopher → Louis-Claude de Saint-Martin was an important influence as well; his *Ecce Homo* (1792) was written specifically for Bathilde. Along with other favorites, among them Franz Anton Mesmer and Bacon de la Chevalerie, he was installed from time to time at her château in Petitbourg, where her confessor Pierre Pontard celebrated mass. Saint-Martin was an intimate of → Jean-Baptiste Willermoz, who practiced mesmerism and was helped in deciphering the hieroglyphic messages he allegedly received from God by Saint-Martin. In striking contrast to Willermoz, however, Saint-Martin (described by one contemporary historian as a ‘metaphysical consultant to mesmerists’) sought to spiritualize mesmerist principles. He combined them with more mystical ideas because he thought mesmerism too materialistic and liable to make persons vulnerable to what he termed “astral intelligences”; it is against such “magical” practice that he wrote *Ecce Homo*. Bathilde’s closest friend was the Baroness d’Oberkirch of Strasbourg, who frequented mesmerist groups in Paris.

As early as 1789, Bathilde had espoused revolutionary ideas, along with her brother, Philippe Egalité, and around that time became involved with two other mystics, Suzette Labrousse and Cathérine Théot (the so-called “Mother of God”), who combined → mysticism with political ideals. Bathilde underwrote the publication of Labrousse’s *Journal Prophétique*, containing prophecies and criticisms of the nobility and the clergy, and edited by Pierre Pontard.

She did a great deal of charitable work; e.g., in Petitbourg she founded a hospice, where frequently she personally attended to patients. She

also studied intensely, and produced two original works, including a book length study based on her experience of administering a fifteen-month long treatment of animal magnetism to a patient in Petitbourg, and her *Opuscules*. The latter contain an account of how she was attracted to the life of the spirit while young, was later led astray, and how, after her marriage ended, she sought out a confessor and renewed her interior journey. From that time on, it is clear that Bathilde conscientiously attended to the details of daily life simply because she believed them important to her spiritual well-being. She believed that one always has a choice with respect to the quality with which one does even ordinary things, writing for example that ‘. . . at each moment we breathe and we are able to pump in [pomper] life or death by all the movements which constitute our physical, moral and spiritual being’.

In the Introduction she says that on the advice of a ‘wise man’ (possibly Saint-Martin), she ‘abandoned herself to prayer . . . while practicing good works’. In a statement characteristic of her attitude, she writes: ‘I received some inner illumination and consolation which detached me more and more from all of creation, in order to live only in and for God . . . this precious pearl . . . is enough . . .’. According to her, it was Providence that had helped her to find the works of Mme. Guyon, which led her to the ‘heart of my religion’. She regarded ‘all terrestrial nature’ as ‘an open book in which we can read the secrets of spiritual nature’, describes the passage of angelic spirits into human beings at the moment of our birth, and adopts the Christian theosophical [→ Christian Theosophy] idea that Adam was originally an androgynous being who was separated into two sexes as a result of original sin. The *Opuscules* contain an original and carefully elucidated articulation of the difference between the “visible” or “teaching” church and the “invisible” or “working” church. It must be noted that the term “interior Church” is never used by Saint-Martin nor by his friends, and first came into use in 1798 through the publication in French of *Quelques traits de l’Eglise intérieure* by → A.V. Lopukhin. Bathilde may have borrowed it from there. But quite as interestingly, Bathilde does give it a sense very different from Lopukhin’s: ‘The visible Church is . . . in my view the schism which broke out since the Apostles, against the true interior Church which is almighty and all pure in the bosom of her divine Master’. She writes that she does not have ‘a conviction that the visible church of our day, which is headed by the Pope, would be the same church

that Jesus Christ wanted to establish'. Closely linked to this distinction is the one she makes between the "teaching church" and the "working church": the former 'is visible to the eyes of the body', whereas the latter is visible 'to the eyes of the soul'. She also says that once one 'possesses the Word in one self' one is enabled 'to truly effect divine works'; here again, she shows she is more concerned with what one does than with what one says.

Bathilde would not escape the wrath of the Revolution. Her wealth and property were confiscated; she was imprisoned in 1793, then released in 1795. Relegated to the provinces, she settled in Petitbourg, until a decree of exile in 1797, when she was banished to Spain. Bathilde refers to a certain Ruffin as one of the guards who escorted her to the Spanish border, and writes that during the journey a great spiritual understanding sprung up between the two. The identity of this man, whom Bathilde usually addresses as 'mon bon ange', has never been definitively established. Two volumes of her voluminous correspondence are devoted to letters sent to him while she was in exile; they were published in 1812.

Although Bathilde had been something of an accomplished harpist, it would appear that she later came to see → music as a kind of indulgence: in one of her letters to Ruffin she strongly advises him to beware of music, because it 'turns us away from the pure and saintly source' and makes us 'run the risk of losing precious time'. In these letters we can also read her theosophical interpretations of the Fall of Lucifer and Adam, her arithmological views [→ Number Symbolism], and quotations from various theosophers to be read by Ruffin, e.g. → Dutoit-Membrini and → William Law. She gives Ruffin her opinion about the French Revolution, which she saw as part of the workings 'of the great machine of the universe', a means for God to save 'as many people as possible'; and using an almost alchemical image, she writes that 'it is God who purifies the water, and who by his action on it liquefies all the parts'. Unwavering in her view of earthly trials as unimportant in the face of the heavenly future, she adapted to greatly reduced circumstances. Her life became more embittered after her son, the Duke of Enghein (born in 1772), had been executed in 1804 upon an order given by Napoleon. Finally granted permission by Napoleon to return to France, she went back to Paris in 1814, where she more or less reconstituted her old circle. On January 10, 1822, she suffered a stroke and died later the same day.

Bathilde d'Orléans' life and work is worth fur-

ther study. The great historian Auguste Viatte may have been instrumental in creating the impression of Bathilde as being somewhat naive, almost certainly neurasthenic, and superficial. His account implicitly compares her to the "prudent" Saint-Martin, who warned her against over-involvement with somnambulists and advised her to abandon herself to prayer, Bible reading, and good works. While Viatte's account is valuable inasmuch as she is otherwise neglected in the literature, delving deeper into the primary sources indicates she was more formidable than one might otherwise surmise. She undeniably deliberately and consciously attempted to embody her spiritual convictions, by trying to make what she said and did in daily life correspond to those convictions. Bathilde deserves a more visible place in the history of theosophy than she presently enjoys.

KAREN-CLAIRE VOSS

Ouspensky [Uspenskii], Piotr Dem'ianovich, * 5.3.1878 Moscow, † 2.10.1947 London

Russian author, spiritual philosopher and teacher who is now remembered chiefly for his deeply influential book, *In Search of the Miraculous*: the most authentic account, written by a pupil, of the teaching of → G.I. Gurdjieff. Ouspensky was born and grew up in Moscow. His mother was a painter. His father, who died when Ouspensky was quite young, was a railroad surveyor and also a mathematician interested in the problems of the fourth dimension, a theme that became one of the central elements of Ouspensky's philosophical and spiritual work. Ouspensky seems to have had an

exceptionally vivid sense of himself even at the age of two and three and, at the age of six, is said to have been reading the works of Lermontoff and sensing that there must be something beyond the world of everyday reality, which he felt was filled with ‘absurdity and lies’. He is said not to have participated in children’s games.

Distrusting all forms of academic science, Ouspensky broke away early from formal scholastic training with a firm decision never to pass any examinations and never to take the academic degrees for which he was qualified. ‘The professors’, he wrote, ‘were killing science in the same way as priests were killing religion’. He studied deeply on his own, traveled widely and made his career as a writer and journalist, being careful to distance himself from all social and political movements, including the secret revolutionary parties which attracted many members of the Russian intelligentsia.

At the age of 29, he discovered the literature of the → Theosophical Society (→ H.P. Blavatsky, → H.S. Olcott, → A. Besant. etc.) and was profoundly influenced by the idea of secret wisdom, which gave him a new impulse for the study of religion, → mysticism and “higher dimensions”. In the following year, 1908, he traveled to Asia Minor and the Middle East. When he returned to Russia, basing himself in St. Petersburg, he undertook an intensive study of occult literature, initiating numerous, psychological experiments on himself in order to test the ideas he was finding in the books of mysticism and → magic. These pioneering experiments on consciousness strongly influenced his subsequent writings. Throughout his life, Ouspensky remained scientific and empirical about the inner world and could not rest content with speculative metaphysics alone.

The first fruits of his philosophical and experimental study of esoteric ideas was a haunting novella about eternal recurrence, *Strange Life of Ivan Osokin*, and his major philosophical work, *Tertium Organum*, published in St. Petersburg in 1912 and in New York in 1920. *Tertium Organum* became an international best-seller and established Ouspensky’s worldwide reputation as a pre-eminent visionary philosopher. Intended to take its place alongside the *Organon* of Aristotle and *Novum Organum* of → Francis Bacon, and rooted in Ouspensky’s personal experiments in changing states of consciousness, it calls for and projects a new level of thinking about the fundamental questions of human existence. Although the book is little studied today, *Tertium Organum*, along with Ouspensky’s other philosophical writ-

ings, comprises one of the most serious and original philosophical visions of 20th-century esotericism. By arguing that the central problems of philosophy – such as the questions of the nature of the self and consciousness, the structure of space and time, the meaning of history and the perennial questions of good and evil in human life – cannot be answered in the state of consciousness in which they have been approached in science, philosophy and conventional religion; and by showing the cognitive power of authentically higher states of consciousness, his writings offer themselves as a bridge between esoteric teaching, considered as hidden knowledge accessible only to the few, and the concrete needs and problems of the human family. His treatment of the idea of higher dimensions of time and the idea of eternal recurrence are meant to provide a response to many seemingly unanswerable questions inherent in the opposing disciplines of theology, art, science and mainstream academic philosophy, based as the latter is on the modernist critique of religion and spiritual knowledge. The ideas and arguments of *Tertium Organum* are developed, clarified and more widely applied in *A New Model of the Universe*, a collection of his essays, published in English in 1930. Although some of the material in these essays may have been revised in the light of Ouspensky’s years with Gurdjieff, most of it was originally written before he met Gurdjieff and stands as testimony to the depth of his own thought and its remarkable resonance to the all-encompassing knowledge that he discovered in the Gurdjieff teaching.

Ouspensky’s first meeting with Gurdjieff took place in St. Petersburg in 1915. He had recently returned from the Orient and was attracting large audiences to his lectures about his “search for the miraculous” in India, Ceylon, Egypt and elsewhere (among his listeners was Sophia Grigorievna Maximenko, who became his wife and, later, also one of the leading figures in the transmission of the Gurdjieff teaching in England and America.). At the urging of some pupils of Gurdjieff who had sought him out at his lectures, he reluctantly agreed to meet Gurdjieff. He recognized at once that Gurdjieff had discovered many things for which he had been looking in vain. ‘I realized’, he wrote, ‘that I had met with a completely new system of thought, surpassing all I knew before’. He began to help Gurdjieff gather people together to study his ideas and from that moment on, for the rest of his life, the study and practical application of these ideas remained Ouspensky’s overriding aim.

As the Russian Revolution closed in, Ouspensky joined the small group of Gurdjieff’s pupils pursu-

ing their study of the teaching under difficult and dangerous political conditions. This period of work included the year in Essentuki (1917) in which Gurdjieff poured forth the formulations of his ideas about man and the universe with great energy and intensity. Ouspensky soon began to feel, however, that a break with Gurdjieff was necessary. Although he had no doubts about the truth of Gurdjieff's ideas, Ouspensky separated himself from him and continued his own work first in Constantinople and then settled in London where, with the help of Lady Rothermere, A.R. Orage and other influential individuals, he lectured and guided the work of numerous pupils until he moved to America during the Second World War. *The Psychology of Man's Possible Evolution*, published in English in 1952, contains the lectures which Ouspensky composed during this period for the purpose of introducing interested people to the psychological ideas of Gurdjieff. Early in 1947, he returned to resume his work in London, where he died later in the same year. Concerning his break with Gurdjieff, Ouspensky writes only that at a certain point he 'ceased to understand him'. John Pentland, a close pupil of Ouspensky, and, later, of Gurdjieff, and who became a central figure in the transmission of Gurdjieff's teaching in America, poignantly characterized this event: 'The break between the two men, teacher and pupil, each of whom had received much from the other, has the elements of a classical tragedy and has never been satisfactorily explained. It was not made final until 1930 when Ouspensky visited Gurdjieff for the last time in Paris' (Pentland 1987).

The latter also contains several useful, brief studies of Ouspensky's ideas and life.

JACOB NEEDLEMAN

Papus (ps. of Gérard-Anacleto-Vincent Encausse), * 13.7.1865 La Corogne (Spain), † 25.10.1916 Paris

His father Louis, a self-taught man originally from the South of France, had married a Spanish woman, Iñes Perrez-Vierra, and at the time of Gérard's birth was trying to sell a medical apparatus of his own invention to the physicians of the Basque region: the "Encausse Generator", a bath allowing the cutaneous absorption of medications. A lack of success impelled Encausse Sr. to settle in Paris, near Montmartre, where he was able to open a clinic in partnership with a certified physician. Gérard was a child with a fertile imagination, but mischievous and undisciplined. He was obliged to quit the Rhetoric class of the Collège Rollin, while dreaming of getting even with his luckier comrades (he did not earn his baccalaureate until 1893). He worked towards medical studies in evening classes, then volunteered for military service. It was in 1885 that he discovered the classics of occultism [→ occult/occultism]: Louis Lucas (1816-1863), → Lacuria, → Eliphas Lévi, and → Saint-Yves d'Alveydre; he would consider the latter as one of his masters. Two years later he published his first article in *Lotus*, the new review of the → Theosophical Society in Paris, and was active in the "Isis" Lodge directed by Félix Krishna Gaboriau, where Papus set out to play a primary role. His intrigues led to the closing of the lodge and to the opening of a new branch, "Hermès", where he held a more advantageous position. However, the field of Parisian Theosophy alone did

not suffice to satisfy either his energetic activity or his ambition. In 1888 he had founded his own review, *L'Initiation*, followed in 1890 by *Le Voile d'Isis*, which gave priority to publishing his own lectures and writings.

The creation of a kind of occultist university, the "Groupe indépendant d'Études ésotériques" (Independent group of esoteric studies, soon renamed "École Hermétique" [Hermetic school]), marked an important stage in the transformation of occultism, hitherto dominated by the personality of Eliphas Lévi, with the entry of societies of "esoteric character" into the public realm. Beside its lectures for the public, the school offered examination-based courses modeled on those of official education, comprising a baccalaureate, a licentiate, and a doctorate – which might cause surprise when subjects such as, for example, Kabbalah [→ Jewish Influences], → Magic, hypnotism, → magnetism [→ Animal Magnetism], and → alchemy figured on its syllabus, as well as the study of Sanskrit and Hebrew. Papus set the example by publishing, like a new → Pico della Mirandola, in fields as various as *La kabbale (tradition secrète de l'Occident)* . . . (Kabbalah, secret tradition of the West, 1892) or *Premiers éléments de lecture de la langue sanscrite* (First elements of reading the Sanscrit language, 1898), even though he was as ignorant of Hebrew as he was of the Indo-European mother tongue. His best works were devoted to popular exposition, such as the *Traité élémentaire de science occulte* . . . (Elementary treatise on occult science, 1888), or his study on → Tarot, the following year: *Clef absolue des sciences occultes, le tarot des Bohémiens* . . . (Absolute key to the occult sciences, the Tarot of the Bohemians). Most of the Parisian occultists taught at the École Hermétique: → Sédir, → Barlet, Marc Haven (real name Dr. Emmanuel Lalande, 1868-1926), and the alchemist François Jollivet-Castelot (1874-1937), while the director and founder particularly explored the medical field, devoting about twenty titles to it. Papus had in fact obtained a title of Doctor of Medicine by equivalence during his military service, and had tried to participate in the experiments on hysteria of Dr. Charcot (1825-1893) in the Salpêtrière Hospital, Paris, taking advantage of the closeness of this state to those of trance and hypnosis. There was a strong demand for healing among those who frequented occult societies, and who tended to associate bodily health with spiritual progress; Papus published in 1913 his *Premiers éléments d'homéopathie pratique* (First elements of practical homeopathy). A friend of his, the bookseller and publisher Chamuel

(real name Lucien Mauchel, 1867-1936), completed the literary side of the enterprise. Its literary soirées attracted the great names of literature interested in the occult, such as Villiers de l'Isle-Adam (1838-1889), poets from the cabaret "Le Chat noir", and Catulle Mendès (1841-1909), who all published in *L'Initiation*. The best-known occultists of the Belle Époque, from → Guaita to → Péladan, had cherished an ambition for a literary career. The remarkable success of the "Papusian" enterprises, for all their apparent lack of seriousness, is explained by the fact that public opinion strongly desired to see scientific legitimacy conferred on speculations of the esoteric type, and hoped for a harmonization of intellectual life with the arts and the religious life.

After resigning from the → Theosophical Society in 1891, Papus tried to crown his organizations by means of a network of initiatic societies that would recruit members in his "schools". The foundation of a Supreme Council of the Martinist Order [→ Martinist: Second Period] in the same year gave him the opportunity. It was a matter of giving an institutional framework to an ancient initiation that → Louis-Claude de Saint-Martin had supposedly founded, and whose transmission had come down to Papus as early as 1882 through the mediation of Henri Delaage (1825-1882), a specialist in animal magnetism. As the new head of the order, Papus tried to justify the legitimacy of his creation in 1899 in a brochure *Martinésisme, Willermozisme, Martinisme et Franc-Maçonnerie* (Martinezism, Willermozism, Martinism, and Freemasonry), in which the functioning of his institution was compared to that of a masonic lodge, in a Christian → Freemasonry that was the heir to the Réau-Croix of → Willermoz, with the grade of "Supérieur Inconnu" (Unknown Superior, S.:I.:) as the ultimate initiatic degree. The Council contained twelve members, including writers as eminent as Maurice Barrès (1862-1923) and Paul Adam (1862-1920), as well as Papus's occultist friends Chamuel, Barlet, Guaita, and Péladan. It developed rapidly in Europe, especially in Russia. By the time of Papus's death, 160 lodges existed in the U.S.A. and Latin America. The setting up of the network also made use of Freemasonry. Twice, in 1899 and 1907, Papus had tried without success to have himself admitted to the recognized major obediences; instead, he had had to enter via minority groups and so-called "fringe" masonry. First of these was the Swedenborgian Rite of → John Yarker in England, which issued a patent in 1901 for the opening in Paris of the "Inri" Lodge, which, thanks to a new patent from Yarker, became the

Grand Mother Lodge for France in 1906. In Spain, the National Rite opened a lodge, "Humanidad", still within the framework of organizations controlled by Papus, which then transformed itself into the Mother Lodge for the Rite of Memphis-Misraim, an obedience whose Grand Mastership Papus occupied from 1908 to 1916.

The exuberant activity of this born organizer was marked by some rough moments: the trips to Russia at the invitation of the imperial family, in the company of the Lyonnais healer → Anthelme Nizier Philippe, and the Masonic and Spiritualist Congress of 1908. The success of Martinism in Russia, where Freemasonry had always been suspect, facilitated the presentation of the magus to the Tsar in 1901 and his activities in Russia during his visits in 1901, 1905, and 1906. Philippe, whom Papus considered as his master, had preceded him, then accompanied him to the court, where his healings had a great impact. Meanwhile Papus's friends let it be known that the magus's theurgical operations had been responsible for the failure of the 1905 revolution; but the presence of the healer, whom the French authorities considered a quack, and Papus's influence over the imperial family caused their departure. The Congress of 1908 involved all the representatives of the esoteric currents that Papus had been able to collect around himself in Paris; but his attempt to juxtapose fringe masons, spiritualists, magnetizers, disciples of → Anna Kingsford, and mystics of socialist bent such as Albert Jounet (1863-1923) did not work, and quarrels proliferated. The Martinist Order had already nourished rivals in its bosom, such as Guaita's *Ordre kabbalistique de la Rose Croix* and Péladan's *Rose-Croix catholique*, while → René Guénon, for his part, tried to take power in one of its lodges in 1909. Papus's lack of a firm doctrinal axis explains the multiplicity of paths followed by him, but his capacity to assimilate and adapt the philosophical systems of those he admired, from Philippe to Saint-Yves d'Alveydre, and to bring them into his synarchic synthesis, endowed him with real creativity, producing more than 90 published works. Papus never failed to rebound. Even his death from exhaustion as an army doctor during World War I was not devoid of panache.

JEAN-PIERRE LAURANT

Paracelsianism

Treating Paracelsianism as a set of ideas or as an intellectual tradition in some way linked to the thinking of → Paracelsus presupposes a non-existent conformity of opinion about what those ideas actually are and about the extent to which Paracelsus himself can be considered the legitimate author of them. Recent commentators have observed the frequency with which Paracelsus expropriated notions found in earlier authors and have discerned both medieval and Renaissance traditions represented in "Paracelsian" texts. Moreover, problems abound in identifying later texts that claim to make use of Paracelsus's medical, cosmological, and chemical ideas with what is actually contained in his own writings. Some indeed did invoke Paracelsus as a forerunner, especially in applying chemical principles to medicine and in turning away from ancient humoral pathology, but it was not necessary to do so since traditions of chemical medicine and even reference to the cosmological *tria prima* of Sulphur, Salt, and Mercury existed as well within other contexts, including traditional → alchemy as well as ancient and Arabic medicine. Already at the beginning of the 17th century the German physician, chemist and gymnasium director, Andreas Libavius (c. 1550-1616) was able to make a crucial distinction, distinguishing between the writings of Paracelsus himself and those texts composed by a group which he preferred to label "Neoparacelsians".

Discrimination in all the occult disciplines is important for anyone who would wish to grasp the historical meaning of terms. Suitably one historian (Stephen Pumfrey) has taken note of a split in historical tendencies between those who attach

the term Paracelsian to a matrix of core doctrines and those who individualize commitments, preferring qualifications such as “moderate” or “semi-paracelsian” to designate writers who retain the more practical parts of Paracelsus’s medical/chemical philosophy while eliminating traces of → magic or → mysticism. Yet, even here, an increasing number of scholars recognize that to separate theory and practice, or to label all those as Paracelsians who align chemistry with medicine, is to build the foundations of a definition upon historical quicksand. Samuel Johnson noted that the writers of dictionaries were required ‘to remove rubbish . . . from the paths of learning’, and with this in mind it is important to acknowledge that, apart from being a category of historical convenience, Paracelsianism possessed a local meaning that was intended as a term of abuse. According to this meaning, the label “Paracelsian” functioned to describe a category of otherness – one that was forged by antagonists anxious about the loss of control over traditional intellectual and linguistic standards, particularly in medicine and philosophy, and who feared the dismantling of trusted coordinates of knowledge. Paracelsianism, in this sense, represented a subversive natural philosophy and medical cosmology in which the human being, viewed as a condensation of the macrocosmos, could both know and operate upon the natural world by recognizing the signatures and → correspondences of creation. The result was a view of nature alive with magical forces and a therapeutic system dependent upon their use. Each individual, Paracelsus thought, comprised within him/herself all existence. Each was a synthesis of physical body, immortal soul, and sidereal, or astral spirit. For some “Paracelsians” such an arrangement meant that the powers and virtues operating in the world at large were also at work within the human body. These were vital forces, penetrating each thing in nature and making them part of a universal living structure. To practice medicine one had, therefore, to comprehend the structure and operations of the greater world in order to understand the vital functions of the body. Paracelsianism, then, stood for a specific type of cognition viewed by some as part of the larger episteme of magic and the occult [→ occult/occultism].

Paracelsus considered nature as *Magierin* and also thought of the human being as *Magier*, or “magus”. Thus philosophical experience worked in harmony with nature. On the one hand, nature broadcast her secret messages in signs which the magician/physician could learn to read through

the study of human disciplines like astronomy, alchemy, medicine, philosophy, physiognomy, and chiromancy, and which, guided by the light of nature, allowed the doctor to recognize individual illnesses as well as specific cures. In addition, nature also impressed upon things a heavenly power which the magus could pull to himself and even transfer to the benefit of those whose constitutions were weak or who had fallen ill.

Two works of the German physician Oswald Croll (ca. 1560-1609), the “admonitory preface” to his *Basilica Chymica* (1609) and a sometimes accompanying treatise on the doctrine of signs, reflect especially well aspects of the magical universe linked to Paracelsus. Even though the two tracts no longer escorted later editions of the *Basilica*, observers like Libavius remained mindful of their magical presence. Indeed, a review of the preface to Croll’s book unlocked for Libavius several features of Croll’s magical thinking which he considered intertwined with Paracelsian philosophy and epistemologically dangerous. According to Croll, one could not learn medicine simply by reading books since only nature could truly instruct the physician. In that regard, it was necessary for the physician to know the internal, invisible or astral structures of things in the greater world and to understand how these related to the organization of the body. Intellectual discovery followed thus not by interpreting the books of human hands, nor from accumulated experience or structured reasoning, but in reading the “book” of nature and by experiencing the divine. If, however, personal inspiration satisfied for cognitive innovation, Libavius wondered, how could one avoid a multitude of opinions being expressed as a result of personal fantasy. ‘Take away teachers and books, and allow anyone to philosophize on his own [and] you will have a lovely philosophy indeed’. Paracelsianism, from this point of view, meant something diabolical. ‘This very thing moreover is one of the devil’s enterprises, so that he may either abolish or pervert every system of learning, and he himself may rule at his own pleasure’. All this was enough for Libavius to place “Paracelsians” into the ranks of ‘Pyrrhonists, Sceptics, Heraclitus, Plato and their like’, who considered that man was the measure of everything.

Thus Paracelsianism, like early Platonism, and other mystical strategies which coalesced realms of matter, spirit, and soul into a single divine unity, became yet another magical tradition which reified the figurative and transmuted analogies into expressions of identity. Like them, it blended spirit

and matter, mixing the sacred and the profane. For Aristotelians there was certainly much to complain about, not the least being the disarray brought by the medley of spiritual, magical, and empirical conviction to the long standing symmetry of traditional disciplines. Accordingly Paracelsianism commanded a strange place in the intellectual geography of the 16th and 17th centuries. It came into existence as a new, and dangerous continent, reports of which drew attention to native habits which ignored Aristotelian customs and confused theological, natural philosophical, metaphysical, and empirical approaches to knowledge – all of which posed a presumed threat to other knowledge habitats and to their established religious and political hierarchies.

The problem was that, especially upon the globe of medicine, the inhabitants of the land of Paracelsus, i.e. those who were supposed to practice Paracelsianism, were often reported as having been seen in other locations. Libavius, tried to deal with the problem by constructing a new cartography drawing lines around different areas of medical custom and commitment. Boundaries were easy to draw around those who followed the teachings of Hippocrates and Galen. These he called dogmatists. Only slightly less precise were the lines delineating a realm of “chymiatrists”, i.e. those who added to ancient method chemical pharmaceuticals prepared by means of alchemy. Here had resided earlier figures like → Avicenna, Mesue, Rhases, and Bulcasis, who were followed by more recent inhabitants, among them Albert, Arnold, → Llull, and Ulstadius. There were troubles in the land of the chymiatrists, however, that required, out of regard for ethnic sensitivity, new lines to be drawn and new names to be created. For some chymiatrists had accommodated the chemical discipline to ancient teachings in such a way as to disclose Galenic principles in terms of chemistry or by reference to the macrocosm. These were to be called “parabolici” and “hermetici”, or even “natural chymiatristi”. But there were others whom Libavius labeled “sophistici” who had long mixed sophistic opinion with Hippocratic references and who thereby had occasioned much disorder throughout the map. The third empire was that of the Paracelsians. However, this too needed to be divided into two parts. For, he says, when novelty became pleasing it enticed the soul to very strange habits so that some began to embrace impious magic. Some rejected alchemy. All rejected Aristotle and Plato while replacing these with a type of philosophy that Paracelsus called “sagax” and which embraced

magic – not the natural sort, but the type linked to the black arts, necromancy, vain → astrology, geomancy, and the art of signs.

Native meaning, as far as Paracelsianism was concerned, was largely constructed of contemptuous components. According to Libavius, to want to be a Paracelsian was 1) to want to injure all the arts, 2) to despise all the ancients and moderns, 3) to force upon people promises for a long life and for curing incurable diseases, 4) to cure by chance or, if by art, in no other way than that of Galenic doctors, 5) to recommend magic along with kabbalah [→ Jewish Influences] and to practice magic through the methods of signs, words, and characters, 6) to attack Galen’s medicine with reproach, 7) to declare oneself the monarch of *arcana* and medicine, and 8) to make oneself an accomplice in shameful deeds. “Paracelsian”, like “Anabaptist”, was a useful category of condemnation – so useful that even Libavius himself was accused of Paracelsian enthusiasm, in this case because he advocated separating pure from impure in making chemical medicines. But simply commending efficacious essences separated from useless dregs did not, Libavius noted, make one a Paracelsian. If it did, he explained, one would have to include Avicenna, Bulcasis, and even some of the doctors at the arch-Galenic school of medicine in Paris within that company.

The continent of chymiatristia may have drifted apart from the region of Paracelsianism on Libavius’s globe, but at the University of Paris many continued to think that the two were inseparable. Foremost among them was the Galenist physician and censor of the medical faculty, Jean Riolan (the elder) (1539-1606). Riolan’s vision countenanced a narrow horizon. For him, even chymiatristia was unnecessary to good medicine. Nevertheless, he permitted freedom of choice for those who were curious about chemical remedies and zealous for novelty, just as long as such physicians made use of pharmacists to prepare their new medicines. New remedies, in themselves, did not require an altered medical philosophy. However Riolan saw in Paracelsianism, aside from philosophical chaos, a threat to established social roles. At Paris, surgery and pharmacy were arts subaltern to the “science” of medicine. If a doctor came by an arcane remedy, preparing the medicine at home did not detract from medical decorum. But his house, Riolan noted, should never become a *pharmacopolium* where remedies were sold. Social and physical distance from prepared medicines was, after all, what protected those who prescribed them. The point is

that, for Riolan, one element of the definition of Paracelsianism was social. Reversing professional tradition, Paracelsian physicians, he determined, made medicines themselves and sold these medications from their own shops.

Something that might be called Paracelsianism, then, involved the perception of a break with the social, textual, educational and linguistic medical continuum. Libavius himself noted that after claiming for himself the monarchy of chemistry, Paracelsus had decreed that he should found a new alchemy as well as a new medicine. In doing so, however, he opened doors to fashioning cures by all sorts of methods and to proclaiming all manner of chemical and medical *arcana*. In this case, Paracelsianism became coupled with an enthusiasm for novelty, and once again Libavius observed that it had thus come about that hardly anyone agreed with anyone else, each person wishing to bring forth something new. By this reasoning Paracelsianism meant intellectual fraud since it allowed a person to agree with no one, while, at the same time, granting him license to contradict everyone else and to condemn all the writings, sayings, and deeds of others.

Intellectual novelty, of course, occasioned a wide variety of sometimes contrasting opinions. Those who might willingly have been attracted to a Paracelsian camp comprised a diverse group and attitudes varied not only over the years but also from region to region. Reactions also differed in Germany, England, France, Italy, and other places depending upon local medical traditions, religious histories, institutional authorities, and the professional rights and privileges demanded by doctors and apothecaries. Such diversity produced what has been called *paracelsismes particuliers*, and paying attention to such particular expressions of Paracelsianism is the most judicious way to gain insight into the local meanings of the term itself. Early editors of Paracelsus's works helped establish particular flavors for Paracelsian ideas. The published collections of Johann Huser (c. 1545-c. 1600) and Michael Toxites (c. 1515-1581) fueled early Paracelsian fervor by combining elements of medical reform with what Joachim Telle has called "transconfessional theo-alchemy". → Gérard Dorn's (c. 1530-1584) edition of Paracelsian texts went further and more firmly established Paracelsus within the cultural context of medieval and Renaissance alchemical writers. In France, Paracelsian medical philosophy appeared as a result of new texts and old wars. The texts were those of two institutional figures, the translator of Galen and teacher of Andreas Vesalius, Johannes Guin-

therius von Andernach (ca. 1497-1574) and the Danish university professor, natural philosopher, and physician, Petrus Severinus (1540-1602). Severinus's text, the *Idea Medicinae* (1571), sought to place itself within the scholarly tradition of learned medicine by connecting the doctrines of Paracelsus with those of Hippocrates and Galen. There emerged a more systematic and less eccentric presentation of Paracelsian notions which succeeded so well in altering the complexion of Paracelsus that even the well known anti-Paracelsian physician and theologian Thomas Erastus (1524-1583), could commend the text to his readers. In Severinus's hands Paracelsianism became eclectic and more obviously neoplatonic, and it was this sort of interpretation that affected the thinking of other notable Paracelsians such as the professor of medicine at Basle, Theodore Zwinger, and the English physician, Thomas Moffett (1553-1604).

For his part, Andernach emphasized a more practical approach to Paracelsian therapeutics. As a prominent medical humanist, a translator of Galen, and, with experience as a professor of medicine at Paris, he prepared, in 1571, an enormous text concerning the old and new medicine strongly supportive of chemical medicines. In other places he argued that the chemical principles Sulphur, Salt, and Mercury could be considered to differ only slightly from ancient elements and judged that chemical procedures could transform poisonous matter into wholesome substances. A further impulse toward Paracelsian and chemical medicines came about as a result of a famous commentary on the works of Dioscorides written by Pietro Andrea Matthioli (1500-1577). The text was published in Latin in 1544 and a French translation appeared in 1561. The book included reference to the use of stones, minerals, and metals, and explained how antimony, which had been described by Paracelsus, could be rendered into an effective purgative. At Paris the debate over the internal use of antimony inspired attacks upon suspected followers of Paracelsus, and the fear of clandestine support for Paracelsian ideas within the university there led to the prompt condemnation of an early advocate of antimony, Roch le Baillif (fl. 1578-1580). It also opened up further debate about the rights of physicians who were not educated at Paris to practice in the city.

Just as Paracelsianism represented for some a radical break with medical authority, it stood for others as an attack upon the intellectual jurisdiction of Aristotelian philosophy, and especially Aristotelian logic. The logical reforms of Peter Ramus (1515-1572) sometimes cohabited with Paracel-

sian medical philosophy. In his *Basilea*, an oration addressed to the city of Basel in 1570, Ramus exclaimed that ‘this man [Paracelsus] has forced his way so deeply into the innermost parts of nature . . . that one could say that with Theophrastus medicine has been born for the first time and is perfected’. In Ramus, logic combined with politics and religion and, as the chemical physicians of Henri IV and Louis XIII would later demonstrate, Paracelsianism, in the guise of practical chemical/medical procedures, would find a source of both social legitimation and financial encouragement within the political institutions of Europe, particularly within the patronage systems linked to royal, imperial, and princely courts.

Paracelsus was certainly a leading social, political, and religious dissident. Paracelsianism, however, became in part associated with aristocratic circles. Paracelsian physicians gained court appointments and the publication of Paracelsian texts was made possible in large part by means of court patronage. One of the first publishers of Paracelsus’s works, Adam von Bodenstein, was court physician to the German Duke of Neuburg, who later became Elector of the Palatinate, Ottheinrich. The early definitive collection of Paracelsus’s medical and natural philosophical texts brought together by Johann Huser and Paul Link began to appear at Basle in 1589 with the financial support of the Archbishop of Cologne. Libavius noticed the court connection and asked at one point, ‘If you are real doctors and do not flee from the light [of wisdom], why do you not teach in the academies? You are occupied at courts where I believe you accomplish more by flattery than by speaking the truth, and advance more by begging than by curing’. In France the political success of Huguenot aspirations at the end of a long period of civil war contributed to a more open, and court supported, Paracelsian presence. Le Baillif was himself a physician in ordinary to the French king Henri III, but other chemical physicians admitting various aspects of a Paracelsian medical philosophy appeared in Paris several years later, arriving there in the company, and with the protection, of the Huguenot turned Catholic, Henry of Navarre. Prominent among this new medical entourage were Jean Ribit (ca. 1571-1605), Theodore Turquet de la Mayerne (1573-1655), and Joseph Duchesne (ca. 1544-1609), also called Quercetanus. Although each stirred controversy in his own right, the writings of Duchesne, which expressed a particular variety of Paracelsian thinking, ushered in an intense period of debate.

Duchesne’s positions were well known for over a

quarter century before the debate about his books began at Paris. In answer to Jacques Aubert in a debate about chemical medicines and the origins of metals, Duchesne admitted that the ignorance and faults of some had caused the “chymici” to fall into disrepute, but that this was no reason to condemn the entire art by which God had revealed so many secrets of nature and so many preparations of herbs, animals and minerals. As concerned Paracelsus, Duchesne did not propose to acknowledge his “patronage of theology” and neither did he agree with him in all other matters. Nevertheless, he confessed, ‘I dare to say and uphold that that man teaches many things pertaining to medicine almost divinely, which a grateful posterity can never sufficiently praise and admire’. Much of the dispute with Aubert centered on a defense of Aristotle’s explanation of the origins of metals against Aubert’s criticisms; but it also involved Duchesne in a defense of alchemy and, more specifically, in an apology for metallic transmutation.

Duchesne’s Paracelsianism would be attacked and defended at Paris and a good indication of the confusion surrounding the issue of definition can be found in the fact that Libavius, who wished to defend the place of alchemy in medicine, ultimately joined the debate as a Duchesne supporter. Regardless of how the intervention was seen by others, especially by Riolan who viewed the intrusion as a sign that Libavius had joined the Paracelsian faction, Libavius remained no friend of Paracelsus. He could, however, stand with other chemical physicians at Paris, and commented about another participant in the dispute, the Paracelsian Turquet de la Mayerne, that Mayerne’s dignity, like his own, was preserved, not by defending Duchesne, but by the sweat rendered in combining Hippocratic and chemical medicine and in picking out good remedies from Paracelsus’s manure.

Medical chemists need not have been Paracelsians, unless, of course, it was convenient for their enemies to label them as such. In the case of another medical doctor named Nicolas Abraham de la Framboisier, the medical faculty at Paris during the reign of Louis XIII seems to have worried about Paracelsian leanings even though the physician himself rejected ‘the sect of Paracelsus’ and argued that he had derived all his chemical remedies from Galen and Hippocrates. Here the multidimensionality of Paracelsianism gave credence to the barest suspicion. Since Paracelsians were aligned with Protestantism in France, the faculty of medicine was alert to the strategy which officially rejected Paracelsus, no matter what one’s private beliefs, while seeking advancement and favor from

royal and ecclesiastical patrons. Definition became clouded by uncertainty as intellectual priorities themselves were obscured by the social and political facts of life.

Despite the problems in France, Duchesne and other French Paracelsians continued to play important roles in the interpretation and transmission of Paracelsianism. After leaving France Mayerne became chief physician to the English king, James I. Elsewhere in England, John Hester († 1593) translated the tracts of Duchesne as well as others, promoting chemical preparations included in works by the Italian physician Leonardo Fioravanti (1518-1588) and the German Philip Herman. Another Englishman, a minister named Thomas Tymme († 1620) also translated large sections of Duchesne's works, especially his discussions of Paracelsian cosmology, into English. Tymme, like R. Bostock, who defended Paracelsian principles and the macrocosm-microcosm analogy in a work of 1585, drew something spiritual from Paracelsus's works and found there as well an anthropology and natural philosophy removed from, and consequently not indebted to, ancient, heathen texts.

Depending upon one's point of intellectual origin, Paracelsianism might mean chemical philosophy or even practical chemical medicine. However, another reading of Paracelsus, especially based upon Paracelsus's theological writings, inspired a far more mystical definition. This interpretation was especially convenient to religious radicals like → Valentin Weigel (1533-1588) and his pseudo-Weigelian imitators, as well as the early Rosicrucian enthusiast → Adam Haslmayr. To Haslmayr, Rosencreutz and Paracelsus both had promised evangelical freedom to a future world and Haslmayr proclaimed accordingly a new religion, the *Theophrastia Sancta*, viewed as a kind of perennial religion practiced in occult circles until Paracelsus had publicly proclaimed its meaning. The basis of the religion was the *tria cabalistica prima*, the three cabalistic principles of *Bitten, Suchen, und Anklopfen* [asking, seeking, and appealing] which Paracelsus had designated in the *Philosophia Sagax* as the means to all natural knowledge. The living word of God sealed within the human being was, on the basis of this theology, far more important than what was written in Scripture. In fact, without the human spirit to enliven them, the Bible itself was merely a collection of dead letters. To the external trappings of Christendom some advocated a renewed "church of the spirit", and it is just such a view of the real church which brokered between Weigel and Paracelsus a theological alliance.

The story of "Weigelian" theology is, in part, a

Paracelsian legacy. As early as the 1570s Weigel, the pastor of Zschopau in east Saxony, had composed treatises and sermons whose content could by no means be considered reflective of either Catholic or main line Protestant opinion. In the early 17th century several publishers busied themselves with the printing of "Weigelian" books. Some, however, were not actually written by Weigel and sorting out the genuine from the possibly apocryphal has become a primary task of Weigelian scholars ever since. Of those texts linked to Weigel, influences stemming from medieval mystical traditions and, after 1578, from Paracelsian natural philosophy predominated. Other "Weigelian" books had a more apocalyptic message, insisted upon inward knowledge, and conflated Paracelsus, kabbalah, and magic. Institutionalized Protestantism needed to make no distinction concerning authorship. It viewed all the writings as depending upon a theology of the inner word well situated to the subjective epistemologies of religious radicals.

In Paracelsus, Weigel seems to have encountered such notions as the *light of nature* and the *light of grace* and to have used them when fashioning his own apprehension of the process of human understanding. He also found in Paracelsus ideas of man as microcosm, produced from *limus terrae*, and depicted as the *quinta essentia* of creation. By contrasting a heavenly flesh, which is eternal, to an earthly mortal flesh, Weigel judged that the flesh of Christ was not that of Adam. The flesh of Christ, therefore, was not from the earth, not from the seed of man, but from heaven. Christ had a heavenly body born of Mary, a heavenly Eve. In Paracelsus's text *Liber de Sancta Trinitate*, which seems to have had an active life in manuscript, Paracelsus described how God was originally alone and without any beginning. Thus the divine separation into three persons was not eternal, and initially there was only one being, one divinity, one person. God remained alone until he wished to multiply and manifest himself, at which point there came into being three persons, three beings, three qualities and forms, all the while remaining, nonetheless, one God, one creator. Paracelsus also described how God separated a female form from himself, represented as a *himmlische weib* or *frau gottes*, which was understood not as a separate divinity, but through whom God the Father produced the second person of the trinity. Embedded here, as well as in the Christologies of other religious writers like Melchior Hofmann († 1543) and Caspar Schwenkfeld († 1561), was a revolutionary and millennial conception of the church. By distancing Christ's flesh from human flesh, Weigel joined

those who cast into doubt the possibility of reforming the old Adam. There had to be a new covenant in which the heart would replace the external Jerusalem as the dwelling place of God. To this end, Weigel recognized three stages of the world ending finally in the age of the Holy Spirit. '[Then] the outer will be brought into the inner. Man himself will be Jerusalem and the temple in which God dwells. Then one will have no need for ordained preachers or other teachers . . .' Such thinking was dangerous. At Marburg, in 1619, two teachers in the city's *paedagogium* named Homagius and Zimmermann, inspired in part by Weigel and Paracelsus's book concerning the trinity, tossed from their windows shredded copies of Greek and Latin *lexica* (among other books) claiming that one should also throw out academic degrees, logic, and the arts as well. No one, they contended, should any longer study Latin, but everyone should read the writings of Weigel and Paracelsus (Theophrastus). These authors had provided the key to scripture. And what was this key? It was that all of scripture was to be understood allegorically, and that the word of God was not to be found strictly in the Bible, but was to be derived from an inner spirit, an internal light. The Bible contained only "dead letters" which could only be comprehended through revelation. Thus, they believed, all those were repugnant who attempted to blow into such dead letters a living soul and who therefore only ended up believing what they wanted to believe.

Paracelsianism could be aligned with spiritualists like Schwenckfeld and Weigel, but it also has been shown to have been appealing to some taking part in the more orthodox theological debates surrounding the symbolic interpretation of the Eucharist. Views of Paracelsus in this regard seem linked to the Swiss reformation, especially to the thought of reformers like Bucer, Zwingli, and Oecolampadius. In this variety of Paracelsianism, it has been argued, Paracelsus became a kind of "Christian Magus" developing a knowledge of God through the study of nature, or as a combination of natural philosopher and religious thinker, gaining special revelation through grace. Nevertheless, Paracelsianism was never officially part of any reformation religion, but existed there, as in many other contexts, as a part of the heritage of neoplatonic and mystical Renaissance philosophy.

Aside from making chemistry relevant to medicine, other themes, philosophical, mystical, and religious, connected later writers to the works and thoughts of Paracelsus. One tradition connected Paracelsus not only to an explanation of disease as specific entities with specific etiologies, reject-

ing thereby the ancient doctrine of humors, but annexed Paracelsian notions to explications of physiological processes in the idiom of chemistry. This aspect of what later became known as iatrochemistry developed especially in the 17th century in the writings of → Joan Baptista van Helmont (1579-1644), Franciscus de le Boë Sylvius (1614-1672), Raymond Vieussens (ca. 1635-1715) and many others. Expressing a natural philosophy in terms of vitalism and macrocosmic influences, and upholding chemical analogies related to the human being inevitably involved reference to Paracelsus, however. Many alchemical texts as well continued to enlist Paracelsus, and the *tria prima*, as influential antecedents to discussions of transmutation. In large part, however, Paracelsus lent himself to mystical cosmologies as one member of a lineage of magical savants aware of inner relationships and forever maneuvering between matter, spirit, and soul. The religious mystic and *Philosophus Teutonicus*, → Jacob Boehme (1575-1624), combined Neoplatonic and Paracelsian themes in numerous prophetic and mystical writings. Currents of → Christian theosophy and → *Naturphilosophie* carried both Paracelsus and Boehme along for years thereafter. Both were influential in shaping the theistic philosophy of → Franz von Baader (1765-1841), who sought to combine realms of matter and spirit in opposition to strictly mechanical explanations of nature, and to post-Romantic writers like the poet-chemist Alexander von Bernus (1880-1965), who insisted upon a spiritual dimension within the natural sciences, and → Rudolf Steiner (1861-1925), who continued to describe the threefold nature of the human being in terms of body, soul, and spirit.

BRUCE T. MORAN

Paracelsus (ps. of Theophrastus Bombast von Hohenheim), *1493 or 1494 Einsiedeln, † 24.9.1541 Salzburg

1. LIFE 2. MEDICAL WORKS
3. ASTRONOMICAL AND DIVINATORY WORKS 4. THEOLOGY 5. MAGIC

1. LIFE

Paracelsus was the son of the physician Wilhelm Bombast von Hohenheim and an unnamed bondswoman of Einsiedeln Abbey in Switzerland. The meaning of the name "Paracelsus", first attributed in the 1520s, is not certain, but could have arisen through the Latinisation of "Hohenheim"; the sense of "beyond or surpassing Celsus" is unlikely. About 1502 Paracelsus moved with his father to Villach (Carinthia). Little is known about his schooldays or studies. According to his own statement, he took his doctorate in medicine at Ferrara (c. 1515). He then made his "great peregrination" through Europe in the capacity of field surgeon. In 1524/25 Paracelsus can be traced at Salzburg. In 1525 he was involved in the Peasants' War. His role is unclear but he had to flee the city. On 5.12.1526 he registered as a resident in Strasbourg and evidently wished to settle here. In March 1527 he was appointed town physician and university lecturer at Basle. He caused a sensation by lecturing in German as well as Latin and attacked the ancient medical authorities. Disputes with the medical faculty, apothecaries, and the Town Council, compounded

by a patient's complaint of excessive fees, led to his flight from Basle at the beginning of 1528. After brief residence in Colmar and Esslingen he lived in Nuremberg for a short period. Documentary sources place him at Beratzhausen in 1530, at St. Gallen in 1531, and after numerous further stations he reached Augsburg in 1536, but even here he stayed only a while. In 1537 he travelled to Mährisch Kromau to treat Johann von Leipa, the hereditary Marshal of Bohemia, and was also resident at Vienna the same year. In 1538 he was briefly in Villach and St. Veit. Relatively little is known about Paracelsus in 1539-1540, but he was in Salzburg in 1541. Severely ill, Paracelsus wrote his will on 21.9.1541 and died three days later.

2. MEDICAL WRITINGS

Paracelsus left an extensive opus. An initial observation concerning his most important medical works, is that the early writings raise special problems. It may be assumed that he composed medical works even before his Basle period. Yet all medical works usually classified as "early" works (all unpublished during his life) cannot be dated with any certainty. A precise chronological ordering, attempted by Karl Sudhoff in preparing his standard edition (and since widespread), such as "Works c. 1520" or "Works c. 1525/26", is unsupported. The book called "Archidoxis" belong to those writings which can be attributed to his pre-Basle period. This is Paracelsus's major "alchemical", i.e. pharmaceutical-chemical text. Here he presents a medically applied → alchemy, whose goal is the separation of the pure from the impure chiefly through methods of distillation. It also treats of "chemical" remedies derived from metals and minerals (e.g. quintessences, arcana, magisteria, elixirs) associated later on with the name of Paracelsus. It is evident that Paracelsus knew the pertinent late medieval alchemical works of → Ramon Llull, → Arnau de Vilanova and especially John de Rupescissa [→ Jean de Rocquetaillade]. However, it is also clear that he did not identify himself with their tradition (nor the academic medicine based on ancient authorities). Many of Paracelsus's recipes in this work were almost incomprehensible for the reader, partly due to deliberate blinks and partly due to careless presentation. This question needs closer examination, as the so-called *Volumen Paramirum* (not to be confused with *Opus Paramirum* c. 1530) is also regarded as an "early" writing. In this text, five causes of disease are described (*Ens astrale*, *Ens venenale*, *Ens naturale*, *Ens spiritale* and *Ens deale*), an obvious deviation from the ancient

medicine of Hippocrates or Galen. The so-called *Treatise on Miner's Disease* also probably dates from this period. Here the various occupational diseases of the miners are described, explicitly stating that the ancient authors do not mention these diseases. All works mentioned so far remained unprinted during Paracelsus's lifetime. Paracelsus's first published medical text did not appear until 1529, a work on syphilis, *Vom Holtz Guaiaco gründlicher heylung*. Here Paracelsus objected to the uncritical use of guaiac wood, a contemporary wonder-cure. In 1530 (possibly even in 1529) a further syphilis text appeared *Von der Frantzösischen kranckheyt Drey Bücher* at Nuremberg. In 1530 Paracelsus was working at Beratzhausen on *Opus Paragranum*. Here he introduced the pillars of his new medicine: Philosophia; Astronomia; Alchimia and – last but not least – the Virtue of the physician (Proprietas or Virtus). In 1531 Paracelsus wrote his *Opus Paramirum* comprising four books at St. Gallen. In its first book Paracelsus dealt with the *Tria prima* of Mercury, Sulphur und Salt, the three fundamental Principles, which constitute all bodies, including the human being. Paracelsus explained the *Tria prima* by comparison with a burning piece of wood: that which burns, is Sulphur; that which smokes, is Mercury; that which becomes ashes, is Salt. On the basis of the *Tria prima*, Paracelsus also developed a new pathology, whereby he attributed a significant role to the stars besides bodily causes in the origin of diseases. The “spark of fire” from the stars could for instance make the Sulphur “ill”, and in consequence the whole body would suffer disease. The second book of *Opus Paramirum*, the *Tartarus-Buch*, relates directly to the *Tria prima* of the first. According to Paracelsus the *Tria prima* carry “excrement” (*Kot*) with them, and this excrement can also cause diseases in the body, called tartar-diseases by Paracelsus. The *Opus Paramirum* identifies the stomach as the seat of tartar production. The third book of the work dealt with women and gynaecological diseases under the title *De matrice*. In the beginning Paracelsus distinguished between the macrocosm, man and woman as three different worlds. Men's diseases were thus distinct from women's diseases. The fourth book of *Opus Paramirum* is entitled *Buch von den unsichtbaren Krankheiten und ihren Ursachen* (Book of Invisible Diseases and Their Causes). Its content was not psychiatry in any modern sense, but rather magic in the broadest sense. In the first part Paracelsus described how the Devil could gain influence through “false belief” over humans and their state of health. Like the

Devil, man could also work curses through “belief”. Some remarks show that Paracelsus assumed the existence of witches. He treated this topic more extensively in *Philosophia de divinis operibus et factis*, which was probably written between 1529 and 1532, and where he distinguished between the marks and works of witches [→ Witchcraft]. Witches who have not yet committed evil deeds can still be cured through Christian remedies such as prayer and fasting. Paracelsus gave no indication of the procedure against witches deemed to be active by their community. It may be assumed that he would have supported drastic measures including the death penalty in such cases. In 1535 Paracelsus's balneological text, *Vonn dem Bad Pfeffers . . . Tugenden* (The Virtues of Bad Pfäffers) was published, followed in 1536 by his *Grosse Wundartzney* (Great Book of Wound-Surgery), in which Paracelsus expounded internal diseases rather than surgical principles. Here Paracelsus also touched on the doctrine of signatures, which is often associated with his name. Many passages contain instructions for “magical” remedies, so that it is not entirely incomprehensible that Paracelsus was suspected of sorcery in his own lifetime. His *Astronomia Magna* (c. 1537/38) is a comprehensive medical anthropology and cosmology, yet remains in a fragmentary form. Here Paracelsus distinguished between a terrestrial and heavenly “part” of the human being, whereby the terrestrial is subject to the stars, while human freedom is of heavenly origin. The Christian aspect of *Astronomia Magna* is evident. The influence of neoplatonic thought [→ Neoplatonism] in this writing is a matter of debate among scholars.

3. ASTRONOMICAL AND DIVINATORY WRITINGS

Paracelsus also wrote astronomical and divinatory works, of which twelve were published (some in several editions) in his lifetime. On closer examination these prove to be thoroughly heterogeneous. The first prophetic exercise of Paracelsus was his *Practica . . . gemacht auff Europen/anzufahen in dem nechstkunfftigen Dreyssigsten Jar/Biß auff das Vier und Dreyssigst nachvolgend* (Almanac for Europe for 1530 until 1534). Seven editions of this very successful almanac were published in 1529-1530 alone; it is not certain whether the first edition appeared in Strasbourg or Nuremberg. Paracelsus substantiated the publication of a four-year almanac in a postscript, stating that one need not only take the chief planetary ruler of today's skies as the basis of prediction. The constellation of the planets also had an effect over

time. Moreover, he did not think it necessary to adduce the specific constellations of the year. The prognostications are relatively ambiguous. Closely linked with the four-year almanac was *Pronosticatio . . . auf dis gegenwertig jar, betreffend ein Confederation, so von andern Astronomis und Practicanten dis jar ausgelassen und ubersehen ist*, printed in 1530. A grand political future was predicted for this unspecified confederation, which would endure for a long time. This prognostication was connected with the so-called *Auslegung über ettliche Figuren Johannes Liechtenbergers*, which has survived only in fragmentary form. In 1488 Johannes Lichtenberger published a prophetic astrological work with 45 woodcuts, in which he prophesied the appearance of an angelic shepherd and a Kaiser of Peace. In his own unpublished text, Paracelsus violently contradicted Lichtenberger on account of his pro-French and pro-Habsburg stance. The Kaiser of Peace would come from "German blood". A further magical pictorial commentary was written about 1529/30. This so-called *Auslegung der Nürnberger Figuren* also remained unprinted. It was a response to a work of the Nuremberg reformer Andreas Osiander of 1527. Osiander prophesied the end of the Papacy in his commentary on a series of pictures of the Pope (at this time ascribed to Joachim von Fiore, the 12th-century Calabrian abbot and prophet). He also saw the advent of Luther the reformer in the pictures. Paracelsus criticised the Papacy vehemently in his own commentary of the pictures, but he firmly rejected Osiander's Lutheran partisanship. No one individual nor group could introduce the necessary reformation. At this time Paracelsus evidently no longer had any hopes of the Wittenberg reformer. In several writings of the period 1531-1534 Paracelsus interpreted natural phenomena and events (e.g. comets) as divine omens. Man must read the Bible, in order to understand these signs (he did not reveal how the text should be read). His *Prognostication auf xxiiii jar zukünftig* of the year 1536 is a mantic text based on personal inspiration and makes no reference to the stars. Paracelsus adopted the scheme of annual predictions in his last prognostical writings of the period 1536 to 1539. He gives no information regarding his methods of prediction.

4. THEOLOGY

However opposed → magic and theology may seem, they form an inseparable unity in Paracelsus's worldview. He understood magic as a method of using the secrets or fundamental laws of nature, while theology provided him with a philosophical

basis to pursue the welfare and resurrection of the soul along the path of eternal ideas. Moreover, the miracles performed by Jesus and the apostles in healing the sick stimulated Paracelsus to postulate a new apostolic medicine, which even went beyond his first reformation of medieval medicine, proclaimed by him at the University of Basle in 1527.

Paracelsus became interested in religious subjects at an early time. His mother had served at the great Benedictine abbey of his native Einsiedeln and he retained a lifelong and faithful devotion to this place. Paracelsus tells us there were several abbots and clergymen among his teachers from different places in his *Grosse Wundartzney* (Great Book of Surgery). The debate initiated by Martin Luther in 1517 about the need for a reformation of the Church must have exerted a strong influence on the youth, who always questioned the traditions and theories of the ancients. These attempts at reform found their way into Paracelsus's first theological writings which stem from the years 1524/25, when trying to establish himself as a physician in Salzburg. *De septem punctis idolatriae Christianae* (Seven Points of Christian Idolatry) gives a harsh critique of the *Mauerkirche* (walled church), which symbolised a church paralysed in outer splendour and empty rituals, in contrast to an inner spiritualistic church. Paracelsus stated: 'The way to bliss needs stillness, it shuns clamour, but proceeds from the innermost heart'. At this time he composed his works on the Holy Trinity and on the Virgin Mary. Paracelsus also wrote an important commentary on the first five chapters of St. Matthew. This was the starting point of a lifelong and intensive study of the Gospels, especially St. Matthew, to which he would dedicate several lengthy commentaries. It is evident that Paracelsus largely derived his ethics, be they personal, social or medical, from the Gospels and above all from the Sermon on the Mount (Matth. 5). The Beatitudes in the Sermon on the Mount contained guidelines for a righteous life leading to eternal bliss, which Paracelsus carried to their far-reaching but logical conclusions: he demanded not only the avoidance of quarrel and wars, but also strict social justice, in which the rich would share with the poor. These radical or even revolutionary social attitudes may have led Paracelsus to join with the revolting Salzburg miners, an act assumed to have been the cause of his sudden flight from the town in the summer of 1525.

In the following years Paracelsus concentrated on his reformation of medicine, based on a system of natural philosophy, astronomy and alchemy. After several frustrations and set-backs in his

career – including expulsion from Basle and loss of his university position, Vadianus' snub in St. Gallen, and his censorship at Nuremberg – he seems to have developed a habit of regularly withdrawing to the Appenzeller country of Switzerland while pondering religious subjects, even to the point of completely giving up medical practice. Only the verse from St. Luke 5:31, as reported in the *Grosse Wundartzney*, that only the sick would need a physician, moved him sufficiently to return to his proper profession. This is but one example of how much the Gospels gave him solace and were a continuous source of inspiration. As he further tells us, he began to address the common people as a lay preacher in 'taverns, inns and public houses'. In this period from 1529 to 1535, Paracelsus wrote the bulk of his theological writings. He wrote an extensive commentary to the Psalter, which remains his most voluminous work, even though only part of it has survived. From the same period we also have commentaries on the Ten Commandments and on the prophets Daniel and Isaiah, several minor monographs about ethical, social and political subjects, three large commentaries on the Gospel of St. Matthew, and several sets of sermons. Another two series of tracts are characteristic of Paracelsus's theology: the writings on the Eucharist and on the *Vita Beata* (Beatific Life). The Eucharist played a central role in Paracelsus's idea of the *neue kreatur* (new creation) bestowed on the world by Christ, which enabled the faithful disciples to perform the same works and miracles as their master. The *Vita Beata* comprises tracts concerning the attainment of the beatific life, and also on the eternal religion, the highest good, the grace of God, happy-mindedness, the martyrdom of Christ, the remission of sins, Christian duties, the honoured and the rich, the churches of the Old and the New Testament, the resurrection and glorification of the body, and baptism. The *Vita Beata* writings are also known as the *Philosophiae Magnae Pars Altera* (Second Part of the Great Philosophy), whereas the first part of the *Philosophia Magna* consists of tracts regarding popular magic (see below).

Towards the end of his life Paracelsus entered a third phase of literary production in his theological works. In his famous *Astronomia Magna* (Great Astronomy, 1537/38) he again summarised the central points of his theology and emphasised the difference between the "light of the nature" and the light of the Holy Ghost. Some years later, around 1540, reviewing the two decades that had elapsed since he first started to write, he laid down his *De secretis secretorum theologiae* (The Secrets

of the Secrets of Theology), where he expounded his mature views on beatific life. Three further sets of sermons date from the same period: *De antichristo*, *In incantatores* (about sorcerers), and *In pseudodoctores*.

The preserved theological writings consist of 40 monographs or single tracts, 16 Bible commentaries, 20 sermons, 20 writings on the Eucharist, and 7 Mariological tracts. As a whole, these writings make up a corpus quite as extensive as the medical and philosophical works, but to this day only half of them have found their way into print. The remaining and so far unedited works, most of them dealing with the New Testament, especially important to Paracelsus, are now being prepared for a scholarly edition.

At first sight, Paracelsus's theological style seems quite orthodox and not so different from traditional religious thought. For the true Christian there are laws and commandments to be followed, the remission of sins has to be attained, and righteous behaviour will pave the way to eternal life. How does this Christian theology relate to the Hermetic and alchemical thought of his medical writings? On closer investigation, the peculiarities become apparent. In contrast to many contemporary religious thinkers, Paracelsus's theology is based on direct exegesis of the Gospels rather than on St. Paul's epistles. The attainment of eternal life plays a role of the utmost importance. Paracelsus does not refer to a somewhat remote future: in "beatific life" man is given the opportunity to achieve a foretaste of eternity. God's laws and teachings as laid down in the Bible must be observed, but also consist in an active belief in God, respect for God, charity, knowledge and hope. Mere outward observance is not enough: the Commandments have to become alive in Christ and should lead to perfect love of God and one's neighbour.

Another marked feature of Paracelsus's philosophy and theology becomes apparent in his speculation on the double body. Man has a mortal and an immortal body, one visible and one invisible, the former confined to the realm of nature, the latter ruled by the stars and tending to eternity. Accordingly, there is an inside and an outside, an above and a below, a microcosm and a macrocosm. This notion of a double corporeality may have been partly inspired by I Corinthians 15, but can also be found in the Middle Ages, in Neoplatonic and Hermetic philosophy, and in alchemical lore. Paracelsus's bipartition also forms one major difference with the perspective of → Agrippa of Nettesheim who with his "mundus triplex" advocated a

tripartite conception of the world. One might think that Paracelsus's concept of the *Tria prima* consisting of Mercury, Sulphur and Salt would lead to a ternary philosophical system. However, this does not hold for Paracelsus's view of the spiritual composition of man and the universe, but only for the composition of matter, or more precisely, of metals, minerals, stones, wood, herbs and all growing things. Paracelsus regarded these three principles as workmen (*werkleut*) in the process of creation helping the superior creative principle, the *archeus*, in differentiating and molding the classical four elements fire, air, water, and earth, which themselves constituted the building blocks of matter. The combustible Sulphur was bestowing a characteristic form upon things, the incombustible Salt was giving the solidity, and the volatile and mediating Mercury was taking care of the nutritional requirements. When alchemy proceeds to decompose a thing into its constituents, the mercurial principle will flee as a fume or manifest as a volatile liquid, the sulphurous principle is separated as a combustible oil or resin, and the salty principle remains as a crystalline or amorphous indestructible matter. The idea of *Tria prima* was highly influential on the conceptual development of chemistry, dominating chemical perceptions until the mid-18th century, and also on iatrochemistry, representing a promising attempt to explain bodily functions in terms of alchemy. Paracelsus had himself speculated in *Opus paramirum* (c. 1531) about the operating of *Tria prima* in the body. However, there is no firm evidence that an equation of the three Paracelsian principles Mercury, Sulphur and Salt with the corporeal tripartition Spirit, Soul and Body respectively, nor even with the Holy Trinity of Father, Son and Holy Ghost, was already part of Paracelsus's own doctrine. These and further philosophical speculations in interpreting the universe chemically have their origin among Paracelsus's followers.

In his early *Volumen paramirum* (c. 1520), where he tries to give a new classification of the causes of disease, Paracelsus is well aware of his "pagan style" in explaining nature and disease in terms of alchemy and magic, but hastens to emphasise that he is a true Christian. It is possible that Paracelsus understood "pagan" philosophy not only as synonymous with ancient, but also in a narrower sense with Hermetic or Neoplatonic philosophy. On the one hand, Paracelsus felt obliged to study nature in its light as well as dark aspects, while on the other, he had to observe a framework of Christian philosophy. An attempt to combine the two viewpoints produced an inevitable ten-

sion. One might say he was bound to Mother Nature as well as to his Mother Church, and this dual allegiance may have been one cause of his personal failure during his lifetime. His *Astronomia Magna* attempts to give a late synthesis of these obviously conflicting worldviews, whereby Paracelsus exhorts man to become a *centrum* between his earthly origin and his heavenly destination.

As an alchemist, Paracelsus was deeply impressed with the mystery of the immaculate conception of Christ and its implications. He was familiar with medieval theories of creation and had written a tract on the generation of man (*Das Buch von der Gebärung*, c. 1520). He obviously attempted to apply these ideas to the heavenly birth described in the New Testament. He adopted the medieval notion of "limbus" as the womb from which God had created man. Paracelsus saw the limbus as a kind of primordial seed or clay which was handed down from generation to generation starting with Adam, and so constituted the very core of man's spiritual potentialities. The "limbus" of Adam came from below, from nature, and was thus limited. The birth of Christ represented a *neue kreatur* coming into the world, a new eternal "limbus" from above, which transferred to man unprecedented possibilities. By the power of this "new creation" Jesus and the apostles were able to perform miracles, such as curing the sick, healing the blind and the lame, and even expelling evil spirits and raising the dead. Paracelsus regarded the power to perform such miracles as the cornerstone of a new and supreme apostolic medicine, surpassing even his own earlier medical reformation. The new "limbus" was bestowed on a person in baptism and renewed during the Last Supper. The Eucharist assumed the utmost importance to Paracelsus, inspiring an entire set of tracts conceived as a complete *Philosophia de limbo aeterno*. In soteriological terms, his central theme was not so much Jesus' death on the Cross, but first and foremost the birth of this new heavenly body.

For Paracelsus, the true Christian Church was not an external institution with its buildings, priests, bishops and human laws, but rather an inner church based on continuous personal revelation. Paracelsus took the foundations for this spiritualistic view of what it meant to be a true Christian from the Gospels. Here St. Peter played a major role, because he was the first to recognise Jesus as the Christ, the Son of God. According to Paracelsus, this was not revealed to Peter out of the lower light of nature, but out of the light of the Holy Ghost. Thus Peter became the prototype of the mystic, illumined by God; and obviously it

was on him – Peter the rock – that Jesus wanted to build his new Church. Paracelsus suggested that the keys to heaven will be handed to “every Peter” who attempts to let himself be guided by the inner light. This is why for Paracelsus there were “two churches”, one being St. Peter’s living church of ongoing revelation, and the other one the *Steinkirche* (stony church) for the blind believers made by man and founded on human laws.

5. MAGIC

From his study of the Bible Paracelsus was able to make a direct link to magic. The period of antiquity, and with it the world of the New Testament, was swarming with ghosts, demons, devils, gods and magicians, and thus provided an ideal setting to discuss this topic. Paracelsus followed → Albertus Magnus in identifying the three kings or magi from the Orient, who had found the Christ child with the aid of the stars, as ideal references for the vindication of magic. Paracelsus repeatedly commented on this passage from the Gospel of St. Matthew. The model of the three kings gave him the opportunity to define a magus as someone who interprets the prophets and performs miracles in front of the people, and foretells events by the help of spirits or the stars. Only a prophet (in later years Paracelsus would prefer to speak of a “divine magician”) can accomplish more: he speaks and acts by direct divine assistance and inspiration, as seen in the case of → Moses, who opposed the Egyptian sorcerers. Paracelsus thought that the three magi were also proficient in medicine, commenting that their gifts were of direct medicinal use. Frankincense helped to protect mother and child from “flying ghosts”, and myrrh, by way of the mother’s milk, freed the baby from threatening worms. This kind of interrelation of medicine, philosophy, astronomy and magic was quite commonplace in the Middle Ages, as can be seen in → Peter of Abano. In his later years, Paracelsus interpreted magic as the art of drawing down the powers of the stars, which he considered proxies of celestial ideas, and to make them work for man. Unsurprisingly, he used the term “astronomy” as a synonym for, or even saw it as superior to magic.

At the turn of the 16th century, the learned discussion of natural magic was in full flood, but Paracelsus remained relatively silent about his sources. Among the abbots mentioned in his *Grosse Wundartzney*, there was one ‘von Spanheim’, which may be identified with → Johannes Trithemius, the authority on demonology, witchcraft and cryptography. Paracelsus called → Marsilio Ficino the ‘best Italian physician’, and there is evidence that he

knew the German translation of Ficino’s *De Vita*. But in the authentic writings of Paracelsus there is no direct reference or even allusion to → Giovanni Pico della Mirandola, → Agrippa of Nettesheim, or any other representative of the Renaissance tradition of *magia naturalis*. However, Paracelsus was deeply indebted to his father who himself was a physician and who had instructed him in the “*philosophia adepta*”, by which Paracelsus may have meant Hermetic or Neoplatonic philosophy. In view of this paucity of direct references, the question of the sources of his magic arises, which is a matter of debate among specialists on Paracelsus. Will-Erich Peuckert, Walter Pagel and Kurt Goldammer were firmly convinced that Paracelsus had involved himself in the already-existing tradition of natural magic, to whose theories he gave further elaboration. Pagel even believed that Paracelsus was indebted to sources from antiquity, → Gnosticism in particular; as his main evidence he pointed to Paracelsus’s ideas on the eightfold nature of Adam. Charles Webster, in contrast, largely denied the Neoplatonic and Gnostic origins of Paracelsus’s magic, pointing instead to his extensive Biblical references. The truth of the matter may lie somewhere between these two extremes. Paracelsus’s dependence on biblical sources and his theological arguments have already been discussed above. On the other hand, in Paracelsus’s time knowledge was frequently passed on by oral teaching rather than the study of books, and Paracelsus, who had been to Italy himself, was certainly well informed about the prevailing philosophical trends and may have looked upon them as common knowledge. He was obviously influenced to some degree by Gnostic ideas, because Western alchemy, being the art that had motivated him most, went straight back to Hellenistic Egypt and was related to Gnosticism. Paracelsus was deeply convinced that all things – minerals, plants, animals and even man – had their invisible counterparts in the macrocosm, where they existed as “*astra*”, which represented their essence. This notion of something like eternal ideas lying behind all things, which is basic to Paracelsus’s theory of signatures, can certainly be called quintessentially (neo)platonian.

Another problem in studying the magical works of Paracelsus is that some of them are certainly spurious. Although they reflect a thorough familiarity with Paracelsian thought, they lack the originality characteristic of the genuine works. They often contain a wild mixture of magical concepts and ideas. These spurious magical writings, combined with spurious alchemical tracts, were accepted as

authentic by posterity for at least three centuries, thus giving rise to the false academic perception of Paracelsus as a gold-making alchemist and a heretical magician consorting with demons and the Devil.

In this context it is useful to itemise some spurious magical works. The tract *De occulta philosophia* touches on various magical subjects. Although rejecting ceremonial magic as un-Christian, it advocates the magical use of pentacles and characters. It contains a discussion of visions and dreams, and earthly ghosts referred to as gnomes. It reviews the power of the → imagination, which, when used with malicious intent, may even provoke pestilence or wars; and it treats of possession by spirits and the magical background of thunderstorms. *De pestilitate* contains a further disquisition on the imagination as causing diseases, and plague in particular. In this context it develops a complicated system of alchemical speculation, including the four elements and the three principles, and continues by discussing the meaning of Kabbalah [→ Jewish Influences], imagination, magic, the poison from the stars and the magnetic power of human “mumia” which may either cause or heal pestilence. The *Liber principiorum* deals with the magical and medicinal meaning of venomous animals such as snakes, worms, spiders, crayfish and suchlike. The book *Archidoxis magica* instructs in the use of magical seals, numbers and signs. The *Liber Azoth* contains a kabbalistic theory of the “linea vitae” (the line of life). Although spurious, all these tracts played a certain role in the reception of Paracelsian thought that began in the late 16th century and exercised a decisive influence on the spiritualistic and mystic currents of the early modern period (see → Paracelsianism).

In his genuine writings Paracelsus discussed magic from an early date on. In his *Volumen Paramirum* (c. 1520), alongside his theory of the cause of disease, Paracelsus also discussed the use of evil spells and enchanted images by “nigromancia” (black magic), which may evoke an illness in the victim. Already in his *Elf Traktat* (Eleven Tracts), written around the same time, he hinted that there were two theories in medicine, corresponding to his double body speculations: the “physica” for the visible world and the “magia” for the invisible realm. Only on the basis of the latter could one find the true cause and cure of an illness. In his early years Paracelsus did not elaborate this medical aspect of magic. In his famous *Paragranum* (1529/30) Paracelsus built his house of medicine not on magic but on the four pillars of natural philosophy, astronomy, alchemy and virtue.

From about 1530 onwards, however, Paracelsus evinced a growing interest in magical issues. He first hinted at a scientific view of natural magic in his important five books *Von den unsichtbaren Kranckheiten und deren Ursachen* (The Invisible Diseases and Their Causes, 1531/32). He not only pondered the impact of belief and imagination on the origin of disease and its cure, but also discussed the medical and magical effect of *mumia* and characters at some length. *Mumia* was a medicinal preparation derived from an embalmed human corpse (the Latin word is cognate with the mummy of ancient Egyptian funerary practice). Paracelsus believed that the quintessence of the invisible human body and its vital force clung to *mumia* even after death, and could thus be used for marvellous purposes. Paracelsus sought to explain the power of pilgrimage sanctuaries harbouring a sepulchre in terms of the *mumia* of the saint's corpse attracting the pilgrims.

Paracelsus did not regard characters as the spells of medieval magic. In his view, magical words and phrases embodied the very language of angels and spirits, who in turn had received their powers from God. This subjection to heavenly forces signified a strong vindication of magic to Paracelsus. The magician was allowed to perform his art as long as he was strictly adhering to the good. Consequently, characters were the only way to retrieve the heavenly powers. Like the physician administering herbs to heal a patient, the magician attained his goal with the aid of characters. Regarding theories of magic, this represents an important shift from the medieval idea of a demoniac influence to that of an impersonal and quasi-natural agent, and thus can be considered as an attempt to establish natural magic on a scientific basis. In the early 1530s Paracelsus produced a set of writings (if, indeed, they are genuine) called *Philosophia de divinis operibus et factis, et de secretis naturae* (Philosophy of Divine works and Actions, and of the Secrets of Nature), but also referred to as the first part of the *Philosophia Magna* (the second part being the set of *Vita Beata* writings mentioned above). Here Paracelsus offers what is in fact a lengthy collection of independent tracts on various aspects of popular magic, such as witches, demons and cases of possession, lunatics, sleep, prophets and fortune-tellers, elementals including fairies, gnomes and salamanders, apparitions, the imagination, characters, homunculi and monsters, invocation and necromancy.

In his *Erklerung der ganzen astronomie* (Explanation of All Astronomy, c. 1536) Paracelsus made a further attempt at elevating magic to the status of

a comprehensive philosophy of nature. Man and nature had to rely on the “astra” or stars referred to above as variation on the theme of celestial ideas. This led Paracelsus to define magic as the art of bringing the power of the heavens down into stones, herbs, words and characters. Magic also taught one how to transmute one thing into another, and demonstrated the significance of the stars, comets and other celestial bodies. Thus he used “astronomy” as a notion superior to magic, since the essence of things was hidden in the stars. The seven subdivisions of astronomy according to this tract were “astrologia” (the art of knowing the course and the properties of the stars), “magia”, “divinatio” (divination), “nigromantia” (the art of controlling astral bodies), “signatum” (the art of detecting man’s individual star), “artes incertae” (the arts of imagination), and “manualis” (the art of making magical instruments and talismans). Within the existing tradition of natural magic there were no models for such a subdivision, so we may assume that it was his own invention.

At the end of his life, Paracelsus attempted to summarize his teachings and describe its key points as clearly as possible. Thus in his *Labyrinthus medicorum errantium* (Labyrinth of Erring Physicians, 1537/38) he once again set forth the foundations of his medicine. As in the earlier *Paragranum*, he emphasized the importance of understanding nature, the firmament and alchemy, but this time he also philosophised about the process of attaining knowledge. He spoke about experience, science, and the role of magic. The medical art should not be grounded in mere speculation, but in a certain revelation; then it would be a “magica inventrix” that revealed to the physician all he needed to know. Thus Paracelsus advocated a scientific method that included intuition as a legitimate way of attaining knowledge.

The crowning of his philosophical endeavours, however, was his voluminous *Astronomia Magna* or *Philosophia Sagax* [Great Astronomy or Philosophy of the Wise, 1537/38], that has remained incomplete. Here he tried to outline a scientific system that should explain nature as well as the supernatural world, that combined his medical and his theological convictions, and that showed the way to knowledge and its application. In this sense, the immense philosophical edifice of the *Astronomia Magna* can be seen as standing at the turning point between the Middle Ages and the Early Modern Period, and comprises an early but so far only poorly appreciated contribution to the rise of scientific thinking. In the first chapters Paracelsus summarized his philosophy of the two worlds and

of the eternal limbus, which in fact constituted the very foundations of his belief and served him as tools to make magic and the biblical wonders plausible or even accessible to the true physician. Thus, for him, “astronomy” in the sense of magic was the cornerstone of medicine, and indeed the mother of all arts. But Paracelsus also stated that where astronomy ended, there religion should start. The conveyance of knowledge takes place by the two corresponding lights: the light of nature, being the light of the firmament, in the natural world, and the light of the Holy Ghost in the eternal, divine world. Paracelsus continued by proposing a sophisticated classification of astronomy that surpassed his former division in the *Erklerung*. The “mother astronomy” is split into four subdivisional “astronomies”: one that is called “naturalis” and reigns in the realm of nature; one that is called “supera” and springs from Christ; one that is called “olympi novi” and comes from faith; and finally one that is called “inferorum” and is used by the infernal spirits that dominate black magic. Each of these four astronomies is again divided into nine “membra” (members): “magia”, “nigromantia”, “necromantia”, “astrologia”, “signatum”, “artes incertae”, “medicina adepta”, “philosophia adepta”, and “mathematica adepta”. There are even more refined subdivisions, not enumerated here. In this complicated system of philosophy, magic played only a restricted role. According to the definition given in the *Astronomia Magna*, magic was the means to induce the heavenly powers to come down to man, who served as a “centrum” or “medium” to receive and control them. As the physician was able to extract medicinal virtues from herbs and plants, the magician could likewise summon the astral powers, and he could do even more: he could transform them and lead them to a higher state, thus becoming a master alchemist who perfects creation. If man taps into the infernal realm, he is a sorcerer; if he depends on nature and interprets the light of the firmament, he is a magus or wise man; and if he relies solely on the Holy Ghost and heaven, then he is a divine magus or prophet, capable of performing the same wonders as Christ. Thus at the end of his life, Paracelsus succeeded in uniting his conflicting doctrines derived from “pagan” and Christian sources into one great synthesis.

Paracelsus’s teachings exerted a powerful influence on posterity. In chemistry, the notion of the *Tria prima* became predominant for two centuries. The attempt to interpret bodily functions in terms of chemical processes stimulated the development of iatrochemistry with → Joan Baptista

van Helmont and Franciscus de le Boë Sylvius as important representatives of the 17th century. In pharmacology, after years of ardent debate, the Paracelsian way of preparing chemical remedies by extracting the active medicinal principle finally grew to general acceptance. No less important was Paracelsus's sway over various currents in Western esotericism and religious movements, and here only a few can be mentioned. It has been shown that the *Vier Bücher vom wahren Christentum* (Four Books on True Christendom), written by the eminent Pietist precursor Johann Arndt (1555-1621) and a source of religious edification until the 19th century, is full of allusions to Paracelsus. There are also interconnections between Paracelsus and the theosophic writer → Valentin Weigel (1533-1588), and the same is definitely and extensively the case in the works of the mystic → Jacob Boehme (1575-1624). In turn, the Christian theosophy of → Johann Georg Gichtel (1638-1710) was deeply influenced by Boehme. Needless to say, Paracelsian philosophy plays an important role in the esoteric literature of the 18th century, including alchemical, Rosicrucian [→ Rosicrucianism] and partly Masonic [→ Freemasonry] sources.

URS LEO GANTENBEIN (SECTIONS 4-5)

Pasqually, Martines de, * 1709/1709 or 1726/1727 Grenoble, † 20/21.9.1774 Port-au-Prince

It has been well said of Martines de Pasqually that he was a "living enigma". The mystery begins with his surname. Gérard van Rijnberk, in his work on Pasqually, takes two pages (I, 14-15) to list the variations of his name, whose diversity far exceeds the loose orthography of the time (it was only at the French Revolution that the registration of names was normalized and fixed). However, from comparison of official documents (registry and military certificates) it seems very likely that his full name (with many orthographic variations) was *Jacques de Lyoron* (or de Livron) *Joachin Latour* (or de Latour) *de la Case Martines de Pasqually* (or else: *Jacques de Lyoron Latour de la Case Joachin Martines de Pasqually*). This name appears to consist of two successive surnames, each preceded by a Christian name (Jacques, Joachin). Van Rijnberk suggested that Martines de Pasqually was a "hieronym": a sacred name attached to the function of

"initiativ chief" with which Pasqually had been endowed, following his father. But this ingenious hypothesis has been eliminated by the military certificates discovered and published by Christian Marcenne in the *Bulletin de la Société Martines de Pasqually* (no. 6, 1996; a society based in Bordeaux). From these, it appears that an uncle, designated as "doum [sic] Pasqually", commanded in 1737 a company of the regiment of Edinburgh Dragoons in the service of Philip V of Spain. As for Pasqually himself, the Spanish title of nobility "Don" (or "Dom") almost always precedes the second part of his name (Martines de Pasqually), and before the first part of his name (Latour de la Case) it is often duplicated by the French title, also indicating nobility, of "Messire" or "Sire". There is no doubt about Pasqually's noble status, attested by many official documents, nor of his title, which was that of *écuyer* (esquire). He almost always signed himself "Don Martines de Pasqually".

The next enigma is his date of birth. The Société Martines de Pasqually, in its Bulletin no. 9 (1999), compared two chronologies deduced from existing documents that are totally incompatible with each other. One, calculated from the death certificate among other documents, has Pasqually born in 1726 or 1727. But it appears to be invalidated by the military certificates mentioned above, which show that Pasqually had a military career in the service of the King of Spain for at least ten years, from 1737, when he was a lieutenant, to 1747 – which cannot have started when he was ten years old. On the other hand, these certificates accord with the masonic letters patent that Pasqually produced as having been issued to his father in 1738, which mention him (the son) as being twenty-nine at the time. This would indicate a birth date of 1708 or 1709. The probabilities thus support an early chronology, which Van Rijnberk already favored (II, 9-10).

Pasqually's place of birth was almost certainly Grenoble; all the official documents agree on this point. His family certainly originated in Spain. In fact, the letters patent of 1738 which he produced in 1762 indicate that his father was born in Alicante in 1671. This Spanish origin, on which all specialists agree, is reinforced by the certificates relating to his military career in the service of the Spanish crown. Several contemporaries close to him bear witness to the fact that his native language was not French (the purely phonetic orthography of his letters also points to this, though that in itself is not a proof).

His origin was not only Spanish, but Jewish. This was already apparent to many of his

contemporaries. The denials on this point in a very late letter (1821) of → Jean-Baptiste Willermoz are not enough to cast doubt on Pasqually's Jewish origins. Besides, on closer reading Willermoz's denials apply to religion, much more than to race. In fact, Martines not only declared himself a Roman Catholic, producing in support a certificate of catholicity, but he also required postulants for entry to the → *Ordre des Elus Coëns* to belong to this confession. This is the very reason why several members of the Reformed Church (e.g. Du Roy d'Hauterive) had to abjure their membership of the latter. Robert Amadou, after studying the question for some fifty years, concluded (cf. Introduction to his 1995 edition of the *Traité sur la Réintégration*) that 'his paternal family was . . . of Spanish Jewish Marrano origin, or, more precisely, semi-Marrano'. The term "semi-Marrano" is used because the authentic Marranos only pretended to be converted to Christianity, to deceive their countrymen, whereas Christianity is inherent in Martines' doctrine, and he always professed it himself. This Christianity, as it appears in his works, is peculiar but nonetheless authentic. According to Amadou, who thoroughly analyzed it (in the Introduction cited above, and in the Preface to his 1999 edition of the *Leçons de Lyon*), Pasqually belonged to a very particular and very archaic category of Christianity, which one would have thought extinct for over a thousand years: "Judeo-Christianity". This would seem to confirm his own constant contention that the knowledge he possessed had been transmitted to him by succession. Willermoz, echoing this, states that 'in his ministry, he had succeeded his father'. The possibility of an "esoteric transmission" inside or outside the family had already been aired by → René Guénon, whom the "enigma of Martines de Pasqually" provoked to the point of writing at least four articles, some of them long ones, between 1914 and 1936.

Be that as it may, nothing is known about Pasqually's youth except his recently discovered military career. We do not even know his biography before his entry onto the masonic stage – and the historical stage – during the decade 1750-1760. The first chapter founded by him seems to have been the *Chapitre des Juges Ecosais* in Montpellier, 1754. He then travelled through France, mainly in the south but also in Paris and Lyons. At Toulouse, where in 1760 he explained before the "united lodges of Saint John" what seems from the minutes to have already been a sketch of his system, he failed to convince the brethren. He had more success in Guyenne, which is important for what follows.

Starting on April 28, 1762, Pasqually settled in Bordeaux, where he resided (except for a few months in Paris in 1766-1767) until his departure for San Domingo on May 5, 1772. He won over the lodge *La Française*, within which he set up a "Temple particulier" (private temple): a lodge which, after wranglings with the other Bordeaux lodges, especially *L'Anglaise*, flew its true colors by taking in 1764 the title of *La Française Elue Ecosaise*. It was especially the regiment of *Foix-Infanterie*, which, after a five year tour of duty in San Domingo, returned to take up quarters in Bordeaux in July 1765, that became a privileged field of activity for Pasqually. He founded there a "Temple coen" called "des Elus Ecosais", under the aegis of the military lodge *Josué* which was probably created for this purpose. Among other masons, he initiated two officers, P.A. de Grainville and G.A. de Champoléon, who would later become his official collaborators and his voluntary secretaries. It was through them that → Louis-Claude de Saint-Martin, assigned to the *Foix-Infanterie* in the very month of its return to France, became acquainted with Pasqually – a decisive encounter for both men – and was speedily admitted to the Order.

As the Grand Lodge of France became caught up in the quarrels between *L'Anglaise* and *La Française*, Pasqually addressed to it a copy of the translation of the "constitution and patent", written 'in the English idiom', as he said, granted to his father on May 20, 1738, and transmissible to himself by 'Charles Stuard [sic], King of Scotland, Ireland, and England, Grand Master of all the Lodges on the surface of the earth'. This patent makes mention of 'Don Martinez Pasqualis, Esquire, aged 67 years, native of the town of Alicante in Spain', and of 'Joachim Dom Martinez Pasqualis, his elder son, aged 28 years, native of the town of Grenoble in France'. This document is generally considered as apocryphal, though Robert Amadou suspends judgment on this point. In any case, no decisive argument has been produced either to confirm or to disprove its authenticity. The question of the Stuarts' relations with → Freemasonry, whether overt or veiled (a question also relevant to the charter granted to Baron Karl von Hund, founder of the system known as "Strict Observance") is currently under research in the North of England and in Scotland. Finally, the Grand Lodge of France took a step of general import: in August 1766 it decreed the abolition of the high degrees. It rescinded this order in October, but not before it had excluded Pasqually from the lodges under its control, calling him a "sectarian". However, being itself prey to

persistent troubles that sometimes involved acts of violence, the Grand Lodge was dissolved by royal edict on February 21, 1767.

Henceforth, Pasqually had a clear field to set up his own system, the Ordre des Chevaliers Maçons Elus Coens de l'Univers (originally called Ordre des Elus Coens de Josué). During a several months' stay in Paris (end of 1766 to beginning of 1767), he admitted many masons, including Willermoz – an encounter that would be as important as that with Saint-Martin, though of a very different kind – and also Bacon de la Chevalerie. The latter was a mason of great skill, whom in the following year Pasqually made his “universal Substitute”, at the same time (spring equinox, 1767) as he founded the Sovereign Tribunal and promulgated the statutes of the Order.

Returning to Bordeaux, Pasqually married in September 1767 the niece and sister of two officers of the regiment of Foix Infanterie. She bore him a son in June 1768, whom he counted on as a successor (using this term in a letter to Willermoz) at the head of the Order, and wrote to Willermoz that he had admitted him as Grand Master Coën right after his baptism. The Abbé Pierre Fournié (see below) was his tutor for a time. But thanks to the turbulences of the revolutionary period, this son ended as a simple police superintendent under the name of De La Tour (or Latour) de la Case (“Pasqually” having disappeared). Serge Caillet (in the journal *L'Esprit des choses* 7, 1994), and the Société Martines de Pasqually (*Bulletin* 8, 1998) have traced the drab career of this son from 1814 to 1830. Another son, born in 1771, died in 1773. In 1768 Saint-Martin, then aged twenty-five, was introduced to Pasqually by Grainville and Champoléon, while in the same year Willermoz was ordained Réau-Croix by Bacon de la Chevalerie in Paris. Willermoz was re-ordained “sympathetically”, meaning at a distance, by Pasqually himself in 1770.

From 1767 to 1772, Martines organized his Order, furnishing it with instructions, rituals, and various recommendations. He started writing the *Traité* with the enthusiastic but disordered assistance of the Abbé Pierre Fournié as secretary, then, from 1771, with the much more methodical and effective help of Saint-Martin (whom he ordained Réau-Croix in 1772). His faithful disciples Grainville and Champoléon acted as occasional collaborators. Despite this, things were far from being finished when Pasqually embarked on May 5, 1772 for San Domingo, in order to sort out matters of inheritance (the Société Martines de Pasqually has passably explained the latter; see *Bulletin* 6, 7, and

8, 1996-1998. Incidentally, this society has published a calendar, year by year, of all the events relating to Martines' life).

From 1772 until September 20 (or more likely 21), 1774, the date of his death in Port-au-Prince, Pasqually was actively engaged with his Order: much more so than has been claimed, indeed almost “feverishly” according to Van Rijnberk. He sent out rituals, instructions, messages of all kinds. As his successor as Grand Souverain de l'Ordre, since his son was not yet old enough, he had named his cousin by marriage Caignet de Lester. But the latter died in his turn on December 11, 1778, and was replaced by Sebastian de Las Casas, who is supposed also to have been a relative of Pasqually's. Meanwhile the Order disintegrated, and in 1781 Las Casas set all the members at liberty. But the history of the Elus Coëns was far from over.

At the height of its prosperity, the Ordre des Chevaliers Maçons Elus Coëns de l'Univers had counted scarcely a dozen temples, enrolling about 100 members. Most of the temples fell into decline, and the members changed their allegiance. However, at least two temples remained active until the revolutionary epoch. The Toulouse temple, as revealed by the Du Bourg papers, continued working under the direction of Du Roy d'Hauterive; that of Lyons, under Willermoz. It was in Lyons, from 1774 to 1776, that occurred those “rehearsals” of Martinesian doctrine already noted by Vulliaud and Guénon, first published by Antoine Faivre in 1975 under the title *Conférences des Elus Cohens de Lyon*, and in a more complete edition by Robert Amadou in 1999 under the title *Les Leçons de Lyon aux Elus Coëns*.

This document is of capital importance, and an indispensable complement to the unfinished exposition which is the *Traité sur la réintégration des êtres dans leur première propriété, vertu et puissance spirituelle divine* (Treatise on the reintegration of beings in their first property, virtue, and divine spiritual power; edited by Robert Amadou in 1995 from a manuscript of Saint-Martin), or *Traité de la réintégration des êtres créés dans leurs primitives propriétés, vertus et puissances spirituelles divines* (Treatise on the reintegration of created beings in their primitive properties, virtues, and divine spiritual powers; ed. R. Amadou in 1974 from two other texts). To these should be added the numerous rituals and instructions made available by the discovery of Fonds Z (derived from Saint-Martin) and the correspondence of Pasqually published by → Papyrus, by Van Rijnberk, and in the journal *Renaissance Traditionnelle*. Among the

notable interpreters of Pasqually's thought are Saint-Martin, who developed it in his works *Des erreurs et de la vérité* (On errors and truth, 1775) and the *Tableau naturel des rapports qui existent entre Dieu, l'homme et l'univers* (Natural table of the relationships existing between God, man, and the universe, 1782); and Willermoz, who expounded it in the *Instruction secrète au Profès* (Secret instruction to the Profès) and especially in the *Instruction secrète aux Grands Profès* (Secret instruction to the Grands Profès), both written shortly before 1778. There is also the work of Abbé Pierre Fournié, *Ce que nous avons été, ce que nous sommes, ce que nous deviendrons* (What we have been, what we are, what we shall become; 1801): a confused and diffuse work but not lacking in original inspiration.

If one combines the last title with that of the *Traité sur la réintégration*, one has a first glimpse, partial but faithful, of Pasqually's doctrine. "Doctrine" is the right term, because he taught "with authority", like a master, not like a thinker expounding a theory of his own invention. Pasqually presented himself as the heir and the transmitter of a long tradition, of supra-human origin: he declared in a letter to Willermoz: 'The science that I profess is certain and true, because it does not come from man'. Pasqually was confident of having been taught or inspired from above; in one place in the *Traité* he writes: 'I will explain it to you as clearly as the truth of wisdom has dictated it to me'. It is clear that for him, the wisdom in question was not human or mundane.

The doctrine taught by Pasqually is thus a science, a "science of man" as → Joseph de Maistre would later write (he who never reneged on his original Martinesism, on this point as on many others). It is a science of man in his 'relationships with God and with the universe', as Saint-Martin expounds it in his *Tableau naturel*. Taking as its point of departure man and the world in their current state, this science goes back to their origins and anticipates their final ends. It begins by speaking of the primitive state of immediate proximity, even of unity, with God of man created in God's image. It goes on to the present state of "privation", of rupture and separation from God. It anticipates a state of reconciliation with God, followed by "reintegration", a return to God. For Pasqually, sacred anthropology and cosmology are thus inseparable, each explaining the other. They are tributaries of a certain "science of God" which is not theology properly speaking, but rather theosophy, because what the theosopher grasps of God, or what grasps him, is Divine Wisdom.

This science is a Judaeo-Christian gnosis, or rather one that is both Jewish and Christian: a gnosis not descriptive, but active. It does not merely obtain knowledge of the reasons for the original fall of man, of his "prevarication", but urges and helps him to repair the consequences of this fall. To this end it obtains the "motor" or instrument of a reconciliation of man with God, then of his 'reintegration in his primitive properties, virtues, and divine spiritual powers'. For Pasqually, the *Ordre des Chevaliers Elus Coëns de l'Univers* was supposed to provide this "motor" or instrument.

If this Order seems to resemble other high-degree masonic systems or regimes flourishing at the time, Pasqually thought, on the contrary, that those belonged to the "apocrypha", to the "profane". For him, his system was the only authentic one. Thus he wrote, in his rather peculiar style: 'I am only a feeble instrument which God wishes to use, unworthy as I am, to recall men, my fellows, to their first masonic state, which is to say spiritually man or soul, so as to make them see truly that they are really man-God, being created in the image and semblance of this all-powerful Being' (letter to Willermoz, August 13, 1768).

The Order created by Pasqually consisted of a sequence of ten degrees, if one includes the three "blue" degrees of Apprentice, Companion, and Master, outwardly similar to those of regular → Freemasonry which he called "profane" (an understandable epithet in this context, since the term etymologically refers to that which is "outside the Temple"). But the similarity is limited to the names of these three degrees. As for the actual Coën degrees, they are seven in number, distributed in four classes (these numbers are important, for the Martinesian doctrine is accompanied by a precise and complex numerology). Though their names vary with the sources and epochs, their divisions remained unchanged: (A) Maître Grand Elu (or Maître Parfait Elu), transitional degree (somewhat like the Maître Ecosais de Saint-André in the Régime Ecosais Rectifié). (B) Classe du Porche, comprising the degrees of Apprenti Coën, Compagnon Coën, and Maître Coën (or Maître particulier). (C) Classe du Temple, with the degrees of Grand Maître Coën (or Grand Architecte), Chevalier d'Orient (or Grand Elu de Zorobabel), Commandeur d'Orient (or Apprenti Réau-Croix). (D) The degree of Réau-Croix, which constitutes a class of its own. Pasqually conceived of these seven degrees as referring to the seven gifts of the Spirit, and as leading progressively and pedagogically to the ever more advanced and integral practice of a ceremonial cult. This cult was a theurgy, in that it

involved and activated the divine energies. It was also a liturgy, the “common work” of masons (a word synonymous, for Pasqually, to “men”) who are involved in it and of “spiritual and intelligent beings” (namely angels) who cooperate in it. The first man, priest-king of the universe, was originally consecrated to this “primitive cult”. Pasqually thus proposed to his disciples that they should apply themselves to it again, following new methods appropriate to the new state of man, who carries the stigmata of his original fall; and this so as to “operate” his personal reconciliation and the universal reconciliation (that of all creation): the “reintegration”. These views are not dissimilar to those that some Fathers of the Church called “transfiguration” and “deification”. Meanwhile, the cosmic liturgy proposed by Pasqually does not intend rivalry with the church liturgy, nor to substitute for the latter (Pasqually required his disciples to assiduously follow the services of the Roman Catholic Church, as well as the daily practice of a ritual of prayers modelled, with due adaptation, on the monastic “hours”).

This is why the *Ordre des Elus Coëns*, which is (to quote the recent title of an article by Serge Caillet in *Renaissance Traditionnelle*) ‘a school of virtue and prayer’, finally appears as a sort of religious order. Its theurgical ceremony was not magical, in the often negative sense of the word. It was not aimed at acquiring natural or supernatural powers. The famous “passes” or “luminous glyphs” (that is, the tangible manifestation of a “presence” in the chamber of theurgical operation) were not, as is sometimes thought, the actual goal of the operations. Pasqually saw in these passes nothing more than symptoms or signs indicating to the theurgist that his reconciliation was in progress. Theurgy, he wrote, is ‘a ceremony and a rule of life to enable the invocation of the Eternal in holiness’. This rule of life, an indispensable condition, demanded a rigorous hygiene of body, soul, and spirit that is almost ascetic. The ceremonial was precise, exacting, and religious: it was destined to ensure the communication with good spirits and to prevent communication with the “perverse spirits” (i.e., demoniac). The “pass” was thus the manifestation of what Pasqually called *la Chose* (the Thing), by which he meant Wisdom personified, the divine Sophia. According to the discriminating analysis by Robert Amadou (in a radio broadcast of March 4, 2000 devoted to the *Elus Coëns*), ‘the Thing is not the person of Jesus Christ . . . , the Thing is not Jesus Christ; it is the presence of Jesus Christ’, just as the *Shekinah* was the presence of God in Solomon’s Temple. In the Martinesian cult,

the Thing was not summoned, for it could not be; it manifested, it caused an epiphany, to express its satisfaction and benevolence. That having been said, the cult itself did not have as its goal the manifestation of the Thing; it was only the occasion for it. This cult had another object, which is sacrificial: it was a matter of “operating”, or at least of advancing, the reconciliation of man and that of the universe. As Willermoz summed it up, it was a cult of expiation, of purification, of reconciliation, and of sanctification.

The time seems to have passed when Martines was decried as a charlatan and an impostor, or else as merely a fantasist full of muddled and bizarre ideas. One is entitled to re-read today, with new eyes, the concordant witness of two of his disciples: ‘This extraordinary man, of whom I have never known the like’ (Willermoz); ‘This extraordinary man is the only living man I have known whom I have not fathomed’ (Saint-Martin).

JEAN-FRANÇOIS VAR

Patrizi, Francesco (Frane Petric’),

* 25.04.1529 Cherso d’Istria,

† 6.02.1597 Rome

An original case of a (partly self-taught) scholar, with an unconventional career and adventurous existence, Patrizi was born in the borderland between the Venetian Republic and what would nowadays be Croatia. During the first half of the 1550s, he studied at Ingolstadt and Padua and probably became acquainted there with both the peripatetic and neoplatonic philosophical traditions, including the writings of → Ficino. The end of the same decade he spent in Venice, trying to make a name for himself as a poet and, like so many other *letterati* of his time, establish his status as an accomplished text editor and a kind of “publishing consultant”, possibly in view (or in *lieu?*) of a still elusive academic tenure. It certainly does come as a surprise to find him residing mostly in Cyprus during the years 1562-1568, in the quite different role of a steward of agrarian estates and a civil administrator for the Contarini and Mocenigo families. His return to Venice, just before the outset of the 1570s, was followed by several sojourns in Spain, where he served as philosophical advisor (to the Viceroy of Catalogna), counselor (more or less self-appointed, it seems) and agent for greek manuscripts to King Philipp II. He does not appear to have been very successful in any of these activities; but back in Italy again, circumstances became more favorable and eventually enabled him to finally secure some considerably more congenial positions. This turn for the better took place from 1576 onwards, first in Modena (in the service of a learned noblewoman), then (1578) at the Court of Alfonso II, last Duke of Ferrara, where Patrizi was created (at his own request) professor of platonic philosophy at the local University. Better still, on becoming Pope Clement VIII, his friend Cardinal I. Aldobrandini called him to the University of Rome (La Sapienza), again to teach pla-

tonic philosophy (1592). Patrizi died there a few years later, in the process of revising his *Nova de universis philosophia* (Ferrara, 1591, 21593[4]) in order to try and win the approval of the Congregation of the Index, which had first asked for emendations and subsequently condemned the book.

It would be hard, even among Renaissance writers, to discover an author whose life and work were more intricate, and who published on a wider range of subjects – including, in Patrizi’s case, some on which he does not seem to have received formal training. As a poet and “man of letters”, Patrizi took part in the literary controversies of his time, like the dispute opposing Ariosto to T. Tasso (he sided with the former), as well as in the activities of learned circles like the “Accademia Veneziana della Fama”, well-known for its “encyclopedic” and innovative interests, much akin to his own. The obvious links between memory [→ Mnemonics] and rhetorics, history and the political and spiritual powers of language (themes dear to 16th century Humanists), he dealt with in his dialogues *Della Historia* (Venice, 1560) and *Della Retorica* (*ibid.* 1562; a *Della Poetica* was partially published later in 1586), in an attempt to substitute Aristotle’s views with a new philosophy of discourse and of history (preceding J. Bodin in this last respect). His criticism of Aristotle he developed in his famous *Discussiones peripateticæ* (1st part Venice, 1571; complete ed. Basel, 1581), and in the *Nova de universis philosophia*, although this last work does retain several peripatetic conceptions (as regards mathematics, for instance). The contents of two late scientific treatises (*Della nuova geometria* and *De rerum natura*, 1587; there is even another writing on ancient roman strategy, of machiavelian inspiration) were subsequently more or less incorporated into the relevant parts of his *Nova de universis philosophia*. This *magnum opus* consists in an imposing fourfold *exposé* of metaphysics and natural philosophy, structured according to the themes of light (both immaterial and corporeal); the universal scale of being (from the plotinian One downwards) and its links with the Trinity and the divine attributes in Christian garb; the world-soul (and the status of individual human souls); and the physical world (resting in turn on the four basic principles of space, light, heat and humidity).

Patrizi’s interest in number [→ Number Symbolism] and geometry applied to cosmology (principally in view of the distinction between “pure”, mathematical space and physical bodies), and in light metaphysics, clearly reflect (as pointed out long ago by P.O. Kristeller) the strong neopla-

tonic and ficinian inclinations which eventually made him famous. His latin translations of Proclus' *Theological and Physical Elements* (1583), of the *Corpus Hermeticum* and the *Chaldaean Oracles* (1593), of the spurious *Theology of Aristotle* (1591), and his compilation of an arithmological (and hitherto unpublished) *De numerorum mysteriis* (1594) obviously reflect the same perspective, which incited him repeatedly to declare Aristotle's philosophy contradictory and inferior to Plato's, and furthermore incompatible with Church doctrines. In doing so, Patrizi not only intended to distance himself from the kind of "concordism" dear to Pico and others, but aimed at nothing less than uprooting the scholastic traditions of learning, which were currently being given new prominence by the Counter-Reformation. His bold request to the Pope, to make the study of his *Nova de universis philosophia* compulsory in the Faculties of theology of Christendom, is a clear indication of his high hopes to change the course of catholic cultural politics, and have his own brand of rational synthesis between Plato, the *prisci theologi* (mainly → Hermes Trismegistus) and Christian doctrines promoted to official status.

For Patrizi is essentially not concerned with the more practical esoteric aspects of late → neoplatonism and hermetic philosophy [→ Hermetic Literature], like theurgy or → astrology, although he does acknowledge their existence; his real pursuit is to establish proof of some of the more theoretical issues of the Christian faith by means of hermetic-platonic arguments. Thus applied, the *pia philosophia* seems to lend a sound rational basis for the development of a new Christian metaphysics, apt moreover to be successfully preached to all non-Catholics, on account of its logical effectiveness. One can hardly avoid having the impression that, in Patrizi's estimate (and quite contrary to Ficino's), the core of truth which was eventually to receive the shape of Christian doctrine had in fact been much more satisfactorily expressed by the ancient sages (→ Zoroaster, Orpheus, Hermes, Pythagoras), whose words and wisdom operated "divine" miracles. This *catena sapientum* having been almost interrupted by the Flood, and later polluted by Aristotle's deviation, it falls to Patrizi's "new philosophy" to retrieve the true signification and spiritual efficacy of Christian dogmas, by restoring their concord with the universal and primordial *religio* (but how the rational side squares with the miracle-working one, is not explained). Such a didactic and theological purpose was bound to be greeted with suspicion and ill-favour by contemporary catholic authorities, notwithstanding the

author's many influential relations within and outside the Church.

JEAN-PIERRE BRACH

Péladan, Joseph-Aimé (Joséphin),
28.3.1858 Lyon (Rhône), † 27.6.1918
Neuilly-sur-Seine

Descending from a Protestant family of the Cévennes that had converted to Catholicism, Joséphin grew up in Lyons in the zealous atmosphere of recent converts. His father, Louis-Adrien (1815-1890) was a publicist in the legitimist newspapers, specializing in the interpretation of prophecies that linked the return of the king, the *Grand Monarque*, to the secret of the end of time. His writing of a rejoinder to Renan’s (1823-1893) *Life of Jesus* earned him a papal decoration and the right to the title of *Chevalier*. Péladan Sr. passed on this vision of an exalted, exotic Catholicism to his two sons. Adrien (1844-1885), the elder, was a polygraph interested in Chinese philology, botany, and homeopathic medicine. According to Joséphin, who admired him enormously, Adrien was the last holder of the initiation of the Rose-Croix of Toulouse, and it was he who interested his younger brother in occultism [→ occult/occultism] and Hermetism [→ Hermetic Literature]. In 1870 the family moved to Nîmes, where Joséphin discovered art and literature, which induced him, as it did most of the occultists of his time, to try his luck in the Parisian literary world in 1881.

Péladan became known through the publication of articles on Renaissance and classical painting, and through the connections of his mistress, Henriette Maillat (1849-?), a veritable Egeria of the literary types who gravitated around Léon Bloy (1846-1917) and → Huysmans. Péladan’s *Le Vice suprême* (The supreme vice, 1884) was published with a preface by Barbey d’Aureville (1808-1889), and, being the first occultist novel, brought him notoriety. He attempted to pursue a double career as littérateur and spiritual master in the Parisian occultist world by combining a series of “classic” novels – *A coeur perdu* (Lost heart, 1887), *La Gynandre* (The man-woman, 1891), *Pérégrine et pérégrin* (1904) in the series “La décadence latine” (Latin decadence) – with a series on occult themes. He called the latter “L’Amphithéâtre des sciences mortes” (The theater of dead sciences), including *Comme on devient mage* (How to become a magician, 1892) and *L’Occulte catholique* (The Catholic occult, 1898). It was in the field of art that Péladan was most successful in joining action with the intellectual life, by organizing the Salons de la Rose-Croix, extravagant shows appealing to high society which began in 1892 and featured most of the symbolist painters of the time: Felicien Rops (1833-1898), Alexandre Séon (1855-1917), Armand Point (1860-1932), Fernand Khnopff (1858-1929), Odilon Redon (1840-1916), Jean Delville (1867-1953), Emile-Antoine Bourdelle (1861-1929), Felix Vallotton (1865-1925), Charles Filiger (1863-1928), and the composer Erik Satie (1866-1925). Only Gustave Moreau (1826-1898) remained aloof. Péladan inaugurated this “aesthetic exploit” in the extravagant costume of Grand Master of the Ordre de la Rose Croix du Temple, and adorned with the Babylonian royal title of “Sâr”. A quarrel with his financial backer, Antoine de La Rochefoucauld, whom he had made a high dignitary of the order, put an end to this enterprise, precipitated by another break: that of Péladan with the Ordre Kabbalistique de la Rose-Croix which he had created along with → Stanislas de Guaita. Fidelity to the Church, of which Péladan claimed to be an obedient son, had motivated this attitude, but it did not prevent him from claiming to exercise a spiritual authority even over the clergy, based on the distinction between what belonged to occult science, the domain of the magus, and what belonged to religion in the strict sense. → Magic, according to the Sâr, combined the concepts of → Eliphas Lévi with the eschatological prophecy developed by Péladan Sr. Joséphin Péladan’s contribution to the field of esoteric thought was slight, but he had decided literary

gifts, and his works were a publishing success up to World War I, though unfortunately marred by his provocations and extravagances that made him an easy prey to columnists and caricaturists. He died during the war from food-poisoning, at the moment when, returning to the interpretation of prophecies, he was proclaiming his country's victory.

JEAN-PIERRE LAURANT

Perates

The Perates are a gnostic group whose name is first mentioned by → Clement of Alexandria (*Stromateis*, VII, 108, 2). Hippolytus identifies two otherwise unknown persons as their founders (*Refutatio*, V, 13, 9): Akembes (IV, 2, 1; Kelbes: V, 13, 9; Ademes: X, 10, 1), who is called ho Karystios (Karystos is a town in Euboia), and Euphrates, who is called ho Peratikos (also mentioned by Origen, *Contra Celsum* VI, 28 as a teacher of the → Ophites). Clement opines that the name Perates is derived from their place of origin. Different suggestions have been discussed: Euboia, the Euphrates region, the Asiatic coast of the Hellespont (cf. le Boulluec, 433, note 221). Hippolytus seems to quote the Perates with an allegorical explanation of their self designation: it defines them as those who claim to move beyond (*perasai*) the realm of corruption (V, 16, 1. 5. 6).

Hippolytus maintains that the Perates derive their wisdom from the astrologers (V, 13); his description of their doctrine in *Refutatio* V (Theodoret, *Historia Ecclesiastica* I, 17 is a mere rehearsal) has a peculiar structure. First, he introduces a system which focuses on the tripartite structure of the kosmos. There is one origin (*archê*), which is like a great source and which

admits of infinite divisions. The first division is the "trias"; and the first, unbegotten part of this trias is called the perfect good, the "fatherly greatness" (*megethos patrikon*). The second, "self begotten", part is an infinite multitude of powers, while the third, "begotten" part is called special (*idikon*). This trias with its second self-generating principle seems to cite a metaphysical scheme which also occurs in other Gnostic and Neoplatonic texts (cf. *Pistis Sophia* 2,2f./24,38f. [ed. Schmidt-Till]; Porphyrius, fr. 223F [ed. A. Smith]). Each compartment of this tripartite kosmos has its own gods, minds, men etc. In the days of Herodes, Jesus Christ, who is of three natures, three powers and three bodies, has descended into this world from the first unbegotten part of the kosmos. Through his descent he wishes to save and restore everything, i.e. all the seeds (*spermata*) that have been brought down from the first two parts of the kosmos into the lowest and third part. This third part of the kosmos, they say, will perish, whereas the other two parts are not subject to corruption (V, 12). In V, 14, Hippolytus seems to quote verbatim from a book called the *Proasteioi up to aether*. It is difficult to make any sense of either the extended quotation or the title; it seems to deal with heavenly powers, winds and stars that influence the life below. In V, 16-17, Hippolytus provides additional information about the Peratian doctrine: it amounts to a sustained scripture-based meditation on this world of corruption and on the possibility of escape from it. Kronos is the power that rules over generation and destruction. The exodus story is allegorized: Egypt is the body, the Red Sea is a symbol of destruction (Kronos), the desert is a realm beyond generation, the dwelling place of both the gods of destruction and the god of salvation (V, 16, 5). The serpent (Num. 21:8) which is subsequently identified with the wise word of Eve (Gen. 3:1ff.), the mystery of Eden, the river flowing out of Eden and the sign of Cain, is a symbol of salvation. A radical reinterpretation of salvation history is proposed: Cain is the hero whose offering the god of this world rejected in favour of Abel's bloody sacrifice. He is the one who appeared as a man in the days of Herod and was born in the image of Joseph and Esau (V, 16, 9ff.; cf. the → "Cainites" in Irenaeus, *Adversus Haereses*, I, 31, 1-2). Jakob received the blessing of the blind one, but later on he saw the face of Esau 'as if a man sees the face of God' (Gen. 33:10). In V, 17, Hippolytus attempts a final sketch, according to which the Peratian doctrine teaches three principles: Father, Son and Matter. The Son (who is identified as the serpent, the salvific principle) is

placed in the midst between Father and matter. He takes the ideas/powers/types from the Father and transmits them to matter. This Platonist model of demiurgical creation is put into a soteriological perspective: those who wake up and realize that they are from above, a type from the father, the perfect copy, the consubstantial race, will return to the father and thus be saved.

It is difficult to assess the authenticity of Hippolytus' doxography: his section on the "Perates" has parallels in other sections dealing with other gnostic groups. Some scholars, notably Salmon and Stähelin, came to the conclusion that Hippolytus derives his information about the Perates and other gnostic groups from a collection of forged documents. If this judgement is probably too pessimistic, Hippolytus' sources still await a thorough and comprehensive exploration.

WINRICH A. LÖHR

Perennialism → Tradition

Perennial Philosophy → Tradition

Pernety, Dom Antoine-Joseph,

* 13.2.1716 Roanne, † 16.10.1796
Paris

Little is known about Pernety's early life. In 1732 he entered the Benedictine Order, and from 1746

onwards he lived in the monastery of Saint-Germain-des-Prés in Paris. His first publication, a translation of a German book on mathematics, appeared in 1743. It was followed shortly after by some pious treatises, including a *Manuel bénédictin* (1755, containing a.o. a commentary on the Rule of St. Benedict), and a *Dictionnaire portatif de peinture, de sculpture et de gravure* (Portable Dictionary of Painting, Sculpture and Graphic Arts; 1757). His interests began to shift after he had found in the library of his monastery a work on → alchemy: the *Histoire de la philosophie hermétique*, published in 1742 by Abbot Lenglet-Dufresnoy, which inspired him to write his two most famous works, *Fables égyptiennes et grecques dévoilées et réduites au même principe* (Egyptian and Greek Fables Unveiled and Reduced to the Same Principle; 2 vols.) and *Dictionnaire mytho-hermétique* (Mytho-Hermetic Dictionary) both published in 1758. The latter is a combination of a glossary and an index to the former, giving a list of symbols, concepts and key-terms with explanations as well as references to his *Fables*. The *Fables*, on the other hand, were written in a tradition of alchemical works starting in the early Renaissance, coming to a head with → Michael Maier's *Arcana arcanissima, hoc est Hieroglyphica Aegyptio-Graeca* (1614), and followed by such works as → Athanasius Kircher's *Oedipus Aegyptiacus* (1653), and Jacob Toll's *Fortuuta* (1687). Pernety heavily borrowed from these three books in particular, but also added much of his own. Throughout his book, Pernety interprets all mythological stories as coded descriptions of the alchemical Great Work, understood in its more "concrete" operative aspect of chrysopoeia. This is the "single principle" mentioned in the title, to which all the myths can be reduced (see further discussion in Faivre 1993). Both *Fables* and *Dictionnaire* soon became a standard reference in alchemy, a position they have enjoyed to the present day, thus popularising the idea that the antique myths of Egypt and Greece were entirely conceived by alchemists, who wanted to cryptically describe the process of metallic transformations which took place in their laboratories. Since the Philosopher's Stone was supposed to represent the final accomplishment of such procedures, the latter had to be disguised. What interested Pernety was not so much the making of gold, but rather finding a universal remedy for all illnesses. This passion for alchemy remains characteristic for most of Pernety's life.

In 1763, Pernety left his monastery in order to travel as chaplain with L.A. de Bougainville on his expedition to the Falkland Islands. Partly due to

that expedition, France officially took possession of the land in 1764, and on that occasion Pernety celebrated a mass there. He kept a detailed diary in which he described everything he encountered, especially all kinds of plants and animals which were new to him. He brought back a collection of them for the gallery of natural history in his monastery. He also recorded the medicines prepared by the Indians; later, in Berlin in the years 1769-1771, Pernety took a strong stand in favour of them, against the views defended by such authors as Cornelius de Pauw, a believer in “progress” who saw the Indians as primitive compared to the Europeans. Conversely, Pernety – similar to Jean-Jaques Rousseau’s concept of the “noble savage” – saw in them the very proof of an original purity of mankind.

Having lived so far from his monastery for a year and a half, he found it difficult to readjust himself, and this may partly account for his subsequent involvement in a reform movement within his Order. In 1765, together with twenty-seven other monks, he submitted to the king a project designed to mitigate the severity of the Benedictine Rule. The initiative failed miserably, and even resulted in Pernety being confined for a short time. Surprisingly, he was nevertheless appointed as member of the committee composed of four monks, charged at that time with elaborating and submitting new constitutions for the monastery, a task to which he devoted himself with zeal. But severe disagreements arose among the four committee members, two of whom were rather conservative; as a result, the more liberal-minded Pernety decided to leave Paris.

According to J.M. Ragon (*Orthodoxie Maçonnique*, 1854), whose perspective has been widely adopted by handbooks of → Freemasonry, Pernety first went to Avignon, where he arrived in 1766. Here he supposedly created a new Masonic Rite, the Rite Hermétique, consisting of six degrees above the three symbolic ones; and one more degree added shortly afterwards, that of Knight of the Sun, would be the origin of one of the current degrees of the Ancient and Accepted Scottish Rite. But Ragon’s statements are extremely disputable. In 1996 a membership list was found of the Lodge “La Royal Yorck de l’Amitié”, existing in Berlin in 1782, which mentions Pernety as a member who had received most of the higher degrees in France (Snoek 2003, 30). It is the only proof we have that Pernety was a Freemason, and since he did not return to France between 1766 and 1783, we may conclude from it that he probably was one when he left Paris. Furthermore, there was no Masonic

activity in Avignon between 1764 and 1772, due to the activities of the Inquisition against Freemasonry during that period. Besides, the practise of hermetically inspired side degrees above the three symbolic ones is not documented in Avignon until 1774. On the other hand, the rituals of the degrees of the *Rite Ecossais philosophique*, which evolved out of the Rite Hermétique, do show affinity to the ideas found in Pernety’s *Fables*. It could therefore be argued that the marquis d’Aigrefeuille, who is now believed to have created the Rite Hermétique, drew on some elements he found in the *Fables*. Like the degrees of the Rite Hermétique, also the degree of Knight of the Sun, now known to have existed as early as 1751, is not likely to have been created by Pernety.

In 1767 Pernety, aged fifty-one, arrived in Berlin; and according to all his biographers he did not return to France until 1783. As soon as he arrived in Berlin, Frederic The Great, King of Prussia, mistaking him for his cousin Jacques, appointed him as his librarian and as a member of the Royal Academy of Berlin. In 1768 he was appointed Abbot of Burgeln (Saxony) by the Pope, but he kept spending most of his time in Berlin. At the Royal Academy he read several essays, starting in 1769 with his attack on De Pauw, which was followed in 1773 by an essay on → reincarnation, in which he defended the affirmative Pythagorean perspective. In 1776 he published a book on physiognomy, *La connaissance de l’homme moral par celle de l’homme physique* (Knowledge of moral man by knowledge of physical man), a subject which had recently become popular through the work of → Lavater but on which Pernety had published already earlier. Among other things he argued that, before birth, souls are competing over the body of the new child. *La connaissance* proves that Pernety was well acquainted with some of the so-called “occult sciences”; but like his *Observations sur les maladies de l’âme* (Observations on the maladies of the soul), published the next year, the book is also an inquiry into psychology and is part of his polemic in the Academy with Le Cat, from 1776 to 1778. In sum, during his first ten years in Berlin Pernety lived the life of a respected scholar. But then things changed.

Probably in 1779 or shortly before (although Pernety himself claimed a date as early as 1771), he borrowed some works by → Emanuel Swedenborg from another scholar, who had received them from the widowed Queen of Sweden, sister of the King of Prussia; and with the help of the brothers Auguste and Carl Frederic Nordenskjöld, and the Swedish consul in London, Christophe Springer,

Pernety managed to get hold of some further writings by Swedenborg. He immediately enthused over the writings of the Swede, and started translating two of them from Latin into French: *Les merveilles du ciel et de l'enfer et des terres planétaires et astrales* was published in 1782, and *La sagesse angélique sur l'amour divin et sur la sagesse divine* in 1786, both in Berlin. Although Pernety did not consider himself a Swedenborgian ('I am a disciple of Jesus-Christ, and not of Swedenborg', he wrote in 1782), he was strongly influenced by Swedenborgian ideas. Apart from these two translations, Pernety published only one more work after 1778. His main line of activity took on a different direction: he became involved into a movement pertaining to what is known as → Illuminism.

In 1779 he became one of the first members of a group later known as the → Illuminés d'Avignon, and he soon moved on to a position of leadership. In 1783 Frederick II discharged him, albeit reluctantly, from his professional obligations. Pernety, now sixty-seven years of age, left Berlin in search for a new dwelling place for his group. After his arrival in Paris, Mgr. De Beaumont tried to persuade him to reenter into his monastery, but after many negotiations and a decree by the Parliament of Paris, Pernety received permission to continue living as a secular priest. Eventually, he settled with his group in Avignon. In 1786, Pernety was secretary of the "Société Académique et Patriotique" of Valence, and he again took up his earlier scholarly activities. Following the dispersion of the Illuminés d'Avignon after 1792, Pernety seems to have returned from Illuminism and alchemy to his Benedictine roots: his last book (1790) was about Mary, and he authored another work, still unpublished, of *Extraits des Epîtres de saint Paul*. Pernety died 16 October 1796, at the age of eighty.

JAN A.M. SNOEK

Pessoa, Fernando, * 13.6.1888 Lisbon,
† 30.11.1935 Lisbon

Portuguese poet and esotericist. After the death of his father when he was five years old, Pessoa's mother took him with her to Durban, South Africa, where she settled with her new husband, the Portuguese Consul of that town. After high school, Pessoa returned to Portugal, where he soon began to work as a commercial correspondent in English and French. He became involved in the Portuguese modernist literary movement, publishing a considerable number of poems, in Portuguese as well as in English, in several short-lived reviews. The only book to be printed during his lifetime was *Mensagem* (1934). After Pessoa's death, a trunk full of manuscripts was found; they were written under several "heteronyms", i.e., literary *personae* who wrote both poetry and prose, in a variety of styles. Each of them had been assigned a specific biography of his own. The most important among them were Alberto Caeiro, Alvaro de Campos, Ricardo Reis and Bernardo Soares. Pessoa is nowadays considered one of the major poets of the 20th century.

Esotericism stands out as one of the most continuous threads to be used when working our way through Pessoa's scattered works. About 1914, he began to attend the séances of → spiritualism organized by one of his aunts. Later on, in 1915, he translated from English into Portuguese several books by authors linked to the → Theosophical Society (→ H.P. Blavatsky, → C.W. Leadbeater, →

Annie Besant). He was very much impressed by the theosophical doctrines, which he at first thought were likely to open for him the doors of Mystery.

Pessoa's early poems (*The Mad Fiddler*; 1911-1916) were written in English under the heteronym Alexander Search. They were strongly influenced by both the Elizabethan metaphysical poets and 16th-century esoteric currents. Platonist as well as pantheistic elements had already left their imprint on his philosophical thought, and this influence would remain through the rest of his life. Pessoa was keenly interested in → astrology, a field in which he reached considerable expertise. The English magician → Aleister Crowley paid him a visit in 1930, after an exchange of letters bearing on astrology. While in Portugal, Crowley, with Pessoa as an accomplice, hoaxed people into believing that he had vanished, in a rocky place near the sea called *Mouth of Hell* – an event which stirred a great sensation.

Mensagem, the most famous of Pessoa's works, can be seen as a crucible, as it were, in which various elements of an esoteric character – rosicrucian [→ Rosicrucianism], gnostic [→ Gnosticism], alchemical [→ Alchemy] etc. – are welded together. It also contains a very elaborate form of Portuguese messianism, known more specifically as *Sebastianism*. It has its roots in the history of King Sebastian, who disappeared on a Moroccan battlefield in 1578. The myth of his impending return, linked to the restoration of Portugal's glory, is one of the most fertile myths in Portuguese culture. *Mensagem* bears witness to the fact that poetry was for Fernando Pessoa a form of initiation, a quest into that realm of the Unknown which throughout his life he struggled to reach. It also shows that he tried to turn his literary work into an *Opus magnum*. For him a man of genius was “an initiate of the left-hand”, like Shakespeare and perhaps he himself. He beautifully defined initiation as ‘admission to the conversation of the Angels’ (a clear reference to Crowley, whose influence on Pessoa has traditionally been underestimated).

Pessoa was also familiar with a number of esoteric orders. He carefully studied masonic [→ Freemasonry] rituals and symbols, even though he was not himself a Freemason. In a number of newspaper articles published in 1935 he publicly took the defense of Masonry and other secret societies, against the attempts of the Portuguese government to outlaw them.

In Pessoa's poetry, God appears as a ‘vision that won't be seen’ (Beyond God): He is the Unknown of an apophatic mysticism (‘Being, Universe, Not-Being is the triple manifestation of the Unknown’).

This Supreme Being unfolds Himself in an infinity of theophanic manifestations. Angels belong to one of these and are considered as guides, like in the Christian tradition. Pessoa declared himself a “gnostic Christian”, and was of the opinion that Catholicism did not give enough importance to the symbolic meaning of Christ's life and death. A form of Christian esotericism indeed lies at the core of Pessoa's religious thought and deeply influenced his poetry. A cosmology tinged with elements borrowed from gnostic traditions pervades his *First Faust*, a work which is embedded in dualism and evinces a pluralistic notion of the Godhead. Fate stands out above all the other gods. Christ is considered as one of these gods, in what Pessoa refers to as “Supreme Polytheism” – a perspective that corresponds, at a metaphysical level, with the plural quality of life itself. Such a system also ties up with the psychological multiplicity which lies at the heart of Pessoa's poetic creation. He was and staunchly remained in search of some kind of philosophical cementing anchorage which might help him to integrate the different parts of his self.

Pessoa's metaphysical quest was centered in the great mystery of God and Life, and his poetry was the main instrument of that search for a “final truth”. *Tremendum* and *fascinans* at the same time, mystery is ‘the Absolute Voice, the Voice Without Mouth’ (*Poems*, published under the heteronym Alvaro de Campos), in whose depths the poet tends towards his own annihilation: ‘I dissolve myself in darkness and universe’ (*First Faust*). Pessoa describes a mystical experience, full of terror and despair, of a descent into the Abyss: ‘And silently I receive / the mystery and horror of the world / In my deep abyss’ (*ibid.*). This experience, which he calls his ‘supreme intuition’, was for him a source of great anguish and melancholy. Gradually, the poet's life ‘became a metaphysical fever, while he constantly discovered occult meanings in things, and played with the fire of mysterious analogies’ (*Book of Disquietude*, published under the heteronym Bernardo Soares). From time to time the experience is interrupted in order for the mind and soul to rest: ‘In the shade of Mount Abiegnus / I rested from meditating. / On the top of it, I saw the high castle / Which I dreamt to reach’ (*Poems*). Pessoa was convinced that “Unknown Superiors” were leading him towards spiritual and literary achievement, but some form of neurotic inertia prevented him from successfully carrying through most of his projects.

ANA MARIA BINET

Peter of Abano (Pietro de Sclavione),

* ca. 1250 Padua, † after 1315

place unknown

Pietro de Sclavione, son of Costanzo de Sclavione, Notary of the Seal of the Commune of Padua, was born circa 1250. Nothing of him is known after 1315. His fame as a physician and astrologer alternates between fact and legend. The legendary part is due to authors of the 15th-17th century (→ Agrippa, → Trithemius, Gianfrancesco Pico, → Symphorien Champier, and others), who created a false image of him as a magus and necromancer. Historical documents have established

that the truth was quite the contrary: he was accused of heresy by the Inquisition of his time (1304-1315) because he *denied* the existence of demons and spirits, condemned ceremonial and necromantic astrological practices based on the construction of images and → amulets, so much so that his position seemed to be a refutation of the Supernatural; and above all because he supported the horoscope of religions, holding that the repopulation of the world after the universal Flood was not due to the miracle of Noah's Ark, but to a natural phenomenon. In the medical field, he denied that melancholy was the work of the demon and explained it through excess of the humor of black bile.

Peter was in fact a rationalist astrologer, physician, and philosopher in the Aristotelian-Avicennian tradition (→ Avicenna), who did not believe that the planets were spirits, but rather saw them as superior physical bodies which move and influence earthly beings in a natural way, particularly concerning the course of maladies and human health. In → astrology, Peter kept to a mathematical, physical, rational doctrine that related the most important events, such as the rise of religious faiths, to the great conjunctions; he believed neither in miracles nor in the biblical story of Noah's Ark and the re-population of the world after the Flood. He was called before the Inquisition for this doctrine, which was considered a refutation of the supernatural and of the religious verities connected with that spiritual plane. Besides, the astrological determinism which could be connected with his doctrine of astral causality seemed to deny the liberty of the individual. It seems, however, that he was only accused, not condemned, thanks to the intervention of a Pope, perhaps John XXII, who saved him from the original charges of heresy.

After his studies in Padua and Paris between 1270 and 1285-1290, Peter went to Constantinople, and was also in Sardinia during those years. In 1295 he was in Paris, where he completed his *Compilatio physiognomiae*. Nothing is known about his Parisian sojourn but what can be drawn from the *explicit* of this work. According to Nardi, Peter was still in Paris in 1298, where he supposedly met → Ramon Llull (Nardi 1958, 20). In 1302 he returned to Padua. During his Paris period he had been accused of heresy by the Dominicans of the Monastery of Saint-Jacques. In 1304, still in Padua, where he was teaching philosophy, astrology, and medicine in 1306, he was again accused of "haereticae pravitatis". From 1303-1310, as he himself states, he revised his principal works: *Conciliator differentiarum philosophorum et medico-*

rum; *Lucidator dubitabilium astrologiae*; and *De motu octavae sphaerae*. In the year 1314 he was Reader in medicine or *physica* at Treviso, even though salaried by the University of Padua. In 1315 he was accused of heresy for the last time; it is not known with certainty whether he was condemned, nor what the accusations were. On May 24, 1315, he made a profession of faith and conformity with the Christian religion. Thereafter we have no more evidence of him.

In his most important astronomical-astrological writings, *Lucidator dubitabilium astrologiae* and *De motu octavae sphaerae*, Peter summarized and discussed all the principal problems of astronomy from the time of Ptolemy up to his own time, including the elaborations of the Arab astronomers (Alpetragio, Albattani, Thabit, and Arzachel), and sought to answer them. The most notable problem concerned the precession of the equinoxes, or the apparent movement of the eighth sphere, due to which the equinox no longer fell on the 21st of March, as fixed in the Christian calendar of the Council of Nicea (323), but by 1310 fell between March 12th and 13th. Preliminary to all the problems were the questions of whether astrology was, or was not, a certain, licit, and permissible science, and at what points it intersected with astronomy. The questions were as follows:

(1) Whether to attribute the diurnal motion to the primum mobile or ninth heaven, while the eighth heaven, or firmament, was left to depend solely on the precessional motion. This would refute the abstruse theory of the Andalusian astrologer Arzachel (10th century) of the “trepidation of the equinoxes”, or their oscillation forward and backward: a doctrine first developed in the school of Thabit Ben Qurra (9th-10th century).

(2) Whether one should accept the eccentric and epicyclic models: whether the variations of motion – accelerations, retrogrades, and stationaries – of the faster planets were better explained by Ptolemy’s eccentric and epicyclic models, or by the homocentric spheres, 27 in all, of Eudoxus and Callippus, and the 55 revolving spheres of Aristotle. This complicated theory is known only through Simplicius’s *Commentary* on the second book of Aristotle’s *De Caelo*. Peter followed Ptolemy, against Eudoxus, Callippus, and Aristotle.

(3) The problem of whether the planets are like nails fixed at the center of the sphere, as Aristotle says, or whether they rotate freely, as Peter maintains.

(4) The order of the planets: whether the sun is in the fourth place above the moon, rather than next to it (in which case Venus and Mercury would col-

lide with it); or whether the order is that of Aristotle, for whom the moon is immediately beneath the sun, hence the order being moon, sun, Venus, Mercury, Mars, Jupiter, Saturn.

(5) Whether the spheres number eight, nine, or ten. Peter affirmed that there are only nine, and that the introduction of the tenth sphere is of a religious and theological nature, inasmuch as this heaven is the place of Paradise; thus the tenth sphere is not astronomical, hence unnecessary and pointless (another censurable thesis).

Unfortunately the work was not completed. It should have continued with a study of the apparent motion of the sun, of which nothing has come down to us but a few titles: whether the sun’s declination is 24° or otherwise; whether the *aux* of the sun is mobile or immobile; whether the center of the sun’s eccentric is 2° 23’ distant from the earth, or whether its equation is different; whether the sun moves with its eccentric in 365 1/4 days.

Among Peter’s medical works, the famous ones are the *Problemata*; a treatise *De venenis* which circulated widely, also in Italian translation; and the translation from the Greek of certain important pharmacological works, including Dioscorides’s *De materia medica*, some of Galen’s works (*De complexione temperata*), and the Pseudo-Hippocratic *De medicorum astrologia*.

Peter attempted to change the conceptual model of astronomical science from being merely speculative (as Aristotle insisted) and divorced from the practical, operative sphere. On the contrary, Peter underlined the close link between the theoretical and practical aspects which exists in all sciences, from astronomy to medicine. As a faithful interpreter of Ptolemy, he thought that the only certain science is mathematics, considered as geometry and astrology. The latter represents the practical aspect of the geometrical knowledge of the celestial motions; it is a theory of the significances of the physical influences of the heavens, hence should be a theory of the “sufficient”, not necessary, causes that produce phenomena. Astrological foresight also resembles medical prognosis, because the individual’s physical condition, his health and sickness, depend on the planetary constitution, on the basis of his nativity drawn up in the *iudicium* (astrological prediction or horoscope). Astrology, therefore, is a general doctrine concerned with the sufficient celestial causes, which in turn explain the causes of the *ens fore* or *futurum*. Medicine is the science of the *ens in facto perfecto*, that is, of what is “curable” or expects to be cured once the medical foresight (prognosis), on which the cure is based, has taken place and has announced recovery.

Astrology is thus a physico-mathematical science: primary, certain (because it has a mathematical certainty and in that sense is not *coniecturativa*), unique, noble, licit, and a *subiecto determinata*; in fact, its substratum, the *subiectum*, is the heavenly body “sufficiently” considered, in reference to its power of being “applied” to the terrestrial world or of applying itself, i.e., influencing the earth. Astrology is licit and not superstitious; Peter follows the speculative direction of the author of the *Speculum astronomiae*, perhaps → Albertus Magnus. Like him, Peter rejects the necromantic techniques of invoking spirits through figures and the planetary images of Hermes, Thabit, and other interpreters of the magical doctrine of *electiones* and *interrogationes*, as he affirms in the first debate or chapter of his *Lucidator*. Like the author of the *Speculum astronomiae*, Peter considers as acceptable only the investigation of those astrological images, such as Ptolemy’s, which are purely physico-astronomical, and not animistic.

The modifications introduced into Ptolemaic and Hermetic astrology by the *Speculum astronomiae* and accepted by Peter allowed him to safeguard individual liberty, because the science of astrological foresight, according to him, is founded on causes that do not absolutely necessitate but merely incline, thus freeing astrology from the magical aspects that according to Thomas Aquinas made it a superstitious and illicit doctrine. It is licit because it is founded on the rational, physico-mathematical rules of the planetary movements. These are not spirits and demons to be invoked, which would seem like pagan astrolatry. Thus Peter represented the same rationalist direction in astrology as Aquinas did, contemporaneously, in theology. Indeed, since the verdicts of Paris (1277), condemned some of Saint Thomas’s rationalist theses, it is no wonder that the Dominicans of Saint-Jacques accused Peter’s medico-cosmological rationalism of heresy. The circumstances of Peter’s accusations of heresy need to be placed in their historical context, if they are to be rightly understood.

It follows that astrology forms the scientific basis of medicine, whose object is an *ens possibile*, a “curable” being, which represents the aim of medicine and which depends on the inclinations that the stars have placed in the individual’s physical constitution. The physician’s task is to discover these, with the result that medical prognosis is always an astrological prognosis.

Natural celestial causality does not exclude, but rather presupposes the supernatural causality of God, who governs the world through his will (*nutu*

Dei). God is the supernatural agent (*agens supernaturalale*) because he acts without movement or change (*absque motu et transmutatione*); his action is immediate and hence miraculous. Beneath divine causality there is the secondary, natural causality, which acts in a threefold manner. The terms Peter uses are not “cause” but “action” (*actio*), “virtue” (*virtus*), “impression” (*impressio*), “influence” (*influxus*), and “sign” (*significatio*), following a tradition that stems from Albumasar’s works which he often cites. The first type of action is a universal one, distinct from the single, particular action; between them stands the median cause. The natural, universal action acts only by means of movement and light, and belongs to the eighth sphere of the fixed stars; it is uncertain and indefinite, like the number of the stars. The second type of action (median) is either that due to the constitution and aspects of the planets, or that due to the contracted virtue of the 48 celestial images. The third type of celestial action is the particular or individual one: it is a matter of a particular stellar influence (*influxus stellaris particularis*), which depends on the position of the planets in the celestial “houses” (*domus*) and their aspecting of each other. This is found in the “nativity” (horoscope), which is bound to the revolution of the planets at the day, the hour, and the exact place of the person’s birth. It is also closely bound to the elementary combination and the virtue of the place in which the influx is concentrated, with the contribution of the parents to the birth of individuals. Thus there is a perfect correspondence between the elementary qualities and the celestial qualities of the astronomical images made by the constellations of the upper and lower hemispheres (36 plus the twelve signs, hence 48 in all). These correspond to the terrestrial qualities in a physico-natural interaction or exchange.

This institutionalized teaching of astrology, consolidated by Peter, was imparted not only in Italy at Bologna, Padua, and Ferrara, but also at the Collège de Maître Gervais in Paris and at Merton College in Oxford. Here John Aschenden (or Eschenden), active between 1340 and 1370, wrote several works of universal astrology, including the *Summa astrologiae de accidentibus mundi* (published Venice 1489) and the universal *Pronosticationes* of the great conjunctions of the three higher planets and the eclipse of the moon in 1345. The *Summa astrologiae*, together with the *Pronosticationes* of the great conjunctions of 1358 and 1365, opened the way for the success of universal predictions based on the appearance of eclipses, or the advent of great conjunctions of the slow planets.

The legend of the life and work of Peter as a magus and necromancer began to circulate in the 16th century, accredited by tales of Gianfrancesco Pico della Mirandola and others. Gianfrancesco, in *De rerum praenotione* said that Peter was given to practicing magic in Constantinople, and the same is stated by Symphorien Champier (*Annotamenta, errate et castigationes in Petri Aponensis Opera per Simphorianum Champerium*, Giunta: Venice 1520). The *Libro dei sogni* of Paolo Lomazzo (1538-1600) includes the figures of spirits who speak to him and tell tales: it has Peter in dialogue with Cecco d'Ascoli about all the necromantic practices and demonic invocations. Thus the legend was established. Magical works spuriously attributed to Peter circulated in the 16th and 17th centuries: an *Alchimia*, the *Profezie* in Latin and Italian; works on necromancy and magic such as the *Elementa magica* which appeared in many copies of the 16th and 17th centuries, when, despite Naudé's defense of him against the accusations of magic, the legend grew of a Peter who trafficked with demons. According to Naudé, Peter was not the author of a magical work entitled *Hep-tameron* that was published at the end of the first book of Agrippa's work; Trithemius accepted the idea that Peter had also authored an *Eleucidarium necromanticum Petri de Abano* and a *Liber experimentorum mirabilium de anulis secundum 28 mansionibus Lunae*, all of them spurious.

Another factor that contributed greatly to the legendary character of Peter as a magus and impostor was the story by Ludwig Tieck (Berlin, 1773-1853) entitled *Pietro d'Abano: Eine Zauber-geschichte* (Pietro d'Abano: A Story of Magic), published in 1825 in the almanac *Märchen und Zaubergeschichten*, in which the authentic image of Peter as a rationalist astrologer, physician, and philosopher dissolved into that of a practitioner of black magic.

GRAZIELLA FEDERICI VESCOVINI

Petric', Frane → Patrizi, Francesco

Philippe, Anthelme-Nizier, known as "Maître Philippe", * 2.4.1849 Loisieux (Savoy), † 2.8.1905 l'Arbresle (near Lyon)

"Thaumaturge", "unknown master", "spiritual master", "man of God", "friend of God": thus his disciples and admirers referred to the man they respectfully addressed as "Monsieur Philippe" or, later on, "Maître Philippe of Lyons". Since he himself wrote nothing but a few cursory letters, the available information about him derives from these disciples, apart from a few newspaper articles and police reports, mostly malevolent and not very trustworthy. Born in a town in Savoy (then part of the Kingdom of Piedmont-Sardinia), he died at l'Arbresle, near Lyons, where he usually resided; he was buried at Lyons, in the Loyasse Cemetery, where his tomb has remained the constant object of worship for a discreet cult. He was not, then, "of Lyons", despite his sobriquet; however, having arrived there at the age of fourteen, he only ever left the region for short trips in France and other countries.

Philippe showed extraordinary characteristics from his earliest years. According to a family tradition reported by Alfred Haehl (1959, 19), 'when his mother was expecting [his birth], she paid a visit to the Curé d'Ars, who revealed to her that

her son would be a very great being'. Philippe himself affirmed that he had performed 'miraculous healings . . . from the age of thirteen' (Caillet 2000, 31).

At fourteen he was sent to work at an uncle's, who was a butcher at Lyon, and at the same time pursued his studies at a religious school. During 1874-1875, he studied at the College of Medicine and Pharmacy to become an officer of health (i.e. a medical professional permitted to practice without having obtained the title of doctor); but he was expelled and disbarred for having cured some of the hospital patients who were supposed to serve as examples for the students. Thus began his controversial relationship with the official world of medicine, which censured him on several other occasions (in 1887, 1890, and 1892) for practicing medicine illegally. However, other physicians – not confined to those in his immediate entourage, such as Dr. Gérard Encausse (→ Papus) and Dr. Emmanuel Lalande (Marc Haven, his future son-in-law) – and some magistrates confirmed the reality of his inexplicable healings, testified by numerous witnesses (1954, 43-46).

As early as age 20, Philippe had acquired a reputation as a healer that would only increase with the years and attract hordes of patients, from the humblest to the noblest. The latter included princes of royal blood and even monarchs, among them King Edward VII of England, Kaiser Wilhelm II of Germany, Emperor Franz Joseph of Austria, and the Bey of Tunis. Of all his dealings, it was Philippe's association with the Russian court, from 1899 until his death, that excited the most curiosity (often malevolent) from the press, and the most agitated distrust from the police. Introduced into the Martinist [→ Martinism: Second Period] entourage of Tsar Nicolas II by Papus (who had established Martinist lodges in Russia in 1897, and created a Martinist Order there in 1899), Philippe made at least five journeys to Russia between 1901 and 1903. On one of them, he made the acquaintance of the famous thaumaturge, the future Saint John of Cronstadt, who saluted him as "brother". For the rest of the time, the Russian aristocracy thronged to consult him. From the moment of his first interview with the imperial couple at Compiègne, in 1901, Philippe commanded the devotion of both the Tsar and the Tsarina. Up until his death, in spite of intrigues and cabals, he was treated as a friend and confidant by Nicolas and Alexandra, to whom he had predicted the birth of the much-desired male heir. These intimate relations are described in detail by Philippe Encausse (1954, 67-113).

Philippe's popularity came from his reputation for inexhaustible charity toward the humble and needy, made possible by his wealthy marriage: 'Monsieur Philippe, he is the father of the poor', proclaimed Papus (Encausse 1954, 64). His sole method of healing was prayer. Even when he let Papus persuade him to open a school of magnetism [→ Animal Magnetism] at Lyons, the form of magnetism that he taught for three years, 1895 to 1898, was singular in that he did not use any hand motions or touches, only prayer. He repeated insistently: 'One always needs prayer', adding, 'I don't do anything myself to heal you; I address the Master, who is God' (Haehl 1959, 62) – whom he also happily called "the Friend". But, he clarified, 'to be heard, you must . . . love your neighbor more than yourself; do not judge your brother'. According to → Sédir [Yvon le Loup], 'he placed brotherly love above all, above prayer and even above faith; it was charity, he said, that engenders true faith and that teaches us prayer; prayer without charity is facile, and faith without charity, that's not faith' (Sédir 1923, 117-118).

Philippe did a great deal of oral teaching, and his disciples piously reproduced his talks, particularly Alfred Haehl. In Haehl's collection *Vie et Paroles du Maître Philippe* (Life and Words of Master Philippe) these teachings are gathered under the not incongruous title *L'Évangile du Maître Philippe* (The Gospel of Master Philippe). In fact, according to Sédir's testimony ('His doctrine was purely the Gospel'; 1923, 117) Philippe himself stated: 'I do not tell you anything that goes against the Gospel' (Encausse 1954, 264). He also proclaimed that 'The Gospel contains all initiation' (*ibid.*). Sédir affirmed (1923, 117, 120) that 'he condemned the practices of esotericism' – i.e. occult practices, hypnotism, sorcery, → magic, and the acquisition of powers, 'as contrary to divine law, not teaching them in any form and not recommending their theories'. It seems that this was aimed mainly at the → Theosophical Society of → Madame Blavatsky. In contrast, Philippe was friendly towards the Martinist Order created by Papus in 1887-1891, which presented itself as a "Christian chivalry", and designed a medal and a pentacle for it (Caillet 2000, 61). Sédir, following his master's teachings to the letter, took the same steps as had been taken a century before by → Louis-Claude de Saint-Martin: he resigned from all the numerous initiatic societies to which he had belonged, to devote himself to his only true Master and only true Friend, the Christ. Later, in July 1920, Sédir founded the Association of "Amitiés Spirituelles" (Spiritual Friendships), which still

exists and has as its object the reunion of ‘all persons of good will who acknowledge Christ as the sole Master of their inner life, and the Gospel as the true law of conscience and of peoples’ (Encausse 1954, 129). Under the auspices of the *Amitiés Spirituelles*, in a collection entitled *Quelques amis de Dieu* (Some Friends of God, 1928), Sédir published an anonymous piece fervently dedicated to Philippe under the title *Un Inconnu* (An Unknown). Also anonymously, Marc Haven, Philippe’s devoted son-in-law, depicted Philippe in the character of → Cagliostro in his book *Le Maître inconnu Cagliostro* (The Unknown Master Cagliostro, 1913). Later he confided to Philippe Encausse: ‘I used a character who resembled him – Cagliostro – to write about him. Only friends will understand’ (Encausse 1954, 47).

Philippe’s influence on his disciples was decisive, and caused a change of orientation in all of them that Papus described thus: ‘You have brought me to know and love Christ’ (Encausse 1954, 19). This orientation was implanted in the Martinist Order, of which Papus proclaimed: ‘Our Order is Christian, essentially and integrally Christian, and one cannot conceive of a Martinist who is not faithful to Christ’. Serge Caillet writes (2000, 140), ‘through Papus, Monsieur Philippe has influenced the Martinist Order, which he has helped to root in the tradition of Christian → illuminism’. Philippe’s influence on Papus’s son, Philippe Encausse, was no less important, even though posthumous. The latter tells (1954, 128) that ‘Monsieur Philippe had announced my birth to my parents (at a time when my dear young mother did not know she was pregnant). He had asked them to give me only one first name: Philippe. He wished, in effect, to be my spiritual godfather’. Philippe Encausse, born in January 1906, five months after Philippe’s death, was certain throughout his life that he was in communication with his godfather and under his guidance. He in turn labored to root in Christianity the Martinist Order created by his father, which he himself revived in 1952. Throughout Philippe Encausse’s term as Grand Master, as during Papus’s term, this Order devoted a veritable cult to the man who was considered its “Spiritual Master” or even, as Papus said, its ‘almost invisible apostle’ (1954, 107).

While Martinism declined after the death of Philippe Encausse in 1984, it has gone down in the history of occultist currents of the late 19th century as a movement that oriented ‘these questers of the occult, Papus, Haven, Sédir, Phaneg, and several others’ (Caillet 2000, 147) toward the simplicity of the “way of the heart” opened by Louis-Claude de Saint-Martin. In this regard, it continues to this

day to exercise a discreet but powerful influence upon spiritual seekers, both in isolation and in groups.

JEAN-FRANÇOIS VAR

Philosophia Perennis → Tradition

Pico della Mirandola, Giovanni,
* 1463 Mirandola, † 17.11.1494
Florence

Born to the noble family of the Counts of Mirandola and Concordia near Modena, Pico lived on the edge of two distinct cultural periods, the former rooted in medieval scholasticism, the latter characterized by the humanistic revival of classical thought. Pico’s strong curiosity led him to study thoroughly both medieval and classical traditions in the most renowned cultural centers of his age. His multifaceted interests in all kinds of knowledge, his peculiar life, as well as his precocious death constituted the basis for the rapid flourishing of his fame and for the spreading of his legendary biography also beyond Italian borders.

Entering the University of Bologna around 1477 in order to study canon law, Pico quickly manifested a specific talent for philosophy, which made him turn his attention towards speculative subjects. He moved to Ferrara and Padua, where he attended the local *Studia* until 1482, when he left for Florence, where he became acquainted with → Marsilio Ficino and his Neoplatonic circle. He was in Paris in 1485, where, under the influence of the Sorbonne theologians, he composed his famous letter addressed to the humanist Ermolao Barbaro; in it, he pleaded in favour of the use of philosophical technical terminology against the accusations of humanists such as Barbaro himself, who considered scholastic Latin a barbaric violation of the purity of the Ciceronian language. This first important work defines Pico’s position in the framework of the current humanistic debate between philology and philosophy. Pico’s defense of the latter is

not to be seen as a reaction against contemporary trends to revive classical Latin: on the contrary, his early production, at least until 1487, does not show any sharp distinction between profound speculative contents and an eloquent prose founded on the most widely accepted Latin models of his contemporaries. Later on, Pico would take a decisive step, mostly devoting himself to philosophy and rejecting his non-speculative production, including his poems. 1486 was a significant year for Pico: he returned from Paris to Florence, subsequently moving to Arezzo (where he caused a scandal due to his abducting a lady who had family ties with the Medicis), Perugia and Rome. In Perugia Pico began his thorough study of Oriental languages and Jewish kabbalistic doctrines [→ Jewish Influences], which were used in his commentary on a platonic love poem by his friend Girolamo Benivieni (*Commento sopra una canzona d'amore di Girolamo Benivieni*), where for the first time his views of philosophical and religious concordance were asserted. Simultaneously, Pico composed his *Conclusiones nongentae* (Nine-hundred Conclusions, or Theses), meant to be publicly discussed in Rome in 1487 and dealing with all fields of philosophical and religious knowledge which the author wanted to join in an all-comprehensive system. As an Introduction to the hoped-for scholarly conference on the *Theses*, Pico wrote an oration, later entitled *De hominis dignitate* (On the Dignity of Man): an outstanding manifesto of the Renaissance conception of the role played by man within Creation. The harsh reaction of the Roman Church against Pico's *Theses* – as a result of which the public discussion never took place – led him to write an *Apologia* in 1487, in which he tried to defend his position. After a brief detention in Paris, at the Pope's request, Pico settled in Florence. Under the patronage of Lorenzo de' Medici, in 1489 he composed here his Sevenfold Commentary on the Six Days of Genesis (*Heptaplus*). In 1492, while devoting himself to a commentary on the Psalms, which was to remain unfinished, the humanist dedicated to his friend Poliziano the short treatise *De ente et uno* (On Being and the One), in which he took up his project of highlighting the similarities between platonic and aristotelian thought. Pico's last years were devoted to the composition of the huge *Disputationes adversus astrologiam divinatricem* (Disputations against Divinatory Astrology), which were left unfinished and represent a further apology and rejection of earlier unorthodox positions. Most of Pico's production was published only after his death, firstly edited by his nephew, Gianfrancesco, in Bologna (1496), and later published in

several editions during the 16th century (the most celebrated edition being the one that appeared in Basel in 1572, reprinted in the 17th century as well).

The myth of the "phoenix of his age", as the young Count was designated already by his contemporaries, has affected scholarly interpretations of Pico's intellectual speculation. Throughout the centuries, Pico's system of thought has been viewed as one of the earlier, more faithful, and most complete expressions of humanism. Only in recent years this interpretation has been subjected to critical revision.

Of particular importance in this regard is the role played by theology in Pico's attempt to create an all-comprehensive system of knowledge, intended to embrace and reconcile the most different rational and religious disciplines. His project of establishing a harmonious syncretism (*concordia*) between various theological and philosophical doctrines was certainly based upon intellectual foundations. For this reason, modern scholars have often considered Pico's thought to have been a strongly mundane achievement; but a closer inspection of Pico's texts allows us to perceive how closely connected Pico was to contemporary Christian religious positions. As a matter of fact, all Pico's speculation expresses his faith and willingness to adhere to Christian orthodox views, although some scholars have assumed that for a man whose work was suspect to the Roman Church this was just a strategy in order to hide his real intellectual concerns. Nevertheless, his program of universal salvation obtainable through an intellectual knowledge starts from an elitist attitude, according to which esoteric doctrines are the unique way for the initiate to better understand his relationship with nature and God.

Since the beginning of Pico's quest for intellectual knowledge, he raised the question of which boundaries are not to be overcome by the human intellect; and he did so on the basis of both classical tradition and Christian authorities. We may assume that his clearly-defined interest in such an issue – one which affected the entire age in which Pico lived – could have actually originated from Pico's stay in Padua, where he attended the local *Studium* in the academic years 1480-1481 and 1481-1482. There he met the Jewish averroist philosopher Elijah del Medigo (ca. 1458-1497), who probably initiated Pico into the averroistic interpretation of Aristotle according to the Arabic tradition. Del Medigo, who translated several averroistic works from Hebrew into Latin on Pico's request, considered Aristotle "the father of all philosophers" and Averroes his most faithful com-

mentator. Moving from Averroes, Del Medigo sharply distinguished knowledge obtained through faith from that gained through philosophical speculation. Despite Elijah's attempt to bring Pico to share his own attitude to rational speculation, the young Count seems to have been inclined to follow a different path of research, the goals of which may appear in a letter sent by Del Medigo to Pico in 1486. In this document the Jewish scholar responds to a previous letter, which has not come down to us, in which the humanist, among other questions, asked for advice about the kabbalistic books which would have allowed him to delve into the hidden doctrines of the Jews. Although actually revealing the titles of the most influential medieval kabbalistic treatises, Del Medigo, by means of rational discussion, tried in his response to deflect the humanist from adopting quasi-gnostic forms of thought; for these, according to him, would lead Pico to create a neoplatonized Christian version of Jewish Kabbalah. In Del Medigo's epistle, as well as in a later Hebrew treatise entitled *Behinat Ha-Dat* (The Examination of Faith), the Jewish scholar showed his contempt for those who assert the existence of various ontological degrees within God, and the possibility for man to affect and change God's perfection through prayer or magical devices.

In spite of Del Medigo's criticism against Kabbalah, Pico probably realized he had found in this Jewish lore one of the major links between rational and religious systems of thought. In 1486, while composing his famous *Nine Hundred Conclusions*, he resorted for the first time to a wide range of Jewish kabbalistic works, which had been translated on his request by the Jewish convert Flavius Mithridates (ca. 1450-1489). As we have seen, Pico wanted to submit and discuss all his *Conclusions* (which he had printed at the end of 1486) during a conference to be held in Rome early in 1487. A committee appointed by Pope Innocent VIII stopped Pico's plans, declaring that six of the theses were suspect and condemning seven others. Most of the condemned *Conclusions* deal with Kabbalah. Pico immediately wrote his *Apology* in order to declare his innocence, but the result of this further attempt was that the Pope eventually denounced all the theses.

In one of the *Conclusions* condemned by the Church, Pico affirmed that 'no knowledge gives us more certainty about Christ's divinity than magic and Kabbalah'. In order to defend this ambiguous claim, Pico made an effort in his *Apology* to distinguish a good from an evil form of → magic, as well as a positive from a negative Kabbalah. Accord-

ing to this distinction, the term Kabbalah was employed by the Jews to point out two distinct hidden disciplines, one dealing with a method for combining letters of the Hebrew alphabet (such a device, according to Pico, was not dissimilar from → Ramon Llull's *Ars*), the second dealing with an investigation of the celestial beings dwelling above the sphere of the Moon; this second discipline was considered by the humanist as the higher form of natural magic. Thus, if investigation of supernal entities could be carried out by means of natural magic, this sort of kabbalistic magic would certainly allow the initiate to penetrate the mysteries of the divinity of Christ. Following Ficino, Pico wanted to establish a beneficent magic based on ancient authorities (and in this perspective Kabbalah could then constitute a *prisca theologia*), which might involve the celebration of special rituals for summoning angels; in this manner the human soul could be united with higher entities, thus creating a path leading to Christ or directly to God. In his approach to kabbalistic mysteries, Pico highlighted the meaning of letters and angelic names, widely employing mystical techniques which were diffused within medieval Jewish milieus and were mostly available to the humanist through Abraham Abulafia's (1240-ca.1291) treatises translated into Latin by Flavius Mithridates. The knowledge of the names of angelic powers like Metatron, Samael or Azazel would allow the kabbalist magician, endowed with the necessary prerequisites, to draw down into this world the positive virtues from the heavens and prevent the malignant agents from harming the lower universe. Seen in this light, Pico's kabbalistic doctrine would be a gnostic-hermetic discipline intended to investigate a hidden God; such investigation was possible through the power, given to the wise man, to comprehend a complicated system of links between lower and higher degrees of reality, by means of a profound meditation on the value of alphabetic letters and angelic names. Such an elitist attitude leads to a particularistic salvation, although his doctrine was intended by Pico to eventually foster the collective redemption of mankind. According to a recent interpretation (Copenhaver 1997), Pico would have envisaged the whole set of his 72 kabbalistic *Conclusiones secundum opinionem propriam* (Conclusions according to his [Pico's] own opinion) as a magic talisman, meant to keep the evil Azazel away and bring the good Metatron closer to the mundane world. If such a reading is correct, we could assume that Pico's attempt to use Kabbalah as a magic tool to bring about redemption is not dissimilar from the views of contemporary Spanish

Jewish mystics who produced the literary *corpus* of the *Sefer ha-Meshiv* (The Book of the Responding [Angel]). Pico's knowledge of Spanish kabbalistic magic can probably be traced to the influence on him of Yohanan Alemanno (c. 1435-c. 1504), a Jewish scholar active in Florence in the last decades of the 15th century.

The problem arising from Pico's use, within a rational system, of esoteric and non-rational doctrines such as the Jewish Kabbalah has been studied by modern scholars according to the most varied perspectives: the above-mentioned interpretation is part of a more general trend of comprehending Pico's speculation as an attempt to transcend physical limits to search for a superior spirituality by means of occult kabbalistic techniques aimed at the theurgical production of a spiritual descent of efflux from above. However, it is also possible to explain the humanist's attitude in purely rational terms, if we maintain that the intellect of the wise man is attributed the privilege of raising itself up to the degree of the Active Intellect, where God's grace will meet it and lead it to the supernal realms of knowledge. A further scholarly approach is represented by those who think that Pico's interest in Kabbalah was a mere hermeneutical and rhetorical device, intended to define a new kind of exegesis of the Christian texts, based on Jewish tradition.

Here we will briefly discuss these views, which are all valid to some extent. If we assume, following Garin's approach, that Pico stressed philosophy over religion, his interest in Kabbalah should be read as merely a search for an intellectual device for overcoming the theory of the "double truth" (which Pico could have derived from Averroes' later interpreters, mainly through Elijah del Medigo's teachings). This interpretation could be supported on the basis of some passages of Pico's *Commentary on Girolamo Benivieni's Love Poem* (see Garin 1937, 464-465). However, even if we admit that Pico originally intended to explore only the hermeneutic dimension of Kabbalah, it must be recognized that already the *Commentary* shows traces of an understanding of Kabbalah as a science of hidden symbols, allowing man to reach an intellectual gnosis of the mysteries of creation and the Godhead. This attitude is more definitely expressed in the *Oration on the Dignity of Man*, where Pico's resorting to hermetic passages dealing with the distinctive role of man within God's creation has often been interpreted as a quasi-gnostic reading of the Biblical Genesis. Pico's claim in the *Oration* that 'God is not less philosopher than priest' can be viewed as reflecting the humanist belief in a revela-

tion pertaining at the same time to natural philosophy and to religion (Dulles 1941, 154).

Traces of such a belief can be inferred mainly from Pico's *Heptaplus*, a commentary on the seven days of God's creation. Here the humanist interprets the book of Genesis as a scientific treatise containing elements of aristotelian natural philosophy (according to a rational type of biblical exegesis common among early Church Fathers, scholastic authors, and medieval Jewish biblical scholars); but at the same time, it is also seen as a prophetic work, the truth of which proceeds in a straight line from the divine revelation received by the *prisca philosophus* → Moses. In the *Heptaplus*, we can observe a strong appeal to prophetic Kabbalah, considered by Pico as a technique revealed to understand and control nature (Dulles 1941, 155-156). In the same commentary, Pico highlights the concept of a network of sympathies animating all nature: this concept, which was common in ancient stoic and neoplatonic thought, was one of the major focuses of Ficino's speculation. Likewise, Ficino's thought was probably responsible for the discussion of man's role within God's creation at the beginning of Pico's *Oration*. There the author asserts the idea of man's free choice of either raising himself up to God through the angels, or lowering himself to the status of an animal. Is this God as distant from man as the gnostic *deus absconditus*? Pico's *Conclusions* could be read in such a manner, since (as is well known after Wirszubski's magisterial studies on Pico's encounter with Jewish mysticism) the humanist's impressive use of kabbalistic material based on Jewish theosophical tradition (and the diffusion of such material in contemporary Tuscan milieu: see Idel 1983, Lelli 1997) made possible an understanding of God's creation according to which a lower evil world is sharply separated from a higher good world. Yet, such a sharp distinction as in kabbalistic treatises is not evident in Pico's *Oration*, while the *Conclusions* can be interpreted in various ways.

The close link between rational and non-rational, or better philosophical and theological doctrines, according to either an averroistic or a kabbalistic reading, may be easily interpreted as leading to a gnostic theology: only those wise men provided with intellectual knowledge from above (through a conjunction with the Active Intellect, or by receiving an efflux directly from God) are in a position to disclose the secrets concealed within nature, thanks to an esoteric knowledge revealed by means of symbols. According to Craven, who describes in detail the various interpretations expressed by modern scholars about the relation-

ship between rationalism and → gnosticism in Pico's thought, the humanist's attitude to gnosticism is not different from that of other contemporaries, who were not convicted of gnostic beliefs. Craven admits a peculiar interest of the young Count for secret teachings, but this trend should be comprised within Pico's intellectual elitism (Craven 1981).

In recent years, theologians have argued that Pico was a faithful and orthodox Christian, basing their assessment mostly on the opening of the *Oration*; thus, according to Raspanti (1991, 107), to attribute gnostic views to a thinker who, in his last years, decided to take the habit of the Dominican friars, is tantamount to misunderstanding the effective meaning of Pico's deeply religious attitude. For instance, the concepts of bliss and grace as dealt with in Pico's *Heptaplus* should be understood within the context of Pico's wide patristic and classical culture: like → Augustine and Bernard of Clairvaux, as well as Plato or Plotinus, Pico stresses the idea of reverting to the source in order to meet the Father. Nature and grace, like philosophy and religion, are but two stages of the only path leading to God (o.c., 88). In other terms, Pico's adaptation of kabbalistic ideas was mostly intended to rescue the church from what he felt were the limitations of scholastic dogmatism; platonic, as well as kabbalistic views more nearly coincide with Christian faith than syllogistic reasonings.

No consistent solution to this issue is possible without a closer inspection of the environment in which Pico developed his speculation. If on one hand we have to admit the strong influence of Ficinian neoplatonism, on the other hand we should recognize, in the same Florentine milieu where Pico spent most of his life, the late 15th-century reappraisal of averroism, as appearing also from the revival of love poems shaped according to the Dolce Stil Novo schemes of the 13th century. It will suffice to recall Pico's poetic activity (which can be explained only in the intellectual frame of this reappraisal), as well as his above-mentioned *Commentary on Girolamo Benivieni's Love Poem*, the aim of which, according to the author, was to found a new poetic theology. The ascent of the intellectual soul to its source through love is a central motif in Italian Renaissance literature; and it could have been connected by Pico to kabbalistic speculation mainly through the numerous mystical commentaries on the Song of Songs, widely diffused in Italian Jewish milieus since the Middle Ages. Pico possessed a Latin version of Gersonides' *Commentary on the Song of Songs*, where the rational and mystical ways of ascent to God are

described (see Lelli 1994, 170-172); this treatise can be seen as further proof of Pico's intention of employing hermeneutic devices for the interpretation of Scripture which could be used only by an elite of wise men, capable of reading texts in not generally accessible languages like Hebrew. According to the Provençal author Gersonides (Levi ben Gershom, 1288-1344), the Song of Songs is an allegoric history of the various stages of the ascent of the human intellect to the Active Intellect of the aristotelian medieval tradition; at the same time it is also a book hiding profound mysteries, such as that of the "death by kiss", which was borrowed by Pico and later became a favourite commonplace of Christian kabbalists. Pico's resorting to a philosophic Hebrew commentary full of mystical implications explains also his assertion that even a rationalist text such as Maimonides' *Moreh ha-Nevukhim* (Guide of the Perplexed) has to be interpreted in an occult manner (see Pico's 63th kabbalistic *Conclusion*). Such an approach towards philosophy was common among Jewish Italian thinkers, who tended to fuse rationalism and Kabbalah, and was represented at its best by the *Commentary on the Pentateuch* by the Italian 14th-century Jewish kabbalist Menahem of Recanati. This work, as well as the aforementioned commentary by Gersonides, were translated into Latin by Flavius Mithridates (Wirszubski 1989, 158-160). Menahem of Recanati often employed significant Spanish and Provençal Kabbalistic treatises which had been influenced by various forms of pagan gnosis still circulating in the Middle Ages (according to Scholem, *Major Trends in Jewish Mysticism*, who saw the Renaissance flourishing of Kabbalah as a major gnostic revival), or embodied an intellectual tradition dating to Biblical and Rabbinic times and strongly dependent on gnostic motifs diffused in the ancient Near East (according to Idel, *Kabbalah: New Perspectives*). Through such channels, mostly ignored by non-Jews until Pico had them translated into Latin, gnostic ideas penetrated the intellectual system of a thinker whose main concern in showing a favourable attitude toward intellectual gnosis was probably more that of highlighting his wide knowledge to the eyes of contemporary scholars than that of transgressing Christian orthodoxy.

After presenting in his *Conclusions* and in his *Apology* a theoretical treatment of magic as a natural art (distinguishing, as we have seen, a good from an evil magic), and after trying to convince his audience about the authority of Arabic and Jewish occult disciplines, in his last years Pico changed his mind about the meaning of → astrology. He

probably intended to respond to his opponent Pedro Garsia, one of the theologians who had been appointed by the Pope to evaluate the orthodoxy of the *Conclusions*. The Spanish bishop's refutation had concentrated on Pico's astrological, magical, and kabbalistic conclusions. This might be the reason why Pico, probably also under Savonarola's influence, decided to denounce the positive value of astrology in his *Disputations against Divinatory Astrology*, arguing on a rational basis against all supporters of astral divination and ceremonial magic (among whom was Marsilio Ficino, although Pico defended him to a certain extent on the assumption that his attitude towards astral magic was only theoretical). Relying on a careful distinction between a negative astral divination, viewed as based upon a determinist doctrine, and a positive divinely inspired prophecy, like that of Savonarola (recalling medieval arguments on the role of occult disciplines in a study program), Pico here seems to open the way to a new understanding of science. The latter might have led him subsequently to reject also the magic and kabbalistic disciplines which had been among the doctrines upon which he had founded, a few years earlier, his all-comprehensive system of thought. However, Pico's sudden death interrupted this momentous project, leaving to contemporaries and followers, as well as to modern scholars, the difficult task of ascertaining the importance of the *Disputations* in view of later scientific developments.

FABRIZIO LELLI

Pierre d'Ailly (Petrus de Alliaco),

* 1350 or 1351 Compiègne,

† 1420 Avignon

Chancellor of the University of Paris from 1389 to 1395; Bishop of Le Puy from 1395 to 1396, of Noyon in 1396 to 1397, and of Cambrai from 1397; and Cardinal from 1411 until his death. A prolific author in matters of theology, ecclesiology, and natural philosophy (including → astrology), d'Ailly was primarily known as one of the leading churchmen during the years of the Great Schism (1378-1414). A noted proponent of the conciliar solution to the crisis, he played a crucial role at the Council of Constance (1414-1417) that brought the Schism to an end. During his years at the University of Paris, d'Ailly taught many of the leading minds of his day, including Nicholas of Clamanges (1363-1437) and Jean Gerson (1363-1429).

Like his pupil Gerson, d'Ailly did compose several treatises on the spiritual life, including *Le jardin amoureux de l'âme dévote* (1401, possibly by Gerson), a *Life of Celestine V* (1408), *Speculum considerationis* (after 1408), *Compendium contemplationis* (after 1408), *Devota meditatio super psalmum: Judica me Deus* (1414), *Oratio dominica anagogice exposita* (1414), *Devota meditatio super Ave Maria* (1414), and *Devota meditatio seu expositio super psalmum: In te speravi* (1414). But if Gerson embraced → mysticism in the years after 1400, his master did not follow the pupil's lead. Although d'Ailly's treatises express an admiration of and need for the contemplative life, the general assessment is that they are fairly traditional and unoriginal compilations on the topic. He was more a man of action than a mystic.

In his final decade, as the crisis in the church reached a head, d'Ailly also immersed himself in

the study of astrology, producing several notable treatises on the topic. D'Ailly's interest in the stars was not new, but his whole-hearted embrace of astrology after 1410 was a reversal from youthful condemnations of the science, such as seen in his *Tractatus utilis super Boecii de consolatione philosophie*, written between 1377 and 1381, and *De falsis prophetis II*, composed between 1378 and 1388. D'Ailly's serious forays into astrology began in 1410, when he composed three treatises that bear the strong influence of the Franciscan → Roger Bacon (ca. 1214-ca. 1292): *Imago mundi*, *Epilogus mappe mundi*, and *De legibus et sectis contra supersticiosos astronomos*. The latter work includes a defense of astrology and its usefulness in predicting religious change (that is, the "laws and sects" of the title) through the examination of conjunctions of Saturn and Jupiter, particularly those falling every 240 ("great conjunctions") and every 960 years ("greatest conjunctions").

Treatises composed on the eve of the Council of Constance reveal that d'Ailly's interest in the stars was tied up with apocalyptic fears surrounding the Great Schism. Many believed, as d'Ailly himself had in the early years of the Schism, that the division in the Church signaled the imminent advent of Antichrist. Astrology helped to reassure d'Ailly that the Council of Constance might indeed end the Schism and delay the apocalypse.

Applying astrology to the study of human history in these treatises demonstrated to d'Ailly that conjunctions and other notable astrological events had correlated with major political and religious changes in the past and could reasonably be expected to do so in the future. Accordingly, in his treatise *Concordantia astronomie cum hystorica narratione*, completed May 10, 1414, d'Ailly produced the culmination of his astrological researches: his prediction that Antichrist would appear in or around the year 1789. He arrived at that date by examining three important signifiers of religious change, namely, a greatest conjunction of Saturn and Jupiter, the completion of ten revolutions by the planet Saturn, and an alteration in the position attained by the *accessus* and *recessus* of the eighth sphere (this latter phrase refers to one of the explanations of the precession of the equinoxes offered in the Alfonsine Tables). Although d'Ailly subsequently would revise many of his pronouncements about astrology (for example, in the *Elucidarium astronomie concordie cum theologica et cum hystorica narratione*, finished on September 24, 1414), he reaffirmed the prediction for 1789 in one of his final works, the *De persecutionibus ecclesie* of 1418.

D'Ailly's writings remained an important source for cosmographers and astrologers through the Renaissance. A number of his astrological treatises appear in two important incunabula (Louvain, 1483, and Augsburg, 1490) as well as in numerous manuscript copies. Christopher Columbus owned and annotated a copy of the 1483 incunable, and d'Ailly's astrological predictions were crucial to Columbus's sense of apocalyptic mission. D'Ailly's prognostications informed later astrological pronouncements, such as those by Jean de Bruges in the 1440s and Pierre Turrell in the 1530s. His work on conjunctions was cited with approval by noted astrologers like Regiomontanus. It may well be that d'Ailly's example opened the floodgates to the wave of astrological apocalyptic predictions that issued from European presses from the late 15th through the 17th centuries.

LAURA ACKERMAN SMOLLER

Pietism

The term Pietism refers to a widely influential reform movement in the 17th and 18th centuries, the first on the Continent since the Reformation. Historical, geographical and personal factors have

all affected the definitions of Pietism, but since the second half of the 19th century a “broad” concept has become common currency. No longer restricted to the Lutheran movement deriving from Philipp Jacob Spener (1635-1705) and August Hermann Francke (1663-1727), together with related currents in the reformed churches of Germany and Switzerland, the concept now embraces the Netherlands, radical and separatist Pietism, as well as Count Nikolaus Ludwig von Zinzendorf (1700-1760) and the Herrnhuter Brethren and even Puritanism. Thus extended, it is possible to identify the distant roots of Pietism.

Johann Arndt (1555-1621) introduced the theme of Pietism in his *Vier Bücher vom wahren Christentum* (1605/10), as the retreat from an outer, formal and rigid Christianity to one that is vital and interior. The intense debate over this book of edification, distributed more widely than any other comparable Protestant work, arose not least because of its swiftly acknowledged reception of unorthodox sources such as → Valentin Weigel, Angela de Foligno, → Paracelsus et al. This ascetic book has remained, albeit with omissions, an enduring part of the Reformation heritage. Ecclesiastical Pietism was thus highly motivated to integrate Johann Arndt and not abandon this influential book to the radical spiritualists. A new pious movement emerging at the beginning of the 17th century in Germany found expression in the vacillating figure of → Johann Valentin Andreae, but Lutheran orthodoxy also made a vital contribution, by fostering piety at all levels of society, and in intellectual and religious life (cf. Johann Saubert, Johann Matthäus Meyfart, Johann Gerhard, Rostock University).

The divisive tendencies inherent in this early pious movement developing c. 1670 at Frankfurt am Main, were integrated by Ph. J. Spener, the leader of Lutheran Pietism in Germany. Already in his Frankfurt period (1666-1686), Spener acquired great authority thanks to his profound theological training, and a patient and shrewd observation of the possibilities of networking closely with noble families. In 1686 he succeeded to the highest position in German Lutheranism as senior court preacher at Dresden, and from 1691 as provost at St Nicolai in Berlin, and as a consistorial councillor where he exercised great influence for more than a dozen years. Spener gave the Pietist movement its manifesto with his *Pia Desideria / Hertzliches Verlangen* (1675), even though it was not particularly original. First published as a Preface to a new edition of Arndt's Postille, *Pia Desideria* was highly effective by weighing complaints about conditions

in the three estates against proposed reforms, and adducing hope for the Church's improvement. Spener's cardinal themes are rebirth, renewal and a personal form of Christianity. His most famous pupil Francke, though inferior to him in theological profundity, surpassed him completely in visionary energy, practical passion and organizational ability, and was able to rely on diligent, selfless and loyal collaborators in his work at Halle (Saale). The influence of Halle Pietism on the Prussian state can scarcely be overestimated. Simultaneously with this Halle Pietism deriving from Spener and Francke, there were similarly influential Pietist movements within the reformed churches both in the Netherlands as well as elsewhere in Germany (Labadists; Theodor Undereyck at Bremen), just as Pietism as a whole is a phenomenon that extends to east and west far beyond the frontiers of Europe.

In Württemberg there developed a special kind of Pietism linked to the Church, but permeated with a strongly speculative element in its major Swabian representatives such as Johann Albrecht Bengel (1687-1752) or → Friedrich Christoph Oetinger. Here in Swabia the dangers of separatism were ameliorated by strategies for special religious gatherings outside official services.

Count Zinzendorf and the Herrnhuters are difficult to classify in the overall picture of Pietism. The origin and biography of the count is complex, but his theories and policy of transforming theology into communal practice were influential. The significance of the Herrnhut brethren in many fields such as theology, with many practical applications in pastoral and missionary work, as well as economics, literature, and much else can scarcely be overestimated.

The diverse basic assumptions of Pietism have been variously emphasised over time: the personal experience of faith; a close-knit community of true believers; a determined effort to grow in sanctity; a critical view of the Church (in both doctrine and hierarchy); a distance from the mundane world as well as the state; an inclination towards self-awareness; an intensive study of what they perceived as the will of God; criticism of a literalist faith; a critical stance towards church services “ex opere operato”. There is no uniform Pietism, a fact evident from the vehement internal controversies between J.A. Bengel and Count von Zinzendorf, between Halle and the Herrnhuters, J. Winckler and J.W. Petersen or → Gottfried Arnold and → Johann Georg Gichtel.

Across this wide thematic range, Pietism produced tendencies which admitted of limited ecclesiastical integration, if at all. One may speak of

“radical”, “separatist” and heterodox Pietism. Communities formed only sporadically and only occasionally lasted for longer periods. The spectrum extends from the “Society of Mother Eve” (Eva von Buttlar) through barely institutionalised communities at small aristocratic courts, Philadelphia communities (e.g. Heinrich Horch, 1652-1729), and followers of Gichtel, to Polycarp Müller’s foundation of independent Moravian church communities. All these represent the occasionally bizarre expressions of Pietism’s early struggle towards a “gathering” of the fellow faithful.

Radical Pietism is difficult to define on account of its overlap with ecclesiastical Pietism. Gottfried Arnold combined both in his own spiritual career, while Gerhard Tersteegen (1697-1769), another Radical Pietist, was also a Quietist, influenced by Pierre Poiret (1646-1719) and Madame Guyon (1648-1717). Other currents and movements approximated Radical Pietism in a modified form: remnants of Schwenckfeldians and Baptist groups, pansophic and kabbalistic circles, and mystical spiritualists. The traditions and sources at work here display affinities to Pietism in their habits and systems of thought, often on the margins of the church and seeking to develop outside official church orthodoxy. Arndt could be regarded as a mystical theologian but for his attempt to institutionalise mystical and spiritualist traditions, as is also the case with Joachim Berke (1601-1663), Christian Hoburg (1607-1675) and Friedrich Breckling (1629-1711).

Boehmean thought has had a strong and varied influence on Pietism. The followers of → Jacob Boehme in Silesia surpass him in their chiliasm or strong criticism of the church (Abraham von Franckenberg [1593-1652], Johann Theodor Tschesch [1595-1649], Daniel Czepko [1605-1666], Johann Scheffler [1624-1677]). Influences on the Netherlands and England were strong. Political and ecclesiastical frontiers offered no obstacle to spiritualists and practitioners of Hermetic arts. In the latter sphere, one finds references to precursors in the 16th century and earlier (Sebastian Franck, Caspar Schwenckfeld, Valentin Weigel). Catholic Quietism and early modern Catholic mysticism were also influential across confessional borders. Christian August, Count Palatine of Sulzbach (1622-1708), initiated reforms involving the Jews far beyond traditional confessional borders. → Franciscus Mercurius van Helmont was able to arouse the Count Palatine’s interest in → Christian theosophy, Kabbalah [→ Jewish Influences] and → alchemy. Three theologians summoned from the

Netherlands, Johann Fischer, general superintendent of Sulzbach, and → Christian Knorr von Rosenroth, active here from 1667 to 1689, all exemplified many facets of Pietism (chiliasm, philo-Semitism, spiritualism).

Enthusiasm coupled with prophetic utterance also played a considerable role in Pietism at the end of the 17th century and in the first third of the 18th century. Extreme enthusiasm is represented by Johann Daniel Müller (1716-85) with his united church of the “Revelation of Christ” and his messianic protest against the Enlightenment. This kind of thinking is particularly strong among musical theorists and practitioners such as Johann Ludwig Fricker (1729-1766), a Swabian Pietist close to F.C. Oetinger. Research opens up a large field here; the prophetic inspirations of Johann Friedrich Rock (1678-1749) have been examined in their historical development, literary expression and ramifications. Enthusiastic movements, particularly among women, have always aroused excitement in the history of Pietism. The question of special revelations beside Holy Scripture has remained an unsolved problem.

The influence of Radical Pietist writings, often appearing in large editions with scant censorship, led to indifference towards dogmatic rigidity, theological teaching and ecclesiastical confessions. They emphasised an interpretation of Scripture based on the presence of the spirit and a relaxation of the literal meaning of the Gospel and even eternal damnation. Indifference towards the outer ecclesiastical structure often extended to a separatist rejection of the church as “Babel”. No confession was regarded as the possessor of the truth required for salvation, but the members of an invisible spiritual church may be found hidden in all confessions. This inner break with orthodox doctrines leading to the development of special teachings smoothed the path towards the theological Enlightenment. The best known product of Radical Pietism is G. Arnold’s *Unpartheyischer Kirchen- und Ketzer-Historie* (1699/1700). One should not underestimate the influence of songs, correspondence, diaries, poetry, journals and (auto-)biographical collections nor their linguistic respect. This is particularly true of such 18th-century figures as Johann Henrich Reitz, → Emanuel Swedenborg, F.C. Oetinger, → Johann Heinrich Jung-Stilling and → Johann Kaspar Lavater, who represent highly individual examples, intensely concerned with natural science, medicine and other branches of science.

Due to its manifold expressions, any consideration of Pietism as a uniform movement in the 19th

and 20th centuries runs the risk of seeing continuity rather than completely new impulses. Recurrent similar phenomena such as the inspirations of Maria Gottlieb Kummer (1756-1828), which accompanied disasters between 1791 and 1809, probably derive from different sources. However new religious communities like the Seventh Day Adventists are akin to Pietists in awaiting the moment of prophetic awakening. Elsewhere a publishing house called "Inneres Leben" seeks to broadcast such works of literature as the Berleburger Bible and works of Gichtel and Gerhard Tersteegen (1697-1769). Around the middle of the 18th century Pietism loses its force as a vital formative movement. Late Pietism and neo-Pietism tend to characterize revivals of classical Pietism rather than an unbroken and continuing influence of Pietism.

Museum exhibitions today (Halle, Herrnhut, Stuttgart, Ludwigsburg) thematize the events and figures of Pietism. The reciprocal influence of Pietism and Hermeticism is slowly emerging now that scholarship is approaching Pietism within a wider and philosophical approach. The question of Pietism's relationship to natural science is also important. The *Bibliotheca Philosophica Hermetica* (Bibliotheek J.R. Ritman, Amsterdam) highlights the many ramifications of the pre-history and associated currents of Pietism and explores its points of contact with the Hermetic traditions. The collections, research, publications and exhibitions of that institution in Amsterdam have an influence extending well beyond that of Pietism.

The doctrine of rebirth in Pietism parallels the process of purification in its many stages from the conquest of Evil up to union with the Godhead. → Alchemy understood as a Hermetic philosophy offered a fruitful soil for these ideas of rebirth but also risks of alienation and falsehood that were not immediately obvious. Two figures of Pietism and its influential pre-history illustrate this medical and scientific thought with special reference to the reception and development of Hermeticism: Johann Arndt and Johann Samuel Carl. Arndt's fourth book of *True Christianity* (1605-10), "Liber Naturae", shows him to be a transmitter of Paracelsian alchemy and mystical spiritualism in the pre-Pietist period. He represents a spiritual alchemy reaching back into the 16th century and fostered by theologically trained physicians and medically literate theologians. The Bible and the Book of Nature are the dominant themes, as transmitted by the Leipzig-born → Heinrich Khunrath into spiritualist and Pietist traditions. Khunrath firmly differentiates Christian alchemy from deceit-

ful gold-making and anticipates the metaphoric use of alchemical concepts as in → Johann Valentin Andreae.

One can scarcely overestimate the influence of → Jacob Boehme on Radical Pietism, which must be regarded as a fruitful humus for Hermetic ideas. Boehme (and Arndt) accord rebirth a far greater significance than the justification by faith in Luther. → Johann Georg Gichtel is the most important follower of Boehme in describing the path of rational man who has turned away from God to the status of one reborn and bathed in a divine light, where the three principles of divine essence and the whole cosmos reflect each other.

→ Gottfried Arnold plays a key role in two respects with regard to the dissemination of Hermeticism within Pietism. In the first place, he describes in his *Kirchen- und Ketzer-Historie* a number of Hermetic authors (→ Paracelsus, Khunrath, → J.B. van Helmont). In the second place, Arnold remained the source for all Pietists sympathetic to Hermeticism in the 18th century (Homburg circle and F.C. Oetinger). Arnold described a biblically founded and divinely illuminated "Magia naturalis", even assimilating Martin Luther's reference to the 'free and natural art of physicians and their like', which had only been perverted by jugglers and sorcerers. A medical and pharmaceutical "Chymistry" is favoured in ecclesiastical Pietism while Radical Pietism inclined more to hermetic-mystical alchemy and Boehmean philosophy. Johann Konrad Dippel (1673-1734) exemplifies the path from rigid Lutheran orthodoxy to separatist radical Pietism with a strong theological, philosophical and medical stamp. His career brought him into contact with Johann Georg Rosenbach and often with J.S. Carl. All three failed in their quest for gold and higher wisdom. Against the background of Hermetic traditions, Dippel founded a comprehensive and philosophically critical anthropology based on communication with God. In 1729 he regarded himself as a friend of Halle Pietism as well as a follower of the new rational chemistry and medicine taught by Georg Ernst Stahl (1660-1734), professor at Halle. Carl was the chief representative of Radical Pietist medicine but tried to overcome what he regarded as its obscure Hermetic fascination. Following in the wake of Stahl and promoting his theories also in the circles of Pietists, Carl's exceptional knowledge of Hermetic literature still enabled him to favour milder remedies against the more aggressive methods of medical and pharmaceutical practice. Carl took his leave of Hermeticism like 'a Hermetic Saul converted into a Stahlian Paul'

(C. Habrich). Accordingly he regarded nature and its God-given order as complete and no longer needful of transformation. This provided material for an intense controversy with Dippel, continued by Dippel's supporter, Johann Christian Senckenberg (1707-1772). The hermetic-mystical position remained one based upon inspiration, while ecclesiastical and radical-separatist Pietists such as Carl and Tersteegen used alchemical concepts only as metaphors. As far as Carl was concerned, the increasingly autonomous spheres of laboratory work and medicine counted for nothing against personal piety. A gulf lay between those Pietists who merely "played" with alchemical notions and the illuminates who espoused a pious Hermeticism such as the Homburgers, who had a high regard for → Georg von Welling's *Opus Mago-Cabbalisticum et Theologicum* (1719, . . . *et Theosophicum* [1735]).

Oetinger represents the zenith and conclusion of Pietism's vital relationship with Hermeticism. He encompasses Hermeticism, alchemy, and a knowledge of antiquity with sovereign independence as well as eclecticism. Finally, Carl Arnold Kortum (1745-1824), a member of the Tersteegen Circle, represents a phenomenon in the late Hermetic period of Pietism, with his call in 1796 for the foundation of a "Hermetic Society" [→ Hermeticism and Hermetic Societies], which conducted alchemical research until 1819.

DIETRICH BLAUFUß

Plethon, Georgios Gemistos, * ca. 1355-1360 Constantinople, † 26.6.1452 (?) Mistra

George Gemistos, best known under his nickname "Plethon", was one of the most notable philosophers of the end of the Byzantine era. After following the traditional course of studies at Constantinople, he made a long stay at the Ottoman court in Adrianople, staying with a Jew named Elisha who was well-versed in the Arab and Persian commentators on Aristotle (Averroes, → Avicenna, and the school of Sohrawardî). From Elisha, he presumably learned some doctrines concerning → Zoroaster. On returning to Constantinople, Gemistos was victimized by a cabal of churchmen on account of the teachings he was giving out. Emperor Manuel II Paleologos sent him to Mistra as political advisor to his son Theodore II, the new despot of Morea. In 1438-1439, Gemistos took part in the Council of Ferrara and Florence on the union of the churches. He held an anti-unionist position, together with his former pupil Mark of Ephesus (Markos Eugenikos), in order to defend the Orthodox cause and, above all, to preserve whatever traces of Hellenism remained in Greek theology. Outside the Council, Plethon attended philosophical meetings in which he was persuaded to give teachings on Plato. In Florence, he wrote for his Italian friends a small Greek work (*Wherein Aristotle Disagrees with Plato*, known under the inappropriate title *De Differentiis*), in which he tried to show that Aristotle went wrong every time he distinguished himself from his master Plato. This work unleashed a fierce argument between Platonists and Aristotelians, much fueled by the Byzantine emigrants in Italy. → Marsilio Ficino later stated that Cosimo de' Medici often listened to Plethon, who was like 'a second Plato', and that this gave Cosimo the idea of restoring the Academy in Florence. On his return to Mistra,

Plethon continued writing a work on the ideal constitution, the *Book of Laws*, which was only to be made known to the so-called *phratores*, members of the *phratria* which he assembled around him (the term, adopted from antiquity, originally referred to a political and religious subdivision of the *polis*; Plethon's *phratria* was supposedly a secret philosophical and religious association with branches in Italy). In the *Book of Laws*, kept hidden because of the threats hanging over him, Plethon based the ideal political constitution on 'theology according to Plato and Zoroaster': a strictly hierarchical polytheism in which the names of the gods were taken from the Hellenic tradition, but could be transposed into other traditions.

The center of gravity of Plethon's philosophical system is the *Magic Oracles of the Magi, Disciples of Zoroaster*. At the time of the Council of Florence, Plethon refused the forced unity that the Latin Church demanded in exchange for materially assisting the Byzantines to repel the Ottomans. Rather than submitting the Orthodox Church to a Pope who was himself contested by the Council of Basel, and considering the impossibility of reconciling the different monotheisms, the philosopher recommended a far more fundamental unity that would bring into one accord the Muslims, the Jews, and the already divided Christians. It would entail abandoning the recent, monotheistic religions, and going back to the original doctrine that must have been common to all the nations of the inhabited world and taught by their wise legislators, from the Iberians in the far West to the Indians in the far East. This doctrine, itself derived from the Ideas (considered as gods), had been best preserved and transmitted by the sage and law-giver Zoroaster and his disciples, the Magi, from whom it had been passed to Pythagoras, Plato, and the (Neo)platonists [→ Neoplatonism]; this was the doctrine of the *Magic Oracles*.

Plethon had discovered these oracles in the collection made by Michael Psellos in the 11th century. He renamed them, expurgated them, and eliminated all Christian interpretation from them. Psellos's collection is known by the title *Chaldaean Oracles* (the Neoplatonists considered them as their sacred book, although the work was actually contemporary with Porphyry). But while the term "Chaldaean" suggested popular → magic, even theurgy, Plethon explained that his terminology referred, rather, to the doctrine of the Magi, who were not magicians but sages. Moreover, he purged Psellos's collection from every trace of Chaldaeism and theurgical prac-

tices, e.g. cutting out the oracles on the Sacrifice of the Mnizouris Stone, on the Spinning Top of Hecate, and the saying 'Never change barbarous names'. As for the *Iynges* or "charms" of the Oracles, he assimilated them to the intelligible Forms and the Ideas (gods) of the Neoplatonists: divinities that were both thought of and thinking. Finally, Plethon reorganized Psellos's collection and interpreted it in the context of a strictly positive and rational metaphysics, thereby separating himself sharply from the Neoplatonic current. On the one hand, he states in the *Book of Laws* that the gods truly allow themselves to be known by humans. Even though the first god of all is known by the 'flower of the intellect' (*noou anthei*: oracle 28b) or 'that in our intellection which is highest and most simple' (as Plethon explains it in his *Commentary on the Magic Oracles*), this approach remains rational: Plethon excludes any recourse to negative theology or to faith. On the other hand, and correlatively, theurgical practices are not considered a relevant method of access to the divine; the only rites prescribed seem to be prayers and hymns to the gods, and these have an effect only on those who recite them.

The link between the *Oracles*, Zoroaster, and the Magi may go back to the time when Plethon was being taught by Elisha, the expert in the Persian commentators on Aristotle. In the *Oracles*, as in Sohrawardi's school, one finds the same theme of light and a similar emphasis on the sage Zoroaster, of whom the ancient Greek as well as the Persian sages are said to be the spiritual heirs.

Zoroaster is thus made to replace → Moses, the common reference-point of the monotheist religions. Plethon also passes over in silence the sage Hermes [→ Hermes Trismegistus], whereas Sohrawardi's school and the Neoplatonists (especially Iamblichus) consider him a primordial sage. This is probably because in Greek patristics, Hermes is coupled with Moses: Cyril of Alexandria, for example, credits Hermes Trismegistus, the Egyptian priest and legislator, with the merit of adopting part of Moses' teachings and of anticipating certain Christian revelations, while Eusebius of Caesarea reports the Jewish historian Artapanus as proving that Hermes and Moses were one and the same. Nonetheless, Plethon was well aware of certain similarities between → Hermetism and the *Oracles*, and admits in the *Reply to Scholarios* that in Egypt the priests adopted the doctrines of Zoroaster and derived their fame therefrom.

Marsilio Ficino, from his *Commentary on the Philebus* onwards, places Zoroaster at the head of

his list of ancient theologians, whereas before 1469 he considered Hermes as the most ancient sage. Ficino owned a manuscript containing several of Plethon's works (preserved in Florence as *Riccardianus graecus* 76), notably the *Magic Oracles of the Magi, Disciples of Zoroaster* with Plethon's *Commentary* (the text, detached, now being lost). In the margin of f.27v. of the *Reply to Scholarios*, Ficino notes, summing up a sentence of Plethon's, that 'the Platonic theology has as its origin the tradition of Zoroaster'. Ficino inserted in his *Platonic Theology* many oracles taken from Plethon's collection, and also included in his own work, without mentioning the fact, whole sections of Plethon's *Commentary on the Magic Oracles* (notably those on the pneuma as vehicle of the soul, and on the idol as image of the rational soul), while attributing this text to the Magi themselves. But Ficino, who also knew and used the collection of the *Chaldaean Oracles* and Psellos's *Commentary*, associated these Magi with the Chaldaeans, and even with the magicians! → Giovanni Pico della Mirandola also owned a copy of the *Magic Oracles*, the loss of which was deplored by → Francesco Patrizi. Patrizi himself compiled an anthology (now Biblioteca Vaticana, *Barberinianus graecus* 179) comprising a copy of the first edition of the *Magic Oracles of the Magi, Disciples of Zoroaster* (printed by Tiletanus in 1538), Latin translations of the collection and of the longer version of Plethon's *Commentary*, the shorter version in both Greek and Latin, and other oracles mostly excerpted from the works of Proclus and Olympiodorus.

If Plethon could assert that Zoroaster's doctrine had been transmitted to Pythagoras and Plato, and could make Plato compatible with the *Magic Oracles*, it was because he believed that Plato's teaching was not limited to what he had consigned to writing. In the *Reply to Scholarios*, Plethon follows Aristotle, Alexander of Aphrodisias, and the Neoplatonists in the idea of a teaching given by Plato by word of mouth. With Plethon, from the start, it is thus an open Platonism that is transmitted to the West, ready to receive into its crucible various esoteric doctrines rejected by Christianity.

Magika logia tôn apo Zoroastrou magôn, Georgiou Gemistou Plêthônos Exêgêsis eis ta auta logia. Oracles chaldaïques. BRIGITTE TAMBRUN

**Poiret, Pierre, * 1646 Metz,
† 21.5.1719 Rheynsburg**

Known as a “Quietist” mystic, Poiret drew upon the theosophy of → Boehme more explicitly than either of the other major figures of this movement, Guyon and → Bourignon, whose works he was instrumental in publishing. Poiret was a Calvinist pastor who preached in Heidelberg until he was converted to the → mysticism of Tauler by Bourignon, and was persecuted by local church officials. By 1676, he was forced to live in Amsterdam, where he met → Johann Gichtel, the “hermit of Amsterdam” and founder of the *Engelsbrüder*, or angelic brethren. Poiret became an influential figure throughout Western Europe not only because he edited and published the works of Guyon and Bourignon, but also because of his own writings, which were widely distributed and read in theosophic circles. His work eventually became influential in the emergence of German → Romanticism, and he drew explicitly and extensively on Germanic mysticism – in particular Tauler, Boehme, and the *Theologia Germanica*. Poiret was in touch with the Philadelphians in England, and was instrumental in making possible the English publications of Bourignon’s works. He died in Rheynsburg in the Netherlands, where he had taken nearly life-long refuge from ecclesiastical persecution.

Poiret’s magnum opus is his seven-volume *L’Economie divine* (Amsterdam 1687), published in English translation in London in 1713. In this *Divine Economy*, Poiret offered a grand view of human history, covering the nature of creation, the fall, and most importantly, ‘L’Economie du Rétablissement de l’homme après l’Incarnation de Jésus-Christ’ (The Economy of Re-establishing Humanity After the Incarnation of Jesus Christ) and ‘L’Economie de la coopération de l’homme avec l’opération de Dieu’ (The Economy of Human Cooperation with the Operation of God). In these sections of *Divine Economy*, we find what might be called the limited millennialism of Poiret, a grand schema in which humanity moves toward reunion with God.

In this major work by Poiret one can perceive the influence of Boehme, but Poiret’s more explicit Boehmean writing is to be found in another work,

Theologiae Christianae juxta principia Jacobi Boehmii teutonici, Idea Brevis et Methodica, published in 1708. Here, as is obvious from the title, Poiret outlines the theology of Boehme ‘briefly and methodically’. He also published a *Bibliotheca mysticorum selecta* (Amsterdam 1708), which contains his selection of the works of mystical authors, as well as a book of commentaries on emblems entitled *L’âme amante de son Dieu, représentée dans les emblèmes d’Hermannus Hugo* (Cologne 1717), sometimes wrongly attributed to Madame Guyon.

From all of these publications, we can recognize in Poiret a figure belonging to the theosophic tradition, a man of immense productivity responsible for a number of major publications, and of often unacknowledged influence on subsequent European literature and religion. Poiret is an enigmatic figure in some respects – for instance, early on he was influenced by the work of René Descartes, who would remain influential even during his later, more Boehmean period. This is remarkable because Cartesian and Boehmean thought are usually considered irreconcilable. Poiret remains a figure whose work deserves a comprehensive reappraisal that fully takes into account his place in the theosophic tradition as a whole, as well as the relationship between Quietism, Germanic mysticism, and theosophy during this period. Major studies are Chevallier (1994), Krieg (1975, 1979), and Wieser (1932).

ARTHUR VERSLUIS

Politics and Esotericism

The difficulties inherent in the potentially unlimited field of politics, combined with the complexity of the definition of → esotericism, requires a definition of the method of approach used here. It includes both a reflection on institutions from the point of view of political philosophy, which opens up the question of the legal status of esoteric groups, and an anthropology of politics including its fields of representation and their variations in space and time. Another serious difficulty lies in the unconscious or deliberate confusion of the esoteric and the religious, which is in fact a prolongation, in this particular aspect, of the interference and conflicts between politics and religion.

In historical terms, the elements of these types of relationship were already in place in classical Greek antiquity and in the world of the biblical prophets. Thereafter, the changes in Western religious consciousness at the time of the Renaissance and the emergence of politics in the modern sense favored speculations of an esoteric kind on the legitimacy of power. At the time of the Enlightenment, and then the French Revolution, the eclipse of the clergy's share in political power, and even in some countries its elimination, gave rise to new needs for unity and a search for meaning, which esotericism was ambitious to satisfy. Tied to the establishment of democracy in the 19th and 20th centuries, the relation of esotericism and politics has evolved in the contemporary world alongside globalization. This evolution has gone hand in hand with that of the religious and scientific imagination.

The transition to citizenship (*politeia*) in Athens occurred in symbiosis with the original familial and tribal society; Aristotle in his *Nicomachean Ethics* presented man as “naturally” political, and Plato entrusted the philosopher with a mission of re-descending into the cave to transmit the divine models that are inaccessible to ordinary men. Thus the practices of the mystery religions and of initia-

tion went together with the appearance of democracy, just as the interpretation of the signs given by the Pythoness at Delphi for the founding of new colonies linked the political strategy of the Greek cities to a type of speculation with esoteric traits. It is not surprising that in the messianic intellectual ambience of the Mediterranean during the Hellenistic era, Philo of Alexandria classified the political arts as belonging to → magic and likened statesmen to magicians and sorcerers (*Treatise on dreams*, 2-39). With the exception of those who incarnated the new divine model on earth, and whose figures are found in the Scriptures (Solomon, and more especially Melchisedech, the mysterious King of Salem, without father, mother or offspring, the guarantee for the legitimacy of Israel to whom Abraham paid his tithe in Gen. 14:20), the attitudes of the Jewish exegetes and the Christian Fathers remained very similar on this point. Moses Maimonides, commenting in the Middle Ages on the Torah in his *Guide to the Perplexed* (2, 39), contrasted the political regimes resulting, for example, from the “laws of the Greeks” with those founded on the words of the prophets. However, a certain doubt concerning the authenticity of advice that arrived through the “voice of heaven” left room even in the Scriptures for divination [→ Divinatory Arts] and for magicians, as testified by about twenty biblical references. The renewal of the prohibition, which proves the continuation of the practice, and the consultation of the Witch of Endor by King Saul (I Sam. 28:7) are examples: “Seek out for me a woman who is a medium . . .”. The confirmation by “occult arts” (Maimonides's expression) of heaven's decree abandoning Saul endowed them with a certain legitimacy: it was indeed the shade of Samuel that appeared. The Middle Ages inherited from Antiquity, with the separation of powers, an uncertainty about the boundary between their respective domains: to the sovereign as image of the divine model corresponded the authority of the State as the foundation of pontifical canon law. The pontifical religious legislation set down in the Decrees of Gratian (1140) rested more on Roman law than on the Bible. Esoteric speculation as a procedure of knowledge capable of effecting a bridge between these two domains thus gradually came to hold an important stake. It was already present in the discourses of visionary prophetesses such as → Hildegard of Bingen, who drew her teachings from her access to the “primordial language” free from any → mysticism, and was heeded by princes and popes during the conflict that opposed them to the Empire, notably to Frederick Barbarossa (1122-

1190). The emergence in late medieval Europe of states founded on juridical bases favored the speculations of such prophetesses, who counseled sovereigns. With the Cistercian monk Joachim of Fiore, commentary on the text of the Apocalypse tended to integrate elements of an esoteric type, arithmological speculations, and exegesis of the signs for recognizing the Great Monarch and the Angelic Pope that would mark the coming of the fourth age. This validation of time by means of a secret history was among the things that prepared the Renaissance, and the innumerable commentators on Joachim followed in the same direction.

At the time of the Renaissance, the emancipation of religious morality was accentuated (Machiavelli's *Prince* being significant in this regard), and politics was henceforth considered an art, opening up to esoteric thought the heritage of a global vision of the world and of a link with the absolute. → Tommaso Campanella, in *The City of the Sun* (1599), associated the question of the union of churches and the realization of "natural law" under the scepter of the King of France with calculations concerning a collision between the sun and the earth. Even in the age of classicism, the argument of John Milton's *Paradise Lost* (1667) linked the fall and original sin to a change in the axis of the earth. Moreover, the wars of religion gave a new vigor to esoteric-political speculation. In *The Ash Wednesday Supper* (1584) → Giordano Bruno identified Elizabeth I of England with the Virgin of the Golden Age to whom the universal empire was promised: certainly a mystic power, but one whose exercise and approach were based on an intellectual process. In the same way, the lilies of the royal arms of France, according to → Guillaume Postel, went back to biblical symbolism and made Francis I into a figure of the universal monarchy. The art of politics, faced with the question of meaning, likewise found a new kind of expression, notably after 1516 with the *Utopia* of Thomas More. But it was the Rosicrucian manifestos [→ Rosicrucianism] that were most significant in associating the themes of secret transmission and of the orient as a source of knowledge with magical and alchemical practices, in the story of the initiatic journey of Christian Rosencreutz. The influence of the *Fama Fraternitatis* (1614), followed by a *Confessio* (1615), then by the *Chemical Wedding of Christian Rosencreutz* (1616), was considerable in the Germanic world of the Holy Roman Empire during the Thirty Years War. The main author, → J. Valentin Andreae, was a Lutheran, studying theology at Tübingen and seeking a hero destined to head the Evangelical Union. The Calvinist prince Chris-

tian of Anhalt (1568-1630) seemed to him capable of playing this role, but this identification changed in the Rosicrucian texts as circumstances altered. In Elizabethan England, one of Andreae's inspirers, → John Dee, author of the *Monas Hieroglyphica* (1563) dedicated to the "liberal" Catholic Emperor Maximilian II of Habsburg, placed his talent as an astrologer at the service of his sovereign; → Michael Maier served Rudolf II (1552-1612) at Prague, etc.

In the 18th century, the Rosicrucian influence soon became part of the movement of → Freemasonry, by being integrated into the various systems of high degrees; it was always very visible in Europe, particularly in the entourage of Frederick the Great of Prussia (1712-1786), with the role of Bischoffswerder (1741-1803) and of the *Gold- und Rosenkreuz* (Golden Rose-Cross). The king had presented a unitary vision of the world in his *Anti-Machiavelli* of 1739: 'If one wishes to reason justly in the world . . . one must go back to the origin of things so as to know, as far as one can, the first principles'. This declaration is significant of the role that the masonic institutions may have played in the great transformations of Europe during the Enlightenment, as the chosen field of debate between conquering reason and various forms of theosophical → Illuminism.

After the dramas of the revolutionary wars, esoteric modes of thought contributed heavily to setting up the new intellectual systems that presided over the difficult birth of democracy and a dawning "sense of history", expressed in equally new formats. The term *ésotérisme*, of learned origin, appeared first in French (1828) and soon after in the main European languages; a little later came *occultisme* [→ occult / occultism] – two terms illustrating the wish to create a legitimate intellectual framework in confrontation with science on the one side, and the struggling churches on the other. Politically speaking, esoteric thought has been used in the romantic sense of a return to the past, to the origins, against modernity, as well as being progressivist in the sense of awaiting the fulfillment of prophecies. While → Joseph de Maistre speculated on the eschatological meaning of the trials of his time in *Les soirées de Saint-Petersbourg* (St. Petersburg evenings, 1821), the first socialists were awaiting the Age of the Spirit, from Richard Owen (1771-1858) to Pierre Leroux (1797-1871, one of the first to use the term *ésotérisme*) and the Saint-Simoniens of Enfantin (1796-1864) who were preparing the coming of the Feminine Messiah. → Eliphas Lévi, the master and inspirer of occultism in the second half of the 19th century, had been

active in the revolution of 1848 and raised Napoleon to the stature of a social Messiah; like Maistre, Lévi thought that the prophecies ever since Antiquity would be realized in the 19th century, at the moment when their esoteric meaning became evident. In the Western world as a whole, there was an apparent contradiction between the progress of public debate essential to the new democratic citizenship, and the growth of numerous and influential secret societies, preparing in the shadows for the times to come. The theory of occult sciences, preserved in the secrecy of the sanctuaries, was an essential key for explaining the delay in the coming of the Spirit, of which democracy was considered the visible, social form. The people's lack of education explained the delay, but thanks to progress, the truths safeguarded "under a bushel" would appear in the light of day.

This new view of the relationship between past and future dominated the political visions of → Madame Blavatsky and → Annie Besant as successive heads of the → Theosophical Society. For Blavatsky, it concerned the relations between East and West during the colonial period; for Besant, the messianic function of woman. The same attitude also underlay the mental constructs of fringe masonry, conceived as the secret laboratories of tomorrow's world. In the Latin countries they were often revolutionary, with the Italian Carbonari fighting for national unity, or the French Carbonerie plotting against royal power. In Great Britain and Germany they actively opposed the "establishment", as for example the para-masonic organizations of the → Hermetic Order of the Golden Dawn and the → Ordo Templi Orientis. In the U.S.A. the success of the Rosicrucian movements beginning with → Paschal Beverly Randolph was also marked by this double face, turned Janus-like towards the past and the future.

A number of new religious movements, particularly in the → "New Age" category, owe to 19th century esotericism the association of technical with human progress in a context of occultist speculations. But the same legacy has also included a rejection of Western individualistic civilization; and this all the more easily since the Christian religions have steadily abandoned the field, leaving it open to esotericism. The totalitarian systems, though not fulfilling a function that can be compared with the association of esotericism and socialism in the first half of the 19th century, seemed to some to have a natural affinity with esoteric thought. → Aleister Crowley combined his rejection of British society with a marked interest first in the Stalinian system, and then in the Italian

Fascism of Mussolini, before being expelled from Cefalu by the latter. → Julius Evola went further, basing his hopes for the return to a traditional society on Fascism, then on National Socialism.

While Stalin tolerated the presence of "Russian Cosmism", a heritage of Theosophy, around the physicist Sakharov, Himmler's S.S. quickly sloughed off the esoteric and mystical pretensions of some of its members, as soon as they tried to exceed a purely decorative role.

A special place must be assigned to → René Guénon, whose radical rejection of the Modern World (1927) and move to Islam had no small influence on esoteric conversions in Europe and North America, through the intermediary of the universalist Sufism of Ibn 'Arabî (1165-1240). In the Muslim world, disquieted by Westernization, this example from the West fostered a return to indigenous traditions, and sometimes a fundamentalist interpretation of the sacred texts.

Finally we should mention the importance of denunciations, found throughout history, within the triangular relationship of the political, the religious, and the esoteric: the political institution typically denounces esoteric religion as a cult, whilst the religious institution denounces the subversion of the state by the esoteric society.

JEAN-PIERRE LAURANT

Pordage, John, * 1607/8 London,
† 10.12.1681 London

The son of a London merchant, Pordage was born in 1607 or 1608 and entered Pembroke College, Oxford, in 1623. It is possible that he obtained a diploma of doctor of medicine at Oxford in 1640, but some scholars doubt this (Hutin 1960, 82). In any case, he was not destined to practice medicine, but to be an exemplar of *homo religiosus*. Pordage entered the order of the Anglican Church and was made vicar of the church of St Lawrence's at Reading in 1644. Soon, under

the auspices of → Elias Ashmole, he was made rector of the rather wealthy parish at Bradfield, a position he held until 1654.

At Bradfield, Pordage's wife, Mary Freeman, an especially pious and spiritual woman whom he married for that reason, began to have visionary experiences. Soon Pordage himself was experiencing remarkable phenomena as well, including angelic apparitions, and these were also witnessed by other members of a small prayer group of theosophers who had gathered around Pordage and his wife. This group eventually came to include men like Thomas Bromley and Edmund Brice – both of whom were educated at Oxford and themselves wrote theosophic treatises – and women like Anne Bathurst and Joanna Oxenbridge, both women of high society who have left us records of their spiritual journeys with the Pordages.

Pordage's visionary experiences began in August of 1649, with an opening of the visionary worlds in which he was approached by a spirit, a giant, and a great dragon with 'great teeth and open jaws' that 'oft ejected fire at me'. Pordage would have been overcome by terror, he wrote, had he not been 'supported in an extraordinary way, by the Ministrations of the Holy Angels' (*Innocencie*, 72-73). This opening of the worlds was the revelation to Pordage and his family of the good and evil invisible realms: Pordage and his family believed that they saw at first hand the *Mundi Ideales*, or invisible realms, one full of love, the other of wrath. The wrathful realm was evidently quite unpleasant: Pordage and his family, he wrote, witnessed not only the presence of evil hierarchies – in monstrous theriomorphic forms, all "misshapen", with cat's ears, cloven feet and fiery eyes – but also their physical manifestations such as sulphuric foul odors and even the imprint of their images on the windows, ceiling, and chimney of the house. He and his wife, being unable to remove these various images from the chimney by using wet cloths, finally resorted to smashing them off with hammers (75).

But Pordage writes that he also passed through the flames and entered into paradise, which he calls the *Mundus Luminosus*. Here he encountered 'multitudes almost innumerable, of pure Angelical spirits, in figurative bodies, which were clear as the morning-star, and transparent as Cristal' (75). He saw the rare beauty of these beings, felt the inexpressible joys and harmonies of heaven, smelled delightful heavenly scents, and heard celestial music. The 'tongue can hardly express these Odours of Paradise', and these glorious visions and sounds, he writes.

About this time, Pordage was tried before the local Anglican commission as an heretical minister of the faith. Against him were arrayed a whole range of charges, including provocative statements and immoral conduct. Pordage was able to defend himself well against all these charges: the supposedly provocative or heretical statements imputed to him he proved to have been taken out of context and misinterpreted; the charge that he had kept a mistress in London he demonstrated to be quite false. Having exonerated himself from the accusations, he was allowed to continue as a minister from 1649 to 1654. But in 1654 Pordage was tried again on the same charges, and despite his eloquent rebuttal he was removed from his ministerial position at Bradfield. One of the chief accusations was 'that he hath very frequent and familiar converse with Angels', and that when he was attacked by a demon in his home, 'his Angel stood by him and upheld him'. Further, it was held against him 'that Mrs Pordage and Mrs Flavel had their Angels standing by them also, Mrs Pordage singing sweetly, keeping time on her breast, and that his children saw the spirits coming into the house, and said, look there, Father . . . And the whole roof of the house was full of Spirits' (*Innocencie*, 14-15).

The hostile atmosphere in which Pordage's second trial took place can be gathered from his account of the judge's rancor. Pordage did have legitimate reason to be upset, for even the very act under which he was being tried was itself not instituted until a full year *after* those things with which he was charged had reputedly taken place. In such an atmosphere, one is hardly surprised to find Pordage on trial, since he was adamantly a non-juror. He defended himself in a moving peroration, asking his fellow ministers what harm he had caused them, especially since he did not proselytize or even criticize them, but only sought to live a reclusive life. Nonetheless, he was convicted and removed from the ministry (*Innocencie*, 79).

Although he was deprived of his livelihood and found himself in extremely difficult circumstances for the remainder of his life, these outward difficulties only served to intensify his, and his group's, convictions and inward life. Their persecution did mean that for some years they felt they lived spiritually in the 'outer darkness' surrounded by wrath; but eventually they were restored to angelic communications and to the spiritual light. Yet until his death, Pordage and his small group kept themselves out of public view so as to avoid censure.

After the Restoration under Charles II in 1660, when suspended clergymen were allowed to return to their positions, Pordage did not take this step,

but remained quietly with his group of fellow theosophers. As a leader of a small, private, non-Anglican religious group, Pordage had, however, to be discreet, especially after 1664 when such non-conformist meetings were again outlawed, and their leaders ran the potential risk of fines and imprisonment. Worse, the years 1665 and 1666 saw the advent of the Great Plague and the great London fire, seen by many as signs of the Apocalypse (fears intensified by the associations of the number 1666 with the number of the Beast in Revelation). Many people fled London, and Pordage and his group had to return to Bradfield, returning to London only in 1668, the year Pordage's wife died.

This time of outer difficulty also saw what is in some respects the most important affiliation of Pordage's life: the one with → Jane Lead, who first felt called to join his group in 1663. She remained a member of his group, and in fact assumed leadership, especially after April 1670 when, after her husband's death, she experienced a vision of the Holy Virgin Sophia, who called her to a virginal life (*Fountain* I.17). From this point on, she began to write a large number of extraordinary visionary treatises, and became a central theosophical figure. In 1674 she moved into Pordage's own house, at his request, so that together they could form a more powerful spiritual union. Pordage died on December 10, 1681.

From the early 1670s until his death, Pordage wrote most of his elaborate, lucid, and concisely expressed metaphysical treatises. All these treatises were based wholly and directly on his own spiritual experience, exemplary of which is the treatise *Sophia*, which consists of twenty-two daily journal entries dated from 21 June to 10 July, and which contains biographical data from the year 1675. Pordage's magnum opus, *Göttliche und Wahre Metaphysica* (Holy and True Metaphysics) was also written during this time, and was probably concluded in the year of his death. But none of these works were published during his lifetime and, even more surprisingly, only two were published in English after his death. Although all his works had a wide private circulation, and were extremely influential in both England and on the Continent, it remains a strange fact that Pordage's primary works – albeit written in English – were published only in German, and have been accessible only in that language to the present day.

We can begin with the two works published in English: *A Treatise of Eternal Nature with Her Seven Essential Forms* (1681) and *Theologia Mystica, or the Mystic Divinitie of the Aeternal Invi-*

sibles, viz, the Archetypous Globe (1683). The *Treatise of Eternal Nature* offers a general introduction to the concept of Eternal Nature, the 'first original and true ground of all created beings and so of all true knowledge' (Preface). Outward, physical nature, then, has its origin in an archetypal, pure realm of "Eternal Nature" similar to the Platonic realm of Ideas or Forms. Thus Divine Nature is 'hid in Nature, as a Jewel in a Cabinet'; it is manifested in the Seven Essential Forms, and has its origin in the Abyssal Nothing, which is the 'ground of all Essences, and yet no Essence to be seen in it', the 'fruitful Mother of all Things' (105, 107). In Pordage's treatise, then, we see a visionary hierarchy or ascent from the natural world to the archetypal, to the Seven Essential Forms (the qualities informing existence), to the Abyssal Nothing of God Himself.

In *Theologia Mystica*, we travel with Pordage on his visionary journey. Lead wrote effusively of Pordage's rich spiritual life, and wrote of 'those wonderful Transportations he had (or rather they had him) for the space of three weeks together . . . His outward Body lay in passive Stillness in this visible Orb' (7). Pordage offers us 'a copie taken out from the Original . . . of all Worlds', which he had seen in visionary trances that sometimes lasted weeks at a time. According to Pordage, all the different realms or "worlds", including this "visible Orb" of physical nature, are comprised within the sphere of "Eternal Nature". Eternal Nature includes the 'Four Elementarie' worlds: the 'outward visible world' below; the 'Dark-fire' or wrath-world of hell on the left; the 'Fire-Light', or 'Severe World' in the center; and the Light-Fire World, or Paradise, on the right. Above them is the 'Angelical, Heaven, or Love-World'. Thus Eternal Nature encompasses all the possible realms of creation, including heavenly, paradisaal, hellish, and earthly.

Pordage employs the images of the Globe, the Eye, the Heart, and the Breath to explain visionary spirituality, and the supreme illumination (31). This illumination is essentially a vision of the Archetypes of all things, which the visionary perceives in the divine Eye within the 'Abyssal Globe' of Eternity (34). Pordage's treatise is structured as a progressive revelation of the Globe of Eternity, of the divine Eye within it that perceives itself, and of the Eye in the divine Heart that is at the center of the Globe, in which one may behold God 'Face to Face' (37-38).

Pordage then writes of the Virgin Sophia, who is 'co-essential' and 'co-eternal' with the Holy Trinity, but not 'co-equal' with them: she is but a pas-

sive efflux of the Trinity, its Glory and Mirror (68-69). Finally, Pordage writes of the nature and qualities of the angelic spirits. The spirits possess a materiality and senses of their own: 'These *Spirits* are endowed with a Spiritual kind of materiality from the Love-Essence in the Heart of God'. The spirits have their own language; they have one ear, one eye, one breath (details that underscore their unity) and their 'food and drink' is power from the Trinity (87, 92). Pordage's treatise therefore leads us from the initial vision and cosmology, through the transmuting power of Sophia, into the angelic heavenly realm itself.

In his treatise *Sophia* – which was extremely influential for German theosophers, including → Gottfried Arnold, whose own book on the Virgin Sophia was drawn in part from Pordage's – Pordage offers his experiential knowledge of Sophianic revelation in a journal form, dated 21 June to 10 July, in twenty-two chapters. Neither the dates nor the number of chapters are accidental. Pordage begins by explaining the nature of Sophia, or Divine Wisdom, as well as of the Light World, and the soul's hunger and thirst for spiritual truth. He discusses the meaning of the Biblical references to the creation of a "new heaven and a new earth"; the harmony of this world below and that above; the Paradisical Eden in the Soul; and the Quintessence or Elixir of Life. Pordage explains that the Holy Virgin reveals the New Jerusalem in the heart and soul of the newly reborn man, and he completes his work by discussing knowledge of the light and dark worlds.

In his *magnum opus*, the three-volume *Göttliche und Wahre Metaphysica* (Divine and True Metaphysics), Pordage discusses these light and dark worlds in detail. The breadth of this work is quite remarkable; around two thousand pages long, Pordage's *Metaphysica* reveals the realm of eternal nature, the wrathful world, the paradisaical realm, and the angelical world in clearly organized sections. His work is explicitly visionary: Pordage writes that it derives not from reason alone, and is not like that of the Platonists, but emerges 'out of what my eternal understanding spirit with its eyes has seen revealed of the Angelic centri' (II.ii.26).

Pordage's first volume discusses the 'Spirit of Eternity' and Eternal Nature, asserting that God permitted the Fall of his creatures in order to reveal his *barmherzigkeit* (compassion). In the second volume, Pordage outlines aspects of the angelical spirits (*Englische geister*) including their immortal nature, their possession of a "materiality" different from that of the physical world (including an Angelic body), their inward unity, their possession

of will, senses, and above all, inward freedom. They are powerful, good, immortal, and made in the likeness of God.

We should note one angelic characteristic Pordage emphasizes: the nature of their bodies. He writes that the angelic body is organic or has functional limbs, and is in many things like man, or rather, man is in his outer form made in the image of the angels (II.iv.12). He writes of angelic noses, mouth, ears, eyes, and so forth; and though Pordage refers to the traditional cherubim and seraphim of the Dionysian hierarchy, he makes it clear that his knowledge of angels comes not from having read → Pseudo-Dionysius Areopagita, but from having visited with angels, whom he is describing.

Pordage's third volume treats of the dark or wrathful world. He discusses the nature of demons or fallen angels, *finstern magia* (black magic), sorcery, the 'Hellish Tincture', the devil, the 'spiritual Babylon', and the spiritual Egypt. But his third volume does not dwell only on evil and wrath; later in the volume he writes of the 'heavenly Tincture', and the Community of Spirits (*Gemeinschaft der Geister*), topics closely reminiscent of his friend Thomas Bromley's work *The Way to the Sabbath of Rest*. He discusses "Eternal Nature" and the three courts of the Globe of Eternity we mentioned earlier, as well as the 'eternal heart of God' (*Von dem ewigen herzen Gottes*), the Virgin Sophia or Wisdom, the Seven Forms or Spirits of God, and the Angelical World.

Any list of Pordage's primary works must include two others, written in the last few years of his life: the *Vier Tractatlein* (Four Little Tractates), and the "Treatise on the Philosopher's Stone". The "Four Tractates", dated 3 August 1676, discuss the 'outer birth and fleshly life of Jesus Christ', the 'Mystical and Inner Birth', the Spirit and Degrees of Faith, and, finally, experimental (experiential) discoveries of the union of nature, essences, tinctures, people, and spirits (*Experimentale Entdeckungen von Vereinigung der Naturen/ Essenzen/ Tincture/ Personen und Geister*). In this last section on "experiential discoveries" we are introduced to foundations for the "Treatise on the Philosopher's Stone", a very concise alchemical work.

The "Treatise on the Philosopher's Stone", only sixteen pages long, is a remarkable work of spiritual → alchemy. In it, we see how theosophers in general and Pordage in particular drew on alchemical terminology and process to explain theosophical transmutation and revelation. Essentially, Pordage sketches here the process by which

the human being is purified, transmutes his energies from wrath into love, and becomes an illuminated and unified being. He points out that fallen man is subject to the influences or energies of Mars and Venus, or anger and lust (emotional attraction and repulsion rooted in selfishness) (7). Eventually there comes the harmony of the planetary qualities, Saturn, Mercury, Mars, Venus, and Luna; the process culminates in the ‘milk and blood of the Virgin’, the ‘Pearl of the Virgin’, and ultimately the unity and harmony of the planetary qualities within the individual, who is suffused with spiritual light (11-16). The treatise ends with the ‘Pearl of the Virgin’, which symbolizes purity and illumination.

On the whole, Pordage is the single most important English theosopher of the 17th century. His works were very influential for such figures as Gottfried Arnold and, much later, Vladimir Solovyov, particularly in his explication of male and female tinctures and his lucid discussions of the virgin Sophia and of his visionary experiences. Although Pordage was denigrated for extravagant mysticism not only during his lifetime, but by subsequent authors like Rufus Jones (who clearly had little if any acquaintance with Pordage’s extensive works), in fact a close study of Pordage’s works reveals their breadth and depth as well as a more catalogical mind than Boehme’s. Thune (1948), Hutin (1960), Gibbons (1996), and Versluis (1999, 2003) provide the major discussions of this figure so far, but we remain in need of books devoted to Pordage alone.

ARTHUR VERSLUIS

Postel, Guillaume, * 1510 La Dolerie,
† 6.9.1581 Paris

Born in Normandy, to a family of humble tillermen, he came to Paris early at his parents’ death. Moved by a passionate desire to acquire instruction and learning, he began by mainly teaching himself in the Liberal Arts and oriental languages, while attending lessons at the Colleges of Sainte Barbe and Cardinal Lemoine; working there as a servant to pay for his education, he is likely to have met some of the foremost representatives of the so-called “Pré-Réforme catholique”, who were precisely teaching at these schools, the *milieu* of → J. Lefèvre d’Etaples. Gradually, Postel came in touch with some well-connected individuals who, impressed by his knowledge, promoted him at the French Court. The first outward indication of royal favour directed towards him consists in his being sent, in a minor diplomatic capacity, to Tunis and Istanbul, on a quest for oriental manuscripts destined to enhance the king’s library (Feb. 1535-June 1537). Back in Europe, he landed in Venice, where he stayed for some two months and came in contact with several important Humanists and printers, like T. Ambrogio (1469-1540) or D. Bomberg. His first books (*Alphabetum XII linguarum, De originibus linguæ hebraicæ*) appeared in Paris the following year and caused him to be appointed “lecteur royal” at the recently founded “Collège trilingue” in 1539. As soon as 1540, the first intimations of a profound and lasting spiritual crisis manifested themselves, which – coupled with his

growing disillusion with courtly life, due to the sudden disgrace of his main protector, Chancellor Poyet – led him to the decision to renounce worldly honours, official positions and the benefices they entailed. He then became convinced of having heard divine voices, summoning him personally to dedicate his life to the pursuit of establishing a universal religious concord. After a last, unsuccessful attempt to persuade King Francis I of the necessity of reforming his kingdom and court, in the face of impending divine anger, and having written his important *De orbis terræ concordia* during the Winter 1543-1544, Postel left Paris for Rome, where he arrived in March 1544, to try and join the newly formed Company of Jesus. He remained in that city until the Spring of 1546, in the meantime ordained as priest by the Vicar General of the city, F. Archinto (1495-1558), but ultimately rejected (Dec. 1545) by the Jesuits on account of his stubborn personal messianic convictions, and his unwillingness to recant his opinion about the decisions of the Council being intrinsically superior to that of the Pope, as well as about the universal monarchy being ultimately devolved to the king of France (two ideas quite unsavory, to be sure, to Ignatius of Loyola and his first – mostly spanish – companions!). Free, henceforth, to move about as he pleased, Postel went to Venice (end of 1546), first taking up residence at the “Ospedaletto san Zanipolo” (hospital St John and Paul) as chaplain and meeting there a woman he was soon to call his “Madre Zuana” (Mother Johanna) and the “Venetian Virgin”. Ministering to the poor and the orphans in the care of this establishment, living an intense mystical life (including the reception of the stigmata), endowed with visions and prophetic revelations, she appears to have shared with Postel certain views concerning the religious concord and imminent “restitution” of mankind.

Having elected him as her confessor, she confirmed his personal claims to an eschatological role (that of “angelic pope”, already announced by Joachim of Fiore) while convincing him, at the same time, of her profound spiritual wisdom and of the veracity of her intuitions, notwithstanding her mundane illiteracy. Soon, our man identified her with the feminine messiah, due to reveal and open the penultimate era of the so-called restitution, of which he considered himself the “first-born”, by regenerating the yet unredeemed lower part (also feminine!) of the human soul. They were in contact for approximately 18 months, and Postel was to remain a lifelong enthusiast of his “Venetian Virgin”, whose private revelations (including, of course, those concerning his own mission) he

found confirmed at every page of the *Zohar* and numerous other kabbalistic texts he was actively meditating, translating or actually composing (*Or ha-Menorah*, 1548) during this venetian sojourn. From the Summer of 1549 until after Easter 1551, Postel – sponsored by his friend Bomberg – travelled to the Middle East and visited Jerusalem. When he disembarked again in Venice, “Mother Johanna” was dead; and a few months later in Paris, at the Epiphany of 1552, Postel experienced his famous “immutation”, during which, having undergone severe illness, interpreted by him as the occasion for drastic spiritual purification, he convinced himself to have incorporated her “celestial body” and, thus, to have become *substantially* her son and that of Jesus-Christ, the first-born of the second Adam and the second Eve!

After several more trips across Europe, which led him to Besançon, Basle and Vienna (where he actively collaborated in the eventual printing, in 1555, of the first Syriac New Testament), our man found himself yet again back in Venice, where he asked for an inquisitorial court to examine his works. At first he probably reckoned with the court’s leniency, since it was headed by his old acquaintance, F. Archinto. As it turned out, he barely escaped with his life by being officially declared insane, and spent the following four years in a roman prison. Eventually released by a popular upheaval following the demise of Pope Paul IV (1555-1559), he resumed his peregrinations throughout Europe (Basle again, Augsburg, Italy, Lyon) before settling anew in Paris (1562). The first of his two final great bouts of spiritual exaltation occurred in 1566, the year of the famous “miracle of Laon” (a public exorcism operated with the help of the Eucharist), to which Postel dedicated several tracts upholding the event as demonstrative of Roman Catholic views on the sacrament, as opposed to the Protestant tenets he knew well, having opposed them all his life. The second occurred in 1573, when he briefly came under the spell of yet another woman, a widow named Marie Villeneuve, who claimed to have been made pregnant by the Holy Ghost (!). A few years later, he died peacefully under the regime of mild confinement he had been sustaining for years at the monastery of St Martin des Champs, having persevered with his private teaching, writing and publishing almost until the end.

The range of Postel’s thought is much too complex, intricate and far-reaching to bear synthesizing here. Apart from the afore-mentioned themes of the universal concord and “restitution”, the acknowledged two main pillars of his doctrine

are the “kabbalistic” theories relating to the *mens Messiae* and *revolutio animarum*. But before we start examining them briefly, two essential features of our author’s intellectual personality should constantly be borne in mind. First, each and every of his favourite tenets, as well as the ideas borrowed from – at a pinch – Plato or the Jewish kabbalah, → Cusa or → Ficino, he (re)interprets and wields in strict dependance on the hazards of his own inner life, and what he firmly considers his ultimate spiritual calling. For instance, his gift for languages he sees as a “sign” of his commitment to bring about religious concord (through books and preaching . . . and the Crusade !), and his capacity of actually writing down huge tomes in a relatively short time becomes a token of his inspiration from above. We are actually dealing with a man who did not hesitate to claim himself (and the Venetian Virgin) to be portrayed in certain medieval sculptures appended to the northern portal of the church of San Marco, sculptures which he believed had been originally commissioned by Joachim of Fiore himself, in order to herald his future mission!

Another, omnipresent aspect of his thought is his obsession with the “fourth term”, as he likes to call the divine immanence within the corporeal side of nature, which he envisages as the most complete and perfect expression of the Godhead, whose ultimate *raison d’être* resides in the spiritualization of the entire material creation. “Substance”, here, is the key word and it is quite literally that Postel understands the *substantial* participation of the christian brethren (indeed, of all mankind) in the “mystic body” of Christ, or the “consubstantiality” of his own kinship with Jesus and Mother Johanna, conceived more or less along the same lines (and *mutatis mutandis*, of course) as the doctrine of the conversion of substances in the Eucharist. Precisely, the ontological gap between the Godhead and physical nature is bridged by this “fourth term”, which he calls “created wisdom” (related to divine wisdom, i.e. Christ, as ‘one side of a coin to the other’), “first spirit of all things” and “mother of the world”, and identifies for these reasons with the Venetian Virgin herself, the ‘lower part of the substance of Jesus-Christ’. Some of the names or images (*daughter*, etc.) Postel uses to describe this particular, half-divine entity, he actually derives from the *Zohar*, an esoteric *midrash*-like commentary on Scripture, replete with myths, symbols, sexual imagery, applied to the cosmological levels as well as to the inner processes of the divine realm and attributes. Although he is of course hard put to reconcile such elements with trinitarian metaphysical conceptions, Postel is not

so much concerned here with theology and rational exegesis as with the dynamic integration of such patterns into his own personal, tense mystical outlook. Underlying all this is his unflinching quest for experiential wisdom, which takes for him the exacting guise of *imitatio Christi*. Thus, instead of merely indulging in speculations about them, he is led to immerse himself in the symbolic and mythical dimensions of themes like the feminine messiah or the transmigration of souls, inseparable from his messianic claims and, accordingly, given an actual expression as concrete stages or episodes of his own spiritual life. According to Postel, therefore, the *imitatio Christi* resides in the accomplishment of the substantial embodiment of divine wisdom, an idea in perfect accord with Pauline views on the subject, if perhaps too literally understood.

Thus it is that Postel attributes the name *mens Messiae* to what he sees as being the fundamental archetype of such an embodiment, ‘the immobile Godhead communicating itself to the mobile [and tangible] world and elements’, an entity of considerably ambiguous ontological status, as we have already said. Inspired by esoteric speculations about the Messiah contained in different passages of traditional Jewish texts (*Beresbit Rabba* and the kabbalistic *Sha’are Orab*, in particular), Postel ends up equating his *mens Messiae* with the “fourth term” mentioned above, which is supposedly instrumental in conferring existence upon every singular living being. This “superior soul of the Messiah” is for him identical with the (divine) Law (or divine/created wisdom, that is: applied to the creation), the universal – active and passive – Intellect, ‘l’esprit de Jésus par la Maternité générale du monde [Mother Johanna] faisant sa finale action dans le corps’. It is also the spiritual source of inspiration common to all *prisci theologi*, at work behind their respective doctrines, and accounts for Postel’s constant preoccupation with the quaternary, and → number symbolism in general, whether envisaged from a theological or a cosmological perspective (the *merkavah* of the vision of Ezechiel and the pythagorean *tetraktys*).

Holding fast to his now familiar Christological focus, Postel interprets the *revolutio animarum* (hebrew *gilgul*, or metempsychosis [→ Reincarnation]), an important notion in both Greek and Jewish ancient cultures, as based on the *anima Christi*. Distinct, nevertheless, from the *mens Messiae*, this “lower soul of the Messiah” revolves, ever since Adam, through all biblical prophets, like Noah or Elijah, up to John the Baptist (an esoteric and, simultaneously, quite literal interpretation of I Peter I, 11). Separated from their upper part at the

time of the Flood, the two “halves” of this soul have animated the two lineages of Japhet and Sem, i.e. that of the first- and second-born of Noah, until they were again harmoniously conjoined in Jesus-Christ and *a potiori* in his later feminine advent. Whether male or female, each human being must undergo a similar psychic process of purification, by which his/her “upper soul” (*mens* and/or *spiritus*) reverts back several times into a body after death in order to be finally reunited with its predestined lower counterpart (*animus* and/or *anima*). Only when these spiritual preliminaries are achieved may the “restitution” be manifested. The preservation of the lower human soul is for Postel both the goal and esoteric meaning of Christ’s descent to Hell (motivated by the necessity of redeeming all lower souls held captive there, including his own!), and explains the fundamental role of woman in accordance with the Jewish law of the Levirate. Thus the *circulatio animarum*, the keystone of which is the *anima Christi*, is made the foundation of the spiritual right of the “first-born”, an idea central to Postel since it symbolizes for him the whole, divinely preordained cosmic harmony, before Satan introduced confusion in the world and in human lineage(s) as well, by inducing man and woman to sin. First-born *par excellence*, Jesus appears on Earth as (humanly) descended from the second-born since “the first will be last” and he has come to set things back in their primordial place.

Self-proclaimed first-born of the “restitution”, as the *substantial* son of the second Adam and Eve, it was therefore inevitable that Postel should also have claimed possession of an enlightened upper soul; accordingly, in a book published as soon as 1547 (*Panthenosia*), he already announced his own (re)endowment with the (illuminated) “reason” of Adam before the Fall, and of the prophet Elijah, who enjoys full understanding of all things and will reunite them ultimately. The Venetian Virgin, whom he met precisely at that time, could but evince even higher privileges, while instructing him into the most arcane mysteries and entrusting him with their ulterior public revelation, when the time would be ripe for such a course of action. Each of these three figures, then, narrowly linked to the “restitution”, has been granted in some measure reunion of his/her lower soul with that of the messiah, and is thus rendered capable of assuming an eschatological role.

Absorbed in his very personal Christian approach, *in paupertate, probro et dolore*, Postel seems unlikely to have been attracted at all by → magic – even “spiritual” – or theurgy, as were so many of his colleagues and predecessors, ‘from

Ficino to Campanella’. Yet, a passage from his *De admirandis* (1549, f. 216r^o; see bibliography) does provide a strange overtone in this respect: mentioning the angelic powers ascribed to different countries and areas of the globe (a very ancient topic, always dear to him ever since the *De orbis*), Postel adds [*aggregatis omnibus mundi Geniis*] *sicut nunc mihi reconciliaui per magni nominis dei virtutes*. Such an assertion could easily be construed as alluding to an operation of “angelic (or kabbalistic) magic”, the kind of which Postel might have considered necessary within the context of his mission, to ensure – for example – the cooperation of the so-called *Genii* in bringing about the universal Christian persuasion or concord. Given the isolated and somewhat enigmatic character of the sentence, one must of course remain wary of the temptation of actually reading too much into it; but the question seems worth raising.

As regards → alchemy, Postel – who intended to live in strict poverty and, anyway, led a mostly peregrine existence – obviously never dedicated himself to the actual pursuit of the philosopher’s stone. Certain general themes, widespread in the literature pertaining to the Art, like the role of the elements in cosmogony or the seminal analogy between incorruptible gold and *terra pura*, he nonetheless frequently adapted to cosmological or even mystical speculations of his own, thus anticipating – along with others – a trend which became famous later, albeit in a very different manner, with → Jacob Boehme.

Postel’s influence may be considered long-standing and, perhaps paradoxically, both discreet and significant. On the one hand, the greater part of his works remained unpublished (some were lost), or rapidly became very scarce on account of the small number of copies printed; most were more or less tacitly considered unreadable, either because of their size (*De orbis*) or because of the obscurity of their contents (or both!). Almost all smacked of heresy, first and foremost among them the small French (*Les très-merveilleuses victoires des femmes du nouveau-monde*, Paris 1553) and Italian (*Le prime nove dell’altro mondo; Il libro della divina ordinatione*, Padua 1555) tracts dealing with the Venetian Virgin, in which the author really seemed to evince unacceptable claims. On the other hand, some of the cosmographical treatises enjoyed new printings during the 17th century (*De universitate, Cosmographicae disciplinae compendium*) and the three small books – important for the author’s esoteric thought and all published by J. Oporin in 1547 – *Panthenosia, Clavis absconditorum, De nativitate Mediatoris ultima*, difficult but seemingly

more accessible, did exert a certain influence on several circles linked to the rosicrucian movement [→ Rosicrucianism], as well as on a number of theosophers and mystical reformers like Jacob Boehme's famous disciple and biographer, Abraham von Franckenberg (1593-1652). The 19th century French and English occultist movement, → Eliphas Levi *en tête*, was up to a point cognizant of Postel's ideas and often acknowledged him, albeit improperly, as one of its forefathers.

Although he was (and still is) rightly celebrated as an important Christian kabbalist, besides being a remarkable linguist and cosmographer, Postel's focus always remained on the *imitatio Christi* and on his self-appointed mission. For the most part, esotericism (including of course kabbalah) is for him but a tool meant to discover "proofs" of his (and Mother Johanna's) messianic role featured in Scripture, and in the Jewish and Platonic traditions; at the same time, and conversely, his "restitution" enables him to publicly reveal their real and ultimate signification(s), of which he alone (by divine favour) has a universal grasp – a typical mystical reformer's attitude.

JEAN-PIERRE BRACH

Prayers → Hymns and Prayers
(Gnostic and Hermetic)

Prisca Theologia → Tradition

Prodicus, 2nd cent.

Prodicus was a Gnostic teacher [→ Gnosticism] of whose life nothing is known. → Clement of Alexandria and Tertullian, who are our primary sources (both about 200 A.D.), almost exclusively speak about the ‘followers of Prodicus’, and when they mention his name it is only as the representative of the movement that was called after him. This might be an indication that Prodicus was not their contemporary but that he had lived earlier in the 2nd century. According to Clement, *Stromateis*, III, 30, I and VII, 41, 3, the followers of Prodicus called themselves “Gnostics”. This

self-designation can also be concluded from the beginning and end of Tertullian's *Scorpiace*. In 1, 5 he says that in times of persecution the "Gnostics" and the Valentinians [→ Valentinus and Valentinians] deceive the simple believers by saying that Christ has died once for all and that it is against God's will to die for Christ. In 15, 6 these two groups are hinted at again, but now by mentioning the name of their founders. He then imagines how 'a Prodicus or a Valentinus' might have tried to dissuade the apostle Paul from his martyrdom, suggesting that one ought not to confess before men, the more so because God did not thirst after human blood and Christ did not ask retribution for his death.

It is impossible to assess whether the followers of Prodicus are identical with the "Gnostics", who according to Irenaeus, *Adversus Haereses*, I, 29, adhered to a Gnostic system which resembled to a great extent that of the *Apocryphon of John*. Tertullian, *Adversus Praxean*, 3, mentions the Valentinians and Prodicians as heretics who introduced not one God as opposed to the Creator, as → Marcion did, but more. This suggests that Prodicus, like most other Gnostics, taught a divine Pleroma, which in itself agrees with the doctrine exposed in Irenaeus, *AH*, I, 29. The followers of Prodicus boasted that they possessed secret books of → Zoroaster (Clement, *Strom.*, I, 69, 6), as did the Gnostics behind the *Apocryphon of John* (NHC II, 19, 8-10: 'If you wish to know them, it is written in the book of Zoroaster'). For the other tenets of the Prodicians, discussed below, there are no parallels in Irenaeus I, 29-30 and the *Apocryphon*, and therefore, the correspondences between these texts and what we know of Prodicus are insufficient to establish with certainty the identity between the followers of Prodicus and Irenaeus' Gnostics.

According to Clement, *Strom.*, III, 30, 1, the followers of Prodicus claimed to be 'by nature sons of the First God', which gave them a strong sense of being above the law. 'Thanks to their noble descent and their freedom they live like they want, but they want to live in pursuit of pleasure. For they believe that nobody rules them, since in their view they are lords of the Sabbath and royal sons of higher birth than the whole race of men. For the king, however, they say, the law is unwritten'. This idea of the Gnostics as a royal race without a king above them is also found in other Gnostic texts, for instance in the *Apocalypse of Adam*, NHC V, 82, 19ff., which says that 'the generation without a king' was elected by the saviour in order to shine upon the

whole aeon. Of course, Clement interpreted this being above the law as a permit to unbridled licentiousness, but he was evidently unable to prove this allegation and, therefore, suggested that the Prodicians committed adultery in secret, afraid as they were of being caught, condemned and punished. 'How could licentiousness and foul language be characteristic of a free person?' (*Strom.* III, 30, 2-3). It seems more probable, however, that the Prodicians, just as the Valentinian pneumatics considering themselves 'saved by nature' and as such elevated above the laws of the Creator, adhered to high moral principles and even to an ascetic way of life. Whether they also rejected marriage and the begetting of children can not be settled with any certainty. That the Prodicians considered themselves by nature the sons of the First God may have led them to the rejection of prayer. In a discussion of the importance of prayer, Clement, *Strom.*, VII, 41, 1-6, says that those around Prodicus taught that one should not pray. He does not want to interrupt his argument by a refutation of the 'unholy Gnosis of those Gnostics falsely so called', but nevertheless he sometimes seems to respond to the arguments of the Prodicians. They apparently argued, as also Clement does, that 'God knows those who are worthy of the good things or who are not; therefore he gives every one what is befitting him'. But, Clement says, from this we should not conclude that prayer has no sense: 'Petitionary prayer is not superfluous, even if the good things are given without request. For example, thanksgiving and prayer for the conversion of his fellow men are the specific tasks of the true Gnostic'.

ROELOF VAN DEN BROEK

**Pseudo-Dionysius Areopagita →
Dionysius Areopagita, Pseudo-**

Ragon de Bettignies, Jean-Marie
(Jean-Marie de Venise, Comte Marie de Venise), * 1781 Bray-sur-Seine (Seine et Marne), † 1866 Paris

The author of *Tuileur général de la Franc-maçonnerie* (General Tyler of Freemasonry, 1861), like F.-T.-B. Clavel (1789-1852) or Thory (1759-1827), was a living memorial of French → Freemasonry from its reconstitution after the Empire up to its secular development in the second half of the 19th century. Ragon's passage through fringe-masonic organizations with occultist tendencies, such as the Rite of Misraïm (which he left in 1816), esoteric churches like that of the Abbé Châtel (1795-1857), or the Neo-Templar [→ Neo-Templar Traditions] order of → Fabré-Palaprat (1773-1838), made him a prominent figure in the French intellectual and spiritual landscape. Little is known of his life. He was treasurer at the general revenue office of Bruges in 1803, at the time of his masonic initiation into the lodge "La Réunion des Amis du Nord", then senior clerk at the headquarters of the national guard of Paris in 1815, when he founded the lodge that would become famous under the name of *Trimosophes*. He then published the periodical *Hermès* (1818-1819), a sort of annual of reviews of masonic sessions and festivals, before leaving with some friends for the U.S.A. He reappeared in Paris around 1835; in the 1860s he lived in the Clignancourt area (18th arrondissement). By then he was considered a great personality and authority of the order, publishing his rectifications in the *Bulletin du Grand Orient de France*. Most of his publications post-date his return from America; he brought back, in particular, a work on the degree of the *Royal Arch . . . contenant une étude sur . . . l'esprit de la Franc-Maçonnerie aux Etats-Unis* (containing a study on the spirit of Freemasonry in the U.S., 1860). Ragon's work combines second-hand interpretations of the origins of the order in Antiquity with expositions of the meanings of degrees and rituals. He goes back as far as Eleusis, Memphis in Egypt, and India in his quest for the sources of initiation – an initiation as imagined by the first theorists of esotericism. His *Cours philosophique et interprétatif des initiations anciennes et modernes* (Philosophical and interpretative course on ancient and modern initiations, 1841) was reprinted in 1860; he stressed the initiatic synthesis that was able to unite the biblical masons with the Templar or Egyptian masons, this capacity being a pledge of agreement between peoples. During the same period, the secularization of the high-degree

rituals in France occasioned his publications on the degrees of "Rose Cross", "Kadosh", Apprentice, Fellow Craft, and Master, as well as on the rituals of adoption. All of this was presented as historical adaptations of an eternal "masonic orthodoxy" (*L'Orthodoxie maçonnique*, 1853). Ragon links this occult masonry with an esoteric Christianity, which he had experienced as "Vicaire primatial" in the Johannite Church of Châtel, in *La Messe et ses Mystères comparés aux Mystères anciens* (The Mass and its mysteries compared to the ancient mysteries).

Cours philosophique et interprétatif . . ., Paris: Berlandier, 1841 ♦ *La messe et ses mystères*, Nancy, 1842 ♦ *Orthodoxie maçonnique*, Paris: E. JEAN-PIERRE LAURANT

Randolph, Paschal Beverly,
* 8.10.1825 New York City,
† 29.7.1875 Toledo, Ohio

Black American visionary and spiritualist whose work transformed the passive and severely limited perspective of 19th-century American → spiritualism by emphasizing active pursuit of individual progress and realization through practical techniques – in Randolph's case, the use of drugs, magic mirrors and sexuality. Born impoverished and illegitimate, he grew up on the streets as an orphan, with minimal education. He took up, in turn, employment as a bootblack, cook, cabin boy and barber. Despite this background and the disadvantage of his color in the period surrounding the American Civil War (1861-1865), Randolph traveled several times to Europe and the Near East. In later life he became known as an orator and, for a time, politician, and wrote numerous tracts and more than 25 books, including very readable novels, most of which are still kept in print by Rosicrucian groups claiming descent from his original occult foundations.

By Randolph's own account, he had been a seer

from childhood and haunted by the spirit of his mother, who had died in the pesthouse at Bellevue Hospital when he was seven years old. This experience led him to embrace spiritualism as it swept the United States after 1848, and he became an ardent apostle of the new teachings. After some early experience in other forms of mediumship, he settled down as a trance medium, delivering communications from the spirits of the dead while unconscious and totally under the spirits' control and influence. During his incessant travels over the northeastern United States in the early 1850s, in support of spiritualism, he claims to have delivered more than 3000 speeches in this manner. In 1855 he traveled to England to deliver the message of the spirits to the World Convention sponsored by Robert Owen in London; but he was not allowed to speak because the socialist Owen, though a believer, feared that Randolph (and spiritualism) would bring ridicule on his political cause. During this entire early period, Randolph is distinguished from other contemporary mediums only by his energy and enthusiasm. The communications delivered by him through his spirits appear to have been standard issue: reassurances of post-mortem existence, consolation of the bereaved, and pleas for general social reform in this world (woman's rights, anti-slavery, and the like).

By the mid-1850s, Randolph had begun to realize the limitations of spiritualism, especially its unchallenged assumption that the communicating spirits were always those of dead humans, and he had become painfully conscious of the dangers of passivity with respect to the controlling spirits. As his personality shifted radically under the control of the various spirits (usually well-known American political reformers and radicals, but occasionally a spirit calling himself "Zoroaster"), he became, as he himself admitted, insane. After failing in his attempts to take his own life, he fled abroad again, to England and Europe in 1857-1858, where his spiritualistic seances garnered him a degree of recognition and a reputation for instability. On this and a subsequent trip in 1861-1862, he also traveled to the Near East, where he encountered what he called the "Ansairee" – the Nusa'iri of Syria, whose secretive ways had excited European interest since the 1780s – and the Rosicrucian Brotherhood whose teachings he propagated for the remainder of his life.

In England and France, Randolph exhibited his powers as a medium, producing wonders and apparitions that were duly noted in the press. He also traveled in the more complex world of Mesmerism [→ Animal Magnetism] and clairvoyance,

which by that time had developed strong elements of occultism [→ occult / occultism] and active magical practice; and he became familiar with the established European traditions of magic mirrors (screying), → Rosicrucianism, theosophic speculation and → magic that he was to make use of on his return to America. It is impossible now to ascertain with certainty the members of this occult underworld whom Randolph encountered on his travels. He mentions various minor spiritualist luminaries of the time, now forgotten, but also the novelist → Edward Bulwer-Lytton, → Hargrave Jennings (the author of dense compilations on the secrets of a supposed sect of phallic-Buddhist Rosicrucians), and Baron Dupotet de Sennevoy (foremost among the French Mesmerists and users of magical mirrors). There also is reason to believe that Randolph moved in the circle of British scryers that included Frederick Hockley, K.R.H. Mackenzie and Robert H. Fryar – although Randolph's fully developed system of using mirrors taught the student to view the wonders of the magic mirror himself, rather than relying on the second-hand revelations of an entranced seer.

With respect to the Near East the situation is even more obscure. The names of the teachers Randolph says he learned from on his travels are meaningless to historical research, and their status is ambivalent as well. Like the Rosicrucians Randolph claimed to have met in Europe, they existed 'on both sides of the grave', i.e. on the material plane as well as in what Randolph called the "soul world" (the vast cosmos of beings and worlds that Randolph believed stretches beyond this earth and humanity to include a bewildering hierarchy of the born and never born: including spirits, angels, seraphs, Arsaphs, Eons, Arsasaphs, Arch-Eons, Antarphim and so on). For Randolph, after he returned from his travels, the crucial juncture between the realities of everyday life and this visionary cosmos inhabited by these creatures of vision lay in the Rosicrucians. They were not simply the Rosicrucians of history. Rather, they were supernal, evolved beings, some human and some never human, who cloaked their activities and presence on earth under the name of Rosicrucians while playing a larger role among the celestial hierarchies – a role that the neophyte Rosicrucian was invited to undertake as well. Chief among these celestial Rosicrucians was the Egyptian Ramus (or Thotmor), "Chief or Grand Master of the Superlative Order of Gebel Al Maruk" – known in Christian lands as the Order of the Brethren of the Rosie Cross, and in America and Europe, where it still thrived, as the "Imperial Order of

Rosicrucia". On his travels Randolph also learned of the power of hashish and other psychoactive drugs (datura, opium and others) which he called by the Arabic name *dowam meskh* and soon began importing in quantity into America for their visionary properties.

In 1858, on his return from his first trip to the Near East, Randolph included what he had learned in his most masterful theoretical book, *Dealings with the Dead*. While confusing and ambiguous in places, it is clearly the product of Randolph's lived experiences rather than of mere learned research or hearsay. It burst like a bomb on the limited world of contemporary spiritualism, and revealed to stunned American spiritualists the glories of man the immortal spirit who was invited to progress through myriads of worlds and incarnations in a never-ending struggle toward self-consciousness, spiritual power and divinization. Far from a simple world in which living humans communicated with their deceased brethren in the Summer Land through the offices of mediums, the world Randolph revealed was a breathtaking vista of over-arching hierarchies in which man could actively struggle to progress through clairvoyance developed by use of drugs and magic mirrors and, most importantly, by techniques of sexual magic. These techniques were circulated only in privately printed tracts and in manuscript, and consisted basically in ritual preparations leading to sexual intercourse, designed to put the student in direct contact with the celestial hierarchy. It is possible that they also included a form of sexual intercourse between the neophyte Rosicrucian and celestial entities themselves, but there remains some unclarity on this point.

Randolph gave various explanations for the sources of this sexual magic, attributing it at times to the Nusairi of Syria and at other times to his own creativity. Whatever the source, however, the effect of such techniques was powerful and they were the secret that underlay the various Rosicrucian groups that Randolph began to organize after 1861, first in San Francisco, then in Boston and other American cities. All of these were short-lived, but their influence endured in other magical groups, such as the → Hermetic Brotherhood of Luxor in the 1880s and the circles around Maria de Naglowska in Paris in the 1920s and 1930s. Most importantly, they survived in the recognition that man's role in the spiritual world was an active one that required the neophyte to put forth the full effort of his "Imperial Will" in order to progress – a commonplace idea now, but novel in the spiritualist world of the 1860s and 1870s. Randolph's

motto on his return to America became "Try!", an injunction reiterated, perhaps not coincidentally, by the Masters of → H.P. Blavatsky in the early days of the → Theosophical Society.

Crucial to Randolph's vision of the world was the notion not only of hierarchies, but of competing hierarchies of the Brothers of the Light (the Rosicrucians) and the Brothers of the Shadow (evil men and celestial entities who had renounced or lost the chance to progress by seeking evil goals, and now remained only to hinder mankind). In this idea Randolph obviously found the explanation of his own troubled life and insanity, but the same notion also underlay the meta-explanations later offered by the Hermetic Brotherhood of Luxor, C.G. Harrison, → René Guénon and others to explain the development of spiritualism in the 19th century: behind the apparent facts of spiritualism was the "hidden hand" of these mysterious, competing brotherhoods, which acted through Randolph, Blavatsky and others to achieve their occult goals.

The success of Randolph's Rosicrucian work on his return to America was hampered, as always, by his race and his instability, but also by the Civil War. In the last years of the war, Randolph, who had always been ambivalent about his race and frequently denied it (claiming Persian or Madagass origin), had momentary success as a Black politician and a teacher for the Freedmen's Bureau, educating newly-freed slaves in New Orleans. In late 1865, he set up in Boston as a physician specializing in sexual problems, and founded what he called the first School of Clairvoyance. To this period belong his numerous works on human affection and sexuality (all designed as enticements to inquire about his more profound secret teachings), *Seership!* (1870), and *Hermes Trismegistus: His Divine Pymander* (1871), a reprint of Dr. Everard's 17th-century translation. After losing everything in the great Boston fire of 1872, Randolph moved to Toledo, Ohio, where in 1874 he published what some regard as his magnum opus, *Eulis*, named after the last and highest degree of his teachings on sexual magic. The same year he tried for the last time to found an order, with a group of students in San Francisco, but this grandly named "Triplicate Order of Rosicrucia, Pythianae and Eulis" came to nothing.

In his later years, Randolph became increasingly depressed and paranoid, and turned to alcohol for relief. On July 29, 1875, shortly after his return from San Francisco, he shot himself in Toledo, in a fit of jealous rage over the supposed infidelity of his wife – a suicide that later occult history has trans-

formed into death in an occult duel with Mme. Blavatsky.

JOHN PATRICK DEVENEY

Reghini, Arturo, * 12.11.1878 Florence, † 1.7.1946 Budrio

Reghini was a key figure in early 20th century Italian esotericism, playing a major role in restoring the spiritual traditions of → Freemasonry, and above all in reviving Pythagoreanism. His books and articles cover a variety of subjects including Masonic symbolism, theosophy [→ Theosophical Society], → Neoplatonism, → Agrippa and → Cagliostro. As editor of the magazines *Atanòr* and *Ignis* he published articles by → René Guénon. He also stimulated the interest of esoteric author → Julius Evola (1898-1974) in the spiritual quest, despite the profound divergences between the two men; Reghini was forced to retire from public life because of his Masonic connections and anticlerical stance, while Evola joined in the anti-Masonic campaign fostered by the fascist regime.

Reghini was born in Florence and got a degree in mathematics at the prestigious University of Pisa. While still a student he struck up a life-long friendship with the musician Amedeo Armentano (1886-1966) who inspired him to investigate Italy's longstanding Pythagorean traditions. He took an early interest in the revival of esoteric studies in Italy, long dormant due to disapproval by the Catholic Church. In 1896 he went to Rome to meet Isabel Cooper-Oakley, the delegate of the → Theosophical Society, and in 1898 was among the first founders of the Italian branch of the Society.

In the pre-war years he was active on the Florentine literary scene, contributing to the avant-garde magazine *Leonardo* with its mixture of philosophy, esotericism and admiration for the Risorgimento. He also founded the Philosophical Library, registered as a public institution.

Reghini became a Freemason in Florence in 1903. A few years later a split developed in the Grand Orient for a variety of reasons, among which were objections to overly close links between Freemasonry and leftwing politics and to a decline of interest in the esoteric quest. This led to the formation of the Grand Lodge, which Reghini supported. In 1911 he was among the founders of the Italian Philosophic Rite. After Mussolini came to power, Reghini called attention to himself by supporting the nationalist stance of the new government while criticising the powerful Catholic wing of fascism. However, the new regime promoted the campaign which led to the prohibition of Freemasonry at the end of 1925. Reghini, then Grand Chancellor, was a signatory of the decree by which the Grand Lodge declared its own dissolution as a precautionary measure (the Grand Orient had done likewise; however, this did not prevent a wave of anti-Masonic persecution and confiscation of property). After collaborating with Reghini in the early 1920s in *Atanòr* and in the Group of Ur, Julius Evola later denounced him in the fascist press. Reghini left Rome to settle in a small town near Bologna, where he conducted research on Pythagorean mathematics until his death in 1946.

The magazines *Atanòr* and *Ignis* represent a landmark in Italian esoteric culture. *Atanòr*, published in 1924, contains articles by Reghini shedding new light on Pythagoreanism and the Egyptian Rites of Cagliostro. The board of editors included the well-known Neapolitan esotericist → Giuliano Kremmerz. There were contributions by Guénon as a result of the close contacts of Reghini's friend, Armentano, in the occult societies of Paris. *Ignis* (1925 and a last issue in 1929), while

continuing this line of study, reflected the pre-occupation about the increasing intolerance being shown by the fascist regime for non-Catholic spiritual traditions. Here his biting irony, typical of the Florentine pre-war literary magazines, did little to attenuate the polemics aroused by what was becoming a full-blown anti-esoteric campaign conducted by clerical-fascist publicists, anxious to smooth the way towards the Concordat between Church and State. Besides his research on Pythagorean mathematics and articles on Masonic symbolism, Reghini wrote a detailed and valuable introduction to Cornelius Agrippa.

Atanòr 1924 (reprint), Rome: Atanòr, n.d. ♦ *Ignis* 1925-1926 (reprint), Rome: Atanòr, 1980 ♦ Amedeo Armentano, *Massime di scienza iniziatica*, Ancona: Ignis, 1992 ♦ Arturo Reghini, *Le parole sacre e di passo dei primi tre gradi ed il massimo mistero massonico*, Rome: Atanòr, 1981 ♦ idem, *I numeri sacri nella tradizione pitagorica e massonica*, Rome: Ignis, 1947 ♦ idem, *Dei numeri pitagorici: Prologo*, Ancona: Ignis, 1991 ♦ idem, "L'intolleranza cattolica e lo Stato", in: *Paganesimo Pitagorismo Massoneria*, Furnari: Editrice Mantinea, 1986.

DANA LLOYD THOMAS

Reincarnation I: Antiquity

Reincarnation, or metempsychosis, metempsychosis, transmigration, is the belief in the passing of a spiritual being, the soul, after death into some other body. The four terms quoted are synonymous, although "reincarnation" is sometimes improperly reserved for the passing of the soul into a specifically human body, whereas "metempsychosis" and "transmigration" are said to include animal or vegetal bodies. In fact, this distinction does not hold for classical theories.

There is a wide-spread belief among pre-literate societies that each human being possesses one or several spiritual vital elements, "souls" or "spirits" – whatever they are called in indigenous languages. At death, these elements are believed to disperse, each one to its appropriate abode – or to disappear altogether. However, at least one of them joins the

transcendent ancestral village or a common pool of vital energies. In the course of time, this element leaves the pool or the ancestral village and enters the embryo of a future member of the clan, very often of a grandson. Being associated with the transcendent life-stock of the community, it is revered as a particularly sacred or even "divine" presence in the human being. Sometimes such beliefs are coupled with an ethical principle and it is said that after the demise of the body the "soul" or whatever it may be called has to undergo rites of purification. These may also be executed by the bereaved community on behalf of the dead person's "spirit". Ethnologists disagree whether these beliefs and practices can be viewed as parallels to classical theories of transmigration, but classical concepts can easily be interpreted as elaborations on these pre-literate traditions.

Even in the absence of written testimonies it is quite likely that in pre-literate Greece or Greater Greece some local communities held similar convictions. We know indeed that in some places a newborn baby was given the name of the grandfather, most probably because people recognized in him a new "incarnation" of the deceased member of the clan. It may be that theories of transmigration ascribed by tradition to itinerant "Orphic" shamans, magicians and soothsayers hail in truth from local beliefs and practices.

The oldest written testimony about reincarnation is due to the poet Pindar (ca. 518-438). In the second of his *Olympian Odes* he celebrates the victory Theron, the tyrant of Akragas (today's Agrigento in Sicily) had won in the Olympic games. In lines 57-80 he describes in rather dark language the fate of the dead. There are three groups: the wicked suffer frightful punishments in the under-world, and the good will be blessed with a carefree existence in the company of the gods. There is also a group of people who will keep themselves free from wrongdoing during three successive lives and who will finally reach the Islands of the Blessed where they will enjoy everlasting happiness. It has been suggested that this latter theory is based on local traditions current at Akragas; stating that a spiritual entity passes through various purificatory bodily stages, it is at any rate not very far away from our model of pre-literate beliefs and practices observed all over the world.

Reincarnationist ideas are firmly attributed to the ancient sage Pythagoras (6th century) and to his disciples. It is said that Pythagoras, observing someone beating a dog, stopped him because he recognized in the dog the soul of a dead friend. In later times people made fun of him pretending

that he knew his former and future lives over ten or twenty generations, including many passages through animal bodies.

We tread on safer ground when we come to Empedocles (ca. 490-435), an important physicist, philosopher and divine. He hailed from Akragas in Sicily, so we might assume that his ideas about reincarnation or transmigration are derived from the same local traditions as the section in Pindar's second *Olympian Ode* mentioned above. Influences from wandering Pythagorean sages may also be at work. Empedocles taught that souls are pre-existent and divine. Being in the grip of a metaphysical agent called Strife they commit murder and other sins and are condemned to purify themselves in the course of many existences. Empedocles states that he himself had been a boy, a girl, a shrub, a bird and a fish, and had attained an outstanding degree of spiritual power, but that he would still have to undergo some more births until his soul could again attain its original status among gods and immortal heroes. It is important to note that transmigration is valued negatively as a punishment, as a type of suffering in a world which itself is nothing but suffering. One of Empedocles' main poetic works bears in fact the title *Purifications*. His model of transmigration turns out to be ascensional: it is return to the lost divine status. The metaphysical agent Strife being the cause of violence and killing among living beings, Love, the second metaphysical principle, will be the ethical guide for incarnate souls. Souls being found everywhere, in humans as well as in animals, the way of purification will be a path of non-violence, a path of complete abstention from killing and from animal food.

It may be noted that Empedocles' depreciative perspective on the necessity of reincarnation is somewhat akin to Indian theories where the perspective of reincarnation engenders anguish and suffering. However, Indians never admit that reincarnation *as such* may ultimately lead to full salvation of the soul. With the Greeks, the purpose of transmigration is, fundamentally, to allow sullied souls to purify themselves and thus to regain their initial divine condition. In India, the process of reincarnation has never begun and will never end by itself. It goes on until the soul is disenslaved by an initiatory rite or by a liberating experience which acts as it were "from outside". There is thus a very marked difference between Indian and Greek ideas of reincarnation.

Returning to Greece, we see that in the 5th century B.C. beliefs about the soul and her destinies received more elaborate developments and became

more widely known. Nevertheless, they were never universally accepted. Critical thinkers like the sophists and Aristotle later on dismissed them with disdain. It may be that the critics were vaguely aware of the folkloristic origin of these beliefs.

But the most powerful and influential defender of the soul and of reincarnationist theories was yet to come: Plato (ca. 428-348). Taking up Empedocles' story of the soul's divine origin, fall and restoration, he completed and refined it. Using narrative, a *mythos* (*Phaedrus*, 248-256), to bring home his ideas, Plato teaches that originally the souls were not only enjoying divine beatitude along with the highest gods but that they lived among the eternal ideal Forms. The intellect (*nous*), the noblest part of the soul, was contemplating the everlasting models of Goodness, Beauty, Courage and Justice which form the ideal spiritual world. Souls enjoyed this bliss, not in isolation but in spiritual company and unity. But they could not sustain eternal bliss. In spite of the intellect's attraction for the wonderful Forms, a kind of boredom coupled with the agitations of desires and other emotions – the lower parts of the soul – caused dissensions and made them fall from their enviable status. So they were condemned to suffer corporeal, physical life. Imprisoned in various bodies, chased from one birth to another, souls still have dim memories of their former bliss and of the ideal Forms they had contemplated. Whereas the intellect strives for renewed admission to the original felicity, the lower powers of the soul act rather as impediments which try to keep it tied to the material world. The good life which alone can guarantee progress in future births is thus a constant fight for transformation of bad desires into positive energies, as for instance transformation of physical *eros* into *eros* for Beauty and Justice. The end of the struggle is again release from the necessity of rebirth and reintegration into the wonderful spiritual domain of eternal happiness. We may also mention the *Myth of Er* found at the end of the dialogue *The Republic* which narrates a kind of "near death experience": in the nether world the hero, called Er, is present at a general convocation of souls some of which had undergone punishment and purification during 1000 years whereas others had sojourned in heaven. All these souls have to choose a new life; forgetting their past experiences they are indeed sent to the new birth they have chosen. Plato's doctrine of reincarnation is fundamentally Empedoclean. It differs from his predecessor's mainly on two points: it identifies several powers or functions which make up the soul – joining, incidentally, archaic beliefs about various vital elements in the

human being – and it offers a more vivid description of its ascensional career.

Plato's philosophy has shaped large areas of hellenistic and greco-roman cultural and religious achievements. So we find his teachings about reincarnation reflected in many pre-Christian and Christian systems of practice and thought. They were apparently introduced as an element of secret lore in several so-called mystery cults. They were eagerly adopted by certain groups of intellectuals whose spiritual practice aimed at the realisation of *gnôsis*, transcendental Knowledge. The gnostic person identifies with *gnôsis* and becomes part and parcel of the spiritual world. Such *gnôsis* could easily be explained in terms of the priceless knowledge enjoyed by the Platonic soul when after the unavoidable incarnations it enters the heavenly realms, the dwelling places of gods and eternal Forms.

Such were the aspirations of hellenistic groups in Egypt which produced during the first three centuries C.E. the ancient → Hermetic literature. One of the Hermetic treatises is called *Korê Kosmou*, "Pupil of the Universe"; it contains revelations imparted by the Egyptian goddess Isis to her son Horus. Among other items, Isis talks about the creation of the blessed souls. Living in heavenly abodes with their heavenly Father-God, the souls were asked to fashion creatures out of a certain substance prepared by the Father. Beginning their work with some diffidence, they eventually formed birds, quadrupeds and reptiles. Having succeeded in their task, they became proud and restive. Finding that the places which the Father had given them to live in did not allow sufficient liberty of movement, they began to desert them. The Father punished them with imprisonment in physical bodies and condemned them to suffer transmigration. In case they proved guilty of ill-behaviour, they would be imprisoned in bodies of animals, and if they continued doing evil they would fall into ever more miserable depths. But if they did well and obeyed the moral laws, there was the possibility of realizing the ascensional career hoped for in traditional Greek reincarnationist doctrines. The end of it would again be renewed heavenly bliss. Here as always in the ancient world, reincarnation is but an unfortunate intermezzo. This is an outstanding example of Platonic reincarnationist ideas in a hellenistic Egyptian garb.

Other examples are found in early Christian traditions. Right from the beginning of their history, Christian communities which had not yet elaborated a unitary authoritative system of doctrines were in contact with hellenistic civilisation and

spirituality. Their over-all conviction was that Christ, risen from death, was their Saviour who delivered them from moral slavery and who guided them through the troubles of this world to eternal life. It was Christ also who gave them, through His Holy Spirit, true knowledge, *gnôsis*, about themselves and about the mysteries of the heavenly domains. It was inevitable that Christians who were particularly eager to be initiated into full *gnôsis* availed themselves of the manifold treasures of hellenistic spirituality. Their quest is documented in the Christian Gnostic literature (→ Gnosticism), particularly in the writings found in 1945 at Nag Hammadi in Upper Egypt.

It is a matter of controversy whether the Nag Hammadi Library and other Christian Gnostic texts contain references to reincarnation. Two writings from Nag Hammadi are most relevant in this regard. Towards the end of the famous *Apocryphon of John* John asks the risen Lord a series of questions regarding the fate after death of various categories of souls (NHC II, 25,16-17, 30 parr.; *Synopsis*, p. 68ff.). He learns that the souls of true gnostics will enter the great lights and go to the 'repose of the heavenly aeons', i.e. the highest spiritual realities. The souls that have received the Spirit, but have not risen to perfect knowledge, will also be saved. But the souls which have not received knowledge at all, over which a counterfeit and despicable spirit has gained power, are 'cast into forgetfulness' and, when they have 'become naked' (after the demise of the body) they will be handed over to the archons, the gruesome rulers of the material world who will 'cast them into fetters' and 'consort with them' until they 'awaken from forgetfulness' (*Synopsis*, p. 71, 16ff.). These lines may simply refer to tortures the soul has to undergo in a demoniacal world after it has left the body, but they may also mean that it has to suffer reincarnation ('be cast into fetters') at the hands of the masters of the world who will torment it in all possible ways. A reincarnationist reading may be confirmed by the next question: 'how does the soul become smaller and smaller and enter again into the nature of the mother or the man?' (72,10ff.). The answer is that it will follow illumined souls and finally be released by the Spirit, in opposition to yet another category of souls which will suffer eternal death. Despite the obscurities of this passage we may conclude that it can be understood as a description of the destinies of souls after death which follows more or less the ancient model found in Pindar's ode: besides those who are saved and those who are condemned there are those who after various reincarnations reach final beatitude.

In a similar way, reincarnation seems to be attested in the Nag Hammadi text called *The Exegesis on the Soul* (NHC II,6). It is a kind of novel which narrates the destiny of the soul. As long as she was with the heavenly Father, she was a virgin. But for reasons not mentioned she fell into a body and became the victim of 'robbers' who passed her from one to another, making use of her by force or seducing her, until she became a prostitute. At the end, deprived of everything, she repented and implored the grace of the Father. Arguably this story describes the adventures of the soul during a single human life-time when she forgets her heavenly nature and yields to all sorts of worldly occupations, forgetting and defiling her pure inner nature. But it is also possible to cling to a mythological interpretation. The 'robbers' are then the Rulers of the world, the Archons who keep the soul 'for a long time' in their power, tossing her about, through the various stages and degrees which are mentioned in the narrative. These stages could be understood as several reincarnations, similar to what is said about the third category of souls in the *Apocryphon of John*. This reading is perhaps confirmed by another Christian Gnostic text known already for more than two centuries which has been given the title *Pistis Sophia*. It is said in its fourth book that the souls are 'robbed' by the Powers and that they suffer pain through several successive lives (*Pistis Sophia* IV,139-141; see other references to reincarnation in I,7 and II, 100).

But it must be admitted that in the Nag Hammadi library, evidence for reincarnation is frail. This notion does not seem to have much attracted the authors of that collection of "gnostic" texts. They were vitally interested in the final release which they considered the true gift of the Saviour. The doctrine of reincarnation is at best the prelude to final emancipation, so it could have been dismissed without regret.

There is nevertheless direct proof that some Christians in search of liberating *gnôsis* did believe in reincarnation as the last stage before final salvation. The great theologian → Clement of Alexandria (end 2nd cent.) has preserved fragments hailing from the Gnostic teacher → Basilides who interprets texts like Deut. 5:9 (punishment for sins striking several generations) and Rom. 7:10 ('I once lived without the Law') as testimonies for reincarnation. We may also mention a hymn which Hippolytus, a scholar and writer living at Rome in the beginning of the 3rd cent. has copied in his *Refutation* (V, 10:2). This hymn says that the soul, ruled by Law and by death, now and again suffers

contradictory states, 'now it dies, now it lives again', until Jesus is sent to give it true *gnôsis*.

In → Manichaeism too the theories of ancient Greece (e.g. Pindar's) concerning the soul's destinies after death were revived. In the Manichaean *Kephalaia* (XXIX, 83,4-8) three paths are open to deceased souls: 'one to death, one to life, one to mingling'. Those who have lost themselves in the realm of Darkness, are condemned to eternal death; the Elect, the true followers of Mani, go to eternal Light and to Life, whereas the Hearers, those who have struggled on in the ambiguous realm where Light and Darkness are mingled, go to reincarnation in that very same realm. The *Fibrist*, a famous Arabic list of authors and books by Abû 'l-Faradj al-Nadîm (10th century), has an important chapter on Manichaeism, with a detailed exposition of the three paths (Flügel, pp. 69-71 arab. and 100-101 transl.; transl. Dodge, II, 796). Similarly, the *Acts of Archelaus*, a 4th century Christian work, elaborates on the reincarnation of people who are still in the world (the Hearers), whereas others are completely lost (*Acta-Archel.* X, pp. 15-17, Beeson).

It is difficult if not impossible to decide whether the Alexandrian theologian Origenes (185-254) held reincarnationist views or not. The results arrived at by very competent scholars are frankly contradictory. Two points seem nevertheless clear. First: like Plato, Origenes defended the pre-existence of souls. It was for this doctrine that he was condemned in 553 by the Oecumenical Council of Constantinople. Second: in case he accepted, perhaps temporarily, the logical implication of this first point, i.e. the Platonic reincarnation of souls (thus perhaps in his systematic work *Peri Archôn* I.8,4 and II.9,7) he certainly did not attach importance to it. It is indeed possible to quote him discarding light-heartedly fantasies about reincarnation of souls: 'it is not taught by the Apostles nor by Holy Scripture' (*Commentary on the Gospel of Matthew*, ad 11,13), and 'We have not found it in the Holy Scriptures' (*ib. ad* 13,1).

CARL A. KELLER

Reincarnation II: Renaissance – present

Traditional beliefs in reincarnation in Europe probably came to an end after the fall of Rome. At the end of the Middle Ages → Gemistos Plethon (1355-1452) revived the idea of metempsychosis, and the same idea had been developed independently by the → Cathars, possibly through their debate about Christian purgatory. Notions of reincarnation in the Kabbalah (Book of *Bahir*, c. 1200) also appear to have emerged independently, although there was some limited contact between Mediterranean Jewry and post-antiquity Gnostic groups. There is no evidence for the transmission of manichaean ideas often discussed in this context [→ Manichaeism]. However, there has been a continuous debate in kabbalistic Judaism from the 13th century up until the present regarding the "Gilgul". The end of reincarnation beliefs in antiquity and their medieval thematisation has hardly been investigated yet.

In the Renaissance the educated classes became familiar with reincarnation beliefs as a result of their engagement with Platonic and Neoplatonic texts [→ Neoplatonism]. However, metempsychosis was usually regarded as a marginal aspect of philosophy or interpreted as an allegory (e.g. reincarnation in animals as a metaphor for bestial behaviour in → Ficino). Nevertheless, a few Renaissance philosophers embraced ideas of reincarnation, but these can be traced no earlier than the second half of the 16th century (no prosopographic survey to date). Most likely inspired by ancient philosophers, notably Pythagoras, → Giordano Bruno conceived of metempsychosis as a complement to his conception of an infinite universe, but

his notion of reincarnation remained practically unknown. Isaac Luria (1534-1572) popularised the Gilgul in the Kabbalah, thereby assimilating the Jewish experience of exile following the expulsion from Spain. Through reincarnation the scattered tribes of Israel in the diaspora were supposed to prepare the way for Tikkun, the messianic restitution of world history. → Guillaume Postel was the first identifiable theologian and philosopher in the 16th century to integrate metempsychosis into Christian theology, probably stimulated by kabbalistic authors. As in Bruno's case, cosmology provided the frame for an anthropology of reincarnation in Postel. The significance of Christian kabbalists [→ Jewish Influences III] for the discussion of reincarnation beliefs has only just begun to attract scholarly attention.

In the 17th century ideas of reincarnation generated a widespread debate in learned circles. For example, metempsychosis was an image of the path of the soul towards its resemblance to God for John Donne (1572-1631), but Cyrano de Bergerac (1619-1655) saw it as an actual path to perfection. An important intermediary may have been → Franciscus Mercurius van Helmont, who, as a Christian kabbalist, included especially Lurianic ideas in his work *Two Hundred Queries . . . Concerning the Doctrine of the Revolution of Humane Souls and Its Conformity to the Truths of Christianity* (1684). He discussed his ideas of "revolution" with → Henry More and Anne Conway (1631-1679) or with Gottfried Wilhelm Leibniz (1646-1716), who again exchanged views on the subject with Elisabeth Charlotte of Orléans (1652-1722), the sister-in-law of King Louis XIV of France. By the end of the 17th century there had developed in several Germanic languages a special idea of metempsychosis, beyond that of the ancient terms in use: *Seelenwanderung* (transmigration of souls; German) or *Zielsverhuizing* (Dutch). This may mark the beginning of an independent discourse.

These philosophical and anthropological issues in the early modern period characterised the debate about reincarnation in Europe over the ensuing centuries. The central question was whether the monistic anthropology of Christianity, which recognised no disembodied soul, was compatible with the dualistic human image of reincarnation beliefs. Almost all theologians denied the possibility of separating body and soul, and regarded the belief in the Resurrection as contradictory to the notion of multiple incarnations. Van Helmont made a significant contribution to the debate with his term "revolution", signifying a multiple resurrection of the same body, whereby an incomplete

life could be perfected in further stages without the separation of body and soul. From a soteriological perspective, this construct probably offered an alternative to the Calvinistic doctrine of predestination. The irreconcilability of Christian anthropological assumptions with reincarnation beliefs severely restricted their spread up to the end of the 19th century.

Eschatology played a further part in this particular history of Western ideas. The numerous cosmologies of the 16th century jeopardised the notion of a collective divine Judgment at the end of time. Individual justice and the salvation of man after death received new formulations. This individualisation of eschatology in Christian theology also became a central consideration in ideas about reincarnation. Likewise, reincarnation was supposed to guarantee the perfection of man, whereby human autonomy was emphasised to the detriment of divine redemption. Furthermore, reincarnation was linked from the end of the 17th century with the idea of the development of humankind and from the 18th century it became an alternative religious belief qualifying the doctrine of evolution. An important example of this reception is Gotthold Ephraim Lessing (1729-1781), whose *Erziehung des Menschengeschlechts* (1780) made *Seelenwanderung* an instrument of divine instruction, leading human beings to perfection. With this adjustment in the 17th and 18th centuries, reincarnation ideas acquired their specific European coloration. No longer viewed as a penance, as in antiquity, in Giordano Bruno or in Asian beliefs, reincarnation was now seen as an opportunity, and this reinterpretation carried important implications for its human subject. Perfection was now the goal and not extinction, as with Buddha and Bruno.

The historical derivation of reincarnation beliefs ran a separate course from its philosophical substantiation. Partly they were regarded as a component of *philosophia perennis*, which → tradition, especially since the end of the 18th century (e.g. in the high grades of the → Illuminaten) was postulated in opposition to the mainstream. Its revival through reference to ancient authors seems to have been a rare occurrence, as in the case of Frans Hemsterhuis (1721-1790), but there is no further reference to Kabbalah except for Jewish kabbalists in the 18th century. → Johann Wolfgang von Goethe (1749-1832) offers an example of the pragmatic use of reincarnation to deal with issues of contingency. Against a Spinozan background he explained “incomprehensible” love affairs in his biography with reference to the transmigration

of souls. Analogical thinking provided important proof or at least plausible evidence. The Swiss naturalist Charles Bonnet (1720-1793) introduced the idea of *palingenesis* (first published in 1769) which Lessing transformed into the transmigration of souls. Bonnet’s “stages”, which man ascends upon a “chain” of planetary worlds, becomes for Lessing the transmigration of souls on earth. In these debates rebirth had only a limited esoteric meaning. Although all discussants were aware that it lay outside the mainstream of theological and philosophical tradition, it was openly discussed in educated circles. Only at the end of the 18th century did reincarnation become a secret tradition, especially in masonic circles.

Far into the 19th century, the idea of reincarnation was the exclusive preserve of an educated elite in a predominantly Protestant milieu. There is no evidence whatsoever of it entering popular beliefs. Its eventual widespread popularisation is closely linked with the history of → spiritualism, which movement split into factions which either accepted or rejected reincarnation following the publication of → Allan Kardec’s *Livre des Esprits* (1857). In the second edition (1859), Kardec presented a catechism of more than 1000 questions and answers, with reincarnation serving as the basis of a universal philosophy. Kardec regarded himself as a Christian theologian: his coining of the word “reincarnation” as an analogue of “incarnation”, may even identify him as its originator. By the end of the 20th century, the generic term “reincarnation” had displaced all other synonyms (metempsychosis, rebirth, *Seelenwanderung*, transmigration, *Wiederverkörperung*) in current usage.

The → Theosophical Society popularised its usage significantly. The founding generation, among whom → Helena Petrovna Blavatsky and → Henry Steel Olcott played the major role, came from the spiritualist camp and replaced its empiricism with an esoteric history of religion. Reincarnation also became a component of the occult history of mankind in this context. When Blavatsky and Olcott moved to India in 1879, Blavatsky accepted reincarnation, most likely through her contact with Buddhist ideas; in her earlier work *Isis Unveiled* (1877), she had actually rejected metempsychosis. Blavatsky asserted that her idea of reincarnation derived from an ancient secret wisdom of Tibetan origin. However, its focus on the human subject and involvement with an evolutionary history indicates its provenance in European thought. The significance of Theosophy for the spread of reincarnation ideas cannot be

overestimated, as important promoters of esoteric thought such as → Rudolf Steiner also took their idea of reincarnation from this source. Theosophy also introduced the notion of *karma* to signify a moral system for the consequences of one's actions leading to a good or bad rebirth. At the end of the 19th century, karma began to supersede the Christian ideas of judgment and retribution, thereby creating a certain distance from Christian terminology in theology and religious studies. Contemporary experiments to find empirical proof of reincarnation, which began in the 19th century in response to scientific methodology, are the long-term results of spiritualist and Theosophical attempts to objectivize reincarnation. No empirical studies of reincarnation have as yet been discovered before the end of the 18th century.

After the turn of the last century reincarnation became a widespread idea among the European middle and upper classes. The astronomer Camille Flammarion (1842-1925), the writer August Strindberg (1849-1912) or the founder of the Ford motor empire Henry Ford (1863-1947) are representative examples. Reincarnation was generally linked to ideas of progress and focused on the individual. Only in exceptional cases was reincarnation marked by a more Buddhistic relativisation of self-realisation, as for example in Arthur Schopenhauer (1788-1860) or his follower Richard Wagner (1813-1883) or, at the beginning of the 20th century, among European Buddhists who read Oriental texts in the original languages or in reliable translations.

In the 20th century, the number of societies propagating reincarnation rocketed, among them the Anthroposophical Society [→ Anthroposophy], the Lectorium Rosicrucianum and → Scientology. After the mid-20th century there was also a massive diffusion of reincarnation ideas outside institutional associations, for example in the → New Age Movement and in the growing market for esoteric literature. Statistical surveys suggest that some 10-30% of the population of Europe and North America now believe in reincarnation. The validity of such surveys is often uncertain, depending on whether it is a question of actual belief in reincarnation or whether it is only considered probable or comforting. The numbers expressing agreement with reincarnation do appear to have remained constant at this percentage. Today reincarnation is not an isolated notion but linked to all other kinds of world-view. The 20th century has introduced only one innovation. Since the end of the 1950s, reincarnation therapy (e.g. past life regression) has developed as a branch of esoteric

psychology and as a significant economic factor in reincarnation beliefs.

Reincarnation has not become a powerful social force in European culture. One reason may be the lack of social relevance. Collective and political expressions of reincarnation beliefs, as in the Hindu caste system or the Tulku genealogies of Tibetan Buddhism, have not developed in Europe. Attempts to relate reincarnation to society and politics, like that of Charles Fourier (1768-1830) at the beginning of the 19th century, remained still-born. There has also emerged a massive critique of reincarnation in response to its growth since the early modern period. For example, there were in the 18th century many alternative theories of palingenesis or ideas of a "planetary round", as in Johann Gottfried Herder (1744-1803) or in → Pierre Simon Ballanche (1776-1847), which sought to link the idea of progress with mainstream European traditions, without invoking reincarnation or positing the separation of body and soul. Meanwhile, there are secular critiques of reincarnation. For instance, it has been banned in Germany if linked to a justification of Nazism and the statement that the extermination of the Jews was their deserved karmic destiny. One and a half thousand years of Christianity in Europe have ultimately marginalised the idea of reincarnation. Even its establishment as a minority world-view since the early modern period occurred within the context of Christianity or its secular residues such as the autonomy of the subject, the linear conception of history or the idea of evolution. This syncretism has produced a particular modern European form of reincarnation belief, which differs notably from its manifestations in antiquity and the Orient.

 Nicolas-Edme, * 23.10.1734 Sacy,
 † 3.12.1806 Paris

Born in a small village in Burgundy, Rétif, known as “de la Bretonne” (the name of his family farm), was the son of a well-to-do peasant, whose idealized portrait he painted in *La Vie de mon père* (My Father’s Life, 1778). Raised by two Jansenist brothers, he received a very strict religious education; however, he learned to read and write very late, and remained self-taught all his life. At age 16, he was apprenticed to a printer at Auxerre, then became a journeyman typographer at Dijon, Auxerre, and Paris. Beginning in 1767, he frequented the Bohemian literary underworld of Paris and published several novels, such as *La Famille vertueuse* (The Virtuous Family, 1767) and *Le Pied de Fanchette* (Fanchette’s Foot, 1769); also various projects for reform, called *Idées singulières* (peculiar ideas), for example *Le Pornographe* (The Pornographer, 1769), *La Mimographe* (The Mimographer, 1770) and *Les Gynographes* (The Gynographers, 1777), in which he purported to reform prostitution, theater, and the education of women respectively. In *L’Andrographe* (The Andrographer, 1782) and *Le Thesmographe* (The Thesmographer, 1789), he appeared to be a precursor of socialism and communism, while in the utopian novel *La Découverte australe par un homme volant* (The Discovery of Austral Lands by a Flying Man, 1781) he showed himself a partisan of evolution.

Rétif became famous in 1775 with the publication of *Paysan perverti* (Perverted Peasant), an epistolary novel that became an immense success, as did the series of *Contemporaines* (Contemporaries), a collection of illustrated short stories in 42 volumes. Near the end of the old régime, between 1780 and 1789, Rétif de la Bretonne was a celebrated writer, a friend of Beaumarchais and Sébastien Mercier, sought out by the aristocrats and welcomed in the salons of Grimod de la Reynière and Fanny de Beauharnais. A fascinated witness of the French Revolution, which he described in *Les Nuits de Paris* (The Nights of

Paris), he was ruined by the collapse of the *assignat* currency and fell into poverty; but continued writing and publishing stories, plays, and above all his monumental autobiography, *Monsieur Nicolas ou le Coeur humain dévoilé* (Mr. Nicolas, or the Human Heart Revealed, 1797). Between 1798 and 1802, thanks to the patronage of Mme. de Beauharnais, he obtained a position at the ministry of police and finished several manuscripts, for the most part unpublished: *L’Anti-Justine* (The Anti-Justine, 1798), *Les Posthumes* (The Posthumous Letters, 1802), *L’Enclos et les Oiseaux* (The Enclosure and the Birds), *Les Mille et une métamorphoses* (The Thousand and One Metamorphoses), and *Les Revies*. In these last works, Rétif fully regained his inspiration: he gave free rein to his imagination and his fantasies, alternating between the erotic and the fantastic.

After his death, he left behind an immense and varied body of work: more than forty titles and two hundred volumes. In these works, Rétif appears as an admirer of Voltaire and a disciple of Rousseau, committed to the Enlightenment and a partisan of the Revolution. But one also notices in certain works, like the *Philosophie de Monsieur Nicolas* (Philosophy of Mr. Nicolas, 1796) or *Les Posthumes*, a zone of darkness and mystery, a secret philosophy, which might be explained by his affiliation with → Freemasonry or by his adhesion to the doctrine of the Illuminés [→ Illuminism]. Up to now, no lodge’s record attesting to Rétif’s membership in a masonic order has ever been found in the archives; however, his life and works show indisputable links to masonry.

Rétif kept up close and steady connections with numerous masons, mostly belonging to the *Neuf Soeurs* (Nine Sisters) Lodge, including Cailhava, Cordier, Cubières, Fontanes, François de Neufchâteau, Lalande, Lepelletier de Morfontaine, Lezay-Marnésia, Mercier, and Nougaret. The designs of Rétif’s reform projects, such as *Le Pornographe* (1769) or *L’Andrographe* (1782), are based on the same model as the statutes of masonic associations. The same fundamental principles are there: an insistence on secrecy, justification of work, praise of equality and fraternity, and morals of reciprocity and solidarity. There is no denying the authentic masonic values in Rétif’s works.

In his writings, there is also a predilection for coded language, in particular a frequent use of masonic vocabulary with terms such as: respectable, venerable, illustrious, immortal, enlightened, fraternity, humanity, zeal, and regeneration. He often reverses letters or syllables when transcribing proper names, resulting in a profusion

of pseudonyms and anagrams. He also assigns a symbolic value to numbers: he readily uses the calendary divisions and displays an absolute mania for dates, anniversaries, and Latin inscriptions.

Like the adepts of Freemasonry, Rétif showed a definite interest in ancient and Oriental religions. In *Les Nuits de Paris* (The Nights of Paris, 1788) there are long discussions on the religion and morality of the ancient Egyptians, as brought back into fashion by → Cagliostro's Egyptian Masonry. Following the mystic traditions of Eleusis and Osiris, Rétif wanted to reestablish initiations for men and for women. He alludes frequently to the Greek myths of Epimenides and the Phoenix, both symbols of immortality. He often praises Pythagoras, admiring his theory of sacred number [→ Number Symbolism] and his belief in metempsychosis [→ Reincarnation]. Nor was Rétif indifferent to the craze for Oriental religions. He often refers to Persian, Hindu, Chinese, and Tibetan religions, believing that his own ideas are to be found there, and he sometimes even quotes the Kabbalah [→ Jewish Influences].

On the other hand, in reaction against the austere Jansenism of his youth, Rétif manifested virulent anti-Christian and anti-clerical sentiments. He did not believe in the personal God of the Christians, nor in Providence, but in an eternal God, the principle of Being, the Great Architect of the Universe, who is one with the All or Nature. For Rétif, God cannot be good and generous, but only just. God is synonymous with Nature and with the Order of the world; there is no Devil, no Hell, no Paradise, and the immortality of the soul is a mere fantasy.

Rétif objected equally to the existence of beings intermediary between God and man, such as angels, sylphs, or genies – invisible beings with whom man could nonetheless communicate. Such beings do occasionally appear in his utopian or fantastic novels, but he criticizes them unambiguously in his didactic works, thus making clear that he wished not to be identified with Illuminés like → Swedenborg or Dupont de Nemours.

Rétif denied the divinity of Jesus Christ, whom he most often calls Jesuah, and sometimes goes so far as to deny his existence altogether. He denied the virginity of Mary, the miracles, and the Resurrection, and considered Christ to have been merely a philanthropist and a benefactor of mankind. In opposition to the church of his time, he praised the merits of the primitive church, in which poverty, equality, and fraternity reigned. But this was a polemical device, and one should not confuse Rétif with mystical Illuminés such as Swedenborg,

→ Willermoz, or → Saint-Martin, who sincerely wanted to regenerate Christianity.

Even more than Christianity, seen as a false religion and source of error and illusion, Rétif attacked the Catholic Church and its priests, whom he presented as self-serving, deceitful, and hypocritical. As for monks, they were even worse than priests: withdrawn from the world, they appeared as cynical and unscrupulous libertines.

With his radical criticism of the Christian religion, Rétif placed himself incontestably among the partisans of the Enlightenment. He admired Voltaire, Rousseau, and Buffon, and did not hesitate to proclaim himself their disciple, even if he sometimes criticized them. He praised “enlightened” statesmen such as Frederick the Great, Joseph II, and Benjamin Franklin. Like Rousseau and Helvetius, he believed in progress through education. His various projects of reform likewise showed his belief in the possibility of improving morals and society: thus we see him applauding the French Revolution, which would nevertheless ruin him. Finally, he never showed hostility towards the science of his time, and was aware of the most recent discoveries of Lavoisier, Laplace, and Laplace.

In response to Mallet of Geneva in 1786, Rétif denied being a disciple of Swedenborg, Cagliostro, → Martinism, or → Cazotte. Nevertheless, he corresponded with many celebrated Illuminés, some of whom were also his friends: Nicolas de Bonneville, founder of the Cercle Social, admirer of Swedenborg and Saint-Martin, who would later edit the *Philosophie de Monsieur Nicolas*; Jacques Cazotte, the famous author of *Le Diable amoureux* (The Amorous Devil) and an adept of the → Elus Coëns and of Saint-Martin, to whom Rétif ascribed the inspiration for *Les Posthumes*; the famous Cagliostro, whom Rétif sometimes called a “great man” and sometimes a “charlatan”, and who was the model for Multiplandre, the hero of *Les Posthumes*; and lastly, the Baron de Corberon, minister to the Prince des Deux-Ponts, disciple of Swedenborg, devotee of occult sciences and esotericism, who declared himself an admirer of Rétif and met him in 1784.

Rétif figures in → Gérard de Nerval's *Les Illuminés*, together with Cazotte, Cagliostro, and Quintus Auclerc. Nerval's notoriety and the success of the book, published in 1852 and often reprinted, contributed largely to Rétif's reputation as one of the representatives of 18th-century Illuminism. Rétif's thought has, indeed, many affinities with the doctrine of the Illuminés. Even if he claimed to be a partisan of the Enlightenment, the

author of the *Philosophie de Monsieur Nicolas* often distanced himself from science: he claimed to reconcile reason and analogy, observation and imagination. He reproached the savants for being mere calculators and “*chiffromanes*” (number-maniacs), incapable of making unexpected connections or wide-ranging hypotheses.

Rétif never hesitated to extrapolate boldly, starting with simple analogies. He based himself on a unique principle: *everything in nature is image and symbol*, so that analogy and comparison are the best means for grasping the hidden meaning of the universe. In this sense, Rétif can be considered an authentic representative of esoteric thought. For him, as for most of the *Illuminés*, there is a profound correspondence between man and nature, between the microcosm and the macrocosm, and their secret relationships can only be revealed through symbols and allegories.

Rétif's thought is fundamentally analogical and symbolic, but even in his most extravagant inferences it does not cease to be logical and rational. His logic is eminently dialectic: it is built upon a favorite principle of the Hermetists, that of the opposition and unity of contraries. Good and Evil oppose and complement each other, like Life and Death, Light and Darkness, Sun and Earth, and the Male and Female principles. Here we find the Manichaean opposition [→ Manichaeism] of Ormuzd and Ahri-man in Persian religion, of Yin and Yang in Chinese philosophy, and also of the two columns Jachin and Boaz in masonic symbolism.

Rétif's philosophy can be defined as a pantheistic materialism, or rather as a materialistic pantheism. From *Le Généographe* (The Geneographer, 1770) to the last “*juvénale*” (Satire, after Juvenal) entitled “*Immoralité folle des athées*” (Insane Immorality of the Atheists, 1797), Rétif never ceased to criticize the atheism of the Baron d'Holbach, Diderot, and Lalande. However, he very soon accepted the principles of the most radical materialism: the idea that all the universe is nothing but matter in motion, and that matter is capable of thought. His philosophy was inspired directly by Spinoza, for whom thought and extension are only methods of a common substance, i.e. God or Nature. In this sense, Rétif was favorable to monism, to the unity of thought and matter, and was opposed to Cartesian dualism.

This materialism and pantheism is at the same time a type of vitalism, because God or the Principle of Being is synonymous with life. God consists of a vital or intellectual fluid, a sort of electromagnetic fluid that animates inert matter and gives it its form. It corresponds to the sum total of

living beings, stars, humans, and animals, united in an immense chain of beings, in which one can distinguish an overall gradation from animal to man, from man to the universe. Like Diderot in *Le Rêve de d'Alembert*, in *La Découverte australe* (1781) Rétif adopted the evolutionist hypothesis and the theory of the transformation of species.

One also finds there a sort of pansexualism: all of Rétif's universe is sexualized. As the primitive androgyne, God is simultaneously male and female, fertilizing and regenerating him/herself. Created by God, the universe consists of a multitude of male suns and female planets, reproducing themselves in an immense copulation. This universe is the only thing deserving of a religion: man's adoration should be addressed to Father Sun and Mother Earth, the male and female principles that govern our world. This worship of heavenly bodies recalls primitive animism and ancient Sabaeism: hence Rétif has been labeled a neopagan [→ Neopaganism] and restorer of the pagan cults.

Rétif went further: he invented a whole original cosmology, which describes the entirety of the universe in mutation, beginning with the explosion of suns that transform into comets, then into planets, under the effect of gravitation and later of crystallization. But for Rétif the universe does not die; it only regenerates and renews itself through a whole series of revolutions and mutations. This concept of the Eternal Return sometimes leads him to envisage metempsychosis, even though he did not believe in the soul's immortality or the permanent identity of the individual ego. For him, only the Whole is immortal; the parts simply aggregate and separate themselves into new individuals, who retain no memory of their past existence in the form of dispersed elements.

Rétif wanted to create a new religion. He invented an original philosophical system and a coherent system of physics, in the form of a vast cosmogony. But this concept was not free from contradictions. Rétif seems divided between rationalism and Illuminism, between rational thought and symbolic thought, just like many of his contemporaries, during the time when science was just beginning to disengage itself from the occult sciences and follow rigorous, methodical rules. According to Bachelard's theories, Rétif's thought is the epitome of pre-scientific thought, which refuses to make the necessary split between image and concept, and above all fails to verify hypotheses through experimentation. Be that as it may, Rétif's literary merit lies in his discernment, well before the Romantics [→ Romanticism] and the Surrealists, of all the poetic riches of Illuminism

that liberate the forces of the unconscious and the imagination.

PIERRE BOURGUET

Reuchlin, Johannes, * 22.2.1455 Pforzheim, † 1522 Liebenzell

Reuchlin was the leading German humanist of the Renaissance, the most prominent Hebraist of his age and the author of the central text of Christian kabbalah, *De arte cabalistica* (1517). The influence of his numerous books and the intense controversy which surrounded them make him a key figure in the history of European spirituality in the 16th century and the main influence on the integration of Jewish and kabbalistic elements into European thought [→ Jewish Influences] and especially European esotericism between the late-15th century and the 18th.

Reuchlin's early studies and scholarship were focused on the Greek and classical languages and traditions. He studied in Freiburg, Paris and Basle. He also obtained a degree in law in Poitiers (1481), taught classics, and wrote a Latin lexicon. In 1482 he travelled to Italy for the first time, and became acquainted with the great humanistic center and library under the patronage of the Medicis in Florence. Here he added Hebrew to his intellectual and linguistic interests, and was exposed to the

influence of the school of → Marcilio Ficino, dominated by the Platonic tradition in a particular spiritualistic interpretation, and to the → Hermetic literature which had been translated into Latin by Ficino. These interests culminated in the publication of Reuchlin's first work on the kabbalah, *De verbo mirifico* (1494): the result of his association with → Pico della Mirandola, the originator of Christian kabbalah. Reuchlin had become aware of the wider horizons of late-15th century knowledge and science, and he adopted the graecized name Capnion. When returning to Germany he became a counselor to Count Eberhard of Württemberg, and continued his studies of Hebrew.

Reuchlin's assimilation of Platonism and Hebrew occurred at a time when the atmosphere in Europe was turning into directions diametrically opposite to his own inclinations. Enmity towards the Jews, expressed by their persecution in Spain (culminating in the expulsion of the Jews from that country in 1492) and the anti-Judaizing campaign of the Spanish Inquisition, was paralleled on the religious-intellectual level by hatred of the Talmud and deep suspicion of all Jewish traditions. The increasingly dualistic world-view of the period (promoted intensively by the Dominicans), which saw the earth as the battleground between Satan and his servants and the Church, placed the Jews and their traditions on the Satanic side. The impact of these views was stronger in Germany than in most other European countries, and the Florentine school of humanism developed a perspective in clear opposition to the prevailing cultural currents.

The distance between Reuchlin and the humanists who followed him, on the one hand, and some of the Church authorities in Germany, on the other, became apparent in the controversy concerning the confiscation and burning of Jewish books which erupted about 1508 and was to accompany Reuchlin throughout his life. His most fierce opponent was Johannes Pfefferkorn, who had been born as a Jew in Nuremberg in 1469, converted to Christianity together with his family in Cologne in 1505, and became Germany's most energetic and prolific writer against the Jews and their books. He claimed that Jews derived their spiritual power from their books, especially the Talmud, and subscribed to the popular notion that the Talmud preaches against Christianity (although he denied the Blood Libel). In order to stimulate their conversion, the books must be taken from the Jews, and several other social and religious restrictions should be enacted against them. With the help of the Dominicans in Cologne, and especially the Dominican inquisitor Jacob Hochstraten, he succeeded to get attention

in the court of the Emperor Maximilian I. His chief opponent was Reuchlin, and a controversy ensued which is documented by treatises from both sides. Pfefferkorn attacked Reuchlin in his *Handspiegel* (Mainz, 1511) and other books, and Reuchlin responded with his famous *Augenspiegel* (1512). The notorious anti-Dominican satirical work *Epistolae obscurorum virorum* (*Dunkelmännerbriefe*; 1515) was published anonymously, but probably written by several humanists inspired by Reuchlin. In 1513, Hochstaden initiated an official procedure against Reuchlin, which was rejected in 1516 but re-enacted in 1520. The controversy became a concern of intellectuals and leaders in Germany, and even the Emperor and the Pope became deeply involved in it. When studying Reuchlin's works and theological positions, one should always be conscious of the atmosphere of accusations, persecutions and religious strife which accompanied his scholarly work; and there is little doubt that, among the contemporary public, Reuchlin's views were shared by only a small minority. The intensification of the hatred towards the Jews following Luther's attacks and the Catholic reaction made Reuchlin's position into an isolated one.

There is no inherent connection between Reuchlin's endeavors as a Hebraist and his theological writings in the field of the kabbalah. His grammar and lexicon of the Hebrew language, *De Rudimentis Hebraicis* published in 1506, has a similar place in the history of Hebraism as *De arte cabalistica* (1517) has in the history of the Christian kabbalah. Reuchlin's philosophical work concerning the Hebrew language followed his previous writings in Greek and his translations of classical Greek texts. All his work reflects the Renaissance humanist drive of widening the horizons of languages and classical lore, and seeking a new understanding by excelling in the mastery of the ancient languages. The study of the Hebrew language did not carry theological implications, as did the adherence to the ideas of the kabbalah, and it was not a significant part of the controversy which erupted around Reuchlin in the last decades of his life.

A comparison between the structures of *De verbo mirifico* and *De arte cabalistica* is most instructive concerning the evolution of Reuchlin's attitude towards the kabbalah, Judaism and the Jews. Both works are presented as dialogues between three participants. In the earlier work, the speaker, Capnion, is in dialogue with the Epicurean philosopher Sidonius and the Jew Baruchias. Capnion (i.e., Reuchlin), is the ultimate authority who, to some extent, proves to the Jew Baruchias that

the real meaning of the tetragrammaton is not to be found in the Jewish four-letter version but in the secret, five-letter one, which is the Christian secret name of Jesus, YHSWH. Jewish tradition is thus placed on a level which supplies important materials, yet the ultimate truth, which is of an esoteric-Christian nature, eludes it. In *De arte cabalistica*, the speakers in the three dialogues are the Muslim Marranus, the philosopher Philolaus, and the Jew Simon. Simon participates only in the first and third dialogues; he is absent from the second, because it is conducted on Saturday, and the participants – like the author – respect his religious obligations on the Sabbath. Simon to a very large extent has “the final word”, and most of the third and concluding dialogue is devoted to kabbalistic information revealed by him. He is described as a descendent of the revered Rabbi Simon bar Yohai, the legendary author of the Zohar; and thus he is the physical embodiment of the kabbalah in general. It is very difficult to find any parallel to such a sympathetic and generous presentation of a contemporary Jew in Christian literature; and in 1517, to publish one was highly unusual and courageous. There is no attempt to convert Simon or make him see the meaningfulness of Christian tradition, and he emerges from the dialogues and the book as a devoted Jew. It is easy to understand why such a portrayal of a Jew infuriated some of his contemporaries, among them Jewish converts to Christianity, even though the attacks on Reuchlin in fact started long before *De arte cabalistica* was published. As demonstrated by the comparison between his earlier and later work, these attacks did not inhibit Reuchlin from further developing his attitude towards Jews and their secret lore.

De verbo mirifico was the first book in Latin dedicated to the kabbalah in Jewish esoteric traditions. *De arte cabalistica* is the work which demonstrates Reuchlin's mastery of the Hebrew language and Jewish world-views, unparalleled both before and for a long time after its publication. Reuchlin seems to enjoy quoting biblical verses in the original, and many talmudic and kabbalistic paragraphs are quoted in Hebrew as well as in Latin translation. The presentation of a Christian theological work in which Hebrew characters embellish almost every page was an unusual event. It gave the work an aura of erudition and reliance on primary, ancient and revered sources, which enhanced its impact and influence.

As a disciple of Pico, it is not Reuchlin's purpose to present a coherent, systematic theology. He quotes Pico's statement that what is incoherent is closer to the truth than what is coherent, as

Reuchlin presents it in *De arte cabalistica* book III (Goodman ed., 269-271). In *De verbo mirifico*, the main message is the basic identity of all religious systems, which, in their roots, are united in one secret, sublime truth; that truth, according to Reuchlin, is the supreme, esoteric truth of Christianity. That truth is revealed best by esoteric lore, and Reuchlin refers in particular to the traditions of Orpheus and, first and foremost, the teachings of Pythagoras. In the second part of *De arte cabalistica* – the dialogue from which Simon is absent – the two debaters present Simon's teachings on the first day as identical to those of Pythagoras. The core of the wisdom which Reuchlin purports to glean from the kabbalah, from Pythagoras and all other sources, is neoplatonic in nature. It is not Reuchlin's way to make fine distinctions and present differences; his method is an inclusive one, demonstrating the essential identity of the teachings which are presented in various languages and terminologies. There should, however, be no mistake: when all the particular characteristics of every ancient lore are removed, the remaining essence is that of Christian truth.

One of the few connections which Reuchlin established between kabbalistic speculation and contemporary Christian historical thought was his formulation of the concept of stages in the history of the spirit as a development of the Hebrew names of God. According to talmudic tradition, employed by Reuchlin, God revealed himself to the patriarchs by the name of Shadday: SDY in Hebrew, a three-letter name. To Moses and the people of Israel on Mount Sinai, when the Torah was given, he was revealed by the tetragrammaton: YHVH, four letters. The redemption is signified by the appearance of the messiah, whose name consists of five letters, and becomes apparent by inserting a *shin* into the tetragrammaton: YHVSH, which Reuchlin believed to be the five-letter original Hebrew name of Jesus. There is actually no kabbalistic element in this construction; it follows the ancient Jewish and Christian division of history into ages, expressing it by the nature and structure of the dominant name of God in that epoch. In Reuchlin's rendering, there is also no distinct eschatological meaning to the gradual, three-epoch historical unfolding of revelation. His concepts have been compared with those of the great 13th-century historian of the revelation of the Trinity, Joachim of Fiore; yet in the system presented by Joachim, the third and last phase of development, the appearance of the *testamentum aeternum* of the Holy Spirit (following those of the Old Testament of the Father and the New Testament of the Son) will announce the beginning of

the messianic age. In Reuchlin's formulation, the five-letter redeeming name is associated with the appearance of Christianity, and thus does not signify a change in contemporary history. As a whole, Reuchlin's work, like those of many humanists of the time, did not include expectations of revolutionary transformations in history and in political and religious institutions.

For a reader of his theological works it is not surprising that Reuchlin, declining all entreaties of his closest friends and colleagues, refused to join the Protestant rebellion. He was never a person to insist on differences and argue against the mistakes and errors of others (except those who attacked him, and even this he did with satirical elegance and camouflage), and the developing schism and civil war in the Church distressed him. Some 19th-century scholars have described Reuchlin as 'the father of the German Reformation', but it is very doubtful whether such a title is correct and meaningful. Like most humanists, he cherished ideas concerning reform and improvement in the Church, but it is doubtful whether his worldview allowed or substantiated a revolutionary upheaval. His contacts with Popes, especially Leo X, the younger brother of his patron Lorenzo de Medici ("the magnificent") of Florence, demonstrate that he sought protection under the Vatican's wings; and he did not hesitate to dedicate his magnum opus on the kabbalah to the Pope, prefaced by a long letter of praise to the Medici family and its humanistic enterprise. Leo X, however, did denounce Reuchlin in 1520 (together with Martin Luther, incidentally). Nevertheless, there is no doubt that Reuchlin did not share the anti-Catholic sentiments of the leaders of the German Reformation.

No less than his impact on the Christian kabbalah, Reuchlin's influence on the development of Hebraism in Christian Europe is second to none. Gershom Scholem has rightly described him as the first great Christian scholar of Hebrew. He started studying and publishing works concerning Hebrew grammar and lexicography in his youth, and continued this activity until his death.

Reuchlin's relationship with → gnosticism must be described mainly in negative terms, but many of the sources he used – including the kabbalah – do contain elements associated with gnosticism. The reverence he demonstrated for the Zohar could have resulted in the development of gnostic motifs, but they did not. Reuchlin rejected both Jewish and Christian tendencies towards theological dualism, and the concept of creation by an evil demiurge could not be integrated in any way in his world-

view. Like Ficino's and Pico's, his attitude towards the world was essentially an optimistic one. Like his fellow-humanists, he was overwhelmed by the discovery of the great secrets of the universe encoded in the old texts, and his main concern was the demonstration of the underlying unity which bound them together. The revelation that Pythagoras and the Zohar, → Hermes Trismegistus and the Egyptian hieroglyphs, were presenting the same message, identical to that of ancient, pure Christianity, was the dominating element in his work.

† 17.7.1968 Santpoort
(The Netherlands)

Jan Leene who, under the pen name of Jan van Rijckenborg, became the founder of the Rosicrucian movement Lectorium Rosicrucianum, or the International School of the Golden Rosy Cross, was born in Haarlem (The Netherlands) on October 16, 1896. His father was a textile merchant, and Jan became his successor when he finished his High School studies. Although the Leenes were a strict Dutch Reformed family, Jan became interested in religions other than Christianity from his early years. He also read Christian esoteric authors, particularly → Jacob Boehme (1575-1624); and he would later translate Boehme's masterpiece *Aurora*.

He was also interested in 17th century → Rosicrucianism, and originally thought its legitimate modern heir was the Rosicrucian Fellowship established in the United States by → Max Heindel (pseud. of Carl Luis von Grasshoff, 1865-1919). Van Rijckenborgh eventually became the leader of the Rosicrucian Fellowship in the Netherlands, and was joined by his brother Zwiervilhelm Leene (1892-1938). From August 1924, an "inner pilgrimage" persuaded van Rijckenborgh that Gnosis as truth lay at the heart of all religions and indeed all human beings, and he oriented the Dutch Chapter of the Rosicrucian Fellowship towards a Gnostic vision of Rosicrucianism. In 1935, together with his brother and Ms. Henny Stok-Huyser (1902-1990), later to be known under her pen name of Catharose de Petri, van Rijckenborgh left the Fellowship in order to establish a Rosicrucian Society of their own. Van Rijckenborgh accused the Fellowship of delving into occult practices, and based the teachings of the new Rosicrucian Society on → Gnosticism and Christian esotericism. He had a particular interest in re-interpreting the Gospel history of early Christianity as the development of an initiation process. The initiate, van Rijckenborgh taught, should evolve from John (the seeker) to Jesus (the twice born) to the Christ (the transfigured human being).

For the journal *New Religious Orientation*, van Rijckenborgh translated several 17th-century Rosicrucian documents. Besides this quite scholarly activity, he also gathered followers around him, who were attracted not only by his teachings

but also by his abilities as a seer. He warned against the dangers of contacts with the spirit world, and condemned spiritualist and occult practices of all kind. During World War II, van Rijckenborgh's Society was banned by the occupying Nazis, and had to continue its activities underground. Van Rijckenborgh proceeded with his work as a translator, however, working on the *Corpus Hermeticum* and several Manichaean texts [→ Manichaeism].

In 1945, the Rosicrucian Society was reorganized under its present name, Lectorium Rosicrucianum, or the International School of the Golden Rosy Cross. In 1946, van Rijckenborgh published his main work, *Dei Gloria Intacta*. In that same year, he travelled to Southern France, where he studied the historical and archaeological records of ancient → Catharism. It was there, in 1948, that he met Antonin Gadal (1871-1962), a key figure of modern → neo-Catharism. Gadal recognized van Rijckenborgh as "Grand Master" of a mysterious Gnostic Brotherhood, and remained a loyal member of the Lectorium right up to his death. Catharism was to remain an important intellectual reference for van Rijckenborgh during his whole lifetime.

In fact, van Rijckenborgh's doctrine affirms the existence of a universal Gnosticism, but takes into account as its principal forms Christian Gnosticism and Catharism; the human being is interpreted as a microcosm, with a divine original spark (the "rose") capable of leading to renewal. The ego, however, creates a number of obstacles to the renewal process, and the initiate should endeavour to free himself from them by connecting the divine spark of the heart to the "sanctuary" located in the head. Van Rijckenborgh referred to this "alchemical" and spiritual process as "transfiguration" and it is, in fact, both an awakening and a return "home" to the Kingdom of Heaven. On the other hand, his teachings strongly reject all occult techniques, contacts with "ascended masters", and spiritualist practices [→ Spiritualism]. Van Rijckenborgh's "auto-Freemasonry" is a personal spiritual process, leading the initiate, at the same time, into an active and fruitful life.

When he died in 1968, van Rijckenborgh had written more than forty books, and several other writings remain unpublished. In total, van Rijckenborgh left to the Lectorium Rosicrucianum more than 30.000 pages of teachings, which still form the basis of the esoteric and religious instruction of some 15.000 members world-wide.

MASSIMO INTROVIGNE

Risenus Thrasibulus → Khunrath, Heinrich

Ritter, Johann Wilhelm, *16.12.1776 Samitz (Silesia, now in Poland), † 23.1.1810 Munich

After studying pharmacology and chemistry in Liegnitz from 1791 to 1796, Ritter enrolled at the University of Iena where he presented in 1797 a 'Demonstration that in the animal kingdom a constant galvanism accompanies the process of life'. This paper's publication the following year stirred a flurry of debate. After its publication, Ritter occupied two more or less overlapping positions within Germany's intellectual world at the turn of the century, namely, that of a *Naturphilosoph* [→ Naturphilosophie] with strong theosophical leanings and that of a great scientist. As a *Naturphilosoph*, in 1799 he became one of → Novalis's best friends, then won the friendship and admiration of Johann Gottfried Herder. Friedrich Schlegel held him in great esteem, as did → Goethe, with whom he conducted some experiments in physics. In 1805 Ritter settled in Munich to teach and do research. There, he collaborated with other *Naturphilosophen*, among whom → Friedrich W.J. Schelling (appointed at the University of that city the year after), → Franz von Baader, who also held a Chair, and → Gotthilf Heinrich von Schubert. Thus emerged the "Schelling-Baader-Ritter triumvirate" – as a contemporary ironically named it –, which played a central role in the history of the so-called "German romantic constellation" in Munich. In 1806, at the Academy of Sciences in Munich (to which he had been elected a member in 1804 with the support of Baader), Ritter gave a lecture titled 'On Physics considered as an Art', which ranges among the most characteristic, theosophically tinged texts produced by German *Naturphilosophie*. At the end of his life he pub-

lished what was to remain his best known work, *Fragmente aus dem Nachlasse eines jungen Physikers: Ein Taschenbuch für Freunde der Natur* (Fragments from the Legacy of a Young Physicist: A Handbook for the Friends of Nature). This compilation of his personal thoughts and reflections, jotted down over the preceding years, is presented as a sum of numbered aphorisms, apothegms, and short developments dealing with chemistry, physics, astronomy, biology, psychology, and → music, pervaded throughout by perspectives of an esoteric character. They are preceded by a “romanticized” autobiography.

Many of the experiments Ritter made as a scientist were concerned with electricity and/or electrochemistry. One of his earliest studies focused upon the manner in which muscle tissue reacts to electrical charges, a research which helped him to develop his theories in the context of *Naturphilosophie*. As a result of these studies, he was the first to establish an explicit connection between galvanism and chemical reactivity (1798-1801). Beginning in 1799 and throughout the rest of his life he contributed articles to several academic journals, including *Allgemeines Journal der Chemie*, *Annalen der Physik*, *Voigts Magazin*. In 1799/1800, shortly after the English chemist William Nicholson had succeeded in decomposing water into hydrogen and oxygen by electrolysis, Ritter improved the process greatly. These contributions paved the way for his invention in 1800 of electroplating, which is still currently used to plate gold, silver and other metals. Besides, in line with one of the prevalent views of *Naturphilosophie*, namely, that an electrical polarity pervades Nature, he put forward the hypothesis that invisible radiation beyond the visible red should be paired to invisible radiation beyond the violet. This led in 1801 (one year after William Herschel had announced the existence of the infrared region) to his greatest scientific accomplishment, the discovery by chemical means of a previously unknown region of the solar spectrum, namely ultraviolet radiation. The same year he observed thermoelectric currents, investigated the artificial electrical excitation of muscles, and anticipated the discovery of thermoelectricity by Thomas Johann Seebeck. Additional inventions of his soon followed, most notably the first dry-cell battery in 1802 and the first electrical storage battery (or accumulator) in 1803. One of his latest interests was dowsing (rhabdomancy), whose connection to galvanism he tried to demonstrate, thereby elaborating the theory of what he called “Siderismus”.

Despite his strong personal connections in the

intellectual world and these important scientific achievements, Ritter sadly remained poor all his life. He could hardly support his family (his wife Dorothea Munchgesang and their four children). Some people (among whom his friend and publisher Carl Friedrich Ernst Frommann) helped him financially, but this was hardly enough. Two reasons seem to account for this situation. First, he spent most of his money in procuring expensive scientific instruments, and in Munich he ruined his health by experiments of electrophysiology (electrical excitation of muscles and sensory organs) with high voltages, not only on plants and animals, but upon himself as well. Second, his difficult, rough and chaotic style (more in the order of poetry) irritated many scientists and deterred them from properly understanding the oral and published accounts he gave of his investigations and discoveries. Moreover, the esoteric part of his interests aroused their suspicion. Significantly, Ritter had more readers among poetically and philosophically oriented *Naturphilosophen* than among professional scientists (with some exceptions, such as the celebrated chemist Hans Christian Oersted, who held Ritter in great esteem). Therefore, many of his findings went unnoticed, only to be independently rediscovered by other scientists later on. It took over a century before his scientific work was given due credit. Ritter died an embittered man a few weeks after his thirty-third birthday.

Ritter's imaginary revolves around a number of symbols which he intends less as metaphors than as metaphysical truths. Objective observations are raised up to the level of a theosophical dramaturgy, so much so that the facts revealed by scientific experimentation are supposed to give an account of mythical recitals. For example, in Ritter the physical element fire refers to an ontological reality, to the point that “Fire” must become the ‘myth of science’, and physics the science of Fire, because in the latter all the energies of the world are enclosed (“On Physics considered as an Art”). In oxidation he sees more than a chemical process only. Oxidation is burning, and therefore cult, prayer, and respiration are also forms of oxidation (Fragment 599): ‘Woman is the oxygenable, Man is the oxygenizing. This is why Woman gains weight in love, like all the bodies that oxygenate’ (Fragment 636). The notion of polarity, widely shared in that period among *Naturphilosophen* and German philosophers in general, is prevalent in Ritter. In this connection, he holds that the Earth, since it is the object of oxygenation processes, in-breathes solar energies and out-breathes lunar ones. Therefore, the Moon is hydrogen par excellence (Fragment

527). The opposite pole of Light is Gravity (as in Schelling), which means that matter is nothing but a condensed Light (Fragment 266).

Many of Ritter's writings resonate with paracelsian notions [→ Paracelsianism]. He considers physics as a physiology, not the reverse. During the Golden Age there were no inorganic forms, and this means that science has to be genetic, not ahistorical as it usually claims to be. The whole solar system is within Man, and each of us is a universe in miniature (Fragment 451). Celestial bodies are the sanguine corpuscles of the cosmos; the Milky Way is its muscles; and Ether runs through its nerves. In addition to that, Ritter is looking for the "original forms". Resonant with Goethe's quest for an "Urpflanze", Ritter wrote in 1808 that he would like to be able to arrest or fix a spark (to petrify it), because this would enable us to see the 'Normal-Figur' (normative figure) to which all organic and inorganic forms of Nature could be brought back.

Ritter will read in the writings of such theorists as → Jacob Boehme, → Baader and → Saint-Martin, posited that matter was created in order to undo the wrath brought about by the Fall of Lucifer. 'Through Light, the Earth remembers times of old' (Fragment 517). The inner radiation of precious stones is laden with promise and is a reminder of the brightness of our Lost Paradise ('Electrical System of Bodies'). The Earth appears to us as a great conflagration, which is now extinguished and of which only a few sparks remain. In a parallel to Paul's Rom. 8:19-22, Ritter says that the fault of that conflagration lies with Man, and that it is incumbent upon us to awaken that Fire from its sleep ('On Physics considered as an Art'). He also deals theosophically with issues bearing on the origin of mankind. For example, he compares Eve, who was created without the aid of a woman, to Christ, for whom the reverse was the case. He announces the advent of an androgyne Christ, in a time when both sexes will fuse into one, and he links his reflections on that subject to → alchemy, in particular to the elixir of Life (Fragments 518, 602). In one of the most beautiful passages of German → Romanticism, Ritter celebrates Sun and Moon, Man and Woman: 'The Moon is a secret love letter that the Sun sends to the Earth, it is the reflection of the surge of love of man toward his beloved' (Fragment 518). Such writings are a blend of science and art, of content and form. Novalis's remark is pertinent: 'Ritter's quest is throughout the true World Soul of the universe. His purpose is to read the visible letters which one can weigh, and to account for the typographic composition of the highly spiritual energies'.

ANTOINE FAIVRE

Rivail, Denizard Hyppolyte Léon →
Kardec, Allen

Robert of Chester, fl. between 1140 and 1150

Robert, sometimes also known as Robert of Ketton or Robertus Rettinensis, was active between 1140 and 1150. We know of him first because, together with Hermann of Carinthia, he was engaged by Peter the Venerable, abbot of Cluny, to translate the *Qurʾān* completed in 1143. He was archdeacon of Pamplona from sometime around 1143. He is also known to have spent time in Barcelona and Tuleda and was evidently in London between 1147 and 1150.

His translation of al-Khwārizmī's *Algebra* completed at Segovia in 1145 introduced not only the word but the techniques of algebra to the Latin West. He was responsible for the revision of several astronomical tables for the meridian of London based upon tables of al-Khwārizmī, al-Zarqāllu and al-Battānī. Hermann of Carinthia identifies him as the translator of the *Opus astronomicum* of al-Battānī, a work which does not survive. Two treatises, one on the construction of the universal astrolabe and the other on the use of the planispheric astrolabe, also circulated under his name. He was probably also responsible for a redaction of Adelard of Bath's translation of Euclid's *Elements*.

Robert is perhaps best known for his connection with the early stages of the transmission of Arabic → alchemy to the Latin west. The Arabic term *al-kīmiyāʾ* may have been first introduced as *alkimia* to Latin readers before 1141 by Hugo of Santalla whose translation of the *Tabula smaragdina* was among the earliest significant texts. But the translation of the first substantive text on *alchymia*, the *Liber Morieni*, is commonly attributed to Robert. Objections have been raised to this attribution, however, due to its relatively late date (13th century) and the association of the name with what appears to be a later redaction of the original translation.

Roberts, Dorothy Jane, * 8.5.1929 Saratoga Springs, New York, † 5.9.1984 Elmira, New York

Jane Roberts – her first given name is never used – preferred to see herself as a poet and writer, but achieved fame by her books based upon "channeled" messages received from a "spiritual entity" called Seth. Her childhood was difficult: her parents divorced while she was still a small child, and Jane spent some years in a Roman Catholic orphanage. Having returned home, she was forced to take care of the household while looking after her invalid, psychotic and abusive mother. Already at the orphanage she had begun writing poetry, which seems to have been considered "heretical" by the nuns. In her senior year in high school, honorable mention in a poetry contest sponsored by *Scholastic Magazine* earned her a scholarship to Skidmore College (Saratoga), but she was expelled after a year for having attended an all-night party at a professor's house. Having placed her mother in a nursing home, she took off on a motorcycle with a boyfriend, to visit her father in California. Back in Saratoga, she married the boyfriend, Walter Zeh, and began working in various small jobs. In 1953 she instantly fell in love with thirty-four year old artist Robert F. Butts. Having divorced her first husband, she married Butts on December 27, 1954. The marriage seems to have been a happy one, with both partners agreeing from the outset about a life single-mindedly devoted to their artistic and literary work. They lived first in Tenafly, New Jersey, supporting themselves with irregular jobs, then moved to Butts' hometown Sayre in Pennsylvania. In 1960 they settled in Elmira, New York, where they would remain for the rest of Jane's life.

In 1956 Jane Roberts' career as a science-fiction writer began with a story titled "The Red Wagon", published in *Fantasy and Science Fiction Magazine*. Interestingly, given the later Seth messages, the story was about past-life memories, and in fact the subject of → reincarnation appears in her poetry at least as early as 1954. "The Red Wagon" was followed by several dozen other stories published in Fantasy & Science Fiction journals and "men's magazines", and three novels: *The Chestnut Beads* (1957), *The Bundu* (1958) and *The Rebels* (1963). Apart from a strain of apocalypticism reflecting concern about impending nuclear holocaust, a strong interest in the untapped potentials of the human mind is evident already from this early production, but after the disappointing

production of *The Rebellers* (bound in a cheap paperback together with another novel), her interest in the Science Fiction genre began to decline.

The turning point in Jane Roberts' life occurred in the afternoon of September 9, 1963. According to her own report, while quietly sitting at the dinner table she was suddenly and unexpectedly hit by an overwhelming "psychedelic" experience: 'Between one normal minute and the next, a fantastic avalanche of radical, new ideas burst into my head with tremendous force, as if my skull were some sort of receiving station, turned up to unbearable volume' (Roberts 1970, ch. 1). Roberts felt herself travelling at top speed through multiple dimensions of reality, while her hands were scribbling down the ideas that rushed through her head. When she came back to normal consciousness, she had written down a manuscript titled *The Physical Universe as Idea Construction*, which eventually turned out to contain many of the core ideas that would be developed in the Seth sessions. Trying to understand what had happened, Jane and her husband developed an interest in extrasensory perception (ESP); in fact, she lost no time in drafting a proposal for a book about how to develop ESP, even though (always according to her own report) she was almost completely ignorant about the subject. Having received a positive response from her publisher, the couple began to experiment with the Ouija board, which at the third attempt began to spell messages from a "Frank Withers" who claimed to have lived in Elmira and died in the 1940s, and to have known Jane and Robert in Denmark during a previous life. On December 8, 1963, the spirit announced that his real name was Seth, and began addressing Robert and Jane as Joseph and Ruburt. Over the next sessions Jane noticed she began anticipating the Ouija board's answers in her head, until she felt impelled to speak them out aloud. Thus the seances developed into "channeling" sessions, during which Jane would go into a full trance while Seth "possessed" her body and spoke through her with a male voice and in a characteristic style entirely different from her own. Robert Butts would converse with Seth and note down the questions and answers in shorthand, and these transcripts became the foundation for the series of Seth books published by Jane from 1970 on. In 1966 she had already published her book on *How to Develop your ESP Power* and a year later she had begun to teach ESP classes in her home, during which she would frequently go into trance, with Seth speaking through her with the participants; these classes continued regularly from 1967 to 1975. In addition she gave occasional lectures

and interviews (see Watkins 2001, 209-210). Although her books made her famous as a psychic, she disliked that label and its associations, and seems to have always experienced a strong aversion against the "New Age" circuit [-> New Age movement]: 'As a writer I feel free to be as psychic as a bird, do what I please, and use my abilities psychically quite freely. When I think of me as a psychic I get hung up because I seem to be in the company of so many nuts' (journal 26.3.1972, in Watkins 2001, 122).

In 1965 Roberts began to experience the first symptoms of rheumatic arthritis, from which her mother had been suffering as well. Over the years her physical problems grew steadily worse, and from the late 1970s on she also developed thyroid. Refusing regular medical treatment until a very late stage, she finally had to be hospitalized; she died in 1984 after a long and difficult sickbed.

Throughout her life, Jane Roberts was single-mindedly devoted to her writing, and of her total output (now at Yale University, Sterling Memorial Library, ms.group nr. 1090) only a small part has been published. Interestingly, and consistent with the complex theory of the relation between mind and reality developed in the Seth material, she considered literary creativity and psychic manifestations as intimately related, and always preferred to see herself primarily as a writer and poet: 'The psychic stuff literally came out of the poetry . . .' (journal 5.5.1972, in Watkins 2001, 114). The series of Seth books that were published from 1970 on, and several of her "own" books not attributed to Seth as the source, contain a comprehensive "spiritual" worldview based upon a complex theory of mind and reality.

The Sethian worldview is explained with considerable intellectual subtlety. It is based upon a concept of the soul (also referred to as "multi-dimensional personality" or "entity") defined as conscious, unlimited energy that is continuously seeking to express itself. It does so by creating "realities" and identifying itself with them. Each human being is in fact a "fragment personality" unconsciously participating in a much larger group entity or oversoul; we all "create our own reality" on the basis of our beliefs, and derive our sense of identity from focusing more or less exclusively on the products of our own creative → imagination while blocking from conscious awareness the multiple alternative realities that are available to us. The reality shared by us as human beings is characterized by the categories of linear time and three-dimensional space; but in fact, reality consists of an unlimited number of dimensions, most of which

are beyond our capacity of understanding, and time does not exist.

These principles are developed with relentless logic into a radical multidimensional worldview reminiscent of the so-called “many-worlds theory” in quantum physics. Since even the tiniest movement of consciousness is inherently creative, it inevitably gets realized. Thus, whenever in our daily life we choose between A and B, this causes our personality to split up into two fragments focused on two parallel universes: one in which we have chosen A, another in which we have chosen B. Any soul’s consciousness may therefore be imagined as an explosion of “fragments” that continuously multiply in an infinite number of parallel realities, each one of which is experienced as “the” only reality by the fragment that is focused on it. Seth devotes detailed discussions to the concomitant philosophical problems, such as the implications for our concepts of personal “identity”, or the nature of “consensus reality” (Seth does not defend solipsism, but claims that consensus reality is permanently being created as an unconscious and automatic telepathic compromise agreed upon by our souls).

Just like each personality is a fragment of a much larger soul or “entity”, entities in turn are parts of a god-like super-entity, referred to as All That Is (and Seth speculates that perhaps All That Is himself might be a fragment of an even larger entity, and so on *ad infinitum*). All That Is strives for self-realization by means of unfolding his infinite creative potential in a dazzling expansion of multiple realities: a process that is never-ending, and yet takes place not in space-time but in what is called the “spacious present”. Conscious participation in this process is what gives meaning to human life: ‘You are here to use, enjoy, and express yourself through the body. You are here to aid in the great expansion of consciousness. You are [here] . . . to create the spirit as faithfully and beautifully as you can in the flesh’ (*The Nature of Personal Reality*, 28). While our “higher self” remains permanently linked to our “multi-dimensional personality”, it guides our ego and personal subconscious through an endless series of lives, during which we experience our self-created realities. Eventually we will learn to make conscious and responsible use of our creative abilities (whereas at present most of us do so unconsciously and irresponsibly), after which we will be ready to “graduate” to even higher cycles of development presently beyond our capacity of imagination. Conventional concepts of reincarnation are ultimately misleading, because they suggest a linear development whereas actually time

does not exist: ‘The reincarnational structure is a psychological one. It cannot be understood in any other terms. . . . The reality, the validity, the immediacy of those lives do exist simultaneously with your present life. The distance between one life and another exists psychologically, and not in terms of years or centuries. . . . Reincarnation, as it is usually explained . . . is a myth’ (*Seth Speaks*, 447/449).

Some sources of the Sethian worldview are obvious: there are clear references to e.g. Emersonian Transcendentalism, William James (the subject of an entire book written by Roberts), and popular accounts of modern relativity physics and psychology. The insistence that we can create our reality by our conscious beliefs reflects not only basic → New Thought convictions, but also a concern about the suggestion of popular psychoanalytic literature that we are at the mercy of our unconscious drives. More research is needed to explore e.g. the sources of Roberts’ early interest in reincarnation, or the extent of her familiarity with → spiritualism.

Regardless of such backgrounds, the Sethian synthesis is remarkable for its originality and internal consistency. Its optimistic and world-affirming spirituality and its message that all of us have the power to create our own reality by changing our beliefs has strongly appealed to many readers since the 1970s. Detailed analysis of the literature of the → New Age movement shows that its basic ideas are modeled after Seth’s worldview to such a degree (Hanegraaff 1996/1998, 126 and *passim*) that, without exaggeration, Jane Roberts should be recognized as one of the major religious innovators in Western society after World War II. Given her pivotal role in creating the foundations of a comprehensive belief system now widely diffused through Western popular culture, she has been surprisingly neglected by scholars of Western esotericism and of new religious movements. A major critical monograph is long overdue.

Romanticism

1. ONTOLOGY 2. EPISTEMOLOGY
3. LINGUISTICS AND POETICS
4. INITIATION 5. MYTH AND RELIGION
6. PHILOSOPHY OF HISTORY
7. NATURPHILOSOPHIE 8. ROMANTICISM AND ESOTERICISM

Rather than attempt an exhaustive catalogue of the connections between esotericism and Romanticism, this entry is structured as a set of brief essays on interrelated topics, illustrated with representative thinkers, and followed by some remarks on the relationship between esotericism and Romanticism. Romanticism is a diverse historical phenomenon: at the very least, one must distinguish the

national Romanticisms of Germany, Britain, and France; and within those national Romanticisms, distinctions must be made by generation or place. Thus there are the German Romanticisms of 1798-1800, 1806, and 1808-1810, or those of Jena, Heidelberg, and Munich; there are the British Romanticisms of Wordsworth and Coleridge and of Byron, Shelley, and Keats; and there is the Catholic and royalist French Romanticism that begins in 1801 and the anti-clerical and liberal Romanticism that begins in the late 1820s. The principal representatives of the western esoteric tradition for Romantic thinkers are → Jacob Boehme, → Emanuel Swedenborg, → Louis-Claude de Saint-Martin, → Antoine Fabre d'Olivet, → Karl von Eckhartshausen, and → Franz von Baader. → Illuminism is a subset of the esoteric tradition corresponding to the last decades of the 18th century and the first decades of the 19th century. There is a strong Boehmenist component to Illuminism (hence the Romantics' tendency to equate Illuminism and theosophy), though other esoteric currents are also present.

1. ONTOLOGY

The God of Romanticism is no longer, as for the Enlightenment, an architect, a clockmaker, a judge, or a paternalistic pedagogue. Freed from the rational fetters which made the God of the Enlightenment a captive of human categories of understanding, the Absolute of → F.W.J. von Schelling or the Infinite of Victor Hugo and Jules Michelet is incommensurable with human knowledge; our reason, Friedrich Schlegel observed, can attain only a negative idea of the Infinite. Behind the Romantic notion of Divinity is the *Ungrund*, the essential Non-being of Boehme which wills Being into existence. Subsequent Boehmenist theosophy conceives of God as the *ens manifestativum sui*, the Life-principle that strives from a dark original cause toward its own realization and corporealization. Divine self-realization, or theogony, means that God actualizes himself progressively in the development of life. This divine unfolding has a dark aspect; evil and suffering are not external to God, but arise as an eternal moment of theogony. And since creation is part of the self-manifestation and self-realization of the divine nature, it too is characterized by conflict and suffering. This gives rise to what the Romantics called the *Nachtseite der Natur* (the nocturnal side of nature). From about 1806, Schelling's metaphysical thinking reflects his reading of Boehmenist theosophy and his discussion of it with Franz von Baader. Under its influence, he attempted to incorporate genetic and

volitional principles into the very core of ontology. The theosophical influence is clearly discernible in *Die Weltalter* (1811-1813, published posthumously), in which Schelling undertakes a logical analysis of the ontological relations that constitute the eternal process that is God. Schelling interprets history and nature, the unfolding of the pre-existent divine nature, as both a theogony (divine self-revelation and self-actualization) and a soteriology (restoration of Creation to unity with God).

The esoteric tradition depicts creation as the emanated self-manifestation of God. The world is a vital infinite reality in which all phenomena, as emblems of the divine, provide symbolic or analogical knowledge of the links between divinity, the self, and the world. Despite the Fall, light from the spiritual world is invisibly active in the sunlight of our world, just as the spiritual nature of creation remains present, though hidden, at the heart of the physical world. The cosmos is thereby a universe of mirrors and → correspondences. The Romantic cosmos is the emanated, living, analogically-linked cosmos of the esoteric tradition, and the Romantic quest, like that of the esotericists, is to create or restore a lost harmony through poetic vision, the restoration of language, initiation, the study of myths and religions, the restructuring of society, and contemplation of nature.

2. EPISTEMOLOGY

Romanticism's epistemological signature is its refusal to accept the Kantian disjunction between the phenomenal and noumenal worlds. Kant's *Kritik der reinen Vernunft* (1781) made the noumenal realm of ultimate truth inaccessible to rational knowledge. Romantics claim to grasp, directly or mediately, the ontological Absolute through an extra-rational faculty: intuition, → imagination, or a reconceptualized reason. Schelling attempted to elude Kantian epistemological pessimism by reconceptualizing reason as a transcendental insight or intuition that communicates with the Pure Actuality of the Godhead. Friedrich Schleiermacher similarly asserts, in *Reden über die Religion* (1799), that intuition is the centre of religious life because it alone brings us into contact with the Infinite. In Britain, Samuel Taylor Coleridge responded to Kant's challenge to metaphysical knowledge by distinguishing between the faculties of understanding and of reason. His distinction, a variation of Schelling's reconceptualization of reason, concedes that Enlightenment rationalism, or the understanding, cannot attain ontological truth but insists that reason, the "organ of the supersensuous", directly apprehends ontological truth and produces sub-

jective knowledge of the interpenetration of the finite and the Infinite. Coleridge alternatively refers to the faculty of reason as the imagination. This epistemology, by which, in *Biographia Literaria* (1817), he theorized the great poetry of his early collaboration with William Wordsworth in *Lyrical Ballads* (1798), also underlies his approach to religious knowledge in later theological works such as *Aids to Reflection* (1825).

The refusal to accept Kantian epistemological pessimism also applies to the Illuminists themselves. In *Vers dorés de Pythagore* (1813), Fabre d'Olivet overcomes Kant's epistemological pessimism, in a manner parallel to Schelling, by redefining reason as an intuitive faculty capable of grasping the ontological Absolute. More commonly, however, the supra-rational epistemological faculty celebrated by the esoteric tradition is the imagination. Predicated on the optimistic presupposition that the Fall has obscured but not entirely blocked our perception of the divine light pervading the universe, esotericism maintains that the imagination, whether Boehme's "eye of fire" or Saint-Martin's and Baader's "organ of the soul", sees through the world of appearances to the spiritual world hidden within and enables access to different levels of reality through the use of mediations such as symbolic images.

Esotericism nourished Romanticism in its aspirations toward knowledge of the Absolute. F. Schlegel proclaimed that the highest philosophy – the science of the nature and relations of divinity – is theosophy, and called for religion and philosophy to unite. Schelling's early philosophy, drawing on J.G. Fichte's *Wissenschaftslehre* (1794), transformed Boehmenist imagination, by adding the elements of subjectivism and voluntarism, into an imagination that, rather than realizing a synthesis of the Infinite and determinate forms, actively gives birth to the entire perceptible world. This transformist sense of imagination characterizes Jena Romanticism. For → Novalis (Friedrich von Hardenberg), the imagination places one in synchrony with the rhythm of the universe, thereby enabling one to change it. The transformist imagination persists in later German romantic literature, as in the poetry of Achim von Arnim and the stories of E. T. A. Hoffmann. Baudelaire's imagination similarly illuminates, animates, and transfigures material reality. For → William Blake, the imagination, which he calls Poetic Genius or Spirit of Prophecy in *The Marriage of Heaven & Hell* (1790), transcends the limits of rationality and sense perception in order to discern the spiritual essence that is eternal and infinite in

every living thing and in ourselves. Blake was influenced by Swedenborg, but turned to Boehme and other esoteric writers when he decided that Swedenborg's grasp on divine truth had been weakened by concessions to scientific rationality and that Swedenborgians sought spiritual escape from the world rather than to transform it.

Since the universe is a vital infinite reality, in perpetual becoming, Romanticism rejects the ideal of an objective, systematic account of a fixed order (of ontology or human affairs or nature or anything else). True knowledge is subjective and non-systematic. Michelet's historical method is to grasp its subject from the inside, by an act of sympathy (preface to *Histoire de France* [1869]). Novalis and F. Schlegel insist that true knowledge is interior, affirming Ludwig Tieck's description in *Phantasia* (1844) of the vocation of man as 'circumnavigator of our interior world'. Tieck, Clemens Brentano, his sister Bettina, and Achim von Arnim (Bettina's husband) polemicized against systematic thought. Romanticism, like the esoteric tradition, replaces systematic thought with correspondences, similitudes, harmonies, and analogies. By these tropes, Novalis said, humanity becomes aware of itself through the experience of the dynamic, developing universe in which it lives. Such knowledge transforms its possessor; Romantic knowledge is salvific knowledge.

3. LINGUISTICS AND POETICS

Esoteric linguistics, prominent in the Romantic period thanks to Saint-Martin and Fabre d'Olivet, among others, holds that behind the present cacophony of languages lies a single, primitive, language. This Adamic tongue enabled the first human beings to participate in the divine speech that had created the universe. In the primitive language of humanity spoken before the Fall, words corresponded to the essence of the things they named. Present-day languages, in which words no longer have an evident relation to the things that they designate, are as they are because of the Fall. The rehabilitation of humanity is linked to the recovery of the original, universal, divinely natural language of humanity. This recovery is possible because traces of the primitive language remain in one (Hebrew was the usual candidate), or a few, historical languages. These traces might one day be assembled and the primitive language reconstructed, thereby restoring humanity to unity and direct communication with God. Fabre d'Olivet illustrates this metalinguistic procedure in *La langue hébraïque restituée* (1815-1816). More typically, Saint-Martin asserts that recovery of the original language of

humanity is possible because something of the original language remains in our degenerate languages. This something is the ability of language to express spiritual reality, not directly or literally, to be sure, but indirectly through correspondences, symbols, figures, and analogies. This indirect speech, which we call poetry, participates in the divine powers, thereby linking humanity to God and apprehending the unity of creation.

Romanticism embraced the esoteric conception of poetry as symbolic knowledge and the key to an analogical world, of the poet as the recipient and transmitter of revelation, and of a recoverable universal language. F. Schlegel and Novalis, writing in the *Athenaeum* (1798-1800), celebrate the poet as a priest who will lead humanity to its eschatological fulfilment by relinking the world here below and divine transcendence. The symbolic imagination of Pierre-Simon Ballanche's poet-seer – exemplified in his *Vision d'Hébal* (1831) and discussed in Book Seven of *Orphée* (1829) – intuitively spiritual truths and translates them into material form; poetry is the intuitive faculty of penetrating the essence of beings and things. Romantic poetry, from Novalis to Joseph von Eichendorff, Alphonse de Lamartine to Hugo, Wordsworth to John Keats, decodes and celebrates the presence of Divinity in the beings and things of the natural world. Since analogy reveals and materializes the unity of divine creation, the symbolic image ceases to be merely decorative and instead conveys meaning. The best-known poetic statements of this theory of harmonies are → Gérard de Nerval's sonnet "Vers dorés" (1845) and Charles Baudelaire's "Correspondances".

Esoteric poetics charges the poet with communicating spiritual truth (or at least the portion of it vouchsafed to him) to his contemporaries. Yet, the communicative obligation collides with the limits of linguistic communication. That which can be said literally is fallen; spiritual truth can only be hinted at by means of correspondences, symbols, figures, and analogies. The limitation of language to express spiritual truth reappears in Romanticism, as does the poet's awareness that he has glimpsed only a portion of the truth (this is why the fragment is a characteristic Romantic genre). Ballanche resigned himself to the fact that his "true book" would never be written; the spiritually acute reader must discern his true teaching from the symbols of his texts. Here, as in the case of other notoriously obscure Romantic works, including such landmarks as Novalis' *Hymnen an die Nacht* (1802) and Nerval's *Les Chimères* (1844-1854), the author did not willfully encrypt

that which could have been expressed clearly; obscurity is a consequence of the epistemological necessity of symbolic circumlocution of spiritual truths.

True poetry, for Illuminism, displays a historical aspect because the relationship of humanity to God – the subject of poetry – is the drama of the Fall and the regeneration to come. Saint-Martin's ideal of poetry as metaphysical, narrative, and prophetic reappears as one of the characteristic genres of French Romanticism: the philosophical epic. Ballanche offers both a theory of the Romantic epic in chapter ten of *Essai sur les Institutions sociales* (1818) and an exemplar, *Orphée*. Other notable efforts include Alfred de Vigny, *Eloa* (1824), Edgar Quinet, *Ahasvérus* (1833), Alphonse de Lamartine, *Jocelyn* (1836) and *La Chute d'un ange* (1838), Alexandre Soumet, *La Divine Epopée* (1840), and Hugo, *La Légende des siècles* (1859–1883).

4. INITIATION

Initiation – an ontological metamorphosis or purification of being effected along with and by means of knowledge of and participation in the hidden mysteries of the cosmos and God – is yet another esoteric theme taken up by Romanticism. In Romantic epistemology, the acquisition of spiritual truths both imperils the aspirant and, once successfully attained, transforms his being. In the literary realm, works from Novalis' *Heinrich von Ofterdingen* (1802) onwards are structured around an initiatic quest; archetypically, a quest for the Castle, the Sanctuary, the Treasure, the Secret, an ordeal of the Labyrinth or dark Forest, an Ascent of the Mountain or Descent into the Underworld. George Sand's *Consuelo* and its continuation, *La Comtesse de Rudolstadt* (1842–1844), describe an initiation into a para-masonic sect. Hugo's *Les Misérables* (1862) transfers initiation from the realm of secret societies to social reality; descent into the underworld becomes the struggle of a former convict against poverty and social annihilation. In Charles Nodier's *La Fée aux miettes* (1832), as in Nerval's *Aurélia* (1855), madness constitutes the descent into the underworld that leads to illumination. Even travel narratives, such as the *Voyage en Orient* of both Lamartine (1835) and Nerval (1843), must also be recognized as accounts of the path to self-knowledge. Initiation may also encompass the discovery of a truth which has social and political implications: the eternal gospel of Sand's *Spiridion* (1839) is the vehicle of the social prophetism of *La Comtesse de Rudolstadt*; the revelations of Hugo's

“Ce que dit la Bouche d'Ombre” (1854) lead to Enjolras' profession of faith on the barricades in *Les Misérables*. Many Romantic philosophical epics are also tales of initiation, including social transformation through initiation. The great example here is Ballanche's *Essais de Palingénésie sociale* (1827–1831) in which social palingenesis, or social evolution, operates by means of the progressive initiation of humanity into knowledge of the primitive revelation and full participation in religion and society. Each successive initiation represents a social evolutionary advance, the sum of which constitute the rehabilitation of humanity from the Fall. Another influential example is the religious humanitarianism of Pierre Leroux's *De l'Humanité* (1840).

5. MYTH AND RELIGION

Schelling identifies myths as intuitions of Spirit that cannot be made manifest by any other means. F. Schlegel's claim that all relation of humanity to the Infinite is religion is closely echoed by Hugo's assertion that the essence of religions is sentiment of the Infinite. Romanticism revalorizes myths as intuitions of Spirit and religions as stages in the unfolding, and humanity's progressive apprehension, of Spirit. Romantic histories of religions chart the unfolding of Spirit. Beginning with *Über die Gottheiten von Samothrake* (1815) and culminating in *Philosophie der Mythologie* (1842) and *Philosophie der Offenbarung* (1841, both published posthumously in 1854), Schelling arranges the mythologies and religions of the world into a history of religions according to the degree to which each manifests the progressive self-actualization in human consciousness (including the subconscious) of the divine nature. Other prominent examples of what Quinet called the genealogy of the Eternal within the limits of time include Joseph von Görres, *Mythengeschichte der asiatischen Welt* (1810), Friedrich Creutzer, *Symbolik und Mythologie der alten Völker* (1810–1812), Benjamin Constant, *De la Religion* (1824–1831), Ferdinand d'Eckstein's articles in his journal, *Le Catholique* (1826–1829), Quinet, *Du génie des religions* (1842), and Michelet, *Le Bible de l'Humanité* (1864).

Since Romanticism holds that the essential content of myths and religions is the same everywhere and at all times (that is, the unfolding of Spirit), it follows that differences among them are only superficial and that there is no absolute distinction between Christianity and the other religions. There is, therefore, no hard and fast opposition between Romantics, such as Schelling and Ballanche, who

maintain that while all religions participate in truth, Christianity is the highest expression of that truth, and those, such as Sand or Hugo, who deny Christianity any special status. In each case, while myths and religions are the vehicle of the universal revelation and embody truth, a hermeneutics is necessary in order to recover the truth hidden beneath the disfigurements of myths and the externalities of the various religions. Romanticism practices an analogical hermeneutics of myth and religion that discovers an inner unity beneath the surface differences that seem so striking.

The Romantics apply the valorization of interior truth over external expression to their own religious lives. One must remain entirely free, Novalis says in *Blütenstaub* (1802), to choose the mediator by whom one is brought into contact with divinity; the least constraint nullifies religion. This idea is also at the heart of Schleiermacher's *Reden über die Religion*. A core theme of Blake's *The Marriage of Heaven & Hell* is the superiority of the poetic genius of the artist over institutionalized religions and their priests; art is internal, original, and liberating, whereas religion is external, derivative, and oppressive. In France, Balzac's religion of the future will be an interior illumination, just as for Hugo, in *Contemplation suprême* (1863-1864), religions are obstacles to the essence of religion. By displacing the idea of revelation from the outside to the inside, Romantic religion escapes from institutional control and is identified with the spiritual life of the individual, whatever the form its activity takes: art, philosophy, or religion in the narrow sense.

Closely linked to the interiorization of religion is the recognition that religion must change and develop as human beings achieve a progressively better apprehension of Spirit. Romanticism presumes the need for an ongoing *aggiornamento* of spirituality. F. Schlegel, in *Rede über die Mythologie* (1800), considering the culture of his day to be disenchanted as a result of the Enlightenment, calls for the creation of a new mythology. He and Novalis encouraged each other in the wish to found a new religion. Their desire was echoed in France by, among others, Hugo, Leroux and Sand. To this end, the Romantics both adapted old myths and religions and created their own in order to meet the spiritual exigencies of their own day. Representative Romantic myths include Orpheus, Oedipus, Cain, the Wandering Jew, Christ, Satan, the Revolution, the Nation, Napoleon, Don Juan, the Androgyne. The Romantics extended the category of sacred texts to include their own inspired works.

The principal elements of Romantic thought on myth and religion – interior truth over external expression, individual illumination over institutional structures, perennialism, syncretism, analogical hermeneutics – are also present, as the Romantics were aware, in esoteric writers. Even the history of religions is represented in Fabre d'Olivet's *Histoire philosophique du genre humain* (1824).

6. PHILOSOPHY OF HISTORY

Romantic philosophies of history arise from the conjunction of an epistemology that grasps eternal spiritual reality and an organic developmentalism according to which essences unfold over time. As such, they express an antinomy basic to Romantic thought: they affirm the existence of eternal ideas while at the same time asserting the meaningfulness of history.

The Romantics found a concept of spiritual evolution in the esoteric tradition. For → F.C. Oetinger, the essence of created things contains not only the form but also all the potentialities and possibilities of realization of a thing. The unfolding of essences is initiated by the operation of a secret interior impulse, which Oetinger calls 'the electrical fire concealed in all things'. The unfolding of essences toward the full realization of spiritual corporeality is the theosophical sense of evolution. Schelling's interpretation, in *Die Weltalter*, of history and nature as the development, or self-actualization, of the pre-existent divine nature is built on an essence-and-development model of evolution derived from Boehmenist theosophy. And yet, Romantic philosophies of history, particularly French ones, depart from the esoteric tradition in the importance they grant to temporalism and actual historical events. For the esoteric tradition, "process" is a dynamism that unfolds outside of time. In Fabre d'Olivet's *Histoire philosophique du genre humain*, the history of humanity is merely the playing out in time of the consequences of the metaphysical principles contained in its essence. For Saint-Martin, as for Fabre d'Olivet, while history is the arena in which reintegration is accomplished, historical events at most mark or symbolize phases of this process; they in no way effect it. The locus of reintegration is the extra-historical interior life of individuals. History belongs to the fallen world of time and matter; reintegration does not redeem history, it is a redemption from history. Romanticism radically revalorizes history. Ballanche's philosophy of history elaborated in *Essais de Palingénésie sociale* fuses the esoteric understanding of evolution as the process of spiritual rehabilitation with

historical-mindedness by reading historical events not merely as signs of the process of the reintegration of the primordial Adam but as the necessary and efficacious means of the reintegration. Human beings themselves, under the guidance of Providence, work out their own rehabilitation in the history of social institutions. The process is taken a step further by Lamartine and Quinet in their philosophical epics, in which a rationalist perfectibilitarianism substitutes for the esotericist telos of the rehabilitation of humanity from the Fall. Here, historical progress, while providentially guided, is no longer merely the sign – as for the esotericists – or even the means – as for Ballanche – of spiritual reintegration; it becomes the end in itself. Salvation is now conceived of as a spiritualization of terrestrial humanity within the historical process. Whereas the early Romantics historicized the esoteric process of reintegration, later Romantics historicized reintegration itself.

7. NATURPHILOSOPHIE

→ *Naturphilosophie* is the application of Romantic ideas on ontology and epistemology to the physical universe, just as its poetics and philosophy of history are the applications of them to other epistemic realms. *Naturphilosophie*, however, was predominantly a German phenomenon; in France, despite the chapter on *Naturphilosophie* in Germaine de Staël's *De l'Allemagne* (1814), the savants of the Institut national remained faithful to the demands of positivity. Coleridge's *Theory of Life* (1816) is a rare British example of *Naturphilosophie*, and depends heavily on German sources.

Nature, for the *Naturphilosophen*, is a perpetually living revelation. Franz von Baader, a geologist, mineralogist and professor at the University of Munich as well as a theosopher, understands Nature as the organ and sensible symbol of Divinity; Novalis, in his professional life an inspector in the directorate of salt mines of Saxony, sees each being and each object in Nature as illuminated by the transcendent light of the divine truth, and thereby transformed into a sanctuary for a believing soul. The sciences, he confided to August Wilhelm Schlegel, must be poeticized. Because the signification of Nature lies outside itself, empirical observation is only a necessary point of departure. Nature must be deciphered by means of correspondences; that is, authentic knowledge of Nature as the invisible processes of Spirit is possible only by means of analogy. Romantic *Naturphilosophen* criticized the objective sciences as being restricted to the surface of things and for conceiving of

Nature as lifeless and mechanical. The idea of a dead universe could only be convincing to those in whom a total enslavement to rationality had degraded the faculty of the imagination. *Naturphilosophie* looks inward as well as outward; knowledge of Nature and knowledge of oneself are linked because the hidden core of both is Spirit. Recognizing that the connaturality of the soul and the world is manifested by the correlation of microcosm and macrocosm, Baader applies to *Naturphilosophie* the epistemological formula of Saint-Martin: 'it is necessary to explain things by man and not man by things'. For Henrik Steffens, study of the developmental history of the earth and its creatures ennoble us because it allows us to grasp the unity of spiritual process in nature and ourselves. For Lorenz Oken, the philosophical study of natural history can unify the German people with themselves and the world. Schelling's *Ideen zu einer Philosophie der Natur* (1797) proposes that the philosopher can attain by investigation of Nature what the poetic vision reveals spontaneously: a glimpse of that eternal and original unity that in Nature and history is rent asunder.

Naturphilosophie is linked with and overlaps other early 19th-century investigations that seek to unveil the hidden forces of Nature and to read essences, hidden natures and ideal types from outward appearances. The many roads to reunion with Nature set out in Novalis' *Die Lehrlinge zu Sais* (1802) indicate the range of the disciplines contributing to Romantic *Naturphilosophie*: cosmology and cosmogony, developmental history of the earth and its creatures, investigations of conscious and unconscious mental states, of electricity, magnetism, galvanism, physiognomy, phrenology, meteorology, mineralogy, and philosophical anatomy. None of these sub-disciplines are independent; a scientific fact is a sign, and because signs correspond, concepts borrowed from chemistry, for example, may be transposed into astronomy or psychology.

Naturphilosophie is directly linked to the holistic and organicistic living Nature of esotericism. The Romantics recognized in Hermetic types of *Naturphilosophie*, which opposed acausal correspondences to the mechanistic causality of the emerging scientific revolution, a viable counter-metaphysic to contemporary mechanism, dualism, and materialism. Representatives of *Naturphilosophie* most attached to esotericism include A.K.A. Eschenmayer, → Novalis, → J.W. Ritter, → G.H. von Schubert, and C.G. Carus.

8. ROMANTICISM AND ESOTERICISM

Scholars who have traced the connections between the western esoteric tradition and Romanticism offer numerous metaphors for the relationship between them: a complicity formed between the Baroque imaginary and the Romantic frame of mind; the Romantics found nourishment in Boehmenist theosophy; the relationship between esotericism and Romanticism is a confluence, rather than an influence; the relationship is one of analogy, not of cause and effect; Romanticism drew on esotericism as an ally in its battle against the Enlightenment; Romanticism is the revival of the esoteric tradition, though a revival with a difference; Romanticism reformulated the esoteric tradition. Each of these metaphors – of complicity, nourishment, confluence, analogy, alliance, revival, reformulation – makes a claim about the relationship of Romanticism to the esoteric tradition. A historical explanation, rather than extrapolating from some essentialist definition of Romanticism, is required in order to adjudicate these claims, and thereby to decide whether or not the extensive connections between the Western esoteric tradition and specific Romantic thinkers warrant the claim that esotericism is an essential, constitutive factor in Romanticism.

We must begin with the fact that Boehme, for example, lived and thought as a man of the 17th century, and not of the 19th century. His theosophy responded to a set of religious, philosophical, social, etc. problems posed to him by his time, his place, and his environment. The thought of other pre-Enlightenment representatives of the esoteric tradition connected to Romanticism is similarly historically specific. For their part, the Romantics themselves belonged to a unique historical moment: post-Enlightenment, post-French Revolutionary, marked by the upheavals of the industrial revolution (fully in Britain, increasingly in France, only slightly in Germany); an age of social and intellectual disintegration, crisis, and renewal; of the crumbling of old religious certainties and a massive expansion of human knowledge. The brutal end of the *ancien régime* in the French Revolution opened up a mental space that came to be occupied by Romanticism. Ideas in the air before 1789, but incompatible with rationalism and empiricism, crystallized into a set of alternatives to Enlightenment attitudes toward art, thought, belief, and life: the primacy of the imagination, the potencies of intuition, the importance of the emotions and emotional integrity, a living Nature, the value of interior spirituality, independent of confessional frameworks, and the uniqueness and

value of every human being in a constantly changing cosmos. What unites Romantics – and provides whatever coherence the term “Romanticism” possesses – is that individual Romantics were all responding to the same historical situation, albeit with national variations, and were subject to the same historical constraints.

The Romantics found in the Western esoteric tradition ideas that answered to the intellectual and spiritual problems of their own historical moment. Their relationship to that tradition is not that of the heir or disciple who piously preserves what is handed down or recites unchanged the master’s teaching. The Romantics used esoteric ideas in order to, and to the extent that they helped, resolve the problems posed for them by their own historical situation. Esoteric ideas are only part, though an important part, of Romanticism. Moreover, while, for example, much Romantic poetry, as the decoding of the presence of Divinity in the beings and things of the natural world, is linked to esotericism, the fact that this link is weak or non-existent for the English poets (for most of whom Oxbridge platonism served in its place) suggests that Romantic poetics does not require an esoteric inspiration, however much it may actually have had one in Germany and France.

The esoteric tradition experienced a second Golden Age from the late 18th century until the mid-19th century – the period of → Illuminism. Sects promising spiritual regeneration, which had flourished as an underground movement during the Enlightenment, were now in harmony with events and spirits. Swedenborgian New Christianity, Boehmenist theosophy, Martinesism and → Martinism, Pythagoreanism, and → Magnetism all spread during the early years of the 19th century. Illuminism, as well as Romanticism, occupied the mental space opened up by the French Revolution. Saint-Martin to an extent, and Fabre d’Olivet and Baader completely, are Illuminists responding to the same historical situation as the Romantics. The difference between Illuminism and Romanticism, aside from the fact that Romanticism draws on many other sources besides esoteric traditions, is that Illuminists give unique authority to the esoteric tradition, whereas Romantics test esoteric texts, like all other authorities, against their own subjective experience. Illuminism complicates the historical relationship between Romanticism and the esoteric tradition; it is both an inspiration of Romanticism and a parallel movement to it. Illuminists like Fabre d’Olivet and Baader reinterpreted esoteric themes and ideas in light of the historical situation of the early 19th century,

thereby making them more accessible to, and more useful for, the Romantics. Complicating matters even further, Romanticism itself influenced the esoteric tradition. The prime example is temporalism. The historical consciousness of the Romantics is alien to esotericism as it had developed hitherto; “process”, for theosophical, alchemical, mystical, and Neoplatonic traditions, unfolds outside of time. Once Romanticism had inculcated into Western culture a historical consciousness, “process” and “transmutation” began to be interpreted, within esoteric traditions themselves, in terms of evolution.

The relationship between Romanticism and the western esoteric tradition is therefore a complex one rooted in the historical situation of the late-18th and early-19th century. Esoteric ideas were important, even central, to certain aspects of Romanticism, but much less so to others – more so for epistemology and poetics than for philosophy of history; more so in Germany and France than in Britain. The Western esoteric tradition contributed importantly to the thought of many individual Romantics, but was not an essential, constitutive factor in Romanticism.

ARTHUR MCCALLA

Roquetaillade, Jean de (Johannes de Rupescissa), * ca. 1310 Marcolès (south of Aurillac), † after 1365 place unknown

Roquetaillade took the habit of the Brothers Minor in 1332 after studies pursued for five years in Toulouse, and continued his studies as a Franciscan until 1337-1338. He would later judge these youthful years to have been wasted in ‘vain disputations and a great din of useless words’. Jean very soon espoused the cause of the “Spiritual” Franciscans whose principal doctrines related to the teaching of Pierre Dejean Olieu († 1298). In 1332, a vision in a dream informed him of the birth of an oriental antichrist in a place called Zaycon, about which he knew nothing at all. Paying no attention to the vision at first, he literally fell into “ecstasy” (*fui subito quasi in extasem conversus*) three years later when, reading letters sent by a brother residing in China, he discovered that the Minor always finished his letters with the name “bishop of Zaycon”. Jean de Roquetaillade was henceforth persuaded that God was signifying to him that he had to proclaim to the world the apparitions and revelations that were granted to him. Heaven favoured him with illuminations so generously that his main works, which are prophetic and alchemical, often have a vision as a starting point. Like Olieu and → Arnau de Vilanova, Jean de Roquetaillade lived in expectation of the Antichrist, of whom he identified several avatars. He adopted the *modus vivendi* of the “Spirituals” and preached the

evangelical poverty that the Franciscans of strict observance associated with the spirit of prophecy. Expressed without caution by a violent and intransigent character, in an era when concessions to Franciscan demands were no longer considered opportune, his imprecations, warnings and denunciations of a Church wallowing in luxury cost him imprisonment from 1344 on. This was the beginning of a long period of hardship, with internments in various places (Figeac, Cahors, Rieux, Avignon, etc.). These confinements obviously did not prevent him from writing down his predictions and visions, or from engaging in alchemical experiments. Inspired by the apocryphal works of Joachim of Fiore, the writings of Robert d'Uzès, pseudo-Cyril (cf. his *Commentaire sur l'Oracle du Bienheureux Cyrille*), → Hildegard of Bingen, the books of Daniel and Ezekiel, and the Apocalypse of John, Jean de Roquetaillade belongs to the Joachimite vein, integrating the contributions of Olieu and of Arnau de Vilanova with the concepts of Joachim of Fiore. One of the great originalities of Roquetaillade is (in his *Liber Secretorum Eventum*) to proclaim a literal millenarianism that postulates 1000 solar years between the death of the great Antichrist and the Last Judgment; then, he writes, 'the fullness of the Holy Spirit will descend over the whole earth' and men will joyfully embrace the lifestyle of the poor Franciscans. He is considered to have been the first to break away so clearly from the Augustinian dogma prohibiting any millenarianism. He predicts the coming to this world below of prophets who will completely understand 'the secrets and hidden mysteries of Scripture'. In the image of an Arnau de Vilanova and of many Joachimites, he thought in fact that the full extent of the Biblical message had not yet been revealed, and that only certain chosen and well-informed individuals were qualified to bring the enigmas of the Book into the open. Jean's ambition was to conjecture future events. On several occasions he flatters himself with having seen correctly; for example, in announcing the capture of King Jean le Bon (in *Vade mecum in tribulatione*). However, his self-appointed mission of bringing current political events in accord with his discourse on the "last things" forced him to make certain adjustments from one work to the other. Situating himself in the purest tradition of oracles and prophecies, Jean multiplied the number of symbolic figures and metaphors (bat, fox, donkeys, eagle, bear, etc.) to the interpretation of which he delivered the keys. One may be surprised at the 'esoteric language' (Bignami-Odier) of these prophecies, composed of enigmatic sentences

marked by a difficult syntax, but in fact, such was the law of the genre. This style is an expression of the sense of mental crisis typical of those who experienced the end of the Middle Ages. Besides the works already listed, mention must also be made of the *Veh mundo in centum annis* (or the *De oneribus orbis*) in which, among others, the author attacks the "sons of Aristotle", the ninth scourge, and the *Liber ostensor*.

Jean de Roquetaillade was renowned not only for his visions and predictions, but owes part of his fame to his books treating of → alchemy. Here again, he is considered a disciple of master Arnau de Vilanova. In *De consideratione quintae essentialis rerum omnium* or *De quinta essentia*, a text of medical chemistry, Jean de Roquetaillade identifies the fifth element, Aristotle's ether, as alcohol and the elixir of the alchemists. In the prologue to this work, he clearly states that the goal of philosophy is not to lose one's time in sterile disputes but, rather, that it consists in providing evangelical men with an admirable medicine that revives their health and vigor. Jean says of his quintessence that it has the power to cure the plagues that occur through the evil influence of the stars, but not those sent by God. Another alchemical book by Jean de Roquetaillade is *Liber lucis*. There Jean connects his revelation of the mystery of the philosopher's stone to his predictions about the Antichrist. If he does not respect the obligation, so dear to the adepts, of keeping the secret, this is because men of the gospel are in need of the stone in order to help the unfortunate who are being persecuted by the sect of the Antichrist. This treatise repeatedly quotes the *Tractatus parabolicus* by Arnau de Vilanova, which compares the alchemical regimen with Christ's passion.

The paradox of an uncommon character like Jean de Roquetaillade is that, despite beliefs and convictions that may well seem fantastical (he announced, for example, the physical destruction of terrestrial animals by enormous earthworms!), he displays so much sound scientific knowledge in his alchemical works that he must be considered one of the distant precursors of iatrochemistry. In addition, it is certainly his total independence with regard to the philosophical dogmas issued from Aristotle, that made it possible for him to develop his theory of distilled alcohol as the earthly equivalent of the fifth element, the matter of the celestial bodies. It is no less surprising that Jean de Roquetaillade, a man brimming with visions and an obscure interpreter of the hidden mysteries of the Scriptures and oracles, was obsessed by numbers and calculations to such an extent as predicting

‘future events with a greater certainty than through miracles and wonders’.

ANTOINE CALVET

Rosicrucianism I: First half of the 17th Century

The phenomenon known as “Rosicrucianism” has its origin in 1614, with a volume that appeared in Kassel, Germany, containing three texts: *Allgemeine und General Reformation der gantzen weiten Welt* (Universal and General Reformation of the Whole Wide World), *Fama Fraternitatis, Deß Löblichen Ordens des Rosenkreutzes, an alle Gelehrte und Häupter Europae geschrieben* (The Fame of the Fraternity of the Praiseworthy Order of the Rose-Cross, Written to all the Learned and Rulers of Europe), and *Auch einer kurtzen Respon-sion* (Also a Short Reponse) signed by → Adam Haslmayr. In a new edition, published in 1615, the first item, a satirical extract translated from Traiano Boccalini’s *Ragguagli di Parnaso* (News from Parnassus), disappeared in favor of the *Confessio Fraternitatis* (Confession of the Fraternity). The *Fama* was an undoubted success, for it was reprinted nine times through 1616, in which year a story entitled *Chymische Hochzeit Christiani Rosenkreutz Anno 1459* (The Chemical Wedding of Christian Rosenkreuz in the Year 1459) appeared in Strasbourg. From the moment of their appearance, the two early manifestoes and the novel the *Chemical Wedding* enjoyed a warm reception over the whole of Europe. In Germany, France, and England, these modest writings unleashed an avalanche of reactions *pro* and *contra*: more than 200 polemics or panegyrics appeared between 1614 and 1620, and some 900 up to the beginning of the 18th century. Some accused the authors of the Rosicrucian manifestoes of heresy, political agitation, or diabolic pacts. Others, more objective, sought the genesis of these

mysterious writings in the alchemical tradition [→ Alchemy], in Paracelsian pansophy [→ Paracelsianism], or in the Hermetic currents of the Renaissance [→ Hermetic Literature III], while others believed that they could identify the source in Brahmanism or even in → Moses.

The considerable success of the first Rosicrucian writings is certainly due in part to their literary quality and to the mystery which surrounded them. But in addition to that, what they contained also put forward solutions to the problems of the time and of the generations to come, within the context of what the present author has called (borrowing Paul Hazard’s expression) “the crisis of European consciousness in the 17th century”. That crisis took on three forms: in politics, religion and epistemology. The Holy Empire was subject to strong tensions which the Peace of Augsburg and the principle *cuius regio, eius religio* had not been able to alleviate. The so-called “Formula of concord” had not succeeded in reinstating the unity between the various Lutheran States. Calvinism was gaining ground, and the Roman Catholic Church had become reinforced since the Council of Trent. As a consequence, Lutheran authorities drew tougher doctrinal lines. On the other hand, the new scientific orientation had been rapidly expanding, as exemplified by the mathematician Ieronymus Cardanus, the geographer Mercator, and primarily the astronomer Johannes Kepler (the influence of the latter on the Rosicrucian writings is indisputable).

The manifestoes originated in the “Learned and Christian Society” established by → Johann Valentin Andreae in Tübingen in 1610. This small group of bosom friends of Andreae’s, notably Christoph Besold and Tobias Hess (his *amici secretissimi*), together conceived of and constructed the Rosicrucian myth. In all likelihood the *Fama Fraternitatis* and the *Confessio* resulted from the cooperation of several authors, whereas the *Chemical Wedding* was written by Andreae alone. Against the background of the crisis referred to above, the members of the Tübingen circle felt that it was necessary to return to the practice of Christian piety, aloof from the dogmatic squabbles of orthodoxy, and reconcile it with the advancement of science and learning.

The *Fama*, the *Confessio*, and the *Chemical Wedding* reflected a worldview based upon an analogical apprehension of God and of the world on the part of man, based upon earlier esoteric sources and traditions in Western esotericism. The rose in this context reveals symbolic attributes similar to those of the lotus in the Far East. It

unfolds on the surface of the Earth-Mother, while the mystic rose is an attribute of the *Mater Dei* (Mother of God) and of spiritualized matter. According to the *Zohar*, the rose is the symbol of God's presence in the world, which will bloom again in messianic times. Medieval iconography made its blossom the image of the Grail [→ Grail Traditions in Western Esotericism], the vessel in which Christ's blood was collected, and thus saw this flower as a symbol of regeneration. In the *Paradiso* of his *Divine Comedy*, → Dante sees 'the eternal rose opening stepwise' in which the Blessed live. Traditionally, the rose is also the receptacle of the fertilizing dew, symbol of the redemptive divine grace. The prophet Hosea has Jahweh say: 'I will be as the dew to Israel; he shall blossom as the lily' (Hos. 14:5/6), while Isaiah speaks of a 'dew of light' that will restore life to the dead (Is. 26:19). The similarity of the Latin words *rosa* (rose) and *ros* (dew) has led some to see in the Rose-Cross the alliance of the dew and the cross.

If the rose is the point of juncture and flowering between matter and the divinity, it is normal for it to be situated symbolically at the center of the cross that unites heaven and earth. → John Dee, in his *Monas hieroglyphica* (Hieroglyphic Monad), had argued that the cross is ternary (consisting of two straight lines plus their meeting-point), representing the Holy Trinity and the trinity of body, soul, and spirit; that it is quaternary, thus terrestrial; and that it is also quinary, the number five evoking the sacred marriage of spirit and matter. Thus it is no surprise that the two symbols should be allied in heraldry, notably in the coats of arms of Luther and of the family of Johann Valentin Andreae, in the Order of the Garter, founded circa 1348, or in the collar of the Annunziata, a chivalric order founded in 1363 by Amadeo VI, Duke of Savoy. These two motifs already appear united in the frescoes and mosaics of primitive Christianity, and in the work of the German mystic Heinrich Suso (1295-1366). → Paracelsus, in his *Liber de resurrectione et corporum glorificatione* (Book of the Resurrection and Glorification of Bodies, circa 1533), explains that man, regenerated by the Cross, thereafter receives a spiritual body whose glorification is symbolized by the rose; it is Christ, the Man-God, who transfigures us, just as the philosophers' stone transmutes metallic matter. It is not surprising, therefore, that the *Fama Fratemitatis* mentions the name of Paracelsus with respect and admiration, nor that it depicts works relating to this author as being present in the vault where the body of Christian Rosenkreuz rests. The founder of the Rosicrucians, as explained in the *Fama*, is supposed to have

died in 1484, and his mausoleum not discovered until 1604, whereas Paracelsus was born in 1493 and died in 1541. The implausible chronology only goes to underline paradoxically the relationship of ideas between the Rosicrucians and Paracelsus. The latter's ideas about the *Astrum*, the world-soul which manifests through the macrocosm; on the *Liber Mundi* (Book of the World) whose hieroglyphs are there to be deciphered; on the invisible half of the cosmos whose secrets man is able to discover because he is the microcosm and the temple of God; on the notion of cosmic time in which the alchemist may intervene as midwife to nature and co-operator with God; on the capacity of the human soul to command the stars, to control events, and even to produce new beings that the *Anima Mundi* "imagines"; and finally his belief in "elementary" beings, i.e., those that live in the elements, the 'nymphs, sylphs, pygmies, salamanders, and other spirits': all these ideas of Paracelsus recur in the *Fama Fratemitatis*. His rich and powerful writings, which were not really accessible until Huser's edition appeared in Basel in 1591, have every appearance of proclaiming him a prophet of the new era.

Another influence is that of *De arte cabalistica* (On the Kabbalistic Art), published by → Johannes Reuchlin in 1517. This contains an account of the symbolic meeting between a Pythagorean, a Muslim, and a Jewish Kabbalist. While the *Fama* is as little sympathetic towards Mohammed as it is to the Pope, it praises kabbalah and emphasizes the musical and philosophical harmony existing between man, heaven, and earth, symbolized by the geometrical perfection of the sphere. As for Christian Rosenkreuz, through his *Axiomata* he is said to have penetrated the secrets of divine mathematics; thanks to his knowledge of the *Rotae Mundi* (wheels of the world), he is the universal man, the axis of the cycles of renovation; and the book entitled *Proteus*, said to be in the library of the first Rosicrucians, evokes the theme of metamorphosis. Thus one can understand the *Fama's* affirmation that there is no contradiction between philosophy and theology.

The *Fama* is not exclusively dogmatic. It also recounts the history of Christian Rosenkreuz: his initiatic journey to the Orient, to Egypt and Morocco, the constitution of the Order of the Rose-Cross, the writing of their 'secret and revealed philosophy' which is a gnosis, and the miracles that they work thanks to their cosmosophy, which is a pansophy, a natural → magic, a spiritualization of matter, by means of which all things are ordered towards divinity. The Rosicru-

cians' wisdom is said to be "revealed" because it is not the result of rational thought, and because it is simultaneously knowledge and procreation. It is presented as an interior vision, a divine gift mediated through the *mundus imaginalis* (imaginal world; the term derives from → Henry Corbin), which is the reason that the *Fama* mentions 'the office of angels and spirits' and evokes the elementary beings as intermediaries. Finally, theirs is a secret philosophy, i.e., one that is connected with the mysteries of the → correspondences between microcosm and macrocosm, which only reveal themselves through masks, in a symbolic ambivalence accessible solely through initiation. This philosophy belongs within a tradition whose initiates are named in the *Fama*: Adam, Enoch, Abraham, Moses, Solomon, Plato, Aristotle, and Pythagoras. One can see that this "philosophy" which encompasses Hermetism and → alchemy is really the *philosophia perennis* [→ Tradition]: it is perennial because it has been perpetuated since the origins of mankind, and it is eclectic because it conciliates the divine revelation and its cosmic manifestations in a higher unity. Without any syncretism, it recognizes the equal value of the Divinity's two forms of expression, Nature and Scripture ('the great Book of marvels is in concord with the Bible').

Christian Rosenkreuz is said to have died in 1484, at the age of 106. In terms of traditional → number symbolism the number 100 evokes individuation, while the addition of 1 and 6 gives the well-known symbolic number of 7. Likewise the date of 1484 reduces to a total of 17, which could be interpreted as the ogdoad (1+7) or, according to a Pythagorean and Shi'ite tradition, the number of those who will be resurrected. Thus number symbolism confirms the particular election of Christian Rosenkreuz. The *Confessio Fraternitatis*, as its appearance was announced in the *Fama*, was to contain 37 reasons for making the Brotherhood public. Although the reasons are not in fact enumerated in the *Confessio*, the symbolism of this number is also obvious: 3+7 gives the number of the Pythagorean tetraktys in which the source and root of eternal Nature is to be found, while their multiplication gives 21, which in the Bible is the number of attributes of Wisdom.

The authors of the *Confessio Fraternitatis* agree with the astrologers that their epoch is entering into the sign of Mercury, who was assimilated by → Michael Maier with Hermes [→ Hermes Trismegistus]. In his *Choephoroi*, Aeschylus has Electra define Hermes as the mediator *par excellence* between gods and men, a function also ascribed to him by the alchemists and by → Heinrich Khun-

rath. Hermes is the messenger and the spokesman of Zeus, the "angel" (Gk. *aggelos* = messenger) of Olympus, the herald of good news. Thus it is normal for astrologers to regard Mercury as 'the lord of the word', and for the *Confessio Fraternitatis* to proclaim the coming of 'the age of the Tongue'. → Jacob Boehme, in his *Morgen-Röthe im Aufgangk* (Rising Dawn, 1612), wrote that in the man who is fulfilled, the planet Mercury gives rise to an inspired language. Possessed by the divine virtues, he becomes the singer of the Word, in communion with the angels (*Aurora*, 5, 11-13). In the same way, the *Confessio* states that the time has come to speak, to reveal the mysteries of the Adamic language, i.e. the primordial idiom, transparent as light, which the animals in Paradise understood and which allowed Enoch to converse with angels. Because the Rosicrucians already possess the knowledge of this language, they claim to be able to go beyond the exoteric meaning of the Bible and give it a spiritual reading, so as to discover that the Holy Scriptures are the quintessence of the entire world, and so as to decipher the characters of the *liber Naturae*. But they make it plain that the book of nature cannot be read and understood except by a minority. They proclaim 'the age of the tongue', but they impose the law of silence on whoever rallies to them. If → secrecy is a fundamental element in the *Confessio Fraternitatis*, which mentions it at least ten times, it is not for the sake of kindling the readers' curiosity, but because certain realities touching on religion, creation, and the book of nature are held to be inaccessible without a long initiation and an alignment of the psyche with the divine and cosmic mysteries. Secrecy is a condition of the sacred. → Hermes Trismegistus says to Asclepius: 'It is an impious thing to divulge to the masses a teaching filled with the divine majesty', and the epigraph of the *Chemical Wedding* recalls that pearls should not be cast before swine. The Rosicrucians' secret is the possession of the gnosis that the *Corpus Hermeticum* defines as a gift from God. And the 'true philosophy' that the *Confessio* extols is Hermetist; the reference to the theological and medical sources of this "philosophy" reflect its Paracelsian origin. In the *Liber Paragranum*, Paracelsus had mentioned as the four foundations of his medicine 'philosophy, astronomy, alchemy, and virtue', and he had stated that 'The philosopher should find nothing in heaven or earth that he cannot equally find in man. The physician should only find in man that which heaven and earth contain'.

Paracelsus' optimism sometimes gives his writings a prophetic tone. According to the treatise

De Mineralibus, there is nothing hidden that shall not be revealed; the author announces the coming of a man who will possess wisdom and be able to unveil all. This same prophetic atmosphere pervades the *Confessio Fraternitatis*, but it also stems from Joachim of Fiore, whose principal writings had been printed at the time of the Reformation. Joachim's reflections on the profound meaning of Scripture had led him to discern in the creation three successive ages: the age of nettles, the age of roses, and the age of lilies. The *tertius status* (third stage) will be that of the eternal Gospel, in which, thanks to a new "spiritual" religion, we will see the heavens open. This third age was to begin at the end of the sixth millennium, when the "sixth seal" would be broken and the "sixth candlestick" be lit. The *Confessio Fraternitatis* similarly situates itself at the end of the 'age of the rose' and evokes the privilege granted to the Rosicrucian Brotherhood to light the 'sixth candlestick', thus inaugurating an era of happiness, health, and prosperity. Paracelsus saw this time of the Holy Spirit already at work in the microcosm and macrocosm; according to him, there is a light in nature whose brightness surpasses that of the sun, and in this light invisible things become visible, ubiquity becomes possible, and the future is unveiled. The *Confessio* alludes to the pseudo-Paracelsian prophecy of the *Lion of the North*, taken up by Haslmayr in his *Responson* to the Brothers of the Rose-Cross that was bound with the first edition of the *Fama*. The action of the Rosicrucians prepares for the advent of the Lion, whose universal monarchy will inaugurate an era of felicity. But the prophecy goes on to say that this golden age presupposes a transmutation that is symbolically described in the *Chemical Wedding of Christian Rosenkreuz*.

This narrative is placed in obscure fashion under the patronage of the *Aurora consurgens* (Dawn Rising), a mysterious text of the 15th century that describes the chemical and spiritual marriage on a new earth; and also under that of Paracelsus, whose name is mentioned in a cryptogram. In his *Liber de resurrectione et corporum glorificatione*, Paracelsus writes that 'the proofs of authenticity of natural gold give us an image of the trials that our regenerated body must undergo . . . Thus, after the resurrection, a new body is born which, being more luminous than the sun, is called the transfigured body'. The resurrection of Christ is an image of our own: 'by him and in him we will arise like the rose and its proud blossoms from the same seed and the same stem'. → Gérard Dorn, whose writings had surely been read by Andreae, speaks in a Latin work of the end of the 16th century called *Aurora*

Philosophorum (Dawn of the Philosophers) of 'rose-colored blood' in which is hidden the soul of the philosophers' stone, and cites this prediction of the alchemists: 'The last times will see the coming to the earth and the world of a man who is absolutely pure, which will permit the redemption of the world. Thanks to the drops of rose-colored blood that he will shed, he will wash away the sin of the world, he will purify it and purge it of all its uncleanness'. Further on, Dorn concludes: 'In the end . . . the matter of our philosophic stone is nothing other than the true hermaphroditic Adam, the microcosm . . . It is the case that our mercury . . . acquires the energy and power of the higher and lower things, whose nuptial union, so to speak, it realizes'.

The Rosicrucian romance of the *Chemical Wedding*, to whose authorship Johann Valentin Andreae eventually admitted, describes the coming of a 'perfectly pure' man, *putissimus homo*, who appears on the earth *in postremis temporibus* (in the last times). Evidently this providential being is not to be confused with Christ, whose redemptive sacrifice saved humanity once and for all and freed it from the tragic burden of original sin. Nor is the *putissimus homo* the *salvator microcosmi*, the savior of the microcosm that is man, but rather the *servator cosmi*, i.e., the liberator of the world, the total man, he who will complete the redemptive work of Christ by practicing "deliverance" in the sense of the Greek word "maieutic"; that is to say, the birthing of nature which Paul says in the Epistle to the Romans 'has been groaning in travail up to now' and 'waits with eager longing for the revealing of the sons of God' (Rom. 8.22, 19). This glorification of Nature which is to achieve the work of redemption is interpreted as an alchemical *opus*: it is the Great Work, the effect of the double mystery of regeneration and of the *hieros gamos*, hence the sacred marriage. Regeneration and hierogamy are understood as two salvific actions due to the intervention of Hermes, or more precisely of the *spiritus Mercurius*, the Spirit Mercury. As for the mission of the *servator mundi*, the liberator of the world, at the end of the *Chemical Wedding of Christian Rosenkreuz* it is granted to the "Knights of the Golden Stone".

The strange symbol drawn on the invitation to the royal wedding that an angel brings to Christian Rosenkreuz is in fact an ideogram that was commented upon in the *Hieroglyphic Monad* of John Dee (1564), and symbolizes the sacred marriage between the material and the spiritual. It evokes the image of a mysterious personage, the protagonist of this hierogamy, who manifests at

certain moments in the sight of mortals. Christian Rosenkreuz in fact says that he comes back periodically to guide mankind.

In this brief presentation of early Rosicrucianism it is impossible to expound in detail the multiple symbolic elements of the *Chemical Wedding*. It must suffice to indicate and decipher the principal stages of initiation of the novel's eponymous hero. When he arrives at the castle of the Wedding, he is met by a fierce lion, which is later found perched on a fountain and holding in its paws a naked sword, which it breaks before throwing the pieces into the fountain and giving a roar. A dove then brings the lion an olive branch, which it swallows. A white unicorn that had come to kneel before it thereupon shows extreme joy. The lion symbolizes among other things the *spiritus Mercurius*, as does the unicorn. It is appeased by the reverence of the unicorn, which represents the active purity, the fecundating sword, the penetrating force of the Spirit Mercury. The white dove, messenger of peace, may also be a symbol of the philosophical mercury, this time in its volatile form, corresponding to the Holy Spirit in the Bible. The water of divine grace is here gathered in the mercurial fountain. It is what the alchemists call *aqua permanens* (permanent water), whose virtue is to transform the body into spirit and confer indestructibility upon it. This mercurial water is the primordial water, of which a 17th century Hermetist author said that it is born from the divine light and that the quintessence is its issue. Just as a spiritual spring once sprung forth symbolically in Judea, for the alchemists there is a mysterious Judea in a place kept secret, with a spring whose water comes from the *lumen naturae* (light of nature). On the following day, Christian Rosenkreuz is again brought to the fountain; the lion holds between its claws a plaque announcing the metamorphosis of Hermes, 'turned to a healing medicine', and invited to drink and purify himself. The enigma of this transformation makes sense in the context of Hermetism. The alchemists say of the Mercury of the philosophers that it is versatile and rejoices equally in the company of the good and the bad. But it is precisely this changing humor that renders it capable of metamorphoses, of an evolutionary process that begins with evil and ends with good. It has issued from Saturn, the *diabolus*, who is its father, but it becomes the mystagogue, the mediator *par excellence* between heaven and earth, between matter and spirit; in short, it is the philosophic stone, the universal tincture. Thus the transformation of the *spiritus Mercurius* into a healing medicine is explained within a hermetic perspective. As the alchemical texts of Andreae's

time show, it is the *medicina catholica* (catholic medicine), i.e., the panacea; the *salvator omnium imperfectorum corporum* (that which cures all imperfect bodies); and the *aqua vitae* (water of life). The *aqua permanens* is simultaneously water, fire, air, and golden tincture. It is the baptismal element from which emerges the second Adam, the *philosophic man*. On Friday, *dies veneris* (the day of Venus), Christian Rosenkreuz discovers in the subterranean caverns the *Arbor philosophica* (philosophic tree) whose branches are like the veins of the earth whose coagulated blood becomes the metals, especially gold. Venus, whom he beholds naked, is the matrix from which its roots draw their sap, and her fecundity will permit the realization of the Great Work. The elect, marked by the sign of the Golden Fleece and led by Hermes the psychopomp, proceed on their journey which brings them to the Tower of Olympus. For the Mercury of the philosophers is the actor of all the metamorphoses that take place, and which are directed by the Virgin Alchemy, herself one of the aspects of the *spiritus mercurialis*. In a treatise dating from the 15th century and attributed to → Marsilio Ficino, it is stated that Mercury, like the Virgin Mary to which he is assimilated, has given birth to the philosophic stone. He carries it in his belly, and when the time is ripe he gives birth to the *Filius macrocosmi* (son of the macrocosm), by whose blood inferior bodies are "tinctured" and gathered, cured, into the Golden Heaven. This transmutation, in which Rosenkreuz is invited to participate in the *Tower of Olympus*, was evoked by Poimandres in the first tractate of the *Corpus Hermeticum* [trans. Copenhaver]: 'First, in releasing the material body you give the body itself over to alteration, and the form that you used to have vanishes. To the demon you give over your temperament, now inactive. The body's senses rise up and flow back to their particular sources . . . and mingling again with the [astral] energies . . . Thence the human being rushes up through the cosmic framework', which is sevenfold, and comes denuded of his vices to the 'ogdoadic nature'. This corresponds to the eighth story of the Tower of Olympus, which is the place of regeneration of the royal couple whose "chemical wedding" will be the supreme act of unification that completes the Great Work.

From the moment they appeared, the first Rosicrucian writings aroused the interest of many readers throughout Europe: among the French, Descartes and Gabriel Naudé; in England, where their impact was considerable, → Elias Ashmole (1617-1692), Samuel Hartlib (1595-1662), John Dury (1595-1680), the pansophist physician →

Robert Fludd (1574-1637) and his German colleague → Michael Maier (1568-1622); in Moravia, → Jan Amos Comenius (1592-1670), who gave the Rosicrucian ideas a planetary dimension and anticipated the humanitarianism of → Freemasonry. From the Royal Society of London to the Alchemical Society of Nuremberg and the folio volumes of → Gottfried Arnold, the Rosicrucian influence persisted throughout the 17th century. This influence remained literary, however: there is no proof that the Brotherhood of the Rose Cross described in the *Fama Fraternalitatis* ever existed, and it is only in the 18th century that actual organizations calling themselves “rosicrucian” first come into existence.

ROLAND EDIGHOFFER

Rosicrucianism II: 18th Century

About one century after the original Rosicrucian manifestoes [→ Rosicrucianism I], in 1710, Samuel Richter published in Breslau, under the pseudonym Sincerus Renatus, a book titled *Die wahrhaftige und vollkommene Beschreibung des philosophischen Steins der Bruderschaft aus dem Orden des Gülden- und Rosenkreutzes denen Filiis Doctrinae zum Besten publiciret*. It is significant that the author had added the word *Gülden* (golden) to the generic term Rose Cross, for this detail changes the meaning of the original myth by accentuating the alchemical *Theo-Philosophia Theoretico-Practica* (according to the title of a work published by Sincerus Renatus in 1711). Moreover, to the book of 1710 he attached fifty-two articles about the practical organization and continuation of what he called the “Society of the Golden and Rosy Cross”. At its head stood, according to him, an emperor appointed for life. The members, unlike those of the original Rose Cross described in the manifestoes, could be Catholic; but brothers were forbidden to enquire about the religious persuasion of their fellow brethren. They could not marry, but were allowed to have sexual relations if their desire was too intense. Some of the fifty-two articles referred to the brothers' alchemical powers, their capacity to materialize the philosopher's stone, precious gems or pearls, as well as their ability to rejuvenate and renew themselves. Sincerus Renatus emphasized in his preface the divine character of true alchemy, whose goal is the purification of Man and Nature. Moreover, he stated that the Rosicrucians had moved to India to live there in peace. Although he invited his readers to join the Society, it is practically proven now that in his era, a Society of the Golden and Rosy Cross did not in fact exist.

The edition of the complete works of Sincerus Renatus appeared in 1741, on the threshold of the second half of the 18th century. The preamble to

this edition puts emphasis on regeneration, considers alchemy a *vocatio secundaria*, and warns that its “theosophical doctrines” must not be read with the eyes of reason but with those of the spirit. The title of the complete edition, *Theo-Philosophia Theoretico-Practica*, is explained by a sentence in the preface (p. 134): ‘We say that philosophy without true theology has nothing enduring in it’. Referring to the Paracelsian doctrine of “signatures”, Sincerus Rhenatus states that God manifests himself through nature like the soul manifests itself through the body (p. 286).

In opposition to the spirit of the *Aufklärung*, Sincerus Rhenatus’ work was to enjoy considerable success among the European intelligentsia of the second half of the 18th century, parallel to that of the Pietists [→ Pietism], who were likewise open to hermeticism and alchemy. Starting from about 1750, a “Rosicrucian tradition” henceforth came to be opposed to the rationalism that, notably in the case of Helvetius, led to a materialistic atheism. In Germany, a doctor Johann Ludolph ab Indagine printed a new edition in 1751 of Conrad Orvius’s *Occulta Philosophia* (first published in 1737), which purported to be from a Rosicrucian society in Holland. In 1761, a member of the “Assembly of Prague” had an *Aureum Vellus seu Iunioratus Fratrum Rosae Crucis* published, which contained the statutes, rituals and membership list of a “Society of the Golden and Rosy Cross”; but partly this document repeats *verbatim* the work published by → Hermann Fictuld in 1749 (see analysis in Faivre 1990, 73-82). In 1762, it was in France that baron Schoudy, originally from Metz, organized Adonhiramite → Freemasonry, the seventh grade of which was called Knight of the Rose Cross or of the “unknown philosopher”, thus introducing a Rosicrucian tendency into the lodges.

Lorraine is not far from the Palatinate and from Sulzbach, residence of a doctor named Bernhard Joseph Schleis von Löwenfeld (1731-1800), who became provincial leader of the Order named “Gold- und Rosenkreuzer” (see *infra*), under the pseudonym Phoebron. From a later controversy between him and baron von Ecker und Eckhofen, the author of a pamphlet published in 1782 under the title *Der Rosenkreuzer in seine Blöße* (The Rosicrucian in his Nakedness), it appears that the first creation of a Rosicrucian order in Germany can be dated from 1763. In the same year 1782, Phoebron wrote his book *Der im Lichte der Wahrheit strahlende Rosenkreuzer* (The Rosicrucian Radiant in the Light of Truth), stating that all the knowledge of the patriarchs had been transmitted to the accomplished Rosicrucians (p. 254).

A professor of medicine at the University of Marburg, Friedrich Joseph Wilhelm Schröder (1733-1778), developed between 1766 and 1774 a significant activity within the circles of Rosicrucians that now existed. Ralph Christian Zimmermann has assembled documentation which strongly suggests that the Swabian Pietist → Friedrich Christoph Oetinger (1702-1782), the theoretician of a “*philosophia sacra*”, had some contacts with the founders of the Gold- und Rosenkreuzer. *Patriarchalphysik*, a work published in 1772 and attributed to him, seems to demonstrate that he was their *maitre à penser*. Finally, → Goethe took an interest in the Rosicrucian myth as well. He had read the novel *Chymische Hochzeit Christiani Rosenkreutz* and in 1786 he dedicated to Charlotte von Stein some verses inspired by the song of the nymphs contained in it. Around the same period Goethe began writing his *Die Geheimnisse* (The Mysteries), an epic influenced by Rosicrucian symbolism, which shows how the pilgrim Brother Markus reaches an idealized Montserrat. A monastic order which seems a mixture between the Templars [→ Neo-Templar Traditions], the community of the Holy → Grail and the Rosicrucian Society has a certain Humanus as prior. He is a symbol of the Total Man, destined to accomplish the new Easter (Passover) of a humanity finally reconciled, and promote the synthesis of all forms of religiosity, Christian, Masonic or Spinozist. In 1782, Goethe was accepted into the Inner Order of the high grades of the Strict Observance, and the following year he entered, with Duke Charles-August de Weimar, the Bavarian Order of the → Illuminaten, whose purpose was to combat the ‘enemies of reason and of humanity’. The Bavarian Illuminaten did not look favourable on the Rosicrucians, whose alchemical theories were opposed to scientific materialism and who had now gained a considerable influence in Freemasonry.

In 1777 appeared a work fictitiously dated 5555 and entitled *Starke Erweise aus den eigenen Schriften des Hochheiligen Ordens Gold- und Rosenkreuzer . . .* (Strong Proofs Drawn from the Writings of the Very Holy Order of the Gold- und Rosenkreuzer . . .), containing instructions meant for the use of Brethren who were already ‘Masters of the Reflection of the Light’. Both this date and this work signal the “official” foundation of the Order of the “Gold- und Rosenkreuzer Älteren Systems” (Gold- and Rosicrucians of the Ancient System), which was to flourish until 1782 (see *infra*).

In 1778 was published a *Hermetisches A.B.C. deren ächten Weisen älter und neuer Zeiten vom Stein der Weisen* (Hermetic A.B.C. of the Philosopher’s

Stone According to the True Sages of Ancient and Recent Times). In 1779, the Rosicrucian doctor from Leipzig, Adam Michael Birkholz, published his *Der Compass der Weisen* (the Compass of the Sages). In 1781, Wöllner and Jugel republished the *Aurea Catena Homeri* under the title *Annulus Platonis*, while in the same year, Friedrich Nicolai procured a reprinting of the first Rosicrucian manifestoes and the *Chemical Wedding of Christian Rosenkreutz*. In 1785, J.D.A. Eckhardt had printed in Altona the *Geheime Figuren der Rosenkreutzer aus dem 16ten und 17ten Jahrhundert* (Secret Figures of the Rosicrucians Dating from the 16th and 17th Centuries), a marvelous album still in print today. In the same year appeared a 280-page treatise entitled *Die theoretischen Brüder oder zweite Stufe der Rosenkreutzer und ihrer Instruktion* (The Theorici Brothers or the Second Degree of the Rosicrucians and their Instruction). In 1788 was printed in Leipzig *Das Geheimnis aller Geheimnisse ex Macrocosmo et Microcosmo, oder der güldene Begriff der geheimsten Geheimnisse der Rosen- und Gülden-Kreutzer mit ihren drey Steinen der Wunder* (The Secret of all Secrets ex Macrocosmo and Microcosmo, or the Golden Concept of the Most Secret Secrets of the Golden Rosicrucians with their Three Miraculous Stones).

The proliferation of these editions or reprints is testimony to the interest of many readers in → Christian theosophy at the very time of the *Aufklärung*, and to the prominent role that the Gold- und Rosenkreutzer had come to play in Freemasonry. According to some of these publications, Master Masons possessed no more than a “reflection of the Light” and had therefore access only to the outer Temple. As adepts of the *philosophia perennis*, the Rosicrucians considered themselves heirs to a gnosis transmitted by the angels to one of Noah’s descendents, who had not participated in building the Tower of Babel; and Abraham had benefited from a supernatural knowledge subsequently cultivated by Nazarean Magi. → Moses had been initiated in Egypt, and the tradition had been nurtured by the great biblical prophets, the adepts of the Eleusinian mysteries, the Pythagoreans, the Druids and the Bards. In Egypt, where St Mark preached the Gospel, an Alexandrine priest named Ormus had been baptized in the year 46 together with six other adepts. His name was a deformation of Ormazd, the god of light and goodness, who had revealed the mysteries of Mazdaism to the great prophet → Zoroaster. Still according to the same legend, Ormus, once converted to Christianity, had founded the Society of the Sages of Light, whose

symbol was a gold and red cross. Its members, established in Palestine, had left the country in 1118 after the defeat of the Crusaders and had spread all over the world. Three of them had created in Scotland “The Scottish Order of the ‘Builders of the East’”, as a foundation for their confraternity. → Ramon Llull had been one of its directors, and King Edward I (1239-1307) one of its members. Descendants of the families of Lancaster and York, their coats of arms comprised of a white rose and a red rose (cf. the War of the Roses), were members as well. It was from these blazons, blended with Ormusian Christianity, that the name Rosicrucian had been derived. Over the centuries, the Order had declined, until Cromwell reactivated it and changed the denomination of “Constructors” into “Freemasons”. The legend thus strongly emphasized the precedence of the Rosicrucians with respect to the Freemasons, who were considered no more than spiritual descendents of the former, and who possessed merely a reflection of the true Light of the ancient Rosicrucian tradition.

The development of the Gold- und Rosenkreutzer of the Ancient System was impressive. Societies had been created in Silesia, Upper Lusatia, Marburg, Ratisbonne, and Leipzig. Vienna was an important center of Rosicrucian influence for all of Austria, Hungary, Bavaria, Wurtemberg and Poland. The Grand Master of the Masons of Austria, prince von Dietrichstein (1728-1808), was himself received into that Order. In Vienna, J.R. von Bischoffswerder, an officer in the service of prince Charles de Saxe, keenly interested in the occult sciences, was accepted into a Rosicrucian circle in 1777. He then went to Leipzig, and next to Wiesbaden, and entered into relations with J.C. Wöllner (1732-1800); this former pastor who had become a Freemason was thirsty for supernatural knowledge, and had been accepted into the Rosicrucian circle of Berlin in 1779. These two characters have been mainly responsible for a rapid development of the administration of the Golden Rosicrucians of the Ancient System: by the end of 1779, it already included twenty-six Rosicrucian circles, distributed over various German cities. In Berlin, Bischoffswerder managed to gain the trust and collaboration of Prince Frederick William (1744-1797), heir presumptive of Frederick II of Prussia. He succeeded in curing the prince of an illness by means of a secret remedy, and did not hesitate (with the support of Wöllner and the prince’s mistress) to dupe him by using the services of a false Viennese magician, a certain Steinert. By a variety of stage tricks, the Austrian ventriloquist conjured before

Frederick William the ghosts of Leibniz, Julius Caesar, Marcus Aurelius and the Prince Elector, founder of the Prussian dynasty. Full of enthusiasm, the prince asked to be affiliated with the Rose Cross, and was admitted in 1781, under the hieronym Ormesus, by Duke Frederick August of Brunswick. In the wake of this political success, the Golden Rose Cross of the Ancient System succeeded in attracting into its orbit the Mother Lodge of the Prussian States, the Three Globes.

Despite such success, the end of Golden Rosicrucians of the Ancient System was near. In 1782 an international Convention of Freemasonry met at Wilhelmsbad, putting an end to the templar filiations, and validating the Reform of Lyon established by → Willermoz. The Rosicrucians, trying to be admitted to the Convention of Wilhelmsbad, sent duke Ferdinand of Brunswick a memorandum composed by Wöllner and members of the Ancient Scottish Lodge Frederick of the Golden Lion. Rather awkwardly written, it expressed the Rosicrucians' intentions of bringing the Masons, who were confined to the threshold of the Temple, out of the shadows and into the light; and it reserved authority concerning the higher grades for themselves. Since the Landgraf Carl von Hessen was attracted by Rosicrucian esotericism, Ferdinand's reply was diplomatic enough not to offend those responsible for the Golden Rosicrucians of the Ancient System, while nevertheless dissuading them from participating in the Convention of Wilhelmsbad. In any case, the author of the pamphlet *Der Rosenkreuzer in seine Blösse* (see above), as well as some of the Bavarian Illuminaten, believed that the Golden Rosicrucians were directed behind the scenes by members of the Company of Jesus, suppressed in 1773 by Pope Clement XIV.

By 1783, the Golden Rosicrucians of the Ancient System were widespread in Hungary, in Poland and in Russia, where they attempted to attract the hereditary Grand Duke. In Austria, however, a governmental decree caused the Rosicrucian circles to close; and in Germany, where Frederick William had become the reigning sovereign, Bischoffswerder and Wöllner, who were hoping for high functions in Prussia, prudently chose to decree in 1787 a "general silanum" that put an end to the activities of the Golden Rosicrucians of the Ancient System. The order of the Bavarian Illuminaten did not survive them by long, disappearing completely in 1790.

These two movements, although opposed to one another in their basic ideas and aspirations, were in fact closely connected, as attested by the research on Rosicrucian history by the Aufklärer Friedrich

Nicolai. His *Bemerkungen über den Ursprung und die Geschichte der Rosenkreuzer und Freymaurer* (Comments on the Origin and History of the Rose Cross and the Freemasons), which appeared in Berlin in 1806, also challenged the assumed link between the Golden Rose Cross and the Rosicrucian myth of Johann Valentin Andreae in the 17th century. The claim of such a continuity had already been cast into doubt in 1781 by Adolf von Knigge in his book *Über Jesuiten, Freymaurer und deutsche Rosenkreutzer* (On the Jesuits, the Freemasons and the German Rose Cross).

In Prussia, the Rosicrucian prince Frederick William's accession to the throne enabled Wöllner to become minister of religion; in this function he concentrated on combating the irreligiosity spread by Enlightenment ideas and the pretended Illuminaten. An edict of 9 July 1788 condemned deist pastors and teachers and prohibited any theological discussion of rationalist tendencies, while books by "free-thinking" authors were censored. The ideology of the Golden Rosicrucians of the Ancient System certainly influenced neither the political economy nor the exterior politics of Prussia; but the Rosicrucian tradition continued throughout the following century, and has influenced the opposition to Enlightenment rationalism characteristic of the German movement of *Sturm und Drang* and European → Romanticism.

Rosicrucianism III: 19th-20th Century

No Rosicrucian Orders in the 19th and 20th century could rightly claim a direct connection to 17th century counterparts. We will deal here with Rosicrucian Orders as autonomous organizations, and not particularly with Rosicrucian degrees within → Freemasonry. The oldest modern masonic Rosicrucian Order is the *Societas Rosicruciana in Anglia*, which was established in London in 1865-1866 by Robert Wentworth Little (1840-1878), an officer within mainstream English Freemasonry. This society, in its turn, generated two American offsprings, the *Societas Rosicruciana in Civitatibus Foederatis* and the *Societas Rosicruciana in America* (both still in existence, but with a very limited constituency). It also influenced the → Hermetic Order of the Golden Dawn and, later, its splinter group founded by Paul Foster Case (1884-1954) and known as Builders of the Adytum (BOTA).

In France, small Rosicrucian bodies were active in Toulouse from the first decades of the 19th century, gathering around Viscount Louis-Charles-Edouard de Lapasse (1792-1867). A larger and particularly significant organization was the Kabbalistic Order of the Rose Cross, founded in Paris in 1887 by → Stanislas de Guaita (1861-1897), → Papus (Gérard Encausse, 1865-1916), and → Joséphin Péladan (1858-1918). The latter, an eccentric poet and very independent Roman Catholic, broke with the Kabbalistic Order in 1890 to create the rival Catholic Order of the Rosy Cross of Temple and Grail. The two Orders fought bitterly, and an amused press dubbed the controversy the “war of the two roses”. Péladan’s organization never had many members, but it did exert considerable influence on French literature, art, and → music at the time. More significant for the first modern Rosicrucian generation was the Kabbalistic Order, although it is difficult to distinguish it from several other occult organizations also headed by Papus. Heirs of Papus’ Rosicrucianism did, however, attend the 1934 foundation meeting of FUDOSI (Universal Federation of Orders and Society of Initiation), which would continue to exist until 1951. Dissatisfied with FUDOSI, other Rosicrucian organizations joined several different Orders into the rival federation known as FUD-OFSI. This European controversy was a consequence of the rivalry in the United States between two American Rosicrucian Orders, the *Fraternitas Rosae Crucis* established by Reuben Swinburne Clymer (1878-1966) on the basis (inter alia) of the occult doctrines of → Pascal Beverly Randolph

(1825-1875), and AMORC. Although there are several other Rosicrucian organizations, we will deal with three in particular, which have reached international dimensions: the Rosicrucian Fellowship, the Lectorium Rosicrucianum, and AMORC.

Carl Louis von Grasshoff (1865-1919) was born in Denmark into a German aristocratic family. He spent his early manhood wandering the seas as a merchant ship captain, and settled first in New York (where he worked as an engineer), then in Los Angeles (1903). In the meantime, he had joined the → Theosophical Society, and in 1907 decided to travel to Germany, where he met → Rudolf Steiner (1861-1925), the later founder of → Anthroposophy and at that time a leader of the German Theosophical Society. Grasshoff later claimed to have met a mysterious “Elder Brother of the Rose Cross”, who took him to a secret temple on the border between Germany and Bohemia. After his return to California, Grasshoff published in 1909 his magnum opus, *The Rosicrucian Cosmo-Conception*, under the pseudonym of → Max Heindel; and in 1910 he married a well-known astrologer, Augusta Foss (1865-1949). Between 1910-1918, Heindel went on to publish several works on → astrology, → Freemasonry, and esotericism in general. He launched a Rosicrucian Fellowship in 1909, which was officially incorporated in 1911. He also supervised the construction of the Fellowship’s international headquarters in Oceanside (California), including a temple and beautiful gardens.

After Heindel’s death in 1919, his wife Augusta continued the Fellowship’s expansion into several foreign countries, with a membership of thousands. Unlike other Rosicrucian organizations, the Fellowship had, since its very beginning, a clearly religious orientation, as evident from the fact that its practices included rituals for weddings and funerals, as well as spiritual healing services. While astrology remains an important part of the Fellowship’s teachings even today, the influence of Theosophy and Anthroposophy is also apparent. It teaches *karma* (the “Law of Consequence”), → reincarnation (the “Law of Rebirth”), and believes in a succession of (theosophical) “root races” on Earth. Heindel also offered an occult interpretation of the United States’ role in history. The Fellowship promotes vegetarianism, and warns against the evil effects of alcohol, drugs, and tobacco. Alcohol, it teaches, had an occult purpose within the framework of the descent of the human spirit into matter: it was used to enable humans to forget their higher selves in the fifth, or “Aryan”, epoch. In preparing for the coming Aquarian Age, humans

should regain knowledge of their higher selves, however, and consumption of all forms of alcohol is therefore rejected.

The Lectorium Rosicrucianum, or the International School of the Golden Rosy Cross, was founded by Jan Leene (1896-1968) and his brother Zwiervilhelm Leene (1892-1938), both leaders of the Rosicrucian Fellowship in the Netherlands. Although the events leading to the Lectorium's foundation date back to August 24, 1924, it was not until 1935 that the Leenes and Ms. Henny Stok-Huyser (1902-1990), who had joined them in 1930, formally declared their independence from the Fellowship and established a Rosicrucian Society of their own (Rozekruisers Genootschap, whose name was changed to Order of the Manicheans in 1936). After Z.W. Leene's death in 1938, Jan Leene and Ms. Stok-Huyser, under the respective pen names of → Jan van Rijckenborgh and Catharose de Petri, started writing several books about their teachings, which took the shape of a kind of Christian → gnosticism influenced by → hermetism, 17th century → Rosicrucianism, and → Jacob Boehme (1575-1624). Following the Nazi invasion of the Netherlands, the movement was proscribed, its property confiscated, and several members executed. It continued its activities underground throughout the war years, however, and in 1945 the movement was reorganized and resurfaced under the name of Lectorium Rosicrucianum. In 1948, the two founders met Antonin Gadál (1871-1962), one of the founding fathers of modern → neo-Catharism, who in 1957 would become the first President of the French branch of the Lectorium. It was after the founders' deaths that the Lectorium, led by an International Spiritual Directorate, became a truly international movement, with currently some 15,000 "members" and "pupils". "Members" of the school are those not yet prepared to "live" the teachings, and are distinguished from "pupils" who meet regularly for services in the temples that the Lectorium has established in a number of countries. Pupils are expected to practice a healthy life style, abstain from alcohol and drugs, reject all occult practices and any form of communication with the dead, and remain wary of the dangers of being unduly influenced by the media (particularly television). Important references in understanding the Lectorium's ideas are Gnosticism and → Catharism, as well as its efforts to reconcile its teachings with those of 17th century Rosicrucianism (which, unlike the former, was not dualistic). A key teaching distinguishes between the original divine Order,

and the "dialectic" Order, including both the dead and the living, and subject to the cycle of living, dying and being born again. However, it is not the ego which reincarnates, but the human microcosm, the latter being called to overcome the wheel of life and death in order to reach the divine realm of immortality and Light. Within the human microcosm, a divine spark remains latent in the heart and calls for a return "home" to the Kingdom of Heaven. Guiding its members in this process of awakening and "transfiguration" is the Lectorium's main purpose.

AMORC, the Ancient and Mystical Order Rosae Crucis, insists that it is not a religion, and that it includes members ("students") from several different religious backgrounds. AMORC was founded in 1915 by → Harvey Spencer Lewis (1883-1939), a New York advertising agent who had been among the founders of the New York Society of Psychical Research. Lewis regarded the Wisshickon (Pennsylvania) community founded in 1694 by Johannes Kelpius (1673-1708) as the first American Rosicrucian experiment, claiming that some of his ancestors had been involved in it. In 1909 Lewis visited France, and reported that he had been initiated into the Rosy Cross in an "old tower" in Toulouse. The first national AMORC conference was held in Pittsburgh in 1917; the Order later moved to San Francisco, Tampa (Florida), and (in 1927) to San Jose, California, where its world headquarters (including a temple, museum, library, and planetarium) have become one of the city's main tourist attractions. After AMORC's success in the United States, several more or less independent AMORCs were established in Europe. Some of them later went their separate ways (such as AAORRAC, the Antiquus Arcanus Ordo Rosae Rubae Aureae Crucis, led by Eduard Munninger, 1901-1965), but Lewis, working jointly with Jeanne Guesdon (1884-1955), was able to keep the large French-speaking branch within the main fold. He was succeeded as leader ("Imperator") of AMORC by his son, Ralph Maxwell Lewis (1904-1987).

When Ralph died, Gary L. Stewart, despite being only 34 years old, was elected Imperator with the support of Raymond Bernard, the powerful leader of the French-speaking branch. Stewart was soon in conflict with the Board of Directors, however, and in 1990 was replaced by Raymond Bernard's son, Christian. After the 1990 crisis, two of Stewart's supporters, Paul Walden and Ashley McFadden, established the Ancient Rosae Crucis (ARC), while Stewart himself founded a Confraternity of

the Rose Cross. The elder Bernard, in turn, distanced himself from AMORC and established a variety of separate organizations including CIRCES (International Committee for Charitable and Social Works), now presented as the humanitarian branch of the Sovereign Order of the Temple of Initiation, a neo-Templar organization Bernard had created while still a leader of AMORC. It is fair to say, however, that AMORC remains, by far, the largest international Rosicrucian organization, with hundreds of thousands of members (the figure of “six millions”, often quoted, refers to the Order’s mailing list).

Most AMORC members enrol in correspondence courses and follow the instructions included in the Order’s “monographs”. For the first nine degrees, initiations may be self-conferred at home (although they may also be received in a temple). For the tenth, eleventh and twelfth degrees, there are no initiations because the member at this stage is advanced enough to establish a direct contact with the occult hierarchy. Before entering the nine degrees, each student goes through five introductory lessons and three “Atria” as a neophyte, learning inter alia the structure of matter, the power of thought, Rosicrucian healing treatments, karma and reincarnation. Additional information about these and other esoteric themes is offered during the course of the nine degrees process, usually completed in five or six years. Beyond the ninth degree, secret teachings include mystical techniques of concentration, meditation, visualization, and spiritual → alchemy. AMORC teaches that, ideally, humans should reincarnate every 144 years (or live to the age of 144 years, then die and reincarnate immediately). The students’ aim, rather than escape in the cycle of reincarnations, is to be received into the Great Wide Brotherhood through a “cosmic initiation”. AMORC insists that it is the heir of a tradition dating right back to ancient Egypt and Pharaoh Tutmosis III († 1450 B.C.). Documents confirming this, it is claimed, exist in the San Jose archives. Other teachings concern Jesus Christ, who is regarded as a member of the Essene Brotherhood [→ Essenes] who did not die on the cross but was saved from it and retired to a monastery on Mount Carmel. Astrology, occult anatomy, and the study of the esoteric meaning of numbers [→ Number Symbolism], sounds and geometrical shapes complete AMORC’s teachings. Controversies notwithstanding, AMORC maintains a very visible presence, thanks to its temples, publishing houses, and magazines in several countries.

Beyond the three largest organizations, several

dozens of smaller Rosicrucian bodies are also active throughout the world. One of the most significant is the *Fraternitas Rosicruciana Antiqua* (FRA), established in the 1920s in Latin America by Arnaldo Krumm-Heller (1879-1949). A one-time associate of → Aleister Crowley (1875-1947), Krumm-Heller was able to build the largest Spanish-speaking Rosicrucian organization, with teachings drawn from → Freemasonry, Theosophy, and several different systems of sex magic. FRA split into a number of competing branches after Krumm-Heller’s death in 1949, none of them as large as the parent organization had been before World War II. FRA and Krumm-Heller are important, however, for their role in the formation of the Gnostic Movement and the Gnostic Church founded in the 1950s in Mexico by Samael Aun Weor (V́ctor Manuel G3mez Rodŕguez, 1917-1977), a Colombian FRA member and a pupil of Krumm-Heller. Although divided, in turn, into several dozens of rival groups after Weor’s death, the Gnostic Movement founded by the Colombian esotericist still maintains teachings and features of Krumm-Heller’s FRA. Combined membership of its branches runs in the tens of thousands, and (although not “purely” Rosicrucian) Weor’s movement should probably be included, along with the Rosicrucian Fellowship, AMORC and the *Lectorium Rosicrucianum*, as being among the largest international bodies still claiming some sort of Rosicrucian heritage in the 21st century.

Rudolf II of Habsburg, * 18.7.1552 Vienna, † 20.1.1612 Prague

Holy Roman Emperor, King of Bohemia and Hungary. Son of Emperor Maximilian II (1527-1576) and his first cousin Maria, daughter of Emperor Charles V. From 1564-1571 Rudolf was sent to Spain to be educated under the supervision of Philip II. He was crowned King of Bohemia in 1575, and elected Holy Roman Emperor the following year. In 1583 he moved the imperial capital from Vienna to Prague. Rudolf never married, though he spent much energy on failed matrimonial plans. Consequently he was succeeded by his hated brother Matthias (1557-1619), who usurped Rudolf's titles and forced him into retirement in 1611.

Rudolf II was unequalled as a patron of the arts and sciences. Those who worked at his court for a longer or shorter time included Carolus Clusius the botanist (1526-1609), Joannes Sambucus the historian (1531-1584), the antiquaries Jacopo Strada (1515-1588) and his son Ottavio (1550-1606), the astronomers Tycho Brahe (1546-1601) and Johannes Kepler (1571-1630), the composers Philip de Monte (1521-1603) and the nobleman-musician Christoph Harant (1564-1621). Rudolf's consuming interest was in his collections, perhaps the richest and most varied of his time. Inspired by his father's collecting and by that of his uncle Ferdinand II of the Tirol (1529-1595), Rudolf assembled a *Kunstammer* which filled four large rooms of the Hradčany Castle in Prague, as well as a large library (mostly kept in the Hofburg, Vienna) and an art collection that included about 3000 paintings. Among artists of the past, Rudolf collected especially Dürer and Jan Brueghel. The living artists whom he patronized included Giuseppe Arcimboldo (1527-1593), Georg Hoefnagel (1542-1600), Adriaen de Vries (1545-1626), Bartolomaeus Spranger (1546-1611), Hans von Aachen (1552-1615), Josef Heintz Sr. (1564-1609), Roelant Savery (1576?-1639), the hard-stone carver Ottavio Miseroni (1560?-1624), and the engraver Aegidius Sadeler (1570?-1629). The loosely-knit "Prague School" cultivated two main areas: mythological subjects with an erotic atmosphere, and naturalistic representations of plants, animals, birds, and landscapes. The *Kunstammer* contained natural wonders from the animal, vegetable, and mineral realms; artefacts from non-European countries; historically significant objects and antiquities; works of art in precious materials (silver, gold, gems, hard stone); automata, machines, and

scientific instruments. Rudolf liked to watch his employees at work, and sometimes worked himself, notably at goldsmithing. Unlike his contemporaries, he did not display his collections to demonstrate his wealth, power, taste, and universality, but kept them jealously for his own study and enjoyment. Very few visitors were admitted to the *Kunstammer*, which then took on a mythical reputation.

In Spain, Rudolf had been indoctrinated with Spanish court ceremonial and a strict Catholic faith. He adhered to the former all his life, in his black costume and the rigid etiquette of his court. The latter had the contrary effect: the sight of an *auto da fé* (execution) of heretics in Toledo had inclined him to a lifelong policy of non-compulsion in religious matters. For a long period he avoided all rites of the Church. From 1601-1608 his friend Johannes Pistorius (1546-1608) persuaded him to confess and communicate at Easter, but Rudolf died, as his father had done, without receiving the sacraments. Given his irenic disposition, Rudolf was frightened by fanaticism, whether it was that of the Czech Brethren and the Utraquists, that of the Calvinist princes plotting against the Habsburg monarchy, or that of the ultra-Catholic Philip II of Spain and the papal nuncios whom Rudolf's mother had installed in Prague. The Bohemian Estates (nobility) were largely Protestant, and they put pressure on the Catholic emperors by withholding taxes to support the war against the Turks. Political unrest drove Rudolf increasingly into the Catholic camp, until the Estates forced him to sign a "Letter of Majesty" (1609) proclaiming religious freedom. Rudolf II lost all support in 1611, after a Catholic mercenary army had ravaged the countryside and invaded Prague.

Rudolf's lack of enthusiasm for any particular Christian sect was certainly due also to his hermetic and esoteric inclinations. His private convictions are unknown, but all his voluntary activities point to a pansophic attitude, embracing the wisdom and beauty to be found in the widest range of spiritual and material creations. Central to this was the philosophy and, to a lesser degree, the practice of → alchemy. Among the alchemists who flourished at Rudolf's court, sometimes in the function of physicians, were Martin Ruland Sr. (1532-1602) and Jr. (1569-1611), → Heinrich Khunrath (1560-1605), → Michael Maier (1568-1622), Michael Sendivogius (1556-*post* 1630), Nicholas Barnaud (1538/39-after 1600), and Oswald Croll (ca. 1560-1609). → Giordano Bruno made a short visit in 1588. The Jewish community in Prague was a

center for Lurianic Kabbalistic studies [→ Jewish Influences], especially under Rabbi Judah Löw (1520?-1609) who met with the Emperor in 1592. Rudolf's confessor Pistorius edited the important collection *Artis Cabalisticæ, hoc est reconditæ theologiae et philosophiæ scriptorum Tomus I* (1587).

→ John Dee and Edward Kelley spent the period 1583-1589 in Bohemia and Central Europe, first at the invitation of the Polish magnate Olbracht Łaski (1536-1605). In 1584 Dee secured an audience with Rudolf, but the mention of angel-magic alarmed the superstitious Emperor, and, still more, his Jesuit supervisors. Dee and Kelley were expelled from Prague and found protection with Vilém Rožmberk until 1589, when Dee returned to England. Kelley then enjoyed two years of Rudolf's favor, but ended his life in prison.

Rudolf's "melancholic" (or manic-depressive) temperament made life difficult for himself and for others. He had a romantic view of Empire and of the glory of his Habsburg ancestors, especially Maximilian I, but could not handle the political realities of his own time. His failure to marry and produce an heir was one result of this. However, he had a long relationship with Anna Maria Strada, the daughter of his court antiquary Ottavio Strada, who bore him five or six children. The fanaticisms of others drove him either to uncharacteristic and poorly-judged decisions, or else to abnegation of his responsibilities. Then he would retreat into his collecting, commissioning, arranging, and experimenting, where he was the undisputed master of his world. After centuries of misunderstanding, this private world and the constellation of talents that it attracted has been given its due as a kind of Hermetic utopia.

Russell, George William → AE

Rupescissa, Johannes de →
Roquetaillade, Jean de

Saint-Germain, Le Comte de, * year and place unknown, † 26.2.1784
Eckernförde

Referred to by Frederick the Great as 'a man whose mystery has never been solved', the first evidence we have of Saint-Germain's existence is a letter by him, dated 22 November 1735 and sent from The Hague (British Library; Sloane MSS 4026, ff. 289r-290v); it is addressed to Sir Hans Sloane, to whom the author offers an incunable. Next we hear of him as being in London, at a time when the invasion by the young Pretender caused foreigners to be arrested. He acknowledges passing under a fictitious name and title, and says he will disclose his real identity to the king only. We do not know whether George II ever received him, but around the spring of the following year we find Saint-Germain as a prominent personality in London musical circles. He composed a considerable amount of music, largely Italian-style and operatic (preserved in the British Library), and played the violin. Leaving England, he disappears from view for some years, to resurface in 1756 at the court of Louis XV. Concerned that France was heading for bankruptcy, he disadvised from seeking loans from foreign powers and so incurring further debts; and he said that for purposes of export he would donate a collection of dyes of extraordinary brilliance, a yellow metal called "Similor" and the secret of a process for removing flaws from diamonds. Although he said that the latter worked by chemical means, the procedure was widely believed to be occult in nature. The fact that Saint-Germain used to decline invitations to dine, even at the King's table, gave birth to the legend that he lived without eating – actually he was a vegetarian – and his interest in finding a way to increase the human lifespan bred the rumour that he himself had lived since antiquity. The less credulous supposed that he was the illegitimate son of some royal lady, and that this was the information he had told the king. Saint-Germain was urging that France must cease its ruinous war with England, where he had good contacts. He believed that the English king would welcome peace, and actually went to The Hague to try and negotiate for peace with the English Ambassador there. However, Louis XV's prime minister Choiseul tried to get him arrested and he had to flee. In Belgium, Saint-Germain sold a Raphael to raise money for starting a dyeing business, but tariffs turned out to be too high.

His real identity remains a mystery. To Karl Alexander, Margraf of Anspach, he said that his father was Prince Rakoczy II of Transylvania; but Rakoczy had only three, legitimate sons, and their

histories are known. In Prussia, Princess Amelia, Frederick the Great's sister, tried to tease the secret out of him, and he replied that he came from a land that had never known foreign occupations, with a royal lineage as long as the Bourbons. Only the Wittelsbach dynasty of Bavaria could make such a boast. The person who knew Saint-Germain best was his last host, Prince Carl von Hessen-Cassel, Governor of Schleswig, and a Freemason. He considered Saint-Germain one of the greatest philosophers who had ever lived; and in his *Mémoires de mon temps* (1861) he says that his friend was indeed the son of Rakoczy II of Transylvania, born from his 'first wife' but brought up in Florence by Gian de' Medici. In fact Rakoczy married only once; however, at the age of seventeen he spent four months in Florence, where he was in contact with a Princess Violante, of Wittelsbach descent, brought from Bavaria to marry Gian's homosexual brother. If the two had a child, the two stories about Saint-Germain's ancestry could be combined; and one imagines that Gian could have spared an incunable and a Raphael as gifts to the boy who had been given into his charge.

From the perspective of the history of Western esotericism, the historical Saint-Germain becomes submerged in the career of the mythical persona. A book of alchemical contents, *La Très Sainte Trinosophie* (The Most Holy Trinosophy; with illustrations in colours), from the end of the 18th century, several times newly edited until the present time, has been persistently attributed to him (although it is not from his pen) and has in no small measure contributed to his fame. Legends circulating about Saint-Germain were fostered to a large extent by Baron Carl Heinrich von Gleichen's *Denkwürdigkeiten* (Memories; 1847). Gleichen gives a vivid narrative of how he met him. The chapter he devotes to Saint-Germain, followed by others dealing with → Cagliostro, → Lavater, → Saint-Martin and the Marchioness de La Croix, was to be repeatedly copied or adapted. It is not surprising that the figure of Saint-Germain had already been used in works of fiction, for instance in Pushkin's *The Queen of Spades* (1834), where he is in the possession of a card-game winning formula, and more importantly in Sir → Edward Bulwer-Lytton's celebrated "rosicrucian" novel *Zanoni* (1842), where he appears as a foil to Zanoni, the hero of the story. Later again, in Rainer Maria Rilke's fictional autobiography *Die Aufzeichnungen des Malte Laurids Brigge* (The Notebooks of Malte Laurids Brigge, 1910), he appears under the name of Marquis von Belmare.

Saint-Germain could hardly have been ignored by modern Theosophy [→ Theosophical Society] and

offshoots such as the → Church Universal and Triumphant. → H.P. Blavatsky first referred to Saint-Germain in her *Isis Unveiled* (1877), and followed this up in an article 'Count de Saint-Germain', in *The Theosophist* of May 1881. This was the year in which A.P. Sinnett received, in Simla, a letter supposedly written by the Master Koot Hoomi, which referred to Saint-Germain as continuator of the teachings of Christian Rosenkretz (see *Mahatma Letters*, 280). Isobel Cooper-Oakley's first articles about Saint-Germain appeared in the November and December issues of *The Theosophical Review* (1897). Cooper-Oakley was interested in Saint-Germain's possible masonic connections, and asked → Annie Besant to get into occult contact with him. Besant at first did not think this would be possible, but in 1898, while she was alone in her room in Avenue Road and preparing to go to bed, Saint-Germain appeared to her, told her to take a pencil, and said 'Rakoczi'. Besant was given to understand that in earlier existences he had been Christian Rosenkretz, Hunyadi Janos (a 15th-century Magyar hero from the Rumanian part of Transylvania) and Lord [Francis] → Bacon (Besant, 'The Theosophical Society and its Work', *The Adyar Bulletin*, nov. 1823, 445-446). In the journal *The Link* of the Theosophical Society's Esoteric School, Besant wrote in February 1909 that Saint-Germain was one of the seven Masters; and at the occasion of his first initiation, on 11 January 1910, Jiddu Krishnamurti saw 'Master the Count' together with the six others. He again saw 'the Count' on 12 June, 1911, when Besant was giving a lecture at the Sorbonne. In her book *The Masters* (1918), Besant described Saint-Germain as having previously incarnated as 'Rakocsi' (she keeps to this spelling according to Rakoczy's autobiography, the Latin of which has no "y"), Bacon, Robertus the Monk (who has resisted attempts at identification), Hunyadi Janos and Christian Rosenkretz. She claimed that he was now living in Hungary, and traveled much.

→ Alice Bailey's Arcane School was a breakaway from the Theosophical Society, but Bailey had been a member of the Esoteric School; in her *Initiation: Human and Solar* (1922), she refers to the 'head of the seventh ray' as 'The Master R ' – presumably this is Saint-Germain. → C.W. Leadbeater, in *The Masters and the Path* (1925), extended the list of the Master's incarnations: St. Alban, Proclus, → Roger Bacon, Christian Rosenkretz, Hunyadi Janos, and Francis Bacon. And in *The Hidden Life in Freemasonry* (1928), he left out St. Alban but added a 19th-century figure, Baron Hompesch. Leadbeater claimed to have met Saint-Germain in 1901, walking down the Corso in Rome in modern dress. Presumably he meant Saint-Germain in his

latest incarnation, for the body in which he walked around the court of Louis XV lies buried beneath the floor of the Nicolaikirche in Eckernförde. The civic authorities were so conscious of burying ‘the man who never dies’ that they listed the possessions he left behind, down to number of razor blades, within the case and without.

→ Manley P. Hall’s influential and repeatedly reprinted book *An Encyclopedic Outline of Masonic, Hermetic, Kabbalistic and Rosicrucian Philosophy* (1928) opens with a large “portrait” (by J. Augustus Knapp) of Saint-Germain in colour, and contains elements which were instrumental in further spreading legends around this figure. Hall also gave a new English edition, with his own commentaries, of *The Most Holy Trinosophy of the Comte De St.-Germain* (see above).

Saint-Germain continues to inspire novelists, the most celebrated contemporary one being Chelsea Quinn Yarbro. Her series of best-sellers which constitute *The Count de Saint-Germain’s Series* in nine volumes (1979 to 1993) have for their main hero our personage, the Count of Saint-Germain of the 18th century, still very much alive. In Yarbro’s highly syncretistic fiction, several themes are combined, like those of vampirism, the mysterious saviour (in the wake of Bulwer-Lytton’s Zanon), and not least, → alchemy.

2. THE “GREAT WORK” OF REINTEGRATION
3. MAGISM/IMAGINATION 4. LANGUAGE AND POETICS 5. CHRISTOLOGY 6. HISTORY
7. ARITHMOLOGY

1. LIFE AND INTELLECTUAL DEVELOPMENT

Saint-Martin, who published under the pseudonym of “the Unknown Philosopher”, was born into a pious family of the minor nobility. He studied law, and practised briefly, but gave it up (although the theme of justice permeates his theosophy) at age twenty-two, for a military career. The principal attraction of the life of a military officer – he received, thanks to the duc de Choiseul, a commission as a lieutenant in the regiment of Foix – was the leisure it allowed him for philosophical and literary studies. Saint-Martin systematically read his way through Enlightenment philosophy, but without finding therein satisfactory answers to the problem of human destiny. He found an alternative solution through some of his fellow officers who were initiates of the Order of → Elus-Coëns, a masonic Rite (or System) comprised of High degrees only, and devoted essentially to theurgical practices founded by → Martinès de Pasqually

(1727-1774). Martinès' wife, in fact, was the niece of the major of the regiment of Foix. Sometime between August and October 1768 Saint-Martin received initiation into the Order. He quickly rose through the grades. From 1768 to 1771 Saint-Martin worked, at Bordeaux, as secretary to Martinès himself. It is during this time that he acquired detailed knowledge of the Order's practice. Martinès' → Illuminism centred on the existence and theurgic cultivation of superior, primarily angelic, powers. Saint-Martin's duties included organizing Martinès' papers and copying the ritual manuals in which were set out the ceremonial → magic by which the adept attains illumination and – the ultimate goal of Masonic theosophy – recovers the primitive faculties possessed by Adam before the Fall. His secretarial duties brought him into contact with → J.-B. Willermoz, leader of the Lodge of Coëns at Lyons. In 1771, at age twenty-eight, Saint-Martin resigned from his regiment in order to devote himself to the study and propagation of Illuminism. Living, principally at Paris and Lyons, in the company of esoteric Masons such as the comte d'Hauterive, l'abbé Fournié, and Willermoz, he spent his time gathering notes for a book, and improving his meditation and practice.

At Lyons, living under Willermoz' roof, Saint-Martin wrote his first book, *Des erreurs et de la vérité, ou Les hommes rappelés au Principe universel de la science* (1775). This work develops a theosophical system in which the ideas of Martinès de Pasqually are transformed into an original system. *Des erreurs et de la vérité*, in presenting a philosophy of nature, of society, and of knowledge, offers a wide-ranging critique of secular Enlightenment reason. Its immediate occasion was Nicolas-Antoine Boulanger's assertion, in *L'Antiquité dévoilée par ses usages* (1766), that religions were born of the terrified imaginations of survivors of the great Flood and allied calamities whose capacity for rational thought had been destroyed by the horrors of the natural catastrophes they had witnessed. Saint-Martin counters that religion is a supernatural gift by which the divine mercy continues to transmit its wisdom to those who can perceive it. He argues that the true cause of, not only religion, but also social institutions, natural laws, and human nature itself is an active, intelligent being. Saint-Martin's second book, *Tableau naturel des rapports qui existent entre Dieu, l'homme, et l'univers* (1782), structured as a theosophical version of the design argument for the existence of God, continues Saint-Martin's attack on Enlightenment philosophy. Whereas the Enlightenment explained humanity by material factors, Saint-Martin

explains the physical world by its relation to humanity and, ultimately, God. In the Fall that which exists in principle immaterial was sensibilized under material forms; nevertheless, everything tends to reenter into the unity from which it emerged. The Fall divided and obscured the virtues or moral and intellectual faculties proper to humanity; we must work, by revivifying our will by desire, to recover those from which we have been alienated. Through this regeneration, which can operate only by virtue of the sacrificial act of the Réparateur, physical nature is also regenerated, and the universe as a whole reattains the Edenic condition.

With the success of his first book, Saint-Martin became the apostle of Illuminism to the *beau monde*. His task was to lead humanity to the supernatural things that belong to it by right, but of which Saint-Martin's generation has lost totally the idea. He saw himself as a 'cleanser of the temple of truth', in opposition to both Enlightenment rationalism and orthodox Christianity in which the letter of Scripture appeared to be valued over the spirit. In his ministry he allied himself with a wide range of fellow-minded personalities: an interest in → animal magnetism brought him into contact with the Marquis de Puységur and the *Société de l'Harmonie* of esoteric Mesmerism; he met → William Law on a trip to London in 1787; and at Strasbourg he made the acquaintance of the Swedish baron Silferhielm, the nephew of → Emanuel Swedenborg, who interested him in his uncle's ideas. In fact, Saint-Martin wrote *Le nouvel homme* (1792) under the immediate influence of Swedenborg, although from the very beginning he was highly critical of the Swedish visionary. The fundamental idea of this work is that we carry in ourselves a sort of text, of which our entire life ought to be the development, because the soul is primitively a Thought of God. We must renew ourselves by reentering into our true nature.

In a letter to Willermoz, dated 4 July 1790, Saint-Martin asks to be struck off the masonic registers. This request signals a profound reorientation of Saint-Martin's theosophy. It is easily explained: he had, during his residency in Strasbourg between 1788 and 1791, discovered the works of → Jacob Boehme (1575-1624). Credit for introducing Saint-Martin to Boehme's writings goes to → Friedrich-Rudolf Saltzmann, a Freemason theosopher, and Madame de Boecklin. In Boehme, who was little known in France, Saint-Martin found a theosophy of human regeneration: if we are not renewed in our essence, we will not attain true understanding. According to Boehme, this second birth is magical, although this magic has nothing to do with theurgy.

It is Wisdom, namely the divine Sophia herself, the symbol of absolute purity, who enables us to be born to true life, whereas spirits such as those which the Order of Elus Coëns claimed to subdue in order to gain knowledge evolve in a sphere where the impure mingles with the divine. Under the influence of Boehme, Saint-Martin moved steadily away from Martinès' theurgical practice. He now rejected, as set out in *Ecce Homo* (1792), commerce with the intermediary beings of the astral realm through the theurgic ritual of the Elus Coëns, as well as other marvels of a lower order, such as magnetic somnambulism or Swedenborgian visions, insisting instead that reintegration is to be achieved through imitation of Christ in the manner of Boehme's *The Way to Christ* (1624). Nevertheless, Saint-Martin did not renounce Martinès entirely; the latter's principal idea of the man-God, or the human being understood as minister and cooperator with the divine will and charged with the soteriological mission of restoring the perfection of his original destiny, always remained fundamental to Saint-Martin's thought.

Saint-Martin initially encountered Boehme through English translations republished in the 18th century and edited by William Law. He learned German in order to tackle the original texts, and set himself to translating Boehme into French. He was assisted in mastering Boehme by a Swiss theosopher, → Niklaus Anton Kirchberger, baron of Liebisdorf, who became his pen friend and his dearest disciple for the rest of his life, although they never met in person. Not only did Kirchberger help him on specific matters of translation, their epistolary discussions deepened his understanding of the essence of Boehme's teaching. With Kirchberger Saint-Martin discovered a range of esoteric writers of whom he had hitherto been unaware: Madame Guyon, → baron von Eckhartshausen, → Heinrich Jung-Stilling, English philadelphes like → Jane Lead, → John Pordage, and Thomas Bromley, disciples of Boehme such as → Johann Georg Gichtel, and Protestant spiritualists from the time of the Reformation, such as Caspar Schwenckfeld and → Valentin Weigel. Of this group, it was Gichtel who had the most notable influence on Saint-Martin. Saint-Martin considered the German thought of his day – particularly that with its roots in Boehme – to be deeper, and much less tainted by Enlightenment materialism than French philosophy. In the years that followed, Saint-Martin understood his vocation to be that of interpreting Boehme for the French-speaking world and for his generation. Yet, Saint-Martin was not merely a

conveyer of Boehme's thought. While he achieved a profound understanding of Boehme's theosophy, Saint-Martin was an original thinker in his own right, and was responding to a historical situation that differed considerably from that of Boehme. The result was a set of works deeply marked by Boehme yet original, principally *L'Homme de désir*, 1790 (later revised editions), *Le Ministère de l'homme-esprit*, 1802, and *De l'esprit des choses, ou Coup d'oeil philosophique sur la nature des êtres et sur l'objet de leur existence*, 2 vols., 1802. To this list of works of exposition should be added his "theosophical" novel, *Le Crocodile*. It is on these works that rests Saint-Martin's reputation as the most inspired and the most powerful theosopher in the French language.

Saint-Martin's sense of himself as fulfilling a vocation in direct opposition to the spirit of the times made him sometimes feel isolated in the midst of a hostile world. He described himself as the Robinson Crusoe of spirituality awaiting the ship that will take him far from his exile. At times this sentiment of isolation brought him to the edge of despair, but for the most part Saint-Martin was able to remain optimistic, buoyed by his conviction that while his mission faces numerous obstacles and appears to proceed very slowly, it will be crowned with glorious success after his death.

Saint-Martin was not, like Willermoz, a creator of masonic Rites, nor did he cultivate disciples in the narrow sense of the term. One should not, however, conclude from this that his influence was short-lived or limited in scope. Saint-Martin's works were read, translated, and commented upon all over Europe, in Russia and Germany as in France. Saint-Martin's influence encouraged French interest in not just Boehme but the entire tradition of German thought from Weigel and Schwenckfeld to Gichtel. He deeply marked French esoteric thought as both the popularizer of Boehme and as an original theosopher in his own right. In Germany itself, surprisingly, Saint-Martin played a role in reintroducing Boehme through the dual medium of German translations of his work and Franz von Baader's promotion of his principal ideas. In Russia, an Illuminism heavily indebted to Saint-Martin flourished under Emperess Catherine II. Beyond esoteric circles, Saint-Martin is the major intermediary through whom Illuminism reached the early 19th century. Balzac (*Louis Lambert* [1833], *Le Livre mystique* [1834-1835]) and → Joseph de Maistre (*Soirées de Saint-Pétersbourg*, Entretien XI) attest to his influence. His greatest impact, however, was on → Romanticism; Martin-

ist ideas and themes recur throughout Romantic writings on poetics, the → imagination, epistemology, and philosophy of history.

2. THE “GREAT WORK” OF REINTEGRATION

Saint-Martin’s theosophy is an epic of fall and rehabilitation. The history of humanity begins from the *prévarication* (a term Saint-Martin borrowed from Martinès de Pasqually to designate the metaphysical Fall of humanity) in which humanity lost the perfection of its primordial state in which it participated in the divine pleroma. Saint-Martin teaches that humanity subsists in a state of forgetfulness of its true nature owing to the Fall, but that its true intellectual (i.e., spiritual) nature renders it susceptible to receive the light emanating from the divine intelligence that permeates the universe. Fallen humanity, which retains the germ of the image of Divinity within itself, must draw out its divine life from under the bondage of its fallen status by reorienting its will, still free despite the Fall, with the divine will. Through contemplation (the soul as mirror – mirrors being living, organic reflections of the divine image, from whose reciprocal play we know ourselves and reassemble a shattered, dispersed world into unity), humanity can awaken to consciousness of its true nature and to the circulation of spiritual forces through the universe. Sensible objects are signs of a hidden spiritual reality. Saint-Martin calls souls who, moved by desire for God, acquire knowledge of the interior truths *hommes de désir*. These “men of aspiration” imitate Christ both in incarnating consciousness of the Word (divine truths) and in expiating the fallen world through sacrificial suffering. Their self-immolation having separated them from the material kingdom, they exercise a spiritual ministry by regenerating others through their sacrifice. Once a critical mass of “men of desire” has been achieved, the *homme-esprit*, or corporate regenerated humanity, is created. *Le Ministère de l’homme-esprit* is to complete the regeneration of humanity through the radical development of its intimate essence. The identity Saint-Martin posits between the regenerated human will and the divine will makes it possible for humanity to regain its true end and become once again the image of God. The attainment of this glorious future is the “Great Work” of reintegration. Like his Enlightenment opponents, Saint-Martin refuses to see humanity as an abject creature humbled before the divine mysteries of the universe, yet at the same time he rejects the Enlightenment repudiation of reli-

gion by bathing humanity in these very divine mysteries.

The reintegration of humanity carries with it the regeneration of nature. *De l’esprit des choses* considers humanity, as a living mirror, to be a reflection of divinity. By giving oneself over to meditation, and renouncing, by the will, all external things, one operates and obtains intimate knowledge of the Prototype, or of the Word, of which the human being is originally the image and the type. This knowledge not only reveals God to the human being, it also reveals our proper relation to Nature. By placing ourselves in harmony with our Principle, we also place ourselves in harmony with original Nature (Boehme’s Eternal Nature). Present-day Nature, fallen and divided in itself and in humanity, nevertheless preserves in its laws, as humanity in many of his faculties, a disposition to reenter into the original unity. By this double relation, Nature is put in harmony with humanity to the extent that humanity coordinates with its own Principle. In this way the “Great Work” of reintegration restores Nature, as well as humanity, to its prelapsarian state. *De l’esprit des choses*, a rare example of French → *Naturphilosophie*, greatly interested the German *Naturphilosophen*.

3. MAGISM/IMAGINATION

Magism operates, in Saint-Martin’s theosophy, on three levels: divine, natural, and human. On the divine level, God manifests or reveals himself externally through the Sophia, but additionally through other mirrors, requiring in their turn new mirrors in which they are reflected. Saint-Martin calls the circulation of spiritual forces through the universe by means of the multiplication of mirrors “divine magism”. This divine magism both reveals to humanity the reflections of the eternal magnificence and, through its action on our hearts, inspires love for it, though in such a way that we cannot appropriate the principle to ourselves (Divinity remains ineffable to creation).

On the level of Nature, there is a triple magism. The first, more or less identical with divine magism, is divine generation itself, or the filtering through the veil of things as much of the spiritual forces as created beings can sustain. This is the capacity that pre-fallen Nature has to manifest God. But Nature is no longer in its original state; like humanity, it is fallen. Hence, another magism, the universal-present, must be exercised in order to protect against the Evil Principle and remove the horror and infection with which the fall has tainted our suffering. In fact, however, the natural magism of the present

universe is in its principle identical to the natural magism of the original universe; it differs only in the realm in which it operates. In addition, each individual entity in the natural world also has its particular magism; each flower, each animal, as a medium between its tangible properties and the invisible and intangible properties that are in its principle of life, is an image of the eternal and original medium of divine generation. The third natural magism is distinct and, as a consequence of the fall, works against the divine forces. It is called *astral* magism. Under the influence of its disorderly and irregular images, our spiritual and physical being alike can be seduced from our true destination.

Saint-Martin calls the human form of magism the → imagination. Its original role was to make ever more beautiful, ever more perfect the sphere wherein humanity lived. This imagination remains with us despite the Fall. Discerning the spiritual glory hidden under the appearances of sensible nature, the imagination is the spiritual part of humanity that possesses the vision of all things. Everything is a symbol in our world; physical objects are the visible signs of invisible forces on which they depend. Through imagination we grasp the spiritual unity of the universe. In Saint-Martin's anthropology, the imagination is not one faculty among others, but a primary vocation as the duty and power of reflecting, or making real, of propagating and re-creating. The term "mirror", then, linked as it is to magism and imagination, does not connote passive reflection, but an active concentrating and focusing that causes germination and growth, the passing from dispersal to the unity of the human being. Just as, however, astral magism opposes the good natural magisms, so there is a negative human imagination, or a faculty of representing to ourselves chimerical beings or composite monstrosities that stand against the plan of harmony and universal restoration. One must cast the negative magism aside in order to become the mirror of God and of Nature.

4. LANGUAGE AND POETICS

Saint-Martin, like many of his contemporaries, argues for a natural origin of language, as opposed to a conventional origin. But by natural origin he does not mean that which Enlightenment philosophes meant by it; that is, that language was born out of the necessities imposed by our terrestrial condition. Languages of such an origin do exist – Saint-Martin points to the idioms spoken by savages – but they are animal languages. The true primitive language of humanity, that spoken before

the Fall, was natural in the proper sense because its words responded to the essence of the things they named. Present-day languages, in which words no longer have an evident relation to the things that they designate, are as they are because of the Fall. Language, like humanity itself, has suffered an exile from its original state. The rehabilitation of humanity is linked to the recovery of the original, universal, divinely natural language of humanity. This recovery is possible because something of the original language remains in our degenerate languages. This something is the ability of language to express the universal faculties of the Supreme Principle, not directly or literally, to be sure, but indirectly through → correspondences, symbols, figures, and allegories. This indirect speech, or poetry, participates in the divine powers, thereby linking humanity to God and grasping the unity of creation. Through poetry, an enduring echo of the universal language, humanity becomes the lyre of God. True poetry, finally, must display a historical aspect because the relationship of humanity to God – the subject of poetry – is the historical drama of the Fall and the regeneration to come (hence, its historical aspect includes a prophetic element). Saint-Martin's poetic ideal is lyric, metaphysical, narrative, and edifying; in short, the epic of Fall and rehabilitation.

Two consequences emerge from Saint-Martin's theories of language and poetics. First, he asserts the idea of a poetic priesthood. Primitive poetry, he says, was religious in character; the history of poetry has been a long decadence, a descent toward terrestrial subjects and futility. Poetry, which has fallen by making itself into a simple translation of the passions or imitator of things, must take up again its primitive function as a celebration of the Principle of our grandeur. Poetry has a privileged function in the relation of humanity to God because it is, of all human productions, that which most reconciles us with our Principle, and which, by the feelings it evokes, best proves to us the dignity of our origin. The second consequence relates to the limits of communication. The Illuminist or sacred poet, by virtue of a transcendent intuition, has become the depositary of the truth. He is charged with communicating this truth to his contemporaries, but the communicative effort collides with the limits of communication. That which can be said literally is fallen; the truth can only be hinted at because of the degeneration of our language. Poetic language attempts to say the unsayable by means of correspondences, symbols, figures, and analogies. The deeper a spiritual truth one tries to express, the more one must resort to

these circumlocutions. The secret possessed by the Illuminist or poet is secret or esoteric, not by his choice, but because the truth that grips him cannot, by its very nature, be put into circulation under a form accessible to all.

5. CHRISTOLOGY

Saint-Martin taught that reintegration is possible because humanity retains a spark of its divine origin, and, moved by desire for God, can acquire knowledge of the interior truths. The various religious traditions of the world, as well as the Bible, confirm for the “man of desire” the truths that he finds within himself. Nevertheless, Christ retains a unique and necessary role in the process of reintegration because fallen humanity retains the possibility of reintegration only thanks to Christ, the divine Réparateur. Christ’s sacrifice renders our suffering efficacious and gives us a new life. Echoing St. Paul, Saint-Martin insists that the Réparateur must be both divine and human since humanity could not be regenerated if Christ had been solely a human Réparateur, while if the Réparateur had not become human the path of suffering would never have been opened and all suffering would have been in vain. Though Saint-Martin accepts that the restoration of fallen humanity began to take form at the moment of the Fall, whence the constant presence of the divine in history, he insists that salvation must await Christ. Christ’s sacrifice culminates the history of bloody sacrificial réparateurs of pre-Christian religions and societies and transforms humanity by offering the possibility of rebirth into a new life. Nevertheless, transformed humanity extends and will eventually complete Christ’s work and bring about reintegration. Through imitation of Christ, “men of desire” are not only redeemed but, coming after Christ and possessing the gift of the Spirit, surpass him in the work of the sanctification of the universe through suffering.

6. HISTORY

Do historical events play any role in effecting reintegration, or is history for Saint-Martin, as for Boehme and Martinès de Pasqually, simply the stage on which a spiritual drama is played out? Saint-Martin’s interpretation of the overwhelming historical event of his generation, the French Revolution, may serve as a test case for this question. Though Saint-Martin observed the Revolution and its social and political consequences with interest and even, in the beginning, enthusiasm, it troubled him, as it troubled an entire European generation. In the mid-1790s he worked out his response to it in *Lettre à un ami, ou Considérations politiques,*

philosophiques et religieuses sur la Révolution française (1795). He returned to the social lessons of the Revolution two years later in *Eclair sur l’association humaine. Le Crocodile* (1799), his novel treating the period leading up to the upheaval, is also relevant to Saint-Martin’s understanding of the Revolution.

History, for Saint-Martin, begins with the Fall. Since, as for Milton, the way back is barred, history is not a question of returning to a past, but of conquering a future. Historical events are signs of the “Great Work” of reintegration. Saint-Martin teaches that post-lapsarian humanity is possessed by nostalgia for its origin, and constantly seeks, without being aware of the true cause of its search, an ideal harmonious socio-political order in which to develop itself in its truth and its plenitude. The quest for such an order governs history. Saint-Martin interprets the socio-political life of humanity as a sequence of violent and convulsive efforts, which he calls crises, toward harmony. Crises, analogous to the delirium of the sick person whose convulsions are at once signs of the illness and of struggle against the illness, are simultaneously signs of the desire for reintegration and of progress toward reintegration. Crises assist the work of reintegration both because they add to the suffering that is part of the reintegrative process and because they provide ideal conditions for the reactivation of the primitive faculties of rapidity and energy characteristic of humanity in its primordial state but possessed only in potential since the Fall. The Revolutionary crisis, in particular, reactivates these primitive faculties and thus marks a new origin for humanity. Not only is this positive spiritual evolution irreversible, it will be extended to other nations through the spread of the Revolution. Historically, the Revolution raises the French people into a “people of the new law”, the law of action that succeeds ages of sacrifice and prayer. Saint-Martin described the Revolution as an ‘abridged image of the last judgement’ in recognition of its epochal status of inaugurating the reign of the *homme-esprit* who rediscovers its function of administering the universe by the creative power of the Word. The Revolution, like all actions in the physical world, is a sign of spiritual action, of divine magism. By manifesting rediscovered human energy and thereby announcing reintegration, the Revolution is a great sign marking the liberation of humanity. Liberation, here, includes an anti-clerical dimension: the Revolution destroyed a Catholic clergy which had interposed itself between God and the people. Saint-Martin’s interpretation of the Revolution, which decodes it as a hieroglyph of

spiritual meaning, was guided by his conviction that nothing happens without permission from Above. Saint-Martin both comprehends the Revolution within the providential order and declares it to be irreversible because it marks spiritual progress. But this positivity has its reverse. God regenerates France, but punishes it; the violence of the Revolution expiates its forgetfulness of God in the century past.

Saint-Martin's reflections on the Revolution contributed to the elaboration within his theosophy of a philosophy of history in which humanity, engaged in a process of historical becoming, raises itself to a dynamic consciousness of eternal truths. The "Great Work" of reintegration, as an epic of the human will, culminates when regenerated humanity, the *homme-esprit*, becomes once again a flawless mirror of Divinity, when the reconquest of humanity's quasi-divine status in the realization of its primordial state restores unity and universal harmony. The providential design for history is thus fulfilled, not by the establishment of new social and political institutions, but by spiritual reintegration. Historical events do not in themselves effect reintegration; rather, they are signs of the activity of the reawakened will and primitive faculties, which are the true agents of reintegration. Saint-Martin values history, not for itself, but for the divine signs it encodes. While his reflections on history and politics inspired certain socialist visionaries of the 1830s in their attempts to establish terrestrial utopias, for Saint-Martin himself historical events are symbolic of, not instrumental to, the reintegration of humanity. Though history points to it, Saint-Martin's new order is outside history altogether. While Saint-Martin's theosophy, reflecting the conviction of French Enlightenment thinkers that political events and social institutions are constituent elements of human development even while repudiating 18th-century rationalism and materialism, marks the beginning of the convergence of voluntarism and historical-mindedness, ultimately Saint-Martin regards reintegration as an interior reorientation of the will and looks to the end, not the culmination, of history.

7. ARITHMOLOGY

Arithmology (or arithmosophy [→ Number Symbolism]) treats numbers not as conventionally agreed upon values, but as signs of the divinely established relationships uniting God, humanity and the universe. In this view, numbers are the expressions of the diverse properties of being; they express truth, but do not give us truths. The science of arithmology is thus a metaphysics of numbers in

which the value of particular integers and the relationships among them teach the investigator about the structure of the cosmos and the linkages among its levels. Arithmological speculation feeds on biblical passages in which specific dimensions are given, above all, those concerning Solomon's Temple and the Ark of the Covenant.

Arithmology was a recurrent interest of Saint-Martin, in which he was guided by Martinès de Pasqually and Boehme. It is prominent in *Des Erreurs et de la Vérité*, *Le Tableau naturel*, and *L'Esprit des choses*, in his correspondence with Kirchberger, and received in-depth treatment in the manuscript *Les Nombres* (published in two modern editions). *Les Nombres* opens with the proclamation: 'Numbers are only the abridged translation, or the concise language of the truths and laws of which the text and ideas are in God, in man, and in nature'. The balance of the work draws out the implications of this view within the structure of Saint-Martin's theosophy.

ARTHUR MCCALLA

Saint-Yves d'Alveydre, Joseph Alexandre, * 26.3.1842 Paris, † 6.2.1909 Pau (Basses-Pyrénées)

The name of "synarchy" given to the synthesis of all human knowledge, as dreamed of by Saint-Yves, played an extraordinary role within the myth of conspiracy that flourished around World War II, bearing no relationship to its author's intentions. Saint-Yves d'Alveydre's reputation was solidly established in the Parisian world after an adventur-

ous life, followed by a written oeuvre that was widely recognized. The early years were difficult for this son of a doctor (most likely an alienist) who treated him very harshly and finally sent him to Mettray, a boarding school specializing in young delinquents but headed by an admirable man, Frédéric Demetz (1796-1873), whom the young rebel considered as a father-figure and an inspirer. Here Saint-Yves read widely and became possessed by the idea of a mission to be accomplished: to become the "Pythagoras of Christianity". After passing his baccalaureate in Paris and serving in the National Marines simultaneously with medical studies, he joined the French exiles around Victor Hugo (1802-1885) on the island of Jersey. Disciples of Pierre Leroux (1797-1871) introduced him to the master, and more importantly to Virginie Faure, a charming old lady who had known → Fabre d'Olivet, and who perhaps owned the latter's manuscripts that Saint-Yves was later accused of plagiarizing. After Jersey, Saint-Yves went to England and made friends with Edward Robert Bulwer-Lytton (1831-1891), the son of the author of the initiatic novel *Zanoni* [→ Edward George Bulwer-Lytton. There was a rumor that Saint-Yves had also met the elder Lytton, as well as → Eliphas Lévi. The turning-point in his life came with his marriage in 1877 to Marie-Victoire, Countess Keller (1827-1895), daughter of a family of chamberlains to the Tsar and close to Madame Hanska (1801-1882), who married Balzac (1799-1850). The couple settled in a magnificent town house in Paris, then in Versailles, where Saint-Yves, endowed with a papal title of Marquis d'Alveydre but spurned by high society, concentrated on realizing his spiritual destiny, supported by the active admiration of his wife.

Saint-Yves conceived a vast historical system around the cycle of Ram, legislator of our humanity (Abraham – Ab-Ram – owed his name to him), whose secret spiritual direction has always been exercised through the intermediary of the "King of the world" out of his subterranean city of "Agartha". The modern world might regain the harmony lost in successive schisms by submitting to the "universal trinitarian synarchy". Saint-Yves presented his project from 1882 onwards, publishing a series of "Missions": *Mission actuelle des Souverains* (Current mission of the sovereigns, 1882), *Mission actuelle des ouvriers* (Current mission of the workers, 1882), *Mission des Juifs* (Mission of the Jews, 1884), *Mission de l'Inde* (Mission of India, 1886, published posthumously), and *Les Etats généraux du suffrage universel* (The states-general of universal suffrage, 1888). His oeuvre was addressed to the political world, the syndicates, the cultivated public,

but definitely not to the occultists, whose organizations he carefully avoided; it proposed the institution of a hierarchy of economic, political, and religious powers in a great spiritual body, conceived on the model of the Christian Trinity. Thanks to communications with his deceased wife, which he received from 1897 in his private chapel at Versailles, he completed his revelation by conceiving of a machine of universal correspondences (sounds, colors, forms): *L'Archéomètre* (1911), which also gave the key to the primordial language of Watan. The "Friends of Saint-Yves" undertook the posthumous publication of the work, but soon fell apart; nonetheless, his influence was felt in fields as various as architecture, → music, the plastic arts, and in the Western Indianism between the World Wars.

JEAN-PIERRE LAURANT

Saltzmann, Frédéric-Rodolphe, * year unknown Sainte-Marie-aux-Mines, † 7.10.1821 Strasbourg

Saltzmann's father, Jean-Rodolphe, son of a wealthy Strasbourg merchant, was pastor at Sainte-Marie-aux-Mines from 1746 to 1759. His mother, Marie-Elisabeth Sauer, was daughter of a manufacturer in the Val d'Argent. In 1759, Saltzmann Sr. was appointed pastor at the Temple Neuf in Strasbourg, and Frédéric-Rodolphe became a pupil at the famous Protestant gymnasium, Jean Sturm. In 1765 he entered the Theology faculty of the University of Strasbourg, but very soon changed to the Law faculty, while still following courses at the Faculty of Letters.

Before devoting himself to → mysticism and → Christian theosophy, Saltzmann led a worldly life. On leaving the university, he became tutor to Baron von Stein, the future reformer of Prussian institutions. Saltzmann's correspondence with Madame von Stein displays his first literary activities at Göttingen, particularly the publication of an *Almanach des Muses* (Muses' almanac) modeled on that of Delalain in Paris. His cultural and literary activities after his return to Strasbourg obtained for him first the secretariat, then the directorship of the *Deutsche Gesellschaft* (German society) founded by the poet Lenz, and of its organ, *Der Bürgerfreund* (The burgher's friend). Saltzmann was also responsible for the publication of another Strasbourg periodical, the *Gelehrte Kunstnachrichten* (Learned art news), organ of the Société des gens de Lettres (Society of literary people) founded by Blessig and Jean de Turckheim.

With these varied literary activities and a vast knowledge of books, which had put him in touch with the famous Berlin publisher of the Enlightenment, Friedrich Nicolai, Saltzmann was well prepared for the work of bookseller and journalist. In 1782 he acquired the Librarie Académique. When the French Revolution broke out, he owned the most important newspapers in Strasbourg. This situation destined him to play a role in political events. A member of the moderate party, he was soon, along with them, the target, then the victim, of the Jacobins. Banishment was his reward.

These trials seemed to Saltzmann to be Providence's invitation to turn away from worldly affairs. His "conversion" had been prepared by frequenting pietist circles [→ Pietism], and also by his activities within the Templar Freemasonry [→ Neo-Templar Traditions; → Freemasonry] of Strasbourg. During a stay in Lyon, from December 1777 to January 1778, he prepared with Jean de Turckheim and → J.B. Willermoz the reformation of French Freemasonry, beginning with the recasting of the symbolic degrees and that of the Scottish Master. Henceforth, the French Templars took the name of → Chevaliers Bienfaisants de la Cité Sainte. This reform was ratified at the Convent of Wilhelmsbad in 1782. Saltzmann (ab hedera) was a member of the Collège des Grands Profès (College of great professed [masons]) created the previous year by Willermoz at the Convent des Gaules. Saltzmann, with Plessen, succeeded in rallying Ferdinand of Brunswick and Charles of Hesse for this new system. But the cause was far from won. In 1785, Saltzmann had to tour the towns of Germany to investigate the situation in the lodges and

hold negotiations in view of their adherence to the Chevaliers – a journey that was disappointing, whatever he said of it.

The Terror marked a break in Saltzmann's life, after which he devoted himself almost exclusively to theosophic and mystical speculations, inseparably linked. The Bible, and especially the writings of the Apostles, held first place here with the Fathers of the Church. But above all, Saltzmann formed a bond with the → mysticism of the Middle Ages. He recognized Johannes Tauler as a spiritual father, → Jacob Boehme as another. Following Tauler, Saltzmann preached the necessity of a mystical union with God in the depths of the uncreated soul of the divinity, in order to cast off the old man and bring about the birth of the new man, who would then regain his primordial power from before the Fall. The end would return to the beginning. Like → Saint-Martin, Saltzmann followed Boehme in his cosmogonic and anthroposophic theories. Averse to the idea of eternal punishment, he also decreed the final reintegration of all beings. Saltzmann and Oberlin gave a graphic description of the other world, relying on the theories of → Swedenborg, among others. Saltzmann debated these in copious correspondence with his theosophic brethren: → Jung-Stilling, → Johann Friedrich von Meyer, → Johann Caspar Lavater and his Zurich circle, Heribert de Berne, and others.

Among Saltzmann and his friends, the prospect of the future was resolutely optimistic, because our era, even though destined to see the general destruction at the end of time (which they thought to be imminent), would give way to a new golden age marked by the return of Christ and destined to last a thousand years. The German Romantics [→ Romanticism] would in turn take up this vision of the golden age, but with a different orientation, for they turned to a far-off, mythic past.

Saltzmann never hoped for his theosophic teaching to act on the broad mass of Christians, and would have wished the esotericism of his thought to have prevented it. He only wanted to address the “men of aspiration”, that little band of interior Christians, that long chain of the children of God, present and future, who are affiliated to the first Christians, whose spiritual heritage they have received and whose superior enlightenment, known to them alone, they transmit to other initiates.

The works of Saltzmann appeared anonymously. Their author was identified thanks to his correspondence with Jung-Stilling and J.F. von Meyer. Several of the writings mentioned therein have disappeared, while others have remained in manuscript, including his autobiography.

JULES KELLER

Sangro di San Severo, Raimondo di
* 30.I.1710 Torremaggiore (Foggia, Italy), † 22.3.1771 Naples

One of the significant figures in the early history of Italian → Freemasonry, Prince Raimondo di Sangro di San Severo was born into one of the most illustrious families of the Naples aristocracy, with family connections extending to European royalty dating back to the Middle Ages. A pupil of Jesuit schools in Rome and Naples, di Sangro emerged in the 1730s as an inventor in several different fields, from fireworks to weaponry, and from hydraulic machines to new fabrics and tapestries. Some of his inventions were greeted with skepticism; others, particularly in the military field (in which di Sangro also excelled, as a commander in the Neapolitan army), apparently worked well, and their creator was celebrated as a precocious, if somewhat bizarre, genius.

Freemasonry, which had its earliest and largest Italian lodges in Naples, became one of di Sangro's most dominant interests in the late 1740s. Even before his formal initiation (possibly no earlier than 1750), and his installation as Grand Master of Neapolitan Freemasonry shortly after, di Sangro wrote several works and letters to political figures in which, capitalizing on his military successes, he argued that the most successful European armies (in empires such as Prussia and Britain) were those which counted mostly active Freemasons among their generals.

This is an argument also advanced in di Sangro's most controversial work, the *Lettera Apologetica*, published in 1750. The *Lettera* is an apology, against Catholic critics, in defense of Freemasonry and its usefulness to monarchs, armies, and the population in general. It is also an unashamed apology for the di Sangro family and its role in Neapolitan history. It is much more than that, however, insofar as it includes (particularly in its very lengthy footnotes) a theory of language, of the magical power of words, and of mysterious sacred languages. Central among these in the *Lettera* is the "quipù", i.e. the language expressed, according to di Sangro, in the knotted cords used by the Incas in Peru (and burned as potentially demonic by Jesuit missionaries). The "quipù", di Sangro argued, reveals secrets of potentially universal value, a truth beyond all sectarian truths in the shape of the "Pachacamac", a benevolent original God who was, it was claimed, surprisingly similar to the → Hermes Trismegistus of the Hermetic tradition.

With the *Lettera* and other works, di Sangro made two different sets of powerful enemies. One included the Roman Catholic Church, the Inquisition (exposed in the *Lettera* in the style of an Enlightened philosopher), and the Jesuits, who accused di Sangro of trading Christianity for a pantheism à la John Toland (1669-1722). The other was the rationalist wing of Freemasonry, which did not like di Sangro's reliance on sacred languages and exotic occult secrets.

For a number of political reasons, di Sangro decided to make peace with the Church. In 1751, when Rome proceeded to excommunicate Freemasons, he accepted to deliver to the authorities a list of all Naples' Freemasons, resigned as Grand Master on July 24, and wrote to the Pope on August 1, seeking forgiveness and the lifting of his excommunication. Although he was informed verbally that the Pope regarded his excommunication as no longer in force, the Catholic Church nonetheless included the *Lettera* in its *Index* of forbidden books in 1752.

To Catholics who claimed that, although perhaps no longer a Freemason, he was still a pantheist, di Sangro answered by re-interpreting his theory of "quipù" in a booklet published in 1753 and dedicated to the Pope; and by drafting and circulating (but not publishing) an *Antitoland* in 1754, in which he tried, with great care, to distinguish his ideas from Toland's pantheism. To Freemasons, who accused him of having betrayed the order, di Sangro replied that his criticism was only directed against the rationalist wing of Freemasonry; in fact, he continued to write about → alchemy and → hermeticism, at least throughout the late 1750s.

Critics created the legend of di Sangro as a dabbler in black → magic and occult sciences [→ occult/occultism], still reproduced in countless works of popular literature. In fact, there is no evidence that he ever practiced ritual magic, and his approach to Freemasonry was, as he claimed, "philosophical", although his philosophy was more in the tradition of → Giordano Bruno than of the Enlightenment *philosophes*. A frequent accusation against di Sangro is that he was insincere and ready to compromise his ideas when political advantages for himself and his family were at stake. di Sangro's ideas were so peculiar, however, that he could with some sincerity deny complete self-identification with any organization of his time, from Freemasonry to the Roman Catholic Church.

On the other hand, a grand idea of the di Sangro family undoubtedly dominated the Prince's life, and should be taken into account when interpreting di Sangro's most visible legacy, i.e. the extraordinary Temple of Piety that he built in his family's Sansevero Chapel in Naples. A late Baroque masterpiece, the Temple does in fact include elements of Freemasonry and non-Christian religions. There is a risk, however, of reading too much into its convoluted architecture and sculptures, and those who look for hidden alchemical secrets are influenced as much by legend as by the real-life figure of the Prince di San Severo. They forget that the Temple was also built in celebration of the di Sangro family, and of the grandiose sense of self-importance of an aristocrat who was not ashamed to dedicate his most important literary works to none other than himself.

MASSIMO INTROVIGNE

Satanism

Theologically, Satanism has been defined as a religious or philosophical system which professes or manifests a hatred of Christianity. Historians and religious studies scholars usually adopt a different definition, and limit Satanism to the adoration, in an organized and ritual form, of the figure known in the Bible as the Devil or Satan. According to this definition, therefore, early modern → witchcraft cannot be defined as Satanism: whatever it was, it was not an *organized* form of Devil worship.

Organized Satanism is a modern phenomenon. Its first incarnation was in the circle operating, at the Versailles court of Louis XIV (1638-1715), around Catherine La Voisin (?-1680) and the defrocked Catholic priest Father Guibourg (whose first name is never mentioned in contemporary accounts: 1603-1683). La Voisin invented the “black Mass”, i.e. an “inverted” Roman Catholic Mass in which, by appropriately changing the formulae, Satan is worshiped and Jesus Christ is cursed. Black Masses at which Guibourg and other renegade Catholic priests officiated were sold by La Voisin as means of obtaining specific favors (such as money or love) from Satan to a number of nobles, including the King’s lover, Madame Françoise de Montespan (1641-1707). In 1695 the royal guards discovered the ring; but because the subsequent investigation involved too many well-known figures it was not carried to its full conclusion, although La Voisin was burned at the stake in 1680 and Guibourg died in jail in 1683. The Versailles incident became famous all over Europe thanks to the then recently acquired prominence of the press, and small rings imitating what they had read of La Voisin and Guibourg were subsequently discovered in France, Italy, and Russia. In the 18th century, the Hell Fire Clubs and the Society of St. Francis, created by British politician and dilettante Sir Francis Dashwood (1708-1781), were in turn

accused of being Satanist organizations, although they were rather anticlerical and libertine clubs, not particularly interested in Devil worship. Catholic authors later connected these episodes to the French Revolution, which they believed had been masterminded by anti-Catholic Satanists. Between 1800 and 1865, more than thirty influential works, exposing a widespread Satanist conspiracy, were published in France and in other countries. This religious literature became discredited by its own excesses, however, and slowly disappeared.

In the 1880s, Jules Bois (1868-1943) and novelist → Joris-Karl Huysmans (1848-1907) explored the French occult underworld, and in 1891 Huysmans published his best-selling novel on Satanism, *Là-bas*, which included one of the most famous literary descriptions of a Black Mass. The Satanists of the 1880s were not invented by Huysmans; they already existed, although they had admittedly only a few members in two or three small cults operating in France and Belgium. Again, public opinion overreacted and, in the wake of the success of *Là-bas* sensational revelations on a worldwide Satanic conspiracy were offered to the French public by journalist Léo Taxil, whose real name was Marie-Joseph-Antoine-Gabriel Jogand-Pagès (1854-1907). He had also announced, with much fanfare, his conversion from → Freemasonry and anti-clericalism to Roman Catholicism in 1885. Taxil revealed that a huge Satanist organization called “Palladism” was behind political anti-Catholicism, Freemasonry, → Spiritualism, and occultism [→ occult/occultism], all placed under the authority of a “Satanic Pope”, revealed to be the prominent American freemason Albert Pike (1809-1891). Eventually, Taxil’s sensational stories came under increasing scrutiny by both Freemasons (including the British Masonic encyclopaedist → Arthur Edward Waite, 1857-1942) and Catholics (particularly the Jesuit press in France and Germany). In 1897, Taxil confessed at a conference in Paris that there was neither a Palladism, nor a worldwide Satanic conspiracy at all; his own conversion to Catholicism had also been a hoax which he had conceived in order to convince the world just how gullible the anti-Masonic Catholics of his time actually were.

Although a body of literature inspired by the Taxil fraud continued to be published well into the 20th century (including *L’Élué du Dragon*, a 1929 book claiming that U.S. President James Abram Garfield, 1831-1881, had replaced Albert Pike as chief of the worldwide Satanic conspiracy before his assassination in 1881), anti-Satanism was

largely discredited after the infamous Taxil hoax. When in the 1930s Russian-born occultist Maria de Naglowska (1883-1936) established an openly Satanist cult in Paris, the press was more amused than scandalized, and some newspapers characterized her kind of Satanism as an interesting “religious experiment”. The international press was less kind when British magus → Aleister Crowley (1875-1947) shocked his contemporaries by styling himself ‘the Beast 666’ and ‘the wickedest man in the world’. Crowley made use of Satanic imagery and is still regarded by many as the founding father of contemporary Satanism. The British occultist, however, was a “magical atheist” who did not believe in the actual existence of Satan; and although he has been influential on later Satanic movements, he should not be regarded as a Satanist in the narrower, technical sense of the term. On the other hand, it is true that Crowley enthusiasts, including movie director Kenneth Anger, were instrumental in founding the Church of Satan in San Francisco in 1966, its notorious spokesman being the former carnival performer Anton Szandor LaVey (pseudonym of Howard Stanton Levey, 1930-1997). LaVey’s Church of Satan and its main splinter group, Michael Aquino’s Temple of Set, remain the largest Satanic organizations in the world. They are not large, however: in fact, their combined active membership (not to be confused with their mailing lists) does not exceed one thousand people and is probably even smaller. The main reason for Aquino’s schism from LaVey was that the former believed in the literal existence of Satan (or Seth), while LaVey, although believing in the power of → magic and ritual, regarded Satan as a metaphor for each person’s higher self, which emerges when liberation is achieved from the strictures of Judaeo-Christian morality.

LaVey’s notoriety certainly played a role in the early stages of the anti-Satanist campaign of the 1970s and 1980s. In his early studies of hysteria, Sigmund Freud used hypnosis, and for a while became convinced that what he called the “theory of seduction” could explain the genesis of hysteria in female patients. All the patients he hypnotized, in fact, remembered being sexually abused in childhood, a memory they were not conscious of while not under hypnosis. While Freud was initially persuaded that these memories corresponded to real, historical instances of abuse, he became perplexed when, continuing the hypnotic therapy, almost all the patients “remembered” abuse by Satanists (mostly their parents) in bizarre ceremonies and apparitions of the Devil himself. Freud dismissed these stories as fantasies, abandoned the theory of

seduction and went on to formulate the alternative explanation for hysteria which eventually made him famous. Eighty years after Freud’s early career, the theory of seduction surfaced again. A Canadian Catholic therapist, Lawrence Pazder, was told by his patient Michelle Smith that she had been abused as a child by a Satanic cult of international proportions twenty years before, had witnessed horrible scenes of human sacrifice and cannibalism, had seen the Devil in person, but had forgotten all these experiences until beginning therapy with Pazder. Unlike Freud, Pazder concluded that Smith’s memories corresponded to true and actual historical events, publishing in 1980 a book that eventually became a bestseller, *Michelle Remembers*. Although the book was written from a religious point of view, it was welcomed more by certain secular mental health professionals than by the churches. Michelle’s story was interpreted within the context of an ongoing discussion on Multiple Personality Disorder (MPD), a disorder whereby the same patient “dissociates” into different “alters” who speak with different voices, may have very different personalities and may not remember what the other “alters” think or do. Therapist Cornelia Wilbur was instrumental in promoting the theory that MPD was almost invariably the result of severe childhood trauma, often in the form of sexual abuse. As a result of increasing media coverage of MPD, thousands of patients in the United States began claiming that they were “survivors” who had been abused by Satanic cults in their childhood. Therapists and anti-Satanist activists alike ultimately repudiated Freud, claiming that the survivors’ stories were literally true. They also called for quick action by public authorities to uncover the perpetrators, who were, they claimed, members of a vast, “multigenerational” and deadly dangerous Satanic conspiracy. Anti-Satanists also speculated that MPD does not always arise as a spontaneous protection mechanism against traumatic memories, but may instead be “planted” by Satanists, who presumably have access to sophisticated psycho-technologies enabling them to brainwash children to dissociation, making their memories so garbled that future identification of the perpetrators becomes virtually impossible. Influenced by the survivor stories, some therapists reasoned that the Satanic cults were probably still operating, and that many of the child sexual abuse incidents (unfortunately common in the United States and elsewhere) may include an undetected Satanic element. The first and the most famous court case arising from these claims involved the McMartin Preschool in the

affluent Los Angeles suburb of Manhattan Beach. The McMartin case began in 1983, when the principals and a number of teachers of the respected preschool were accused of operating an underground Satanic cult, which ritually abused and tortured children. Mental health professionals involved in the case were later accused of having “planted” the stories in the children’s minds (some of them only two or three years old) based on their own theories about Satanic conspiracies. The McMartin trial was the most expensive in United States legal history, and ended in 1990 with no convictions. It had an enormous media impact, however, and undoubtedly had something to do with the hundreds of subsequent similar accusations of Satanic ritual abuses in both day-care centers and in family settings. Although complete statistical data is lacking, it is possible that as many as two thousand cases of Satanic ritual abuse of children were investigated in the decade 1983-1992. Although, in a handful of cases, pedophiles did use Satanic symbols and paraphernalia in order to scare their victims, there was no evidence confirming the existence of an international Satanic network of abusers. Gradually, sociologists and other academics emerged as the most vocal critics of the theory of a Satanic conspiracy and did much to ridicule the stories of survivors.

By 1991, even some psychiatric MPD specialists were harboring doubts on the factual truth of the survivors’ Satanic stories. In 1994 two official reports, one by the U.S. National Center for the Prevention of Child Abuse and Neglect, and one by sociologist Jean S. La Fontaine on behalf of the U.K. government, concluded that stories of Satanic ritual abuse were largely figments of the survivors’ imaginations, that no secret Satanic underground existed, and that the imaginary evil of international Satanic pedophile cults should not be confused with the very real evil of pedophilia. After these reports, the number of court cases involving allegations of Satanic ritual abuse decreased from several hundreds to less than ten per year on a worldwide scale, and most convictions based on survivors’ accounts were reversed on appeal.

It is also important not to confuse the debate on the Satanic ritual abuse of children with discussions of adolescent Satanism. There is little doubt that there are gangs of teenagers performing some sort of home-made Satanic ritual mix (copied from comics, books or movies) and drug parties. These teenagers are often guilty of minor crimes such as vandalism or animal sacrifice. In less than a dozen cases over the last two decades, more serious crimes appear to have been committed, including a

handful of murders. In these cases, it is difficult to determine whether drug, gang-related violence or Satan worship are mostly responsible for the crimes. What is clear is that teenage Satanism is not connected with any international conspiracy, and is a different phenomenon from both “ritual” child abuse by adult pedophiles and the religious Satanism represented by leaders such as the late Anton LaVey or Michael Aquino. As far as the latter is concerned, the excesses of the anti-Satanist campaigns based on survivor accounts have again made the media more reluctant to attack religious Satanism. Indeed Satanic rituals are still being practiced, comparatively undisturbed by the authorities, by the Temple of Set, what remains of the Church of Satan after LaVey’s death in 1997, and a handful of smaller organizations (the largest of which may have been the Italian Children of Satan in the 1990s).

Summing up, from the Court of Louis XIV right through contemporary California, the pendulum has periodically swung between Satanism and anti-Satanism. Small Satanic cults have existed from time to time and have produced (since Satanism is, by definition, intolerable) gross overreactions in the form of Satanism scares. The success of the anti-Satanist campaigns has been limited by their own exaggerations. The fact that each wave of anti-Satanism has been discredited, has allowed new Satanic cults to operate for a while, creating in turn a new overreaction, and so on.

MASSIMO INTROVIGNE

Satornilus, ca. 120

Satornilus (Gr. Satorneilos, in Lat. sources Saturninus) was a Christian Gnostic (→ Gnosticism)

active in Antioch. Our knowledge of Saturnilus derives almost exclusively from the information provided by Irenaeus of Lyons in his *Adversus Haereses* I, 24, 1-2 (ca. 180). According to Irenaeus and other anti-Gnostic writers Saturnilus was a pupil of → Menander, but this view is based more on the assumption of a Gnostic “genealogy” than on a correspondence between their essential doctrines. He taught that there existed one Unknown Father who had created ‘angels, archangels, powers and dominions’. Seven specific angels had made the world and everything in it, and man also was a creation of the angels. When an image of light from the highest power appeared in the world and the angels were unable to catch it, since it immediately withdrew to heaven, they said to each other: ‘Let us make man after the image and the likeness’ (Gen. 1:26). So they did, but because of their weakness they could not raise their mould, which crawled like a worm. Then the Power on high had pity with this creature because it was its image, and sent a spark of life which raised the first man and made him alive. At death the spark of life returns to its origin and the body is decomposed into its constituents. This biblically inspired creation myth is typically Gnostic; it is found in several Gnostic documents, *inter alia* in the *Apocryphon of John*.

Saturnilus’ doctrine of salvation, as reported by Irenaeus, does not completely fit, or at least qualifies, the creation story mentioned above. A distinction is now made between the Unknown Father, the angels who created the world, and the demons. The Jewish God is one of the angels and probably their head; the devil, who apparently is the chief of the demons, was originally an angel but hostile to the other angels and the Jewish God. The prophecies were partly given by the angels, partly by the devil, which implies that Saturnilus valued certain Old Testament prophecies more than others. This shows that Saturnilus took part in the 2nd-century discussions about the meaning of the Jewish scriptures within the Christian context. But notwithstanding this differentiation between the heavenly powers, Saturnilus taught at the same time that they all tried to remove the Father from his supreme position and that for that reason Christ had been sent. It was his mission to break the power of the Jewish God and save those who would believe in him, i.e. those who possess the spark of Life. It now turns out that the angels had made two kinds of human beings, good and evil ones. Only the good ones had received the spark of life, the evil ones are assisted by the demons. The primeval man who was raised up by the spark of

life apparently symbolizes the class of good people, the one who crawled on the ground and was unable to stand up refers to the class of evil people. The Saviour has come to destroy both the demons and all evil men and to save the good ones.

Saturnilus and his followers abstained from marriage and the begetting of children as instigations of Satan, and also from carnal food. In doing so, Irenaeus says, ‘they deceived many by this seeming abstinence’. If Irenaeus’ report is trustworthy – and there are no reasons to doubt it – Saturnilus adhered to or, less probable, developed himself an early version of the classic Gnostic myth as represented, in a more developed form, by the *Apocryphon of John* and related texts. Saturnilus may have been influenced by Jewish speculations on the creation of the world and man, but his rejection of the Jewish God and the clear distinction he made between two classes of human beings make him one of the first Christian Gnostics of whom we know more than a name.

Foerster, in: idem (ed.), *Gnosis: A Selection of Gnostic Texts*, English trans. edited by R. McL. Wilson, vol. 1, Oxford: Clarendon Press, 1972, 40-41.

ROELOF VAN DEN BROEK

Scabelloni, Antonio → Scaligero, Massimo

Scaligero, Massimo (Antonio Scabelloni), * 17.9.1906 Veroli (Province of Frosinone, Italy), † 26.1.1980 Rome

One of the most distinguished members of the Italian Anthroposophical Society [→ Anthroposophy], Scaligero was born as Antonio Scabelloni in Veroli (not far from Rome) on September 17, 1906. As a teenager, he became interested in yoga and in different forms of Western esotericism, and in 1921, while on vacation in Sardinia, had a mystical experience of the universe as light and energy. He subsequently became a disciple of Giovanni Colazza (1877-1953) at that time the member of the Italian Anthroposophical Society closest to Anthroposophy’s founder → Rudolf Steiner (1861-1925). Scaligero later reported that Colazza was one of the twelve chosen disciples with whom

Steiner attempted in 1913-1914 to perform a ritual which, had it succeeded, would allegedly have prevented World War I.

In those years, Colazza also worked closely with → Arturo Reghini (1878-1946), → Julius Evola (1898-1974), the poet Arturo Onofri (1885-1928) and others within the framework of Rome's "Gruppo di Ur". Although several members of this group were neo-pagans, Colazza maintained a firm Anthroposophical orientation (and, in 1924, persuaded Onofri to preface the first Italian edition of Steiner's *Occult Science*). Contrary to persistent rumours, Scaligero was not a member of the group at this time; he was introduced to Evola only in 1930. A favourable review of one of Evola's works on race later caused Colazza's young disciple (who had now adopted the pen name of Massimo Scaligero) to be occasionally counted, after World War II, among those intellectuals who supported Fascist anti-semitism. Actually Scaligero was not particularly interested in Fascist politics at that time, although he later wrote, in the 1960s, several books criticizing Marxism and counted among his students several young right-wing intellectuals.

Scaligero went on to befriend Evola, but (just as his master Colazza) nonetheless remained a devoted Anthroposophist throughout his entire life. His books, published from the 1950s to the 1970s, confirm his basic Anthroposophical orientation. They are, however, interesting for their many references to several movements and figures of Italian esotericism. In this milieu, Scaligero knew almost everybody, and was widely respected. He wrote about practically every topic discussed within the esoteric "underground", and frequently added new insights of his own. His sister, Adelina Scabelloni (1908-2000), married Christian esotericist Paolo M. Virio (pseudonym of Paolo Marchetti, 1910-1969), and in turn wrote several esoteric books under the pen name of Luciana Virio.

Avvento dell'uomo interiore: Lineamenti di una tecnica dell'esperienza soprasensibile, Florence: Sansoni, 1959 ♦ *Trattato del pensiero vivente: Una Via oltre le filosofie occidentali, oltre lo yoga, oltre lo Zen*, Milan: Feriani, 1961 ♦ *La luce: Introduzione all'Immaginazione creatrice*, Rome: Tilopa, 1963 ♦ *Graal: Saggio sul Mistero del Sacro Amore*, Rome: Perseo, 1969 ♦ *Dallo Yoga alla Rosacroce*, Rome: Perseo, 1972 ♦ *Reincarnazione e karma*, Rome: Mediterranee, 1976.

MASSIMO INTROVIGNE

Schelling, Friedrich Wilhelm Joseph von,
* 27.1.1775 Leonberg, † 20.8.1854
Ragaz

The son of a pastor, and himself a student (with Hölderlin and Hegel) in the seminary of Tübingen, Schelling very soon began to publish works in the tradition of Fichte. As early as 1797 he became professor at the University of Jena, and subsequently, in 1803, at that of Würzburg. In 1801 he parted ways with Fichte, in presenting his own system of philosophy. From 1806 to 1827, he left teaching to occupy the lucrative and undemanding position of director of the Academy of Fine Arts of Bavaria. In 1827 he once more became a professor, at the University of Munich, and in 1841 he was called to the University of Berlin. His inaugural lecture has been described by Karl Jaspers as the last great public event of the German university. However, the student audiences remained faithful to the memory of Hegel and soon deserted Schelling, who took his definitive retirement in 1846.

A professor showered with honors and a philosopher universally recognized as one of the most typical representatives of German idealism (together with his teacher Fichte and his comrade Hegel), at first glance Schelling may not seem to belong to the history of esotericism. In fact, he did not have much opportunity to actually encounter representatives of esotericism in his life – except for a friendship, soon broken off, with → Franz von Baader. However, a reading of his work and his correspondence nevertheless reveals a precocious contact with Germanic → Christian theosophy, first through the works of → Oetinger (which were in his family's library), then, probably starting in 1802, by a direct reading of → Boehme. This influence is evident in the most original part of the young professor's work, his *Naturphilosophie*, developed notably in *Die Weltseele* (The World Soul, 1797), *Darstellung meines Systems der Philosophie* (Presentation of my System of Philosophy, 1801), and *Aphorismen über die Naturphilosophie* (Aphorisms about *Naturphilosophie*, 1806). We find in it the typical Boehmian pattern of a revelation of the Absolute, beginning paradoxically with its *velatio* in matter subject to gravity, and then freed from matter through the redemptive action of light. However, the perspective in Schelling's case is not so much that of Christianity as that of an astral paganism in the lineage of → Giordano Bruno (*Bruno*, 1802).

Schelling's viewpoint changes in the *Philosophische Untersuchungen über das Wesen der*

menschlichen Freiheit (Philosophical investigations about the essence of human freedom) contemporaneous with the meeting with Baader (1809), and in Schelling's major unfinished work *Die Weltalter* (The ages of the world) of which there are several versions (1811, 1813, and 1815). Here, the initially neutral Absolute takes on the personal characteristics of the Trinitarian God: the Father, who is pure freedom, while passing into existence, becomes subject to an internal contradiction, a "wheel of anxiety" from which he cannot escape except by engendering his Son, his redeeming sun (*Sohn/Sonne/Sühne*), who clarifies the paternal chaos and replaces it with the consonance of the Spirit.

In 1827, returning to teaching after an interval of almost twenty years, Schelling maintained this theogonic scenario, but placed it within the context of a "philosophy of mythology". The latter appears as the struggle of the ancient God Kronos (who stands for the universal power that usurped the place of the divine act of existing [*Sein*]), whereas he should have remained its simple foundation [*Grund*] with the young god Dionysos, God's very act of existing. Once having gained the victory, he abdicates his acquired dominion and, submitting to the Father in the Incarnation, makes possible the advent of the Spirit within the Church. The latter, following the Joachimite pattern, has developed historically as the Church of Peter (= Catholicism, based upon observance), followed by the Church of Paul (= Protestantism, based upon subjective faith), finally to culminate in the Church of John, founded on the positive philosophy of which Schelling considers himself the initiator.

To the influence of Boehme seems to have been added, by 1810, that of → Swedenborg. It was probably from the latter that Schelling borrowed his identification of the Son with the divine act of existing (perhaps by way of Fichte's *Anweisung zum seligen Leben* [1806]). We again find Swedenborg's influence in the background of the beautiful dialogue *Clara* (1810?) in which Schelling, still in shock about the death of his first wife, tries to unravel the mystery of the *Geisterwelt*. This work, like the *Weltalter* and the lectures on Mythology and Revelation, only appeared after Schelling's death (although the lectures were published during his lifetime in several "pirated" editions).

Among his contemporaries, Schelling never managed to free himself from the image of a pantheist and *Naturphilosoph*, suggested by his first writings. Only in the 20th century, authors interested in → Christian theosophy such as Vladimir Soloviev or Franz Rosenzweig began to do justice to the religious dimension of his work. *Naturphilosophie*,

from this perspective, appears not so much as the expression of an immature science but, rather, as the ultimate version of an alchemical myth in which the Christ-Light acts, prior to his historical mission, as the redeemer of nature (or of the unconscious, in the philosophy of mythology). This mythical background, combined with a rejection of all initiatory esotericism, gives Schelling's work (not unlike that of → Carl Gustav Jung one century later) its remarkable character of "a mystery in broad daylight".

JEAN-FRANÇOIS MARQUET

Schlag, Oscar (or Oskar) Rudolf,
* 22.3.1907 Osterhofen (Bavaria),
† Zurich 29.11.1990

Already as a teenager, Schlag was held to possess mediumistic faculties. In 1927, Albert Schrenck-Notzing, a dominant figure in continental parapsychology at the time, recruited him as a test subject in the laboratory he had set up in Landshut (the association lasted no more than a few months). Two years later, Schlag settled in Luzern, where he worked as a philatelist. In 1930 he moved on to Zurich where he was to remain for the rest of his life, except for several stays in other countries, notably in North and South America. In Zurich, no later than 1929, he began to hold séances in which he was the medium. Then, in 1932, he began to study under the guidance of the celebrated graphologist Max Pulver, to the point of eventually becoming himself a highly respected graphologist. In the same period he also studied psychology at the *Institut für Angewandte Psychologie* (Institute for Applied Psychology), where in 1938 he began

to give lectures on psychic phenomena and on the theoretical foundations of Yoga. He continued this activity for many years. From 1949 to 1962 he busied himself intensively with psychoanalysis. He trained for a career as a psychoanalyst under Oskar Pfister, and afterwards enjoyed great success with his own practice as a psychological consultant in Zurich. He authored poems, a few articles, and essays, some of which have remained unpublished (they are preserved in the archives of his library).

Unlike many mediums, Schlag was a very cultivated man, particularly in history of Western and Eastern religions, and more specifically of esoteric currents. From the early 1930s on, he began to create a superb library of his own, which expanded over the years to *ca.* 26.000 books, and must be considered one of the three richest European libraries in the domain of Western esotericism. After his death, it was made over to the Zentralbibliothek in Zurich and is now open to the public. It is still located in his house, where its holdings are preserved as well. In collaboration with the Zentralbibliothek, the Oscar R. Schlag Foundation (created in 1990), also in Zurich, is responsible for the maintenance of both these holdings and the house. Schlag's importance in 20th century Western esotericism is not only due to his activity as a collector of books, for he was himself a practicing esotericist as well. His connections to numerous initiatory societies, in particular to the → Ordo Templi Orientis (OTO, of which he was, however, not a member), are well documented. His posthumous renown as an esotericist results largely, however, from the publication (as of 1995) of the *Lehren*, or *Unterweisungen* (Instructions), transmitted from 1929 on during weekly séances in Zurich by an entity that presented itself under the name of Atma, and was "channeled" by Schlag. The first ones were written down by a participant during these séances; but as soon as it became technically possible they were recorded on disks and typed out afterwards. Among the early participants, most of whom were reputable scholars and scientists, were Fritz Allemann (a member of the Eranos group), the psychologist and Art historian Rudolf Bernoulli (who lectured at Eranos in 1934) and his wife Katharina, the psychiatrist and parapsychologist Eugen Bleuler (→ Carl Gustav Jung's superior at the clinic Burghölzli), and Max Pulver. Carl Gustav Jung himself participated in one of these séances, resulting in a long recorded conversation between him and Atma (see *Die Lehren des Atma.*, I, 14. November 1930). This original group of participants dwindled after a few months, and was eventually reduced to the Bernoullis and Alle-

mann. But the séances continued to be held almost every week throughout the 1930s, and more sporadically afterwards (some took place even as late as the 1960s). The typescript of all these sessions consists of many thousands of pages, starting on September 20, 1930.

Atma's provenience and ontological status remain obscure. In his statements about himself, he occasionally suggests he might be an "egregor" (i.e., a product of the participants' collective psyche), but more often he presents himself as an entity of divine nature. His Instructions constitute a kind of never-ending story or dream, with beginning nor end. As his inspiration goes, he dwells and comments on a great variety of symbols, themes and myths for a while, then suddenly leave them for others, only to take them up again later. He extensively deals with → alchemy, kabbalah [→ Jewish Influences], the → Tarot, Egyptian and Greek mythology, Buddhism, Hinduism, and last but not least a great variety of Yoga theories and practices. He does so in a way that very much reflects the literature of the period. Written in a German not deprived of some moments of poetic beauty, these texts are always characterized by a "noble", oracular style.

Interestingly, during the first séances (1929/1930), another entity made its appearance as well. It went by the name of Cyprian, referring to a person who had allegedly died many years before. This spiritualist aspect was no longer present after Cyprian had left the stage. Taken as a whole, the "Instructions" are anthropocentric in character (i.e., almost devoid of cosmogonical or cosmosophical elements), dealing mostly with the development of human potentialities for the benefit of the individual person, by means of initiatory techniques. In this respect, the séances with Atma belong to the forbears of the so-called channeling literature that was to flourish within the → New Age movement as of the 1960s. In 1946, Atma stated that the Instructions he had been giving for so many years now represented a body of material from which benefit could be drawn also by people outside the group. In response to this, the Instructions are now in the process of being published.

ANTOINE FAIVRE

Schneider, Joseph Anton → Bô-Yin-Râ

Schneiderfranken, Joseph Anton → Bô-Yin-Râ

Schubert, Gotthilf Heinrich von,
* 26.4.1780 Hohenstein-Ernstthal,
† 30.6.1860 Munich

The son of a Saxon pastor, Schubert attended lyceum at Weimar, where he followed the courses of J.G. Herder (1744-1803). The work of this great thinker would play a decisive role in the development of Schubert's philosophical thought. He studied theology in Leipzig before turning to medicine and the natural sciences. A deep faith inherited from his Pietist education [→ Pietism] combined with a veritable passion for science would mark the rest of his life.

An authentic theosopher [→ Christian theosophy], Schubert never ceased to refer to the fundamental importance of the "two books": the Bible and Nature. Throughout his life, he sought to make these two "readings" coincide in his publications. Through his openness to the ideas of his age, and also through his vocation as a teacher and writer, he helped promote the philosophical theses of → Schelling, with whom he studied in Jena from 1801 to 1803, and the original intuitions of the physicist → J.W. Ritter.

After following A.G. Werner's (1749-1817) courses in mineralogy and "geognosis" at the Academy of Mines in Freiberg, Saxony, he contin-

ued his scientific activity in Dresden, where he played a central role in a circle of Romantics [→ Romanticism] that included Adam Müller (1779-1829), Heinrich von Kleist (1777-1811), and the painter Caspar David Friedrich (1774-1840). It was in this context, during the winter of 1807-1808, that Schubert gave his famous lectures entitled *Ansichten von der Nachtseite der Naturwissenschaft* (Views of the night-side of natural science). In his speculations on somnambulism, → animal magnetism, seership, and dreams, Schubert tried to restore the link that he believed had once existed between man and the universe. He gave attention to the → correspondences uniting the One with the All, and discovered in *Sehnsucht* (nostalgia) a thread of continuity that could be traced through the whole of creation.

Published in 1808, these lectures reached a vast audience and had considerable success. After his nomination in 1809 as director of the Nuremberg lyceum, Schubert discovered the world of the mystics and theosophers by reading the works of Meister Eckhart (1260-1327), → Jacob Boehme, and → F.C. Oetinger. These years were decisive for the evolution of his philosophical and religious thought. His meeting with → Franz von Baader definitively turned him toward the theosophy of → Saint-Martin. In 1811, Schubert translated the "Unknown Philosopher"'s *De l'esprit des choses* (On the spirit/mind of things). Saint-Martin's → illuminism marks most of Schubert's subsequent writings, especially *Die Symbolik des Traumes* (Symbolism of the dream, 1814). In this highly successful work, which was reprinted eight times, Schubert expounds a veritable metaphysics of the dream and unconscious states. Thanks to the principle of analogy he believed to have discovered that dream, poetry, revelation, and myth have in common a universal, inner language that has its source in the night-side of the soul. The myth of the Fall explains the disappearance of the original harmony, while animal magnetism makes it possible to re-establish the unity between conscious life and unconscious activity.

In 1819 Schubert was appointed as professor at the University of Erlangen, where he taught mineralogy, zoology, and botany. His career culminated in 1827 in his appointment at the University of Munich, where he found Schelling, Baader, and Görres (1776-1848) at his side. King Ludwig I of Bavaria entrusted the education of his sons to him, and bestowed the "von" on his name. Schubert gave courses in anthropology and psychology, while expounding his philosophical system in a work of over 1000 pages, *Geschichte der Seele*

(History of the soul, 1830). In this book, which he considered his major work, Schubert set himself the task of discussing human nature and its connection with the material universe as well as the spiritual world. His esoteric understanding of life allowed him to connect the human soul with the world soul, 'this spiritual link that maintains the cohesion of the sensible world'. He assigned to psychology the task of describing the progress of the soul, in nature and man, on its way toward God.

Schubert's works were extremely successful among the Romantics, and inspired many writers. Heinrich von Kleist, E.T.A. Hoffmann (1776-1822), → Justinus Kerner, and later F. Hebbel were profoundly influenced by them. Quite original in his thought, nourished by esotericism, and marked by speculative → mysticism, Schubert never tired of investigating the vibrations of nature and the messages of the unconscious. His work fits well within the grand tradition of Western theosophy that goes from → Paracelsus to → C.G. Jung. A major representative of *Naturphilosophie*, Schubert appears – with → Mesmer, C.G. Carus (1789-1869) and others – as a precursor of psychoanalysis.

PATRICK VALETTE

Schuon, Frithjof (also known as Shaykh 'Isâ Nur al-Dîn Ahmad al-Shâdhilî al-Darqâwî al- 'Alawî al-Maryamî), * 18.6.1907 Basle (Switzerland), † 5.5.1998 Bloomington, Indiana (USA)

Swiss esotericist and Sufi master [→ Neo-Sufism] whose personal life was complex and whose substantial corpus of metaphysical writings ranks among the most clear, profound, and gifted ones produced by any similar author in the 20th century. Schuon was born of German Roman Catholic parents. His father was a violinist and poet, described by Schuon as highly gifted but a dreamer. His mother was apparently the opposite. Schuon's affinities were clearly with his father, who influenced him greatly. He describes him as strongly inclined toward the esoteric and the mystical; he maintained a small, darkened room in the family house, probably for meditation, that contained nothing but a table with copies of the Hindu *Vedas* and the *Qu'ran*. It was in this Germanic childhood environment of esotericism, mythology, and poetry that Schuon lived his formative years, attending school with his life-long friend Titus Burckhardt, until his father's death in 1920. Thereafter he, with his brother and his mother, moved to Mulhouse, France, just across the border from Basle. Schuon was thrust abruptly from German into French culture; he was enrolled at a French school and became a French citizen, while simultaneously attempting to adjust to his father's death. After a three-year period of depression and melancholy, Schuon left school and found employment as a textile designer. It was also during this time that he briefly joined the Roman Catholic Church; but while his brother went on to become a monk, Schuon soon left the Church again, considering its perspective too narrow. In 1924 he discovered the works of → René Guénon, which had a significant impact upon his life, confirming his youthful perceptions and inquiries into the inner life and esotericism.

In 1928 Schuon joined the French Army. He spent 18 months at Besançon, which he later

remembered as a period of boredom as well as stress. He thereafter relocated to Paris, where he again worked as a textile designer. He remained in Paris for two years, immersing himself in the arts and other forms of cultural expression, and began to study Arabic. In 1932 he left Paris for Algeria: his first visit to a “traditional” society. Here met Sheikh Ahmad al-‘Alawī to whom he would come to refer as his spiritual master. Following this, Schuon assumed the Arabic name ‘Isā Nur al-Dīn.

After his return to Europe he divided his time between Paris, Basle, and Lausanne. From 1932 to 1939, Schuon made other trips to Algeria and Morocco, and two separate trips to Cairo in 1938 and 1939 to see René Guénon. After the last trip he sailed with two of his disciples to Bombay; but the eruption of World War II forced him to return to France. Schuon again joined the French Army, but within months was captured by the Germans, who sought to make him join the German Army. He escaped and fled to Switzerland, where he would remain until 1980, when he relocated to Bloomington, Indiana, in the United States.

During the forty-year period from 1940 to 1980, Schuon wrote many of his seminal works on metaphysics. He gradually shaped his Sufi *tariqa*, which he named *Maryamiyah*, of which he was the *sheikh* or spiritual master, and into which he initiated several hundred men and women. Around 1946 he parted ways with Guénon over a dispute regarding the efficacy of the Christian sacraments, and a number of disciples left the Schuon *tariqa* to join Guénon’s group. In 1949 Schuon married one of his disciples, a German Swiss woman named Catherine Feer. Following the deaths of Ananda K. Coomaraswamy in 1947 and René Guénon in 1951, Schuon gradually assumed the role of the premier expositor of the *philosophia perennis* [→ Tradition] and leader of the Traditionalist school which the two had started. Also during this forty-year period Schuon and his wife traveled extensively, including several trips to the United States, where they visited and were ceremonially initiated into the spiritual practices of the Crow and Sioux Indians.

In 1980 Schuon and his wife left Lausanne and moved to Bloomington, where a community of disciples took shape at Inverness Woods. Schuon assumed the role of resident spiritual master; and a publishing house, World Wisdom Books, was established to publish and promulgate his writings. In 1991 Schuon was indicted by a Monroe County grand jury on several counts of child molestation and sexual molestation. This stemmed from a practice peculiar to his *tariqa*, which Schuon called “primordial gatherings”, in which group nudity

and sexual symbolism played key roles; they are described in his autobiography under the heading “Sacred Nudity”. All charges were eventually dropped, but the *Bloomington Herald-Times* had run nearly a dozen stories on the affair, and a French Guénonian group antagonistic toward Schuon established Internet websites using these stories to further accusations against him as being a cult leader. The affair was reportedly demoralizing for Schuon, and was a sad episode at the end of his otherwise brilliant career as the foremost expositor of the *sophia perennis* in the late 20th century. Schuon died in 1998 without producing another major book.

Schuon was a prolific author whose published corpus contains scores of books and articles, the complete list of which appears in *Religion of the Heart* (p. 299) cited hereafter. What follows is a list of Schuon’s principal works in their first English translation, with the year of original French publication in brackets where applicable. *The Transcendent Unity of Religions*, London: Faber & Faber, 1953 [Paris: Gallimard, 1948] ♦ *Spiritual Perspectives and Human Facts*, London: Faber & Faber, 1953 [Paris: Les Cahiers du Sud, 1953] ♦ *Gnosis: Divine Wisdom*, London: John Murray, 1959 [Paris: La Colombe, 1957] ♦ *Castes and Races*, London: Perennial Books, 1982 [Lyons: Paul Derain, 1957] ♦ *Stations of Wisdom*, London: John Murray, 1961 [Paris: Buchet/Chastel, 1958] ♦ *Understanding Islam*, London: Allen & Unwin, 1963 [Paris: Gallimard, 1961] ♦ *Light on the Ancient Worlds*, London: Perennial Books, 1965 [Paris: Editions Traditionnelles, 1965] ♦ *Logic and Transcendence*, New York: Harper & Row, 1975 [Paris: Editions Traditionnelles, 1970] ♦ *Islam and the Perennial Philosophy*, London: World of Islam Publishing Co., 1976 ♦ *Esoterism as Principle and as Way*, London: Perennial Books, 1978 [Paris: Dervy-Livres, 1978] ♦ *Sufism, Veil and Quintessence*, Bloomington: World Wisdom Books, 1981 [Paris: Dervy-Livres, 1980] ♦ *From the Divine to the Human*, Bloomington: World Wisdom Books, 1981 [Paris: Le Courrier du Livre, 1981] ♦ *In the Face of the Absolute*, Bloomington: World Wisdom Books, 1989 [Paris: Le Courrier du Livre, 1982] ♦ *Survey of Metaphysics and Esoterism*, Bloomington: World Wisdom Books, 1986 ♦ *Having a Center*, Bloomington: World Wisdom Books, 1990 [Paris: Maisonneuve Larose, 1988] ♦ *Roots of the Human Condition*, Bloomington: World Wisdom Books, 1991 [Paris: La Table Ronde, 1990].

Schuré, Edouard, * 21.1.1841
Strasbourg (Bas-Rhin), † 7.4.1928 Paris

Schuré came from the Lutheran Protestant bourgeoisie of Strasbourg, his mother being the daughter of a university professor and the granddaughter of a pastor. His education, in French and German, was thorough but austere and conventional. Having passed through the faculty of Law, he traveled from one university to another, as customary in his days; thus he spent some time in Heidelberg, Bonn, Berlin, and Munich. He was a great admirer of → Goethe and Nietzsche, with whom he exchanged letters (a chapter of *Précurseurs et révoltés* [Precursors and rebels], 1904, is devoted to him); and as one of the first persons in France – along with → Péladan – to recognize the genius of Wagner, he became a habitué of Bayreuth. His *Le Drame musical: Richard Wagner, son oeuvre, son idée* (The music drama: Richard Wagner, his work, his idea, 1875) was reprinted several times. A taste for the intellectual and social life of Paris also marked his personality. He frequented the fashionable spiritualist salons [→ Spiritualism], especially the one of the very wealthy Lady Caithness (1832-1895), a “Christian” theosophist and dissident member of the → Theosophical Society of → Madame Blavatsky. The whole occultist [→ occult / occultism] world passed through this salon, together with liberal Protestants and spiritualist feminists like Emilie de Morsier (1843-1896), whose principles Schuré supported. He chose to write in French, despite pressures from the German side, then opted for French citizenship after the annexation of 1871. But it was in Italy that he found his road to Damascus, in another literary and aristocratic salon: that of Margarita Albana-Mignaty in Florence. Margarita, of Greek origin, inspired a hopeless passion in him and would remain his inspiration until his death, regarding both the feminist question and his vision of the origins of mankind and the fundamental unity of religions. He paid a biographical homage to her in *Femmes inspiratrices et poètes annonciateurs* (Inspiring women and prophetic poets, 1908), where one finds her in the company of Cosima Liszt, Mathilde Wesendonck, and Malwida de Meysenber. Among the “poets” referred to in this title was the esotericist → Saint-Yves d’Alveydre, whose mediocre poetry Schuré esteemed and who also inspired Schuré’s vision of a global history, conceived of as starting with the “cycle of Ram”, the mythical founding hero from India. Saint-Yves had used → Fabre d’Olivet, another one of Schuré’s principal sources; but these two influences ended

up producing in Schuré’s mind a very simplistic vision of global spiritual progress, leading from Ram to Krishna, Orpheus, Pythagoras, → Moses, and Jesus Christ. This genealogy was offered to the general public in *Les Grands initiés* (The great initiates, 1889). The immense success of this work has persisted through innumerable editions, continuing up to the present day. Another work that strongly contributed to the development of Schuré’s ideas was *The Perfect Way* (1887) by → Anna Kingsford, whose French edition (1891) he prefaced. Schuré’s “progressivism” was based on his belief in a hidden motor of history: the permanence of the esoteric tradition, ageless and common to all peoples. Buddha and Mohammed were missing from the fresco of the *Grands initiés*, which was further modified in *L’Évolution divine: Du Sphinx au Christ* (Divine evolution: From Sphinx to Christ, 1912). These modifications were inspired by Schuré’s meeting with → Rudolf Steiner in 1905: Schuré henceforth insisted that the chain of “great initiates” culmination in a cosmic Christ, conceived (after the fashion of *The Perfect Way*, and also in line with a tradition common in 19th-century theological thought) as inheritor of the Greek Eleusinian Mysteries. Mystical union through gnosis marked the higher spiritual state of man, according to Schuré, who reproached the Church for having confiscated Christ. Yet before his death he returned to the Lutheran faith.

Le Drame musical, Paris: Sandoz et Fischbacher, 1875

JEAN-PIERRE LAURANT

Schwaller, René Adolphe (called de Lubicz; pseudonym Aor), * 31.12.1887
Asnières (France), † 5.12.1961 Grasse (France)

This occultist writer, Egyptologist, and founder of spiritual brotherhoods was of Alsatian origin,

his pharmacist-chemist father having set up practice in Strasbourg. René aspired to be a painter and was a student in Henri Matisse's atelier in Paris. Under the pseudonym of "Aor" he was an active member of the → Theosophical Society, and it was at a lecture in the Adyar Hall of the Paris Theosophical Society, in 1915, that the decisive encounter took place between him and → Oscar de Lubicz Milosz. In 1917 the Baltic poet was fascinated by Schwaller's publication of a booklet on → Number Symbolism, which expounded a vitalist conception of their extension, beginning with the "irreducible one", which supposedly provided the key to the birth of the universe. Milosz was so struck by it that his destiny remained linked with Schwaller's until 1926, and even went so far as to adopt him: Schwaller was thereby authorized to join to his surname the noble name of "de Lubicz" and use the Lubicz coat of arms.

There followed the foundation of a chivalric order called the "Veilleurs" (Watchers), which had a hierarchical structure and a secret inner circle. As founding members, the journalist Fernand Divoire (1883-1951) and the writers René Bruyez (1886-1969), Carlos Larronde (1888-1940), and Gaston Revel (1880-1939, a leading figure in French Theosophy) joined with some of the great names of Parisian literary and artistic circles, from Vincent d'Indy (1851-1931) to Henri de Régnier (1864-1936). The group was inspired by the ideas of Charles Fourier and the Saint-Simonians as revived in → Saint-Yves d'Alveydre's dreams of "synarchic" unity; it published a successful periodical, *L'Affranchi* (The Emancipated). However, its existence was marked by journalistic attacks, of such virulence that Schwaller eventually left Paris, in 1922, for the Engadine region of Switzerland. Here a closed community called "Suhalia" functioned as an "initiatic monastery" until 1927.

Schwaller broke with Milosz in 1926 due to the incompatibility of their respective illuminations, especially concerning Milosz's Christian interpretation of → alchemy (see his *Ars Magna*, 1920). Thereupon Schwaller cruised the Mediterranean by yacht, thanks to the generosity of a disciple, Jeanne (Isha) Lamy. In 1927 she became his wife, and in turn received a revelation, concerning the secret meaning of the Egyptian hieroglyphs. The Schwaller de Lubicz couple now founded a "Groupe de Louqsor" (Luxor Group) with the support of the Egyptologist Alexandre Varille (1909-1951). Their study of the proportions of the temples of Luxor and Karnak and of the Pyramids, combined with a new decipherment of the best-known stelae, gave rise to a series of publications

on the sacred symbolic language; the latter was supposed to furnish the key to the relationship between the "temple of stone" and the "temple of man", with the Pharaoh as the model of the initiate and perfect man. The Schwallers' enterprise belongs to an old tradition of attempts to find the origins of knowledge. After William Warburton (*The Divine Legation of Moses*, 1738) and the Abbé Terrasson (*Sethos*, 1767), the occultists [→ occult / occultism] of the 19th century had taken up the idea – already present in Plato's *Phaedrus* – of looking to ancient Egypt for the key to all the sciences, and the Schwallers were trying in their own way to adapt it to the scientific language of their time. Their teachings have remained widely known in Parisian esoteric circles up to the end of the 20th century, and are often associated with those of → Fulcanelli.

JEAN-PIERRE LAURANT

Scientology

Scientology is a religious philosophy and a set of ritual practices partly based on Dianetics, a "do-it-yourself-therapy" developed by the American adventurer, philosopher and science fiction writer L. Ron Hubbard in a number of articles and, exhaustively, in the book *Dianetics: The Modern*

Science of Mental Health published in 1950. The first Church of Scientology was founded in Washington, DC in 1955.

Lafayette Ron Hubbard was born in Tilden, Nebraska on the 13th of March, 1911, as the son of a naval officer and a teacher, Harry Ross and Ledora May Hubbard. According to the extensive hagiographical tradition of Scientology, from his very early years he was brave and outstanding for his age, and eagerly interested in different cultures, people and customs, including various Indian traditions; as a twelve-year-old he was introduced to the teachings of Sigmund Freud which, it is emphasized, left him with many unanswered questions. Due to his father's naval career, he was given the opportunity to travel through the East, where he became familiar, so we are told, with the cultural and religious traditions of China, Japan, Guam, the Philippines and other areas of the Orient. Although keenly interested in everyone and everything he met on his way, he concluded that no Eastern tradition of wisdom had found the answer to Man's basic problems of suffering, misery and despair. This was a great disappointment. According to Scientology sources, in 1929 he returned to formal education in Manassas, Virginia and Washington DC and was enrolled at George Washington University in mathematics and engineering.

From this time on, Hubbard devoted himself to a series of quasi-scientific studies and experiments in order to "solve Man's problem", while providing for himself and his family as a science fiction novelist. The science fiction milieu, including the circles around the magazine *Astounding Science Fiction* and its editor John W. Campbell, Jr., who became a key figure in promoting Hubbard's ideas, consisted of all kinds of intellectuals and scientifically-trained individuals such as astronomers, chemists, doctors and engineers. The articles written and read by these people in *Astounding* not only reflected an interest in science fiction or related subjects such as extraterrestrial life, weapon development, space research and developments in technology. The magazine also published many articles on alternative medical practices, psychology and occultism [→ occult/occultism]; in many ways the milieus surrounding the magazine were similar to the environment, ideas and practices that would later be referred to as the → Human Potential Movement and → New Age. Dianetics and, later, Scientology were therefore both developed as part of a living Western occult tradition where ideas were exchanged within a freethinking and creative subculture. In the mid-forties, Hubbard was also very briefly in contact with Jack Parsons,

the head of → Aleister Crowley's → Ordo Templi Orientis (O.T.O.) in Pasadena. However, trivialities apart, no specific influence from Crowley can be traced in Hubbard's later teachings in terms of Scientology.

By the end of the 1940s, editor Campbell got interested in Hubbard's new therapeutic system, Dianetics; and prior to the big release of *Dianetics: The Modern Science of Mental Health* on the 9th of May, 1950, Campbell wrote an enthusiastic foreword to an article, 'The Evolution of a Science', published in the May volume of *Astounding*. The decision to release Dianetics to a broader public of lay readers seems to have been connected to the fact that Hubbard and his co-worker at that time – medical doctor Joseph A. Winther, who had moved to Bay Head, New Jersey to take part in Hubbard's work (having become familiar with it through Campbell) – had not succeeded in breaking through to the American Medical Association or the American Psychiatric Association. These early rejections seem to have played a crucial role in Scientology's later polemics, which have continued until the present, against the medical and psychiatric establishment worldwide, and have contributed to Scientology's self-understanding as a religion that promotes the truth that mainstream science and society at large refuse to recognize.

According to *Dianetics*, Man is suffering from powerful mental and psychosomatic traumas because of the function and structure of the mind. The human mind, according to Hubbard, is subdivided into three minds, the analytical mind, the reactive mind and the somatic mind. While the latter serves as the body's tool in acting out the decisions and impulses from the two other minds on a physical level, the analytical mind is described as a perfect computation system that will always make the best decisions by means of analyzing the available data in the memory bank. However, in every incident in a person's life that involves just a minimum of physical or mental pain, the analytical mind shuts down and the reactive mind takes over. And this is where the trouble begins. In the reactive memory banks of this mind, "engrams" are stored. Engrams are Hubbard's conceptualization of memory units that involve pain. These engrams are, in part, reactivated every time a person meets a situation that is just remotely similar to the incident that originally caused the engram to be stored in the bank. This function, Hubbard claims, is the cause of all kind of irrational ("aberrated") action and psychosomatic illness. In *Dianetics* Hubbard fully developed these ideas, and presented a practice designed to eliminate the harmful influence of

the engrams and the reactive mind: the Dianetics therapy called “auditing”.

Soon after, Hubbard took his ideas and his therapeutic practice beyond the materialistic limitations of early Dianetics, and from 1951 he began to transform his therapy into a fully developed soteriological religious system, by including in his system metaphysical ideas and “axioms” about the individual and his or her spiritual character and potential as well as about the cosmos at large. In 1954 Hubbard announced that what was initially a therapy, Dianetics, had now become transformed into a religious system in its own right. The new religion was named Scientology (from Latin *scio*, to know and from Greek, *logos*, word or thought; i.e. knowing about knowing or the science of knowledge).

From the very beginning, Hubbard was inspired and influenced by science, religion and various occult traditions and other conceptual systems. Like many of the religious activities later found in the New Age Movement, Hubbard, in developing Scientology, was blending secular and religious inspirations: on the one hand his perspective reflects a critique of established science, while on the other he considered his inventions scientific and he had scientific ambitions for his creations – without ever really exhibiting a scientifically valid understanding of the premises of science. At the same time, although already at an early stage he criticized older religious traditions, e.g. Buddhism, for not being capable of solving the problems of Mankind, his system nevertheless reflects Buddhist, Hinduist as well as Gnostic ideas [→ Gnosticism]. Hubbard presented Scientology as true science as well as true religion, the latter in the sense of “wisdom”, as also done by present-day scientologists.

The basic idea of Scientology is that man is a composite being of body, mind and spirit. The most important unit is the spirit, i.e. the true individual, called a “thetan”. The basic problem is that in a very early stage of their development, thetans were led to believe that they were dependent on the physical universe, and thus on bodies, in order to function on this planet. Scientology aspires to teach its practitioners how to gain the gnosis that the thetan is not dependent upon anyone or anything in the physical universe, and is capable of taking control over himself and the events in his or her existence. Each thetan or individual has existed through an endless amount of incarnations on this planet and others, during hundreds of millions of years, and every single incident occurring to each and every body throughout this mytho-evolutionary history determines who a person is now, how he or she is feeling, and how he or she is functioning both phys-

ically, mentally and spiritually. Each incarnation has left the thetan with certain types of karmic experience, which are still present on his or her “timetrack”. Through the ritual practices (“auditing”) and courses of Scientology, a person can reach insight about these matters and ritually confront his or her mythological past, thereby improving his or her happiness, relationships, physical condition and individual spiritual truth.

Scientology is a practical and non-dogmatic religion in that the ideas developed by Hubbard from 1950 to his death in 1986 are not seen as truths that must be unconditionally accepted by each individual scientologist. The truth is “what is true for you”. On a theoretical level, this rhetoric implies the idea that the scientological practice is thought to work for everyone no matter how the person’s conceptualizations of the world might be. On a practical level, however, obviously individuals engaged in the soteriological ritual practice of Scientology find the resources for their own individual stories in the reservoir made up of the extended Hubbard material. Therefore, in practice, being a scientologist does not imply seeking high and low for theological elements fit for one’s own construction of meaning but, rather, consists in integrating the Hubbardian truths in one’s own life. It is a very individual matter how far this integration is taken, but three things seem always to be present in scientologists’ conceptualizations, e.g., the idea that a person is a spiritual being, the idea of the timetrack, and the appreciation of Hubbard’s outstanding qualities as a human being. Still, it is very individual how reflective scientologists are. Many do, in fact, seem to apply the principles of Hubbard in their practice without speculating on their truth value. Practice is the central issue; gnosis is individual – although certain incidents on the timetrack, according to Scientology, have turned out to be common to all people.

Scientology offer its practitioners a salvational path to individual enlightenment, the “Bridge to Total Freedom”, and each practitioner moves up through the extensive soteriological hierarchy through a long series of initiations in a codified prescribed sequence. The goal is to move the individual to higher and higher states of consciousness and orders of existence towards the ultimate enlightenment. Furthermore, the intention is to make the person capable of existing without the deplorable dependence upon the body and the physical universe. The gnosis presented by Hubbard is legally protected by an organization known as Religious Technology Center. This unit, within the complex system of Scientology branches, owns all trade-

marks and servicemarks of the world and licensing of his teachings, so as to ensure that no other church, mission or person is using ritual techniques that are not a hundred percent in line with Hubbard's original teachings and instructions.

Because of the nature of its worldview, Scientology can be seen as belonging within the domain of Western esotericism. However, Scientology can also be called "esoteric" in the sense of "secret religious tradition", for at least three interrelated reasons. First, its soteriological system is considered to gradually initiate the individual into higher and higher states of awareness and gnosis. Without these initiations there can be no progress and no salvation. Second, the soteriological hierarchy is constituted by several steps of which the upper levels, called the OT levels (OT meaning Operating Thetan), are considered harmful to persons with no suitable initiation. The steps must be taken in the correct sequence and persons already initiated cannot speak to others about their ritual experience. Although it is known in Scientology circles that the truths revealed in several of the OT levels are obtainable in Hubbard's publications available to all scientologists, for instance *Scientology: A History of Man* (1952), discipline and selfdiscipline are supposed to prevent scientologists from trying to obtain the gnosis outside the context of the ritual initiations. Third, it is not only the presence of specific secret teachings and rituals that makes the religion esoteric. The system of guidance and maintenance of the religious secrets not only demarcates initiates from not-yet-initiates within the religion itself, but also implies that the religion holds certain religious truths that can never be obtained by outsiders. Esotericism in the sense of → secrecy is therefore an important tool of power not only inside the religious organization but also in Scientology's relations to the surrounding world. This lack of transparency and its distinctive secretiveness is one cause for the accusations Scientology has faced in the public sphere over the years. Still, it is clear that it is an important element in Scientology's self-perception that Scientology is protecting the truths, gnosis and the road to freedom discovered and systematized by Hubbard while, at the same time, protecting individuals from seeking this knowledge without being properly prepared.

During the Church's fifty years of history, the atmosphere between the church and its surroundings has been tense. A number of individuals, e.g. former scientologists and their families, have taken the church to court because of financial controversies or due to accusations of abuse, for instance in regard to contracts. The Church, in turn, has taken

individuals to court on accusations such as e.g. infringement of copyright on secret documents. Furthermore, several countries, e.g. Germany, have run campaigns not only against the church but also against individual scientologists because of a fear of what is perceived as the totalitarian character of the organization. These court cases and governmental attacks on the church have been supported by massive media campaigns throughout the Western world not only in regard to the specific actions taken by the governments and other institutions but also, on a more general level, because of a general distrust of what is considered a totalitarian multinational that is accused of harassing individuals in and outside the Church, of tiring out its critics, and of publicly throwing suspicion on any individual who does not sympathize with church practice. The secrecy surrounding the soteriology of the Church seems to contribute to this tense atmosphere.

Today Scientology is present on all continents, in more than 145 countries. The Church estimates that 8 million people worldwide are using Hubbard's religious and therapeutic techniques one way or the other. Not all of these people are devoted members, however. Most of them are clients that buy books and take courses, and go through rituals on a regular basis without considering themselves scientologists. The estimation of the Church includes all individuals that are on the scientological mailinglists, and it might be fair to estimate that no more than one million people are in fact active scientologists worldwide.

1. INTRODUCTION 2. SECRET KNOWLEDGE 3. SECRET ACTS 4. SECRET IDENTITIES

1. INTRODUCTION

The only fruitful way to study secrecy in ancient cultures and religions is to study it as a social phenomenon. The private secrets of individuals, that is knowledge of facts kept hidden from everyone (for example a woman who hides from her husband the fact that the child she is bearing is not his), are not only lost to us forever, but also do not really constitute a subject that could be analysed profitably. That is why, following a lead from the German sociologist Georg Simmel, secrecy in antiquity as an object of study is most often said to have a “triadic” nature: the three activities of “concealing”, “keeping hidden” and “revealing” knowledge involve, in turn, at least three parties: two people who share the secret and a third party, the ones who do not know it.

Secrecy in social life is a double-faced phenomenon. It is in many cases socially and psychologically productive and produces feelings of identity and belonging among those who share the secret, but it can also be disruptive to the point of annihilating social structures, such as family relations or political alliances. As a concept, both insiders and outsiders exploit it: those who guard a secret may use it to increase their personal prestige or to make their group seem more attractive, whereas outsiders can launch the suspicion of subversive secrecy to mobilise feelings of rage among those excluded, and use it as a weapon against opponents or to divert attention from their own activities.

All ancient religions were characterised by a certain amount of secrecy. Certain restrictions could apply to parts of the temple; there were rituals without any human audience, featuring only the god and his priest, and knowledge and texts could be kept out of reach from all but a few trusted ones. A few further distinctions must be made here, before we can analyse the concept and the working of secrecy in the ancient world.

In the first place, secrecy is connected with publicity and with accessibility, in other words, with

tradition. If it is about excluding and including, about handing down knowledge, texts, or rituals to a privileged person or group, the secret needs to be capable of being transmitted. There is a wide gap between secrecy on the one hand and → mysticism on the other, in the sense that secrets can be articulated, accessed and transmitted, with severe restrictions, whereas mystical experiences, including the emotional impact of secret acts, defy formulation. The ineffable may be a private secret; it is not a social one and must be treated elsewhere.

In the second place, there are numerous cases of supposed secrecy, which on closer inspection turn out to be something else. If outsiders are excluded from witnessing certain rituals, because the place where these rituals are performed, the dwelling place of a god, must be protected from pollution (as is the case in Zoroastrian fire-temples or in the two holy cities of Islam), this does not automatically characterise these rituals or places as secret. On the contrary, the rituals may be witnessed in priestly schools, where they are being taught to students, elaborate descriptions of these rituals and places can be found in priestly and scholarly literature and all “insiders” are welcome to observe and tell about them in every detail. Characterising such rituals as secret betrays a typical “third party” point of view, but is incompatible with the intentions of the other two parties.

We know both more and less than people in antiquity. We know more, because we can dig up ancient sites and structures that would have been closed to the majority of the population in antiquity. We know something, for example, of the layout of the cult-places of the god Mithras (*mithraea*), which were hidden from sight in the ancient world, and we can study Mithraic art that was hidden in these sanctuaries. We can study papyri and texts that would have circulated only among a few privileged members of a guild or a religious association. That we know less is obvious: secrets that were transmitted orally, including the interpretation of Mithraic art, for instance, are lost to us, together with the vast majority of texts, locations, and artefacts. Our knowledge is restricted not by codes of secrecy, for there would be no one to enforce them, but by the vicissitudes of history. What we know or can reconstruct, can be treated here under three headings: secret knowledge (texts, names, myths and their explanations, etc.); secret acts (chiefly rituals); and secret identities.

2. SECRET KNOWLEDGE

To be able to speak of “secret” knowledge, we must first tackle its opposite, the “public” nature of knowledge in antiquity. Estimates of literacy rates

for any ancient culture rarely rise above ten percent. This means that “published” works in writing were inaccessible to the vast majority of the population. In the political processes, including deliberations on government and justice, only a few (for instance, local, free-born men of a particular social background) could participate. Practical knowledge in crafts and trade was passed on in the family or in guild structures. Education, again, was most often neither public nor free and for many people either impossible to reach or undesirable. In religious matters, the situation was not much different. The primary *locus* of religious socialisation was the family. Those who chose religion as their vocation or were destined for a job in a religious organisation were taught their rituals and other practical knowledge by their older colleagues in a style not unlike the tradition of craft knowledge. There is a striking difference between the ancient civilisations of the Near East and Egypt on the one hand and the institutions of the ancient Greeks and Romans on the other. In Mesopotamia, in particular, priesthood was often a lifelong vocation, involving enormous amounts of study, both in order to be able to perform the required rituals and to acquire a solid grounding in theology and literature. In Greece and Rome, by contrast, priesthood was rarely associated with learning in this sense. Priesthoods were often honorary positions that did not preclude other vocations, required little formal training and were rarely associated with the transmission of more knowledge than was required for the performance of one’s duties. It is not surprising, therefore, that the concept of “secret knowledge” received a much greater emphasis in the context of the religions of the Near East than it did in the context of the public religions of the Greeks and Romans, even though in both clusters of civilisations, religion was very much a state affair.

Among the Greeks, the concept of secret knowledge gained more currency in small-scale groups of a teacher with his pupil(s). In these groups, exemplified by Pythagoras and Empedocles, for instance (or what the tradition made of them), knowledge was passed on that was felt to contain truths about reality that not every mortal was able or entitled to find out. Among a range of options in restricting access to that knowledge, the most common features are preparatory purifications, certain prescriptions for the style of living (e.g. dietary rules) and formal or informal teaching, following which the hidden truths were destined to be perceived or experienced by the pupil. The question whether this knowledge was considered too sacred to reveal to those who were not properly prepared or was thought to be beyond the reach of those without

the initial stages of purification and instruction, seems to be a modern preoccupation. The common ground between the two is the factor of experience: the knowledge revealed transforms the person who receives it. To hand it out to those without preparation was not seen as offensive as much as it was pointless: it would not work. This, at least, seems to apply to the often-encountered injunction to keep things secret in the history of Platonism, whose texts frequently stress the fact that people may laugh at the knowledge that is being handed down.

What was handed down? One common denominator in the content of the secret traditions seems to be living truths underlying ordinary things: the (nature of the) gods, stories about the gods, texts that were read by everyone and the world surrounding us. Under the right guidance, a new interpretation of all these sources of information could lead to other, better understandings of reality. This is, of course, a claim common to all systems of instruction and does not necessarily require codes of secrecy or extensive preparations, but it is certainly characteristic of these secret traditions. A second element is the defragmentation of reality: whereas our common experience naturally leads us to a fragmented view of reality (a myth is relevant to a particular subject, a hymn is sung to please a god of choice, literature serves an aesthetic experience and mathematics are useful for measuring or trading, etc.), the hidden teachings would most often stress the interrelatedness of all these things. Almost every aspect of human culture and experience could be presented in the light of overarching themes that one would not ordinarily associate with them. The typical subjects of these overarching theories were the (organisation of the) cosmos, the human soul and his mind and the reality of the divine. In the interrelations between these subjects, reality was made much simpler than ordinary (sensory) experience would lead us to believe and at the same time was thought to reveal profound truths that would transform a person’s life.

The third element that must be stressed is the power secret knowledge could bring. The experience of hidden truths not only changed a person’s view of reality or transformed his life, but it also invested him (or her) with hidden powers. Here, in particular, belong those elements of secret knowledge that would teach the hidden names of divine beings, which would enable a person to lay them under his control, the formulas, words, or syllables that would influence the course of nature and the symbols with which his soul could find a path beyond this world. None of this knowledge would be useful without a proper understanding of their

origins or of the workings of reality; revealing them to the uninitiated could be perceived or presented as dangerous, in leading persons to places or stages for which they were unprepared, or as pointless, in giving someone instruments he would be unable to use.

One of the most extensive sources for this type of “secret knowledge” is the *Corpus Hermeticum* [→ Hermetic Literature I] which reveals several of the characteristics mentioned above: the visionary setting of the *Poimandres* (CH I), for instance, in which truths are revealed, first, in visual experience, and then explained by a divine teacher. The texts of the CH frequently explore the subject of silence: it is only in silence, in speechless words and soundless song, that the mind can access God. Secrecy is also enjoined explicitly, especially in CH XIII, which contains a ‘secret hymn’ that is said to be a ‘secret kept in silence’ and may not be divulged. The reasons for this silence and secrecy are located in the ‘suppression of all the senses’ (CH X.5) necessary for true understanding.

It is much more difficult to locate “secret knowledge” in those traditions that belong more firmly in the orbit of Christianity, such as Gnostic varieties of Christianity [→ Gnosticism] and → Manichaeism. In “mainstream” Christian texts and traditions themselves, the concept of secrecy (and its companion, “mystery”, which originally belongs to the realm of initiation) is often used, as is the idea of “revealing” hidden messages. It is a moot point, however, whether this knowledge was considered the special reserve of initiated members of a certain group, or rather knowledge available to all those willing to acquire it. It is often assumed that in the development of Christianity, the “esoteric” character of texts and ideas gave way to the appeal to broader audiences quite early, leaving a void in “experiential knowledge” that came to be filled by Christian mysticism. In this schematic approach to the development of the traditions (of which G.G. Stroumsa’s work is an outstanding example), Gnostic texts are frequently thought to display a longer continuation of early Christian secret or initiatory knowledge. Certainly, many of the texts from the Nag Hammadi *codices* stress the secret nature of knowledge preserved in those texts. Since we know so little about the patterns of organisation of “Gnostic” Christians, however, it is by no means certain that there were definite, imposed, restrictions in the access to this knowledge. The case of Manichaeism may be a good illustration: from the organisation of the religion, it is clear that it was centred around the possibility of acquiring knowledge of the true origin of the world and the

human soul: those who entered the religion could gain the knowledge necessary for salvation. The complex practical rules for the desired lifestyle of Manichaeans were based on the realisation of these insights. Yet, the knowledge itself (among them Mani’s written works), was by no means “secret”: it was, in fact, propagated with great zeal by Manichaean missionaries all over the world, with no perceivable restrictions. Gnosticism was, therefore, not by definition secretive, and the differences between “exoteric” Christianity and “esoteric” Gnostic Christianity are more a matter of emphasis than of substance.

3. SECRET ACTS

The language used in the section on “secret knowledge” comes very close to the language necessary for secret rituals, to the language of initiation and mystery cults. The most important secret from the ancient world without any doubt was the experience of the Mysteries of Eleusis. A large number of the citizens of Athens took part in these Mysteries in some stage of their lives, and the “secret”, therefore, must have been widely known. It was guarded and enforced with much energy. It is widely assumed that the other mystery cults of antiquity, including those of the so-called “Oriental” deities (Cybele, Mithras, Isis, etc.) in part emulated the Mysteries of Eleusis. The secrecy of the rituals, in most cases, functioned as a “control for experience”, although it could be formulated in different terms. In Athenian law, “profaning” the Mysteries (i.e., revealing them either by describing them in words or by acting them out) was punishable by death. This was certainly not the case with the other, private, mystery cults, but in all cases secrecy seems to have served the same purpose: to ensure the emotional impact of undergoing the ritual. Revealing the rituals and their symbols beforehand not only meant transgressing sacred institutions, but also spoiling the effects the ritual was supposed to accomplish.

This, however, should not be pushed to its extreme. If the reports we have of some of the rituals in the mystery cults are correct (and even though the majority derives from hostile early Christian authors, there is little reason to doubt the accuracy of some of them), candidates for initiation in, for instance, the several grades of the mysteries of Mithras, knew at least some of the rituals beforehand, for they were supposed to do certain things during these rituals for which they had to be prepared (the best example is the initiation to the *Miles*-grade, during which the candidate had to shake off a wreath placed on his head and proclaim

solemnly, “Mithras is my wreath”). In general, it seems plausible to assume that the secrecy of certain initiation rituals was kept as a control for experience of the candidates, whereas the secrecy of the rituals in regular meetings (ritual meals, for instance) lay more in the special significance these rituals were thought to have and the wish to celebrate these in a fitting manner with initiated members only.

The rituals affecting the course of things in the cosmos were of a different nature. These belong more to the realm of “secret knowledge”. There is a sizeable body of literature from late antiquity, drawn from many confessional groups, which gives instructions to people wishing to perform rituals to attain a certain goal, in transforming their own lives or in influencing their surroundings. The magical papyri belong to this group, as do the possibly more public discussions and manuals of Neoplatonic theurgy [→ Neoplatonism] and handbooks and ritual instructions from Christians, Jews, and others. These are not so much group rituals destined to impose identity on new members, but specific texts and rituals imparting powers and the knowledge required for harnessing these powers.

Little is known of the social organisation(s) behind the Hermetic texts. Several scholars (most famously A.J. Festugière) have doubted whether there is a social reality behind this literature at all, but it seems unreasonable to reject this as a possibility. If there was an organisation, there must have been rituals, but we are very poorly informed about these. Hermetism, to be sure, was not a separate religion with an identifiable “church” hierarchy and specially consecrated buildings, etc. The term that seems to have stuck in modern scholarship to imagine Hermetic “communities” is that of a “lodge”, and from a number of passages in Hermetic literature, it has been possible to reconstruct the presence of gatherings of small groups of initiates, for the singing of hymns, praying, study, and a communal meal with symbolic acts. Since the language of initiation lies heavily on these passages, it is reasonable to envisage these rituals as meetings for initiates only, in which proximity (or unity) with the divine could be experienced.

The rituals of Gnostic Christians are even more difficult to reconstruct. Most evidence derives from the opponents of Gnostic varieties of Christianity. It is most likely that Gnostic Christians knew most of the rituals that were performed by Christians in general (baptism, anointment, [communal] prayer, etc.) and that it was in their interpretation that they differed from other varieties of Christianity. In addition, special rituals seem to have been devel-

oped among certain Gnostic Christians: a ritual of redemption (*apolytrōsis*), and the rites of the “bridal chamber” are among them. The details of these rituals are only poorly known, but their great importance is stressed both by early Christian opponents of Gnosticism and in Gnostic literature (e.g. the *Gospel of Philip*).

4. SECRET IDENTITIES

It is beyond doubt that the secrecy of certain groups was a major element in their attraction to outsiders. From a sociological point of view, enforcing secrecy about the inner workings of a group, about the knowledge handed down and the rituals performed, helps to raise the prestige of the group. In a tolerant, benign world, this seems to be the most important aspect of secrecy: apart from being a control for experience, it is an instrument to attract new following. This certainly seems to be true for the mystery cults, which could thrive in the Hellenistic and Imperial periods by promising personal transformation and enrichment without threatening the political or religious *status quo*. The ancient world, however, was not always either tolerant or benign and the history of private religious associations also shows the other side of secrecy. Already in the 5th century B.C.E., the Pythagoreans of Southern Italy were massacred and the history of religions in the ancient world shows a large number of incidents in which religious groups were persecuted, outlawed, or executed. The final secret to be discussed, therefore, is the secret identity.

Mystery cults were, in principle, a private matter that would not interfere with a person’s social life. A person was not obliged to report his memberships and could choose not to declare it, with the exception of a number of cases: the *hierophant* of Eleusis, for instance, was not allowed to take part in other mysteries. Not declaring membership in a religious organisation therefore did not automatically imply the urge to keep such membership secret out of fear of persecution. Once an organisation had been outlawed, however, this could become a real option. The best illustrations we have of this concealment of identity belong to the history of Christianity and Islam. The traditional religions of Greeks and Romans did not as a rule interfere in the “content” of various cults and organisations. The early Christian churches were not in a position to do so, but the growing centralisation and authority of the Church brought with it repeated attempts to formulate, centralise and control the content and the practice of the religion (ideas, exegesis and ritual), which led to the exclu-

sion of a large variety of different interpretations and practices. From the moment the Church gained sufficient power to do so, this exclusion had in it the danger of persecution. Secrecy, or rather the presumption of secrecy, was used as a weapon in this battle: persons, ideas, texts, and rituals were “unmasked” in attempts to stamp out heresy. It is certain that many groups were anything but secretive in their interpretation of the requirements of Christianity, but several groups indeed chose the option of outward assimilation to mainstream Christianity, while concealing their particular interpretations and rituals. It is in Shiite Islam that this practice came to be institutionalised in the right to dissimulation (*taqīya*) in the face of danger to one’s life. In the world of antiquity, secret identities were most often figments of the imagination and instruments for repression.

ALBERT DE JONG

Secrecy II: Middle Ages

There has always existed within Christian culture the notion that there are certain forms of knowledge hidden from ordinary mortals and uniquely available through God to the prophets, saints and elect (an understanding visible in some biblical passages, e.g. Amos 3:7). However, a new rhetoric of secrecy begins to emerge into popular-

ity in the later middle ages. This rhetoric, adopted from a host of neoplatonic [→ Neoplatonism] and Hermetic sources [→ Hermetic Literature] into various branches of Islamic natural philosophy, was imported into Western Europe in the many works of natural philosophy, → astrology and → magic which began drifting from Arabic sources into the eager hands of Latin translators and writers in the 12th century. In regard to the popularity of the literature of secrets in the later middle ages, it is important to note that in the 12th through 15th centuries, secular learning (education in the liberal arts and philosophy) gains considerably in economic importance with the rise of the universities; and at the same time, and connectedly, due to the strengthened influence of neoplatonic thinking, worldly knowledge comes increasingly to be understood as a kind of integument for divine knowledge (as well as, in some representations, a means by which it may be attained). Books claiming to disseminate the secret knowledge of the ancients or provide knowledge of the liberal arts and philosophy through esoteric or magical means may have been particularly attractive to the emerging class which could only sometimes afford the cost of a liberal arts education; but struggling young clerics and professionals were not the only people to read and take seriously the literature and rhetoric of secrets. It is possible to find suggestions adumbrated in different kinds of medieval writing (as for example in the *De reductione artium ad theologiam* of St. Bonaventure [1221-1274]) that some esoteric knowledge might be a regular part of normal learning, or that normal learning might lead to divine knowledge; the liberal arts thus might be seen as a key to the divine as well as mundane worlds. All of these things contributed to the ethos which made the rhetoric and literature of secrets popular.

There were many late medieval books offering to deliver secrets of art or nature to the reader, often translated from or modelled on Arabic precursors, and containing a wide variety of formulas and experiments, not always particularly recondite. They included medical recipes; traditional lore about the properties of stars, herbs and stones; magical experiments; ethical advice; and advice on the care of the self. Perhaps the most influential among books of this type was the *Secretum secretorum* (in Arabic *Sirr al-Asrār*), first translated from Arabic to Latin in the mid-12th century, and purporting to have been written by Aristotle at the request of his student Alexander the Great. The book’s medieval audience believed in the attribution to Aristotle, and as the popularity of Aristo-

tle's genuine works increased, so too did the popularity of the *Secretum secretorum*, which was understood to contain the esoteric side of his doctrine. The two versions of the work came to exist in many manuscript copies, and were translated from Latin into many vernacular languages.

In the mid-13th century a Latin edition of the *Secretum* was prepared with comments and annotations by → Roger Bacon, on whom the work clearly had a strong influence, and the understanding of secrecy he found there is adapted and paraphrased by him in many of his own works. Bacon's motivations for an interest in secrecy were intensified by his frequently expressed concern to keep important information out of the hands of the Antichrist, mingled with a desire for the education of the Christian world, to the end that they might rediscover knowledge hidden from human beings since ancient times but intended to be restored in time for the coming apocalypse. Like many others, Bacon accepted the claim of the *Secretum* to transmit lore which contained the divine wisdom granted to the saints and prophets; but it is clear that this lore is conceived of as the secrets of particular causes of things in nature (not that this excludes divinity, as he notes: 'when we speak of the power of particular agents, we do not exclude the regimen of the universal agent and first cause' [*Epistola*, c. 3]). Thus Bacon's rhetoric of secrecy wraps itself around an idea of normal knowledge too: the "secrets" of Art and Nature, which are not more than the wise philosopher might deduce, are also not less than secrets of God.

Clearly in the *Secretum Secretorum*, as in Bacon's reception of it, the spiritual/magical and the mundane/technical streams of thought were not always readily distinguishable. This is certainly the case for many works in which the rhetoric of secrecy is manifest. Sometimes, however, particular books seemed to run more in one channel than another. In the more mundane/technical stream might be found books like the *Secretum philosophorum*: a late 13th century text structured in seven chapters co-ordinated with each of the seven liberal arts. The apparent concern with the normal scheme of knowledge suggested by arrangement around the liberal arts is not quite carried out in the content, though this remains mundane enough, for some of the chapters contain simple party tricks and ways of deceiving the senses, while others are filled with instructions for such things as the making of pigments or experiments to be performed with flasks and retorts. In other works, such as the *Secrets of Galen* (or *Rasis*), or the *Secrets of Women* attributed to → Albertus Magnus, the concerns are

primarily with natural or medical "secrets". While elaborating their information within an astrological framework [→ Astrology], these books did not really push the envelope of normal medieval natural philosophy.

Alchemical literature [→ Alchemy] began to enter the magical/spiritual stream in a more obvious way, though what counted as secret knowledge in alchemy might be implied to be at times technical and practical, at times spiritual, at times both at once. Certainly it is also true in alchemy that the secrets of art and nature are interwoven with the secrets of God. To the end of concealing such secrets from the common crowd, some medieval alchemical books were written in enigmatic or encrypted language; but even the more apparently straightforward of them typically gestured in the opening pages at the need for enigmatic language to keep the secrets of alchemy from the unworthy (frequently of course insisting on the importance of clarity at the same time). For example in the preface to the *Libellus de alchimia* attributed to Albertus Magnus, the author proposes to write of 'the true art, clear and free from error; however in such a way that seeing they may not see, and hearing they may not understand', and goes on to adjure the reader to hide the book from the foolish (*Libellus*, 3). In alchemical writings, the "secrets" imparted through the text might also suggest something akin to an initiatic secret, a spiritual knowledge that could be achieved only by an operator who had gone through certain steps of purification and learning. In the *Ordinal of Alchemy* of Thomas Norton (ca. 1433-1513), the reader is enjoined that no one can attain the science unless God send him a master, and that while he must choose a successor to receive the knowledge after he dies, he is bound by sacred oath not to teach it to anyone, not even to his own children, unless virtue prove them worthy (*Ordinal*, c 1, 181ff.).

Most thoroughly steeped in the magical/spiritual channel of literature containing the rhetoric of secrecy we find a variety of different works of a theurgic or necromantic character concerned chiefly with the principles of or rituals for the invocation and/or binding of spirits. This somewhat heterogeneous category would include necromantic handbooks, works adapted from Arabic precursors like the *Liber de essentia spirituum*, and *Picatrix* (or *Ghayat al-Hakim*), and texts probably of Hebrew origin like the *Sworn Book of Honorius* and *Ars notoria*, which emphasize a direct approach to divine knowledge. For the most part works of ritual magic (including those of the necromantic type)

insist on the purity of the operator as strongly or even more strongly than the alchemical books do, and some also manifest concern with something akin to an initiatic secret. The *Sworn Book*, for example, purporting to be the only work to contain the true knowledge of → magic, begins with a narrative describing a gathering of 811 magicians convened to address the question of the preservation of the ancient wisdom in the face of opposition to magic by bishops and prelates. This council agrees on a set of oaths by which the owner of the book and bearer of its knowledge must be bound, including of course an oath not to reveal the secrets of the book to anyone but an appropriate successor. In works of this type, we might feel ourselves to be very far indeed from the realm of mundane and practical knowledge; but here too there may be found evidence of a preoccupation with the value of the entire spectrum of knowledge, not just the extra-linguistic knowledge implied by the idea of divine revelation. The goal of the *Ars notoria*, and following it the *Liber visionum* of John of Morigny (fl. 1304-1318), is the infusion into the mind of the operator of the seven liberal arts culminating in the knowledge of theology. In both works, but perhaps especially in the *Liber visionum*, the science of theology is represented as a revelation of divine secrets; but this final revelation requires the attainment (also by divine infusion) of the liberal arts as a preparatory proceeding. Here as elsewhere in the medieval literature of secrets, divine secrets and normal knowledge are closely contiguous; indeed it sometimes seems that “secret knowledge” is little more than a metonymy for knowledge itself.

CLAIRE FANGER

Secrecy III: Modernity

1. SECRETS WITHIN NATURE AND HISTORY
 - (A. THE OCCULT SIDES OF NATURE
 - B. THE OCCULT SIDES OF HISTORY)
2. CONCEALMENT AND SECRECY IN RELATION TO TEXTS
 - (A. EXPLICIT AND IMPLICIT SECRECY
 - B. THE DIALECTICS OF CONCEALMENT AND UNVEILMENT IN TEXTS)

The notion of secrecy is often associated with that of → esotericism, even to the point of reducing the sense of this latter term to that of the former. The typological meaning of “esotericism” as referring to secrecy should, however, be clearly distinguished from the historical meaning used in the present reference work and increasingly in general academic parlance. The problematics of the relationship between esotericism and secrecy, then, concerns the question of to what extent and in which forms secrecy is present within the discourses of the representatives of Western esoteric currents.

Given the centrality in modern and contemporary Western esotericism of → correspondences, in particular, related to concepts of living nature, imagination, and mediations, it comes as no surprise that esotericists evince a tendency to look for hidden meanings they assume to exist beneath the surface of the empirically observable world. In this understanding, Nature, History, and the works of humankind present themselves as a network of interrelated “signatures”; in other words, apparent reality is replete with secrets. That aspect is the subject of the first part of this entry. The second part concentrates on the very discourse of many esoteri-

cists, which purports to have something secret in it, and/or is characterized by a dialectics of concealment and unveiling.

I. SECRETS WITHIN NATURE AND HISTORY

A. THE OCCULT SIDES OF NATURE

Before the dawn of modern science, Nature as a whole appeared – not only among esotericists – as a *terra incognita* full of occult [→ occult / occultism] correspondences. The term *philosophia occulta* refers in great part to such a view, for instance in the title of one of the most influential books of Renaissance esotericism, *De occulta philosophia* (1533), by → Heinrich Cornelius Agrippa. That view was to prevail also among paracelcists [→ Paracelsianism], Theosophers [→ Christian Theosophy], Rosicrucians [→ Rosicrucianism], etc. (the more recent substantive occultism has been used in a similar sense, although it had and still has other meanings as well). Occult correspondences within Nature are seen as operating at various levels of reality and as constituting, like Holy Scripture, an allegorical and symbolical unfolding of mysteries. “Occult philosophy” is therefore a matter of deciphering the *signatura mundi* in order to discover methods of finding one’s way through correspondences (between, for instance, plants, metals, parts of the human body, etc.). “Signatures” are seals that, once opened, do not so much unveil closed, definite meanings as they make new significations appear which, in turn, lead back to others, thereby providing ever new insights.

To this view three main ideas are attached. First, Nature likes to hide herself and, at the same time, be known. Second, she is full of secret energies. Third, a creative → imagination is the means by which Man has access to her secrets. The image of the goddess Isis as representing the invisible creativity of Nature is a commonplace one, well beyond the borders of esoteric literature proper. When masonic Rites happen to be of an esoteric bent, they occasionally quote the inscription that, according to Plutarch, was to be read on the Temple of Sais: “No mortal ever lifted my veil”. This resonates with the Platonic idea (see the *Timaeus*) that the phenomena of Nature have an origin not likely to be directly grasped. The metaphor “secret bosom of Nature” used by → Scottus Eriugena, referring to her proclivity to operate secretly, is echoed by what → Paracelsus called *mysterium magnum*. Similarly, → Franz von Baader, the main representative of Christian theosophy in the first

half of the 19th century, liked to emphasize that still uncompleted or unfinished products of natural processes are reluctant, as it were, to appear in broad daylight, lest the light should kill them, as exemplified by the foetus, the roots of plants, certain underdeveloped species living in the dark (like batrachians), and so on.

It is telling that in alchemical literature [→ Alchemy] the concept of secret or secrecy, far from always having the sense of intentional concealment, frequently refers, rather, to the existence of “secret energies”. This is exemplified by the widely disseminated *Lexicon Alchemiae* (1614) by Martin Ruland, which has no entry for “secret” or “secrecy”, but does have one for “Arcanum”, defined as ‘something secret, uncorporeal, which Man cannot know without experimentation. This virtue proper to any one thing operates one thousand times more effectively than that thing itself [in which the Arcanum is contained]’. Indeed, Nature and Man are seen by alchemists as containers of secret energies or seminal forces which it behooves the “philosopher” to know how to use. In such a context, imagination constitutes a power of unveiling that operates through the images and symbols of the myth and makes visible what would otherwise have remained in darkness.

B. THE OCCULT SIDES OF HISTORY

Not only Nature is the object of esoteric interpretations, but also the whole history of mankind. History, as it presents itself in the form of documented events and visible traces, is full of gaps that are not just the result of a lack of empirical data. Indeed, concrete, tangible events are not what they would seem to be at face value (in that sense, the notion of secret History leads us back to the classical distinction between the orders of the profane and the sacred). In the context of the modern esoteric corpus, the idea often appears, for example, that one secret → tradition has been running for centuries through the apparent diversity of the philosophical and religious ones. That tradition is often believed to be maintained by certain people who ensure its continuity, despite its invisibility on the public stage. According to → René Guénon (see his *Le Roi du Monde*, 1927), there exists somewhere in this world a hidden spiritual centre regulating the life of humans. Before him, → H.P. Blavatsky had tried to convince her readers of the existence of Mahatmas, a group of sages or initiates in India and Tibet who oversee the destiny of the world. Many esoteric or para-esoteric conversations bear on an alleged secret of the Knights Templar [→ Neo-Templar Traditions], purported

to have been the link – the missing one, for the esotericizing historian – between the Gnostics [→ Gnosticism] and the Cathars [→ Catharism] on the one hand, and the Rosicrucians and the Freemasons [→ Freemasonry] on the other. Such ideas have been instrumental in nurturing conspiracy syndromes which fuelled the inspiration of pulp fictions of an anti-esoteric bent. Umberto Eco made a vivid and spicy use of such literature in his novel *Il pendolo di Foucault* (1988).

A typical example of secret History is provided in the 18th century by some esoterically oriented masonic Rites with side degrees. Two examples are given here, from among many others. Around 1750, Baron Karl von Hund attempted to legitimize the creation of his esoterically tinged masonic Rite called Strict Observance by claiming that it was, by way of uninterrupted transmission, the successor of the Knights Templar, whose existence had been carried on secretly up to that date. Within such a mythical history, the Knights Templar disbanded by Philip the Fair were to be considered one of the various transitional and contingent forms which a more ancient wisdom had taken on since the origins of the world. After having been revealed to Adam by God, that wisdom had been preserved from age to age within the bosom of lodges of initiates. In Hund's wake, the more esoterically tinged masonic Rectified Scottish Rite created by → Jean-Baptiste Willermoz in the 1770s had (and still has) its upper degrees instructions based on the teachings of the theosopher → Martines de Pasqually and partly on those of → Louis-Claude de Saint-Martin. These instructions present themselves as the unfolding of a comprehensive theosophical system bearing, as such, on the hidden relations between God, Man, and the universe. Willermoz and the co-founders of this Rite considered a meditation on History as being part of the initiation. But since the veracity of their teachings was not (and could not) be “proved” by resorting to undisputable documents, the legitimacy of their ritual was based on the secret of its origins. The same goes for many rituals of this sort. Thus, the knowledge on which one prides oneself is true because it is grounded in obscurity – the criterion of truth is the obscurity of the sources.

An illuminating parable of secret History is provided in Mircea Eliade's story *Adieu* (in *Bei den Zigeunerinnen*, 1980), in which a theatre curtain is pulled down, thus preventing the audience (i.e., the historians of religions, the observers “from the outside”) from seeing what is happening on the stage. Only the actors (i.e., the personages that real reli-

gious history is made of) are able to understand the play; the audience has no access to it.

2. CONCEALMENT AND SECRECY IN RELATION TO TEXTS

In esoteric texts the secret may be either explicit or implicit. Moreover, we often find various forms of interplay or dialectics between concealment and unveiling.

A. EXPLICIT AND IMPLICIT SECRECY

In esoteric milieus an aura of mystery is sometimes created around certain personages (Count de → Saint-Germain or → Fulcanelli, for instance), about whom legendary, long-lived stories are put into circulation. One also observes a preference for “secret writing” [→ Cryptography], to which magical powers are attributed (→ Johannes Trithemius's famous “steganography”, at the dawn of the 16th century, remains a classic example). More generally, initiatory rituals, not only those of an esoteric bent, have their own passwords and secret signs, and their members are theoretically forbidden to reveal what is going on during the assemblies. But since initiation often aims at transforming or even transmuting the candidate by providing him/her access to a *mysterium*, secrecy may simply mean here that one just could not reveal one's own experience of initiation, not so much because it is forbidden to do so, but rather because the experience is ineffable and would therefore remain incomprehensible to a non-initiate. That might well be the sense underlying the rule of *disciplina arcani* among the members of such societies (in contradistinction to the law of silence common to political or criminal secret societies, and to confessors and lawyers as well). Then again, the claim is not uncommon among esotericists that they have to refrain from saying all they know, because they resent the idea of throwing their pearls before the swine.

Besides explicit or deliberate forms of secrecy, there is the widely spread idea that an implicit secret exists within some esoteric and/or non-esoteric works. First, regarding the esoteric ones, it is a matter of assuming the presence of covert meanings in works that are already esoteric (in the sense of obviously pertaining to esoteric literature or art). Such meanings are not always supposed to have been intentionally concealed. For instance, the Christian kabbalists [→ Jewish Influences III] of the Renaissance believed to discover in Jewish kabbalah the presence of Christian truths. Neo-Alexandrian hermetists [→ Hermetic Literature IV]

enjoyed identifying in the *Corpus Hermeticum* symbols pertaining to the Christian Trinity. Many alchemists claim that in the writings of their predecessors, underneath the manifest meanings, other layers of meaning lay hidden, which had not necessarily been inserted on purpose. This is consistent with the fact that so many esoteric discourses are essentially interpretative (i.e., they consist of an exegesis of texts which in most cases are already exegeses themselves). “*Offenbares Geheimnis*” (“manifest secret”), an apt expression used by → Goethe, means that a secret within a work beckons, as it were, to the reader, informing him/her of its presence, regardless of the intention of the author.

Second, esotericists are not unfrequently bent upon convincing their readers that a secret is contained in works (of fiction, painting, sculpture, etc.) which at face value do not present themselves as esoteric. The baffled readers are thus expected to believe that the authors of these works have, unwittingly or not, inserted esoteric meanings. Such endeavours bear witness to the tendency of most esotericists of transforming one type of discourse into another. Thus, Shakespeare’s plays have been the object of esoteric glosses contending that the playwright’s main intention had actually consisted in conveying arithmological [→ Number Symbolism], alchemical [→ Alchemy] and/or astrological [→ Astrology] messages. Holy Scripture has been the object of interpretations going far beyond the common theological ones (particularly in theosophical discourses, like → Christian theosophy and Jewish as well as Christian kabbalah). ‘In all times’, writes Umberto Eco, ‘the Hermetic mind has been transforming the operational jargon of various crafts into a symbolic language’ (*Les limites de l’interprétation*, ch. II) – whereby he alludes to the fact that the vocabulary used by stone carvers, architects, chemists, and so on, has, over and over again, been utilized in initiatory rituals and hermetic texts. Indeed, alchemists often consider Greek or Egyptian mythology as an ensemble of cryptic messages that depict the stages and modes of the Great Work. As late as the 20th century, Fulcanelli (*Le Mystère des Cathédrales*, 1925) and other alchemists have scrutinized the cathedrals and other spiritual mansions, claiming to find in statuary and architecture an array of symbols witnessing to an uninterrupted hermetic tradition.

B. THE DIALECTICS OF CONCEALMENT AND UNVEILMENT IN TEXTS

Here we have three kinds of examples. First, the circularity of the discourse challenges the compre-

hension of the reader. Second, the secret of the discourse is the non-communication of something that is not transmissible. Third, contrariwise, other discourses present themselves more as a pedagogical agenda than a plea for secrecy, and some in this latter category go as far as making a plea for a “deseculation of the occult”.

A circular discourse challenges the comprehension of the reader. This is a frequent case, and most often a frustrating one. The author gives the impression that he conceals while revealing and reveals while concealing. He multiplies veils and wrappings supposed to be reverberations of a light not very likely to be eventually grasped. Alchemical literature in particular is replete with examples of this stance. Usually, when an alchemist speaks about natural substances, he is transferring the universal principles of sympathy and resemblance into language in such a way that any word or image becomes the signified of several other signifieds, so that in the end – or even at the outset – the distinction between signified and signifier becomes blurred. What is upsetting is that we feel unable to make out which real, concrete, identifiable metals or liquids are meant. A word or an image refers less to an empirical substance than it leads back to other words or other images. The text provides us with would-be information about, for instance, the preparation of silver or gold, but that information presents itself as being intelligible only with reference to the texts of other authors. Even so, the reader who makes the effort to procure and read all (or as many as possible) of the texts hinted at or quoted in the work, finds him/herself entangled in a circular discourse that ends up by functioning as a veil which eventually seems to constitute the message itself. The paradox is that the text says countless things and, at the same time, says one main thing to which the reader is not privy (see Eco, *ibid.*).

The example of alchemy is paradigmatic in that it can serve to exemplify something that is more or less conspicuous in other esoteric discourses. In quite a few of the latter, any text (religious message, philosophical teaching, artistic work, poem, fiction, etc.) is supposed to contain a secret which, in turn, will refer us to another secret, so that there seems to be no ultimate definable secret or truth at all – at least none that is likely to be identified clearly, or called by its proper name. Bound up with that trait is the preference of many esotericists for exotic lore, hieroglyphical signs, mythological figures and settings, and incomprehensible languages attributed to a remote past. Theosophers

are lavish in circular discourses. Their work rarely presents itself, in spite of its inner coherence, as systematic sets of orderly devised propositions, but rather as puzzles made up of scattered elements, so that the reader is challenged to organize the latter into a more linear or chronological story. Many theosophers are inspired by an inner central vision (*Zentralschau*) that radiates in all directions. They are prone to employ words or images in a both literal and figurative sense, and these words or images moreover contain various levels of interrelated occult meanings likely to be illuminated by other passages in the same text – but the latter turn out to lead back to the earlier passages. To understand a theosophical text (of → Jacob Boehme, for example) entails having succeeded in finding the spot from which the author speaks. But in order for us to find this spot, we must have understood the text. That having been said, such a paradox appears to be less conspicuous or disheartening in theosophical than, for instance, in alchemical literature.

The secret of the text is the non-communication of something that is not transmissible. In the esoteric context we repeatedly hear that the representatives of philosophical and religious traditions of a more-or-less remote past had to veil the inner core of their doctrines. At the dawn of modern times, → Pico della Mirandola set the tone for such a statement in his *Oratio de Homini Dignitate*. To the same *topos*, Cornelius Agrippa devoted a famous and influential chapter in his *De Occulta Philosophia*, entitled “On the silence and cultivation of the things that are secret in religions”. Why so many discourses about things one is not supposed to talk about? Two factors seem to account for that paradox, which apparently began to come to the fore during the Renaissance. First, at the time, Western culture was in the process of becoming a culture of the printed book. This resulted in a change of paradigms with regard to the transmission of knowledge, which was formerly more strongly oral in character. Once printed, a teaching or message found itself bereft of part of its aura. The claim that some secrets had been preserved orally for the benefit of selected people partly made up for that loss, as it were. Second, certain people were convinced that the time had come for hitherto concealed mysteries to be made manifest. Indeed, during the Renaissance, some persons (→ Guillaume Postel, for instance) of this persuasion considered themselves as providential beings commissioned by the decrees of secret history to reform the world. With this in mind they set out to scrutinize what had remained concealed in History pending riper times. But how were they to speak about

these mysteries without making them, by the same token, stale? How to speak about, say, the Spirit who is the concealed motor, the hidden driving force of History? As such, he is inexpressible, therefore non-transmissible by way of any discourse, let alone by printed texts, which are liable to falling into the hands of readers unable to grasp their inner core. Here the plea for secrecy again comes into play, understood, as it were, as the needle of a compass pointing to a mythical “Orient” and serving to mask the impossibility of transmission. In this understanding, esoteric transmission cannot unveil secrets. Rather, it is the non-communication of what is not transmissible that constitutes the secret. Hence the abundance of discourses that illustrated this paradox in the Renaissance and have, in the wake of the latter, continued in various forms to bestow on many esoteric texts their specific colouring.

Rending the veil: the text is meant as a desoccultation of the occult. Desoccultation comes in two main categories, the differences between them lying in the degree to which the author relates to the traditions of the past.

Saint-Martin represents the first category. His intention was not to be secretive, but to deliver his esoteric knowledge for the benefit of as many readers as possible. To wit, he took from the hothouse of the secret masonic association of the → Elus Coëns the essentials of the theosophical teachings that → Martines de Pasqually had meant to be reserved for his initiates, and he translated → Boehme into a clear French (at least, into a language more accessible or fluid than its German baroque original). In his works, Saint-Martin not infrequently resorted to the very style in use among the philosophers of the Enlightenment. Indeed, he conceived his work as pedagogical, aimed at fostering the Regeneration of Man and Nature. Adam appears here as a child whom God had to educate. Likewise, humankind is engaged in an unceasing process of regenerating education. Saint-Martin thus developed a “pedagogical theosophy”, as it were, aimed at helping any man or woman to meditate about the essentials of Revelation in order for him/her to reach genuine adulthood. Ultimately, though, he did not so much undertake a desocculting of the occult as he tried to make the occult available and accessible without reducing myths and symbols to concepts. The same could be said of → Franz von Baader in the later period.

Typical of the second category, which is more at home in the esoteric landscape of the second half of the 20th century, is → Raymond Abellio. In contrast to authors like Saint-Martin and Baader, we

are dealing here with a deliberate “desocultation of the occult”. Abellio was certainly not committed to explaining away esoteric or occult traditions (Western and Eastern: he dabbled in → astrology, the *Y-King*, the → Tarot, Kabbalah, etc.) by way of scientific or pseudoscientific forms of hyper-reductionism. But he was intent upon reducing them all to a small number of common denominators which he presented in a severe, abstract and geometrical manner; the final result being a geometrical three-dimensional figure he called “the Absolute Structure”. It is not by chance that the writing and publication of his work *La Structure Absolue* (1965) coincided precisely with the vogue of structuralism in France. Besides, the word “fin”, in the title of his later book *La Fin de l'Esotérisme* (1973), has in French two complementary meanings, i.e., “goal” and “end”. “Goal” refers to the *raison d'être* of esotericism (that is to say, for Abellio, the acquisition of what he considers a genuine gnosis). “End” means that esoteric texts of the past become unnecessary once their hitherto occult significations have been unveiled, which Abellio contends to have done. Once discovered, truth helps dispense with texts.

3. CONCLUSION

Although very much present in the context of modern esoteric currents, the notion of concealment or secrecy has varied meanings, so that it would be inadequate to specify the form of thought common to these currents. It remains that “esotericism” is still frequently used by scholars as a synonym for secrecy (see e.g. Guy G. Stroumsa's book *Esoteric Traditions and the Roots of Christian Mysticism*, 1996), and by a wide public in the sense of hidden knowledge/teachings about a truth behind the veil (and/or of the means to attain that truth), and of practices of concealment. Admittedly, there is no reason why it should not be so, since the term was intended in that sense from the moment it came into use in the first third of the 19th century. Nevertheless, in academic parlance it has come to designate, as already noted, a specific corpus of authors and currents, without special reference to the notion of secrecy. For these reasons it behoves the historian to be cognizant of the contexts in which the term is used whenever he/she comes across it. Depending on whether “esotericism” refers essentially to secrecy or not, the notion of secrecy finds itself either highlighted, or pushed into the background.

ANTOINE FAIVRE

Sedacer, Guillaume (Guillelmus Sedacerii), * ?, † 1382

Very little is known of the life of this Catalan Carmelite, except that he benefited, at least during the last years of his life, from the protection of the Infante John of Aragon (future John I, who reigned from 1387 to 1395), known for the sympathy he had for the alchemists. The description, preserved in a notarized act, of thirty-four manuscripts that had belonged to Sedacer, makes it possible to determine his three main centers of interest: astronomy/→ astrology, medicine and, especially, → alchemy.

Posterity has retained only the alchemical aspect of his written work, but Sedacer was also the author of a surgical treatise, which remained unfinished and was entitled *Ars chirurgie*, a sort of summary, written in 1378 for the use of students, of works by Lanfranc (13th century) and his master William of Saliceto (ca. 1210-ca. 1280). He was moreover connected with the medical teaching milieu at the College of Medicine of Montpellier.

Sedacer's two alchemical treatises, *Liber alterquinus* and *Sedacina totius artis alchimie*, are intimately connected: the first is a long *practica*, that is, a long series of recipes, rather roughly arranged in

four books. It was from this material that Sedacer later drew to compose *Sedacina*, ordering it, completing it, and supporting it with a theoretical introduction, but still maintaining the same plan in four books. *Sedacina*, however, suddenly stops short in the midst of the second book: the hand of death seems to have interrupted Sedacer in his work.

The term *sedacina*, invented by Sedacer to entitle his second treatise, well defines the alchemical work of the Carmelite Friar. It means not only “Sedacer’s thing”, but also, by playing on the meaning of the Catalan word *sedasser* (merchant or maker of sieves), the result of putting previous alchemical texts through a sieve. Indeed, his work is very derivative of treatises extremely widely circulated as early as the 13th century, that is, among others, *De perfecto magisterio* of pseudo-Aristotle, *De salibus et aluminibus* of pseudo-Razi and *Semita recta* of pseudo- → Albertus Magnus, to which we may add *Verbum abbreviatum de leone viridi*, a text that circulated since the 14th century under → Roger Bacon’s name. Sedacer largely drew from these sources, reproducing them word for word and juxtaposing, in some places, passages from different texts, thus developing a true “mosaic”, very characteristic of medieval compilations. Nevertheless, Sedacer knew of recent alchemical texts, and notably the treatises circulating under the names of → Arnau de Vilanova and → Ramon Llull, or again the *Rosarium* by John Dastin. He was moreover the first known alchemical author to cite Ramon Llull as an alchemical authority. Nevertheless, he is in disagreement with the ideas expressed by these authors and notably with their rejection of organic substances in making the elixir, a rejection that was provided with a precise theoretical foundation for the first time in the *Summa perfectionis* of the Latin pseudo-Geber (13th century). For Sedacer, on the contrary, it is quite as possible to make the ‘stone and not stone’ (that is, the philosopher’s stone) starting with mineral and vegetable substances as it is from animal ones. In fact, Sedacer’s alchemical work stands completely in the line of *De anima artis alchimie* of pseudo- → Avicenna, one of the basic texts of alchemy translated and rewritten from the Arabic in the 13th century and on which most of his sources depend. He himself is not a builder of theories; his alchemy is above all operative and the clearly sought-for goal is the transmutation of metals. Even in *Sedacina*, the theoretical introduction, essentially composed of *topoi*, is there only to bring in and justify the long sequence of recipes. However, one substance fascinates him more than any other: glass. The recipe for making glass, which correctly reflects the technical knowl-

edge of the time, acts as a model for many recipes for making “stone and not stone” in his works. However, even if he repeats several times ‘una via, unus modus et unus finis’ (a single way, a single process, a single purpose), to emphasize the paradigmatic character of glass making for alchemical practice, in his treatises he nevertheless gives many transmutatory recipes not stemming from this model. In fact, Sedacer primarily seeks to transmit a whole series of procedures, juxtaposing, as usual in such *practicae*, perfectly proven procedures stemming from metallurgical techniques and indications with a transmutatory purpose. Some of his recipes therefore accumulate ingredients and operations, with a concern to lose nothing and exclude nothing.

Apart from his fascination with glass, there is another characteristic aspect of Sedacer’s alchemical work: the Carmelite Friar forged a vocabulary all of his own, which he substituted systematically for that of his sources. To begin with, the titles of his two treatises are words invented by him: *alterquinus* (synonym of *alchimicus*) and *sedacina* (*cf. supra*). Above all, each substance used in a recipe is designated by a specific term (for example, *lubricus* for mercury, *rabiz* for vinegar or again *stultus saltans* for saltpeter). To constitute this stock of words, Sedacer no doubt drew on his imagination as well as on various sources, among which were medical synonymies. He has recourse to several procedures, but especially uses metaphors and terms that originate, he says, from foreign languages. For Sedacer, it is a matter of discouraging the unworthy reader; but, since he is careful to give, here and there, synonyms allowing all this vocabulary to be understood, his coding system does not seem very effective. In addition, an element of playfulness, and the sheer pleasure of inventing verbal puns, certainly also helps explain his approach.

In brief, Sedacer is a good example of an “ordinary alchemist” of the end of the Middle Ages. His work, which did not have much influence but was well distributed (17 manuscripts are known to this day), bears witness to an alchemy essentially oriented toward practice and concrete manipulations of matter. However, this does not necessarily imply that he himself put his procedures into practice, as we would expect today; indeed, it would certainly be incorrect to see Sedacer as a laboratory man who had tested all his recipes. The practical knowledge to be transmitted was mainly bookish, even if not exclusively so: the emphasis on glass, for example, probably originated from a real experiment. The notion of thought experiments – that is to say the mental contemplation of processes that accord-

ing to alchemical logic necessarily have to come to realization – provides another key to understanding the relationship taken towards practical alchemy by a man like Sedacer.

PASCALE BARTHÉLEMY

Sédir, Paul (ps. of Yvon Le Loup),

* 1.1.1871 Dinan, † 3.2.1926 Paris

This Breton, rather gauche in appearance and fragile in health, was employed in a bank. He had had no special intellectual education before meeting → Papus (Gérard Encausse) in 1889 at the occultist Chamuel's bookshop *La Librairie du Merveilleux*. At the time, Papus was running a vast network of periodicals, esoteric teaching, and initiatic institutions, in a half-learned, half-social enterprise in which Le Loup (whose pseudonym Sédir is an anagram of *désir*, from → Louis-Claude de Saint-Martin's *homme de désir*, “man of aspiration”) found his place, writing articles for *L'Initiation* and teaching in the *Groupe indépendant d'études ésotériques* and the schools that belonged to it. He practiced → magic in the company of the alchemist Albert Poisson (1869-1894), and was initiated into almost all the secret societies that Paris had to offer, notably the Martinist Order [→ Martinism: Second Period] of Papus and the fringe-masonic groups linked to it. He was also to be found in the *Ordre Kabbalistique de la Rose-Croix* of → Stanislas de Guaita. Sédir's publications, usually derivative, also touched on everything, ranging from tech-

niques of divination [→ Divinatory Arts] (*Urim et Thumim*) to the translation of → Gichtel's *Theosophia Practica* for the “Bibliothèque roscrucienne” of René Philipon (1869-1936), and to Hindu fakirism. However, he suddenly changed his spiritual direction after his encounter with a Lyonnais healer, → Maître Philippe, who caused him to realize the absolute superiority of Christ. After this meeting, *L'Initiation* in 1909 announced Sédir's resignation from all the initiatic organizations; he now founded another network, *Les Amitiés spirituelles*, a sort of “interior church” after the fashion of the theosophers [→ Christian Theosophy] of the end of the 18th century. The group settled in Bihorel-les-Rouen, Normandy. Sédir's thought integrated the occultism [→ occult / occultism] of the 19th century, which he never completely renounced, considering the Revelation as the résumé and crown of “natural religion” while breaking with the myth of progress. The idea that from age to age, esotericism had preserved and transmitted the purest part of the eternal doctrine [→ Tradition] served as the guiding thread in his *Histoire des Rose-Croix* (*History of the Rosicrucians*), reprinted by “Les Amitiés spirituelles” in 1932, a work that would notably inspire → René Guénon in his *Ésotérisme de Dante* (*Dante's esotericism*, 1925). Sédir's last works were devoted to → mysticism: *Commentaires sur l'Évangile* (*Commentaries on the Gospel*, 1908-1909) and *Bréviaire mystique* (*Mystical breviary*, 1910).

JEAN-PIERRE LAURANT

Sethians

1. THE HERESIOLOGICAL EVIDENCE
2. A MODERN DEFINITION OF SETHIANISM
3. ASSESSMENT OF THE EVIDENCE

Modern scholarship has as yet reached no agreement whether or not there existed in Late Antiquity a distinct religious group or sect that took its name from Adam's son Seth (Gen 4:25; 5:3). Whereas

some scholars express scepticism (e.g. Wisse), others feel confident in demarcating a body of Sethian literature and in reconstructing the doctrine of a distinct group of Sethians (e.g. Schenke, Turner). They claim that the Sethians were as much a distinct group as the Valentinians [→ Valentinus and Valentinians]. In the following the evidence of ancient heresiology that points to the existence of a group or groups of Sethians will be reviewed (1). Then a modern definition of “Sethianism” will be presented (2). A brief assessment of the evidence and an indication of possible topics for further exploration will form the conclusion (3).

1. THE HERESIOLOGICAL EVIDENCE

1.1. The first Christian author to mention Sethians is Hippolytus of Rome. In *Refutatio*, V, 19-22 / X, 11 he relates their complex system which is based on the interaction of the principles of light, spirit and darkness. According to his heresiological scheme, Hippolytus claims that they derive their doctrine from the ancient physicists, the ancient theologians Musaios and Linus, and Orpheus (V, 20, 1. 4). Hippolytus refers to the ‘numberless treatises’ (V, 21, 1) of the Sethians; one of them has the title *Paraphrasis of Seth* (V, 22, 1). Perhaps this book title inspired the designation of “Sethians”; apart from it, Seth is mentioned only once as one of the three sons of Adam (V, 20, 2) and plays no role in the “system” of Hippolytus’ Sethians. According to Hippolytus the Sethians recommended to their disciples particularly the study of the doctrine of mixture and confusion as taught by, amongst others, the Peripatetic Andronicus (V, 21, 1; cf. NHC II, 1, 18, 14-19, 2 where the section on the passions agrees with the tradition of Pseudo-Andronicus of Rhodos as attested by Cicero, *Tusculanae disputationes*, IV, 7, 16 [cf. Tardieu, 1986]). Hippolytus’ report about the Sethians is part of Hippolytus’ “Sondergut”, i.e. a group of reports about various Gnostic heresies that evince significant parallels of thought and wording amongst each other. A proper evaluation of Hippolytus’ report about the Sethians presupposes a general analysis of the “Sondergut” – a task that has not yet been completed.

1.2. Origen refers to a group of heretics that call themselves Sethians (in PG 14, 1303D; cf. le Bouluec, II, 525, note 300).

1.3. Pseudo-Tertullian, *Adversus omnes haereses*, II, 7, mentions Sethians and gives an account of their teaching different from that in Hippolytus, *Refutatio*, V, 19-22. Seth plays a prominent role: whereas Cain and Abel had been created by angels, the power above all powers, the Mother, gave birth to Seth in order to destroy the angels. The Mother

brought about the Flood in order to destroy the mixed breed that was the product of angels and men. But in Noah’s ark there was not only the pure race of Seth, but also Ham who was a descendant of angels. Thus evil continued and filled the earth even after the Flood. Later on Seth appeared as Jesus Christ. The doxography of Epiphanius of Salamis, *Panarion*, 39, and Filastrius of Brescia, *Diversarum haereseon liber*, 3, largely agrees with Pseudo-Tertullian. Lipsius (188-192) accounted for this similarity by assuming that all three derive their information from Hippolytus’ of Rome lost *Syntagma*. Epiphanius, however, dimly remembers having met with a sect of Sethians in Egypt; moreover, he claims to have ‘discovered some things about it in an actual encounter, by inquiry’ (*Panarion*, 39, 1, 2; cf. 26, 17); other things he has gleaned from their literature (ibidem). In *Panarion*, 39, 5, 1, Epiphanius informs us about Sethian pseudepigraphy: seven books are ascribed to Seth, others are called *Allogeneis* (cf. Porphyry, *Life of Plotinus* 16 [see below]; NHC XI, 3 [see below]). Yet another book is apparently called *Apocalypse of Abraham* (see below; cf. Puech, 1936; Origen, in PG 13, 1889; this treatise should not be confused with another writing with an identical title, cf. J.H. Charlesworth [ed.], *The Old Testament Pseudepigrapha*, I, New York 1983, 683); there were also books under → Moses’ name.

1.4. In *Panarion* 26 Epiphanius deals with a heresy he calls “Gnostics”. He claims personal acquaintance (26, 17) and refers, amongst others, to books called *Noria* (cf. the reference NHC II, 5, 102, 10-11, 23-25; for her connection with Seth, cf. Irenaeus, *Adversus Haereses* I, 30, 9; Epiphanius, *Panarion*, 39, 5, 2f.), the *Gospel of Perfection*, the *Gospel of Eve* (26, 1, 3; 2, 5; 2, 6); books in the name of Seth, *Greater / Lesser Questions of Mary*, *Apocalypses of Adam* (cf. NHC V, 5; *Cologne Mani Codex* 48-49 [ed. Koenen-Römer, 30-33]; marginal gloss at *Epistle of Barnabas* 2, 10a in the Codex Hierosolymitanus Graecus Taphou 54 [cf. Tardieu, 1981, 86]) (26, 8, 1).

1.5. In *Panarion*, 40, Epiphanius refutes the teaching of the so called → “Archontics”. In this context he cites their many apocryphal books, mentioning, amongst others, a *Lesser Harmony*, a *Greater Harmony*, *Strangers (Allogeneis)* (40, 2, 1-3), and books by Seth and under the name of Seth himself and his seven sons (40, 7, 4). He adds: ‘For they say that he had seven sons, called “strangers”, as I mentioned also in other Sects – I mean the Gnostics and the Sethians’ (40, 7, 5). Thus we can infer that the book title *Allogeneis* refers to the seven sons of Seth. Moreover, the Archontics also

spoke of other prophets, i.e. Martiades and Marsianus (perhaps a Syriac name for Enoch, alluding to Gen 5:24; cf. Tardieu [1992], 532-33, note 69), who had been taken up into the heavens and had descended after three days. Seth, the revealer and Saviour who is protected by the good God, fights against the powers and principalities.

1.6. The Neoplatonist philosopher Porphyry mentions in his *Life of Plotinus* 16 sectarian Christians, ‘men of the schools of Adelphius and Aquilinus, who possessed a great many treatises of Alexander the Libyan and Philocomus and Demonstratus and Lydus and produced revelations by → Zoroaster and Zostrianos, and Nicotheos, and Allogenes, and Messos, and other people of the kind . . .’ (transl. A.H. Armstrong). According to Porphyry, Plotinus’ pupil Amelius composed 40 volumes against the book of Zostrianus, whereas Porphyry himself exposed the spuriousness of the alleged book of Zoroaster (for apocryphal “Zoroastrian” literature in general, cf. Bidez-Cumont). It has been proposed to identify the treatise *Zostrianos* mentioned by Porphyry with the Nag Hammadi treatise *Zostrianos* (NHC VIII, 1; for the name “Zostrianos”, cf. Arnobius, *Adversus Gentiles* I, 52), a suggestion that seems to be confirmed by some agreements between the terminology of NHC VIII, 1 and Plotinus, *Enneads* II,9 and by Tardieu’s brilliant discovery that part of this treatise, i.e. NHC VIII, 1, 64, 13-66, 11 (66, 12-84, 22), has a verbatim parallel in a section (49, 9-50, 21) of *Adversus Arium* I, a theological treatise of the 4th century Roman Christian Marius Victorinus. These parallel passages formulate both a negative and an affirmative theology of the One. Tardieu (1996) argued that this parallelism can be explained by assuming a common, Middle Platonist source (Numenius) for both *Zostrianus* and *Adversus Arium*. There is some scholarly controversy about the date of *Zostrianus* (NHC VIII, 1): some claim that the triad of existence, life and mind presupposes the metaphysics of Porphyry (Abramowski, Majercik) and points to a revision of the treatise after it had been criticised by both Amelius and Porphyry. Other scholars feel confident in asserting a pre-Plotinian, Middle Platonist background for this triad and other “Platonist” features of the writing (Tardieu). Tardieu has further suggested that the treatise *Zostrianus* explains or continues the treatise *Zoroaster*, just as the treatise *Messos* (the son of Allogenes, cf. NHC XI, 3, 50, 19; 68, 28; 69, 16) contains an interpretation of the treatise *Allogenes*. Nicotheos, who is also mentioned in the Bruce Codex (ed. Schmidt-Till, 342), may be another name for Enoch; Zoroaster and

Zostrianus are names of heavenly messengers, members of the race of Seth. The literature of these Roman Christians seems to focus on a kind of heretical “prophetology” (Tardieu, 1992).

1.7. Theodoret of Cyrus, *Graecarum affectionum curatio*, I, 14, identified the Sethians with the → Ophites mentioned by Irenaeus of Lyon, *Adversus Haereses*, I, 30.

1.8. In his *Liber scholiorum* (A.D. 791/2), when he is dealing with the sect of the so called → Audians, Theodore bar Konai quotes and refers to an *Apocalypse of Abraham*, an *Apocalypse of Strangers* and a *Book of Strangers* (*Mimra* XI, 63 [CSCO 69, 319-320 / French translation: CSCO 432, 239]). A quotation from the latter work (God is speaking to Eve: ‘Become pregnant by me in order to prevent the creators of Adam from approaching you’) can – with some textual variation – also be found in the reports that Agapius (A.D. 942; *Kitab al-‘Unwan*, PO 7, 562-563) and Gregor Bar Hebraeus (13th century; *On the heresies*, PO XIII, 259-260) devote to the Audians. In Agapius and Bar Hebraeus the quotation is part of a religious myth of which some further details are related (French translation by Puech [1936], 939-940f.): the Father of Life and the Mother of Life come together and produce many gods; the Father of Life creates an angel who creates all the other angels. In defiance of the Adversary (i.e. the Devil), the Father of Life creates Eve, who becomes pregnant by him and thus produces a race that multiplies. The human body is made of matter, the soul derives from the substance of the Father of Life. The jealous Adversary manages to detach a particle from the Father of Life, to clothe it with a body and send it into the world in order to call mankind to worship the Adversary. The Father of Life gets angry, and kills and crucifies Christ. In the end the Father of Life, the Mother of Life, and the divine realm produced by them will perish (!). In order to evaluate properly the information provided by Agapius and Bar Hebraeus, further research into the heresiology of these and other oriental authors is needed. The idea that Eve is at the origin of a particular divine race has clear parallels in other writings attributed to the Sethians. Puech suggested that books mentioned by Theodore are perhaps identical with the *Apocalypse of Allogeneis* referred to by Porphyry (see above), and the *Apocalypse of Abraham* and *Allogeneis* mentioned by Epiphanius of Salamis (see above). According to Puech the schismatic church of the Audians which sprung up in the 4th century later developed into a heretical Gnostic group.

1.9. Seth plays also an important role in →

Manichaeism: he belongs, together with Noah, Abraham, Shem and Enoch, to the series of embodiments of the divine Nous (Lieu, 23; Stroumsa, 145-167). The Cologne Mani Codex quotes an *Apocalypse of Seth* (pp. 50-51, ed. Koenen-Römer, 32-35]. Serapion of Thmuis designates a "Sitianus" as a heretical predecessor of Mani (*Adversus Manichaeos*, III).

From our survey we can conclude that for Hippolytus, *Refutatio*, V, 19-22 and Epiphanius, *Panarion*, 39, the distinguishing trait of the Sethians was their production and use of (pseudepigraphic) religious literature. Neither heresiologist seems to know anything about distinct Sethian ethics, group organization, liturgy or sacramental practice. Theodoret makes an heresiological inference when he connects Irenaeus' Ophites with the Sethians. Epiphanius, *Panarion*, 26 and 40, identifies "Gnostics" and "Archontics" as producers of Sethian literature; we learn from Porphyry that Roman Gnostics around 250 produced Sethian treatises. Sethian books were also read by the followers of → Mani. Later Syriac heresiology refers to the Audians as authors of Sethian books. Hence we are faced with a problem: on the one hand the heresiological tradition indicates that the production and use of certain books defines the identity of the Sethians. On the other hand it suggests that the production of Sethian literature was not the prerogative of only one religious group.

2. A MODERN DEFINITION OF SETHIANISM

Emulating the precedent of ancient heresiology, modern scholarship tried to identify a "Sethian" type of gnosticism by demarcating a Sethian body of literature and inferring from it the existence of Sethians. As regards the Nag Hammadi Coptic library, Schenke proposed to label the following writings as "Sethian": the *Apocryphon of John* (NHC II, 1; III, 1; IV, 1), the *Hypostasis of the Archons* (II, 4), the *Gospel of the Egyptians* (III, 2; IV, 2); the *Apocalypse of Adam* (V, 5); the *Three Steles of Seth* (VII, 5); *Zostrianus* (VIII, 1); *Melchizedek* (IX, 1); the *Thought of Norea* (IX, 2); *Marsanes* (X); *Allogenes* (XI, 3); the *Trimorphic Protennoia* (XIII). To this catalogue he added the *Untitled Treatise* of the Codex Brucianus, the teaching related by Irenaeus, *Adversus Haereses*, I, 29 and the doctrines described by Epiphanius of Salamis in sections 26, 39 and 40 of his *Panarion omnium haeresium* (Schenke, 1981, 588-589).

This list is compiled on the basis of a catalogue of 14 distinctive features which allow us to label a

writing as Sethian: 1. the self definition as pneumatic seed of Seth; 2. Seth as the saviour of the race of Sethians; 3. a particular version of negative theology; 4. a specific philosophical terminology; 5. the divine family triad of Father (Invisible Spirit), Mother (Barbelo), Son (Autogenes); 6. the aeon of Barbelo as consisting of Kalyptos, Protophanes and Autogenes; 7. the four light aeons of the Autogenes (Armozel, Oriel, Daveithai, Eleleth); 8. the three or four ministers of the four light aeons, e.g. Gamaliel, Gabriel, Samblo, Abrasax; 9. the Coptic name "Pigeradamas" for Adamas; 10. Yaldabaoth as the evil demiurge and enemy of the race of Seth; 11. the division of salvation history into three periods; 12. an ecstatic prayer; 13. the baptism of the Five Seals; 14. secondary Christianization (Turner, 2000). Not all of these features are present in every text labelled as Sethian; according to Turner (136), Melchizedek (NHC IX, 1) is 'farthest removed from the core interests of the Sethian group'.

A closer look at this list reveals that three of the eleven writings selected from the Nag Hammadi Corpus can be labelled as Sethian pseudepigraphy in the sense that they are somehow attributed to Seth himself: the *Gospel of the Egyptians* pretends to be written by Seth who placed it in the mountain Charaxio; it will be revealed at the end of time (NHC III, 2, 68), the *Apocalypse of Adam* pretends to be a revelation transmitted from Adam to his son Seth (NHC V, 5, 64.85), and in the *Three Steles of Seth* Dositheos reports what he has read on three steles inscribed by Seth (NHC VII, 5, 118). A further Nag Hammadi writing, the *Second Treatise of the Great Seth* (NHC VII, 2), mentions Seth only in the title and does not exhibit any of the features which according to Schenke and Turner allow a writing to be labelled as "Sethian".

If we enquire about the role of Seth and the Sethians in the Nag Hammadi texts of Schenke's list, we find some variation: in the *Apocryphon of John* Seth is present on two levels: he is first mentioned (NHC II, 1, 8-9) as the son of the perfect Man (Pigera-Adamas) who in turn is the product of the will of the invisible Spirit and of Autogenes (Christ/the sixth emanation from the Father). Whereas Pigera-Adamas is placed over the first of the four illuminators Armozel, Oriel, Daveithai and Eleleth (coming from Christ, the indestructibility, through the Spirit), Seth is placed in the second light aeon Oriel. Seth's seed (= Sethians, saints) have their place in the fourth light aeon Deveithai. On a lower level, Yaldabaoth, the archon in the form of a lion-faced serpent, is the product of Sophia's abortive

attempt to conceive without the agreement of the invisible spirit (NHC II, 1, 9-10). Yaldabaoth brings forth a creation of his own, thus unwittingly emulating the pleroma of the transcendent father. Among his twelve aeons there are two called Cain and Abel (NHC II, 1, 10ff.). The creation of Adam is a long and complicated process, it is Yaldabaoth who, by blowing his spirit into Adam's lifeless body (cf. Gen 2, 7), conveyed his mother's power to him (NHC II, 1, 19). When the powers realized this, they cast Adam out into the lowest region of matter (NHC II, 1, 20). Since the transcendent Father pitied Adam, he sent him the luminous Epinoia which helps, instructs and restores Adam during his stay in the region of matter. The chief archon Yaldabaoth wished to rob Adam of the luminous Epinoia, but he failed and produced only a likeness of her, that is Eve. But when Adam looked at Eve, the luminous Epinoia appeared in her and Adam pronounced Gen 2:23-24. Yaldabaoth, in a second attempt to catch the luminous Epinoia, seduced Eve – but the Epinoia had already left her. Eve gave birth to Eloim and Yave, two archons, the one with a bear face, the other with a cat face, the one righteous, the other unrighteous. Thus sexual desire came into the world through Eve, her two bastard sons rule over the order of birth and death. Their camouflage names are Cain and Abel. Adam, however, having been awakened and having seen the luminous Epinoia, the likeness of his own foreknowledge, produced the likeness of the son of man, that is Seth (Gen 5, 3 / NHC II, 1, 24). Seth is the origin of a spiritual race, the dwelling place of the aeons. They drank from the water of oblivion and did not know their origin; it is they on whom the Spirit of Life will descend, rendering them perfect and imperishable (NHC II, 1, 25). In the *Hypostasis of the Archons* Seth is mentioned as a replacement for Abel (NHC II, 4, 91; cf. Gen 4: 25). *The Gospel of the Egyptians* – like the *Apocryphon of John* – speaks of Autogenes and the four lights Harmozel, Oroiael, Davithe and Eleleth (NHC III, 2, 1-52). Seth, the son of the incorruptible Adamas, puts his seed in the fourth aeon / the third light, Davithe (NHC III, 2, 56). Seth's seed, the unmovable race is preserved in spite of the persecutions it suffers from the powers and angels. The great Seth passes through three *parousias* (the flood, the conflagration, the judgement of the powers; NHC III, 2, 63); in the last he puts on Jesus Christ 'and through him . . . nailed the powers of the thirteen aeons' (NHC III, 2, 64). *Melchizedek* contains a reference to the children of Seth (NHC IX, 1, 5).

3. ASSESSMENT OF THE EVIDENCE

In order to warrant the inference from diverse Sethian texts to a religious group or sect called Sethians, one must first try to bring the texts we either have or whose existence and contents we can surmise into some chronological order, sketch a connection between them and try to discern a development. In this way a reconstruction of the history of Sethian literature can be attempted. As a second step one can try to view the history of Sethian literature as a history of "Sethianism" (as the religious ideology of a distinct group) or, simply, the Sethians. According to Turner, Sethianism originally arose as a coming together of two groups that had sprung up in the 1st century: on the one hand the "Barbeloites" who taught that baptismal immersion (the "Five Seals") gave access to a revelation of divine wisdom coming from Barbelo, the First Thought of God. On the other hand the "Sethites" who were 'morally earnest persons' and defined themselves as the race of Seth. The "Barbeloites" first fused with Christian baptismal groups and then, in the early 2nd century, with the "Sethites": the product of this fusion were Christian Sethians. Towards the end of the 2nd century, these Christian Sethians suffered more and more exclusion from the emerging Christian orthodoxy. In reaction to this process, Christian Sethianism redefined itself as Platonic Sethianism by shedding parts of its distinctive mythology. However, by the late 3rd century the Sethians were also attacked and rejected by the Neoplatonists [→ Neoplatonism] (Turner, 2000, 131-144).

Turner's history of Sethianism as a movement is a bold and ingenious sketch. It depends on his reconstruction of the development of Sethian literature. Turner tries to explain the ancient evidence for the production and use of Sethian literature in different contexts by assuming a later fragmentation of an originally more unified movement. However, it is doubtful whether this explanation gives full weight to the evidence provided by the ancient heresiologists. Some of the groups mentioned by them seem to have produced or used other writings whose titles we sometimes know but which might not have been Sethians by any standards. We have no indications that there was a canon of Sethian literature in the same way as there were Jewish, Christian or Manichaean canons.

Much remains to be done before we can firmly locate Sethian literature in its contemporary context. Modern scholarship has rightly emphasized its indebtedness to both Judaism and Greek philosophy. The complex mythology that deals with Seth

and Sethians has to be further explored, its roots in Jewish midrashim and apocrypha have to be determined. The problem of the precise relation between the Roman “Gnostics” and Plotinian and Porphyrian Platonism is still unsolved. It would also be important to follow up a possible link to the Valentinian school: some Valentinians designated the pneumatic race as descendants of Seth (Clement of Alexandria, *Excerpta ex Theodoto*, 54). The relation between Sethian writings and Christian literature is equally unclear; perhaps the Sethian books can partly be read as an attempt to outflank and supersede mainstream catholic Christianity.

Bearing in mind these considerations it seems at present safer to assume that ‘Sethianism is . . . a convenient working designation for a tentatively defined network of mythological and theological relationships among certain sources, the nature of whose social historical connections is still uncertain’ (Williams, 13).

Silvester, Bernard → Bernard Silvester

Simon Magus, ca. 50

1. INTRODUCTION 2. THE BIBLICAL SIMON MAGUS 3. SIMON MAGUS AS THE SUPREME GOD 4. HELENA AND THE DOCTRINE OF SALVATION 5. THE "GREAT REVELATION" (APOPHASIS MEGALĒ) 6. CONCLUSION

1. INTRODUCTION

Simon was a Samaritan magician who lived in the first half of the 1st century A.D. and is first mentioned in the biblical book of Acts (8:9-25). The early Christian anti-heretical writers considered him the founding father of → Gnosticism, the arch-heretic, 'from whom all heresies derived' (Irenaeus, *Adversus haereses* I, 23, 2). The various and sometimes contradictory traditions about his vicissitudes and teachings make him an elusive and legendary figure. In the 2nd and 3rd centuries there were Gnostics who called themselves Simonians but their relationship with the historical Simon and

his teachings is difficult to assess. After Acts, our main sources are Justin Martyr (ca. 155), Irenaeus of Lyons (ca. 180), Hippolytus (ca. 220), the apocryphal *Acts of Peter* (2nd century) and the so-called Pseudo-Clementine *Homilies* and *Recognitions* (4th century). The main elements of the teachings ascribed to Simon in these sources are the following. He claimed to be a manifestation of the "Great Power", i.e. the supreme god, and said that his companion, called Helena, a former prostitute, was in fact his First Thought. The creators of the world, which she herself had brought forth, had imprisoned her in a female body and subjected her to a long series of reincarnations until Simon finally found her in a brothel and rescued her. Because of this salvation, Simon became in the view of his opponents a Gnostic saviour and Helena the prototype of the Gnostic believer. As could be expected, all kinds of magical tricks were ascribed to him, especially in the legends which deal with his confrontations with the apostle Peter. It is extremely difficult to determine which elements belong to the earliest layers of the Simonian tradition and which are later developments. In the following, the main elements of the traditions listed above are discussed in their chronological development, preceded by an analysis of the New Testament data about Simon.

2. THE BIBLICAL SIMON MAGUS

Literary criticism has made clear that Luke's report in Acts 8 is a combination of two sources, reflected in Acts 8:9-13 and 8:14-24 respectively. The first of these sources ascribed the mission in Samaria to the scattered 'Hellenists' (see 8:1 and 4) and the second to the apostles in Jerusalem. The information about Simon from the first source is, historically, by far the most important. It related the conversion of a certain Simon, a magician, by the Christian missionary Philip. Before this event, Simon had dazzled the city by his magical arts, and his claim to be 'someone great' had been accepted by 'all of them, high and low'. They said (lit.): 'This one is the power of God which is called the great' (8:10). The scholarly debate about the meaning of this sentence has not yet come to an end, but the following observations are accepted here as ascertained: the addition 'of God' is typically Lukan (comp. Luke 22:69 with Mark 15:62 and Matthew 27:64) and the same holds for the expression 'which is called'. Then the original confession of Simon's divine status said: 'This one is the great Power'. There is a wealth of parallels which show that this corresponds either to a claim by Simon himself: 'I am the Great Power' or to a confession

of the believing community: 'You are the Great Power'. As a designation of God, the term "the Great Power" was well known in Jewish, Samaritan, Gnostic and non-Gnostic early Christian literature. On the basis of the designation alone there is no reason to suppose that the early Simonians were strongly influenced by Samaritan religious ideas or represented a group of pre-Christian Samaritan Gnostics. The only certain fact seems to be that the followers of Simon, and perhaps Simon himself, declared that he was a manifestation of the "Great Power", the highest God himself.

The second part of Luke's story of Simon, Acts 8:14-24, is generally thought to have no historical value. One of its most conspicuous objectives is to point out the difference between the miracles of pagan magicians and those of Christian missionaries, since the latter are due to the gift of the Holy Spirit. The source behind this story apparently did not know that, according to another tradition, Simon was one of the new converts who received the Holy Spirit through the laying-on of hands by Peter and John. He is said to have tried to buy the power of bestowing the Holy Spirit. Peter rebukes him: 'May your money go with you to damnation, because you thought God's gift was for sale!' (origin of the term "simony"). The story ends with Simon's request to Peter to pray for him 'that none of the things you have spoken of may fall upon me'. This scene, in which the Prince of the Apostles defeats the pagan magician, provided the pattern for later legendary confrontations between Simon and Peter.

3. SIMON MAGUS AS THE SUPREME GOD

Justin Martyr, who also came from Samaria and whose report, in his *Apology* I, 26, may be independent of Acts 8:9ff., seems to have known a group of Simonians in Rome. He says that Simon came from the Samaritan city of Gitta and in the time of the Emperor Claudius (41-54) 'performed mighty acts of magic' in Rome and 'was reputed to be a god'. According to Justin, 'almost every Samaritan, and even a few from other regions, worship him and call him the First God', which might be Justin's own Greek interpretation of the term "Great Power". His choice of words shows that by the term "Samaritan" Justin meant someone who came from the region of Samaria. In his *Dialogue with Trypho*, 120, Justin speaks about 'my people, i.e. the Samaritans', who 'err in being seduced by the magician Simon who lives in their nation'. This seems to imply that Simon was especially successful among the people Justin himself came from, the

Hellenistic Greek inhabitants of Samaria, and not in particular among the Samaritans in the specific ethnic and religious sense of the word. It seems most likely that the Simonians Justin met in Rome belonged to a syncretic religious community that had originated in Samaria and which might have adopted some specific elements of the Samaritan religion. One of these elements might be the designation "the Standing One", a divine epithet, which according to later traditions was applied to Simon (see below, sub 5). According to Justin, Simon was even honoured by the Roman Senate with a statue, erected on an island in the Tiber, with the inscription: 'To Simon, the holy god'. In *Apol.* I, 56, 4, Justin asks the Senate to destroy this statue. That such a statue had actually existed was proven in the year 1574, when a column was found on Tiber Island with an inscription of which the first words read: 'Semoni Sanco Deo'. Semo Sancus was an old Italian-Roman deity that became to be identified with the Greek Zeus Pistios. As will be shown below, Simon's followers identified Simon with Zeus, which makes it very probable that Justin knew that the Simonians of Rome claimed that the statue on Tiber Island in fact represented their Simon-Zeus. They apparently interpreted 'Semoni Sanco Deo' as 'Simoni Sancto Deo'. Irenaeus, *Adversus haereses*, I, 23, 2, repeats this story and says that Simon was glorified by many as a god. In addition to this, he says that Simon taught that he had appeared as Son among the Jews, had descended as Father in Samaria, and had come as Holy Spirit among the other nations. He was the Supreme Power, the Father who is above everything, and accepted to be called by every name people would like to call him. This means that the Simonians considered Simon a universal god, to whom the names of all known deities could be applied, those of the Christian god included, as is shown by the trinitarian structure of his appearances.

4. HELENA AND THE DOCTRINE OF SALVATION

Another aspect of the Simonian traditions first mentioned by Justin is that the Simonians not only worshipped Simon as the First God but also said that on his travels he was accompanied by Helena, a former prostitute, who was honoured as his First Thought. More information about Helena is given by Irenaeus, *Adversus haereses*, I, 23, 2, who probably depends here on Justin's lost *Syntagma against all Heresies*. Simon is said to have bought Helena in the city of Tyre, and to have called her his 'First Thought, the Mother of everything'. His

first thought had been to create the angels and archangels, and, accordingly, she had abandoned him and descended to the lower parts of the cosmos, where she had brought forth the angels and powers that were to create the world. But her offspring had imprisoned her, since they did not want to be held for someone else's offspring. In order to prevent her from ascending to her Father, she had been maltreated by her children, who locked her up in a female body and forced her to migrate from one body to another through the course of the centuries. The famous Helen of Troy had been one of her incarnations and she had finished as a whore in a brothel: she was the lost sheep of the parable (Luke 15:6). It seems certain that Helena is here a symbol of the fallen soul, which makes her historical existence very doubtful. The identification with Helen of Troy is understandable since this famous woman was considered adulterous and lascivious. She is also a symbol of the fallen soul in the *Treatise on the Soul* (NHC II, 136, 36). This text and also another text of the Nag Hammadi Library, the *Authoritative Teaching*, clearly express the idea that the soul prostitutes itself in the body (NHC II, 127, 22-128, 17 and VI, 23, 12-16; 23, 24-24, 22; comp. 24, 7-8: 'he puts her into the brothel'). The figure of Helena is very complex and, therefore, difficult to interpret. The idea that she is the first thought of the supreme god suggests a connection with the Greek goddess Athena, who was said to have sprung from the head of Zeus, which the philosophers interpreted as the manifestation of the thought and the ideas of the highest god (Lüdemann 54-56). Also in several Gnostic systems the first emanation of the unknowable god is called his first thought (Ennoia). According to Irenaeus, *Adversus haereses*, I, 23, 4, the Simonians possessed images of Zeus/Jupiter and Athena/Minerva, which they venerated as Simon and Helena respectively. It has been suggested that these identifications might be traced back to a syncretistic Zeus cult in 1st century Samaria (Lüdemann). There are, however, also many parallels between Helena-Ennoia and the Jewish Sophia, i.e. personified divine Wisdom, as well as with several Near-Eastern female deities (Ishtar, Isis) who in their turn have influenced the idea of Sophia (Fossum-Quispel). The idea of the fall of a divine emanation into the world of matter and its salvation by a Saviour is certainly not Greek but Gnostic. If it is true that Irenaeus' report in I, 23, 2, depends on Justin's *Synagoga*, it seems certain that already before the middle of the 2nd century the Simonians adhered to a undoubtedly Gnostic myth, in which the highest god and his first emanation were involved in a cos-

mic drama of fall and salvation. However, in I, 23, 3, Irenaeus ascribes to Simon a full-fledged Gnostic doctrine of salvation. The Unknown Father had come down in the person of Simon to save Helena and the human beings in general 'through the knowledge of themselves'. He wanted to correct what had gone wrong under the bad government of the angels. He appeared as a man, though he was not a man, and he suffered in Judaea, though he did not really suffer, which implies that Simon identified himself with Christ. Man is saved by Simon's grace, not by righteous deeds, for deeds are not good by nature but by accident. There are strong indications that Irenaeus or his source has attributed here some specific ideas of Basilides and the Carpocratians to Simon (Lüdemann, 81-86), of which we may be sure that they were not already part of the historical Simon's teaching.

5. THE "GREAT REVELATION" (APOPHASIS MEGALĒ)

In his *Refutatio*, VI, 19, Hippolytus mainly repeats the information he found in Irenaeus, with the addition of some allegorical interpretations of the Homeric Helen of Troy. More important is Hippolytus' presentation, in VI, 9-18, of an alleged writing of Simon himself, called the *Great Revelation* (*Apophasis Megalē*). Literary analysis has shown that the work Hippolytus had at his disposal was in fact a paraphrase or commentary, not the original *Apophasis* (Frickel). The paraphrase is a rather late Gnostic composition, possibly from the beginning of the 3rd-century, characterized by a strong philosophical, especially Neo-Pythagorean, influence (Aland). The fundamental idea of the original *Apophasis* can be deduced from a few literary quotations recorded in the paraphrase. The primeval Power, described as the 'root of the universe' or as fire, is in itself nothing, but potentially it contains everything, being and non-being. The universe gradually emanates from it; the visible originates out of the invisible, but the latter remains hidden in the former. The two worlds co-exist peacefully, there is no opposition between a pure divine world and a bad material world. In the paraphrase, this fundamental idea is interpreted in a Gnostic sense. It is used to explain both the presence of a divine spark in man and its possible return to its divine origin. As a result, the paraphrase neglects the peaceful co-existence of the two worlds of the original *Apophasis* and takes the usual negative Gnostic view of the material world for granted. It remains unclear, however, whether the original *Apophasis* was a mystical philosophical writing with some Gnostic leanings or a distinct Gnostic

composition. There is a general consensus that the *Apophysis* was not a work by the historical Simon and also that its paraphrase in Hippolytus has nothing or very little to do with the doctrines of the Simonians as recorded by Justin and Irenaeus. The only element that seems to point to an authentic Simonian background is at least part of the expression ‘He who stands (*hestōs*), took his stand (*stas*) and will stand (*stēsomenos*)’. It is used for the primeval Power, which originally was in its unalterable state of being, then expressed itself in the world of matter, and finally will return to its original status, and as such prefigures the fate of the Gnostic believer’s own self. According to Hippolytus, *Refutatio* VI, 9, Simon identified himself with Christ, who really is ‘the One who stands, took his stand and will stand’, which seems to suggest that the Simonians described Simon in that way (similar remarks in the Pseudo-Clementine *Homilies*, II, 22, 3-4, may be dependent on Hippolytus). What we certainly know is that the Simonians called Simon “the Standing One” (*ho hestōs*), as is testified *int. al.* by the non-Gnostic writer, → Clement of Alexandria, *Stromateis*, II, 52, 2. As an indication of the highest god or principle this term is found in Samaritan, Hellenistic Jewish and Greek philosophical and hermetic writings [→ Hermetic Literature]. It has been taken as proof of the Samaritan background of Simonian Gnosticism (Fossum), but the evidence is far from compelling. The same holds for the connection between Dositheus, a heretic in Samaritan sources, and Simon. According to the 4th-century Pseudo-Clementine *Homilies*, II, 24, Dositheus succeeded John the Baptist as leader of the sect, but he was outrivalled by Simon, who then came to be worshipped as the Standing One in his place. The Pseudo-Clementines are based on an earlier writing (“Grundschrift”) which was strongly influenced by Jewish-Christian ideas. The magician Simon figures in them as the opponent of the apostle Peter, but there is a broad scholarly consensus that behind Simon the real targets are the apostle Paul and (also or exclusively) → Marcion.

6. CONCLUSION

Already before the middle of the 2nd century there was a Simonian sect whose members worshipped Simon as the manifestation of the First God and Ennoia/Helena as his First Thought. The association of Ennoia with Helena, who was a symbol of the fallen soul, makes it virtually certain that these Simonians were Gnostics. If it is true, as accepted by many scholars, that the Jewish Sophia is hiding behind Helena, the Simonians may have

adhered to a primitive Gnostic system, in which the Highest God comes down to rescue his fallen female counterpart, thus prefiguring the salvation of the individual believer. The creation of the world by maleficent angels may also have been part of their ideas, which is the more likely if Irenaeus, who is the first to mention this, at this point is dependent on Justin Martyr. There is no evidence, however, that these ideas go back to the teaching of Simon Magus himself. If the information in Luke’s Acts is to be trusted, he seems to have been a pagan miracle worker and a strong religious personality, who proclaimed, or was by his followers proclaimed, to be a manifestation of the Great Power, the supreme god. There is no indication that at that time Ennoia/Helena was already connected with Simon. That he was influenced by some typically Samaritan religious ideas or even can be taken as a pre-Christian Samaritan Gnostic, cannot be proven with any certainty. Simon remains a very elusive figure: “The quest for the historical Simon (and Helena!) is even less promising than the quest for the historical Jesus” (Meeks).

ROELOF VAN DEN BROEK

Sincerus Renatus (ps. of Samuel Richter),
* end of 17th century Reichau, † year
and place unknown

A native of Reichau, a village of the duchy of Brieg in Silesia, Richter is said to have worked as a tutor for noble families and studied medicine, then theology, at Halle, before becoming a Lutheran pastor at Hartmannsdorf, near Landeshut (also in Silesia). His first publication, dated 1709, published 1710, and presented by the author as an ancient manuscript transmitted by initiates, was called *Die Warhaffte und vollkommene Bereitung Des Philosophischen Steins* (The True and Perfect Preparation of the Philosophic Stone). Two further works of Sincerus Renatus appeared in Breslau in 1711, entitled *Theo-philosophia theoretico-practica* (Theoretical-practical Theo-philosophy) and *Goldene Quelle der Natur und Kunst* (Golden Fountain of Nature and Art). The contents of these three works found such a reception among readers that a complete reprint was necessary in 1741. This

appeared in Leipzig and Breslau as *Sinceri Renati sämtliche philosophisch- und chymische Schriften* (Sincerus Renatus’s Complete Philosophical and Chemical Writings).

The complete titles of these texts indicate the twin foci of their content: → alchemy, and the Rosicrucians [→ Rosicrucianism]. Samuel Richter belongs within the tradition of Christian Hermeticism [→ Hermeticism and Hermetic Societies] which included → Paracelsus, → Weigel, → Jakob Boehme, Schwenckfeld, and the pietists [→ Pietism]. He states that there can be no philosophy without theology, and vice versa, since God and Nature cannot be separated. His *Theo-philosophia* resides in the unity of faith and knowledge.

According to Richter, the whole universe has arisen out of God’s desire to manifest himself. Following the example of Boehme, Richter thought that God had first been *Ungrund*, the bottomless Divinity. Then, in order to know himself, God had to manifest in duality, divide himself, be born from himself, and so become Nature (the Latin word *natura* is derived from the verb *nascor*, which means “to be born”). Thus God initially divided into two principles: dark fire and luminous fire, or wrath and love. The fire is God the Father; the light is the Son; and the Holy Spirit manifests the eternal Wisdom. As in Boehme, this creation was realized in seven stages. It was afterwards that Lucifer appeared, who by his luminous hyper-concentration destroyed the equilibrium between light and darkness. He was thus the first creature to oppose his own will to that of his Creator, and to introduce evil into the world.

God was thereupon constrained to make a new creation, manifested by the divine Word: “Let there be light”, while Lucifer was thrown by God into the realm of death. As for man, he was originally the perfect creature in God’s own likeness. That is why he was then both male and female, able to reproduce through → magic. But when Adam felt himself to be alone, he lost the magic force of the divine *fiat*. God then created a companion for him and fed them both on the manna of Paradise, until Lucifer’s renewed intervention with the apple precipitated both Adam’s fall and the corruption of the new creation.

But before this occurred, according to Sincerus Renatus, God had introduced the ‘name of Jesus into the seed of the woman’, in such a way that Jesus is invisibly inscribed in the nature of each human being. He is ‘the true philosophers’ stone, the tincture of our inner being’, capable of purifying and redeeming him. Samuel Richter states that God has also given to outer and corrupted nature

an earthly Savior, a *Lapis philosophorum*, which every man is capable of preparing as soon as Christ has purified his soul and regenerated him.

It is evident how far removed this pastor, a disciple of → Hermes Trismegistus and → Ramon Llull, was from Lutheran orthodoxy; but in the redemption of nature, in this *Theo-Philosophia* which was in fact a philosophy of divine immanence, one finds ideas of → Heinrich Khunrath and certain aspects of → Johann Valentin Andreae's novel *The Chemical Wedding of Christian Rosencreutz*. However, Samuel Richter modified the name of the original Rose-Cross by instituting a "Gold- und Rosen-Creutz" (Gold and Rose Cross), at the same time supposing that the last representatives of the Rosicrucian brotherhood had left Europe and settled in India to found a new community there, whose statutes he reproduced [→ Rosicrucianism II].

It is precisely in the last chapter of his vast work that one finds a collection of fifty-two practical rules to be followed by the members of the Brotherhood of the Gold and Rose Cross after their profession of faith. Among other things, one learns that after their admission they must change their name and become rejuvenated thanks to the grace of the philosophers' stone; that their Christian allegiance, whether Protestant or Catholic, must not be revealed; that they are not permitted to marry, but if need be may satisfy their desires with a woman; that they must convoke at Pentecost; that it is absolutely forbidden to them to reveal the secrets of the Art that has been communicated to them; and lastly that their Emperor must change his name and his residence every ten years.

Samuel Richter's thought carried on in the so-called "enlightened" 18th century the convictions of alchemical theorists such as Heinrich Khunrath and → Gérard Dorn, whose ideas had influenced the first Rosicrucians. Moreover, Rolf Christian Zimmermann has amply demonstrated how strongly the Hermeticism of Sincerus Renatus oriented what he calls the "private religion" of the young → Goethe. Finally, the Golden and Rose Cross launched by Samuel Richter had an important influence in the circles of → Freemasonry, so that one may say that he has continually been *renatus* – reborn.

Spiritualism

1. TERMINOLOGY 2. ORIGINS 3. THE SPREAD AND DEVELOPMENT OF SPIRITUALISM 4. REFORMISM AND PROGRESSIVISM 5. CRISIS AND TRANSFORMATION 6. SPIRITUALISM IN ENGLAND 7. SPIRITUALISM OUTSIDE ENGLISH-SPEAKING COUNTRIES

1. TERMINOLOGY

In its most basic form, Spiritualism is simply the belief that living men can and do hold intercourse, usually through an intermediary, with "spirits" of the dead. It is thus both a recurring possibility of human experience in all ages and a specific, historically defined phenomenon with roots in mid-19th century America. The first definition is so sweeping as to be of little use, encompassing as it does every-

thing from the trance voyages of shamans to King Saul's recourse to the Witch of Endor, and only the historical movement will be discussed here.

2. ORIGINS

The middle 50 years of the 19th century in America were a time of unprecedented religious and social unrest. Upstate New York, which was to witness the birth of Spiritualism in 1848 as it had already seen the birth of Mormonism, Adventism, Millerism and other new cults, was the heart of the "burned over district" where religious revivals had flourished and then died, leaving in their wake a yearning to find experience, conviction and novelty and establishing a socially accepted framework for expressing them when found. There was widespread dissatisfaction with the established, old-line Evangelical churches and their exposition of the Bible, and in New York and the entire Northeast of the United States generally those soon to embrace Spiritualism in droves had turned to the more socially conscious Universalism which denied all authority but that of the individual's own experience ("Individual Sovereignty"), rejected the uniqueness of Biblical revelation, the Church and the role of Christ and rejoiced in the fact that death no longer promised judgment and threatened hell but instead was but the gateway to continued life. This northeastern Universalist background of its first adherents was the predominant force in shaping early Spiritualism, and with rare exceptions the new movement made few inroads in the more evangelical southern states or among Catholics in America.

Although the American Shakers had been communing with the spirits of American Indians since the early 1840s (and later asserted their priority in founding Spiritualism), the origins of Spiritualism lie in the experiences in 1848 of the three daughters of John D. Fox. Fox, a Methodist, had moved to a farm near Hydesville, New York, in the vicinity of Rochester in late 1847. With him were his wife and two unmarried daughters, Margaretta (7.10.1833-8.3.1893) and Catherine (Kate) (27.3.1837-2.7.1892). The girls' older married sister, Ann Leah Underhill (1814-4.11.1890), lived nearby in Rochester. The family regularly heard mysterious knockings about the house without being able to ascertain the cause. The house was small and single-storied, and the family slept together in a loft under the pitched roof. It was there on the night of March 31, 1848 as the family prepared for bed that Margaretta and Kate responded to the knockings and precipitated Spiritualism. While the knockings were occurring, Kate snapped her fingers or

clapped her hands and her pattern was imitated. Margaretta then called out, 'Now do just as I do', and clapped her hands while counting out numbers. The knocks followed her lead. The children's mother then asked if the source of the noise was a spirit, and told it to respond with one knock for 'no' and two knocks for 'yes', and heard two resounding knocks – Yes! Communication had been established.

The family's neighbors were called in the next day, to hear the knocking and ask questions of their own. It gradually came to light that the spirit communicating was that of a peddler, slain in the house and buried in the basement – an assertion later buttressed by the father with the production of a few bones and teeth supposedly found in the basement. Seeking advice and help, the family visited Isaac Post (1798-1872), a Quaker and devoted abolitionist, who devised the long-standard method of communicating with rapping spirits by assigning each letter of the alphabet a certain number of knocks.

Among the instructions thus received from the spirit, was the command to give public demonstrations of the girls' abilities, and the first was held at Corinthian Hall in Rochester on November 14, 1848. Four hundred attended, paying 25 cents each for the privilege, and, despite some criticism that the girls were causing the rapping themselves, the audience largely gave credence to the spirits' messages of consolation to the bereaved and the continuity of life after death. In 1850 the girls visited New York City, where they gave three seances a day (at \$1.50 per person) and managed in the process to convert Horace Greeley, the editor of the *Tribune*, to the new cause. By 1852 they had removed to New York City to conduct seances, but by that time the sisters, who had never in any sense been the leaders of the new movement or believed to be in any way more holy, highly evolved or "spiritual" than those attending their seances, had become peripheral, though revered, figures in the movement. The sisters' subsequent history is marked by strife, alcoholism and confessions of fraud. As Spiritualism moved away from simple rappings, the girls tried other forms of mediumship and Kate in later years even touted her infant son as a writing medium, but despite their efforts they never recaptured the public acclaim of their youth.

3. THE SPREAD AND DEVELOPMENT OF SPIRITUALISM

The new movement spread immediately and widely. By the end of 1849, it was the subject of universal discussion, and seances were being held

throughout the Northeast and as far west as Ohio. New mediums (as those with the ability to communicate with the spirits were called) appeared everywhere in the Northeast, usually young women who developed the talent spontaneously after attending one of the Fox sisters' seances or simply after hearing of them. New methods also began almost immediately to be developed to facilitate the spirits' communication – and to heighten the mystery and conviction of the seances.

Circles for the investigation of the new phenomena appeared before 1850 in Auburn, Boston and Stratford (Connecticut), and an informal ritual quickly began to emerge for private seances, involving the preparatory singing of church hymns, the dimming of the seance room lights and the holding of hands around a table. By 1855 the number of spiritualists in the United States was estimated to be between one and eleven million people – in a country of only 28 million. These numbers, and all of the other frequently cited membership estimates from the rest of the century, are unreliable, but it cannot be doubted that the number of people who believed in the new phenomena and occasionally attended a seance was very large. The high point of enthusiasm in America was probably the mid-1850s. The American Civil War (1861-1865) and the beginning of the revelations of bogus and fraudulent mediums at about the same time put an end to the rapid growth of the movement, and the last quarter of the century saw the gradual diminishing of interest in Spiritualism coupled with an increasing recourse on the part of mediums to theatricality.

Almost immediately Spiritualism began to turn to ever more phenomenal, theatrical methods and demonstrations of the spirits' power. First came automatic writing, in which the entranced medium's hand was taken over to write the spirits' words, then light trance, in which the medium was inspired to speak the thoughts of the spirit, and full trance, in which the unconscious medium voiced the words of the spirit. Soon there were painting mediums, whose organisms were used by the spirits to draw scenes from the afterlife or of departed friends; slate readers, who could read the messages scrawled by the spirits between bound slates; and musical mediums, in whose presence musical instruments flew around the darkened rooms and played simple tunes. Throughout the 1850s tables and furniture shook and turned of their own accord and rapped out the spirits' messages.

By the mid-1850s a class of professionals had arisen, called "test mediums", who took the stage at public demonstrations to show the power of the

spirits. To their audiences, they were largely undistinguishable from stage magicians, and indeed the connection between stage magic and prestidigitation and this development of Spiritualism is very strong, with several of its practitioners having a foot in both camps. The Davenport Brothers, Ira Erastus (1839-1911) and William Henry (1841-1877) are a good example. Beginning in the 1850s, they traveled the United States and Europe with their wonderful show, challenging the audience in each place to invent better ways to tie them to prevent cheating. While the brothers were bound in their special cabinet the spirits would speak in their own voices and play instruments to entertain the audience. It is no accident that in 1910 Ira Davenport, in his old age, recognized his kinship with Harry Houdini. Another example is Annie Eva Fay, an American in London in the mid-1870s, who first tried to promote abilities very similar to those of the Davenports as stage magic, and then, achieving no success, turned her abilities to mediumship.

The pinnacle of this phenomenal side of Spiritualism was materialization. By the early 1870s, mediums were able regularly to produce the physical appearance of the spirits, usually as faces seen through apertures in the medium's cabinet, though occasionally as full, three-dimensional materialized bodies that could wander among and touch the attendees at seances. Notable in this regard was the English medium Florence Cook (1856-1904) whose spirit Katie King enthralled Sir William Crookes. In America, the Eddy Brothers, William (1838-1932) and Horatio (1842-1922), produced a host of materialized spirits at their house in Vermont.

From some early spiritualists' point of view, the increasing involvement of the spirits with the material world was simply a demonstration that the spirits were learning how to interact with matter. From a more cynical point of view, however, the tendency toward showmanship might more readily be explained by the competition of mediums for jaded audiences, a competition that must not be ignored in assessing the movement. Increasingly lost sight of in all this flourishing of the marvelous was any connection with the spirits' original messages, which tended to take second place to the test mediums' showmanship. Some, such as → A.J. Davis, denounced these developments as unwholesome and fraudulent, while others, such as D.D. Home, pointed out the dangers of entrusting the prosperity of the new movement to the honesty of promoters and showmen. The debate continued until the end of the century in America, with the leading spiritualist journal, *The Banner of Light*

of Boston, crediting each phenomenal claim and ignoring the increasing evidence of fraud, while its competitor, *The Religio-Philosophical Journal* of Chicago, took the opposite tack and denounced phenomenalism and publicized every occurrence of fraud. By 1900, the massive evidence of deception convinced even the *Banner*, and organized Spiritualism began to distance itself from recourse to the marvelous as proof of its message – although fraudulent phenomenal Spiritualism still existed sufficiently in the 1920s for Harry Houdini to crusade against it.

One should note in the above description of early Spiritualism the limited role assigned to the medium and the simplicity of the spirits' message. The medium was the necessary condition to the appearance of the spirits – the wire, as it were, of the spiritual telegraph (as the new phenomenon was dubbed), bridging the two worlds – but no more than that. Mediumship required no special spiritual talents or holiness, conferred no authority, and was a gift that left its possessor spiritually unchanged. It was only gradually that individual mediums, such as → Emma Hardinge Britten (1823-1899) and Cora Linn Victoria Scott (later the Rev. Cora Richmond, 1840-1923), imposed their personalities on the movement and took leading roles in guiding and developing it. The original spirit message delivered by the mediums was simply that the human individuality survived death and could communicate from the afterlife. Immortality should have been a commonplace belief in Christian America, but the spirits supplied proof to a skeptical and doubting world with their wondrous rappings.

Lacking in the simple message of Spiritualism in the early days was a coherent philosophy distinguished from that of non-spiritualists. In the truest Protestant spirit, each man was his own interpreter. Each convert brought to the new movement his or her own beliefs and easily combined them with the fundamental tenets of survival and communication, although the teachings of → Swedenborg and the Mesmerists [→ Animal Magnetism] most readily and commonly were called upon to meet the needs of the new movement. La Roy Sunderland (1802-1885), for example, who founded the first truly spiritualist journal – *The Spiritual Philosopher* in Boston in July 1850 – explained the phenomena in light of his own predilection for phreno-magnetism, calling the result “Pathetism”, just as the Rev. Thomas Lake Harris (1823-1906) turned to the teachings of Swedenborg. It remained for Andrew Jackson Davis to craft what, lacking a better alternative, the spiritualists adopted in

broad outline as their version of cosmology and philosophy.

Davis was properly a clairvoyant seer, rather than a spiritualist, and although it was his Harmonical Philosophy that American Spiritualism commonly took up as the filter through which to view its phenomena, his visions antedate Spiritualism and properly stand independent of it – a fact that required Davis in later years, especially in the debates in the 1870s over the value of marvelous phenomena and the relative merits of Spiritualism and occultism [→ occult / occultism], to explicitly avow that he believed in ghosts and was himself a medium. He saw the cosmos as a series of successive, concentric universes, thrown off from the primordial vast globe of divine central fire. God was thus immanent in man himself and in nature, and man at death began his progress through ever higher and more refined spheres of the divine.

The first publication of his teachings, a pamphlet (deliberately never reprinted) entitled by Rev. Smith, the transcriber of Davis's trance utterances, *Lectures on Clairmativeness* (New York 1845), was still decidedly Christian in tone. “Clairmativeness” was the neologism used to describe the heightened state of clairvoyance in which Davis experienced his visions. By 1847, however, when the first major compilation of his revelations was published as *The Principles of Nature*, he had become increasingly opposed to the Bible and to Christianity, rejecting the unique place of Jesus Christ and discarding the idea of the resurrection of the dead and other Christian doctrines. Davis went on to write voluminously of his visionary experiences and medical discoveries. Though he survived until 1910, his role in Spiritualism was finished by the early 1870s when he attacked the errors of phenomenal Spiritualism.

4. REFORMISM AND PROGRESSIVISM

Despite its general adoption of Davis's philosophy, American Spiritualism in its first 25 years of existence was extremely limited in its cast of characters, its goals, and its view of the nature and potentialities of man. Almost without exception, the only entities who appeared at seances (or indeed who were thought to exist in the spiritualists' universe) were spirits of dead humans, and fairly recently dead humans, at that. The spirits of American revolutionary heroes such as Tom Paine, Benjamin Franklin and Thomas Jefferson, along with the spirits of suitably progressive American Indians, appeared most commonly at seances, joined occasionally after the Indian Mutiny of 1857 by the unrepentant spirit of Nana Sahib. Surprisingly,

non-human spirits such as angels played little role at seances; nor was there room in the worldview of the movement for the appearance of spirits of living men or of the great spiritual teachers (prophets, masters, mahatmas, adepts and the like) of the past.

All of this is understandable in the light of the fact that the understood purpose of early Spiritualism was simply to convince of immortality, nothing more. The goal was not personal fulfillment, development, perfection, individualization, psychic powers or vision in this life. Individual progress might come in the next life, since it was obvious that the spirits of the dead were more evolved and better informed than the spiritualists who attended seances, but this progress was thought to be the product of good living and morality, rather than the result of initiatic, occult or magical effort directed toward that goal. The goal of the early spiritualists, once convinced of their own survival and immortality, was profoundly this-worldly: social progress and reform here and now. An article in the *Religio-Philosophical Journal for Bastille Day 1866* made the point explicitly: 'From the earliest announcement of modern Spiritualism, it has been heralded by its advocates both public and private as a reform movement. The "Fatherhood of God and the Brotherhood of Man", "Free Speech", "Free Press", and Equal Rights under the law, whether the civil or higher law . . .'. All spiritualists were thus reformers, and, conversely, almost all of the mid-century reformers (whether devotees of woman's rights, abolition, prohibition, economic reform, or food, health and dress fads) dabbled, at least, in Spiritualism and found support among the spirits for their views.

Intimately coupled with this commitment to reform was the spiritualists' belief in eternal progress and evolution, both here and after death. In this world, the existence of the American republic was the crowning proof of progress. In the next world, in the most common cosmological mythology adopted by the spiritualists (that of A.J. Davis), the soul after death was to progress and ascend to the next level of existence, there to work out its faults before continuing its inevitable ascent through an indefinite series of worlds, each higher and more perfect than the preceding. An important corollary of this belief in progress was the spiritualists' conviction that higher truth lay in the future, not in the past, and in the developed West rather than in the benighted East. There was simply no room in early Spiritualism for the notion of hidden, secret wisdom or *prisca theologia* handed down from a past Golden Age or preserved among the adepts and masters of the East. Spiritualism thus

rejected as rank superstition the accouterments of ancient → magic and mystery, and denounced as undemocratic all thought of spiritual elites, initiation and secret societies.

Finally, early Spiritualism was unsatisfactory from a personal point of view because it was first and foremost an indirect, secondhand experience. The medium, herself frequently unconscious and in trance, mouthed the messages of the spirits to the faithful, who received them passively, in their normal consciousness, in exactly the same way as they might have received ideas from reading or from attending a sermon. The difference lay only in the special conviction imparted by the wondrous methods the spirits chose to use in communicating, and these were subject to challenge and doubt.

5. CRISIS AND TRANSFORMATION

Spiritualism had a brief resurgence in America around the end of the Civil War in 1865, perhaps the consequence of bereaved relatives seeking consolation from their sons and fathers dead in the war, but by the early 1870s the movement had fallen on hard times. One after another, spiritualist journals ceased publication, and the reports of seances and traveling mediums in the journals grew fewer. It was precisely at this low point that Spiritualism experienced a profound crisis that was, in the end, to transform it beyond the recognition of its earliest followers. The transformation is associated with the names of → Paschal Beverly Randolph, Emma Hardinge (Britten), → H.P. Blavatsky and → H.S. Olcott.

Randolph (1825-1875), was a black American visionary, and his visions first led him into Spiritualism, where he became a highly regarded trance medium in the mid-1850s. As he struggled to preserve his sanity from possession by the spirits, however, he came to see the dangers inherent in the medium's passivity, and sought refuge in Europe and the Near East. There he found both psychoactive drugs and a system of active magical practice involving clairvoyance through magic mirrors and sexual magic. On his return to America he founded the first of several short-lived Rosicrucian orders to promulgate his teachings. He did not deny the truths of Spiritualism, though he had denounced the immorality and passivity of trance mediums in 1858, but addressed in turn each of the perceived limitations of Spiritualism. For Randolph, man was a spiritual being, independent and immortal, who by Imperial Will and active magical practice could elevate himself in this life to a role in the celestial hierarchies. There were spirits of the dead, and mediums could communicate with them, but far beyond them were the awful denizens – gods,

powers and demigods – who ruled the universe. Man could come into contact with them through active clairvoyance and magical practice. Randolph's ideas had some success among the spiritualists of the 1860s and 1870s, but ultimately he was rejected because of his race and his eccentricities. He committed suicide in Toledo, Ohio in 1875, though his work survived in the early → Theosophical Society, the → Hermetic Brotherhood of Luxor and other occult groups, all of which arose from and built upon a spiritualist base.

Emma Hardinge Britten (1823-1899) was far more an integral part of Spiritualism. Born in England and trained as a pianist and singer, she came to New York in 1855 and almost immediately embraced Spiritualism and became an inspirational medium. Until her death, she labored mightily in the cause of Spiritualism, crisscrossing the United States, Australia and Great Britain to deliver the spirits' message. Her short standard instructions for conducting seances are still in use in spiritualist circles today, and her two massive histories of the early days of Spiritualism are indispensable to the student. Despite this effort and enthusiasm, however, Hardinge's Spiritualism was in many surprising ways unorthodox.

By her account, her occult life began long before she left England where she had functioned as a magnetic subject with a magical group in London she called the Orphic Circle. The group was secret, but the details of its workings were told by Hardinge (in the person of the Chevalier Louis de B., one of the group's members) in novel form in *Ghost Land*, in 1876, and in *Art Magic*, a treatise on magic and the magical world published later the same year, both of which excited a storm of protest among the spiritualists. For Louis/Hardinge, the universe was the familiar univocoelum of A.J. Davis, but it was populated by far more than living and dead humans, and, with proper instruction and practice, men, both in this life and after death, could become 'God-men – heavenly men, strong and mighty Powers, Thrones, Dominions, World-Builders, glorious hierarchies of Sun-bright Souls . . . Gods in person' in a never-ending ascension through the celestial hierarchies. Louis/Hardinge's most lasting lesson to Spiritualism was that there were 'no phenomena produced by disembodied spirits, which may not be effected by the still embodied human spirit, provided a correct knowledge of these powers is directed by a strong and powerful will'.

This mixture of occultism, adepts, astral projection, secret societies and practical techniques of individualization and spiritual development crys-

tallized in the mid-1870s in the work of Mme. H.P. Blavatsky and Col. H.S. Olcott, and it was upon their heads that directly fell the onslaught of threatened Spiritualism. Under the guidance of Mme. Blavatsky, Olcott in 1875 and after had begun publicly attacking Spiritualism for precisely the deficiencies already pointed out by Randolph and Hardinge, but he had the audacity, following the lead of Mme. Blavatsky, to challenge the most fundamental tenant of Spiritualism: the identity of the communicating spirit. According to Blavatsky, the entity that most often communicated at seances was the discarded psychic shell of the dead, and not the departed's immortal spirit. The outrage was enormous as every prominent spiritualist joined in denouncing the superstition of what came to be called "magical spiritualism", but when the uproar settled down, Spiritualism itself had been transformed and had incorporated into its shared presuppositions the leading thoughts of occultism: active will, individual spiritual development, magical practice, and hierarchies of beings besides man above and below him on the cosmic ladder – all of which, together with the idea of → reincarnation derived from Theosophy, formed the *koine* of Spiritualism as it entered the 20th century.

6. SPIRITUALISM IN ENGLAND

Word of the new movement reached England almost as soon as it began. A.J. Davis's *Principles of Nature* had been published simultaneously in America and England in 1847, and the first American medium, Mrs. Maria Hayden, reached London in 1852, where she caught the attention of → Edward Bulwer-Lytton, Earl Stanhope, Dr. John Ashburner, Ms. Anna Blackwell and many others of the fringe intelligentsia, and started the first English spiritualist journal, *The Spirit World* (1853). She was the first of a wave of American mediums, including P.B. Randolph and the repatriated Emma Hardinge, to descend on England, and American mediums held a place of preference there until the 1880s. In 1855, the Scotch-born but American-raised Daniel Dunglas Home (1833-1886) appeared in London and created a furor among the upper classes for whom he presented his phenomenal powers. According to the awed accounts of his visitors, with his helping spirits he was able to levitate himself at will, fly in and out of open windows, rock massive tables and play instruments – all more or less in the light. Home made no contribution to the philosophy of Spiritualism, but was the most successful of the phenomenal mediums and enjoys the reputation (not totally accurate) of never having been exposed or caught in trickery.

By the end of the 1850s, England was home to a large number of spiritualists, divided largely along class and regional lines. The first major spiritualist journal was *The Yorkshire Spiritual Telegraph and British Harmonial Advocate* (1855-1859), largely devoted to accounts of the wonders of the seance, followed by *The London Spiritual Magazine* (1860-1877), a Christian monthly edited by Thomas Shorter and William Wilkinson. The pre-eminent journal of the early period was *The Spiritualist Newspaper* (1869-1882), devoted to the investigation and analysis of the phenomena of Spiritualism.

England's great contribution to Spiritualism was organizational and analytical. While there had been halfhearted and unsuccessful efforts to organize Spiritualism in America beginning in the 1860s, they came to naught over the fierce independence of the American spiritualists and their aversion to dogmatic formulation, and an American National Association of Spiritualists emerged only in the 1890s and then only as a means of garbing Spiritualism, for practical and political reasons, as a church – a fact that would have struck the early adherents of Spiritualism as preposterous. Provincial British spiritualists, largely middle class in background, united under the influence of Emma Hardinge Britten to form the Spiritualists National Federation in 1891 and the organization continues today as the Spiritualists National Union. The spiritualists of London, a more educated lot, first organized as the (British) National Association of Spiritualists, then as the Central Association of Spiritualists, both of which struggled to reconcile the members' conflicting interests and then expired, to be replaced by the London Spiritualists Alliance under the direction of William Stainton Moses ("M.A. Oxon."), a noted writing medium and author. The LSA survives today as the College of Psychic Sciences – which reveals in its name the transformations that early Spiritualism has undergone since its founding. Britain also pioneered the secular, intentionally disinterested and supposedly scientific study of the phenomena of Spiritualism in isolation from its doctrine – an attempt that after 120 years has proved inconclusive. The Society for Psychical Research was begun in 1883, with such eminences as W.S. Moses and F.W.H. Myers as members, and later included such noted historians of Spiritualism as Frank Podmore.

7. SPIRITUALISM OUTSIDE ENGLISH-SPEAKING COUNTRIES

The origins of Spiritualism in France were complicated by the existence there of a well-developed form of Mesmerism, exemplified in the work of

Baron Dupotet (1796-1881) and Louis-Alphonse Cahagnet (1809-1885), who had extended the boundaries of Mesmerism to embrace many of the phenomena and experiences of Spiritualism and what came to be called magical Spiritualism. By the time American Spiritualism reached France in 1849, their investigations had already established the existence of the trance state ("somnambulism") and the value of drugs and magic mirrors for contacting the dead and the celestial hierarchies, and Cahagnet's book *The Celestial Telegraph*, which was published in English in 1848, was of considerable value in confirming the truths of Spiritualism among the educated Americans.

The situation of Spiritualism in France is further complicated by the doctrines of its leading early exponent, Hypolyte Léon Denizard Rivail (→ Allan Kardec, 1804-1869). His approach to Spiritualism was doctrinal, and he drew his doctrines from the spirits themselves, through the lips of his magnetized somnambules. His *Le Livre des Esprits* (1857), which taught the multiplicity of inhabited worlds and the role of a personal God as well as the survival of the individual soul, has never since been out of print in many languages and in a variety of countries, and it has become the Bible of the leading current of French Spiritualism – denominated "spiritism" to distinguish it, and especially its belief in reincarnation on this earth, from American and British Spiritualism. For a time in the 1860s and 1870s, two rival French spiritualist papers, Kardec's *Revue Spirite* (1858-) and Z. Piérart's *Revue Spiritualiste* (1855-1870), struggled for supremacy on behalf of the competing streams of thought, but by the end of the century spiritism had triumphed in France. At the International Spiritist and Spiritualist Congress organized in Paris in 1889 with the young Gérard Encausse (→ Papus) as secretary, the attempt was made to formulate an agreement at least on the two fundamental points of (American) Spiritualism, belief in the immortality of the soul and in communication with the spirits of the dead, but the attempt came to naught over the spiritists' insistence on the special position to be accorded Kardec's works.

While the first mediums from the U.S. and England visited Germany in the early 1850s, Spiritualism took root there only slowly. As had been the case in France, it immediately accommodated itself to pre-existing movements, especially idealism and Mesmerism (as exemplified in the Odic researches of Baron Karl von Reichenbach, 1788-1869), and the fascination with the visions and powers of the Seeress of Prevorst (Friederike Hauffe (1801-1829) [→ Justinus Kerner]). The first spiritualist journal in

Germany, *Psyche: Deutsche Zeitschrift für Odwissenschaft und Geisterkunde* (Grossenhein, 1865-1866), appropriately, reflected these interests in its title. The most notable characteristic of Spiritualism in Germany was its broader acceptance in intellectual and scientific circles, an acceptance that Spiritualism never came to have in the rest of the world. This is exemplified by the work of Johann Karl Friedrich Zöllner (1834-1882) and Gustav Theodor Fechner (1801-1887) in studying the slate-reading abilities of the American medium Henry Slade in Leipzig in the late 1870s. The fact that recourse was had to a foreign medium is indicative of the movement's lack of penetration among the population in general, though there were indigenous German-speaking mediums, such as the Hungarian Baroness Adelma von Vay (1840-1925). The most influential German-language spiritualist journal was the monthly *Psychische Studien* (1874-1925, and then as *Zeitschrift für Parapsychologie* until 1934). Paradoxically, it was founded and edited by the Russian Aleksandr N. Aksakov (1832-1903). Censorship in Russia had prevented its publication there, as it had forced *Rebus* (1881), an earlier Russian spiritualist journal that Aksakov financially supported, to be disguised as a puzzle magazine. *Psychische Studien* combined accounts of spiritualist phenomena (many of them from British and American journals) with theoretical discussions of Spiritualism and its phenomena contributed by leading scholars, all tending over time in the direction of parapsychology and away from the original simple notions of American Spiritualism.

In Spain, Spiritualism had existed in isolated pockets even before arrival of the teachings of Allan Kardec in the late 1850s, but it was his books that set the tone for and determined the path of Spiritualism in Spain in the late 19th century. The revolution of 1868 freed the movement from Catholic censorship (there had been an auto-da-fe of spiritualist publications as early as 1857), and by 1888 the Spanish spiritualists hosted the "Congreso Internacional Espírita". The leading early journals were *El Criterio Espiritista* of Madrid (1869) and *La Luz del Porvenir* of Barcelona, published by the poetess Amália Domingo Soler (1835-1909).

In Italy, unlike Spain, Spiritualism developed both along spiritualist and spiritist (Kardecist) lines, prompted initially by the visit of D.D. Home there in 1854. The first Italian-language journal, *L'Amore del Vero*, appeared in 1863, contenting itself with recounting tales of spiritualistic wonders from foreign journals, but it was superseded by the

influential *Annali dello Spiritismo in Italia*, begun in Turin the next year by Niceforo Filalete (ps. of Vincenzo Scarpa), which functioned as the clearinghouse for information on Spiritualism in Italy and throughout the rest of the century.

It is always easier to discern the presence and activity of the literate classes, since they were the ones who have left traces in the surviving periodicals and publications, but the widespread nature of spiritualist activity in Spain and Italy can be gleaned from the existence of local societies whose only surviving record is their name. There were over a hundred each in Spain and Italy by 1875, many with their own small journal, indicating an active recourse to Spiritualism that continues even today, although Spiritualism there – as everywhere – has been profoundly modified by Theosophic and occult ideas. In Spain and Italy also, as in all of the Catholic countries to which it spread, Spiritualism rediscovered its original "progressive" political nature, intermingling it with a decidedly anticlerical tone.

The most striking example of the successful spread of Spiritualism (and of its ability to accommodate new strains of thought) is provided by Brazil. By the early 1870s, Spiritualism in its Kardecist form had reached Brazil, where it initially enjoyed wide support among the wealthy classes of European background despite opposition from the Catholic Church. The first journal was begun as early as 1876, and the Federação Espírita Brasileira, which continues today, was founded in 1884. Spiritualism in Brazil is perhaps the most active form of Spiritualism in the world at present, though it has taken two distinct paths, largely distinguished along class lines: one branch continues the "pure" spiritism of Allan Kardec and the other intermingles Kardec's ideas with beliefs and practices based upon Umbanda and Candomble and other alternative religions of African derivation.

By the time of the First World War, Spiritualism worldwide had been transformed by its incorporation of the leading elements of western occultism, Theosophy and → New Thought and, in America, by its adoption of the outward form of a peripheral Christian church. At present it is distinguished from the → New Age generally only by its emphasis on mediums and the seance.

JOHN PATRICK DEVENEY

Starkey, George (ps.: Eirenaeus Philalethes), * 8 or 9.6.1628 Bermuda, † summer 1665 London

The character of George Starkey has long been eclipsed by that of his fictional creation the alchemical adept Eirenaeus Philalethes, "author" of some of the 17th century's most influential and popular treatises on transmutational → alchemy. Starkey's books, published both under his own name and under that of Philalethes, render him the most widely read scientific writer from the New World until Benjamin Franklin.

Starkey was born in Bermuda, the son of a Scot-

tish minister who had settled there in 1622. As a youth, he showed keen interest in natural history, and made detailed observations of insects, especially their metamorphoses. When he left Bermuda is unclear, but as early as 1639 one of his deceased father's associates wrote to John Winthrop, governor of the Massachusetts Bay Colony, looking for educational opportunities for the young Starkey. In 1643, Starkey matriculated at the fledgling Harvard College, where he received the bachelor of arts degree in 1646, and the master's probably in 1649. In 1644, he embarked upon his life-long study of chemistry and its medical applications; already towards the end of the summer of 1645 he began practical experiments in search of the Philosophers' Stone. Soon becoming acquainted with the writings of → Joan Baptista Van Helmont, Starkey quickly added the alkahest and the volatilization of alkalis to his list of sought-after secrets. By 1648, at the age of twenty-one, he had also developed a flourishing medical practice in New England. During his time in the Massachusetts Bay Colony he associated with John Winthrop, Jr., first governor of Connecticut, who was himself interested in alchemy, as well as with many skilled metallurgists, physicians, and technicians. In early 1650, Starkey married a daughter of Colonel Israel Stoughton, but whether they had any children is unknown.

In late 1650, Starkey left New England for London because, as he later recalled, he was unable to conduct laboratory experiments adequately in Massachusetts owing to the scarcity of fit equipment and supplies. In London he met the intelligencer and German emigré Samuel Hartlib – who had received reports of Starkey's prowess some years earlier – and was introduced to the circle of reformers and projectors gathered around him. In January 1651, he met → Robert Boyle (possibly acting as his physician) and soon thereafter he began tutoring Boyle in chemistry, introducing him particularly to Helmontian ideas. Starkey shared several of his most treasured chemical secrets with Boyle, and Boyle partly financed Starkey's work, including the preparation of *ens veneris*, a Helmontian pharmaceutical. Starkey's formative influence on the young Boyle was profound.

Despite Starkey's success as a physician, he gave up his practice in the early 1650s to devote himself fully to his research after the *arcana maiora*. Unfortunately, this decision, together with the depletion of his wife's dowry, resulted in his imprisonment for debt in 1653. After his release, possibly helped by Boyle, he resumed his studies and later published two works on Helmontian pharmacy – *Natures Explication and Helmont's Vindication*

(1657) and *Pyrotechny Asserted* (1658) – which incorporated his new laboratory findings. For much of the remainder of his short life, Starkey was embroiled in financial and legal difficulties, and published only brief tracts and broadsides advertising his medicines or asserting his priority over preparations co-opted by others. In the well-known mid-century battle of Helmontian “chymical physicians” versus the predominantly Galenic medical establishment, Starkey was a vociferous champion of the former. Finally, during the Great Plague of 1665, while the Royal College of Physicians fled London, Starkey and several fellow Helmontians remained, with the result that Starkey himself caught the plague and died.

In 1651, Starkey had begun telling of an anonymous alchemical adept he had known in New England. This adept, who would later bear the name of Eirenaeus Philalethes (“Peaceful Lover of Truth”), allegedly demonstrated transmutation before Starkey and gave him a small portion of the White Stone as well as several manuscripts dealing with how to make the Stone. Starkey circulated what he claimed to be some of these “American” manuscripts in the Hartlib Circle where they were eagerly received. Starkey’s first publication, appearing under the name of Eirenaeus Philoponus Philalethes (he had used the name Philalethes Philoponus for himself privately in 1651), was the verse treatise *Marrow of Alchemy* (1654-5). This work deals with making the Philosophers’ Stone, but also recounts the tale of Starkey’s dealings with the mysterious adept; while Starkey here veils his own name in anagrams (“Egregius Christo” and “Vir gregis custos”) and casts himself only as an “editor,” he later acknowledged his authorship of the book. In late 1655, during Starkey’s absence from London owing to his employment in mineral works at Bristol, one of the circulated “Philalethes” manuscripts was published without his knowledge. This work, the *Epistle of George Ripley to King Edward IV Unfolded*, was the only other Philalethes text published during Starkey’s lifetime. After his premature death, however, many more manuscripts which had circulated during his lifetime were eagerly sought after, published, and studied. These treatises adopt a “Mercurialist” approach to the Stone; they argue that a special philosophical mercury is to be prepared from common mercury, and this substance then digested with gold over a lengthy period of time to provide the transmuting powder. The Philalethes works were favored by, among many others, Sir → Isaac Newton.

Although the identity of the author of the Phi-

laletes treatises was long a matter of controversy, it is now clear that Starkey was in fact their true author. Significantly, in the *Vade-mecum philosophicum* (published 1678), Philalethes is cast as the student of a master named Agricola Rhomaeus. This name is revealed as a clever and learned word-play by translating the Latin first name into Greek and the Greek last name into Scottish dialect, which gives us “georgios stark”, as the true master, and indeed creator, of Philalethes. Starkey hid his authorship so well that even his friend Boyle did not know the truth, and long after Starkey’s death Boyle endeavored to contact the elusive Philalethes whom he believed to be living in France.

Starkey’s surviving laboratory notebooks, recently published, reveal him as an extraordinarily careful and able experimenter. Starkey combined his practical laboratory prowess with scholastic methods of logical inquiry and textual analysis and the Helmontian emphasis on quantitative analysis and weight determination. These private notes reveal how a prominent mid-17th century alchemist carried out his daily researches, reflecting upon practical results, deriving theories therefrom, and using theory in return to propose new “conjectural processes” to be tested in the fire. Moreover, Starkey’s writings also reveal much about the secretive, allegorical style of alchemical treatises, for while the Philalethes tracts contain some of the most elaborate and bizarre imagery in all of alchemy, the very same processes are described in clear, detailed, and reproducible terms in Starkey’s private papers and letters. Thus, the conscious use of alchemical *Decknamen* and allegory to encode practical laboratory secrets in a measured, organized way is apparent. Starkey also developed corpuscular theories of matter, expressed both in works published under his own name and under that of Philalethes.

LAWRENCE M. PRINCIPLE

Steiner, Rudolf, * 25.2.1861 Kraljevec (Croatia), † 30.3.1925 Dornach (Switzerland)

Rudolf Steiner was born in Kraljevec, Croatia (then part of the Austrian-Hungarian Empire) on 25 February 1861, although his official birthday is the 27th, the day he was baptised. He was an eldest son, with a sister and a younger brother born later. Having worked originally as a forester, Steiner’s father was employed at the Austrian railways, mostly in the more remote parts of the Austrian-Hungarian empire. Steiner received a formal Roman-Catholic education, but this was largely for reasons of tradition and conformism: his father considered himself a *Freigeist* (“free spirit”) and had strong anti-clerical sentiments.

Already as a child, Rudolf had clairvoyant experiences. When he was seven years old, he had a vision of an aunt committing suicide, but could not share this experience with either his parents or anyone else in his surroundings. As he tells us in his autobiography, he instead retreated into his soul, finding there an inner life that was full of spiritual experiences, especially with regard to the beautiful natural surroundings that formed the background of his youth. The only comfort in his loneliness was geometry, which showed him a world of the spirit that was completely detached from sensible, material reality. Geometry as well as science, especially cosmology, were among his earliest interests. In October 1872 Steiner entered the *Realschule*, a technical high school in Wiener Neustadt, graduating with great success in 1879. At age sixteen, he discovered Kant’s *Critique of Pure Reason* which he clandestinely read during the boring history lessons, but without finding any answers to the questions that occupied him, and without being aware of Kant’s place in the history of philosophy. On the whole, Steiner was very much a self-taught pupil, finding his own way in German literature, philosophy and higher trigonometry and calculus.

In 1879 Steiner registered as a student of geometry and physics at the Technical University

(*Technische Hochschule*), with the intention of becoming a teacher at a *Realschule*. Nevertheless, his most inspiring teacher during this period was Karl Julius Schröer (1825-1900), who was neither a mathematician nor a physicist, but a rather isolated professor of German literature. Schröer has been a very important influence on Steiner. He introduced him to → Goethe and the thought of the *Weimarer Klassik* in general, which was to become one of Steiner’s most important preoccupations in the years to come. Schröer was one of the few to seriously study the very philosophical, but in the mind of many also very undramatic and unperformable second part of Goethe’s *Faust*. Steiner would later not only give extensive commentaries on it, but would also bring it to the stage in its entirety.

Furthermore, Steiner took many courses in philosophy, especially those taught by Robert Zimmermann (1824-1898) and Franz Brentano (1838-1917). Although as a student he took a very critical attitude towards these figures, Brentano’s philosophy in particular was to become a life-long interest. In his later *Von Seelenrätseln* (On Enigmas of the Soul, 1917) Steiner states that a consistent elaboration of Brentano’s phenomenology would have led the man straight to a more spiritual understanding of the human soul, something which, however, Brentano himself never achieved. Again, Steiner’s most important philosophical studies were extra-curricular. Right at the beginning of his student years, he discovered the *Wissenschaftslehre* by Johann Gottlieb Fichte (1762-1814), which provided him with the basis on which the rest of his philosophical work would be built. Fichte’s philosophy centres around the “I” (*Ich*) that posits itself in an act of non-empirical self-perception. The “I” is thus the self-identical centre or focal point of all diverse and qualitatively different acts of consciousness. Having discovered by means of Fichte the true nature of the human spirit and its pure thought activity, Steiner then struggled with the question of finding the bridge from this solipsistic “I” to external nature. The answer came in 1881-1882 by means of his contact with Felix Kogutzki (1833-1909) a collector of medicinal herbs who lived in the country, but whom he met on the train to Vienna, where Kogutzki sold his herbs. Kogutzki transmitted to Steiner a non-academic, traditional and spiritual knowledge of nature, which the latter would later refer to as the last vestiges of Rosicrucian wisdom [→ Rosicrucianism]. In his four *Mystery Dramas* of 1910-1913, Steiner gives a portrayal of Kogutzki in the person of Felix Balde. In the so-called “Document of Barr”, a series of auto-

biographical notes for the French theosophist → Edouard Schuré (1841-1929), and in an autobiographical lecture of 4 February 1913, Steiner emphasizes that Kogutzki acted as an intermediary who introduced him to an even more important person. Using theosophical terminology, he refers to this person as one of his two “Masters”, who initiated him (the other one being Christian Rosencreutz himself). Steiner suggests that in the years following his “initiation”, this unknown “Master” gave him a few further tasks. He was to devote himself, first, to the respiritualisation of the decadent, materialist Western civilisation, and especially its intellectual foundation, the physical sciences; and second, to the public teaching of a Christian, non-Oriental understanding of → reincarnation and karma.

The only tangible outcome of this encounter with Kogutzki is a manuscript that Steiner sent to the philosopher Friedrich Theodor Vischer (1897-1888) in 1882 and that was found in Vischer's *Nachlaß* in 1938. In this manuscript, entitled “Einzig mögliche Kritik der atomistischen Begriffe” (Only Possible Critique of Atomist Concepts), Steiner sketches how pure thought can grasp what he calls the “Ideas”: pure, non-empirical essences reminiscent of Plato, which can then be recognised in nature through sense experience. In this way, nature can be seen as the external revelation of the spirit that man can also sense from within. This conviction would become the nucleus of Steiner's subsequent philosophical and scientific work.

Soon after his contact with Kogutzki, Steiner started reading Goethe's works on the natural sciences. Through the mediation of Schröer, this led in 1882 to an invitation by Josef Kürschner to edit these works for his “Deutsche National-Literatur”. Steiner would only finish this project in 1897. In his introductions and notes, and in publications such as his 1886 *Grundlinien einer Erkenntnistheorie der Goetheschen Weltanschauung* (Basic outlines of an epistemology of the Goethean worldview, 1886), Steiner states that Goethe's work in the natural sciences was more than just a haphazard set of empirical observations combined with a poetical, idealist look at nature; it was the application of a consistent epistemology, which Steiner calls phenomenological. Steiner describes Goethe's method as a path that leads from empirical observation to the experience of the objective Ideal Type; in the case of plants this is the so-called “Urpflanze”, the objective Idea that underlies the diverse appearances and metamorphoses in empirical reality. Thus, in the 1880s and 1890s Steiner developed his

philosophy, which can be seen as a reintroduction of the objective idealism of Hegel and Schelling at a time when philosophy was dominated by the subjectivism and anti-Idealism of neo-Kantianism. Steiner, however, did not simply restore Hegel's abstract speculations, but combined his dialectical method with the empiricism or phenomenology of Goethe and a conception of the free, non-empirical thought activity of the “I” that was ultimately derived from Fichte. In fact, whereas Goethe had claimed ‘never to have thought about thinking itself’, Steiner applied Goethe's phenomenological method not just to external phenomena but to thought activity itself.

Steiner had to develop this philosophy in a non-academic context. In 1882, he had decided to quit his studies and devote his time to the Kürschner edition and other literary activities. In order to gain a living he was forced to become a private tutor in rich Viennese households. His most memorable job was with the rich Jewish family Specht, that had many connections with members of the Viennese elite, including Sigmund Freud's collaborator Josef Breuer (1842-1925). Steiner's education of the youngest, mentally retarded son was such a success that the boy was later able to get a university education and become a dermatologist. These experiences and the ones with his own deaf and dumb younger brother became the basis of his later *Heilpädagogie*, an orthopedagogical method geared at the mentally handicapped that has become an international movement. In this period, Steiner also became a political editor of the *Deutsche Wochenschrift* and came into touch with members of the cultural elite of Vienna, such as the poets Marie Eugenie delle Grazie (1864-1931) and Rosa Mayreder (1858-1938), and the neo-Thomist professor of theology Wilhelm Neumann (1837-1919). The poet Friedrich Eckstein, personal secretary of the composer Anton Bruckner, introduced Steiner to → alchemy, Rosicrucian writings, modern theosophy [→ Theosophical Society] (Sinnet's *Esoteric Buddhism* and Mabel Collins' *Light on the Path*) and the theosophical circle around Marie Lang (1858-1938). In letters and personal conversation with Rosa Mayreder, however, Steiner still showed himself quite critical of the “Schwachgeistererei” (feeble-mindedness) of the theosophists. From the correspondence between Eckstein and Steiner we learn that Steiner was, nevertheless, profoundly interested in Eckstein's discoveries of the alchemical and Rosicrucian symbolism in Goethe's *Märchen* (The Fairytale of the Green Snake and the White Lily), his unfinished *Geheimnisse* (Secrets) and *Faust II*. In fact, this kind of esoteric reading of

Goethe's poetical works would later mark Steiner's transition from his philosophical to his esoteric career.

Steiner's work on the Kürschner-edition led to an invitation from the recently grounded Goethe-Archives in Weimar to edit Goethe's works on natural sciences in the framework of the new, critical edition, the famous *Weimarer Ausgabe*. Steiner moved to Weimar in 1890 and stayed there until 1897. He complained bitterly about the bad salary and the boring philological work, but found the time to write his main philosophical works during his Weimar period. These are, first, his doctoral dissertation, which was accepted by the University of Rostock in 1891 and turned into a book in 1892 under the title *Wahrheit und Wissenschaft: Vorspiel einer Philosophie der Freiheit* (Truth and Science: Prelude to a Philosophy of Freedom); second, his *opus magnum*, the *Philosophie der Freiheit* (Philosophy of Freedom) of 1894; and third, his 1895 book on Nietzsche, *Friedrich Nietzsche: Ein Kämpfer gegen seine Zeit* (Friedrich Nietzsche: A Fighter Against His Time).

Steiner's high hopes that his philosophical work would gain him a professorship at one of the universities in the German-speaking world were never fulfilled. Especially his main philosophical work, the *Philosophie der Freiheit*, did not receive the attention and appreciation he had hoped for. In this work, Steiner develops his definitive version of objective idealism. The world initially appears to us in its separation between sensible experience ("Beobachtung") and intelligible idea ("Begriff"), or in other words, matter and form of knowledge. By uniting the experience of the object with its non-empirical idea in the act of knowledge, the human mind restores the original unity of Essence ("Begriff") and Appearance ("Beobachtung") of the object itself. This act of knowledge is a free creation of the human spirit that by its very creation is part of evolving reality itself. Steiner thus strongly repudiated the neo-Kantian subjectivism that dominated the philosophical scene in his days. While the first part of the book develops his epistemology, the second part propounds his ethics, which has its center in the free individual. Moral acts are not a matter of obedience to general rules or abstract duties, but acts which originate in knowledge of a unique situation which is founded upon a freely captured idea ("Intuition"). This general idea becomes individualized through the moral subject's individual feelings and experience, or in other words through love and respect for other people and through moral phantasy. Steiner here criticizes the abstract duty ethics of the Kantians, on the one

hand, and the dominant Schopenhauerian pessimism, naturalism and anti-intellectualism, on the other. Both parts of the book are clearly complimentary and centre around the concept of freedom. The act of knowledge presupposes a free act of human consciousness, while free, moral acts presuppose knowledge of the situation through the Intuition. Both epistemology and ethics are concerned with the free human act, which is nevertheless part of an objective reality that, precisely through these free human acts, has the character of an evolving, dynamic whole. In 1918, long after Steiner changed his philosophical for his esoteric career, Steiner issued a second edition of this work, which substantially differed from the original one. He now claimed that the individual appropriation of its contents by the reader would provide the experiential basis for a spiritual path that turns conventional, materialist thought into an organ for spiritual experiences by which the free individual gains access to the spiritual world. While there is certainly a certain tension between the "philosophical" version of 1894 and the "esoteric" version of 1918, it must be said that the description of the intuition in 1894 as a non-empirical, spiritual ("geistiges") capture of the objective idea does constitute a bridge to Steiner's talk of a spiritual world and spiritual experiences in 1918.

During Steiner's Weimar years, Elisabeth Förster, Friedrich Nietzsche's sister, tried to engage him in her project of editing both the published and the unpublished works of her brother, who had now fully fallen victim to mental illness; but these attempts ended in an open conflict. These circumstances may perhaps explain, partially at least, the surprising contents of Steiner's small book on Nietzsche of 1895. It consists of a short summary of the main elements of Nietzsche's philosophy, combined with remarkably extensive passages in which Steiner praises Nietzsche as an *unzeitgemäße* hero who shows us a way out of our decadent civilisation. These passages stand in stark contrast to the criticisms of Nietzsche voiced by Steiner prior to 1895, and especially to a number of publications from 1899 onwards, which speak of Nietzsche's philosophy as a 'psychopathological problem' and as the ramblings of a man 'who is not one of the leading figures of the age'. Part of the explanation may be, not only that Steiner hoped to be able to flee from the Goethe Archives and work for Elisabeth Förster, but also that his book on Nietzsche immediately followed his own main philosophical work. Steiner fully identifies himself with his subject, and to a large extent his summaries tell us more about his own philosophy than about that of

Nietzsche. This is especially true of the concept of *Übermensch* (Superman), which Steiner interprets as the free, autonomous individual that becomes intellectually aware of his own motives of action, realising these while respecting the autonomy of the other members of his community. Steiner thus explains away Nietzsche's biologism, his anti-intellectualism, his glorification of unconsciousness impulses and the Superman's destructive, anti-social and profoundly egoistic behaviour. After having completed his book, Steiner was introduced to Nietzsche himself. According to his own much later report in his autobiography, he was able to gain a spiritual insight in Nietzsche's soul, that dwelled freely in the spiritual worlds, detached from his ailing body that lay idly on the couch. Whether or not Steiner already fully realized this in the 1890s, it seems that this observation integrated both his positive and negative judgments of Nietzsche. On the whole, he saw Nietzsche as a truly great mind and a philosophical idealist, who would have agreed with most of Steiner's own philosophical positions if he had not, due to his weak sense of objective truth, become a victim of the materialism and scientism of his age, leading him to his bizarre and even dangerous later philosophy that was but a prelude to his insanity.

In 1897 Steiner moved to Berlin, where he became the chief editor of the literary journal *Magazin für Literatur*. He engaged in contacts with most of the leading writers and artists in Berlin. He also became a member of several literary and philosophical clubs, such as the circle around Ludwig Jakobowski (1868-1900) which comprised writers such as Else Lasker-Schüler (1869-1945) and Erich Mühsam (1878-1934), and the *Giordano Bruno Bund* founded by Bruno Wille (1860-1928), which propagated a non-confessional, anti-clerical monism according to which matter was completely permeated by spirit. Moreover, despite his harsh words about socialism in the *Magazin für Literatur*, Steiner accepted an invitation to teach in the *Arbeiterbildungsschule*, a social-democratic school for the working classes founded by Wilhelm Liebknecht (1826-1900). It appears that the turn of century was also a personal turning-point for Steiner. In his autobiography he speaks about a crucial inner experience that occurred shortly before 1900: he had a spiritual vision of what he calls the Mystery of Golgotha, Jesus Christ's redemptive, world-transformative death and resurrection.

In fact, Steiner's life did change considerably after 1900, though the evolution of his thinking seems to have taken place gradually. First of all, he gave up his editorship of the *Magazin für Literatur*.

Moreover, in the years immediately after 1900 Steiner not only became active within the → Theosophical Society, but simultaneously grew closer to Christianity as well. The very combination of these two facts already makes it clear that Steiner occupied a rather unique place within the theosophical current. In 1900 he was asked by Countess Brockdorff, leader of a theosophical circle in Berlin, to give a memorial lecture on Nietzsche, who had died in the same year. This led to an invitation for further lectures. Steiner now decided to speak about *Goethes geheime Offenbarung* (Goethe's Secret Revelation), having written an essay under the same title in 1899. In his lecture, Steiner discusses the esoteric, more in particular Rosicrucian sources of Goethe's work, especially in his fairy tale on the green snake and the white lily.

Thus, the transition from Idealist philosopher to esoteric teacher was marked by a discussion of Goethe, who, according to Steiner, not only stood on an Idealist basis, but was also profoundly influenced by the alchemical-Rosicrucian tradition. In his explanation of Goethe's fairy tale, Steiner states that the snake that sacrifices itself stands for the lower forces of the soul which have to be transformed in order to serve as a bridge to the higher, spiritual worlds. After this, the secret temple, which stands for the old esoteric wisdom and currents exemplified by the Rosicrucians, will be able to rise to the surface, i.e. become publicly known. In fact, these two themes (as well as many others that can be traced in the fairy tale) of sacrifice and transformation of the natural soul, and the public revelation of old, secret doctrines preoccupied Steiner in the following years.

Steiner also lectured on *Die Mystik im Aufgang des neuzeitlichen Geisteslebens* (Mysticism at the Dawn of the Modern Age), which he turned into a book in 1901. Discussing late medieval and early modern "mystics" such as Eckhart, Tauler, → Nicholas of Cusa and → Jakob Boehme, Steiner shows that external knowledge of nature and inner, mystical experiences do not exclude each other but, on the contrary, mutually enrich each other. He claims that, *mutatis mutandis*, modern natural science should be combined with an inner, "mystical" path. On the one hand, this will prevent the spiritual path from drifting off into foggy, uncontrolled speculation, while on the other, it will prevent natural science from becoming materialist and anti-human. What we witness here is a metamorphosis of his earlier philosophical position which tried to combine Idealist philosophy not only with Goethean physics but also with the modern scientific method (the subtitle of *Philosophy of*

Freedom is: “Seelische Beobachtungs-Resultate nach naturwissenschaftlicher Methode”, i.e. “Results of observations of the soul by means of scientific method”), which is actually quite reminiscent of Brentano’s program of a “scientific” philosophy of mind. Steiner now tried to combine spirituality or “mysticism” with modern physics.

Steiner deepened his relation to the Christian tradition in a subsequent series of lectures, *Das Christentum als mystische Tatsache* (Christianity as a Mystical Fact), which also resulted in a book (1902). Here, Steiner gives his own version of perennialism [→ Tradition]: Christianity was foreshadowed by the secret wisdom that was transmitted to a few chosen ones who were allowed to be initiated in the Greek and Egyptian temples. The initiates had to go through inner processes of death and resurrection, after which they were shown all kinds of secrets concerning both the macrocosmic and microcosmic world. Christ did not just teach these things, but physically went through all these processes in broad daylight, thereby turning secret knowledge into a public, physical fact. Spiritual knowledge, which, until then, had only been accessible either after natural death or by the artificially-induced “inner” death in the temple, could henceforth be acquired by each and every person by means of our natural, daily consciousness.

In subsequent years, Steiner came to a deeper understanding of the importance of precisely this “mystical” fact. His spiritual experience in 1899 may have made a deep impression, but it nevertheless took him quite a struggle to shake off his earlier quite dismissive attitude towards Christianity, apparent in his book on Nietzsche and in many other places. In the years around 1900, for example, we find him defending Ernst Haeckel’s (1834-1919) version of Darwinism against his creationist critics in a number of publications. True, Steiner tried to avoid Haeckel’s materialism by combining it with Goethe’s idea of metamorphosis, but he certainly did not spare Haeckel’s Christian critics. In the years after 1900 Steiner was able to find his own access to what, using theosophical vocabulary, he called esoteric or true Christianity: a Christianity which went beyond the denominational differences and theologies of ordinary Christianity, of which he had been so critical.

Together with his later second wife Marie von Sivers (1867-1948), Steiner became the leader of the German Section of the Theosophical Society in 1902, the year in which he also publicly announced himself to be a theosophist. He did so by means of a lecture on *Monismus und Theosophie* (Monism and Theosophy) for the *Giordano Bruno Bund*, of

which he continued to be a member until 1905. Steiner considered it important to give a public statement of this fact, because of his preoccupation with the public revelation of old, secret knowledge. He shared this preoccupation with → Madame Blavatsky, whose *Secret Doctrine* and other works he had gotten to know and appreciate around 1902.

The following years, Steiner led an amazingly productive life as a writer and teacher within the Theosophical Society. He founded his own journal, *Luzifer-Gnosis* and, together with Marie von Sivers, his own publishing house, the *Philosophisch-Anthroposophischer Verlag* (in 1908). By these means he was able to disseminate an incredible amount of books and lectures, all of which were to a certain extent tributary to Blavatsky and other theosophists, but also gradually emancipated themselves to a considerable extent from theosophical vocabulary and approaches. Despite his success as an esoteric teacher, Steiner seems to have suffered from being shut off from academic and general cultural life, given his continued attempts at getting academic positions or jobs as a journalist.

In the years after 1902, Steiner composed a series of works that are known as his “basic” books. Among them is *Theosophie* (Theosophy) of 1904, which contains a spiritual psychology according to the three-fold division of body, soul and spirit (“Geist”) and the four-fold division of physical body, etheric body, astral body and “I”. This “I” or spirit is described as the immortal core which reincarnates in a new body. In 1904/1905 Steiner wrote his *Wie erlangt man Erkenntnisse der höheren Welten?* (How does one attain knowledge of the higher worlds?; translated as “Knowledge of the Higher Worlds and Its Attainment”) which describes a path for developing spiritual knowledge of higher worlds, divided into the three levels of → imagination, inspiration and intuition. It also contains Steiner’s version of the theosophical doctrine of Chakras. Finally, mention must be made of *Geheimwissenschaft* (Secret Science; translated as “Occult Science”) of 1910, which is Steiner’s most voluminous work. It not only describes the planetary evolution of the earth, but also human evolution. This is also the book in which he fully discusses the central importance of Christ’s death and resurrection for both the earth and humanity. It allows man to overcome and transform evil, described here for the first time in its dual character of Ahriman and Lucifer. Furthermore, in a series of lectures, such as *Die Apokalypse des Johannes* (The Apokalypse of St. John) of 1908, *Von Jesus zu*

Christus (From Jesus to Christ) of 1911, and several lecture series on the four gospels, Steiner provided the basis for one of his core doctrines, namely his Christology. Furthermore he gave an enormous amount of other lectures all over Europe on a wide range of topics.

Besides the descriptions of the spiritual path contained in *Knowledge of the Higher Worlds* and elsewhere, that were meant for the general public, Steiner also privately taught pupils in his *Esoterische Schule* (Esoteric School). This school comprised three “classes”, related, respectively, to, imagination, inspiration and intuition. The third class, which was intended to spiritually coach people in their daily, professional life, does not seem to have functioned, but the first two classes did. The first class, active from 1904 until 1914, worked with spiritual exercises based on theosophical literature such as Collins’ *Light on the Path*. Until 1907, this group was formally part of the Esoteric School of Theosophy. However, in that year Steiner decided to withdraw his “first class” from the EST in the wake of several scandals, the most important of which centered around → Annie Besant’s claim that the Mahatmas who had appeared at → Henry Steel Olcott’s death bed had nominated her as his successor. Annie Besant in fact agreed with Steiner’s decision, but interpreted it in terms of a division of labour: Steiner, who supposedly knew nothing about Oriental wisdom, would concentrate on his Christian-Rosicrucian spiritual path, whereas Besant herself would be responsible for the Oriental yoga-path.

Steiner’s second class, active from 1906 until 1914, had a more ritual and artistic, and less intellectual character. Steiner adopted the Memphis-Misraïm rite of John Yarker’s masonic order, of which both he and Marie von Sivers became members. In this connection they had to get into contact with Theodor Reuss (1855-1923), who would later be involved in the so-called → Ordo Templis Orientis (OTO), associated with → Aleister Crowley and centered on sexual magic. Despite many allegations to the contrary, it seems that Steiner’s contacts were merely formal, and occurred before the somewhat adventurous OTO-affair. Likewise, Steiner’s relation to → Freemasonry was a rather loose one, and during the First World War Steiner even publicly accused Anglo-American masonic lodges from manipulating politics in order to gain world dominance. In several lectures he describes masonic forms and rituals as dead entities, which have to be resurrected from a completely new perspective. For instance, Steiner gave his own interpretation of the masonic *Tempellegende*, which

tells the story of the antagonism between King Solomon and Hiram, the temple architect. Steiner sees it in terms of the deeper division between a current that comes from Abel and another one that comes from Cain; or in other words, the current of the priests (that according to Steiner was eventually represented by the shepherds present at the birth of Jesus), and the current of the inventors, builders and cultivators of the earth (represented by the kings or magi who paid their homage to Jesus). In many ways, Jesus Christ thus reunited these two historical currents within humanity.

The period from 1910 until 1914 was a very eventful one. Steiner wrote his four *Mystery Dramas* (three further ones were planned, but never written), which showed on stage the karmic connections of an esoteric group of people and their evolving relations to Christ and Lucifer/Ahriman over several incarnations. In these plays, Steiner and Marie von Sivers continued an artistic impulse that they had already initiated at the 1907 World Conference of the Theosophical Society in Munich, when they had decorated the conference room with occult symbols largely derived from the Rosicrucian tradition and had staged Edouard Schuré’s mystery plays. This artistic impulse would find its culmination with the building of the *Goetheanum* (initially called *Johannesbau*) in Dornach (Switzerland) from 1913 onwards, after several attempts to build similar edifices in Stuttgart, Malsch and Munich had failed. The *Goetheanum*, completely constructed out of wood, and one of the first examples of organic architecture, was not only meant to provide a headquarters for Steiner’s esotericism, but also to be a visible realisation of the Goetheanist ideal of a new synthesis of religion, art and science – domains that had fallen apart in the secularized, materialist western world.

From 1910 onwards the relations between Steiner and the leaders of the Theosophical Society, especially Annie Besant, became more and more strained. This finally led to a break between Steiner and the Theosophical Society, the immediate cause of which was the movement around Jiddu Krishnamurti and the foundation of the *Order of the Star in the East* in 1910/1911, which venerated him as the incarnation of “Maitreya the Christ” (Christ and Maitreya the Buddha taken together). Initially, Steiner tried to avoid open criticism of this development, but he did start a series of lectures where he explained his view of the second coming of Christ (e.g. *Das Ereignis der Christus-Erscheinung in der ätherischen Welt*: Christ’s Appearance in the Etheric World, a number of separate lectures in 1910). According to Steiner, the Second Coming

should be understood as the apparition of Christ in the etheric world, and not as a new physical incarnation. From 1933 onwards, humanity would, according to Steiner, develop new organs for experiencing Christ in the spiritual world. By his redemptive act Christ had already transformed the physical world and man's physical body and hence he did not need to reincarnate again in a physical body. In this connection, Steiner also extensively discussed the figure of Christian Rosencreutz and the Rosicrucian manifestoes of the early 17th century [→ Rosicrucianism I]. Steiner took the biographical accounts in the *Fama Fraternitatis* and the *Chymische Hochzeit* as largely authentic reports of real occurrences. According to Steiner, Rosencreutz is the leading Master of the modern West, who will help us find the etheric Christ.

Steiner thus increasingly stressed his own adherence to Western, Christian esotericism as opposed to the orientalism of Besant c.s. At the same time, however, he continued to pledge allegiance to theosophical perennialism by stressing the important contributions of the Vedanta tradition to the development of esotericism, the similarities between Christ and Krishna etc., in a number of lectures, such as *Die Bhagavad Gita und die Paulusbriefe* (The Bhagavad Gita and the Epistles of Paul, 1912-1913), which followed up on earlier lecture series such as *Der Orient im Lichte des Okzidents* (The Orient in the Light of the Occident) of 1909. Nevertheless, in these lectures Steiner did present Indian spirituality as a stage of preparation for Christianity, and certainly not as an equally high or even higher form, as Besant did. In this connection, Steiner also suggested that the breathing exercises of the yoga tradition were good for ancient Indians but not for modern Europeans, who had to follow the purely spiritual, more intellectual path described in *Knowledge of the Higher Worlds*. According to Steiner, breathing exercises tie our souls more to our physical body, whereas we should try to liberate ourselves from it. After a series of events in 1913, the rift between Steiner and Besant could no longer be repaired. Steiner's group founded the *Anthroposophische Gesellschaft* on 28 December 1912, which had its first official meeting from 3 to 7 February 1913. Steiner himself did not become a member of the board of this society, which used the term "anthroposophy" that he had mentioned from time to time in his lectures. After the break, Steiner came to consistently refer to his own esotericism as "anthroposophy", and increasingly used his own terminology instead of the old theosophical vocabulary, which was also deleted from the new editions of works such as

Theosophy and Knowledge of the Higher Worlds.

During the First World War, Steiner continued to oversee the building activities in Dornach, undertaken by a very mixed and colourful group of local workers and exiled anthroposophists from many European countries, and to give his lectures on a wide range of topics. In response to the war, Steiner in these lectures intensely focused on political and social questions. Drawing from the theosophical doctrine of races as well as the Romantic cultural psychology of Herder and others, he devoted special attention to the problem of the different *Volksseelen* (the souls of the several European peoples, especially those of *Mitteleuropa*) and their specific tasks. Steiner showed himself highly critical of President Woodrow Wilson and what he called Anglo-American dominance in general, defending the position of Germany and Austria. In lectures, memoranda to both the Austrian and German governments (to which Steiner had access thanks to high-ranking anthroposophical officials), a book (*Die Kernpunkte der sozialen Frage* [The Core Issues of the Social Problematic], 1919; translated as "Towards Social Renewal: Basic Issues of the Social Questions") and a pamphlet (*Aufruf an das Deutsche Volk* [Appeal to the German People]), Steiner outlined his vision of a new political and social philosophy that avoids the two extremes of capitalism and socialism. Steiner propagated the so-called tri-partition of society, distinguishing between the domain of the state or the legal sphere, responsible only for inner and outer security; the domain of cultural life, in which different national, religious and other groups should freely organise their own education and culture; and the domain of economical life, which should be based on free associations of producers and consumers who coordinate needs and prices. In this way Steiner tried to give a new content to the slogan of the French Revolution: liberty (cultural life), equality (state/legal sphere) and fraternity (economic life). The independence of cultural life from the state, in particular, was intended as a solution for the problems of the multi-ethnic Austrian-Hungarian Empire.

At the request of Emil Molt (1876-1936), director of the Waldorf-Astoria Tobacco Factory, Steiner also became involved in the founding of a new type of school, the *Waldorfschule*, for which he provided the curriculum and the pedagogical philosophy. This pedagogy is based on Steiner's idea of the tri-partition of the human organism, a doctrine on which he had worked from 1904 onwards, but which came to full blossom in this period. Steiner divided the human organism in the

region of the head or nervous-sense system, seat of the activity of thought; the heart-lung region or rhythmic system, seat of the activity of feeling; and the metabolic system, seat of the activity of will. This tri-partition became the very core of Steiner's anthropology; and in many publications he traced what he called an occult physiology, studying the relation of the human organism to the Trinity, the celestial hierarchies, its development in life after death, the soul's path through the diverse planetary regions, etc. Steiner's educational philosophy is based on the principle that all three aspects of the human organism should be harmoniously mobilised in a child, avoiding the customary overemphasis of the intellectual pole.

On New Year's Eve 1922/1923 the *Goetheanum* was set on fire and completely destroyed. In the final years of his life, Steiner not only drew up a plan for a new *Goetheanum* built of concrete, which was only realised after his death, but also worked towards a new constitution of the Anthroposophical Society, which was re-founded during the so-called Christmas Conference (*Weihnachtstagung*) of 1923. After long hesitation, Steiner decided to become the president of a society that tried to combine external life with inner spirituality, in an attempt to revitalize the academic, cultural and professional domains. The heart of the new society was formed by the *Freie Hochschule für Geisteswissenschaft* (Free Highschool of Spiritual Science) which besides a general section was divided into several professional sections (medicine, physics, agriculture, education, arts etc.), with the task of doing spiritual scientific research according to Steiner's guidelines. Steiner thus gave a new form to his Esoteric School, again divided into three classes. He only managed to develop part of the meditations for the first class.

As for the sections, Steiner developed the basics for a new medicine, based on the tri-partition of the human organism (*Grundlegendes für eine Erweiterung der Heilkunst* [Foundations for an Expansion of Medicine] of 1925, translated as "Fundamentals of Therapy"). He did so together with the Dutch physician Ita Wegman, who not only became a very close collaborator but also played a vital role in the re-foundation of the Anthroposophical Society. Steiner moreover put down the foundations for a new, so-called bio-dynamic agriculture, based on knowledge of the spiritual, especially astrological [→ astrology], forces operative in the earth. He further helped the founders of the *Christengemeinschaft* (Christian Community), a movement for religious renewal that tried to reunite Catholicism and Protestantism, by giving them new sacraments.

The Waldorf Schools, bio-dynamical agriculture, the Christian Community, and anthroposophical medicine have all become worldwide movements. Finally, before his death on 30 March 1925, Steiner gave a series of lectures in which he developed his definitive understanding of reincarnation and karma (*Esoterische Betrachtungen karmischer Zusammenhänge*, "Esoteric Studies Concerning Carmic Connections").

Steiner's immense oeuvre is edited in the *Gesamtausgabe*, published by the Rudolf Steiner Verlag in Dornach (Switzerland), which is still not finished. Many of his works have been translated into English and are available through Rudolf Steiner Press and other publishers.

CEES LEIJENHORST

Stella Matutina

The Order of the Stella Matutina was the largest and most successful of the three segments into which the → Hermetic Order of the Golden Dawn divided in 1903. At the time of that division the Isis-Urania Temple of the Golden Dawn remained in the hands of → A.E. Waite who interpreted the workings of the Order in a mystical sense, while those members who remained loyal to → S.L.M. Mathers continued the magical tradition. The Stella Matutina followed a rather different path, which reflected the credulity and psychic enthusiasms of its founder, Robert William Felkin (1853-1926), and which may best be described as the path of magical fantasy.

A former medical missionary, who was then a lecturer on tropical medicine at the Edinburgh Medical School, Felkin was initiated into the Amen-Ra Temple of the Golden Dawn in March 1894, taking the motto of *Finem Respice*. His first wife entered the Order at the same time as Soror *Per Aspera ad Astra*. Felkin came to believe that the Secret Chiefs of the Order – whom he referred to as the Sun Masters – communicated with him through automatic writing, and when he moved to London in 1896 his apparent psychic abilities impressed the more credulous of his fellow members

of the Isis-Urania Temple. In 1903 they gave their allegiance to Felkin and joined the newly founded Amoun Temple of his Stella Matutina Order.

Felkin was not the only significant member of the new Order. J.W. Brodie-Innes, a Scottish lawyer and minor novelist, joined him in providing teachings from the Sun Masters, and when → W.B. Yeats resumed his involvement with the Golden Dawn it was within the Stella Matutina: in July 1912 Felkin approved Yeats's advancement to the Grade of Theoricus Adeptus Minor. And while Waite disapproved of the magical emphasis of the Stella Matutina, he remained on reasonably friendly terms with Felkin, eventually, in April 1907, establishing a concordat between their two branches of the Golden Dawn. Despite the significant differences of approach, the concordat survived for five years.

A naïve belief in both past and present Secret Chiefs was only one of Felkin's many articles of faith. He also believed that he could find them in the flesh, and in 1906 he made his first visit to Germany in search of both living and dead adepts. Felkin failed to find the tomb of Christian Rosencreutz, but on a visit four years later he did meet → Rudolf Steiner. Their first meeting was brief, but Steiner impressed him greatly and Felkin believed that he would provide a link between the Stella Matutina and the German adepts who had supposedly inspired the Golden Dawn.

Early in 1911 Felkin sent one of his disciples, Neville Meakin, to receive both initiation and teaching from Steiner. Meakin had been chosen on the advice of Ara Ben Shemesh, one of the discarnate entities with whom Felkin had been communicating on the astral plane since 1908, but Meakin's sudden death soon after his return to England prevented him from passing on what he had received from Steiner. Felkin now had no option but to go himself to meet Steiner once more. Accompanied by his second wife, Harriet Davidson – his first wife had died in 1903 – Felkin went again to Germany in 1912, and they returned home convinced that they had both received initiation into high Rosicrucian grades. Steiner later denied, in a conversation with A.E. Waite, that any initiation had taken place during the ceremonies that Felkin and his wife observed, but he did admit to teaching them a series of psychic “processes”. These were duly incorporated into the ritual practices of the Stella Matutina, but it is unlikely that they formed any part of the ceremony which Steiner attended during his visit to London later that year.

These “processes” were not the only innovations made by Felkin. He was utterly convinced that he

and his wife received “directions and instructions” from Christian Rosenkreutz in person, and that they had visited “great secret hidden Temples”, albeit on the astral plane. This conviction led, in 1909, to a requirement that all members of the Order sign a pledge accepting without question the ‘messages and communications, the teachings and the rituals of the Order of the Stella Matutina’. Such material came largely through Felkin, his wife and his daughter, although by 1915 he was advising ‘the more clairvoyant and clairaudient’ members of the Order that they, too, might ‘get direct instruction from C.R.C. himself.’

Felkin's credulity was, however, offset by his personal integrity and his medical skill – qualities that were praised by A.E. Waite, even as a final breach was opened between the Stella Matutina and his own branch of the Golden Dawn. The two Orders had co-operated in the production of printed grade rituals in 1910, but Felkin did not adhere to the terms of the concordat. These required him to be the sole head of the Stella Matutina, and when Waite discovered that Felkin was maintaining the old system of three Chiefs the concordat came under severe strain. It finally broke in 1912 when Felkin was persuaded by Brodie-Innes that he could no longer work with Waite, because Waite's denial of the reality of the Third Order, and thus of the Secret Chiefs, removed legitimacy from his Order.

Two years later Waite closed down his Independent and Rectified Rite when his own scepticism came into conflict with the growing credulity of the majority of his members. Many of these promptly joined the Stella Matutina, and by November 1915 its numbers, which were evenly divided between men and women, had grown to eighty-three Outer Order members and forty in the Second Order. It was now an international body, for at the end of 1912 Felkin had made an extended visit to New Zealand and founded a new Temple, named Smaragdum Thalasses No. 37. This was established in a house named ‘Whare Ra’ – by which name the Temple itself came to be known – at Havelock North in Hawke's Bay, but no satisfactory explanation has ever been given for its odd, non-sequential numbering.

After a further visit to Germany in 1914, Felkin and his family moved permanently to New Zealand in 1916, but before leaving England he revised the structure of the Stella Matutina. Felkin remained Chief of the Order, but appointed Miss Stoddart (Soror Het Ta) as Imperator of Amoun Temple in his place, and founded three new Temples. These were Hermes No. 28 at Bristol, and two new Temples in London. One of these, Merlin, was

for the former members of Waite's Independent & Rectified Rite, and the other, known as The Secret College, was restricted to freemasons who were also members of the Societas Rosicruciana in Anglia. This proved to be the high-water mark of the Stella Matutina, its subsequent history in England being one of continuing decline.

In New Zealand Felkin was more successful. The Temple at Havelock North had a permanent vault, through which passed a flow of new adepts, happy to accept Felkin's authority and eager to receive the teachings that came through him. The affairs of the Stella Matutina in England were very different. Miss Stoddart's psychic visions took on a darker hue until she could see nothing but evil in the Order. Felkin attempted to reason with her – he suggested that it would be better to co-operate with true Rosicrucians than to fear 'imaginary black Rosicrucians' in Germany or elsewhere – but her obsession grew, and she became convinced that Ara Ben Shemesh and other astral entities were all part of an international Jewish-Masonic conspiracy against western civilisation. Finally, in March 1923 Miss Stoddart left the 'awful incubus' that the Order had become for her.

By this time only the Amoun Temple remained in London, with the Rev. A.H.E. Lee, one of Waite's former members, as Emperor. Although its membership in England was much reduced the Stella Matutina continued, and skilful management by his wife and daughter ensured that Felkin's death in December 1926 did not result in difficulties for the Order. All went well until 1933 when Francis Israel Regardie joined the Hermes Temple in Bristol.

Regardie had received the first two grades of the Golden Dawn in 1926 and 1927 in the Societas Rosicruciana in America, which had incorporated them in its working after the rituals were printed in *The Equinox* in 1909-10. He advanced rapidly but became dissatisfied with the inadequacy of the teachings given and the poor quality of the rituals worked in the Temple. To save the Order from the imminent extinction which he believed it faced, Regardie decided to give to the world all that he knew about the Golden Dawn. Between 1936 and 1940 he published almost all of the Stella Matutina rituals and Knowledge Lectures and such of its history as he knew. The immediate reaction of the Order, and of other branches of the Golden Dawn, was to withdraw still further from public view. The onset of World War Two added to the Order's troubles and its activities in England were suspended until the war had ended.

Paradoxically, publication of the rituals, albeit inaccurate and incomplete, benefited the members of the Stella Matutina: ready access to the printed

text removed the need to make manuscript or typescript copies, and there was a brief surge in membership of the Hermes Temple during the late 1940s. It proved, however, to be short lived and the Order went into its terminal decline. In 1970 the Hermes Temple closed down, and Smaragdum Thalasses entered its final decade. The Stella Matutina had effectively ceased to be, but the actions of its most errant member were destined to give it a vicarious afterlife. During the 1970s Regardie's ritual texts were reprinted several times and their availability led aspiring adepts to found new Golden Dawn Temples throughout Europe and North America. Some of these have survived into the present century, continuing to work the grade ceremonies as practised in the Stella Matutina. It is doubtful, however, that their members appreciate how much greater a debt they owe to Dr. Felkin than they do to → Westcott, Mathers or Waite.

Sufism, Neo- → Neo-Sufism

Summit Lighthouse (Church Universal and Triumphant)

Summit Lighthouse is the original name for an eclectic, → New Age religious organization that since 1974 has called itself Church Universal and Triumphant (CUT). The group has its roots in such New Age forerunner traditions as Theosophy [→ Theosophical Society], → New Thought, the Arcane School [→ Alice Bailey], and the Saint Germain Foundation. In particular, CUT has adopted the Saint Germain Foundation's belief in a hierarchy of spiritual masters known alternatively as the Great White Brotherhood or the ascended masters. This hierarchy's purported mission is to inspire the

spiritual evolution of the human race and to communicate their esoteric teachings through carefully selected messengers. Theosophy, the Arcane School, the Saint Germain Foundation, and Summit Lighthouse each claim that their founders were designated emissaries of the Great White Brotherhood.

CUT also draws from New Thought and the Saint Germain Foundation a belief in the power of the spoken word. New Thought teacher Emma Curtis Hopkins (1853-1925) taught that a verbal affirmation using the words "I AM" – the name by which Yahweh was revealed to Moses in the Hebrew scriptures – connects the speaker's intention with the Divine Self that is every human being's true nature. Through positive "decreeing", persons can call on the Divine Spirit to change negative outer conditions and bring about physical, emotional, and spiritual healing. Both the Saint Germain Foundation and Summit Lighthouse adopted versions of decreeing, and it remains a primary spiritual practice for CUT members. The practice also resonates with various forms of affirmation across the spectrum of American Christianity that "claim God's promises to believers", from the more mainstream ministries of Kenneth Hagin, Kenneth Copeland, Robert Tilton, and Robert Schuller, to Unity and the Church of Religious Science. CUT's particular version of decreeing remains close to that of its predecessor movement, the Saint Germain Foundation, but differs in the actual speaking rate utilized, which has increased. The overall tonal quality produced by this rapid-fire decreeing resembles a buzzing or humming sound that is difficult to decipher in terms of words or phrases.

New Thought teacher Annie Rix Militz (1856-1924) claimed that the goal of human life was not continual → reincarnation, but ascension, a spiritual reunion between the individual soul and the God Self in heaven. Militz taught that ascension was not the exclusive domain of Jesus, but rather the crowning stage of human evolution, open to everyone. Summit Lighthouse adopted this teaching and postulated a tripartite being in humans that includes the I AM Presence (the spark of God at the core of each person), the Christ Consciousness (the mediator between the divine and the human worlds), and the soul (the mortal aspect of being that is made immortal through the rite of ascension). In CUT's cosmology, members can achieve ascended master status after death if they faithfully walk the path of initiation revealed through the church's messenger, wed themselves to the Christ Consciousness, balance their karma, and

break free from the continuous round of physical incarnations.

Summit Lighthouse was founded by Marcus (later "Mark") L. Prophet (1918-1973), a student of the Saint Germain Foundation and its spin-off rival, the Bridge to Freedom. The Bridge emerged during the late 1940s and early 1950s at a time when the Saint Germain Foundation was embroiled in a prolonged lawsuit alleging mail fraud. One of the foundation's New York members, Geraldine Innocente († 1961), began receiving dictations in the 1940s that she claimed emanated from the ascended masters. After several years of discreet circulation among foundation members in Philadelphia and New York City, these dictations were published under the pseudonym of Thomas Printz in 1951. This publication and widespread dissatisfaction among Innocente's partisans with the Saint Germain Foundation led to the formation of the Bridge to Freedom, whose mission was to spread the message of the ascended masters as communicated through Innocente. Soon, however, other claimants to messengership for the ascended masters emerged. One such claimant was Mark Prophet. Prophet at first published his messages anonymously in a monthly publication sponsored by the Lighthouse of Freedom, a Bridge to Freedom spin-off established in Philadelphia during the 1950s. In 1958, Prophet founded his own organization, the Summit Lighthouse, to spread the messages of the ascended masters in the New Age. His dictations were published in the form of small booklets entitled *Pearls of Wisdom*; *Pearls* is still CUT's most important publication and is available in its entirety on CD ROM.

Summit Lighthouse grew very slowly during the 1960s, its membership consisting mainly of middle-aged, middle-class women and men who had been involved with The Saint Germain Foundation, the Bridge to Freedom, or the Lighthouse of Freedom. Prophet conducted classes in a hotel in downtown Washington, D.C., and delivered "dictations" from the ascended masters in these public forums. He also traveled around the United States, visiting subscribers to the *Pearls of Wisdom* and organizing study groups. During this period Prophet created an organization of disciples called the Keepers of the Flame Fraternity. In return for a monthly tithe, Keepers received a series of graded lessons that detailed the path of ascension, the practice of decreeing, the mission of the ascended masters, and the special mission of the United States in bringing about the coming Golden Age of freedom and spiritual illumination. Similar in con-

cept to the correspondence course offered by the Ancient and Mystical Order of Rosae Crucis (AMORC) [→ Rosicrucianism III], these lessons drew upon the rich traditions of Western esotericism and gnostic Christianity that had long been present in the American cultic milieu. Keepers of the Flame members also constituted a core group of believers that in time became the foundation for Church Universal and Triumphant.

Prophet left his wife and children and married Elizabeth Clare Wulf (b. 1939), a student, in 1963. Although Mark Prophet continued to deliver the dictations from the ascended masters at public classes and Sunday services, he began privately to train his wife as a co-messenger. Following a move to Colorado Springs in mid 1966, the Summit Lighthouse began to attract increasing numbers of counterculture youths. In time, a sizable contingent of these young persons were invited to move into the Prophets' large mansion and to devote their lives to the ascended masters' work. Mark and Elizabeth Prophet became personal gurus for these young persons in a style similar to that of other spiritual communities of the period. The Prophets continued to send out the *Pearls of Wisdom* and hosted seasonal conclaves that brought together Keepers of the Flame and other students from around the world. They also inaugurated Montessori International as an alternative educational institution that combined secular and spiritual education for children. Though based primarily on the teachings of Maria Montessori and the ascended masters, these schools drew on an eclectic mix of educational theories and innovations. The Prophets instituted Ascended Master University (later called Summit University) in 1972 to give interested students an intensive immersion in CUT's esoteric doctrines. Students came to live at the movement's teaching centers, took classes, participated in decreeing and dictation sessions, ate in common, and came under the personal guidance of the Prophets. This early vision of a New Age mystery school would find its fulfillment in 1977 with the inauguration of Camelot, the church's 218-acre campus on the grounds of the former Thomas Aquinas College near Malibu, California.

When Mark Prophet died from a sudden stroke in 1973, Elizabeth Prophet began to put her personal stamp on the movement. She renamed the group Church Universal and Triumphant and relocated to Southern California. The Summit Lighthouse became the official name for the organization's expanding publishing arm.

The most important books published at this time

were *Climb the Highest Mountain* (1972), by Mark L. and Elizabeth Clare Prophet, and *The Great White Brotherhood in America* (1976), by Elizabeth Clare Prophet. These books acknowledged the movement's roots in earlier versions of ascended master activity, but claimed to be a further revelation under the direct sponsorship of the Ascended Master El Morya for the Aquarian Age. These books and other teachings published by the church proclaim CUT as the true church of both Gautama Buddha and Jesus Christ, who are revered as ascended masters of the highest order. The publications also lay out a gnostic vision of creation, postulating a Great Central Deity that emanated from itself individual sparks which were each a perfect replica of divinity. These sparks of God then became entangled in matter and lost sight of their divine identity. The purpose of the ascended masters' teachings is to lay out a path of initiation whereby the human soul can be reunited with its eternal I AM presence and ascend to higher realms. During the 1980s, in works such as *The Lost Years of Jesus* and *The Lost Teachings of Jesus*, the church portrayed Jesus as a great teacher and gnostic revealer who traveled to Tibet and India before beginning his public mission in the West. Like other esoteric Christian groups, CUT claims that many of Jesus' inner teachings were discarded by an increasingly worldly orthodox church. Part of CUT's mission is to make these inner teachings of Jesus available for present day Christians as humanity enters a new spiritual dispensation. These lost teachings include the art of spiritual healing, the use of affirmations, decrees, and mantras to dispel evil conditions and the laws of karma and reincarnation.

By the late 1970s, Elizabeth Clare Prophet was a well-known figure in New Age circles. She appeared on television and radio and went on a series of national tours billed as "Stumping for Higher Consciousness". Her presentations used sophisticated visual and sound technologies and included public dictations and initiatory blessings using the many jeweled rings Prophet wore. The church espoused a strong position on controversial social issues, encouraging its members to speak out against abortion, pornography, communism, and terrorism. Like its predecessor The Saint Germain Foundation, the church is unabashedly patriotic, continually reaffirming the special role of the United States in the earth's spiritual evolution. In its sanctuaries an American flag stands among the various pictures and statues of Gautama Buddha, Jesus, → Saint Germain, and Lord Manjushri. In

spite of this strongly nationalistic subcurrent, however, the group has never espoused versions of British Israelism or anti-Semitism. From its earliest years, church members came from diverse racial, national, and socio-economic backgrounds, and much of the group's growth today is taking place in Latin America and Russia.

CUT received national and international publicity during the late 1980s when it built a sophisticated network of fallout shelters beneath the Grand Teton mountains on its ranch property just north of Yellowstone Park in southern Montana. These shelters were constructed after the ascended masters forecast (through Prophet) a possible nuclear exchange between the United States and the former Soviet Union between 1989 and 1991. Following the destruction of the Branch Davidian compound near Waco, Texas, in 1993, CUT was portrayed in the national media as another "Waco waiting to happen", and Prophet appeared frequently on such American television programs as *Nightline*, *Larry King Live*, and *Oprah* defending her church's intentions. She emphasized during these media appearances that her community was not an armed compound of apocalyptic extremists, but rather a broad-based movement of well-educated, patriotic men and women that posed no threat to American society. Prophet also claimed to be the sole messenger for the ascended masters in the New Age, taking care to distinguish between her dictations and the "channeling" and "spiritualism" of the New Age movement, which she disparaged.

Following this period of intense but ultimately failed apocalyptic expectation, the church has lost more than one third of its membership, downsized its staff from 600 to about 70, and begun selling large parcels of its Montana property to raise operating funds. In 1996, CUT's board of directors inaugurated a period of reconstruction and reorganization. It appointed a Belgian corporate executive as its president and made a concerted effort to redirect itself away from apocalypticism and toward co-creating a golden age of spiritual illumination and self-empowerment. During 1998-1999, Prophet announced that she had suffered from epilepsy since her teen years and that she was now the victim of Alzheimer's disease. Prophet relinquished both temporal and spiritual authority in the church in July 1999. CUT is now focused on the electronic and print distribution of Prophet's writings and the creation of New Age spiritual communities around the world. It regularly broadcasts its decreeing rituals and public meetings around the world via the internet.

CUT is gradually moving to routinize its charisma and now shares its leadership among three presidents, a board of directors, and a twenty-four member council of elders. It is also adapting itself to entrepreneurial currents long present in the New Age subculture. The church's internal news organs now speak of "business plans" that provide "consistency and integration among all of the organization's products, services, and communications", and "fiscal balance". Although Elizabeth Clare Prophet no longer lives on the church's ranch – she currently resides in Bozeman, Montana, about seventy miles away – she remains a revered figure in the movement.

PHILLIP CHARLES LUCAS

Swedenborg, Emanuel, * 29.I.1688 Stockholm, † 29.3.1772 London

1. SCIENTIFIC PERIOD 2. SPIRITUAL CRISIS 3. VISIONARY PERIOD

Without exception Swedenborg's biographers see his religious crisis in mid-life as the defining experience of his biography. His response to this crisis created his place in history. Despite considerable achievements during the first half of his life, Swedenborg is remembered as a seer, a mystic, a revelator or a theosopher and not as an inventor, scientist, mining expert or philosopher. Clearly none of the activities of this multifaceted genius during the first half of his life would warrant his inclusion in this volume. And from a scientific perspective, if he is remembered at all, it is as a rather minor figure on a very broad stage. While biogra-

phers differ as to the nature of the relationship between the two phases of his life, they all acknowledge that a profound shift took place. The scientist and philosopher became a biblical exegete and theologian. The very public man sought anonymity. The author of elaborately produced, expensive and elegantly written books suddenly shifted to publishing plain and inexpensive works in simple Latin prose.

Swedenborg's reputation and influence rests on his authorship and his claims in the eighteen religious works he published between 1749 and 1771 – from the *Arcana Coelestia* (1749-1756) to *Vera Christiana Religio* (1770-1771). He published his books anonymously until 1768. It is on the title page of *Amore Coniugiali* that he wrote for the first time, 'Emanuel Swedenborg, a Swede'. Although the modifier of his signature changed on the title pages of the three additional works he published, he acknowledged authorship of all of them. However, his claims about his inspiration and his purpose remained constant throughout the whole of his religious corpus: he believed he was called to reveal the internal sense of the Bible and to announce a new "True" Christianity. He said he was able to do this because, as he wrote in the first volume of the *Arcana* # 68, he had had direct experience of the spiritual world: *vidi, audivi, sensi*, 'I have seen, I have heard, I have felt'. Furthermore, while he clearly stated in his final work, # 779, that he was 'called' to write and publish, he never attempted to organize a new religion. Today, however, there are many Swedenborgian or New Church (name taken from Revelation 21:2) organizations worldwide [→ Swedenborgian Traditions].

I. SCIENTIFIC PERIOD

Swedenborg's family background provided the motivation and the models for both the scientific and religious paths in his life, but his drive for systemization and synthesis seems to have been his own. His father, Jesper Swedberg (1653-1735), was a Lutheran priest with pietist leanings and a strong belief in the supernatural. He was ordained in 1683, was elevated to Dean of the Cathedral in Uppsala in 1693 and became the Bishop of Skara in 1702. While involved in various Church controversies, Bishop Swedberg is remembered for his contributions to education and for the many hymns that he wrote.

Swedenborg's mother, Sarah (1666-1696), was the modest and pious daughter of a wealthy mine owner, Albrecht Behm, whose family traced its lineage to King Gustav Vasa (1496-1560). The wealth that Sarah Behm brought to her marriage to Jesper

Swedberg in 1683 came in the form of a partial interest in several iron mines. Mining was therefore not a distant echo in Swedenborg's life, but a very practical and vital concern. It is not surprising that in his adult life he was drawn to develop expertise in this field.

Emanuel was one of Jesper and Sarah Swedberg's nine children. The children were ennobled in 1719 and at that time took the name of Swedenborg. Emanuel was third child and second son. In June of 1696 Swedenborg lost both his mother, Sarah, and his older brother, Albrecht, within a ten day period due to an epidemic. Swedberg married for a second time in 1697 to a kind and wealthy widow by the name of Sarah Bergia (1666-1720). No children were born of this marriage, but she was a warm and loving mother to Swedberg's seven remaining children. During his early formative years Swedenborg absorbed the religious atmosphere of his home. In later life, he wrote in a letter to Gabriel A. Beyer of Göteborg, 'From my fourth to my tenth year I was constantly engaged in thoughts upon God, salvation, and the spiritual diseases of men'.

Swedenborg matriculated at the University in 1699 at the age of eleven. Until that date, he had been tutored at home, where among other subjects he certainly learned Latin and perhaps Hebrew. At the time that Swedenborg became a student at Uppsala University the controversy between the conservative Aristotelian professors and the modernizing Cartesian ones had been decided by royal decree (1689) in favor of the Cartesians. The caveat was that Lutheran theology should remain untouched by the new approach. The Swedish scholar Inge Jonsson has interpreted this as a victory for the Aristotelians.

Nonetheless because Swedenborg chose to study with the Philosophy faculty, which at that time was also the umbrella discipline for the natural sciences, he most certainly absorbed the Cartesian perspective. Later in life, when Swedenborg develops his own philosophical system, he appears to draw on both Aristotle and Descartes, as well as the empirical sciences which he absorbed during his first trip to England.

During the years while Swedenborg was a student in Uppsala, a strong interest was evident among the faculty and students in the study of Hebrew and its application to Rabbinical texts. The only direct evidence of Swedenborg's connection to this golden age of scholarship is his signature on a thesis presented to the faculty in 1699 by Benedict Lund written under the direction of Johan Palmroot. It was entitled: *Lucos Hebraeorum & Veterum Gentilium*. Noting that Swedenborg

attended the university during this fertile period of Hebrew studies may be of particular interest to scholars with an interest in Swedenborg's knowledge of the kabbalah [→ Jewish Influences]. Another possible link between Swedenborg and esoteric Judaism is his uncle, Eric Benzelius, who had a deep and abiding interest in "Orientalism". In 1716-1718 he published a two-volume work entitled *Notitiae Litterariae* which focuses on 'Res Judaeorum'. In Volume One, Chapter Six, he specifically touches on the Kabbalah and its foremost document the *Zohar*.

One year after Swedenborg graduated from the University in Uppsala, he sailed from Sweden to London, England: the center and frontier of natural science in the 18th century. He was intent on mastering mathematics and applied mechanics. During his stay he developed relationships with some of the leading scholars in Europe, such as the astronomers John Flamsteed (1646-1719) and Sir Edmund Halley (1656-1742). He worked for a while as an assistant to Flamsteed in Greenwich and then moved to Oxford in 1712 to learn from Halley. He also studied the new calculus of → Newton, but it is unclear whether he ever met him.

It would appear that it was during his first trip to England that he read Thomas Burnet's *Telluris Theoria Sacra* (1681). Inge Jonsson sees in this work the 'decisive stimulus' of Swedenborg's cosmology, although he suggests that Swedenborg's effort was much broader in scope. Burnet attempted to account for the creation of the earth, and used the classical myth of the world egg to do so. Swedenborg used the concept of 'how [the earth] lay *in ovo*' (257) in part III chapter IV of his *Principia* (1734). Swedenborg, however, does not refer to Burnet's work in any of his letters to Benzelius during his first stay in England.

He does refer to the work of a Dr. John Woodward (1665-1728) who was the author of a book entitled *A New Theory of the Earth* (1695) in which he attempted to give scientific proof of the scriptural account of the flood. He also refers to the work entitled *Astronomia* (1701) by David Gregory M.D., a Savilian Professor of Astronomy at Oxford, and a Fellow of the Royal Society. Swedenborg read this work during his first trip to England, perhaps while he was resident in Oxford. Gregory's work presents various theories of the motion of the planets developed by such philosophers as Kepler, Descartes, and Leibniz. Swedenborg made extensive use of Gregory's work in his *Principia*.

Swedenborg left England for the Continent toward the end of 1712, in pursuit of more sci-

entific knowledge and information. He also notes that he visited with Anton van Leeuwenhoek to learn more about his pioneering work utilizing a microscope. Swedenborg would later cite van Leeuwenhoek's observations in his own anatomical studies. From Leiden Swedenborg traveled to Utrecht and was resident in the city at the time of the Peace Congress in 1713. At the conclusion of the Congress, he pressed on to Paris carrying with him letters of introduction to important diplomatic and cultural personalities.

Once settled in Paris, he first met with Abbé Jean Paul Bignon (1662-1743), another correspondent of Erik Benzelius and a man of great learning and renown in France. Through him Swedenborg was introduced to the mathematician Paul Varignon (1654-1772) and the astronomer Phillipe de la Hire. He visited the Royal Library, attended the public meetings of the Royal Academy of Sciences, explored the bookstalls in search of works that would advance his interests, and was awed by his visit to Versailles. In fact, the gardens of Versailles appear to have encouraged him to write some Ovidian fables that he would publish just prior to his return to Sweden.

Swedenborg began his journey homeward in the spring of 1714. He stopped in The Hague for several weeks, and then went to Hanover with the hope of meeting Leibniz, who was unfortunately in Vienna at the time. He no doubt had a letter of introduction from Eric Benzelius, who had met Leibniz in 1696. Disappointed he traveled to Hamburg and then to Swedish Pomerania. He lived for a time in Rostock and while there sent his brother-in-law, Eric Benzelius, an inventory of inventions that had occurred to him during his travels. In a letter dated September 8, 1714 he wrote a list of fourteen items that include a submarine, a 'flying carriage', a siphon, sluices, pumps, and 'a method of conjuring the wills and affections of men's minds by means of analysis'.

He moved to Greifswalde a short time later in order to publish two works he had written during his trip abroad. It is noteworthy that both were literary efforts and not scientific or mathematical treatises. One was a collection of poems entitled *Ludus Heliconius* (1714) which he enlarged and reissued in Skara in 1716. The other was a collection of political allegories called *Camena Borea* (1715).

In November, while Swedenborg was engaged in these efforts and his usual studies, Charles XII suddenly arrived in Stralsund, Pomerania after a strenuous and lightening quick journey from Bender, incognito and accompanied by only two compan-

ions. To commemorate the Swedish King's heroic return from five years of semi-captivity in Turkey, and fourteen years of military adventures in Eastern Europe and Russia, Swedenborg wrote and published *Festivus Applausus* (1714/1715).

With the coming of the King, security in Swedish Pomerania deteriorated and just prior to the encirclement of Stralsund, by Danish, Saxon and Prussian troops seeking Charles, Swedenborg managed to secure passage home to Sweden on a yacht. After a five-year journey, he arrived back at his father's home, Brunsbo, in Skara in July of 1715. At the age of twenty-seven, finding gainful employment was the major task ahead of him. He had gone abroad to immerse himself in the practical sciences of his day. He had dreams of using science and technology to modernize Sweden. There were few positions in which he could accomplish those dreams in the traditional social structure of Sweden.

Upon his return home, initially Swedenborg seems to have wanted some sort of academic position, but as one was not forthcoming he turned his energy into creating another kind of position for himself. He became the editor and publisher of Sweden's first practical scientific journal called *Daedalus Hyperboreus*, and published six issues between 1716 and 1718. The publication of *Daedalus* brought Swedenborg into contact with two very significant Swedes, the inventor Christopher Polhem (1661-1751) and the King, Charles XII. *Daedalus* featured Polhem's inventions, which of course pleased the inventor. A job as Polhem's assistant quickly followed for Swedenborg. Early in 1716, Polhem was called to Lund by the King and he brought his assistant, Swedenborg, with him.

Swedenborg successfully organized the transport of the King's ships overland, to surprise the Norwegians at Fredrikshald, but became concerned about 'intrigues' and chose not to accompany the King to the siege of the Norwegian fort. The death of the King on November 30, 1718 affected the Swedish nation and Swedenborg's own fortunes. When Ulrika Eleonora ascended the throne, on March 17, 1719, the "Age of Freedom" came to Sweden. Two months later, on May 23, the Swedenborg children, along with the children of other Bishops, were ennobled by the Queen in order to strengthen her hand in two houses of the Riksdag – the Clergy and the Nobles. Swedenborg took his responsibilities as a member of the House of Nobles seriously and during his lifetime he wrote several memorials dealing with economic matters. *Modest Thought on the Fall and Rise of Swedish Money* was presented in 1722, and *The Balance of Trade* was submitted in 1723.

In 1716, Polhem had been instrumental in securing an appointment from the King for Swedenborg on the Board of Mines, as an extraordinary assessor. However, given the shift in the political climate after the death of Charles XII, it was not until 1724 that Swedenborg was actually seated on the Board in a paid position. The Board of Mines was the oversight agency for all the mines in Sweden. The position of assessor entailed the many administrative, technical and judicial responsibilities necessary in dealing with Sweden's most important industry.

In 1733, he asked for a leave of absence from the Board in order to go abroad to publish his first major work, *Opera Mineralia*. He published the three volumes in Dresden and Leipzig in 1734. The first volume contained his cosmology, and the second and third volumes were scientific studies of Iron and Steel, Copper and Brass.

In his cosmology he presented both a nebular hypothesis and an intriguing atomic theory of matter. His aim was to explain the origins of the universe using mathematical and mechanical principles. Put in other words, he wanted to explain the relationship between the Creator and the world of creation. Starting with Descartes' vortical theory, he postulated that the mathematical point underlies all natural particles, and that it follows geometrical rules. This indivisible point exists midway between the infinite (which created it), and the finite world of nature (of which it is the source). It is devoid of extension and is created by motion from the infinite. While not substantial, and therefore not subject to being put in motion, it contains within it a *conatus* or a tendency toward motion. The first point stands two-faced like Janus seeing both universes simultaneously. Endowed with the tendency toward motion, points give rise to aggregates that are progressively complex. The first finite is created out of this process, containing two tendencies: one toward equilibrium and the other toward disequilibrium. Elementary particles therefore are composed of both passive and active substances.

Believing that he adequately understood how the universe was created from the first natural point, in another shorter work that he also published in 1734, in Dresden and Leipzig, Swedenborg raised the question of the nature of the infinite and its relationship to the finite. The small book is entitled *Prodromus Philosophiae Rationcinantis de Infinito et Causa Finali Creationis; deque Mechanismo Operationis Animae et Corporis*. Drawing on his earlier effort in the *Principia*, in which he demonstrated that the entire universe is subject to

mechanical laws, in this new work he argued for the spatial extension of the soul. It was his belief that in this way atheism and materialism would be intellectually undermined.

While the *Principia* began with acknowledgement of the creator as the first cause of creation, and at the end of that work Swedenborg suggested that it is to the infinite that all creation must return, it is in *De Infinito* that he attempted to demonstrate both the existence of the creator and that the creator is the first and final cause of creation.

According to Martin Lamm (1915; 2000), Swedenborg's line of reasoning regarding the spatial extension of the soul resembles that of → Henry More and Andreas Rüdiger, among others. Lamm indicates that Swedenborg was familiar with both More and Rüdiger, and found in their work support for his own. His familiarity with Rüdiger is noted in an anonymous review of the *De Infinito* in *Acta Eruditorium* in 1735, which contains praise for Swedenborg's effort 'to explain the commerce of the soul and body by means of "physical influx"'. The review acknowledged, however, that some might find this characterization of the soul 'somewhat gross'.

In *De Infinito* Swedenborg also found it necessary to demonstrate why the role of human beings in nature should be examined at all. An exploration of the human place in creation would only be justified if human beings played a unique or discrete role in creation. He argued that since human beings resemble nature as to their body and organs, or as to means, if they are undifferentiated from the rest of nature as to ends as well, then the principles that explain the 'least of creation' would likewise explain the human – thus making any further examination of nature unnecessary.

In the same small work, Swedenborg also demonstrated to his own satisfaction that the human played a unique role in the relationship between the infinite and the finite, thus providing him with the philosophical foundation for his next major project – the charting of the soul's domain in the human body. The focus of this great effort, to which he devoted his tremendous energy over the next ten years, was 'to reveal the immortality of the soul to the very senses'; and it resulted in two works: *Oeconomia Regni Animalis* (Amsterdam 1740/1741; two volumes) and *Regnum Animale* (The Hague 1744/London 1745; three volumes). Swedenborg had published his first effort after five years of intense study, in which he sought to understand all the systems of the human body. For a time he did his own investigations, having learned dissection in order to do so. But he soon abandoned

this method, because he found that relying on his own observations blinded him to the worth of the findings of others.

In a manuscript written in the early 1740s, one sees that Swedenborg indeed relied on both anatomical and philosophical insights from countless others, in writing the *Oeconomia* and *Regnum Animale*. The manuscript in question has come to be known as *A Philosopher's Notebook*. It was translated and edited by Alfred Acton and published in 1931 by the Swedenborg Scientific Association in Philadelphia, Pennsylvania. In this notebook Swedenborg has copied quotations from the works of Aristotle, Plato, Rydelius, Leibniz, Malebranche, Descartes, Wolff, Grotius, Bilfinger, and Spinoza, among others. And in the quotations themselves one finds the names of over one hundred and fifty additional philosophers and writers. The notebook also has several hundred citations from the Bible.

Swedenborg commenced *Regnum Animale* because he was dissatisfied with his first attempt to find the principal cause through which the microcosm of the human body operated. This new effort was to be a seventeen-part work, but in the end he published only studies of the digestive system, the glands, the urinary system, the respiratory system, and the organs of taste, smell, and touch. Left in manuscript form and not published in this series were studies of the remaining senses, the reproductive system, and works entitled 'Rational Psychology,' and 'The Fiber'.

It is in an effort to trace the world of cause from the world of effect that Swedenborg elaborates his concept of representations and → correspondences. He had begun a discussion of correspondences in a short unpublished work entitled *Clavis Hieroglyphica*, written in 1741, and again picked up the theme in his *Philosopher's Notebook*, citing such philosophers as Plato, Malebranche and Bilfinger. The unpublished works are filled with examples, but finally in *Regnum Animale* he presents the concept of correspondences as a general principle or doctrine in which the physical world may be viewed as purely symbolic of the spiritual world.

2. SPIRITUAL CRISIS

It is during this same period, when Swedenborg was publishing what he hoped would be his *magnum opus*, that he experienced his life-altering spiritual crisis. The crisis began simply enough, with dreams that were sufficiently disturbing for Swedenborg to wake up and record them. He wrote them down in what was originally a travel diary, begun when he left Sweden in the summer of 1743,

on a journey to The Hague to publish his *Regnum Animale*. This private journal would remain unpublished until 1859, long after Swedenborg's death. At that time, 99 copies were produced by G.E. Klemming, entitled *Swedenborgs Drommer*. Altogether the journal contains 286 entries, with the first ten devoted solely to observations and events during his trip. It is perhaps the oldest and longest series of dreams ever recorded. Almost immediately Swedenborg began to interpret his dreams in addition to documenting them, and in March of 1744 he instituted a dating system for them. The dreams and experiences were revealing and intense. He believed that they were communications to him about his spiritual state of health. In one dream he is lying beside a pure woman, who he believes to be his guardian angel. He is told by her that he smells ill. This signaled the beginning of a period marked by fierce temptations. These, at times, brought him to the edge of despair. It is then, he wrote, that the real temptation began.

Over time his temptations began to alternate with experiences of blessedness. For example, on the night of April 6-7, the day after Easter, he heard a great thunder and was cast prostrate on the floor. In prayer he sensed the presence of Jesus Christ and he saw him face to face. Jesus asked him if he had a clean bill of health. Swedenborg replied, 'Lord, thou knowest better than I. 'Well do so', was the answer. This exchange appears to harken back to an incident in Swedenborg's youth, when he arrived in London for the first time in the spring of 1710. The ship he sailed on was quarantined due to the presence of bubonic plague in Sweden, the country of inbarkation. London officials made it clear that no one was to leave the ship. Nonetheless Swedenborg was enticed by young friends already in London to come ashore. He was discovered by the authorities and would have been hanged without some intervention on his behalf because he had no "clean bill of health".

It is not until October that the states of temptation subsided, leaving Swedenborg with a deep sense of peace and a feeling of innocence. Included in the entries for October 26-27 is one that contains Christ's admonition to Swedenborg not to undertake anything without him. Save for a few questionably dated notes written perhaps six months later in May of 1745, Swedenborg's personal dream journal comes to a close in the fall of 1744. Although he continued to see the third volume of *Regnum Animale* through the press, after this last dream experience the larger project itself, of which that work was only a small part, was abandoned.

3. VISIONARY PERIOD

Swedenborg was seeking direction, and his next effort can be viewed as an offertory to God. While still in London, early in 1745, he published the first two parts of *De Cultu et Amore Dei*. It is a charming prose poem in which science and mythology are blended to tell the story of creation and of the life of the first couple in paradise. The work draws on Swedenborg's cosmological and psychological studies in the *Principia* and in the *Soul's Kingdom* series. Shortly after publishing the first two parts of *De Cultu et Amore Dei*, Swedenborg returned to Sweden and re-immersed himself in the study of Hebrew in order to read the Old Testament in its original language.

Ever since 1724, Swedenborg had faithfully attended to his duties on the Board of Mines, and he had become a highly respected member. In 1747, he was appointed to fill the position of President by unanimous vote. He declined the honor, however, and asked to be relieved of all his duties on the Board so that he might devote himself to 'an important work' which he now had in hand. That important work was the *Arcana Coelestia*.

Over the next three years Swedenborg attempted three additional interpretations of the creation story before he published the first volume of his *Arcana Coelestia* in London in 1749. After *De Cultu et Amore Dei*, the second attempt was a small work written in 1745 entitled *The History of Creation as given by Moses*. It is a work of only forty-three numbered paragraphs and it covers only the first three chapters of Genesis. The third attempt has been called *Adversaria in Libros Veteris Testamenti* or *The Word Explained* and was written in four volumes between 1746-1747. The fourth effort has been labeled the *Index Biblicus*. It is a work in several volumes that has never been published in a critical Latin edition. A portion of its contents have been taken from the manuscript, translated and rearranged in a work entitled *The Schmidius Marginalia together with The Expository Material of The Index Biblicus*. It was edited by E.E. Iungerich and published in 1917 by the Academy of the New Church.

What is significant about these three interpretations after *De Cultu* is that they document Swedenborg's unfolding understanding of the sacred story of creation, now specifically located in the book of Genesis, and what sources and methods he discovered were relevant in his attempt to uncover its deeper or hidden meaning. In *De Cultu et Amore Dei*, natural science provides the framework, and reason provides the standard of truth, whereas in the these next three unpublished works

Scripture becomes the source of truth. This is clear in what Swedenborg writes in # 19 of *The History of Creation*: 'whatever does not absolutely agree with things revealed must be pronounced wholly false'.

These works also demonstrate a dramatic change in style, compared to his philosophical works, and a change in terminology particularly with reference to God, as Swedenborg attempts to understand his true essence. The Supreme Being of *De Cultu* becomes Jehovah God in *The History of Creation*, and God Messiah in the *Adversaria* and in the *Index Biblicus*. However, in the edited version of the *Index Biblicus*, he also declared that Jesus Christ is the very entrance to all of holy scripture.

In the *Arcana Coelestia*, the God Messiah of the *Adversaria* becomes the Lord Jesus Christ, Savior of the world. God is one, and Swedenborg rejects traditional understandings of the Trinity: 'These three Father, Son, and Holy Spirit are the three essentials of one God, and they make one as soul, body, and operation make one in man' (*Arcana Coelestia* # 163:2). While Inge Jonsson writes that 'Those who want to understand the fundamentals of his [Swedenborg's] system should devote greater attention to his activities as a scientist than to his theosophical period' (1999, 21) the reader clearly will not understand the particulars of Swedenborg's theology from his science. While his science provides an indispensable foundation and framework for his theology, Swedenborg refined his understanding of God as well as other important concepts in his study of scripture – not through his cosmology or his physiology and psychology.

The publication of the first of the eight volumes of the *Arcana* in London in 1749 marked the beginning of Swedenborg's career as a theologian and revelator. In this work he gives a line-by-line and often word-by-word interpretation of the books of *Genesis* and *Exodus* as well as inter-chapter material which he claimed were drawn from his experiences in the spiritual world. During the next twenty-two years he published works on a wide range of theological topics.

Although in agreement with many Christian teachings and practices, Swedenborg called his theology a new Christianity. It contains a radical and rational Christian message. In the first paragraph of the *Arcana*, the reader is told that 'the mere letter of the Word of the Old Testament . . . contains deep secrets of heaven, and everything within it both in general and in particular bears reference to the Lord, to his heaven, to the church, to religious belief, and to all things connected with them'. In

508 of his last work, *Vera Christiana Religio*, it is stated that 'now it is permitted to enter into the mysteries of faith with understanding'. Furthermore he claimed that the much feared and long-awaited Last Judgment foretold in Revelation was in fact a spiritual event that took place in 1757. The judgment was spiritual and not natural, according to Swedenborg because the Word itself is internally and therefore essentially a document that addresses spiritual matters. 'The new heaven and the new earth', that are to be established according to the book of Revelation, is the new church, both in the heavens and on the earth. Swedenborg made clear in his works that the Second Coming, was now at hand. It does not refer to a physical coming of the Lord a second time, but points to the coming of the Lord now fully revealed in the spiritual sense of the Word. The Second Coming is, therefore, a spiritual event that may now take place in the heart of every individual who acknowledges the Lord made fully visible in *Vera Christiana Religio*.

Swedenborg claimed that the Judgment of Christianity resulted from the fatal separation of faith and charity within all the Christian churches of his day, which left them spiritually dead. This separation was the result of their longstanding and fundamental misunderstanding of the nature of the Trinity, and thus of the act of redemption and the means of salvation. If God is one in essence and person, and that essence is divine love and wisdom, then the traditional understanding of the passion of the cross among Christians no longer makes sense. Traditionally, the angry Father sent his only begotten Son, Jesus, into the world to atone for the sins of the human race by his fulfilling the law and suffering on the cross. But according to Swedenborg, in his *Doctrina Hierosolymae de Domino* (Amsterdam 1763) 'the Lord came into the world to subjugate the hells and to glorify his human, and the passion of the cross was the final combat whereby he fully conquered the hells and fully glorified his human'. In Swedenborg's understanding of the Trinity the Soul of the Father through the Holy Spirit provided Jesus with the infinite love and the divine means to subject the hells he has assumed within himself by taking on the body through Mary. In this way he restored human freedom in spiritual things. The merit of Christ is not something that can be borrowed at the moment of death, but rather, is a power that everyone can call on when faced with one's own spiritual temptations in life. The Lord gives eternal spiritual life to everyone whose choices over a life-time indicate a true desire for salvation. However, for those who freely choose the evil in their heart and do not seek to

mend their ways in life, Christ's merit does not magically save them in death.

Swedenborg emphasizes in his extensive and detailed descriptions of the spiritual world, that we create and choose our own heaven or our own hell after death. By the choices we make in life, we bring with us the texture, color, shape, form and substance of our spiritual life. For those who subdue their love of self and the world, in order to usefully serve the Lord and the neighbor, the joys of heavenly life await. For those who indulged their love of self and the world and who inwardly despise the Lord, the neighbor and useful service, a frustrating life in hell unfolds. In Swedenborg's view true happiness abounds in heaven because life there corresponds to and is filled with love and wisdom from the Lord. The social consequences of good loves are harmony and beauty. While those who live in hell may love it, the social consequences of their evil and competing desires are constant conflict, mutual torment, and ugliness. In the presence of angels, hellish environments appear dark, rocky, and barren and smell dank and putrid. However, because those in hell love it, it seems beautiful to their mind's eye.

Swedenborg states that heaven is built in the cooperative form of what he calls the "Grand Man", where everyone contributes to the life of the whole, and where the whole, infused with the heat and light of God's love and wisdom, nurtures everyone. Heaven is based on the marriage of good and truth, and married couples form one angel and together make the smallest heavenly society. Hell, on the other hand, whether more or less diabolical, is based upon the love of dominion. Every resident in hell sees him- or herself as the center deserving all honor, all obedience, all pleasure and all things. Hell provides as much satisfaction as possible to those who live there, given the fact that everyone there wants, schemes, and plots to have it all alone.

Swedenborg's theological works employ the concepts outlined above to construct a new religious worldview. He continued laboring to reveal its form and substance during the last third of his life. Although he began his project in anonymity, an event in 1759 revealed him to be the author of these strange and wonderful books. Swedenborg was staying in Göteborg on the West Coast of Sweden in July, having just returned from a year-long trip to London where he had published five separate theological works, including *Heaven and Hell* and *The Last Judgment*. While dining at the home of William Castel on the 19th, he had a clairvoyant experience of seeing a fire raging through Stockholm over three hundred miles away. He reported

the progress of the fire to his dinner companions, and was relieved when the fire stopped before it reached his own house. The next day he was called to the provincial governor's house to give a detailed description of what he had seen. On July 21st a messenger arrived from Stockholm with a letter reporting the disaster, which coincided exactly with the account given by Swedenborg. Before long the story was circulating both in Sweden and abroad, arousing great curiosity. This and other stories of Swedenborg's extraordinary powers gradually led people to associate his name with the anonymous theological volumes published in London and Amsterdam.

Immanuel Kant (1724-1804) was one of those who became curious about Swedenborg because of his reported clairvoyant experiences. A Fraülein von Knobloch had written to him seeking an explanation concerning the remarkable stories circulating about Swedenborg. After some inquiries, Kant wrote to her and gave her an essentially favorable report about Swedenborg's character. He also purchased the eight volumes of the *Arcana* and read them. However, in 1766 Kant published his *Traüme eines Geistersehers*, a satire on Swedenborg and his spiritual experiences and philosophy, in which he criticized Swedenborg's work as an example of the "dreams of metaphysics" generally. Kant sent Moses Mendelsohn a copy of the book, eager for his comments. Mendelsohn was particularly critical of its tone. In response Kant wrote, 'I had to rid myself of my suspected knowledge of all these anecdotes'. This was necessary, according to a small but important scholarly tradition, because Kant feared that others would wonder whether his own philosophy was tainted with metaphysical dreams. Kant's text was published anonymously, but eventually his authorship became known, and as his fame spread in the years following, the mere fact that he had critiqued Swedenborg had a detrimental effect on Swedenborg's reputation.

Swedenborg continued to write and publish new works throughout the 1760s, traveling when necessary to publish his works outside of Sweden, so as to avoid censorship. Toward the end of the decade, two Lutheran priests in Göteborg became convinced of the truth of the ideas they found in his books, and began to use them in their teaching at the gymnasium and in sermons. As a result, they were removed from the theological faculty, although they were permitted to continue teaching Latin and Hebrew. In the fall of 1769, they were charged with heresy, and tried before the Consistory. The findings were inconclusive and the case was sent to Stockholm for resolution. Although

there was some talk of bringing charges against Swedenborg himself, he had many friends in the highest circles in Sweden, so the charges were never brought.

In July 1770, Swedenborg set sail from Sweden for the last time, with his manuscript of *Vera Christiana Religio* in hand. During the next year he saw the work through the press in Amsterdam. Upon its publication, he traveled to London, also for the last time. In December he suffered a stroke, and although he partially recovered, he remained essentially bed ridden. During this period he received word that John Wesley would like to talk with him, but he died on March 29, 1772, before a meeting could take place. On two occasions prior to his death, Swedenborg was asked whether what he had written was true, and he is reported to have replied, 'I have written nothing but the truth, and could have said more, if it had been permitted'.

JANE WILLIAMS-HOGAN

Swedenborgian traditions

→ Swedenborg never tried to establish any kind of esoteric or religious organization during his lifetime: what he left behind were his writings, his message regarding the inner meaning of the Holy Scriptures and the coming of a new Christianity. However, already during his life, his work had found some enthusiastic readers; consequently, it is not surprising that some of them attempted to establish groups based upon Swedenborg's teachings as they understood them. The most enduring organizations have been church-like groups, usu-

ally calling themselves "New Church" or "Church of the New Jerusalem". Indeed, according to Swedenborg, the New Jerusalem of the Book of Revelation means the New Church, which succeeds the Christian Church and is established by means of Swedenborg's revelations. Consequently, dealing with Swedenborgian traditions leads one to pay attention to small religious groups and a variety of associations related to them and founded for the purpose of spreading what the Swedenborgians call "the Writings" (with a capital "W"), i.e. the theological works of Swedenborg.

Probably the first organized effort to make those works more widely known was the creation of the "Society for printing, publishing and circulating the Writings of the Hon. Emanuel Swedenborg" in Manchester in 1782. The key figure in that undertaking was Rev. John Clowes (1743-1831), Rector of St. John's Church in the same city. A minister of the Church of England, Clowes remained in that ecclesiastical position to the end of his life, while translating many of Swedenborg's works and openly preaching New Church doctrines from his pulpit. Clowes felt that the newly revealed doctrines were bound to influence the existing Churches and that he could use his position for spreading them more effectively than if he would have severed his affiliation with the Church of England. Contrary to the path which others would follow, he did not feel the need for a separate church organization. In this way, from the very beginning of the Swedenborgian movement, there was a "non-separatist" tendency, even if it rarely found organized expression. To this day, there are people who remain affiliated with other religious bodies (or with none) while accepting Swedenborg's message entirely or in part. Interesting also was the emphasis put from the beginning upon publishing "the Writings". Swedenborgian recordkeepers used to be eager to proclaim impressive numbers of published books and translations in various languages. To a large extent, however, these numbers were not the result of a heavy demand from a wide audience (even if titles such as *Heaven and Hell* have always tended to sell quite well, due to the nature of the subject), but of organized missionary efforts combined with the dedication of a few, able, and persevering editors and translators.

Similar attempts to promote and distribute Swedenborg's works took place in Scandinavia. In 1786, the Exegetic and Philanthropic Society was founded in Sweden. Several of its members belonged to the nobility, and even the brother of the King became a member. The Society wanted to preserve and publish Swedenborg's writings, but the

interests of its members were not confined to Swedenborg: they were also strongly attracted to → animal magnetism, and a few of them were interested in → alchemy. It is striking to observe how Mesmerism actually had a strong influence on a number of early Swedenborgians, even during the 19th century. → Jean-François-Etienne Le Boys des Guays (1794-1864), who became the indefatigable translator and promoter of the New Church doctrines in French-speaking countries, was strongly involved in magnetism at the time he discovered Swedenborg. In any case, after its initial successes, the Exegetic and Philanthropic Society had trouble, due in part to the failure of the gold-making schemes of some of its founders, and it was disbanded in 1789. Subsequently and in a more discrete way, another society, Pro Fide et Charitate, was organized in Sweden in 1796 in order to continue the publication of Swedenborg's works. It survived until the 1820s, and it was not before 1871 that a New Church group was granted official recognition by the Swedish government.

Due in part to the greater freedom granted to “non conformist” religious groups, it was not in a Nordic country, but in the United Kingdom that the New Church as an organization was born. In 1783-1784, a few individual readers of the writings of Swedenborg began to meet regularly and soon took the name of ‘The Theosophical Society, instituted for the purpose of promoting the Heavenly Doctrines of the New Jerusalem, by translating, printing, and publishing the Theological Writings of the Honourable Emanuel Swedenborg’. Some of the people who participated in the meetings of the “Theosophical Society” were not satisfied with attending religious services presided over by ministers who believed in the New Church message but remained members of the Established Church. These “separatists” were not convinced by the arguments of those ministers, that the “Heavenly Doctrines” would in this way gradually and insensibly permeate the Church of England. Consequently, they decided that it was time to establish public worship. They met in July 1787 ‘for the purpose of forming, by the Divine Mercy of the Lord, the New Church upon earth’ and for the first time celebrated Holy Supper as well as New Church baptisms. In 1788 they opened a chapel in London and adopted the denomination of “The New Church, signified by the New Jerusalem in the Revelation”. It is important to realize that a number of participants came from Methodist or Dissenting religious backgrounds. Actually, no less than six Methodist preachers joined the nascent New Church. As several historians have correctly

observed, the familiarity with Protestant Nonconformity played a decisive role in the emergence of the New Church as an independent organization. The first General Conference took place in 1789. The organized General Conference of the New Church still exists today, along with other church organizations (the most important other ones being headquartered in the United States). Organized Swedenborgianism manifests itself to this day through those religious denominations as well as through associations devoted to publishing and spreading the message, such as the Swedenborg Society in London (founded in 1810) and the Swedenborg Foundation in the United States (founded in 1849 as the American Swedenborg Printing and Publishing Society, which changed to its current name in 1928).

While Swedenborgianism thus took the form of religious denominations in the English-speaking countries, ‘French and German interest in Swedenborg had arisen mostly among speculative Freemasons and students of the occult’ (Lineham). In the formative years of the Swedenborgian movement, religious believers and seekers of a secret spiritual knowledge interacted quite extensively. The French → Illuminés d’Avignon gathered around → Dom Antoine-Joseph Pernety (1716-1796), who translated elegantly, but not very faithfully, some of Swedenborg’s writings. In 1786, Pernety sent an emissary to the English Swedenborgians. He tried to impress them, giving them to understand ‘that he and his society were in possession of some grand secret, which he was not then at liberty to divulge, because the time proper for its disclosure had not yet arrived’ (Hindmarsh). But the English Swedenborgians in the end were not very impressed and the relations with the Society in Avignon were soon discontinued.

It should not be assumed that all British Swedenborgians were immune to occult interests, however. Although the name of the distinguished soldier is not even mentioned in Hindmarsh’s history of early Swedenborgianism, Lineham indicates that one of the early members of the Society in London was General Charles Rainsford (1728-1809). Rainsford was well-known for his interest in alchemy, → Rosicrucianism and → Freemasonry, and was also the translator of at least one of → Robert Fludd’s treatises into English. In addition, some of the apostles of Swedenborgianism, well-known for their contribution to the cause, were active Freemasons. A French surgeon resident in London, Bénédict Chastanier (1739-1816?), was among the early followers who devoted much zeal to spreading the cause of the New Church and at the same

time made no secret of his masonic involvement. For a long time, there have been unconfirmed rumours according to which, as early as 1767, before he left France, Chastanier had already formed a Lodge of “Theosophical Illuminati” (*Illuminés théosophes*), sympathetic to the ideas of the New Jerusalem. This would then still have been during Swedenborg’s lifetime. In October 1935, the magazine *Theosophy* presented Chastanier and his alleged Lodge as one of the precursors of → H.P. Blavatsky’s mission. Unless documentary evidence appears, however, the existence of a Swedenborgian inclined lodge at such an early period must be considered with much caution and skepticism. On the other hand, it is true that Chastanier published in 1787 a project for a Swedenborgian periodical (‘Plan d’un Journal Novi-Jérusalémité’), which he addressed to ‘all the lovers of the Truth who have already tasted it in the Theological Writings of Emanuel Swedenborg as well as to all the Freemasons who currently are seriously looking after it’. Obviously, Chastanier saw Swedenborg’s revelations as opening the way to a deeper understanding of spiritual truths. This was confirmed later in the address presenting his project, in which he stated that Freemasons only know the external symbols, while Swedenborg would open to them the understanding of their internal meaning.

It is not surprising that there were other important early followers of the doctrines of the New Jerusalem who were also Freemasons. One example is J.P. Moët (1721-1807), Royal Librarian at Versailles, who was the first to translate the entire theological work of Swedenborg into French (part of it would be published after his death). But was Swedenborg himself a Freemason? There have been authors who claim it. In its October 27, 1869 issue, the American New Church periodical, *New Jerusalem Messenger*, printed the translation of a document provided by a leading Freemason in Lund (Sweden), according to which Swedenborg had been initiated in London in 1706. But, as Tafel observed, the problem is that Swedenborg did not travel to England until 1710, and none of the attempts to explain this discrepancy in the dates has been very convincing. While claims still circulate that Swedenborg became a Freemason, no conclusive evidence has been presented that he was one.

Of more interest to us are the later references to Swedenborg in some Masonic circles. While it is not at all clear that Chastanier practiced a Swedenborgian rite, later there were attempts to establish such a rite. In 1870, Samuel Beswick (1822-1903) published in New York a book under the title:

Swedenborg Rite and the Great Masonic Leaders of the Eighteenth Century. The volume not only claimed to summarize Swedenborg’s Masonic contacts during his travel and to give indications about the activities of a Swedenborgian rite during the late 18th century; it also stated that, ‘[i]n the year 1859, a number of Swedenborgians who had taken the higher degrees were initiated into the Swedenborgian degrees’ in the United States. It further stated that the Swedenborgian Rite was now called ‘the Primitive and Original Rite of Symbolic Freemasons’, consisting of six degrees. The first three were the common degrees of the York Rite, and the other three formed the Swedenborgian Rite proper. According to Beswick, all the higher officers of the Order were Swedenborgians, although it was also open to non members of the New Church. Beswick himself came from a Swedenborgian family in the United Kingdom and was ordained a New Church minister in the United States, although during his life he had turbulent and tense relations with Swedenborgian religious denominations. Regarding the Swedenborgian Rite and its rebirth, however, Beswick’s report seems exaggerated, as R.A. Gilbert’s research has shown. But Beswick managed to recruit a few members for his Swedenborgian Rite in the United States and Canada. It also spread to the United Kingdom, but ceased to exist in the early 20th century, although one cannot rule out the possibility of a revival somewhere in some form. The assertion by a Swedenborgian author that ‘the Writings [of Swedenborg] have exercised a considerable influence on that Ancient and Honorable Fraternity’ (*New Philosophy*, October 1977, 148) seems overstated.

As Robert Kenneth Jones has observed, the Swedenborgian movement is at variance with the prevailing culture, while at the same time accommodating itself to it. Due to the nature of Swedenborg’s ideas and to his claim to have been chosen to inaugurate a new Christianity, there have always been interactions between Swedenborgians and the “cultic milieu” (as defined by sociologist Colin Campbell). Not only were Swedenborgians obviously open to ideas considered as unorthodox in their times, they were also deeply convinced that the influx of the New Dispensation would be felt more and more in the entire world, well beyond the borders of New Church societies (this is the so-called “permeation theory”, which for a long time remained quite popular with some sections of the New Church). Thus they would be receptive to new trends and movements. Even if this may seem quite puzzling today, there was a wave of enthusiasm for Fourierism in some Swedenborgian circles in the

1840s. Much more of a challenge, however, was the phenomenon of → Spiritualism. Since Swedenborg had claimed to have gained access to the spiritual world, would not other people be able to do the same? Spiritualism was attractive to some Swedenborgians, but in the eyes of those who claimed to be “orthodox” New Church members, it rather presented a serious threat. The uniqueness of Swedenborg’s revelations could become diluted among a proliferation of other channels; in addition, in some messages allegedly received by mediums from Swedenborg himself, the latter sometimes “corrected” his earlier teachings upon the basis of new knowledge supposedly acquired after death! For instance, Swedenborg supposedly communicated by automatic writing to James E. Padgett (1852-1923) that he – Swedenborg – had been ‘a failure’ because ‘I prevented, by my preconceived ideas of what the truth should be, the real and pure truth from coming to me and thence to humanity’. Obviously, Padgett himself was expected to do better! Such messages could hardly have delighted true Swedenborgians, and many members of the New Church were actually quite suspicious of people claiming to communicate with the spiritual world; in their eyes, Swedenborg’s revelations had an authority which those later “channels” could not match.

In more recent years, the → New Age has been attractive to some Swedenborgians, but it has also led some scholars (especially German theologians) to look for its roots and to conclude that Swedenborg played a key historical role. For instance, Hans-Jürgen Ruppert has observed that Swedenborg not only influenced various figures of the New Age movement, but that some of his teachings correspond more or less (according to Ruppert) to the core idea of New Age itself: the passage from the Christian era to a new dispensation. Thus Swedenborg provided the earliest pattern (*Ur-Modell*) for alternative religious groups. Similarly, British New Church minister Michael W. Stanley estimates that Swedenborg ‘should be seen as the Father of the New Age’, beyond the external appearances of writings ‘colored by the . . . thought forms and jargon of the eighteenth century’. This opinion is subject to debate: although it cannot be denied that elements of Swedenborg’s message have become part of the multifaceted cultic milieu, it is somewhat difficult to identify Swedenborg’s specific and direct influence. His name is sometimes quoted, but mixed with many others – and mainly by people who obviously have never seriously read his writings. Moreover, while the New Age is post-Christian, Swedenborg remains very strongly

Christocentric. From the perspective of the history of religions, the Swedenborgian impulse has provided elements to alternative religious strains, but this has not prevented Swedenborg and the New Church from remaining within the sphere of Christianity. The way in which much organized Swedenborgianism has tended to cling to the external forms inherited from Christian culture may constitute a significant indication.

Swedenborg can be claimed as a precursor or a prophet by people of diverse orientations, and his writings can also be understood in different ways. However, if we examine Swedenborgian traditions in their organized and lasting forms, we encounter primarily small religious denominations, not esoteric societies. It is true that some members of the smallest of those denominations, The Lord’s New Church (see below), have in recent years attempted to present the doctrines of the New Jerusalem as “Esoteric Christianity”. But for them, the term “esoteric” refers to a non-literalist, or symbolic, approach; they do not understand it in the sense of esoteric knowledge reserved for a small elite. According to this perspective, ‘Esoteric Christianity looks beyond what is external into what is internal’ and ‘The theological writings of Emanuel Swedenborg are among the finest examples of Esoteric Christianity ever given to the world’. This is an interesting, but apparently still isolated attempt among New Church organizations.

Statistically, Swedenborgianism belongs to the smaller traditions of Christianity, and several of its branches have decreased (or only experienced a rather modest growth) over the past decades. While nobody knows exactly how many New Church members there are around the world, estimates numbering them around 30.000 worldwide seem realistic (although there are some figures going up to 50.000 and more). The largest group of Swedenborgians is currently found among black South Africans, and may be 15.000 members strong (note that Swedenborg’s writings took a quite positive approach toward Africans). As already mentioned, the General Conference of the New Church is the oldest existing organization, with less than 1500 members. In the United States, the Swedenborgian Church of North America (formerly called the General Convention of the New Jerusalem), organized in Philadelphia in 1817, currently claims around 2.000 members. The General Church of the New Jerusalem, with a worldwide membership that is slowly increasing (now 14.000 members), broke from the Convention in the late 19th century. It is headquartered in Bryn Athyn (Pennsylvania), not far from Philadelphia, a borough which has

a majority of Swedenborgian residents and only Swedenborgian schools. The General Church always emphasized the importance of a distinct New Church education for the future of the movement, so that children could ‘be kept in the church sphere until they can think for themselves’: ‘The true field of evangelization is with the children of New Church parents’. The smallest Swedenborgian denomination with headquarters in the United States, the Lord’s New Church which is the New Jerusalem (often simply called “Nova Hierosolyma”), is the result of a schism from the General Church over doctrinal issues in 1937 and has its headquarters in Bryn Athyn as well, but it does not gather more than a few hundreds followers worldwide. In addition to those main church organizations, there is a variety of church groups (usually small, except in Africa) in European countries and other parts of the world: the New Church is even present in places such as Korea, Japan and Sri Lanka. Most of the groups outside of America feel a special affinity with the doctrinal orientation of one of the three religious bodies headquartered in the United States, and sometimes get support from one of them. The story of the New Church and its pioneers in each country cannot be summarized here – and the impact of Swedenborg’s works has quite often gone beyond those small groups, influencing to some extent authors, philosophers or artists. Although some of them have occasionally misunderstood Swedenborg, they have contributed to his fame.

The issues which led to separations among the religious bodies identifying with the New Church have been related to both doctrinal and organizational questions. For instance, both the General Conference and the Swedenborgian Church (formerly General Convention) developed a structure of a congregational type, while the General Church insisted upon the role of the priesthood and the implementation of an episcopal structure. In addition, while the Swedenborgian Church is a member of an ecumenical body such as the National Council of the Churches in the U.S.A., the General Church emphasizes the distinctiveness of the New Church, which succeeds the old Christian Church and has to be kept separate from it. The occasional heated debates not only concern the structure of the Church but also deal with some specific issues of the faith. Most of these are too specific and would require too much space to be discussed here, but some even touch on questions such as vaccination and other medical practices.

One of the most essential differences of opinion among Swedenborgians concerns the extent to

which Swedenborg’s writings must be considered as authoritative. This has been a question discussed since the early times of the Swedenborgian movement. Members of the General Conference and the Convention usually believe that Swedenborg’s writings contain divine truths indeed, but would not define them as an additional Scripture: the writings illuminate and explain the meaning of the Old and New Testaments, and offer a doctrinal foundation for the Church. According to the beliefs of the General Church, however, Swedenborg’s writings are fully authoritative. Not only do they explain the internal sense of the Old and New Testaments, but they should be accepted as Sacred Scriptures revealed by the Lord. Finally, the Lord’s New Church considers the theological work of Swedenborg as the Third Testament in the fullest sense of the word, i.e. to the extent that it contains an internal sense which can be drawn out of it. It is a complete revelation in itself, and not just the doctrine of the Church or the inspired explanation of the deep meaning of the Old and New Testaments.

Despite differences, Swedenborgian denominations cooperate when it comes to the publication of Swedenborg’s writings. As already mentioned, the amount of printed material published by Swedenborgians has always been quite impressive compared to their numerical strength, and the theological works of Swedenborg continue to be republished, or published in new translations. For instance, recently the Swedenborg Foundation has launched a New Century Edition in English. The wide circulation of those books has no doubt contributed to the impact of Swedenborg; independent of the increase or decrease of particular Swedenborgian groups, their continual publication will ensure that interest in Swedenborg can remain alive and, perhaps, will even give rise to new branches of the Swedenborgian tradition.

JEAN-FRANÇOIS MAYER

Tarot

Card games in general and tarot cards in particular, like children’s and adult’ games, make a particularly strong appeal to the symbolic → imagination. Whereas the standard pack of cards has been able to serve as a tool for divination [→ Divinatory Arts] mainly by combining the interpretation of signs with chance procedures, tarot cards have added to this function the desire to tap the secrets of the gods, by including a system of references and symbolic connections of an esoteric type, correlated with the planets and the cosmic hierarchies. The introduction of card games in Western culture can be traced back no further than to 1375 Florence, where Nicola della Tuccia (*Chronicle of Viterbo*, 1379) ascribed to them an Oriental origin under their initial name, *naibe*. However, all the

images of these initial cards have been lost, and the same is true of the rules of the game. The cards that circulated in Germany and Italy around the beginning of the 15th century bore figures reflecting the culture and social problems of the time, and they multiplied rapidly thanks to the progress in the art of engraving; the “tarocchi” ascribed to Mantegna (1460) fall into this category. Given this context, the hypothesis according to which the tarot has an ancient Egyptian origin can be relegated to the realm of fiction. Moreover, the first elements of a divinatory and esoteric interpretation of the tarot do not seem to have appeared before the 18th century, particularly in France, after the number of cards and the figures on them had become sufficiently standardized.

The so-called “Tarot of Marseille” (actually of Italian origin), around which → Antoine Court de Gébelin formed his “Egyptian” interpretations in *Le monde primitif* (1781), has 22 cards, like all the other games. They are known as the “major arcana” or as “trumps” (derived from “triumphs”), and go from “Juggler” to “Fool”, with the “Emperor” and “Empress”, the “Hermit”, the “Pope”, the “Popess”, the “Hanged Man”, etc., in between. Each card carries an inscription, a sequential number, and more or less fixed colors in which blue and red predominate, though there are important variations from one game to the other. The Pope and the Popess are often replaced by Jupiter and Juno, the Juggler by the Magus, etc. The pack is completed by 56 common cards or minor arcana (53 in French games), divided into four suits: Swords, Cups, Wands (or Scepters), and Coins (or Pentacles), each numbered from 1 to 10 plus the court cards Page, Knight, Queen, and King. In English and French the game is called tarot; in German and Dutch *Tarock* or *Tarok*, derived from the Italian *tarocchi*; Spanish has retained a name close to the original, *naipes*.

Court de Gébelin, in the spirit of the → Egyptomany of his time, attributed the paternity of the tarot to the god Thoth/Hermes [→ Hermes Trismegistus], interpreting the game as a hidden text, a *mutus liber* (silent book) similar in nature to the *Corpus Hermeticum*. This hypothesis was circulated in the masonic community to which Court de Gébelin belonged, thanks to Alliette (→ Etteilla), a Parisian cartomancer and Grand Magus of the lodge of “The Perfect Initiates of Egypt”, who two years later published a *Maniere de se récréer avec le jeu de cartes nommées tarots* (Manner of Recreating Oneself with the Card Game Known as Tarot; see Bibliography). Alliette here revealed the true meaning of the game as a veritable synthesis of pri-

mordial knowledge, thanks to some modifications that he made of the figures. A secret society of the “Interpreters of the Book of Thoth” was founded in 1790.

It fell to the occultist [→ occult / occultism] → Eliphas Lévi to construct the most complete system of tarot in his *Dogme et rituel de la haute magie* (1856), by making of divination the secret of secrets. His argument included a historical dimension, according to which the Ars Magna of → Ramon Llull had actually been a cryptic commentary on the tarot. The decisive argument, for Lévi, was provided by → Guillaume Postel, whose *Clef des choses cachées depuis la constitution du monde* (Key to Things Hidden since the Constitution of the World, 1546) contained an illustration of a key ornamented with geometric designs and accompanied by an inscription that could be read as R O T A in one direction and T A R O in the other. These were two quite arbitrary interpretations, especially since the passage of Postel concerns an interpolation in the Franckenberg edition (Amsterdam 1646). Lévi adopted Alliette’s assertions wholesale, but relativized them by claiming that while Alliette had presented the truth, he, Lévi, had finally unveiled it by re-establishing the symbolic → correspondences in their precise meaning. ‘The tarot, this miraculous book, inspiration of all the sacred books of the ancient peoples, is, because of the analogical precision of its figures and numbers, the most perfect instrument of divination, which can be used with complete confidence’ (*Dogme et rituel de la haute magie*, vol. 1, ch. 10). In a later work, *La clef des grands mystères*, Lévi analyzed the symbolism of numbers with reference to the cards, but for unknown reasons stopped at 19, although stating that the sacred language (Hebrew) had 22 letters. The occultists followed in Lévi’s footsteps. → Stanislas de Guaita planned his series of works forming *Le serpent de la Genèse* (1891-1897) in three volumes – I. *Le temple de Satan*, II. *La clef de la magie noire*, III. *Le problème du mal* – with seven chapters in each volume in the order of the cards (the 22nd, the World, serving as a conclusion). Guaita was preceded by Paul Christian (ps. of Christian Pitois) in *L’Homme rouge des Tuileries* (The Red Man of the Tuileries; 1863). → Papus (Gérard Encausse), brilliant popularizer of the great themes of *fin de siècle* occultism, followed with many references scattered throughout his oeuvre and two entire works dedicated to an interpretive synthesis: *Le tarot des Bohémiens* (The Tarot of the Bohemians/Gypsies, 1889, reissued in 1911) and *Le tarot divinatoire* (The Divinatory Tarot, 1909). He reworked and classified the labors of his

predecessors, stressing the cryptic aspect of this primordial revelation: a veritable Bible for the “Bohemians” and preserved in popular traditions, albeit confusing good and evil, the fall and “reintegration” of man. The concordance with the *Archéomètre* (1910) of → Saint-Yves d’Alveydre, who had supposedly reconstituted the primordial language, showed that the universal key to symbolism could indeed be found in the secrets of the tarot. Some Freemasons were also concerned with the interpretation of the game; one example is Oswald Wirth (1860-1943), former secretary to Guaita and renovator of the symbolism of French → Freemasonry, who published *Le tarot des imagiers du Moyen Age* (The Tarot of the Medieval Artists) in 1926. These speculations crossed the English Channel at the end of the 19th century with → Arthur Waite, a disciple of Lévi who published *The Pictorial Key to the Tarot* in 1910, while in 1913 → P. D. Ouspensky published another study of its symbolism as a “model of the universe”, in the light of oriental religions and of → Carl Gustav Jung’s depth psychology. The occultist and paramasonic society of the → Hermetic Order of the Golden Dawn played a large role here; the notes of one of its founders, → MacGregor Mathers, were collected by Israel Regardie in a *Golden Dawn Tarot*. But it was above all → Aleister Crowley, one of its most conspicuous members, who systematically integrated the tarot in his magical and masonic speculations, with the help of → astrology and the kabbalah [→ Jewish Influences V]. In *Magick in Theory and Practice* (1930) and *The Book of Thoth* (1944), Crowley changed the names of the major arcana and interpreted the trumps as hieroglyphs charged with universal energy. His tarot and that of Waite published by Rider are the most widespread in the English-speaking world, and are constantly reprinted.

One of the most remarkable examples of the tarot’s capacity to furnish a basis for esoteric and mystic meditation can be found in the works of → Valentin Tomberg, *Méditations sur les 22 arcanes majeurs du tarot* (1980), prefaced in the French edition by the Catholic theologian Hans Urs von Balthasar. The latter situated the enterprise in the framework of “spiritual readings”, supported by Christian as well as non-Christian traditions and by esoteric exegeses. Tomberg’s “inner experience” illustrates the expansion of the field of tarot to embrace literature and the arts; in this context von Balthasar cites *The Greater Trumps* (1950) by Charles Williams (1886-1945, a friend of T.S. Eliot and J.R.R. Tolkien). *The Golem* (1915) by → Gustav Meyrink is also based on an interpretation by

means of the tarot; Jean Paulhan (1884-1968) prefaced Paul Marteau's *Le tarot de Marseille* (The Tarot of Marseille, 1949).

The publication of tarot packs today covers a wide cultural radius, ranging from Central America to Germany, and offers an amazing variety of illustrative styles. Lady Freida Harris painted the *Tarot Thoth* cards after Crowley's instructions (the originals are at the Warburg Institute); Pamela Colman Smith, member of the Golden Dawn, painted those of the Rider-Waite edition. The *Tarot of Xultun*, painted by Peter Balin in Guatemala, combines symbolic iconography with Indian mythology; photographs have been used for the *Tarot of Mountain Dreams* (a version of Rider-Waite). There are tarots of advertising (Alitalia, of cubist inspiration) and calendar tarots using titles of popular songs (Pop rock, New York 1972); pen and ink designs are frequent. California has furnished many versions connected with new forms of religiosity of the → New Age type: *The New Tarot for the Aquarian Age*, modeled after Crowley (designs by John Cook, 1968) and the *Aquarian Tarot* designed in "Art Déco" style by David Mario Palladini (Morgan Press, 1973). The quantity of literature on the tarot is impressive: the bibliography of Gérard van Rijnberk (*Le Tarot*, 1947) contains more than a thousand titles, while a semi-exhaustive list of 1700 titles has been compiled by Stuart Kaplan, *The Encyclopedia of Tarot* (1978-1986).

JEAN-PIERRE LAURANT

Templars → Neo-Templar Traditions

Théon, Max (ps. of Louis Maximilian Bimstein; also known as Aia Aziz), * ca. 1848 Warsaw, † 4.3.1927 Tlemcen (Algeria)

Théon was Grand Master of the Exterior Circle of the → Hermetic Brotherhood of Luxor (H.B. of L.) around 1884, and later (about 1900) founded the *Mouvement Cosmique* mainly under another pseudonym (Aia Aziz). Furthermore he is known as a practitioner of occult [→ occult / occultism] medicine and adept in practical occultism, and as the author of an initiatic work of over 10.000 pages written in collaboration with his wife, their teachings being known as the *Philosophie Cosmique*. Little is known about Théon because of his reticence in regard to public life, and his habit of involving himself only from a distance in the groups which he directed. It must be added that Théon himself remains the sole source for what little we know about him.

A Jew, and the son of a rabbi, Théon was initiated into Hasidic circles at an early age; but he is also said to have received "oriental initiations" at a later stage, which seems to be corroborated by his knowledge of the Vedas and of Sanskrit. Having left Poland, he seems to have been in Paris in 1870 and in Great Britain in 1873. Using Peter Davidson and Thomas H. Burgoyne as intermediaries, while remaining "under a veil" himself, he launched the H.B. of L. in 1884. In 1885, in London, he married Mary Ware (ca. 1843-1908), a poet of Irish origin who, the year before, had founded the Universal Philosophic Society under the pseudonym of Una. The "scandal" which dealt a severe blow to the H.B. of L. in Great Britain obliged the couple to leave London for southwest France in 1886. In 1888 they settled permanently in Tlemcen where, in semi-retreat, they cultivated an intense "psychic cooperation" involving techniques of trance and exteriorization aiming at the attainment of super-

natural powers. One of Théon's direct pupils in practical occultism was Mirra Alfassa (1878-1973), who would later become famous as "The Mother" of the Sri Aurobindo Ashram in Pondicherry and the founder of Auroville.

The Théons' techniques were used by them to clairvoyantly explore humanity's past, even at its most distant. The result was a series of long initiatic narratives that were translated into French – sometimes poorly – by their secretary. In 1899 Max Théon contacted French circles of magnetisers, but his articles encountered the animosity of the spiritualists. In 1901 he launched the *Revue Cosmique*, thanks to → F.-Ch. Barlet (1838-1921), formerly representative of the H. B. of L. for France, almost every article of the magazine being anonymous. The enmity of → Papus hindered the spread of the movement in the French occultist world, so that the *Mouvement Cosmique* remained confined to a very small public, especially after Barlet's resignation of his position of director in 1902. The most important personalities in the group were Julien Lejay, Louis Lemerle and Louis M. Thémanlys (1874-1943). In 1908 the Théons came to Paris, but in september Mme Théon died in Jersey, which put an end to the *Revue Cosmique* after seven years of publication. After the return of Théon to Tlemcen in 1909, Thémanlys reorganized the movement under his direction. A new magazine, *Le Mouvement Cosmique*, begun to be published in 1913. In 1919 Théon tried to give a new impulse to the movement; but he returned to Algeria a year later, and the magazine ceased its existence in 1921. Thémanlys continued to introduce the movement's ideas in some artistic and literary circles; but at Théon's death in 1927, its success had remained limited, although persons such as Claire Boas de Jouvenel and Marc Séménoff had become interested in the group's ideas.

The influence of the *Philosophie Cosmique* has hardly reached beyond France, except through publications of Peter Davidson in the U.S.A. There was, however, an indirect influence in India, via "The Mother" and Sri Aurobindo (1872-1950), and in Russia, where the ideas of Russian Cosmism, a broad intellectual movement based upon the teachings of Nikolai Fedorov (1828-1903), are remarkably close to those of the Théons.

According to Théon, the *Mouvement Cosmique* was simply the continuation of the H.B. of L. under another form. However, the teachings of the *Philosophie Cosmique* seem much richer and more original than those of the H.B. of L. While inspired more particularly, although only implicitly, by the

kabbalah [→ Jewish Influences], they are quite far removed from the ideas of the occultist movements of the end of the 19th century. The *Philosophie Cosmique* presents itself as non-dogmatic, aimed at practical realization, and based upon the primordial Tradition anterior to all religions, referred to as the *Tradition Cosmique*. The central idea of its vast and ambitious cosmogony is that the entire cosmos is material, except the *Sans Forme* (Formless) or *Impensable* (Unthinkable). The material world is regarded as a set of nested spheres surrounding the Nucleolus, that is, the first manifestation (Love, Light, Life) of the *Sans Forme* (which is not referred to as God or the Absolute, because in our present time matter does not completely and freely reflect the triune manifestation). The main reason why his material vesture is incomplete is that the "Hostile one", a being of very high origin, occupies the *Etat nerveux* ("nervous plane", which amounts to the astral plane of the occultists), the state closer to the world of material substance (there are three other and more "subtle" worlds, each with seven states or planes), and influences the *degré nerveux* ("nervous degree" which corresponds to "the Vital" of "The Mother" and Sri Aurobindo) of man, creating lack of balance on earth. The "Hostile One" has deprived man of his "true physical body", the immortal body of his origin; and the divine task of man consists, according to the Théons, in recovering this body. Attainment of this goal will result in physical immortality, at least for divine humanity (for the Théons, there are four levels of terrestrial life: mineral, vegetal, animal and psycho-intellectual or "human Divine"); this victory over death will allow man to conquer the *Etat nerveux* and unify the cosmos.

A modern magus who appeared totally unadapted to the social realities of his time, Théon ended up, paradoxically, proposing a series of ideas that are thoroughly modern: the primacy of love and liberty, the quest for progress and individual development, the prolongation of life, mistrust of political and religious ideologies (which are considered to be merely masks for politics), and the absence of a division between animal and man. Despite the veil of mystery that surrounds his initiatic path, Max Théon stands at the crossroads of Eastern and Western spirituality, as one of the most attractive figures of the movement devoted to the "disoccultation of the occult" (i.e., initiation by and through daily life rather than submission to the techniques of occult initiations, and public teachings rather than secret instruction) which he tried to pioneer. His work sought to demonstrate that

there need not be a contradiction between the wisdom of the past and the perspectives of endless progress offered to modern man.

Theosophical Society

1. OVERVIEW 2. ORIGINS AND THE NEW YORK YEARS 3. PASSAGE TO INDIA 4. THE 1880S 5. DIVISIONS AND DISSENSIONS 6. THE THEOSOPHICAL SOCIETY UNDER ANNIE BESANT 7. THE THEOSOPHICAL SOCIETY AFTER ANNIE BESANT

1. OVERVIEW

The organizations identified with the dissemination of teachings collectively known as Theosophy and derived primarily from the writings of → Helena P. Blavatsky (1831-1891) and her associates and followers may be referred to as Theosophical societies. The one society that has a direct or administrative link back to the first president and co-founder of the original Theosophical Society, → Henry Steel Olcott (1832-1907), is currently the largest and most international of all the surviving societies: the Theosophical Society, with headquarters in Chennai (Adyar), India [henceforth identified as the Theosophical Society (Adyar) or abbreviated as TS]. It is this organization that is

most closely associated by the general public with its co-founder and leading theoretician, H.P. Blavatsky. Unlike other, lesser well-known organizations, the Theosophical Society (Adyar) allowed her teachings to languish for a time in the early 20th century while under the leadership of its second President, → Annie Besant (1847-1933). Rather than looking to Blavatsky’s teachings as the direct font of Wisdom, the Society’s leaders, especially Mrs. Besant and her close associate, → Charles Webster Leadbeater (1854-1934), developed a set of teachings currently known as Second Generation Theosophy. Although the Theosophical Society (Adyar) at present bases its Theosophy primarily on Blavatsky’s interpretation, the Society is nonetheless perceived by many within the broader Theosophical Movement as more liberal than either of the two other principal organizations that have remained consistently faithful to her teachings: the Theosophical Society, with headquarters in Pasadena, California [henceforth identified as the Theosophical Society (Pasadena)], and the United Lodge of Theosophists [henceforth identified as the ULT].

The Theosophical Society (Adyar) claims direct descent from the original Theosophical Society, which was inaugurated in New York City on November 7, 1875. The members of this original Society opened membership to those with varying backgrounds and beliefs, all united, in the words of the Society’s own description, ‘by their approval of the Society’s Objects, by their wish to remove religious antagonisms and to draw together men of goodwill whatsoever their religious opinions, and by their desire to study religious truths and to share the results of their studies with others’. In the opinion of the original Society, and certainly of its descendants, Truth or Divine Wisdom (*theosophia*) is found, at least in part, in all religions; it thereby accepts the expected consequence that all religions should be studied rather than condemned. It also places much emphasis on study – of Theosophy, of religions, of philosophies, and indeed of any field that may express the Divine Wisdom as it is understood by the Society and its members.

2. ORIGINS AND THE NEW YORK YEARS

The roots of the Theosophical Society may be found in the fascination with science and the increasingly popular view during the second half of the 19th century that the spiritual realm was scientifically verifiable and that its inhabitants – spirits – were in communication with the physical realm. The modern spiritualist movement [→ Spir-

itualism] was initiated in 1848 with the mysterious rappings in a Hydesville (New York) farmhouse. The publicity surrounding these rappings excited the imagination, hopes, and faith of people from all levels of society, so much so that by the 1870s almost twenty-five percent of the population of the U.S. claimed some manner of association with spiritualism. Side by side with this popular movement there existed an esoteric tradition with long-standing antecedents in the Western world that appealed to prominent minds in philosophy and science.

Both these movements – Spiritualism and Western esotericism – were embodied in H.P. Blavatsky by the time she arrived in New York in 1873. Her claim to have experience in spiritualist mediumship and in acquiring both practical and theoretical knowledge of the Western and non-Western esoteric currents contributed to the creation of the Theosophical Society in 1875. Although much is written by and about Blavatsky regarding her reasons for coming to the United States (including her assertion that she did so primarily in order to establish a society that would advance esotericism or the Ancient Wisdom), there can be no doubt that her primary role in the foundation of the Theosophical Society was as a charismatic raconteur who gathered some of the leading spiritualists and Western esotericists in her apartment in New York City, where she related her adventures in search of the Ancient Wisdom and sought to demonstrate the practical side of esotericism and → magic. On one occasion, September 7, a participant in these gatherings, George Henry Felt (1831-1906), gave a lecture variously titled “The Lost Canon of Proportion of the Egyptians” or “The Cabala” (depending upon the source summarizing the lecture). Felt suggested an explanation of the Egyptian and Greek Canon of Proportion, and revealed that he had discovered how to cause “elementals” or “creatures evolved in the four kingdoms of earth, air, fire, and water” (identified as gnomes, sylphs salamanders, and undines) to manifest. One or both of these claims led to the suggestion by Colonel Olcott, only one day after Felt’s lecture, to form a society for just this sort of study. The suggestion led to the inauguration of the Society on November 17. Thus, the persons directly responsible in forming the nascent society were Olcott, who first suggested the idea and later contributed to its organization; Felt, who presented the lecture that provoked Olcott’s suggestion; and Blavatsky, who had created and sustained interest in esoteric topics for the participants of these soirées and who assented to Olcott’s suggestion that a society be formed to promote occult research. It is not clear

how involved Blavatsky was in the initial proposal of the society. Olcott related how he wrote his suggestion to form a society on a note that he passed to Judge. The note was then passed to her, who ‘read it and nodded assent’.

It was Olcott, the newly elected President of the TS, who voiced the purpose of the Society in his inaugural address on November 17 and in its by-laws. The by-laws make it quite clear that the objects of the Society were ‘to collect and diffuse a knowledge of the laws which govern the universe’. In his inaugural address, Olcott suggested that the study of theosophy or the “Divine Science” was to be investigative and unbiased rather than doctrinal: Olcott conceived of the Society as an organization for research whose scope of interests included the “unseen universe” and the powers therein. Both were subsumed under “magic” – interpreted by Blavatsky, in *Isis Unveiled*, as “spiritual Wisdom”; accordingly, “magicians” were persons capable of causing nature to be their servant. Felt’s promise of manifesting the elementals, by procedures discovered by him, was just the kind of experiment that appealed to Olcott.

During these early years in New York, mediums were tested; experiments were conducted in psychometry, thought reading and mesmerism (→ Animal Magnetism); and papers were read. However, the TS soon proved to be more than an organization for research. For reasons never fully explained, it became a secret society in early 1876, most likely in connection with psychic experiments, including attempts to achieve out-of-body experiences, which were never intended for public exposure. Such types of practice, clouded in → secrecy, survived well into the mid-1880s. Incidentally, the theoretical side of magic or “spiritual Wisdom” – as articulated in Blavatsky’s writings, particularly her *Isis Unveiled* (1877) – attracted no less an inventor than Thomas A. Edison (1847-1931), who applied for Fellowship status on March 27, 1878, and was formally admitted on April 5.

Shortly thereafter, information about a South Asian organization known as the Ārya Samāj and its leader, Swami Dayānand (Svāmī Dayānanda Sarasvatī, 1824-1883) was presented to the Society by the head of the Bombay branch, Hurrychund Chintamon. The information was attractive enough to cause the Council of the TS to ‘unanimously [resolve] that the Society accept the proposal of the Ārya Samāj to unite with itself, and that the title of the Theosophical Society be changed to the “Theosophical Society of the Ārya Samāj”’. This association came to an end in 1882, when Olcott realized that the Hindu fundamentalist

Ārya Samāj had little in common with the Society's goals. Another initiative taken in order to expand the influence of the Society came with the formation of the British Theosophical Society, which was organized in London on June 27, 1878, by the Treasurer of the TS, John Storer Cobb.

Prior to Olcott's and Blavatsky's departure from the U.S. in 1878, an event took place that had little to do with the teachings or practices of the Society but helped to identify its character. This was the death of one Joseph Henry Louis Charles, Baron de Palm, who, shortly before his death, just two months after joining the TS on May 20th, 1876, had requested a funeral that would 'illustrate the Eastern notions of death and immortality'. This led to considerable publicity and public interest in what was called a "Pagan funeral" by the New York press. Negative reactions against the Theosophical leaders caused a delay in the cremation service until December 1876. The cremation of Baron de Palm was described by Olcott as 'the first scientific cremation in America' and the introduction of 'the Hindu mode of sepulture'.

3. PASSAGE TO INDIA

Olcott and Blavatsky's decision to leave New York for India came in May 1878. Prior to their departure, Olcott requested General Abner Doubleday (1819-1893), a prominent Civil War general who had joined the TS only as recently as June 30, 1878, to be Acting President. Having departed from New York on December 18, 1878, on New Year's Day, Olcott and Blavatsky arrived in England, where they remained for seventeen days before departing on January 17, 1879 aboard the ship *Speke Hall*. An administrative decision made by Olcott on the day of their departure, known as Foreign Order, No. 1, formally appointed Doubleday as President, *ad interim*; David A. Curtis, a journalist, as Corresponding Secretary, *ad interim*; George Valentine Maynard as Treasurer; and William Quan Judge (1851-1896) as Recording Secretary. The journey to India lasted almost a month, and Olcott and Blavatsky entered Bombay Harbor on February 16, 1879.

Soon after their arrival in Bombay, on February 25, they received a letter from an individual who was to become an invaluable contact for both the travelers and the Society: the editor of the *Pioneer* (Allahabad), A.P. Sinnett (1840-1921), who wished to make their acquaintance. The friendship of the editor of a prestigious newspaper proved to be a Godsend for the pair, for Sinnett helped to publicize many of their activities, including Olcott's first address in India, "The Theosophical Society

and Its Aims", which took place on March 17, 1879. Later in the year, Sinnett publicized their intention to establish a journal called *The Theosophist*, the first volume of which was published in Bombay in October 1879 and which is still published today at International Headquarters of the Theosophical Society (Adyar). One reason for publishing this journal was to provide non-Western scholars with an opportunity to publish articles about the religions of South Asia – Hinduism, Buddhism, and Zoroastrianism.

Sinnett was soon to have a significant impact on Theosophical teachings by engaging in alleged correspondence with two of the Mahātmas or Masters of Wisdom that Blavatsky claimed to have had as her teachers. These Masters were believed to be the sources of the Ancient Wisdom and so provided the authority behind Blavatsky's interpretation of this Wisdom. The correspondence lasted for approximately five years (1880-1885), with the principal teachings summarized by Sinnett in *Esoteric Buddhism*, first published in 1883. Sinnett was to have a significant influence – positive and negative – on the British TS in the years following these publications.

4. THE 1880S

The Theosophical Society remained in the public eye due to widespread curiosity about the activities of its President (Olcott) and Corresponding Secretary (Blavatsky). In May 1880, with six additional members accompanying them, they went to Ceylon (Sri Lanka), to the great delight of the Sinhalese populace. There they created new branches of the TS and "took *pānsil*" or the Five Precepts ceremony: an act required for conversion to Buddhism. According to Olcott's statement in his chronicle of the early TS, *Old Diary Leaves*, their participation in this ceremony was regarded by them not as a conversion to Buddhism but merely as confirmation of his and Blavatsky's status as Buddhists – an important observation, considering their earlier connection with Buddhism, and by implication, Eastern Theosophy. During this first visit to the island and following their confirmation as Buddhists, the two initiated what Olcott called the 'beginning of the second and permanent stage of the Buddhist revival begun by Megittuwatte (Gunananda Mohottivatte, an activist monk who organized the Society for the Propagation of Buddhism and a debater who often engaged in public debates with Christian missionaries), a movement destined to gather the whole juvenile Sinhalese population into Buddhist schools under our supervision . . .' (*Old Diary Leaves* II, 166). The out-

come of their activity was the establishment of the Buddhist Theosophical Society, which consisted of seven lay branches (Kandy, Colombo, Pānadure, Bentota, Galle, Matarar, Welitara) and one monastic branch. Furthermore, a number of prominent monks became members of the Society, thus establishing a close relationship between the Theosophical Society and the Buddhist population of Ceylon. This relationship was further strengthened by the founding, through Olcott's efforts, of Buddhist secondary and Sunday schools, which provided an opportunity for Sinhalese to be exposed to Buddhist and Western education. Olcott would continue to actively participate in the Buddhist revival throughout the 1880s and 1890s.

Blavatsky and Olcott's association with the Buddhist revival in Sri Lanka and their early involvement with the Ārya Samāj of Swāmī Dayānanda helped to create the perception that the TS was tilting more toward an Eastern philosophical perspective. Olcott, through his words and deeds, gave the impression that the Buddhist and Hindu philosophies, as he understood them, were closer to the Ancient Wisdom than was Christian Wisdom. Furthermore, Blavatsky's anti-clerical statements made it very clear that she had no love for the brand of Christianity that was practiced in Europe and evangelized in India and other parts of the colonized world. Their move to India was, of course, perceived as the most blatant example of such a shift in emphasis from Western to Eastern esotericism.

It was because of this shift that, as early as 1881 or 1882, George Wyld (1821-1906), the president of The British TS, became so disenchanted with the Theosophical leaders that he attempted to establish – unsuccessfully – an independent society aligned with Christian rather than Buddhist or Hindu teachings. Having failed in his attempt, Wyld resigned from the TS in 1882.

On January 3, 1883, → Anna Bonus Kingsford (1846-1888) joined the TS, and only four days later, during the Annual General Meeting, she was elected to the Presidency of the Theosophical Society of Great Britain (its new name). Together with Edward Maitland (1824-1897) as Vice-President, she took immediate steps to change the direction of the Society. Like Wyld before her, Kingsford – a Roman Catholic and co-author (with Maitland) of *The Perfect Way; or, the Finding of Christ* (1882) – attempted to focus on Catholic theosophy rather than the Oriental (i.e., Hindu and Buddhist) Theosophy of Blavatsky. Kingsford and Maitland's agenda, however, was challenged with the arrival of A.P. Sinnett in England in April 1883. His recently published book *Occult World* (1881) and

the soon-to-be-published *Esoteric Buddhism* (June 1883), engendered considerable interest among the Fellows of the London Lodge of the Theosophical Society (the new name of the Theosophical Society of Great Britain as of June 1883). *Esoteric Buddhism* detracted attention from Kingford's Christian esotericism; and Sinnett was perceived by Maitland to be too much of a popularizer and propagandizer. After the book had been published, Sinnett initiated a study group in order to examine the book's contents more carefully; and a resolution was passed by the Lodge, advocating the study of esoteric philosophy as taught by the Masters of India. For Kingsford, the issue was whether *only* the Theosophy of the Masters as represented in *Esoteric Buddhism* should be studied, or whether Theosophy itself should be perceived in broader terms: 'We are one at heart, for he [Sinnett] has been taught by his Oriental Gurus the same esoteric doctrines which I have found under the adopted pagan symbols of the Roman Church . . . Greek, Hermetic, Buddhist, Vedāntist, Christian – all these Lodges of the Mysteries are fundamentally one and identical in doctrine'. Yet, by the end of 1883, Kingsford and Maitland had come to perceive *Esoteric Buddhism* from a much different perspective. They were sharply critical of the book and perceived Sinnett as a purveyor of "transcendental physics" instead of esotericism. Sinnett, on the other hand, viewed Kingsford as a non-believer of sorts. By April 1884, the time of the election of officers in the Society, it was suggested (either by Kingsford or by Olcott, depending on the source) that the London Lodge organize into itself two branches: one to study Oriental Theosophy, the other – which was to be called either The Hermetic Theosophical Society or the "Hermetic Lodge, T.S." – to study Hermetic or Christian theosophy. Olcott thereupon offered a charter to Mrs. Kingsford to form a separate Hermetic TS; and after discussion with her colleague C.C. Massey (1838-1905) she accepted the offer. The "Hermetic Lodge, T.S." was organized only two days after elections were held for office within the London Lodge on April 7, 1884; these resulted in the election of G.B. Finch, an ally of Sinnett's, to the office of president and of Sinnett to that of vice-president and secretary. Many members of both the minority Kingsford-Maitland group and the Sinnett faction in the London Lodge desired to participate in the instructions on esotericism offered by both branches; but they were prevented from doing so as the result of a rule issued by Olcott that disallowed dual membership in both branches. On Olcott's suggestion, the charter of the Hermetic Lodge of

the TS was returned, thus making it possible for Kingsford to form an independent Hermetic Society [→ Hermeticism and Hermetic Societies], which was inaugurated on May 9, 1884. The Hermetic Society's stated aim was to concentrate on the study of the Hermetic teachings, the schools that were based upon them – the Pythagorean, Platonic, and Alexandrian – and the Greek Mysteries. This Society and its founder, Anna Kingsford, reflected an alternate path by maintaining an exclusive focus on Western esotericism, thus resisting the growing influence of Hindu and Buddhist esotericism as interpreted by Blavatsky.

This resistance to the eastern Theosophy of Blavatsky and Sinnett was also shared by Kingsford's and Blavatsky's mutual friend and sometime Theosophist, the Countess of Caithness (*née* María Mariátegui, 1830-1895), who herself became President – on June 28, 1883 – of the recently inaugurated Société Théosophique d'Orient et d'Occident in Paris. In 1884, she published a work reflecting the Société Théosophique's range of study, *Théosophie universelle*, the first part of which was subtitled *La Théosophie Chrétienne*, and the second *La Théosophie Bouddhiste*.

This difference of opinion regarding the Ancient Wisdom among the leaders of the TS was nothing compared to the uproar created by the conclusions of the Society for Psychical Research after its investigation of the phenomena associated with the TS. Established in 1882 'to examine, without prejudice or prepossession and in a scientific spirit those faculties of man, real or supposed, which appear to be inexplicable on any generally recognized hypothesis', the SPR's interests were similar to those that inspired Olcott's original concept of the TS. But whereas the SPR was involved only with the investigation of psychic phenomena, the TS claimed to be the fount and focus of such phenomena (whether "real or supposed", in the words of the SPR). An SPR committee had been established to investigate certain claims of the TS: the supposed existence of highly evolved Mahātmās or Masters, the letters they allegedly addressed to Sinnett *et. al.*, and the 'evocation of sound without physical means'. The so-called Mahātma letters were unusual not only because of their alleged authorship but because of the way they were produced. In the words of the SPR Report (1885), these letters, and other 'ponderable objects', were transported 'through solid matter' and appeared by means of 'precipitation of handwriting and drawings on previously blank paper'. The investigation began on the 11th of May 1884, when Olcott was interviewed by F.W.H. Myers (1843-1901) and J. Her-

bert Stack (?-1892). It was followed by interviews with other members of the Society, including Blavatsky. The conclusions of the first (preliminary and provisional) report of the SPR, issued in December 1884, were somewhat tentative. They acknowledged 'a *prima facie* case, for some part, at least, of the claim made, which, at the point which the investigations of the Society for Psychical Research have now reached, cannot, with consistency, be ignored'.

Two months prior to the appearance of the SPR's first report, an exposé had appeared in *The Madras Christian College Magazine* of September and October 1884, containing fifteen letters purportedly written by Blavatsky to her housekeeper and Assistant Corresponding Secretary and Librarian at Adyar, Emma Coulomb. Coulomb's husband (Alexis Coulomb) was a member of the Managing Committee, whose duty it was to oversee the Adyar headquarters. For the background to the publication, one has to go back many months in time. The Coulombs had both been expelled from the TS after Mme. Coulomb threatened to expose Blavatsky if she did not receive a Rs. 3000 bonus. Having been forced to leave the headquarters, she and her husband stayed in a house provided by a group who published the *Christian College Magazine*. The published letters implicated Blavatsky in a scheme to produce fraudulent phenomena. Such revelations convinced the SPR that further investigation of the TS was in order, so it dispatched one of its members, Richard Hodgson (1855-1905), to India in November 1884, for a period of three months. Hodgson's investigations caused the SPR to conclude that the accusations were true, and that a massive fraud was perpetrated by Blavatsky. The letters supposedly written by the Mahātmās Koot Hoomi Lal Sing and Morya had been written by either Blavatsky or her Theosophical assistant and chela (disciple), Damodar K. Mavalankar, who had also arranged for the letters to be received through the Shrine (a cabinet located in the "Occult Room" opposite Blavatsky's bedroom at the Adyar headquarters). The Mahātmās themselves were mere fictions, and none of the phenomena claimed by Theosophists at Adyar could be substantiated. As for Blavatsky's motive, Hodgson concluded that it was neither due to the 'aloe-blossom of a woman's monomania' nor due to her desire for monetary gain. It was his suspicion, rather, that she was a Russian spy and that the TS was actually a political organization. This suspicion was nothing new. It dated back to the time of Blavatsky and Olcott's passage to India, at which time the British Indian government became interested in her activities.

Because of its suspicion, the government had kept her under surveillance during her first year in India. Hodgson concurred with the government's suspicions that 'her real object has been the furtherance of Russian interests'. This second SPR Report, better known as the Hodgson Report, was issued on June 24, 1885, dealing a major blow to the credibility of Blavatsky as well as of the Society.

After leaving India for the last time in 1885, Blavatsky eventually settled in England, where she completed her *magnum opus*, *The Secret Doctrine*, in 1888. Just prior to its publication, she established a new organization, the "Esoteric Section of the Theosophical Society" (ES), whose primary purpose was to offer esoteric instruction. Administratively independent of the ES, Blavatsky in fact acted as its leader. She was known as the Outer Head – the Inner Heads being the Mahātmas, with whom she was supposed to have direct ties.

When Blavatsky and Olcott left the United States in 1878, the Society had been in a moribund state. While its membership grew in the following years, especially in India, the American TS remained relatively unchanged. After Abner Doubleday's interim Presidency, an American Board of Control was established in 1884, followed by the establishment of the "American Section" of the TS under its General Secretary, William Q. Judge. Judge, one of the co-founders of the TS, was to become responsible both for the revitalization of the Society in the U.S. and the eventual separation of the American Section from the parent organization. These events took place over the course of ten years, with Judge taking on an ever-increasing role in the leadership of the international Society.

The final significant event of the 1880s was the addition to the Society's membership of one of the most prominent activists in labor activism and Fabian socialism, → Annie Besant (1847-1933). Besant's membership was important for the prestige and public profile of the TS, because of her activism and her superior communicative skills. She soon became Blavatsky's key disciple in the ES, the co-editor of Blavatsky's magazine *Lucifer*, and, after Blavatsky's death, the Outer Head of the Eastern School of Theosophy (the new name for the ES). In effect, together with Judge (who served as Outer Head of the EST in America and Vice-President of the TS) she became Blavatsky's successor, and a major interpreter of her teachings.

5. DIVISIONS AND DISSENSIONS

Strong personalities and disagreements over teachings invariably lead to schisms and splits within organizations, large and small. The TS is no

exception, as was already demonstrated by the founding of the Hermetic Society under Anna Kingsford and Edward Maitland over the issue of Christian versus Eastern Theosophy. We have seen that a similar situation arose in France: like Anna Kingsford, Lady Caithness was more inclined to discuss Christian Theosophy in her works *Old Truths in a New Light* (1876) and *Théosophie universelle* (the first part entitled *La Théosophie Chrétienne*). Caithness had introduced Theosophy – in embryonic form – in France as early as 1878, according to one account, but certainly by 1883, with the founding of *La Société Théosophique d'Orient et d'Occident*, recognized by Olcott as an official branch of the TS. Although Lady Caithness's views of Theosophy were close to those of Blavatsky, she had an independent streak that resulted in her resignation from the TS on at least two occasions in the mid-1880s. A person of her talent and influence might well have separated herself from the TS permanently; but unlike Kingsford, rather than rejecting the Eastern Theosophy of Sinnett and Blavatsky, she internationalized it. The unity of French Theosophy was more seriously challenged by the former Theosophist → Papus (Gérard Encausse) who by 1891 had come to consider Blavatsky and Olcott as frauds.

It was not until 1895 that the TS met its most serious challenge – not in France but in the United States, involving the TS's highest-ranking officials – Olcott, Besant, and Judge – and its most important section – the American. In the years preceding 1895, W.Q. Judge was accused of forging letters from the Mahātmas. This charge brought an internal investigation by a Judicial Committee in 1893 and 1894; it did not rule on the issue, however, since it considered it out of its jurisdiction. A resolution was brought by Mrs. Besant during the Society's December 1894 convention in Adyar, that Judge resign his vice-presidency of the TS. He refused to resign, and by February 1895 told Olcott that he intended to withdraw from Adyar. This intention to withdraw from Adyar's authority became a reality at the American Section's convention in April 1895, with the delegates voting on the proposal and appointing Judge President for life of the "Theosophical Society in America". This Society continues down to the present under its current name the Theosophical Society. It has had an impact on the Theosophical Movement, especially under the activist leadership of Katherine Tingley (1847-1929), who established a well-known community and headquarters at Point Loma (San Diego, California) in 1897 and who renamed the Society "The Universal Brotherhood and Theosophical

Society” in 1898. The Society moved from Point Loma in 1942 and is currently headquartered in Pasadena, California.

This schism would not remain the only one. After Judge’s death in 1896, Ernest T. Hargrove († 1939) became the new President of the TS in America, but the true power resided in the Outer Head of the Eastern School of Theosophy. Although the identity of the Outer Head was unknown at the time of Hargrove’s accession to the Presidency, it was soon revealed to be Katherine Tingley. Because of her activism and reformism, some members soon grew disenchanted with her redirection of the Society. Hargrove, increasingly aware that his role as President was becoming ineffectual, resigned the office in 1897 and, after an unsuccessful attempt to take power during the 1898 convention, formed his own group and held a convention that same year. Known as The Theosophical Society in America, with headquarters in New York City, and known from 1908 simply as the Theosophical Society, it had attracted some of Theosophy’s most informed and intellectual followers. Some of the best articles on Theosophy are found in its magazine, *The Theosophical Quarterly*, which was published from 1903 to 1938. The Society as an organization has been inactive since 1935.

In the same year, 1898, a second group issuing from Tingley’s Universal Brotherhood and Theosophical Society was founded by Dr. William H. Dower (1866-1937) and Mrs. Francia LaDue (1849-1922). Known as the Temple of the People, the organization emerged from the Syracuse (New York) Lodge. By 1903, the Temple’s community and headquarters, known as Halcyon, relocated in California. The purpose of the community was to lay the ‘mental, physical, and spiritual foundations of the coming sixth race’, reflecting the Theosophical notion that humanity evolves through seven major groups called Root Races.

In 1909, another organization, the United Lodge of Theosophists, was organized in Los Angeles by a former member of The Universal Brotherhood and Theosophical Society and Hargrove’s Theosophical Society, Robert Crosbie (1849-1919). Although a member of Hargrove’s Society when he formed the ULT, it would appear that he reacted more against the methods and policies of Tingley, whose organization he left in 1904. Of the two societies, the ULT resembles Hargrove’s TS to a greater degree: assuming the role of anonymity on the part of its members, only far more strictly, maintaining an intellectualism similar to that of

Hargrove’s TS, and maintaining the teachings of Blavatsky and Judge as its basic source of Theosophy. At present, ULT lodges and study groups are found in the US, India, and Europe.

Many more organizations have originated from a Theosophical society or are inspired by Theosophical teachings. When a tally was taken in 1930, one official in the TS (Point Loma) noted that there were twenty-two Theosophical organizations. How many more have come into existence since 1930 is difficult to determine.

6. THE THEOSOPHICAL SOCIETY UNDER ANNIE BESANT

Following the death of Col. Olcott in 1907, the Presidency of the Theosophical Society (Adyar) passed to Annie Besant. Her influence prior to achieving this office and her association with Charles Webster Leadbeater (1854-1934) helped define the course of the Society under her tenure. Like Olcott, she displayed an activist role as leader of the TS. Olcott’s activism was focused on the Buddhist Revival in Sri Lanka, the Buddhist cause in South-east Asia, and the establishment of the “Pariah schools” in India for the benefit of the depressed classes. Besant’s activism was more wide-ranging, covering the areas of education, politics, social reform, and the introduction of ritual as an important element of the Society’s activities. Her involvement with the establishment of the Central Hindu College in Benares in 1898, together with the formation of the Home Rule League, the drafting of the Home Rule Bill (1925), and the creation of the Theosophical Order of Service in 1908 are but a few examples of her activism. Furthermore, Mrs. Besant, along with Leadbeater, were responsible for introducing a new emphasis and focus within the Theosophical framework. This was but the latest challenge to Blavatsky’s interpretation of Theosophy, a challenge that dated back to George Wyld’s version of Christian Theosophy (1880), Subha Row’s (1856-1890) interpretation of Eastern Theosophy based on Vedântic philosophy, and the above-mentioned interpretations of Anna Kingsford and Lady Caithness, to name but a few. From the mid-1890s until well into the 20th century, Besant and Leadbeater were collaborating on the study of occult phenomena, and from 1898 they were also investigating “Esoteric Christianity”. Their research was temporarily halted as a result of the resignation of Leadbeater from the TS in 1906 on charges of immoral conduct – more specifically, pederasty. After Besant’s election as President in 1907, Leadbeater resumed his collab-

oration with Besant. Their occult investigations resulted in a body of publications that served as the basis of a new and developing form of Theosophy, somewhat related to the Theosophy of Blavatsky but containing elements that had little or nothing to do with the earlier teaching. The differences were documented by Margaret Thomas in her privately circulated booklet, *Theosophy or Neo-Theosophy* (1924 or 1925), which cites twenty-six areas of disagreement between Blavatsky's Theosophy and Besant's and Leadbeater's "Neo-Theosophy". Nowadays referred to as "second generation Theosophy", it differed from the earlier teaching in four significant ways: (1) The introduction of Catholicism and its attendant sacraments into the Theosophical Society (Adyar), through the agency of the Old (later Liberal) Catholic Church and through the efforts of its Presiding Bishop, James Ingall Wedgwood (1883-1950) and his close associate, C.W. Leadbeater. (2) The claim, based on a psychic reading by Leadbeater in 1909, that a young Indian boy, Jiddu Krishnamurti (1896-1886), would serve as the vehicle of the World Teacher, the Christ or Maitreya. This assertion led to the establishment, shortly thereafter, of an organization to promote this belief, the Order of the Star in the East. (3) Emphasis on the writings of Annie Besant and C.W. Leadbeater as the main purveyors of Theosophical teaching, to the almost total exclusion of the writings of H.P. Blavatsky. (4) Emphasis on the acquisition and practice of psychic or occult powers rather than on the theoretical understanding of the occult.

The Liberal Catholic Church, an organization that was to become an important ally of the TS, has its roots in the Old Catholic Church in Holland, an independent organization that separated from the Pope in Rome in 1702. This Dutch Church spread to Great Britain with the consecration of Arnold Harris Mathew (1852-1919) as Old Catholic Bishop for England on April 28, 1908. By 1915, most of the clergy in the Church were members of the TS and the Order of the Star in the East, including its future leader, Bishop Wedgwood, and Leadbeater, whom Wedgwood consecrated as Bishop on July 22, 1916. Although Theosophists were associated with various elements of the Old Catholic Church, it was Wedgwood who was largely responsible for introducing Theosophical teachings into Church doctrine and for making the Church into a vehicle for the coming World Teacher, Lord Maitreya. Archbishop Mathew's demand that Wedgwood and his fellow Theosophists resign from the TS and Order of the Star in

the East led to a schism from Mathew's Old Roman Catholic Church at the end of 1915. The Church under Wedgwood became in effect the Theosophical section of the Old Catholic Church. The schism from Mathew's original body was officially recognized on September 6, 1918, at a synod fixing the new name of Wedgwood's Church as the Liberal Catholic Church. From this time on, the Church was to play a significant role in the TS (although having no official or administrative connection with it), especially in the 1920s when J. Krishnamurti was being prepared for his special role as the vehicle for the World Teacher, who was expected soon to "take possession" of Krishnamurti's body.

The promotion of Krishnamurti as the vehicle of the World Teacher or Lord Maitreya was perhaps the single most important project of the TS under Besant. Along with the discovery of the vehicle for the World Teacher came the requisite preparations for the Teacher's coming, including the training and education of young Jiddu. This led to the establishment, as already stated, of an organization whose main purpose was to promote the idea of the coming World Teacher: the Order of the Star in the East, founded by George Arundale (1878-1945) in Banares in 1911.

In the minds of some Theosophists, however, all this was a distortion of Blavatsky's Theosophy. One serious consequence was the departure from the Society of the influential General Secretary of the German Section, → Rudolf Steiner (1861-1925), who took with him fifty-five of the sixty-nine German lodges under his leadership. A new society, the Anthroposophical Society [→ Anthroposophy], was established under his leadership in early 1913. Moreover, within the Theosophical Society itself there existed a sizable minority of members who opposed the "post-millenarianism" of Mrs. Besant. It resulted in a "Back to Blavatsky" movement, first mentioned in the November 14, 1917 issue of a fairly well known publication devoted to prison reform and Theosophical matters, the *O.E. Library Critic*. Its editor, Henry Newlin Stokes (1859-1942), used this phrase to refer first to the writings by H.P. Blavatsky and to Theosophical literature faithful to her teachings, expanding it later to include those Theosophical lodges within the TS and independent Theosophical groups that remained faithful to her teachings. The most important such group within the Society was the Theosophical Society Loyalty League, established in Sydney, Australia in 1921. Its organ, *Dawn*, published articles from November 1, 1921, to November 1, 1924, emphasizing what it perceived as the pernicious

infiltration of the Liberal Catholic Church within the Society.

Despite the activities of the Back to Blavatsky movement and the TS Loyalty League, the millenarian fervor surrounding Krishnamurti and the World Teacher continued unabated throughout the 1920s. Indeed, Mrs. Besant confidently declared in 1927 that the World Teacher had already arrived.

On August 3, 1929, however, Krishnamurti himself, after some years of increasing doubt about the claims made by Mrs. Besant and her followers, rejected his role as the vehicle of the World Teacher and dissolved the Order of the Star (as it was called at the time of its dissolution). He continued, however, as a teacher and educator outside the Theosophical fold, eventually becoming one of the better-known popular philosophers of the 20th century. The TS, on the other hand, suffered a significant drop in its membership and popularity.

7. THE THEOSOPHICAL SOCIETY AFTER ANNIE BESANT

Mrs. Besant never fully recovered from the shock of Krishnamurti's abandonment of his Messianic role. After her death in 1933, she was succeeded by George Arundale (president from 1934-1945), who was an activist like Mrs. Besant, but focused on the needs of the TS itself rather than on external activities such as had been pursued by both Olcott and Besant. Examples are the establishment of the Besant Educational Trust and Besant Memorial School in Adyar in 1934, whose main purpose was to provide Theosophical education; and the foundation in 1936, by Dr. Arundale's wife Srimati Rukmini Devi (1904-1986), of the International Academy of the Arts (later known as Kālākshetra, 'the Field or Holy place of Arts'), which had as its object (1) '[t]o emphasize the essential unity of all true Art'; (2) '[t]o work for the recognition of the arts as vital to individual, national, religious and international growth; and (3) '[t]o provide for such activities as may be incidental to the above objects'. Associated with the second purpose of Kālākshetra was the revival and development of the ancient culture of India. To Dr. Arundale, Indian dance revealed occult ritual or, in his words, 'the occultism of beauty'. Furthermore, the Society's publication activities continued through the Theosophical Publishing House and the Vasanta Press.

Arundale was succeeded by Leadbeater's protégé, C. Jinarājadāsa (president from 1946-1953), who, among his many contributions to the Society, displayed an active interest in publishing documents centering on the history of the Society. As one of the foremost Theosophical authors, Jinarā-

jadāsa displayed a distinctly scholarly bent in his publications. Furthermore, in order to carry out the third object of the Society ("To investigate unexplained laws of nature and the powers latent in man"), he inaugurated in 1949 the School of the Wisdom at the International Headquarters at Adyar, on the anniversary date of the TS's own inauguration, November 17.

Jinarājadāsa was succeeded by N. Sri Ram (president from 1953-1973) – who was responsible for building the current Adyar Library building – John S. Coats (president from 1973-1979), and the present International President of the TS, Radha Burnier (1980-present).

The Theosophical Society currently focuses on educational and welfare activities. These include The Olcott Educational Society, which controls The Olcott Memorial School and Olcott Memorial High School; the Social Welfare Centre, which cares for infants of working mothers in the vicinity of the Headquarters; the Animal Welfare Centre; the Vocational Training Centre for Women; and the Besant Scout Camping Centre. The TS's primary activity, however, is the dissemination of Theosophical teaching, not only those of Blavatsky but also those of a number of Theosophical writers after her.

JAMES A. SANTUCCI

Theosophy, Christian → Christian Theosophy

Tomberg, Valentin, * 26.2.1900 Saint Petersburg, † 20.2.1973 Majorca

A Russian-Baltic Lutheran by birth, already as a young man Tomberg began to move in the esoteric circles of Saint Petersburg, joining the → Theosophical Society in 1917. The Bolshevik Revolution having taken a heavy toll on his family, he fled in 1918 to Tallin (Reval, in Estonia). There he married in 1922, held (after several other jobs) a position at the Estonian postal administration, and in 1925 was elected to the Vice-Presidency of the German-speaking branch of the Estonian Anthroposophical Society [→ Anthroposophy] (in 1932 he became Secretary General of the Baltic Anthroposophical Society branch). At the age of thirty-one

he experienced a spiritual revelation which, he claimed, put him in contact with the angelic world. From 1930-1938 he gave many lectures on Anthroposophy and contributed articles to journals of that movement. Some of these works were published as early as 1933 in volumes titled *Anthroposophical Considerations* (on the Old and the New Testament), which went through several editions. The same year he married for the second time. Over the 1930s he distanced himself little by little from the Anthroposophical Society and he eventually resigned in 1937. This change of orientation was due partly to his own Christianity, which was more christocentric than → Rudolf Steiner's, and partly to various conflicts within the European Anthroposophical Society Sections after Steiner's death in 1925. In 1939 Tomberg came to Rotterdam in the Netherlands, where he gave many lectures (most of which were subsequently published), in particular on the return of Christ in the ethereal world. He then settled in Amsterdam, where he made a living as a translator and language teacher, and for many months had to hide with his family from the Nazis. At the end of the war he converted to Catholicism, then enrolled at the University of Cologne to study Law under the direction of Ernst von Hippel, and was awarded an LL.D. in International Law. In this connection, he authored two treatises in German (*Degeneration und Regeneration der Rechtswissenschaft*, Bonn 1946, new edition 1974, and *Die Grundlagen des Völkerrechts als Menschheitsrecht*, Bonn 1947). In 1948 Tomberg left Germany and definitely settled in England, where, thanks to his remarkable linguistic gifts, he held a good professional position at the BBC. He retired in 1960, and spent the rest of his life in Reading, near London, where from 1963 to 1967 he devoted himself to the writing of several works, among which are his *Meditations on the Tarot*. While traveling in Majorca in 1973 he died of a stroke.

Tomberg's career as an author can be divided into two main periods: the one before and the one after his conversion to Roman Catholicism. During the first, his writings were rooted primarily in the context of Steiner's Anthroposophy. During the second, his written output was more personal and original. With the exception of his two studies in German devoted to International Law, his oeuvre consists mainly of a number of works (published either anonymously or posthumously) of an esoteric character. These – and mostly the *Meditations* – were to make him famous after his death.

It is obvious that in terms of presentation, Tomberg's *Meditations* was influenced by a work of the Russian Vladimir Chmakov (a name which Tomberg

quotes only occasionally): *The Great Arcana of the Tarot, the Absolute Beginning of the Synthetical Philosophy of Esotericism* (in Russian, Moscow 1916; repr. Moscow 1993). Both Chmakov's book and Tomberg's *Meditations* are subdivided into twenty-two chapters whose contents only tenuously correspond to their titles. Each title consists of the name of one of the Major trumps, but seems merely a formal pretext for introducing reflections not actually related to the symbolism of the card (not unlike Montaigne's *Essais* or → Foix-Candale's *Le Pimandre d'Hermès Trismégiste* in the 16th century, in which the titles of the chapters are likewise only loosely related to the discussions they announce). Taken as a whole, Tomberg's *Meditations* is nonetheless characterized by a very coherent unity of thought and inspiration. Not at all a new method for reading the Tarot, it is, rather, a synthesis of the life-long meditations of a Christian hermeticist.

The author of *Meditations* is well versed in both Christian theology and the literature of modern Western esoteric currents (15th to 20th centuries), primarily spiritual → alchemy, classical theosophy [→ Christian Theosophy], → *Naturphilosophie*, as well as the more recent so-called Occultist current [→ occult / occultism]. The book is a blend, as it were, of those currents and of Roman Catholicism as Tomberg understood it. He finds himself in contradiction with regard to Catholicism, however, in so far as he declares himself a defender of the belief in → reincarnation. With regard to what he calls "hermeticism" [→ Hermeticism and Hermetic Societies] (i.e., esotericism as the form of thought of modern Western esoteric currents), he discusses a great many of its representative figures, and defines the hermeticist as the theologian of a Holy Scripture which is that of "the World". In other words, for Tomberg there are two complementary theologies: the first or classical one is that of the established Churches, the second one is a hermeticism, which is ultimately a Philosophy of Nature. Like the romantic *Naturphilosophen* (to whom, nevertheless, he barely refers), throughout his book he evinces a strong tendency to think in terms of polarities at all the levels of reality (material, psychic, spiritual, divine, etc.), in the existence of which he believes. Although also very much at home in the literature of the Occultist current – especially the francophone one of → Stanislas de Guaita, → Papus, etc. – Tomberg is quite critical of many forms of practical → magic, and in this connection may be said to stand in the wake of the form of theosophy represented by, for instance, → Louis-Claude de Saint-Martin, whom he appreci-

ates and with whom he shares many commonalities. Indeed, Tomberg can be considered a theosopher in the classical sense of the term, although he only uses the word in the context of discussions of the ideas of the Theosophical Society. In addition, he lavishly reflects on figures representative of classical Christian → mysticism. In an original and creative way, he compares Christian mysticism to both Eastern mysticism and Western hermeticism. Furthermore, Tomberg discusses some major issues of psychoanalysis, aligning with → Carl Gustav Jung, whose views he tries to complement by adding to analytical psychology the dimension of what he calls "transconsciousness". In sum, *Meditations* may be defined as both a compendium of modern Western esotericism and a stimulating critique of some of its aspects, containing many profound thoughts and beautiful poetic passages. In terms of contents and reception it has to be positioned among the foremost books in Western esotericism published in the 20th century.

Written in French but first published in a German translation (1972), *Meditations* went through several translations and editions. The felicitous initiative of publishing the manuscript is mainly to the credit of Martin Kriele, a German jurist (and successor of Ernst von Hippel, see above) who considered himself Tomberg's spiritual heir. In the 1970s and 1980s, under the pretext of respecting Tomberg's anonymity, the editors and publishers of the book have contributed to the creation of an aura of conspiratorial mystery around its author. This insistence on → secrecy has been partly responsible for the *Mediations*' success, but eventually, and not unexpectedly, lost force. Be that as it may, the interest in Tomberg triggered by his *Meditations* is mainly responsible for the subsequent publication and/or re-edition of some of his other writings. As a matter of fact, the reception of Tomberg's works already has a complex and rich history (especially since the beginning of the 1970s). This reception has taken on three main aspects.

First, a great many enthusiastic readers have authored laudatory articles on Tomberg, mainly on the *Meditations*. Second, Tomberg is the subject of severe criticism in a plethora of writings emanating from the Anthroposophical Society (Faivre 1996, 227 nt 9). For example, Prokofieff (see Bibliography) warns Anthroposophists to steer clear of him. He considers Tomberg as a secret disciple of the Jesuits, a Catholic agent inimical to the "true" message of Rudolf Steiner (the fact that Cardinal Hans Urs von Balthasar was chosen by the editors of *Meditations* for writing the preface served to fuel such a critique) and as a hermeticist infected with

the occultist stream represented by → Eliphas Levi, Stanislas de Guaita, Papus, etc. And third, since the beginning of the 1990s there has been an increasing amount of objective scholarly studies devoted to Tomberg. Most important among them are the publications of the Ramsteiner Kreis (The Ramsteiner Circle), a Society established in 1990 to study Tomberg's life and works.

ANTOINE FAIVRE

Tradition

1. INTRODUCTION 2. PRISCA THEOLOGIA AND PHILOSOPHIA PERENNIS 3. MAIN AUTHORS AND DEVELOPMENTS
4. THE WISDOM OF THE ANCIENTS
5. TRADITIONALISM/PERENNIALISM
6. PERENNIAL PHILOSOPHY IN GENERAL CULTURE

1. INTRODUCTION

Primarily in Western esoteric contexts, but not exclusively there, a wide range of terms have been used to refer to the idea that there exists an enduring tradition of superior spiritual wisdom, available to humanity since the earliest periods of history and kept alive through the ages, perhaps by a chain of divinely inspired sages or initiatory groups. In tracing the development of this idea through its main historical stages, we will restrict ourselves to those authors and currents who explicitly align themselves with such a tradition under one of its common names – e.g. *prisca theologia*, *prisca sapientia*, *pia philosophia*, (*philo*)*sophia perennis*, *perennial philosophy*, *perennial wisdom*, "the wisdom of the ancients", or simply "Tradition" with a capital T – rather than widening the field so as to include any theory focused on the need to recover a lost spiritual world-order. The term "philosophia perennis" has been used in the latter sense notably by Wilhelm Schmidt-Biggemann, in a major study (1998) which includes so much that most mystical and esoteric as well as many additional philosophical traditions from antiquity to the period of → Romanticism can be seen as falling under the umbrella. Although it is true that the authors and currents treated below under the heading of "tradition" typically evince a sense of nostalgia

for a lost or diminished world-order of wholeness and truth (an interesting exception, however, will be discussed at the very end of this overview), it is by no means the case that every author in whom we find such longings perceives himself and his work as a link in the chain of those who have preserved Truth and Wisdom through the ages. What characterizes the currents and authors treated here, however, is precisely this sense of being part of a trans-historical “community”, of which it is believed that all members would basically have agreed among one another, had they been able to meet. Thus, for example, an author like → Jacob Boehme – treated under the heading of “philosophia perennis” by Schmidt-Biggemann – is not included, precisely because his work is presented as a new and original revelation rather than as a reformulation of enduring truths. In contrast to authors like Boehme, representatives of “tradition” as understood here typically engage in exegetical commentaries on earlier religious and philosophical texts and traditions, in order to demonstrate that – apparent contradictions notwithstanding – all of them contain the same universal verities; this is very different from what we find in authors like Boehme, who concentrate their exegetical enterprise not on human texts and traditions but on the Bible itself understood as God’s Word.

2. PRISCA THEOLOGIA AND PHILOSOPHIA PERENNIS

Already Plutarch referred to the ‘ancient, venerable theologians’ (οἱ τε πάλαι θεολόγοι, or “prisci theologi”: *De animae procreatione in Timaeo* 33, 103A-B; cf. *De Iside et Osiride* 10) as the ‘oldest philosophers’, and a high regard for pre-platonic philosophers as teachers of religious wisdom can be found in various classical, (neo)platonic as well as Christian authors (see e.g. Diogenes Laertius, → Augustine, Lactantius, Iamblichus, Proclus, Michael Psellus, and many medieval theologians interested in the → Hermetic literature). To understand how such references came to be interpreted by the Renaissance proponents of *prisca theologia*, obviously in a Christian context, they must be seen in connection with what various other classical sources had to say about *μαγεία* or magic. Its practitioners (the Magi) were recognized not only among the Persians, but also among the Egyptians, Babylonians, Syrians and Indians. And beginning with Pseudo-Plato (*Alcibiades* 1.122A) there existed a tradition – e.g. Diogenes Laertius, Dio Chrysostomus and Porphyry – which held that this *μαγεία* was not a black art but the ancient “worship of the gods” (Albert de Jong, *Traditions*

of the Magi [1997], 393, 400). Combining these two traditions, it was natural for Renaissance philosophers to conclude from the sources at their disposal that true philosophy had not begun with the Greeks and true religion had not begun with the Hebrews; the two had their common origin in a much more ancient “*prisca theologia*” or “*prisca sapientia*”, also known as magic and widespread in the ancient world; and of course – by the very fact that it was “true” – this ancient wisdom had to be compatible with the fundamental tenets of Christianity.

In terms of its underlying macrohistorical assumptions [→ Macrohistories], this thesis contained an inherent paradox that has not been systematically analyzed by scholars. In 1964 Frances Yates opened her *Giordano Bruno and the Hermetic Tradition* with the statement that ‘[t]he great forward movements of the Renaissance all derive their vigour, their emotional impulse, from looking backwards’, and continued by nicely formulating the fundamental paradox: ‘progress was revival, rebirth, renaissance of antiquity’ (1964, 1). She did not, however, call attention to the deeper roots of the same paradox: the very superiority of Christianity with respect to earlier religions would seem to imply a doctrine of progress, whereas the idea of a superior *prisca theologia* would seem to imply a doctrine of degeneration.

It might be suggested that the concept of a “*philosophia perennis*”, which is historically later than that of “*prisca theologia*” (see below), reflects a certain awareness of this paradox and perhaps an attempt at solving it. The earlier term emphasized the idea of a wisdom that has been lost, forgotten, overlooked or neglected, and should now be recovered (implicitly admitting, even if this was not the conscious intention of its defenders, that Christianity had so far failed to recover it), whereas the later one emphasized the continuity of true wisdom through the ages. The perennial wisdom had always been present: the fundamental verities of true religion – monotheism, the Trinity, the creation of the world *ex nihilo*, and so on – could be found already in the religious wisdom of the ancient philosophers. This emphasis on “enduring truth” might mitigate the danger of making the ancient wisdom superior to the more recent religion of Christianity, but of course it did not really solve the problem: if the fundamental verities of Christianity had already been known before the birth of Christ, did this not undermine the uniqueness of the Christian revelation and perhaps even make it superfluous? But the logical solution – perceiving Christianity as superior to any earlier

religious wisdom, implying a macrohistory of religious progress – would imply the inferiority of the “ancient wisdom” and thereby undermine the very project of either a *prisca theologia* or a *philosophia perennis*. From a historical perspective, this inherent paradoxality might be seen as the main creative impetus that has propelled the continuing quest for “tradition”: the very fact that the problem could never be definitely solved made it necessary to keep trying.

3. MAIN AUTHORS AND DEVELOPMENTS

Perhaps not surprisingly, the originator of the Renaissance *prisca theologia* discourse was not a Christian. The Byzantine platonist → Giorgios Gemistos Plethon (1355/1360-1454) believed in a universal religious philosophy, the principles of which were ‘as old as the universe and were always among mankind’. The most ancient representative of this wisdom known to Plethon was Zoroaster, whom he believed to have flourished some 5000 years before the Trojan War and be the author of the Chaldaean Oracles (actually written in the 2nd century C.E.). From here, Plethon outlined a chain of sages: in chronological order the universal religious wisdom had been proclaimed by Zoroaster, Eumolpus (founder of the Eleusinian mysteries), Minos (the Cretan lawgiver), Lycurgus (the Spartan legislator), Iphitus (the reviver of the Olympic games), and Numa (reformer of Roman religious worship). By means of the Pythagoreans the original Zoroastrian wisdom had finally reached Plato. Plethon, who had little respect for the Egyptians, never mentioned Hermes Trismegistus.

→ Marsilio Ficino’s *Theologia Platonica* presents Plato – read by Ficino through neoplatonic lenses – as essentially a religious author. That the foundational tenets of his “theology” did not originate with him but had very ancient origins is already suggested in the “Argumentum” that prefaces Ficino’s famous translation of the *Corpus Hermeticum* (1463; publ. 1471). Ficino here describes a genealogy of wisdom – explicitly referred to as *prisca theologia* – consisting of six main figures: Mercurius (Hermes) Trismegistus, Orpheus, Aglaophemus (an Orphic teacher of Pythagoras), Pythagoras, Philolaus, Plato. Except for Trismegistus, the genealogy is derived from Proclus (*Theologia Platonica* I, 5), but Ficino explicitly follows → Augustine (*De civ. Dei* XVIII, 39) in placing Hermes after Moses, who may have been learned in all the arts of the Egyptians (Acts 7:22) but cannot have derived his wisdom from Hermetic sources. This primacy accorded to Moses did not last, how-

ever: from 1464 on and until the end of his life, Ficino decided to give precedence to Zoroaster as the very earliest *priscus theologus* (largely because of the authority of the biblical story of the Magi, interpreted as Zoroastrians, who had worshipped the Christ Child as ‘the ultimate Zoroastrian’; see Allen 1998, 37-40, cit. 39). Zoroaster preceded not only Hermes Trismegistus, but even Moses; in fact, associating Zoroaster with the Chaldaeans as well as the Persians, Ficino suggested that Abraham himself had already taken the Zoroastrian wisdom with him when he set out from the city of Ur of the Chaldaeans in quest of the promised land (Allen o.c., 39). Accordingly, in Ficino’s *Philebus*-commentary (1469) and in the *Theologia Platonica*, finished in 1474, Philolaus has vanished and Zoroaster is added as the very first authority in the list, with Hermes as the second one (see e.g. *Theol. Plat.* 4.2.1; 6.1.7; 10.3.5; 17.1.2; 17.4.4; 17.4.11). Interestingly, although Ficino mentions Zoroaster more than seventy times in his work, and almost fifty times with reference to the Persian Magi, and although he clearly associates him with magic, he made no reference to the traditional topos of Zoroaster as the one who had invented it (Stausberg 1998, 163; and cf. 503-569).

That Ficino – undoubtedly inspired by Plethon – gave Zoroaster the first place in his chain of wisdom is of great importance for understanding how the *prisca theologia* could come to be seen as support for a revival of → magic and the occult philosophy [→ Occult/Occultism] in Renaissance culture. Since the neoplatonic theurgy of the Chaldaean Oracles was attributed to Zoroaster, the chief of the Magi and earliest in the chain of wisdom, nothing could be more logical than seeing *prisca theologia* and *mageia* as equivalent. Hence the conclusion, attributed to → Giovanni Pico della Mirandola, that ‘Zoroaster . . . in practicing magic, took that to be the cult of God and study of divinity; while engaged in this in Persia he most successfully investigated every virtue and power of nature, in order to know those sacred and sublime secrets of the divine intellect; which subject many people called theurgy, others Cabala or magic’ (Pico as quoted by Pietro Crinito, see Walker 1972, 50). It must be noted that, remarkably, Hermes Trismegistus is the only *priscus theologus* *not* listed as a magician by Pico (Farmer 1998, 121); perhaps because he wanted to avoid the notorious problem of the “god-making” passages in the *Asclepius* (23-24, 37-38), condemned by Augustinus as idolatrous. Pico differs from Ficino not only in his explicit defense of *mageia* as the ‘perfect and highest wisdom’ and ‘nothing but the absolute consummation

of the philosophy of nature' (in contrast, of course, to the 'execrable and monstrous' practices of *gòeteia*; see *De hom. dign.*), but notably also in espousing a syncretism so extreme and all-encompassing that it ended up relativizing the very exclusivity of the *prisca theologia*: truth could be found in many, indeed in all traditions, including Averroes, the Quran, the kabbalah, and even Aristotle and the medieval scholastics (Schmitt 1966, 513; cf. Farmer 1998).

While Ficino gave chronological priority to Moses over Hermes (although not over Zoroaster), others argued that Hermes had lived much earlier. Thus → Lodovico Lazzarelli referred to Diodorus Siculus, who in his *Bibliotheca Historica* I. 13ff. had related how first the gods and then men reigned in Egypt. Since it is known that Trismegistus 'lived among the gods in the time of the gods' – which is taken to mean 'perfect and true men and sages' –, Lazzarelli concludes that therefore he cannot have lived in the period of the Pharaohs, who were 'neither divine nor true and perfect men, but can scarcely be called human at all' (1st Preface to Correggio). And in his *Crater Hermetis* (3.1) he quotes Porphyry (Fragment 323 F), according to whom the Egyptians were the first 'to pass on the tradition', which moved on from them to the Phoenicians and the Assyrians, and from there reached the Hebrews. In Lazzarelli, then, more clearly than in either Ficino or Pico, it is Hermes Trismegistus who stands at the origin of the *prisca theologia*. Zoroaster is mentioned only once (*Crater* 30.1), with reference to Pseudo-Plato's *Alcibiades* 1.122 A (see above), and Lazzarelli does not discuss his place in the chronology. Lazzarelli is also interesting in how he handles the paradox of *prisca theologia* mentioned above (sect. 1). In an attempt to solve the problem of the god-making passages in the *Asclepius*, he argues that Hermes had lapsed into idolatry because as a pagan he was not yet capable of perfectly understanding the message revealed to him; only Christians are capable of this, and only in his own days has the harmony between hermetism and Christianity been fully revealed – in the person of Lazzarelli's master → Giovanni "Mercurio" da Correggio, the "hermetic Christ". Thus Lazzarelli comes close to achieving the impossible: defending the *prisca theologia* within a discourse of "progress" – not, of course, of the divine truth as such, but of its correct understanding and expression by human recipients – from Hermetism, via Christianity, to the synthesis of both in his own times.

A clear preference for Hermes over Zoroaster is also to be found in → Francesco Giorgio. Although

Giorgio generally mentions Zoroaster in a positive sense, Hermes is given much greater prominence. Among all the *prisca theologi* he has revealed the highest and most sublime wisdom, derived not from books or human science but directly from the divine source itself (*In Scripturam Sacram Problemata* c. 316, VI). Giorgio frequently refers to all the other standard *prisca theologi* but – espousing rather a "philosophia perennis" approach – seems somewhat less concerned with genealogies and more with the general theme of a continuity of wisdom: he tends to merely give lists of authorities rather than putting them in a clear chronological order. The exception to this is his insistence on the priority of Moses: in the end, all the non-biblical authorities in his many lists, Hermes included, are imitators of Moses, the only man who ever spoke with God face to face.

→ Francesco Patrizi's genealogies of wisdom are strange variations on Ficino's, and surprisingly start with Noah's son Ham, usually considered the originator of idolatry, superstition and demonic magic. Patrizi's genealogies exist in several variations, but their main elements seem to be that Ham is either identical with Zoroaster or had a son of that name, who was a contemporary of Abraham and was known in Egypt as Osiris. Zoroaster/Osiris's counselor there was a certain Hermes Trismegistus, whose grandson was likewise called Hermes Trismegistus. This younger Hermes was a little older than Moses, and wrote the *Corpus Hermeticum*. Orpheus adopted the Hermetic wisdom when he came to Egypt, and took it with him to Greece, from whence it was passed on from Aglaophemus and Pythagoras to Plato and his pupils.

The Italian *prisca theologia* tradition was adopted by many later authors during the 16th century and beyond. In addition to the central *prisca theologi* already mentioned, other names came to be added. Among the more frequent candidates were Adam, Enoch, Abraham, Noah, the Brahmins, the Druids (popular among French authors, for obvious chauvinistic reasons), and the Sybils. But later genealogies of ancient wisdom might also include e.g. Asclepius, Musaeus, Daedalus, Homer, Lycurgus, Solon, Heraclitus, Aristotle, Eudoxus, Democritus, Plotinus, Numenius, Philo of Alexandria, Origin, Augustinus – in short, anyone considered an authority by the author in question. Special mention must be made of the French authors (including, among many others, → Lefèvre d'Étapes, → Champier, → Lefèvre de la Boderie, and → Foix-Candale) who adopted the *prisca theologia*-tradition from Italy. They provide often very different lists of ancient sages, but in line with their

cautious attitude towards magic (Walker 1972, 63), Hermes tends to be given precedence over Zoroaster. The crucial question always concerned, rather, the relative priority of Hermes Trismegistus and Moses. Most French authors (e.g. Champier, Lefèvre d'Étaples, Louis le Caron, Philippe de Mor-nay) preferred the safer because more obviously orthodox option of making Hermes a contemporary or successor of Moses, thus making sure that the origins of wisdom could be located with the Hebrews, from where it could have been passed on via Egypt to other Gentile nations. A minority of French authors (e.g. Foix-Candale) followed Laz-zarelli in giving chronological priority to Hermes; but those who chose that option were careful to restrict the pre-Jewish revelation only to those reli-gious truths that could be attained by natural reason (Walker 1972, 70).

The entire edifice of the *prisca theologia* obviously rested on belief in the great antiquity of the founding authorities and their writings: Zoroaster and Hermes. In 1567, Gilbert Genebrard in his *Chronographia* gave arguments why Hermes could not have been a contemporary or predecessor of Moses but must have lived in more recent times, and additional arguments were adduced by Matthieu Beroalde in 1575. Jean van Gorp (*Hieroglyphica*, 1580) even went as far as denying that Hermes had ever existed. Patrizi's four-volume *Discussiones peripateticae* (1581), which strongly restated the *prisca theologia* perspective, was attacked in 1584 and 1585 by a pupil of Genebrard, the humanist grammarian Teodoro Angelucci, who used all the arguments given by Genebrard, Beroalde and van Gorp. Responses by Patrizi and his friend Francesco Muti did not succeed in changing Angelucci's mind, and in a long letter to Antonio Persio written in 1588 (first published by Mulsow in 2002) he wrote down the most thorough criticism of the *prisca theologia* edifice known to us from the 16th century. In 1614, finally, Isaac Casaubon published his *De rebus sacris et ecclesiasticis exercitationes XVI*, in one chapter of which he correctly dated the *Corpus Hermeticum*, thus definitely undermining the intel-lectual foundations of the *prisca theologia* edifice. As for the *Chaldaean Oracles*, their attribution to Zoroaster seems to have been first questioned by the Calvinist theologian Theodore Beza; and from the 17th century on, an increasing number of schol-ars (e.g. Petrus Lambecius, Theophilus Spizelius, Johann Heinrich Ursinus, Thomas Burnet) came to recognize them correctly as products of hellenistic platonism from the period after Christ.

The term *philosophia perennis*, as distinct from

prisca theologia, was first introduced in 1540 by the theologian and biblical scholar Agustino Steuco, then librarian of the Vatican. A representative of the liberal wing of 16th-century Catholic theology, Steuco was a staunch opponent of the Reforma-tion. In fact, both the *prisca theologia* and the *philosophia perennis* in the Renaissance in general seem to have been largely a Roman Catholic affair: not by chance, Casaubon's 1614 attack on the authenticity of the *Corpus Hermeticum* was the product of a Protestant scholar criticizing a church history in Counter-Reformation style (Cesare Baronio's *Annales Ecclesiastici*, 1588-1607). As explained by Walker (1972, 126f.), the few Protes-tants influenced by the Ancient Theology belonged to the more liberal wing of the Reformation, that based its arguments on an appeal to reason; but most Protestants either neglected the *prisca theologia* or heaped scorn on it.

Steuco's large work *De perenni philosophia*, dedicated to the author's friend and protector Pope Paul III, was reprinted several times during the 16th century and enjoyed much prestige until far in the 17th century. Although it also came in for its share of criticism, it was never placed on the Index, contrary to some other works by Steuco that were hit by official condemnations. Its key theme, which defines the very concept of *philosophia perennis*, is the existence of 'one principle of all things, of which there has always been one and the same knowledge among all peoples'. As pointed out by Schmitt, Steuco's narrative is lacking in any concept of progress. Instead, he emphasizes either con-tinuity or degradation: in the first stages of history knowledge is still perfect, being handed down by God himself; then it gets dissipated and scattered; and finally, 'it seems to us to be like a mere story or dream' (Schmitt 1966, 517). After the Flood, the perfect divine knowledge began to decline, as many things had not been written down and were forgot-ten. The *vera philosophia* was kept alive only by the few, mainly among the Chaldaeans, Armeni-ans, Babylonians, Assyrians, Egyptians and Phoenicians. From the Chaldaeans the true wisdom was passed on to the Jews, who transmitted it to the Egyptians, from whom it traveled on to the Greeks, who finally introduced it to the Romans. Steuco roughly follows Ficino's genealogy of wisdom but strongly emphasizes Hermes Trismegistus, who is mentioned no less than 214 times (against 16 times for Zoroaster and 96 for Orpheus; Crociata 1987, 234-239) and whose importance might be equal even to that of Moses. Somewhat like Pico, he is engaged in a project of extreme syncretism, trying 'to make nearly everyone agree' (Schmitt o.c., 523).

This includes the philosophy of Aristotle, who is treated with respect but clearly seen as inferior to the tradition flowing from ‘divinus Plato’ (*De per. phil.* III, 10).

Charles B. Schmitt has traced the reception history of Steuco’s work through the 16th and 17th centuries up to the early 18th, discussing defenders of his approach as well as critics (1966, 524-531). An important late adherent of this history is Gottfried Wilhelm Leibniz, who was long believed to have invented the term *philosophia perennis*. He used it in a much quoted letter to Remond (august 26, 1714): ‘Truth is more widely spread than one might think, but it is very often obscured . . . In calling attention to these traces of truth among the Ancients . . . one would be drawing the gold from the mud, the diamond from its mine, and light out of darkness; and that would in fact be *perennis quaedam Philosophia*’. Important here is that Leibniz seems to have been the first to mention the term *philosophia perennis* without specific reference to Steuco. The result was a rupture in the transmission history of the term: while Steuco’s work fell into oblivion and Leibniz’s fame caused his reference to be picked up by later authors unaware of its Renaissance precedents, “*philosophia perennis*” now began to be used in a new, more general and often vaguer way.

4. THE WISDOM OF THE ANCIENTS

Prisca theologia, *philosophia perennis* or related concepts of a primordial or universal tradition of wisdom play only a minor role in the predominantly Protestant esoteric traditions of → Paracelsianism, → Rosicrucianism and → early Christian Theosophy (Faivre 1999, 12-16). The phenomenon of an “invention of Tradition” only re-emerged as a major trend in Western esoteric currents with → Freemasonry in the early 18th century. The *Constitutions* of James Anderson (1723) contain a grand mythical history of the Order, beginning with Adam, who had ‘the Liberal Sciences, particularly Geometry, written on his heart’ by the Grand Architect of the universe. He taught it to his sons, and from there it spread all over the world. Almost all biblical personalities of any importance are presented as masons and experts in geometry and architecture, and the story of how this knowledge was transmitted is carried on from biblical times to the 18th century. The *Constitutions* furthermore refer to the existence of a ‘Religion in which all Men agree’, and which allows each Brother the freedom to form his own particular opinions. Thus we see re-emerge the basic themes of a primal wisdom carried on through the ages until it reaches its

present-day representatives, and of a universal religion that transcends external worship and the disagreements of dogmatic theology. But in spite of its prominence in the *Constitutions*, the mythical history of the Order has not come to play a great role in regular Freemasonry; it continued to be further developed mostly in the various systems of “high-grade” masonry, where all kinds of legendary and esoteric materials could be used to construe narratives (often quite fantastic) of how the true knowledge had been passed on. For example the para-masonic → neo-Templar traditions believed in a secret transmission of knowledge since the suppression of the Knights Templars in the middle ages, and the system of the Philalethes proclaimed the existence of ‘a science as ancient as men on earth’ that has been passed on by tradition and that is able to give ‘the greatest possible happiness to man’. This tradition is like the trunk of a tree, from which have sprung the ‘occult sciences, known under the name of magic, kabbalah, hermetic philosophy, theosophy, pneumatology, theurgy etc.’, all of which are seen as closely related to Freemasonry. Important later authors who include a variety of earlier esoteric currents and the occult sciences within a masonic context are e.g. → Jean-Marie Ragon de Bettignies (*La philosophie occulte*, 1853) and John Yarker (*Scientific and Religious Mysteries of Antiquity* [1878], *The Arcane Schools* [1909]).

The notion of “tradition” begins to play a role in the Christian theosophical current only during the later 18th century. Johann Friedrich Kleuker (1749-1827), in his commentary on the first books by Saint-Martin, speaks of a ‘chain of Tradition’ that can be perceived through all periods of history. This ‘continuous thread’ has its origin in ‘an original light’, and ultimately leads back to the Creator himself. → Louis Claude de Saint-Martin himself, in *De l’esprit des choses* (1802), speaks of a “mother Tradition” written by God in the very hearts of men and anterior to any books or human traditions. The latter are only “copies” of the one Tradition, it being understood that the Jewish and Christian ones are more faithful to the original. The macrohistorical notion of degeneration – in line with basic Christian theosophical notions of the Fall – is clearly implied in Saint-Martin’s description of ‘all traditions of the earth . . . as ruins of a fundamental mother-tradition’ (o.c. II, 147). The same notion of a “mother-tradition” is also adopted by → Franz von Baader (*Sämtliche Werke* IX, 371-381).

In → Swedenborg, although his system has no room for a concept of the Fall, we find remnants of

classic golden-age theories and the idea of a gradual decline of wisdom. The members of the “most ancient church”, before the Flood, were “celestial people”; their “adamitic intellect” allowed them to communicate directly with the angels and have an intuitive grasp of the truth. They were followed by the “most ancient” church after the Flood, the members of which no longer had an intuitive grasp of the truth, but could read the signs of divine wisdom in nature, and expressed it by means of an elaborate system of signs, images, emblems and hieroglyphs. The third, “Jewish Church” represented a further stage of decline; but the Old Testament still contained the true wisdom in a coded form, which the Jews themselves did not understand. The birth of “the Lord” in the person of Jesus Christ was the beginning of the fourth Church, which declined and degenerated, and will now be replaced by the fifth or “New Church” based upon Swedenborg’s own revelations. Swedenborg may be seen as a boundary case in terms of the concept of “tradition” as understood here. His work does not contain any concept of a *philosophia perennis* carried on by inspired sages through history; but one might say that his revelations are intended to lead humanity back to a *prisca theologia* or primal divine wisdom, which has been reinstated by “the Lord” in successive stages of history. In describing those stages, however, Swedenborg does not focus on persons (there are no significant references in his work to e.g. Zoroaster, Hermes Trismegistus, Orpheus, Pythagoras, or Plato) but on *Churches*: even many persons mentioned in the Old Testament are interpreted as codes for Churches and divisions of Churches.

It is interesting to compare Swedenborg’s approach with that of another 18th-century author, → Antoine Court de Gébelin in his *Le monde primitif* (9 vols.; 1773-1782). Both attempt to recover an original wisdom that was known to the most ancient peoples, and a lost harmony between heaven and earth, and both believe that the original knowledge was once expressed in the “hieroglyphic” language of myth and symbol. Both also combine Protestant backgrounds with a rationalist approach of “demythologization”, that seeks to decipher ancient traditions according to an allegorical method. Both, furthermore, do not concentrate on the philosophers of antiquity but are mostly interested in how the wisdom of the ancients flows into the Hebrew tradition and is passed on from there. But different from the case of Swedenborg, Court’s strongly neoplatonic and neopythagorean approach explicitly refers to e.g. the Hermetic writings and kabbalistic traditions.

Later than Swedenborg and Court, but still representing a somewhat similar approach, is the neo-Pythagorean esotericist → Antoine Fabre d’Olivet. Fabre believed that all doctrines were derived from ‘a grand Unity, the eternal source from which everything flows’ (*Histoire philosophique du genre humain* I, 1). This original unity corresponds with an original language revealed directly by God. From the four antediluvian idioms of this language derive the three primordial idioms of Hebrew, Sanskrit and Chinese, all three of which are hieroglyphic languages that contain deep esoteric truths. The “Tradition” or primitive revelation was passed on from Egypt to, notably, → Moses, Pythagoras and Orpheus; but Fabre also refers to Buddha, writes that Orpheus derived his ideas from Ram, Zoroaster and Krishna (“Krischnen”), and suggests that Moses’ knowledge has its origins in Atlantis. In other words, we find in his works a confused reception of *prisca theologia* and *philosophia perennis* traditions combined with a new interest in Hinduism and Buddhism, typical of his time. However, it is important to realize that, all these references to historical traditions, persons and lines of transmission notwithstanding, Fabre’s approach is explicitly non-historical. Undoubtedly in reaction to the “historicism” typical of the Romantic era, he is at pains to distinguish between “allegorical” and “positive” history. The latter merely records dates and events, and is inferior to the former. Allegorical history, which alone is worthy of study, freely includes fictional and mythological elements, and ‘arranges events that may never have happened into a dramatization of the spiritual destiny of humanity’ (McCalla 1998, 259). The very distinction between fiction and truth in historiography is rejected as the sterile product of the ‘cold chronologists’. This attitude already foreshadows the blanket rejection of academic historiography typical of the 20th-century Traditionalist current, and in fact Fabre d’Olivet must be regarded as a major source for the latter (Faivre 1999, 22).

The general idea of a “primitive Tradition” (also referred to e.g. by → Joseph de Maistre), the rise of “historical consciousness” in the early 19th century, the new knowledge of and appreciation for oriental religions, and the Romantic quest for a universal mythology and symbolism, all combined to produce a novel genre of esoteric and occultist historiography in the 19th century. While presenting themselves as factual and descriptive histories, in fact its representatives typically mix up fact and fancy, history and myth, thus producing highly fantastic narratives carried by the Romantic attraction

of arcane secrets, long forgotten or suppressed by the establishment but now finally revealed. Thus → Éliphas Lévi in his *Dogme et rituel de la haute magie* (1854-1856) proclaimed ‘the discovery of the grand secrets of religion and the primitive science of the magi and the unity of the universal dogma’; and his *History of Magic* (1859) is a thoroughly confused and highly Romantic amalgam of traditions beginning with the ‘fabulous origins’ of magic in the books of Enoch, continuing with Zoroaster, the Indian gymnosophists (descended from Cain and the source of → gnosticism), the Egyptian Hermes Trismegistus and the → Tarot, the Greeks (incl. Orpheus), Pythagoras, and the Jewish kabbalah. Although Plato gets less attention (he had ‘less depth but more eloquence than Pythagoras’, and his ‘doctrine’ was derived from Egypt; o.c., 124, 127), one still recognizes here the main stages of the traditional *prisca theologia*; but with the important qualification that all these traditions of ancient wisdom are now seen as reflections of “kabbalah”, understood in a universal sense [→ Jewish Influences V].

Many books based upon essentially the same approach have been published since the second half of the 19th century and throughout the 20th, in the contexts of occultism and modern Theosophy. They typically trace their authors’ own beliefs and religious allegiances back to the teachings of ancient “mystery schools” in East and West, and most of them are in fact attempts at comparative study of religions from an esoteric point of view. All of them claim a universal wisdom, as programmatically formulated e.g. by → Anna Kingsford in *The Perfect Way* (1881, Introduction): ‘there has been in the world from the earliest ages a system which . . . being founded in the nature of Existence itself, is eternal in its truth and application, and . . . is no other than that which all the great religions of the world have, under various guises and with varying degrees of success, striven to express’.

One particular title must be highlighted here, not only because of its enormous influence (it has been reprinted many hundreds of times, and translated into many languages), but because it explicitly combines the original Renaissance concept of *prisca theologia* with a 19th-century project of “comparative religions” on occultist foundations. → Edouard Schuré’s *The Great Initiates: A Study of the Secret History of Religions* (French orig. 1889) is based upon a genealogy that places the sources of wisdom in India, but has it flow from there by way of Egypt to Israel and Greece, finally to culminate in Christianity: his genealogy of “great initiates” consists of Rama, Krishna, Hermes, Moses, Or-

pheus, Pythagoras, Plato, and Jesus (Schuré published a separate treatise devoted to Buddha). Schuré writes that the truth has always been available to man: it can be found in all the great religions and sacred books, if only one knows how to read them. Referring to Leibniz’s mention of a *perennis quaedam philosophia*, he explicitly announces a “comparative esotericism” that proves the great antiquity, continuity, and unity of esoteric doctrine in East and West.

5. TRADITIONALISM/PERENNIALISM

Occultist historiographies as discussed above are engaged in an “invention of tradition” within a 19th-century historicist context: uncritical and naive though they may be in their use of sources, and questionable though their underlying assumptions may be, they are nevertheless attempts at writing actual histories of the “ancient wisdom” and its continuation through the ages. Their implicit respect for historiography – i.e., the importance attached to sources and documents as “proof”, see e.g. the mysterious books referred to by → H.P. Blavatsky as basic to *Isis Unveiled* and *The Secret Doctrine* – makes their approach different from that of the so-called “perennialist” or “Traditionalist” current represented by authors like → René Guénon, Ananda Coomaraswamy, → Frithjof Schuon, → Julius Evola, Seyyed Hosseyn Nasr and many others. As summarized by Antoine Faivre (1999, 33), the perennialist perspective is based upon three postulates: (1) There exists a primordial Tradition of non-human origin – humanity has not invented but received it – which has progressively gotten lost, and of which the various historical traditions and metaphysics are the *membra disjecta*. The source of this Tradition cannot be identified by means of scholarly historiography. (2) Modern Western culture, science and civilization is inherently incompatible with Tradition; never before has humanity been alienated from the latter as seriously as today. (3) The Tradition may be recovered, partially at least, by focusing on the common denominators of the various religious and metaphysical traditions. Such research cannot be neutral but requires the seeker to embrace the fundamental Traditional values and perspectives, and preferably to have undergone “initiation”. The Tradition can only be understood from the perspective of Tradition itself; the very idea of neutral, “disinterested” historical research in which the evidence of surviving sources is the ultimate yardstick reflects a modernist and historicist perspective incompatible with Tradition.

→ René Guénon, usually seen as the “founder”

of the 20th-century “perennialist” or “traditionalist” school, was born in a milieu of strict Catholicism, and his concept of tradition owes much to his early familiarity with the French current of Roman Catholic “traditionalism”, including authors such as Jean-Sébastien Devoucoux (1804-1870), → F.-G. Lacuria (1806-1890), Jean-Baptiste Pitra (1812-1889) and Alexis de Sarachaga (1840-1918). Guénon does not use the term “*philosophia perennis*” but prefers to speak of “the primordial tradition” or simply “metaphysics”. He never clearly defines it, not even in the chapter “What must we understand by Tradition?” in his *Introduction générale à l'étude des doctrines hindoues* (1921); but one may summarize his perspective by saying that Tradition for him stands, quite simply, for the enduring Truth as he sees it. This Truth is based upon certain metaphysical “first principles”, which are therefore universal by definition. They cannot be doubted: any attempt to “prove” their truth by arguments means putting the cart before the horse, for these principles themselves should be accepted as the foundation and starting point, in order for any correct understanding of reality to be possible at all. It is therefore internally consistent that Guénon refuses to play by the rules of the historian and does not underpin his statements by source quotations; and all the more so since “historical consciousness” itself is a product of modernity, which is considered the antithesis of Tradition in all respects. Likewise, he does not appeal to the authority of earlier wisdom traditions or inspired teachers and sages; he merely takes it as axiomatic that, through the ages, the Truth has always been available, and has been perceived by those who opened their eyes to it. But it has become ever more difficult to do so, for while the Tradition was still integral to the most ancient cultures (and now still survives notably in primitive, Chinese, Hindu and Islamic ones), a gradual process of degeneration has taken place, reaching its final and lowest point in the present “Kali Yuga” based upon the “reign of quantity” that dominates the modern West: whereas Traditional cultures were based upon correct metaphysical principles, modern Western culture indoctrinates the population with values and principles that are the very antithesis of Tradition. It is not possible to lead the world back to Traditional culture by means of reforms; the cycle will have to run its course, after which a fresh one will begin. Those who embrace Traditional values therefore have no other option than an “inner emigration”, being in the world but not of it, perhaps in Traditionalist communities that are like islands of truth in the general sea of modernist error.

As for Western esoteric currents, they have no special prominence in Guénon’s vision. The various French occultist currents and orders in which he was himself involved during his early years he later came to reject as perversions, and he wrote books against → spiritualism and the perspective of the → Theosophical Society. About the hermetic/alchemical, paracelsian and Christian theosophical currents since the Renaissance – a period which for him represented not a rebirth of ancient wisdom but one more stage in the process of degeneration – he knew little, and cared less. We discuss him in the present context, therefore, not because he identified himself as belonging to the history of Western esotericism but because, as a matter of historical fact, his perspective has come to play an important role in its subsequent development, particularly in the French context. For Guénon himself, the trans-historical “community” with which he identified consisted simply of those in East and West who had let themselves be guided by metaphysical Truth, regardless of their religious allegiance.

Ananda K. Coomaraswamy (1877-1947) had already developed convictions very similar to Guénon’s by the time he encountered the latter’s writings, by 1930, and began to correspond with him. He preferred the term “primordial doctrine”, but did use the term “*philosophia perennis*” as well; both are synonymous for him with Tradition. Frithjof Schuon (1907-1998) is similar to Coomaraswamy in that both found their inspiration originally in the interpretation of art. For Schuon, the perennial wisdom is the key to understanding the “transcendent unity of religions”, and in this he has been followed notably by the influential contemporary historian of religions Huston Smith.

Clearly, in these and similar contemporary authors as well, we are no longer dealing with anything that could be defined as “Western esotericism” in the historical sense of the word (see → Esotericism): Tradition, or perennial philosophy, has become an approach to the comparative study of religions and cultures in general, or even a general philosophical perspective on reality as such. Tradition is not *a* tradition, esoteric or otherwise; it is seen as the true metaphysics than can be found in *any* “authentic” tradition. This has not prevented some representatives of the “perennialist” or “traditionalist” school from writing books about Western esoteric currents from their perspective; examples are e.g. Julius Evola’s writings on the hermetic tradition, Leo Schaya’s book about kabbalah, or Titus Burckhardt’s studies of alchemy, and one might add here the masonic interests of authors such as e.g. Constant Chevillon and Jean Tourniac.

But even if some Traditionalists have a more than average interest in at least some Western esoteric currents, their perspective is applied quite as easily to e.g. Tibetan Buddhism (e.g. Marco Pallis), Islam (e.g. Seyyed Hossein Nasr) or Christianity (e.g. Jean Borella).

The vitality of the perennialist or traditionalist milieu is reflected in the flourishing of conferences and colloquia with titles such as “Science and Tradition”, “Tradition and Modernity” and so on, and the publication of quite a number of journals (see details in Faivre 1999, 37, 40f.). In the English language alone, one may think of *Studies in Comparative Religion* (1967-1987), *Sophia: A Journal of Tradition Studies* (since 1995), *Parabola: The Magazine of Myth and Tradition* (since 1975), and *Avaloka: A Journal of Traditional Religion and Culture* (since 1986); in other languages there are journals like e.g. the Italian *Rivista di Studi Tradizionali*, the Spanish and South-American *Axis Mundi: Cosmología y pensamiento tradicional*, *Symbolos (Arte, Cultura, Gnosis)* and *Epimelia: Revista di Estudios sobre la tradicion*, and the French *Études Traditionnelles* and *Connaissance des Religions*. The scope of such periodicals goes far beyond the domain of Western esotericism; rather, selected currents of the latter tend to be interpreted in strongly religionist fashion as depositories or survivals of Traditional wisdom, their greatest common denominator (and attraction) being their distance from “modernity”. The same common denominator applies to quite a number of influential authors who do not strictly belong to the Traditionalist current but have been influenced by it to some degree; to this group belong e.g. the historian of religions Mircea Eliade, the islam scholar → Henry Corbin, the physicist/philosopher Basarab Nicolescu, the philosopher/anthropologist Gilbert Durand or the philosopher and writer → Raymond Abellio, to mention only a few.

6. PERENNIAL PHILOSOPHY IN GENERAL WESTERN CULTURE

Finally, a few words must be said about concepts of “*philosophia perennis*” (or clearly related expressions, such as “*sophia perennis*”) in modern and contemporary Western culture outside the specific domains of Western esotericism and Traditionalism. Since the early 20th century the term has been in use in neo-thomist or neo-scholastic Roman Catholic circles, inspired by authors such as e.g. Etienne Gilson and Jacques Maritain, where it refers, precisely, to the enduring truth of Roman Catholic theology and philosophy as expressed

particularly by Thomas Aquinas. The term has even been used in this sense by Pope John Paul II, in an address to students (‘Address on the Perennial Philosophy of St. Thomas for the Youth of Our Times’, Rome, 17 nov. 1979). Probably more widely influential has been the book by Aldous Huxley, *The Perennial Philosophy*, first published in 1944. Exemplifying the “rupture” in the transmission of the term, referred to earlier, Huxley mentioned neither Steuco nor any of the Traditionalists, but did refer to Leibniz, in this study devoted to ‘the metaphysic that recognizes a divine Reality substantial to the world of things and lives and minds’ as well as the psychology and ethics related to it.

In the wake of Huxley’s book, the vague notion of a “perennial philosophy” has come to enjoy a certain vogue in the domains of alternative spirituality and the → New Age movement. Thus we find that even the notorious Indian guru Bhagwan Shree Rajneesh (now referred to as Osho) has published a book (also available as videotape) called *Philosophia Perennis*, devoted to a commentary on the Golden Verses of Pythagoras. Implicit and partly explicit belief in a perennial wisdom is widespread in the New Age movement (see references to e.g. → Edgar Cayce, David Bohm, Matthew Fox, Vivianne Crowley, Caitlín and John Matthews, Stanislav Grof, Willis Harman, Peter Russell, George Trevelyan, Shirley MacLaine, and the Ramala community, in Hanegraaff 1996/1998, 327-330).

A particularly interesting case, finally, of perennial philosophy in the wake of Huxley is the influential American transpersonal psychologist Ken Wilber. In the earlier phase of his career he made many references to his own ideas as a psychological application of the *philosophia perennis*, understood by him as grounded in “unity consciousness”, and usually illustrated with examples from Hinduism and Buddhism (see e.g. *Eye to Eye* [1983], 126-133). In sharp contrast to practically all traditional understandings of the concept (whether in its Renaissance or Traditionalist manifestations), but in line with the mainstream of New Age, Wilber sees no contradiction between his belief in a perennial philosophy and the pronounced evolutionism typical of all his writings. Any sense of nostalgia for a lost or diminished world-order of wholeness and truth, present to some degree in all authors and currents discussed above, is rejected by Wilber as reflecting a Romantic sentimentalism that mistakenly looks backwards in search of a lost paradise, instead of aspiring to transcendence as the final term of the evolution of consciousness. It is not in the “pre-personal” stage of mere indiffer-

entiated fusion but in the “trans-personal” stage of integrated wholeness that salvation can be found; with this message, the philosophia perennis has definitively left the realm of history that has been our concern here, and entered the domain of the mind.

WOUTER J. HANEGRAAFF

Trithemius, Johannes, * 1.2.1462 Tritenheim, † 16.12.1516 Würzburg

1. LIFE AND WORK 2. THEORY OF MAGIC 3. TRITHEMIUS’S INFLUENCE

1. LIFE AND WORK

Benedictine abbot of St. Martin at Sponheim, 1483-1505, and of St. Jacob at Würzburg, 1506-1516. Notable for writings in the fields of monastic instruction, mystical theology, ecclesiastical history, Christian humanism, demonology, and → magic. In his capacity as a working magician Trithemius is counted among the pioneers of the art of cryptography, his foremost contributions in this area consisting of his uncompleted *Steganographia* (c. 1500) and *Polygraphia* (1508).

Following youthful stays in Trier and the Netherlands, Trithemius settled in Heidelberg for the completion of his formal education. While there he fell into company with some of the foremost German humanists of his day, among them Conrad Celtis (1459-1508), Jacob Wimpfeling (1450-1528) and → Johannes Reuchlin, joining them in forming the Rhenish literary sodality. On assuming the Sponheim abbacy he transformed his cloister into a renowned seat of Christian learning containing over two thousand handcopied and printed volumes. In time, however, resulting from a combination of the disruptions caused by numerous outside visitors and his reputation as a stern taskmaster who busied his charges in the cloister’s scriptorium even as the novel technology of printing was making handcopying anachronistic, Trithemius came into such acerbic conflict with his Sponheim monks that he reluctantly severed connection with them and his magnificent library. Following temporary stopovers at Cologne and Berlin as a guest of the margrave-electors Joachim of Brandenburg, Trithemius took up permanent residence in the more austere surroundings of Würzburg.

In his monastic and mystical roles Trithemius, an active participant in the Bursfeld reform movement, inscribed numerous sermons exhorting learned piety and delineated successive stages of spiritual ascent following guidelines laid down by, among others, Jean Gerson (1363-1469) and → Nicholas of Cusa (1401-1464). In his historiographical role he composed chronicles, annals, catalogs,

biographies, and an autobiography, in which capacity, prodded by a zeal to establish hereditary links between contemporary Germans and the ancient Trojans and Druids, he did not demur from fabricating such ancient chroniclers as Hunibald and Meginfrid. In his humanist role he advocated the union of eloquence with knowledge, in the furtherance of which he encouraged linguistic skills in Latin, Greek and Hebrew. It is, however, in his demonological and magical roles that Trithemius most famously has come to the attention of successive generations.

According to a story put into circulation soon after his death Trithemius was once summoned to the court of Emperor Maximilian I (1459-1519) where, in a dramatic demonstration of his necromantic powers, he conjured from the dead, together with sundry ancient heroes, Maximilian's deceased wife Mary of Burgundy. That a comparable feat was contemporaneously ascribed to a certain Doctor Faustus (c. 1480-c. 1540) at the court of Maximilian's grandson Charles V (1500-1558) was not lost to the demonological critics of both men. It apparently did not help his case that, in the first documented evidence of the historical personage behind the Faustus legend, Trithemius presented a highly unflattering epistolary portrait of its subject. For despite Trithemius's efforts to distinguish between his own divinely sanctioned magic and the illicit magic of Faustus, he subsequently accrued a diabolical legend of his own resembling that of Faustus. What decisively separates Trithemius's legend from its Faustian analogue is that, whereas Faustus did not leave behind so much as a written word about the motivation for his magical interests, depending for that on others incorporating it into their own agendas, Trithemius bequeathed a formidable scholarly corpus documenting his own motivation.

Until 1499 Trithemius' reputation rested primarily on his monastic, mystical and humanist writings. Then, in that year, his magical notoriety burst onto the historical stage like a lightning bolt, signaled by a 1499 letter to a Carmelite friend, Arnold Bostius (1445-1499), announcing the birth of the art of steganography, a form of cryptography ostensibly invoking angels for the conveyance of secret messages. Far from having himself invented the art therein described, Trithemius assured Bostius, he had been instructed in its principles through a divine revelation. Inasmuch as the intended recipient had deceased prior to the letter's arrival, the prior of his cloister gained access to its contents and, aghast at what he therein encountered, insti-

gated the abbot's necromantic legend. If the unforeseen disclosure of the Bostius epistle can be said to have delivered the first serious blow to Trithemius's reputation, a second severe blow was inflicted in the following decade by the French scholar Carolus Bovillus (c. 1479-1553), who, following a 1503 Sponheim visit in which he was given access to the partially completed *Steganographia*, condemned its author in a widely circulated letter as a diabolically inspired sorcerer.

Instead of deterring Trithemius from his excursions into the arcana as might be expected, the uproar incited by the Bostius and Bovillus affairs rather had the effect of motivating him to enlarge on and sharpen his theoretical justification of magic. Notable testimonies to this response are found in a defense of magic inserted by Trithemius into his autobiographical *Nepiachus* (1507), extensive prefaces to his *Steganographia* and follow-up *Polygraphia* – the latter purged of the suspect planetary-angelic system of cryptic mediation, and lengthy explicative epistles to selected correspondents. Trithemius's histories in turn furnished sundry anecdotal illustrations for fleshing out his occult principles on the stage of everyday life. Also interlocking his occult with his historiographical methods was a willingness on his part to counterfeit ancient sources for the buttressing of his postulates. For much as Trithemius's "discovery" of Hunibald and Meginfrid in his histories has subsequently proved to be spurious, so can that of a certain ancient cryptographer Menastor in his exposition of steganography.

While appearing to emphasize methods of exorcism more than the inculcation of sorcerers in his demonological treatises, Trithemius nevertheless bears responsibility for encouraging the witch persecutions [→ Witchcraft]. His *Antipalus maleficiorum* (1508), select entries in his *Liber octo questionum* (1508) addressed to Emperor Maximilian, and a preface and outline for a projected encyclopedia of demons – all establish Trithemius's positioning as an unabashed apologist for the witch hunts. Echoing a misogynist bias characterizing a prior treatise on this subject, the *Malleus maleficarum* (1484), Trithemius was in no danger of confusing the sorcery of illiterate female witches with his own interests in occult subjects. The same cannot be said, however, for his unfavorable portrayal of many learned male magicians, among them → Simon Magus and Apollonius of Tyana (1st cent. A.D) in ancient times and → Giovanni Mercurio da Correggio and Faustus in his own day.

2. THEORY OF MAGIC

Central to Trithemius's critique of illicit magic is a radical distinction, with such revered prior authorities as St. → Augustine and St. Thomas Aquinas to back him up, between miracle and magic. When entering into the arcana on his own, however, with such ancient "pre-Christian" sources as the Greek Pythagoras, the Egyptian → Hermes Trismegistus, and Hebrew kabbalah [→ Jewish Influences] as his guides, he effectively reformulated the miracle-magic relationship bequeathed through the Augustinian-Thomist legacies. St. Augustine and St. Thomas had vehemently condemned magic in principle as a demonic instrument intended to lure souls into the Devil's service by feigning true miracles. Trithemius, on the other hand, in keeping with a medieval tradition of ritual magic, distinguished between a diabolically sponsored utilization of magic geared to submerge souls in the demon-infested world and a divinely sponsored utilization of magic geared to lift the human soul above the demon-infested world. Put another way, Trithemius's aim was to transform the Hermetic *magnum miraculum* into a *magnum miraculum Christianum*.

Trithemius's express object in his occult writings, facilitated by the three ancient languages of Latin, Greek, and Hebrew promoted by the Christian humanist movement, was to chart a way, through magical means, to the same unobstructed vision of God – the so-called Beatific Vision – which traditional mystical theology assigned to the culminating stages of spiritual ascent. In keeping with his mystical-magical program Trithemius conceived a series of meditative stages leading from the bounds of finite nature to the boundless realm of God, with the occult sciences [→ occult/occultism] facilitating ascent comprised of Hermetic alchemical [→ alchemy] and natural magic, → astrology, Pythagorean numerology [→ Number Symbolism], Neoplatonic [→ Neoplatonism] spirit-magic and kabbalah. Distinguishing "true astrology" from a false look-alike denying freedom of the will, Trithemius placed it in the service of "true alchemy" as presented in the Hermetic Emerald Table. He in turn, in several epistolary expositions of his occult theory, coalesced his astrological and alchemical precepts with Pythagorean numerological and kabbalistic ones geared to direct the soul of the magus, as he put it, from the worldly finite to the divinely infinite realms. Guiding each purgative step in the ascent to mystical-magical illumination for Trithemius was the rule of esoteric → secrecy, a principle in his mind simultaneously fulfilling two cardinal

requisites of his occult methodology. The first requisite was to explain why the motive for his magical inquiries had been misunderstood by uninitiated critics, and the second requisite, to furnish a hermeneutic device for protecting the soul of the initiated from contamination by the demons and their human confederates, the witches and sorcerers.

The astrological and angelical backdrop for Trithemius's occult theory is set forth in his *De septem secundeis* (1508), the celestial scheme of which, adopted from → Peter of Abano, establishes a repetitive succession of cosmic-historical cycles governed in turn by seven "secondary intelligences", so-called because they are held to rule under the supervision of the "First Intelligence", God the Creator. Adopting the names of these ruling powers from kabbalah, Trithemius identified them in hierarchical order as Orifiel in the sphere of Saturn, Anael in the sphere of Venus, Zachariel in the sphere of Jupiter, Raphael in the sphere of Mercury, Samael in the sphere of Mars, Gabriel in the sphere of the moon, and Michael in the sphere of the sun. According to the chronological scheme presented by Trithemius each planetary angel is appointed to rule for an interval of 354 years and four months, with the seven-interval cycles repeated in continuous revolutions until they are apocalyptically terminated.

By this scheme Trithemius not only envisaged a cosmological context for the discernment of patterns of history, but also, by extending those historical patterns beyond the present, rationalized the possibility of accurately predicting the future. The supposition guiding this tract, like his affiliated historical writings, was that prophecy is an extension of history into the future, and, conversely, history is consummated prophecy. Of the more intriguing passages in this regard, one near the close of the tract, addressed to the third rule of Martial Samael assigned to Trithemius's own time, foretells an imminent religious schism suggestive of the impending Protestant reformation.

Following the identical cosmic scheme, signifying an inner linkage between his cosmographical and steganographical operations, Trithemius conceived of a system of angelic mediators for the conveyance of his cryptographical communications. In the furtherance of his steganographical objectives he subordinated to the seven planetary angels two subservient realms of spirits, the first comprised of 31 regional or district spirits ruling over as many domains or mansions, and the second comprised of 24 temporal spirits ruling over the hours. In addition he subjected to the regional and temporal

angels a multitude of subsidiary angelic attendants likewise accessible to steganographical invocations. Planetary harmony, Trithemius was persuaded, is the outward celestial manifestation of the inward occult harmony suffusing and binding all things; hence, he reasoned, the magus, to gain access to the inner workings of nature, must also gain access to the planetary spheres and to the secondary intelligences ruling over them.

As testified by the 1499 expository letter to Bostius and the later attack on Trithemius's magic by Bovillus, the magical abbot's detractors pointed principally to his steganographical methods, explicitly invoking the assistance of the planetary angels and their regional and temporal subordinates as evidence for his sorcerous intentions. His strategy in warding off such attacks consisted not only of distinguishing what he held to be his licit natural and angel magic from the illicit magic he had so strenuously condemned in his demonological writings. It also consisted of shifting focus to a less suspect form of cryptography, termed polygraphy, the enigmas of which, with the help of a key he himself furnished, were expressly decipherable in linguistic terms free of angelic trappings. Tracing its origins to the ancient world, foretold by Egyptian hieroglyphics, Trithemius counted among its more prominent ancient gentile practitioners, together with the spurious "Menastor", Archimedes, Cicero, and Augustus Caesar. As for its more prominent early Christian practitioners, Trithemius cited among them St. Cyprian, the Venerable Bede, and, serving as a prime paradigm for Maximilian's benefit, Charlemagne.

As the preface to the resulting *Polygraphia* makes clear, the shift in methodology between the two forms of cryptography, steganography and polygraphy, in no way meant a shift away from the theory of magic undergirding their practical applications. If it can be viably maintained that Trithemius's annexation of a key to his steganographical tract bolsters a fully linguistic analysis of his codes and ciphers along the same lines as those guiding his polygraphical operations, it can equally be averred that his polygraphy as fully as his steganography was directed to higher spiritual ends commensurate with those spelled out in his mystical theology. In his polygraphical as in his steganographical theory Trithemius made clear his belief that magic, while having the kinds of practical applications that made it appealing to such secular patrons as Emperor Maximilian, Count-Elector Philip of the Palatinate, and Margrave-Elector Joachim of Brandenburg, at bottom is aimed at a transmundane

goal, to wit, the conveyance of the magician's soul from earth to Heaven.

3. TRITHEMIUS'S INFLUENCE

Finding an apt precursor and alter ego in his German predecessor → Albertus Magnus, Trithemius claimed among his own more notable disciples → Agrippa of Nettesheim, who dedicated the first edition of his *De occulta philosophia* (1510) to the abbot. Although a widely promulgated report that Trithemius had tutored → Paracelsus in the arcana is not so easily verifiable, there is no question that various subsequent representatives of the Paracelsian movement [→ Paracelsianism], among them → Jacques Gohory (= Leo Suavius, † 1576) and → Gérard Dorn (16th cent.), elaborated on the precepts of their master under that working assumption. Across the channel → John Dee expressly credited Trithemius, following a chance discovery of a manuscript copy of the *Steganographia* while on a diplomatic assignment to Antwerp in 1563, with stimulating the composition of his kabbalah-inspired *Monas hieroglyphica* (1564). It was, however, through his occult specialties of steganography and polygraphy that Trithemius exercised the most patent and durable impact on future generations – a legacy which, while still exercising influence on modern day enciphering practices, found in the two centuries following his death its most outspoken and sustained train of emulators. Among the more expressly indebted beneficiaries of Trithemius's cryptic methods during this period, all presenting prefaces to their relevant tracts attesting to the abbot's pious intentions, were Sigismund of Seon († 1634); Duke August II of Braunschweig-Lüneburg under the pseudonym Gustavus Selenus (1579-1666); Juan Caramuel y Lobkowitz (1606-1682); and Wolfgang Ernst Heidel († 1721).

Complicating the course of Trithemius's posthumous reputation is the fact that he presented in his demonological writings the same kinds of arguments as have been leveled against him by many of his critics. The posthumous debate surrounding his name understandably intersected not only with the witch hunts which he helped to foster, but also with Reformation polemics and the unfolding scientific revolution. Whereas Protestant critics tended to perceive a connection between Trithemius's magic and his "superstitious" Catholic beliefs and monastic way of life and Catholic critics tended to view his magic as a well-meaning but errant excursus from an otherwise impeccable career in the promotion of learned piety, Protestants and Catholics

alike could be found to make use of his cryptological methods, and even to enlarge on them, with the practical intent of hiding their true thoughts from the uninitiated. And whereas some receptive to the emerging currents of philosophical rationalism took Trithemius to task for engaging in what they characterized as superstition, others, including such admiring members of the English Royal Society as John Wilkins (1614-1672) and Robert Hooke (1635-1703), praised Trithemius's cryptological techniques even as they rejected the occult principles on which they were based. The trend among these was to present the abbot as a pioneer in their campaign to produce a universal cryptic language to complement that of mathematics, commensurate, as it were, with their quest for a universally valid scientific method.

Following the latter strategy, the trend has been to convert Trithemian cryptology from an esoteric discipline based on ancient occult theory to an exoteric discipline of language independent of occult theory. Until recently the task of reducing Trithemian cryptic methods to wholly linguistic terms has been impeded by the resistance of the third, unfinished book of the *Steganographia* to a cryptological solution. That obstacle, with the help of the computer, having now been overcome (see bibliography), the way would now seem clear to sever the cryptographic techniques invented by Trithemius from the theoretical precepts on which they are ostensibly founded. However, while Trithemius's steganographic methods are now established to be radically free of a need for angelic-astrological mediation, still left intact is an underlying theological motive for their contrivance. For as the preface to the *Polygraphia* equally establishes, the everyday practicability of cryptography was conceived by Trithemius as but a secular consequent of the ability of a soul specially empowered by God to reach, by magical means, from earth to Heaven.

In his pursuit of the infinitely removed heavenly realm Trithemius openly favored the will over the intellect, a bias conditioning his mystical theology before it was restated as a basic guideline of its derivative magical theology. While freely admitting to its practical application, Trithemius conceived of his magical specialty, cryptography, as at bottom a *spiritual* instrument intended to assist the soul of the adept in achieving eternal bliss. Through this underlying incentive behind his magic, the name of Trithemius has come to occupy a place of honor at the table of modern theosophy. Just as significant for posterity, however, are the practical applications of his cryptological speculations, establishing his

credentials as being on the cutting edge of modern techniques in the art of encoding and enciphering.

UFO traditions

Among contemporary religious and esoteric phenomena, there are some which seem so closely associated with modern ideas and themes that it might be considered premature to associate them with a word like "tradition", evocative of something with roots in a relatively long past. The esoteric currents associated with UFOs (Unidentified Flying Objects) represent such a case. The emergence of the "flying saucer" phenomenon is usually

associated with Kenneth Arnold's (1915-1984) sightings in June 1947. However, research done over the past decades has clearly shown that the UFO theme existed already earlier: certain pre-1947 books of fiction contain most of the elements subsequently associated with manifestations of extraterrestrial entities, including the physical shape of the spaceships. As has been demonstrated by Bertrand Méheust, a number of novels published between 1880 and 1945 had developed an approach which "technologized magic" and "resacralized technology", thus creating features from which the UFO myth would extensively borrow. Moreover, and of direct relevance for issues dealt with here, groups of UFO believers did not appear out of the blue, but received much of their inspiration from the occult milieu [→ occult/occultism], with which a number of "contactees" were actually familiar. An adequate overview of UFO beliefs therefore needs to trace their pre-1947 roots.

The prehistory of the UFO traditions probably begins around the 18th century, and as observed by Gordon Melton, → Emanuel Swedenborg can be considered an appropriate point of departure. Some of Swedenborg's theological treatises have occasionally been a source of embarrassment even for the Swedish seer's most fervent admirers, and *De Telluribus in Mundo nostro Solari* (Earth in the Universe) is an obvious case. Did not Swedenborg claim to have spoken with spirits of the Moon and of other planets? Most of the content of this treatise can actually be found in Swedenborg's *Arcana Caelestia*, but the fact that Swedenborg also published it as a separate volume indicates that he attributed some particular importance to it. And in this he was not alone: *Earths in the Universe* was actually the first of his books translated and published into German (by → Friedrich Christoph Oetinger, 1770), and four German editions appeared during Swedenborg's lifetime. It was also one of the first volumes translated into French (by → Pernety in 1782). If the treatise has embarrassed late 20th century Swedenborgians, during the 18th century it was seen, on the contrary, as a rather attractive approach to solving the riddle of the plurality of the worlds. Swedenborg was not alone in his speculations about inhabitants of other worlds: his famous critic, Immanuel Kant (1724-1804), not only seriously considered the hypothesis that there could be human beings on other planets, but even the possibility that they might be places of residence for people from Earth in future incarnations after their present life.

However, Swedenborg was not the first "con-

tactee": while his reports do not belong to the category of literary utopias or fantastic voyage novels, neither did he claim to have travelled to other planets in his physical body aboard some spaceship or to have spoken with extraterrestrial entities descended to Earth for bringing some message. Rather, he claimed to have spoken with spirits and angels who lived on those other planets, having been transported there in the spirit while his body remained on our Earth. Still, his style of writing is not unlike contemporary travel reports, in which an explorer depicts exotic civilizations. The extraterrestrials turn out to have human forms, even if they may have some peculiar features: for instance, the residents of Venus are giants. Interestingly, Swedenborg explains that there are also inhabited planets outside our solar system, and claims to have met some of their representatives as well. In any case, none of these extraterrestrials are presented as messengers of a new religious doctrine: Swedenborg's universe is Christocentric, and Ernst Benz has even suggested that Swedenborg was a pioneer in the elaboration of a cosmic Christology.

Several other philosophers commented on the plurality of the worlds in their works. Among the recipients of new revelations, → Lorber received dictations about the Moon, Saturn and their inhabitants, which are still read with interest by some UFO believers today, especially in German-speaking countries. But most important for the emergence of the UFO tradition was the current of 19th century → Spiritualism. If one reads the *Revue spirite* published in Paris from 1858, it is easy to discover, from its very first year of publication, articles mentioning the plurality of worlds. It dealt with such topics because communications received by several mediums confirmed the existence of living beings on other planets; the acknowledgement of the plurality of inhabited worlds was therefore widespread in Spiritualism from its very first years. Spiritualism offered the possibility to get in touch with other planets without needing a spaceship. As with Swedenborg, there is definitely a fascination with the exotic: undoubtedly it is not just by chance that the medium Elise Müller, alias Héléne Smith (1861-1929) – who was closely examined in Geneva at the end of the 19th century by the renowned psychologist Théodore Flournoy (1854-1920) and described in his book *Des Indes à la planète Mars* (1900) – reported about civilization on Mars in one series of communications, and had India as the background of another series; the popularity of spirits of American Indians among some mediums is a well-known phenomenon as well.

Spiritualism thus offered unlimited venues for discovering exotic cultures and exploring unknown territories. But from a doctrinal perspective, there was more at stake. According to the Spiritualist school led by → Allan Kardec (1803-1869), the plurality of worlds and the plurality of existences were closely related: human beings incarnate successively on different planets in accordance with different levels of spiritual evolution. Such views opened grandiose perspectives on an interplanetary brotherhood. And it may be more than a coincidence that the famous French astronomer Camille Flammarion (1842-1925) was also associated with the Spiritualist movement. Even though he eventually admitted that Spiritualism had brought him no new knowledge in the field of astronomy, early in his life he had published a book titled *La pluralité des mondes habités* (1862), in which he declared his belief that people on other planets in space belong to ‘our immense human family’, and stated that ‘The doctrine of the plurality of the worlds has led us to the gates of a religious belief built upon the real system of the world’. In a later work, *Les terres du ciel* (1877), however, he speculated that residents of other planets were likely to be completely different from what we are, and possibly had forms we were not even able to imagine.

Spiritualism did not exist in isolation: it frequently tended to interact with other alternative worldviews, as one can see from the list of participants and topics dealt with at Spiritualist international congresses. Thus, the → Theosophical Society obviously could not remain immune from the interest for other worlds. In his book *The Inner Life* (1910-1911), → Leadbeater described the ‘present conditions of the planet Mars’ as ‘by no means unpleasant’, and not overcrowded; the Martians, he explained, ‘are not unlike ourselves, except that they are considerably smaller’ – once again, we find a perception of extraterrestrials as basically human or humanoid beings. Leadbeater’s work also reads somewhat like the description of an utopia: ‘it is the custom to hand over all the children to the State at a very early age to be reared and educated’, ‘they have absolutely no religion . . ., nothing is true but what can be scientifically demonstrated’. Leadbeater did not claim to have physically traveled to Mars: astral travel could obviously do the same job. Most interesting is his mention of the existence of a secret society on that planet, whose members had developed ‘a good deal of power’: ‘Some at least of the members of the secret society have learnt how to cross without great difficulty the space which separates us from

Mars, and have therefore at various times tried to manifest themselves through mediums at spiritual seances, or have been able, by the methods which they have learnt, to impress their ideas upon poets and novelists’. Here we have a hint about a possible role of extraterrestrials not just as beings who obligingly reply to inquisitive mediums, but as agents who take deliberate action to deliver selected information to their terrestrial counterparts. Leadbeater’s suggestion that such information could be transmitted through fictional literature as well is worth noticing, since some UFO enthusiasts continue to hold such beliefs even today: for instance, members of the American group Heaven’s Gate (who committed suicide in March 1997) considered popular science fiction entertainment series as valuable sources of information and explained that ‘the context of fiction can often open the mind to advanced possibilities which are, in reality, quite close to fact’.

But there was more to the Theosophical Society than Leadbeater’s astral scouting into other worlds. → Blavatsky’s elaborate system could obviously not limit itself to only this Earth: ‘Every celestial body in space, of whatever kind or type, is under the overseeing and directing influence of a Hierarchy of spiritual and quasi-spiritual and astral beings’. Most of the planets inside as well as outside our solar system are inhabited by human beings. Similar to Kardecist teachings, each planet corresponds to an evolutionary stage in mankind’s progress. Most important of all, Theosophical teachings are said to go back to a visitation of our Earth by “Adepts” from Venus. The careful research conducted by Wiktor Stoczkowski has shown how the ultimate roots of the Ancient Astronaut theory – according to which the origins of mankind and of civilization go back to extraterrestrial intervention – can be found in Blavatsky’s doctrines and cannot be understood without that preexisting occult milieu. As this French anthropologist has correctly observed, this does not mean that advocates of the Ancient Astronaut theory have read Blavatsky’s works in depth: due to the numerous and diverse posterity (legitimate or otherwise) of the Theosophical Society, Theosophical teachings have had such widespread influence that its basic ideas can become familiar even to those who have not been in direct contact with Theosophical literature.

Venusian Masters returned to the scene with Guy Warren Ballard (1878-1939) and his → “I AM” Activity. Published in 1934 under the pen name of “Godfré Ray King”, his *Unveiled Mysteries* culminate in the narrative of an assembly of

Masters at a mysterious American retreat, welcoming visitors from Venus ‘robed in white scintillating garments, surpassing all powers of description’: ‘Their brilliant, piercing, violet-blue eyes were beautiful and fascinating’. The Venusians were obviously much more advanced than the people of Earth, for Ballard and his family were allegedly given the opportunity to take a first glimpse at ‘tremendous’ Venusian inventions which ‘will come into use on earth in the Golden Crystal Age we have now entered’. While it may be going somewhat too far, as some scholars have done, to claim that “I AM” was the first religious movement built on contact with extraterrestrials (in fact it was mainly built on contacts with “Masters”, following the pattern of the Theosophical Society, while transforming it), it has definitely some features which would become part of the subsequent UFO religions: the description of attractive, handsome extraterrestrials, with piercing eyes, evoking the idea of divine messengers; the superiority of the extraterrestrial; and their message of relief and salvation for the Earth, which will be able to overcome its predicaments thanks to the extraordinary technological knowledge brought from other worlds.

After the 1947 sightings, it did not take long for the first contactees to emerge. While the importance of the occult milieu in relation to this development is emphasized here, it should be clear that there were other dimensions involved as well. When one reads the literature of UFO believers in the late 1940s, it is striking to see how the “things seen in the sky” (→ C.G. Jung) are constantly associated with the nuclear threat: the extraterrestrials were manifesting themselves in order to warn mankind of the risk of self-destruction (and possibly to evacuate those deemed worthy to escape, in case annihilation could not be prevented). While equipped with superior technology, the entities from other worlds were seen as much wiser than human beings in their use of it. In any case, there are strong reasons to assume that the UFO myth would not have unfolded the way it did without the horror of Hiroshima at the end of World War II.

Flying Saucers Have Landed was the title of a book published in 1953, in which George Adamski (1891-1965) claimed to have met a being from Venus, in November 1952. Significantly, from the very beginning the Venusian made it clear to Adamski that concern about atomic weapons was the reason for the extraterrestrials to contact earth. The Venusian provenience is worth noticing as well: it remains on the line of the Theosophical inheritance, and actually there are several direct references to Theosophical literature in the first

part of the book, written by a co-author. Adamski insisted that one should not make a religious belief out of UFOs; but this did not prevent him from publishing a *Science of Life Study Course* (1964), based upon teachings supposedly delivered to him by the Venusians. Especially interesting is the fact that Adamski re-used materials he had already published many years before his alleged contact with UFOs: the title of that earlier book had been *Wisdom of the Masters of the Far East* (1936), connected with Adamski’s launching in the 1930s of a “Royal Order of Tibet”. In his 1964 work, Adamski replaced the words “Royal Order of Tibet” by “Space Brothers”. In the 1930s, he claimed to have lived as a child in Tibetan monasteries and – while preaching an eclectic universalist doctrine very far from anything Tibetan – he had explained to the *Los Angeles Times* (8 April 1934) that he had ‘learned great truths up there on the roof of the world’. What matters is not the obvious fact that Adamski – who had also published a novel in 1949 called *Pioneers of Space: A Trip to the Moon, Mars and Venus* – was a fraud, but that he had a previous career in the alternative religious milieu, and how easy it was for him to just continue propagating the same views in a new, extraterrestrial garb.

Not all contactees claimed to have physically met extraterrestrials. George W. Van Tassel (1910-1978), one of the early contactees, originally claimed to have been in psychic contact with beings from other worlds since 1952. It was only at a later point, in 1953, that he reportedly was allowed to enter a flying saucer. Since mediums had already been transmitting information about life on other planets long before the popular wave of flying saucers began, it is not surprising that some mediums now began to channel messages from extraterrestrials; in fact, such messages became increasingly common during the 1950s. As Ellwood and several other scholars have observed, religious belief in UFOs and Spiritualism are of the same type: ‘Both presuppose an order of spiritually significant beings between the human and ultimate reality, with which one can have conversational and disciplic relationships. . . . interaction with them opens up a sense of expanded consciousness and cosmic wonder. . . . In both there are physical phenomena or “traces” which serve to support belief, but which for real believers are like “signs” in a religious sense . . .’. This does not mean that all mediums began enthusiastically to receive communications from extraterrestrials: it has been observed that the ‘adoption of extraterrestrials as spirit guides is much more prevalent among → New

Age channelers than among traditional Spiritualists' (Porter).

As could be expected, contactees – psychic or otherwise – incorporated a number of previously-held beliefs. Extraterrestrial contact became one more step in an occult career. A well-known case is the group led by Dorothy Martin, alias Sister Theodora († 1992): not very large or influential in itself, it was the subject of a famous book by three American sociologists, *When Prophecy Fails* (1956). Martin had been acquainted with occult teachings as early as in the 1930s, became involved in Dianetics [→ Scientology], and was fascinated by the teachings of “I AM”, before she herself began to receive messages from Sananda (Jesus in an earlier incarnation), now a resident of the planet Clarion. In the typical style of UFOs' warnings about impending disasters, in August 1954 she received a message informing the world that cataclysmic changes would soon change the face of America and other continents, while the lost continent of Mu would rise again before the end of that same year. The failure of this prophecy did not prevent her from continuing her activities for the rest of her life, and founding the “Association of Sananda and Sanat Kumara” in 1965.

Another good example of interaction between UFO belief and the occult milieu was George King (1919-1997), founder of the Aetherius Society (referring to the name of a Venusian Master). He came ‘from a family imbued with occult inclinations’ (his mother was a psychic and clairvoyant) and had himself developed a keen interest in the occult and yoga, before he was contacted in 1954 by a Cosmic Master and was called to become the “Voice of the Interplanetary Parliament”. King referred to the Great White Brotherhood, to Adepts and to a whole range of terms typical of the Theosophical current – while mixing them in a quite eclectic way with elements taken from a number of other systems with which he was familiar. Among UFO religious groups, the Aetherius Society represents one of the most obvious derivations from Theosophy – Theosophical Adepts being transformed into “Cosmic Masters” or “Gods from Space”. In some cases, like Ashtar (see below), the multiplication of newly-revealed entities leads to the creation of a ‘pantheon consist[ing] of a wide range of gods, goddesses, and spiritual masters from various planets’, Ashtar and Sananda siding together with “Lady Athena” as a kind of new Trinity (Wojcik). This is not unlike Ballard’s “I AM”, with its many Masters. Ellwood has suggested that UFO beliefs could also be seen as a reinvention of polytheism.

Although the connections should by now be clear enough, UFO religious groups have often developed into more than just a variation on general occult teachings. Rather, they have amalgamated some elements from esoteric traditions with other beliefs, very often including a millenarian message, since, as we have already seen, extraterrestrials do not just come in order to share some inspired wisdom, but also to preserve humanity from impending threats. Thus they could be described as modern religions of salvation. A good example are the mediums and groups claiming to receive messages from Ashtar, Commander of a fleet of spaceships sent by the Galactic Federation in order to rescue Earth. With a number of these mediums – not necessarily connected with each other – Ashtar’s messages have taken a decidedly catastrophic tone: disasters are likely to occur within the near future, but the chosen ones will be rescued. One can see here an obvious influence from premillennial dispensationalist scenarios, according to which a “rapture” will take place in order to spare the elect from having to go through the “Great Tribulation”: Ashtar’s “Evacuation” is a transparent adaptation of the rapture to a UFO based scenario. This shows that UFO beliefs do not necessarily have to build upon themes from esoteric traditions only, but may quite as easily borrow elements from the Christian tradition – or any other one. In Italy, Giorgio Bongiovanni (b. 1963) declares to have received from the Virgin in Fatima the stigmata of Christ, first on his hands (1989) and later on his forehead (1993); and at the same time he poses as a spiritual successor of the Sicilian contactee Eugenio Siragusa (b. 1919), despite the latter’s disavowal. Certain Christian groups have incorporated UFO themes as well. One example was Father Michel Colin (1905-1974), who claimed to be the Pope, assumed the pontifical name of Clement XV and created a Renovated Catholic Church; he spoke about “interplanetary” beings and told his faithful that the elect would be taken to Planet Mary. Some Danish followers of Adamski felt attracted toward Clement XV.

Groups of believers in UFOs will frequently borrow from esoteric themes and sometimes be completely immersed in the occult milieu, but they do not necessarily have to. For instance, the Raelian Movement – at this moment the largest UFO group worldwide, most other UFO groups having remained quite small – holds a materialistic worldview and has little to do with esotericism in any form. The founders of Heaven’s Gate had been familiar with Spiritualist and Theosophical

doctrines, but they finally construed a doctrine which to a large extent drew its inspiration from Christian mythology (admittedly with major revisions). UFOs seen as celestial saviors can adjust to a variety of theological backgrounds and develop into new religious beliefs: due to the classical association between the sky and transcendence, the sheer fact that UFOs are seen in the sky can easily endow them with religious connotations. UFOs come from heaven, extraterrestrials seem omniscient, they are close to perfection or at least much more advanced than people of the Earth, they offer salvation from man-made disasters threatening to destroy our planet: as observed by Ted Peters, these are covert religious structures which can easily become a vehicle for a modern religious mythology. In this manner, Extraterrestrials are transformed into the angels of a technological and scientific era. Due to aspirations found in some occultist trends since the 19th century and to a pre-existing interest for extraterrestrial life, it is therefore not surprising that modern esotericism has sometimes become associated with an emergent UFO mythology.

Valentinus and Valentinians

1. SOURCES AND THEIR PROBLEMS
2. VALENTINUS 3. TWO MYTHOLOGICAL SYSTEMS 4. ANTHROPOLOGY 5. THE BRIDAL CHAMBER 6. COSMOLOGY 7. CHRISTOLOGY 8. THE TRIPARTITE TRACTATE 9. PTOLEMAEUS 10. HERACLEON 11. THEODOTUS 12. THE GOSPEL OF TRUTH

1. SOURCES AND THEIR PROBLEMS

The Valentinian school represents the most important heretical Christian current of the 2nd

and 3rd centuries AD, whose traces are still evident as late as the 7th and 8th centuries. The name "Valentinians" is first found in Justin (*Dialogus cum Tryphone*, 35, 6) and Hegesippus (in Eusebius, *Historia Ecclesiastica*, IV, 22, 5), and also in the form 'those who stem from Valentinus' (frequent in Origen), while Irenaeus, → Clement of Alexandria, Hippolytus, and others speak of "Valentinus's school". The group was distributed throughout the Mediterranean area (especially in Rome, North Africa, and Asia Minor), and formed its own social and cultic-ritual community apart from the nascent church of the Catholic majority. This division took place through a long process (*Interpretation of Knowledge*, NHC XI, 1, reflects on this), and despite ample source-material it is very difficult to form a picture of the historical development of the Valentinians. The sources fall into two groups. The first consists of the Church Fathers' arguments against the Valentinian heresy, in texts marked by a polemic that somewhat distorts the subject (Hippolytus, *Refutatio*, VI, 42, 1 reports that a Valentinian group has taken issue with Irenaeus's distorted representation of them). These authors are not primarily interested in historical truth, or else are inadequately informed on the matter. They often do not use original sources, and repeat secondhand reports which they treat in a careless fashion. The second source is preserved through the discovery of the papyrus collection at Nag Hammadi, containing many original texts in the Coptic language that were probably translated from the Greek and written down in the 4th century A.D. These texts are handed down without information on their authorship or the time and place of their origin, so that controversy often exists over whether a text is authentically Valentinian, or whether it just shows Valentinian influences. The name of Valentinus himself only appears once, in a polemical context (*Testimonium of Truth*, NHC IX, 3, 56, 1ff.). None of these sources reveal much about the social realities of the Valentinians. One four-line epigram found in the Via Latina in Rome is offered as evidence (Guarducci 1983), but is debatable because of its fragmentary nature.

The very existence of the Valentinian writings creates a further problem. One may assume that they gave out their teachings at different levels, intended for different hearers (on the practice of keeping certain doctrines secret, see Tertullian, *Adversus Valentinianos*, 1). We can differentiate roughly here between "exoteric" and "esoteric" teachings, whereby an exoteric writing would be closer to the positions of the majority church, and merely leave unstated the doctrines consid-

ered to be particularly heretical. Irenaeus (*Adversus Haereses [AH]*, 1 praef.) already writes: 'They speak as we do, but their meaning is all to the contrary'. Such a text, however, cannot then serve as evidence for a specific stage of development within Valentinianism. The contents of the "esoteric" writings certainly included the cosmogonic myth, in which the entire theology and philosophy of the Valentinians is contained. This myth is preserved in many different and in some respects contradictory variants, and was surely revealed only to certain well-prepared hearers. The differences between these versions show that the myth was not a dogmatic, fixed system for the Valentinians, but a highly versatile means of setting forth their teachings about God, creation, and redemption (its prototype was surely the Platonic myth in the *Timaeus*). Each author constructs his own interpretation of certain basic ideas and structures of thought common to the Valentinians, and neither can it be excluded that various versions of the myth may be attributable to one and the same author, distinguished further by their degrees of abstraction. The myth provides the background for the Valentinian exegesis, applied especially to Paul and John, but also to the synoptic gospels, and already employed a highly sophisticated allegorical method. Here the Valentinians seem to have been in advance of the common Christian exegetes: Valentinus's famous pupil Heracleon undertook the first coherent commentary on a New Testament text.

The reconstruction of the history of the Valentinians is further hindered by the fact that only a few original fragments remain from their founder, Valentinus, whose spirit and rhetorical gift were acknowledged even by his opponents (Tertullian, *Adv. Val.* 4). Attempts to ascribe further texts to him remain controversial. This slim basis has even led to Valentinus being seen as a Platonically-inclined *Vermittlungstheologe* (intermediary theologian) who stayed within the framework of the majority church; thereafter his pupils and their pupils supposedly invented the heretical myth of the "fall" of Sophia and the origin of the world through an inadequate world-creator. Such a view must ignore certain vital elements in the fragments, and cannot well explain why the different pupils should have propounded such similar ideas independently of their master. It is said of the pupils that they split into an Italian school – Ptolemaeus, Heracleon, Secundus – and an Eastern one – Axionicus in Antioch, Bardesanes, Theodotus (thus Hippolytus, *Refutatio*, VI, 35, 7; it is astonishing that he ascribes Bardesanes to the

Valentinian school). Following Tertullian's statement that only Axionicus preserved Valentinus's teachings intact (*Adv. Val.*, 4, 3), Valentinus would have to be included on the Eastern side. But even this report of a split is unhelpful, since so few characteristics of these schools can be reconstructed, and an unambiguous attribution of the surviving texts to one school or the other seems impossible (e.g. Markos is attributed to both). As in the cases of Secundus and Axionicus, we know little more of the other Valentinians than their names: Alexander (Tertullian, *De carne Christi*, 15f.: Christ without earthly and human body), Theotimus (Tertullian, *Adv. Val.*, 4, 3 calls him the exegete of the "pictures" of the Law), Florinus (Irenaeus wrote letters to him and asked Victor to take legal action against him; see Eusebius, *Historia Ecclesiastica*, V, 20, 4-8), Candidus (with whom Origen disputed circa 230 A.D. in Athens; see Rufinus, *De adulteratione librorum Originis*, 7; Jerome, *Adversus Rufinum*, 2, 18f.).

Consequently, all that today's interpreter can do is to place the various texts and reports side by side, without being able to sort them into a definite historical context or a demonstrable sequence. Among the few fragments of Valentinus, there is above all Irenaeus's exposition of the Valentinian teachings (*AH*, I, 1-20, circa 180 A.D.) and a parallel exposition in Clement (*Excerpta ex Theodoto*, 43-65, circa 200 A.D.), and a related myth transmitted by Hippolytus (*Refutatio*, VI, 29-36, circa 220 A.D.); possibly one should also include the "Naassene tract" transmitted by Hippolytus, V, 6-10. The Church Father Epiphanius preserves an original "Letter to Flora" by Ptolemaeus (*Panarion*, 33, 3-7), and a "Valentinian doctrinal letter" (*Panarion*, 31, 5, 2-6, 10) which with its complicated speculations on Aeons probably represents a later development of Valentinianism. Origen's Commentary (225-250 A.D.) preserves extracts of Heracleon's exegesis of John's Gospel, and there are also Valentinian interpretations in *De principiis* and his Commentary on Romans. Last of this group, Clement of Alexandria collected excerpts attributed to Theodotus. In contrast, Tertullian's *Adversus Valentinianos* (circa 210 A.D.) depends for the most part on secondary sources; and the same applies to the anti-heretical writings of Pseudo-Tertullian, Epiphanius, Filastrius of Brescia, and Theodoret. It is very doubtful that Justin's lost *Syntagma* can be reconstructed from these late sources. Finally, Valentinian influence is visible in the *Acts of John* (94-102, 109).

Among the Nag Hammadi discoveries, the texts of the Jung-Codex (NHC I) are the ones that most

belong within a Valentinian milieu. In almost all of the five texts included there, the authorship of Valentinus or one of his better-known pupils has been considered, without any consensus being reached. The most important texts, which are related to each other in many respects, are the *Gospel of Truth* (NHC I, 3, Frg. in XII, 2) and the *Tripartite Tractate* (NHC, I, 5), to which may be added the short but, in terms of style and content, no less demanding *Treatise on the Resurrection* (NHC I, 4). The majority of scholars accept the Valentinian origin of these three texts. Considering their extraordinary quality, it is evidently problematic that scholarship favors an attribution of them to an unknown Valentinian; even if we knew no more, it would be improbable that their author was an "Anonymous". The *Prayer of the Apostle Paul* (NHC I, 1) and the *Apocryphon of James* (NHC I, 2) are possibly of Valentinian origin. The second codex contains the uncontestedly Valentinian *Gospel of Philip* (NHC II, 3): an anthology of extracts of very different genres (aphorism, parallel, paranesis, polemic, exegesis, treatise), including among other things valuable information on the sacraments of the Valentinians. Lastly there are two texts in the eleventh codex, unfortunately only fragmentarily preserved, for which a Valentinian origin is generally accepted: the *Interpretation of Knowledge* (NHC XI, 1) and *A Valentinian Exposition* (NHC IX, 2), with five supplements on the *Anointing, Baptism* (A and B) and *Eucharist* (A and B). The influence of Valentinian teachings is detectable in *The Exegesis on the Soul* (NHC II, 6), *The first and second Apocalypse of James* (NHC V, 3 and 4), *Authoritative Teaching* (NHC VI, 3), and *The Letter of Peter to Philip* (NHC VIII, 2). A special problem is posed by the *Apocryphon of John* (NHC II, 1, III, 1, IV, 1 and BG 8502,2). This text, preserved in both a short and a long version, has clear parallels to the texts excerpted by Irenaeus in *AH*, I, 29-30. This Church Father claims that the adherents of this teaching, whom he calls "Gnostics", stem from → Simon Magus and are in turn the spiritual forerunners of Valentinus (*AH*, I, 11, 1). In accordance with this theory, many scholars see in the *Apocryphon of John* a non-Christian, Sethian [→ Sethians] (or Ophite [→ Ophites]) myth, which Valentinus first christianized. The alternative view, which is preferred here, sees in Irenaeus's theory the polemical attempt to discredit the Valentinians by tracing their origins to → Simon Magus, the apostle's opponent. Irenaeus invents the sect of "Gnostics" as link between Simon and Valentinus, and attributes to them a mythical scheme that does in fact show clear influences of Valentin-

ian teachings (Epiphanius, *Panarion*, 27, 1, 2 makes the Valentinians depend on the “Gnostics”, as does Theodoret, *Haereticarum fabularum compendium*, 1, 13). In this view, the *Apocryphon of John* first appeared around the middle of the 2nd century in a Valentinian milieu.

2. VALENTINUS

Little is known of Valentinus's life. ‘He came to Rome under Hyginus (136-140 A.D.), passed the best of his age under Pius (140-155 A.D.), and remained until Anicet (155-166 A.D.)’ (Irenaeus, *AH*, III, 4, 3). The text does not state that he taught in Rome unopposed; on the contrary, Tertullian reports that → Marcion and Valentinus ‘were thrown out by turns’ (*De praescriptione haereticorum*, 30, 2). He was probably born in Egypt around the turn of the century, and certainly studied Platonic philosophy (possibly in Alexandria; thus Epiphanius, *Panarion*, 31, 2, 3). His teacher was supposedly Paul's pupil Theodas (Clement of Alexandria, *Stromateis*, VII, 106, 4; a certain Theuda is named in NHC V, 4, 44, 18). Although he must have taught in Rome for a considerable time, he seems to have been unknown to Justin, who stayed in Rome at about the same time; nor does Justin's pupil Tatian mention him. It is difficult to judge the veracity of the report that Valentinus wanted to become a bishop, but was refused (Tertullian, *Adv. Val.*, 4, 1f.). Valentinus is also said to have lived in Cyprus, and there first fallen away from the “true faith” (Epiphanius, *Panarion*, 31, 7, 2). Beside the few surviving extracts from sermons and letters, Pseudo-Anthimus (= Marcellus of Ancyra?) testifies to a work entitled *On the Three Natures* (*De sancta ecclesia*, 9).

Valentinus is said to have written Christian psalms (Tertullian, *De carne Christi*, 17, 1; Origen, *Enarrationes in Jobum*, 21, 12), and among the fragments there is also a short hymn in meiuric dactylic meter (Hippolytus, *Refutatio*, VI, 37, 7). This presents the divine trinity of Father (called Bythos), Mother (presumably Sophia), and Child. This new-born child is identified with the divine world of Ideas, the Logos. Another fragment specifies the visionary recognition of the identity of the new-born child and Logos as the starting-point of the heretical myth (Hippolytus, *Refutatio*, VI, 42, 2): Valentinus sees the connection of the philosophical logos-conceptions with the biblical account of the child in the manger. Valentinus's importance can be seen in the fact that he made what was probably the first comprehensive attempt to interpret the New Testament report against the background of contemporary Greek philosophy.

The realization that the order of the cosmos and the ensoulment of man have their origin in this child is described as the eschatological event of the “harvest” that is anticipated in this life (following John 4, 35-38). The divine act that caused the appearance of the world and of man attains its goal in human knowledge: that which God sowed at the Creation, man harvests through this knowledge. At the same time, this knowledge is the dissolution of the cosmos, that is, of its transitory parts (Clement, *Strom.*, IV, 89, 3); according to the *Treatise on the Resurrection* (NHC I, 4), in this knowledge the resurrection of the dead already takes place (cf. 2 Tim. 2, 18). The cosmos of Valentinus is indeed ruled through and through by God, but as a material creation it is subject to death. Man can only escape this if, thanks to his knowledge, he turns away from the transitory and returns to the divine. Jesus lived this in exemplary form: his *enkratia* went so far that although he ate and drank, he did not digest (from a letter to Agathopus in Clement, *Strom.*, III, 59, 3). This failed attempt to picture the divinity and humanity of the Redeemer in concrete terms points to the later problems that would arise from the further encounter of Greek thought with the Christian kerygma.

Additional traces of Valentinus's cosmology and anthropology are visible in two fragments (Clement, *Strom.*, II, 36, 2-4 and IV, 89, 6-90, 1). Valentinus takes from the concepts of middle Platonism the distinction between the highest God and lower creator-figures. To God is connected the transcendent level of being of the Ideas, which Valentinus, like his philosophical colleagues, seems to have understood as God's thoughts, motions and emotions (Tertullian, *Adv. Val.*, 4, 2). As lower actors, a host of angels (the plural coming from Genesis 1, 26) took part in the origin of mankind, and the Demiurge in that of the cosmos. The effects of the divine world of Ideas are personified in the Logos (also called Aion); in the creation of man, the motive force that emerges from the Idea of man is made manifest in the “Anthropos” (primeval man; the Anthropos being the aspect of the Logos that is concerned with the creation of man). Logos and Anthropos bestow the divine element, platonically speaking: the form that stamps the matter and makes it the image of the Ideas; this form also gives its name to the individual thing. The effects proceeding from matter, however, are symbolized in mythological language by the angels and the Demiurge. The world and man can only arise through the collaboration of the divine and demiurgic powers; but the lower powers are in a state of ignorance in relation to the divine. This is why the

angels were alarmed when newly-created man, bearing the divine within him, gave evidence of divine knowledge, and why the cosmos remains so inferior a copy of its original model. Evil arose because the angels refused knowledge and separated man from God. The emotions and the evil deeds that result from them are, according to Valentinus, the consequence of ignorance of the divine. These emotions are frequently described in colorful language as demons in the hearts of men, which only fail when man is enlightened by God (Clement, *Strom.*, II, 114, 3-6). In Valentinus's conception of the creative powers as being ignorant of the divine, he differs both from the majority of his Christian fellow-believers and from his philosophical colleagues. Only by ignoring his negative view of the creative powers can one imagine that he had not abandoned the framework of the majoritarian theology of the 2nd century. This ignorance of the lower creators marks the world, and especially man. Only through the revelation of God in his Son can man be freed from the state of ignorance which makes him subject to the demons. For man is not capable by himself of overcoming the material world and becoming 'Lord over the creation and all things temporal' (Clement, *Strom.*, IV, 89, 3). Therefore Valentinus criticizes a theology that promises man that he will overcome death through suffering bodily martyrdom. He, however, who has recognized God through his revelation also recognizes the divine in himself, which Valentinus calls 'the law written in the heart' (from a sermon *On Friends*, Clement, *Strom.*, IV, 52, 4). Man now understands himself as a 'child of eternal life' (Clement, *Strom.*, IV, 89, 1). The self-manifestation of God through his Son, who gives man the saving knowledge, thus stands at the center of Valentinus's theology. But this Son is the same being who at the creation, as Logos or "Anthropos", creates the prerequisites for this knowledge: he gives man a divine element, the 'seed of the higher being', which first put man in the position of gaining knowledge (Clement, *Strom.*, II, 36, 2). Valentinus thereby attempts to link anthropology with soteriology, with the help of Platonic traditions. Since man, in this view, is simultaneously subject to matter and its powers, he is in danger of falling victim to ignorance and the emotions that result from it. From the fragments the question arises of how the ignorant, lower creative powers, beside God and the world of Ideas connected to him, could ever have come into existence at all (Ptolemaeus poses this question explicitly at the end of his *Letter to Flora*). The Valentinian myth tries to offer an answer to this question. In view of the inner coherence and

well thought-out structure of Valentinus's teachings, which are evident in the fragments, it is unlikely that it was the pupils who first sought to answer this question with the help of a myth. We have to assume that Valentinus himself created a cosmogonic myth that explained the existence of deficient creative powers; but what form it took can no longer be reconstructed. An important witness to it is Irenaeus's account *Against Heresies* (*AH*, I, 1-9). Scholars have attributed this myth to the Valentinian pupil Ptolemaeus on the basis of a brief remark at the end of the eighth chapter, which however is only found in the Latin translation. But it appears from Irenaeus's Foreword that this Church Father excerpted writings (*Hypomnemata*) by persons who called themselves 'pupils of Valentinus'. Since Irenaeus refers to several different versions of the myth (the two chief ones are known as Systems A and B; Irenaeus treats further versions in *AH*, I, 11-21), it can no longer be clarified in what relation the outlines by the "pupils" stand to Valentinus himself. A parallel to one section of this myth is offered by part of the excerpts attributed to Theodotus (Clement, *Excerpta ex Theodoto*, 43-65); another mythological sketch, similar in many points but unfortunately very damaged, is offered by the *Valentinian Exposition* (NHC XI, 2).

3. TWO MYTHOLOGICAL SYSTEMS

The myth in Version A begins with the description of the Pleroma, the "fullness" of the divine, transcendent world: out of a "Forefather" (*Propator*) who is also called "Depth" (*Bythos*) there arise thirty Aeons ("Eternities") who are grouped into a first Eight (*Ogdoas*), a Ten, and a Twelve (Pythagorean number speculation [→ Number Symbolism] being in the background). All the Aeons are organized by pairs in syzygies: at the top are "Forefather" and "Silence" (*Sige*), who is also called "Thought" (*Ennoia*). Unlike the God of the Old Testament, who creates through the word (Genesis 1), the Valentinian God does so through silence. Next there arise "Reason" (*Nous* or "Monogenes") and "Truth," "Word" (*Logos*) and "Life" (*Zoe*), "Man" and "Church", who together comprise the Eight. Irenaeus ascribes this sequence of Aeons expressly to Valentinus (*AH*, I, 11, 1), and they also underlie the *Valentinian Exposition* (NHC XI, 2, where a further 100 and 360 Aeons proceed from the 30; cf. Secundus in Irenaeus, *AH*, I, 11, 2). A comprehensive exegesis of the Prologue to John's Gospel, handed down by Irenaeus, suggests that the first eight Aeons were named in relation to this text (*AH*, I, 8, 5; cf. Clement, *Excerpta*,

6f.). The remaining 22 Aeons present philosophical concepts ("Mixture", "Insight," "Desire", etc.) and models of Christian virtues ("Faith", "Hope", "Love", etc.), and the final Aeon is "Wisdom" (*Sophia*). The 30 Aeons correspond to the 30 years of Jesus' life, and since each one reveals the divine Pleroma, his life presents an image of transcendent eternity (cf. Plato, *Timaeus*, 37f.).

Nous alone knows the Forefather. This fact becomes the cause of all later events, because the Forefather prevents the Nous from sharing its knowledge with all the other Aeons. The reason given for this is that they should first arrive at a thought of, and a desire for knowledge, which leads to seeking it. Basic to this is the Platonic principle that the act of knowledge must arise from a consciousness of previous ignorance, and from longing to overcome it (the concept of "longing" and "seeking" is found, e.g. in Plato, *Meno*, 84c). One who already believes that he knows will not seek, and thus never arrive at knowledge. This epistemological approach is used in the myth in question to describe the occurrences in the Pleroma. The Aeons, too, before they know the Father, experience a phase of ignorance, or rather of non-actualized knowledge, which they must recognize as such, because only thus will the longing arise to seek the unknown. The divine goes through a kind of crisis: in order for knowledge to take place as act, it must first experience the absence of knowledge. This absence explains the appearance of the world, for the lack of knowledge leads to emotions, which in their further development form the material substratum of the world. The myth does not try to give any account of the world's arisal in terms of natural philosophy (how could ignorance turn into matter?), but describes the cosmos as it is presented to man: it is characterized by a lack of knowledge and is therefore a strange and threatening place; within it and without it, man can find no access to God. Consequently the cosmos dissolves again when knowledge of the divine is achieved and all ignorance is overcome. The remarkable thing about this solution of the question of why there is evil in the world (theodicy) lies in the fact that ignorance has its origin on the divine plane of being of the Aeons, and is expressly willed by the highest God. Thus the material cosmos that arises from this is an unavoidable station on the way of the divine to itself, i.e. to the actualized knowledge of its highest cause.

In the myth, the crisis that the Aeons experience is precipitated by the Aeon Sophia. She separates herself from her companion Theletos (the "Willed") and seeks in passionate excitement

(*tolma*) for her Father. Her search takes a form that was not willed by God, for together with the ignorance provoked by the Father, there was the danger of a false kind of seeking. Sophia represents the natural-scientific form of the search for God, which tries to grasp him objectively without realizing that the Father is ungraspable. In the figure of Sophia, the myth distances itself from the attempts to reach wisdom by the philosophical schools, who in Valentinus's view ignored the transcendent divinity of the Father. In the myth, Sophia is stopped by a barrier (*Horos*) which surrounds the Father and is identified with the cross, and is thereby convinced that the Father is ungraspable. Her intention (*Enthymesis*) and her passion (*Pathos*) are banished from the Pleroma. The banished Enthymesis becomes, as outer Sophia or "Mother", the decisive actor in all subsequent events. The action of the Horos is understood as a crucifixion; the Christian redemption event already takes place archetypically in the Pleroma: it is an act of knowledge and a separation from all the non-divine (on Horos, cf. *Valentinian Exposition*, NHC XI, 2, 26, 32ff., where four powers are attributed to it: 'a separating one, a consolidating one, a formative one and a substance-providing one'). Similarly all the other Aeons are led to knowledge by Christ and the Holy Spirit, who are now emanated. The events in the Pleroma thus comprise a self-contained salvation story: the arisal of the divine, its existence in ignorance, and the knowledge through revelation and final trial.

The history of the "misfortune" (the expression "fall" is problematic) of a divine being is characteristic of the Valentinian myth, and this event is recounted in ever new ways. In another version of the myth (B), presented in the so-called "gnostic" collection used by Hippolytus (*Refutatio*, VI, 29ff.) but already known to Irenaeus (*AH*, I, 2, 3-6), Sophia's fate is described as follows. The divine Father exists alone as "Monas" without a female partner (the Valentinians, according to Hippolytus, were divided over the question of whether the highest God should or should not be thought of with a female element beside him; see *Refutatio*, VI, 29, 3; cf. *Valentinian Exposition*, NHC XI, 2, 22, 23-27, which even attempts to combine both approaches). The Father, who is alone in himself, first emanates the "Dyas", the first duality of a pair of Aeons ("Nous" and "Truth"), out of whom come a further 13 pairs of Aeons (the ground of creation here being named Love, which seeks an object); Sophia, the 28th Aeon, wants to give birth like the Father without her companion "Will", but brings forth only a formless creation, a miscarriage; cf. *Valentinian*

Exposition, NHC XI, 2: 'That she should suffer, then, was not the will of the Father, for she dwells in herself alone without her consort'. This event is accompanied by states of ignorance, sorrow, fear, and dismay; the Aeons turn pleadingly to the Father. Thereupon two further Aeons, Christ and Holy Spirit, are emanated, who complete the number 30; they remove the miscarriage from Sophia and form it into the outer Sophia, who is in no way less wise than the Aeons in the Pleroma. A Platonic doctrine also underlies this theme, concerning the relation of substance (imagined as female) and form (imagined as male). Sophia's attempt to give birth without spiritual form fails; her creation needs additional formation by the Redeemer; in the same way, everything earthly and cosmic is regarded as formless, and must be newly formed by the knowledge that Christ brings.

The story of salvation in the uppermost realm repeats itself at a middle level in the fate of the outer Sophia, who is called Achamoth: in System A she finds herself outside the Pleroma and is formed as to her existence, but not as to knowledge. She too must realize her condition of exile from the Pleroma and feel longing for the divine. But she also suffers emotions in her ignorance; eventually she turns upward beseechingly. Thereupon a second Christ (the "Soter") comes down and, as revealer and redeemer, brings her the form of knowledge and the detachment of her emotions. Out of the latter arises the matter (*Hyle*) of the world, and out of her beseeching, the psychic. Moreover, the outer Sophia brings forth the "pneumatic" seeds, which are sowed in (certain) men as the divine element. She gives birth to the pneumatic sparks at the sight of the angels who accompany her redeemer.

The salvation history of the Aeons and Achamoth repeats itself at a third level in mankind. The similarity of events is reflected in the vertical line of descent (upper Sophia – lower Sophia – pneumatic seeds). The human pneuma must also be formed, i.e. must attain to knowledge. This formation, which is achieved by the earthly Christ, is the actual goal of the entire mythical event. As with the Aeons in the Pleroma and with the lower Sophia, the man who possesses a pneumatic core finds himself in a state of ignorance; he must become aware of this lack and apply himself to the search for the divine.

4. ANTHROPOLOGY

This condition of man is clear from his three parts, or rather modes of existence: he has a pneumatic seed, but also carries within him a hylic (material) man and a psychic man (the visible body,

is fleshly covering, is counted as a fourth element). In his hylic aspect, his ignorance and fallen state are evident in the emotions. His psychic part stems from Achamoth's beseeching of the divine. For the human soul, this means that it has a decisive part in the redemptive act of knowledge; for man must turn to his redeemer in order to find knowledge there. The myth indicates that the soul or psychic man possesses free will (*autexousios*). Thus it is in no way predetermined which man will attain saving knowledge; the soul chooses freely whether to turn to Christ, or not to do so. Only when this conversion is made can the divine be formed. Beside this aspect of free will, there is, however, a doctrine of human classes, which became a chief object of criticism on the part of the Church Fathers. According to this, there are three different natures among mankind, represented by Cain ("hylic"), Abel ("psychic"), and Seth ("pneumatic"). Clement especially accused Valentinus (calling him 'the naturally redeemed') and his students of preaching predetermined salvation, without appreciating the crucial function of the soul. The myth teaches that men are not all created equal: only a few possess the divine pneuma; they are called "pneumatics" and the "chosen". The reasons or criteria by which one soul receives a pneuma and another not are seldom stated. This pneuma-doctrine represents the attempt to interpret the Pauline doctrine of grace with the help of a Platonic doctrine of natures. Man can reach salvation through the pneuma; however, it is not within his power to possess it – it is not at his disposal but is a gift. Yet the possession of the pneuma does not guarantee salvation; it must be formed with the help of the freely-acting soul, i.e. it must attain the knowledge of its divine origin; cf. *Apocryphon of James*, NHC I, 2, 5, 3-6: 'He will reckon you to have become beloved through his providence by your own choice'. If this does not occur, the divine pneuma, which cannot die, must be sowed in another soul. Next to the "pneumatics" are the "psychics", who possess no pneuma but can still turn to the Redeemer. They are the "called"; they do not attain pneumatic knowledge, but remain at the stage of faith and must do good works (see, however, e.g. the *Treatise on the Resurrection*, NHC I, 4, where faith is the mark of the pneumatics). These "psychics" refer to the Christians of the majority church who reject the Valentinian teaching, but can still attain a limited salvation. The third class of men is the "hylics" or the "choics" (the "earthly men"), in whom the soul (the psychic man) does not even manage to turn to Christ, but is totally given over to the lower parts of the soul or to material interests. This doctrine of human

classes fulfils two distinct requirements: it attempts on the one hand to explain the difficult relationship between grace and freedom, and on the other, to define the relationship of the Valentinian Christians to those of the Church and the rest of their environment.

The foundations of Valentinian ethics follow from the distinction between pneumatics and psychics. The pneumatic, through his knowledge, has left the earthly world behind; it has a neutral value (*adiaphoron*) for him. The psychic, in contrast, must prove his faith repeatedly through good works; the precepts of the law apply to him. The Church Fathers criticized this scheme and accused the Valentinians of ethical libertinism, expressed especially in sexual debauchery. The truth of these accusations is difficult to ascertain: the original sources from Nag Hammadi are marked throughout by an ethical rigor and an ascetic attitude, as for instance *Interpretation of Knowledge*, NHC XI, 1, 21, 31f.: 'But if we surmount every sin, we shall receive the crown of victory'. Nevertheless, some Valentinians may have demonstrated their superiority to the world through activities that seemed offensive to their Christian environment (e.g. eating sacrificial meat, taking part in gladiatorial combats). It is also possible that in situations of persecution they denied their Christianity, seeing this confession before the earthly rulers as irrelevant to their salvation. Thus Heracleon in his commentary on Luke 12, 8-11 reckons it better to confess through faith and conduct than by mouth; the latter is required 'when it is necessary and good sense demands it' (Clement, *Strom.* IV, 71, 4).

In System B, an identical soteriology is developed with a different anthropological model. Every man consists of body and soul, but before the revelation, every soul was filled with demons: in pre-Christian times, all men were hylics. Christ comes into the world to bring the emotions of the soul into order, i.e., he comes to drive out the demons. This happens when the human soul uses the power that it possesses from the pleas and beseeching of the outer Sophia – and that is its free decision – and turns to Christ. Such a man becomes a psychic. But again, it depends on divine grace whether the "Logos" is sown through the encounter with Christ, so that a man attains perfect knowledge and becomes a "gnostic" ("one who knows"). The classes of mankind arise in System B through the encounter with Christ; but here, too, the doctrine concerns the problem of grace and free will.

5. THE BRIDAL CHAMBER

As the formation of knowledge in the case of Achamoth is presented as unification with the

Redeemer who descends to her from the Pleroma, so the Valentinians also use a sexual metaphor for the redemption process of the human pneuma. Perhaps this derives from Aristophanes' speech in Plato's *Symposium*, for the pneuma-sparks are seen as female, and as uniting with their male companions, the angels (cf. Clement, *Excerpta*, 21). The pair of Sophia and Redeemer (*Soter*) thereby represents the totality of human pneuma-sparks and angels; in the myth, this is shown through genetic relationships: the angels are brothers of the Redeemer, the pneuma-sparks creations of Sophia. The saving knowledge is presented in the image of the bridal chamber in which the two separated parts find themselves together again. It is debatable whether besides baptism (and anointing) there was an independent rite of the bridal chamber (possibly as sacrament for the dying), in which the union was ritually symbolized. At any rate, one reads in the *Gospel of Philip* (NHC II, 3, 67, 27-30): 'The Lord did everything in a mystery, a baptism and a chrism and a eucharist and a redemption and a bridal chamber', and Irenaeus states of a Valentinian group (*AH*, I, 21, 3): 'For some of them frame a bridal chamber, and solemnize an initiation, with certain invocations upon those who are being perfected, and they say that what they do is a spiritual marriage, after the similitude of the marriages on high'. Possibly this is a matter simply of a "pneumatic" interpretation of baptism, expressed in specific formulae and prayers; cf. *Gospel of Philip*, NHC II, 3, 69, 25-27: 'Baptism includes the resurrection and the redemption; the redemption takes place in the bridal chamber'. That which is forgiveness of sins for the "Church Christians" is for the "gnostic" Christians "redemption" (*lytrosis*), through which the pneuma can return to its heavenly home (cf. *Tractatus Tripartitus*, NHC I, 5, 128, 33-36: 'Baptism is also called "bridal chamber" because of the agreement and the indivisible state of those who know they have known him'). Others, according to Irenaeus, rejected baptism and preferred only an anointing (cf. *Gospel of Truth*, NHC I, 3, 36, 17ff.); a few dispensed with sacraments altogether and saw "redemption" in knowledge alone.

6. COSMOLOGY

To the anthropological event that sets Achamoth in motion, there corresponds the cosmological event. Achamoth herself represents in the cosmos the eighth and outermost sphere of the fixed stars ("Ogdoas"), beyond the seven planets known in Antiquity. In philosophical terms, she represents the noetic World-Soul which surrounds the cosmos and ensures its ever-constant motion. Above her is

the transcendent world of Ideas, bound to no space, which is represented in the myth by the thirty Aeons. In her function as noetic World-Soul, Achamoth is also that which forms everything below. From the psychic substance that arose out of her appeal to the divine she brings forth the Demiurge, who dwells in the Sevenfold (“Hebdomas”); beneath him are the other planetary rulers. The Demiurge, an image of God the Father (Clement, *Excerpta*, 47, 2), is not hostile to the divine; rather, he is also destined to turn eventually toward the Redeemer. Until the revelation, however, he as well is a prisoner of ignorance and defined by emotions. In this condition he forms, as creator, everything psychic and material, whereby – without knowing it – he is guided by the outer Sophia. The result is a principial distance vis-à-vis the world and all the orderings in it: ‘The rich have become poor, and the kings have been overthrown! Everything is prone to change. The world is an illusion! – lest, indeed, I rail at things to excess!’ (*Treatise on the Resurrection*, NHC I, 4, 48, 24-30). The Demiurge is identified with the God of the Old Testament. His ignorance shows itself especially in the expression of Isaiah 45, 5/46, 9: ‘I am God and none beside me’. It is he, too, who made the hylic and psychic man in Paradise, the fourth heaven. The demotion of the Creator of the world and of man met with the most decided resistance from the Church Christians. For the Valentinians, it was the consequence of their assessment of the visible world as the place of ignorance and emotions. The transcendent God of knowledge cannot have anything to do with this world; only the pneuma-sparks that are in it have the possibility of surmounting it and returning to the divine Pleroma. When all the pneuma-sparks have reached perfection, the world perishes. Sophia rises to the Pleroma and, together with the Redeemer, becomes a syzygy. The duplication of Sophia lasts, therefore, only for the duration of the world, and is abolished at the end of time; as long as the world lasts, however, the juxtaposition of the transcendent Pleroma and the cosmic “Ogdoas” is constitutive. Like Sophia and the Redeemer, at the end-time the pneuma-sparks and the angels will find their bridal chamber in the Pleroma, having left behind what is psychic and material. The Demiurge and everything psychic that has turned to Christ will find its salvation outside the Pleroma in the highest sphere of heaven (“Ogdoas”) (cf. Heraclion, Frg. 13, in Origen, *Comm. on John*, X, 33). Everything else will perish in a final conflagration.

7. CHRISTOLOGY

The act of knowledge, which takes place first on the highest plane of the Aeons, secondly outside

the Pleroma, and finally in man, becomes possible through the revelation; there are consequently three Christ-figures who act on their respective levels of being. This threefold nature prompted much criticism and also much confusion among the Church Fathers (and the Valentinians themselves?), so that it is often unclear which Christ is being discussed. Apparently the Valentinians also argued about whether the earthly Christ, who has assumed nothing material, possesses a psychic or only a pneumatic body; and this supposedly brought about the split into an Italian and an Eastern school (Hippolytus, *Refutatio*, VI, 35, 5-7). In Christ’s martyrdom, only his psychic part is capable of suffering; this suffering has the purpose of attaining the state of emotionlessness (“apathy”) (Clement, *Excerpta*, 61, 3). Crucifixion and resurrection are the place at which Christ finally overcomes death, by deceiving the earthly powers which seek to kill him, and thereby robbing them of their power. This salvation, however, does not apply to anything bodily or material: that must perish. In order to understand the threefold nature of the Christ figure, one must refer to the Platonic model of archetype and copy, which is of great significance for the Valentinian myth: ‘For all things here, they say, are types (*typoi*) of the things there’ (Irenaeus, *AH*, I, 7, 2). The archetype is not to be understood in a historical sense, as if it existed in space and time at an earlier period. It is more a supra-temporal model for earthly events, and stands outside historical development. In this sense, the redemptive event on the level of the Pleroma and the outer Sophia is only the archetype for the fate of the human pneuma; and likewise the higher Christ figure is the supra-temporal model for the earthly Christ. The myth which proceeds in temporal sequence is not to be taken literally in this respect. What is historical is God’s revelation through the Son, which is the beginning of the revolution that will have reached its goal when everything divine in the world has attained knowledge. This historical event has archetypes outside space and time, which can elucidate the meaning of earthly events but are not themselves part of history.

8. THE TRIPARTITE TRACTATE

The discovery of manuscripts at Nag Hammadi has given us access to an extremely important and original text, which describes in a similar way how the divine came out of itself, created the world and man, and returned to itself again. The text has come down without a title, and was named by the first editors, on account of its division into three parts of different length, the *Tripartite Tractate* (I, 5). Part I (51, 1-104, 3) describes the Father and

his emanations and the fate of the Logos; Part 2 (104, 14-108, 12) is devoted to the creation of man; and Part 3 (108, 13-138, 27) to soteriology and eschatology. With 88 pages it is one of the longest of the Nag Hammadi texts, and also one of the best-preserved. Until now, no attempt to attribute it to an author has met with universal consent; the author seems to have come to terms with the Church's criticism of the Valentinian teachings, and perhaps under Origen's influence to have attempted a new version of the myth in the 3rd century AD, in order to minimize the doctrinal difference between the "majority church" and Valentinianism. The most important points at which he diverges from the system as transmitted by Irenaeus, or makes different emphases, are as follows. The unity of God is emphasized (as in System B): he alone is responsible for the existence and the being of the cosmos. "Son" and "Church" are his first creations (not presented as syzygies), which cause all the other Aeons to appear and which embrace them. These are not thirty Aeons organized in pairs, but the entirety of all divine powers. The author chooses an astonishing image to explain their unity and multiplicity (58, 21-29): 'Those which exist have come forth from the Son and the Father like kisses, because of the multitude of some who kiss one another . . . , the kiss being a unity, although it involves many kisses'. Their creation is not understood as a temporal beginning, but as the transition from a merely potential existence (in the mind of the Father) to an actual one in the consummation of God's self-knowledge. Thereby the Father is understood as static, the Son as "spreading himself"; this points to the Platonic-Pythagorean doctrine of the transition from "unity" to "duality", and to the doctrine illustrated by Numenius of a first Nous at rest and a second Nous in motion (cf. *Valentinian Exposition*, NHC XI, 2, 22, 21ff.). The crisis of the divine does not condemn the female Sophia, but the male Logos, though he acts from similar motives; it is said that his actions are free, and in concord with the will of the Father (77, 6-11): 'It is not fitting to criticize the movement, which is the Logos, but it is fitting that we should say, about the movement of the Logos, that it is a cause of an organization which has been destined to come about'. After his change (*metanoia*), the Logos divides (cf. the duplicated Sophia), and part of him returns to the Pleroma. The "Redeemer", called "Son", enlightens the lower Logos, who now orders the lower world (*oikonomia*) with the help of the (ignorant) Demiurge which he has created (103, 4-5): ' . . . whom he too used, as a hand and as a mouth and as if he were his face'. The different classes of mankind first distinguish themselves, as

in System B, in the encounter with the Redeemer, whose incarnation in body and soul is emphasized; in a similar way, the *Treatise on the Resurrection* (NHC I, 4, 44, 13-15) states that the "Son of man" has taken on flesh. The rather conventional interpretation of the Paradise story is also interesting: the expulsion was willed insofar as man must learn the consequence of ignorance – death – so that he can appreciate the blessing of its overcoming. Especially striking is the fact that the "psychics", who are divided into several groups, should have the same expectation on the other side as the "pneumatics" (123, 21-29). Not without reason does the text end with a hymn to the Revealer (138, 22-27): ' . . . the Lord, the Savior, the Redeemer of all those belonging to the one filled with Love, through his Holy Spirit from now through all generations forever and ever'.

9. PTOLEMAEUS

After Irenaeus had excerpted the myth (with its variants) from the available 'writings of the pupils of Valentinus' (*AH*, I, Preface), he tried to show the contradictory nature of the Valentinian doctrines (I, 11-21). Beside Valentinus, Marcus, and some un-named ones, he also mentions Ptolemaeus and his school (I, 12, 1). Unfortunately he mentions no more than that the highest God brought forth the first pair of Aeons, Nous and Truth, with the help of two (creative) states of mind (*diatheseis*): through his Thinking and Willing (cf. *Gospel of Truth*, 37, 13ff.). Here the Aeons are seen as the product of God's thought and will, whereas Tertullian reports that Ptolemaeus understood the Aeons as self-subsistent beings (*personae substantiae*) outside God (*Adv. Val.*, 4, 2); possibly the Valentinian doctrine (System B) was meant, according to which God stands without a companion beside the other Aeon-syzygies. How Ptolemaeus's myth continued remains unknown. Nor is anything more known of his life. Most unclear is the question of whether the Ptolemaeus named by Justin in his second Apology as having suffered martyrdom in Rome around 152 AD is identical with the Valentinian Ptolemaeus (*Apol.* 2, 9). The only certain source is his *Letter to Flora* (Epiphanius, *Panarion*, 33, 3-7), in which Ptolemaeus treats the Pentateuch, the first five books of the Old Testament, in pretentious style and with a methodical philosophical dissection. The author of the Law, he says, is the Demiurge, who stands in the middle between the perfect Father-God and the Devil (which shows an anti-Marcionist tendency). The Demiurge, in contrast with the perfectly good Father, is only just. However, not only the Demiurge but also → Moses and the oldest of the Hebrews were responsible for

parts of the Law. Within the parts given by the Demiurge one should distinguish three types: a) the Ten Commandments as pure lawgiving, which the Savior, the son of Father-God, completed (the lawgiving of the Demiurge, therefore, having been imperfect); b) the laws involving injustice (e.g., “An eye for an eye, a tooth for a tooth”), which the Savior repealed; c) symbolic or typical laws, i.e. the directions for worship, to which the Savior gave a spiritual meaning (fasting, for instance, means abstinence from all evil deeds). The criterion of the latter two types is the Savior’s words and conduct; with his appearance, the age of symbols and images ends and that of truth begins. At the end of the letter, Ptolemaeus refers to the myth, which explains how the middle, the material, and evil could come forth from the perfect good. As in Valentinus, the letter gives evidence of Platonic trains of thought, which are blended with the interpretation of the biblical text.

10. HERACLEON

Heracleon is only mentioned by Irenaeus once, in passing (*AH*, 2, 4, 1), yet Clement calls him the ‘most eminent’ representative of the school (*Strom.*, IV, 71, 1; cf. Origen, *Comm. on John*, II, 14). He must have flourished in the second half of the 2nd century, but it is not known where (at Rome and/or Alexandria?). Apparently “memo-randa” (*hypomnemata*) were made from his exegesis of John, which Origen cites in his commentary on John’s Gospel (48 fragments) and criticizes (Heracleon’s interpretation of Luke 12, 8-11; see above). We do not know how extensive and thorough this exegesis was, but it probably began with John 1:3. This might suggest that Heracleon was silent about his Aeon doctrine, because in his exegesis he was addressing a general public. In his interpretation, which also draws on the other gospels, Paul, and the Old Testament, there is a myth in the background whose exact form can no longer be reconstructed. What is clear is the disparagement of the Demiurge who is also the lawgiver, as opposed to the highest God. Beneath him is the Devil (*Diabolos*), who symbolizes matter and its powers. The Logos takes part in the creation of the world and of man; he is the ‘true creator’ (Frg. 22, Origen, XIII, 19). Heracleon emphasizes the historical significance of the coming of Christ: ‘Now at last he is here’ (Frg. 8, Origen, VI, 39); henceforth the Old Testament can be understood as an image of salvation history. The chief message of the surviving fragments concerns anthropology and soteriology. The three classes of men, “pneumatics”, “psychics”, and “choics”, are identified

with the various people who converse with Jesus. Man consists of soul and body. If the soul rules over the body and follows the divine will through its own free decision, it attains a limited salvation, like John the Baptist or the son of the royal official (John 4:46-53, Frg. 40, Origen, XIII, 60); the soul of the “choic,” on the other hand, is subject to bodily urges, so that he deserves to be called the son of the Devil. The only one who can attain gnostic knowledge is he whose soul carries a pneumatic seed within it; but as in the myth related above, even this kind of soul is in a state of ignorance and sin before the coming of the Redeemer: its divine core must be illuminated. Heracleon finds this destiny of the “pneumatic” illustrated in the story of the Samaritan woman (John 4:1-42, Frg. 17-23). Her six lovers represent her entanglement in material evils; but she seeks to be freed from it and comes to Jacob’s Well: she hopes to find God by practicing obedience to the Law. This attempt cannot succeed; it is only in the encounter with the Revealer that she can recognize her ignorance, the cause of her former sins, and overcome it. Her knowledge is described in the image of the uniting of her soul with her heavenly companion. Only thus can the soul find its original “fullness” and attain salvation and immortality.

11. THEODOTUS

Theodotus the Valentinian also remains a shadowy figure. Among Clement’s works are preserved ‘extracts [*epitomai*] from Theodotus and from the teachings of the so-called Eastern school of Valentinus’s time’. We cannot be certain from this that Theodotus was Valentinus’s contemporary. Hippolytus mentions a Theodotus from Byzantium (‘the Cobbler or Leather-seller’) and a Theodotus the Banker (Hippolytus, *Refutatio*, VII, 35f.), but the teachings ascribed to them have little agreement with those in Clement’s *Excerpta*, in which it is very difficult to decide which extracts are attributable to Theodotus. Beside portions that contain Clement’s own arguments, others are ascribed to the Valentinians in general (also introduced by “They say”); the parallel version to Irenaeus’s myth is unfortunately given without any indication of origin (*Excerpta*, 43, 2-65). A few extracts are introduced with “Theodotus says”, or “he says”. Among these is an interpretation of I Cor. 15:29, on baptism for the dead. This applies to the angels, who have themselves baptized for the sake of the human pneuma-sparks that represent their other halves. The angels need this pneumatic part, because only thus can they ascend (*ibid.*, 35). The “Mother” brought forth these pneuma-sparks as

her minor children, who first acquire a “father” through their formation by the Savior (*ibid.*, 68). The Church represents the totality of the sparks that were elected before the world’s foundation (*ibid.*, 41, 1f.). Like the angels, Jesus was baptized when the “Son” or “Monogenes” descended on him in the form of a dove (*Excerpta*, 22, 1-3; cf. 26, 1). Jesus’ visible parts, according to Theodotus, stem from Sophia; the Logos clothed himself with them when he descended (*Excerpta*, 1, 1f.); a psychic Christ seems not to be envisaged here. His archetype is the Christ whom Sophia brought forth after her exit from the Pleroma, but who left her and rose to the Pleroma. At his request, Jesus, the Paraclete, was sent to Sophia (*Excerpta*, 32, 2f., cf. 23, 2 and 39). Sophia however, after Christ’s ascension, brought forth the inferior Demiurge (*ibid.*, 33, 3). This doctrine of Christ’s origin replaces the duplication of Sophia in Irenaeus’s account (or the division of the Logos in *Tripartite Treatise*, NHC I, 5); the ascending Christ corresponds to the higher Sophia, the one left behind to the lower. Irenaeus specifies that this was Valentinus’s own teaching (Irenaeus, *AH*, I, 11, 1); likewise the *Valentinian Exposition* (NHC XI, 2, 33, 35-37) says: ‘These things Sophia endured after her son had hastened upwards’. It is possible that in this detail Theodotus stayed true to the mythic design of his teacher. In another interesting detail, Theodotus speaks against abstinence from human reproduction: the latter is needed because only thus can the elect seeds come into the world, so as to find knowledge there (*ibid.*, 67). A longer extract is devoted to fate (*heimarmene*), which determines human life together with the various powers that manifest in the stars; with baptism their rulership ends. Baptism is understood as rebirth, and this also is an act of knowledge: ‘It is not the bath alone that frees, but also the knowledge of who we were, what we became, where we were, wherein we were thrown, whither we strive, wherefrom we are freed, what are signified by birth and rebirth’. (*ibid.*, 78, 2). He who attains this knowledge in baptism receives the ‘seal of truth’ and is untouchable by all other powers.

12. THE GOSPEL OF TRUTH

The most famous scripture of the Valentinian school is the *Gospel of Truth* (NHC I, 3), so called from its incipit. Irenaeus confirms this title as Valentinian and mentions the work’s difference from the canonical gospels (*AH*, III, 11, 9; probably derived from that is Ps.-Tertullian, *Adversus omnes haereses*, 4, 6). According to Irenaeus, the text must have been written before 175 A.D.; when

he gives its date as ‘not long ago’ (*ibid.*), he presumably means that it does not come from the time of the canonical gospels, but is of recent date. The original language of the text was probably Greek; a Latin word also occurs (*forma* in 27, 2; cf. *Tractatus Tripartitus*, 55, 8 and 61, 12), and there are stylistic reminiscences of Oriental wisdom-literature and hymnody. There is much debate about the genre of the text, which was first described as a homiletic reflection on the good news brought by the Redeemer. This seems to be the sense of the work’s title “On the Gospel of Truth”; the author attempts therein to explain the significance for mankind of the true message of the Redeemer, which is presented in the (canonical) gospels that he cites. At the end, the author speaks in the first person to his readers (42, 41-43, 5): ‘It is not fitting for me, having come to be in the resting-place, to speak of anything else . . . , it is fitting to be concerned at all times with the Father of the All and the true brothers’. A structural analysis of the text is almost impossible, since the author’s argument has no clear sections and is interwoven with numerous repetitions, anticipations, reinforcements, and digressions. The text can be regarded as a demythologized variant of the Valentinian myth, for the systematic main points concerning the divine doctrine, especially the question of theodicy, anthropology, and soteriology, are not given in the form of a cosmogonic story, but in a didactic form that uses a rich and very demanding imagery, and contains many reminiscences of the New Testament scriptures. Consequently, no distinction is made between the three levels: Pleroma, heaven and earth; the Aeons are simultaneously the human pneuma-sparks, and the transcendent Son and Name of God is simultaneously the earthly Jesus.

This avoidance of a narration unfolding in time is particularly visible in the figure of “error” (in Greek, the feminine *planē*), which characterizes the cosmos and human existence before the coming of the Redeemer. “Error” and its associated emotions arise because the Pleroma, the entirety of divine powers or emanations, is ignorant of God, who as in the *Tripartite Tractate* appears as a unity (“Monas”) without a female element (22, 27-33): ‘It was a great wonder that they were in the Father, not knowing him, and (that) they were able to come forth by themselves, since they were unable to comprehend or to know the one in whom they were’. As in the myth, ignorance is needed because it is the prerequisite for the search for God (17, 4f.). Only because God at first withheld knowledge (envy having no part in it), could he enable the return to him in perfect knowledge (19, 4-6). The

cause of the godless world lies in God, even if he did not create it (18, 1-3): 'Oblivion did not come into existence from the Father, although it did indeed come into existence because of him'. The arguments about "planē" thus substitute for the myth of fallen Sophia and the Demiurge. It is interesting that beauty is counted among the works of "error" (17, 19f.); it seduces those situated in the middle (man's interior). But the Son and the Holy Spirit enlighten them and give them truth instead of (earthly) beauty. Only then do they advance from a potential to an actual existence. Through the revelation of the Son 'the aeons may know him and cease laboring in search of the father, resting there in him, knowing that this is the rest' (24, 16-20). The author teaches the predestination of those who come to knowledge (e.g. 21, 26f.; cf. *Treatise of the Resurrection*, NHC I, 4, 46, 25-29): 'We are elected to salvation and redemption, since we are predestined from the beginning not to fall into the foolishness of those who are without knowledge'. Beside the chosen there is only the group of "materials" (31, 1), who will perish; a middle group of Church Christians is not mentioned (cf. *Valentinian Exposition*, NHC XI, 1, where however the middle "psychic" seems lacking). This circumstance may point to the origin of the text at a time when the division of the Valentinians from the majority church was not yet complete, or else it may be an indication that it is an "exoteric" scripture that sought not to alienate the members of the majority. The emphasis on the vicarious death on the cross may also point in this direction: "error" persecutes and kills the Revealer, but in doing so can only affect its own work, the body. Jesus sheds the "perishable rags" and clothes himself with "imperishability" (20, 31f.), cf. *Treatise on the Resurrection* (NHC I, 4, 45, 14-17): 'The Savior swallowed up death. . . for he put aside the world which is perishing. He transformed himself into an imperishable Aeon'. In the same way, those who attain the repose of knowledge simultaneously cast off lack, i.e. the ignorance that turned into matter. From the experience of salvation comes the urge to pass on this knowledge (32, 35-37): 'Speak of the truth with those who search for it and of knowledge to those who have committed sin in their error', and, in one's own case, not to abandon it (33, 15-21): 'Do not return to what you have vomited to eat it. Do not be moths, do not be worms, for you have already cast it off. Do not become a (dwelling) place for the devil, for you have already destroyed him'.

JENS HOLZHAUSEN

Vaughan, Thomas (Eugenius Philalethes), *1621 Newton-by-Usk, Breconshire (Wales), † 27.2.1666 Albury, Oxfordshire

Younger twin brother of the poet Henry Vaughan (1621-1695). Vaughan was educated privately by Matthew Herbert (ca. 1600-1660), admitted to Jesus College, Oxford in May 1638, proceeded to the BA degree in 1642, and continued his studies there for some years thereafter. He fought in the Civil War on the Royalist side, and was taken prisoner at Rowton Heath in 1645. He became rector of his home parish of Llansantffraed ca. 1645, and was evicted in 1650 under the provisions of the Act for the Propagation of the Gospel in Wales. The charges against him were more serious than for any other Breconshire incumbent, describing him as 'a common drunkard, a common swearer, no preacher, a whoremaster and in arms personally against the Parliament'. The first charge was apparently accurate; an entry in Vaughan's MS notebook refers to his having 'revellled away many yeares in drinking'. By the time he

was evicted from his living in 1650, Vaughan was already living in London. In May of that year Samuel Hartlib (ca. 1600-1662) noted the publication of Vaughan's *Anthroposophia Theomagica*, described its author as having for some years 'tried Chymicall or Physical Conclusions', and as living with Thomas Henshaw at Kensington 'where they lay their heads and hands together to see what they can produce'. Kensington is the first of five of Vaughan's known London residences. Henshaw was one of the founding fellows of the Royal Society, like Vaughan an ardent Royalist, who, after being taken prisoner and given the gentleman's option of pledging not to fight again or being confined, travelled on the Continent (from 1644-1645 with Evelyn in Italy). Hartlib said of Henshaw that both his parents were 'great chymists', and that he had a substantial library of alchemical works, printed and in manuscript. We also learn from Hartlib that in 1650 Dr. Robert Child (ca. 1612-1654) was endeavouring to form a 'chymical club' of which Henshaw and Vaughan were to be members; its purposes included the collection of alchemical [→ alchemy] books and manuscripts with a view to publishing them in one volume. Later in that year Child told Hartlib that Henshaw was about to put in to practice 'a model of [a] Christian Learned Society', referring to the *Christianae Societatis Imago* of → J.V. Andreae, translated in 1647 by John Hall as *A Model of a Christian Society*. Its members were to have all things in common, dedicating themselves to devotion and studies, separating themselves from the world by leading a severe life as to diet and apparel; they were to have a laboratory and 'strive to do all the good they can to their neighbourhood'. It is likely that this club was actually formed, but Vaughan is unlikely to have lived monastically for very long. He was married (28.9.1651) to Rebecca († 17.4.1658), probably the daughter of Dr. Timothy Archer (1597-1672) and his wife Rebekah Beedles of Cambridgeshire. Archer, the rector of Mappersall in Bedfordshire, was an ardent royalist. It seems apparent from the MS notebook that the marriage was happy, and that Rebecca participated in Vaughan's study of alchemy.

In 1661 Vaughan was embroiled in a legal battle, arising from his practice of alchemy, of which the outcome is unknown. He did not return to his ecclesiastical living after the Restoration, but continued to work as an alchemist, most probably as an assistant to Sir Robert Moray (1608/1609-1673), first President of the Royal Society. Henry Vaughan wrote that Vaughan 'gave all his bookes & manuscripts' to Moray; Aubrey reported

Moray as saying that he had buried Vaughan ‘at Albury’. Vaughan’s pseudonym, Eugenius Philalethes, appears on all his title pages, except that of *Aula Lucis*, where he appears as S.N. a Modern speculator. He had some posthumous reputation; substantial passages were transcribed into commonplace books; and he was read in German translations through the 18th century.

Vaughan dedicated his first published work to the Brothers of the Rosy Cross [→ Rosicrucianism], and he republished two Rosicrucian tracts with a substantial preface. His title *Magia Adamica* is a clear allusion to → Robert Fludd’s *Philosophia Moysaica*. He praised → Cornelius Agrippa in *Anthroposophia Theomagica*, *Anima Magica Abscondita* and *Magia Adamica*; in the last-mentioned work he also praises Libanius Gallus, → Johannes Trithemius, → Francesco Giorgio da Veneto, Michael Sendivogius and the kabbalistic scholar → Johann Reuchlin, who was a major source. The first doctrine he announces is that of the pre-existence, and the royalty, of the soul: a clear attack on Calvinist views. He followed → Paracelsus in substituting the three “elements” of sulphur, salt and mercury for Aristotle’s four. Like his brother Henry, he praised the state of childhood, but stressed the child’s desire for knowledge rather than his innocence. Again as in Henry’s work, the historical figure of Jesus is less important to Vaughan than was Christ conceived cosmically, as in St. John’s Prologue and in Colossians 1:17. Christ’s redemption is for the whole Creation, – again, in mid-17th century England, an anti-Calvinist position (*Anthroposophia Theomagica*, 56). See also, in this respect, *Euphrates*, 517–518: ‘I fear not to say, that *Nature* is so much the business of *Scripture*, that to me, the *Spirit of God*, in those sacred Oracles, seems not only to mind the *Restitution of Man* in particular, but even the *Redemption of Nature* in *generall*. We must not therefore *confine* this *Restitution* to our own *Species*’. Like others of his time, Vaughan thought of the Bible, and the oral tradition of its commentators, as a source of scientific wisdom; on the other hand he sought out scientific truth by “chymical” experiments. He was an animist, opposed to the peripatetics, who ‘look on God, as they do on Carpenters, who build with Stone and Timber, without any infusion of life’ (*The Man-Mouse*, 249). His view of chemistry is in line with his Arminian, anti-Calvinist theology, salvation being ‘nothing else but transmutation’ (*Lumen de Lumine*, 357). Perhaps the most interesting thing about the Vaughans, from a modern perspective, is their opposition to the view, commonly expressed

by neo-Calvinists of the period, that the non-human creation is of value only insofar as it is useful to human beings. The question of how we should consider and treat the non-human world is a contested area in our time, in, for example, the confrontations between environmentalists and logging companies. It is clear from their work where Vaughan and his brother would have stood on this issue; the non-human for them was not merely instrumental, but an object of admiration, reverence and love. ‘God is not absent from his creatures’, Vaughan wrote, after considering the wisdom of the spider and the hare (*Anima Magica Abscondita*, 112).

Villard de Honnecourt and the Medieval Craft

Villard de Honnecourt, who, in his manuscript written in the French of Picardy (Bibliothèque Nationale de France Ms fr 19093), spelled his name “Wilars”, is known only by this collection of small parchment leaves (14 × 22,5 cm. on average), bound in a leather portfolio. Many folios have disappeared since the 13th century, when the author assembled the drawings and texts executed in various places to form, as he called it, a book. Remaining are thirty-three folios (66 pages) out of about fifty that it must have included originally. It was discovered in 1825, in a collection from the abbey of St. Germain des Prés. The first facsimile, annotated by J.B. Lassus, published in 1858, was reproduced, soon afterward, with commentaries in English, by Robert Willis.

Religious scenes, traditional figures, machines and various engines, automata, formulas for geometry and surveying, procedures for stonecutting, models of building construction, church furniture, partial plans of religious structures, devices for vaulting, surveys of existing buildings, templates for stone elements, figures of people and animals, drawings having both esoteric meanings and mnemonic purposes [→ Mnemonics] are the subjects treated in this manuscript. It is a mine of information as much on technical knowledge as on life in the 13th century and on initiatory crafts associations, whose rituals have been transmitted until the contemporary period.

A great many scholars, historians, and architects

have taken an interest in this outstanding manuscript. Some of its drawings have been reproduced many times, sometimes with errors, and many articles concerning it have appeared. Viollet-le-Duc, notably, cited the drawings of Villard, and works on the history of technology allude to some of the machines represented in this manuscript, whose reduced format and subsequent binding in folios suggest the description of “sketchbook”. Some facsimiles have appeared after that of Lassus. A facsimile (annotated by Alain Erlande Brandenburg, Jean Gimpel, Régine Pernoud and Roland Bechmann), accessible to the public, was published in France in 1986 and reproduced in Italy and Spain. The only study of all the drawings that appeared before the 1980s is that of Hans Hahnloser published in 1935 in German. The present author’s most important contribution, more specifically focused on the technical and mnemotechnical drawings, was published in 1991.

The social position, the functions, and the life of Villard are unknown. The period of his activity, the first third of the 13th century, can be determined to within a few decades by what he represented in his manuscript. In this era, the most beautiful cathedrals rose in Western Europe, later known as “Gothic”. Also unknown is whether Villard was a native of Honnecourt, an inhabitant of that small town, or a member of the Benedictine community of the abbey, the heart of that urban area. He appears as an expert in matters of building and machinery, having traveled in France and other countries, such as Switzerland and Hungary, sketching whatever seemed interesting to him, or could be useful for the projects for which he was providing advice or assistance.

An artist with a gift for drawing, Villard was attracted to all that seemed unusual or new to him in every area of construction and mechanics. His lively sketches evoke characters of daily life, but also scenes or traditional figures that we find again in the sculpture of that period. Some drawings concern churches in construction in his time, such as a tower of the cathedral of Laon, or the apsidal chapels of Reims, with technical details concerning pillars, mullions, and ribs. His manuscript, in which we find the first example of the word “ogive”, contains plans of church apses, of which some correspond exactly to finished buildings, as well as a model plan for a Cistercian church. He drew a curious rose for the cathedral of Lausanne and another recalling that of Chartres. He indicates that he had been ‘sent’ to Hungary, where indeed at that period the Cistercians, come from France, had founded several abbeys.

In the literature, Villard has been designated, without any proof, as the architect, or at least a participant in the construction, in the case of seventeen churches. He gave instructions – but we do not know in what capacity – for the construction of the cathedral of Cambrai, and he may have taken part in that of the church of Vaucelles. He may have worked on the collegiate church of Saint Quentin, whose interior layout resembles the survey that Villard made in Reims. Moreover, researchers have found on a wall of this collegiate church an engraving very analogous to a rose drawn by Villard and, more recently, a spiral similar to that sketched in the manuscript. In 1996, the present author discovered in the same church an engraving of arch stones applying a method of stonecutting described in the manuscript. Several plans by Villard correspond to those of finished churches, without thereby providing any indication on his possible contribution to these buildings.

From the viewpoint of the history of technical subjects, his drawings reveal the knowledge of the builders of this period in the areas of geometry, stereotomy, and engineering, as well as their widely diverse centers of interest and the scope of their competence. We perceive traces in them of the teachings of Euclid, Vitruvius, and the Roman agrimensors. The deciphering of the technical drawings in Villard de Honnecourt's manuscript, which had been neglected, despised, or misunderstood, show that the builders of this era possessed, in matters of geometry and stereotomy, knowledge and methods that could explain how they had been able to erect such impressive buildings. In the dedication meant for the professional people to whom he bequeathed his work, Villard stated that it contained many indications in matters of masonry and construction. He also mentioned the method of drawing, called *le Trait*, which prefigured descriptive geometry and stereotomy, and made possible the conception, the exact drawing, and the preliminary cutting of works in wood and stone. In this manuscript, we find the first mentions and examples of the application of this art that, transmitted between initiates, was divulged only from the 16th and 17th centuries, by Philibert de l'Orme, and then by Mathurin Jousse, in a work with the revealing title: *Le Secret d'Architecture* (The Secret of Architecture). This method is still used today by the "Compagnons du Devoir".

We must wonder whether Villard was already part of a workers' association, of an initiatory nature, from which the "Compagnons du Devoir" would have issued in France. These were "operative", that is, working manually, and their often-

prohibited groupings had to remain underground. In the historical context, this hypothesis would be plausible and, in the manuscript, some indications tend to confirm it. At the beginning of the 12th century, crafts guilds officially existed in England, including journeymen and apprentices, who met periodically and owed one another assistance. In 1276, Emperor Rudolph of Habsburg granted a chart of freedoms to the stonemasons of Strasbourg. However, the Authorities controlled these organizations, whose essential goals were not the interests of the workers, and dreaded the initiatives and pressures that the workers could exercise to improve their condition. In France, on several occasions, from the 12th century, the authorities and the Church made a stand against the associations, confraternities, and organizations of solidarity requiring secrecy from their members, and declared them prohibited, notably, in 1189, at the Council of Rouen, and in 1326, at the Council of Avignon. According to Martin Saint Léon, historian of *compagnonnage*, the municipal magistrates of Amiens, at the end of the 13th century, forbade the city workers to meet in groups of more than four and to have a common treasury. In 1506, a ruling by the Châtelet, in Paris, reiterated the prohibition against clandestine meetings of workers. Only the Corporations, instituted and organized under the control of the Authorities, were allowed.

The building workers, who moved frequently because of the unpredictability in the progress of construction sites, must have felt the need for organizations of mutual aid and information, indicating places where work was available and lodgings. Moreover, by belonging to such a society, the workers guaranteed their professional competence to the supervisors. For France, no documents survive on this subject. However, in the countries of Germanic language and in England, the existence of professional organizations uniting stonemasons is attested, starting in the last third of the 14th century. The written documents record the customs of these organizations, which seem to have been tolerated in some countries, where the traditions were less centralizing than were those of France. Speculative → Freemasonry, which has united, since the 17th century, adherents from every profession and often influential personalities, considers itself to have originated from such organizations of manual workers.

The engineer Franz Rziha, who surveyed, in Central Europe, some twelve hundred engraved monument markings, has found that they were placed in geometric patterns specific to the stonecutters of each of the regional "lodges" affiliated with the

Germanic *Bauhütte*. He thinks that the lodges must have existed as early as the 12th century. On the last of the four pages of Villard's manuscript concerning the Art of Geometry, a face is drawn in a grid of squares. Over this is superimposed a graphic, which resembles the marks drawn on the pattern corresponding to the Grand Lodge of Strasbourg, which Rizha surveyed. Could this have been the personal mark of Villard? What indications, in the sketchbook of Villard, would make it possible to suppose that he had been affiliated with such a society, or, at least, been part of a profession practicing certain rites of recognition and using certain symbols that reappear, centuries later, among the Compagnons and the Freemasons, whose traditions are sometimes similar?

Two drawings from folio 19r very exactly illustrate two rituals of recognition, which historians of Compagnonnage describe in detail, notably Raoul Vergez, J. P. Bayard, and François Icher. Representations of the same scenes appear on medieval buildings in Poitiers. Various figures of both folios 18 and 19 refer to designs that are still known and used by certain Compagnons du Devoir. A collective work on the cathedral of Lausanne, of which several of the authors were Compagnons, compares the designs employed with the drawings in Villard's sketchbook.

The composition appearing in folio 6r of the manuscript is presented as 'the sepulcher of a Sarrazin', that is, of a pagan. No tomb corresponds to this composition. On the contrary, it recalls the frontispieces of some books by architects from the Renaissance period, and certain compositions appearing in medieval works, as well as the "tracing boards" of the Freemasons, of which Marc-Reymond Larose has explained the symbolism. For the Compagnons, the word Sarrazin referred to Hiram, a foreign architect called by King Solomon to build the Temple of Jerusalem. This page contains symbols that reappear in the traditions of the Masons and the Compagnons: hence, the two columns recalling those of the Temple, steps, ewers, lilies, mallets, draperies, and pomegranates. The two figures, on either side of what seems to be a drawing board, appear to be holding, the one a plumb line, and the other a set square. However, these two basic tools are not shown, as though to recall that the technique of *le Trait* is a secret. The central character, which is carrying a scepter resting on his left shoulder, is making the sign of the master with his right hand, the index and the little finger extended, and the thumb folded back on the other fingers. The proportion of the fronton at the bottom of the drawing, in the shape of an isosceles

triangle, whose superior angle measures 108 degrees, a number of which François Rabelais, in the 16th century, evoked the symbolic value, reappears notably on the frontons of the "apprentices' board" and the "fellows' board" of the Freemasons. Moreover, the present author has shown that this mysterious composition is constructed on a perfectly regular pentagonal star.

With regard to the four pages representing people and animals with geometrical designs, Villard specified that these are figures of the art of geometry, useful for working. Some have believed these figures to be a method to facilitate drawing, but they were in fact a memento of geometrical layouts. The same aim of memorization accounts for the attribution to the celestial constellations of names that recall the arrangement of the component stars, and in the medieval Arabian and Western treatises on geometry, the attribution of imaginative names to figures of Euclid.

These folios show two characteristic images of a recognition ritual between compagnons, of which the drawings recall various procedures for useful designs, and are replete with symbols, only a few of which we still understand today. Other pages are also noteworthy. Thus, the "dice players" of folio 9r in fact represent a master and an apprentice, as the dice indicate – a five-pointed star and a cross framed by four dots, in the hand of the master, while the dice in the hand of the other person have only dots. In folio 8, we see the inscription *AGLA* (corresponding to the Hebrew invocation, "*Atha Gibor Lebolam Adonai*", meaning, "You are eternally great, Lord"), which reappears in the works of some printers of the 14th and 15th centuries and would be that of a secret society of book artisans.

All these indications form a body of evidence sufficiently great for us to consider it probable that, at the time of Villard of Honnecourt, there already existed an initiatory association of builders, possessing rituals of recognition and a tradition, expressed in symbols, to which different meanings may subsequently have been given, but which were maintained.

ROLAND BECHMANN

Viterbo, Egidio da (Egidio Antonini), *1469 Viterbo, † 12.11.1532 Rome

Having entered the Order of Augustine Hermits (1488), where he rapidly became the secretary of Fra Mariano da Genazzano, Lorenzo de' Medici's favourite preacher and a well-known early opponent of Girolamo Savonarola (1452-1498), Egidio Antonini acquired the elements of a complete humanistic education, including the study of several oriental languages: aramaic, hebrew and arabic. Gifted and hard-working, he achieved an enviable reputation as a poet, an orator and a remarkable connoisseur of Greek literature and philosophy. Honors came swiftly to crown such promising beginnings: he was appointed successively a Papal Nuncio, the Prior General – and reformer – of his Order (1507-1518) and a Cardinal (1517), apart from being singled out for delivering the inaugural address to the 5th Lateran Council (1512). In → Reuchlin's wake, he remained a staunch upholder of Jewish literature, and of its relevance for reform and a deeper understanding of Christian Scripture

and religion. Thus, during his lifetime, he collected a rich hebrew and kabbalistic library, part of which is today deposited in the Paris National Library. He was also in close and lasting contact with the most famous Jewish and Christian representatives of Renaissance humanism, from A. Giustiniani (1470-1536), → P. Galatino (1460-1540) or J.A. Widmanstetter (1506-1557) to E. Levita (1468-1549), to whom he gave shelter for almost fifteen years at his house in Rome. He constantly maintained a whole retinue of servants and *amanuenses*, both Jewish and converts, occupied with writing and translating texts and treatises for him, kabbalistic and otherwise.

Two among the main intellectual interests of Egidio's life concern us most here: Christian kabbalah [→ Jewish Influences III] and, secondarily, Joachimism. In following these trends, he merely reflected the atmosphere and spiritual proclivities of his time, which affected so many prominent minds, like Galatino or → Guillaume Postel (1510-81), to name but two. That the General of Augustine Hermits should have been aware of the Joachimist expectations fermenting in certain circles within his own Order was surely inevitable; but there is little doubt that he condoned such speculations himself, even if in a milder measure than some, as shown by his receiving the dedication of the *Expositio abbatis Joachim in Apocalypsim* (1527) published in Venice by S. Meucci, in which the editor recalls meeting (in 1519) and being encouraged by the Cardinal in person (a fact pointed out long ago by M. Reeves). An Augustine Hermit himself, S. Meucci directed in Venice, from 1516 to 1527, the publication of a whole range of prophetic writings and biblical commentaries, some spurious and some authentic, ascribed to the abbot of Fiore. Furthermore, traces remain to our day of this aspect of Egidio's orientations, in the form of manuscript copies of tracts of the same persuasion still extant in his *Nachlass*.

Despite our author's strong personal commitment to the perspectives of Christian kabbalah, it is a noted fact – and one difficult to explain, even considering his demanding position – that almost never in his lifetime did he send anything to the press, in this field as well as in others. Among the translations he commissioned or did himself, versions (mostly partial) survive of the books *Bahir*, *Raziel*, *Sefer Yetzirah*, *Temunah*, *Sha'are Orah* and *Ginnat 'Egoz* by Rabbi J. Gikatilla, and excerpts from the *Zohar* and many other documents of kabbalistic, midrashic or even talmudic origin. Among his original works, most conspicuous are the treatises entitled *Scechina* and *Libellus de litteris*

hebraicis, along with the earlier *Historia viginti sæculorum*. Unfinished, yet datable from 1530, the first of these texts (but the last one written by the Cardinal) consists of a lengthy (ca 400 pages) exposition of the mysteries of the Shekinah, that is of the divine Presence residing among men. Through Egidio's agency, writing at Pope Clement VII's request, the Shekinah supposedly reveals the secrets of the kabbalah to the emperor Charles V, via the mystical meanings of numbers [→ Number Symbolism], (hebrew) letters and divine names. It is really an esoteric interpretation of the history of the Church, understood in the light of God's continued revelation, the complete grasp of which has hitherto eluded Christians because of their ignorance of the kabbalah. Here, the Shekinah is assimilated with the Holy Spirit, which progressively confers the plenary intelligence of the divine mysteries to the prophets.

New trials are about to manifest themselves for mankind, soon to be followed by impending messianic events which require cogent preparation. Egidio thus attempts to present the emperor with illuminating developments based on the ten *sefirot* – the last of which being the world of the Shekhinah proper – linked to ten different periods, up to the pontificate of Leo X (Clement VII's predecessor) who, along with Charles V (these numbers, as also III and VII, are of course considered significant), inaugurates the incoming era of spiritual fulfillment. Accordingly, the teachings of the Shekhinah aim at elevating the emperor above earthly matters and passions, beyond the celestial spheres, to the contemplation of the divine realm, in order to transform him – in obvious neoplatonic fashion, reminiscent of → Pico della Mirandola or → Ficino, whom Egidio both met – into a faithful minister, below, of the heavenly decrees above, in other words to train him as a political and spiritual reformer.

The *Libellus* (1517), which the *Scechina* expands on, is a brief but remarkable tract dealing with the symbolism of the shape of hebrew letters and based (as is well-known) on the kabbalistic *Sefer ha Temunah*.

As the elements outlined above clearly reveal, Egidio's works blend moderate messianic expectations (applied essentially to his own time) with a wealth of Jewish erudition, combined with extensive Greek learning. One might well wish that, by remaining unpublished, the writings of this complex figure – a high prelate, indefatigable preacher, religious reformer, major Humanist and Christian kabbalist, once famous for his rare blending of eloquence, erudition and piety – had not been, for the

most part, denied the fame and influence they thoroughly deserved.

JEAN-PIERRE BRACH

Waite, Arthur Edward, * 2.10.1857
Brooklyn, N.Y., † 19.5.1942 Bridge,
Canterbury (England)

Writing as an apologist and critical historian of his subject matter, Waite was the author, editor or translator of more than eighty works on → alchemy, → Freemasonry, kabbalah [→ Jewish Influences], → magic, → mysticism, → Rosicrucianism and other aspects of western esotericism. Through a series of translations of → Eliphas Lévi's major works on magic he effectively introduced Lévi to the English-speaking world, while the tarot pack that he designed in 1909, in conjunction with Pamela Colman Smith, has been more widely distributed than any other of the 20th century. He saw himself, however, not as a magician but as 'the exponent in poetical and prose writings of sacramental religion and the higher mysticism, understood in its absolute separation from psychic and occult phenomena'.

Waite's parents – Emma Lovell, an English woman, and an American sea captain, Charles F. Waite – seem not to have been married and after the death of his father Waite was brought to England in 1859 with his infant sister. Rejected by her family, Waite's mother raised her children in the northern suburbs of London, and sought spiritual solace by conversion to the Roman Catholic Church. After the death of his sister in 1874 Waite suffered a loss of faith and turned, successively, to → spiritualism and Theosophy [→ Theosophical Society] in an attempt to restore it. He rejected both creeds and gradually developed his own brand of sacramental Christianity infused with such elements of esotericism as proved acceptable to his temperament. His spiritual progress can be discerned in his early poetry, but he also discovered the works of Eliphas Lévi, whose ambivalence to the Church of Rome mirrored Waite's own feelings, and in 1886 he published an anthology of Lévi's writings, *The Mysteries of Magic*.

This was soon followed by other editorial work (*Lives of Alchemystical Philosophers*, and *The Magical Writings of Thomas Vaughan*, both 1888), and by Waite's own studies, *The Real History of the Rosicrucians*, 1887, and *The Occult Sciences*, 1891. With these and other works Waite's reputation as an objective but sympathetic critic was

established and he was accepted into more *recherché* esoteric circles: in January 1891 he was admitted to the → Hermetic Order of the Golden Dawn. His initial stay in the Order, however, was brief: he demitted early in 1893, leaving in order to concentrate on his writing. Waite also needed to earn a living – he was now married and had a small child to support – and re-invented himself as a publisher.

Between 1893 and 1896 Waite edited and published a series of English translations of classic alchemical texts, thus providing source material for English-speaking students of alchemy for the next hundred years. In addition Waite also edited *The Unknown World*, 1894-1895, the first journal to be devoted solely to Western esotericism, but while it was a critical success it was also a financial failure and Waite left publishing to take up paid employment as the commercial manager for Horlicks, the manufacturers of malted milk. Freed from financial anxiety Waite was now able to indulge his own taste in writing and to continue his progress in esoteric Orders.

In 1896 he published *Transcendental Magic*, his translation of Lévi's *Dogme et Rituel de l'Haute Magie*, and in the same year he rejoined the Golden Dawn, entering its Second Order, the Rosae Rubeae et Aureae Crucis, three years later. At this time Waite did not play a significant part in the Order's affairs, preferring to increase his initiatic experience. In 1901 he was made a freemason and rapidly explored → Freemasonry's many facets, entering every masonic and quasi-masonic rite and order that was open to him. When the Golden Dawn broke apart in 1903 Waite did not stand upon the sidelines: he seized control of the Isis-Urania Temple, re-named the Order the Independent and Rectified Rite, and took his branch of the Golden Dawn firmly away from magic and in the direction of an idiosyncratic Christian → mysticism. His Rite flourished for ten years, but in 1914 Waite closed down the Isis-Urania Temple, partly for reasons of personal quarrels – which led also to his withdrawing from the Societas Rosicruciana in Anglia – but principally because of internal dissension over Waite's increasing emphasis on a mystical interpretation of the rituals.

This shift away from traditional esotericism is apparent in Waite's writing from 1900 onwards. He was drawn increasingly towards the idea of the "Secret" or "Interior Church"; not an instituted body but 'the withdrawn spirit of the outward Holy assembly', made up of 'the integration of believers in the higher consciousness'. Coupled with this notion was Waite's concept of "The Secret

Tradition”, which he developed from his interpretation of the doctrine of the Fall, defining it as ‘the immemorial knowledge concerning man’s way of return whence he came by a method of the inward life’. This tradition, Waite argued, has been maintained down the ages in secret by means of ‘Instituted Mysteries and cryptic literature’.

For the world at large Waite propagated his doctrines in a series of major works on significant themes within Western esoteric traditions. He began with *The Hidden Church of the Holy Graal*, 1909, in writing which he was aided by the essayist and fantasy writer, Arthur Machen who was among Waite’s closest friends and who provided him with a leaven of Christian orthodoxy. From the Grail [→ Grail Traditions] he progressed to Freemasonry and the kabbalah, with *The Secret Tradition in Freemasonry*, 1911, and *The Secret Doctrine in Israel*, 1913, following these with *The Way of Divine Union*, 1915, an original and perceptive study of Christian mysticism. He completed the series with *The Brotherhood of the Rosy Cross*, 1924, and *The Secret Tradition in Alchemy*, 1926. But for those he saw as initiates he provided something else.

In 1915, following the collapse of the Independent and Rectified Rite, Waite created a new Order, the Fellowship of the Rosy Cross, among whose members was Charles Williams – novelist of the supernatural and unorthodox theologian. This Order was, like its parent Golden Dawn, initiatic and offered a series of progressive grades based on a spiritual ascent of the kabbalistic Tree of Life. It differed from the earlier Order in that it was wholly and avowedly Christian, with neither magical nor occultist practices, but utilising traditional esoteric symbolism as a means of presenting the spiritual practices of Western Christianity.

Throughout his later life Waite continued to develop his ideas. After his wife’s death in 1924 he married Mary Schofield who had been his disciple and amanuensis for many years. With her support he revised his studies of the kabbalah, the Holy Grail, and esoteric Freemasonry, and completed his memoirs, *Shadows of Life and Thought*, 1938. This was Waite’s last work and, fittingly – for Waite was, above all, a mystic – it incorporates a comprehensive but succinct analysis of the ground of mystical experience.

By contemporary standards of scholarship much of Waite’s critical work may be found wanting, but he was a pioneer of the academic study of esoteric traditions, an innovative exponent of the philosophy of mysticism, and a creative genius in the field of practical spirituality.

ROBERT A. GILBERT

Weigel, Valentin, * 1533 Grossenhain (Saxony), † 12.6.1588 Zschopau (Saxony)

Lutheran pastor and author of writings of a critical, theoretical, theological, and devotional character. The son of commoner parents, Weigel depended upon princely patronage to attend an elite Latin school and subsequently studied theology at the Universities of Leipzig and Wittenberg, possibly also teaching briefly at the latter. In 1567 Weigel was ordained as a pastor, a position he held in the Saxon city of Zschopau from that year until his death. His was a career outwardly disturbed only by the tensions and disputes of the Gnesio-Lutheran controversies between rival Lutheran theological factions. Chapter 23 of his *Der güldene Griff* (1578) recounts the seminal impact of these disputes on his thought. In despair over the failure to attain free concord and over the role of intolerance and secular power in religion, Weigel turned to the inner word, following the path of Meister Eckhart, Tauler, the *Theologia Germanica*, and Sebastian Franck, whose writings he studied and incorporated into his own. Weigel’s thought is distinguished from theirs by his incorporation of elements of nature speculation and → mysticism drawn from → Nicholas of Cusa and → Paracelsus, as well as conventional cosmological sources of his time. Though he published almost nothing during his life, he exchanged views and collaborated with pastoral colleagues.

His earliest independent writings dating from 1570 reveal an eclectic tendency that attains originality in his *Gnothi seauton* (1571). Under suspicion of heterodoxy, Weigel penned a successful defense and turned to pastoral writing, composing sermons and a posthumously influential tract on prayer. The years that saw the preparation and enactment of the Lutheran Formula of Concord of 1577 stimulated a renewal of his more critical and

theoretical work, most notably *Vom Ort der Welt* (On the Place of the World) of 1576 and *Der güldene Griff* (The Golden Grasp) of 1578. Other writings critical of the orthodox church establishment and its officially enforced doctrines followed, one of the finest of which is the *Dialogus de Christianismo* (1584). Authorship of the Weigelian works is sometimes unclear due to his collaboration, the lapse prior to posthumous publication, and his adherents' unfortunate habit of composing and printing similar writings in his name.

Since in Weigel's thought the inner overshadows the outer, inner truth or spirit outweighs external nature, → alchemy, or associated spirits or forces. Cosmological interests, the contemplation of the macrocosm, or a belief in the Paracelsian elemental spirits serve to warrant the primacy of the inner or spiritual over the outer or material. Weigel's contemplation of infinitude, reminiscent of Pascal's, shows that the path to ultimate truth and salvation lies within. Weigel's thought is perhaps most forward looking in its idealist epistemology and its emphasis on religious tolerance.

Beginning in 1609 the posthumous publication influenced the Lutheran orthodoxy, the precursors of → Pietism, especially Johann Arndt, and around the time of the Thirty Years' War, dissenters and non-conformists during the 17th century. His name was associated with radical dissent. Partially translated into Dutch and English, Weigel became known to the Quakers. Scholarly interest in his work was revived in the 19th century. The complete works are only now being definitively edited.

Sämtliche Schriften (ed. W.E. Peuckert/W. Zeller), Stuttgart-Bad Cannstatt: Frommann-Holzboog, 1962-1978 (7 Installments); new edition (ed. **Welling, Georg von, * Summer 1655
Kassel, † 28.2.1727 Bockenheim**

Before the publication of Petra Jungmayr's dissertation on von Welling in 1990, almost nothing was known about his life. He occasionally presented himself as Baron von Welling, but whether he was actually granted this title cannot be confirmed. He served as captain in the army (1683-1685) and participated in the defense of Vienna against the Turks. The following years he seems to have spent as a riding master (Hofjunker). From 1705 until ca. 1710 he was an estate lessee (Pächter) in the mining district of Wenigerode. Then he moved to Berlin where King Frederick I made him councillor of legation (Legationsrat), a position that he held only briefly. From 1717 to 1720, von Welling was appointed director of the mines of the Duchy of Wurtemberg, then settled in Pforzheim. There he entered the service of marquis Karl Wilhelm at the Court of Karlsruhe in 1721, and until 1723 served as director of the marquis's private chemical/alchemical laboratory. In 1722, von Welling also worked for a short period in Anspach as an expert in the salt mines of marquis Wilhelm Friedrich, himself also a person with alchemical interests. Von Welling spent his remaining years in Bockenheim near Frankfurt. He was unable to find a professional post there, and thus found himself in dire financial straits.

Besides the work which made him famous (*Opus mago-cabbalisticum et theosophicum*, written in German), von Welling authored other texts. First, in the *Opus* he mentions three (possibly short) published pieces, but these have not yet been recovered (see Jungmayr, 75). They apparently dealt with St. John's Revelation and with certain astrological calculations. Second, a few technical, unpublished pieces have survived, bearing on matters concerning von Welling's profession as a mineralogist and/or his laboratory work at the Court of Karlsruhe. Third, there are editorial comments given to the *Curiose Erwegung* (see further below).

The *Opus* seems to have remained von Welling's only true book. Originally intended to be only about the → alchemy of salt, it ended up covering much more. Published in 1719, and edited by "S.R." (see below), the author signed it as Gregorius Anglus Sallwigt. A note in it informs us that it was finished as early as 1708. This first edition contains only what was to be the first of the three parts of the subsequent versions. The second edition, published in 1729 (after von Welling's death and signed G.A.S), was the first to contain all three parts. Its first part had been edited by S.R. in 1719. The third edition (1735) was later re-edited in 1760 and

1784, and is considered the definitive and complete edition. It is signed Georg von Welling and edited by C.S.; this stands for Christoph Schütz, a theosopher likewise interested in alchemy. Schütz also wrote the preface and inserted a text of his own on the “Eternal Wisdom”. All three versions bear slightly different titles (see Bibliography). The editor, “S.R.”, of the first edition, is in all likelihood Samuel Richter, also known as → Sincerus Renatus. He seems to have gotten hold of the first edition without von Welling’s permission, since von Welling writes in his preface of 1735: ‘the first part of this work came to the light without our consent’.

As far as the third version (1735) is concerned, the words “mago-cab[b]alisticum”, found in the titles of all three editions, are misleading. Nothing is said in the book about either kabbalah [→ Jewish Influences] or → magic. For von Welling, these words are just synonyms for knowledge of Nature and Christian faith, understood in the “gnostic” sense von Welling intends them to have. They serve to designate his purpose of bringing together the “mysteria naturae” and the “mysteria scripturae”. For him, Jewish Kabbalah employs ‘throughout a misuse of the Divine Names’; but, the other hand, he occasionally praises the Christian Kabbalists. Actually, the *Opus* is a book of → Christian theosophy, and for all practical purposes, the terms “kabbala” and “magic” are to be understood here as synonyms of it. This explains the choice of the word “theosophicu[m]s”, which in the titles of 1721 and 1735 felicitously replaces the “theologicum” of 1719. The *Opus* contains graphic geometrical drawings that have something of a “magical” flavor to them – not surprisingly, since they are meant to convey theosophical notions. Some of these drawings were later reproduced by numerous other authors and added significantly to the fame of the work.

The three parts of the *Opus* correspond to → Paracelsus’ “Tria prima”, namely salt, sulphur and mercury. The central topics treated are the alchemy of salt, cosmogony, the Lucifer myth, an exegesis of Genesis, and chiliastic/eschatological speculations. Many of the themes of *Opus* are also borrowed from → Jacob Boehme. First there is the “Urgrund”, understood as the ontologically primary reality in and of God, and His creation of the seven Spirits. Furthermore, one finds Boehme’s exegesis of the first words of Genesis, the androgyny of Adam, and the myth of the Fall of Lucifer who becomes Satan. Last, but not least, von Welling borrows from Boehme the belief in an “apokatastasis panton”: the belief that after the consummation of all things at the end of time, all beings, be they good or evil, will return to God. But unlike

Boehme, von Welling does not deal with the theme of the Divine Sophia.

Von Welling offers numerous theosophical interpretations of biblical verses in the light of alchemical concepts. For instance, salt, which is the main term around which most of his speculations revolve, corresponds to Christ; and the process of purification in alchemy is compared to that of Lucifer on the Last Day. This is not a new line of interpretation, since for already over one hundred years, theoalchemy – theosophy blended with alchemy – had offered speculations about salt. It was variously and even simultaneously regarded as a substance, a metaphysical principle and a religious metaphor. Von Welling assigns to the three Paracelsian principles (salt, sulphur, mercury) a role that is both celestial and terrestrial. In the wake of → Knorr von Rosenroth, → Heinrich Khunrath, → Franciscus Mercurius van Helmont *et alii*, he deals with the “Schamajim”, or the original balance between Fire and Water (in Hebrew “Aesch” and “Majim”, used here as a symbolic oxymoron). Their separation is due to the Fall. It is more specifically in terms of both cosmology and metallurgy that von Welling is much indebted to F.M. van Helmont’s *Paradoxal Discourses, concerning the Macrocosm and Microcosm . . .* (London 1685; German ed. 1691). Both share the same complex vision of the four elements as related to the planets, and similar cosmosophical views as well. The spirits of the four elements, or “elementals”, are the object of a strong interest for von Welling, who deals with them in connection with his exegesis of the creation of the world, and edited a separate text on them (see Bibliography). The two earlier relevant and important works on this matter had been Paracelsus’ *Liber de nymphis, sylphis, pygmaeis et salamandris* (written in the 1530s), and Nicolas P.H. Montfaucon de Villars’ *Le Comte de Gabalis* (1670).

Of the theosophical writings of the first half of the century, along with the works of Sincerus Renatus and → Hermann Fictuld, the *Opus* ranks among the more influential. Its reception reached its height in the second half of the 18th century, during which two more editions appeared, in 1760 and 1784. Among the patients to whom the physician Johann Friedrich Metz recommended readings of these kinds was the young → Goethe. Metz urged Goethe to immerse himself in von Welling’s writings; and in his autobiography, *Dichtung und Wahrheit* (1811, Book VIII), Goethe even devoted a few pages to the readings that he had made of theoalchemical books, and in particular to his personal exegesis of von Welling’s Lucifer narrative. In 1786 Lorenz Schubert gave an extensive commentary

(*Welling im Auszug mit Anmerkungen . . .*, Frankfurt/Leipzig) on the *Opus*.

Within German → Freemasonry, some Systems with Higher Grades, mainly the Order of the Gold- und Rosenkreuzer [→ Rosicrucianism II] and that of the → Asiatic Brethren, made wide use of von Welling's book. The Gold- und Rosenkreuz's rituals and "instructions" both borrowed heavily from the *Opus*. Furthermore, a flurry of widely disseminated publications by members of the Gold- und Rosenkreuz or by authors close to the latter referred to it as one of the supreme authorities (for instance, AdaMah Booz [A.M. Birkholz], *Die sieben heiligen Säulen*, 1783; Ketmia Vere [C.E. von Jääger], *Compass der Weisen*, 1779; *Der Signatstern*, 1803; *Annulus platonis*, 1781). Johann Gottfried Jugel's numerous books on chemistry and alchemy, which began to appear as early as 1744, are also strongly inspired by the *Opus*. They were widely read by the members of the Gold- und Rosenkreuz, to which Jugel also seems to have belonged. The Order of the Asiatic Brethren came into existence in 1780-1781. Considering the many common characteristics shared with the former Order, it is hardly surprising that its founders praised the *Opus* quite as much as those of the Gold- und Rosenkreuz did. Both the *Opus* and → Louis-Claude de Saint-Martin's *Des erreurs et de la vérité* (1775) were part of the Asiatic Brethren's main referential corpus. During the same period the Gold- und Rosenkreuz proper and its publications spread in Russia, notably within the esoteric circle of → Nicolai Ivanovich Novikov. In that country no less than eight translations (made from 1791 to ca. 1840, unpublished) of the *Opus* are recorded. In the Habsburg Monarchy, as well, it was recommended within the masonic Draskovitch System, which owned near Budapest a laboratory for alchemical experiences.

Preface and Postscript to the anonymous *Curiose Erzeugung der Worte Moysis Gen. VI, 2*, of which von Welling was also the editor [Amsterdam? i.e. Korte in Altona?], 1699. New editions: 1700: Amsterdam [Korte in Altona?], 1701; Amsterdam [Korte in Altona?], 1727. Possibly the author was either F.M. van Helmont, or Andreas Wolfgang von Runckel. Text reproduced in von Welling's *Opus* (1735), 473-485 without von Welling's Preface nor Postscript ♦ Gregorius Anglus Sallwigt [= Georg von Welling], *Opus mago-cabalisticum et theologicum: Vom Ursprung und Erzeugung Des Saltzes, Dessen Natur und Eigenschaft . . .*, Anton Heinscheidt (printer): Franckfurt am Mayn, 1719 ♦ G.A.S. ANTOINE FAIVRE

Westcott, William Wynn, * 17.12.1848
Leamington, † 30.7.1925 Durban

One of the most prominent British occultists of his time, Westcott wrote many essays on a wide range of esoteric topics such as arithmology [→ Number Symbolism] (*Numbers: Their Occult Powers and Mystic Virtues*, 1890), → alchemy (*The Science of Alchymy*, 1893), → astrology (*The Origin and History of Astrology*, 1902), Jewish Kabbalah [→ Jewish Influences V] (*An Introduction to the Study of the Kabbalah*, 1910); and edited English versions of ancient and modern esoteric texts (such as the *Sepher Yetzirah*, 1887, or → Eliphas Lévi's *Magical Ritual of the Sanctum Regnum*, 1896). Particularly important and influential was his edition of the nine-volume series of *Collectanea Hermetica*, including new English editions of alchemical, hermetic, or kabbalistic texts, as well as original contemporary essays (such as Florence Farr's *Egyptian Magic*, 1896). Today he is best remembered for his fundamental role in the creation and early development of the → Hermetic

Order of the Golden Dawn. He was an active and dedicated Freemason for most of his life (attaining, for example, the position of Master of the Quatuor Coronati Lodge), as well as a member of the Societas Rosicruciana in Anglia (of which he became the Supreme Magus in 1892) and of various fringe-masonic Orders (such as the Rite of Swedenborg and the Sat B'hai).

Westcott was born in a family of surgeons and he followed the same professional career, first at Martock, Somerset, and then, after 1881, in London, eventually becoming Coroner for North-East London. It is unclear when his interest in Western esoteric traditions arose, but it must have been early in his life, since as early as 1875 he was applying for membership of the S.R.I.A., which he joined in 1880. This interest became so important to him that he decided to spend a two year period of retirement, between 1879 and 1881, studying in depth 'the Kabbalah, the Hermetic writings, and the works of Alchemists and Rosicrucians'. In 1882, soon after having moved to London, he became acquainted with → Samuel Liddell "MacGregor" Mathers, also a recent member of the S.R.I.A. and an enthusiastic occultist. It seems evident that neither of them, like many other English occultists of the time, could content himself with what the Rosicrucian Society had to offer. The S.R.I.A. had in fact no practical esoteric teaching to deliver: it focused largely (albeit not exclusively) on erudite research rather than spiritual enlightenment. The → Theosophical Society, whose influence was then rapidly spreading in Europe and whose "secret doctrine" had much that appealed to them, could not provide a valid alternative, since it seemed to lack the very practical dimension they were looking for, and was too Eastern-oriented for their tastes. Some of their hopes were focused on the Hermetic Society [→ Hermeticism and Hermetic Societies] of → Anna Kingsford and Edward Maitland, founded in 1884 as a Western-oriented counterpart to the Theosophical Society, but these were soon to be dis-appointed due to Kingsford's premature death in 1887. The possibility of creating a new group which could add a practical dimension to the theoretical study of Western esoteric traditions first arose when, around 1886, Westcott came into possession of a cipher manuscript, containing the text of some rituals of initiation and of lectures on various esoteric topics. This was the first step towards the creation of the Hermetic Order of the Golden Dawn. Over the last thirty years scholarly research has cast doubt on the official version of the history of the Order that was taught to its members, which linked its origins

to a warrant granted by a Continental adept. It is today safe to assume that the cipher manuscript had been produced in the 1870s or in the early 1880s by another English occultists, Kenneth R.H. Mackenzie (1833-1886), and that the correspondence with the supposed German adept Anna Sprengel was fabricated by Westcott in order to provide the Order with a convincing initiatic pedigree. When Westcott, after Mackenzie's death, came into possession of the cipher manuscript, he appealed to Mathers in order to give a more elaborate, definite shape to the rituals contained in it. The Order came actually to life in 1888, and was nominally led by a triumvirate composed of Westcott, Mathers and William Robert Woodman (1828-1891), the latter being at the time Supreme Magus of the S.R.I.A. It has sometimes been assumed that Mathers was the leading personality behind the early development of the Order, but it is now clear that Westcott contributed to it on an equal level with him, and that he was particularly instrumental in the creation of a consistent body of teachings. In 1897, rumours about his involvement with the Order somehow reached his superiors in office, putting his professional position at risk. Consequently, in order to avoid difficulties, he had to loosen his ties with the Order. He was never again to recover a prominent role in its affairs, although for many years afterwards he continued, as an outsider, to closely follow its activities. However, his moral authority among the members of the Order was shaken in 1900 when, during the clash between Mathers and the majority of the members of the Second Order in London (which led to the first and most important schism in the history of the Order), Mathers stated that Westcott had never been in contact with any Continental adept and had actually forged the correspondence with A. Sprengel. Westcott decided not to take sides in the controversy or to defend himself against Mathers's charges. In the following years he continued pursuing his esoteric studies, contributing regularly to the transactions (i.e., the official proceedings) of the S.R.I.A. In 1910 he was again indirectly involved in a controversy concerning the Order, this time between Mathers and → Aleister Crowley, over the publication of the Order rituals in the latter's occultist journal, *The Equinox*. By way of a third party, Mathers asked Westcott for financial help with the legal costs, and in return Westcott tried to make Mathers retract his charges of forgery. Mathers did not accept his terms and the two were never to be in contact again. In 1918 Westcott retired from his profession and moved to Durban, South Africa, where he spent the rest of his life. He

continued to cultivate his studies and occult interests until his death in 1925.

Westcott's writings have been widely read in the circles of the early Theosophical Society, the S.R.I.A., and the Golden Dawn, and were particularly instrumental in the definition of a Western esoteric tradition as distinct from, albeit complementary to, the "secret doctrine" of the East as presented by → Madame Blavatsky. As is typical for this generation of English occultists, Westcott presents his works more as the result of erudite research than as the fruit of mystical revelation or esoteric speculation.

MARCO PASI

Willermoz, Jean-Baptiste, * 10.7.1730
Lyons, † 29.5.1824 Lyons

Willermoz stemmed from an old bourgeois family of Saint-Claude (the name was originally written Vuillermoz) which, according to family documents, was of distantly Spanish origin. His father had settled in Lyon as a haberdashery merchant. The family included several priests, and young Willermoz was educated by the Jesuits. The eldest of twelve children, he was very soon sent out

into the world, being apprenticed at the age of fourteen to a retailer of silk goods. By twenty-four he had risen to be a manufacturer in his own right. Shortly before the masonic Convent of Wilhelmsbad (1782, see below), a notice described him as 'manufacturer of materials in silk and silver thread, and broker in silk goods'. He sold his business in 1782, still keeping a financial interest in the wholesale haberdashery of his brother Antoine and his brother-in-law Pierre Provensal, husband of his eldest sister Claudine. Willermoz devoted the greater part of his long life to → Freemasonry, but he also took part in urban life by placing his abilities as organiser and administrator in the service of religion and charity. He was successively or simultaneously the administrator of the Hôtel-Dieu (notably during the Terror, in 1793), then of the civic hospices of Lyon, a member of the parish council of Saint Polycarpe, and Councillor General of the Department of the Rhône. He was involved in primary education, and was also a keen farmer.

It was nevertheless through his masonic work that Willermoz has remained known to posterity. Initiated in 1750 at the age of twenty, in a lodge whose name is unknown, he very quickly rose through all the ranks. Elected as Venerable Master of his lodge scarcely two years later, in 1752, he felt the need to put order into a situation marked, as he once wrote, 'by abuses that were gaining ever-increasing currency' in Freemasonry. To this end, he contributed to the formation, in 1760, of the Grande Loge des Maîtres Réguliers de Lyons, which was recognized in 1761 by the Grand Lodge of France. After having been President of this G.L.M.R. in 1762-1763, he succeeded in becoming its "Keeper of Seals and Archives". He preferred this type of function in practically all the bodies to which he belonged. By taking advantage of the commercial correspondence that he maintained throughout Europe, Willermoz could thus indulge one of his favorite activities: collecting, studying, and comparing the rituals of all possible masonic degrees. He was a collector by nature; but he had another motivation as well, which he revealed in a letter of November 1772 to Baron Karl von Hund, the founder of the masonic system known as "Strict Observance": 'Since my first admission to the Order, I have always been persuaded that it contained the knowledge of a goal that could and would satisfy the honest man. Following this idea, I have worked tirelessly to discover it. Studies pursued for over twenty years, a very extensive private correspondence with informed brethren in France and abroad, and the deposit of the archives of the Order of Lyons, entrusted to my care, have fur-

nished me with many means . . .'. That is why, in order to study all the "high degrees" of which he had obtained information, Willermoz formed during these years what he called a "laboratory", namely a Chapter reserved for a "small society", the Chapter of the "Chevaliers de l'Aigle noir", whose presidency he entrusted to his brother Pierre-Jacques.

The object of this research concerned the question of knowing what the true goal of Freemasonry might be. The answer was revealed to Willermoz when he was admitted in March 1767, by → Martines de Pasqually in person, to the latter's *Ordre des Chevaliers Maçons Elus Coëns de l'Univers* [→ *Elus Coëns*]. In a letter addressed in 1772 to a dignitary of the *Strict Observance* (Baron von Landsperg), Willermoz explained himself with discretion, but clearly: 'Certain fortunate circumstances brought me the opportunity, during my travels, of being admitted to a society, highly organized but small in membership, whose goal, revealed to me outside the ordinary rules, won me over. After that, all the other systems I knew (for I cannot judge those I do not know) seemed to me futile and unpalatable. This is the only one where I have found that inner peace of soul, the most precious possession of humanity in relation to its being and its principle'. In point of fact, Willermoz, once convinced of having discovered the truth of Freemasonry, never departed from this conviction, and remained faithful to his initiator Martines, his doctrine, and his Order.

Shortly after Willermoz's reception into the Order in 1767, Martines named him "Inspecteur général de l'Orient de Lyon et Grand Maître du Grand Temple de France". In May 1768, the *Substitut Universel* of the *Ordre des Elus Coëns*, Bacon de la Chevalerie, ordained Willermoz to the highest degree of this Order, called *Réau-Croix*. Although the ordination had taken place with Martines' authorization, Martines felt some doubt as to its perfect regularity, and decided two years later to confirm it. This "confirmation" took place in May 1780, by the "sympathetic way", i.e., at a distance: a method frequently used by the *Elus Coëns* in their operations, notably in those workings known as "equinoctial". Willermoz took very seriously the functions that had been conferred on him. Meticulous by nature, he was the most eager of Martines' disciples in pressing the master to give rituals, instructions, and other documents that the *Coëns* needed for their work. In this regard, his correspondence with → Louis-Claude de Saint-Martin, after the latter had become Martines' secretary, is extremely valuable to the historian. Of value, too,

are Willermoz's notes pertaining to the *Coëns'* rituals. By dispensation from the rule which he had imposed on himself for other masonic systems, including his own – the *Régime Ecossais Rectifié* – he insisted on continuing to supervise the *Temple de Lyon*. In fact, he kept this temple active long after the dissolution of the *Ordre des Elus Coëns*, right up to the first troubles of the Revolution. During that time, Willermoz caused not the slightest change in this Order. He left it completely outside his great enterprise of the reform – or "rectification," as it was then called – of Freemasonry. Despite the differences of character between the two men, Willermoz always held Martines in great respect. As late as 1821, he wrote about him as 'This extraordinary man, of whom I have never known the like'.

The fact is that Willermoz had subscribed from the start, and definitively, to the doctrine of "reintegration". He believed that this doctrine had been, and must always be, at the basis of what he considered to be primitive and authentic masonry. If this doctrine was lacking in one or another masonic system, that was for Willermoz the sign that the system was 'futile or unpalatable', or even 'apocryphal' (terms that he borrowed from Martines). Nonetheless, these convictions in no way prevented Willermoz from pursuing his inquest into all the masonic systems that came to his attention. He tirelessly solicited his numerous correspondents (often princely ones, like Karl von Hessen-Kassel) to "exchange illuminations" with them. Some interpreters have seen in these investigations the symptom of an incessant and ever-unassuaged need for knowledge of the "truth". But in fact, Willermoz was convinced that he had already received this truth, which fully satisfied him. While he never stopped seeking its presence otherwise than in Martines' Order, it was purely with the goal of gathering into one body all the "authentic" masonic systems, that is, all the systems capable of acting as vehicles for the doctrine he had made his own. It was also in order to 'reunite the branches grown from the same trunk', to use his own words. This idea – the wish to unite all the masonic rites and systems – obsessed him for many years. He expounded it publicly in 1782 at the Convent of *Wilhelmsbad*. One can detect its echoes in the official title of the *Lodges of the Régime Ecossais Rectifié*, namely "Loges réunies et rectifiées de France".

There is no other way to interpret his membership (and that of the two groups of which he was the principal inspiration, at *Strasbourg* and *Lyons*) of the *Strict Observance*, also called "Maçonnerie

réformé ou rectifiée de Dresde”. This membership rested on a misunderstanding. When Baron Georg A. von Weiler, an emissary of Karl von Hund (founder of the Strict Observance) spoke of ‘re-establishing the Order in its first state’, he implied by that the re-establishment of the Order of the Temple, abolished in 1313. But Willermoz took this expression to mean the return to the “primitive masonry” whose foundations Martines taught. This is why Willermoz later wrote to Charles of Hesse that he had been stupefied to find in the Strict Observance ‘nothing but a baseless and proofless system’, and a ‘profound ignorance of the essential things’. The importance that Willermoz attached to Martines’ doctrine is also attested to by his efforts after the latter’s departure for San Domingo to organize at home, in Lyons, from January 1774 to October 1776, “instructions” or “lessons” in which Saint-Martin, Du Roy d’Hauterive, and he himself participated, sometimes as instructors, sometimes by taking minutes.

Willermoz’s deep knowledge of the French and European masonic panorama had soon persuaded him that Martines’ system was really too different from the masonry of that time to be lastingly implanted, and even less to supplant the other systems. The Ordre des Elus Coëns was in fact a sort of crypto-masonry, or, as it was also called, a “masonry beyond masonry”. It was then that Willermoz had the idea of setting up his own system, so as to transmit both by teaching and by initiation the “truth” as he believed it to the Régime Ecossois Rectifié. The latter was officially constituted on a national scale by the Convent des Gaules, held in Lyons in November-December 1778, then internationally by the Convent of Wilhelmsbad in Germany, in August-September 1782.

This “Régime” had a concentric structure, with three successive circles: (1) The symbolic class or Ordre maçonnique with its four degrees of Apprenti, Compagnon, Maître, and Maître Ecossois. (2) The Inner Order, which was chivalric, with its degrees, or rather stages, of Ecuyer Novice (a probationary period) and Chevalier Bienfaisant de la Cité Sainte. This two first circles constituted what Willermoz called the “ostensible classes” of the Régime. They borrowed their essential outer forms from the masonic and chivalric degrees that were current in France and Germany. (3) The “secret class”, called the class of “Profession” and of “Grande Profession”. This is where Willermoz’s major innovation was to be found. These three circles or classes constituted the Régime Ecossois Rectifié, properly so-called. But there was an additional, fourth circle, protected under a veil of mys-

tery, which was none other than the Ordre des Elus Coëns. Although situated as though at the very heart of the Régime Rectifié, the Ordre Coën was of a another nature. In fact, on passing from the former to the latter, one entered something entirely different. In the classes of the Régime Rectifié, Willermoz forbade anything that might pertain to theurgical practices, as well as to kabbalah or → alchemy: domains that were the exclusive preserve of the Ordre Coën.

On the other hand, what the Ordre Coën and the Régime Rectifié had in common was the doctrine of reintegration: the “science of man” (as → Joseph de Maistre called it). The function of Freemasonry was to teach this science, and to set it in motion on the initiatic plane. This is why both the Ordre Coën and the Régime Ecossois Rectifiée rested basically on two doctrinal elements: on the one hand, the belief in an original glorious state and an original fall of man; on the other, the return of man and his “reintegration” into his primitive state, thanks to initiation. In order for this to be effective, it required the intercession and the action of the “Grand Réparateur” who is Christ.

If these are indeed the teachings of Martines, there are also traces left by Willermoz’s readings of certain Fathers of the Church. Willermoz possessed a solid religious culture; the masonic collection of the Bibliothèque Municipale in Lyon has preserved some of his reading notes, especially of the Greek Fathers (whom he certainly read in translation). It was this very theme of the fall and reintegration that the Fathers, from Irenaeus of Lyons onwards, expounded in their interpretation of the biblical theme of “image and likeness” – man having been created in the image of God and after his likeness; the fall having caused him to lose that likeness, whilst the divine imprint of the image remained unaltered; thus it was a question of regaining this likeness. That, for Willermoz, was the very object of initiation.

In addition, convinced that intelligence is a talent received from God which it is man’s duty to cultivate, Willermoz added a pedagogical program to the initiatic process, writing a series of “instructions”. These proceeded from one degree to another with the object of progressively clarifying and completing this doctrine of reintegration in all its aspects: anthropological, cosmological, theosophic. All the essentials of these instructions, and their final achievement, are to be found in the *Instruction secrète des Grands Profès* (Secret instructions of the Grands Profès), of which Willermoz was the author, as well as in the “Leçons de Lyon” (Lessons of Lyons) which are partly of his

devising. The same pedagogical concern is found in the *Préavis* (Notice), a virtually programmatic discourse delivered by Willermoz at the Convent of Wilhelmsbad on July 29, 1782, which was intended to present both the structure and the spirit of the Régime Ecosais Rectifié. Two things should be emphasized, however: first, that Willermoz always denied being the true “author” of these instructions, of which he was nevertheless the writer; and second, that he believed the assurance of Martines when the latter also affirmed that he had done nothing but transmit a very ancient, quasi-immemorial tradition. This means that for Willermoz, as for Martines, this tradition (being simultaneously a science of man, a science of reintegration, and the initiation that accompanies them) derived from a unique “High and Holy Order”, as Willermoz called it, whose origin was as old as the world, and of which both the Ordre des Elus Coëns and the Régime Ecosais Rectifié were temporal manifestations. Hence also came his belief in a kind of pre-established harmony between this tradition and these institutions.

When he died in 1824 at the age of 94, Willermoz may have felt that his work was dying with him, or even that it had predeceased him. But it was nothing of the sort. After various ups and downs, the Régime Ecosais Rectifié with all its classes took on new vigor, as did the Ordre des Elus Coëns. In the course of the 20th century, it ended by occupying an important place in a number of masonic obediences. A fair and objective approach to Willermoz and his work began to be adopted in 1973, when in his book *L'Esotérisme au XVIII^e siècle*, Antoine Faivre wrote: ‘One may say that he attained a high spirituality and an uncommon breadth of vision. Willermoz showed himself as gifted in meditation and inner illumination as in organization and administration. The Revolution was nearly fatal to his work; but he is always considered one of the greatest figures of masonic history’ (176). Since these words were written, and thanks especially to the many archival documents that have come to light, the importance of this figure has become more and more evident.

JEAN-FRANÇOIS VAR

William of Auvergne, * 1191 Aurillac, † 1249 Paris

Born in Aurillac, William became a canon before 1223, a master of theology in 1225, and bishop of Paris in 1228. He enjoyed the confidence of Louis IX and also that of the popes, despite a certain "Gallicanism". His pastoral activity concerned the development of religious orders, the reorganization of parishes and monasteries, and the defense of Christian doctrine. Under his episcopate occurred the university strike of 1229-1231, the conflict between the chapter and the royal officers (1238), and finally the "burning of the Talmud" (1240). His responsibility as bishop led him to write numerous exegetical, philosophical, and theological works. He showed himself a faithful follower of → Augustine, while also feeling the influence of Aristotle and → Avicenna. His sources were very widespread: the *Timaeus*, Aristotle, the Church Fathers, the → Hermetic literature, Arab and Jewish astrological books [→ Astrology]. His theme was the exaltation of truth and the destruction of error. In the *De universo creaturarum* (On the universe of creatures), one of the seven treatises making up the *Magisterium divinale et sapientiale* (Divine and sapiential magistry) written between 1228 and 1240, he treated at length the question of demons, which gave him cause to denounce a number of superstitions. These demons, he says, already appeared to the Ancients under the guises of Priapus and Venus, and their vanity had been fortified by the worship paid to them. They have power, but their faculties are degraded by the passions, especially envy. Nevertheless, God sometimes allows them to afflict men, as we see from the examples of the plagues of Egypt and the sufferings of Job. William does not deny the existence of divination [→ Divinatory Arts], but he condemns it because it is an unseasonable imitation of divine

power. In this regard, the Old Testament prophets can in no way be confused with diviners. William admits the material influence of the stars, but denies that they can alter free will. He does not discount the possibility that the wizard Merlin was the son of a demon. On the other hand, he rejects popular superstitions: → magic, curses, phantoms, werewolves, abductions. All that is the work of illusionists who deceive the ignorant by resorting to conjuring and sleight of hand. Nor does he believe in incubi and succubi, the expression of all-too-human lust, as the work of demons. On the other hand, how could one admit that the prince of demons consents to obey men, as the necromancers maintain, and lend himself to all the tricks attributed to him? Charlatans, however, do not dare to try this sort of phantasmagoria on "rational and learned" minds. William himself was accused of practicing magic, but this is a misperception paradoxically caused by his attacks against it.

MICHEL LEMOINE

Witchcraft (15th-17th centuries)

Witchcraft is the human exercise of supernatural powers for antisocial, evil purposes. The term also refers to the whole of beliefs in the existence of power by means of which someone can change nature or harm people. Over time, the idea of witchcraft has started to include the idea of a diabolical pact or at least an appeal to the intervention of the demons: supernatural aid is usually invoked to kill someone, to awaken the passion of love in

others, to invoke the dead, to bring calamity upon enemies, and so on. These are some of the principal purposes that witchcraft has been made to serve in nearly all periods of history. Witches are considered to worship Satan and to be associated either with the occult [→ occult /occultism] and → magic or with attempts to establish a kind of evil religion.

According to traditional belief, the witches or wizards entered into a pact with Satan, cursed Christ and the Church, observed “the witches’ sabbath”, and in return received preternatural powers to torment their chosen victims. A “familiar spirit” was sometimes at their disposal, able and willing to perform any service. The witch was not simply an innocent victim of the devil (as in the case of demonic possession) but, rather, his willing instrument; witches could therefore be legally prosecuted because they had free will. The belief in witchcraft and its practice seems to have existed among all primitive peoples: in the ancient world it played a conspicuous part, as existing records plainly show. In the Holy Scriptures references to witchcraft are frequent, and their strong condemnation of such practices is based upon a total rejection of magic as such (Deut. 18:11-12; Exod. 22:18). The debate on witchcraft and on its reality is ancient: the *Canon Episcopi*, a 9th-century canon, was the first official document that expressed scepticism with respect to the reality of witchcraft and the “Decretum” of Burchard (about 1020) evinced the same attitude. Witchcraft became a major religious concern, however, when the Inquisition started to treat charges of witchcraft (around 1230). In 1258, Alexander IV tried to restrict the inquisitors’ powers to those cases in which there was some clear presumption of heretical belief. Slowly the process of demonization acquired specific elements, – such as the pact and the Sabbath –, in which stereotypes of persecution and folkloric traditions came to be mingled, and high culture met and permeated low culture.

Basic to the witch persecutions of the 15th-17th centuries was the notion of *maleficium*, considered punishable by law already in antiquity; but it was only over the course of a long and complex development that *maleficium* turned into witchcraft. Moreover, the idea of a formal pact between man and the devil was developed gradually during the Middle Ages; and thus from an idea of magic that could be correlated with natural philosophy without any dangerous effect, we pass to a condemned notion of witchcraft which now encompassed all the magical arts, natural as well as demonic. The demonization of heretics was the first step leading towards the witch hunts: after pope Gregory IX’s bull *Vox in Rama* (1233), the idea started to spread

that heretics were promiscuous and stood in some kind of relationship with Satan. The really intense period of witch persecutions occurred in the period from the 15th to the 17th centuries. The psychological basis for the persecution consisted in the belief that witches were trying to create an anti-Church led by Satan, with the witches’ Sabbath as a ritual mockery of the Mass. The popular imagination pictured these witches as old, poor women, who lived as drop-outs in their village communities.

In Early Modern Europe fierce denunciation and persecution of supposed witches characterized the cruel witch hunts, as is well known. In this context it is worth noting the role of confessions, which demonstrate how witchcraft beliefs consist of various folkloric elements. In earlier centuries only a few prosecutions took place, on an individual basis; some suspected witches were tortured according to Roman law, and many were subjected to the ordeal of cold water (i.e., it was believed that if they were guilty, they would float; if they were innocent, they would sink. . .). In the early Modern period, however, many persecutions occurred. Many scholars have debated the origins of the witch hunt, but no agreement has been reached: among the various explanations that have been adduced are shifts in the interactions between high and popular culture (Trevor Roper 1969), the emergence of the modern state (Levack 1987), the tradition break of the Reformation, the war of the sexes (Keith Thomas 1971), and conflicts among people and neighbours according to the functionalist approach (MacFarlane). Anthropologists, psychologists, historians, and so on, have attempted to explain witchcraft according to their own approaches and methods. It is hard to say whether the witch-hunt is the outcome of a long-term trend of marginalizing the poor and the drop-outs, or the survival of ancient beliefs, or yet something else. Highly innovative were the studies of Carlo Ginzburg, who in his first book, *I benandanti* (1966) revealed the existence of a group of people who practiced fertility rites; in so doing he echoed, to a certain extent, the discredited thesis of Margaret Murray about an actually existing “witch cult” in European culture. More recently, in *Ecstasies* (1989), Ginzburg explored the cultural backgrounds to the image of the Sabbath.

The witch-hunt should be seen as a central event in the formation of early modern Europe, which illuminates larger social and cultural issues. In this respect Muchembled (1987) has emphasized that witch-hunting is fundamentally a political phenomenon and not a religious one; and Robert Mandrou,

with his portrait of French magistrates (1968), has analysed a traditional mentality highly influenced by the demonologists.

We can follow the evolution of demonological thoughts through some of the most important treatises. During the Council of Basel in the mid-1430s, where some fundamental questions about papal and ecclesiastical power were discussed, Johann Nider wrote his *Formicarius*, a dialogue between a theologian and a sceptic, in which he showed a deep knowledge of the supposed phenomena of sorcery. One of the first authors to identify witchcraft as heresy was the Inquisitor Jean Vineti, in his *Tractatus contra Demonum Invocatores* (1450); still in the same century, Ulrich Molitor, wrote a *Tractatus de Pythonicis Mulieribus* (1489), in which he argued against Archduke Sigismund of Austria that even though witchcraft may be illusion, it should be punished as if it were real. But the witch craze really began when Pope Innocent VIII, with his Bull *Summis desiderantes affectibus* (1484), appointed the Dominicans Jacob Sprenger and Heinrich Kramer as inquisitors to intensify witchcraft trials, with the use of torture. Two years later Sprenger and Kramer wrote their *Malleus Maleficarum*. Using a thomistic concept of the devil, they laid the basis for the witch craze and defined the heresy of witchcraft in terms of a rigid code, which would set the pattern for 300 years. The *Malleus* was influenced by Nicolaus Eymeric's *Directorium Inquisitorum* (1369) and made extensive use of ancient misogynist arguments. Kramer and Sprenger spread the belief that witches were members of a heretical sect, whose aim was mankind's damnation. The invention of printing meant that the *Malleus* could be widely reproduced and exercise great influence.

One of the first spokesperson against Luther, Prierias, in his *De Strigimargarum Dæmonumque Mirandis* (1521) accepted the reality of witchcraft and developed a theory about it, including a set of rules for trials. Popular belief in the power of the Devil as exercised by means of witchcraft and other magic practices became more and more important, but one must also take note of the attitude of the Reformers, Luther and Calvin, towards witchcraft. Luther, taking literally the Biblical command (Exodus 22), advocated the extermination of witches; and Calvin was interested in fighting every kind of superstition, witchcraft included. Nevertheless in the context of Protestant Demonology, the moral implications of witchcraft having been marked, doubts about the reality of witchcraft gradually gained prominence. There were no substantial differences between Catholic and Protestant

demonology, however: both shared the same evangelising aims and sources (Saint Augustine and Thomas, for instance), and therefore both were in favour of persecuting witches.

An important document was the *Carolina* (1532), an Empire law which decreed that sorcery should be treated as a criminal offence, and that if it had allegedly inflicted injury upon any person, the witch was to be burnt. The first author who attacked the identification of witchcraft as heresy was the Franciscan Samuel de Cassini, who wrote against Savonarola, while Andreas Alciatus, in his *Parergon Juris* (written around 1514, but published in 1558) revealed himself as a sceptic who thought that the witches' delusions about the Sabbath could be cured. The same opinion can be found in Pietro Pomponazzi's *De Naturalium Effectuum Causis* (written in 1520, but published in 1556), which was likewise leaning to scepticism; his views caused him some troubles, and he escaped punishment by arguing that as a philosopher he was permitted to doubt, while as a Catholic he truly believed everything the Church taught. The lawyer Gianfrancesco Ponzinibio, in his *Tractatus de Lamiis* (1520) opposed the witchcraft delusion and the conduct of trials by the Inquisition, referring to the humanistic legal tradition. Another lawyer, Gianfrancesco Pico della Mirandola, nephew of the more famous → Giovanni Pico, wrote his *Strix*, the first witchcraft treaty written in Italian; and the famous → Agrippa of Nettesheim defended a woman supposed to be a witch. Commonly regarded as the first systematic opponent of the witchcraft trials, Johann Wier (1515-1588) believed that witch-hunts were reprehensible attempts to punish crazy old women. In his work, *De praestigiis daemonum ac incantationibus* (1563), he tried to show that witches could not actually do anything, but that Satan deluded them. According to his biblical exegesis, he believed in the devil's existence and activity; but he distinguished between magicians, who are aware of the nature of their actions, and witches, who are not. The same theme was repeated by the Lutheran Johann George Godelmann in his *Tractatus de magis, veneficis et lamiis* (1591). He did not manage to stop the hunt, but he was the first one to express doubts about its legitimacy and legality, on the basis of natural, theological, philosophical and legal arguments. So after him, jurists had to consider melancholy, for instance, as a malady conducive to witchcraft. Jean Bodin (1530-1596), a French lawyer, wrote his *De la Démonomanie des sorciers*, (1580) in response to Johann Wier's *De Lamiis*, a synthesis of his main work. Bodin wanted

to develop and improve the witch-hunt, claiming that witches should be put to death because, according to his political and demonological theories, they were disloyal to the monarchy and to God. Putting emphasis on the idea of witchcraft as a *crimen exceptum*, Bodin focuses his attention on the fact that witches are aware of their relationship with Satan, thus rejecting the theory of Wier, whom he accused of being a sorcerer.

Another opponent of witch-hunt was Reginald Scot, who in his *Discoverie of Witchcraft* (1584) denied the reality of witchcraft. James VI Stuart, king of Scotland and later king of England, answered him with his *Daemonologie* which allowed local courts to examine witches; other responses to Scot included the Catholic Bishop Binsfeld, *De confessionibus* (1589) and *Disquisitiones Magicae* (1603) by the Jesuit Martin Delrio, who wished to mitigate the severity of the witch trials and denounced the excessive use of torture.

With respect to the 16th century, most of the trials at which witches were condemned and burned by lay tribunals suggest that in the Mediterranean countries, such as Spain, Portugal and Italy, the witch craze did not reach the level of violence and fierceness found in northern Europe. This interpretation is confirmed by an Inquisitorial Instruction discovered by John Tedeschi; written by Deodato Scaglia in 1657, it provides new procedural safeguards. In his interesting contribution to witchcraft studies, Tedeschi has used this document to show how the Roman Inquisition adopted legal safeguards and proper procedures with respect to witch trials, and how it became inclined to scepticism in regard to witchcraft.

The German Jesuit Friedrich von Spee disapproved of credulity with respect to witches in his *Cautio Criminalis* (1631), a real and violent *j'accuse* against the methods used by inquisitors and lawyers in the witch trials, stressing the unreliability of accusations and confessions extracted under torture. He rejected the death penalty as cruel and too severe for those mad women, and began a stream of criticisms directed at the juridical feature of the witch-hunt. But the great change came with Balthasar Bekker and his *De betoverde weerd* (1691): applying the new Cartesian approach to witchcraft, he argued against this belief and the practice of persecution, denying the existence of the Devil, so that he was himself accused of Atheism. But the seeds of his thought began to blossom.

During the 17th and 18th centuries, the witch trials gradually came to an end in Europe; it is important, however, to remember that it was as late

as 1692 at Salem that the greatest American witch-hunt started. The advent of the Enlightenment in the late 17th century contributed to an intellectual climate that favoured naturalistic explanations such as mental illness; and in the wake of the Scientific Revolution, the belief in witchcraft gradually lost its appeal.

MICHAELA VALENTE

Wronski, Jozef Maria Hoëné-,
* 23.8.1776 Wolsztyn (near Posnan,
Poland), † 8.8.1853 Neuilly (France)

The mathematician-philosopher-messianist Wronski was the son of an architect who came to Poland from Bohemia and a Polish mother. He participated in the Kosciuszko uprising in 1794, then joined the Russian army, from which he retired in

1797 in order to study philosophy in Germany. In 1800 he went to France to recommence his military career with a Polish unit, but soon gave himself over to the philosophical and scientific studies that would last the rest of his life, first in Marseille and then in Paris. In August 1803, he experienced a flash of illumination which changed the course of his thought. Having discovered the Absolute and grasped the mystery of the beginning and end, he henceforth devoted himself to the development of his Absolute philosophy as the vehicle for the universal regeneration of humanity (which is why he called it a "Messianism").

Wronski's Absolute philosophy begins, as do the contemporary German Idealist philosophies, with Kant's Copernican revolution in philosophy while rejecting Kant's identification of the *a priori* forms of knowledge with the subjective forms of the human mind. The *a priori* principles, he asserts, are objective, because the laws of reason are identical with the laws of the universe. An *a priori* knowledge of the noumenal reality is therefore possible. Wronski acknowledges that his system originated in a flash of *intuition*, in an act of illumination, but insists on the necessity of a total rationalization of knowledge and identifies the Absolute with creative *reason*. This claim depends on his distinction between the "chrematic" reason (from the Greek word *chrema*, "thing") and the "achrematic" reason. The former is limited to the phenomenal realm of finite things; the latter attains to the Infinite. Despite its intuitive nature, Wronski insists that the achrematic reason is a rational faculty, having nothing to do with → mysticism (which in his usage includes contemporary Illuminisms). The active, creative spontaneity of reason, as he sees it, is the opposite of mysticism, which is a passive, thoughtless striving for an irrational union with the Absolute (Wronski claimed to be persecuted by gangs of Illuminists, whose infernal goal was to hinder present-day humanity from attaining its destiny). Since the Absolute, or Being itself, is rational, there is no heterogeneity between Being and knowledge, and Absolute Knowledge is capable of systematization and expressible in mathematical formulae. Wronski was one of the pioneers of the idea, very much in the air in the Romantic period, of a new Encyclopedia that would be synthetic where Diderot's had been analytic. He proposed an organic system of sciences, deduced from one principle, governed by one universal law, and integrating different branches of science in an "absolute system of the world".

Wronski's philosophy of history, which he began to work out around 1814, divides history into three

great ages. The first age (itself subdivided into four periods) was that of direct rule by providence in which humanity did not know its destiny. Human aims in this period, which lasted from the ancient East to the Enlightenment, were relative: successively striving for physical well-being, justice, holiness, and knowledge. The second age is an era of transition; providence has ceased to act directly, but humanity has not yet grasped its destiny and is therefore ignorant of the correct course of action. We are now well advanced in the second age; the intellectual confusion of the age of transition has produced the contemporary state of "social antinomy" characterized by individualism and revolution. This crisis is manifested in the political realm by the struggle between the Right – the party of feeling, of the Good, of revelation and divine right – and the Left – the party of cognition, of the True, of empiricism and liberty. Wronski's Messianism resolves the antinomies and inaugurates the third age by demonstrating that true liberty can only be achieved by bringing human reason into accord with the divine laws. Correspondingly, the third age, the Age of Absolute, will be theocratic but not repressive. It will be an era of harmony in which human reason reconciles itself with the divine laws, liberates itself from the conditions of physical existence, and returns to the Absolute. Wronski's is a metaphysical philosophy of history: history is a progressive return to God through the reorientation of human will and knowledge.

In the sphere of religion, Wronski's discovery of the Absolute inaugurates a great reform in which Christianity, a religion based, like all revealed religions, on sentiment of the Absolute, is to be succeeded and completed by scientific religion, or "séhélianism" (from a Hebrew word meaning "reason"). The new religion, a rationalized synthesis of existing world religions, will be founded on knowledge and rational demonstration. Séhélianism is reminiscent of Deist natural religion, but with Wronski's Absolute philosophy substituting for Enlightenment rationalism.

Wronski was a notoriously prickly individual who claimed absolute originality for his thought. Nevertheless, he unquestionably absorbed influences, and read Fichte and → Schelling carefully. Wronski considered Schelling's philosophy the highest achievement of German Idealism, but not even Schelling had raised himself to the "achremic" reason and therefore had not been able to penetrate the inner essence of the Absolute. Nevertheless, Wronski's Absolute philosophy is an alternative all-embracing system to those of the German Idealists. Wronski's philosophy of history is also

comparable to Idealist philosophies of history, although its concern for contemporary social and political events indicates the further influence of French thought, particularly that of → Pierre-Simon Ballanche. Wronski was more familiar with theosophy than he cared to admit. He read the kabbalists [→ Jewish Influences] and → Boehme and his disciples, who influenced him as much as Fichte and Schelling. While Wronski is to be distinguished from his theosophical predecessors inasmuch as religion has become the object of knowledge, his Absolute philosophy is an early-19th-century version of a phenomenon that appears at various times in the history of Western esotericism: the presentation of abstract universalist structures as keys of unification of all fields of knowledge (e.g. → Ramon Llull). Wronski's Absolute philosophy is a synthesis of post-Kantian Idealism and Illuminist reintegration [→ Illuminism].

While Wronski had a series of disciples in his lifetime (P.J. Arson, E. Thayer, C. Durutte), all of whom assisted him financially, his principal influence was on Polish poets and philosophers in the 1840s: A. Mickiewicz, Z. Krasinski, B.F. Trenowski, and K. Libelt.

ARTHUR MCCALLA

Yeats, William Butler, * 13.6.1865
Sandymount (Ireland), † 28.1.1939
Roquebrune (France)

Modern Irish poet noted for his eclectic theories on the human personality, spiritual development, human history, and cosmology. Though known chiefly as one of the primary architects of the Irish Renaissance and as a tireless proponent for Irish independence, Yeats's posthumous appeal to a global readership concerns the poet's interactions with Western and Eastern esoteric traditions,

which formed the foundation of his literary work in the domains of poetry, drama, fiction, the essay, and memoir. In the essay "If I Were Four-and-Twenty", the 54-year old Yeats reflected that his youthful impulse to 'hammer [his] thoughts into unity' resulted in a fusion of his three primary interests: 'a form of literature, a form of philosophy, and a belief in nationality'. Most significant to Yeats's reputation as a student of esoteric thought is his treatise *A Vision* (1925, revised 1937), a volume synthesizing a lifetime of research, experimentation, and meditation. Yeats's theories resulted from a combination of personal studies, collaborative efforts with close associates (most especially his wife, George Hyde-Lees, 1891-1968) and his participation in several esoteric societies.

In 1885, Yeats chaired the first meeting of the Dublin Hermetic Society [→ Hermeticism and Hermetic Societies] (which would change its name a year later, becoming the Dublin Lodge of the → Theosophical Society). At this time his main aspiration, under the influence of his father John Butler Yeats (1839-1922), was to become a painter. Yeats attended Dublin's Metropolitan School of Art, where he met the mystic poet and artist George Russell (1867-1935), who dubbed himself → AE. In 1887, the Yeats family moved to London, where the young poet met → Madame Blavatsky, and joined the Theosophical Society. In his *Autobiography*, Yeats records his admiration for Blavatsky's genius and powerful presence, balanced by the constant suggestion of potential fraud. True to his individualism, his main objection to the Theosophical Society was its tendency to breed dogmatism in its adherents. In 1889 Yeats was asked to leave the Society, as he insisted, against Blavatsky's wishes, on conducting occult experiments. The purpose of the experiments was to verify the truth of the theosophical knowledge, and to counterbalance the danger of a one-sided emphasis on the abstract intellect. Concurrently, he met → Samuel Liddell Macgregor Mathers (1854-1918), author of *The Kabbala Unveiled* and one of the founders of the → Hermetic Order of the Golden Dawn. Mathers tutored Yeats in his symbolic system, encouraged experimentation with the inducement of visions, and initiated him into ritual → magic. Yeats joined the Golden Dawn in 1890, but subsequently distanced himself from the powerful influence of Mathers. Echoes of Golden Dawn thought and ritual, and of Yeats's complicated attitude toward Mathers, may be found in the 1896 short fiction "Rosa Alchemica". One of the principal characters, a charismatic leader of an occult society, Michael Robartes, is modeled on Mathers. In 1901,

after Mathers' expulsion as leader of the Golden Dawn, Yeats played a pivotal role in maintaining stability within the Order. Of great importance in this respect is his speech entitled "Is the Order of R. R. & A. C. to Remain a Magical Order?" (reprinted in Harper 1974), which argues for the maintenance of Unity within the society. In his opinion the ranking of adepti, and the passage from one degree of attainment to the next, reflected the very structure of the macrocosm: 'The passing by their means [the grades of initiation] from one Degree to another is an evocation of the Supreme Life, a treading of a symbolic path . . . a climbing towards the light which it is the essence of our system to believe, flows continually from the lowest of the invisible degrees to the highest'.

In 1893 Yeats edited, with Edwin Ellis, *The Works of William Blake*. This edition reveals Yeats's wide-ranging familiarity with Western esotericism, including → Cornelius Agrippa, → Paracelsus, → Swedenborg, and a number of hermetic [→ Hermetic Literature], Neoplatonic [→ Neoplatonism], and Rosicrucian [→ Rosicrucianism] writers. The project provides early evidence of Yeats's agenda of carving a place for himself in a tradition of the "poet-philosopher".

Another close association that had rich resonance in Yeats's spiritual, literary and political activities was his long-standing friend and lover Maud Gonne (1865-1953). The two met in 1889, and maintained close acquaintance through their mutual concern with Ireland's political future, and Yeats and Maud declared their love for each other in a "spiritual marriage" in 1897. Yeats's idea of spiritual marriage as an alliance between mystic soror and fratre was modeled upon the legendary alchemist → Nicolas Flamel and his wife Pernelle. Again in 1908-1909, the two re-experienced their mystical bond, as may be noted in their letters as well as in Yeats's *Memoirs* (1972). Their spiritual partnership would never take the form of a legal marriage.

In 1917 Yeats married George Hyde-Lees, a 26 year old woman who was also a Golden Dawn member. Four days after they were married, George attempted automatic writing and was able to transmit a text attributed to "Instructors" in the spirit world. To Yeats's questions about the purpose of their instruction, they announced 'we have come to give you metaphors for poetry'. The first fruit of this are evident in the poems "The Phases of the Moon", "Ego Dominus Tuus", and "The Double Vision of Michael Robartes", as well as an extended prose meditation "Per Amica Silentia Lunae" (1918). In the latter Yeats rearticulated his

ideas on the connections between the human mind, memory, and history, such as he had presented earlier in the essay "Magic" (1901): 'I came to believe in a Great Memory passing on from generation to generation. But that was not enough, for these images showed intention and choice . . . If no mind was there [i.e., a greater mind], why should I suddenly come upon salt and antimony, upon the liquefaction of the gold, as they were understood by the alchemists? This study had created a contact or mingling with minds who had followed a like study in some other age, and that these minds still saw and thought and chose. Our daily thought was certainly but the line of foam at the shallow edge of a vast luminous sea'.

After seven years of working with automatic writing, Yeats produced *A Vision*, which outlines the soul's circular journey through the 28 phases of the moon, coming to completion in Unity of Being. Through a geometrical representation of two interlocking spirals – or gyres – Yeats maps out the history of civilization, and further suggests the fate of the soul after it leaves the body. In the chapter "Dove or Swan" Yeats uses the same paradigm to discuss the evolution of art in the East and West, suggesting that Byzantine art represents a climax in that history, a Unity of Culture. In one form or another, this framework of interlocking spirals is at the base of all of Yeats's writings, poetic or dramatic, from 1920 to his death in 1939. Given his tremendous labors to elucidate what he called 'the spiritual intellect', it may seem ironic that Yeats wrote in the last month of his life that 'Man can embody truth but he cannot know it'.

WILLIAM GORSKI

Ziegler, Leopold, * 30.4.1881 Karlsruhe (Germany), † 25.10.1958 Überlingen (Germany)

Ziegler is an important 20th-century figure in the theosophic current [→ Christian Theosophy], not least because he sought to understand Asian religious traditions, particularly Buddhism, while developing a theosophically influenced Christian mystical perspective in a world context.

Ziegler was born to a reasonably well-off family; his father was a merchant. Relatively early in life he became friends with a number of artists, including the painter Karl Hofer, and the sculptor Karl Albiker, who would remain a lifelong friend. It is thus not surprising that particularly his early works deal with artistic topics: see e.g. *Die Tyrannis des Gesamtkunstwerks* (The Tyranny of the Gesamtkunstwerk, 1910), an attack on Wagner's work, or *Florentinische Introduction zu einer Philosophie der Architektur und der bildenden Künste* (Florentine Introduction to a Philosophy of Architecture and the Visual Arts, 1911). Ziegler's writings were to range over a vast array of topics, from the arts to economics, from politics and Platonism to comparative religion and theosophy. In this broad range of subjects, he was rather similar to one of his great influences, → Franz von Baader.

Ziegler studied in Heidelberg, and his dissertation, *Der abendländische Rationalismus und der Eros* (Occidental Rationalism and Eros), under the direction of Ernst Haeckel at Jena, was approved in 1905. During this period, Ziegler studied the works of Schopenhauer, Eckhart, → Schelling, Baader, and Hegel. He lived at Überlingen until his death in 1958, carrying on an extensive correspondence, writing occasional intellectual columns for newspapers, and publishing books.

A prolific if somewhat difficult author, Ziegler's

main works were published during the period from 1920 to his death, beginning with *Gestaltwandel der Götter* (Transformation of the Gods, 1920), and including *Zwischen Mensch und Wirtschaft* (Between Man and Economy, 1927). But Ziegler's most important works were to come later, and include *Überlieferung* (Transmission, 1936) and *Menschwerdung* (Becoming Human, 1948), as well as a selection of his writings entitled *Spätlese eigener Hand* (1953). Ziegler won a number of prestigious prizes, including a *Nietzsche-preis* in 1920, and a *Goethepreis* in 1929.

Ziegler most explicitly developed his view of Asian religions in his book *Der ewige Buddha* (1922), which is in four sections, discussing Buddha as a Protestant; Buddha as witness; Buddha as knower; and Buddha as an East-West figure. Along with his friend and correspondent Hermann Keyserling, Ziegler was an early and often overlooked major figure in what is now called inter-religious dialogue, perhaps most notable for his early recognition of the impact that Asian religious traditions could have in the West, even if he himself did not have access to much in the way of original texts or extensive translations from Asian religions, and even if – as he himself later wrote – his earlier presentation of Buddhism was not without error.

That Ziegler saw himself in the theosophic tradition is evident even from the dedication of his massive work *Menschwerdung*, a word meaning "Becoming Human" and a pivotal concept for → Jacob Boehme. Ziegler dedicated the book to 'Jakob Boehme, Sören Kierkegaard, and Franz Baader', and offers a genuine contribution to the theosophic tradition while discussing the revelation of Christ in relation to Lao Tzu and Buddha, Shankaracarya and Ramanuja. In other words, he began to develop a uniquely theosophic approach to the emerging concept of comparative religion.

In an article published late in life, entitled 'Von der Muttergottheit' (On the Mother Deity, 1953), Ziegler sketched an overview of the Sophianic traditions of the West. He refers to such figures as Schelling and Solovyov, alluding as well to his own view that only under the sign of Sophia the split between Europe and Eurasia could be healed – a healing that he saw as of paramount importance in a world so given to conflict and conflagration. In brief, one could say that Ziegler represents a 20th-century continuation of the ecumenical intellectual theosophic current represented in the 19th century by Franz von Baader. Ziegler is a significant figure in the history of theosophy, and his work still awaits full scholarly analysis.

ARTHUR VERSLUIS

Zoroaster

Zoroaster is the Graeco-Latin name of the Iranian prophet Zarathustra (Avestan *zaraθuštra*), who is thought to have lived around 1000 B.C. in southern Central Asia. He is regarded as the founder of Zoroastrianism by all Zoroastrians and by most modern scholars, although credible information about his life and teachings is very sparse. In classical (i.e. pre-modern) Zoroastrianism, the whole of the Avesta, the revealed literature of Zoroastrianism, which comprises the texts of the Avesta in Avestan and their commentaries in a vernacular (chiefly Middle Persian or Pahlavi), is attributed to Zoroaster. In modern scholarship, he is considered the author of a tiny portion of the Avesta, written in a more archaic variety of Avestan and consisting of the five Gāthās ("songs") and a short prose ritual text known as the *Yasna haptanḡhāiti* ("worship of seven chapters"). Although the Gāthās are exceptionally difficult to understand, they seem to be ritual texts extolling the goodness and greatness of the god Ahura Mazdā ("the wise lord") and outlining ways for humans to please him by performing the proper rituals and by embodying certain divine notions, such as truth and righteousness. The Gāthās are partly strongly opposed to a group of outsiders, who are characterised mainly by their

lack of regard for the proper rituals and for the notions to be embodied. The central ideas of later Zoroastrianism were developed mainly on the basis of the Gāthās and the other Old Avestan texts. In later Zoroastrianism, Zoroaster has become the central figure in the history of the world, for whose chief responsibility, bringing the revelation to the world, preparations were made already before the creation of the world and whose posthumous sons will ensure the victory of good over evil and the renovation of the world at the end of time.

Zoroaster became known to the Greeks in a comparatively early period, chiefly as the founder of the (Persian) priesthood of the Magi and, consequently, as the founder of → "magic", → astrology and many of the arcane sciences. The Western image of Zoroaster owes little to Zoroastrian traditions and seems to have developed independently. In the intellectual history of Europe, Zoroaster was reinvented several times and his name often served to establish authority. He was seen as a very ancient philosopher or king who had attained the highest imaginable level of knowledge of divine matters. Although the high regard for Zoroaster did not go uncontested, he was the subject of intense interest among Pythagorean and Platonic philosophers. Although his name does not occur in the *corpus Platonicum* as it is usually defined, he is present in the *Greater Alcibiades*, the authorship of which is currently disputed. In antiquity, however, it was firmly believed to have been written by Plato himself and, indeed, to offer the best introduction to his ideas. In the development of Platonism in antiquity, there is a certain move towards an "Iranian" style of dualism (opposing good and evil in addition to the opposition between spirit and matter). In this connection, Zoroaster is regularly discussed, both in his own right and in relation to Plato. In late antiquity, Zoroaster was seen as one of the fountainheads of ancient wisdom, on a par with → Hermes Trismegistus.

In the European Middle Ages, Zoroaster is scarcely ever mentioned, but in the Renaissance, his reputation became firmly established among Western thinkers in a double development. First, → Georgius Gemistus Plethon (± 1355-1454) attributed the *Chaldaean Oracles*, a collection of oracular sayings from (late) antiquity, to him and thereby sparked renewed interest in his supposed ancient knowledge. In his fight against Aristotelianism, or his defence of Platonism, Plethon even went so far as to surmise that Plato himself taught nothing but the lore of Zoroaster's followers, the Magi. The attribution of the *Chaldaean Oracles* to Zoroaster

went largely uncontested in the pre-modern period. Therefore, wherever the authority of the *Oracles* was invoked, Zoroaster's name was bound to surface.

A second development began with → Marsilio Ficino, who often refers to Zoroaster and the Magi, especially in his elaboration of the notion of a *prisca philosophia* [→ Tradition]. In fact, Zoroaster figures not only as the author of the *Chaldaean Oracles*, whose influence on Ficino has been considerable, but also as the first of the “lawgivers”, earlier even than → Moses. Ficino attributed the fundamental notion of the triad of God, Ghost and Soul (and its many permutations) to Zoroaster, whom Plato merely interpreted.

These two elements, the triadic structure of Zoroaster's thought (based on Platonic materials and on the *Chaldaean Oracles*) and the belief that Zoroaster was the chief authority behind Plato have ensured a lasting popularity of Zoroaster's name among an astonishing line of (chiefly esoteric) European philosophers, especially in the 15th and 16th centuries. With the decline of interest in the *Chaldaean Oracles*, one would expect the image of Zoroaster to have become less influential as well, but this does not seem to have been the case. On the contrary, his reputation as an early philosopher was so firmly entrenched that few authors thought it possible to omit him from their works. As Stausberg interestingly observes, however, from the 17th century onwards, a new, historical, interpretation gradually overshadows Zoroaster's fame as the inventor of magic or the first of the philosophers.

In the 18th century, Zoroaster came to be enlisted as the chief spokesman of the Enlightenment, especially in his capacity of bearer of a profound, non-Biblical, ethical religion. The evidence used for this interpretation was, on the whole, slim, but the importance of the thesis, according to which “history shows” that it was possible for an ethical religion to appear without any connection to the Bible, was considerable. The high expectations of this (largely imagined) religion of Zoroaster among the Encyclopaedists suffered a well-known blow with the publication of a translation of the Avesta by A.H. Anquetil du Perron. This led to a long-drawn battle over the authenticity of that text. Since that battle, there have been two separate lines of development: scholarly research of Zoroaster and Zoroastrianism on the basis of Iranian materials and the living tradition; and the remarkably strong continuation of the “European” tradition of using Zoroaster's name to invoke authority for entirely non-Zoroastrian religious or philosophical systems. The 19th and 20th centuries

have, for instance, yielded “Zoroasters” as spokesmen of esoteric philosophy in connection with the natural sciences (G.Th. Fechner; S.D. Laing), as the embodiment of a non-moral philosophy (F. Nietzsche) and as the precursor or founder of various religious movements that are more or less connected with the teachings of the → Theosophical Society (such as the “Grail Message” of Abd Ru-Shin and Mazdaznan). Interestingly, this tradition has found its way back into Zoroastrianism, with the development of a theosophical interpretation of that religion among some of its adherents.

ALBERT DE JONG

Zorzi, Francesco → Giorgio, Francesco

Zosimus of Panopolis, fl. late 3rd/early 4th century Panopolis

The first alchemist from antiquity whose works can be studied somewhat more firmly in historical context is Zosimus of Panopolis, who lived in Egypt around the beginning of the 4th century C.E. Despite his own constant protestations that he is merely relying on earlier authorities and bringing nothing new, Zosimus is generally seen as a pivotal figure in the development of ancient → alchemy. In particular, the development of alchemy from a practical metallurgical and technical craft to a fully developed mystical religion, involving practical experiments in conjunction with a full-blown theological system, is attributed to Zosimus both by his successors and in modern scholarship. Zosimus seems to have been the last alchemist from antiquity to constantly explore and expand the practical experiments, of gilding, dyeing and transforming. He was also the first to systematize a theosophical system underlying those experiments.

Almost everything we know of Zosimus' life and works must be culled from his own texts. His successors frequently quote him and refer to him, but offer very little biographical information. For them,

Zosimus had already acquired an unassailable position of sanctity. The “very holy” Zosimus, “crown of the philosophers”, is chiefly invoked in later literature to add prestige and authority to ideas and practices. As is the case with the majority of alchemical texts from antiquity, Zosimus’ works have chiefly come down to us in Byzantine miscellanies, containing fragments of texts and whole texts of a large variety of authors. Among these authors, Zosimus is often represented, but it is frequently difficult to single out texts that can be properly ascribed to him. Alongside these original texts, there are two further important collections of sources. The first of these are translations of Zosimus’ texts in Syriac, Arabic, and Latin. The second are fragments from Zosimus’ texts that are quoted (often with titles of the texts) by later authorities.

Much less is known of Zosimus’ life than could be considered desirable, but a few aspects emerge from the texts. Zosimus was an Egyptian, who must have grown up in a *milieu* where local Egyptian culture was in constant contact with Greek traditions. Most sources agree that he was born in Panopolis (present-day Akhmīm) in the Thebaid. Panopolis was a prominent place in Upper Egypt that had grown around the temple of the god Min. Textual finds from Panopolis show that the Egyptian religion was a thriving affair in late antiquity, even though the city also acquired fame as a centre of early Christianity. The presence of Gnostic [→ Gnosticism], Hermetic [→ Hermetism], Greek, and Christian traditions in the area is evidenced profusely by the codices that were discovered in Nag Hammadi, halfway between Panopolis and Thebes. Zosimus records a visit to Memphis and may have seen the Serapeum in Alexandria. Many scholars, in fact, believe that Zosimus must have spent at least part of his life in Alexandria, mainly because of the large number of texts and ideas from many different sources and communities that can be found in his works. Prominent among these are Jewish sources, as well as Christian and Greek texts and traditions. In his works, Zosimus quotes Homer and Pindar, Plato and → Zoroaster, the Septuagint, texts from the *Corpus Hermeticum* [→ Hermetic Literature] and many (mostly unnamed) Egyptian, Jewish and Christian texts. These quotes and the evidence of a sound knowledge of the chief intellectual traditions of his time, would seem to be most at home in Alexandria, but it is by no means excluded that knowledge of all these authorities and ideas could have been gained in Upper Egypt.

As to the most likely dates of Zosimus’ life, we

are entirely in the dark. From the fact that he mentions the Serapeum in Alexandria as a functional organisation, one may infer that he lived before the destruction of that temple in 391. The fact that he quotes Julius Africanus (who died in 240) and refers to the threat of → Manichaeism, would suggest a date somewhere in the late 3rd or early 4th century. Especially the reference to → Mani has been connected with the anti-Manichaean edict of Diocletian of 302, but since Zosimus’ reference to Mani appears to derive from a Christian source, a direct connection with Diocletian (who persecuted Christians even more than Manichaeans) seems unlikely. Nevertheless, Zosimus must have lived in a time when the Manichaean presence in Egypt was sufficiently gaining in strength to provoke strong reactions from Christians as well as from the imperial administration, which fits the early 4th century very well. J. Letrouit has recently suggested a slightly earlier date for Zosimus on the assumption that Zosimus refers to Mani as still being alive, which would place him before the year 278, but the wording of the text does not really allow of such a confident interpretation. Zosimus may be quoting an earlier text or may have been unaware of the fact of Mani’s death.

Zosimus’ works were catalogued or published in antiquity in a number of different systems. The strongest tradition claims that he wrote a series of texts that were divided according to the letters of the Greek alphabet. Of these, only the book *On the sacred letter omega* has been preserved, but references are also found to the book *kappa* in Zosimus’ own writings, and to the book *sigma* in a later commentator. The Syriac fragments of Zosimus frequently refer to the books of various letters of the Aramaic alphabet. A second division is chiefly found in the manuscripts: it is the collection of texts under the heading *Authentic Commentaries* or *Authentic Memorials* (*gnēsia hypommēmata*), which may have subsumed the “alphabetical” ordering, although this is not certain. In addition to texts headed under these rubrics, many other texts are known by name (the *Final Count*, the *Book of Sophe*, *Imouth*, etc.).

The addressee of a number of texts is a woman named Theosebeia, who is sometimes referred to as Zosimus’ “sister”. The authentic texts of Zosimus offer little information on her, other than the fact that she must have been a practising alchemist herself and looked upon Zosimus as her teacher. Syriac fragments (largely unpublished) fill in some blanks. These fragments show that Theosebeia and Zosimus had different opinions about the public character of alchemy. Zosimus blames Theosebeia

for containing within a small circle knowledge that could and should be shared with everyone who is interested.

The majority of Zosimus' writings seem to have been practical alchemical texts, discussing furnaces and the shape of the vessels used, the substances involved and the conditions to be observed. In addition, however, a number of texts reveal the theological system underlying those experiments. These texts have been studied with much greater attention than the technical texts and it is to these that we shall confine ourselves here. Both in the *Letter Omega* and in the *Final Count*, Zosimus reacts sharply against the tendency, prevalent among his contemporaries, to combine the work of alchemy with → astrology or → magic. The argument concerns a type of tincture known as "propitious", which suggests that success in obtaining these tinctures depends on the observance of the proper times or periods to engage in the experiments. This procedure is described both in astrological terms and in terms of working with one's personal demon and is flatly rejected by Zosimus. His chief objections go to the heart of the nature of alchemy and its practitioners. Alchemy, for Zosimus, is an art that can only work if two conditions are met: the technical requirements must be perfect and perfectly understood and the alchemist must have gone through a process of mental preparation or purification to gain knowledge of his real self and his ultimate origin. This origin lies outside the seven spheres of the created world, which constitute Fate. The guardians of the seven spheres, whom Zosimus calls "watchers" or "pretenders" and who are obviously planetary beings, distract man from the knowledge of his origins. Any alchemist who uses → astrology, therefore, by definition cannot escape the works of Fate and is led astray. In order to explain this, Zosimus describes the origin of the first man, Thoth-Adam, who has a double progeny. His material being is the product of Fate, but his inner, spiritual self, is a being known mainly as *phōs* (a Greek word that can mean both "light" and "man"). This spiritual man was seduced twice: once by Fate, to unite itself with the material Adam and thus constitute the first man, and a second time by the creation of woman, which further bound him to the material world. In *The Letter Omega*, Zosimus chiefly uses Greek, Jewish and Christian "proof-texts" to make his point, up to the point of introducing Jesus Christ as the person who will guide mankind back to its ultimate origins, but he invokes these texts mainly to establish connections with local Egyptian ideas, including Hermetic texts. In the *Final Count*, a very

similar mythical pattern can be found, which is related in more alchemical symbolic language, with strong Hermetic overtones.

The Hermetic legacy in Zosimus is, therefore, considerable. It is also to be found in the most bizarre texts of Zosimus to have been preserved, the so-called *Visions*. These relate dream-like visions, in which the "I" of the text describes series of purifications in the language of ritual. These descriptions, containing images of death and mutilation, autophagy and despair, have been interpreted both as symbolic descriptions of the alchemical processes and, famously by → C.G. Jung, as actual descriptions of inner experiences. If the choice is between these two, the alchemical interpretation is certainly to be preferred and the bodies being mutilated are in all likelihood references to the metals under treatment, but the imagery itself, of steps leading up to an altar, of mixing-bowls and white-clad priests, has most convincingly been interpreted as deriving from Hermetic literature and, possibly, ritual.

Scholars have claimed that for Zosimus, the 'procedures of conventional alchemy are strictly preparatory to the purification and perfection of the soul' (Fowden 1986, 123). Many texts, by contrast, suggest that purification of the soul was, for Zosimus, a *conditio sine qua non* for the alchemical work, which could lead to the knowledge allowing a person to escape the bonds of Fate.
