Preface

Mr. Kenneth Giniger some time ago suggested to Dr. Holly Johnson, then President of Blanton-Peale Institute, New York, NY, that Blanton-Peale compile an encyclopedia of psychology and religion, a comprehensive reference work consisting of articles contributed by scholars of importance in the fields of religion, psychology, psychology and religion, and psychology of religion. Dr. Johnson also saw the need for such an information source and began planning work on the project with the assistance of Blanton-Peale colleagues, Dr. Walter Odajnyk and Dr. David A. Leeming. Long working together with Blanton-Peale on behalf of *Journal of Religion and Health*, Springer Science+Business Media became publisher, with Dr. Leeming, Dr. Kathryn Madden, and Dr. Stanton Marlan named as Editors-in-Chief. Dr. Leeming became Managing Editor of the project. He has taught courses in myth, religion, and literature for many years and has published several books on these subjects, including the *Oxford Companion to World Mythology*, and until recently was Editor-in-Chief of the award-winning *Journal of Religion and Health* and Dean of Blanton-Peale's Graduate Institute. He is currently President of Blanton-Peale Institute. Dr. Madden served as Dean and later President of Blanton-Peale, was Associate Editor and later Executive Editor of the *Journal of Religion and Health*, and has recently published *Dark Light of the Soul* (Lindisfarne Books). She teaches and lectures regularly and is in private practice. She received her M.A., M.Phil., and Ph.D. degrees in Psychology and Religion from Union Theological Seminary in New York City. She has published many articles in her field and is Editor of *Quadrant*. Dr. Marlan is a clinical psychologist in private practice. He is a training and supervising analyst for the Inter-Regional Society of Jungian Analysts and is President of the Pittsburgh Society of Jungian Analysts. He is also Adjunct Clinical Professor of Psychology at Duquesne University and holds diplomates in both Clinical Psychology and Psychoanalysis from the American Board of Professional Psychology. He has been Editor of the *Journal of Jungian Theory and Practice* and is the author of numerous articles and books in the field of Jungian psychology. Parentage of the *Encyclopedia of Psychology and Religion* comes naturally to the Blanton-Peale Institute. Founded in 1937 by Dr. Norman Vincent Peale and psychologist Smiley Blanton, the Institute is a mental health clinic and psychological training institute dedicated to the constructive integration of religion and psychology. The *Encyclopedia of Psychology and Religion* provides a crucial new resource for the collaboration and mutual illumination of these two fields.

Entries are drawn from a wide variety of religious traditions, not only modern world religions, such as Christianity, Judaism, Islam, Buddhism, and Hinduism, but also, for example, African Animism, pre-Christian Celtic and Germanic traditions, Egyptian, Greek, Gnostic, and Native North American and Mesoamerican religious movements. Approaches to the subjects demonstrate a broad range of methodologies. Each entry is intended to create a tension of meaning between traditional religious terms and psychological interpretations. The goal is not to impose *the* correct or definitive meaning, but to explore new and latent deposits of meaning that bear implications for human self-understanding, cross-cultural interpretation, and therapeutic possibilities.

Occasionally, more than one article on a given subject is included to present different points of view. Extensive cross-referencing allows the reader to enhance understanding of particular subjects through direct access to related topics. The *Encyclopedia of Psychology and Religion* will serve as a valuable and accessible reference work in both electronic and print versions for academic libraries and their patrons and will be of particular use to the growing community of researchers, academics, teachers, clergy, therapists, counselors, and other professionals who are involved in the developing reintegration of the fields of religion and psychology.

Acknowledgment

The Editors and Blanton-Peale Institute thank the members of Springer Science+Business Media staff in both Germany and the United States for their support on this project. We are particularly grateful to Carol Bischoff, Thomas Mager, Susanne Friedrichsen, Heike Richini, and Christine Hausmann for their consistent help and support.

David A. Leeming, Kathryn Madden, and Stanton Marlan

Introduction

The world's great religions have always served as the repository of the psychological truths and values of mankind. Religions address the fundamental questions of human existence: the purpose and meaning of life; our relationship with God; the nature of the soul; the existence of evil, suffering, and death; ethical behavior and conscience; our search for happiness, redemption, and salvation. In previous centuries theologians and religious philosophers were not inclined to differentiate between matters of "soul" or "psyche." Figures such as St. Paul, St. Augustine, Martin Luther, Pascal, and Kierkegaard were people of faith who also grappled with the mysteries of human interiority, will, and motivation.

In the course of addressing these issues, every religion has developed a definition of human nature and examined our fundamental motivations, drives, and desires. Religions have been crucibles for the time-tested psychological principles that assure a sense of identity, community, and meaningful life. All religions, for example, have discovered that negative psychological states, such as pride, anger, hatred, lust, envy, ignorance, selfishness, and egotism, lead to personal and social conflict, injustice, and pain. On the other hand, positive mental and emotional attitudes, such as love, altruism, forgiveness, compassion, generosity, humility, equanimity, and wisdom, lead to a sense of personal well-being and social harmony. From a psychological perspective, religions are all-encompassing therapeutic systems that deal with major life events, transitions, and crises and respond in a healing, often life-saving way to the travails of the suffering soul and the impoverished spirit.

With the emergence and then dominance of scientific rationalism, however, the fields of religion and psychology diverged and entered into a relation of mutual suspicion. Beginning with the Enlightenment and its materialistic, secular, and rationalistic *weltanschauung*, the previously generally accepted religious and spiritual delineation of human nature was seriously challenged. In time, a split occurred between studies of human nature based on secular definitions and the age-old religious knowledge of the human soul and spirit. The two fields that should have been allied and in creative dialogue instead became estranged from each other, and often ignored or rejected the knowledge that each could have contributed to the enterprise of understanding human nature. Purely secular notions of human nature emerged: human beings were seen as rational animals; a person was born a *tabula rasa*, neither good nor evil, with parenting and education forming the personality; human beings were a composite of their economic and social relations; human beings were initially motivated by instinctive, irrational, and unrealistic drives and desires; all human behavior, emotions, and motivations and those most sublime cultural creations, religious beliefs and experiences, were the result of complex organic, neurological, and biochemical interactions. The tradition inspired by Sigmund Freud tended to view religion as an illusion, a cultural vestige of immaturity and projection. Consequently, those in the religious camp came to view psychology as a reductionist enterprise that denied the sacred and transcendent aspects of reality.

While some continue to subscribe to such stereotypes, a more sophisticated understanding of religion – particularly as advanced by the field of depth psychology – has done much to overcome them. The secular paradigm that has ruled the domain of psychology for the past centuries was challenged early on by pioneers such as William James, C. G. Jung, Roberto Assagioli, Viktor Frankl, Erik Erikson, and the humanistic psychologists Gordon Allport, Erich Fromm, and Abraham Maslow. During the 1970s, these thinkers were joined by the transpersonal psychologists, who have sought a synthesis between secular psychology and the great spiritual traditions. While they have accepted the stages of personal development described by various exponents of secular psychology, they have added the stages of transpersonal development evidenced in the world's contemplative and meditative traditions. Because of the cultural shift represented by the above and the persistence of religious beliefs in the vast majority of populations worldwide, contemporary psychologists are beginning to recognize that a purely secular approach to the study and treatment of human beings is inadequate. A science dedicated to the exploration of the basic characteristics and strivings of human beings and to the classification of the laws of human behavior needs to be inclusive and not exclusive of the religious dimension.

The need to address religious and spiritual problems is now deemed not only legitimate, but also clinically and ethically imperative. The 1994 edition of the *Diagnostic and Statistical Manual of Mental Disorders* published by the American Psychiatric Association, for example, contains a new classification, "Religious or Spiritual Problems."

This *Encyclopedia of Psychology and Religion* grows out of the developing awareness of the need to reintegrate the sciences of the mind with the science of the spirit. By bringing together the disciplines of psychology and religion, it

unites the two areas of study concerned with the behavior and motivations of human beings and provides a crucial new resource for the collaboration and mutual illumination of these two fields. For those in the study of religion, it offers new tools for understanding the images, structures, symbols, and rhythms that constitute the vocabulary of religious experience. For those in the field of psychology it reveals deep patterns of meaning and practice that inform human culture and the personal identity of millions.

This *Encyclopedia of Psychology and Religion* illustrates, even to the skeptical, the vital importance of religion in our world and the serious depths of its symbolic universe. For those already immersed in religious studies, it demonstrates layers of meaning that are enriched – not reduced – by the tools of psychological investigation.

We trust this encyclopedia provides comprehensive timely accessible information from a multi-faceted perspective that reflects the intersection and the growing synthesis of psychology and religion.

Abraham and Isaac

Anais N. Spitzer

The pivotal story of the *akedah* (the “binding” of Isaac) occurs in *Genesis 22* wherein God commands Abraham to sacrifice his long-awaited and only son with his wife, Sarah. This divine dictum is considered a test, since at the last minute when Abraham draws the knife to kill Isaac, God sends an angel to stay the sacrifice, and a ram is substituted in place of his son. God rewards Abraham for not withholding his only son from God and therefore passing the test, and promises Abraham numerous offspring, guaranteeing Abraham that he will be the “father of nations” blessed by God. It is Abraham’s absolute faith in God that makes him willing to sacrifice Isaac, and it is precisely this strict obedience that renews Abraham’s covenant with God and, in turn, God’s covenant with the patriarch, Abraham (which begins with God’s first call to Abraham in *Genesis 12:1–3*) and his subsequent generations. The *akedah* constitutes the foundation of the three monotheistic (also called Abrahamic) traditions: Christianity, Judaism and Islam. It is Abraham’s near-sacrifice of his son that establishes his absolute faith in God, while simultaneously defining faith within the context of these monotheistic traditions.

Qur’anic Significance

In the Qur’an, Abraham is no less a man of faith than in the Hebrew Bible. He is considered to be the first monotheist because he is “sound in the faith,” and thereby a Muslim (one who submits to God) (3:60). The sacrifice story occurs in Sura 37:100–13. There are two notable differences. First, Abraham learns in a dream that he must sacrifice his son and he reveals this to his son: “My son, I have seen that I should sacrifice thee” (37:101), to which his son replies, “My father, do what thou art bidden” (37:102).

Lastly, the Qur’an does not specify *which* son is to be sacrificed: Isaac or Ishmael, Abraham’s first born through his slave, Hagar. Therefore, many Muslims assume that it was Ishmael who was offered for sacrifice, since he was the first born. However, according to some Qur’anic scholars, there are an almost equal number of authoritative statements within Qur’anic tradition that consider Isaac the intended victim as there are those that point to Ishmael (Delaney, 1998:170).

Søren Kierkegaard

In one of his most famous, pseudonymous works (penned under the name, Johannes de Silentio), *Fear and Trembling* (1843/1983), Kierkegaard uses the *Genesis 22* account of Abraham’s near-sacrifice of Isaac in order to engage in a philosophical meditation on the question of faith. Although cast within the philosophical tradition, *Fear and Trembling* opens the question of Abraham to the individual and private sphere, thereby adding a psychological component. Kierkegaard was not the first to engage the story of Abraham’s near-sacrifice of Isaac philosophically. His writings were a direct response to and critique of those of the pre-eminent German philosopher, Georg Wilhelm Friedrich Hegel (1770–1831).

Like Kierkegaard, Hegel considered himself a pious Christian. Hegel’s interpretation of Abraham appears in an early essay, “The Spirit of Christianity and Its Fate” (written between 1798–99 and published posthumously), and forms the basis of what eventually matures into Hegel’s idea of the dialectic, which he elaborates in his famous *Phenomenology of Spirit* (1807/1977). In his early writings, Hegel declares that “the first act which made Abraham the progenitor of a nation is a dismemberment which snaps the bonds of communal life and love” (Hegel, 1984: 185). For Hegel, Abraham the Jew characterizes “the Jewish multitude” that “wreck[s] [Jesus’] attempt to give them the consciousness of something divine” (Hegel, 1984: 265). Abraham represents “unhappy consciousness,” a term that Hegel later elaborates as

“inwardly disrupted consciousness” of a “contradictory nature” (Hegel, 1977: 126). In other words, Abraham as unhappy consciousness doesn’t realize the implicit unity that underlies all things. Unhappy consciousness is but the second, unfulfilled step in the dialectical process, which moves from identity to difference to finally, the identity of identity-and-difference. As such, unhappy consciousness is imperfect and incomplete, not yet having reconciled and harmonized identity and difference, and realized the inherent unity of thinking and being.

Kierkegaard recovers Abraham as the highest and truest man of faith. Kierkegaard considers Abraham to be a “knight of faith” who believes despite reason and demonstrates that faith is a matter of lived experience. Importantly, Abraham also demonstrates that there is in fact a “teleological suspension of the ethical”; in other words, Abraham, the single individual, is higher than the universal, ethical sphere. In this way, Abraham’s act cannot be comprehended by reason alone nor subsumed under the ethical order, which is dictated by reason. In an act of absolute faith, the “knight of faith relinquishes the universal in order to become the single individual” (Kierkegaard, 1843/1983: 75). The individual is higher than the universal. Furthermore, for Kierkegaard, interiority is higher than exteriority. Thus, “the paradox of faith is that there is an interiority that is incommensurable with exteriority” (Kierkegaard, 1843/1983: 69). Faith, therefore, in its paradoxical absurdity (it is absurd since it cannot be completely comprehended by reason alone) involves a leap into the unknown. And this must be carried out alone by the single individual in the fear and trembling of uncertainty. This act and experience of faith is intimately personal and private.

Freudian Perspective

Although Freud wrote extensively on fathers and sons, he repeatedly emphasized the significance of the son killing the father, and not the inverse. In *Totem and Taboo*, where Freud discusses the Oedipus complex, the focus is on the son killing the father, even though the Greek story of Oedipus begins with Laius’ attempt to murder his son. Freud, however, takes up the myth after these events have transpired in order to bring attention to the later part of Oedipus’ life and to his killing his father. Even in *Totem and Taboo*, where Freud attempts to trace the origins of monotheism through an exploration of the primitive, primal horde, it is the act of the sons usurping and sacrificing the father that founds the basis for religion. Freud emphasizes sacrifice, but not of the son.

Furthermore, Freud’s later work in which he deals with the question of Jewishness and religion, *Moses and Monotheism*, focuses on Moses – not Abraham. The anthropologist Carol Delaney devotes several chapters of her book, *Abraham on Trial: The Social Legacy of Biblical Myth*, to this thought-provoking absence, arguing that Freud’s exclusion of Abraham and his omission of the dynamic of fathers killing sons point to “a glaring *scotoma* or blind spot” in Freud’s work (189). Her study is an exploration of the significance of such a curious absence. Many Freudian scholars and psychoanalysts have attempted to use the Abraham and Isaac story as a corrective to what they consider to be the shortcomings of Freud’s Oedipus theory. What Delaney and others possibly overlook is the feminine element that figures predominantly in the Oedipal story and thus underlies Freud’s Oedipus complex. This component is not overtly present in the Abraham and Isaac story, and for this reason, perhaps, Freud chose Oedipus over Abraham.

Jungian Perspective

Jung’s most extensive engagement with the idea of sacrifice occurs in his work *The Sacrifice*, (Jung, 1956: 613–682) and in *Transformation Symbolism in the Mass* (Jung, CW 11: 296–448). From Jung’s perspective, sacrifice is an act of the unconscious and “the impulse to sacrifice comes from the unconscious” (Jung, 1956: 660). From the ego perspective, however, an act of sacrifice is impossible psychologically because the ego cannot decide to make a sacrifice. Rather, “an act of sacrifice takes place,” revealing that “a process of transformation is going on in the unconscious whose dynamism, whose contents and whose subject are themselves unknown” (Jung, 1956: 669). Sacrifice is a mystery and can never be fully understood by ego-consciousness since it is impossible to “derive the unconscious from the conscious sphere” (Jung, 1956: 670). Thus, the “I” can neither demand nor fully comprehend the sacrifice. Jung argues that, although the conscious may like to consider itself higher than the unconscious, it is the unconscious that is greater than the conscious. In “the act of sacrifice the consciousness gives up its power and possessions in the interest of the unconscious” (Jung, 1956: 671). The ego unwittingly sacrifices the “I.” Read in another way, just as the ego cannot choose to make a sacrifice, the “I” can’t do therapy, but therapy, nonetheless, happens. This uncontrolled and absolute giving (which is a relinquishing of the egoistic claim and therefore not overseen by ego-consciousness), which is a form of self-sacrifice, is a Self-possession (the

autonomous, transcendental Self which includes unconscious components as opposed to the self identified strictly with the ego and consciousness) since the Self causes the ego to renounce its claim on behalf of a supraordinate authority and in so doing, increases Self-knowledge. Every advance of the Self requires that the ego be sacrificed to something higher than itself, not unlike Abraham's absolute act of giving to God.

Abyss

Kathryn Madden

Origins and Images of the Abyss

Abyss from the Greek *abyssos* typically signifies a bottomless or boundless deep. The abyss appears in biblical tradition in several related senses. In the Hebrew Bible, Genesis 1:2, *abyssos* relates to the Hebrew *têhôm*, which most likely stems from the Babylonian *Tiāmat*, a

personification of the primordial deep of waters existent before creation of world (NRSV). In Babylonian mythology, *Tiāmat* as the primal sea was personified as a goddess, (Jacobsen, 1968: 104–108) and also as a monstrous embodiment of elemental chaos (Dalley, 1987: 329).

The Egyptian worldview had a similar concept in *Nun*. *Nun* referred to the primeval water that encircles the entire world, and from which everything was created, personified as a god. In contrast to *Tiāmat's* goddess, feminine nature, *Nun* was considered to be an ancient god, the father of all the gods, which refers to his primacy rather than literal parentage (Lindemans, 2000).

Abyss became identified with *Sheol* and *Tartarus* (Job 41:24) based upon its association with notions of primordial depth and chaos. In Greek mythology, *Tartarus* was the gloomy prison of dishonorable opponents of Zeus. *The Book of Enoch* defines abyss as a place of punishment for fallen angels.

In post-biblical Jewish literature, because of its associations with chaos and death, the abyss became identified as the prison of rebellious spirits and the realm of the dead. By the time of the New Testament writing, the abyss was an abode of demons (Luke 8:31) and Hades (Romans 10:7), where the devil is imprisoned in a bottomless pit (Revelations 20:2). The Gnostics of the first century made abyss, under the name of *Bythus*, into a divine first principle, the source of all existence, thus representing a return to an original unity.

The images of the abyss throughout the Judeo-Christian era traditionally have been symbolic of hell, destruction, or death with the exception of the Gnostic myth which attributed to abyss both the source of life and life's return to this source. The Gnostics, along with their myths, were persecuted and eliminated as being heretical to the canonical truths of the mainline Church.

Psychoanalytic Perspectives

Contemporary psychoanalyst James Grotstein speaks of the abyssal experience as “the black hole” of nothingness, meaninglessness, and chaos – a “zero-ness” expressed, not just as a static emptiness but as an implosive, centripetal pull into the void (Grotstein, 1990: 257–258). Grotstein, from the neoclassical school of Freudian psychology, views the abyss of the black hole as “nameless dread,” an empty matrix and “container” of meaninglessness (drawing from Wilfred Bion, 1962, 1967). The abyss or void is associated with the death instinct which prepares us to anticipate and to adapt to the ultimate horror of death.

This black hole is the “pre-perception” of an experience-released anticipation which warns us of the extinction of the psyche.

Grotstein claims from clinical experience that “the minds of patients suffering from primitive mental disorders. . . are hypersensitively vulnerable to the detection of randomness and meaninglessness; they often substitute archaic, apocalyptic (meaningful) scenarios in order to prevent their minds from dissolving into the maelstrom of nothingness” (Grotstein, 1990: 265). Failure to tolerate the gap and its empty nothingness causes a default into “no-thingness. . .” (1990: 273).

Grotstein primarily focuses upon the borderline disorder and psychosis in which the person experiences “a spaceless, bottomless, timeless and yet, paradoxically, condensed, compact, and immediate yielding suffocation anxiety” (Grotstein, 1990: 281). Truly, psychopathology may prevent an individual from achieving sufficient meaning in the self and object world. A borderline or psychotic condition might make it impossible for the person to withstand the entropic pull toward nothingness and meaninglessness – ultimately toward chaos (randomness), the traumatic state, “the black hole” (1990: 286). Yet, there are non-psychotic states of being in which a person may experience the void, or “black-hole” of nothingness and return to a world of meaning.

Alternative Views of the Abyss in Analytic Psychology and Religious Experience

The more typical notion of abyss that has been passed down through history is like the sea; we fear being pulled down into the abyss to our annihilation. Yet, there is something about the abyss, as there is about the sea that exerts a strange pull on us.

There are alternative psychological understandings of the notion of abyss. Two examples of the abyssal experience were manifest in the imagery of Jacob Boehme, a seventeenth century German shoemaker and religious mystic, and Carl Jung, the twentieth century Swiss psychoanalyst. Both men gave witness to this layer of existence as not so much the “abyss of hell” but as a symbol of a unitary reality.

Boehme’s abyss, which he called the *Ungrund*, or unground, was pre-existent, underlying all of creation, even God. Jung’s notion of the Self exists before the beginning of the individual human being and is our ultimate goal in terms of psychological life.

The abyss, for Jung, analogous to the objective unconscious, and the Ungrund for Boehme, provided for both men, a “window to eternity.” Boehme was enabled to see through to the constellated reality of Christ, and for Jung, to the Self; for both, to something that points beyond itself to a transcendent ultimacy.

For Boehme, the abyss is a Self-revealing reality that gives life to the world but is itself a mystery. Spirit meets us as a dynamic reality at the abyss level and points beyond itself. Beyond what we know, we receive glimpses of “conscious communion or participation in a timeless reality” (Wood, 1982: 209).

Following a period of melancholia, Boehme allowed himself to be drawn inward to an abyssal state where he discovered a new image of God, fuller and more complete than before. Boehme’s experience inspired in him the production of a profound theme: that of the Ungrund, (unground), a groundless abyss, a state of pre-being underlying not only all of creation, but even God.

The Ungrund

The Ungrund is anterior to God and anterior to Being. The Ungrund lies in the eye, the core of God and creation (Boehme, 1969: 3:1, 16:16) and is eternally a mystery to God because it is what God was before God became conscious of God’s Self. The Ungrund is pre-distinction, pre-existent and is difficult to characterize except as *ewiges Kontrarium*: the nothing is the all; the emptiness is the fullness. The Ungrund, or abyss, contains all antinomies, but all the contradictions are still in harmony because these contraries are only potential and not yet differentiated.

As W. P. Swainson says, “[W]ithin this Abyss is an eternal, bottomless, uncreated Will, or Byss. This Will, or Byss, ever desires to become manifest – ‘It willeth to be somewhat.’ This is only possible in a state of duality or differentiation, for without contrast there could only be eternal stillness, nothing could ever be perceived” (Swainson, 93–94).

The Ungrund (abyss) is not the personal creator God but the absolute-in-itself, a moment at the commencement of the divine life and process of self creation and revelation of Being and the divine (Boehme, 1965, 1:1).

Boehme’s creation myth articulates a process in which God created God’s-self from the abyss through an eternal will. In A. E. Waite’s *Three Famous Mystics*, Swainson describes how God differentiates himself from this abyss: “This Will, or Byss, fashions what is called a Mirror, which reflects all things, everything existing already in a latent

or hidden state in the Abyss. . .[and] makes them visible or manifest. The Supreme [then] perceives all things in Himself. The dual principle is latent in Him. He is both Byss and Abyss. He could not otherwise know Himself . . . Boehme terms this Mirror the Eternal Wisdom, the Eternal Idea It is the Infinite Mother, the Will being the Infinite Father. . .” (Swainson, 93–95).

When the Will, or the Father, beholds Himself in this mirror, creation become active and manifest through the union of the Will and Wisdom: the archetypal Father and the Mother. The abyss for Boehme, then, is a “place” beyond time and space from which emanates all possibilities. All of creation arises from a “breathing out of God’s self” (Swainson, 209).

While Boehme’s visions may have followed a disintegrating period of melancholy or psychic disturbance, the visions led to healing rather than disintegration. These were humbling, not inflationary, experiences, which left Boehme with a feeling of awe and gratitude. Boehme’s (1978: 209) visions were noetic: his inner-self gives over to divine will and speaking. He exhibited a diminution rather than an inflation of ego.

Themes of opposition – of feminine and masculine, creation and destruction, good and evil, Christ and Lucifer, Ungrund and Sophia, life and death – abound in Boehme’s map. A comparison of his insight to that of modern depth psychology, places him squarely in the realm of analytical psychology and the notion of Carl Jung’s the Self-field where all naturally occurring oppositions of the psyche are encountered, held, and united in harmonic tension.

The Pleroma

Carl Jung likewise experienced an inbreaking image of abyss, what he called Pleroma, during his 6-year *Nekyia*, or descent into the deeper layers of the unconscious. His experience of the Pleroma was that of a paradoxical nothingness containing all opposites out of which God differentiates himself.

As a culmination of a long-term process of encounter with the deepest layer of the collective unconscious, specifically the psychoid, archetypal layer, Jung believed that we, potentially, experience something analogous to what, for Boehme, would be a pre-existent unitary reality.

Jung’s notion of the archetype as psychoid (Jung, 1963: 351) alerts us to a notion in which the unfolding of the Self, an archetype that unites opposites and orders our whole psyche, is an innate bridging reality that links the material and psychical, inner and outer in one reality.

Jungian analyst, Erich Neumann describes the Self-field as a pre-existing unitary reality that we developmentally emerge from. We find at a certain layer of reality a unitary reality existing beyond and before the primal split (consciousness from unconsciousness) that occurs when our conscious minds develop into a polarized reality. Except in cases of severe trauma or developmental injury, most of us have experienced this unitary reality in some form while we were in the mother’s womb or at a very early stage of development (Neumann, 1989: 9–10, 20).

- ▶ The prenatal egoless totality is associated with an unconscious experience – which can, however, be recalled in later life as a dim memory – of an acosmic state of the world. In this totality there exists a pre-psychic ‘nebular state’ in which there is no opposition between the ego and the world, I and Thou, or the ego and the self. This state of diffusion of the world-soul and the corresponding emptiness of the world is a borderline experience of the beginning of all things which corresponds to the mystic’s experience of the universal diffusion of the unitary reality (1989: 74).

Unitary Reality

The pleromatic/abyssal experience of unitary reality is something that is there from our inception. Developmental injuries and specific traumas may impair an individual’s knowledge of this unitary reality, but unitary reality (abyssal reality) underlies all experience. Drawing from Jung (1921: para. 424), the soul is thus like a two-way mirror, reflecting unconscious to ego and ego to unconscious.

The experience of unitary reality is relevant to clinical practice because abyssal experience is radically transforming. A new reality is born to us, offering us a new intrapsychic core, perhaps even restructuring the entire personality in a way the ego can better deal with its context and circumstances, one that enables us to see through to our former origins.

Spirit, from this view, is an *a priori* reality always in motion, moving toward us, shattering our consciousness, summoning us to receive that which is archetypally present and spiritually actual; as Boehme attests: (. . .) “to wrestle with the love and mercy of God, and not to give over, until he blessed me, . . . *And then the spirit did break through!*” (Boehme, 1915: 485–487, italics mine).

Active Imagination

Leon Schlamm

C. G. Jung’s development of the dissociative technique of active imagination, the visionary practice of “dreaming with open eyes,” arose out of his early experimentation with paranormal phenomena, especially mediumship, itself a dissociative technique of contacting the dead which traces its provenance to shamanism. His discovery of active imagination led him to associate psychological and spiritual transformation with the autonomous creation and manipulation of images.

Jung’s Descent into the Unconscious

In December 1913, believing himself to be threatened by a psychosis, Jung overcame his violent resistance to experiencing a series of waking fantasies, which would provide the raw material for the subsequent development of analytical psychology (Jung, 1963). In these waking visions, triggered by the suspension of his rational critical faculties enabling conscious receptivity to unconscious psychic contents (Jung, 1916/1958; Chodorow, 1997), Jung descended to the Land of the Dead (which he subsequently equated with the unconscious) where he encountered a number of significant *others* in the objective psyche, subjects independent of his consciousness (Jung, 1963). He learned to treat the numinous figures of his inner life, Elijah, Salome, the Serpent and Philemon, an Egypto-Hellenistic Gnostic who later functioned as his inner guru, as objective real *others* and to engage in dialog with them as equals (first verbally and later through writing, painting, and drawing) (Jung, 1916/1958, 1925, 1963; Chodorow, 1997), thereby discovering a meditative technique for psychological healing and spiritual transformation in marked contrast to the meditative practices of stilling the mind and transcending all images associated with yoga (Jung, 1963).

Active Imagination as Confrontation with the Unconscious

The function of this visionary practice, triggering a dynamic, confrontational exchange between consciousness and the unconscious in which each is totally engaged with the other and activating a stream of powerful, unconscious emotions and impulses, Jung discovered, was to access numinous unconscious images concealed by these emotions and impulses (Jung, 1916/1958, 1955–1956, 1963; Chodorow, 1997). By consciously dialoging with the flow of images produced by active imagination, Jung learned to transform and control these powerful emotions and impulses, thereby discovering the transcendent function (1916/1958, 1955–1956, 1963), the union of the opposites of consciousness and the unconscious which he identified with the individuation process, as well as healing himself. However, it is important to remember that, for Jung, it is through the *affect* that the subject of active imagination becomes involved and so comes to feel the whole weight of reality. Numinous images encountered during active imagination are based on an emotional foundation which is unassailable by reason. Indeed, the whole procedure is a kind of enrichment and clarification

of the affect, whereby the affect and its contents are brought nearer to consciousness, becoming at the same time more impressive and more understandable (Jung, 1916/1958, 1951, 1952/1954).

Jung was well aware that the practitioner of active imagination unable to maintain a differentiated, self-reflective conscious point of view in the face of unconscious visionary material would be vulnerable to mental illness: either in the form of psychosis where consciousness is overwhelmed by unconscious visionary materials; or in the form of conscious identification with numinous unconscious contents leading to possession by them (Jung, 1916/1958, Chodorow, 1997). However, he insisted that his visionary practice, if approached responsibly by an individual endowed with a well developed consciousness, could bring considerable rewards. In addition to the strengthening and widening of consciousness itself (Jung, 1916/1928, 1916/1958, 1931/1962, 1934/1950, 1955–1956), dreaming with open eyes could enable the practitioner to realize that unconscious contents that appear to be dead are really alive, and desire to be known by, and enter into dialog with, consciousness (Jung, 1963). If one rests one's conscious attention on unconscious contents without interfering with them, employing the Taoist practice of *wu wei*, just letting things happen, discussed by Jung in his Commentary on *The Secret of the Golden Flower*, it is as if something were emanating from one's spiritual eye that activates the object of one's vision (Jung, 1916/1958, 1930–1934, 1931/1962, 1955–1956). Unconscious contents begin to spontaneously change or move, begin to become dynamic or energetic, to come alive. Jung characterizes this process by the German term *betrachten*: to make pregnant by giving an object your undivided attention (Jung, 1930–1934, 1935/1968, 1955–1956), a psychological process anticipated by his 1912 dream of a lane of sarcophagi which sprung to life as he examined them (Jung, 1963).

These experiences which Jung characterizes as numinous, however, require a vigorous, active, self-reflective conscious response endowing them with meaning, and thereby changing them (Jung, 1916/1958, 1955–1956, 1963). Here lies the significance of Jung's claim that the dead seek wisdom from the living in his pseudonymously produced Gnostic poem of 1916, *Septem Sermones ad Mortuos*, itself the product of active imagination, rather than, as in mediumistic practices, the living seeking the wisdom of the dead. The dead, numinous, unconscious contents, need the living, consciousness, as much as the living need the dead (Jung, 1963; Segal, 1992; Welland, 1997; Bair, 2004). This process of continuous dynamic interaction and collaboration between consciousness

and the unconscious is expressed by the German term *auseinandersetzung* – coming to terms with, or having it out with or confronting unconscious psychic contents – and is mirrored in Jung's religious narrative calling for divine-human collaboration underlined by his heretical observation that whoever knows God has an effect on Him in *Answer to Job*, another product of active imagination (Jung, 1916/1958, 1952/1954; Chodorow, 1997; Welland, 1997).

Active Imagination in Western Religious Traditions

Jung himself alleged the use of active imagination in Gnosticism and alchemy on which he drew heavily in his later work (Jung, 1944, 1951, 1955–1956; Segal, 1992), and was clearly gratified by Corbin's research on active imagination in theosophical Sufism (Wasserstrom, 1999). However, as Merkur's recent scholarship tracing the history of active imagination in the West has confirmed, the incidence of this visualization technique in mystical traditions is more widespread, and can be found, for example, in Gnosticism, Kabbalah, Sufism, alchemy and more recent European esotericism, as well as shamanism (Merkur, 1993), thus providing considerable support for Jung's claim that his post-Christian, psychological practice of dreaming with open eyes is analogous to, and can be understood as a detraditionalised form of, spiritual practice fostered by many Western religious traditions during the last two millennia. Merkur also distinguishes between what he calls intense "reverie" states, including Jung's active imagination, and trance states. Whereas the latter involve the increasing repression or restriction of ego functions (or consciousness), the former would seem to involve their increasing relaxation and freedom.

Adam and Eve

Stuart Z. Charmé

One of the central features of creation stories in most cultures is a description not only of the genesis of the cosmos but also of the appearance of the first human

beings. Such stories often serve etiological purposes, explaining the origin of the different forms and characteristics of human beings. The Biblical story of Adam and Eve is the most well-known and influential story of human creation and is often used as a “proof text” justifying particular values and models related to family, marriage, sexuality, and gender roles. Yet it is important to remember that creation stories are a form of religious myth. Their importance and meaning do not lie in the literal, historical accuracy of their details, and to focus on such issues misses the level on which their power and truth exists. The Adam and Eve story offers profound theological and psychological insights about human beings’ place in the world, their relationship to each other and to a transcendent dimension of reality. Biblical editors linked the Adam and Eve story (Gen. 2) with the seven-day creation story that precedes it (Gen. 1) as a further elaboration of the nature of the sole creatures who were made “in the image of God.” The famous story of Adam and Eve’s loss of paradise as a result of ignoring God’s instructions has a far more complex message than that disobeying God is bad. Indeed, Jewish tradition takes little notice of Adam and Eve and certainly does not hold them up as the main reason for a flawed human nature. Only later are they elevated to their Christian status as the original sinners.

The multi-dimensional nature of religious myth makes it impossible to encompass the full meaning of a story in any single psychological interpretation. Nonetheless, psychological approaches to the Adam and Eve story help us to attribute meaning to the peculiar details in this story: a man created from earth, a woman born out of his rib, a tree with forbidden fruit, a seductive serpent, nakedness and shame, punishments and expulsion, etc.

Psychoanalytic Interpretation of Adam and Eve

From a psychoanalytic perspective, religious myths are expressions of both conscious and unconscious human struggles, projected onto archetypal figures. Accordingly, one way to look at a story like that of Adam and Eve is to see it as an expression of the struggle between fathers and sons and the ambivalence of their attachments to one another. On the one hand, it emphasizes the importance of the son’s subordination and submission to the authority of the father. For Freud, God is both a loving and protective father, but also one easily provoked to anger and punishment. He represents the power of the super-ego to keep instinctual desires under control. Yet the story also

contains a thinly disguised expression of Oedipal revolt, not simply in the son Adam's striving to become like God the father through the acquisition of knowledge, but also in giving expression, yet simultaneously condemning, the forbidden intimate relationship between mother and son. Such an interpretation is able to make sense of some of the peculiar details of the story and the obvious suppression of a mother figure. Taking the story at face value, Adam has a father but no real mother, and even Eve is born out of a male body. This creation of Eve out of Adam's rib makes more sense, however, as a disguised inversion of their true relationship, for it is out of the bodies of females that males are born and it is only a mother who can rightly call her child "bone of my bones and flesh of my flesh" (Gen. 2:23). If Eve, who is later called "the mother of all the living," is regarded as the missing mother figure in the story, thereby reconstituting the Oedipal triangle, then the nature of Adam and Eve's sin is thrown into a whole new light. God the father forbids his son Adam the one kind of instinctual knowledge that a father and son should not share. A phallic serpent who tempts Adam and Eve to taste the fruit, a sense of shameful nakedness after the act, and a punishment that highlights female desire, pregnancy and childbirth all offer a strong subtext of sexual taboos that have been violated in this story. Confirmation of this view may be seen in Adam and Eve's very first act after their expulsion from the garden, their immediate exercise of the new sexual knowledge and desire they have acquired (Gen. 4:1).

Although greater responsibility for the fall is projected onto Eve and indirectly on all women, it is primarily a cautionary tale addressed to sons regarding the danger of challenging the rights and prerogatives of the father. The central characters in subsequent Christian myth can be seen as a reenactment of this same Oedipal ambivalence. This time, however, it is through absolute obedience to the authority of God the father that Jesus, the second Adam, and the Virgin Mary, the new Eve, ultimately displace the father when they ascend to heaven and are seated side by side as celestial king and queen.

Jungian Interpretation of Adam and Eve

Other psychological interpretations of the Adam and Eve story do not see the fundamental tension in the story as related to sexual prohibitions and violations. For many of them, the fall of Adam and Eve describes the difficult process of human growth and development. For Jungians, for example, the garden of Eden is an archetypal expression of primordial wholeness that is both the origin and

ultimate goal of human life. At the beginning of human consciousness, there is an undifferentiated unity between the individual psyche and nature, God, and the unconscious. The story of Adam and Eve is an account of the growth of consciousness and the emergence of an ego with awareness of the tension of opposites in human life. Thus Adam is created not as a male, but as the original union of male and female in all human beings. The creation of Eve represents a break-up of the original wholeness of male and female that ideally is still reflected in individual human personality. The serpent is not a dangerous character tempting humans with sin, but rather a symbol of wisdom and the renewal of life. From this perspective, the eating of the fruit of the knowledge of good and evil represents a growth of consciousness that brings an awareness of all polarities and opposites. The couple's self-consciousness about their nakedness describes the inevitable dawning of ethical consciousness and a more mature awareness of gender differences.

The Fall Story and Psychological Development

In this context, the story of Adam and Eve is not about a tragic mistake that condemns humanity, as traditional Christian theologians have contended, but rather about a difficult but necessary step in the psychic growth of all human beings. Adam and Eve achieve a new level of consciousness, but it comes at the cost of feeling alienated, separated and expelled from their childhood paradise. While the story is typically viewed as an endorsement of what Erich Fromm has called "authoritarian religion," in which obedience to divine authority is the cardinal human virtue, it also implies something quite different. Fromm points out that the authoritarian model of religion leaves humans alienated, infantilized, and impoverished by projecting all of their human powers for love, knowledge, and freedom onto an external deity. He insists that such a position contradicts the more humanistic perspectives within the Biblical tradition. At a deeper, more subversive level, the message of the story is to emphasize the painful necessity of breaking free from the security of a childhood that is governed by parental authorities and to assume the knowledge and responsibility necessary to create new relationships, build new families, and determine one's own path in life. And this, many argue, is not really disobedience to divine command as much as a fulfillment of human beings' mature spiritual capacity.

In some ways, the Adam and Eve story is therefore a developmental story, describing the struggle of

adolescence to separate and individuate from one's parents. Paradoxically, the process of becoming an adult, i.e., being like God, only can happen through an act of disobedience which challenges the absoluteness of parental authority. And it is a story that emphasizes the centrality of human relationship to realize this process, for it is not good for man to live alone, physically or psychologically.

The story offers no lament that Adam and Eve might have done otherwise and perpetually remained in paradise. Rather, the loss of paradise is inevitable and inescapable, and it enables man to become a partner with God in the redemption of the broken and alienated dimensions of the world.

Patriarchal or Feminist Approaches to Eve

It is hard to talk about the Adam and Eve story without considering its complicity in persistent misogynistic elements within Biblical tradition. Such interpretations have constructed women as spiritually inferior, psychologically weak beings who need to submit to their husbands in particular and male authority in general for the good of all. The story traditionally been used to reinforce images of women as temptresses and to justify the religious, social, and political subordination of women. In the original cultural context of this story we can also find evidence of patriarchal religious leaders' efforts to delegitimize religious symbols and ideas associated with sacred images of female power from surrounding cultures. Wisdom-bearing serpents and trees with life-giving knowledge about fertility were likely references to elements of older religious traditions emphasizing connection with the life-giving power of the earth, often symbolized by goddess figures. The Biblical version transforms these elements into manifestations of rebellion and disobedience, and implies greater culpability to the female character who first gives in to temptation.

Some recent feminist re-interpretations of this story offer more sympathetic readings of Eve. If the underlying psychological message of the story involves the difficult yet necessary process of growing up, the dawning of conscience, intellect, desire and sexuality, then it makes little sense to demonize the character who initiates this process. In this reading, Eve is not gullible and weak but rather a strong, decisive, and courageous woman who actively seeks new knowledge and experience. As with other important religious myths, the central characters of this story have

been rediscovered and reinvented by modern readers in response to the concerns and issues of our time.

Adler, Alfred

Melissa K. Smothers

Background

Alfred Adler (1870–1937) was an Austrian psychiatrist and recognized as one of the fathers of modern psychotherapy. He was born in Vienna in 1870 and decided at an early age that he wanted to be a doctor in order to “fight death.” He was the second child in a large family and suffered from numerous illnesses as a child. He studied medicine at the University of Vienna and preferred not to treat a client's symptoms in isolation, but rather considered the whole person, including their social setting.

In 1902, Adler was asked to join a weekly psychoanalytic discussion circle and became an active member in the Vienna Psychoanalytic Society; other notable members included Sigmund Freud and Carl Gustav Jung. However, after nine years, he and about a dozen other members split from the society over theoretical differences. He went on to form the Society of Individual Psychology, which emphasized the role of goals and motivation in people's behaviors. Adler developed his theory of *Individual Psychology*, using the word individual to emphasize the uniqueness of the personality. In the year after leaving the Vienna Psychoanalytic Society, he published *The Neurotic Constitution*, which outlined his theory.

During World War I, Adler served in the army as a physician and became increasingly aware of the necessity for humans to live peacefully and develop social interest, in which one feels as they belong with others. After the war, Adler's concept of *Gemeinschaftsgefühl* or social interest/social feeling became a central aspect of his Individual Psychology theory. He went on to develop child-guidance clinics throughout Vienna and was the first psychiatrist to apply mental health concepts to the school environment.

By the mid 1920s, the *International Journal of Individual Psychology* had been founded and published until 1937; it resumed publication after World War II. Between 1914 and 1933, Adler published more than a dozen books, including, *The Practice and Theory of Individual Psychology*, *What Life Should Mean To You*, *Religion and Individual Psychology*, *Social Interest: A Challenge to Mankind*, and *Cooperation Between the Sexes*. Due to the rise of Nazism in Austria and similar to other Jewish people of his generation, Adler left Europe, and settled in the United States in 1935. While on a European lecturing trip, Adler died suddenly of heart attack at the age of 67.

Individual Psychology

Individual Psychology suggests that people are responsible for their own choices and the way they deal with consequences. In this theory, humans are self-determining, creative, and goal-directed. When individuals are able to understand their goal in life, they can see the purpose of their own behavior. Adler sees each individual as a unity and viewed all problems as social problems. Adler viewed the answer to life's difficulties as social interest, or the feeling of connectedness with the whole of humanity and that each person must fully contribute to society. According to Adler, the true meaning of life is to make a contribution to the community.

In Adler's view, religion was an expression of social interest. His theory of Individual Psychology has religious undertones in that his definition of social interest is similar to those religions that stress people's responsibility for one another. While Adler did not believe in God or in the Bible, he did collaborate with clergyman. His book, *Religion and Individual Psychology*, was coauthored with Reverend Ernst Jahn. Adler believed that if clergy had training in Individual Psychology, he would be able to make greater accomplishments in the arena of mental health and hygiene. Adler believed that there are many religious initiatives that try to increase cooperation, and he stated that

there are many paths that lead toward the ultimate goal of cooperation.

As compared to other systems of psychology, Individual Psychology and Adlerian psychotherapy have been more open to spiritual and religious issues. The Adlerian position toward religion is most commonly positive, viewing God as the concept of complete perfection. Adler defined God as the human understanding of greatness and complete perfection. As opposed to Freud, Adler viewed God as the conceptual idea of perfection, not as an internalized parental image.

One of Adler's most prominent ideas is that humans try to compensate for inferiorities that we perceive in ourselves. He developed the idea of inferiority complex, as well as the goal of superiority. A lack of power is often at the source of the feelings of inferiority. One way in which religion enters into this is through beliefs in God, which are characteristic of one's attempts at perfection and superiority. In many religions, God is often considered to be perfect and omnipotent, and instructs people to also strive for perfection. The person, who is always striving, is aware that he or she cannot experience such perfection, but that having a goal defines life. By attempting to identify with God in this way, people compensate for their imperfections and feelings of inferiority. Adler believed that the idea of God inspires people to act, and that those actions have real consequences. One's perspective on God is important because it embodies one's goals and guides social interactions.

Numerous authors have compared Adler's Individual Psychology to Confucianism, Buddhism, Judaism, and Native American religions. In the literature, Christianity appears most frequently cited as having similar tenets with Individual Psychology. For example, there are considerable commonalities between the basic assumptions of Christianity and Individual Psychology regarding the view of humans. Both view individuals as creative, holistic, social oriented and goal-directed and emphasize equality, value and dignity of humans. A focus within the Christian Bible is on human relationships, with God, oneself and others and provides guidelines for relationships for living with others. Humans are responsible for caring for one another, emphasized both in the Old Testament and in the teachings of Jesus. Both the Bible and Adlerian psychotherapy emphasize the relationship between spiritual-mental health and social interest. The Bible's decree of love one's neighbor is synonymous with the Adlerian concept of social interest.

Individual Psychology and Buddhism are both based on holism in their understanding of the human mind

because they believe there are no conflicts between elements of the mind. Yet, while Buddhism applies holism to understanding the structure of the universe, Individual Psychology recognizes conflicts between the individual and the world. Individual psychology denies the idea of the self as separate from the rest of the individual; no self exists apart from the whole. Similarly, Buddhism denies the existence of the self as such.

The view of human distress, can be viewed in corresponding terms from a Buddhist and Adlerian perspective. In Adler's Individual Psychology, an individual strives towards his or her life goal while inevitably facing specific difficulties in his or her life, referred to by Adler as life tasks. When facing difficulties, the person feels inferior; therefore striving towards one's goals leads to feelings of inferiority or suffering. Likewise, in Buddhism, three thirsts cause suffering: the thirst for pleasure, the thirst to live and the thirst to die. In addition, in Buddhism and Individual Psychology, all conflicts are interpersonal and occur between the individual and life events; they both deny intrapsychic conflicts. Life unavoidably produces interpersonal conflicts and these conflicts make an individual suffer. In contrast to Individual Psychology, Buddhism asserts that the awakened or enlightened do not deal with conflict in the world. Through three ways of studying, a person can understand that the conflicts he or she has in life are only illusions.

Adoption

Ronald Katz

The Bible doesn't "speak" to us in words about adoption but conveys great insight through its stories. It teaches us by example. Adoption consists of two parts: the relinquishment of the child by the parent(s) and the adoption of the child by a new parent(s). In the Bible, the relinquishment of the child is always associated with the threat of death to the child. In the first instance, Abraham relinquishes his son Israel to G-d while expecting that it will result in his son's death. In the next story of adoption, the mother of Moses is forced to relinquish him by placing him in the Nile River in order to save him from certain death. In the story of Esther, not part of the actual Bible itself, relinquishment comes about as a result of the death of Esther's parents. In a related example of relinquishment in the Bible, two women appear before King Solomon claiming to be a baby's mother and when the King threatens to kill the baby by cutting it in half, the real mother relinquishes the baby to the other woman in order to save the child's life. In ancient classical literature this association between relinquishment of the child and death manifests itself in Sophocles' trilogy about Oedipus. Here the relinquishment of the child Oedipus takes place with the expectation of death to the child as a consequence. The thread running through these stories is that the bond between parent and child is of such primal significance that it can be broken only as a matter of life or death. The Bible does speak to us in words about the attitude toward relinquished orphan children and so does the Qur'an. In the world of Islam, the orphaned child is treated with great love and care. The Prophet Muhammad (peace be unto him) once said that a person who cares for an orphaned child will be in Paradise with him. The Qur'an gives specific rules about the legal relationship between a child and his adoptive family. The child's biological family is never hidden; their ties to the child are never severed. The adopted parents are like

loving trustees and caretakers of someone else's child. In the Bible there are references to orphans: the repeated attitude is that they should be treated with special consideration and that it is a blessing to those who care for them. This attitude is manifested in the stories depicting relinquished children who are delivered into loving hands. When Abraham relinquishes his son Israel, G-d immediately sends an Angel to protect Abraham's relinquished son Israel from death and then promises such a wonderful future that all of his family (descendants) will inherit the surrounding lands which were (eventually) named Israel after him. After Moses was relinquished, he was rescued from the Nile River by Pharaoh's loving daughter who protected him from the Pharaoh's death decree, arranged for his biological mother to nurse him and raised him to be adopted into the Pharaoh's family. Esther who was relinquished as a result of her parent's death was adopted by her loving uncle Mordecai who protected her from the wrath of the Persian ruler by hiding her Jewish origins. And in the related story about the mother who relinquished her baby to King Solomon's judgment in order to save the child's life, King Solomon gives the baby back to his loving mother. In the Classical Greek story about Oedipus who is bound and abandoned in the wild by his parents, he is found and delivered into the loving hands of King Merope and his Queen and raised as a noble. And what is the outcome one can expect from this loving care of the adopted child – nothing less than a loving, faithful and loyal offspring.

These scriptural and classical literature stories teach us that our love and support of the adopted child will be rewarded with the love and loyalty of the child in return. In today's times there is controversy over whether the adopted child should be aware of his adopted status. What insight is shed on this subject by these religious and classical sources? The Qur'an quite clearly spells out in words the view that the child's awareness of his adoptive status is very necessary. The adopted child must retain his/her own biological family name (surname) and not change it to match that of his adoptive family. There can be no doubt or mystery about the adoptive status of the child. The Bible conveys the importance of this awareness again in its stories. Abraham is accepted and his son adopted into the religion of one G-D, Judaism, and this "adoption" is proclaimed to the world and fought for.

Esther is knowingly adopted by her Uncle and raised in accord with her racial and religious roots. She is loyal to her adoptive parent to the point of risking death to please him by confronting the Persian King. And later when the relinquishment of the Jews by genocide from their

adoptive home in Persia is sought by the Prime Minister Haman, Esther again risks her life in loyalty to her adoptive father by proclaiming to the King her secret, that she is a Jew.

These stories also illustrate the contrasting effect on the adopted child of adoption unawareness. Moses' adoption was trans-racial, a Hebrew child in an Egyptian family. His adopted family was the ruling class of the country while his biological roots were with the enslaved class. We are given the impression that he had no knowledge of his adoptive status growing up until he is regarded as "brethren" by the Hebrew slaves he was supervising. We can surmise that he may have had unspoken conflicts and identity confusion that couldn't be revealed and acknowledged. Moses is portrayed as a poor communicator who struggled with rage in the Bible. At one point he explodes and kills an Egyptian overseer who was brutalizing some Hebrew slaves. The mixture of anger, fear and guilt often underlies the many reports of the high incidence of anger in adoptees. The strength of Moses' loyalty to his adoptive family was made evident by his self-imposed exile from Egypt which lasted for as long as the Pharaoh lived.

Not knowing one's biological roots puts one in danger of violating a fundamental human taboo against incest which the adoptee who lacks specific knowledge of his biological roots is subject to. Islam specifically addresses the issue by insisting on clear demarcation between blood relationships and non blood relationships. The Bible's solution is exemplified in the story of Moses. In his years of self imposed exile Moses marries a non-Hebrew, thus avoiding the possibility of incest when he establishes a family of his own.

What do we learn about the road from identity confusion to identity resolution? Moses' identity crisis is resolved and solidified by a the recognition of and reunion with and the support of his birth family. This reunion helps him accept himself as a Hebrew and as G-ds' spokesman. In his mission to gain the relinquishment of the Hebrews from their adoptive home in Egypt, Moses repeatedly confronts the new Pharaoh of Egypt. Here too the relinquishment of the Hebrews from Egypt is only brought about after their children were threatened with death by the Pharaoh. In this story, the Pharaoh acts on his murderous feelings toward the Hebrews as he tries to prevent their separation from Egypt by ordering the death of the first born Hebrew children and later by trying to kill the Hebrews after allowing them to leave Egypt. The Pharaoh's murderous decree against the Hebrews results in the death of his own child and the destruction of his

army. We see that the suppression of the adoptees true identity results in conflict and ultimately destruction to the suppressor.

In the story of Oedipus we see the consequences of not knowing the true biological identity played out in dramatic fashion. In the story of Oedipus, his adoptive roots are not consciously known to him. He is an unknown puzzle to himself as exemplified by the problem posed to him by the sphinx: Who is man? We know that his biological parents had arranged for his relinquishment by death through abandonment. We know that out of loving loyalty to his adoptive parents he had fled them rather than risk their destruction after hearing the Oracle's prophesy that he would kill his father. The inevitable outcome is that he kills his biological father and had an incestuous relationship with children by his biological mother. The incestuous dangers of the adoptee's ignorance of his true biological roots is brought "to life" in this play. The play too adds to the insight that loving care of the orphan by the adoptive parents results in a loving and devoted child whereas murderous action towards the child brings about a murderous reaction. The lack of conscious knowledge of one's adoptive and biological origins is portrayed here as causing turmoil and conflict in the life of the adoptee.

These ancient insights have also been reflected in the writings of psychoanalyst and adoption specialist Florence Clothier (1943) in "The Psychology of the Adopted Child" who wrote "... the severing of the individual from his racial antecedents lie at the core of what is peculiar to the psychology of the adopted child." "... the ego of the adopted child ... is called upon to compensate for the wound left by the loss of the biological mother. Later on this appears as an unknown void, separating the adopted child from his fellows whose blood ties bind them to the past as well as to the future."

What are the common threads that run through these writings:

1. Adoptive parents who raise their children in a loving way will have loving children who will not destroy them with their aggression.
2. Acting out of primal hostile impulses by parents toward their children begets the acting out of primal hostile impulses towards themselves.
3. Acknowledgement of adoption can help prevent incest.
4. Knowledge of one's true "core" is essential for mental well being.

Affect

Jo Nash

Definition

Affect is a term used in psychology to denote the broad field of emotional and mood based experience of the human subject, and is a concept deployed in the post-structural theory of Deleuze and Guattari (1987) and related fields of social and cultural theory, to describe the means of visceral communication which invests the experience of relationship between an organism and its environment with meaning, in the broadest possible sense. Protevi writes, "An affect is that which a body is capable of, and so the affectivity of conceptual personae becomes materially grounded in what Alliez will later not hesitate to call a 'biology of intellectual action'" (Protevi, 2005).

When we consider that affect involves embodied, visceral perception that is intuitively apprehended (Bion), is object relational, and may be both generative of cognition, or a product of cognition, or even pre-cognitive (instinctual), or trans-cognitive (integrative), we can understand that affect mediates all experience at both conscious and unconscious levels of awareness, and is an important mediator of all religious and spiritual experience. In *Affect, Religion and Unconscious Processes* Hill and Hood write,

"Insofar as religious experience involves representational worlds, or object relations, affect is hypothesised to play a central role as a mediator (that often is not associated with awareness) of such processes that underlie various behaviours" (Hill and Hood, 1999: 1018).

Affect Theory and Integration

For the psychoanalytic psychologist Silvan Tomkins (1962, 1963, 1991, 1992), who developed what has

become known as “affect theory,” affect can also be understood as an important factor in motivation, in that it is generative of stimuli and also mediates the complex human biofeedback system in an attempt to sustain homeostasis. The adoption of a religious or spiritual practice can be understood to be motivated by the human need to optimise positive affect and ameliorate negative affect to achieve harmonious bio-psycho-social functioning. The need to identify with a positive “Image” for Tomkins, is rooted in a need to identify with the beloved parent, who resonates with positive affects such as love, joy, patience, acceptance and so on. This process of identification enhances optimal development and facilitates highly complex forms of psychological integration dependent on the mediation of ever more subtle affective processes or states. As McGroarty writes: “This also allows for a finer imagination . . . In addition to expanding categories of imagination and perception, this process also may be somewhat therapeutic, in cases where the event under analysis has instigated trauma . . . The feedback system is ultimately geared toward reporting on the progress toward this state [homeostasis], humans are freer than other animals because of the complexity of the Images they hold, and variety of strategies with which they may pursue these images” (McGroarty, 2006: 60–61).

It follows that identification with the positive Images associated with spiritually developed or integrated others, whether they are ministers, teachers, gurus or saints, will be a source of motivation for adopting religious or spiritual practices or values, because the processes involved enhance the ability of the human affective system to sustain homeostasis when under stress from negative stimuli, and thereby regulate itself harmoniously.

In short, identification with highly integrated persons and aspiring to become like them, by adopting practices that enable affective self regulation, enhances happiness and well being. A sense of freedom is also enjoyed by those with a highly developed ability to regulate their own affective states. Spiritual and religious practices are one set of tools available to enhance the development of affective self regulation, and forms of psychotherapy that deploy elements of contemplative practices in particular, have been demonstrated to be very effective in achieving this objective.

Affect Regulation and Contemplative Practice

Mindfulness based stress reduction or MBSR (Kabat-Zinn, 1990) and mindfulness based cognitive therapy or MBCT,

(Segal et al., 2002) are two forms of therapeutic affective self-regulation which deploy Buddhist meditation techniques and yoga exercises to enhance affective self-management. They have been demonstrated to be particularly effective interventions in mood disorders such as recurring depression and substance abuse problems, which are often rooted in misguided attempts to use alcohol, drugs and/or food to regulate emotions and mood.

More recently, a new type of intervention designed to regulate affect called “analytic meditative therapy” has been described by Harrison (2006) as a non-dual psychotherapy rooted in the Tibetan Buddhist practices of Dzogchen and Mahamudra, which enables “relaxed contact with absolute reality and [...] mental healing to occur spontaneously” (Harrison, 2006: 73) through “contemplative resting in non-dual mental space” (Harrison, 2006: 73). Such an intervention embraces the tendency of human affect to achieve equilibrium when given the “mental space” to do so. Certain skills in contemplative discipline are required to create the mental space that enables this to occur.

The above descriptions of the role of affect in the generation and mediation of psychological states, including spiritual and religious experience, is made more interesting by research that demonstrates the converse relationship also exists. Ancient contemplative practices generate and mediate affect in predictable and repeatable ways, with meditation and breathing techniques now being used to enhance psychological well-being as highly effective therapeutic interventions in the field of emotional health.

African-American Spirituality

Kathy Coffman · Jamie D. Aten · Ryan M. Denney · Tiffani Futch

Spirituality has played a paramount role in shaping the identity of African Americans, permeating many aspects of life. African American spirituality has its roots in African religious traditions and culture (Boyd-Franklin, 1989), according to which, people are born spiritual beings, and thus, religion and spirituality are an integrated part identity. African religion and spirituality have also influenced African culture, education, social life, politics, and economics (Idowu, 1992). Overall, African spirituality is very communal in nature as noted by John Mbiti, who said, “I am because we are; and because we are, therefore, I am” (1969: 108). Reflected in this quote is the idea that consciousness of oneself stems from duties, responsibilities, and privileges experienced with others.

Role of Faith

African spirituality helped those affected by slavery to nurture and promote a sense of community while under the influence of the white slave owners’ European religion (Battle, 2006). African spirituality also helped those forced into slavery redefine themselves, find unity, and express inner strength, despite their experiences of oppression. Further, African spirituality buffered white slave owners’ attempts to destroy African cultural identity. Strength would be drawn from one another in secret meetings as well as through music and dance; the presence of

the sacred would be celebrated through songs, beating drums, prayers, and stories (Cook and Wiley, 2000). Traditional African concepts of spirituality and religion are interwoven into African American spirituality and are reflected in contemporary African American culture (Wiggins and Williams, 1996). For example, a fundamental African spiritual concept that was retained by African Americans is the idea that people live in a religious universe and therefore the whole of a person’s life is deeply religious. This idea includes the belief that one is connected to past, present, future humankind, nature, and God. African spirituality is the legacy of African Americans and is present in African American spirituality and culture today. Likewise, as in African worship, African American worship involves verbal and physical expression that includes the whole body and is expressed in the form of song and dance. Music and spirituality are linked in the African American culture and elements of “spirituals,” reveal cultural patterns that have been sustained through the years (Wiggins and Williams, 1996). These elements include the use of metaphor, symbolism, and imagery which appear in the form of blues, rap, and jazz (Wiggins and Williams, 1996).

Role of the Church

Still, communalism continues to play a central role in African American spirituality that promotes a collective identity involving psychological and spiritual integration with others and the sacred. African American spirituality also continues to be an integral part of the struggle for liberation from injustices that followed slavery and has become part of the survival system of African Americans in contemporary times (Boyd-Franklin, 1989; Wiggins and Williams, 1996). This can be seen in the emergence of the Black church in America for example, which has been integral to the development of African American religion, politics, and social justice issues. Being one of the first institutions that belonged solely to African Americans, it became multifunctional and was considered a place of refuge in a hostile world (Boyd-Franklin, 1989). With time, the Black church, empowered by the communal nature of African American spirituality, would be shepherded by Reverend Martin Luther King, Jr., who together with the Black church, helped give rise to the Civil Rights movement which was focused on eliminating the racial discrimination of African Americans.

Currently, the African American churches continue to have a communal foundation that serves as an extended family where social attitudes, values, and codes of conduct of the church and the family are interwoven (Cook

and Wiley, 2000; Boyd-Franklin, 1989). Most African American churches continue to be representative the African American spiritual lifestyle by reinforcing the concept that the sacred exists in all things animate and inanimate (Cook and Wiley, 2000). This is exemplified in the way that African American churches provide resources such as food, shelter, financial aid, child care, recreation, health care, political action, cultural expression, and mental health services to meet the basic needs of the community (Cook and Wiley, 2000). On the whole, African American spirituality continues to be a significant source of strength, hope, meaning, identity, liberation, and forgiveness. It is also continues to play a central role in affirming ethnic, cultural, and historic pride (Lincoln and Mamiya, 1990).

Role of Clergy

Within the African-American church, the pastor is viewed as the leader and spokesperson for the congregations. The modern-day pastor is representative of the tribal leaders and/or shamans of African tribes. The African chieftain was responsible for the welfare of his people acting as protector, provider, and counselor. The shaman offered spiritual guidance and was a liaison to the metaphysical realm. African American pastors have similar duties, serving as providers of spiritual knowledge and motivation, offering guidance to the troubled, and protecting the people. The role of pastor in the African American church is one of reverence whose influence encompasses the church and the family, and extends out to the larger community (Cook and Wiley, 2000). As in African cultures, religious leaders are perceived as being knowledgeable professionals who are intermediaries between church members and the sacred (Idowu, 1990). The pastor sets the moral foundation of the church, and members often look to pastors for help with their problems and needs (Cook and Wiley, 2000). It is viewed as a pastor's duty to go to God with prayers on behalf of the individual, family, or community (Idowu, 1992).

Ahimsa

Trish O'Sullivan

Ahimsa is a Sanskrit term meaning non-harming. It is the supreme virtue in the three great religions of India – Hinduism, Buddhism, and Jainism. It is the first Yama or discipline in Yoga, the first precept in Buddhism and the first great vow in the Jain moral code. If this discipline or vow is kept than the others will automatically be attained. For example, the Buddhist precepts of truthfulness, non-stealing, control of sexual activity, and avoidance of intoxicating substances are forms of non-harm of both self and other. This non-harming ethic is said to benefit others not only through their ensured personal safety but also by the creation of a peaceful atmosphere wherein others are moved to give up their own hostility. Ashoka (268–233 BC) was an Indian emperor that used rapacious violence to conquer and enforce his rule killing thousands. He converted to Buddhism and adopted the practice of Ahimsa. The peaceful change that followed forever linked his name with Ahimsa.

The fulfillment of ethical demands removes existing karmic impurities that create suffering and prevents the accumulation of new impurities. Just as non-harming is the root virtue leading to freedom from suffering, violence is the root cause of all suffering. Practitioners are expected to consciously minimize violence as much as is practicable so as to get rid of the violent attitudes of mind which are not suitable for meditation and will make bad karma.

While all three traditions focus on non-harming in daily life, the Jains go to relatively extreme lengths to avoid harming any creature. Some sweep the ground as they walk so as to avoid stepping on any insects and/or

wear facemasks to prevent small insects from injury while breathing. The widespread custom of vegetarianism in India is related to the practice of Ahimsa.

The Indian Mahatma Gandhi utilized Ahimsa as a political tool, through which the Indian Colony achieved freedom from Britain. Other freedom fighters such as Martin Luther King, Jr. in the U.S. successfully applied these principles in the African American struggle for civil rights. While Gandhi was certainly a role model for MLK there is a pacifist tradition within Christianity also. Christian peace churches such as the Religious Society of Friends or Quakers closely adhere to Jesus's teaching of nonviolence.

The animal rights and environmental movements, are modern examples of a growing non-harming consciousness with a positive regard toward life including both individual life forms and the natural world as a whole.

Ahimsa and Psychology

All three traditions teach that nonharming must be practiced in thought, word and deed. Nonviolent communication involves speaking truthfully with regard for the other person and listening deeply with compassion.

Thich Nath Hanh, the Vietnamese Buddhist Master teaches that psychological violence against the self occurs when feelings are held back and pain ignored. Nonviolence involves being present and recognizing one's own pain or despair, otherwise pain builds and can push one to become caught in one's views or to lash out in anger.

Psychotherapy involves the examination and reduction of violent and other self-harming thoughts and deeds. It involves the generation of compassion towards others who suffer or who have harmed one through the realization that all harm comes from others pain.

The conscious therapist is the embodiment of nonviolence by maintaining a position of presence, listening and unconditional positive regard for the patient. It is this therapeutic stance that allows for healing to progress, eventually leading to a lessening of harming activities either internal or external in the patient's life.

Akedah

Lynn Somerstein

The Bible Story called the “Akedah,” in Hebrew tells of the ending of ritual child sacrifice. It is frequently translated as the “Sacrifice of Isaac,” but the correct translation is the “Binding of Isaac.” Although the word “akedah,” in Hebrew, denotes the bound limbs of an animal prepared for ritual sacrifice, Isaac is not sacrificed.

The events of the Akedah are well known. God ordered Abraham to sacrifice his son Isaac. Isaac and Abraham climbed Mount Moriah together and approached the killing place. Abraham carried the knife, really a cleaver used for butchering animals, and the sacrificial fire. Isaac carried the wood to be used later to burn his body in an offering to God. Although Isaac asked Abraham where the sacrificial animal was, he knew that he was doomed; he did not resist when his father bound his hands with ropes, placed him on the funeral pyre, and reached out to slit his throat. Isaac's feet were not bound- he could have run away.

Isaac submitted to his father's desire to kill him but he was saved when an angel appeared and stopped Abraham's hand. The Lord blessed Abraham and promised to multiply his seed “as the stars in the heavens and as the sand on the shore of the sea” (Genesis, 22:17–18).

A traditional understanding of the Akedah is that God did not want Abraham to kill Isaac because murder is wrong even if God commands it, and God will never again ask for anyone to submit to such a test of faith.

An alternative understanding of the Akedah is that it expresses perfect love. Abraham showed God that he loved Him perfectly when he agreed to sacrifice Isaac, and Isaac loved Abraham perfectly when he agreed to

allow himself to be sacrificed. The Akedah marks the time when literal child sacrifice was stopped; it reveals the beginnings of compassion while it exemplifies God's power and male hegemony.

Abraham thought of sacrificing Isaac, but he did not actually do so. The Akedah is an important story for theories of human psychology because it shows the growth of the human psyche as we begin to understand that words are not the same as deeds.

Often people act as though words and deeds are the same; their thoughts can be experienced as crimes, "thought crimes" deserving punishment, which can lead people to feel guilty, anxious and depressed, even though they have not done anything wrong. One of the many goals of psychotherapy is to help people realize the difference between thoughts and deeds so that their thoughts and feelings can be examined without blame.

Isaac did not attempt to run away, he acquiesced to his father's apparent desire to kill him. Did he believe he would be saved? Might there be other reasons? Did Isaac feel compelled to comply in order to win his father's love? Maybe he was too scared to run. We meet many fathers and sons in treatment who need to answer these questions for themselves.

Alchemical Mercurius and Carl Gustav Jung

Mathew Mather

Alchemy and Mercurius

In alchemy the figure Mercurius has a close association to the substance quicksilver and to the planet Mercury, and therefore also to the Greek Hermes. Indeed the term *Hermetic Art* associates directly to this figure.

As a substance, the element mercury exhibits remarkable properties. In Alexandrian alchemy it was used to affect a spectacle of transformation. Specifically, by crushing and heating a piece of cinnabar ore, a metallic vapor was released. This vapor could then be distilled to yield quicksilver. Reheating the quicksilver transformed it into a red-like crystal, reminiscent of the original cinnabar ore. In effect, it portrayed a transformation mystery whereby a piece of earthly matter could undergo a "tortuous ordeal of purification and renewal." In the animistic worldview of archaic alchemy, it illustrated the idea of a spirit "captured in matter" that could be released and transformed through alchemical operations.

The alchemists also noted the highly reactive and transformative nature of quicksilver. It combined readily with substances such as sulfur, gold, silver, copper and tin. In particular, it reacted powerfully with sulfur, to the extent that some of the Arabian alchemical systems were even referred to as the Mercury–Sulfur systems (not unlike the Chinese concept of Yin–Yang).

The concept of mercury, in alchemy, was also not restricted to the literal substance of quicksilver. For example, the alchemist Newton writes of any metal in its fluid form as being the "mercury of the metals." In this view, the elements can be reduced through heating into a primal matter. Through appropriate operations this primal matter would then be reconstituted, in a quest to achieve a more "noble" state.

In the alchemical worldview, each metal also has a range of "magical associations." In this schema, quicksilver associates to the fast-moving and erratic planet mercury. Not surprisingly, it has been associated pre-eminently to a trickster-like psychopomp as intermediary

between the realms of day and night (symbolically, between consciousness and the unconscious).

Jung and the Alchemical Mercurius

For Jung the chthonic spirit, referred to in medieval alchemy as Mercurius, was a central concern. This figure had a profound influence on his personal and intellectual life. For example, in his personal life whilst preparing lectures on this figure in 1942, he emotively writes of being “dissolved almost.”

During his presentation on this figure, he expressed exasperation in attempting an articulation. He dramatically complained that “the concept swells dangerously” and “the end is nowhere in sight.” In this lecture he also described Mercurius as “ambiguous, dark, paradoxical, and thoroughly pagan,” and as a “symbol . . . compensatory to Christ.” Not surprisingly, he also associated the alchemical Mercurius to the figure of Merlin.

Jung also represented this figure in stone carvings at his Bollingen retreat. On one of the stone walls he created a trickster face, and accompanied this by the astrological glyph of the symbol for mercury. This particular image was done whilst he was working on the concept of *synchronicity*. This same glyph also appears centrally, carved in his enigmatic Bollingen stone.

Altered States of Consciousness

Brandon Randolph-Seng

Altered states of consciousness (ASC) can be very profound and life changing experiences to the religious believer. For example, conversion, testimony, and revelation can all be seen within the context of ASC. An altered state is a subjective reality in most religious experiences and can be identified across all religions and cultures (Bowen, 1998). However, the psychological study of these seemingly important human experiences can be difficult. Even finding an agreed upon definition of ASC is challenging. Despite this challenge, in the scientific study of religion, ASC can be defined as experiences interpreted by the experiencer as an encounter with a reality that is other than ordinary (Geels, 2003). Using this definition, mystical experiences may be considered a type of ASC. For a religious believer, having an ASC or mystical experiences may be the defining moment for their understanding of and motivation toward life. Many of the world's religions are sustained by and even created through reported instances of ASC. As a consequence of the centrality of ASC to a religious believer, understanding the circumstances in which these states arise is important for articulating the psychological influence of religion on a believer's perceived reality and behavior (see Randolph-Seng & Nielsen, 2009).

American Buddhism

Robert Kaizen Gunn

Current Popularity of Buddhism in the United States

Contemporary Buddhism is one of the strongest and perhaps subtlest catalysts for change in United States history, soon to equal, if not surpass, the role of both Christianity and Judaism in the shaping of American religion, philosophy, values, culture and identity – even, perhaps, American politics and economics. It is a new *basso continuo* of change in America, finding expression not only in direct religious practices, but interpenetrating both intellectual and popular culture.

Like one of its central metaphors, the diamond net of Indra, which consists of a necklace of diamonds, each of which is connected with every other diamond, is separate and yet within each diamond is every other diamond, American Buddhism consists of many highly varied *sanghas* (local groups) whose common root is in the teachings of Shakyamuni Buddha of third century BCE India, and has now interpenetrated every aspect of American culture. It is found in common images in marketing (the Dalai Lama on Apple computer), in music (e.g., Philip Glass, Buddha Bar), in movies such as *Seven Years in Tibet* (1997, Director Jean Jacques Annaud. The movie was based on the true story of Heinrich Harrer with the Dalai Lama from 1944 through the invasion of Tibet by China in 1951), *Kundun* (1997, Director Martin Scorsese. Based on the life of the Dalai Lama's life from childhood to adulthood) or *Matrix* (1999, Directors Andy Wachoski and Larry Wachoski), Richard Gere, in psychology (the plethora of books on Buddhism and psychotherapy), philosophy (*The Monk and the Philosopher: a Father and Son Discuss the Meaning of Life*, 2000 by Jean-Francois Revel, Matthieu Ricard with John Canti, translator. New York: Random House), science (www.neiltheise.com, accessed 6/19/09, the Dalai Lama's *The Universe in a Single Atom*, 2006), education

(Naropa Institute, the rise of departments on Buddhism in universities and seminaries), restaurants (Zen Palate), bars (Zen, West Hempstead, NY) and politics (former governor of California, Jerry Brown). Buddhist thought may be found indirectly in some of the most popular movies such as *Star Wars* (1977, a movie, Director George Lucas), *The Matrix* (1999, above), *The Lion King* (1994, a movie, Directors Roger Alers and Rob Minkoff) and *Pocahontas* (1995, a movie, Directors Mike Gabriel and Eric Goldberg).

After a growth of 170% between 1990–2001, according to the American Religious Identity Survey, Buddhism has become the fourth largest religion in America with at least 1.5 million members (after Christianity, Judaism and Islam), approximately 7% of the population.

Its beginnings, however, were subtle and small.

Early History of Buddhism in the United States

Buddhism first came to America, as many religions move, through commerce and trade. The first American merchant ship, *The Empress of China*, which reached Canton in 1784, was the first of many American merchant ships, often members of the East India Marine Society, which brought Buddhist statues and artifacts along with silk, lacquer ware, furniture and porcelains back to America.

In literary and intellectual circles, Asian religion appeared in Benjamin Franklin's *Oriental Tale* (originally titled "A Letter From China"; Franklin 1905-7: 200, 204, 205, 207-9), in the writings of Joseph Priestley, the letters of John Adams to Thomas Jefferson, and most notably in Hannah Adams' *Dictionary of All Religions* (1817/1992). Dissatisfied with the Christian bias in all the existing reports of other religions, Ms. Adams set about to present other religions in the world in a more objective light. Using a Romanization of the sound of the Chinese character for Buddha, Ms. Adams wrote, "The most predominant sect is that of *Foe*. . ." (Tweed, Prothero, 1999: 55).

The direct contact with actual Buddhists on American shores came with Chinese immigrants who began to arrive around 1820. Their number increased considerably beginning with the California Gold Rush of 1849, such that, by 1852, there were some 20,000 Chinese in California. Within a decade, nearly one-tenth of the California population was Chinese. The first Buddhist temple in the U.S. was built in 1853 in San Francisco. By 1875, there were eight such temples. The Chinese Exclusion Act of 1882, which forbade the importation of any more Chinese laborers, stalled further immigration from China. Chinese

Buddhism remained primarily a practice among the Chinese until the second half of the twentieth century.

Chinese Buddhism has grown enormously in the U.S. in the past 50 years. Largely a monastic group, the “City of Ten Thousand Buddhas” was established by Hsuan-Hua in Talmadge, California in 1959. It continues as the headquarters of the Dharma Realm Buddhist Association. In 1978, the Hsi Lai Temple was established outside Los Angeles. Today there are over 125 Chinese Buddhist organizations in the U.S., and they comprise an eclectic combination of different Buddhist schools, including Ch’an, Vinaya, T’ien-t’ai, Tantra and Pure Land traditions. This eclectic approach may be found also in the Vietnamese Buddhism that came with the many immigrants from the war in Vietnam, and the Korean Buddhists who came in the last 50 years.

It was Japanese Buddhism that, from its first appearance, sought to engage non-Asian Americans. Its arrival may be dated from the *World Parliament of Religions*, which was held in conjunction with the Chicago World’s Fair in 1893. Among the participants was Shaku Soen, a Roshi who would return to America 10 years later to promote Rinzai Zen Buddhism.

The Pure Land School of Japanese Buddhism sent missionaries, Shuye Sonoda and Kakuryo Nishijima, to San Francisco in 1898, to establish the Buddhist Mission of North America. In spite of the Japanese Immigration Exclusion Act of 1924, by 1931, they had established 33 temples.

With the United States’ occupation of Japan after World War II, however, a qualitative leap was made by two gifted American soldiers who subsequently devoted their lives to the study and practice of Japanese culture and religion: Philip Kapleau, an American who learned about Zen as a court reporter for the War Crimes Trials, returned to the U.S. to found a Rinzai Zen training center in Rochester, New York; and Donald Keene, who established a department of Japanese Studies at Columbia University.

These efforts by Americans coming back to bring Zen to other Americans were matched by the advent of three Japanese Zen masters: Taizan Maezumi, Roshi, who established the Zen Center of Los Angeles in 1967; Shunryu Suzuki who founded the San Francisco Zen Center; and Soyu Matsuoka Roshi who established the Chicago Buddhist Temple in the Soto Zen tradition. At about the same time, though not an official Zen master, Daisetz Teitaro Suzuki, through his prolific writings and teaching at Columbia University, made Zen Buddhism well known throughout America, especially in academic circles. Suzuki’s work achieved its greatest recognition in his last years

in America, 1950–1958. Hakuun Yasutani Roshi, who first came in 1962, brought an integrated approach of both the Soto and Rinzai Zen traditions, as had Taizan Maezumi Roshi.

With the efforts of these teachers, Zen Buddhism sprouted exponentially during the 1960s, as American counter-culture went through a revolution that, through a combination of dissent against the growing war in Vietnam, rebellion against entrenched authorities in both politics and education, the death of God movement, the hippie movement and the experience for many of hallucinogenic drugs with its mind-expanding (and sometimes destructive) effects, opened a path for non-traditional, non-Western religion.

The most recent entry of Buddhism into the United States is the Tibetan. Although there had been Tibetan Buddhists in the U.S. before, the great influx of Tibetans was prompted by the Tibetan holocaust in which Chinese Communists invaded Tibet and tried to extinguish its religion. Many people, including the Dalai Lama, went into exile at that point, to India, Bhutan, Nepal, Sikkim and America.

The other Buddhist tradition that has grown considerably in recent years, due to the instability of Laos, Cambodia, Thailand and Burma (Myanmar), is the Theravadan tradition. Because of the influx of immigrants from those countries, many temples have sprung up in major American cities. Like their predecessors from China and Japan in the earliest days, they tend to settle into their respective ethnic communities and focus on the needs of the newly migrated.

Ongoing Interactive Impact Between Buddhism and American Culture

Although one may easily discern clear differences in the history and development of the Buddhism that came with immigrants from Asian countries, both recent and distant past, and the history and development of the Buddhism that grew with primarily Euro-American converts, there are several other developments that resist such a dichotomizing perspective.

While the references to Buddhism’s presence in American pop culture above may be superficial (a designation which post-modernism would not deem negative), there are other developments that suggest Buddhism’s influence is a major factor in American cultural change.

1. One of the main conditions that prepared American soil to be receptive to Buddhism was the flourishing of

psychology and psychotherapy in the culture at large. Although the number of people who themselves entered into personal psychotherapy might be relatively small, from the 1960s on, the idea that the human mind was largely responsible for how people behave, that that mind was itself highly conditioned (from both depth psychological and behaviorist perspectives), and a source of unknown powers for creative and destruction (the unconscious); and that attention to the mind's assumptions and conditioning could bring healing and transformation, made Buddhism a natural fit, because of the central role of mind in every aspect of the Buddhist quest for alleviating suffering. Buddhism, with its central admonition to look within for the source not only of one's problems and existential questions, but for their resolution, entered American culture like a fish takes to water.

Psychology and Buddhism became twin partners engaged in the process of transformation. The number of books and conferences dealing with them as mutually enhancing as well as significantly different practices is incalculable. It set the stage for a global, not just American evaluation of the relation between psyche and spirit. Prompted, to take just one example, by American, Japanese and British psychologists, there have now been two International Conferences on Buddhism and Psychotherapy in Kyoto. There are now entire training programs in psychology at Buddhist institutes and universities, and Buddhism has come to be recognized as offering a model of mind that deserves to be included in the curricula of training programs for psychotherapy and chaplaincy.

2. Although Jesuits had been deeply engaged in the study and practice of Buddhism in Japan for hundreds of years, and a Jesuit wrote one of the most comprehensive histories of Buddhism in English (Dumoulin), it is reasonable to say that the birth of Buddhist/Christian dialog as a mutual exchange between equals, rather than an exercise in polemic or condescension, was prepared in both a broader (larger audience) and deeper (as a dialog between Buddhist and Christian monks) way by the Cistercian monk, Thomas Merton. Moments before he died in Bangkok, Thailand, ending his only trip to Asia with his talk on "Marxism and Monastic Perspective," Merton urged that the dialog between Buddhism and Christianity be continued across national, cultural and linguistic boundaries. It has been continued since his death through a variety of forms and forums, including at least two events at Merton's own monastery, the

Abbey of Gethsemani in Bardstown, Kentucky. The dialog was broadened to include other Christians and Buddhist groups, and lay people as well as monastics through the Society for Buddhist Christian Services, which holds biannual conferences ever since. The impact of these dialogs continue to shape not only emerging consciousness among Buddhists and Christians, but has created a much more comprehensive attention to all religions, leading many to prefer to speak of spiritualities rather than religions. Buddhist is thus a catalyst not only for Buddhist/Christian dialog, but also for religious/spiritual consciousness in American generally.

3. It is perhaps not possible to tell the story of Buddhism's explosive growth among converted Buddhists without a reference to the war in Vietnam in the 1960s and 1970s. Although America was deeply divided by the war and torn apart within over its worth, it unquestionably served to alienate many Americans from everything that was considered to be its cause – the Establishment in political, economic, educational and religious leadership. Among that alienated group, many found common cause and common mind with Buddhists in opposing the war, working for immigration and resettlement of displaced Vietnamese, Laotians and Cambodians, and conducting campaigns for peace. Led pre-eminently by a Zen Buddhist priest, Thich Nhat Hanh, Engaged Buddhism emerged not only in America but also around the world as an effort to raise consciousness and create change. It is distinctive within Buddhism in its emphasis on taking the personal transformation of consciousness that comes from meditation and reflection and shifting it to social consciousness and action for social change. It continues today as a powerful movement advocating for ecology, education, and political and economic reform, as well as opposing war. It is significant within America especially in offering a uniquely Buddhist approach to consciousness raising and public confrontation, and finds expression through the Buddhist Peace Fellowship in Berkeley, California and its journal, *Turning Wheel*.

4. The surge in Buddhism since the 1960s happened at the same time as the rise in women's consciousness, the concern for women's rights and the political, literary and economic critique of patriarchy. Unsurprisingly therefore, Buddhism has become not only a catalyst for American change, but has itself been changed by the feminist movement, challenged to look at and change its own long-entrenched patriarchy within Buddhist texts and hierarchies. Among others, Rita Gross and Stephanie Kaza have been on the forefront of integrating a feminist perspective into

Buddhist thought and practice from the academic side. Enkyo O'Hara, Joan Halifax, Eve Marko and Myotai Treace, among others, have themselves not only been ordained but received full transmission and authorization to teach, and have developed their own sanghas.

With a critical analysis of patriarchy now clearly on the table of American Buddhism, the questioning of other aspects of patriarchal assumptions continues apace, with respect to understandings of gender identity and sexual orientation. Buddhism shares with Christianity, Judaism and Islam a checkered history of views on homosexuality and transgender issues. As the gay and lesbian (and later, bisexual and transgender) liberation movement followed the civil rights movement for African Americans and the women's rights movement, so Buddhism in America finds itself changing its traditional assumptions about sexual differences (cf. work of Roger Corliss).

These four developments within American Buddhism are not experienced or shared with all Buddhists in America. Some immigrant Buddhists coalesce into islands of self-protected and self-sustaining communities, focused on the preservation of forms of language, culture and religious practice, as they knew it on their native soil. Their children and grandchildren deal constantly with the often excruciatingly complex issues of assimilation and acculturation within America, often setting generations in conflict with severe fragmentation over authority and the challenges of a pluralistic America. We have grown, however, beyond the simple dichotomy of immigrant versus converted Buddhists into much greater complexity.

There are two small examples of what may open in the future: the first is the small book written by Eric Liu, former Clinton speech writer, *The Accidental Asian: Notes of a Native Speaker*. Liu traces in great depth his own struggle as a second generation Chinese to come to terms with his father and the culture his father left behind, forcing the son to forge a new identity and bring his learning into the emerging American culture. This kind of personal reflection is a heart-warming and thought-provoking model of how one might struggle with all the issues of how to reclaim pieces of tradition and bring what remains valuable into the future. The second example is in a course taught by Dr. Paul Knitter, Paul Tillich Distinguished Professor of Systematic Theology and World Religions at Union Theological Seminary in New York, called "Double Belonging." Knitter makes the case for people who practice in two traditions and maintain them simultaneously without reducing one to the other,

nor rejecting one in favor of the other. This is one model for how to live between now and some as-yet-undetermined future form.

Although it is not possible to predict how these many movements within and outside Buddhism will affect its future in America, one may safely say that, consonant with the pluralism that pervades every dimension of American life, it may be more appropriate to look for the continuing varieties of Buddhism than to assume any reduction in its complexity. If it so emerges, American Buddhism will thereby be both profoundly Buddhist and profoundly American.

Amita Buddha

Minqin Wang (王敏琴) · Lee W. Bailey

The name “Amita” comes from the Sanskrit *Amitabha* and *Amitayus*, translated “Boundless, or Infinite Light and Life.” The Chinese is (阿弥陀佛) *A Mi Tuo Fo*, the Tibetan is *O-pa-me*, the Korean is *Amit'a Bui*, the Vietnamese is *A-di-da Phat*, and the Japanese is *Amida Butso*. He became in China and Japan especially, the supreme personification of the *Dharmakaya*, the highest enlightenment, the supreme beauty of infinite love, not one of many Buddhas, but of Buddhahood itself (Malalasekera, 1961 I: 434). He was not conceived of as a god. He was a man who became an awakened Buddha in the traditional manner (Malalasekera, 1961: 438). Mahayana Buddhism believes that many awakened Buddhas can exist simultaneously, not just in past and future.

Pure Land

Amita is the leading Buddha of Pure Land (or Ultimate Bliss) Buddhism, practiced primarily in China and East Asia, and is spreading worldwide. The Pure Land is a marvelous transcendental western paradise of gold, gems, flowers, perfume, music, and numerous Buddhas. It is the goal of devotees of Amita to develop a Pure Land consciousness, to improve this life and prepare to go to the Pure Land at death. This can be achieved in various ways, by repeating a mantra of the Amita with faith many times, thereby strengthening one’s character and the tendency to do good deeds, and by meditating.

History

Historically, the earliest surviving evidence of Amitabha comes from the stone pedestal of an Amitabha statue discovered near Mathura, near Delhi (which was a major source of Buddhist sculpture) dated 104 CE, making it the oldest document of Mahayana Buddhism (Pure Land). Commentaries on Amita were written by masters of most every school of Chinese Buddhism. The earliest known sutra mentioning Amitabha, which is said to have begun the practice of Pure Land Buddhism in China, is the translation into Chinese of the *Pratyutpanna-samahi Sutra*, by the monk Lokaksema during the later Han dynasty (Lokaksema). A major shrine is on Lu Shan [Mt. Lu]. This was begun by Hui-yuan (334–416 CE), who founded an

Amita Buddha. Figure 1 A MI TUO FO (Amita Buddha); courtesy of Wan Fo Chan Si, in Liaoning Province, at <http://www.wanfochansi.com/>.

Amita Buddha group there in 402 CE, called Bai-lian-she. They practiced meditation based on the *Pratyutpanna Sutra*. It was on Lu Shan that the post-Liberation revival of Buddhism began in 1923 (Welch, 1968: 55).

Amita temples are commonly built in conjunction with the goddess Guan Yin, who is closely associated with Amita Buddha (Chen, 1964: 341–342). But in ancient Amitaba tradition, no women were allowed in his realm unless they were reborn as men (Malalasekera, 1961: 435). In Chinese Daoism Amita-fo is also considered by some to be the incarnation of *Laozi* (老子). Some see early versions of Amita-fo imported from lands far to the West, others argue that it was brought from India, others say that the concept of the Pure Land has been embedded in Chinese consciousness for thousands of years (Hsien, 2000). After centuries of development in China, Amita Buddhism spread to East Asia, notably in Japan in the eighth century, when many temples were built in Kyoto.

Art

In paintings, mandalas, and statues, the bodhisattvas *Guan Yin* (or *Avalokitesvara*), and *Da Shi Zhi* (大势至) “Great

Power Comes,” are Amida’s two important assistants. The three together are called “the three saints in the Western Paradise.” Mandalas such as the eighteenth century “Larger Sutra Mandala” portray Amita in the center in his characteristic seated meditative position, with the various elements of the Pure Land Western Paradise surrounding him. Large temples commonly housed numerous impressive statues (Taira, 1961). In some images of Amita, he is standing on a lotus, with a halo around his head, holding a lotus or jar of royal unction, with a small swastika on his chest. This image, reversed, was taken by some warlike twentieth-century Europeans who horribly distorted its original compassionate meaning. Amita art expanded to include images of the terrible punishments of Hell, as well as the blissful wonders of the Pure Land paradise. A colossal bronze outdoor statue of the meditating Amita, fifty feet high, was cast in 1252 in Kamakura, Japan, and called the Daibutsu, or “Great Buddha” (LaFarge, 1887).

Texts

A primary text in Sanskrit is *The Larger Sutra on Amitayus*, or *The Infinite Life Sutra*, in one of the Buddha’s past lives, when he was called the Buddha Lokeshvararaja. During the time named “The King of Freedom of the World” (世自在王), a king heard the Buddha’s teaching and then became a monk named Dharmakara, or in Chinese, *Fa Zang* (法藏) “The Container of Dharma.” The Buddha told him to create a realm, by his own efforts, where sentient beings could find utmost happiness. He took 48 vows, among which the eighteenth is the crucial one:

- ▶ If, when I attain Buddhahood, sentient beings in the lands of the ten quarters who sincerely and joyfully entrust themselves to me, desire to be born in my land, and call my Name, even ten times, should not be born there, may I not attain perfect Enlightenment. Excluded, however, are those who commit the five gravest offences and abuse the right Dharma (*Larger Sutra*, Part 1, 268, 48 Vows, 18).

and he also swore:

- ▶ If, when I attain Buddhahood, sentient beings in the lands of the ten quarters, who awaken aspiration for Enlightenment, do various meritorious deeds and sincerely desire to be born in my land, should not, at their death, see me appear before them surrounded by a multitude of sages, may I not attain perfect Enlightenment (*Larger Sutra*, Part 1, 268, 48 Vows, 19).

This scene has been recorded by many Buddhists in different times and places. This monk Dharmakara/

Fa Zang became the major Buddha named Amita Buddha. Since then whoever wants to become a Buddha can get his help.

The *Amitabha Sutra* or *The Smaller Pure Land Sutra* is another primary text in Sanskrit. It is a description of the Buddha speaking to a huge crowd of distinguished Gods and spiritual leaders. He described in detail a Buddha realm of Ultimate Bliss, or Pure Land to the West, which in China is the direction of spiritual wonders, where resides the Amitabha Buddha, who teaches the Dharma with excellent blessings. He says that there are Buddhas as numberless as the Ganges sands, such as the “Measureless Life Buddha” and the “Pure Sound Buddha” (*The [Smaller] Amitabha Sutra*).

In the third primary sutra, *The Amitayurdhyana Sutra*, Amita prescribes a three-fold goodness: (1) Support your parents, serve and respect teachers and elders, be compassionate, and abstain from injury, (2) Take refuge in the Buddha, Dharma, and Sangha, fulfill all the moral precepts, do not lower your dignity, and do not neglect the ceremonies, (3) Give your whole mind to enlightenment, deeply believe the karmic law of cause and effect, study Mahayana doctrines, and encourage others to do the same (Malalasekera, 1961: 436).

Practices

Reciting the name of Amita with a sincere heart is the primary practice, but doing it for others is more meritorious than doing it for oneself. Accumulating merits is a path to the Pure Land, and in an ancient tradition, merit can be transferred to the dead. The highest goal is to become one with Amita.

Amita Buddha has another 37 names, among which there are 12 names connected with light, such as immeasurable, incomparable, joyful, pure, inexpressible, and all-pervasive. But Amita is generally called “The Buddha of Boundless Light” and “The Buddha of Boundless Life.” Whereas Sakyamuni Buddha is seen as a teacher, Amita is seen as a savior who gives faith.

Amita is not just the name of a Buddha, but also a mantra, practiced not only by Buddhists, but also commonly used as greetings by Buddhists and non-Buddhists in China. It is a kind of blessing, wishing that others may have boundless light and boundless life. It has such an unfathomable power that people can escape from more than a thousand disasters when they hear the name just once. That is why people are encouraged to read his name.

Expansion from China

In Japan, widespread Amita Buddhism may be called *Jodo-Shinshu* or *Shinran*. Shinran (1173–1262) was a very important leader of what is now the largest Buddhist denomination in Japan (Malalasekera, 1961: 438). He forbade followers from praying for personal interests or temporal welfare. The faithful are to turn all difficulties over to the Buddha. *The Collected Works of Shinran* are primary Japanese sources. The mantra practice is called *Namu Amita Butsu* (“Adoration of the Amita Buddha”), or in brief, *nembutsu* (Ryukan, 1997 “Major Expositions”). The simple practice of chanting such mantras gives Pure Land a wide appeal and contrasts with the more abstract and challenging paradoxes of other branches of Buddhism, such as Zen’s “Nothingness.”

There is a debate about whether calling the name Amita just once, even at the moment of death, is sufficient to attain birth into the Pure Land, or whether one must call the name many times in life to achieve birth in the Pure Land. One answer is that many-calling is only the accumulation of single-calling, for death may strike at any surprising moment, even after one calling (Ryukan). The proper attitude is one of gratitude, service to Amita, free of selfishness and pride.

Psychology

There are numerous fruitful books on Buddhism and psychology. Psychotherapists who have also practiced Buddhism, such as Mark Epstein M.D., have expanded far beyond Freudian nineteenth century materialism. They explore the similarities of psychotherapy and Buddhist practices. Both seek to bring to consciousness feelings that block healing or enlightenment, not always from childhood, but often in relationships. Buddhist meditative practices – silent listening and mindfulness – are similar to therapeutic non-attachment from neurotic emotions, learning to stand back and observe them, rather than identifying with them. These and other themes are explored by many. Epstein’s focus is on humiliation, thirst, release, nowhere-standing, remembering, repeating, and working through (Epstein, 1995).

Therapy in a rationalist society involves opening to intuition, and a faith in finding an authenticity. This may overlap with the Buddhist opening to transcendence, discovered in visions, mandalas, mantras, and ethical guidelines. Amita chanting could be seen as a therapeutic practice of focusing the deeper mind on a refined higher self to detach the ego from neurotic habits of feeling.

Taking refuge in the Buddha, the Dharma, and the Sangha could be likened to therapeutic commitment in psychotherapy, except with a transcendent purpose.

From a Jungian analytic or archetypal view, when caught in neurosis or suffering, one must first have or develop an ego strong enough to stand back and watch unconscious material coming up, rather than being overtaken by it and identifying with archetypal images, such as Jesus or the Buddha, and losing a sense of one’s human limitations. Then in analysis, one encounters in dreams, etc., unconscious feelings and brings their meaning to consciousness, leading toward the ego’s serving the Self, the experience of archetypal divinity. Here Jung wrestles with the paradoxes of the Eastern extreme of identifying with the “non-ego,” the divine, or “becoming Amita Buddha,” and the Western extreme of identifying with the overly-rational, conscious ego and denying the reality of the transcendent Self. The former may seem to allow “jumping over” feelings into the wonder-filled transcendent. The latter imagines the ego to be in control, free of unconscious or transcendent influences. Jung, and many Asian thinkers, reject either Western absolutizing the ego, or Eastern negating the ego. Rather, Jung seeks to direct the ego toward guidance from the Self, the archetypal experience of the transcendent divinity, as in Amita Buddha. “The ego needs the self and vice versa” (Jung, 1979 CW11: para. 961). One might say: “Keep your feet on the ground and your head in the clouds.”

The Buddhist priest, university professor, and Jungian analyst Mokusen Miyuki says that the Amita meditative and chanting practices focus the mind on the Buddha. Jung saw religion as rooted in an experience of the numinous, as in rituals. So rituals such as chanting of the name of Amita (“Namo Amitabha” – “Adoration to Amitabha”) can produce experiences of the numinous which can reorganize one’s psyche away from ego-centric focus toward sincere participation in the higher Buddha-mind, and thereby overcome suffering. “. . .the ego functions in conjunction with the self in creating a state of constant renewal and enrichment” (Miyuki, 1994: 142). Miyuki agrees with Jung that this is not to dissolve the ego, but to let the ego be guided sincerely by the numinous Self or Buddha-mind, via the ego-Self axis, or Dharma-gate, leading to birth of a stronger ego within in the uplifting, larger Pure Land consciousness.

According to Buddhism, everyone inherently has the Buddha nature – cosmic Light – in oneself. But during incarnation, the Light is typically clouded by all kinds of desires, such as crude greed, sex, and pursuit of wealth and fame. So if people read in Chinese “*Na Mo a Mi Tuo Fo*” (“Devotion to Amita Buddha”), or chant

Amita-Buddha's name sincerely in any language, their unconscious will be activated and vibrate together with Amita's power in the universe. Their soul will be full of the liberating Light that frees one from ego's base desires, attachments, and suffering. They will become more sincere, happy, and enlightened, and have a long life in this incarnation. They will be born into the transcendental, blissful, Pure Land consciousness.

Amplification

Joe Cambray

Amplification is Jung's signature method for identifying and accurately applying mythic, historical, cultural and universal analogies to unconscious material of a collective nature. This can foster engagement with deeper resources in the personality, facilitating individuation. The idea developed as a part of his general study of associations and their dynamics, as when applied to dreams, fantasies, delusions or hallucinations. In exploring such material as the fund of personal associations becomes depleted yet considerable psychological energy remains with an image, Jung recommended employing parallels from history and culture that drew upon the patterns in the collective unconscious such as myths, legends, folklore, fairy tales, alchemy and so forth. This became a part of his method for understanding dreams.

Brief History of the Idea

Although Jung had discussed the use of comparative material from cultural sources in his Fordham University lectures on "*The Theory of Psychoanalysis*" in 1912 (in *CW* 4) and published an extensive study using such material, *Wandlungen und Symbole der Libido* (first published in 1912, which he later revised to form the text of *CW* 5), it was not until 1914 in a lecture to the Psycho-Medical Society of London, published under the title "*On*

Psychological Understanding” that he introduced ideas which would more clearly develop into the theory of archetypes in conjunction with the method of amplification (Jung, 1915, in *CW* 3: pars. 388–424; see n. 12). It may be that a full separation from Freud’s influence, which occurred in 1913, was needed before Jung could allow his own unique approach to flourish. In the 1914 article Jung argues for a constructive as opposed to reductive method, leading to a non-causal, synthetic approach with prospective understanding that “build up towards an unknown goal.” From the start he linked amplification with complex processes that will culminate in his formulation of individuation.

By the time of his “*On the Psychology of the Unconscious*” in 1917 (in *CW* 7), Jung speaks explicitly of the method of amplification with a dream example comparing the causal-reductive and the synthetic-constructive approaches, including the use of imagery from the I-Ching. He demonstrates the psychological relevance and benefit of amplifying dreams with symbolic understanding. Through out the 1920s and 30s Jung frequently used this method in a practical manner in his various seminars.

In 1935 Jung gave five lectures at the Institute of Medical Psychology (London’s Tavistock Clinic) (in Jung, 1980 *CW* 18). After acknowledging the feeling of not knowing that is inherent in any real contact with unconscious material, Jung explains how he proceeds, drawing upon his earlier researches in the word association experiment. “I adopt the method of the philologist, which is far from being free association, and apply a logical principle which is called *amplification*. It is simply that of seeking the parallels” (Jung, 1980). He continues with the importance of understanding the context of each image in a dream for any overall interpretation, seeking “what tissue that word or image is embedded in. That is *amplification*.” For Jung, this differentiates his approach from Freud’s, which he feels “is seeking the complexes” whereas he is “looking for what the unconscious is doing with the complexes.” The shift towards identifying operational dynamics in psychic processes considerably broadens the scope and utility of this method. Parenthetically the 38 year old W. R. Bion, who at this time was unpublished, is known to have been in the audience along with his patient Samuel Beckett who was greatly impressed by Jung. Bion went on to become a renowned psychoanalytic theorist whose work included exploration of mystical states. His work contains many echoes of Jung’s comments and his followers often employ myths in their explorations of unconscious contents.

In his 1944 treatise *Psychology and Alchemy* (Jung, 1935/1968 in *CW* 12) Jung includes an extended discussion of a series of dreams of a young man whom we now know was the Nobel laureate in physics, Wolfgang Pauli. The longitudinal use of amplification with such a dream series provides a fuller appreciation of the value of the method in the context of an observed individuation process. “As manifestations of unconscious process the dreams rotate or circumambulate round the center, drawing closer to it as the amplifications increase in distinctness and in scope” (Jung, 1953/1968 *CW* par. 12: 34). The center for Jung is, of course, the transpersonal Self. In this text, he also firmly locates the method in the alchemical tradition of transformation of substances: “The method of alchemy psychologically speaking is one of boundless amplification. The amplification is always appropriate when dealing with some obscure experience which is so vaguely adumbrated that it must be enlarged and expanded by being set in a psychological context in order to be understood at all” (1953/1968 *CW* 12: par. 403). From Jung’s perspective the alchemist’s purpose in employing such a method was to bring out the hidden value in the rejected, unwanted, base aspects of life. Amplification thereby serves to orient consciousness to matters of deep importance that might be avoided if only viewed superficially.

From the late 1940s until the end of his life, Jung expanded his view of amplification to include both the method of active imagination and the feeling function. In his 1947/1954/1969 essay “*On the Nature of the Psyche*” (in *CW* 8) speaking about active imagination he notes that it does not involve “a *reductio in primam figuram*, but rather a synthesis . . . a kind of spontaneous amplification of the archetypes.” (*CW* 8: 403) Inclusion of a more profound valuing of subjective experience, a feeling response, rather than relying only on scholarly researches to reveal the connection to the deeper layers of the psyche is seen in his 1958 essay “*Flying Saucers: A Modern Myth*” (Jung, 1970 *CW* 10). There Jung remarks: “The symbological or ‘amplificatory’ approach produces a result that looks at first like a translation back into primitive language. And so it would be, if understanding with the help of the unconscious were a purely intellectual exercise and not one that brought our total capacities into play. In other words, besides its formal mode of manifestation the archetype possesses a numinous quality, a feeling-value that is highly effective in practice” (Jung, 1970 *CW* 10: par. 646) Thus in his fullest expressions of this method, Jung require the whole person to be partake of the action for it to be psychologically substantive.

There have been numerous developments in Jungian method over the years. In particular articulating the

cultural layer between the personal and the archetypal aspect of the unconscious has been an important refinement – see especially, Henderson (1993); Singer and Kimbles (2004).

Contemporary Utility of Amplification

Various clinical and cultural implications stemming from the analytic method amplification have been noted over the years by Jungians. Some of the more important are:

1. Recognition of patterns of psychological life which are forming, be it in an individual or in a society. In the language of the contemporary science of complexity, systems which can self-organize to produce forms and behaviors operating at a level above that of the component parts, and not found in their component, but only coming into being through the field of interactions between the components, are termed emergent. Amplification can facilitate psychological emergence drawing attention to and focusing psychic energy on just those nascent patterns most relevant to life.
2. Providing a more richly textured narrative background for a life, helping a person discovers aspects of being which live in myth. For the disenfranchised elements of the personality this can offer a helpful link to the broader human community. The method thus allows a pathway for engagement with archetypal energies, at the core of complexes which comprise the personality. Making unconscious processes more ample through the adroit use of analogies renders these processes more available to examination; see for example Samuels in *Post-Jungians Today* (Case-ment, 1998). In applying this method care must be taken that narcissistic elements which can become dangerous, as through inflation, are not excessively activated but that there be a relativizing of the ego and a metabolizing of any identifications with the self.
3. Deciphering the potential significance of unconscious productions such as symptoms and dreams through a comparative process. This can provide valuable orientation of diagnostic and prognostic value, which can help in determining a course of treatment or intervention. For an example see remarks by John Beebe on the “case of Joan” in *The Cambridge Companion to Jung* (Young-Eisendrath and Dawson, 1997) regarding a patient’s suicide wish to “. . . jump in a river” as a kind of urge towards baptism, or spiritual renewal through immersion in unconscious processes, which addressed this use of amplification. Beebe integrates the religious ritual dimension of the impulse with clinical thinking by suggesting it may point to a need for a period of regression, with less organization or verbalization available to patient and therefore the possible use of artistic forms of expression to sustain engagement; a period of quiet containment as dissolution forces breakdown the old structures. Note in the clinical setting actual amplifications are often not shared explicitly with the analysand. As with Jung’s later thoughts on active imagination and “spontaneous amplification,” reverie, as explored by psychoanalysts such as Thomas Ogden, may itself be seen as a form of amplification, especially when used to explore an interactive field, to make the exchanges occurring within it more available to consciousness. The psychoanalytic literature does not touch, however, on the notion of reveries linked with the collective unconscious, which is one way of looking at myth.
4. Shedding light on archetypal processes occurring intersubjectively as well as intrapsychically, within an interactive process as Jung indicated in his essay on *The Psychology of the Transference* (Jung, 1946 in CW 16). The analytic field may manifest in metaphoric or symbolic form in an emergent process, as when a psychological content becomes activated for both partners in an analysis. These often have a synchronistic feeling as in Jung’s famous story of the woman who dreamed of a piece of jewelry in the shape of a scarab beetle and in the analysand’s telling of the dream, Jung caught a similar beetle inexplicably trying to come into his office window. Once in a secured, symbolic field (Goodheart 1980), amplification can thus support a mutual playfulness at the root of creativity.
5. Provides a more expansive model of the psyche, allowing inclusion of cultural processes. This can form a basis for understanding unconscious aspects of social, political, religious, aesthetic, historical, and even scientific discourse. While the use of symbolic forms always derived from a cultural and historical context, there is most likely a biological predisposition to generate these forms (see Pietikainen, 1998 and responses). There remains the need to more fully trace out the cultural evolution, including disjunctions, of these forms.
6. Helps to identify the scale-free network qualities of the field of the archetypes of the collective unconscious thus allowing contemporary research on networks to be applied to Jung’s model of the psyche. For ease of comprehension, consider the World Wide Web which is just such a network, with sites connected by hyperlinks: the pattern of nodes (sites with few links) and

hubs (sites with large numbers of links) together with their lines of connectivity. These networks have self-organizing properties which foster resilience to removal of nodes. Psychologically this offers new insights into both the resilience of defenses in analytic work and the possibility of stabilizing new relations between the ego and the unconscious which developing during such work – for an initial discussion of this see Cambray and Carter (2004), chapter 5.

Analogy (Islamic)

Amani Fairak

Analogy (Islamic) or *Qiyas* is the fourth source of *Sharia* (Islamic Law). In case of the lack of direct text, from the Quran or Hadith, on any contemporary issue, making judgment based on analogy is permissible by Sharia. Analogical reasoning can be deduced from a known Islamic judgment and then applied to the unknown problem within the Islamic model of the Quran, Hadith and the Islamic consensus. This means that the Quran and Hadith can be further analyzed and extended from a primary known issue (*asl*) to a new problem (*fara'*) if there is a common cause (*'illa*) for both problems.

Example: drug abuse and wine drinking are both not permitted by Sharia although they are two different problems. The first was not known in the early days of Islam and it was not mentioned in the Quran or Hadith. Analogically speaking, since drug abuse has the same effects of alcoholic abuse (loss of consciousness), which is forbidden in the Quran and Hadith, therefore, drug abuse must be banned by law as well.

Analytical Psychology

Claudia Nagel

Introduction

Analytical psychology is based on the works of C. G. Jung (1875–1961). The term was first used by Jung when he left the psychoanalytic community around Freud in 1913, to describe a new psychological science with the aim of exploring the unconscious and its relationship with the conscious. The symbol-creating function of the psyche can not be understood and used for the process of personal development without the conscious. In the course of life the individual can go through a process of individuation enabling him to achieve his innate potential and thus give meaning to his life.

Jung studied medicine (M.D. in 1900) and underwent additional training in psychiatry (1905) at the Swiss Burghölzli Clinic. His close relationship with Freud lasted from 1907 to 1913. After the painful break from Freud he underwent several years of auto-analysis and in 1921 he published his work *Psychological Types*, which formed the basis for an independent psychological school of thought, Analytical Psychology. In the first 30 years of life he laid the foundation for his extensive psychological oeuvre, dedicating himself in the second half to the study of topics from history, religion and cultural history which strengthened and differentiated his theory (Stein, 1998). Throughout his life he devoted himself to the exploration of the question if and how religious and mythical experiences can be investigated by empirical scientific methods.

The Nature of the Self

Although, to cite Murray Stein, Jung has designed a map of the human soul, it is the development of the Self which is at the center of his explorations of the soul. His concept of the Self is fundamental for the differentiation from other schools of psychoanalytical thought, in that it forms the basis and the goal of human development. The core element in the process of individuation, which is central to his psychoanalytical approach, is the unfolding and development of the Self. Man is to become what he is meant to be.

Jung's concept of the Self is different from self-concepts of other psychoanalysts as, e.g., Kohut, primarily regarding the idea of transference. This means that the Self is situated outside the individual psychic field, which it defines but in which it is not contained. Not the "I-am-(my)self" is meant by this concept, but rather something incomprehensible, unperceivable, greater than oneself. The self forms the primeval basis for the communality of the subject with the world, with the basic elements of being. Subject-object, I-other are connected in the self in a common field of structure and energy (Stein, 1998).

- ▶ As an empirical term the Self defines the totality of all psychic phenomena in human beings. It expresses the oneness and wholeness of the total personality (...) it comprises that which can be experienced, and that which can not be experienced, or can not yet be experienced. (...) In as far as wholeness, which consists of both conscious and unconscious contents, it is a postulate, it is essentially transcendent, (...) As there are, in fact, phenomena of the conscious and the unconscious, the Self as a psychic totality contains a conscious as well as an unconscious aspect. Empirically the self becomes manifest

in dreams, myths and fairy tales in the figure of the 'superordinate personality' like a king, hero, prophet, redeemer, etc., or as a symbol of totality as, e.g., the circle, quadrangle, quadratura circuli, cross, etc. Inasmuch as it represents a *complexio oppositorum*, a union of opposites, it can also appear as a union of two as, e.g., the interaction of yang and yin in the Tao (...). It thus confirms itself as an archetypal concept which is different from other concepts in that it takes a central position through the significance of its content and its numinosity (Jung, 1921/1995, CW 6, § 891).

The Numinous

The numinous corresponds to the God-image in the individual. The archetypal character of the numinous manifests itself in different symbols which occur across all cultures and express the relationship between the numen and human beings in again and again similar ways (e.g., mandalas, crosses, etc.). Jung therefore postulates that man is in essence religious and that religion is a native form of expression or attitude of the psyche. In his work there are, however, no personal statements regarding his faith. "One might then say that the term 'religion' denotes a particular attitude of a consciousness which has been altered by the experience of the numinous" (Jung, 1939/1995, CW 11, § 9). This numinous, the inexpressible, mysterious and at the same time terrifying is that which is particularly moving or touching in the perception of the self. It is the perception of wholeness which transcends conscious reality. As the numinous reflects this divine character, the self corresponds to the God-image or "a God in us." However, Jung makes a clear distinction between the question of the existence of God and the God-image:

- ▶ It is, of course, due to the perpetual commingling of object and image that one can not understand the difference between 'God' and 'God-image,' and therefore believes to be speaking of God – to be explaining 'theologically' – when speaking of the God-image: Psychology as a science is not entitled to call for the hypostatization of the God-image. Nevertheless, consistent with known facts, it needs to anticipate the existence of a God-image. It is therefore (...) understood that (...) the God-image corresponds to a specific psychological complex of facts and thus represents an important element and a basis for work, yet the question as to the nature of God is not to be answered by psychological science (Jung, 1928/1995, CW 8, § 528).

Reflected in the self and in the symbols of the self are thus human experiences with the Devine, although neither of these permits any conclusions regarding the nature of the Devine.

The Self-Regulating Psyche and the Role of Symbols

Analytical psychology assumes that the function of the Self is to hold the dynamic totality of the psychic system together. If, for example, symbols of the Self occur in dreams, this may be seen as a compensatory act of the psyche aimed at healing a psychological crisis in the conscious. In the totality of the Self opposites like good and bad, light and shadow are united. The perception of this totality expresses the wish for psychic union of the opposites in a synthetic third, which constitutes a decisive factor in the process of personal development. The principle of opposites and enantiodromy is based on the concept of self-regulating psychic mechanisms. The psychic energy expressed in the striving for individuation is directed towards the achievement of wholeness and is controlled and driven by the Self as a transcendent center outside the psyche. It is therefore not the ego which is responsible for the process of individuation, but the compensatory function is the deciding factor. The self-regulating function of the psyche implies that the unconscious counterbalances the one-sided tendency of the conscious. “For all excessive processes compensations are made immediately and inevitably” (Jung, 1947/1995, CW 16, § 330). It is primarily the repressed or other unconscious contents which – in the presence of excessive one-sidedness – irrupt into consciousness in the form of dreams, images, or irrational actions (like the famous Freudian slip). As a bridge between the conscious and the unconscious serves the symbol which is created by the transcendent function.

In the symbol, which has a central role in analytical psychology, different aspects are “thrown together” (the Greek root *syμβάλλειν* signifies to throw together): antithetical contents (conflict, polar aspects) conscious and unconscious (transcendent function), past and future (myths and dreams), form and content (image), inner and outer (projection). Areas or aspects which are (can) actually not (be) directly related are connected with each other in different constellations through the symbol so that something new, a third is created, i.e., the symbol. The development of the symbolic attitude is therefore of crucial importance in the process of individuation. The transcendent function enables the emergence of a symbol. It is the capability of the psyche to unite pairs of opposites in a

synthesis, where something new is created. The transcendent function connects the unconscious with the conscious: a creative relationship develops in which the transition from one attitude to another becomes possible. Symbols and archetypes are the vehicles of the transcendent function.

The Role of the Ego

The symbol-forming function of the soul – and thus the compensatory function – can become effective only if it is comprehended by the ego, i.e., the symbols have to be understood and integrated with the help of the conscious. The ego should be in a compensatory relationship with the self and a so-called “Ego-Self axis” (E. Neumann) should be formed. This Ego-Self axis illustrates the dynamic relationship between the ego and the Self. Neumann assumes that the ego dissociates itself from the Self at the beginning of and during the first half of life, increasing consciousness develops and a center of consciousness in the form of an ego-complex arises. According to Jung the essential part of the individuation process occurs in the second half of life, which is marked by a backward movement of the ego to the Self, characterized by the broadening of consciousness and integration of the personality. Although the concept of dissociation of the ego from the self advanced by Neumann has lost in importance in the light of more recent findings of developmental psychology, the Ego-Self-axis is nevertheless helpful in understanding the self-regulating function of the psyche. An identification of the ego with the self would, for example, be either an indication of inflation or of psychotic delusions of grandeur.

The ego in analytical psychology is the center of the field of consciousness and is also understood as the ego complex. It is characterized by a high degree of continuity and identity with itself. “The ego-complex is a content of the conscious as well as a prerequisite thereof, because I am conscious of a psychic element, in as far as it is related to the ego-complex” (Jung, 1921/1995, CW 6, § 810). The ego is a part of the total personality and the prerequisite of our ability to experience and reflect the world and ourselves. The ego is not a creation of our conscious wanting, but transcends it. Environmental factors have a role in ego formation and can be described with Winnicott as “facilitating environment.” From today’s perspective the ego or ego-complex, like all complexes, is formed in early infancy as the result of attachment relationships, in later life other relationship experiences also contribute to the formation and alteration of the ego-complex.

Complexes and Archetypes

Jung viewed complexes as more or less unconscious psychic contents held together by an identical emotion and a common core of meaning, the archetype. He understood a complex as an unconscious focal point of psychic processes, charged with a high degree of negative or positive emotional energy. A negative complex may be caused by a deeply felt emotional experience, a psychological trauma, or negative childhood experiences. Complexes may also be seen as “split off components of the psyche” (Jung, 1934/1995, CW 8, § 204), which if they have not yet become conscious, may cause psychic disturbances in the unconscious. Jung demonstrated the effectiveness of complexes with the help of the association experiment, which he had developed further. The presentation of complex charged words can produce changed reactions, as well as a galvanic skin response. Today, complexes are understood as the dynamic compression of internalized relationship experiences, capable of changing and developing throughout life. Complexes can be compared with other psychological models as, e.g., Stern’s representations of interactions generalized (RIGS), or the internal working models developed by Bowlby. Analysis focuses on the elucidation of these complexes: they are brought to consciousness, emotionally worked through and processed. The symptoms of a complex can be understood and interpreted symbolically. This enables the release of the psychic energy bound in the symptoms, the psychic equilibrium and inner balance can be re-established, and an instant of personality integration occurs.

Complexes always have an archetypal core. Comparable to complexes, archetypes are a central building block of analytical psychology. Based on Kant’s concept of the *a priori*, Jung postulates the existence of an *a priori* in all human action and thought, an “innate and therefore preconscious and unconscious individual structure of the psyche” (Jung, 1939/1995, CW 11, § 151). These preconscious structures can not be described, they are a type of unconscious predisposition to act in a certain human manner. They have no concrete contents and are therefore to be understood as shapes or “primordial images,” which are passed on from generation to generation of humans. “Visible” contents are added to the archetype through individual experience. Archetypes in addition to the self, which is frequently described as the primary archetype, include the animus and anima, the shadow and the persona. Neurobiologic findings have contributed to a somewhat changed understanding of the archetype. Today it is preferred to view archetypes as “image schemas, early developmental mental structures

which organize experience while themselves remaining without content and beyond the realm of conscious awareness. . . . The image schema would seem to correspond to the archetype-as-such, and the archetypal can be equated with the innumerable metaphorical extensions that derive from image schemas” (Knox, 2003: 96). They represent mechanisms which serve to organize experience in the human brain. In addition, they also appear to be unconscious “representations of dynamic patterns of relationship between self and other” (Knox, 2003).

The Collective Unconscious

At first glance the described new perspective appears to render access to Jung’s essential construct yet more difficult; in particular because it has an important role in considerations from a religious perspective, i.e., the collective unconscious, which Jung differentiates from the personal unconscious. However, recent research in developmental psychology has demonstrated the phylogenetic endowment of newborn infants with regard to communicative abilities. The collective unconscious represents the deepest layer of the human psyche, which is formed from universal archetypes and instinct-based forces and is identical for all humans.

- ▶ We can differentiate a personal unconscious that comprises all acquisitions of personal existence, i.e., what has been forgotten, repressed, subliminally perceived, thought, and felt. In addition to these personal unconscious contents there are other contents, which do not derive from personal acquisitions, but from the congenital possibility of psychic functioning per se, namely from the congenital brain structure. These are the mythological aspects, motifs and images, which can develop at any time and anywhere without historical tradition or migration. These contents I describe as the collective unconscious (Jung, 1921/1995 CW 6, § 919f).

The collective unconscious reveals itself primarily in myths and fairy tales, whose analysis enables access to archetypal contents and appears primarily in dreams, literature, art and culture. The language of the unconscious are symbols and images, because they exert a powerful influence on the conscious, in particular with a view to their numinosity. The psychological unconscious is further ascribed a tendency towards finality, which finds expression in the teleological principle. Within the framework of the individuation process the individual might succeed in grasping the finality of the unconscious from the individual perspective, enabling him to experience his

own actions and life as meaningful. To a degree determined by itself, the ego is thus forced to comply with and understand the demands of the self. This individual striving for meaning can therefore be understood as religious.

Ananda

Paul Larson

Ananda was one of the main disciples of the Buddha. He served as his personal attendant and occupies a similar place in Buddhism that the Apostle John does in Christianity. Both were very close to their Lord in a personal as well as spiritual way. As such, Ananda wielded much influence in the First Buddhist Council, immediately after the death of the Buddha (544 BCE). Because of his close relationship to his teacher he is the source of many of the stories told in the canon of scripture known as the Sutras (Skt.) or Suttas (Pali). Of all the qualities attributed to him, good memory was one. Service to others was another. His name means “bliss.”

Androgyny

Jeffrey B. Pettis

Plato's *Symposium* addresses the subject of human nature (*anthrōpinen physin*) in its former state (*palai hemōn physis*) (189D). According to the speaker, Aristophanes, there were not two but three “kinds” (*ta genē*) of humans: male (*arren*), female (*thēlu*), and an equal combination of both male and female (*ampheterōn*) (189D). In this third type male and female are joined into the form (*eidos*) of one unity, *androgynon* (189E). This *androgynon* is quite

vital, which according to Aristophanes, threatens the gods who thus split the form in half, creating the separate forms, male and female. Each has only a portion of the original vigor, and are therefore no longer a concern to the divine patriarchy. Aristophanes says, this “man-woman” nature has ultimately been vanished (*aphanistai*), and Aristophanes himself appears to devalue it by referring to it as a “thing” (*auto*). Other notions of androgyny also occur. The ancient Gnostic text *Interrogationes maiores Mariae* quoted by Epiphanius of Salamis (d. 403 CE) tells of Jesus producing a woman from his side. The image symbolizes Christ as the Anthropos, the Second Adam who is both male and female after the way of the first, hermaphroditic Adam (cf. Gal. 3.26–28; Matt. 22.30). In Hindu Vedic traditions the androgynous Original Man Purusha, who “as large as a man and woman embracing,” divides his self to create husband and wife (*Brihadaranyaka Upanishad* 1.4.3; cf. *Aitareya Upanishad* 1.1–14; *Atma Upanishad* 1–3). In the Cabbalist tree King David is associated with the tenth sefirah *Malkhut* the feminine aspect of judgment. She is *Matronita*, the Grand Lady of the cosmos. She has a special affinity for the left side, being referred to as the gentle aspect of wisdom. Within the history of the Church, the eleventh to thirteenth centuries show particular interest in the androgyny of Christ. The Cistercians are especially noted for a reworking of the symbol of Jesus and the integration of the feminine aspect. Anselm the theologian and Archbishop of Canterbury (1033–1109 CE) writes: “But you, Jesus, good Lord, are you not also a mother? Are you not that mother who, like a hen, collects her chickens under wings?” (Prayer 10 to St. Paul, *Opera omnia* 3:33 and 39–41). The French abbot Bernard of Clairvaux (1090 CE–1153 CE) in his series of sermons on the Song of Songs refers to the refreshing sweetness and perfume of the breasts of Christ the Bridegroom. They are “better than wine, but smelling sweet of the best ointments” (Sermon 9.4). According to Jung, the separating into male and female sets up a pair of opposites and makes consciousness possible. It manifests latent symbolism and unconscious processes as compensation response to external, conscious condition of undifferentiated unity (Jung, 1969: 204 ff.). Jung also equates the duplex figure to the Anthropos as the idea of wholeness and unitary being which existed prior to human beings and represents the end-goal of human life. As Anthropos, the androgynous figure occurs as the essential, governing archetype and “organizing principle of the unconscious, the quaternary, or squared circle of the self” (Jung, 1969: 204).

Angels

V. Walter Odajnyk

The word comes from the Greek *angelos*, a translation from the Hebrew *mal'akh*, meaning “messenger.” In the major Western religions angels are ministering spirits and guardians of the supreme deity and serve as messengers and intermediaries between the divine and human realms. They act as extensions of the divine will, reveal divine truth, watch over the world and guide souls to their postmortal destiny.

The motif of attendants upon the supreme deity who also serve as messengers and intermediaries between heaven and earth is widespread. In Chinese and Japanese religions there are ministering spirits and divine messengers whose role is similar to those in the West. The ancient Mesopotamians depicted giant winged genies as divine ministrant and guardian spirits. In Zoroastrianism there are six spiritual entities that attend the chief deity. In Hinduism the *angiris* are the messengers between gods and men. The function of a Boddhisattva in Buddhism is comparable to that of an angel. Hermes and Iris, both with winged sandals, are the divine heralds in Greek mythology. The messengers of the Celtic Otherworld often appear in the guise of swans. But not all winged entities are angels. Wings indicate swiftness (the winged sandals of Hermes and Iris) and the ability to function in the air, and by analogy in the realm of the spirit. The winged Nike represents the Spirit of Victory and is not an angel, i.e., a messenger.

In the Bible angels appear as wingless young men. Only the Seraphim and Cherubim are winged and not

human in form. Until the thirteenth century angels were depicted as adolescent males. The late Gothic romantic ideal of beauty led to the feminization and etherealization of the angelic form. In popular belief angels are divine or semi-divine creatures entitled to be worshipped in their own right. They are sometimes equated with daemons, fairies, elves, jinn, etc. that are amenable to human manipulation and used in magic. The notion of a personal guardian angel developed in the second century A.D. probably influenced by various religious and folk beliefs in protective ancestral guardians or spirits.

Judaic: Angels appear often in the Bible as messengers and protectors. The most striking representation of angels as intermediaries between the divine and human realms is Jacob's dream of the ladder reaching from earth to heaven with angels ascending and descending on it and God standing at the top of the ladder. An angel stayed Abraham's sacrifice of Isaac, wrestled with Jacob and named him Israel and appeared in the midst of the burning bush to Moses. The Seraphim, fiery, serpentine, six-winged angels surround the throne of Yahweh. The Cherubim, four-winged and four faced, bear his throne and were depicted on the cover of the Ark of the Covenant. A Cherub was posted east of Eden to prevent human beings from returning and eating also of the Tree of Life. Satan, also called Lucifer, led a rebellion against Yahweh and was cast down from heaven to the earth with his host of rebellious angels. Two angels are named in the Bible: Michael ("like God"), warrior leader of the angelic hosts, and Gabriel ("man of God"), who interpreted Daniel's vision. When sent as messengers the Biblical angels appear as young men. Two other angels appear in the Apocrypha: Raphael ("God has healed"), guide of physicians and travelers and Uriel ("fire of God"). Seven archangels are mentioned in the apocryphal Book of Tobit and in post-biblical Judaism, especially in apocalyptic literature seven angels, sometimes called archangels lead the heavenly hosts (First Book of Enoch).

Christian: Angels play a significant role in the New Testament. Gabriel announced the conception of John the Baptist to his father, Zacharias and the conception of Jesus to Mary. Angels appeared to shepherds in the fields of Bethlehem to announce the birth of Jesus. Angels appear with Christ at the Second Coming and play a significant role in the Last Days described in The Revelation. Later Christian writers, particularly Pseudo-Dionysius and Justin, developed elaborate hierarchical schemas of angels, describing their roles and attributes. One such ranking consists of nine orders: Seraphim, Cherubim, Thrones, Dominions, Virtues, Powers, Principalities, Archangels and Angels. The nine orders are divided into

three choirs, emphasizing the symbolism of the Trinity (3×3). The first choir contemplates God, the second governs the universe, the third executes the orders of the superiors. Clement of Alexandria, under Hellenistic influence, thought angels control the course of the stars and the four elements (earth, water, fire, air).

Islamic: When Allah created Adam he asked the angels to prostrate themselves before him, all did except Iblis (Satan). For this sin of pride Iblis was banished from heaven and became the enemy of mankind. Angels revealed the *Qur'an*, to Muhammad, who fearing he was possessed by jinn was about to throw himself off a cliff when Jibril (Gabriel) appeared and confirmed him as a prophet. Angels surround the throne of Allah, record the good and evil deeds of human beings, intercede with God on their behalf, escort the soul at death, reward the good and punish the wicked. In Islamic tradition there are four orders of angels: four throne bearers; the cherubim who praise Allah; four archangels; and a host of lesser angels. The archangels are: Jibril, the revealer; Mikal (Michael), the provider; Isra'il, the angel of death; and Israfil, who places souls in bodies and sounds the trumpet at the Last Judgment. Malik is the angel in charge of hell. In popular belief, there are also female angels, the *huris*, who provide male Muslims with erotic delight in paradise (they are similar to the Hindu *apsaras*).

Commentary

From the Freudian perspective angels are wish fulfilling fantasy creations of the protective, caring, and guiding aspects of the parental imago. As attendants and guardians of the male supreme deity they represent aspects of patriarchal power. As messengers and intermediaries they are internalized voices of parental authority and function as the superego, rewarding good and punishing evil behavior. The rebellion of Satan and his host of angels and their banishment from the deity's presence dramatizes the consequences of opposing the parental will. The Cherub with a fiery sword placed at the entry to the Garden of Eden protecting the Tree of Life refers to the patriarchal threat of castration and annihilation aimed at regressive incestuous impulses for a return to the womb. The "sons of God" who had intercourse with the "daughters of men" probably refers to the original band of brothers who killed the primal patriarch and usurped his sexual prerogatives. The angelic announcements of various Biblical conceptions is a "spiritualization" of parental sexual activity and perhaps an attempt on the part of both parents and children to see birth as a unique and special ("blessed") event.

From the point of view of Jungian psychology, angels are manifestations of the various characteristics and functions that belong to the transpersonal archetype of the Self or are attributes projected onto it by human beings, e.g., power, protection, intelligence, narcissism, pride, the source of life and death and of good and evil. As messengers, they represent attempts on the part of the Self to convey information to ego consciousness that otherwise would not be understood or apprehended. Their manifestation in human form allows for an empathic connection and makes the messages they convey comprehensible to human beings. As intermediaries between the divine and human realms, angels are attempts on the part of the transpersonal unconscious to maintain a relationship with human consciousness and to participate in the personal and temporal world. For example, it is noteworthy that angels prevented the sacrifice of Isaac, renamed Jacob Israel, appeared in the burning bush to Moses, announced the birth of Ishmael and of Jesus and revealed the *Qur'an* to Muhammad. In *Genesis* (6: 2ff) there is mention of “the sons of God” who took “daughters of men” for wives and fathered children who “became mighty men...of renown.” The divine or semi-divine birth of a hero is a universal motif. It depicts, so to speak, the desire of the transpersonal Self to have intercourse with the human realm and incarnate in the three-dimensional world. In strictly psychological terms, the motif portrays an impetus on the part of the transpersonal psyche to realize itself in ego consciousness. In this regard, the role of Satan (also called Lucifer, literally, “light bearer,” Isa. 14–21) in the three dominant Western religions is significant. The banishment of Satan and his rebellious angelic host from heaven to the earth is also an incarnation motif. (The banishment to hell is Milton’s poetic license and based on The Revelation where that occurs at the end of the world.) This “fall” of the angels precedes that of Adam and Eve and must be viewed as a preconscious foundation for the formation of a conscious human ego structure.

Anima and Animus

John Ryan Haule

Terms introduced by C. G. Jung to describe certain functions of the human “soul” (*anima*, Latin). *Anima* names the feminine unconscious factor in a man, while *animus* applies to the corresponding masculine factor in a woman’s unconscious. Noting the frequency with which he encountered such contrasexual figures in the dreams of his patients, Jung theorized that every individual is born with the potential for both sets of gender characteristics but – under the influence of genes and socialization – only one set is developed consciously, leaving the other latent in the unconscious. Because dreams tend to “compensate” for an inevitable “one-sidedness” in conscious attitude, archetypal images of the opposite gender are common in dreams.

Gender Relations

Jung described the “masculine principle” as *logos* (the tendency to trust logic and verbal formulations) and the “feminine principle” as *eros* (the tendency to trust emotional connections and relatedness) (Jung, 1959: 14). A logos-oriented man will undervalue relational skills and feeling values, including his own. In the unconscious, however, they have numinous power, for they belong to the archetypal realm of goddesses and film stars. The situation with the eros-oriented woman is similar but opposite, with logos-characteristics numinous in the unconscious: male figures with fascinating verbal and intellectual qualities. When the two meet romantically, they tend to project their mythically idealized inner figures upon one another, making disillusionment inevitable when they discover that their partner is a poor match for the projection. When this happens, each partner will suffer from the limitations of the other’s undeveloped side: the man’s touchy, undifferentiated feelings and the woman’s stereotyped thinking.

Ultimately, however, anima and animus are essential for psychological transformation, where the disillusionment of projection failure may become the beginning of wisdom. Unconscious contents become known when one catches oneself in the act of projecting them; and few opportunities to do so are as unmistakable and personally painful as erotic conflicts. With enough presence of mind to recognize a projection for what it is and “withdraw” it – in

the sense of acknowledging it as one's own – one begins to become acquainted with anima or animus as unconscious potential. While an unrecognized contrasexual archetype will draw an individual into one unsatisfying encounter after another, an anima or animus that has become known will function intuitively to supply the formerly missing perspective and complete an understanding of the world and of oneself. This integration of the contrasexual archetype is known in myth as the hierosgamos (Greek for “wedding of the gods”). It leaves one more adequate for mature relationships and more capable of effective engagement with both the inner world and the outer.

Mediation: Ego and Self

Discussions of anima and animus that become fascinated with gender differences tend to overlook the fact that, at bottom, the anima/animus syzygy (or “pair of opposites”) plays the same role in every psyche. It mediates between ego and “self” (Jung’s name for the wholeness of our being, including both conscious and unconscious elements). The oppositeness of their gender reflects their personification of an inner world that is largely opposite to and compensatory for limitations in the conscious attitude. The allure of anima- and animus-figures, whether seen in visions or in a flesh-and-blood partner, inspires interest in unknown aspects of self and world and mobilizes psychic energy, drawing the individual into life and opening up a deeper and more compelling inner world.

Always lurking behind anima and animus is the self they mediate. As the most powerful and significant force in the psyche, self is the God of one’s inner world. From the psychological perspective, therefore, Tao, Brahman, Christ, Buddha, Atman, and the like, are projections of the self; while from the theological point of view, the self is that aspect of the human psyche that God uses as the “dark glass” through which divine revelations are possible.

Religious Dimensions

The numinosity of the godhead is an essential attribute of anima and animus, for the mediator reveals the presence of the greater being and glows with its splendor. This is the reason mystics – historically, those who have published accounts of their experiences have been overwhelmingly male – typically speak of their love of God in erotic language; why in the Kabbalah the nearest *sephira*, or “sphere of divine manifestation,” is the feminine Shekhinah (“Divine Presence”); why Rumi and many of the Sufis rhapsodize over a divine Beloved they experience as a

supernatural woman who entangles them in her black tresses; why Roman Catholic nuns describe themselves as “brides of Christ”; why devotion to Mary the Mother of God and to Muhammad’s daughter, Fatimah the Resplendent, are so important in their respective religions.

Animectomy Complex

John Eric Killinger

Terminology

Term coined by American psychologist William Herbert Sheldon, Ph.D., M.D. (1898–1977). Though better known for his theory of and work with somatotypes, Sheldon wrote a book on a psychological approach to religion, education, and medicine entitled *Psychology and the Promethean Will* (1936). Despite demonstrating the influence of William James, the book appeared soon after Sheldon’s pilgrimage to Europe of 1934–1935 where he studied the psycho-physiological work of Ernst Kretschmer, conversed with Sigmund Freud, and spent considerable time with C. G. Jung discussing the theory of psychological types. The “animectomy complex” was coined not only “in good-natured appreciation” but also for “poking good-natured fun at” the Freudians for “their utterly delightful castration complex” (Sheldon, 1936: viii, 200).

Sheldon asserts that the word “animectomy” follows in the somewhat “vulgar” practice in medicine to mint neologisms from an admixture of Latin and Greek terms. In this case, the Latin *anima* (soul) is paired with the Greek *ectomy* (cut off). Sheldon’s definition of animectomy is “amputation of soul.” His primary concern seems to have been that psychology, if it already had not done so, was in danger of losing its soul, a fact echoed in the last several decades by John Sanford and James Hillman. That Sheldon should compare his neologism to the Freudian castration complex is interesting, for animectomy literally means “castrated soul.” The Greek *ectomy* derives from ἐκτομάζω (*ektomazō*), *I castrate, cut off, excise*, and it is occasionally used to refer to the circumcision of women. Unlike the castration complex, however, the animectomy complex is “merciful and fatal” (Sheldon, 1936: 200).

Diagnostically, the animectomy complex is dissociation from feeling-awareness, in other words, the soul. For Sheldon, *soul* means oneness, unity, union between inner wish and outer reality. In his psychological theory, Sheldon mapped out five levels, or panels, of consciousness, the lowest being that of material relations (economic consciousness) and the highest being feeling-awareness, or aesthetic consciousness. It is a dissociation from this highest panel consciousness that constitutes his animectomy complex, a dying back of the brain.

In other words, what Sheldon refers to is neither a physiological or anatomical construct, nor is it a metaphorical reference to regression to the reptilian brain. Rather it is a kind of complacency on the part of human beings who find it easier not to see and feel simultaneously a meaning and thus truly perceive and understand the world. This is not *Psychodaiktes*, the epithet of Dionysos as destroyer or killer of the soul. Neither is it *psycholethros*, the death of the soul. The animectomy complex is the end or loss of aisthesis in a person’s life, and it is with this loss that Sheldon is concerned and that he opposes with the need of Promethean will.

Influences

Sheldon’s (1936) work is influenced perhaps more by Jung’s *Psychological Types* (1921/1971) than he admits. Both draw from similar resources, including Carl Spitteler’s prose epic, *Prometheus and Epimetheus* (1881/1931). In the long run, Sheldon’s view is that if we continually practice routing out conflict and/or error, we will ourselves undergo an animectomy complex. We need conflict. In fact, it would even seem that we need error, too, in order to function and grow into the level of aesthetic feeling-awareness, to grow into soul to the extent that

in order to understand what suffering others are experiencing we need to experience or undergo something of an amputation/castration/circumcision of soul. In other words, it is suggested we pass through a symbolic dismemberment – if not death – that encourages, permits, and fosters psychic rebirth. This is related to the *Ascent of Mt. Carmel* and *Dark Night of the Soul* of St. John of the Cross from a religious vertex. From a psychological one it is also related somewhat to what W. R. Bion has termed the experience of O (q.v.), the godhead or the unknowable ultimate reality that is an existential difficulty that must be passed through as a *rite de passage*, a *communitas* (q.v.) in its own right, in order to experience psychic rebirth.

There is something to be said for the experience of a psychic death in order to reap the benefits of a rebirth of wholeness within the self. In fact, Lawrence Staples (2008) in his book *Guilt with a Twist: The Promethean Way*, suggests that we must eat the forbidden fruit and bear guilt if we are to grow, steal the fire, and accept the punishment for bringing its knowledge to others. Again, this goes straight to Bion’s differentiation between “knowing about” and “becoming *being*” in his discussions concerning O. Bion argues that from the start, we’ve had this injunction from the deity in which thinking and knowledge (K) is forbidden. This is precisely what Jung was looking for in *Psychological Types* and Sheldon in *Psychology and the Promethean Will*. One could use the analogy of the computer reboot, even a complete shutdown and restart.

Polemic, Prosthesis, and Reconciliation

Sprinkled throughout *Psychology and the Promethean Will*, as well as given a fair-sized portion, is somewhat polemical writing on what Sheldon terms “waster culture.” Loud, monotonous music, art that fails to transform the beholder (one thinks of similar mild fulminations in Castoriadis (1999/2007) with regard to art and institutions in this vein), and philosophy that has lost its brotherly love for Wisdom. Today such waster culture is apparent in the proliferation of MP3 players, text messaging, multitasking cellular telephones, gothic and other subcultural pursuits, and reality television programming. If anything, Sheldon’s polemical style is meant simply to grab our attention and shake us out of uncritical apathy, much as Freud (1913/1950) attempted to do with his critiques of the caricature of religion, art, and philosophy.

If an animectomy complex is, as Sheldon defines it, a repressed fear of the amputation of soul, then reparations via psychology would be mere prostheses, attachments or

applications via proposition and projection. The cognate of prosthesis, *prothesis* (placing in public) is not quite helpful either, for this would perhaps lead to the individual's melting or dissolving back into the collective slipping into repression or unconscious, what Sheldon, following William James, called the dying back of the brain.

As to a sense of psyche as psyche becoming unconscious, Slater (2008) draws our attention to our predilection for keeping psyche at bay, which he notes is a "dislocation of psychic disturbance from psychic ground" (2008: 352). The animectomy complex is psychic numbing, absenting feeling-awareness, or aisthesis, in the face of suffering and trauma – in short, dissociation.

Even if one were to experience this "animectomy complex" as Sheldon suggests analysts do, this very well could be akin to Giegerich's (1988/2005) call to sublimate our psychologies at the risk of crossing the threshold into madness. The amputation of soul, let alone its loss, is a caricature of psychology inasmuch as Freud (1913/1950) suggests that obsessional neurosis is a caricature of religion, hysteria is a caricature of art, and paranoid delusion is a caricature of philosophy. The point being that amputation or castration of soul pushes us into critical thinking about the place of psyche in psychology. Psychology must show itself the barriers on which it can exercise its liberating power, thus doing more to help it to a better and more critical understanding of itself.

John Sanford (1929–2005) has articulated the disappearance, indeed the amputation of soul, from psychology. "Look in any dictionary or encyclopedia of psychology and see if there is a definition of *soul*. If there is one, it will only be a perfunctory one. The soul has gone out of modern psychology... almost" (Sanford, personal communication, October 11, 1992).

It is a valid point. Even Hillman and Ventura (1992) argue that in the 100 years since its inception psychotherapy is not helping to improve our world. Their critique occurs only because psychotherapy demands, even wants, at least a questioning, at most a hearing. The overstimulated post-modern information age in which we live seeks instant gratification, band-aids, less infrastructure, and pills and elixirs to cure one's ills and ailments. Depression, for example, is no longer the purview of the exponents of the talking cure; instead, we are continually bombarded with televised messages and magazine advertising sponsored by drug companies, insurance firms, and their lobbyists, who do not want time spent working through depression but rather desire the process sped up with medicines because depression is now considered a medical problem rather than a symptom of repressed psyche.

We face the problem of continuing horizontal splitting of psychology into cognitive, behavioral,

neurological, abnormal, and the like, let alone within traditionally recognized Freudian, post-Freudian, Jungian, and post-Jungian psychologies. We suffer an overwillingness to medicate, due in part to this horizontal splitting. Perhaps in certain instances whereby the working through complex psychological issues in such a climate of overstimulation and rapidly advancing technology, medicines are not only useful but necessary; however they are not the panacea the consuming public is proffered. The medicines do not help us arrive at the core or root of the problem. In all this over- and understimulation (or its deadening/numbing) there seems to be an eradication of time for reverie, reflection, meaning-making, and myth building required to make the journey toward wholeness. It would seem that the hearty endorsements of insurance companies to use more drugs than long-term "talking cure" therapy are only prostheses for amputated souls, and there is very little hope for castrated psyches, if this indeed is the impetus of meaning intended by Sheldon.

Perhaps what is called for is a reconciliation of the differential aspect of the promethean and the regenerative aspect of the epimethean. In this way, one progresses away from dying at the back of the brain (the comfort zone of merely knowing about) toward the aesthetic of becoming being. It is psychologically legitimate to accept a criticism of psychology as a negative of the negative in order to present a true positive, not unlike the Hegelian *Aufhebung*, but mere distinction between horizontal splitting of the field and its caricature in public and private practice leads to nothing more or less than further non-observance and repression of psychic phenomena. Even if it is perhaps good to put into practice the idea maintained in the apocryphal book of the Old Testament known as Ecclesiasticus (Wisdom of ben Sirach) that leisure is necessary for the development and praxis of wisdom, we do well, as Jesus ben Sirach does, neither to discount nor dismiss and marginalize those for whom dying at the back of the brain is in fact their rightful function and place in life.

The animectomy complex presupposes that we no longer throw our hat in the ring with the notion that the gods have become our diseases. If these gods are in fact no longer *absconditus* but *absentia*, what happens to the voice of the symptom? Is it forever cast heroically into the darkness where there is wailing and gnashing of teeth, or have we simply lost the ability to deal with the amputation of soul from a vertical perspective? In other words, without Eros there is no Psyche. Without symptom there is no divisibility. Without divisibility we suffer from the dying back of the brain.

So we need the courage to realize the unavoidable necessity of the death to be died by our frame of mind

(Giegerich, 1988/2005: 230). It is this that mellows us so that rebirth of the aesthetic panel might occur.

Animism

Lee W. Bailey

A Modern Tool: Tylor

“Animism” is not a religion, it is a theoretical construct that attempts to explain a wide range of religious beliefs and practices. It is a modern concept, a by-product of the theoretical dualistic division between subject and object, grouping together religious beliefs that breach or confuse

that division. Originally defined as the erroneous attribution of life or soul to inanimate objects by primitive people, “animism” was developed as a major category in “primitive” religions, a “minimum” definition of natural religion by E. B. Tylor (1832–1917) in his 1871 book *Primitive Culture*. Today a “new animism” is developing along quite different, more ecological lines.

Traditional beliefs grouped under this concept originally included the view that a person’s or animal’s shadow, breath, blood, liver, heart, or eye holds their soul. Animals have souls, and all of the earth and sky is full of souls, Some are re-incarnated ancestors, some are friendly spirits, some are hostile ghosts. One’s shadow-soul could be devoured by a crocodile. Eating an animal’s liver could transfer some of that animal’s qualities to you. Animals or things seen in dreams or visions are believed to have souls. At the moment of death, the eerie experience of seeing a life turn into a corpse suggests to many the departure to an afterlife of a soul (*anima*) that once animated, or gave life to the body. A tree may be seen as requiring placation before it can be cut, since it has a soul. Stones and gems may have souls. Ghosts and spirits of the dead are believed to populate the world and need magic, sacrifices or food to keep them alive or satisfy their potentially dangerous tendencies, such as revenge for a wrongful death. The ontological sources of the world, such as “Mother Earth” or the origin of a species of life may be perceived as souls in the world. Tylor contrasts animism, in which the soul is the origin of life, with materialism, in which matter is the origin of existence (Tylor, 1871, I: 453).

Evolution of Religion

Tylor argued that animism is the childish, primitive, lower, savage origin of all “higher” religions, in his scheme of the evolution of religion from an amorphous animism through more differentiated polytheism to anthropomorphic monotheism, all at war with science. R. R. Marrett, in his 1909 *The Threshold of Religion*, argued that an even earlier phase of undifferentiated “preanimism” or “animatism” (similar to electricity) that preceded animism. This reductive evolutionary scheme, promoted by others, such as Charles Darwin and Herbert Spencer, was often implicitly or explicitly seen as part of the August Comte’s 1822 positivist attack on religion as an early phase of illusory beliefs he called “fetishism,” that theoretically faded away in the triumph of rational modern science. Arnold van Gennep in 1909 called it “dynamism.”

Metaphysics

Tylor and others presented their schemes as “laws” of science, but they were heavily laden with metaphysical assumptions. When Tylor speaks of animism as “extranatural interference and causeless spontaneity” (Tylor, 1871, I: 3), he assumes that we know completely what nature is, and what it excludes. When he speaks of “inanimate objects,” he is picturing the world through the Cartesian lens of the subject/object metaphysic. Speaking of “cause,” he assumes that this is a universal principle that is omn-explanatory, and religion is a cognitive error. This is heavy-duty metaphysics, inflated by the narrow horizons of nineteenth-century positivist confidence in science. It is a nexus of a major ontological feud between archaic cultures and modern industrial society. Believing that souls inhabit the world outside human minds is essential to “animism,” and believing that NO souls inhabit the world outside the human mind is essential to the scientific worldview.

Attempting to make sense of the reports from cultures newly discovered by European global travelers, Tylor’s theory of animism did explain, for example, that funeral rites requiring the deaths of the wife, weapons, food, and servants of a powerful man, had some crude form of reason and practical value. Within their worldview, all these souls [*animae*] were going to heaven to serve their master’s soul. But to Tylor this kind of reason was finally subjective superstitious nonsense to be disposed of by the presumed progress of new scientific knowledge and more advanced races’ higher morality that respects human life.

Survivals

Tylor was Oxford’s first Professor of Anthropology when he retired in 1909, but his assumptions were soon eclipsed by more functional anthropology, which stressed social functions of religion rather than evolutionary progress, and psychoanalytic psychology, which saw the unconscious and symbolic side of archaic religions, rather than the early rational, practical side.

Tylor did see that animism survives in modern times, both in indigenous people’s tribal customs, such as sun-worship and divination, and in “higher” cultures’ superstitions, such as medieval witchcraft, spiritualism, and games of chance. He believed, as did many, that contemporary “savage” practices are survivals from archaic times, so they allow us to reconstruct past animism. But Tylor was

generally criticized for seeing archaic religions as too intellectual and rational, rather than emotional and intuitive.

After René Descartes proclaimed “I think therefore I am,” which helped shove previous intuitions of “animist” soul in the world aside as subjective irrationalities, these intuitions were sometimes happily dismissed as superstitions, and sometimes retained as mystical phenomena. The Romantics kept open a peek at soul in the world. Nineteenth-century Spiritualists maintained communion with what they saw as departed souls still in the world.

In the shadow of apparently triumphant industrialism, some contemporary indigenous people still hold to the archaic ontology when they say things such as “that mountain has spirit . . . ask Mother Nature to spare you some meat . . . worship the land, the ground and the stars and the skies, for they are the ones that have spirits. They are the mighty spirits which guide and direct us, which help us to survive” (Trimble, 1986: 24–47). Some cultures, as in Asia, still believe that eating a shark’s fin, rhino’s horn, or tiger’s penis, for example, can transfer some of that animal’s soul – aggression or sexuality – to you at dinner. “Bush meat” from African monkeys is still prized at some European restaurants. This demand is the source of ongoing bloody damage to wild animals. Children’s teddy bears, pets, and toys, people’s homes and home towns may be said to have souls. Such enduring childish or “primitive” practices indicate that the nineteenth century evolutionary scheme that attempted to leave “animism” in the dust of developing rationality in technological cultures was not as triumphal as some believed.

One might detect elements of animism in major religions. Anthropomorphism in general contains elements of animism, seeing generalized numinous powers as persons. In Christianity, the incarnation of Christ could be seen anthropomorphically as an embodiment of the religious instinct. Seeing certain literalist beliefs as the Devil may be seen as animist. Seeing gods as fathers, mothers, animals, or any earthy form may be seen as a form of animism. Statues, icons, and paintings, dancers, and all the many ways that spirituality is embodied may be seen as animism today. The Eastern Orthodox Christians have made a refined distinction in their debates about the presence of the divine in icons. The “essence” of God cannot be known in an icon, but the lesser “energy” of the divine may be felt. Giving spirits “spirit houses” as in Indonesia, or setting out rice balls as food for ancestors in a domestic shrine in Asia is animist. Animism survives, however refined, today, but not without continuing opposition.

Depth Psychology

Modern depth psychology has also edged toward the perception of souls in the world. On the one hand it helped rationalism strip the world of soul with its important theory of “projection.” This theory describes well how we all see out in the world what is actually rooted in unconscious dynamics. Sigmund Freud borrowed this concept from nineteenth-century culture, where theatrical *Camera Obscurae* at carnivals frightened people with tricks making pictures or actors seem to be spirits hovering in a dark room (Bailey, 1988). Similarly the “magic lantern” (now called the “slide projector”) was widely used by traveling performers to astonish and frighten people across Europe (Bailey, 1986). Ludwig Feuerbach used the concept in 1841, saying; “The personality of God is nothing else than the projected personality of man.” (*Die Persoenlichkeit Gottes ist die entäußerte Persoenlichkeit des Menschen.*) (Feuerbach, 1957: 226).

The key German word “*entäußerte*” translates “externalization,” not “projection,” but Feuerbach’s English translator George Eliot used the term “projection.” So when Freud adopted the concept in 1895 (the same year that the movie projector was invented by Edison and others), “projection” became a strong psychoanalytic image for withdrawing soul from the world, while it helped patients discover their inner lives rather than imagine their souls only in the world. While a healing concept, it also helped strip the world of animism and soul.

Sigmund Freud

Sigmund Freud opened psychology up to the meaningfulness of the unconscious psyche as a healing factor, and the importance of symbolic language for psychology, but he retained key elements of nineteenth-century materialism, such as the subjective interiority of the psyche, dynamics such as projection, and the view of religion as an infantile illusion. In psychoanalysis, the transference/counter-transference relation in therapy has evoked much heated debate about the presence of crude, infantile, refined, or even transcendent presences in the analytic container. Some see it as a necessary element in therapy, others do not. Some allow for it to become actively erotic, others do not. But it is at least analogous to animism in its unconscious perception of psychological and spiritual dynamics in the analyst-client interaction field, sometimes infantile, sometimes shadowy, but rarely missing in such an intimate alliance, for it provides an

externalization of key unconscious dynamics to be worked out, as animism does in religion.

Carl Jung

Carl Jung adopted many of Freud’s psychoanalytic discoveries, such as the meaningfulness of the unconscious psyche, but rejected Freud’s focus on sexuality as central, and his denigration of religion. He also opened his “archetypal” depth psychology, however hesitantly, a step further toward “animism.” First, Jung developed his theory of the collective unconscious, which moved psychology out of a narrow subjectivism. This expanded the psyche into a deeper and wider sense of soul in the human community and history. He also elevated mythology to a symbolic language of the collective unconscious, giving traditions such as alchemy a positive meaning denied since the Enlightenment. He also showed how myths and dreams echo each other, both coming from the collective unconscious. A key therapeutic practice is to take the motifs of a dream (e.g., virgin girl) and search for parallels in archaic myths (e.g., Virgin Mary), thus amplifying and externalizing its meanings with historical and anthropomorphic depth.

After Jung’s transforming near-death experience in 1944 (Jung, 1961/1971), which opened him to a more cosmic sense of the soul’s journey, Jung became even more mystical and worked on uncovering the deeper meanings of traditions such as alchemy. The ancient and medieval alchemists wrote about transforming base materials such as lead into treasures such as gold, and Jung realized that they were talking in code language about their own soul transformations, for example, transforming depression and death into a treasure, the “philosopher’s stone.” These were in part “projections” from their inner lives onto outer matter, but Jung tread closer to “animism” and religion. In the alchemist Khunrath he reads: “It is the Aqua Permanens, eternally living.” The “radical moisture” is animated . . . by a fiery spark of the World-soul, for the spirit of the Lord filleth the whole world.” (Jung, 1963, CW XIV: para. 50).

Jung concluded his extensive alchemical explorations with the term “*mysterium coniunctionis*,” meaning: “Everything that happens, however, happens in the same ‘one world’ and is a part of it. For this reason events must possess an *a priori* aspect of unity, though it is difficult to establish this by the statistical method” (Jung, 1963, CW XIV: para. 662).

Although Jung sought to retain his Kantian subject/object epistemology and his role as scientific psychologist rather than theologian, toward the end of his life he

repeatedly tip-toed across the border between subjectivist psychology and a mystical sense of the oneness of the world (*unus mundus*) that allowed for a refined “animism” and religion.

Jung also saw many archetypal constellations, as between parents and children, as forms of *participation mystique*, Lucien Levy-Bruhl’s term for Jung’s sense of the wholeness of archetypal collective attractions, repulsions, and identifications as with tribe, society, religion, or nation. “The all-embracing womb of Mother Church is anything but a metaphor, and the same is true of Mother Earth, Mother Nature, and ‘matter’ in general” (Jung, 1963, *CW X*: 64–71).

One form this paradoxical struggle took was Jung’s concept of synchronicity, or “meaningful co-incidence.” outside the narrower laws of causality, such as extrasensory perception, clairvoyance, or precognition. Once a patient was discussing a dream of a golden scarab (a symbol of rebirth), and at that moment, a very similar scarabaeid beetle (rose-chafer) flew to the window (Jung, 1963, *CW VIII*, 843).

Jung’s critics call these explorations “mysticism,” and in them one might see elements of animism.” The later Jung did acknowledge that he stretched the boundaries of modern science. However, the many mysteries in areas such as physics’ subsequent explorations of dark matter have become the topics of postmodern questioning of the certainty of science, for which Jung was a precursor. Moreover, Jung never lost his strong ego and ability to step back and analyze the mysterious depths of soul-in-the-world that he uncovered.

James Hillman

Of Jung’s successors, James Hillman pressed forward the issue of soul-in-the-world farther. In *Revisioning Psychology*, Hillman devotes an entire chapter to “Personifying or Imagining Things,” where he criticizes the subjectivist view of defensive projections “out there” being withdrawn back “in here” and seen as merely fictional or imaginary, understandable only for the irrational: children, primitives, or the insane. This metaphysical assumption pervading psychology he challenges and instead seeks to “penetrate the interior realm of animism. For we are in search of *anima*, or soul” (Hillman, 1975: 3). This metaphysic is the real defense, he argues, against the psychic power, not as allegories under the rule of reason, but of vital, autonomous animated images. Against this religious and psychological literalism, he urges being in the world and experiencing it as a psychological field. The

ancient Greeks did this when they personified the psychic forces in culture such as Fame, Insolence, Timing, Hope Ugliness, Friendship, Modesty, Mercy, Peace, and in the world as Dawn and Night. This poetic language is necessarily mythological, but must be rescued from its rationalist prison and released to free the soul to experience the vitality of the inner and outer worlds. Hillman says: “Subject and object, man and Gods, I and Thou, are not apart and isolated each with a different sort of being, one living or real, the other dead or imaginary. The world and the Gods are dead or alive, according to the condition of our souls” (Hillman, 1975: 16).

While these worlds of Night and Hope are within us, we also live within them. The epidemic of depression in our society, Hillman says, may well be not simply personal problems, but feelings of collective grief and helplessness about the way industrial society has ravaged the world with pollution: “I know now that a great deal of the depression I suffered in Los Angeles was due to the effect of the smog. . . (1992: 82).” Avoiding literalism, we must also see through varieties of soul-in-the-world to the deep mysteries that they disclose, the one collective world below the ordinary particulars of life – the *anima mundi* – soul of the world. This is a de-literalized, radical, and highly refined form of the old “animism.”

Thomas Moore

Thomas Moore is another archetypal therapist in the Jungian tradition who presses forward the phenomenon of soul-in-the-world. In *Care of the Soul* he says: “Our felt relationship to things” in a soul-ecology “wouldn’t allow us to pollute or to perpetrate ugliness. We couldn’t let a beautiful ocean bay become a sewer system for shipping and manufacturing because our hearts would protest this violation of soul” (Moore, 270). *Anima mundi*, he says, is not a “mystical philosophy requiring high forms of meditation, nor does it ask for a return to primitive animism (Moore, 281). In involves simply a cultivating and feeling the arts of life with depth – art, music, food, and gardens. This shift is needed to care for our souls more fully, to balance the one-sided rationality that industrial society demands.

In *The Re-Enchantment of Everyday Life*, Moore goes further and explores “enchantment,” as when one walks in the woods and feels transported by the wonder and may even imaginably feel the inward voices of the trees and waterfalls speaking. From the farm spirit to garden paradises, Moore urges industrial societies to re-awaken ancient songs in the heart of nature spirituality to head off

our ecological suffering with a radically new openness to the mysterious and enchanting depths of nature.

Many other thinkers are exploring these same themes from various angles. Martin Heidegger offers a powerful and influential new ontology of Being-in-the-world (*dasein*). Jane Goodall has shifted animal studies toward accepting the souls of animals rather than behaviorally treating them as machines. Graham Harvey is writing about a new animism, as *Animism: Respecting the Living World*. Thomas Berry is exploring a *Universe Story* that integrates theology and nature. The old animism was a way of clearing the world for industrialism of the very soul that the new animism is re-awakening, but as it develops, the new animism will engage in a dialogue with science and religion that will change both.

Anthropocentric View

Stacey Enslow

The anthropocentric view is a human-centered ideology. Christianity, Judaism and Islam are all religions that are considered to have a strong anthropocentric view. This owes to the origin mythologies shared among these religions that claim all of creation was created by God for the use of humans, as in the Biblical *Genesis*:

- ▶ Then God said, 'Let us make man in our image, in our likeness, and let them rule over the fish of the sea and the birds of the air, over the livestock, over all the earth, and over all the creatures that move along the ground.'
- ▶ God blessed them, and said to them, 'Be fruitful and multiply; fill the earth and subdue it; and have dominion over the fish of the sea and over the birds of the air and over every living thing that moves upon the earth.'
- ▶ God said, 'I have given you every plant bearing seed that is upon the face of all the earth, and every tree with seed in its fruit; you shall have them for food' (Gen 1:26–29).

In the anthropocentric view, humans are the favored children of the creator. This is in contrast to other religions such as Buddhism, which doctrinally ascribe a favored status to all beings, as in *The Lotus Sutra*:

- ▶ I cause the Dharma rain to rain on all equally, never lax or neglectful.
When all the various living beings hear my Law,
they receive it according to their power,
dwelling in their different environments. . .
The equality of the Buddha's preaching is like a rain of a single flavor,
but depending on the nature of the living being,
the way in which it is received is not uniform,
just as the various plants and trees each receive the moisture in a different manner (Watson, 2000: 46–47).

Philosophical movements, such as the Deep Ecology movement, which are expressed through radical environmentalist and animal-rights movements, favor a “biocentric” or even “earth-centric” view; in which entire ecosystems are seen as the primary placeholder of importance. In such a view, humans are only important as one factor in an interconnected web of relationships.

Anthropomorphism

Lee W. Bailey

Anthropomorphism is the portrayal of the gods and spiritual powers beyond and in the world as having human appearance and qualities. It critically reverses the saying that “humans were made in the image of God” to “the gods were made in the images of humans.” Theriomorphism is the analogous portrayal of spirits in animal form. It is an ancient, widespread aspect of religion, evident in statues of gods and goddesses as if they were human, as in Egypt (Osiris), Greece (Aphrodite), or India (Krishna). They may blend human and animal images, as in animal-headed human figures. The Roman orator Cicero (106–43 BCE) complained of the “poisonous honey of the poets, who present us with gods afire with rage or mad with lust, and make us the spectators of their wars.” But he concluded that “we must admit there are gods,” due to innate ideas of the divine (Cicero, 87–88). Anthropomorphism may criticize the former and debate the latter.

Anthropomorphism is an issue that combines both ontological and psychological elements. It appears in both natural and cultural contexts. All have thick layers of mythic expressions. (1) Ontological anthropomorphism appears in both transcendent, heavenly theologies and immanent nature religions such as the Pueblo Kachinas. Many combine the two, as with Ishtar, Babylonian goddess of fertility who lives at least part of the year in the heavens

Anthropomorphism. Figure 1 Art from W. J. Wilkins (1975). *Hindu mythology: Vedic and puranic*. Calcutta: Rupa & Co.

with other anthropomorphic deities and descends to the underworld of death. (2) Human psychological drives or archetypal images also provide ripe opportunities for mythic anthropomorphism, from heroes (Superman) to lovers (Helen of Troy) and enemies (Satan). (3) The tendency to personify powers of the cosmos and nature continue in the names of planets (Jupiter), hurricanes (Katrina), and animals (Hanuman, the Indian monkey-headed god). (4) We find the urge plentifully in cultural artifacts – puppets (Pinocchio), dolls (Barbie), and machines (android robots – The Terminator). Theologically, the questions are whether the gods are “nothing but” finite human images, whether the ultimate cosmic reality is in any way analogous to images of our planet’s life forms, whether humans can participate in a portion of the energies of the divine, or whether we can know nothing of the divine through human images. Psychologically, are anthropomorphic images inevitable? Ontologically are they necessary?

Ontologically, the question is whether or not anthropomorphic images are accurate expressions of the ultimate reality that they seem to signify. Is God really fatherly? This cannot be proven, so in religion believers must acknowledge their faith, or, if more forceful, press their orthodoxy and literalism, either tolerantly or intolerantly. Psychologically, the question of the role of imagination in perception and cognition is central, whether in strict literalism or poetic metaphor. The psychology of the unconscious since Freud helps to see anthropomorphism theoretically as an unconscious tendency that is an inevitable psychic dynamic with its own patterns, as in dream

symbolism where a human represents a dynamic, such as sex or moral guidance. Freud, however, while showing the inevitable and meaningful nature of unconscious symbols, saw them as distortions of psychological reality, and tended to interpret images narrowly to fit his theory of the sexual predominance of unconscious drives – guns as male genitals, boats as female, etc. Oedipus and Narcissus are the classic Freudian mythic anthropomorphic images. His theory of projection, rooted in Feuerbach's critique of God, offers a strong theoretical basis for understanding anthropomorphisms as symbolic externalizations of inner dynamics, such as threatening Oedipal fathers seen in social (teachers), mythic (villains), or religious authority figures (God). Can anthropomorphism be fully rejected? Should it be? These questions have been answered in a cluster of five types of arguments: the arguments that interprets anthropomorphism as disposable, necessary, analogous, personifications, or presence.

The Disposable Argument

Anthropomorphism is inevitable but unnecessary, in this argument, because it is disposable entirely in the scientific method's rigorous epistemology of eliminating subjective additions to objective reality which excludes any religion. Scientific efforts to disenchant the world attacked the attribution of human qualities to nature in order to clear the way for a more rational analysis. Zeus no longer throws thunderbolts from the heavens when science can give a better and fear-reducing explanation. Galileo's rejection of the cosmology of an earth-centered universe was so controversial because it attacked the parochialism of the anthropological assumption that humans are the center of the cosmos. Nineteenth-century anthropologists such as Edward Tylor culminated the modern attack on animism, stripping the world further of whispers of the sacred. Anthropomorphism is seen by most scientists as an outdated, distorting primitive regression of children, poets and madmen, that has been replaced by scientific method that requires its distortions to be removed from the real world known only by scientific method. The epistemology here assumes that imaginative language and its symbols have no valid part to play in rational, scientific knowledge, and that religious language can be stripped of its primitive layer. Some call anthropomorphism a "pathetic" fallacy, referring to the "pathos" (Greek for suffering) or passion in the images supposedly clouding reality.

But anthropomorphism has not entirely left the scientific stage. Scientists debate this issue in animal ethology, for example, where some name the elephants,

chimps, or whales that they study. Jane Goodall names her chimps and Katy Payne names her elephants, describing mothers, aunts, and bulls, using family analogies, blended with detached scientific analysis. They develop empathy for them and even hint at a sense of the sacredness of their existence, threatened by poachers. Those who oppose such empathy may number the animals they study to prevent empathic anthropomorphizing. But can animal behavior be understood at any depth without making analogies to our own animal feelings? Astronomers still anthropomorphize planets with names of ancient gods – Venus, Mars, Jupiter, and physicists describe aspects of dark matter as "machos" and "wimps" (Greist). The best efforts at "objectivity" have not succeeded at eliminating all anthropomorphism from science. Unconscious remnants or conscious empathy have not been shed, and perhaps cannot or should not be shed. The unconscious is difficult to eliminate in thought, and ethical considerations such as empathy for animal suffering may make some anthropomorphism ethically valid.

The ancient worldwide anthropomorphic principle of sacrifice was the portrait of divinities that required to be fed by sacrifices of valuables in order to bestow on humans gifts such as children, food, or military victory. The gradual ethical humanization of Western religions stopped this practice. Human sacrifice was rejected in the story of Abraham almost sacrificing his son Isaac, for example. Then Jewish animal sacrifice finally stopped in 70 CE, when the bloody sacrificial practices of the second temple, destroyed by the Romans, gave way to local synagogue rabbinical teaching. Christians interpreted Jesus as the "last sacrifice" to God to atone for human sin.

The disposable argument still influences theologians in a different way. Rudolf Bultmann sought to demythologize the New Testament, not just to reveal the true historical events, but to strip away the anthropomorphic mythic accidents of its environment and translate it into abstract existentialist categories for a purer theology. The myth of the Messiah becomes faith in the freedom to live an authentic life. Today some biblical scholars, such as the "Jesus Seminar" group, continue the nineteenth-century effort to find the historical foundation of the Bible by eliminating as many mythic symbols as possible. They assume that the only valid language of faith is historical, not imaginative. The problem with this approach is that it is unable to rid itself of its own embedded imaginative language.

Gender is a sore point here, when feminists accuse scientists of reserving true scientific objectivity to the male psyche, and charge theologians with still referring to God as "He," thus retaining the father myth of God. Feminists

are experimenting with using images of God such as mother, friend, or lover. Others see in science an anthropomorphic assumption that human rationality is part of the intelligibility of the universe, and can know it all (scientism). But despite its successes and empirical testing, it may be that science is able to know only a narrow range of existence, and by ignoring the rest, distorts its picture of the whole as with our images of flawed android robots. The Disposable argument depends upon conscious knowledge and neglects unconscious anthropomorphizing.

Iconoclasm, or “image-smashing” is a cultural and religious attack on images, especially of the divine. Judaism built iconoclasm into the Ten Commandments, saying “no graven images” were allowed of anything in heaven or on earth, perhaps reacting to their experience in Egypt. Similarly Islam rejects human and animal images in its art and allows only calligraphy and plant forms. Theoretically iconoclastic Roman Catholic churches are full of frescoes, paintings, and statues of Jesus, Mary, and saints. Protestants discarded numerous visual images and decorations in churches, so much that Calvinist churches were described as having only “four walls and a sermon,” stressing the “Word” rather than the visual image. All, however, use literary images profusely in their faiths – God as warrior, liberator, king, harsh judge, merciful, and above all, male and fatherly. Buddhism stands out among highly anthropomorphic Eastern religions for its theoretical rejection of anthropomorphism, although its acceptance of the Asian belief in reincarnation retains a sense of transmigrating spirits pervading all sentient beings. The iconoclastic view that anthropomorphism is disposable neglects the unconscious or unacknowledged role of imagery in culture.

The Necessary Argument

Anthropomorphism is inevitable and necessary, some argue, because it is a functional part of perception, knowledge, and religion. It provides necessary organizational frameworks that reduce chaos and fear. Imagination is a part of the way we think, and how can we avoid thinking in metaphors from our environment? For most who think this way, there is no divinity behind the images. Here anthropomorphizing is a type of imaginative projection into the world that is a necessary way of stabilizing the world. The supposed objective world cannot be fully known, only the “marked” world of meanings. They are subject to critical analysis and change, but are not all disposable. Astrological anthropomorphisms, for example, can be withdrawn as erroneous projections, but

certain symbols, such as scientist-heroes, are needed to stave off chaos, fear, and despair.

In Holland, Fokke Sierksma thought that anthropomorphic gods, such as a lawmaking, loving fatherly God are needed to complete the *terra incognita* beyond the world ruled by ego. They are needed subjective gap-fillers in a world whose depth below the subject-object divide finally eludes us. But he believes that God is dead. These psychological and theological constructs can be modified by critical thought.

Stewart Guthrie argues that anthropomorphism pervades perception for good reasons. We are predisposed, shows cognitive science, to see the human form and qualities everywhere, and the more organized these “faces in the clouds” are, the stronger perception is. The more we see what we expect to see, in familiar images and categories, the clearer and more certain knowledge or religion seems. But comfort is not a function for anthropomorphism, because some images, such as Satan, are frightening. For Guthrie, anthropomorphism is the very core of religious experience, and any religion that seeks to eliminate the gods is not a religion. For Guthrie there is no real god – the clothes have no king. This position gives more importance to anthropomorphism, but psychologically, it seeks to keep the world ruled by cognitive ego-consciousness, theoretically in control of all its worldly imaginative projections.

The problem with this view is a lack of critical flexibility. The familiarity of the frameworks makes them seem unchangeable. In technological culture, the solution to problems is too often imagined to be just more technology in the same framework (re-enforced by science fiction anthropomorphisms), not a re-examination of the assumptions of technology itself, such as the domination of nature. Much anthropomorphism is taken literally, especially in religion. Fundamentalist religions claim patriarchal privileges, because God or an incarnation of God is male and literal views of creation and social roles because it says so in the holy text. This blocks the critical flexibility of reforming outdated anthropomorphisms. Also, mainstream religions that allow some critical adaptations need to ignore old parts of the sacred text, such as slavery and patriarchy. This selective neglect can become embarrassing, as when critics point out the pervasive violence in major religious texts, which become blessings on bloody nationalisms.

The Analogy Argument

Theism is the major religious expression of the divine with human qualities. While most believers talk as if

the anthropomorphic images of the gods were literally true (e.g., God the Father), philosophers and theologians have wrestled with how this could be. Maimonides argued that God is absolute and without anthropomorphic qualities, but organs such as the heart are metaphorically used to describe God in similes to awaken a sense of “His” higher spiritual reality. The Neo-Platonic principle, that by *participation* the divine intelligible world descends into the material world, influenced many, notably the Christian Eastern Orthodox, who struggled with whether the divine is present in their icons, and concluded that earthly forms can convey the “energy” of God, but not the “essence.” Very influential has been the ancient principle of *analogia*, expressed by Denis the Pseudo-Areopagite, who wrote that creatures have the capacity to receive divine ideas, but only by analogy, or in proportions, not giving complete knowledge of God. Hugo of St. Victor wrote that the world is a book written by God, and many saw in nature the signature of God. The Roman Catholic principle of *analogia entis*, or analogy of Being, is the acknowledgement that human images are analogies, proportional images of the vast mystery of Being itself. Thomas Aquinas wrote that human qualities such as goodness are figurative and limited in proportion to God’s goodness.

In India the *Rig-Veda* (x, 90) describes the creation of four social castes – brahmanic priests, warriors and government officials, shepherds and merchants, and servants – from the body of the anthropomorphic Purusha, a sacrificial personification of the world-soul. Thus the entire caste system is justified on an anthropomorphic analogy. Later Vedantic gurus mingle anthropomorphisms such as Ishvara (Brahman with qualities) and Brahman as the ground of all physical experience, but stress the underlying oneness of all existence in Brahman (Radhakrishnan and Moore, 1957: 507).

The subtle quality of the analogy principle makes it difficult for theistic traditions to avoid anthropomorphism. Even sophisticated theologians cling to literalisms such as the maleness of God and Jesus or the Brahmanic priestly tradition to justify a male-only priesthood. Again, unconscious anthropomorphism may overcome the best of intentions in this position.

The Personifications Argument

Anthropomorphism can also be seen as a robust type of imagination, which is acknowledged to be a full partner in knowledge and faith, a valid epistemology of the heart that is essential to a full life. In archetypal psychology there is an argument that when anthropomorphic

(or thieromorphic) images become fascinating in society, nature, culture, or dreams, they are inevitable and necessary, but not literal, archetypal personifications of the soul with important messages. They should not be seen as completely disposable or suitable for conversion into an abstraction such as “the father archetype.” One should, especially in psychoanalysis, explore the meaning of these images, for they bring important messages from the personal and collective unconscious. In imaginative conversation with these figures, one may, for example, realize that one has outgrown their childhood image of their father, may be able to forgive him his flaws, and thus release painful self-judgments, anxiety, or depression. This helps free religions of fatherly anthropomorphisms as well.

Such working with anthropomorphic images of psychic dynamics does not take the personifications literally, or translate them into conscious theories, but imaginatively engages them as meaningful expressions of real psychological forces. There is a paradoxical involved empathy, yet an ability to stand back and withdraw from the drama, think about it, and integrate it into daily life. This takes a strong yet imaginative ego able to relax and journey into the “underworld,” play with personifications without being overcome, and return to ordinary ego-consciousness.

This theory does not seek to follow overly conscious, literal scientific methods, but is used in psychotherapy, where symbolic unconscious dynamics behind conscious life are discovered and brought to the surface for conscious reflection. Archetypal theory, originating with Carl Jung, explores the depths of the collective unconscious and helps see the meanings of the unlimited range of anthropomorphic images that form an inevitable part of the soul, but do not cancel religion. Archetypes are unconscious, collective psychological patterns on a continuum with biological instincts. How, for example, does the psyche experience terror and evil? Jungians emphasize the strong role of shadow figures, often anthropomorphic, mythic images of evil: Satan, Hitler, villains, monsters, beasts, Frankenstein, the terrifying, repressed “other.” For Jung they show that in analysis one typically confronts the secret shadow (e.g., bad parent) and hopefully finds a treasure in it (e.g., good parent). Each archetypal pattern has its shadow. The lover Jung described as the *anima* (a man’s dream mother, lover, or shadow witch), and the *animus* (a woman’s dream father, lover, or shadow beast). Contemporary archetypal feminists let goddess images express the wide range of feminine roles.

Jung emphasized the central, regulating role of the Self archetype, which he saw as an image of psychological

divinity with innumerable symbols, such as the abstract mandala circles, animals (lion “kings”), nature (mountains, precious stones and metals), and humans (avatars, incarnations, prophets, priestesses, innocent children). This symbolic flexibility in expressing divinity opened many doors for theology, notably the feminist goddess explorations and ecological nature spirituality.

Archetypal theory offers a valuable way of seeing anthropomorphism, free of naïve or dogmatic literalism, reductive scientism, or excessively cognitive ego-centered consciousness. It allows for anthropomorphic symbolism, but at the same time it sees it as a kind of poetic, mythical play of the soul that can be made conscious only partly, but is subject to critical analysis and change. So God the “father,” for example, is a useful way to express that aspect of divinity, but it is incomplete. The great mystery of the infinite divine cannot be reduced to one half of this planet’s human reproductive system and its mental styles. The beauty of the goddess in all her spectrum of powers and the unspeakable wonder of the universe and earth’s rainbow of pre-verbal forces – stars, stones, mountains, lakes, animals, plants, etc. – can also be seen as expressions of the numinous immensity, not just those aspects that can be symbolized by an anthropomorphic father-like God.

The post-Jungian analyst James Hillman emphasizes the value of “personifying” or imagining. He rejects the “disposable” theory of anthropomorphism for being nominalist by denying the natural validity of imaginal experiences. Personifying respects images as they appear in gods or mythic figures. Much as an author’s fictional characters develop their own realities, personifying is an immediate receptive experience. It is a way of being in the world and feeling the world as a numinous, soul-filled psychological field. Ancient Greeks and Romans personified psychic powers such as Hope, Timing, Night, and Ugliness, not as unreal illusions, but as images of real phenomena. Athens had altars to Friendship, Modesty, Mercy, Peace, Victory, and Fortune. When such powers are not given their imaginative due, they may become illnesses, Jung stressed. Personified images have feeling tones and can be cherished or may reveal shadowy truths under the covers that need to emerge. Plotinus, Michelangelo, Vico, and Blake all saw the necessity to personify mythic perspectives to understand the soul’s intentions. Distinct from the dead world of industrial society, personification lets the world speak. Moonlight becomes love, dream villains demand attention and transformation, and gods offer salvation from suffering. Personifying is natural and only de-mythologizing is un-natural, Hillman argues. People may fear a personified world as a child

fears the dark, but befriending the stories as imaginative expressions of deep forces of the collective soul is transforming, like a child’s security doll or popular adult heroes who conquer evil. Anthropomorphism may be a necessary way of charming fearful strangeness out of the world.

Gods symbolically express deep and powerful collective forces that are inevitably experienced as human in appearance and qualities, but at the same time if not literalized, they can be taken into the imaginative psyche for what they can provide. The monotheistic God is not a literal father, but the father-ness of “his” image offers an image of life-giving, nurturing, loving moral guidance, just as the goddess offers “her” life-giving, nurturing, loving moral guidance with a different emotional tone, perhaps dancing rather than fighting many-armed gods express their many manifestations. These autonomous images are both in us and we are in them. They reduce the hard-nosed, literal influence of cognitive ego-consciousness and draw us into their enchanting world under the surface of control. We can interact with their different aspects and be transformed by them, taking up karate or dance, love or forgiveness, as they suggest. This process of soul-making requires faith in their powers, not as literal people out there or back then, but as personified soul-in-the-world. This is a difficult but stimulating challenge for industrial consciousness and theism.

The Presence Argument

The most abstract theoretical response to anthropomorphism goes beyond iconoclasm and personification to an affirmation of the mystical presence of an impersonal ultimate reality, not a thing because it is the source of all things, beyond yet within— *neti, neti*, not this, not that, say the *Upanishads*. This *theologia negativa*, points to the divine darkness, the cloud of unknowing, the deep mystery beyond all human images and knowledge. Some speak of a pure consciousness, difficult to perceive and articulate, subtle and quiet, but deep enough to transcend various religions and provide a foundation for the many images and theologies. Meditation is their common practice. Eastern traditions more readily differentiate between higher and lower forms of religious practices. In Hindu Vedanta, the Absolute is impersonal, and personalist theism and *bhakti* devotion is seen as a lesser practice. South Asian traditions commonly distinguish between conventional truth and absolute truth. Be still and know, say Buddhists such as Thich Nhat Hanh. The Zen monk meditates with an anthropomorphic statue of the

Buddha, yet seeks Nothingness. Find your own face before you were born, they say, and find ways of speaking of the great mystery that are original and authentic for you. This is a difficult challenge. This path is atheistic, in the sense of denying (but tolerating) the need for theistic personal images in the quest for ultimate spiritual reality.

This position acknowledges that for most people, images of divinity are inevitable and necessary, but for those who undertake deeper practices, the masks of the gods fall away and an ineffable, powerful experience of ultimate reality emerges that is beyond words and pictures. This “apophatic” position sees images as useful approximations, but disposable earthly images that must be set aside. Images of “light” are common here, or philosophically, abstractions such as Being, Presence, Emptiness, or Buddhmind.

Plato sought to purge philosophy of anthropomorphic Greek gods with his abstract ontology of Being, but he also told many myths, such as a creator god (*Plato, Timaeus* 69b). Michel Montaigne summed up a long debate, writing that

- ▶ The least-known things are the fittest to be deified; wherefore to make gods of ourselves, like antiquity, passes the utmost bounds of feeble-mindedness. . . . But to have made gods of our condition, the imperfection of which we should know, to have attributed to them desire, anger, vengeance, marriages, generation kinships, love and jealousy, our limbs and our bones, our fevers and our pleasures, our deaths, our burials – this must have come from a marvelous intoxication of the human intelligence (Montaigne, 383).

Nineteenth-century religion scholars envisioned an evolution of religions from naïve animism and anthropomorphism, as with the Egyptian gods with animal heads, upward to an iconoclasm that purified religion into a more abstract theistic god that retained personal qualities. But such a preliminary evolutionary schema is not valid, given the continuing multiplicity of religious forms today. Mystics commonly stand for the “presence” position, emphasizing cosmic mystery and the importance of the presence of ultimate reality found in experience over theorizing. Meditation, near-death experiences, and visions are common ways that this ineffable presence is experienced.

Buddhism is noted for its emphasis on simply sitting quietly in meditation, cultivating mindfulness and clearing the mind of worldly distractions, awaiting the appearance of the un-nameable. Images such as statues of the Buddha, incense, robes, and traditional monastic

practices, especially meditation, are central, but the awakening cannot be forced by form. Poetic, original, paradoxical names such as “the sound of one hand clapping” are honored as creative approximations, but not dogmatic concepts that harden cognitively and lose their energy. The bottom drops out of the ordinary ego and compassionate energy floods the humble practitioner who is grasped by a power beyond anthropomorphic representations.

One aspect of this approach is sometimes the attempt to leap over the passions, emotions, and grief of the normal ego and transcend them, rather than wrestle with them, as in psychoanalysis. Equanimity in the face of suffering, indulging in neither pleasure nor pain, are the goal, in contrast to the Western post-Freudian encounter with the unconscious soul on the way to transcendent peace. Some, such as Jung, say that, no matter how spiritual, any effort to leap over the passions is mistaken.

Anthropomorphism is a natural and strong human way of trying to make sense of the world. Some embrace it, consciously or unconsciously. But it can interfere with the search for truth, and needs critical detachment to prevent its limiting control of thought or belief. Critics who seek to eliminate anthropomorphism entirely should acknowledge the difficulty of knowing nature and ultimate reality behind the images of unconscious mythic dramas. Psychological personification and meditative wisdom point beyond literalism and abstract rationalism to poetic and pre-linguistic experiences that may ring with echoes of a far but near power.

Antichrist

Bobbi Dykema Katsanis

Introduction

Antichrist, at the most basic level of understanding, is simply any opponent of the Christ (q.v.), or, more commonly, *the* ultimate final opponent of Christ. This figure embodies all that is antithetical to Christ, Christ's teachings, and Christ's salvific action in the world as Christians understand these concepts. While based in a few rather obscure passages of Christian scripture, the concept of Antichrist and accompanying narratives and descriptions about Antichrist's identifying characteristics, deeds and context have developed in a long and rich tradition from the earliest days of Christianity.

Antichrist is mentioned as such only once each in two of the three epistles of John in the Christian New Testament. However, Christian theologians from very early on began associating Antichrist with the Beast described

in the scenes of final judgment in the Apocalypse (q.v.) of John (also known as the book of Revelation), as well as with apocalyptic imagery in the Hebrew Scriptures book of the prophet Daniel, and with brief apocalyptic moments in each of the four canonical Christian gospels. The main thrust of the Antichrist story is that in the final years of life as human beings know it on Earth, Antichrist through his charismatic powers of deception will come to hold sway over the affairs of humankind for a period of seven years. At the end of this period, Antichrist will ultimately be defeated by Christ and condemned to eternal torment in the lake of fire, after which all people, living or dead, will be subject to final judgment and either eternal reward or punishment for their earthly deeds and faith (or lack thereof). Adele Yarbro Collins relates Antichrist imagery to a primeval "combat myth" of cosmic struggle between good and evil at both the beginning and end of the world.

The earliest influential expansion of the Antichrist legend beyond scriptural accounts was originally entitled *A Little Book on Antichrist*. This tenth-century work by the French Cluniac abbot Adso describes the figure's identifying characteristics and context in detail. Many later writers continued to embroider upon the legend, bringing the Antichrist narrative to a level of detail on par with that of the vitae of many important Christian saints. Joachim Fiore (1135–1202) developed a three-phase system of the final days in which Antichrist would reign over the last few years of human life on earth, and Dante's *Inferno* associates Antichrist with those who have committed the sin of simony, i.e., selling ecclesial office for profit. The Antichrist narrative gained peak traction during the Protestant Reformation, when reformers such as Wyclif, Hus, and especially Luther hurled the polemical language of Antichrist at their religious opponents, primarily the papacy.

Further developments of the Antichrist legend in the modern period have been more subdued; yet the legend still carries weight, particularly with American Christian fundamentalists. The Zionist movement in the state of Israel has been associated with aspects of the apocalyptic narrative of Antichrist in the writings of Hal Lindsey (*The Late Great Planet Earth*), and of Jerry Jenkins and Tim LaHaye (the *Left Behind* series of novels, films and television shows). Important modern literary and filmic treatments of the figure of Antichrist include Dostoevsky's Grand Inquisitor in *The Brothers Karamazov*, and Roman Polansk's adaptation of the Ira Levin novel *Rosemary's Baby*. The figures of Sauron and Saruman in Peter Jackson's adaptations of J. R. R. Tolkien's *Lord of the Rings* trilogy also function as important.

Antichrist figures in the popular imagination, as do horror-genre versions such as Stephen King's *The Stand*.

Description

Antichrist is characterized primarily as a deceptive figure whose main danger is his charismatic ability to lead some, but not all, faithful Christians astray. The reign of Antichrist over human affairs in the coming period of “end times” will be marked by persecution, oppression and tyranny, and by various “signs of the times,” including war, earthquake, famine, and disease. Antichrist has been specifically identified by contemporaries with various tyrannous figures in history, including Antiochus IV, Nero, Henry II of England, the Holy Roman Emperor Frederick II, Pope John XXII, Napoleon Bonaparte, Benito Mussolini, and Saddam Hussein, and collective figures such as “the Jews.” Interestingly, Adolf Hitler appears less often in contemporaneous Antichrist rhetoric than does Mussolini; the careful interpreter of biblical and developing Christian Antichrist mythopoetics in any age would not have failed to note that Antichrist is traditionally associated with Rome, Babylon, and Jerusalem, and not with the barbarian lands to the north. In other strands of the tradition, Antichrist is geographically associated in more general terms with Empire, in which case the Third Reich is a classic example of intuitive free association with this aspect of the legend.

Other figures associated with the Antichrist legend and mythos include a messianic Last World Emperor whose rise to power is a harbinger of the arrival of Antichrist; the Beast or seven-headed dragon, who is often equated with Antichrist, in whole or in part; the figure of the False Prophet, who serves as Antichrist's public relations associate; and Gog and Magog, who are variously identified as specific figures or, alternately, as regions from which Antichrist may come; during the Cold War era American Antichrist discourse often identified Gog and Magog with the nation of Russia.

The figure of Antichrist exists in a matrix of tensions. Various readings and interpretations of the figure have emphasized either a more symbolic or a more literal understanding; an understanding of Antichrist as either an interior tendency within the human psyche or an external enemy; a collective or an individual understanding; and so forth. An important distinction must be made between Antichrist and Satan. Antichrist is a powerful and charismatic *human* opponent of God. Satan, while also powerful and charismatic, is characterized in Jewish, Christian and Muslim scriptures as a celestial opponent

of God, specifically a fallen angel. Conversely, Antichrist will ultimately be defeated by Christ, but the actual death blow might be dealt by Christ's agent the archangel Michael, allowing the figure of Christ himself to never be associated directly with the irredeemable downfall of any human person.

Psychological Significance

Religious historian Bernard McGinn has characterized Antichrist as a “projection of irrational fears about enemies.” The historical use of the Antichrist legend to demonize enemies, delineate boundaries of identity, and understand rapid and frightening cultural change is thoroughly documented in theological and, to a lesser extent, psychological and historical literature. The figure of Antichrist has often been used as a rhetorical device to mobilize the faithful in defense of orthodoxy or toward renewal of community life. Antichrist language often appears in the context of communal conflict or anxiety about powerful charismatic leaders both religious and political, such as the pope (Great Reform and Reformation periods); or the emperor in various moments of consolidation of civic power in the Western and Christian world.

The call to watchfulness and mobilization on the part of believing Christians occasioned by the proximity of Antichrist may provide meaning and stability in times of crisis, uncertainty and fear. Certain aspects of contemporary secular rhetoric also partake of some aspects of apocalyptic and/or Antichrist imagery, such as current fears regarding global warming and all-out nuclear warfare; while the groups and individuals engaged in public and private discourse on these concerns do not necessarily identify specific contemporary figures as Antichrist, the emotional appeal to a dualistic system, in which one group is destined for salvation and the other associated with the ultimate enemy, is at least occasionally a feature of such discourse. An internalized Antichrist, by contrast, does the psychological work of explicating the human impulse toward evil thoughts and actions and the existence of evil in the world. For at least some Christian believers, the figure of Antichrist is important in the context of divine intervention in human history, and only makes sense when coupled with a linear and progressive (or anti-progressive) understanding of history. The figure of Antichrist is used as a way of defining deviance and policing the boundaries of acceptable behavior, as well as imbuing quotidian human affairs with cosmic significance. Manifestations of Antichrist rhetoric may be identified by such common markers as: polemical

language; prophetic utterances describing the future; popular anxiety, stress, or strife, often denoted by persecution complexes or actual persecution; purposeful targeting of suspect groups by those who believe themselves persecuted, which can include parties from either or both sides of a specific conflict; and parodies of the main tenets of the vitae of the figure of Jesus Christ.

Jung (q.v.) characterized Antichrist as a personification or manifestation of the essential shadow side of, rather than simply a privation of, that which is good. Thus, ignoring or refusing to confront the existence of evil personified by Antichrist as a component of that which is good can be just as psychologically damaging as ignoring the good itself. For Jung, the figure of Christian is “parallel to the psychic manifestation of the self”; therefore Antichrist is the self’s shadow-side manifestation. This paradox is necessary because for Jung, light and shadow must be in balance in human self-understanding to ensure the psychological health of the whole person.

While Freudian psychology (q.v.) does not necessarily deal specifically with an Antichrist figure, elements of the conflict between Eros and Thanatos (q.v.) tend to be present wherever Antichrist themes are drawn into public and religious discourse. Robert Fuller has characterized Antichrist language as an outward manifestation of human fears of strong emotions, pleasures and lusts. Emotions are channeled through religious symbolism and in symbolic terms, helping the individual and community to deal with otherwise unacceptable feelings and behaviors. Antichrist embodies that which is taboo, becoming a demonization of hidden or unconscious desires and externalizing the struggle against seductive ideas and disloyal thoughts. Additionally, the scatological and erotic components of Antichrist rhetoric point toward a possible developmental-psychology understanding of the figure of Antichrist.

Bruno Bettelheim has suggested that the dark, erotic and/or violent aspects of children’s fairy tales serve a vital developmental purpose in slowly acclimating juvenile minds to the real terrors of the world outside the nursery. Given the titles and styles of certain important historical Antichrist, such as Adso’s “Little Book on Antichrist” or the 1521 Reformation pamphlet *Passional Christi und Antichristi*, it is possible that Antichrist legend has historically been a component of the religious and psychological developmental education of children.

The often conservative and even reactionary uses of Antichrist rhetoric seem to imply that Antichrist language might be useful to communities that find themselves in cultural opposition to intellectual trends, whose truth claims are subject to cognitive dissonance with modern scientific and technological understandings of

the physical world. That Antichrist will ultimately be defeated reassures the Christian believer that God is in control of human affairs and that in the end evil will not prevail.

Jewish

While a discrete figure identified as the ultimate human opponent of God has not been an important part of Jewish tradition, the Jewish figure of Armilus also draws upon the apocalyptic imagery in the book of the prophet Daniel. However, no such figure appears in Jewish writings before the Second Temple period, and Armilus is not attested to by name before the seventh century, appearing in the Targum to Isaiah. There he is described as the offspring of a coupling between Satan and a beautiful stone statue of a female human being. In the Midrash, the eschatological role of Armilus is to slay Messiah ben Joseph, after which he himself will be slain by Messiah ben David.

Islamic

Similarly, the Islamic figure of the Dajjāl, while functioning in similar ways to the figure of Antichrist in Christianity, perhaps carries rather less weight in Islamic traditions than the Antichrist figure does in the Christian imagination. The Dajjāl does not appear in the Qur’an, but develops in the *hadith* or sayings concerning the prophet Mohammed. The Dajjāl figure is a false last prophet, a bizarre human monster who attempts to lead the Jews in conquest of Islamic lands, but is ultimately defeated, usually by Jesus.

Anti-Semitism

Daniel Burston

Christian and Nazi Anti-Semitism

Anti-Semitism (or, as some say, Judaeophobia) is an amorphous but remarkably persistent form of religious and racial prejudice. While some scholars trace it to pagan sources (Manetho, Tacitus, Ovid, etc.), most stress its Christian origins. Generally speaking, Christian anti-Semites believe that Jews, unlike Christians, are a distinct “race,” with specific “racial characteristics,” such as darker skin and hair, a large, hooked nose and a grasping, materialistic, and decidedly tribal outlook on life that is the opposite of the noble Christian ideal, which aspires to spiritual universality. It is because Jews allegedly possess

these odious (physical and spiritual) characteristics that they reject Jesus as the Messiah and are responsible for his Crucifixion. Nevertheless, some anti-Semites say, Jews can redeem themselves and overcome their hereditary guilt by renouncing their ancestral faith and embracing Jesus as their savior. If they do, they are saved, and worthy of (grudging) inclusion in the Christian community. According to the Nazis however, faith (or the lack of it) is utterly irrelevant. The Jews' hereditary or "racial" characteristics loom so large in the Nazi imagination that someone's theological frame of reference simply does not matter. Thus in Nazi Germany, you could be an ardent Catholic or Protestant. But if you had one Jewish grandparent, you were labeled Jewish, and were to be transported to Auschwitz in due course.

Though the Nazis thought of Jews as "Semites," the truth is that Jews are not a "race" any longer. Indeed, when the term "anti-Semitism" was first coined in by Wilhelm Marr in 1879, it was already an anachronism. Long ago, Jews were in fact a Semitic people, as our common language, Hebrew, attests. But the phrase that occurs so frequently in our liturgy, *Am Israel* – "the people of Israel" – no longer refers to a discrete ethnic or racial group. It now refers to a community of believers that is as racially diverse as Christendom or the Muslim *umma*.

One reason that Christian anti-Semitism is so baffling is that Jews and Christians have so much in common. One conviction we share, rooted in Genesis, chapter 1 (verse 21), is that each and every human being is made in the image and likeness of God (Genesis 1:26). The practical upshot of this belief is our shared emphasis on the oneness or unity of the human species, on the one hand, and on the worth and singularity of each and every human being on the other. In addition, Judaism and Christianity converge impressively in their emphasis on the virtues of justice and mercy, and their desire to foster a truth-loving disposition among the faithful.

Another core conviction we share is the virtue of *courage*, which both Christians and Jews associate closely with another trait, namely *faith*. Jews and Christians claim that their faith gives them the courage needed to live a life based on justice, mercy and a truth-loving disposition, or to continually aspire to live in harmony with these values when we fail, as we all do, from time to time. In addition to courage, we place considerable emphasis on two other virtues, fidelity and humility. A synonym for fidelity is faithfulness, which carries the implication that those who are unwavering in their loyalty to their God are also full of faith. So, for Jews and Christians alike, courage, fidelity and humility are virtues which pivot around the central experience of faith.

Why do Judaism and Christianity share these core convictions? Because they were rooted in the religious environment that Jesus grew up in. Nevertheless, many Christians still subscribe to the mistaken idea that Jesus first taught or inspired this kind of faith, while the Jews were lacking in these attitudes and sensibilities, being robotically enslaved to "the law." This persistent fallacy is subtly anti-Semitic, and when coupled with the claim that the Jews are collectively responsible for the death of Jesus, constitutes the core of Christian anti-Semitism. That being so, it is important to stress that the habits of the heart that pious Jews and Christians share today were simply Jewish in the first instance. The gospels are strangely silent on Jesus' religious education, but he must have absorbed these ideas with the very air he breathed, and probably from some of the same Pharisaic rabbis the New Testament roundly condemns for their lack of realism, generosity, and spiritual authenticity. That is what most scholars believe, anyway (e.g., Crossan, 1996).

The belief that the Jews are collectively responsible for the death of Jesus may have been brewing for a century or so before it was finally published in 167 AD by Bishop Melito of Sardis. This claim was not formally repudiated by the Catholic Church until the Council of Trent (1545–1563). As subsequent history attests, however, this important declaration of principles had little impact. In response to Kristallnacht – in which the Nazis terrorized the entire Jewish population, killed almost 1,000 Jews, and transported another 30,000 to concentration camps, in Germany and Austria on Nov 10, 1938 – Pope Pius XI began composing an encyclical condemning anti-Semitism, but this was canceled by his successor, Pius XII, presumably to protect the Catholics living under Hitler's power from retaliatory measures he might have taken. As a result, it was not till after World War II, at the second Vatican Council (1962–1965) that the Catholic Church reiterated its stand on this matter, and started serious efforts to combat anti-Semitism in its own ranks.

Meanwhile, according to many historians, Kristallnacht, which foreshadowed the horrors of the Holocaust, was timed – at least in part – to coincide with Martin Luther's birthday on November 10. Despite the refreshing philo-Semitism he espoused in 1523, when he published "*That Jesus Christ was Born a Jew*," Martin Luther (1483–1546) was bitterly disappointed by German Jews persistent refusal to join his Church, and became bitterly anti-Semitic. Indeed, he explicitly called for violence against Jews in tracts like "*On Jews and Their Lies*" (1543) and many public speeches toward the end of his life (Horkheimer and Adorno, 1941; Burston, 2007).

Anti-Semitism and Islam

A similar trajectory can be traced in the career of Muhammad (570–632). Though the founder of a new religion, rather than a Christian reformer, Muhammad initially bade his followers to pray in the direction of Jerusalem, in honor of Abraham, and started preaching in Arabia full of proselytizing zeal and good will toward Jews, which turned sour as he grew older, issuing in frequent bursts of anger and occasional campaigns of violence (Medina in 625, Khaybar in 628). Consequently, there are passages in the Koran which revile Jews, and some which can plausibly be interpreted as providing religious sanction for *jihad* against them, simply for being Jews. That said, in 638, after the death of Muhammad, Muslim rulers invited Jews back to Jerusalem – against the wishes of the Christian Patriarch. With a few notable exceptions, Muslim rulers were more tolerant of Jews than Christian rulers were until the 1880s, when pogroms in Russia and elsewhere in Eastern Europe prompted the first wave of Zionist settlers to settle in Palestine. Ever since then, Muslim anti-Semitism has intensified, and become intricately intertwined with anti-Zionist sentiments and beliefs and a widespread tendency to Holocaust denial. Nowadays, when Christian anti-Semitism has abated somewhat in the West, radical Islamists continue to communicate and co-operate with left and right wing extremists to keep the whole sordid thing going.

Anti-Semitism and Psychoanalysis

Anti-Semitism had a profound impact on the history of psychoanalysis. The young Sigmund Freud had his heart set on becoming a research neurologist, but was deterred from that goal in 1885 by the quotas set on the number Jewish University Professors permitted to teach by ordinances passed by Vienna's notoriously anti-Semitic city council member, Karl Leuger, who became mayor of Vienna from 1897–1910. Leuger was an ardent Catholic whose ideas and activities contributed mightily to Freud's anti-Catholic animus. Had it not been for Leuger's civic ordinances, Freud might never have traveled to Paris to study with Charcot, and psychoanalysis might never have been created! (Frosh, 2005).

Somewhat later, in 1907, Freud "anointed" C. G. Jung, the son of a Swiss minister, as his heir apparent, provoking anger and consternation among his (mostly Jewish) followers, because he thought that Jung's growing stature in the world of medical psychiatry would deflect anti-Semitic criticism of psychoanalysis as a "Jewish science." These hopes were short lived. The relationship between

Freud and Jung dissolved in mutual anger and disappointment in 1913, and after World War I, Jung started to characterize Freudian psychoanalysis as a "Jewish psychology" in racist journals (Adams and Sherry, 1991; Samuels, 1991). After World War II, Jung angrily rejected the charge that he was anti-Semitic, though it was not merely Freudians who thought so. Erich Neumann, one of Jung's closest followers, and a Zionist as well, broke with Jung in the early 1930s because of his involvements with National Socialism. In *Eclipse of God*, Martin Buber accused Jung of neo-pagan tendencies that are predicated on a hostility to monotheism, and to Judaism in particular (Buber, 1952). In retrospect, like many highly educated Protestants of his era, Jung harbored both philo-Semitic and anti-Semitic tendencies. However, his struggle with Freud, and Freud's rigidity on matters of theory and practice, probably tipped the balance of his sympathies in a predominantly anti-Semitic direction for many years (Hogenson, 1983; Burston, 1999).

Quite apart from its impact on the lives of notable theorists in the field, anti-Semitism has been an object of study for several generations of psychoanalytic theorists. In 1938, Freud published *Moses and Monotheism*, which purported to explain anti-Semitism as a result of sibling rivalry and Freud's phylogenetic fantasy of the primal parricide. However, as ingenious as it was, Freud's book was highly speculative, and simply could not account for the devastating ferocity of the Nazi onslaught. Many questions remained, and in 1946, Ernest Simmel edited an anthology entitled *Anti-Semitism: A Social Disease*. More recently, in 1988, W. Bergmann published *Error Without Trial: Anti-Semitism in Psychoanalysis*. Meanwhile, just before World War II, the Frankfurt Institute for Social Research launched a psychoanalytically informed European anti-Semitism which was full of probing philosophical reflection, but utterly oblivious to the religious/theological underpinnings of anti-Semitism in the pre-modern world. This project culminated in the creation of the "A" (or anti-Semitism) scale in Adorno's monumental study, *The Authoritarian Personality* (Adorno et al., 1950). According to Adorno et al., anti-Semitism is highly correlated with religiosity and pro-fascist tendencies among American in the Cold War era. Left wing anti-Semitism, which dates back to Marx's infamous essay "*On the Jewish Question*" (1845) – and which has grown enormously since 1967, in conjunction with Islamic fundamentalism – was not even mentioned in this context.

Anti-Semitism is a baffling, protean and extremely resilient phenomenon - one that is not likely to disappear any time soon. While no single theory to date can account for all its diverse manifestations, everyone interested in

psychology and religion ought to ponder its meaning and origins for themselves.

Anxiety

Allan Hugh Cole, Jr.

Anxiety is a common condition that presents in multiple forms and affects emotional, cognitive, physical, behavioral, and relational states. It includes feelings of uneasiness, worry, fear, apprehension, nervousness, and distress, and also longing, aching, and yearning. Anxiety may

also involve difficulty concentrating, ordering thoughts, speaking, and erratic conduct. A natural reaction that prepares one for responding to perceived dangers, anxiety can serve a protective function. Chronic or severe anxiety causes emotional distress, obsessive thinking, compulsive behaviors, relational struggles, and generalized restlessness. Anxiety often coexists with depression, and these exacerbate one another. Similar to depression, sources of anxiety, its effects, and its relief may be psychological, physiological, or religious in nature.

Studies indicate that approximately 13% of adults between the ages of 18 and 54 suffer from an anxiety disorder (NIMH, 2004). Other studies indicate that between 25% and 33% of the population will experience significant anxiety-related problems (Craske, 2002). A survey of primary care physicians conducted in the late 1990s found that 33% of office visits were prompted by some type of anxiety (Hallowell, 2001). Studies have shown further that anxiety disorders affect women (30%) at higher rates than men (19%) (Crowe, 2004), although this disparity likely reflects underreporting by men. Anxiety disorders, like depression, affect adults over the age of 65 at higher rates than younger populations (NIH, 2003; NIMH, 2004). Anxiety among older adults is often associated with decline in health, functioning, independence, and economic stability, role loss, and increasing numbers of interpersonal losses.

There are 12 types of anxiety disorders (American Psychiatric Association, 2000). The most common include generalized anxiety disorder, panic disorder, obsessive-compulsive disorder, specific phobia, and social phobia. Agoraphobia, which involves anxiety about places or situations from which fleeing is perceived as difficult or embarrassing, is not a anxiety disorder per se, but rather is associated with other stated anxiety disorders.

Anxiety differs from fear. Fear is tied to an identifiable source of perceived danger, such as a specific person, object, or situation. Anxiety lacks a specific source. It involves a pervasive, yet objectless or vague, threat to one's wellbeing (May, 1996). Most people find it easier to manage fear than anxiety. Because the source of fear can be identified, one may avoid, compensate for, or exert some control over it, whereas because the source of anxiety remains somewhat uncertain, one lacks a sense of control. Anxiety also differs from worry. Although anxious persons often worry, this is only one effect of anxiety.

Psychoanalytic Theory

This theory began with Sigmund Freud (1856–1939). He placed anxiety at the center of human motivation,

experience, and psychological difficulty. His most mature theory held that anxiety arises when one feels helpless in the face of a perceived threat (Freud, 1959/1989). This happens first in infancy, with the threat of losing the primary caregiver and what that person provides, including food, warmth, and comfort. As a child matures, anxiety involves threats of losing the caregiver's love and affection. Eventually, the basis of anxiety broadens to include threats of bodily injury and of losing the love or appreciation of other significant people. Childhood anxiety becomes a basis for anxiety throughout life. Present threats, as well as awareness of future ones, cause one to re-experience the helplessness known in past dangers. Anxiety signals the need to marshal adequate resources to fend off the new (or future) threat.

Freud distinguished between three kinds of anxiety (real, neurotic, and moral or social), but also points to the close relationship between anxiety and fear. *Real anxiety* is essentially fear. It is based on an identifiable threat posed by an external object or situation. *Neurotic anxiety* has to do with something unknown and that needs discovering. Freud thought that psychoanalysis demonstrates neurotic anxiety's basis in threats posed by internal drives, such as the desire for a sexual affair or seeking inappropriate control in a relationship. *Moral or social anxiety* relates to one's conscience and social expectations. This anxiety remains largely concealed from awareness by adhering to moral and social customs and expectations, and also by avoiding (repressing) unacceptable urges, thoughts, or behaviors. One may experience anxiety tied to all of these simultaneously.

Alleviating anxiety through psychoanalysis involves creating a safe environment that fosters identifying causes of anxiety without concern for disapproval or judgment. Deepening awareness of anxiety's sources and expressions, and reworking one's relationship to them, helps to control anxiety's effects.

Interpersonal Theory

This was developed by the psychiatrist Harry Stack Sullivan (1892–1949) in the mid-twentieth century. He expands Freud's principal focus on the individual's internal world (instinctual impulses, wishes, and fantasies) to include interpersonal engagement and its role in personality formation, and psychological health and problems.

Several assumptions guide Sullivan's theory. First, personality formation occurs *as* one engages interpersonally. Beginning in infancy, personality forms and emotional life operates according to interactions (communication)

with significant others. How primary caregivers respond to the infant's basic needs is paramount. Mental stress follows from inadequate communication, not only in early years but throughout life. Second, anxiety is what impedes communication. As anxiety increases, communication breaks down. Third, individuals in relationship contribute to a shared interpersonal field, so that interactions between two or more persons affect each individual.

Anxiety arises *not* from within us *per se*, but as a condition of our interpersonal field. It begins when a child senses an emotional disturbance in her caregiver and emotional disturbance that alters responsive interactions and prevents meeting the child's basic needs. The child "catches" the caregiver's emotional disturbance, which is interpreted as a form of anxiety, and internalizes it. The child becomes anxious. Trying to be responsive, the "disturbed" caregiver brings the anxiety "closer" to the child and increases anxiety for both of them. The child acts to alleviate this shared anxiety by seeking the caregiver's approval. Striving for approval leads to becoming what parents and others want as opposed to whom one wants to be. Although seeking approval leads temporarily to feeling more secure (non-anxious), this eventually exacerbates anxiety. Anxiety in childhood has lasting effects, for the same dynamic process reoccurs throughout life.

Like Freud, Sullivan placed importance on helping anxious persons explore sources of anxiety in therapy, and especially on increasing understanding of how anxiety relates to interpersonal relationships and conduct aimed at meeting others' needs and expectations. Relieving anxiety involves learning new ways of responding that focus on meeting more of one's own needs and expectations.

Sullivan also advocates for therapists nurturing anxious people interpersonally, with the goal of increasing their sense of security. Greater security fosters increased self-esteem, and helps rework anxiety-laden interpersonal patterns in a non-threatening environment.

Cognitive Theory

This theory locates the source of anxiety in one's thoughts and thinking processes. It was proposed by the psychiatrist Aaron T. Beck (b. 1921) in the late 1960s. He observed that depression and anxiety arise from certain patterns of thinking. These patterns consist of negative assumptions and beliefs. With depression, beliefs have to do with one's value, talents, and successes. With anxiety, beliefs involve the inability to remain secure amid

potential threats. Beliefs informed by operative cognitive patterns come automatically and only subsequently provoke emotions or affective states associated with them. How one thinks about experiences, including how information is processed, determines how one feels. Beck suggested that anxiety, like depression, can be alleviated by becoming aware of operative cognitive patterns and learning to replace them. “Cognitive therapy” involves identifying and internalizing less depressive and anxiety-laden cognitive patterns.

Beck recognizes the close relationship between anxiety and fear, but he understands the relationship differently than Freud and Sullivan. Beck calls anxiety a “fear episode” that involves an *appraisal* of a dangerous situation. Appraisal begins as a threat enters awareness and one immediately evaluates its potential for harm and resources to fend it off. This process suggests that fear involves a cognitive process. One must *think* about the danger. If assessment determines a lack of protective resources, fear gives rise to anxiety, which is the *emotional* process (feeling state) that follows from being afraid (the thought process). Thinking about a threat (fear) precedes feeling anxious about it. The cognitive component of fear gives rise to its affective one, namely, anxiety.

Since anxiety is a response to fear of perceived danger, as opposed to the cause of it, therapeutic efforts should not focus on anxiety itself. The focus should be identifying, understanding, and diminishing the fear that prompts the anxiety response by changing operative cognitive patterns. This involves working on how one appraises the fear that eventuates in anxiety.

Gary Emery (b. 1942) develops Beck’s principles of cognitive therapy and applies them to anxiety disorders. Emery’s view of “cognitive restructuring” involves education around five matters: (1) enhancing self-awareness; (2) modifying negative imagery; (3) modifying the affective component tied to anxiety (how it feels) to lessen its severity; (4) modifying the behavioral component tied to anxiety, especially avoidance; (5) and restructuring assumptions about three major life issues: acceptance, competence, and control (Beck and Emery, 1985).

Religious Perspectives

Søren Kierkegaard (1813–1855). The Danish philosopher and theologian called anxiety “spirit sickness.” It follows from awareness of freedom, which is given by God, and the discovery that this may be used in limitless ways.

The biblical account of “the fall” (Genesis 2–3) demonstrates that Adam was the first to experience

freedom and its possibilities. Adam acted against what God had commanded, and in doing so, Adam discovered his freedom. This discovery prompted anxiety over the ability to choose. Adam could choose what he desired but was forbidden, or he could choose otherwise. Either way, he exercised freedom. Adam’s choice, moreover, actualized the opportunity for sin, which existed in the state of anxiety (Coe, 1985). Therefore, original sin followed from weakness as opposed to defiance (Marino, 1998). One cannot defy what one does not know, and Adam did not know between good and evil before he was presented with a free choice and made it. But Adam does not relinquish responsibility for the choice that led to sin. He could have made a different choice in his state of anxiety.

Adam discovered further that one’s own freedom and choice corresponds with those of others’, including God. Kierkegaard suggests that our greatest anxiety involves awareness that God is free *not* to choose us.

Anxiety has a paradoxical quality. It involves desiring what one fears (Kierkegaard, 1837), and thus it involves much ambivalence (Coe, 1985). This quality of anxiety recalls the Apostle Paul’s description of his own struggles, “I do not understand my own actions. For I do not do what I want, but I do the very thing I hate” (Romans 7:15).

Kierkegaard suggested that anxiety plays an invaluable role for human beings. Though painful, it quickens one to faith. Anxiety remains necessary for the Christian life. It reminds one of a need for Christ, and it helps one make choices appropriate for a life faithful to Christ (Gouwens, 1996). In this view, anxiety cannot be treated in the clinical sense, but it can be understood as a gift that promotes faith and reliance upon God. This understanding assuages the destructive effects of anxiety that follow from a fear of being rejected by God.

Paul Tillich (1886–1965). A philosopher of religion, Tillich called anxiety an ontological condition, specifically, “self-awareness of the finite self as finite” (Tillich, 1951: 192). Going beyond Kierkegaard’s view, Tillich differentiated between *existential anxiety*, a basic, universal type tied to being, and *neurotic or abnormal anxiety*, which issues from basic anxiety and has specific features. Existential anxiety, which all people experience, has its source in the awareness of the possibility of nonexistence, or “threat of non-being.”

Set in human beings’ limited and dependent natures, existential anxiety tends to transform itself into fear. It seeks an identifiable and concrete object of which to be fearful, as opposed to remaining in a state of uncertainty. Unlike anxiety, there is a resource for fear, namely, self-affirmation and corresponding courage. Courage defends

against despair by “taking anxiety into itself,” such that anxious persons must cultivate “the courage to be” (Tillich, 1952). This courage for self-affirmation in the midst of threats to the self comes principally from God, whom Tillich refers to as the Ground of Being. Abnormal anxiety follows from severe existential anxiety that has not been diminished by courage and, instead, has turned into despair.

Existential anxiety receives Tillich’s primary attention. Universal in scope, it has three principal expressions. These include anxiety of death and finitude, anxiety of meaninglessness, and anxiety of guilt and condemnation (anxiety of sin). These interact and sometimes merge. Existential anxiety is overcome in authentic relationships with God and other people, which foster the courage to be.

Physiological Considerations

Anxiety often has physiological sources and effects. Like depression, physiological factors can help produce anxiety or derive from it. Physiological factors in anxiety relate to neurobiology, including how genes, hormones, neurotransmitters, other brain chemicals, and brain structures and functions interact with various body systems. Persons with anxiety disorders tend to have highly sensitive anxiety triggers. Minimal potential threats to their wellbeing prompt significant changes in neurochemical and hormone levels, and they cannot prevent an acute anxiety response from fully activating. Along with different types of psychotherapy, especially cognitive and cognitive-behavioral approaches, treating anxiety often involves medications that help maintain appropriate levels of two principal neurotransmitters, norepinephrine and serotonin.

Apocalypse

Charles B. Strozier

“Apocalypse” is a transliteration of the Greek work *apokalypsis* meaning “to uncover or disclose.” Within the Judeo-Christian tradition it means the specific ways in which God reveals himself or herself to humans. Prophecy, in turn, is the form of our access to that apocalypse, though some scholars have distinguished the prophetic from the apocalyptic traditions. In prophetism, it is argued, we are called to a change of heart, to repentance in the present, to a new way of living. It is a call to efficacy

and a challenge to change so that we can avoid catastrophe. In the apocalyptic, or the already-determined future, hope is deferred, which is why it is so often associated with the poor, the broken-hearted, the oppressed (Buber, 1954/1957: 192–207).

In that revelation that defines the apocalyptic, human history ends as God becomes fully immanent. In most (but not all) such myths, great violence is associated with this transition from the human to the divine. World-ending notions – the hallmark of apocalypse – are thus at the same time grim and profoundly hopeful. Endings are by definition beginnings. Out of violence comes redemption, renewal, hope.

In the Christian story, Jesus returns after apocalypse. This is a central message in His teachings, as for example in the Gospel of Matthew, when He describes (24:6–30) the “wars and rumors of war,” how “nation shall rise against nation” and “there shall be famines, and pestilences, and earthquakes,” how “they shall deliver you up to be afflicted” and “there shall be great tribulation,” even “the sun be darkened, and the moon shall not give its light, and the stars shall fall from heaven, and the powers of the heavens shall be shaken,” but for the faithful who survive, there “shall appear the sign of the Son of man in heaven” in great power and glory. Fundamentalists rely on a specific version of this general story, one that is more closely based on a close interpretation of the book of Revelation, the last and dramatic book in the Bible. In it a sequence of events leads from the Rapture, through Tribulation, to the story of His millennial rule following the great battle of Armageddon, past a second great battle of good and evil and into the glorious making of the new heaven and the death of death itself when Satan and sinners are cast onto the lake of fire.

The apocalyptic energizes all forms of contemporary fundamentalism, including most noisily the Christian but also importantly the Jewish and Moslem traditions. These themes include the ambivalent struggle of all fundamentalisms with modernity (which is a very different thing from a rejection of the modern project), a tendency to create social and cultural enclaves that are in a sense open on one side, an exceedingly patriarchal attitude toward women, an attitude toward texts that always moves towards literalism, often but not always an evangelical outreach, and a sense of apocalyptic doom that involves a new relationship toward violence. The general principle is that fundamentalists radically alter the faith traditions out of which they emerge but in their extremities themselves share more in common than they would ever like to admit. There is even a fundamentalist mindset, which embraces rigid dualistic thinking, is totalistic or

absolutist, moves all too easily toward a paranoid style, lives within a frame that lends it a special relationship to the divine, embraces either an actual or a potential for violence and the dispensing of the evil other, and is always apocalyptic. The fundamentalist always and absolutely yearns for the radical end of this world that will be transformed in a firestorm into some image of final redemption, peace, and eternity.

Apocalyptic ideas, however, are rampant in American culture and by no means restricted to religious fundamentalism. Everywhere there are images of Armageddon and the end, from Homer Simpson who works fitfully for the local nuclear plant, to Schwarzenegger’s “Terminator,” to the banal *Left Behind* series (LayHaye and Jenkins, 1996, 1997, 1998, 1999, 2000a, 2000b, 2001a, 2001b, 2001c, 2001d, 2001e, 2004a, 2004b). Sometimes, a genius like Don DeLillo explores apocalyptic themes in ways that bring new meaning to old forms. In *White Noise* (1985), for example, a professor of “Hitler Studies” moves through traumatic history to nuclear threat, and in *Mao II* (1991) the narrator joins the cultic frenzy of the Moonies with immersion and death in Beirut terrorism of the 1980s. Some of our most perceptive contemporary philosophers are equally drawn to the power of the apocalyptic. How can they not notice it, since it defines the most terrifying and yet sublime levels of contemporary existence? It is not surprising a new shelf of books on 9/11 has appeared filled by Jacques Derrida in 2003 (*The Work of Mourning*), Paul Virilio in 2005 (*Ground Zero*), and Giovanna Borradori in 2004 (*Philosophy in a Time of Terror*), among many others.

Hope lies in the idea of totalistic redemption. Our own successful nineteenth-century experience of abolitionism would have been inconceivable without its apocalyptic undertow, as I have argued in *Apocalypse* (Strozier, 1994). In Christian theology, as Catherine Keller has argued (1997: xi–xiv), people as diverse as Daniel Berrigan and Liberation Theologians from Allan Boesak, Elisabeth Schussler Fiorenza, and Pablo Richard read the book of Revelation as a call for the oppressed to overthrow the world in their own image. Lois Ann Lorntzen (1997), in turn, describes the apocalyptic nature of the environmental activism of Earth First!, and one could add that of PETA and the very interesting and hopeful movement of anti-globalists among young people all over the globe. Even on the less psychologically stable fringes of this movement, among the millions of those who either feel they have been abducted by UFOs or have faith in the truth of the phenomenon, the feeling among many, as the late John Mack (1995) of Harvard described it, alien beings outside of our familiar Cartesian world are

attempting to save us from our path of destruction toward collective death. Finally, people such as the German theologian, Jurgen Moltmann (1993), in *The Theology of Hope* argues for a renewal of Christian eschatology in his read of Revelation, and Catherine Keller (1997) argues passionately in *Apocalypse Now and Then* and in many subsequent essays, that the book of Revelation is a text of hope, filled with dark and ominous images, especially against women, but that the wild and poetic flux of end time images must be yoked toward our salvation.

But nor can we ignore the malevolent power of the apocalyptic and its role in the creation of “atrocious-producing narratives,” as Robert Jay Lifton (1973: 65) has put it. The book of Revelation is in this sense a very dangerous text. It is filled with images of blood running up to the bridles of the horses, of seals opening to death, of trumpets blowing violence, and of vials pouring forth destruction in three great sequences of sevens, each linked forward and backward at the endpoints of destruction. Revelation is a story of biblical genocide, with God acting, in the words of James Jones (2006), as a “Divine terrorist.” There is a logic to our aspirations toward sacred, apocalyptic redemption. Dispensing of the other in collective ways, something we call genocide, grows out of an intensely felt idealistic and moral commitment to make the world better, as Lifton (1961: 433–437). People commit individual violence for all kinds of idiosyncratic reasons, but it is the deeply idealistic goal of changing history, of correcting it, of purifying it racially and ethnically that leads to genocide. And for the most part, those who carry out exterminatory projects feel they are acting on behalf of a messianic goal or on behalf of God’s end time purposes in the world, or some variation of these motivations.

The text of Revelation is presented as a dream, which is why John writes it in the past tense, and it moves quite logically from the release of great violence at the hands of an angry God to final redemption in chapters 19 through 22. Revelation is also a survivor narrative, for the text proves simultaneously the death and torment of the other and the salvation and redemption of the elect. There are, of course, many survivor narratives, and some can become paradigmatic of the hopeful for all time. But in the apocalyptic as we know it from the book of Revelation the survivor narrative gets corrupted and turned into violence as it gets totalized, or turned into an absolute story of redemption.

Apocalyptic or endist narratives, however, are not one thing and certainly are not restricted to the book of Revelation but have themselves evolved historically, from

the Egyptian *Book of the Dead* in the thirteenth century BCE, to the early Zoroastrians some six centuries later, to the author of the book of Revelation, John of Patmos in 95 CE, and to Joachim of Fiore (1135–1202) in the Middle Ages. But in no way have apocalyptic ideas emerged more importantly than in our recent historical discovery of the ultimate power of destruction with nuclear weapons and increasingly with other biological agents. Nuclear and other ultimate weapons have changed us psychologically and spiritually in ways we are just beginning to understand. We do not need God anymore, as we have since the beginning of culture, to carry out the end. The agency shifts. Ultimate power of destruction, which along with creation is the essence of God’s divine power, is now in human hands. It changes us in ways we are just beginning to understand.

Apollo

David A. Leeming

One of the most important of the Greek gods, Apollo was the son of the high god, Zeus, and the Titan, Leto. Apollo's twin sister was Artemis. Apollo was the god of light and reason. He was associated with music and the other arts. By defeating the Python, a mythical relative of the old Mother goddess at Delphi, Apollo became known as Pythian Apollo. His defeat of the old power, like his overruling of the same power represented by the Furies at the trial of Orestes for matricide, establishes him as the symbol of patriarchal order at the center of the classical Greek world view. That order was based on the mind rather than emotion, on reason, moderation, balance, and form as opposed to what was seen as the old chthonic chaos. If the old female power was of the earth and its mortality, Apollo's was of the sky, heaven and its eternity. In his attention to social order, Apollo's concerns are not with individual worth, but with "higher values." To quote mythologist Walter Otto, "The sense of his manifestation is that it directs man's attention not to the worth of his ego and the profound inwardness of his individual soul, but rather to what transcends the personal, to the unchangeable, to the eternal forms" (Otto, 1954: 78).

"Know thyself" was Apollo's motto. As Sophocles's great Oedipus plays remind us, that motto does not refer to deep individual searching but to a public grappling to a sense of one's place in a larger world of divine and social priorities and realities.

The killing of the Python is crucial to the psychological identity of Apollo. The Python, as the representative of the earth goddess Gaia, the first deity to emerge from Chaos "in the beginning," has contact with the depths of the underworld, representing for us the chaotic unconscious. She is the logical victim of the god who takes over the Pythian oracle at Delphi and represents intellect, analysis, and consciousness. In today's world Apollo stands out on one hand as the anti depth psychologist, concerned not with the inner self but with learning one's place in society. In another sense he is the model of the process by which the unconscious is "conquered," brought to the light of day, and of the ego in complete control over the demands of libido and superego.

Apollonian and Dionysian

David A. Leeming

Since Friedrich Nietzsche discussed the Apollonian-Dionysian dichotomy in his *The Birth of Tragedy*, the dichotomy has been extensively applied by philosophers, theologians, and especially by literary critics to discussions of an essential conflict between two human

impulses or ideals symbolized by Apollo and Dionysos in Greek mythology.

Terms generally applied to Apollo are reason, order, intellect, form, moderation, and consciousness. It was Apollo, the god of light, who defeated the primordial goddess-empowered Python and installed himself as the source of oracles at the sacred precinct of Delphi. The defeat of the Python represents the classical Greek patriarchal culture's defeat of the old chthonic and chaotic goddess power of Gaia, the first-born of Chaos in the Greek creation myth.

Dionysos was associated with the earth and the world rather than the sky and the heavens. He was, like Apollo, a son of Zeus, but only a marginal Olympian. He was the "Mad God," associated with ecstasy and chaotic emotions. Dionysos is the god of the grape, of drunkenness.

It has become usual to suggest in various contexts that both the Apollonian and the Dionysian impulses need to be celebrated and kept in a state of balance. A work of art that is all form and no emotion is by definition inferior. The same could be said of a marriage or an athlete's approach to sport. Nietzsche, in his discussion of tragedy, recognized the necessary tension achieved by the presence of both the Apollonian and the Dionysian. Scholars remind us, in fact, that Dionysos and Apollo in ancient Greece were not necessarily seen so much as opposites as parts of a whole. In fact, as Apollo spent part of the year at Delphi – the navel of the Earth – Dionysos spent the other part there.

In terms of human psychology, the Apollonian aspect of our psyches is that which emphasizes order and self-control. That side is balanced by the Dionysian need to experience the emotional depths. Apollo, the god whose motto is "Know thyself," is the ego overcoming the chaotic elements of the unconscious so that an ordered, sane life can be lived. Dionysos is the need to delve into that unconscious and to experience its chaos before true individuation or wholeness can be achieved. As Dionysos descended to the Underworld and returned, the voyager into the unconscious can hope for a rebirth into an Apollonian self.

Apotheosis and Return

Alice Mills

Monomyth

According to Joseph Campbell's monomyth model of the hero-quest in *The Hero with a Thousand Faces*, there is a variety of ways in which a quest can end. The quest does not proceed at all for the person who steadfastly refuses the call to adventure. The hero may die at various points, especially during descent to the underworld. At the climax of the quest, apotheosis may occur as the hero transforms to a god. If the quest story completes the monomyth cycle of events, the hero experiences a return to society which may prove difficult. Reintegration to the familiar world of family, friends and ordinary everyday reality is hard on both sides, for the hero who has experienced the life-changing events of the quest and for those who have remained at home with little or no idea of what the hero has undergone.

Religion

In terms of religious experience, the equivalent to the hero's difficult return is to be found in life after conversion. Religious conversion involves the overthrow of previously held values, beliefs and attitudes. Having gone on this religious hero-quest and gained their spiritual treasure, converts are then likely to face the difficulty of rejoining a society that either does not comprehend or is actively hostile towards their transformation, unless they choose to renounce their earlier social and familial ties altogether. Full reintegration is not possible, as it would entail renouncing the spiritual insights gained in conversion. Remaining true to those new spiritual beliefs may well mean encountering persecution. The convert's sense of assured meaning and purpose in life can be found particularly vexatious when it clashes with a well established faith that the convert once subscribed to: of such clashes are martyrdoms made.

Boundary Issues

An equivalent to hero-quest apotheosis can be found in religions that seek for enlightenment. As Campbell

discusses, in Mahayana Buddhist belief the Bodhisattva Avalokiteshvara chooses to remain on the threshold of apotheosis until all sentient beings attain the state of enlightenment. Enlightenment is apotheosis not in terms of physical transformation but in attaining a godlike state of wisdom. According to the practitioners of Voodoo, the gods mount their human carriers without transforming them in rituals which might be understood as temporary apotheoses. Another form of apotheosis is the divine vision to which the lives and writings of mystics in many religious traditions bear witness. While apotheosis is usually a permanent transformation from mortal to divine in myth, in religious experience it is described as a temporary union of deity and human. The three religions of the book, Judaism, Christianity and Islam, are wary of apotheosis, despite their wealth of mystical writings. Part of this wariness about claiming even temporary unity between god and human derives from the Old Testament deity's denunciation of other deities. In Islam, the mystical Sufis have long been persecuted as heretics. Among Christians, wariness of apotheosis stems in part from the bloodstained history of heresy, in which devout practitioners of theologically divergent faiths each calling itself true Christianity persecuted and attempted to annihilate one another. Theological battles raged, and lives were lost, over the question of whether Christ was true man who experienced apotheosis and became god at some time during his mortal life, or true god who only appeared to be a mortal man, or simultaneously true god and true man. It was this latter doctrine that became medieval Latin church orthodoxy in the Nicene Creed, ruling out apotheosis as an interpretation of Jesus' life and death.

Psychology

Psychologists are likewise wary of claims of apotheosis. Those human beings who assert their divinity in the secular Western world are likely to be diagnosed as mentally ill and to have their symptoms controlled with drugs. Jung warns of the dangers of inflation, which he defines as occurring when a human being identifies too closely with an archetype. The problems of return from the hero-quest and reintegration into society are well-recognized issues in psychotherapy. The person seeking therapy, understood as engaging in inner quest work to examine, recognize and alter destructive patterns of behavior, may well succeed in self-transformation, profoundly altering understandings of self and the world, changing beliefs, attitudes and values. On their return these heroic

venturers into the depths of the psyche are likely to behave very differently towards their families and friends. They may be welcomed with approval or rejected, even persecuted, and they may find that they can no longer live in the old way, stay in the same relationships, keep the old friendships alive or slot back into their jobs. Whether the difficulties come from within or without, once a person has deeply changed in psychotherapy, complete reintegration into the old ways of living is no longer possible. For the therapy client as for the mystic and the quest hero, the end of the process can bring active persecution or lonely suffering along with joys beyond the imagination of those who have not traveled that path.

Archetype

Ann Casement

Archetype is one of Jung's two "signature concepts" according to the Jung scholar, Sonu Shamdasani, the other being the *collective unconscious* with which it is closely linked. Jung states that the collective unconscious is the part of the psyche which can be negatively distinguished from a personal unconscious by the fact that unlike the latter it does not owe its existence to personal experience. Whereas the personal unconscious consists for the most part of *complexes*, the content of the collective unconscious "is made up essentially of *archetypes*" (Jung, 1959: 42).

Jung first used the term "archetype" in 1919 in his paper *Instinct and the Unconscious*. He states there is good reason for supposing that the archetypes are the unconscious images of the instincts themselves, in other words they are "*patterns of instinctual behaviour*" (Jung, 1959: 44). He goes on to say: "There are as many archetypes as

there are typical situations in life” (Jung, 1959: 48). In Jung’s model, the unconscious rests on a spectrum with the archetype at the ultraviolet end and the instinct at the infrared end. These struggle and intermingle with each other in the unconscious to form units of energy and motivation that manifest in ideas, images, urges and strivings. From this it may be deduced that the psyche is located in the space between instinct and archetype, matter and spirit, the body and the transcendent mind. “Psychologically, however, the archetype as an image of instinct is a spiritual goal toward which the whole nature of man strives” (Jung, 1960: 212).

Jung combined his reworking of the problem of instinct with “Plato’s high valuation of the archetypes in his theory of forms, which was maintained through to medieval philosophy, the archetypes had been reduced by Kant to a few categories” (Shamdasani, 2003: 242). Jung frequently relates his writing on archetypes to Plato’s “eternal, transcendent forms” (Jung, 1959: 33).

Jung went on to distinguish between “the archetypic representations, and the archetype itself, similar to Kant’s *das ding-an-sich* (the thing-in-itself) which is irrepresentable” (Shamdasani, 2003: 260). Kant’s theory of knowledge divided human cognition into what it could grasp viz. the phenomenal world and what it could not, which he termed the noumenal world – the *a priori*, timeless, spaceless, and causeless entities both within and outside the psyche. Jung linked Kant’s thinking on the *a priori* entities to his theory of archetypes.

The *archetypic*, or primordial image as it was first called by him, is frequently met with in mythology and the great religions. The irruption of these archetypic images from the unconscious into the conscious realm may be viewed as the basis of religious experience and of the need for the mysterious and symbolic that underlies the quest for what Jung calls *individuation*. As Jung states: “When. . . modern psychotherapy once more meets with the activated archetypes of the collective unconscious, it is merely the repetition of a phenomenon that has often been observed in moments of great religious crisis” (Jung, 1953:36).

The analytical psychologist, Anthony Stevens, says: “Jung took the term ‘archetype’ from the *Corpus hermeticum*. . . where God is referred to as the archetypal light” (Stevens, 2006: 79). “With his theory of archetypes operating as components of the collective unconscious, Jung sought to define the living bedrock of human psychology” (Stevens, 2006: 74). The analytical psychologist, Murray Stein’s, definition of the term archetype is that *typos* means stamp, and *arche* means the original or master copy.

Bi-Polarity of the Archetype

An important influence on the bi-polarity of Jung’s concept of the archetype was the pre-Socratic thinker, Heraclitus, with his concept of opposites and *enantiadromia*, a psychological law that denotes running contrarily so that eventually everything turns into its opposite which is an archetypal way of behaving. Jung’s theory of opposites states: “True opposites are never incommensurables; if they were they could never unite. . . God himself (is defined) as a *complexion oppositorum*” (Jung, 1960: 207).

Archetype and instinct are also opposites as follows: “Archetype and instinct are the most polar opposites imaginable, as can easily be seen when one compares a man who is ruled by his instinctual drives with a man who is seized by the spirit. . . They belong together as correspondences. . . they subsist side by side as reflections in our own minds of the opposition that underlies all psychic energy” (Jung, 1960: 206). The archetype is spirit and Jung goes on to state that: “The essential content of all mythologies and all religions and all isms is archetypal” (Jung, 1960: 206). As can be seen, both archetype and instinct are deeply implicated in religious and spiritual questions which Jung affirms as follows: “Confrontation with an archetype or instinct is an *ethical* problem of the first magnitude” (Jung, 1960: 208) (Original italics).

Another pair of archetypal opposites, *anima/animus* is relevant here as follows: “The archetypal images that link the self and ego-consciousness form a middle realm, which Jung calls *anima* and *animus*, the realm of soul. In Jung’s view, polytheistic religions stem from and represent the realms of the anima and animus, while monotheistic religions base themselves on and point to the self archetype” (Stein, 1998: 102–103) (Original italics).

Spirit and instinct were united in symbolic form in the archetypal form of the alchemical *hieros gamos* or higher marriage of opposites. “. . . the symbolic has the great advantage of being able to unite. . . incommensurable factors in a *single* image. With the decline of alchemy the symbolical unity of spirit and matter fell apart, with the result that modern man finds himself uprooted and alienated in a de-souled world” (Jung, 1959:109).

The Phenomenological Approach to Archetype and Religion

The group of scholars that gathered together under the leadership of Jung at Eranos included the Romanian-French historian of religion, Mercea Eliade. He was a

phenomenologist who was interested in uncovering the archetypal structures and pattern of religious life. In his writings on religion (*Patterns of Comparative Religion* 1958; *The Myth of the Eternal Return* 1954; *Shamanism: Archaic Techniques of Ecstasy* 1964) he recognized a basic division between traditional religions such as the archaic cults of Asia, Europe, and America, and the historical religions of Judaism, Christianity, and Islam. The chief element in the former is the depreciation of history and the rejection of the profane, mundane world, combined with an emphasis on actions and things that repeat and restore transcendental models. Only those things that participate in and reflect the eternal archetypes through which cosmos came out of chaos are real in this outlook. The mode of expression in this model is in consequence repetitive.

Post-archaic or historical religions such as Judaism, Christianity and Islam tend to see a discontinuity between God and the world and to locate the sacred not in the cosmos but beyond it. These hold to linear views of history in the belief that the meaning for humankind is worked out in historical process which is seen to have a purposeful plan. For this reason, the historical religions have been monotheistic and exclusivist in their theologies.

The following statements from Jung demonstrate his archetypal approach in relation to Eliade's writings on religion: "The life of Christ is understood by the Church on the one hand as an historical, and on the other hand as an eternally existing, mystery. . . . From the psychological standpoint this view can be translated as follows: Christ lived a concrete, personal, and unique life which, in all essential features, had at the same time an archetypal character" (Jung, 1958: 88). He says Catholicism "gives the archetypal symbolisms the necessary freedom and space in which to develop over the centuries while at the same time insisting on their original form" (Jung, 1958: 465). And: "...archetypal situations only return when specifically called for. The real reason for God's becoming man is to be sought in his encounter with Job" (Jung, 1958: 397).

Criticisms and Revisions of the Theory of Archetypes

Jung's theory of archetypes has been the object of criticism from many sources including the French structural anthropologist, Lévi-Strauss, as summed up in his statement that it is possible to "dispose of theories making use of

the concept of 'archetypes' or a 'collective unconscious'" (Lévi-Strauss, 1996: 65). He accuses Jung of attempting to find universal contents in his concept of archetypes but as the analytical psychologist, Wolfgang Giegerich, says of Jung's later thinking: "He (Jung) is no longer concerned with any substance, any entity. . . .he simply expresses the abstract notion of the oppositional structure or form of the psychic. . . .What the opposites are is here not said, and it cannot, should not be said in the context of this late work (*Myterium Coniunctionis: An Inquiry Into the Separation and Synthesis of Psychic Opposites in Alchemy*), because this would be a relapse into the substantiating style of thought that this title has long left behind" (Giegerich, 2006).

Brief summaries of the views of two writers, the analytical psychologists, George Hogenson and Jean Knox, whose work represents major revisions of archetypal theory will be reproduced here. Lack of space inhibits elaboration of the important work of other writers in this area such as the analytical psychologists, Joe Cambray, who views archetypes, as well as various other key aspects of Jung's approach, as emergent properties from the complex interaction of the psychic system with the world; and Patricia Skar, who takes a similar line and goes on to suggest archetypes are the early products of developmental self-organization and should be considered to be a special category of complex.

George Hogenson asks the key question: What architecture of mind is best suited to underwrite the theory of archetypes? His conclusions are that cultural patterns encoded in the genome "what most Jungians would recognize as archetypes" (Hogenson, 2003: 108) are not and points instead to a less *a priori* structure of the mind. This is based on his study of robotics and dynamic systems theory whose "research paradigms conflict with the notion that strongly innate or *a priori* internal representations of the world are necessary to explain complex behaviour" (Hogenson, 2003: 109). Hogenson's interest in Baldwinian evolution (named after the psychologist, James Baldwin) is succinctly expressed by Terence Deacon, Professor of Biological Anthropology and Linguistics at the University of California at Berkeley, who is quoted by Hogenson as follows: "Baldwin proposed that by temporarily adjusting behaviors or physiological responses during its lifespan in response to novel conditions, an animal could produce irreversible changes in the adaptive context of future generations. Though no new genetic change is immediately produced in the process, the change in conditions will alter which of the existing or subsequently modified genetic predispositions will be favored in the future" (Hogenson, 2003: 110).

Jean Knox points to the convergence in recent times of cognitive science, neuroscience and psychodynamic theory in recognizing the self-organization of the human brain whereby genes do not encode complex mental imagery and processes but “. . .instead act as initial catalysts for developmental processes out of which early psychic structures reliably emerge” (Knox, 2004: 4). Furthermore: “Archetypes are not ‘hard-wired’ collections of universal imagery waiting to be released by the right environmental trigger” (Knox, 2004: 4). Instead, archetypes as emergent structures play a key role in psychic functioning and symbolic imagery. The way archetypes have often been portrayed is that there is information stored in a genetic code waiting “like a biological Sleeping Beauty, to be awakened by the kiss of an environmental Prince. This. . .is frequently implicit in discussion about archetypes, in Jung’s own writings and in that of many former and contemporary analytical psychologists” (Knox, 2004: 5). The gradual emergence of archetypes in analysis may enable the coming into being of the capacity for symbolization.

All the writers included in this last section are critical of any notion of archetypes as innate or “hard-wired” into the genes in their revision of Jung’s theory of archetypes.

Arhat

Paul Larson

In Buddhism, the term (Skt.) “arhat” (Pali “arahant”) refers to a person who has achieved realization or enlightenment; having attained a state of nirvana. It is the model for spiritual development in Theravada Buddhism, one of three branches of contemporary Buddhism (cf.), also known as the southern transmission, because the tradition went southward from India to Sri Lanka, then to Thailand, Burma, Laos and Cambodia. In the Mahayana and Vajrayana traditions, the model of the arhat is replaced by the model of the Bodhisattva (cf.).

The arhat is a fully realized being and upon death they do not return to the cycle of birth, death and rebirth, the samsaric wheel of life. One attains this state through much dedication and effort, probably across many lifetimes. The earliest Buddhist scriptures, the *Tipitaka*, recount stories of how many of the monks who studied with the Buddha attained arhatship during their lifetimes.

There are four stages over which the already advanced practitioner reaches the final stage of release from the wheel of life. The “stream-enterer” is the first stage, the “once-returned” is the second, the “never returner” the third, and the arhat the fourth stage. In the experience of stream entering, the person is sufficiently well along in the path to actually taste the direct experience of (Skt.) nirvana or (Pali) nibbana. But the experience is fleeting because the mind-stream is not completely purified of the obscurations of attachment. As the mind is purified, the person achieves the degree of stability in the enlightened state of mind that they are only needing one more life-time to complete the process, and in the non-returning stage, if one is reborn at all, it is into one of the higher realms, and for the arhat, the achievement occurs in this lifetime.

For many lay Buddhists in the Theravada tradition, it is recognized that to achieve enlightenment one needs to be able to devote much time to meditation. As a lay person, a “householder,” one cannot realistically hope to achieve that goal. What one can strive for is to gain sufficient merit over the course of this life time to have a better reincarnation next time, and perhaps then to be able to release attachment to worldly things and focus on spiritual progression. By treating other sentient beings with “loving-kindness” (Pali “metta”) and above all, by supporting the ordained sangha (cf.) of monks and nuns through offering, one can gain much merit.

The basic means of achieving enlightenment is through the practice of meditation. In contemporary Theravada Buddhism, this involves the practice of vipassana (Pali) or insight meditation. This style of meditation is particular to Buddhism, and is found in all three branches, Theravada, Mahayana and Vajrayana. In the latter two traditions it is known as shamata, or calm abiding meditation. Vipassana is described in the Mahasattipattana Sutta, part of the Tipitaka, or “three baskets” of Buddhist scriptures in the Pali language (Thera, 1962).

Ascension

Jeffrey B. Pettis

The ancient world understood the earth to be suspended within the larger *kosmos* consisting of various concentric realms. The whole order was perceived to be spiritually alive, its vastness creating anxiety among the ancients. Plato says that human beings existed as mere puppets having only a small portion of reality (Plato, *Laws* 804B, 644 D–E). Marcus Aurelius wrote that the activities of humans are “smoke and nothingness,” and the rewards of life vanish “like a passing bird” (M. Ant. 10.31; 6.15; 5.33; 10.10). This sense of alienation and the notion of the inferior nature of immediate existence created a desire to separate from the material world and ascend into the purer, celestial realm. Plato’s *Phaedrus* tells of the soul’s longing to spread its wings for upward flight to attain to god. In its fallen state it beholds beauty on earth making it desire the “true” beauty of the divine. It cannot attain this however, resulting in unending anguish (*parakinōn*, 249D). In his *Contra Celsum*, Origen of Alexandria (185 CE–ca. 254 CE) refers to Celsus’ discussion of the seven stages or “gates” of the soul’s ascent associated with the ancient Mithras cult of Persia. The stages are like a ladder at the top of which is the golden gate of the

sun and divine union. Each gate corresponds to one of the solar planets. The soul travels through each of the gates from the realm of the lower world to the higher realm of the gods (VI.22). The initiate looks directly into the rays of the sun to see a youthful deity, “beautiful in appearance, with fiery hair, in a white tunic and a scarlet cloak, wearing a fiery crown” (634–35). The ascension symbolizes the movement from the darkness of the unconscious realm into the light of consciousness. According to Jung, passage through the planetary spheres releases one to become free from characterological traits and compulsion specified in the horoscope and of which one is born: “he has won the crown of victory and become a god” (Jung, 1963: 230). Compare “The Angelic Liturgy” and the seven stages of angelic ascent to view the throne of God in the Dead Sea Scriptures (11 QShirshab). In a letter to the church in Corinth Paul speaks of being “snatched away” (Greek, *harpagēnta*) into the third heaven (2 Cor. 12.1–5; cf. the *Apocalypse of Paul* 3). The Old Testament pseudepigraphic writing 1 Enoch tells of the ascension of Enoch: “the winds were causing me to fly and rushing me high up into heaven. . . and I came into the tongues of fire” (14.8–9). Compare *Apocalypse of Abraham*, *Testament of Abraham*, *3 Baruch*, *Ascension of Isaiah*. A consideration of ascension should also note its opposite, which is descending. Homer’s *Odyssey* speaks of the cave sacred to the nymphs that are called Naiads, and the two doors, one toward the North Wind by which persons go down, and the other toward the South going upward and is the “way of the immortals” (*athanaton hodos*) (XIII.104–114). Porphyry (232–305 CE) the disciple and editor of the Neoplatonist philosopher Plotinus, likens this cave to the grotto of Zoroaster in the mountains near Persia. Souls journeyed down into the generative potencies of the cave to be ascended into the way of immortality (Porphyry, 1917: 2).

Asceticism

Fredrica R. Halligan

All the major world religions have recommended, at some point in their history, various practices of self-sacrifice in order to deepen and advance spiritual development. Asceticism is particularly pronounced in monastic orders. Ascetic practices vary from the passive (e.g., fasting, renouncement of desires) to the active (e.g., self-flagellation or, at the extreme, martyrdom). Most asceticism calls for moral choices and an austerity of lifestyle (the latter being quite counter-culture in the U.S. today). In general, asceticism is intended to fulfill one or more of the following functions: control of appetites and sense pleasures, detachment from materialism and even from relationships, awareness of mortality and impermanence, gratitude for divine blessings, expiation for sins, and identification with the suffering of others (e.g., with the Passion and crucifixion of Christ).

In psychotherapy and spiritual direction today, the question to be addressed is the healthfulness of ascetic practices, or lack thereof. This discernment must explore the consequences on the reality plane as weighed against the spiritual benefit expected in the spiritual realm. Questions must include: Is the individual likely to be hurt now or in the future? Will others potentially be hurt? In the current days of awareness of terrorist mentality, the meaning and consequences of all acts of self-sacrifice must carefully be discerned. Also of concern is the matter of motivation, along with the question of whether a specific act of self-surrender is life-giving or essentially destructive. Ascetic practice can be very beneficial to the spiritual aspirant as long as the motivation and consequences are appropriate, not ego-driven and not destructive to self or others.

Astrology

Rod Blackhirst

Along with alchemy, astrology is one of the cornerstones of the traditional cosmological sciences. In a popular sense the word astrology refers to the study of the influence of stars, planets and other heavenly bodies upon terrestrial events. The belief that celestial bodies influence or control events upon earth, including the inner life of human beings, is exceedingly ancient and is found in virtually all civilizations and cultures. It is more accurate, though, to understand astrology as an extensive symbolic language that permeates traditional cosmological thought far beyond the question of stellar “influences” upon earthly life. Traditional cosmology tends to understand the earth and sky as a single integrated system or even as a single living organism, in which case the planets are the “organs” of the cosmos. There are Western (Hermetic), Indian (Vedic) and Chinese systems of astrology, amongst others.

While astrology was often regarded as a priestly and divine science in ancient times, it has tended to be marginalized in the perspectives of the monotheist faiths because it is perceived to compromise the absolute nature of the Divine Will. These faiths have been keen to insist that the planets are not gods and that the predetermination of events is subject to Divine Will and not the outcome of mechanical cosmological forces. In the Middle Ages many Churchmen, including Popes, were practising astrologers but in more recent centuries (especially since the Reformation) astrology has tended to be cast as an “occult” science – or even one of the “black arts” – and so antithetical to orthodox religious faith.

In ancient texts astrology is inseparable from meteorology and weather prediction but it is also linked with character analysis and the determination of human temperaments. The notion that mental disease is caused by or is associated with the configurations of stars and planets is also age-old and has left its mark in modern languages in terms such as “lunatic” (one driven mad by the moon).

Belief in astrology persists in modern times in spite of the scientific revolution and the fact that the entire premise of astrology as it is usually formulated – non-physical and subtle or spiritual causal forces – violates the most basic tenets of the scientific paradigm. In fact, it is arguable that belief in astrology has never been so widespread and popular as it is today. Countless people “follow their stars” in astrological columns in magazines

and newspapers and there is a vast industry of astrologers offering consultations and “readings” to paying clients.

Much of this takes the age-old form of soothsaying and prognostication – the prediction of coming events – but in the modern context much of it may take a more diagnostic form with the astrologer offering psychological and character analysis from the study of a horoscope (natal chart) drawn up for the client’s time and place of birth. Since the nineteenth century there has been a strong movement to resituate astrological theory and practice away from the traditional methods of deterministic prognostication (called horary astrology) toward an understanding of astrology as a type of ancient and occult psychology with a corresponding emphasis upon natal astrology (the astrology of individual’s births.)

The most important proponent of this shift was Carl Jung who argued that astrology (along with alchemy) were premodern forms of the psychological sciences and who was even known to consult horoscopes (nativities or natal charts) of his patients in the belief that this could reveal aspects of their personality and especially their unconscious motivations. Jung said that “astrology represents the summation of the psychological knowledge of antiquity” (1962) and regarding its use in clinical practice added “I must say that I very often found that the astrological data elucidated certain points which I otherwise would have been unable to understand” (1948).

Jung attempted to provide a scientific basis for the use of astrology in psychology by advancing the theory of synchronicity which he styled as an “acausal connection principle” and more generally in his theory of the collective unconscious. According to Jung and the many astrologers who have followed him the planets and stars (zodiac) represent universal principles reflected in aspects of human psychological make-up. There is thus a *correspondence* between the heavens and the structure and contents of the human psyche. For example, it is supposed that planets that are situated below the horizon at the time of birth (and so are in the lower half of a horoscope) represent forces and motivations of which the native (patient) is not usually conscious. If, for instance, the planet Mars (traditionally the planet of the war god) is below the horizon and in a position considered to be “afflicted” or detrimental, then the native may be subject to violent and unpredictable rages over which he/she has little control. It is then supposed that a knowledge of one’s horoscope can provide self-insight and offer solutions to psychological problems.

Jung regarded the horoscope as an adjunct to more conventional modes of psychological analysis and a useful tool for therapists. The development and systemization

of this basic proposal has been pursued by many astrologer/psychologists since Jung, most notably by Dane Rudhyar who adapted aspects of the so-called humanistic school psychology (Carl Rogers, Rollo May et al.) to astrology. For him, the horoscope (natal chart) is a map to be used for the exploration of the complex inner world of drives and functions that together constitute the complete psychological organism. The publication of Rudhyar’s *The Astrology of Personality*, in 1936 was a milestone in psychological astrology. Carl Rogers published his *Client-Centred Therapy* in 1951. In the 1970s Rudhyar extrapolated Rogers’ ideas to what he style as a “transpersonal astrology.” His *Person-Centred Astrology* was published in 1972. In this work he redefines astrology as a language of symbols to be deployed as a diagnostic tool in the quest for psychological wholeness, integration, actualization and personal fulfilment.

These ideas were further developed by such astrologers as Marc Edmund Jones, Robert Hand, Michael-Meyer and Richard Idemon and have done much to change the face of contemporary astrology. In the United States today there is an Association for Psychological Astrology directed by Glenn Perry and staffed by men and women who are both practicing astrologers and qualified psychologists. The organization offers masters and doctoral degree programs.

The enthusiasm of psychological professionals and therapists for astrological tools, however, has waned since the 1970s – astrology has been psychologized far more than psychology has been astrologized – and one cannot really speak of a legitimate conjunction of the two disciplines. Despite its popularity astrology is still regarded as a fringe or pseudo-science while psychology, especially in the last 30 years, has sought fuller legitimation as an empirical, mainstream science and has been eager to shed its associations with quackery. Astrologers have tried to legitimize astrology (as “astrotherapy”) by presenting it as akin to or as an adjunct to the psychological sciences, but it cannot be said the association has been endorsed in kind by most psychological professionals.

Astrology and Alchemy

Claudia Bader

Alchemy and astrology are complementary disciplines. Sister sciences seen as the precursors to chemistry and astronomy respectively, their practitioners also consider them arts. They posit a universe where consciousness and matter are one. Alchemy relied upon astrology; astrology does not need to incorporate alchemy.

Astrology is the older discipline; some of the oldest written astrological references are Mesopotamian, and go back to approximately 1800 BC. (Britton & Walker; p. 42). It is an interpretive art as well as a science. The science of astrology is the observation and charting of the sky. The configuration of the planets is an objective fact based on geometric calculations, set up for the day, minute, and location of a person's birth. The universal element, the sky on a given day, is made personal through connecting it to earth through the time and location. This creates the wheel of the 12 houses of astrology, which determines exactly how the sky on a given day will manifest for whatever question is asked. This can be related to many different things: a person, business, country, or question.

Astrological work is most importantly the interpretation of the meaning of the configurations charted. The study of astrology involves memorizing the different archetypal meanings of the different elements of astrology: planets, signs, houses, and aspects (the geometric relationships between the planets). The art of astrology is in the synthesis and interpretation of these in relation to the subject at hand. The stars and planets have set orders and sequences. The meanings of the signs and planets have been consistent for thousands of years in western and eastern (Jyotish/Vedic) astrology. One

conceptualization of astrology is that it shows how we internalize and individualize the greater whole of life symbolized by the planets and signs. However it is conceptualized, it is about an external, orderly, a priori process made internal.

Alchemy is the inverse. In alchemy, the order has to be pulled from within the process. Alchemy is mysterious in that there is no order that is observable from the outside; even deciding what substance is chosen to begin the transformation is cloaked. Practitioners had to experiment to find this out; work with dream and revelation was just as important as scientific experiments in guiding the alchemist.

Alchemy is about process and transformation. The physical work in alchemy literally involves transforming substances from one thing to another. The goal is to obtain a substance that has the ability to transform: the philosopher's stone. However, the journey to obtain this is a transformative journey in itself, effecting psychological and spiritual change. The central metaphor of alchemy, the transmutation of lead into gold, is a metaphor for the refinement of one's being.

The planets and signs hold great archetypal significance for alchemists. In terms of correspondences, each planet has a metal associated with it; in alchemical formulation, the metals from the planets are spun from the cosmos into the earth. Alchemists used astrology to time their alchemical work, determining when to initiate a process. This allowed the alchemist the maximum alignment with the energies he/she sought to transform. These are the correspondences of the planets and the metals:

Sun: Gold
 Moon: Silver
 Mercury: Mercury
 Venus: Copper
 Mars: Iron
 Jupiter: Tin
 Saturn: Lead

In addition to the above, the seven basic alchemical stages defined by Edward Edinger in *Anatomy of the Psyche* have correlations to astrological archetypes (reprinted by permission of Open Court Publishing Company, a division of Carus Publishing Company, Peru, IL, from *The Anatomy of the Psyche* by Edward Edinger, ©1985 by Open Court Publishing Company).

The stages Edinger chose are: Calcinato, Coagulatio, Solutio, Sublimatio, Mortificatio, Separatio, Coniunctio.

Although alchemy is no longer in the forefront of modern consciousness, the archetypal power of the imagery and themes resonates psychologically as Jung, and

many Jungians, have explicated. However, the connection between astrology and alchemy is still alive, and the maxim of “As Above, So Below” can be observed in contemporary times by studying astrology, as well as in dream imagery, and themes and experiences of individuals.

People who have certain astrological themes highlighted in their charts natively or in a particular stage of their life will have characteristics and/or experiences correlating with the qualities of alchemical stages.

The astrological correlates along with the physical definition of the alchemical stages, examples of imagery and psychological themes are as follows:

Calcinato – Mars, Pluto, Fire

- *Chemical Process:* The intense heating of a solid to remove water and all other constituents that will volatilize. What remains is a fine, dry powder.
- *Images:* Fire, Burning, Hell, Purgatory, Wolf, Lion
- *Psychological Themes:* Desire, Passion, Power, Attachment, Envy, Anger, Integrity.

Coagulatio – Earth, Saturn, Moon

- *Chemical Process:* The turning of vapor or liquid into a solid state. Cooling, or evaporating, or a chemical reaction which can create a new compound.
- *Images:* Body, Eating, Crucifixion, the Fall, Incarnation, The World of the Senses, Sex, Clothes (The body is the clothing for the soul).
- *Psychological Themes:* Embodiment, Object Constancy, Dealing with Reality, Containment, Limitation, Time and Space.

Solutio – Water, Neptune, Moon

- *Chemical Process:* A solid is turned into a liquid.
- *Images:* Water, Ouroboros, Swimming, Baptism, Bath, Flood, Dew.
- *Psychological Themes:* Compassion, Fusion, Idealization, Dependency, Addiction, Selflessness.

Sublimatio – Mercury, Jupiter, Uranus, Air

- *Chemical Process:* The material is turned into air by volatilizing and elevating it. The solid, when heated,

passes directly into a gaseous state and ascends to the top of the vessel, where it resolidifies on the upper, cooler, region.

- *Images:* Flight, Heights, Towers, Radio Stations, Jacob’s Ladder, Cosmic Ladder, Angels, Birds
- *Psychological Themes:* Detachment, Objectivity, Dissociation, Grandiosity, Observing Ego.

Mortificatio – Pluto, Saturn, Mars

- *Chemical Process:* none.
- *Images:* Blackness, Feces, Rotting, Smells, Mutilation, Overflowing Toilets, Worms, Pollution, Resurrection, Rebirth, Growth, The Nigredo. The blackness is brought about by the slaying of something, usually the dragon, but often the king, the Sun, or a lion.
- *Psychological Themes:* Mourning, Loss, Ego Death, Depression, Hatred. The death and transformation of the ruling principle within.

Separatio – Saturn, Uranus, Mars, Libra

- *Chemical Process:* The Prima materia is thought of as a confused composite of contrary substances that require separating out. The substance when heated will separate out into a volatile part which vaporizes and one which coagulates. A composite is separated out into orderly parts.
- *Images:* Swords, Knives, Logos, Compasses, Measurement, Numbering, Weights, Divisions
- *Psychological Themes:* Separation/Individuation, Discrimination, Discernment, Schizoid States, Splitting.

Coniunctio – Sun, Venus, Whole Chart, Saturn in Libra

- *Chemical Process:* Two substances come together to create a third with different properties. In particular, molten metals and the formation of amalgams by the union of mercury with other metals.
- *Images:* Marriage, Sexual Intercourse between Sun and Moon, Love
- *Psychological Themes:* Integration of the self into a whole; Individuation, Maturation.

Astrology and Mandalas

Claudia Bader

“Mandala” is the Sanskrit word for circle. The basic structure of a mandala is extremely simple. It is a circle. The circle encloses a sacred space, thought to include both the circumference and the center. When you see it on a page, it creates an inner and an outer space. It starts to become elaborate when it is concentric, or when a quadrated form is placed in or through it, as seen in *Fig. 1*. This sacred circle is found everywhere, in the sun, the moon, a flower, a face, an eye and so on. The mandala with a cross shape in it is a classic form. The combination of quadration with the circle establishes a relationship of opposites. The four directions of the cross fix the endless movement of the circle, which has no beginning or end. It is a symbol for the eternal whole, which transcends time and space. From this foundation, it is elaborated upon in multitudes of ways, creating meditative devices the world over.

The cycles of life – day and night, and the regular returns of the seasons – define the circular motif in our

viscera. Juxtapose this with the linear experience of time and aging, or the quadrated experience of the equinoxes and the solstices – and the circle with a cross becomes imbedded in our very bones.

An astrological chart is a mandala.

Its foundation structure is a circle with a cross. Two axes, horizontal and vertical, anchor the chart; then two more axes are drawn, creating the full astrological wheel of 12-pie shaped houses (*Figs. 2 and 3*).

To understand the significance of the cross within the wheel, note the horizontal line in the chart. It is symbolic of the horizon line. This is where the rising sign, or the ascendant, determined from the day, minute, and location of someone’s birth, is placed. The sign on the ascendant is the section of the sky containing the constellation coming up over the horizon at the day, minute, and place of someone’s birth.

It organizes the signs on the wheel, which are placed on each axis called a house cusp, in a counterclockwise direction. The astrological houses rule different areas of experience, and also represent different dimensions of the psyche. The basic meanings and archetypes of the houses are given below.

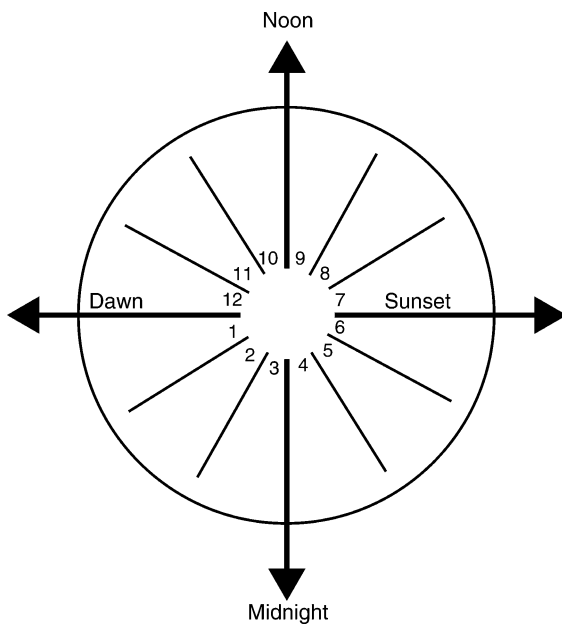

The Houses:

1. Self-Projection, Body, Beginnings: The Divine Spark/ Divine Child
2. Self-Worth, Personal Resources, The Body as First Possession, Finances: Conservationist
3. Near Environment, Information, Conceptualizing a Self: Siblings
4. Roots, Home Life, Parenting: The Tribe, The Source
5. Romantic Love, Self-Expression, Pleasure: The Lover/Artist
6. Daily Life, Physical Health, Work: The Servant
7. Marriage, Other People, Partnerships, Open Enemies: Marriage
8. Sex, Death, Transformation, Shared Resources: Initiation
9. Larger Horizons, Life Philosophy, Knowledge: The Priest and Priestess
10. Life Task, Profession, Parents: The Culmination
11. Life Wishes, Group Affiliations, Friendships: The Community/Idealist
12. Life Transcendence, Psychological Health, Sense of the Eternal, Self-Undoing: The Monk, Mystic, Prisoner

The planets are then placed in the wheel of the houses, and where they are placed is determined by the sign on the axes, which are called house cusps.

Astrology and Mandalas. Figure 1 A mandala with quadrations. Artist: Patricia M. Bowers.

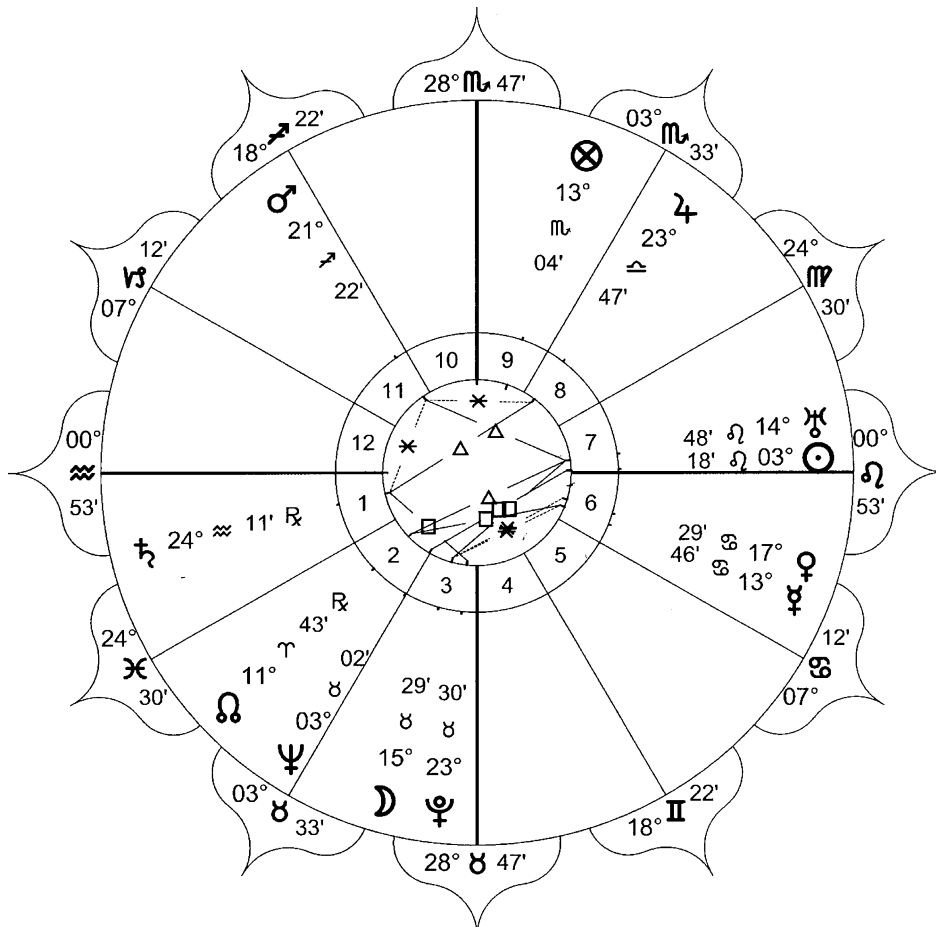

Astrology and Mandalas. Figure 2 The basic structure of an astrology chart, the wheel of the houses.

This determines how the sky of the day will affect someone personally.

This is important because the sky is universal, not individual; everyone born on a particular day will have the same placements of the planets in the sky (i.e., Sun in the sign of Pisces, Moon in Cancer, Venus in Aries, etc.). This is organized through the circle of the zodiac in the sky that hugs the ecliptic. This is the circle of the astrological mandala. The ascendant fixes the universal energy in time and space, literally bringing it down to earth. This is the cross of the astrological mandala.

This has a counterclockwise order.

In addition, there is a clockwise order as well in the chart, also beginning at the ascendant. Moving in a clockwise direction, it is the beginning of the cycle of a life, dawn. The next turning point represents the noon of life, and is at the top of the chart. The third angle, exactly opposite the ascendant, represents sunset. The final angle, at the bottom of the chart, represents the midnight of life, the end of the matter as well as the root issues in life (Fig. 4).

Astrology and Mandalas. Figure 3 Complete astrology chart with the planets placed into the wheel of the 12 houses.

Thus, the astrological chart is a graphic image of how we come from one source, as symbolized by the circle, becoming individualized through time and space.

In this way we inhabit a mandala of existence on earth, and to study an astrology chart is to contemplate a mandala.

Psychological Aspects

Mandalas and the astrology chart share archetypes of self, center, and reconciliation of the opposites. Jung stated that the mandala is the archetype of wholeness, relating it to the Self. Mandala images arise spontaneously in dreams and art as symbols of the center of the self.

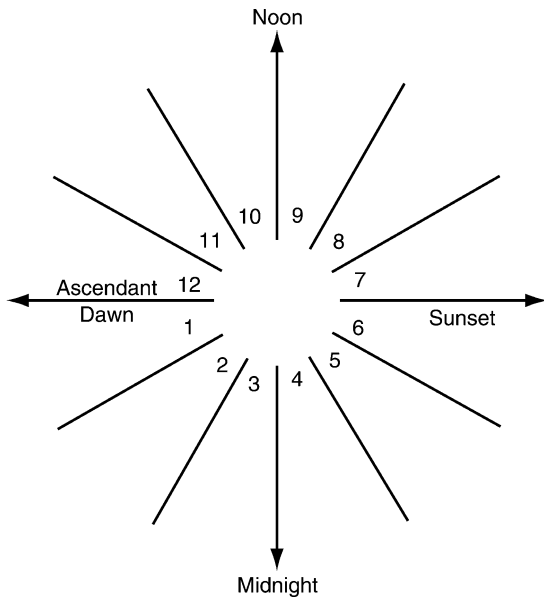

In addition, the wheel of the zodiac and the circle of the mandala create symbolic holding environments, which hearken back to the experience of lying in the circle of one's mother's arms.

Another powerful underlying psychological resonance is the experience of the underlying geometry of the face and the eye.

The face has a mandalic structure (Fig. 5). In learning to draw, artists are trained to see the underlying geometry in physical form. To draw a face with accurate proportions, you learn that the space from the top of the head to the eyes is approximately the same distance as that from the eyes to the chin. As far as a mandalic structure is concerned, the horizontal axis is the eye line, and the vertical axis is the line created by the nose.

The eye is another mandala contained within the face. The underlying mandalic geometry is powerful because of the experience of being held in one's mother's arms and looking into her face.

In children's drawings, mandala forms emerge very early on, in the scribbling stage which occurs from 18 months to 4 years old on average (Figs. 6 and 7).

Astrology and Mandalas. Figure 4 The progression of the angles.

Astrology and Mandalas. Figure 6 Copy of typical mandaloid scribble (2 year old).

Astrology and Mandalas. Figure 5 Face Mandala.

Astrology and Mandalas. Figure 7 Copy of a typical 3-year-old drawing of a human.

The earliest images of humans usually have a mandala formation, with a huge head with markings at the approximate place of the cross in a mandala.

Thus, the core architecture of the mandala, and the astrological chart, evokes this early preverbal experience.

Astrology and the Transitional Object

Claudia Bader

In discussing transitional phenomena, Winnicott states,

- ▶ this is the place I have set out to examine, the separation that is not a separation... but a form of union (1974: 97–98).

An astrological chart is created from the date, minute, and place someone takes their first breath. It creates a map which describes how an individual expresses a piece of the cosmos, a similar to the idea of a fractal. Astrology is a symbolic language, and someone's chart is a symbolic bridge. In addition to being a symbolic language about the self that becomes internalized, it is also a concrete image drawn on a piece of paper.

A person's chart shows how he or she is both separate and individual, yet one with the universe. In this way, an astrological chart is literally a transitional space, and the chart itself a transitional object.

To look at these ideas, I'm going to list the qualities of the transitional object and explore how these dynamics are reflected in people who are cathected to astrology. The bolded sentences are direct quotes from Winnicott in his book *Playing and Reality*.

These are the qualities that define the transitional object, as quoted from Winnicott in *Playing and Reality*.

Qualities of the Transitional Object

1. **The infant assumes rights over the object, and it is agreed upon by all.**

The charts are their charts, real and meaningful. It is an objective fact anyone can agree upon, based on personal birth data.

2. **It stands for the breast, or the object of first relationship.**

The chart works as a surrogate mother in that it holds an image of the person for them; it is drawn in a circle, which is a containing space, and conceptually provides a container which facilitates the ability to hold one's self. The astrology chart represents the first relationship, which is to the ultimate container, the cosmos, the ultimate "Great Mother." The round chart itself is a circle with a center, a breast/mandala/eye image.

The eye image adds a layer of symbolism related to lying in mother's arms looking into her eyes. Seeing and being seen, this crucial early experience begins the emotional life. Looking into her eyes we see ourselves reflected there through her responses to us and her love. We are mirrored by her.

It has a breast energy in that the chart feeds with information and provides mirroring. It is demand feeding, totally under the control of the subject, since it can be pulled out and looked at it whenever it is desired. However, it is not always a "good" breast – sometimes it is positive feeding when it presents "good aspects," and sometimes it is negative feeding or a "bad" breast when seen in terms of "bad aspects."

3. **It antedates established reality testing.**

The chart is set with the first breath, before there is any ability to test reality.

4. **It is a possession.**

The astrology chart is our unique and special object. It is both an internal mental construct and an external object that can be possessed, the chart drawn on a piece of paper.

5. **It is not internal nor external. It comes from without from our point of view, but not so from the baby's point of view. Neither does it come from within; it is not a hallucination.**

The chart is based on something wholly without – the planets at the time and place of birth. It is where a person connects to the objective universe. Yet it is also within us as a completely subjective reality – an expression of someone's life and life's meaning, as well as a developmental timing device. The predictable cycles of the planets reflect universal life

developments as well as reflecting individual differences within the universe. Therefore a chart is within and without.

It is not a hallucination because it is based on the hard facts of the planets' places and movements.

6. **The object is affectionately cuddled and excitedly loved as well as mutilated. It must never change, unless changed by the infant. It must survive instinctual loving, hating, and pure aggression if need be.**

A person's chart is a drawn image on a piece of paper. This piece of paper is often carried around, looked at, poured over. It is played with in the sense of doing calculations on it. It often falls apart, but can be redrawn. On a more superficial level of astrological information, people read their horoscopes in newspapers; but the columns and their information are excitedly read. Either the actual chart or the newspaper columns can be rejected, hated, and put away if the individual chooses. They never change, in that the natal chart is fixed, and ones' sign never changes. They survive.

7. **It must seem to have a warmth, or to move, or to have texture, or to do something that seems to show it has a vitality or reality of its own.**

The chart is filled with life. It comes from and represents the living universe. It moves on its own in that it reflects time and changes the timing techniques in astrology, called transits and progressions.

8. **The infant passes from omnipotent control to manipulation. It may develop into a fetish object persist into the adult sexual life. It may stand for feces. It is created by the child.**

A popular astrological theory is that the chart is "chosen" before someone was born or reincarnated. In this sense, they have created it. It is their life path, an indicator of who they are, and what energies we are using. The chart may be seen as having an omnipotent power to help control life by showing what will happen. This gives the user an illusion of control. Of course, as one continues studying and/or experiencing astrology, it becomes clear that it is not omnipotent, that perfect knowledge of the future is not obtainable although one can be forewarned of some aspects of it. By studying ones self through astrology, learning to work with (manipulate) the chart and its symbols, there is a sense of gaining mastery over ourselves and our lives.

9. **Its' fate is to be gradually decathected. It is not forgotten, but it loses meaning.**

Chart interpretation is a synthesizing of the meanings of all the symbols in their positive and negative modes. The ability to see good and bad at the same time is a developmental achievement. However, the root of symbolic meaning in astrology is beyond both good and bad. The ultimate object of the study is to know life and reality so well that the chart is not needed to mediate one's life and thus can eventually be discarded. In therapy, I notice that often the chart is initially a very important topic of discussion and interest, but as the therapy progresses it is talked about less and less until eventually it is referred to only during times of stress.

Atheism

- [▶ Schopenhauer, Nietzsche, and Atheism](#)

Atman

Fredrica R. Halligan

In Hindu thought, *Atman* is the true Self of each individual, which is at one with the Divine, Brahman, the Absolute. C. G. Jung acknowledges indebtedness to this concept in *Aion* where he refers to the "atmic self." The

Hindu concept differs from Jung, however, in that the Atman is one and the same in every person. Atman is Brahman since, as it is said in India, “That thou art.” Thus God is the Indweller of every soul. The life task of each person is to discover Atman within.

In the *Upanishads*, ancient scriptures of India, Atman is described as the innermost nature of every living being, pure and unchanged. Neither birth nor death, nor re-birth can alter Atman. It is the Real, the unchangeable. In contrast, body, mind, and personality are changeable and are therefore defined as unreal, or illusory. This usage of the words Real (unchangeable) and unreal (changeable) often create confusion in the minds of westerners who use the same words differently. Whether Hindus chant, “Lead me from the unreal to the Real,” or talk of *Moksha* (liberation), God-realization or Self-realization, the meaning is the same, i.e., discovery of the eternal Atman within. This is the essential spiritual yearning, dating back to ancient Vedic times and continuing today.

The concept of Atman or Higher Self is not without controversy, however. In India the topic has long been debated, with Buddhists taking the contrasting view, which they call Emptiness, no-self or *Sunyata*. Some spiritual pundits (e.g., Jungian analyst, Hawyo Kawai) believe that, at the ultimate experience, both paths end up at the same place, i.e., that paradoxically Emptiness and Fullness of Self are essentially the same experience. What is clear is that both Hindu and Buddhist meditative traditions teach that mind and ego must be transcended in order to achieve the ultimate state of Realization (*Moksha* or *Nirvana* respectively.)

Wilber’s Synthesis

In western psychology, Ken Wilber conceptualized a spiritual-developmental path that he dubbed, “The Atman Project.” In Wilber’s perspective, the pathway to realization of Atman initially follows an outward arc towards development of ego, followed at midlife and beyond by an inward arc where ego is renounced and desires are transcended in order to approach the ultimate unity, with consciousness resting only in God, i.e., the Atman. Wilber synthesizes psychological, Hindu and Buddhist practice when he states that the ultimate goal, whether called God, Atman, Buddha or Ultimate Reality, is accompanied by recognition that “all things and events in the Universe are aspects of one fundamental Whole, the very source and suchness which is the Real itself” (Wilber, 1980: 101).

Traditional Hindu Pathways

In ancient India, Patanjali was the renowned pundit who charted the journey in search of *Atman*. Patanjali’s *Yoga Sutras* call for devotion to God as the means toward liberation or Self-realization. Spiritual practice and deep psychological purification is needed. Mind must be stilled and freed from all desires. What bubbles up, advanced meditators proclaim, is a state of absorption in Atman, nothing else. The experience has been described metaphorically as a light that does not flicker in a windless place. Thus one-pointed meditation is recommended as an important *sadhana* (spiritual practice). This transcendent state of liberation is considered to be beyond the western mapping of psychological states.

In the *Bhagavad Gita*, central scripture of Hinduism, the realization of Atman is described as union or merging with God, a state that is free from all worldly attachments, free also from ignorance, greed and pride. To discover the infinite Self, the Atman, the Divine within, there is a gradual shift from the small self (or ego) to the higher state of consciousness. This shift is toward ever-more subtle states of awareness. In the process a detached observer arises, sometimes called the Watcher. Some say that this observer is the Atman. Others say that eventually even the Watcher disappears.

Hindus believe that the Self underlying the personality is perfect, but is covered by layers of illusion. Atman lies beyond the senses, beyond the emotions, beyond the intellect. Realization of one’s true identity (Atman) requires letting go of ego and all that has previously been thought of as “I-me-mine.”

Atonement

Ruth Williams

The concept of atonement is closely associated to forgiveness, reconciliation, sorrow, remorse, repentance, reparation and guilt. It is a spiritual concept which has been studied since time immemorial in Biblical and Kabbalistic texts.

It is in a linked pair (or *syzygy*) with forgiveness.

It is also associated with the Christian idea of confession and repentance which requires atonement.

Atonement is an archetypal idea and, as such originates in an archetype (which Jung describes as “an irrepresentable, unconscious, pre-existent form that seems to be part of the inherited structure of the psyche and can therefore manifest itself spontaneously anywhere, at any time” (Jung 1958/1964: par. 847).

To atone is an act of conscience. True atonement must come from the ego since it must needs be a conscious humbling rather than moral superego flagellation from “on high.” (“Ego” is used here in the Freudian sense, whereas from a Jungian perspective, true atonement would be an expression of Self.)

Some regard the process of psychotherapy itself to be a transformative process of repentance in as much as the very act of entering into psychotherapy has a dynamic effect on all those closely connected with the patient him or herself. There is usually a process of reflection, on past acts as part of the path of individuation (a Jungian term for the unfolding process of becoming more fully oneself which is broadly the goal of a Jungian analysis). Achieving this requires a person to follow what is known in Kaballah as the path of the Zaddik (the path of honesty/integrity) which ultimately leads to “at-one-ment” in the sense of a one-ness with God which may be seen as the potential inherent in the genuine process of atoning. This accounts for the immanence, the numinous quality associated with the sense of completion achieved in fully embracing atonement.

The ability to atone is connected to one’s ego strength. If the site of the betrayal or “sin,” is one which is suffused with narcissistic wounding, shame or hubris can inhibit the ability to atone. It therefore takes great sensitivity – in both collective and in personal situations – to enter into such a process.

In Judaism the “book of life” is considered to be open until the end of Yom Kippur (Day of Atonement). The book of life is seen as containing one’s fate (contingent on

the process of atonement undergone during this period) for the next year and the book is sealed at the end of the Yom Kippur festival. In organizations such as Tikkun (a modern/progressive Jewish community whose name means to heal, repair and transform the world) the imagery of Yom Kippur has been turned into a spiritual path: they take a ten day period over the festival to examine what changes are needed in life, and how seriously one will take the year-long process of making those changes. By condensing the period of heightened attention to ten days, they are making sure that there is a time when these matters are brought to the forefront of one’s conscious awareness. If one has not been able to make any progress in self-awareness and steps toward change in those ten days, then in a certain sense one’s fate is considered to be sealed, the idea being that we will continue to receive the karmic consequences of being the way that we are at the current moment, and to the extent that we want that to change, this ten day period becomes a spiritual retreat and intensive short-term “psychotherapy.”

Yom Kippur is the most sacred day of the year in the Jewish calendar which is marked by fasting, abstaining from work, sex, washing, wearing of perfume and leather shoes (much like the Christian period of Lent). To truly engage with such a process has a transformative effect, although, as with all religious dogma, it can simply be treated as a ritualistic act.

The idea of the scapegoat originates with the rituals performed during the Yom Kippur festival. In ancient times the high priest of the Temple in Jerusalem would conduct a sacrificial ceremony on Yom Kippur. He would be clothed in white linen and would confess his own sins and then the sins of the people of Israel before making a blood of sacrifice. The priest then ejected a goat from the temple with a scarlet piece of woolen cloth on its head. It was goaded and driven, either to death or into the wilderness, which was seen metaphorically as carrying away the sins of Israel. It was believed that if these sins were forgiven the scarlet cloth would turn white.

Some regard the Old Testament scapegoat as being a prefigurement of the New Testament Christ whose suffering and death similarly expunged man’s sins. William Holman Hunt inscribed the following two Biblical quotes on the frame of his painting “The Scapegoat”: “Surely he hath borne our Grievs, and carried our Sorrows/Yet we did esteem him stricken, smitten of GOD, and afflicted.” (Isaiah LIII, 4), and “And the Goat shall bear upon him all their iniquities unto a Land not inhabited.” (Leviticus XVI, 22).

In the absence of atonement, *someone* becomes scapegoated and left carrying the Shadow.

Sylvia Brinton Perera explores the etymology in *The Scapegoat Complex*: “The Hebrew word for atonement, *kipper*, is related to *kippurim*, eliminatory procedures. A Babylonian rite on the fifth day of the ten-day New Year festival was called *kippuru* and involved purgation, purification, confession of sins and a human sacrifice” (1986: 11).

Some of the elements in the complex – e.g., guilt and reparation – have been explored by Melanie Klein (1937) in a model which looks back to infant anxiety and the early development of conscience.

Cook draws our attention to the African philosophy of *ubuntu* which emphasizes the connection between the individual and the collective which perhaps facilitated the balancing of understanding and reparation rather than going down the path of vengeance and retaliation.

Desmond Tutu (1999) (Commission Chair) writes about the principles of restorative justice which underlay the Truth and Reconciliation Commission, being rooted in the African concept of *ubuntu* which is akin to atonement. *Ubuntu* emphasizes the relatedness between humans whereby everyone is diminished when someone is dehumanized. Criminality is seen as a breach in relationship which is restored by healing the breach as opposed to punishment *per se* (see Tutu 2004 lecture pp.4–5; concept also described in detail in Tutu 1999: 34–36).

The acts of atonement and forgiveness are seen as linked, the process involved being partially located in the realm of what Jung described as the psychoid unconscious, so that failure to atone produces a scapegoat. This perspective highlights how energetically we are tied to each other: one person’s failure to act, can have a significant impact on the ability of the other party in such a dyad to forgive. It is in this impasse that situations can seem quite intransigent and incapable of change. (Might it be in this impasse that blame is more likely to arise?)

This failure to take responsibility by the wounding party thus creating a scapegoat would be seen in terms of the Shadow being projected on to the “other.”

Augustine

Nathan Carlin

Life and Legacy

St. Augustine of Hippo (354–430) was born to a pagan father and a Christian mother. After a rather wild adolescence, he began to work out his own intellectual and religious beliefs by means of trying on a number of ideas: to name a few, he was highly influenced by various strands of Platonism; he struggled with Manichaeism and skepticism; and, finally, he embraced Christianity. As Augustine noted in his *Confessions* – the first western religious autobiography – his heart was restless until it found rest in God. St. Ambrose baptized Augustine in the year 387, and Augustine later organized a monastery that eventually became established in Hippo, where he was made bishop in 396.

While he impacted the western church much more than the eastern church, Augustine, for better or for worse, is undisputedly one of the most influential theologians of all time. With regard to the history of doctrine, he is perhaps most well known for his ideas of original sin and just war theory, as well as for his views on the Donatist and Pelagian controversies. He also greatly influenced John Calvin, the greatest mind of the Protestant Reformation.

On Psychology

While Augustine was doing theology, he also addressed psychology. In *On the Trinity*, for example, he made a case for the rationality of the idea of the Trinity – how, in

other words, one could rationally conceive of God as “three-in-one” – on the grounds that human personality (one) consists of being, knowing, and willing (three), though, admittedly, he noted that this analogy does not perfectly convey the nature of the Trinity. As Diogenes Allen (1985) points out, “Augustine used the human mind as his analogue because human beings are created in God’s image” (p. 103). In human beings, then, Augustine looked for “trinities” to learn something about the Trinity (1985: 103).

On Sexuality and the Body

Augustine wrote about human sexuality as well (cf. Brown, 1988). In *The Literal Meaning of Genesis*, Augustine notes that some interpreters of Genesis 3 regarded the first sin to be intercourse. One might say that these interpreters made proto-psychoanalytic interpretations centuries before Freud when they argued that the tree in the garden represented a penis and that the true or deeper meaning of the story concerns pre-mature, premarital, and irrational sex. Augustine, however, takes the text at face value and sees the sin simply as disobedience to the LORD’s commands (cf. Kvam, Scheering, and Ziegler, 1999). In any case, Augustine still does not have a positive view of sexual intercourse – far from it – even if he does not see the first sin to be of a sexual nature. Sexual intercourse as human beings experience it now, Augustine argues, gives evidence for the “fall.” Augustine holds that, before the “fall,” human beings could have pro-created without passion and as a deliberate act of the will, but now, Augustine laments, sexual arousal is not governed by the will. So the first sin, if not sexual, nevertheless had serious consequences for human sexuality. Another point to add here is that, for Augustine, the original sin of Adam and Eve is passed down by means of procreation – that is, by means of sexual intercourse. And because all human beings after Adam and Eve (except the Virgin Mary and Jesus) have come into the world by means of sexual intercourse, all human beings, following Augustine’s logic, bear the consequences of the sins of Adam and Eve.

Since Augustine was so influential in the history of doctrine, his views on human sexuality have naturally affected many strands of Christianity and western culture in general. In cotemporary scholarship, Daniel Boyarin has written extensively and eloquently on the cultural effects of Augustine’s views. In his *Carnal Israel: Reading Sex in Talmudic Culture*, Boyarin (1993) notes Augustine’s infamous charge against “the Jews” – namely, that they are people of the flesh. Ironically, Boyarin, himself a Jew, says

that “Augustine knew what he was talking about” (p. 1). But conceding to Augustine this point enables Boyarin to turn what was once a criticism of Jews into a criticism of Christianity and other dualistic metaphysics. How? Boyarin argues that, “for rabbinic Jews, the human being was defined as a body – animated, to be sure, by a soul – while for Hellenistic Jews (such as Philo) and. . . Christians (such as Paul), the essence of a human being is a soul housed in a body” (1993: 5). The importance of this perhaps subtle difference in theological anthropology is that

- ▶ The notion that the physical is just a sign or a shadow of that which is really real allows for a disavowal of sexuality and procreation, of the importance of filiation and genealogy, and of the concrete, historical sense of scripture, of, indeed, historical memory itself. The emphasis, on the other hand, on the body as the very site of human significance allows for no such devaluations (1993: 6).

In *The Body and Society*, Peter Brown (1988), generally regarded as the leading scholar on Augustine, has written about such issues as well.

The Psychological Study of Augustine

In the field of psychology of religion, there has been considerable interest in Augustine. Parsons (2003) marks the beginning of the modern psychoanalytic study of Augustine with an article by Charles Kligerman (1957) and a symposium in *The Journal for the Scientific Study of Religion* during the years 1965–1966. Two decades later, Parsons notes, followed another symposium in the journal that led to an edited volume by James Dittes and Donald Capps (1990). Capps and Dittes (1990) mark the beginning of the modern psychological study of Augustine with William James, who characterized Augustine as a “divided self” (p. vii). They note that, while the psychological publications on Augustine “are scattered among journals and books of several academic disciplines and the writers reflect diverse professional and scholarly orientations, the psychological study of Augustine is a matured field” (1990: vii). And so the purpose of the Capps and Dittes volume is “to recognize that field of study, to give it a sense of identity and to demonstrate its accumulated wisdom, to introduce fresh interest and to open new vistas” (1990: vii). Since then, the most recent full-length psychoanalytic study of Augustine is by Sandra Dixon (1999); James O’Donnell’s (2005) work is noteworthy as well. By reviewing the works cited here and the works cited in these bibliographies, the reader will have a good sense the psychological studies of Augustine to date.

In *Psychoanalysis and Mysticism: The Case of St. Augustine*, Parsons (2003) sketches a portrait of what he thinks a contemporary (and future) adequate psychoanalytic interpretation of Augustine would entail. Parsons notes that, in the psychoanalytic theorizing of Augustine, one can observe three types or schools of interpretation – namely, classic, adaptive, and transformational. Parsons (1999) previously suggested these categories for understanding the psychoanalytic study of mysticism, and in this article he peruses the psychoanalytic literature around Augustine with his own categories in mind. How does Parsons define the three categories? By “classic” he means traditional or orthodox (and therefore usually oedipal and reductive) psychoanalytic interpretations of mystical experiences. Here a mystical experience is usually explained in terms of developmental conflicts, and sometimes such experiences are rendered pathological and, therefore, pejoratively (cf. Kligerman, 1957). “Adaptive” interpretations do not interpret mystical experiences to be pathological. Quite the contrary, here mystical experiences are understood often to lead to growth. With regard to Augustine’s mysticism, Parsons notes that Dixon (1999) argues “for a preoedipal basis for Augustine’s mysticism when she states that the ascent with Monica to the ‘region of inexhaustible richness,’” which is, for Dixon, “the inexhaustible breast” (Parsons, 2003: 159). Parsons thinks that this argument is representative of an “adaptive” reading, as is Philip Woollcott’s (1966) argument that “the mystical visions were complicit in enabling Augustine to cure himself” (Parsons, 2003: 158). “Transformational” interpretations go even further and break with classic and adaptive interpretations in that transformational interpretations give epistemological legitimacy to the mystic, even while acknowledging the validity of classic and adaptive interpretations. As Parsons puts this with regards to the psychoanalytic study of Augustine, “a transformational approach must also create metapsychological space for a mystical desire which ‘ascends’ beyond the purely developmental” (2003: 169). The transformational approach, then, seeks a dialogical approach to religion and psychology.

Donald Capps (2007a and b) has continued to write on Augustine, and two of his recent articles have appeared in *Pastoral Psychology*. In *Augustine’s Confessions: The Story of a Divided Self and the Process of Its Unification*, Capps (2007a) notes that, when he began his professional career over thirty years ago, he wrote an article “on the psychologies of religion identified with Sigmund Freud and William James” (p. 551). Capps says that he didn’t realize then that he “would be engaged in a sort of dialectical embrace of these two innovative thinkers throughout

[his] career” (2007a: 551). So, in the first article, Capps (2007a) uses, as his subtitle intimates, James’s notion of the divided self to interpret Augustine’s *Confessions*, and, in the second article, Capps (2007b) focuses on Freudian interpretations of the *Confessions*, specifically on the often-noted issue of self-reproach in the *Confessions*. All of this is to point out, in other words, that the psychological study of Augustine is alive and well, and one wonders if a third symposium on the psychological study of Augustine will take place in the near future.

Authoritarian Personality

Daniel Burston

Authority and the Father

The “authoritarian personality” is a social psychological construct derived from early psychoanalytic theories of attachment to (and conflict with) the father. To begin with, note that Freud’s own attitude toward paternal authority was profoundly ambiguous. In 1910, Freud attributed Leonardo Da Vinci’s astonishing precocity to the fact that he had “escaped being intimidated by his father in earliest childhood”, implying that the routine exercise of paternal authority leads to the suppression of free and unfettered intellectual development in children, and later on, in adults. Without saying so in so many words, Freud’s tribute to Leonardo suggested that childhood and adolescent rebellion against paternal authority is essentially an *emancipatory* process.

However, three years later, in *Totem and Taboo*, Freud linked rebellion against paternal authority to an intractable ambivalence rooted in our phylogenetic inheritance, which presumably underlies the “collective obsessional neurosis” that underscores all religious ideation. On this second reading, rebellion against paternal authority is an unconscious re-enactment of a collective rebellion against a prehistoric tyrant - in short, a repetition compulsion. Freud never reconciled these contradictory views of rebellion against paternal authority, or even acknowledged their existence in his work (Burston, 1994: 214).

Freud attracted many followers who resonated with the anti-authoritarian elements in his thought. However, all those who were radical or uncompromising in their opposition to patriarchal authority were eventually thrown out of the International Psychoanalytic Association, e.g., Otto Gross (in 1909) Wilhelm Reich (in 1933) and Erich Fromm (in 1954).

Though greeted as a theorist of great promise in 1907, Otto Gross was a “wild analyst” disowned by Freud and Jung by 1909 (Burston). Before his dismissal from “respectable” psychoanalytic circles, Gross was immersed in the matriarchal theory of J. J. Bachofen (Michaels, 1983; Green, 1999). In 1916, Gross inveighed, both publicly and in print, against “the patriarchal-authoritarian character” – an idea taken up by Wilhelm Reich a decade later (Cattier,

1970, Chap. 9 and 10) in his efforts to explain the growing appeal of Nazism.

Unlike most of his colleagues on the Left, Reich was alert to the quasi-religious character of the Nazi movement, and explained the religious and mystical dimensions of Nazi thought and propaganda as sublimated expressions of sado-masochistic tendencies in the collective psyche.

Fascism and Sado-Masochism

When it is used to describe a sexual perversion, the word “sado-masochism” denotes a kind of emotional numbness, or an inability to experience full sexual arousal and release without inflicting pain on others, or having pain inflicted on oneself. But this narrow definition of sado-masochism was abandoned, or more accurately, expanded by Freud and his followers in the 1920’s. Freud noted, for example, that sadism and masochism seldom appear in pure form, and that sadistic and masochistic tendencies are always found together in the same person. As a result, a person who prefers the sadistic role harbors masochistic tendencies, because a great deal of the pleasure derived from sadism derives from a process of unconscious identification with their victim. Conversely the masochist identifies with the sadist, and derives pleasure from this in the midst of his pain (This explains why sado-masochists often exchange roles.).

Taking his cue from Freud, Reich said that our definition of sado-masochism should be expanded beyond overt sexual behavior to include sadistic and masochistic *character traits*, which may or may not take on sexual form. People with a predominantly sadistic character may not gravitate to S & M per se, but take great pleasure in dominating, defiling and humiliating other people, robbing of their dignity and their powers of autonomous decision and action. They love power and control. Hitler was clearly such a person. He wasn’t interested in sex, really, but loved power, control and killing people, as did most members of his inner circle. Masochistic characters, by contrast, take pleasure in submission. They feel anxious unless they are neurotically attached to a more powerful person who tells them what to do. They love power and control too, but typically seek it out in others, rather than trying to seize it for themselves. Many of Hitler’s followers fit the masochistic profile. They silenced their consciences and their critical faculties and obeyed their Fuehrer, regardless of how heinous and bizarre his ideas and behavior were.

According to another analyst, Erich Fromm, neither the sadist nor the masochist – in this diffuse, characterological sense – is capable of genuine love or compassion for other human beings. Instead, they cultivate a kind of sordid intimacy with others – what he called “symbiotic attachment.” According to Fromm, people with a pronounced and open preference for sado-masochistic sex are relatively rare, and often conflicted about their inclinations, because they are frowned upon by the general population. But sadistic and masochistic *character traits* are quite prevalent in the general population, and when they proliferate beyond a certain point, authoritarian and anti-democratic regimes tend to flourish. In such circumstances, people who are relatively normal in terms of their sexual behavior and daily habits, but whose conscience has atrophied, support leaders whose sanity is quite precarious. The more grandiose and inflated a sadistic leader’s ego becomes, the more his followers revel vicariously in their leader’s (real and imagined) power. This attitude toward power legitimates the use of force and deception to solve problems, and abets an ideological emphasis on the natural inequality of man, which justifies the oppression of one race (or sex) by another. In chapter 6 of *Escape From Freedom*, published in 1941, Fromm said:

- ▶ Usually Hitler tries to rationalize and justify his wish for power. The main justifications are the following: his domination of other peoples is for their own good and for the good of the culture of the world; the wish for power is rooted in the eternal laws of nature and he recognizes and follows only these laws. . . (p. 251).

Moreover, Fromm continued

- ▶ The second rationalization, that his wish for power is rooted in the laws of nature is more than a mere rationalization; it also springs from the wish for submission to a power outside of oneself, as expressed particularly in Hitler’s crude popularization of Darwinism. In “the instinct of preserving the species”, Hitler sees “the first cause of the formation of human communities”.

The instinct of self-preservation leads to the fight of the stronger for the domination of the weaker and economically, eventually, to the survival of the fittest. The identification of the instinct of self-preservation with power over others finds a particularly striking expression in Hitler’s assumption that “the first culture of mankind certainly depended less on the tamed animal, but rather on the use of inferior people.” He projects his own sadism upon Nature who is “the cruel Queen of all Wisdom,” and her law of preservation is bound to the brazen law of necessity and of the right of the victory of best and the strongest in this world.”

Fascism, Conservatism and Anti-Semitism

While *Escape From Freedom* remains Fromm’s best known study of authoritarianism and Nazism, his empirical research on pro-fascist sympathies among blue collar workers in the Weimar Republic actually in 1929, while he was Director for Social Psychological Research at the Frankfurt Institute for Social Research, under the Directorship of Max Horkheimer. Horkheimer was accustomed to thinking of pro-fascist sympathies as an artifact or expression of Right wing sympathies, and was disagreeably surprised by Fromm’s discovery that they are actually quite prevalent among Left wingers as well. For this – and other – reasons, Horkheimer refused to publish Fromm’s study, which only appeared posthumously (Burston, 1991).

Fromm left the Frankfurt Institute for Social Research – which had relocated to Columbia University in 1937 – in 1938, and was replaced by Theodor Adorno, who used Fromm’s unpublished work as a pilot study, which informed his (much larger) study of pro-fascist and anti-Semitic attitudes among Americans, called *The Authoritarian Personality* (Adorno et al., 1950). Significantly, Adorno found no evidence of Left-wing authoritarianism in America, but did find striking correlations between “pseudo-conservative” trends and pro-fascist thinking, and between (Right wing) anti-Semitism and intense religiosity, which appear to imply that there is some necessary or inherent linkage between intense religiosity and authoritarian (and/or anti-Semitic) trends. These findings may have been valid in their time and place, but must be taken with a grain of salt nowadays. Why? Since the 1950s, Left-wing anti-Semitism has grown apace, while conservatives like William F. Buckley and Barry Goldwater have made anti-Semitism anathema in American conservative circles. While it certainly has not disappeared from the scene, anti-Semitism is entirely overshadowed by philo-Semitic attitudes (on the Right). Therefore, efforts to replicate Adorno’s study today would yield very different results.

Moreover, and more importantly, Adorno et al. shared Freud and Reich’s assumption that religiosity is the expression of repressed inner conflicts, sublimated sado-masochism, or other “pre-genital” libidinal fixations. The idea that religiosity per se is a symptom of immaturity, or a derivative expression of psychopathological trends is an example of Enlightenment bias that Fromm, for one, never shared. Fromm had trained for the rabbinate before becoming a psychoanalyst, and though an atheist himself, held the spiritual traditions of the East and the West in high esteem. Indeed Fromm devoted a chapter of *Sigmund Freud’s Mission* (1959) to demonstrating the

presence of authoritarian tendencies in a notoriously *irreligious* thinker – namely, Freud himself. Fromm’s reflections on Freud’s authoritarianism hark back to essays he wrote in the early 1930’s on matriarchy and patriarchy, and what he called “patricentric” and “matricentric” trends in individual and social psychology (Fromm, 1959).

Avatar

Fredrica R. Halligan

Avatar (or *Avatara*) is an Indian concept meaning the descent to earth of a deity. In particular, Vishnu, the aspect of the Hindu Trinity who is devoted to preservation of the creation, is believed to have incarnated on earth many times. Whenever negative energies are rampant and the world is in great peril, in danger of imminent

destruction or chaos, Vishnu is said to return. He comes to guide humanity back to righteous living (*dharma*) in order to preserve the harmonious order of the universe.

Interfaith Perspectives

Psychologically we must compare this idea of Divine Incarnation with other traditions. It is well known that Christian belief in Jesus as Incarnate God impacts the whole belief system and worldview of the individual. In contrast, there is a somewhat more muted impact in Jewish and Moslem reverence for the prophets and in Buddhist reverence for the Buddha. For Hindus, like for Christians, the belief that God has incarnated on earth has profound psychological implications. Prayers to that incarnated Divine One are believed to be efficacious. This belief provides a strong resource for coping with the vicissitudes of life, an inspiration and model of behavior, and a supportive, calming religious-introject in the psyche of the believer. Unlike Christianity, however, the Hindu belief in divine incarnation is multiple.

Incarnation in the Hindu Tradition

Some of the earliest legendary *Avatars* were thought to take animal form (e.g., a fish, a turtle, a boar and a hybrid man-lion), but for thousands of years only human incarnations have been reported. These human incarnations have been mostly male, but recently a few female claimants have been reported (e.g., Mother Mira). The best known and most frequently worshipped *Avatars* are Rama, hero of the *Ramayana* epic, and Krishna, whose legends appear throughout the *Mahabharatha* epic, ending with the *Bhagavad Gita* (Song of the Blessed One). In recent times, Sai Baba is also believed to be an *Avatar*, one who first incarnated in Shirdi and secondly re-incarnated in Puttaparthi, India.

For the Hindus, as for many Western religions, God is Love. Thus the *Avatar* is an embodiment of pure Love. Of the four major spiritual paths in Hinduism (*Jnana*, *Bhakti*, *Karma* and *Raja*), *Bhakti* – the path of devotion – is most readily practiced in relation to an incarnate person. All humans are socialized to love other humans, so devotion to the *Avatar* is a natural extension beyond devotion to the family, to one’s own *Guru* (teacher) and other humans. Like Jesus in Christianity, the *Avatars* are reported to be miracle workers, healers, teachers, and expansive lovers of all creation. They are believed to be fully divine as well as human. Their wisdom is meant for all humanity.

Purpose of the Avatars

In Indian thought, the Will of God (*sankalpam*) is to protect the structure of the universe, so *Avatars* arrive when evil threatens to vanquish good. These incarnations are said to occur in response to earnest prayers by devotees, each manifestation suitable to the particular time and circumstance. The *Avatar* provides a role model of righteousness, truth and compassion.

Avatars incarnate to renew the spiritual endeavors of humanity. By example they illustrate the tender, human side of the divine; and by their miracles they demonstrate God's power. They teach how to achieve God-realization. Humans cannot fully understand the nature of God until they merge with the Divine. The *Avatar* teaches essential processes towards that end, including adherence to truth, non-violence, peaceful equanimity, loving service of others. In the *Bhagavad Gita*, Krishna teaches the way to merge with God: to be a willing instrument of God, acting in accord with Divine Will and leaving the outcome in God's hands. This equanimity is characteristic of *Avatars* and of advanced spiritual followers who merge with God, thus discovering their own true spiritual Self.

Axis Mundi

David A. Leeming

The Axis Mundi or World Center is embodied for many cultures in such objects as world trees or centering towers (Ziggurats, temple mounts, etc.) or mandala centers. In Native American pueblo cultures the Axis Mundi is

the place of the people's emergence into this world, symbolized by the small hole or sipapu in the center of the religious space, usually underground, known as the kiva. For Norse culture the axis mundi is Yggdrasil, the great tree that in the creation myths links the various segments of creation – the lower world, the middle world, and the upper world. Axle trees such as this exist in many cultures. In Korea it was believed that a sacred tree connected the three worlds of existence. For ancient Tartars in Central Asia a giant pine tree grew out of the earth's navel and reached to the home of the supreme god in the heavens. For Christians, the cross is a kind of world tree on the world center hill of Golgotha. A city or town can be the world center, as in the case of the Greek oracular center, Delphi, often called the world navel.

Symbolically speaking, then, the axis mundi is the object that embodies the essential identity of a culture – its center or soul. In terms of individual psychology, the axis mundi is an expression of the interaction between various segments of the psychic world. If we think of the axis mundi as a tree, this understanding becomes clear. The tree's roots are in the mysterious depths; its leaves reach to the sky and its trunk is the vehicle for the energy that derives from the roots and reaches up to the energizing power that comes from the sun. In terms of the individual's quest for wholeness or individuation, the tree's roots explore and take nourishment from the subconscious – the unconscious world of dreams, where monsters are fought and lost treasures are to be found. The energy from this process makes possible the growth of the trunk – the lived life – and opens the individual to the budding and leaf-making which can be thought of as individual enlightenment or self-knowledge. The total tree is the unified Self.

B

Baal Shem Tov

Mark Popovsky

General

Israel ben Eliezer (ca. 1700–1760), the founder of the Hasidic Movement, was born in the Ukraine at the beginning of the eighteenth century. Among devotees, he is most commonly referred to as “The Besht” – an acronym of his Hebrew title, Baal Shem Tov, literally “Master of the Good Name.” His purported ability to perform miracles accounts for the moniker as he was able to harness the power of the “good name” – that is, God’s name – for healing. In his 30s he emerged as a charismatic leader, story-teller and traveling healer who quickly amassed a wide following among the impoverished Jews of Galicia. The Baal Shem Tov functioned mostly outside of the established communal structure. The stories told by his followers usually depict him as speaking in small groups or with individuals instead of preaching in the synagogue.

Core Teachings

The Baal Shem Tov preached an anti-establishment message, downplaying the importance of traditional text study as an act of piety in favor of narrative, song and dance. Such spiritual practices are accessible to everyone, not only the educated religious elite. He taught that individuals attain spiritual redemption by striving for a state of constant joy, especially when worshiping. Rather than something to be restricted, physical pleasure is valued because it leads to spiritual pleasure which in turn brings one closer to God. Some of the Baal Shem Tov’s sharpest criticism was reserved for Jewish leaders who encouraged asceticism through fasting or other rigorous practices which limited physical pleasure.

Though there is no evidence that the Baal Shem Tov was a scholar of Talmud or Jewish law, he did study Kabbalah (Jewish mysticism). Until his time, Kabbalistic

traditions generally resided in the hands of a small elite and were not taught or practiced widely. Through his travels, the Baal Shem Tov attempted to popularize some Kabbalistic notions, especially those related to the idea that an individual can become one with the divine through spiritual practice and good deeds. However, he also rejected some Kabbalistic principles, especially those that encouraged individual isolation. The Baal Shem Tov and his followers were roundly criticized by many contemporaneous rabbis for oversimplifying complicated mystical teachings and for creating a cult that was preoccupied with miracles, talismans, and the supernatural.

Influence in Hasidic Movement

The Baal Shem Tov became the first of many Hasidic Tzadikim (“righteous ones”; sing: “Tzadik”). The Tzadik or “Rebbe” was recognized by his followers to have attained a higher spiritual level and was believed to have the power to elevate the souls of those in his community through his righteous acts and ritual practice. Consequently, the Tzadikim of the Hasidic movement garnered loyal and devout *ad hominum* followings, much more so than that of a standard rabbi in the non-Hasidic world. After his death in 1760, a number of the Baal Shem Tov’s grandchildren and disciples became Tzadikim with their own followings. Within two generations, the Hasidic movement had spread throughout Eastern European Jewry attracting many adherents and simultaneously eliciting vigorous rabbinic opposition. It remained the primary spiritual orientation for many religious Jews in the region until the destruction of Eastern European Jewry during the Holocaust.

The Baal Shem Tov never wrote any works of his own; the stories he told were passed on orally among his followers. However, after his death his scribe, Dov Baer of Linits, compiled a collection of teachings, correspondences and narratives in a volume entitled *Shivhei Ha-Besht*, translated into English as *In Praise of the Baal Shem Tov*. Some modern scholars have argued that the Baal Shem Tov’s emphasis on the spiritual value of story-telling, extensive use of symbolic language, fascination

with dream material and veneration of physical pleasure indirectly influenced the thought of Sigmund Freud whose father was raised in the Hasidic tradition.

Bahais

Benjamin Beit-Hallahmi

The history of the Bahais presents us with a fascinating case study in religious, cultural, and psychological transformation. It starts with the appearance of the Babis, a millenarian group of Islamic origins, which developed out of the messianic Shiite tradition, founded by Ali Muhammad (1819–1850) of Shiraz, Iran, known as the Bab. Ali Muhammad proclaimed himself to be the Bab (Gate) in 1844, a thousand years after the disappearance of the twelfth imam, according to Islamic Shiite tradition. (In the Shiite Muslim tradition, Muhammad ibn al-Hannifiya, who disappeared (or died) in 880 CE is the Hidden Imam, who is in hiding and would come back one day to restore peace and justice.) The Bab, in Shiite lore, was supposed to announce the coming of one greater than himself, who would open a new era of peace and justice. At first, Mirza's claim was welcomed, but when he started deviating from the Islamic tradition, the reaction was violent. In 1848, the Babis declared publicly their secession from Islam, and 2 years later Muhammad was executed by a firing squad.

The group leadership was then assumed by 2 half-brothers, Yahia Nuri (1830–1912), later known as Sabh-i Azal, and Husayn Ali Nuri (1817–1892), later known as Baha'u'llah. The next stage was a split in the movement which occurred when the former claimed to be the appointed successor, while the latter said that he was the

prophet foretold by the Bab. Followers of Baha Allah started a new movement, BAHAIIS.

The followers of Yhaia Nuri, known as Azalis, continued the tradition of BABISM. Their sacred book is *al-Bayan*, written by Ali Muhammad of Shiraz. According to this book, some elements of traditional Islamic law are abolished, and a promise is made of a prophet to come. The number 19 had central significance, and a calendar of 19 months, having 19 days each, was created. Another splinter group, the Bayanis, rejects Sabh-i Azal, and claims to follow the Bab alone.

The founder of Bahaism, Husayn Ali Nuri, known as Baha Allah or Baha'u'llah ("Glory of God"), was a Babist who, while in exile and in prison, became convinced that he himself was the prophet or the Messenger of God, whose coming was announced by the Bab. He wrote the Bahai scripture *Kitab-i-Aqdas*, detailing the laws of the faith. In 1863 he announced that he was the promised "Manifestation of God." After his death, his son Abbas Effendi (1844–1921), known as Abd-ul-Baha ("Servant of Baha"), was recognized as the leader, and starting in 1908, when he was released from prison after the "Young Turks" political reforms in the Ottoman Empire, undertook successful missionary work, especially in English-speaking countries. In 1921 the leadership passed to the founder's great-grandson, Shogi Effendi (1897–1957). After his death in 1957, the movement was reorganized, and it is now being run by a nine-member body, known as the Universal House of Justice, elected in 1963. The world center of Bahaism, and its holy places, are located in Israel. Bahaism's holiest shrines are concentrated in the Haifa area, where the founder worked and died, and the Shrine of the Bab, with its golden dome, is one of Haifa's best known landmarks. The BAHAI organization in the United States, among the largest in the world, is known as the National Spiritual Assembly (NSA) of Bahais in the United States. A National Spiritual Assembly (NSA) exists in more than 100 countries.

Bahaism, having distanced itself from Islam, claims to be a universalist religion, preaching the religious unity of humankind and human equality. The religious prophecies of all past religions are supposedly being fulfilled now through the movement.

Baha'u'llah is described as the messianic figure expected by Judaism, Christianity, Islam, Zoroastrianism, Hinduism, and Buddhism. Earlier prophets are recognized, but with the coming of Baha'u'llah, the "Manifestation of God", a new era has begun, lasting 5000 years. It will lead to the Bahai Cycle, lasting 500,000 years. This will happen only after a global catastrophe and the disintegration of the present world order.

There are rules covering prayers, fasting, marriage, divorce, and burial, and prohibitions against political activities, homosexuality, and the use of drugs. Alcohol and pork are avoided. Prayers are said five times a day, and in addition there are blessings for many everyday occasions. Bahais of West Asian origin are expected to follow special rules, in keeping with Islamic customs. The numbers 19 and 9 are considered sacred. All Bahais are expected to pay 19% of their earnings to the group. The BAHAI calendar, which started in 1844, has 19 months, each having 19 days, and the year starts on March 21, following the Zoroastrian calendar. The 19 days preceding it are fast days till sundown. Bahais meet on the first day of the month, and regular meetings are devoted to scripture readings. Local congregations are tightly knit, and the private lives of members are closely supervised by the congregation and its leaders. While there is no involvement in politics, Bahais support the ideal of a world government and the activities of the United Nations. They have suffered prosecution in Islamic countries, especially Iran, where the persecution has become especially severe after the founding of the Islamic republic in 1979. According to Amnesty International, about 200 BAHAIS were executed between 1979 and 1992 in Iran.

Some descendants of Bahaism's founder, Baha'u'llah, have refused to accept leadership succession and organizational authority, as they were being marginalized by the leadership. The Bahai World Federation was founded in 1950 in Acre, Israel, by Amin Effendi, the founder's last surviving grandson, but it has become more marginal after losing all legal struggles against the majority leaders over Bahai real estate holdings and over official recognition by the State of Israel.

Since the 1950s, there have been several Bahai splinter groups in the United States which have predicted catastrophic floods and nuclear wars for 1963, 1980, and 1995. One such group is Bahais Under The Hereditary Guardianship, known also as Orthodox Bahais or Remyites, founded in 1960 by Charles Mason Remy (1873–1974), who in 1957 became a member of the Bahai collective leadership of 27, known as Hands of the Cause and also of the 9 Chief Stewards following the death of Shoghi Effendi. In 1960 he proclaimed himself to be the Second Guardian of the Faith, and was declared a Covenant-Breaker by the other members of the leadership, thus being excommunicated.

According to the group's doctrine of the great global catastrophe, major changes in the earth's crust would lead the rise of the seas and the death of two thirds of humanity. Remy predicted in 1960 that a catastrophic

flood would inundate most of the United States and urged his followers to move to the Rocky Mountains. This catastrophe was initially prophesied for 1963 and then postponed to 1995.

Bahais Under The Provisions Of The Covenant (BUPC) is a U.S. schismatic BAHAI group, founded in 1971 by Leland ("Doc") Jensen (1914–1996). Jensen left the official United States Bahai organization in 1960 and joined the Bahais Under The Hereditary Guardianship. Noting the predictions of Charles Mason Remy about the impending flood that would cover the low lying areas of the United States in 1963, Jensen moved to Missoula, Montana, where he opened a chiropractic office in 1964. In 1969 he was convicted of sex offenses and sentenced to 20 years in prison. After arriving in prison, Jensen reported having a series of revelations, and claimed the identity of several personalities mentioned in the Bible. Jensen combined Bahai teachings, occult ideas, and Christian eschatology to create the BUPC credo. He predicted a nuclear holocaust in 1980, followed by a thousand years of peace for those who would join BUPC and save themselves from destruction. He was paroled in 1973 and started recruiting followers immediately. April 29, 1980 at 5:55 p.m. was the time specified by Jensen for a nuclear war to destroy one third of humanity. That would be followed by 20 years of added upheavals, starvation, revolutions and natural disasters, and in the year 2000 God's Kingdom would be established, followed by 1000 years of peace. About 150 followers made preparations for the nuclear holocaust. When this did not take place, revised predictions were issued. The group entered a period of crisis and decline, but managed to survive.

The Bahai movement, which started as a heterodox Moslem sect growing out of Babism has proselytized successfully in the West, and now has followers on all continents. Its history reflects continuing psychological tensions between visions of apocalyptic destruction and of universal unity and peace. The appearance of dissident groups, competing with the main leadership, reflects these tensions.

We should keep in mind that this is a modern movement, started fairly recently, which has undergone quite a few transformations. At the leadership level, we can observe the expected conflicts stemming from personal ambitions and opposing visions. The movement has undergone a series of identity upheavals, involving social, psychological, and geographical changes, as its leadership has shown creativity and the ability to adapt and go beyond its historical origins to. What started in Shia millenarianism is today often perceived as a Western belief system, attracting followers all over the world. Its public

image is clearly at variance with its complex history and the psychological processes which created it.

Baptism

David A. Leeming

Baptism, (Greek: *baptein* = immersion) is a term usually applied to the Christian ritual of initiation by water, and it is the psychology of this ritual that will be addressed here. It must be noted, however, that such acts are by no means peculiar to Christianity. In many other traditions of the ancient and modern world water is used for ritual cleansing and/or initiation. Ritual washings at death can symbolize a cleansing in preparation for the journey to another world, as in the case of the ancient Egyptians. The Greeks had many bathing rites, as, for example in the washing of initiates entering into the Eleusinian mysteries. Jews have ablution ceremonies associated with washing away various forms of uncleanness. Muslims perform ritual ablutions before praying.

Baptism for Christians can be compared to Jewish circumcision in the sense that through baptism the individual is “marked as Christ’s own forever” as in circumcision the Jew is marked as a part of his “nation” for ever.

Christian baptism has immediate antecedents in the Jewish tradition of baptizing converts seven days after circumcision and in the then radical practice of John the Baptist (the Baptizer) who performed the ritual in the Jordan River. Jesus came to John to be baptized into his life’s mission. It was the apostle Paul (formerly Saul), in the early development of the Christian church as it broke away from its Jewish roots, who established the full symbolism of the baptismal ritual, one administered at various stages in Christian history at death, in early adulthood, or in infancy and in various ways according to the sect involved. The descent into or ritual administering of water in the ceremony was, for Paul, a symbolic

death based on the death of Jesus. Arising from the water the initiate follows Christ’s resurrection and is reborn. The initiate dies to the old life and is reborn, this time into life as part of the Church, the “Body of Christ.”

There was always a psychological element to the sacrament of baptism for Christians, a sense of a new knowledge or understanding that comes through the new life. The early church father and theologian, Clement of Alexandria, believed that “baptized, we are enlightened.” In terms of modern psychology baptism can become a symbol of the birth or recovery of Self. Water has always been the symbol of pre-creation, the symbol of the universal mother, the primal birth waters. In baptism it can be said that the initiate returns to the creative waters to be reborn as potential Self, ready in this new state of being to confront the various traumas and passages of life and ultimately death itself. The descent into the waters can also be seen as a model for the necessary descent into the mysteries and traumas of the unconscious and the old life in order to be reborn, this time with the understanding making it possible to face the realities and challenges of the life ahead.

Bhagavad Gita

Fredrica R. Halligan

The *Gita*, as it is affectionately called, has been described as the bible of the Hindus. It is a verse Upanishad, and has become widely known even in the West because it has been the daily reading of Mahatma Gandhi as well as millions of other Indians. The story of the *Bhagavad Gita* is the tale of the Mahabharata war, the great conflict of good and evil. In this epic tale of war between cousins, the Pandavas won out because they relied entirely on God. Arjuna, the Pandava prince and accomplished archer,

turns to Krishna, his friend and charioteer who is God in disguise, for answers to the great questions of life.

- ▶ Imagine! A man we can all identify with is in dire straits, at a crossroads, brought to his knees by the great pressures and complexities of life, shakily reaching out. And his best friend, an incarnation of God, takes his hand and walks him through the answer – explaining step-by-step the most profound secrets of all ages (Hawley, 2001: xxiv).

The Gita is thus the story of a psychological war we all wage within, and the answers given teach us how to live so as to win God's grace. Chapters two and twelve are the most significant in their messages to humanity.

The Gita's Essential Wisdom

In Chapter 2, Arjuna is bent down with worry and remorse, not wanting to begin the battle that will cause the bloodshed of so many of his family and mentors. In response, Krishna teaches him that (1) we must each do our duty, (2) the death of the body is not the death of the person because the soul (*Atman*) lives on (with a description of the doctrine of re-incarnation) and (3) to be an instrument of the Divine is to be in union with God. This third point is the essence of the wisdom of the Gita. When we surrender to God, and dedicate all our actions to the Divine One, then we can get beyond our own egos and allow God to take over. We must: "Let go and let God" (as this same thought is reworded in the 12-step programs for recovery from addictions today).

To accomplish this vital surrender to God, we must let go of our personal desires, and we must leave the outcome in God's hand. This leads to equanimity, when we neither relish the praise, nor cringe under accusations and blame, that may accompany the outcome of our actions.

- ▶ The central points of issue, Arjuna, are desire and lack of inner peace. Desire for the fruits of one's actions brings worry about possible failure – the quivering mind I mentioned. When you are preoccupied with end results you pull yourself from the present into an imagined, usually fearful future. Then your anxiety robs your energy and, making matters worse, you lapse into inaction and laziness. . . . Work performed with anxiety about results is far inferior to work done in a state of calmness. Equanimity – the serene mental state free from likes and dislikes, attractions and repulsions – is truly *the ideal* attitude in which to live your life (Hawley, 2001: 20f).

This spiritual wisdom has profoundly beneficial results in psychotherapy today. It is, of course, counter-culture in the USA to talk of desirelessness and relinquishing the fruits of our labors, but anxiety disorders can be ameliorated by psychoeducation with this "wisdom of the East" in mind.

God's Most Beloved Devotees

In chapter twelve of the Bhagavad Gita Krishna teaches Arjuna that God especially loves those who are genuinely devoted and surrendered to Him, those who love and serve others, and those who are possessed of equanimity. In the expression of particular love, Krishna in the Gita teaches humankind how to live in harmony with God's Will. He states that he loves most:

- ▶ He who hates no being, who is friendly and compassionate to all, who is free from the feeling of 'I and mine,' even-minded in pain and pleasure and forbearing. Ever content, steady in meditation, self-controlled and possessed of firm conviction, with mind and intellect fixed on Me, he My devotee is dear to Me (Chidbhavanda, 2000: 658).

This is a profound statement of how to live a spiritually-oriented, values-based lifestyle, as valid today as it was thousands of years ago when the Bhagavad Gita was written. In a recent, more Western translation, Krishna is also saying:

- ▶ I love those who do their worldly duties unconcerned by life. I love those who expect absolutely nothing. Those who are pure both internally and externally are also very dear to Me. I love devotees who are ready to be My instrument, meet any demands I make on them, and yet ask nothing of Me. I love those who do not rejoice or feel revulsion, who do not yearn for possessions, are not affected by the bad or good things that happen to and around them and yet are full of devotion to Me (Hawley, 2001: 112).

Sai Baba (q.v.), a contemporary *Avatar* in India teaches that the wisdom of the Gita provides guidance for all humans who live today. He summarizes:

- ▶ The great teaching of the *Geetha* is: 'Put your trust in God, carry on your duties, be helpful to everyone and sanctify your lives.' Dedicate all actions to God. That is the way to experience oneness with God. God is in you. You are in God. This oneness is the basic truth. Chant the name of the Lord and render social service in a spirit of selflessness and devotion to God (Sai Baba, 1995: 235).

Oneness with God has long been the aim of the mystical traditions of all religions. These small clues on how to attain that sense of union are vital for all spiritually-oriented clients in psychotherapy or spiritual direction. To dedicate one's daily actions to God is a profound spiritual practice with beneficial results in both the psychological and spiritual dimensions of life.

Bible

Jeffrey B. Pettis

The Bible (Greek, “the little books”) constitutes a collection of writings understood to be sacred and essential for the life and worship of Judaism and Christianity. Most of these works are compilations of various oral and literary traditions ranging from the second millennium BCE through the second century CE. They reflect the life and narrative of various groups and socio-political contexts of a monotheistic religion taking on distinct qualities and notions of ritual and worship. The Book of Genesis evidences many of the themes which permeate the Bible as a whole. The account of the creation story (Gen.1–3) sets forth the creative powers of the Divine to bring about life *ex nihilo* (“out of nothing”). This is a YHWH who is mighty and receives sacrifices from patrons to appease his temperament and persuade his actions in the mortal, material world: “And Noah built an altar (Hebrew, *mzbch*) unto the Lord. . . and offered burnt offerings on the altar. And the Lord smelled a sweet savor; and the Lord said in his heart, I will never again curse the ground any more for man’s sake” (Gen. 8.20–21). Compare Isaac’s altar at Bersheba (Gen. 26.25), Jacob’s altar at Shechem (Gen. 33.20), Moses’ altar at Rephidim (Ex. 17.15), Solomon’s

altar at Giben (1K. 6.20; 8.64). The notion of “revelation” also occurs as a central theme in Genesis and other texts, the purpose and needs of the Divine being made known to the heroes of the Jewish people. Abraham has a revelation that his people will become a great nation (Gen. 12.1–4) and that God is with him as a “shield” (Gen. 15.1). At Bethel Jacob has a dream of angels ascending and descending a ladder and awakens afraid, knowing that he has been encountered (Gen. 28.10–22). His son Joseph dreams and interprets dreams through which the divine purpose becomes realized (Gen. 37–50; cf. 1 Sam. 3; 1 Sam. 28; 1 Kings 9; Isa. 6.1). Compared to the Canaanite religion of that time, the notion of afterlife in the Jewish Scriptures is minimal. Covenantal existence with God in the present world through faithfulness to Torah receives the primary focus. To be in right relation with YHWH is to experience the goodness and blessing of a full life: “Blessed is the one who does not walk in the counsel of the ungodly. . . but delights in the law of the Lord. . . He shall be like a tree planted by the rivers of water, that bring forth fruit” (Ps. 1.1–3). It is not until the Book of Daniel (168–165 BCE)—the latest writing of the Jewish scriptures—that any clear notion of resurrection and life after death occurs (Dan. 12; cf. Ezek 37; Isa. 24–27). Embraced by Jewish groups such as the Pharisees and the Essenes, it is this belief which becomes central for early Christian communities and its writings. Paul writes how Jesus died, was buried, and was raised on the third day according to the scriptures. Jesus then “became manifest” (*ōphthē*) to Cephas, then the twelve disciples. Then he appeared to more than five hundred brethren at one time” (1 Cor.15.3–6). Paul himself had a theophanous experience while traveling to Damascus. The event leads to his conversion to Christianity as one of its strongest advocates (Acts 9.1–22; 2 Cor. 12.1–5; 1 Cor. 9.1; cf. 1 Cor. 15.5–7). His understanding that a person is justified through faith and not through the works of the Law (Gal. 3.10–14) points to the cultural and political conflict over religious identity and the issue of Gentile (non-Jewish) membership in Jewish Christianity. Jesus as the “Son of Man” (Matt. 16.27–28, 10.23; Mark 10.45; cf. 1Tim. 2.5–6; Eph. 5.2; Titus 22.13–14), may be understood to continue the Son of Man in Judaism and occurs in the Book of Daniel (Dan. 7.13–14), a writing itself part of apocalyptic tradition especially rooted in the Maccabean Wars (168–65 BCE) and the Jewish resistance to the oppression of Antiochus Epiphanes the Seleucid King of Syria (Dan. 7.8; 8.9; cf. 11.31; 12.11). He is the central figure who points to the anticipated “new age” of divine justice and redemption, where those who have suffered and died for the sake of their faith will be restored to new

life (cf. 1 En. 46–48; 4 Ezra 13.3, 51f.; 1 Cor. 15.37–50). According to Jung, in Christian Gnosticism the Son of Man is the Original Man, a visualization of God as Arch-anthropos, and the real organizing principle of the unconscious (Jung, 1969, 203). As an apocalyptic and visionary, Jesus as the final sacrifice (John 6.53–54) is presented in the Gospels expecting a dramatic change of world-order. In Matt.1.15 he declares: “The time is fulfilled (*peplērōtai ho kairos*) and the kingdom of God is near” (cf. Matt. 4.17, 16.28; Luke 4.19). Christ is both Messiah and “Lord” – an apocalyptic identification which is unique to early Christianity and its reading of sacred text (see Ps. 110.1; cf. 11QMelech). Paul too anticipates the return of Jesus and new world-order: “For the Lord himself will descend from heaven with a cry of command, with the archangel’s call, and with the sound of the trumpet of God” (1 Thes. 4.16; cf. 1 Cor. 13.12, 15.1–6; 2 Cor. 3.18). For Paul, the new age begins with Christ’s resurrection and will conclude with its return. The Book of Revelation, the last book of the Bible and dated around the end of the first century CE presents this age as the “new heaven and new earth” (Rev. 21.1). However, by the third generation of Christianity the immediate return of Christ and notions of millennialism lessen as the church focuses (necessarily) more on the manifest practice of its beliefs in the present world. Implicit within this shifting is an interest in evangelism and personal witness which roots Jesus’ life and resurrection in real time. Unlike Paul’s inward mysticism and his notion of the “spiritual body,” the Gospels present the fleshly resurrected Jesus (John 21.24–31) who appears for the salvation of the outward world: “Go tell the disciples and Peter that he goes before you into Galilee; there you will see him, as he told you” (Mark 16.7). The Jesus of the Gospels have a missionary emphasis and a focus upon faith in the apostolic tradition. This more material-world orientation becomes a foundation for the formation of the “church” in concrete terms. The Book of Acts is a good of example of the story of the church establishing itself in the Greco-Roma second century world. Other writings such as the Epistle of James, 1 Peter, and 1 Timothy show this religio-social shift from Pauline interiority and the numinous to the outward and literal orientation. In this way the unconscious processes and content of religious experience in Christian and Jewish scriptures is becoming conscious and formulated. This includes the instituting of rituals such as the Eucharist and baptism, and codes of behavior, dress and diet.

Biblical Narratives Versus Greek Myths

B

Kalman J. Kaplan · Matthew B. Schwartz

Fifty years ago, Dr. Eric Wellisch, medical director of Grayford Child Guidance Clinic in England, called for a Biblical psychology, arguing that:

- ▶ The very word “psyche” is Greek. The central psychoanalytic concept of the formation of character and neurosis is shaped after the Greek Oedipus myth. . . . In ancient Greek philosophy, only a heroic fight for the solution but no real solution is possible. Ancient Greek philosophy has not the vision of salvation . . . There is need for a Biblical psychology (Wellisch, 1954: 115).

Religious leaders in traditional societies often performed the function of applying the psychological wisdom implicit in the Biblical religious traditions to the particular life problems of members of their flock. Rabbis, priests and pastors used Biblical wisdom to help people with concrete real-life problems. The contemporary situation is very different. The therapist is largely ignorant of if not antagonistic to religion, often in a manner incongruent with the patient’s own orientation.

Several studies for example, have found that over 90% of patients believe in a transcendent God, compared to only about 40% of clinical psychologists. This is a huge disconnect! Most mental health professionals avoid reference to, or recognition of their patients’ religious beliefs and the deep influence of these beliefs on patients’ lives. Few mental health professionals fully incorporate a patient’s religious beliefs into a treatment plan.

There are a number of possible reasons for the resistance toward religion on the part of mental health professionals, and for the resistance of religious leaders to the insights and findings of the mental health field. For one, the fields of religion and mental health have historically been in conflict with each other with psychology/psychiatry allying itself to science and medicine. Second, psychology/psychiatry often has approached issues of spirituality in a superficial manner, treating spiritual development as something foreign to the development of the individual personality. Third, issues regarding life meaning are too often relegated to the theological realm alone. Fourth, much of the biological cause of mental illness has been relegated to psychology and psychiatry. Finally, much of traditional psychotherapy has been based on classical

Greek rather than Biblical foundation models. For example, traditional psychoanalysis has focused on Greek foundation stories such as Oedipus, Electra and Narcissus rather than on respective Biblical alternatives such as Isaac, Ruth and Jonah.

In a series of books on religion and mental health, we (Kaplan, Schwartz and Markus-Kaplan, 1984; Kaplan and Schwartz, 1993; Schwartz and Kaplan, 2004; Kaplan and Schwartz, 2006; Schwartz and Kaplan, 2007; Kaplan and Schwartz, 2008) have delineated ten important contrasts with regard to mental health between classical Greek and Biblical thinking: (1) the primacy of God versus nature; (2) the harmonious relationship of body and soul, (3) cyclical versus linear conceptions of time, (4) the relationship between self and other, (5) the relationship between man and woman, (6) the relationship between parent and child, and (7) sibling rivalry and its resolution, (8) the relationship between freedom and suicide, (9) the question of rebelliousness versus obedience, and finally (10) a tragic versus therapeutic outlook on life. Let us briefly describe each of these Hellenistic biases in mental health and suggest a biblical alternative.

God and Nature

Hesiod's *Theogony* portrays Earth and Sky mating and giving birth to the titans, in particular Cronus, who later begat the Gods. In other words nature exists before the gods and creates them. The family pathology commences immediately, as the Sky father shoves the children back into the Earth mother. Such action of course breeds reaction and Earth repays Sky, by plotting with their son Cronus to castrate his father. The father-son conflict becomes ingrained as a law of nature foretold by Earth and Sky.

The Biblical story of creation sees God as creating heaven and earth. In other words, God exists before nature and creates it. (Gen. 1:1). God then proceeds to create order out of chaos. First, light is divided from darkness (Gen. 1:24). God then divides water from the land (Gen. 1:9). Then, God begins to prepare this world for the entrance of man. First, He has the earth bring forth vegetation (Gen. 1:11). He places living creatures in the sea and fowls in the air (Gen. 1:20). Now God places living creatures on the earth – cattle, creeping things, and other beasts (Gen. 1:24). The world is now ready for people, and God creates them, His ultimate handiwork, in His own image and gives them dominion over all that He has created. (Gen. 1:27–29). There is no irreconcilable conflict

between people and God, between man and woman, or between parent and child.

Body and Soul

Plato sees the relationship between body (soma) and soul (psyche) as conflictual and unfortunate. The soul is a helpless prisoner in the body, compelled to view reality only indirectly and unclearly (Phaedo, 82d). Plato, perhaps following Orphic teachings, called the body a prison of the soul, and others with comparable ideas called it a tomb (The Oxford Classical Dictionary, 1970: 895).

In Biblical thought, the human body and soul are both sacred, both created by God. They can and must function in harmony to fulfill God's purpose in the world. Emotion, intellect and body are all integral components of a human being, and there is no opposition between body and soul or flesh and spirit (Urbach, 1979).

Conceptions of Time

The pervasive Greek view of time is cyclical, mirroring the seasons of nature. A man rises up only to be overcome by hubris (pride) and cast down into nemesis (retribution), the nadir of the circle.

The Biblical view of time is linear, freeing itself from the cyclical seasons of nature. History begins in God's creation, continues with His ongoing revelation to man, and ends in God's messianic age. The book of Ecclesiastes distinguishes the cyclical view of time regarding natural events: "The sun riseth, and the sun goeth down." (1:3–7) from the developmental view embedded in human events "To everything there is a season, and a time for every purpose under the heaven: A time to be born, and a time to die" (3: 1–8).

Self and Other

Greek thought sees self and other as fundamentally opposed. One wins at the expense of another losing. The legend of Narcissus is prototypical in this regard. The earliest sources of the myth of Narcissus have long since been lost. Our most complete account from antiquity is from Ovid's *Metamorphosis* (ca. 43–17 CE). Although physically beautiful, Narcissus leads a life full of precarious oscillation between self-absorption and infatuation with another, which turns out to be his own reflection. He ends up in his psychotic attempt to integrate self and

other, and he suicides (Ovid, 1955: 3; Conon, 1798: 24) “Alas! I am myself the boy I see. . . I am on fire for love of my own self.” The Apollonian side of Greek culture relies totally on a walled-off and disengaged intellect. The Dionysiac side of Greek culture portrays an enmeshment which destroys individual boundaries.

Biblical thought sees self and other in harmony. Jonah avoids the polarities of disengagement and enmeshment. When he runs away to Tarshish, (Jonah 1: 1–3). God acts as a protective therapist, saving Jonah from suicide on several occasions: first with a fish (2: 2–11), and then with a gourd (4: 6). Jonah finally learns the message of divine mercy (4: 9–11) and that he can reach out to another without losing himself. In the words of the Jewish sage, Hillel, “If I am not for myself, who will be for me? If I am for myself only, what am I?”

Man and Woman

Greek narratives portray men and women in basic conflict. Pandora, the first woman, is sent by Zeus as a punishment to man because Prometheus has attempted to steal fire for man to make him autonomous. Pandora is given many gifts to entice man, but, ultimately, is seen as responsible for man’s destruction and as a block to his autonomy. She opens the box she has brought to Epimetheus containing all the evils of the world, leaving only hope left locked inside and unavailable to humanity (Hesiod, 1973: 60–96).

Biblical narratives portray men and women as different, but in basic harmony.

Eve is sent as a blessing and partner, a “helpmeet opposite,” not as an instrument of punishment. Together she and the man are seduced by the serpent to eat of the fruit of the tree of knowledge, and while this leads to their expulsion from Eden, they do not die but build a life together with divine help and hard work (Genesis 2 and 3).

Parents and Children

Fathers and Sons: Laius/Oedipus vs. Abraham/Isaac. The Greek story of Oedipus portrays the father (Laius) and the son (Oedipus) in basic conflict. The father is told by an oracle that his son will kill him and marry his (the son’s) mother. Such a conflict is originally portrayed in the Greek theogony discussed above, and describes a pattern where the father feels the son is trying to displace him and the son feels the father is trying to block

him. The story begins with Laius trying to kill Oedipus and proceeds with Oedipus killing Laius and marrying his mother, Jocasta (Sophocles, *Oedipus Rex*). This conflict is resolved in Freudian thinking through a fear of castration. This is the basis of the introjection of the superego for the son, and thus it is fear-based (Freud, 1923a, 1923b, 1924).

The Biblical story of Isaac portrays the father Abraham receiving the gift of a son, Isaac, late in his and his wife Sarah’s lives. Abraham then receives the command from God to sacrifice this son that he loves to God. However, this is only a test, and Abraham demonstrates his loyalty to God, Who sends an angel to stay Abraham’s hand, preventing child-sacrifice which had been so prevalent in surrounding cultures. The blessing of Abraham will continue through Isaac. (Genesis, 22) Covenantal circumcision can be seen as a non-injurious alternative to castration, transforming the father into a teacher and the son into a disciple. The father wants the son to both succeed and surpass him. The mother is not a seductress but a harmonizer. The basis of morality is thus not fear but a covenantal relationship between God, father and son. The son does not need to rebel against the father because he already has his father’s blessing.

Mothers and Daughters: Clytemnestra/Electra vs. Naomi/Ruth: The Greek story of Electra portrays a basic antagonism between mother (Clytemnestra) and daughter (Electra). Clytemnestra accuses Electra of preferring her father, Agamemnon. Electra accuses Clytemnestra of being unfaithful to her father. She and her brother Orestes murder their mother (Aeschylus, *Agamemnon*, Euripides, *Electra*). This story of Electra has been used by Jung as a term for a “feminine Oedipus Complex” (Jung, 1961: 347–348).

The Biblical Book of Ruth tells of the relationship between the Moabite Ruth and her mother-in-law, Naomi. Even when Ruth’s husband dies, she refuses to abandon Naomi. Naomi does not try to block Ruth and, indeed, facilitates her marriage to Naomi’s kinsman Boaz, who is impressed by Ruth’s kindness to Naomi. Naomi is brought into the household as a nurse to their son Obed who is described as the father of Jesse, who is father of David. There is no hint of the antagonism between mother and daughter implicit in the Electra complex.

Siblings and Family

The Hebrew Scripture contains many stories of sibling rivalry: Cain and Abel, (Genesis 4), Isaac and Ishmael (Genesis 17–25), Jacob and Esau (Genesis 25–27) and

Joseph and his brothers (Genesis 37–50). The greater incidence of sibling rivalry in narratives in Genesis than in Greek mythology is misleading. It is a function of the underlying purpose of the biblical family – the sons compete to inherit the covenant of the father. The father’s blessing can help resolve this rivalry, as with Jacob’s blessings to his sons, each given uniquely given the blessing he needed to suit his own personality and his situation (Genesis 49).

The Greek family is purposeless. The father is not a source of inheritance but an impediment. Sibling rivalry is initially masked by the threat of the father to the sons, who must band together to protect themselves: Uranus versus his sons (Hesiod, 1973: ll. 155–210), Cronus versus his sons (ll. 453–725), Zeus versus Heracles and Iphicles (Hesiod, 1914: ll. 35, 56 and 80), and Oedipus versus Polynices and Eteocles (Sophocles, *Oedipus at Colonus*; Aeschylus, *The Seven Against Thebes*). However, this bonding is shallow and will disappear as the paternal threat recedes. This pattern is expressed tragically in the curse of the weakened and blinded Oedipus to his two sons to slay each other at the gate of Thebes. (Sophocles, *Oedipus at Colonus*, ll. 1386–1394; Aeschylus, *The Seven Against Thebes*, ll. 879–924).

Freedom and Suicide

Like many Greeks both historical and mythological, the Stoics clearly approved of suicide. The Roman Stoic Seneca, for example, saw suicide as freedom. “You see that yawning precipice? It leads to liberty. You see that flood, that river, that well? Liberty is housed within them. You see that stunted, parched and sorry tree? From each branch, liberty hangs. Your neck, your throat, your heart are so many ways of escape from slavery. . . . Do you inquire the road to freedom? You shall find it in every vein of your body (Seneca, *De Ira*, 3.15.3–4). Indeed, for Plato, philosophy is “preparation for death.”

Biblical thought is clearly opposed to suicide as no better and perhaps worse than homicide. “For your life-blood too, I will require a reckoning” (Genesis 9. 5). The human being is commanded to choose life: “See, I have put before you today life and death, blessing and curse, and you shall choose life so that you and your seed shall live.” (Deuteronomy 30.19) Freedom is seen not in suicide, but in life following God’s commandments. “Read not *harut* (carved) but *herut* (freedom). One is not free unless he devotes himself to the study of Torah” (Avot, 6.2). Indeed, Hebrew thought sees the Bible as a “guide for living.”

Rebelliousness Versus Obedience

A great deal has been made of the clash of Islamic and Western (European, American and Judeo-Christian) civilizations. Yet there is a more profound line of demarcation between those cultures that view rebellion and rebelliousness as the highest form of development (e.g., Albert Camus) and those that view obedience to the divine will as the highest goal. The underlying message of the Nuremberg trials of Nazi war criminals after the Second World War was to mock the defense “we were just following orders.” Thus the mantra of the west came to be a distrust of *authority per se* (i.e., parents, community and religious leaders, and law and system of morality) rather than of a particular authority. Yet the Bible criticizes the Israelites, newly freed from Egypt, for building a golden calf. (Exodus 32). The question of rebelliousness versus obedience is complicated. In Greek mythology, Zeus cannot be trusted. Prometheus must rebel against him to help human beings. Prometheus steals fire for men, who are then punished by Zeus by means of the woman Pandora. In Biblical thinking, in contrast, God can be trusted and indeed must be trusted. According to Talmudic interpretation of the Biblical story of creation, God has provided the means for Adam to invent fire (Midrash Genesis Rabbah, 11:2). Thus the serpent is tempting Eve with the siren call of disobedience, but in Biblical teaching, this act is sinful. In short, one must know who one’s god is. If it is Zeus, one should rebel: if it is the Biblical God, one should obey. This does not mean we should not question a particular authority. However, this is different than questioning the very idea of authority.

Tragedy Versus Therapy

Bruno Snell (1935) has argued that the differences in the respective orderings of God and nature are not just chronological, but logical and psychological as well. The Classical Greek view is deterministic and the essence of the tragic vision of man; the Biblical view is intrinsically open to the possibility of change and transformation and lies beneath the idea of genuine psychotherapy. Before the Biblical God, nothing is impossible: He can cancel the natural order of things, alter it in any number of ways, or, indeed, create something out of nothing, just the way He created nature. A Greek god is confined to acts that may show his power but that cannot truly transcend natural law or defy fate. Lev Shestov (1966) argues very much the same thing, insisting that the Biblical God is not subordinate to Necessity. The

Greek view of tragedy and the Biblical view of therapy can be contrasted in two main points. First, bad family background is impossible to overcome in the Greek tragic vision: “But now, I am forsaken of the gods, son of a defiled mother, successor to his bed who gave me my own wretched being.” (Sophocles, *Oedipus the King*, ll. 1359–1361). However, a bad family background can be overcome in the Biblical therapeutic vision: “Cast me not off, neither forsake me, O God of my salvation. For though my father and mother have forsaken me, the Lord will take me up” (Psalms 27:9–10).

There is a profound difference between the Greek and Biblical vision with regard to the efficacy of prayer and a general sense of hopefulness. For the Greeks, prayer is useless in this determined world: “Pray thou no more; for mortals have no escape from destined woe” (Sophocles, *Antigone*, l. 1336). The Bible believes in the efficacy of prayer, even in the most hopeless of situations.

Biblical Psychology

Jeffrey H. Boyd

Mindfulness, a Buddhist view of human experience, is widely employed in psychology today. Every major religion offers a view of human experience, i.e., a spiritual psychology. The most popular is the biblical view.

There are two billion people in the world who say they are Christian, one billion Muslims, 0.8 billion Hindus, 0.4 billion Buddhists, 0.02 billion Jews, and 1.6 billion people who are none of the above. The biblical view is shared by those who call themselves Jews, Christians, and Muslims.

There is more than one biblical view. For example, in the book of Joshua there is a ferocious attitude toward people of other religions (“kill the Jebusites”); whereas Jesus taught us to live peaceably in a pluralistic society (“love your neighbors”).

The Bible’s God-Centered Approach

The Bible from a Christian perspective offers a God-centered view of people. God is the creator, rescuer, and goal of humans. Comparing today’s popular psychology with the biblical approach is like comparing a pre-Copernican to a Copernican model of the solar system. Popular psychology teaches clients to love themselves and trust their own understanding. The Bible teaches that we should “Trust in the LORD with all your heart and lean not on your own understanding” (Proverbs 3:5). Claudius Ptolemy said that the sun and planets revolve around the earth. Nicolaus Copernicus said that the earth and planets revolve around the sun. We are facing a similar debate in psychology today. Popular magazines, TV and public opinion teach that YOU are the center of the psychological universe: “believe in yourself.” The Bible proposes that you revolve around God, meeting or frustrating God’s wishes: “believe in God.”

Self-esteem is considered essential in popular psychology today, because you are the center of value in a pre-Copernican solar system. Self esteem is almost completely absent from the Bible. Often self esteem is viewed as a problem, as in the quote above from Proverbs 3:5. All value comes from God. Humility is valued: we should worship and obey God, not worship ourselves. When a non-Christian psychotherapist urges a Christian client to acquire self-esteem, the therapist is barking up the wrong tree. She would be more successful speaking to the client about how God values the client.

While popular psychology speaks of self-esteem, Christians speak of Christ crucified. They are parallel statements. Why? Because “Christ crucified” implies he died for me. Therefore I am valuable. The implication is that if Jesus had not been crucified for my sake, then I would have no value, because I would be a sinner with no foundation for being forgiven by God. But since Christ was crucified in place of me, my worthlessness doesn’t

count, and God loves me without reservation, as if I were Jesus Christ himself. Not only is self esteem otherwise absent from the Bible, the Bible is the most realistic description of humans acting horribly that has ever been written.

Another difference between the Bible and popular psychology is that individualism is almost entirely absent from the Bible. The Bible thinks of people socially, as members of a church, family or nation. The community is the central focus; individuals are important as they serve the needs of a community.

When we compare an individualistic (i.e. popular psychology today) with a God-and-community (i.e. biblical) view of humans, different things are emphasized. The individualistic approach values breaking rules, refusing to submit to authority, being unique. The God-and-community approach emphasizes obedience to rules, submitting to authority, and loving God and neighbor as much as you love yourself. The individualistic view emphasizes authenticity and honesty; but the Bible encourages you to control your tongue (James 1:26; 3:3–12). The Bible values humility and seeing yourself as small in the larger scheme of things. Popular psychology cannot comprehend that idea. When others are obnoxious, popular psychology tends to hold grudges and resentments. The Bible demands that we forgive our enemies, just as God previously forgave us even though we didn’t deserve it. This implies that, when you are married to someone obnoxious you should forgive and reconcile with your spouse.

The Bible’s Story

Every day the news media report disasters. What sort of a world do we live in? Is this an evil place? The Bible’s view is that the world is primarily good, for God created it (Genesis 1). But then humans rebelled (Genesis 3). Things have been a mess since people arrived.

The story of the Bible, starting in Genesis 12, is how the hero of the Bible (God) sets about to rescue people, and also the environment, from disaster. People are at war with God. The central problem is how God can love people who are vicious both to God and to God’s representatives (those who are those people who are powerless). God offers a series of peace treaties (called “covenants”), which say, in effect, “If you follow these simple rules then I will bless you; but if you violate them, I will curse you.” The Ten Commandments is such a covenant (Exodus 20, Deuteronomy 5). People violated the Commandments, so God destroying the nation Israel in the year 587 BC.

The last peace treaty in the Christian view is based on Jesus’ blood. God offers to be at peace with people providing they made a decision to believe that Jesus had died for their sake. The Bible promises an experience of “the peace of God, which surpasses all understanding” (Philippians 4:7). The blessings and the curses attached to this treaty are more severe than to the Ten Commandments. The blessing is that, if you accept the terms (i.e. belief in Jesus), then you would have eternal life, which is a quality of everyday experience, and also a promise after death. But the curse is that, if you reject Jesus, then you are choosing to remain at war with God, so you will suffer an embattled life now and misery after death.

A person without faith usually lacks motivation or interest in the God of the Bible. Some people, upon hearing about this God, find the biblical story repulsive. Others make a decision to become part of the biblical story. At that moment God comes into the person’s heart and fills it with an awesome experience of new energy. Suddenly there is peace with God; the antagonism of life vanishes. This does not mean that the believer is a perfect person. It means that God treats the person generously and is now responsive and available. From then on the believer has a psychological problem: whether to indulge in the old worldly lifestyle, or stick to the new lifestyle described in Matthew 5–7. Experience shows that the new lifestyle is more rewarding. Over decades there is slow progress of the good gaining more influence. But by the time of death the believer is still a thousand miles from perfection. The believer approaches death with confident anticipation.

Bion, Wilfred Ruprecht, and “O”

B

John Eric Killinger

Speaking of “O”

In seeking to formulate a general theory of the internal object, the British psycho-analyst Wilfred Ruprecht Bion (1897–1979) developed an epistemological understanding of the absolute truth *in* and *of* any object. This absolute truth he called O. While O cannot be known, it can be known about – even its presence can be recognized and felt as, for example, in the Zen or Archimedean experience of eureka. But O itself is unknowable.

Knowledge respectfully leads to the indescribable ultimate reality, godhead, or “O,” but the two concepts are not synonymous. Mathematically, Bion might have written this as $K \rightarrow O$, not $K = O$, for $K \neq O$. Transformations occur *in* or *under* “O,” the godhead rather than *imago dei* or God, for both *imago dei* and God are imbued with activity, while the godhead is irreducible to operations. K, which stands for knowledge, is usually referred to by Bion as “curiosity.” Bion often quoted a statement of French author and critic Maurice Blanchot (given him by André Green) – *La réponse est la malheur de la question* (Blanchot, 1969: 13) – translating it as “the answer is the dis-ease of curiosity.” This is a key feature in understanding that we must allow for possibilities and not close off the realm of the imaginal, especially the Void and formless infinite that is another way of referring to O. To kill curiosity is simplicity itself: just stuff an answer down a person’s throat. If curiosity is flattened, then mystery dies with it.

In another paper, Bion (1957/1984) points out the movement that ensues from attempting to extinguish curiosity from life. When this occurs, the death of curiosity leads to arrogance, and arrogance is on the road to stupidity. The bumper stickers that proclaim Jesus as *La réponse* express an attitude of “I know,” which indicates the inhibition and prohibition of the occurrence of possibilities. If this attitude prevails, curiosity becomes not unlike the image of the crucifixion of Jesus as, for example, Matthias Grünewald imagined and painted him, who stretched out in his agony, assumes the leprosy of the marginalized. When curiosity begins breeding *scintillae*, or soul-sparks, we ought to be fanning them into flame

rather than trying to stamp them out because of their seeming irrationality.

Mental pain is thus necessary to sustain the dynamism within the analytic encounter so as to make possible and foster development. By mental pain, which the patient (and analyst!) must come to tolerate, is meant a link to transformation in K – knowledge/curiosity – that leads to transformation in O and the passing through of resistance (psychological turbulence), which can be written TK → TO. Psychological turbulence is resistance to an interpretation that moves one from the comfort zone of “knowledge about” to a less comfortable one of “becoming being” because O is equated with the Void and formless infinite. As with Jung’s notion of individuation, this passage is not a once-for-all event but a process. The mental pain comes about because most people prefer the “knowing about” to “being” or “becoming *being*.” This is comparable to William Sheldon’s understanding that most people are comfortable/content with repression (the “dying back of the brain”) rather than soul-making.

Speaking of O is not unlike attempting to define the Tetragrammaton, יהוה (YHWH), in which the vowels are left out of the name of the godhead because it is a way of talking about a force or power that cannot be described in articulate speech appropriate when discussing omnipotence, omniscience, or other formulations of religion.

Bion’s Lateral Move

Essentially what Bion does is begin with Plato’s theory of Forms to anchor the significance of O. Transformations of phenomena into representations of what once was but is/are no longer known are representations of a person’s experience of O. This gives the transformations themselves an anamnestic quality, that is, they serve to re-mind or help us unforget what has been repressed.

The lateral move that Bion makes is from Platonic Forms to the doctrine of Incarnation as expressed by the so-called Rhineland mystics Meister Eckhart and Doctor Admirabilis, John (Jan) van Ruusbroec. O is not 0 (zero). O is unknown ultimate reality. O is whole. The desire to be either completely good (the absence of evil) or completely evil (the absence of good) does a disservice to O, for O is *being*, the thing-in-itself. To be either good or evil is to be forever split, which is not in accord to being O or even attaining at-one-ment with it.

O is analogous to Meister Eckhart’s prayer, “I pray God to rid me of god,” (Eckhart, 1941: 231) an invocation of emptiness that allows one to be filled with the godheadness of the godhead. The capitalization and lower case

usage of “God” and “god” respectively in this translation is explained by Eckhart’s reading of the *Timaeus* of Plato. Ruusbroec describes a movement from union through an intermediary (God’s grace + one’s holy way of life) through union without intermediary (bare and imageless understanding, i.e., the abyss) to union without difference (the dark stillness which always stands empty out of which all things come [*tohuwabohu*, *abaissement de niveau mental* (!)], superessential to us and essential to God). It is a good demonstration of Bion’s epistemological movement of transformations of curiosity to transformations of unknowable ultimate reality, or TK → TO. Distilled from the thinking of these medieval mystics, O as a function of knowledge that emanates from being without implying action in the world does so without preconceptions, foreknowledge, even identification, for doing so would put distance between O and the person. We can be O but we cannot identify with O. Qualities attributed to O are links to O (such as Love, Hate, and Knowledge [curiosity]), and these qualities or links are but substitutes for and approximations of O. These links are inappropriate to O; however, they are appropriate to transformations in (or under) O, written as TO. After enumerating several types of transformation, Bion raises the question:

- ▶ It is possible through phenomena to be reminded of the ‘form.’ It is possible through ‘incarnation’ to be united with a part, the incarnate part, of the Godhead. It is possible through hyperbole for the individual to deal with the real individual. Is it possible through psycho-analytic interpretation to effect a transition from knowing the phenomena if the real self to being the real self? (1965: 148).

What is at Stake

For Bion, what is at stake is this bit between, the gap betwixt what he terms “knowing about phenomena” and “being reality.” For example, one could compare this to knowing about psychology and being psychologized – experiencing the stirring of soul, its provocation, the waking of the sleeping bear, which despite being quite wrong by standards of common sense is quite right in order to free the *dynamis* of *psyche* by means of provoking or sustaining mental pain. This is what leads to realizing transformations *in* or *under* O.

At-one-ment with O is possible, though it is not attainable through curiosity/knowledge (K). Curiosity depends upon the evolution of O → K, which means ridding curiosity of memory and desire. So it would seem that to become one with O requires a transcendent position, and it is analogous to the Lacanian Real.

Grotstein (1996/2000) notes that the letter *aleph* in Borges' story, "The Aleph," captures the essence of O. In the Hebrew alphabet, *aleph* as first letter represents a person reaching simultaneously toward the sky and toward the earth. As such, the *aleph* is the point at which all points converge. Regarding the story of Borges (1949/1998), a view of its shadow and a penumbra of associations is offered by Blanchot (1959/2003). In the Kabbalah, *aleph* is the *Ein Sof* or Godhead. According to a story regarding the creation in *Sefer Zohar*, the blessed Holy One explains that despite creating the world through the second letter of the alphabet, a (*aleph*) is to be the first of all the letters, and only through *aleph* does the blessed Holy One become One. "No union," remarks the blessed Holy One, "is actualized except by a [*aleph*]" (Matt, 2004: 16).

The change from curiosity to the unknowable ultimate reality ($K \rightarrow O$) is for Bion a special case of transformation, and he regards it as of particular concern to the analyst in "[their] function of aiding maturation of the personalities of [their] patients" (Bion, 1965: 158). In such a transformation from description of action in the world to representation emanating from being, psychological turbulence, or resistance to interpretation, is bound to occur. Bion cites the third dark night of the soul from *The Ascent of Mt. Carmel* of St. John of the Cross. This transformation in O ($K \rightarrow O$) that involves becoming is felt as being inseparable from becoming ultimate reality. The dark night pain is, according to Bion, the fear of megalomania, and this fear inhibits acceptance of being responsible and/or mature because it has the appearance of involving *being* God with the pain that can be expressed inadequately as megalomania (Bion, 1965: 159).

Grotstein notes "The generally feared connotation of 'mysticism' has occurred through the projective identification of 'mystique' onto it by those who, according to Bion, are afraid of truth and so mystify its clarity" (1996/2000: 301). What is needed is to learn to see things as they really are, to see through the camouflage and deception of words and symbols.

Black Elk

Richard W. Voss · George A. Looks Twice · Georgine Leona Looks Twice · Alex Lunderman, Jr. · Vern Ziebart

Black Elk, also known as *Hehaka Sapa* (Brown, 1953), Nicholas, baptismal name (Steltenkamp, 1993), and Choice, Black Elk's boyhood name, *Kahnigapi* (Neihardt, 1984), was born in December 1863 in a family of healers; his father and grandfather were prominent Oglala medicine men. (DeMallie, 1984: 3). He, too, was a powerful thunder medicine man, leading in traditional (Yuwipi) ceremonies. As a *Heyoka* he worked with the thunder and dog medicines; and, as such, often worked in paradoxical (contrary) ways. The *Heyoka* or thunder dreamers often do or say the opposite of the intended meaning. Black Elk actually practiced traditional healing and medicine throughout his life, converting to Catholicism only in 1929 when he married his first wife, Katie War Bonnet who was a Catholic. Black Elk's family believes that his "conversion" to Catholicism and his work as a catechist were not absolute. Family members recall that he continued to pray with the pipe, especially when the

thunder beings came (during thunder and lightning storms), along with maintaining his Catholic practices (G. A. Looks Twice, 8 August 2007, personal communication). However, some family members report that Black Elk did not practice the traditional ceremonies after his conversion to Catholicism.

Black Elk as an Historical Figure

As an historical figure he was remarkable in many ways. As a young man he fought in the Battle of Greasy Grass (Little Horn) and traveled with Buffalo Bill's Wild West Show across the United States, performing at Madison Square Garden and in Europe, including England, France, and Germany. He was actually left behind when the Wild West Show returned to America, and lived in Europe for a year, traveling across Europe. In a letter written in 1889, Black Elk commented that he wished he could have seen the land "where they killed Jesus..." but noted that it required "four days on the ocean and there was no railroad. [and] If horses go there they die of thirst..." nothing that "[It would require] much money..." (DeMallie, 1984: 10). He was a survivor of the massacre that occurred at Wounded Knee in 1890. Black Elk survived three wives and fathered numerous progeny. He married Katie War Bonnet in 1892. He had three sons from this union, William (1893), John (1895), and Benjamin (1899); all baptized as Catholics. Katie died in 1903 and Black Elk was baptized as a Catholic in 1904 and named "Nicholas Black Elk". In 1906, he married Anna Brings White, a widow who had two daughters. He fathered three children from this union, Lucy (Looks Twice), Henry, and Nick, Jr. (Goins, n.d.). Two of his grandchildren, George A. Looks Twice, 74, co-author of this article and Esther Black Elk DeSersa, 80, still live in the Pine Ridge Indian Reservation (Fig. 1).

There are also five other living grandchildren of Nicholas Black Elk Sr., whose father was Nicholas Jr. Nick Jr. was married to a Rosebud (Sicangu) woman by the name of Bertha Brings Three White Horses. Black Elk died in August, 1950, at the ripe old age of 87.

Black Elk as an Anthropological Informant

Most of what the non-Indian world has come to know of Black Elk has been through recorded or transcribed interviews about his vision talk and explanation of the rites of

Black Elk. Figure 1 This photo shows Black Elk and his grandson, George Looks Twice (co-author) at the summer Indian Pageant held in the Black Hills, Rapid City, South Dakota, during the 1930s. (Photo from Vern Ziebart's collection, Rapid City, S.D.)

the Oglala that he gave to non-Indian partners whom he made his kinship relatives through formal (Hunka) adoption ceremonies. From 1931 to 1947, he shared different things about himself with each partner and relative. These interviews were given to John G. Neihardt (summer of 1931) and later published in *Black Elk Speaks* (1932) and *When the Tree Flowered* (1951). They focus on Black Elk's pre-reservation experiences as a boy and young man and his life-long struggle with the major vision which he carried with him with much sadness and regret. Neihardt based these books on material gathered from three visits to Black Elk. Later, Black Elk shared extensive information about the rites of the Oglala with Joseph Epes Brown who published *The Sacred Pipe: Black Elk's Account of the Seven Rites of the Oglala Sioux* (1953). Brown actually lived with Black Elk and his family for almost a year, during which time he became a part of Black Elk's family.

Black Elk as a Transformational Leader

It is difficult, if not impossible, for the non-Indian unfamiliar with reservation life to comprehend Black Elk. Recall the two extensive works (Brown, 1953; Neihardt, 1932) written about him, which chronicle about 20 years of his life – mostly his pre-reservation experiences, “the way things used to be for the Lakota...” This leaves approximately 67 years unaccounted for, which leads us to consider the third source of information about this important figure in the history of religion and cultural studies. This source is Lucy Looks Twice, Black Elk’s daughter, who shared her perspective on her father with Michael F. Steltenkamp, who at the time was a teacher at the Red Cloud Indian High School (1993) on the Pine Ridge Indian Reservation. This perspective on Black Elk paints a different image of him from the earlier sources (Neihardt, 1932, 1951 and Epes Brown, 1953) in that it looks at the previously unrecorded years of Black Elk’s life, when he was known for his tireless catechetical work with the Jesuit missionaries. As Steltenkamp talked to people in Black Elk’s home community, he realized that while few people even knew about the books written about the man, everyone knew Nick Black Elk for his sense of humor and his dedication and skill in teaching Catholic doctrine to children, as well as his kindness and tireless service to his community (Steltenkamp, 8 February 2007, personal communication; see also Steltenkamp, 1993).

Steltenkamp felt that Neihardt had misunderstood Black Elk to some extent, and missed some of the humor in Black Elk’s interviews. One example was where in *Black Elk Speaks*, Nick Black Elk talked about escaping Wounded Knee, commenting that, “We were very hungry because we had not eaten anything since early morning, so we peeped into the tepees until we saw where there was a pot with papa (dried meat)...” While eating the papa, they came under fire by the soldiers; he noted that they “kept right on eating until we had our fill. Then we took the babies and got on our horses and rode away. If that bullet had only killed me, then I could have died with papa in my mouth...” (Neihardt, 1961: 270). While Neihardt viewed this comment with a deep sense of sadness and loss, Steltenkamp noted that this was a good example of Nick Black Elk’s wry humor... comparable to the warning many mothers give to their children to always wear clean socks... “you never know when you might be in an auto accident [and you don’t want to be found wearing dirty socks when you go to the hospital].” There was also a striking sense of defiance – in that even while under fire, the young Black Elk and his friend eat their fill of the

papa. Steltenkamp felt that Neihardt missed the essence of Black Elk’s humorous style.

Decolonizing Black Elk’s Legacy

Of course, there has been considerable debate as to “Who is the real Black Elk?” We see the traditional Oglala holy man, the brave, self-sacrificing warrior who resisted, fought, and survived the massacre at Wounded Knee in 1890, the witness of the traumatic events during the transition of the plains Oglala Lakota to reservation life, a devout Roman Catholic catechist and the archetypal image of the plains Indian portrayed to tourists visiting the old Indian village during the 1930s (Fig. 2).

Clearly, Black Elk is a complex figure who defies simple categorization. The second author, Georgine Looks Twice, believes that Black Elk’s “conversion” to Catholicism was due in part to his sadness toward his vision but also a way to protect the rituals and traditions that at that time and space were banned by the

Black Elk. Figure 2 This photo shows Black Elk poring in full regalia at the summer Indian Pageant held in the Black Hills, Rapid City, South Dakota, during the 1930s. (Photo from Vern Ziebart’s collection, Rapid City, S.D.)

U.S. Government (Indian Offenses Act, in *Lame Deer*, 1992: 230).

To Black Elk's descendents, Black Elk's conversion to Roman Catholicism was also a survival strategy (Georgine Looks Twice, 17 February 2008, personal communication; see also Lone Hill, 2008). Converting to Catholicism during the early reservation era enabled Black Elk to assert leadership in his community during a very tumultuous period of history for the Lakota people. Black Elk's great granddaughter (and co-author) believes that Black Elk's compliance with the Catholic missionaries was his response to the oppression that was part and parcel of reservation life. Black Elk discovered a way to transform the broader and pervasive oppression into personal and spiritual transformation, enabling his people to better understand their new situation while holding on to traditional values.

The process of understanding Black Elk is like setting up a traditional 3-pole Lakota tipi – each pole a different informant – Neihardt, Brown, and Steltenkamp. While setting up the tipi may seem simple at first glance, it is much more complex and elegant than someone inexperienced with the process might realize. The foundation of the traditional Lakota tipi are three poles laced in such a way that two of the poles can be pulled apart to form the inverted V shape, with the third forward pole serving as the lifting pole, which actually raises the tipi – this can all be done by one person which is quite remarkable considering that each pole is approximately 20–26 feet high and may weigh as much as 50–60 pounds each. After the foundation tripod has been set, the remaining poles are lashed under each of the three foundation poles, which, when finished, forms an elegant spiral when looking up at the poles from inside the center of the tipi. Of course, invariably there are inexperienced people trying to set up a tipi. They generally yell instructions to one another, maybe become so frustrated they may even give up. Most of the times the end result of their effort is usually a disaster – or at least a very wobbly tipi that will blow away in the strong prairie winds. For many non-Lakotas, attempting to understand Black Elk is like this.

Acknowledgment

Dedicated to the memory of my Hunka relative (adoptive mother, one of the ceremonies which Black Elk discusses), whose name is Margaret Richard Lunderman, a Member of the Oglala Sioux Tribe and descendant of Chief Red Cloud. She crossed into the spirit world on 03-03-08. With esteem, Rick Voss.

Bodhi Tree

Paul Larson

The Bodhi Tree is a symbol in Buddhism. It is so called because it was under such a tree that Siddhartha Guatama became the Buddha of this age. By legend it was a fig tree

(*ficus religiosa*), known for its heart shaped leaves. In modern Bodh Gaya, India, a tree at the Mahabodhi Temple is revered as the Bodhi Tree, though the exact spot where a tree stood in Buddha's day is not known with precision. The original tree was destroyed in the seventh century, but the current tree is a scion of a scion of the original tree which was sent by Asoka to Sri Lanka. For the pilgrims, it doesn't matter, because the act of reverence is sanctifying beyond the literal aspects of history.

Bodhisattva

Paul Larson

In Buddhism, the “Bodhisattva” (Snskt) is one who has realized enlightenment, or “nirvana,” but out of compassion for the suffering of sentient beings has deliberately resolved to delay reaching final nirvana, complete release from samsaric rebirth, in order to aid others in achieving enlightenment. This is a principal doctrine of the Mahayana tradition of Buddhism, also known as the northern transmission, since it passed into the rest of Asia from India northwest via the Silk Road. It is the motivation that drives spiritual development in the Mahayana and Vajrayana traditions in contrast with the model of the arhat (cf.), which is the motivating ideal in Theravada Buddhism, the southern transmission, going from Sri Lanka to the rest of southeast Asia.

The Bodhisattva vow is taken by lay and monastics alike in the Mahayana tradition, and involves the commitment to work for the release not only of oneself (the goal of the arhat) but for all sentient beings. The eighth century Indian Buddhist scholar, Shantideva, authored the *Bodhicaryavatara*, roughly translated as the path of the bodhisattva, which is one of the major statements of Mahayana doctrine, and a source of numerous commentaries. The ethical heart of the image of the

Bodhisattva is compassion and any merit one's actions gain is dedicated, therefore, to the enlightenment of all sentient beings. In Buddhist iconography, images of transcendental Buddhas and Bodhisattvas are numerous. Among the most important of the Bodhisattvas is Avalokiteshvara in the Indian and Tibetan traditions, and Kuan Yin in the Chinese, Korean and Japanese traditions. The former is represented as a male, the latter as a female. These images are used in meditation to generate the underlying attitude of compassion, and also serve as foci of devotion, prayers, incense and other offerings. Other Bodhisattvas include Manjushri and the Bodhisattva who will become the next Buddha, Maitreya.

Body and Spirituality

Roberto Refinetti

In secular philosophy, the distinction between body and spirituality is more commonly known as the distinction between body and mind. In either case, it is assumed that humans have at least two dimensions: a material one (body) and a spiritual one (mind). How these two dimensions relate to each other is a contentious matter.

Body and Mind

For over a century, it has been common understanding that the part of the body related to mental activity is not the foot, the heart, or the liver, but the brain. Thus, the so-called mind-body problem is actually the mind-brain problem – that is, how psychological phenomena relate to

the activity of the nervous system. Many potential types of relationship between mind and brain have been proposed. Classifications of systems of ideas are always arbitrary to a certain extent, but a convenient classification recognizes four major groups: idealism, mentalism, psychophysical parallelism, and materialism (or materialist monism).

Idealism refers to a conception that only the mental realm truly exists and that the brain (and the rest of the material world) is merely an illusion. This position has very few sponsors nowadays. Mentalism refers to the conception that mental events can be fully explained by psychological concepts without any reference to the nervous system. This is a dualistic viewpoint, as it implies that mind and brain are distinct and largely independent from each other. Psychophysical parallelism refers to the conception that mind and brain are distinct but closely related to each other. This form of dualism may imply that mind and brain are only different sides of the same coin or even that neural activity can affect the operation of the mind without actually creating the mind. Finally, materialist monism refers to the conception that mental events are nothing more than neural events. This is a monist viewpoint because it implies the existence of only one dimension – the neural dimension.

As one reads the scientific literature, one gains the impression that psychophysical parallelism is the dominant conception among behavioral neuroscientists. To start with, the idea that mental events are correlated with neural events has a long tradition in psychology. Four of the major psychologists in the late nineteenth century and early twentieth century made explicit statements about the parallelism between mind and brain: the highly influential William James, the father of psychoanalysis (Sigmund Freud), the discoverer of classical conditioning (Ivan Pavlov), and the creator of the intelligence test (Alfred Binet). Particularly after the development of positron-emission tomography (PET) and functional magnetic-resonance imaging (fMRI), it has become evident that activity in particular circuits of the brain is correlated with particular mental events.

Going beyond mere correlation, however, lesion and stimulation studies in animals and in brain-surgery patients have provided evidence that mental events do not have a life of their own – that is, that mental events can be reduced to neural events. As philosopher Mario Bunge put it, behavioral neuroscience performs a limited type of reduction: an ontological reduction without full epistemological reduction, but nonetheless a reduction. Thus, although most neuroscientists are not themselves aware of it, their work actually provides support for materialist monism. The reduction of mind to matter is

also a basic assumption in cybernetics, as Norbert Wiener (the creator of cybernetics) asserted that if we could build a machine whose mechanical structure is entirely consistent with human anatomy and physiology, then we would have a machine whose intellectual capabilities are identical to those of human beings.

It is not difficult to see why behavioral neuroscience needs the reduction of mental events to neural events. After all, if one can see, touch, and disturb nerve cells, one would like to do the same with mental events. Because one cannot do the same with mental events, one assumes that they do not really exist. If mental events are neural events, then there is no immaterial world to be dealt with. Thus, we feel terrified or ecstatic, drowsy or excited, because of specific electrochemical processes taking place in our brain. Likewise, so-called psychological causes of mental illness are merely those causes whose neural bases are not yet known. In general, to understand behavior is to understand the action of the nervous system. The mind is simply a name associated with brain functioning, just like breathing is a name associated with lung functioning and movement is a name associated with particular forms of muscle functioning. Francis Crick (Nobel laureate for the discovery of DNA) called this The Astonishing Hypothesis because most people who are not neuroscientists (and even many neuroscientists) are astonished to learn that the mind is nothing more than a label attached to the operation of the brain.

Body and Soul

Although various religions have pronouncements about the relationship of mind and body, the lack of technical detail in these pronouncements prevents close comparisons with the secular perspective. A major roadblock is the nebulous distinction between mind and soul. In Christianity, both Augustine and Aquinas held that the soul lives in the body but is non-material and immortal. Because most psychologists believe that the mind ceases to exist when the body dies, the soul must be distinct from the mind. Thus, there may be a need to recognize three human dimensions: body, mind, and soul, which are only loosely related to the Ancient Greek concepts of soma, psyche, and pneuma. On the other hand, mind (or spirit) and soul are used interchangeably in many biblical passages, which favors a simple dichotomy of body and soul (the latter somehow incorporating the mind).

The major difficulty in equating mind and soul is that the qualities of the mind cannot be properly characterized without the restrictions of time and space, whereas the

soul is eternal and not bound by geography. For instance, in Piaget's model of cognitive development, the mind of a 4-year-old child operates according to a pre-operational scheme, whereas that of an adult operates according to a formal operational scheme. Under what principle does the soul operate? Similarly, the mind of an American speaks English, whereas the mind of an Angolan speaks Portuguese. What language do their souls speak? It would seem that the soul must be distinct from the mind. In this case, the concept of spirituality would be related partly to the mind and partly to the soul.

Whether or not the mind is considered to be the same as the soul, the concept of the soul is incompatible with a materialist view that reduces spirituality to the operation of nerve cells. Therefore, the religious perspective (at least in the tradition of Christianity) favors either idealism or mentalism (as defined above) and is, therefore, in disagreement with the secular perspective that favors psychophysical parallelism and materialist monism as explanations for the relationship between body and spirituality. In analytic psychology, Carl Jung was a major proponent of mentalism and had great interest in religion.

Boisen, Anton

Curtis W. Hart

Boisen's Life

Anton T. Boisen was born in Bloomington, Indiana in 1876. His early life was marked by the death of his father at the age of seven. An able scholar and student, he graduated from the University of Indiana at Bloomington and taught romance languages there for a time before entering the Yale School of Forestry. Later he attended

Union Theological Seminary in New York where he studied under George Albert Coe, a professor steeped in the approach of William James to the psychology of religion. After ordination in the Presbyterian Church and a lackluster career of some ten years in the parish ministry, he experienced in 1920 the first of three psychiatric hospitalizations where his diagnosis was that of schizophrenia of the catatonic type. The second occurred in 1930 after the death of his mother and the third on the occasion of the death of the love of his life, Alice Batchelder, a woman he courted for years even as she consistently rebuffed his advances and proposals of marriage. He became convinced that his first hand encounter with mental illness was for him, as he often said, a "problem solving experience" that permitted him a new lease on life and vocation when he was well into middle age. He set about the task of educating seminarians and clergy about mental illness and ministry in mental health in the hospital setting and doing research in the sociology of religion and the psychology of religious experience. This investigation into mental illness and religious experience utilized what he had personally gone through and followed William James' descriptive and biographical approach to these phenomena in his magisterial work *The Varieties of Religious Experience* (1902). Boisen held two major chaplaincy positions, first at Worcester (Massachusetts) State Hospital and later at Elgin (Illinois) State Hospital where he died in 1965.

Boisen's Contribution to Psychiatry

Boisen made invaluable contributions to the dialogue between religion and psychiatry. His pioneering work includes, first, his efforts at establishing pastoral care as part of treatment in psychiatric institutions and, second, his passionate interest in the education of seminarians and clergy through encounters with what he called "the living human documents," individuals making their way through psychiatric illness, an experience he poetically describes as "the wilderness of the lost." He inspired individuals to follow him into this field of endeavor that evolved overtime into clinical pastoral education that is regularly offered to or required of those involved in graduate theological education. At the same time he tirelessly promoted his ideas and articles of an interdisciplinary character that reached a wide professional audience in both the religious and psychiatric communities. Besides his autobiography, *Out of the Depths* (1965), he also wrote *The Exploration of the Inner World: A Study of Mental Illness and Religious Experience* in 1936, a work that is still regarded as a classic in the field. His articles appeared

regularly in the journal *Psychiatry*, a publication edited by his friend and colleague, the well known and highly regarded psychiatrist Harry Stack Sullivan. Sullivan thought very highly of Boisen whose books he reviewed and ideas and writings he utilized and quoted. He also visited Boisen's pastoral education training programs at Elgin State Hospital where he interviewed patients for student groups and shared in their case reviews. Boisen's work has been highly regarded enough to have one of his pieces entitled "*Personality Changes and Upheavals Arising Out of A Sense of Personal Failure*" written in 1926 and published in the *American Journal of Psychiatry* included in that august publication's *Sesquicentennial Anniversary Supplement* in 1994. There it appeared alongside seminal pieces by such luminaries as Sullivan, Erich Lindemann, and Leo Kanner. Boisen's article focuses upon the existential dimension of the experience of mental illness as it relates to broader philosophical concerns. The article demonstrates both his analytical gifts and rhetorical powers.

Boisen's Legacy

The latter half of Boisen's life was filled with professional success along with a great deal of personal loneliness. His efforts in promoting the dialogue between psychiatry and religion were formidable. Among his shortcomings was what critics have identified as his all too clear and certain separation between organic and functional causal factors in psychiatric illness. He also developed as years went on something of a brusque, authoritarian manner in dealing with both colleagues and students. He also lacked the organizational skills to help guide the twentieth century's clinical pastoral movement past its early stages in the 1920s and 1930s. He remains, however, an important figure and formative influence whose person and ideas deserve ongoing attention.

Bonnell, John Sutherland

James G. Emerson

Introduction

In 1962, John Sutherland Bonnell (January 10, 1893–February 26, 1992) known as "Sid" to his closest friends, retired as Pastor of the Fifth Avenue Presbyterian Church in New York City.

Contribution from the Personality Sciences

Although known best through his radio ministry when he succeeded Harry Emerson Fosdick as the preacher on ABC's National Vespers, his basic contribution lay elsewhere. As a pastor, Dr. Bonnell brought the insights of psychoanalysis into the world of pastoral care in a way that gave those of conservative faith access to that field. In effect, his witness gave the conservative pastor "permission" to see the positive contributions of Freud, Jung and Adler to the practice of ministry – even though the pastor might not agree with the philosophical or psychological views of any of those three when it came to the Christian faith.

In many ways, through his books *Pastoral Psychiatry* and *Psychology for Pastor and People*, Dr. Bonnell opened doors not only for what clergy might do but what people in the pew might consider both for themselves and for their "lay ministries."

Brief Biography

"Sid" Bonnell was born in a barn on a farm of Dover, Prince Edward Island, Canada. He became a truant in the eighth grade and worked in Falconwood Hospital – a hospital for the "insane" – of Charlottetown, PEI, where his father had become superintendent. (His father was not a doctor but a farmer with administrative skills who was brought to the management of the hospital.)

In that hospital a patient by the name of Brown took interest in the tall, lanky young Bonnell and tutored him. Out of that training he passed the examinations for entrance to Prince of Wales College, and he was on

his way. The hands – on experience of working in the Falconwood Hospital, however, remained the background and basis for Bonnell's further studies as the works of Sigmund Freud and William James became part of the educational scene in Canada and the United States.

“Sid” Bonnell also enlisted in the Canadian army in World War I, was twice wounded in Europe, and then was sent home after suffering the effects of mustard gas. A shell fragment would have taken his life were it not for a large watch that he carried in his chest pocket. The watch deflected the fragment.

Princeton Lectures

In 1923 “Sid” married Bessie Louise Caruthers, of Charlottetown, PEI. She was the daughter of a prominent physician on “the Island.” The Bonnells had four children, George, Catherine, Elizabeth, and Margaret.

After a four point pastorate in the area of Cavendish, PEI (a community made famous by the story of *Anne of Green Gables*), the Bonnells moved to the St. Andrews parish in St. John New Brunswick; the Westminster Church of Winnipeg; Canada, and then in 1936, the pastorate of the Fifth Avenue Presbyterian Church in New York City. Although the Bonnells became American citizens, they never lost their Canadian roots. Three months of every summer found them on Prince Edward Island where Dr. Bonnell did most of his writing.

Basic Viewpoint

After writing the book *Pastoral Psychiatry*, Dr. Bonnell also became a visiting lecturer at Princeton Theological Seminary in New Jersey. His course basically dealt with case studies that grew out of his own experience. His early work showed the influence of Sigmund Freud's writings, but Dr. Bonnell never moved the work of pastoral care into a pastoral model of Freudian analysis. Rather, he used the nomenclature of Freud's work, such as “the Oedipus Complex” as a tool for helping a parishioner identify the nature of a problem. He wrote, “. . .the minister who values his time and desires to conserve his mental and spiritual resources will inform himself of the teaching of these sciences that deal with the human mind” (Bonnell, 1938: 53).

Dr. Bonnell therefore saw the science of psychotherapy as something that spoke not just to therapy and counseling but to the whole range of ones ministry.

The Context of Care

Dr. Bonnell took seriously the context in which the “cure of souls” (read, “care of souls”) took place. He made use of a small but comfortable room with cathedral style window frames that gave both a church frame of reference and a source of comfortable outside light. On the wall he had a picture of Christ at prayer in Gethsemane. The parishioner sat in an upright but comfortable chair and Dr. Bonnell sat behind a small desk that served simply as a prop for use when necessary but did not give the impression of an imposing study.

The room for this counseling was set across a hall from the entrance to the floor and avoided both the pastoral offices and the secretarial offices. The context for the pastoral counseling was therefore both private and faith centered but not doctrinally overwhelming.

Evaluation of His Work

Dr. Bonnell never developed a particular system for pastoral care nor did he formulate a theological construct for his work. Basically, Dr. Bonnell was a practitioner and his lectures were more case studies than theoretical discussions. Whereas the work of Norman Vincent Peale, a contemporary and friend in New York, became popular best sellers, much of the two key books in the field by Dr. Bonnell centered on the work of the pastor. His lectures at Princeton were heavily attended.

The Evaluation by Others

Others in the academic field of that day, such as Seward Hiltner of Chicago and Princeton and Hans Hoffmann of Harvard, saw three strengths in Dr. Bonnell's work: an uncanny ability to sense an individuals “real” problem when that person went to the counseling room; a clear, structured means of communicating an answer to that problem; and a clear context of faith that was not imposed on the one with a problem but created an atmosphere of safety and of concern.

The weaknesses observed by these and others were: a person with a weak ego could be overwhelmed and lost in the “larger than life” presence and approach of Dr. Bonnell; for the same reason, pastors often tried to imitate him rather than understand the dynamics behind a counseling session. That failure resulted in a

pastor or student failing to develop his or her own approach to a parishioner. The lack of a theoretical framework within which to understand the counseling process left a major need in the area of pastoral care and counseling.

Books Written

Although Dr. Bonnell wrote some 13 books in his lifetime, the key ones that relate to the field of psychology and religion are listed below.

In the first two of these, Dr. Bonnell spoke of pastoral psychology as the “healing of the soul” E. B. Holifield sees him as understanding the goal of pastoral psychology as that of “keeping one in touch with God and the spiritual resources that flowed from God” (Hunter, 1990: 105). His practice also showed three dimensions: a dimension of personal strength and competence that he brought into the counseling room, a dimension of concern for the well being of the parishioner who came for help, and a dimension of diagnostic accuracy the later professionals such as Seward Hiltner regarded as remarkable (In personal conversation with the writer).

His solutions were practical and immediate. It was not uncommon for a counselee to leave the office with a sense of direction and an immediate task to do. One such counselee needed space and time to work out his concerns and Dr. Bonnell facilitated his having work on a farm for a summer. Another counselee needed a meaningful role that would give a sense of purpose in life and found herself given an opportunity to visit shut ins. That opportunity had the double value of meeting the need of others and, in so doing, meeting her need for a meaningful role in life.

Some sessions ended with prayer; but that was not the rule. Dr. Bonnell was not “client centered” in the way of Carl Rogers, but he was aware of where the person was, of what the person brought to the counseling moment, and of the fact that the person, not he, set the agenda for the hour in the counseling room.

In the third of these books, Dr. Bonnell sought to reach lay people. In a day called “the age of anxiety,” he focused on anxiety and both inadequate remedies and sound remedies. He had a particular concern for the issue of the ultimate escape – namely suicide. In the book, he sought to help the reader learn how to confront the problems of the day from a spiritual as well as a psychological frame of reference.

Breathing

Paul Larson

The use of the breath in spiritual practice has a long history and the metaphor of the breath as a symbol for life is equally long-standing. First let us note its strong association with life itself. We now know that there are heart beats and brain function in the womb, but before that knowledge we knew that taking in a breath was one of the first things we did as we are born. Our airway was cleared, the cord cut, and then we cried out. It is also the last thing we do as we die, we expire, literally. So the glyph in Egyptian for life was an airway and lung, the word in Hebrew for the life spirit is “nefesh,” the ancient Greeks termed the life force, “pneuma,” and in Sanskrit “prana” is also a term linking breath and life.

A basic limb of yoga as laid out by Patanjali was pranayama, the discipline of using the breath as a spiritual practice. Anyone who has practiced hatha yoga knows how intimately the breath is connected with the ability to stretch the body into the postures, or asanas. Different styles of breath are used for different purposes. Alternate nostril breathing has a purifying effect, the breath of fire, short rapid breaths is an energizer, and so on. Likewise most of the Asian forms of martial arts make great use of breath control to enhance the power of blocks, punches or kicks. A standard technique in Western stress management techniques is diaphragmatic relaxing breath. It is among the most useful techniques since it can be done relatively unobtrusively.

As any singer or orator knows, breath support and breath control is essential in performing long phrases whether chanted, sung or spoken. So indirectly, breath control is implicitly involved in a wide range of other spiritual practices. In short, the breath is a foundational skill in a wide range of human activities, many of which are directly or indirectly spiritual in nature and the breath has an obvious association with life itself. In Western

psychology, diaphragmatic breathing is taught as a relaxation and stress management technique (Everly and Lating, 2002). Similar approaches are used in a variety of voice training (speaking or singing) and in many of the martial arts. Thus, the ability to effectively use the mechanisms of breath has importance as a clinical tool and for effectiveness in a variety of recreational activities. The breath as both involuntary capacity to sustain life and as a voluntary tool is a vital part of psychology and spirituality.

Buber, Martin

Maurice Friedman

Martin Buber (1878–1965) had a highly significant impact both on the religious thought of his time and on the theory and practice of psychotherapy.

The foundation for both of these contributions was Buber's early and later lifelong concern with Hasidism – The popular communal mysticism of the Jewry of Eastern Europe that arose with Israel ben Eliezer (the Baal Shem Tov) (1700–1760). In his lifelong work on Hasidism Buber moved from the fuller stories of his youth, such as *The Legend of the Baal Shem*, to the much shorter tales of the Hasidim – “legendary anecdotes.” When in 1948 the great German-Swiss novelist Hermann Hesse nominated Buber for a Nobel Prize in Literature, he claimed that by his tales of the Hasidim Buber had enriched world literature as had no other living person. Buber also wrote *For the Sake of Heaven*, his Hasidic chronicle-novel and the little classic *The Way of Man According to the Teachings of the Hasidim* plus essays on Hasidic life and community that were collected and published in English translation in *Hasidism and the Modern Man* and *The Origin and Meaning of Hasidism*. In Hasidism Buber found a great emphasis upon *kavana*-dedication, devotion, and inner intention. Accompanied by a life of action for man and

God best expressed in the phrase “hallowing the everyday,” Buber was not himself Orthodox and observant. This led many to criticize Buber for his failure to emphasize in the tales *halakah*-the Jewish law, including his friend Abraham Joshua Heschel, a scion of Hasidism who was directly descended from some of the great Hasidic *zaddikim*. Once, however, when someone suggested to Buber that he free Hasidism from its confessional fetters as part of Judaism, Buber replied, I do not need to leave my ancestral house to speak a word that can be heard in the street. “I brought Hasidism to the Western World against the will of the Hasidim themselves.”

Although there were many things in Judaism that Buber could not accept, he felt that in the Hebrew Bible, more than anywhere else there appeared the dialog between God and man, it was to biblical Judaism and not to the rabbinical Judaism that succeeded it that Buber gave his full attention. He translated the Hebrew Bible into German with his friend Franz Rosenzweig, until Rosenzweig's death in 1929, emphasizing the “cola” or breathing units of the text. “Do we mean a book? We mean a voice,” he said.

God does not ask for “religion” but for community. Buber unfolded his view in a series of important biblical interpretations: *The Kingship of God* (from the beginning of the covenant with Israel, God makes the absolute demand of bringing all of life in relation to him), *Moses* (here Buber replaced source criticism by “traditional criticism”), *The Prophetic Faith*, and *Two Types of Faith*, in which Buber contrasted the *emunah*, or trust in relationship, of the Hebrew bible, Jesus and the Hasidism with the *pistis*, or faith based on a knowledge proposition that characterized Paul and many Christians who followed him.

Buber's philosophy of dialog, with the eternal Thou that is met in each finite Thou did, however, speak in universal and not just Jewish terms. Buber saw God as the “absolute Person” who is not a person but becomes one to know and be known, to love and be loved by us. We can dedicate to the absolute Person not only our personal lives but also our relationships to others. Buber moved from the actual event-the “lived concrete”-to symbol and myth. Countless concrete meetings of I and Thou have attained expressions in the relatively abstract form of myth. It is just this that gives these myths their universality and profundity and enables them to tell us something of the structure of human reality that nothing else can tell us. The that can only be met as a Thou. “Love is the responsibility if an I for a Thou.”

Buber was a philosophical anthropologist as well as a religious and community socialist. His teaching of the “life of dialogue,” influenced many fields of thought that

are not in themselves religious, such as sociology, education, psychology and psychotherapy. Basic to these fields of thought was the dialog between person and person and not between God and man. A German book has appeared entitled (in English translation) *Buber for Atheists!*

In psychotherapy, as in teaching and in the relationship of pastor and congregant Buber spoke of “a normative limitation of mutuality.” This limitation did not mean the I-It relation but a one-sided I-Thou in which the therapist or teacher “imagines the real” makes the other person present in his or her uniqueness. No such seeing the other side of the relationship is possible for the patient or pupil. Yet the patient is not, to Buber, the subject of a psychoanalysis but of a “psychosynthesis,” to use the term that Buber shared with the Italian therapist Roberto Assagioli. Buber’s concern was the whole person who made decisions out of the depths of his or her being rather than with the conscious rational mind alone. “Inclusion,” or imagining the real, in the essential first step to making the other present, and making the other present in his or her uniqueness is the essential step to “confirmation.” Confirmation, to Buber, did not mean merely accepting or affirming the person. It could indeed include confrontation and wrestling with the other. “The inmost growth of a person does not occur, as people like to suppose today, through one’s relation to oneself but through being made present by another and knowing that one is made present.”

Buber’s influence was not confined to individual one-on-one psychotherapy. It also affected group therapy and that “contextual” or intergenerational family therapy that was founded by Ivan Boszormenyi-Nagy, M.D. In such therapy the adult children come to understand the childhood of their parents while avoiding “parentifying” their own children. So here the central statement of *I and Thou* – “All real living is meeting” – is applied to the relationship between person and person within the family or outside of it without any explicit reference to an I-Thou with the eternal Thou.

In 1957 the Washington (DC) School of Psychiatry brought Buber to America to give the Fourth William Alanson White Memorial Lectures on “What Can Philosophical Anthropology Contribute to Psychiatry.” The lectures that Buber gave then brought together into one whole (now published in Buber’s book *The Knowledge of Man*) the various strands that have before and since, served as the groundwork for all Hialogical Psychotherapy.

The *between* is the ontological dimension in the meeting between persons, or the “interhuman” (not to be confused with the “interpersonal which includes I-It as well as I-Thou!”) that is usually overlooked because of our tendency to divide our existences into inner and outer,

subjective and objective *Dialogue* is the way through which we relate to others in their uniqueness and otherness and not just as a context of our experience. The intrapsychic is only the accompaniment of the dialogue and not as so many psychologists tend to see it, the touchstone of reality in itself. Underlying the I-Thou as also the I-It is the twofold movement of “setting at a distance” and “entering into relation” (*distance and relation*).

Essential in psychotherapy when it is a question not of some repair work but of restoring the atrophied personal center, is “healing through meeting.” Corollary to this is the fact that Buber saw the *unconscious* as the wholeness of the person before the differentiation and elaboration into psychic and physical, inner and outer. Buber felt that Freud and Jung and all other psychologists missed because of the logical error that if the unconscious is not physical, as many claimed, then it must be psychic. The unconscious can only be grasped dynamically and in process and not as some sort of fixed object. Buber particularly wanted to guard against that “psychologism” that removes reality and the meeting with others into the intrapsychic so that life in the soul replaces life with the world. Jung saw religion as psychic events that take place in relation to the unconscious and God as an autonomous psychic content, a function of the unconscious. “Otherwise,” wrote Jung, “God is not real for he nowhere impinges upon our lives.” Psychology becomes in Jung the only admissible metaphysics. The fiction of the world in the soul conceals the possibility of a life with the world.

Existential guilt, is an event of the between, something that arises from the sickness between person and person and that can be healed only through illuminating the guilt, persevering in that illumination, and repairing the injured order of existence through an active devotion to it. Existential guilt is an ontic dimension that cannot be reduced to inner feelings or the introjection of the “superego.” This put Buber at variance with Freud who saw guilt as only neurotic and Jung who saw guilt as one’s failure to achieve individuation. Neither saw guilt as a reality of the human person in relation to the reality entrusted to him or her.

Therapy too rests on the I-Thou relationship of openness, mutuality, presence and directness. Yet it can never be fully mutual. There is instead what Buber called “a normative limitation if mutuality” that applies to the therapist, the teacher the pastor, and, of course, the parent. There is mutual contact, mutual trust, and mutual concern with a common problem but not mutual inclusion. The therapist can and must be on the client’s side and, in a bipolar relationship, must imagine quite concretely what the client is thinking, feeling and willing. The therapist cannot expect or demand that the client practice

such inclusion with him or her. Yet there *is* mutuality, including the therapist's sharing personally with the client when that seems helpful.

Inclusion or "imagining the real," must be distinguished from the empathy that goes over to the other side of the relationship and that identification that remains on one's own side and cannot go over to the other.

Confirmation comes through the client being understood from within (by parents, family, friends, and lastly through the therapist) and through the therapist going beyond this to that second stage in which the demand of the community is placed on the client. This demand enables the client to go back into dialogue with those from whom he or she has been cut off. Buber saw inclusion, or making the other present, as anything but passive or merely receptive. It is rather a "bild swinging" into the life of the other where one brings all one's resources into play.

Buddha-Nature

Trish O'Sullivan

Buddha-nature is a teaching of the Buddha regarding the true nature of Self. After attaining enlightenment the Buddha stated that all beings have Buddha-nature. Propagated in the Mahayana School especially, the teachings espouse that all sentient beings possess a True Self that is unconditioned, undefiled, indivisible, and timeless. This True Self or Buddha-nature is beyond the realm of ordinary consciousness and practitioners must transcend ordinary conceptual thought (usually through meditation) in order to perceive it. While it is said that Buddha-nature is to be attained through meditation, it is also emphasized

that everyone already has it and the process is one of piercing conceptual ignorance and uncovering something that is already there. The experience of attaining Buddha-nature is realization or enlightenment.

The realization of Buddha-nature brings with it a cessation of over-identification with the body, emotions and mental processes. This results in release from Samsara or suffering related to attachment to the idea of a separate self and the related grasping and aversion that results from that idea.

Buddha-nature contrasts with the idea of the self as the essence of over individuality in that with the realization of Buddha-nature all notions of individuality and separateness become less fixed. Psychologically this concept of interconnectivity and non-distinction from all sentient beings, since all beings have the same Buddha Nature is a perspective that decreases isolation and brings compassion, understanding and peaceful practices such as ahimsa or nonharming. It can also diminish the fear of death and other forms of insecurity.

From the psycho therapeutic perspective, the experience of being viewed by the Buddhist therapist as someone who is ultimately undamaged and has the capacity for attaining enlightenment and full Buddhahood is a positive one. Many Buddhist authors and therapists encourage psychotherapy clients to meditate in order to diminish attachment to negative emotions and situations. This can reduce suffering while the client works through their issues and is a valuable skill useful throughout life.

Buddha-nature is not something that can be adequately explained with words but must be experienced for complete comprehension. Within Buddhism there are many teaching tools that point to Buddha-nature rather than attempt to explain what it is. The following is a traditional Chinese Zen poem of unknown authorship pointing to Buddha-nature:

- ▶ The Human Route
Coming empty-handed, going empty-handed—
That is human
When you are born, where do you come from?
When you die, where do you go?
Life is like a floating cloud which appears.
Death is like a floating cloud which disappears.
The floating cloud itself does not exist.
Life and death, coming and going are also like that.
But there is one thing which always remains clear.
It is pure and clear, not depending on life or death.
Then, what is the one pure and clear thing?

Buddhism

Paul Larson

Buddhism is one of the world's major religions. It arose in northern India in the 6th century before the current era in the teachings of Siddhartha Gautama (563–483 BCE.). It grew out of Hindu thought and shares a common world view based on the concepts of dharma, karma, reincarnation, and the manifest world as illusion or “maya.” Dharma, translated often as “law,” “way,” or “path” refers to the immutable structure of the world and its constituent elements. But it differs from the Western concept of law, as it is not promulgated by a personal creator god, but rather is simply the structure of reality. “Karma” (cf.) is likewise an impersonal force through which the fruits of one's actions come back to enhance or diminish from one's growth on the spiritual path. This contrasts with the Western view of being subject to judgment by a personal god. Reincarnation refers to the cycle of individual birth, life, death and rebirth. This is termed the “wheel of life,” or “samsara.” The goal of spiritual development is to end this cycle.

Siddhartha Gautama was reputedly a son of a king of the Śākya tribe (hence the epithet, “Shakyamuni,” or sage of the Śākyas) and was sheltered from viewing human suffering by his father. At age 29 he encountered a old person, a sick person, a corpse, and a mendicant, or wandering holy beggar common in the Hindu tradition. He found this new awareness deeply troubling and decided to leave his wife and child, his palace and life of comfort to pursue the religious life. He wandered with the sadhus, received much training in meditation and the practice of self denial and discipline. However he felt

he had not received full attainment. After he broke a fast by taking a bowl of milk from a woman cow herder, his followers left him, thinking he had strayed from the path. Then he sat down in meditation firmly intending to make the final breakthrough. He continued into the night and received many temptations for power, comfort and so on, but persisted. He did achieve a final enlightened state where the whole of existence was made known to him including knowledge of all his previous life times. As the dawn broke he realized he had achieved his goal. His title, the Buddha, means “the enlightened one.” He claimed to have awakened fully and completely to the ultimate nature of reality with the capacity to retain this awareness while still embodied in the flesh. This day is celebrated in Buddhist tradition as Visaka. It is a combined birthday and day of enlightenment.

He initially doubted humans could either believe him or achieve this same result, but became convinced he nonetheless needed to tell humanity about his achievement. So he sought out his former students who had gone to a deer park in Sarnath near what is now Varanasi (Benares) and preached his first sermon. This is known as the “first turning of the wheel of dharma.” In this sermon he identified the Four Noble Truths which include the Noble Eight-fold Path.

The first of the four Noble Truths is the reality and pervasiveness of human suffering. The second noble truth is the awareness that suffering comes mostly from our very human attitude of grasping, desiring, reaching out for something. That can be a feeling, a mental state, a relationship with a person, or an object such as wealth, power, or fame. The third noble truth states that there is a way out of this endless cycle of suffering. The fourth noble truth is that the way out can be summarized in the noble eight-fold path, eight specific ways in which one can work toward achieving that same enlightenment that the Buddha experienced.

The Noble Eight-fold Path is the most succinct statement of Buddhist spiritual methods and means by which spiritual growth is to be accomplished and how one is to live. It is often broken down in to three groups, two comprised of three truths, and a third comprised of two. The first triad, “sila,” (Skt. morality), is comprised of right speech, right action, right livelihood. The second triad, “samadhi” (Skt. meditational absorption) consists of right effort, right mindfulness and right concentration. The third, “prajna” (Skt. wisdom) involves right understanding and right thought. The former means seeing the world as it truly is and not as it appears, the second refers to the transformation of our thought processes which comes

from the practice of the others, particularly those involved in samadhi.

Of all of the major world religions, Buddhism is often described as the most psychological. This is true, since the whole foundation of the religion is the practice of meditation, a certain type of mind state that is cultivated through practice. In a comparative sense, the “gnosis” that leads to salvation (nirvana) is completely experiential and direct. It is not mediated through concepts and talking or thinking about the divine; it is the experience of the divine. In both Hindu and Buddhist views, that experience is beyond personhood and the boundaries of conceptual logic. The path of spiritual development of all beings is the attainment of that state of non-duality which is known as nirvana. The very etymology of “Buddha” refers to the view that enlightenment is state of being fully awake and aware in a cosmically uncompassing mind. Despite the ineffable nature of the mystic union which Buddhists call enlightenment, it is the attainment of that state through the discipline of the mind that makes it such a powerful psychological tool. The goal of spiritual development is ultimately the dissolution of the self, which really is a fiction anyway. This contrasts with the Western goal of salvation of the individual soul.

After the death of the Buddha, there were several Buddhist councils which sought to redact his teachings (Skt. sutras) and codify rules for monastic life (Skt. vinaya). Soon explanatory and philosophical discourses (Skt. abhidharma) were added to make the third division of material within the Buddhist scriptural canon. The canon is known as the “Tripitaka,” (Skt) meaning three baskets in reference to these major divisions of the material (Goddard, 1938/1966).

The Buddhist sangha, or community, comprised of both monastic and lay followers soon diversified into several schools of thought. The initial distinction occurred geographically, one branch went south, to Sri Lanka, Thailand, Burma Cambodia, Laos and Vietnam. The other branch went first to the northwest, to Pakistan and Afghanistan, then over the high mountains of central Asia into the Tarim basin of modern China. Here several Buddhist kingdoms flourished before the arrival of Islam. From there it went on to China, Korea, Japan, and meeting the southern transmission in Vietnam. The Sanskrit term “yana” is generally translated as “vehicle,” and the southern stream called the Hinayana, or lesser vehicle and the northern transmission called the Mahayana, or greater vehicle. The original Hinayana teachings became transformed into the modern Theravada school, which is the only remnant of that transmission (Theravada is the preferred name for this

score, avoiding any pejorative connotations of Hinayana). Later, in the first millennium Buddhism was influenced by a pan-Indian movement known as Tantrism. Out of this influence came esoteric Buddhism, or the Vajrayana, or diamond vehicle, as it is now known.

It is not a great surprise that the generation of Western students of Buddhism which began in the 1960s was drawn to the religion through the practice of meditation rather than the cultural aspects of daily religious practice that is at the heart of Buddhism in the ethnic Asian communities where Buddhism was the dominant religion (Fields, 1986). Westerners went right for the psychological consciousness-based experiences and only later became aware of and began to find meaning in the cultural cycles of feasts, fasts, and the close interrelationship between a lay and a monastic community. The job of religious education of children and communal bonding was for many Westerners, a secondary acquisition. Buddhist meditation practices are quite wide-ranging. It shares with Hindu tradition the use of mantra meditation, based on developing the psychological of concentration, it has especially developed an open-focused meditation style now known as “mindfulness” in the psychological literature (Germer, Siegel, and Fulton, 2005). Tibetan meditational practices are the most complex, involving visualizations, chanting, use of gestures (Skt. mudras) and ceremony.

The spectrum of Buddhism offers just as much variety of religious experience as in the Western monotheisms. As with many religions, there are traditions and sects where profound devotion to a particular saint, guru, or person is worked out through more emotional sorts of practices and devotional liturgies, and others which are more austere and involve solitude and or denial. The artistic iconography of Buddhism likewise reflects the full range of human experience, from the bare and clean lines of a Japanese rock and sand garden, through the ornate and vivid tankas of multi-armed divine beings in coital embrace all portrayed with a busy border of paisley brocade.

C

Cain and Abel

Mark William Ennis

Cain, according to the Hebrew Scriptures, is the first human being born on the earth; the first child of Adam and Eve who were created out of the dust of the earth by God. Qur'an tells a similar, although not identical, story of Cain and Abel. The name Cain in Hebrew means "I have gotten a man from the Lord." Cain was a tiller of the land as was his father, Adam, following Adam's expulsion from the Garden of Eden. In the course of time a younger brother, Abel was born. The once only child now became an oldest child. Unlike his father and his older brother, Abel became a shepherd of sheep.

The day comes when Cain and Abel each bring offerings to God. God finds Abel's offering acceptable but God finds Cain's gift un-acceptable. Many have speculated as to why one offering was acceptable and the other not. Perhaps this reflects a culture that valued pasturing animals over that of land-based farming. Perhaps it is because Abel brings the first of his animals while it is not specified if Cain's offering was the first fruits. Maybe it shows God valuing younger, less powerful people at the expense of the older or more influential. This theme is not uncommon in Hebrew scripture. Jacob is the younger of two sons but becomes the inheritor of their father's estate as well as the father of Israel. Likewise, King David was chosen to be king of Israel over and against his older brothers.

The fact is that we can not know for certain the reason for the rejection of Cain's offering. But, from my point of view, the more interesting question is how Cain reacted to this rejection.

One can glimpse the family system approach of Bowen in Cain's reaction. Reminiscent of his father, Cain seeks to externalize his difficulties. Adam, when confronted by God for his eating of the forbidden fruit in the Garden of Eden seeks to blame Eve, and by extension, God himself, for his failing. Likewise Cain sees the

fault in Abel and somehow seems to believe that the death of his brother will make his offering acceptable. Instead, he gains further isolation, and his brother's blood even poisons the earth. True to Bowen, the toxins of a sick family trickle down and contaminate the family in subsequent generations as well as effect the super-family system.

One may also gain a foreshadowing of Alfred Adler's examination of birth order in this story. In Adlerian thought, the oldest child is an achiever who considers subsequent children as a threat to his place in the world. In this particular account, the older brother is indeed supplanted in worth by the little brother. This ancient story is a tale of sibling rivalry within the context of a fallen family contaminated by parental sins. Cain is ultimately trying unsuccessfully to please a creator father while staving off the rivalry of a brother and suffering from the contamination of his human father.

Cain's reaction to this rejection is murder and the subsequent estrangement from the only community that he loved. Here we see a personality disorder as described by Rotter. Had Cain developed a mature personality with a strong internal control mechanism, he might have avoided becoming a murderer.

Cain, with a stronger personality, with the strength to reject his family pattern might have received the answer that we find unanswerable, "God what can I do to make my sacrifice acceptable?" He might have altered his history and not become the world's first murderer.

Call, The

Alice Mills

The call to adventure is the first stage in the monomyth, when the hero is summoned to undertake a quest. The monomyth is a pattern of hero quest narrative developed by Joseph Campbell in *The Hero With A Thousand Faces* from a host of fairy tales, myths and other sacred tales that span millennia and cultures. Campbell points out that not all hero quest narratives contain all the features of the monomyth, but the call to adventure is omnipresent in these narratives. Sometimes the hero only recognizes the summons in hindsight and if the tale has a trickster element, it may be well hidden. A helpful and wise guide sometimes explains the call to the prospective quester but it may also appear, as in some Biblical examples, to be an incomprehensible demand outraging common sense. The call may summon the hero towards a specific task, such as killing a dragon; it may take the form of an epiphany, profoundly transforming the individual's perceptions and understanding of self and the world; some calls to adventure are aversive, when the hero's dissatisfaction with the status quo propels him or her into a quest for change. The call always announces the prospect of change, whether for a kingdom or an individual soul.

The monomyth hero quest can also be understood as guidelines for the psychological hero quest that, in Jungian thinking, every psyche should undertake. The call to adventure would then be a summons alerting the psyche to unconscious contents that are ready for the work of integration that Jung terms individuation. In this sense, the call to adventure may come in such forms as a generalized dissatisfaction with ordinary everyday life or disturbing dreams, an illness or retrenchment from a job. While the mythic monomyth very often involves a youthful hero, the Jungian hero quest can be undertaken

at any age. The hero in the mythic monomyth is an extraordinary individual, but for Jung the hero quest is a path available for all human beings, since all have a shadow in need of integration. As Campbell's pattern shows, while individual hero quest stories may deal with only one quest and have a "happy ever after" ending, the hero quest as a pattern should be regarded as cyclic. When one quest is ended, the next call to adventure may well occur. For the individual psyche, the call to adventure, to recognize and integrate shadow contents, is not a call to achieve complete integration then and there; for Jung, there is always more shadow to emerge and be integrated.

Calvinism

Jaco J. Hamman

Calvinism refers to a particular understanding of the Christian faith and an approach to the Christian life first articulated by the French Protestant theologian, John Calvin (1509–1564). Subsequently, it has been upheld in Protestant Christianity's Reformed tradition by persons such as John Knox (Scotland), John Bunyan (Britain), and Jonathan Edwards (America) (McGrath, 2007).

Calvinism has five basic beliefs: (1) Humanity is totally deprived due to original sin; (2) God unconditionally elected those who will be saved to receive eternal life; (3) Jesus Christ has died for those who were elected by God; (4) The Holy Spirit pours irresistible grace over those saved; and (5) Believers will persevere and are eternally saved in Jesus Christ. For Calvinists, the sovereignty of God reigns over all aspects of a person's life: personal, spiritual, intellectual, political, and economical. Education informed by Calvinist dogma is important as is distinguishing the sacred from the secular (Spencer, 2002).

Calvin believed that knowledge of self – realizing one's depravity and need for salvation – and knowledge of God

leads to wisdom (McMinn & Campbell, 2007). Following their founder, Calvinists generally judge psychologies harshly in light of God's sovereignty and humanity's deprivation. They often question the philosophical foundations and models of personhood, health, and abnormality of most psychologies (Browning & Loder, 1987).

Campbell, Joseph

Anais N. Spitzer

Joseph Campbell (1904–1987) is one of the most widely recognized scholars of mythology. The public television series *The Power of Myth* (1985–1986), consisting of interviews with Bill Moyers, propelled him into the public spotlight. A follow-up book, published posthumously, (Campbell, 1988) increased his popularity and catapulted his earlier work, *The Hero With a Thousand Faces* (1949), onto the *New York Times* best-seller list in 1988. George Lucas' public acknowledgment of Campbell's work as inspiration for the *Star Wars Trilogy* cemented Campbell's place in the popular canon. Although many of Campbell's ideas have been embraced by the public at large and his importance has been recognized beyond the walls of academia, Campbell is no less a scholar. That he spent most of his life as a teacher and academic, along with the rigor of his work and its subsequent use among scholars, affirms the pertinence of his ideas to the study of myth within the academy.

Life and Scholarship

The oldest of three children, Campbell was born in New York City in 1904 to Irish Catholic parents. In 1910 Campbell's father brought him to see Buffalo Bill's Wild West show, igniting a life-long interest in Native America religions. He quickly exhausted the share of children's books on the subject and by age 11 was already reading Bureau of American Ethnology reports.

Early on, Campbell was an avid reader, excellent student and gifted athlete. In 1921 he enrolled in Dartmouth College to study biology and mathematics but, after discovering the humanities, he transferred to Columbia University as an English major in 1922, earning a Bachelor of Arts in 1925. A member of the Columbia track team, he set the school's half-mile record.

In the summer of 1924, while enroute to Europe, Campbell met Jiddu Krishnamurti (with whom he sustained a lifelong friendship) who introduced him to Buddhism and Hinduism. This early encounter with Eastern religions had a lasting impact on Campbell's life and scholarship.

In 1926 Campbell returned to Columbia University to pursue a Master of Arts in Medieval Literature. His thesis, "A Study of the Dolorous Stroke," was supervised by the Arthurian scholar Roger Loomis. Hungry to continue his studies but already aware that his interests crossed disciplinary boundaries and were incompatible with the specialization a Ph.D. would require, he traveled on a Proudfit Fellowship to the University of Paris to study Romance philology and later to Munich where he learned Sanskrit. Campbell became enthralled with the European intellectual milieu that led him to the works of James Joyce, Thomas Mann, Leo Frobenius, Sigmund Freud and C. G. Jung. All of these figures would later come to influence his theory of mythology and his writing and teaching.

Campbell began his teaching career at Sarah Lawrence College in 1934, beginning his career-long acclaim as an exceptionally skilled and popular teacher. His first major publication was *A Skeleton Key to Finnegans Wake* (1944), co-authored with Henry Morton Robinson. Another highly influential figure in Campbell's life was the German Indologist, Heinrich Zimmer, whom Campbell met in 1941. A speaker (along with a plethora of other famous intellectuals from across the globe) at the prestigious Ascona, Switzerland based Eranos Conferences, Zimmer introduced Campbell to Paul and Mary Mellon, founders of the Bollingen Foundation, which later published many of Campbell's works. The Mellons solicited Campbell to write the commentary to the first book of the Bollingen series, *Where the Two Came to Their Father: A Navaho War*

Ceremonial (1943). After Zimmer's unexpected death in 1943, Campbell was put in charge of editing Zimmer's posthumous writings, a project that took twelve years and yielded four volumes. During this time, Campbell presented two important papers of his own at Eranos: *The Symbol Without Meaning* (1957) and *Renewal Myths and Rites of the Primitive Hunters and Planters* (1959). He also edited a series of volumes consisting of papers presented at the Eranos conferences. In the summer of 1953, while in Switzerland, he met Jung for the first time.

Campbell retired from Sarah Lawrence in 1972 and moved to Honolulu where he continued his research and writing. A few of his works from this period include *The Inner Reaches of Outer Space: Metaphor as Myth and as Religion* (1986) and *The Mythic Image* (1974). During this time he also completed *The Power of Myth* interviews. He died of cancer in 1987.

Notable Works

Campbell's studies in literature, the psychology of Freud and Jung, anthropology and Eastern religion informed his famous study of hero myths, *The Hero With a Thousand Faces*, which employed Joyce's idea of the monomyth in its examination of hero myths across the globe.

One of Campbell's most significant works of comparative mythology is the four-volume *The Masks of God* (1959–1968), a study of “primitive,” “oriental,” “occidental,” and modern literary, “creative” mythology. On the one hand, the volumes set out to “view the cultural history of mankind [sic] as a unit” and to “compose into a single picture the new perspectives that have been opened in the fields of comparative symbolism, religion, mythology, and philosophy” (1959: 3, 4) by tracing worldwide re-occurring mythological themes. On the other hand, the volumes carefully assert that “the myths of differing civilizations have sensibly varied throughout the centuries” (1959: 18) in such a way that the virtue of one culture's mythology is the vice of another, and one's heaven, another's hell. In other words, Campbell warns in his prologue, “mythology is no toy for children. . . . there is a real danger, therefore, in . . . joining the world in a single community, while leaving the anthropological and psychological discoveries from which a commensurable moral system might have been developed in the learned publications where they first appeared” (1959: 12), making note of the fact that his comparative study was cognizant of the importance of historical differentiation and the dangers of morphological parallelism and historical diffusion.

At the end of his life, Campbell undertook another comparative study, producing the richly illustrated two-volume *Atlas of World Mythology* (1983, 1989), which further extended his studies of the historical origin and diffusion of myths.

Theory of Myth

For Campbell, myth functions symbolically, as “energy-releasing, life-motivating and – directing agents” (1959: 4; 1969: 178). Mythology reveals a psychological truth that shows itself in stories and images. Underlying the historical and cultural particularities of mythology is also the potentiality for shared meaning across time and culture that exists because of the psychological and metaphysical underpinnings at work in the stories and alive in the human spirit. Campbell believed that myths are of nature – that is, they are part of the very structure of human biology and the psyche – and although they manifest within and are influenced by culture, they are not exclusively of culture (as Claude Lévi-Strauss proposed). For Campbell, the gap between nature and culture is bridged by myth. Nature is not only out there in the world beyond the human, but it is also within. Myth unites the inner world with the outer. Toward the end of his life, Campbell summed up myth as the “experience of life” (1988: 5). This later statement echoes Campbell's insistence that the interpretation of mythology is anything but systematic. In fact, in *Hero With a Thousand Faces*, he uses the shape-shifting god Proteus as a metaphor of mythology in order to suggest that mythology is psychological, historical, anthropological and metaphysical and cannot be reduced to a single function.

Myths – including mythic discourse and thinking – can function in one of two ways: as a symbol “functioning for engagement” or as a symbol “functioning for disengagement, transport, and metamorphosis” (Campbell, 1969: 169). Campbell carefully elaborates these two functions in his 1957 Eranos lecture “The Symbol Without Meaning” by drawing on the metaphor of a bow that serves either to engage or disengage meaning. When the symbol is given a meaning, “either corporeal or spiritual, it serves for the engagement of the energy itself” (Campbell, 1969:178). As an agent of engagement, myth works to confer meaning. In this way, it can be read as a “literature of the spirit” that provides one with “clues to the spiritual potentialities of the human life” (Campbell, 1988: 3, 5) that aligns the individual with society (in particular, the collective unit of family, religion, tribe, state and nation)

and the cosmos. Myth unites the inner with the outer and shows how each is mirrored in the other.

However, when the symbol functions to disengage, myth does not provide any assurance of meaning. When “all meaning is withdrawn, the symbol serves for disengagement, and the energy is dismissed – to its own end” (Campbell, 1969: 178). Rather, myth evokes an experience of existence instead of positing a specific meaning that always runs the risk of being taken dogmatically. In fact, Campbell frequently warns against interpreting the symbolic literally and even argues that such literalizing is absurd (and potentially even dangerous) in a “de-mythologized” world (1969: 124–126). Inasmuch as myth can reveal the previously unknown, making it known and bringing it to consciousness, it can also point to the unknown as unknowable.

Criticism

The bulk of negative criticism of Campbell’s work comes from academics in the fields of religion and folklore, and stems from one basic complaint about his hermeneutic of comparativism. Many detractors have simplistically likened him to Mircea Eliade and Jung on the issue of archetypes and universals, equating the psychological with the universal and ahistorical in order to argue that Campbell’s comparativism is unscholarly (dismissed by Wendy Doniger as “Muzak mythology” (Doniger, 1992: 78)) since it overlooks historical and cultural particulars in favor of generalizations.

In his 2004 Presidential Plenary Address to the American Folklore Society, Alan Dundes takes aim at Campbell’s “universalizing,” arguing that some mythological motifs do not exist in all cultures. To support his assertion, Dundes cites the lack of a deluge myth in sub-Saharan Africa as one example. Earlier in his speech, however, Dundes does emphasize the point that interpretation “would not have been possible without recourse to grand theory” (2005: 4), of which “universalizing” is a key part. In the same speech, Dundes also credits Campbell “for getting people interested in our discipline” (2005: 10).

David L. Miller forcefully argues that these claims against Campbell do not bear closer analysis because Campbell was neither a Jungian, nor unaware of the importance of historical differentiation. Invoking Plotinus’ *Enneads*, Miller avers that Campbell’s method is that of comparing the likeness of unlike things (that is, of finding similarity within inherent difference), as opposed to the likeness of like things (1995: 168–177). Miller points out several pivotal and often neglected parts of

Campbell’s scholarship that affirm this, adding that Campbell’s choice of language in the titles of his books (a thousand faces as opposed to one face, masks of God) subtly points to the complexity of Campbell’s approach.

Robert Segal has also made the case that Campbell is not a Jungian and that, in fact, his theory of myth differs significantly from Jung’s (1990: ix–xi; 1987: 244–262; 1999: 463–465). Furthermore, Segal calls into question the flippant dismissal of comparativism, asserting that “any theorist – of myth, religion, or anything else – is a universalist” in some way (1999: 463) and lists James Frazer, Northrop Frye, Bronislaw Malinowski and Claude Lévi-Strauss as some offenders who are not always subjected to the same scrutiny as Campbell.

Castration

Stefanie Teitelbaum

A modern definition of castration is any action, surgical, chemical, or otherwise, by which a male loses the functions of the testes or a female loses the functions of the ovaries. Castration is also referred to as gelding, neutering, orchietomy, orchidectomy, and oophorectomy. Traditional definitions of castration refers only to the physical removal of the testes. Judaism, Christianity and Islam all share strict prohibitions about mutilating God's creations.

Freudian castration refers to the biological penis of the Oedipal boy fears castration by the father as punishment for incestuous wishes towards the mother. Internalization of this fearful father is a formative factor in the creation of the superego, the psychical agent of morality and civilization in the structural topology of the psyche. Psychoanalysis in Freud's lifetime, post-Freudians, and psychoanalytic feminists have elaborated, revised and/or reviled his phallo-centric position. Current views of castration anxiety include all psycho-sexual erotogenic zones and functions in men and women.

Psychology and religion share thoughts about castration and/or fear of castration serving to free the spirit from the forces of instinctual gratification. Both psychoanalysis and religion have had controversy over the blurred boundary between biological and psychical castration imagery.

Religion

Olympian Creation Myth

At his mother's Gaia's urging, the titan Cronus castrated his father Uranus. The Goddess of Love and Beauty, Aphrodite, was formed from the foam of the severed

testicles in the sea. Uranus sought sexual gratification every night, but hated the children conceived by his lust.

Paganism

The priests of Cybele castrated themselves as early as 415 BCE as a sacrifice to purify the soul, transcend the demands of passion, society and family in order to reach the divine.

Judaism

In Deuteronomy 23:1, castrated men are expelled from the assembly of Israel.

Christianity

The Gospel According to St. Matthew, (19:12) includes a quote of Jesus', in which he says that there a men who make themselves eunuchs for the kingdom of heaven's sake. St. Augustine of Hippo argues against a literal reading of Matthew 19:12 indicting physical castration as a return to Cybellene cults, an assault on manhood, and a mutilation of God's creations. In Europe, women were not permitted to sing in church choirs. Boys were sometimes castrated to preserve their pure soprano voices which broke at puberty. Such boys were called castrati. In the late nineteenth century the Roman Catholic Church, took a formal position that castrating singers is a mutilation of the body and therefore a sin.

Islam

A hadith, the oral tradition relating to the words and deeds of Muhammad, orders the physical alteration of the female genitalia in language unclear to both Arabic and English speaking people. Two of the ritual procedure rising from that hadith, clitoridectomy and excision, have been termed female castration in modern times (Badawi, 1989). The Qu'ran forbids alteration of Allah's creations, naming such practice the work of Satan.

Psychology

Psychiatry and Psychosis

Biological castrations have been performed on men and women to control deviant sexual behavior and masturbation

primarily in the nineteenth century, although such practice was never widespread. Chemical castration to control deviant sexual behavior is a current treatment. Auto-castration has been observed an onset indicator of schizophrenia, and one self-castrator incorporated Matthew 19:12 in his delusional system (Waugh, 1986, Meyers and Nguyen, 2001). The question of madness was raised in the Cult of the Gates of Heaven, wherein members castrated themselves prior to a mass suicide in preparation of a return to God. Freud's account of Daniel Paul Schreber's paranoid delusions included castration so as to be able to mate with God and produce God's children (1911/1955).

Psychoanalysis

Castration anxiety and symbolic castration are primary forces to repress instinctual and/or id impulses towards forbidden and gratifications, particularly the taboo of incest. A son gives up his sexual desire for his mother for fear of castration by the Father God. The superego, the internalized Father conscience and guardian of civilization, evolves in response to castration anxiety and eliminates the need for the totem Father. Freud thought of women as castrated beings, therefore with weaker a superego structure. The threat of castration has no authority to the already castrated. A child's experiences shock and horror of seeing the castrated mother and fearing that such castration will happen to him as well. Freud's view of fetishism, based on questionable scholarship about tribal ritual, is that the fetish covers up the knowledge of the castrated mother. The mother, who in the infant's fantasy has a penis, is the pre-Oedipal phallic mother. The experience of castration anxiety is necessary to resolve the Oedipal phase. Freud postulated that penis envy is the girl's counterpart of the boy's castration anxiety (Freud, 1913/1955, 1923/1955, 1924/1955, 1927/1955).

Melanie Klein introduced the concept of pre-oedipal castration anxiety and part objects, elaborating on Freud's (1905/1955) ideas of psycho-sexual zones and the child's lack of differentiation of penis, feces and baby (1926/1955), and the experience of the loss of the breast (1917/1955). Any psycho-sexually significant body part or function which a child holds dear, that is filled or cathected with libido, is subject to loss by a castrating god-like mother. The breast, experienced by the child as a part of his/her own mouth, the anal sphincter and its feces, the urethral sphincter and its urine, and an imaginary internal penis for boys and girls, are Kleinian part objects (Eigen, 1974). Jacques Lacan added voice and gaze to the Kleinian part object inventory.

Lacan's re-reading of Freud set out to correct Freud's blurred inner and outer reality boundaries and defined castration in purely psychical terms. Lacanian, castration is to be cut off from the *jouissance*, defined as both orgasm and excess, of identifying with and having the imaginary phallus of the pre-Oedipal phallic mother. Within this model, both boys and girls need to undergo this castration and accept that the mother desires the father's real phallus, the anatomical penis, rather than the child's imaginary phallus like that of the phallic mother. This castration is necessary to accept the reality of the external world and to form language. The Lacanian view places the Oedipus story as a reconstructed explanation of a castration already experienced. Freud's Oedipus story forces a behavior to avoid castration by a Father god. Psychoanalytic feminists have found the revised unisex Lacanian phallus as a gateway to incorporating Freud in post-modern feminist psychoanalysis (Bevis & Feher-Gurewich, 2003).

Commentary

The earliest castration story, the son Cronos, urged by his mother to castrate his lustful, unloving Father to create a pure allegorical woman representing Truth and Beauty foretells millennia of struggle within psychology and religion to modulate the sometimes mutually exclusive demands of satisfying the flesh and satisfying the soul. Freud sought to solve this problem of dualism in his concept of sublimation and the fear of castration contributes to the sublimation process. Biological castration as a religious purification is the extreme enactment of soul-body dualism, devoid of symbolic resolution.

Freud posited circumcision as a symbolic substitute for castration (1909/1955), and castration anxiety holds a central position in Freud's religious and cultural texts as well as those texts about the unconscious. Freud's uncanny (1919/1955), the psychical experience of something missing, relates to both the circumcized/castrated Jewish male and the castrated pre-Oedipal phallic mother. These castrated beings induce castration anxiety in Gentile men encountering the castrated Jew, and in any man encountering the castrated woman. Castration anxiety is thus a causal factor in both anti-semitism and misogyny. While Freud himself explored the relationship between castration anxiety and death anxiety, Freud may have eroticized the fear of death at the hands of the woman as mother, wife and death figure, with his phallic, father-centric theory (Jonte-Pace, 2001). The triple White Goddess of mother, wife and death (Graves, 1948/1966), may be hidden in Freud's death/castration anxiety displacement.

The castrating mother, a popular image in contemporary society, is seen as causal in Jung's Puer Aeternis. The eternal boy-man is symbolically castrated by a symbiotic, infantilizing mother and sacrifices his manhood to remain his mother's beloved boy. In both the modernist Freudian as well as Jungian reading, the puer aeternis, a castrated boy in fantasy, may be male or female in external reality (von Franz, 2000). While Melanie Klein's work on the castrating mother sought to express the power of a Mother God to the infant, the castrating, phallic woman is often a representation of misogyny.

St. Augustine, in his rejection of a literal reading of Mathew 10:19, said "What then doth all that which remained of him after his gelding signify?" Augustine's use of signification anticipates Lacan, post-modern feminism and psycho-linguistic signification's role in gender identification challenging Freud's omnipresent "anatomy is destiny". Muslim women are regularly gelded, and are still signified as women. Men and women are gelded in life-saving surgeries and still retain their gender signification. Melanie Klein's all-powerful castrating mother god is an iteration of Freud's all-powerful castrating father god, opening gender ambiguity of god figures, a parent god that is both male and female. "And God created man in His image, in the image of God He created him; male and female he created them" (Genesis 1:27).

Symbolic castration, the freedom of the demands of instinctual passions, opens the gates of heaven, beauty, art civilization to men and women.

Celtic Religions

David Waldron

Pre-Christian Celtic religion, mythology and symbolism have left an incredibly rich and varied legacy in European culture. That being said it is a field of folkloric mythological studies that is extremely diverse, varied and, to some

extent, historically quite problematic. The extent to which perceptions of Celtic culture and religious practices have been shaped by contemporaneous socio-political factors and the ubiquitous problems raised by Christian and Roman transmission has made attempts to develop a holistic understanding of the religious beliefs of the pre-Christian Celts an inordinately difficult and complex affair. However, despite the very murky waters surrounding the historical record of Celtic polytheistic religion there are very powerful archetypal themes and cultural forms that resonate through to the present.

Unlike the Paleolithic peoples before them the iron-age Celts were semi historic in that they left traces of their culture in written records and in the enormous wealth of archeological finds (Hutton, 1993). In particular there are minted coins from Gaul, Raetia, Noricum and the British Isles, sculptures and other cultural artifacts, Roman eyewitness accounts and an array of literature and bardic lore transcribed in the middle ages. However, these sources leave a great deal to interpretation. The material left in artwork and archaeological finds suggest a great deal and leave many tantalizing themes for speculation on the nature of Celtic culture and religion. The classical eyewitness reports, especially that of Caesar and Poseidonius, attempt to directly translate Celtic Gods and rituals into Roman equivalents and the medieval accounts of Celtic folklore, such as that of the *Mabinogion*, strongly reflect medieval Christian and Saxon/Norman preoccupations, power structures and social mores (Darvill, 1987).

The Roman Conquest and the Celts

When examining the religious practices of Celtic polytheism there are three distinct phases in the transmission of Celtic religion, folklore and mythology. Firstly, there are the religious practices, artwork and festivals of pre-Roman conquest Celtic civilization. Secondly, there is the synthesis and syncretism of the Roman colonization of Britain and Gaul. Finally there is the further synthesis and development during the Christian period. In this context however, and given the diversity and localization of many of the religious practices and rituals recorded, it is a problematic exercise to attempt to find a pure or unadulterated form of Celtic religious belief. Rather it is a living cultural tradition engaged in constant evolution and development in relation to socio-political issues, cultural transmission and eclectic engagement with other societies and religious beliefs, forming a synthesis of mythological, religious and cultural forms held together by

common archetypal themes and symbols of powerful aesthetic and psychological resonance (Matthews, 1991).

Celtic Culture, Religion and Folklore in the Roman Era

While there is an enormous amount of diversity between Celtic regional and tribal affiliations there are several key hierarchical, ritual and festival themes that remain central to the religious practices of the Celts of antiquity. Caesar and Poseidonius both refer to Celtic religious practices being dominated by a triumvirate of religious castes, the Druids who acted as priests and judges, the Ovates who acted as seers and prophets and the Bards who specialized in versecraft, lineage and lore keeping (described as *Filid* in Ireland). This pattern of three religious castes was also chronicled by the later Christian scholars of the middle ages. Indeed the number three seems to have been of enormous significance to the Celts appearing in numerous pieces of artwork, in the triple aspect manifestations of many of the deities and in much of bardic lore transcribed by medieval Christian scholars (Darvill, 1987).

Similarly with regards to festivals, while there were immense variations between districts and language groups with regards to seasonal festivals and their ritual/festive activities it is fairly certain that the four quaterly seasonal festivals associated with the solstice and equinox were practiced through Celtic society. Of these Samhain, commemorating the end of the year and communing with the spirit world, and Beltane, celebrating the beginning of summer and the harvest were the most significant. However, recent research by Ronald Hutton suggests that the centrality of Samhain and Beltane to Celtic religious practice may be far less than is generally accepted (Hutton, 1993).

Attempting to understand the nature of Celtic deity is similarly difficult in that there was a complicated system of localized tutelary gods and, more commonly mother goddesses, deities mixed with folkloric hero archetypes such as Lugh and a collection of zoomorphic deity like beings such as Epona the horse Goddess and Cernunos the hunter God which was appropriated as the divine male deity figure by contemporary Wiccans. This network of polytheism varied immensely between districts and language groups and is extremely difficult for the contemporary historian to study in earnest due to the aforementioned problems raised by Roman and Christo-centric transmission. The result is that we are left with a bewildering and fragmentary array of evocative and powerful images, rituals, symbols and archetypes open to much speculation and interpretation (Hutton, 1993).

The Problems of Roman Transmission

During the post-Roman conquest period this problem was further exacerbated by the well documented tendency of Caesar, Poseidonius and other Roman chroniclers to assume the Celtic deities were direct equivalents of Roman and Greek deities without attempting to contextualize them within the established Celtic cosmology and social system. Furthermore, during the period of Roman colonization many of the deities and ritual practices did merge together with Roman equivalents and cults to Mercury (associated with Lugh in Celtic folklore), Mars (associated with Toutatis) and Jupiter (Taranic) among others were very common and widespread through Gaul and the British Isles. This merging of Celtic and Roman mythology, religious beliefs and deities problematizes anthropological and historical interpretation through the loss of the original cultural meanings ascribed to the historical archetypal images of Celtic deity. At the same time, however this synthesis enriches the analytical psychological perspective through the analysis of what the underlying mythic figures and deities in Celtic religious beliefs archetypically represent in the collective unconscious. A similar pattern occurs when studying the influence of Christian chroniclers who were similarly preoccupied with an alternate cosmology and religious world view. They also found the symbolism, mythology and archetypal resonance of the Celtic polytheistic mythos deeply inspiring, albeit in a medieval Christian context. Indeed, artwork and mythology inspired by Celtic mythology and deities deeply permeates the nominally Christian artwork and literature of medieval Western Europe. Perhaps the most notable example being the merging of Celtic mythic figures and deities with Catholic Saints, in particular St Patrick and St Brigid (Hutton, 1993).

The Celtic Revival

Another important legacy of Celtic religious practices has emerged in the late nineteenth and twentieth century pagan revival movements. Of particular relevance are the Druidical Pagan revivals spawned by folklorist and poet Iolo Morgannwg and related organizations such as the “Order of Bards, Ovates and Druids” and the “British Druid Order” (Hutton, 1993). Drawing on the Romantic literary tradition’s fixation on nationally oriented cultural authenticity and sacrality of the landscape, the impact on Welsh and English national identity and culture inspired by these movements is immense and speaks to the archetypal power and psychic resonance of the mythology and

religious beliefs of Celtic civilization. Similarly, Celtic inspired mythology also deeply permeates other Pagan revivalist movements, most notably Wicca and Goddess or Dianic Paganism with a strong fixation on the role of feminine associated Celtic deities such as the Morrigan and Brigid (Bonewits, 2006). Thus while developing an empirical historical understanding of Celtic religious practices can be a fragmentary and problematic exercise, in analytical psychological terms it is a powerful and pervasive model of archetypal symbolism in European culture and a rich source of symbolism in the collective unconscious.

Celtic Shamanism

M. J. Drake Spaeth

Though coming into increasing popularity as a contemporary spiritual practice, Celtic shamanism has also generated quite a bit of controversy over the past two decades. The term “shamanism” is not a religion as much as it seems to be a term that refers to ancient techniques for altering consciousness to accomplish spiritual purposes (Eliade, 2004); nor is it in itself Celtic. There is no substantive historical evidence that individuals recognizable as shamans existed among Celtic tribes or Druid groups (Matthews and Matthews, 2002). Nevertheless, several folklorists and historians have noted intriguing similarities between elements of Celtic mythology, tradition, fairy tales, and art and practices traditionally identified as shamanic (e.g., Cowan 1993, 2002; Matthews and Matthews, 1994; MacEowen, 2002). These Celtic elements do, in fact, closely resemble what anthropologist Michael Harner (1990) has identified as common or nearly

universal elements of indigenous shamanism. He has labeled these elements core “shamanism”, and they are typically experienced in what he has identified as the “shamanic state of consciousness”, or “SSC” (Harner, 1990). These similarities have inspired a contemporary system of spiritual practices for healing, alteration of consciousness, and self development that proponents have termed “Celtic shamanism”. Celtic shamanism has been particularly popular among those of European and Celtic descent who are demonstrably hungry for a sense of spiritual connection with their ancestors.

Harner’s identification of common elements of shamanic experience around the world has led some to identify the shaman as an archetype – one of the universal thematic patterns of experience found in what Jung calls the collective unconscious (e.g., Cowan, 1993; Smith, 1997). Cowan (1993) identifies several elements as shared by both Celtic mythology and the shamanic archetype. To paraphrase Cowan they are (1) the ability to sojourn in the “Otherworlds”, (2) the assistance of animal guides or powers in order to acquire or retrieve wisdom or power, (3) an initiatory experience (usually a literal or symbolic death and rebirth) or other experiences of a calling to heal or quest for wisdom or power, (4) a transformational experience of interconnectedness of all things or a state of unity, and (5) abductions by Otherworldly entities in this case Faeries – into the Otherworld proper (pp.13–14). Matthews and Matthews (1994) additionally point out that contacts and communication with ancestors and otherworldly beings are frequent elements found in Celtic stories, as are omens found in appearances of animals and plants, as well as acts of nature (p. 2). These authors also argue that in these stories druids, poets, and seers are frequently inspired by divine wisdom and are identifiable as shamans. Finally, themes of heroic retrievals of lost objects of power, such as are found in the Grail quest stories call to mind Ingerman’s (2006) work, in which she describes in detail a key task of the shaman – namely, that of soul retrieval. Ingerman shows that throughout history, indigenous shamans have worked to bring back lost parts of a person’s spirit or soul that are regarded as having fled in response to trauma or illness. The fact that the Grail is frequently identified with the Sacred King himself (i.e., Arthur) supports a correspondence between Celtic and shamanic concepts.

This link between Celticism and shamanism may have important implications for psychotherapy and counseling – particularly when spiritual issues are a focus of consideration. Moodley and West (2005) point out that many forms of indigenous spirituality and healing practices (which often go back more than a thousand years)

are resurfacing and are enjoying popular contemporary practice – often in concert with traditional psychotherapy and counseling. Many such individuals find that such practices compensate for what they see as shortcomings of conventional therapeutic approaches due to lack of sensitivity to their particular experience of diversity or even outright contempt for “folk healing”. Celtic shamanism may afford individuals of European ancestry a means of connecting with their own unique cultural heritage. Familiarity with Celtic shamanism in psychotherapeutic contexts may enhance the therapist’s competence in the area of spiritual diversity, thereby contributing to an overall understanding of issues and phenomena related to diversity.

Celtic Spirituality

M. J. Drake Spaeth

Celtic spirituality is a contemporary term that encompasses practices, beliefs, attitudes, and values that are

loosely based on themes and remnants of Ancient Celtic traditions that survive in fairy tales and Celtic mythology. It is difficult to ascribe to the Celtic tribes an ancient, coherent, organized religious structure, though arguably Druidry in various permutations embodied religious elements. For this reason, the term “spirituality” is particularly useful when describing contemporary Celtic spiritual practices, as it is widely regarded as embodying less authoritative, organized, institutional, and dogmatic phenomena than is generally implied by the term “religion.” Many scholarly works, book, and websites are devoted to discussion of the distinction and relationship between religion and spirituality, a full consideration of which is beyond the scope of this article.

Contemporary Celtic spirituality routinely and syncretically blends Christian and Pagan elements of ideology and practice. For excellent examples of such syncretism, the reader is referred to O’Donohue (1998, 2000), Cowan (2003), and MacEowen (2002, 2004). All of these works focus heavily on the idea of “longing” or “yearning” as a significant feature of the Celtic spirit – longing for connection, for deep meaning, for a sense of power and significance, and for a realization of one’s place in the natural world. Drawing on such themes, deeply rooted as they are in mythology and practices that date back to pre-Christian Ireland, Wales, and Scotland primarily, practitioners of Celtic spirituality uniquely find a sense of balance and connection to others, to place, and to natural rhythms of life. Such a sense of connection arguably comes closer to a “universal” definition of spirituality than anything else.

Other Celtic themes utilized by practitioners of Celtic spirituality are shapeshifting (or identifying with animals, plants, stones, or other features of the natural world to experience a multiplicity of perspectives of the natural world); awakening to one’s place and purpose in the world; fostering recognition of the body as sacred and as the gateway to higher spiritual consciousness, initiation through rites of passage (or spiritual death and rebirth experiences); making choices that are in alignment with a higher purpose and accepting responsibility for said choices; living in balance and harmony with the cycles of seasons and of the earth; communing with ancestors and with the immanent divine spirit in the land; and recognizing the divine spark within oneself.

It is not difficult to discern within these concepts a strong correspondence to Humanistic-Existential and Transpersonal Psychology. Humanistic-Existential psychologists, such as Abraham Maslow, Rollo May, Victor Frankl, Carl Rogers, Fritz and Laura Perls, James Bugental, and Leslie Greenberg all speak articulately about the

psychological value of an active search for connection, meaning, and purpose in one’s life. They also emphasize that psychological health is rooted in a sense of moving from a state of fragmentation and separation into a state of balance, and wholeness and integration. They identify the value of living in congruence between one’s inner perceptions and values and the external reality of one’s life. The existentialists, in particular, stress the necessity of “waking up” and actively resisting a somnambulistic tendency to conform and surrender to the “herd mentality” – not to mention actively and responsibly making choices and exercising our inherent power and freedom. Transpersonal psychologists such as Ken Wilber, Stanislav and Christina Grof, Stanley Krippner, and Roger Walsh broaden and expand the definition of “human” to encompass a connection with the “higher” or divine aspects of ourselves and the world.

Celtic spirituality affords its practitioners a unique, culturally-congruent means of seeking and finding meaning and purpose in their lives. A culturally-competent psychotherapist or counselor would benefit from an understanding of these spiritual practices in order to help clients of Celtic and European background who are experiencing a sense of cultural disconnection that underlies more superficial problems, challenge, and difficulties.

Centering Prayer

Chad Thralls

Centering Prayer is a method of Christian contemplative prayer based on the fourteenth century mystical text *The Cloud of Unknowing*. *The Cloud* offers spiritual guidance to one who is ready to progress in the spiritual life to nondiscursive prayer. Because the divine is ultimately beyond human comprehension, *The Cloud* envisions God lying above the one who prays with a cloud of unknowing in between. The goal of prayer is to focus attention on God by directing darts of loving desire into the cloud. Since prayer is understood as attention focused on God, the text envisions a second cloud, a cloud of forgetting, lying between the one who prays and the world. The anonymous author insists that any ideas or thoughts that arise during prayer are distractions that pull attention away from God and must be avoided by shoving them under this cloud of forgetting (Johnston, 1963).

Methods

Centering Prayer originated in the 1970s at St. Joseph's Abbey in Spencer, Massachusetts. Two Trappist monks, M. Basil Pennington and Thomas Keating, have popularized this method of prayer through publications and retreats. The method itself is quite simple. One begins by concentrating attention on God. This is done by choosing a word that focuses one's desire for God. The word is then repeated slowly. Repetition of the word serves as an aid in focusing attention and desire onto God. In the course of prayer, one may find that the word is no longer needed and stop repeating it altogether. Next, during the prayer one will find that distractions inevitably arise. Instead of heeding the thoughts and images that clamor for attention, simply return to the prayer word. This helps return focus to God. Finally, after 20 min, end the prayer by repeating the Our Father (Pennington, 1980).

Distractions

Centering Prayer acknowledges that distractions are unavoidable during contemplative prayer. In *Intimacy with God*, Thomas Keating addresses the mental noise that plagues attempts to pray using this method. Much of this noise is simply distracting material, including items from our to-do list, intellectual insights, and the

temptation to reflect on how well the prayer is progressing. Keating asserts that other types of material that pop up such as long forgotten memories, fantasies, or disturbing images are symptomatic of deeper problems. Moreover, he claims that the practice of Centering Prayer can facilitate the healing of these emotional illnesses (Keating, 1994).

Healing

Keating explains how Centering Prayer contributes to healing by interpreting it as a cycle composed of four moments. The first moment of the cycle initiates the sacred word and establishes attentiveness to God. This ushers in the second moment which brings a deep sense of rest and refreshment. During this moment, Keating envisions that God is present in an analogous way to that of a therapist. Such a supportive relationship creates an atmosphere in which painful memories can be shared. Because such an accepting space has been established, in the third moment, Keating claims the unconscious unloads images that represent emotional wounds into consciousness. During the course of the prayer, these images are registered as distractions. Finally, in the fourth moment which Keating terms "evacuation," the emotional baggage is released from the psyche. Then the cycle continues by returning to the sacred word (Keating, 1994).

Distractions and the Unconscious

Ann Ulanov envisions how healing can occur through prayer in a different fashion. Sigmund Freud refers to the psychic life of the unconscious as primary process thinking. This level of the psyche is a raw, rushing flow of being composed of wishes, images, instincts, emotions, urges, and drives. One characteristic of the contents of the unconscious is that they continually attempt to communicate their presence to consciousness. Utilizing these concepts, Ulanov refers to the distractions that plague attempts to pray as "primary speech." She interprets them as unconscious material trying to get the attention of consciousness. Ulanov does not agree that healing occurs by the simple unloading and evacuation of unconscious emotional baggage. Instead, she recommends deliberately directing attention to distractions as they emerge during prayer. For her, it is by being honest about all the parts inside of us, and using them as conversation starters in a dialogue with God, that psychological healing occurs when one prays (Ulanov and Ulanov, 1982).

Chakras

Trish O'Sullivan

The term chakra (Sanskrit *cakra* but pronounced *chakra* and in general printed usage in the West) comes from the Hindu/Yoga tradition and is a Sanskrit term meaning wheel or mystical circle. The term refers to psychoenergetic centers in the subtle or nonphysical human body (*lingadeha*) discovered in ancient India. The chakras are believed to move in a circular manner and funnel universal energy into the human energy system. References are made in the ancient (ca. seventh Century BCE) Upanishads to an esoteric human anatomy composed of subtle life energy or *prana*. This anatomy is comprised of 72,000 *nadis* or channels along which subtle energy travels. Although the chakras or energy centers are not specifically mentioned in the *Upanishads*, the *Maitri Upanishad* (6.21) mentions the *Sushumna* channel which is central to the *Kundalini Yoga* philosophy and practice as are the chakras. The Upanishads also describe five elements – earth, water, fire, air and ether associated with this subtle body.

Investigation of this subtle body by later Yogic and Tantric practitioners, led to a more thorough description including the three vertical channels – *Sushumna*, *Ida* and *Pingala* aligned with the spinal axis. It is in the Tantras composed in the medieval period that the term chakra was first applied in written form to these focal points or centers. The *Sat-Cakra-Nirupana* (ca. 1577) describes each of the seven chakras in detail. It was the translation of this text by Sir John Woodroffe (penname Arthur Avalon) entitled, *The Serpent Power*, published in 1919

that brought specific knowledge of the chakras and Kundalini to the West.

The five elements are associated with the first five chakras. The higher chakras are associated with spiritual knowledge beyond the physical realm. Knowledge of this subtle anatomy and the association with these elements spread from India to Tibet, China and Japan where distinct practices developed. For example, Chinese acupuncture is based on the flow of subtle energy or Chi through the nadis or meridians and the balance of elements in the body.

Tantrism and Yoga typically distinguish seven chakras aligned along the spinal axis. A reserve of spiritual energy or Kundalini is believed to abide in the *Muladhara* chakra located at the base of the spine. Meditation, breathing and mantra practices arouse this dormant energy and encourage it to rise up the spine through the *Sushumna* channel. During this process the other six chakras are encountered and energized. Depending on their energetic state they can either block or facilitate this upward flow of spiritual energy. Kundalini Yoga especially focuses on this subtle body and the raising of the Kundalini from the base chakra to the *Sahasrara* chakra at the crown of the head with the intention of attaining spiritual realization. However, all forms of Yoga have the intention of awakening and raising the Kundalini in order to stimulate moral and spiritual growth.

Just as the associated elements progress from gross (earth) to fine (ether) the energies associated with each chakra are believed to be more gross or lower vibration in the lower chakras and finer, or higher vibration, in the higher chakras. The spiritual journey is, thus, a developmental one with sequential steps or levels on the path to transformation of consciousness.

Each chakra is believed to control specific physical, spiritual, emotional and psychological functions and elaborate mandalas came to be associated with each. These mandalas include Sanskrit letters, colors, god or goddess with associated symbols, geometric shapes, an element, seed sound or mantra, animal and specific number of lotus flower petals (the chakras are sometimes referred to as *padmes* or lotuses) indicating the rate of vibration of the energy associated with the particular chakra.

There is variability related to the number and placement of the chakras e.g., *Sahasrara* is sometimes placed above the crown of the head. In Buddhist Yoga there are five such centers and in Hindu Yoga six or more chakras. Following is a table of the major chakras depicted in Hindu Yoga and located along the central *Sushumna* channel.

Chakras. Table 1 Seven Major Chakras

Chakra	Sanskrit translation	Location	Associated element
Sahasrara	Thousand-petaled	Crown of head	
Ajna	Command	Third Eye	
Vishuddha	Pure	Throat	ether
Anahata	Unstruck	Center of chest	Air
Manipura	Gem site	Solar Plexus	fire
Svadhithana	Own abode	Below navel	Water
Muladhara	Root support	Base of spine	Earth

Reference is also sometimes made to minor chakras located at various parts of the body.

While knowledge of the chakras has come to the West primarily from the Indian Tantric tradition, other religions such as the Jewish Kabbalists, Sufis and Taoists also describe energy systems and centers.

Psychology and the Chakras

Meditations and asanas have been developed by Yoga Masters to heal both body and mind and there are specific practices developed to open the chakras and alleviate anxiety and depression as well as medical illnesses.

The emergence of Western depth psychologies coincided with the translation and dissemination of Yogic texts in the West. However, the Western distinction between philosophy and psychology, its emphasis on empirical methodology and ignorance of subtle energy mechanics has prevented the acceptance of the chakras as a subject of serious consideration and research in the West.

Jung was very interested in the chakras and viewed them as symbolically depicting inner experience, and psychological stages of development. He thought of the Kundalini process as a metaphorical journey such as climbing a sacred mountain. A series of lectures he gave on this topic with J. W. Heur in 1932 reveals his deep interest and intensive study of available material, particularly Sir. John Woodroffe's *The Serpent Power*. Jung saw Kundalini Yoga as a process of individuation and translated Kundalini Yoga terms into those of analytical psychology. Jung viewed the system as strictly metaphorical and eastern spiritual realization as a projection of unconscious contents. At the same time, Jung also talked about Kundalini

as if it were a real phenomenon and warned that transitions from one chakra to another can lead to psychological crises. He cautioned Westerners away from experimentation with the chakras and Kundalini.

There is a phenomenon known as “meditation sickness” in the East, wherein headaches, chest pain or stomach aches may occur when the beginner practices excessively. This is believed to result from chi (kundalini energy) rising too fast. The antidote is to leave off meditation practice until it goes away. This may take weeks or months.

This ladder hierarchical model of the chakras corresponds at places to Maslow's Hierarchy of Needs with physical safety and security associated with the first chakra (Muladhara) and autonomy with the seventh (Sahasrara).

During the past few decades many books have been published about the chakras in the West particularly by New Age authors yet few psychotherapies have developed utilizing this subtle energy system. However, Western clinicians with experience with Eastern spiritual practices are beginning to develop psychotherapies incorporating this focus. OME (Organic Mind Energy) Psychotherapy and Seemorg Matrix Work are two such psychotherapies.

Reichian, Bioenergetics and Rolfing are related body therapies that work to release constricted vital energies in the body.

Chan Buddhism

Wing-Shing Chan

Chan Buddhism is a major Chinese Buddhist sect attributed to Bodhidharma that emphasizes attaining Buddhahood, the supreme Buddhist religious goal, through enlightenment of one's own mind, which subsequently spreaded to Japan and named as Zen. In Chan Buddhism, the word "Chan" comes from "Dhyana" in Sanskrit (Soothill and Hodous, 1937), which refers to meditation, samadhi (one-pointed concentration or perfect absorption), but nevertheless goes beyond the meaning of dhyana to become the manifestation of wisdom with simultaneous perfect composure of the mind (Huineng, 1969).

With its focus on personal enlightenment of the mind in the present life, Chan Buddhism is characterized from the other Buddhist sects by its disrespect for religious rituals, sacred texts, godly figures or intellectual understanding, but instead emphasizes on meditation, intuition, master-student relationship and practising and realizing within the mundane here-and-now life.

Development of the Enlightenment Seat

Our Buddha nature, the mind of enlightenment, is considered to be ever present, just await for discovery through meditation, practice or direct intuitive insight. Lineage transmission between enlightened minds is stressed with Bodhidharma, transmitting the right enlightened mind from Buddha to the Chinese patriarch Huike, Sengcan, Daoxin and Hongren and to the sixth patriarch Huineng, considered the source for the subsequent flourishing of

the five Chan sects, including the dominant and still surviving Linji (Jap: Rinzai) and Caodong (Jap: Soto) sects.

The Six Patriarch's Platform Sutra, likely to be written by the disciple Shenhui (Hu, 1953), established Huineng (638–713) as beginning a Chan era of sudden enlightenment, for which the Chan sect is externally received and recognized.

Sudden enlightenment refers to the sudden, or quick glimpse of self-nature, Buddha nature or emptiness, without necessarily going through extended years of meditation or practice. Chan masters were recorded to be able to set off an enlightenment experience in their students through twisting a student's (Baizhang) nose to pain, skillful verbal remarks (Master Mazu) enlightening instantly a novice hunter, or banging a door on the student's (Yunmen) leg. Analytically there are probably two relevant causes that make these sudden enlightenment experience possible:

1. A significant piece of psychological (or spiritual) attachment is suddenly forced to detach and an enlightening experience is resulted (Chan, 2008).
2. The discursive mind is suddenly forced to halt or bypassed whereby the non-discursive enlightening mind is revealed.

The gradual enlightenment path refers to a more gradual, or relatively continual revelation of enlightenment in parts attained normally through extended years of meditation or practice.

Essentially the practice of Chan Buddhism had mainstreamed into two sects, namely, the Linji sect that emphasizes the sudden enlightenment path with instructional methods including shouting and hitting; the Caodong sect, predominantly a gradual enlightenment path that relies heavily on meditation practice.

The sudden enlightenment era of Chan in the Tang Dynasty gradually went to its historical downturn, and by the Song Dynasty, the myriad masterful ways of initiating sudden enlightenment had lost its transmission and the Chan sect began a more safeguard way of practice with more fixed form for enlightenment.

The Linji sect, attributed to Dahui (1089–1163), adopted the "Huatou" or "Gongan" method of practice. By huatou or gongan method, a practitioner is instructed to generate real "doubts" by paying attention to a phrasal excerpt of a gongan, the recorded open case of enlightenment experience; or the whole gongan itself, such as the phrase "What is Wu (nothing or emptiness)?" or the gongan whereby Master Zhaozhou said "Dog has no Buddha nature!" Vigorous immersion into the query might eventually lead to the disbursal of the "doubt mass" with a

shattering of the illusive mind so that one can suddenly “see” the Buddha nature.

The Caodong sect, through Master Hongzhi Zhengjue (1091–1157), had come up with a method of practice called “silent illumination,” by which a practitioner practices a kind of formless (no fixed concentration focus) meditation (Chan, 2004) whereby non-discursive silence is coupled simultaneously with illuminative contemplation so that a non-moving mind with clarity and wisdom is gradually attained, which is itself enlightenment. This method was subsequently transmitted to Dogen who established the Soto Zen in Japan with a similar practice called Shikantaza (just-sitting).

In final analysis, there is no definite advantages of sudden enlightenment over gradual enlightenment, for sudden enlightenment can be quick but not thorough while gradual enlightenment can be slow but firm. Ultimately it is the degree of vexation dissolution and attachments disintegration (Chan, 2006b) that count toward attainment of no-self and genuine complete enlightenment.

Since the Ming Dynasty, Chan sect further declined in China as the Amitabha sect of recitation of Buddha’s name became more popular and prevalent. Many Chinese Buddhists combined the methods of Chan with recitation of Buddhas’ names. A common huatou within the Chan sect had become to investigate “Who recites the Buddha name?” transforming the Buddha name recitation into a huatou method that can lead to enlightenment.

The Chan sect today has witnessed some revival led by efforts of Master Sheng Yen (1930–2009), who had led numerous international Chan retreats on both huatou and silent illumination methods, and espousing a three stage Chan theory (Sheng-Yen, 1979) of (1) Small self, the discursive self of the ordinary people and beginning practitioners, (2) Big self, the unified self of the concentrated mind and harmonized body and (3) No self, the mind who has seen Buddha nature or attained enlightenment.

Distinctive Expressions of Chan Buddhism

Chan Buddhism is also renowned and distinguished from other Buddhist sect by its disrespect for literal medium and rational thinking, a strange exhibition of uncommon behaviors in the gongans and sometimes, a display of highly abstract symbolism in language and art. The underlying thread linking all the above Chan characteristics is actually a need to bypass the ordinary defiled and discursive cognitive thinking mind such that the pure

and non-discursive mind of enlightenment may have a chance to reveal.

Unlike other Buddhist sect, there is also a de-emphasis on precepts or practice. Absolute freedom and spontaneous rightful action appropriate to the circumstances are believed to be attained through enlightenment such that prima facie adherence to strict moral rules becomes both unnecessary and a hindrance. Famous gongans are Guizong’s ploughing dead a snake in a field work and Nanquan’s chopping a cat among disputes among monks.

The ultimate Chan practice is believed to be both effortless (no concentration effort) and methodless (everyday life as practice) (Chan, 2004) and that explains why Chan masters instruct students practice only by eating or excreting, wearing ropes or daily works with no meditation needed, e.g., Linji sleeping at the Chan meditation hall after enlightenment. The Chan sect is also well-known by its disrespect for religious symbols, such as Buddha, patriarch or sutras. This is in accordance with the need to attain absolute non-dwelling emptiness (Madhyamika, the middle way) for which any attachment to “sacred” symbols, even Buddha or Buddhism itself, could stand as the last hindrances to complete enlightenment.

Lineage transmission between master and students is considered essential in Chan Buddhism for it is the self-experience of realizing Buddha nature and liberating enlightenment that is important, not the understanding of religious facts, principles or the acting out of religious behavioral guidelines. Typical attainment verification guidelines include, e.g., the “*Ten Ox Herding Pictures*” (Sheng-Yen, 1988), which depicts the progressive stages a practitioner would go through, by the analogy of taming the mind like taming the ox; and Master Dongshan’s (Five positions of king and minister), a list of five successive Chan attainment stages through the transposition of the manifestation between wisdom and vexations (Chan, 2006a).

Chaos

Fredrica R. Halligan

In archetypal creation myths, the origins of the cosmos are believed to be a state or condition called Chaos. Even Western science with its "Big Bang" theory, can be construed as being an origin in chaos. In ancient wisdom we find many creation stories that began with chaos. In the Judaic tradition, for example, God's voice called out over the deep and thus did creation emerge from chaos and darkness. In similar fashion, in the Vedic tradition, when the Absolute spoke the primal word "Om," the wonders of the created universe emerged from chaos, each element pervaded by the Divine. Thus ancient visionaries seemed to recognize the intimate connection between chaos and creativity; and this is an interrelationship that many scientists have been actively exploring today. As Briggs and Peat state:

- ▶ Although we humans tend to abhor chaos and avoid it whenever possible, nature uses chaos in remarkable ways to create new entities, shape events, and hold the Universe together... Just what is chaos? The answer has many facets... To begin with, chaos turns out to be far subtler than the common sense idea that it is the messiness of mere chance... The scientific term 'chaos' refers to an underlying interconnectedness that exists in apparently random events. Chaos science focuses on hidden patterns, nuance, the 'sensitivity' of things, and the 'rules' for how the unpredictable leads to the new (1999: 1–2).

Chaos is ubiquitous. From weather patterns to the behavior of homing pigeons, from raging rivers to the nerves and blood vessels in the human body, from craggy coastlines to the intricacies of fern leaves, nature is filled with

complexity, and scientists are discovering common, archetypal patterns that underlie seemingly chaotic systems (Conforti, 2003). Moreover, science is discovering there is an enduring interrelationship between chaos and order. Like waves in the ocean, all the energetic patterns of life arise and fall; wax and wane. Chaos organizes itself into order; and order inevitably dissolves into chaos. The sequence – chaos to order to chaos to order – repeats itself in the ever-changing patterns of life.

Chaos Theory as a New Paradigm

Today's chaos scientists have rejected the compartmentalization of the sciences, where part-systems have long been studied in isolation from the whole – a compartmentalization that often leads to reductionism and oversimplification. Rather, the new inter-scientific paradigm crosses the fields of physics, mathematics, biology, astronomy, meteorology, psychology, physiology and more. James Gleick was among the first to recognize and articulate the interrelationships of chaos patterns across the varied scientific fields. He wrote: "Patterns born amid formlessness: This is biology's basic beauty and its basic mystery. Life sucks order from a sea of disorder" (Gleick, 1987: 299).

Among the many component parts of chaos theory, perhaps the most widely known is termed: "the butterfly effect," after Edward Lorenz's discovery in 1960 that tiny changes in initial conditions can have major impact on resulting weather patterns far away. This occurrence has been likened to the mathematical properties of feedback loops and iterative processes, both of which are common in many areas of nature. In his 1972 paper, "Predictability: Does the Flap of a Butterfly's Wing in Brazil Set Off a Tornado in Texas?" Lorenz (1993: 181–184) sets about correcting misconceptions due to his use of the ancient Chinese proverb about the far-reaching effects of small variability such as a butterfly's wings flapping. But the fact remains that feedback loops and non-linear mathematical systems often appear to create chaos when, in reality, they are behaving precise laws that are often so subtle as to be undetectable. The very unpredictability of weather systems, for example, makes the current debate about global warming most intense. One must remember, however, that feedback loops often reach a point-of-no-return where one pattern is irrevocably shifted into another entirely different pattern. The butterfly effect lies behind many currently unknown subtle effects and unanswered questions. In climatology, for example, how much change in average temperature will cause sufficient ice-melt to irrevocably raise sea level so as to wipe away shorelines and inundate coastal

cities worldwide? Or the butterfly effect from the perspective of individual clinical health psychology: how much does a tiny taste of sugar affect a dieter's resolve? How much does a whiff of alcohol disturb the precarious balance of an alcoholic's life? Or in the complexity of a family system, how much can a single eyebrow raised in criticism trigger the eruption of chaos that may affect the entire system with repetitive, dysfunctional patterns?

Repeating Patterns

Another element of chaos theory that is well known is the mathematics of “*fractals*.” First introduced and named by Benoit Mandelbrot at IBM, fractals are complex forms that possess self-similarity at many different levels or scales – whether seen in a microscope or viewed from a great distance. Intricate patterns repeat in the many branches of a fern, for example, or in the folds and crevices of the human brain. In psychotherapy, similar patterns are seen over time when one studies the dynamics of an extended family system. This “multigenerational transmission process” described by Murray Bowen can also be conceptualized as a fractal viewed over time.

Just as chaos and order are interrelated, so too are such apparent opposites as competition and cooperation. They are complexly interwoven. “A complex chaotic system...contains a constantly unfolding dynamic in which what we call competition may suddenly become cooperation and vice versa. In chaotic systems, interconnections flow among individual elements on many different scales” (Briggs and Peat, 1999: 63). Furthermore, patterns repeat. Because it is thought that the system is “attracted” to a particular pattern of behavior, that pattern is called a “*strange attractor*.” Clinically, one needs only recall Freud's description of the “repetition compulsion” to know that these strange attractors are found in psychology as well as in the other sciences.

The spiritual dimension of chaos theory is found in the profound glimpses that this theory gives into the basic mechanisms that underlie all of life. In studying the interweaving complexities of chaos theory as it applies to all of the sciences, the sacred dimension of mystery is heightened and a sense of awe is engendered. We humans with our own complex patterns of intra-psychic and interpersonal group life, in many ways echo the complex patterns – the archetypes – that are being discovered increasingly in the entire creative/chaotic environment in which we are embedded.

Charity

Kate M. Loewenthal

How has charity been seen in religious tradition? How has it been understood by psychologists? What are the relations between religious affiliation and charitable activity, and how well do we understand that psychological processes involved?

Religion and Charity

The practice of charity is demanded in all religions (Argyle, 2000): all major religions have clear requirements: Buddhism, Christianity, Hinduism, Islam, Judaism, and others. Charity is generally seen in two ways in religious tradition. First, donating a fixed proportion of one's income and agricultural produce to appropriate beneficiaries is a religious duty. Religious traditions also endorse providing assistance – financial, food and whatever else is required – to the needy. These two practices overlap, but there are distinct religious duties: taking and donating a fixed proportion of property, even if there is no desperately needy recipient, and assisting the needy – even if one has already given away one's tithes, one is still obliged to help. Charity is considered as enhancing the spirituality of the donor, and is regarded by many commentators as the highest religious virtue (e.g., Shneur Zalman of Liadi, 1796/1973; Porter, 1993).

Psychology and Charity

In psychology, the term charity is seldom indexed in social psychology and psychology of religion textbooks. This does not mean the topic is seldom studied: charity has come under the heading of altruistic behavior in general (Macaulay and Berkowitz, 1970). Altruism has been

defined as “behavior that aims at a termination or reduction of an emergency, a neediness, or disadvantage of others and that primarily does not aim at the fulfillment of own interests” (Montada and Bierhoff, 1991), the behavior being carried out voluntarily.

There has been much debate about whether altruism, helpfulness and charity can be truly selfless, or whether they result from innate own-group and kin helpfulness, or other motivations which are not selfless. These include increased status, social desirability or social approval, and the assuaging of guilt (Carlsmith and Gross, 1968). More recently, Seligman (2002) has argued that the practice of charity and kindness stems from a psychological strength, the practice of which will result in greater psychological health. For example, Loewenthal (2007) cites the case of a depressed holocaust survivor who reported a steady gain in psychological well-being after being advised by a rabbi to give charity regularly.

How Does Religion Affect Charity?

Does religion promote altruism in general and charitable behavior in particular? Most recent work has supported the view that this is the case. For example, in the UK in 1993, those for whom religion was said to be very important, gave about \$50 monthly, compared to \$15 monthly from those who said religion was not important (Argyle, 2000). In the USA (Myers, 1992), weekly church attenders gave away 3.8% of their income, and non-attenders, 0.8%. Regnerus, Smith, and Sikkink (1998) reported that charitable giving was affected mainly by whether a person professed a religion, regardless of what that religion was. The relations between socio-economic status and charitable giving are slightly complex, but on the whole, the better-off give away more. The straightforward explanation of these findings is that religiously-active people are likely to behave according to religious injunctions. The relations between religion and charity apply not only to financial giving, but to voluntary work (Lynn and Smith, 1991), and to humanitarian compassion (Perkins, 1992). Religiosity is a much better predictor of charitable giving and activity than is economic status – and religion predicts giving to non-religious causes, as well as to religious causes (Brooks, 2003).

Conclusions

We can conclude that there is growing evidence that religious activity and identity correlate very reliably with

the practice of charity, and some suggestion that charitable activity may promote psychological health. There is scope for more detailed investigation of the cognitive and motivational factors that underlie these effects.

Child, The

Philip Browning Helsel

In describing the significance of the child and childhood, a brief historical overview provides a perspective in which to place the developments of psychology and religion in

relation to the child. In the classical period, children were not considered individual beings, but were useful to the family and society in the fact that they would eventually become good citizens (Cunningham, 2005: 23). In antiquity, children were often abandoned when families were not able to take care of them, to the extent that almost every family had abandoned at least one child (Cunningham, 2005: 19). Christian emperors challenged this practice, but seemed to not enforce penalties for it (Cunningham, 2005: 25). Developments in theology increased the visibility of the experience of the child. With Augustine's *Confessions*, and his development of the idea of original sin, the child began to be seen as being "on par with the adult" in terms of its "moral dilemmas" (Cunningham, 2005: 26). Caregiving and childrearing began to concern adults in the Middle Ages, as evidenced by the publication of literature relating to the care of children (Cunningham, 2005: 29). However, it seems that the child of the medieval period was understood as less than fully human, being described as "lacking in adult attributes, marked by his or her deficiencies" (Cunningham, 2005: 34).

An important transition began to take place from the era of humanism and the Reformation, culminating in the nineteenth century. People started to believe that what happened to a child would contribute to what the adult person would become. Children thus became the subject of interest and even idealization. During the height of Romanticism, children were described as "fresh from the hand of God," but at the same time some Puritan writers called for "rigid disciplines" which would break the will of the child (Cunningham, 2005: 29, 69). During the eighteenth century, especially among the middle and upper classes, a "wall of privacy" separated the family from the wider world, and the home came to symbolize the safe haven from the degradation which surrounded it (Cunningham, 2005: 59). On the other hand, with the advent of industrialization, poor children were separated from their families at the age of ten and forced to work in grueling circumstances under the supervision of strangers (Cunningham, 2005: 89).

The twentieth century has been called the "century of the child" (Cunningham, 2005: 170). First, state governments took over from philanthropic organizations to provide compulsory schooling and outlaw child labor. Second, psychology demonstrated the influence of childhood on the adult self and began to see children as sexual persons. Finally, children began to be viewed as agents with rights (Cunningham, 2005: 160, 177). In the second half of the twentieth century, children asserted this autonomy as "parental authority declined," "[demanding] and

[receiving] entrance into the adult world" in their teenage years (Cunningham, 2005: 194). As children became members of the consumer culture, they began to exercise authority in ways that would have been unimaginable in previous centuries. In spite of this fact, children continue to be the victims of abuse and neglect, and are seldom seen as complete persons, either in religious settings, or within the wider culture.

Commentary

Psychology was born at the beginning of the "century of the child," and it provided its own view of childhood, suggesting that the riddle of the adult self was rooted in the experience of the child. Freud once claimed that the development of the super-ego was a direct result of the unusually long period of dependence on her parents which the human being experiences (Freud, 1923/1960: 31). In his controversial *Three Essays on the Theory of Sexuality*, Freud described childhood as a time in which the child experienced sexual satisfaction at the hands of her caregivers and began to entertain fantasies in relationship to them (Freud, 1905/1962: 90, 93). Freud concentrated his clinical work on the oedipal period, spanning between the ages of three and five, when the child negotiates these fantasies. If they are unresolved and repressed, they can become the bedrock for future neurosis, but if they are accessed through psychoanalysis, they can serve as a source of creativity. Freud occasionally alluded to anecdotes about children, but only seems to have had one child patient, Little Hans (Freud, 1920/1961: 13). Most of his clinical conclusions about childhood were drawn from his interpretations of the free associations of his patients, attempting to break through the barrier of repression that blocked out all memory of childhood sexuality.

In a quite different approach, Carl Jung explored the prevalence of the Divine Child-motif across a wide range of religious and mythological material, and suggested the presence of a "child archetype" (Jung and Kerenyi, 1949: 111). This archetype gave the person who was in the process of individuation a ground in the "still existing state of childhood," thereby freeing her for future growth in responsibility (Jung and Kerenyi, 1949: 113).

Anna Freud began direct work with children which shaped the development of ego psychology, the theoretical field for which she was largely responsible. Erik H. Erikson began his psychoanalytic career teaching in a Montessori school under her tutelage, and continued this interest in the direct experience as a source of psychological insight. In his first book, *Childhood and Society*,

Erikson studied children in a variety of societies and cultures, placing the problems and concerns of children front and center (Erikson, 1950/1963). While Freud thought of dreams as the “royal road to the unconscious,” Erikson suggested that it was actually the play of children. Reflecting on the sayings of Jesus late in his life, Erikson marveled that Jesus claimed that the “kingdom” is only available to those who “turn and become like children” (Erikson, 1981: 348). Erikson considered this exhortation to the “preservation and reenactment of the wonder of childhood,” to be a humbling word to those psychologists who imagined they had “discovered” childhood in the first place (Erikson, 1981: 349).

The child’s earliest experiences became important in the object relations school of psychoanalytic psychology. Margaret Mahler’s influential theory of infant development traced the adult psyche back to the earliest experience of the child with his mother (Mahler, Pine, and Bergman, 1975: 43). From this perspective, the child’s relationship to his mother in the pre-oedipal period proved to be important to psychic health in even more fundamental ways than the child’s resolution of the oedipal complex. D. W. Winnicott, a pediatrician who became a psychoanalyst in the object relations school, focused his clinical work on the direct observation of mothers and infants, and developed the theory of the transitional object. The transitional object was an object chosen, or “created” by the child that existed in the space between mother and infant. This object received the child’s affection and rage, yet remained intact, thereby helping to establish the child’s own sense of self.

For Heinz Kohut, being denied the original experiences of childhood narcissism in which one is the object of love and attention can provoke serious and long-lasting damage in the child and subsequent adult. Kohut found himself increasingly working with persons who had an extremely fragile self-structure, including feelings of unreality and a strange sensation of the passage of time. Kohut suggested that while “classical analysis discovered the depression of the child in the adult,” his own version of psychology had “discovered the depression of the adult in the depths of the child,” in the child who senses that her development will not be fulfilled, and thus sabotages her own growth with isolation (Kohut, 1985: 215–216).

Religion has attempted to address the needs of children, but it has also perpetuated many myths that have been harmful to children. Judaism was born in a near-Eastern context in which child sacrifice was a current religious practice. In spite of the attempts to distance themselves from this demand, stories such as the binding of Isaac and the sacrifice of Jephthah’s daughter indicate

that such traces had not entirely disappeared (Bergmann, 1992: 76, 93). In a psychoanalytic view, such images perform an important function, bearing their roots in the “murderous wishes of children directed at their parents and murderous wishes of parents directed at their children” (Bergmann, 1992: 314). David Bakan focuses on the latter, suggesting that Job may have not lost his children, but wished they were dead, as a reflection of a father anticipating his own rejection (Bakan, 1968: 110, 116). Religion addresses the trauma of a forbidden and buried past, but in its attempts to do, it may sometimes leave traces of the original wish. In the case of Christianity, the trauma of these wishes are reflected again in the sacrifice of the Son to the Father (Bergmann, 1992: 315).

There are also more redeeming traces of the meaning of children within religion. As mentioned earlier, the statement of Jesus that all must become like children, as well as his invitation to children to be close to him provide counter-points to some of the cruel imagery of the Judeo-Christian tradition, even that which stands behind his own sacrifice. The intimacy with which Jesus addressed God, using the familiar Aramaic form for father, indicates the child-like nature of religious belief. Religious persons have often seen themselves as God’s children, and thus incorporated into a wider family in which they are cared for by God.

However, within religious circles, children themselves have often been neglected as sources of insight. While the education and moral formation of children has been a traditional religious activity, the experience of children itself has seldom served as a centerpiece of theological thought (exceptions are Coles, 1991; Miller-McLemore, 2003, Lester, 1985). Frequently those who educate children in religious faith are not given the same status as ordained leaders in the tradition. In the same way, religion frequently neglects the actual experience of children, focusing instead upon adult emotional and spiritual needs.

Chinese Religions

C. Harry Hui · Eddie C. W. Ng · M. Hannah Tai

According to the International Religious Freedom Report (2005), 8% of the population in Mainland China claimed to be Buddhists, and another 20–28% of the population practiced traditional folk religions. The latter include worship of local gods, heroes and ancestors, and often present as loose affiliates of Taoism, Buddhism or cultural practices of ethnic minorities. In Taiwan, 35% of the population claimed to be Buddhists, 33% Taoists, and 4% believers in *Tiende Jiao* and other traditional folk religions. However, the 2006 *World Fact Book* indicated that 93% of the Taiwan population could be followers of a hybrid of Buddhism, Confucianism, and Taoism. Distinct religious classification may be difficult.

A substantial portion of Chinese people claim that they do not believe in any religion. Data showed that 59% of the population in mainland China are nonreligious (Johnstone, 1993). Some 8–14% called themselves atheists (Barrett, George, and Todd, 2001; O'Brien and Palmer, 1993). The 2001 *World Value Survey* showed that 55% are nonreligious and 24% are convinced atheists. In

Taiwan, 12–24% of the population call themselves atheists (Inglehart, Basanez, Diez-Medrano, Halman, and Luijckx, 2004). In another study conducted in Taiwan, 43% of the respondents labeled themselves as not believing in any religion (Chou and Chen, 2005). The statistics presented above paint a confusing yet true picture, that it is difficult to arrive at clear distinction among religions in Chinese culture.

Taoism

Taoism could mean the Taoist school of philosophy as well as the Taoist religion. Tao (or *dao*) means “way”, everlasting and yet ever changing. Chuang Tzu believed that the world is in peace and harmony in the original state. Disorders arise because of human intending to manipulate and mistakenly dichotomize the world and our understandings of it. The only solution is to acknowledge the limitation and relativity of dichotomized views, and to embrace them all. Based on the philosophy of Lao Tzu and Chuang Tzu, Taoism the religion emerged in the second century, being propagated as *Tianshi Dao* or *Wudoumi Dao* (Celestial Masters) and *Taiping Dao* (Great Peace). Much of its philosophy, values, and religious practices could be traced to its sacred text *Tao Te Ching*. However, as Lai (2003) noted, scholars on Taoism are still debating on what actually constitute the religion.

Certain concepts attributed to Taoism have found favor among some psychologists, especially those with a humanistic persuasion. They include:

1. *Qi*, or ch'i. According to Taoist belief, *qi* (energy) runs in every individual. Such *qi* is connectable to the energy of the universe. Davis (2004) applied this belief to organizational psychology, and posited that leadership energy similarly flows through the social network of an organization. Empirical evidence for *qi* is, however, lacking.
2. *Yin* and *yang*. The universe, as well as each individual person, is a reflection of the balance of two principles or natures, the *yin* (negative, darkness, weakness) and the *yang* (positive, light, strength). Health is when a person experiences a balance (or homeostasis) of the *yin* and the *yang*. According to Taoism, too much of one thing, however good in its own right, can be dysfunctional. It remains an empirical question how much is too much.
3. Taoism advocates being *wu wei*, which is effortless, spontaneous non-intervention in handling the external world. It entails the return to quiescence and

harmony with nature. *Wu wei* is the way to achieve absolute happiness, a high level of mental health (Yip, 2004). A leader exercising *wu wei* is, however, like adopting a less effective, laissez-faire style of leadership (Bass, 1985).

4. Intuition. In Taoist conceptualization, true understanding (*dao*) cannot be named but can only be experienced and understood through meditation and intuitive awareness. Intuition is knowing through personal and subjective experience, in contrast with the objective scientific method. Instead of being a cognitive process, intuition is spontaneous. It attends to the presence (Olson, 2002). According to Taoism, in spite of its elusive nature, intuition can be nurtured through experiential learning and formal education, like what clinicians have done to develop their clinical intuition.
5. Mindfulness. In Taoism, being mindful is when a person is fully involved in the present moment and focused on what is being done, rather than worrying about the outcome. This process enhances the wisdom of the person, by freeing the person from worries about the past or future, to perceive and understand oneself and others more accurately. This person can then readily attain peace and be able to work interdependently with others. The concept of mindfulness is also found in Buddhism.

In Taoism, a person is an integrated whole, embracing physical, emotional, social and spiritual aspects. Illness and suffering result from the disconnection of the person from himself/herself, others, nature and the universe. That is why it is important for a Taoist to enhance the harmony between yin and yang, and get in touch with the inner self. Through meditation, Taoism develops one's self-awareness and intuition, bringing about "an emotionally and spiritually balanced individual who relates harmoniously with others and with nature" (Olson, 2002: 161). In other words, this religion contributes to personality development and helps people attain humility, simplicity, genuineness, flexibility, adaptability, spontaneity, persistence and acceptance (Olson, 2002).

Learning Taoism may have positive impact on subjective well-being among senior citizens in China (Zhou, Yao, and Xu, 2002). Taoist philosophy has been incorporated into some cognitive psychotherapy to help college students high on neuroticism and patients with generalized anxiety disorder. The technique may improve coping and reduce neurotic symptoms. However, more empirical evidence on its effectiveness is needed. (Huang, Zhang, and Yang, 2001; Zhang, Young, Lee, Li, Zhang, Xiao, Hao, Feng, Zhou, and Chang, 2002).

Confucianism

In the midst of civil struggles, Chinese people in the suffering slowly turned away from their gods and spirits to focus on the problems confronting human society and governance. This is the *zeitgeist* in which Confucius (551–479 BC) lived. Aiming at restoring just rule and legitimate government of the early Zhou dynasty, Confucius advocated a new form of education and expounded ethical principles. He described *ren*, the "way" of the perfect man. Avoiding the subjects of the supernature and afterlife, Confucius would rather "revere deities and ancestral spirits, but keep them at a distance". His concern was on the earthly, human situation in the world. Thus some people consider Confucianism more a philosophy than a religion.

The influence of Confucianism diminished after the third century and the emergence of Buddhism. It was only until the eleventh century, by the effort of thinkers like Zhu Xi and Wang Yang Ming, influenced by Buddhist theories of mind and enlightenment, that Confucianism revived, consolidated and reclaimed its status among the Chinese elite. Despite the interest in spiritual elements such as self-awareness and meditation, the original goal towards establishing order within society remained unchanged in neo-Confucianism (Overmyer, 2002).

Behavior with other people is regulated in accordance with the "ethical system of benevolence-righteousness propriety (*ren-yi-li*)" (Hwang, 2001). *Ren* is showing affection to all humankind. *Yi* is respecting others. *Li* is treating others according to their status and roles. Confucianism has a strong faith in people's own ability and power in attaining perfection. According to Ho's analysis (1994), it is the root of parents' authoritarian moralism and cognitive conservatism, as well as children's high rigidity and low cognitive complexity. Nevertheless, it is also the basis of many Chinese people's high achievement motivation.

Buddhism

Buddhism took root in ancient India in the sixth and fifth century, BC and arrived in China in the second century, BC. Buddhism and traditional Chinese thoughts were at odd with each other in the beginning. However, Buddhism had an appeal to both the ordinary people and the intellectuals, because of its simple religious practice, sophisticated philosophy, promise of life after death, as well as a range of religious and social advantages such as full-time

religious vocation in an institution independent of family and state (Overmyer, 2002). Buddhism underwent much “sinicization”, incorporating some Taoist and Confucian concepts.

Buddhism has much to say about human motivation and emotion. For example, *sukha* is an enduring trait that arises from an equilibrium in mental state and awareness of the true nature of reality. It can be likened to happiness. Achieved through sustained training in attention, emotional balance and mindfulness, it results in changes in mood and even changes in temperament (Ekman, Davidson, Ricard, and Wallace, 2005). According to Buddhism, some mental states (such as craving and hatred) are afflictive regardless of their level or context in which they occur (Ekman, Davidson, Ricard, and Wallace, 2005). This view is different from the prevalent psychological perspective that emotions are adaptive (Cosmides and Tobby, 2008; Ekman, Davidson, Ricard, and Wallace, 2005).

Psychological well-being (e.g., happiness, peacefulness, personal growth, and self-reflective insights) seems to improve among participants in Buddhist retreats (e.g., Page, McAuliffe, Weisis, Ugyan, Wright, and MacLachlan, 1997). Tori and Bilmes (2002) observed a positive correlation of Buddhist beliefs with reaction formation, and a negative correlation with regressive emotionality and projection. They found that in Thailand, Buddhist monks’ defense mechanism (unconscious coping) was low in regressive emotionality and high in denial, reaction formation and repression when compared with a local sample.

Ancestor Worship, Folk Religions, and Animism

Chinese people worship natural objects (e.g., trees, thunder, etc.), heroic personalities (e.g., *Guandi*, etc.), and even one’s own deceased relatives. Many religious activities such as ancestor worship are based on a belief in afterlife (Overmyer, 2002). That is why in burial grounds for important people as early as the Shang dynasty, extravagant burial offerings including “decapitated human beings, horses, dogs, large numbers of bronze vessels, and objects of jade, stone and shell” (Overmyer, 2002: 258) can be found. To contact the deities, people engaged in sacrificial rituals. Sacrifices were made alongside requests for some benefits in return. According to Overmyer, this principle of reciprocity is the prevalent pattern of human-deity interaction throughout the history of Chinese religions.

A fear of the unknown and an inability to master nature are probably some psychological roots of this line of religious beliefs and practice. Inscriptions on oracle bones and bronze sacrificial vessels show how ancient Chinese asked for help or favor from their ancestors. It was believed that the longer ones had been dead the more powerful were their spirits. The deified ancestors are like the “intermediaries between their living descendants and the more powerful gods of natural force” (Overmyer, 2002: 258). Since they can bring harm or aids to them, it was “necessary to propitiate the ancestors to ward off their anger as well as to bring their blessing.” (Overmyer, 2002: 258). Besides this desire to gain and to avoid curse, there may also be a Taoist-based desire to become *xian*, namely deities. In addition, the Confucian doctrine of filial piety provides the ethical basis of ancestor worship. Ancestor worship are practiced not only to comfort the dead and to make them harmless, it also reflects the “authority on the part of the parents and filial piety on the part of the son” (Hsu, 1948: 276). The practice extends and strengthens the impact of ancestor in shaping the descendants’ personality as well as their lives.

Conclusion

The four religious traditions differ in terms of how the “self” is treated. The self is the ultimate goal being served by ancestor worship and animistic practices. In the Confucian tradition, people are viewed as embedded in a social network, with the family as the most important environment for personal development. The self is thus defined in terms of membership in a collective. In the Taoist tradition, the self is “but one of the countless manifestations of the Tao and . . . an extension of the cosmos” (Ho, 1995: 120). The ideal self is, paradoxically, selflessness. In the Buddhist tradition, construction of self is rejected while “owning” one’s self is an illusion and the source of suffering (Ho, 1995: 121). To Ho (1995), the commonality among the three religions is about psychological decentering. While the reciprocity principle in Confucianism masks the differentiation between the self and others, the selfless person advocated by Taoism embraces the dichotomy between self and others. The abandonment of selfhood in Buddhist tradition essentially puts the self and craving to death.

Historically and at a doctrinal level, Confucianism, Taoism, Buddhism, and animistic folk religions have distinct worldviews and belief systems. However, as these

religions evolved over the years, being formed and modified by the socio-historical contexts, there were competition as well as amalgamation among them. For example, the cosmology in the classic Confucian text *Diagram of the Supreme Ultimate (Taiji tushuo)* has incorporated Taoist description of genesis of the cosmos. Likewise, the neo-Confucian's ideas of self consciousness, innate knowing and meditation did not originate from Confucius or Mencius (another leader of Confucianism), but are rooted in the Buddhist philosophy and Taoist practice. Conversely, Taoism has adopted from Confucianism social ethics (such as loyalty, filial piety, and social responsibility towards the society) into its religious practice, and linked them to the Taoist philosophy of immortality. These adoption and fusion have been done by each religion to refine and supplement their own doctrinal systems.

At a practical level, Chinese people do not make clear distinctions among various religions. Chinese people worship deities and honor sages from more than one religion at the same time. It is therefore not surprising to find someone who claims to be a Buddhist to practice Taoist rituals, and a Confucian offering incense to a *xian*. Hui, Chan, and Chan (1989) found in a factor analysis of beliefs about death that the Buddhist view and the Taoist view congregate in the same factor. Regardless of the kind of religion one holds, it has impact on the way one interprets the world. Yip (2003) reported that Chinese religious beliefs affect the contents, manifestation and meaningfulness of delusion and hallucination of Hong Kong schizophrenic patients. Such influence on subjective psychotic experience would in turn affect one's cognition and behavior (Yip, 2003).

Christ

Sharn Waldron

Christ as the Ideal Individual

Psychologically speaking Christ is not only the ideal individual, he is also the representative individual. The life of the evolving human being is lived in archetypal patterns, consciously or unconsciously. Christ's life is human life, and true wholeness is genuine Selfhood, which involves the recognition that this reality is one's own reality. Thus, by curious paradox, it is precisely in respect of those features that give Christ his uniqueness (his dual nature) that his essential identification with all humanity is all-important.

If Jesus had been seen only as a historical figure and his humanity had been regarded as the whole truth about him, then it is likely that his present effect would be no greater than Socrates or Plato. It is precisely because he was regarded or recognized and responded to as being God himself, and therefore beyond the reality of the historical, that his life takes on the quality of revelation. This recognition or response was shaped by the "consensus of unconscious expectation," and continues into the present because of the perseverance of this same unconscious in the contemporary western world.

Therefore, when Carl Jung speaks of the life of Christ, he is concerned primarily with that life as interpreted by some other person or group of persons. Jung ranges widely in his quotations about Christ and is prepared to establish the psychic facts of his life from the New Testament, the early Church Fathers, later exponents of orthodoxy, from the mystical traditions, from medieval alchemists and from dream experiences of contemporary men and women.

There is a miraculous element in Christ's birth, the account of the annunciation, Jesus' conception by the Holy Spirit and the virginity of Mary. This miraculous element corresponds to the "non-empirical" genesis of the Self. Since the Self is a transcendent reality that encompasses the essentially unknown realm of the unconscious, it cannot by its very nature be known in empirical ways. Both the birth of Christ and the rise of the Self from the collective unconscious come upon one unawares. They are unexpected and surprise happenings, much like Jung's experience of the underground chamber and the vision of God's enormous turd shattering the cathedral.

The Bearer of Light

In spite of the extraordinary elements, the birth of Christ was an obscure and insignificant event by ordinary standards. He was born without the basic comforts and security of a home. He was born to parents who were powerless in the religious and political power structures of their day. His mother was a Galilean peasant woman and his father a carpenter. Shortly after the birth the child was supposedly taken on a trip to Egypt to escape the rage of the King. Almost nothing more is heard of the child until he is nearly 30 years old. This obscurity combined with the element of danger is symbolic of the extraordinary difficulties an individual must face and overcome in the attaining of psychic wholeness. The very possibility of achieving individuation is precarious. The emerging Self is realized by the conscious but is brought into consciousness by the unknowable and unpredictable forces of the unconscious.

The child Jesus is recognized by Simeon and Anna as the expected Savior of Israel. The Isaiah prophecy is repeated at this time, "Wonderful, Counsellor, the Mighty God, the Everlasting Father, The Prince of Peace" (Luke 2:25-38; Isaiah 9:5).

Jung speaks of the child god, or child hero, as a familiar archetypal figure in myth, religion, folklore, and in spontaneous psychic images in contemporary visions and dreams. The Christ child is only one among many such images: e.g., Apollo, Belder, Hercules. Each of these has, in common with Christ, an obscure or miraculous birth, threat from the outset of life, the apparently invincible powers over which he ultimately triumphs, a destiny to bring light into darkness, and a death brought about by something intrinsic to his existence.

Christ's childhood and the appearance of symbols of Christ in the form of the divine child, correspond to the necessary link that the Self forms with the primitive origins of humanity in general and with the individual person in particular. However, the significance of the Christ child and other child gods go beyond this. The child is represented as growing to become a future deliverer. The child therefore suggests potential. Individuation is a movement toward a goal. The child figure points to the necessity for the continued development of the emerging Self but it is a development that does not involve the severance of the necessary roots in the past.

Birth of Christ

The emergence of the child figure in the individuation process is an anticipation of the future synthesis of

conscious and unconscious elements in the personality. It is therefore, writes Jung, “a symbol which unites the opposites: a mediator, a bringer of healing, that is, one who makes whole” (Jung, 1951/1979: par. 278).

The Christ child is also recognized as the one who brings light into darkness. The theme of light opposed to and threatened by darkness, is recognized in connection with Jesus at a number of points in the New Testament and particularly in the writings of the Gospel of John. Light and day are, according to Jung, synonymous with consciousness and similarly darkness and night are synonymous with unconsciousness. Thus the advent of the bearer of light reflects the eruption of consciousness into existence and consequently its differentiation from the unconscious, a necessary pre-requisite of true Selfhood.

In this context the infant Christ can be understood as the archetypal child-god/child hero image, who performs the function of healing the individual and group by connecting back to the true origins; who gives a sense of destiny which is necessary to complete psychic wholeness, who unites the opposites of light and dark, human and divine, conscious and the unconscious, in order to form a transcendent reality, a wholeness which is the Self. The child is the irrational third that consciousness could not conceive of unaided and which provides the necessary union of opposites and psychic attraction by its meaningful, but essentially unknown, content. In the individuation process the Self has to be experienced in terms that take seriously the materiality of the body. The child symbol also fulfils this objective because children provide potentiality, the promise of growth and development but they also need to be physically cared for and nurtured.

Jesus of Nazareth

The Gospel records that after he commenced his public ministry Jesus had nowhere to lay his head: He lived a life of hardship, which culminated in the agony of Gethsemane. Christ’s life parallels the process of individuation. In Jung’s construction of this, there is much suffering and estrangement in the process of becoming individuated. In the individuation process, in a very real and frightening way, the rational person is threatened by this process, threatened with being swallowed up in a dimension greater than his ego can comprehend. All securities seem to be lost, menace seems everywhere present and there seems to be no clear resolution to the conflict (Jung, 1942/1948: par. 233). The experience of Christ upon the cross

signifies the dramatic and extreme nature of the loss of all values that must be endured before the supreme value can be realized (Jung, 1940: par. 149).

Christ was crucified between two thieves; the one destined for paradise the other for hell. The suffering emphasized here in the crucifixion clearly has a redemptive quality about it. Jung expresses the psychic analogy in terms of the crucifixion of the ego “in its agonising suspension between two irreconcilable opposites.” The confrontation between consciousness and the unconscious presents a tremendous threat to the ego but one that must be endured if the Self is to emerge. The ego must die, must relinquish its claims to being the center of the whole of psychic reality in order to make individuation possible (Waldron, 2003).

After death comes three days in hell in which the loss of all value seems to be a permanent state. Then follows the resurrection and the ascension and newness of life. In the genesis, that is, the creative process by which the Self moves from a state of primeval chaos and unconsciousness into consciousness, order and balance, the apparent chaos and absence of securities and order turn out to be a necessary part of the coming to terms with the depth of unconsciousness, in order to establish a new order of values and hence a supreme clarity of consciousness, by the integration of the contents of the collective unconscious into consciousness. The New Testament records few post-resurrection appearances and the nature of these is often veiled. The woman at the tomb does not recognize the risen Christ (John 20:11–15). The disciples on the Emmaus road did not know him until he broke the bread (Luke 24:13–35). The disciple Thomas needed to feel the wounds of Christ before he would believe the testimony of his compatriots (John 20:24–39). So too, says Jung, “the transferred values are not easy to find or recognise” (Jung, 1951/1979: par. 79).

Christ as Symbol of the Self

Sharn Waldron

The Self and the Christ

Jung wrote, “Anything a man postulates as being a greater totality than himself can become a symbol of the Self. . .” (Jung, 1948: par. 232). He also argues that not every image is fully adequate. For him, the figure of Jesus Christ is not a symbol of totality because it lacks evil and sin. Rather, it is Christ’s suffering at the hands of the collective society that is significant for it is an image of the suffering that the ego must go through at the expense of the unconscious, in the process of individuation (Jung, 1948: par. 233).

Within the process of individuation – the realization of the Self, the image of Christ suspended on the cross between two thieves aptly expresses the tension between good and evil and between consciousness and the unconscious.

It is a paradox, a statement about something indescribable and transcendental. Accordingly the realization of the Self which would logically follow from recognition of its supremacy, leads to a fundamental conflict, to a real suspension between opposites (reminiscent of the crucified Christ hanging between two thieves), and to an approximate state of wholeness that lacks perfection (Jung, 1951: par. 123).

Jung argues that the imitation of Christ does not consist of casting one’s burden on Jesus but means undertaking the same experience of life that Jesus had, the way of individuation. That is the great and liberating thing about any genuine personality; he voluntarily sacrifices himself to his vocation, and consciously translates into his own individual reality what would lead to ruin if it were lived unconsciously by the group.

There is a parallel between the symbol of Christ and the process of individuation. The incarnation of Christ is God becoming a human, the breaking into the world of consciousness from the unconscious, an integration of one with the other. For Jung, the Christ symbol is a part of the wider symbol of the Trinity. The Trinity symbolizes a process of development and consciousness that has taken place in the individual and the collective community over the centuries. Jung postulates that while the Trinity is symbolic of the process of individuation it is not a symbol of the goal of that process, the realization of the Self (Jung, 1954: par. 400).

Within this process, God the Father is representative of the unconscious state of childhood. At this stage of development, life for the child is habitual, and law-regulated. The Incarnation begins with the Son taking over the Father’s position. This is not reflective of a development of consciousness because the old customs are still retained. Differentiation and development of consciousness occurs when the individual begins to reflect, discriminate and suffer the conflict of the moral opposites resulting from his freedom from the law.

The advent of the Holy Ghost represents the recovery of the Father and his reintegration with the Son. Consciousness recognizes the unconscious as a higher authority that stands beyond the power of reason.

However, Carl Jung argues that a symbol of the Self requires a form that embraces good and evil, masculine and feminine. He perceives that evil and the feminine are both missing from the Trinity. Jung postulates the need for a compensatory essence within the god symbol. This is a fascinating development in Jung’s thought. He is proposing, out of his conscious, clinical rationale to add to and modify a symbol which he has postulated emanates out of the unconscious and therefore is transcendent and universal. Jung partially addresses the question in *Psychology and Western Religion* when he states:

- ▶ The God-image is not something invented, it is an experience that comes upon a man spontaneously. . . The unconscious God-image can therefore alter the state of consciousness, just as the latter can modify the God-image once it has become conscious (Jung, 1948: par. 289).

For Jung, the inclusion of the doctrine of the Assumption of Mary within the god image is psychologically more satisfying. He proposes a quaternity which he states:

- ▶ Is [a] consistent and logical restoration of the archetypal situation, on which the exalted station of Mary is revealed implicitly and must therefore become a ‘conclusio corta’ in the course of time (Jung, 1938: par. 122).

Behind this dialectic interaction between the Trinity and quaternity stands Jung’s hypothesis of the Psyche. In his continuing pursuit of this missing fourth dimension, Jung seeks to explore the relevance of Satan and Christ as the dark and light sons of Father. God the Father is the equivalent to the unconscious. Christ and Satan are symbolic representations of the tension between good and evil which originate in the development of consciousness. The continued incarnation of God in humankind through the Holy Ghost is representative of the process of individuation. The culmination of this

conception of the symbol of quaternity is the birth of the Self.

For Jung, Jesus Christ is and is not a symbol of the Self. Jung argues that in the New Testament figure of Jesus of Nazareth we see the development of a myth in which the portrait of Christ takes the place of the historical Jesus. It is significant and should be noted that Jung writes out of a time when one of the central issues in theology and biblical scholarship was the question of the differentiation between the historical Jesus and the overlays of reflection evident in the gospel narratives.

In this perspective, Christ became an object of his contemporaries' collective unconscious expectations, resulting in a general projection of divinity onto the figure of Christ.

The Christ and Jesus of Nazareth

The life of Jesus Christ has all the hallmarks of the hero's life: improbable origins, divine father, hazardous birth, miraculous deeds, symbolic death and resurrection. These characteristics point to the underlying archetypal idea of the Self that is present in humanity as an unconscious process. In this way Christ realized the idea of the Self. Jung postulates that the Christ figure is, "perhaps the most highly developed and differentiated symbol of the Self, apart from the figure of Buddha." Jung appears to carry his own personal contradictions on this issue. While at one point he argues Christ is the most highly developed symbol of the self, a little later he argues that Christ is not an adequate symbol but is an image of the journey. Christ "becomes" an embodiment of the Self. It is perhaps because Jung is not able to separate himself from a Calvinistic interpretation of Christ which is rather Docetic in character. (Waldron, 2003) that he sees Christ as removed from the reality of normal human existence, and in this context he is able to parallel the Buddha and the Christ, which would seem an unlikely marriage. Buddha eschews the experience of human passion to attain paradise, but Christ embraces the passions, suffering and evil in order to transform them.

Docetism was a second Century heresy which conceptualized Christ as a phantasm in order to address an inability to conceptualize God existing in a material and finite human form. To the Docetists, their perception of God as utterly holy and good was incompatible with God's existence in the form of a human, for being human meant being subject to the imperfection of the flesh, to dirt, to suffering, and most significantly, to death.

In saying that Jung's view of the Christ is Calvinistic and as a consequence has a Docetic character I allude to the tendency of Calvinistic theology to have such a high view of the divinity of Christ that even though Calvin would say that Christ is fully human his work suggests that the divinity of Christ strongly overshadows his humanity. Calvin sees Christ as all good. He may be a human being but he is not a human being as others are human beings. He knows all. His words and actions are totally good. In his goodness he redeems us who are of sinful flesh.

Jung always addresses the Christ question from the perspective of Calvinistic Christology. In Jung's framework, the self-revelation of God in Christ illustrates the way in which the problem of opposites arises when God becomes an object of conscious reflection.

In the Christ figure, because evil is absent there is a void, a construct emanating out of a seemingly conscious reflection on the god-image. Jung sees the opposition between Christ and Satan as a more accurate reflection of the god-image (Jung, 1951 : par. 351).

When conscious reflection modifies the god-image, our sense of identity becomes based on our ideals of perfection instead of upon the complete psyche and the images emanating out of it. It is from this construct that Jung is able to differentiate between the god-image that is an aberration of one's unconscious and the god-image that is a totality, holding in tension the opposites and so engendering a reconciliation of the psyche.

Images of God

Jung reflects that while our images of god are a projection of our own unconscious, it is important not to confuse the image of god with that transcendent power which all images point to and hint at. As collectively and individually we move toward individuation, the god-image will, inevitably, correspondingly metamorphose to parallel the psychic reality. The transitions in the god-image are reflective of this journey. And yet, inevitably, the difference between the image of god which is a construction of reason and the image of god which represents the transcendent unconscious and is beyond perception of reason is only conceivable through our conscious perception. This conscious perception of the image of Jesus and the image of god is a reflection of our psychic journey. It is a reflection of our image of the Self.

Christianity

Jeffrey B. Pettis

Christianity begins in the first century CE and occurs as an outgrowth of a variety of groups that constitute Judaism during this time. It has as its focus the figure Jesus of Nazareth who preached, taught and practiced an interpretation of second-temple Judaism and the Torah which drew both adherents and opposition. He was eventually martyred in Jerusalem ca. 33 CE. Christians claim that he was resurrected by God from the grave, and that he yet lives and is present as *ho Christos*, “the Christ” (meaning the “Anointed One”). Early believers gathered in their homes to worship and partake in rituals including the Eucharist and baptism. A variety of Christian groups emerged, including the Petrine following in Jerusalem, the Johannine community possibly in Palestine, the Montanists in Asia Minor who focus on eschatology, and the Pauline movement with its focus on Gentile membership. It is not until late first century and early second century that the “church” and Christianity as a religion begin to take form as an institution, evidenced, for example, in the letters of Ignatius of Antioch (ca. 100 CE) who gives much attention to ecclesiology and the central role of the bishop as head of the congregation. “We are clearly obliged to look upon the bishop as the Lord (*ton kurion*)” he writes to the church at Ephesus (6.1). To the church in Smyrna he writes: “All of you should follow the bishop as Jesus Christ follows the Father; and follow the presbytery as you would the apostles. Respect the deacons as the commandment of God. Let no one do anything involving the church without the bishop” (8). For early Christians the Jewish

scriptures represented the authoritative sacred writings. At the same time a new collection of literature begins to emerge from an oral tradition of the sayings of Jesus. The letters of Paul represent the earliest Christian texts, and along with other writings deemed important by Christian leaders becomes part of the *New Testament* Canon. Together these writings which include stories, teachings, exhortations, parables, sermons, travel accounts and sayings relate the Jesus of history, and even more the Jesus of the theology. Paul speaks of encountering the posthumous Jesus in a vision experience and the potency of that experience for Paul leading to his Christian conversion (2 Cor. 12.1–10; 1 Cor. 9.1; 15.1–6). From this event Paul becomes passionate to include Gentiles into Christian membership, as he establishes church communities in places such as Corinth, Philadelphia, and Galatia. The NT canon consists also of the Gospels. The Gospel of Mark presents Jesus as one who exorcizes demons and moves in mysterious secrecy amid the crowd and his followers. The Gospel of John presents Jesus who is the *logos* made flesh and dwelling in the material world. The Gospel of Luke presents Jesus as a social reformer, and the Gospel of Matthew presents Jesus as a great teacher. In this way the gospel writers each present Jesus in ways specific to their own socio-political and religio-spiritual concerns. They all however present Jesus as the bringer of a new age. In Mark Jesus is clear to say: “The time has been fulfilled (*peplērōtai ho kairos*) and the kingdom is near; repent and believe in the good news (*euaggelion*) (Mark 1.15; cf. Matt. 4.17; Luke 4.15; cf. John 13.31–33). With regard to the era of Christianity, Jung refers to the emerging of the Aion, or *piscus* (Latin, “fish”), the new archetype embraced by the collective (unconscious). The fish is symbolic of Christ coming to the surface and made manifest as the true Light (1 John 2.8–11) in the waking, conscious world. Early Christian catacomb include the fish as symbol of Christ, the Greek spelling for fish, *ichthus*, taken to mean “Jesus Christ Son of God, Savior.” In the Gospels there are accounts of Jesus providing fish to feed large groups of people (Mark 6.35–44; Luke 9.10–17; Matt. 14.13–21; cf. John 6.1–13), and in the Gospel of John Jesus’ final post-resurrection appearance is to the disciples whom he causes to have a great catch of fish, a portion of which they all share as a meal (John 21.1–14). The early church into the Middle Ages struggles to define the relationship between the human and the divine in the figure of Jesus. The Council of Nicea (325 CE), consisting of about 300 bishops called together by the Roman Emperor Constantine, is significant for establishing the notion of *homoousios*, Christ being of the same substance

as the Father. Through Constantine's conversion to the faith Christianity becomes the official religion of the Roman world, which includes the western Latin church and Rome and the eastern Greek church with its center at Constantinople. Many of the religious beliefs and practices of these two traditions remain into the present time.

Chthonic Deities

Sukey Fontelieu

Chthonic is from the Greek, $\chi\theta\omicron\nu\nu\iota\zeta$ or *khthonios*, meaning “of the earth” and is used in reference to that which is beneath the surface of the earth, or the underworld and its state of darkness. Chthonic also refers to a state of abundance. For the ancient Greeks, chthonic was not to be confused with the visible layer of the soil, where Demeter reigned as the goddess of the harvest or with Gaia, the earth mother who bore and united with Ouranus and is a primal life force (Farnell, 1908/1971). Rather, chthonic implies lower, abundance, darkness, and death.

The chthonic deities and heroes were worshipped in their own cults and sacrificed to in specific ways that differentiated them from Olympian deities. For example, black-skinned animal offerings were preferred for sacrifice to the chthonian gods and light skinned for the Olympians. However, any sort of strict lines of demarcation to categorize the Greek's system of religious affections meet with frustration. The line between the chthonic and the Olympic is immediately blurred as soon as one considers Persephone, Hermes, or, for that matter Zeus himself, who had cults where he was worshipped with the epithet *Zeus Chthonios* (Burkert, 1977/1985).

A chthonic deity, then, is the carrier of the projection of human nature's instinctive drives and dark, rejected propensities and yet is also a fertile and divine source of abundance. Aspects of human nature that were wisely discerned by the ancient Greeks with caution and recognized as potentially dangerous in humans were nonetheless honored in their gods. Through rituals the Greeks were participating in a relationship with the projected darker parts of their own nature. Devotion to this principle has fallen into disuse.

Psychological Implications

Today, rather than a reverential attitude toward the awe-some power of the chthonic force, even in psychological systems and religions, much of this drive is the target for a life long battle to contain, banish, or defeat it in oneself and in society. Unlike the Greek chthonic cults, today darkness is not worshipped, it is feared. Denial of the dark side of the soul (dark did not mean evil to the chthonic cults, but implied an insufficiency of illumination) inevitably creates projection of one's own unacknowledged urges onto others.

Death was considered transformative for human beings in religion in the ancient Greek cults and is still thought to be so today. Today, only if the darker aspects of the personality are defeated does the transformation end in a better life. The dead were understood to be of aid to the living by the Greek cults and all mortals went to the underworld after death. Immortality was not bestowed upon a mortal based on a judgement of the quality of their life. The chthonic cults worshipped their ancestors and heroes at their gravesites, believing that the dead were able to deliver oracular messages that could help them with their daily burdens.

Dualistic Thinking

Dualistic thinking categorizes the chthonic in a split between good and bad. Chthonic is bad. Olympian is good. But to the ancient polytheistic cult members this would be a gross oversimplification. They might even view it as the one psychological state they perceived as sinful: hubris. The chthonic gods and goddesses all had healing and destructive tendencies, as did the Olympians.

The Greek God Pan

One well-known example of the chthonic is personified by the Greek goat god Pan. Pan's cult began in Arcadia on the Peloponnesian peninsula. He was half divine and half beast, a god of fertility, the hunt, and an aide to men and the divine in battle. He also brought panic and unbridled sexuality. Other Greek chthonic cults worshipped Hermes, Hades, Persephone, Dionysus, Hecate, and Haephestus among others. Each carried different shades of the chthonic spirit, which the polytheistic Greeks saw as aspects of the many sided mystery that surrounded and animated all of life.

Circumambulation

Paul Larson

Circumambulation is a religious practice of walking around a sacred site. It can take at least two different outward forms; each with a slightly different but related psychological meaning. The first use of sacred walking comes in the form of a communal act of celebration of a particular deity or saint. At various times in the religious calendar of ancient Egypt, an image of the god was taken out of its shrine and paraded for the people to see. In many Roman Catholic countries, statues of saints are taken around the plaza on the saint's festal day. These acts of circumambulation are a kin to an animal ranging over the domain of its territory. The parade marks the loyalty of the local populace to the patron deity or saint. Another form is solitary or more solemn pilgrimage. An example of this would be the circumambulation of Mr. Kailash in Tibet. This is a multi-day journey and involves not only the physical travail of a difficult and long hike, but becomes a focal period of reflection, meditation and devotion.

In either form, the act of circumambulation is a human attempt to create or observe what Eliade (1959) termed "sacred space" and "sacred time." In the act of marking off a space through physically walking its circumference, humans create a boundary between the sacred and the profane or mundane aspects of their world. In the course of the journey of circumscribing a space, the person or group exists in sacred time. Often the opportunity provided by a day long or even multi-day event allow individuals who participate to enter into ecstatic trance states or deeply focused meditational states even as they are active in a bodily sense.

Circumcision

Mark Popovsky

General

Circumcision refers to the removal of the prepuce (foreskin) covering the glans of the penis. Egyptian mummies from 2300 BCE. were found circumcised and earlier wall paintings suggest that the practice began long before. Approximately one-sixth of the world's men today are circumcised; the vast majority are Muslims or Jews. Throughout history, the basis for the procedure has traditionally been religious or cultural; however, in America, Canada and Australia, many men are circumcised for medical or esthetic reasons.

No consensus exists as to how circumcision originated. Anthropologists have proposed theories including that it began as a mark of defilement for enslaved man, that it served as a sign of cultural identity similar to a tattoo and that it once was believed to enhance fertility. Today, circumcision is the norm among Muslims, Jews, some African churches, several African tribes and Australasian Aborigines.

Judaism

Religious Jews traditionally circumcise male babies on the eighth day unless there is a health-related reason to postpone it. The act is performed by a *mohel* (circumciser) who need not be either a rabbi or a physician. The baby is held firmly by the *sandak* (holder) who is usually an elder male relative. Traditionally, the procedure is done without anesthetic. In pre-modern times, blood was sucked from the penis following the cut. Among most Jews today, this is done only symbolically using a straw.

Circumcision is understood by Jews to signify acceptance into the covenant between God and the Jewish people whereby Jews agree to follow the laws of the

Torah and God, in turn, agrees to bless the Jewish people. An early iteration of this covenant between God and Abraham is described in Genesis 17; the passage concludes with the command for all of Abraham's descendants to be circumcised. Covenants in biblical times were often sealed by severing an animal, with the implication that the party who breaks the covenant will suffer a similar fate. In Hebrew, the verb meaning to seal a covenant translates literally as "to cut." It is presumed by Jewish scholar that the removal of the foreskin symbolically represents such a sealing of the covenant. A number of sovereigns, beginning with Hadrian and Justinian, attempted to forbid the practice among Jews and anti-Semitic rhetoric throughout Western history has often included a notable anti-circumcision component. Some Reform Jewish theologians of the nineteenth century argued that circumcision should be abandoned as it ran contrary to the Jewish principle of universality. Despite common misconceptions, a child born to a Jewish mother is considered fully Jewish regardless of whether or not he has been circumcised.

Christianity

With Paul's teaching that faith served as a sufficient prerequisite for conversion to Christianity, circumcision fell away as a religious ritual for early Christians. It is explicitly rejected as a requirement for conversion in Acts 15:3–11 and Galatians 5:6 but non-therapeutic circumcision was never forbidden by the Roman Catholic Church until the fourteenth century. The practice has been retained in Coptic and Ethiopian Orthodox churches.

Islam

Though circumcision is not mentioned explicitly in the Koran, it is considered to be a binding "prophetic tradition" among Muslims. There is a great diversity of opinion among Islamic jurists as to the proper time for the ritual to be performed. Often it is during the first 40 days of life, most commonly on the seventh day; however, it can be as late as age seven in some communities. Who performs the circumcision and how varies significantly from community to community in the Muslim world.

Psychology

Freud understood Christianity as a "religion of the son" which held an Oedipal desire to kill the "religion of the

father," Judaism, from which it was born. Freud further viewed circumcision in Judaism as symbolic of man's submissiveness to God. Consequently, by rejecting circumcision and thus removing that symbol of submission, the "son" asserts its authority over the "father." Freud views circumcision as symbolic of castration and he posits that much anti-Semitism may be rooted in the anti-Semite's fear of castration. Other psychoanalyst theorists have disagreed with Freud, arguing that, far from serving as a symbol of castration, circumcision gives the penis the appearance of a permanent erection. The ritual then may seek to ensure fertility and the continued existence of a group which perceives itself as threatened.

Contemporary Debate

A passionate debate as to the value of circumcision rages across the literature in the fields of medicine, psychology and anthropology among others. Proponents often cite medical benefits and the importance of respecting cultural traditions. Opponents generally focus on the pain of the procedure to the infant and rights of the neonate. No solid data exists as to the long-term psychological impact – positive or negative – of circumcision on the individual. The mere intensity of the debate attests to the fact that the practice strikes deep psychological chords for many.

City

David A. Leeming

Cities (and villages) have traditionally represented various concepts associated with the idea of centering. For many cultures their major city or village is the World Center.

In Egypt creation itself occurred when a primal mound rose from the Nile and became the cult center at Heliopolis. Delphi, home of the Greek oracle, was the navel of the world. Any village into which the people emerged from Mother Earth into this existence is the World Center, as in the case of many of the pueblo cultures in the American Southwest.

Most ancient and medieval cities were built around a central temple or church, often defined by walls with four gates representing the four directions. In a sense, then, cities were mandalas, representing wholeness and security and a sense that through the structure of the city the inhabitants participated in that wholeness. In terms of collective psychology, cities have represented not only wholeness but a reasoned barrier against the chaos surrounding their walls. Cities were often referred to by the feminine pronoun and a constant fear was of the ravishing of the city by invading armies. In mythology, as in history, the fall of a city is a terrible tragedy equated with the psychological and emotional destruction of the culture. The fall of Troy is a prime model for this tragedy, its gates penetrated and its streets filled with the murdering invaders.

Cities, like humans, can be corrupted and can serve as a model for the psychological corruption of a people. A sphinx torments the sinful city of Thebes and inside at its heart we find the specific crimes of incest, regicide and patricide in the person of Oedipus, who lacks the one psychological quality he needs, self-knowledge.

Cities sometimes have mythological, spiritual and political significance related to particular events. As we know in connection with Jerusalem, a city can be holy to more than one people. Jews, Muslims, and Christians who have fought for the right to occupy that city have, from their points of view, fought for their cultural souls, for their very being. Take away Jerusalem and the people in question no longer are connected to what or whom they believe themselves to be. "By the rivers of Babylon, there we sat down, yea, we wept," sings the psalmist of the Hebrew Exile to Babylon and the destruction of Jerusalem. "If I forget thee, O Jerusalem, let my right hand forget her cunning" (wither away) (Psalm 137).

In the *Republic*, Plato discussed the city as an expression of our lack of self-sufficiency and our need to look for help beyond ourselves – i.e., in the collective experience. Ultimately, then, the city, whether Jerusalem, Troy, Athens, Thebes or Heliopolis, is a mandalic model for a culture's psychic wholeness, a model, like the heroes who defend it, of the collective Self, the perfect union of the society's psyche in both its unconscious and conscious forms.

Clitoridectomy

Stefanie Teitelbaum

Introduction

Clitoridectomy, the removal of the clitoris, is a term and practice that is not mentioned in formal psychological or psychoanalytic literature. There is incidental mention in medical texts of Western women in Europe, America, and Australia in the nineteenth century subjected to psychosurgical clitoridectomy as treatment for hysteria and to prevent masturbation, but these surgeries never became common practice. The significance of clitoridectomy is within Islamic religious and cultural tradition. The Qur'an does not mention clitoridectomy but there is a hadith, the oral tradition relating to the words and deeds of Muhammad, discussing the physical alteration of the female genitalia in language unclear to both Arabic and English speaking people.

Religion

African Tribal Religions

Clitoridectomy predates Islam, in ancient African tribal religions. There is much debate as to which force, the old tribal or Islam is the primary religious force in African female genital cutting (Badawi, 1989; Roald 2001).

Islam

Clitoridectomy is one of several ceremonial procedures often referred to as female circumcision, female genital

cutting, or female genital mutilation. This is a Sunni tradition, now debated among Sunnis. Shi'ites have never practiced female genital cutting.

The four procedures are differentiated (Roald, 2001) as

1. Circumcision; the removal of the prepuce or hood of the clitoris.
2. Clitoridectomy; the removal of the clitoris.
3. Excision; the removal of the clitoris and of all or part of the labia minora.
4. Infibulation; the removal of the clitoris, labia minora and all or parts of the medial part of the labia major. Infibulation is practiced mostly in the Sudan.

In one of the earliest efforts of a scientific, systematic inquiry into practice and psychological impact of female circumcision, the phrase female castration first appeared. In his small sample of female circumcision in Egypt, none of the samples were circumcisions, all were castrations – clitoridectomy and excision (Badawi, 1989).

The Arabic word, *bazr*, from the circumcision hadith is alternatively translated as prepuce of the clitoris, or the clitoris itself. The World Health Organization (WHO) classifies clitoridectomy as Type I Female Genital Cutting, including both circumcision and clitoridectomy, reflecting the Arabic dual definition. The WHO Type I clitoridectomy subsumes both. Muslim opponents of all forms of female circumcision quote Holy Qur'an in their argument, saying that clitoridectomy alters Allah's creation and is the work of Satan. The strength and authority of the clitoridectomy hadith is questioned by Islamic clerics and scholars because, as Dr. Muhammad Salim al-Awwa, Secretary General of the World Union of the Muslim Ulemas states "in Arabic language, two things or persons may be given one quality or name that belongs only to one of them for an effective cause" (Kurzman, 1998).

Cultural Psychology

The psychological and psycho-sexual function of female clitoridectomy is also debated. Scholars, clerics, and women who have been circumcised and/or castrated speak of controlling sexual desire, enhancing sexual pleasure, limiting sexual pleasure, the rite of passage from childhood to adulthood, and even making the female genitalia more beautiful. Information about the psychological impact of clitoridectomy is also split; some are devastated, some report enhanced self esteem at being beautiful within a culturally defined beauty. Some women report frigidity, some report increased sexual

pleasure. There are reports of adult women who had sexual experience prior to clitoridectomy reporting no difference in sexual pleasure (Roald, 2001). The split in psychological experience is blurred because of reporting circumcision and clitoridectomy as one category (Badawi, 1989).

Commentary

Freud considered clitoral sexuality to be an infantile mimicry of male phallic sexuality, an expression of penis envy in the service of denying a woman's biologically determined identification as a castrated being. To resolve her Oedipus Complex, the girl must identify with her mother and reject the subsequent maleness of her clitoris. This is accomplished by the psychical mechanism of decathexis or emptying of the clitoris' libidinal excitement in favor of the passive receptor of the vagina, thus fulfilling the destiny of feminine submissiveness that is determined by a woman's anatomy (Freud, 1905, 1924, 1925, 1933). Freud's theory of female sexuality might be considered clitoridectomy by decathexis, or psychical atrophy, but most clearly a function of the unconscious. If Islamic clitoridectomy represents an externalization of unconscious fantasy, this kind of externalization happened within Freud's intimate circle. Princess Marie Bonaparte, a devoted friend and student of Freud's subjected herself to a clitoral surgery to facilitate psychical decathexis and cure frigidity despite Freud's vehement objections. Bonaparte sought to do psychological research about excised women when she lived in Cairo during World War II, but was prevented from doing so by the Egyptian government (Walton, 2001).

The concept of female castration anxiety and unconscious fantasy has been a topic of psychoanalytic inquiry which began during Freud's lifetime, challenging Freud's castration complex as being strictly male (Abraham, 1920). The difference in unconscious fantasy and psychical structures regarding castration in Islamic women who have grown up with clitoridectomy in their collective cultural consciousness has not yet been explored. To do so at this time, utilizing Freudian-derived work on female castration would be imposing a Western lens on an Islamic unconscious. Clitoridectomy seems unquestionably repellent to the Western soul, and objective observations are easily swept away in passionate moralism and disgust. Vehemently supported and opposed within Muslim communities, the only seeming point of agreement about clitoridectomy is that the dilemma needs to be addressed within its own communities without Western interference or the imposition of Western sensibilities (Roald, 2001).

Psychoanalytic theory postulates that male circumcision is experienced as symbolic castration (Freud, 1909). This unconscious confusion contributes to the difficulty of defining and signifying clitoridectomy as either circumcision or castration. The Freudian unconscious would not differentiate circumcision from clitoridectomy nor differentiate prepuce from clitoris, in parallel with the confusion of Arabic definition. East and West may need to return to God's covenant with Abraham, the circumcisions of Isaac and Ishmael, and follow the journey of those two circumcised boys to modern times to open a meaningful dialogue between psychology and religion about current day clitoridectomy.

The word clitoridectomy does not appear in psychoanalytic literature and the phenomenon is thus far unsignified in a psycho-linguistic lexicon. In a Lacanian perspective, real meaning exists in the space behind the signifier and the absence of key signifier in a chain of signifiers creates a hole in the Symbolic Order leaving psychotic phenomena. The passionate madness surrounding clitoridectomy limits the dialogue between psychology and religion.

Coincidentia Oppositorum

Hillary S. Webb

God as Unity and Multiplicity

According to fifteenth century cardinal, mathematician, and mystic Nicholas Cusanus (also referred to as Nicholas of Cusa and Nicholas of Kues), the *coincidentia oppositorum* – or “coincidence of opposites” – constitutes the “least imperfect” name for God and was the means by which humanity could achieve religious toleration and, ultimately, world peace. Cusanus’ concept of the *coincidentia oppositorum* later influenced the work of a number of Western scholars, most notably Carl Jung, the founder of analytical psychology, who considered the psyche of each individual to likewise be a coincidence of opposites – a blend of conscious and unconscious elements which together constitute a harmonious and unified whole called the “Self.”

Nicholas Cusanus (1401–1464) has been called “the first modern philosopher” (Bond, 1997: 17) in part because of the era in which he lived, but perhaps more importantly because he is considered responsible for heralding a new stage in the deconstruction of language and epistemology. Unlike most of the Christian theologians of his time who held a monotheistic vision of God as a supernal power that exists independent of the physical world of existence, Cusanus stood out as a controversial figure because of his belief that God does not exist separately from Creation, but rather is both transcendent of and immanent within it – a simultaneous *unfolding* of Oneness into multiplicity and the *enfolding* of multiplicity within the One.

- ▶ [W]hen I am at the door of the coincidence of opposites, guarded by the angel stationed at the entrance of paradise, I begin to see you, O Lord. For you are there where speaking, seeing, hearing, tasting, touching, reasoning,

knowing, and understanding are the same and where seeing coincides with being seen, hearing with being heard, tasting with being tasted, touching with being touched, speaking with hearing, and creating with speaking (Cusanus, 1453/1997: 252–253).

Because God is infinite and absolute, Cusanus argued, all things in existence are aspects of God, without which God would not be adequately represented. For Cusanus, this concept had not just theological significance but social implications as well, for he believed that it was the inability to accept all forms of religious worship as a necessary reflection of God that was the cause of humanity's most devastating conflicts. He felt certain that if people were educated to the truth of this idea, humanity would recognize its ultimate unity, and there would be perpetual peace.

But, as he bemoans in *De Visione Dei* (“On the Vision of God”), “How can the intellect grasp you, who are infinity? The intellect knows that it is ignorant and that you cannot be grasped because you are infinity. For to understand infinity is to comprehend the incomprehensible” (Cusanus, 1453/1997: 258).

The “Least Imperfect” Name for God

For years, Cusanus struggled to find a way of describing his vision of God as both a unity *and* a plurality, an infinitude *and* a finitude. In what was perhaps his defining work, *De Docta Ignorantia* (“On Learned Ignorance”), Cusanus considers the difficulty of “naming” God, for – due to the limitations of reason-driven language – there is not one name that is not opposed to another. If one describes God as “this,” it implies that God is not “that.” However, since God is everything, there is nothing that God is not. For example, to call God “Absolute” implies that God is not “Not-Absolute.” Therefore, Cusanus argued, any description for God must acknowledge and reveal its own limitations, for since God is everything, there is nothing that God is not. Because of this, many of the names that Cusanus used included linguistic contradictions such as “One-and-All,” “All-in-One.”

In 1453, on his way home from Constantinople where he had gone with the hope of reuniting Eastern and Western Christendom, Cusanus claimed to have had a mystical vision in which he conceived of the “least imperfect” name for God: the *coincidentia oppositorum* or “coincidence of opposites.” The *coincidentia oppositorum* was not a description of God, Cusanus insisted, but an explanation of how God works. That is, God was not “*the*” coincidence of opposites, but rather “*a*” coincidence of opposites.

Although branded as a heretic by some of his contemporaries, Cusanus and his use of the name *coincidentia*

oppositorum as a way of describing the simultaneous plurality and unity of the Absolute had, and continues to have, a profound influence on the work of later Western thinkers. Religious historian Mircea Eliade used the term frequently in his work, citing the *coincidentia oppositorum* as being a representation of “man’s deep dissatisfaction with his actual situation, what is called the human condition” (1969: 122) and of humankind’s “nostalgia for a paradoxical state in which the contraries exist side by side without conflict” (1969: 122).

The Psyche as Coincidentia Oppositorum

Within the discipline of psychology, the *coincidentia oppositorum* found its most prominent articulation in the work of Carl Jung, the founder of analytical psychology. For Jung, the *coincidentia oppositorum* became a kind of meta-archetype to describe the workings of the human psyche, which he saw as being made up of binary oppositions such as conscious-unconscious, anima-animus, persona-shadow.

Like Cusanus, Jung devoted himself to tackling the problem of opposites. But while Cusanus focused his attention on the social and religious implications of this idea, Jung emphasized its use as a symbol for the “Self” – the core essence and totality of the psyche. The Self, Jung wrote, “can only be described in antinomian terms” (1951/1968 9ii: 63) for it is the dialectical unity of “both ego and non-ego, subjective and objective, individual and collective. It is the ‘uniting symbol’ which epitomizes the whole union of opposites” (1966 16: 265). Jung believed that all psychological imbalances (such as neurosis, addiction, and various dissociative disorders) represented a “self-division” (1917/1966 7: 20) – a state of disunity with oneself due to this war between various processes within the psyche. “The self is made manifest in the opposites and in the conflict between them; it is a *coincidentia oppositorum*” (1944/1968 12: 186), he wrote. The individual would not be whole until these opposing parts were brought into harmony within the Self. Jung believed that psychological healing could be achieved through the ego’s confrontation with and ultimate reconciliation of the “shadow” aspects of the unconscious. Only by doing so could one begin to withdraw projections and integrate the seemingly antithetical aspects of one’s personality into a single, indivisible unity or whole. He called this process “Individuation.”

More recently, the *coincidentia oppositorum* as a symbol of both spiritual and psychological transcendence has been highlighted in the work of the contemporary philosopher Ken Wilber (2001), as well as others in the field of transpersonal psychology.

Collective Unconscious

John Ryan Haule

In Jungian psychology, the totality of inherited potentials, or the full complement of archetypal patterns that are universally human. In addition to ego-consciousness, lie all the forgotten material of an individual's lifetime (called personal unconscious) as well as the vast reservoir of latent possibilities that belong to the human species (collective unconscious).

Many popular discussions of the collective unconscious give the mistaken impression that it is a sort of storehouse of images or even a memory bank for everything that has ever happened in the course of the world.

Jung insists that it is not images or memories that are inherited but rather the capacity to recognize, imagine and enact typically human patterns of thought and action. The collective unconscious is best understood as the sum of all the behavior patterns we inherit with our DNA: the capacity to learn and speak a language, for instance; the propensity to fall in love, form lasting bonds and propagate; the set of aptitudes for nurture and mothering; and so on. Thus the seemingly effortless facility that very young children show for distinguishing linguistic patterns in the conversations going on about them, as well as for assimilating a huge vocabulary and the grammar to organize it. Such inborn facilities for language illustrate several aspects of the collective unconscious: (1) an inherited capacity to recognize relevant stimuli in the environment, (2) the motor capacity to reproduce sounds and gestures in order to communicate, (3) the possibility of combining those typical acts, ideas and images in countless ways, and (4) the fact that all typically human patterns take on cultural variations, as the language capacity will become specified as the mother tongue of Japanese, Arabic or English. On the basis of the collective unconscious, we recognize typical forms of human behavior when we encounter them, intuitively know how to respond and also know how to enact them ourselves.

We not only enact the archetypal patterns of the collective unconscious, we also use them – or, more accurately, use the capacity to recognize and to imagine such patterns – consciously or unconsciously to reflect upon our lives. The evidence for such acts of imagination and their effects upon us when we encounter them are to be found in, among other things, literature, philosophy, theology and dreams. Some dreams seem to be nothing more than variant retellings of the events of the previous day and can be understood without reference to the collective unconscious. Others that refer to crises, challenges and life-transitions, however, may be expressed in imagery that seems archaic, numinous, uncanny and impersonal. These are images and themes in which the typically human patterns of the collective unconscious (archetypes) emerge relatively free of personal associations and take on mythic significance.

All of evolution is implicitly present in the collective unconscious. For it not only gives human beings a common foundation that accounts for the survival of our species and forms the basis by which we naturally understand and relate to one another; but it also connects us with our primate cousins, who are also highly social beings who groom one another to form friendships and also cultivate “political” alliances for personal and communal advancement. Indeed, since the collective unconscious represents the sum of our inherited capacities, it

links us to every DNA-bearing creature on earth. Jung imagined peeling the unconscious like an onion until he arrived at the psyche of an amoeba upon reaching the center.

The narratives of myth and the constructs of theology all express, in one way or another, the fundamental realities of the collective unconscious. Indeed, because they originate in that domain of the psyche which all humans share, such doctrines and stories move us deeply and seem to be eternally true. Religious rites, ceremonies, and rituals are also expressions of the collective unconscious that automatically engage the psyches of all participants, bring them into harmony with one another, and generate altered states of consciousness within which some of the originating ideas and aspirations of the tradition can be re-experienced in the present by each individual.

Communal and Personal Identity

John Ryan Haule

Personal identity, one's own individuality, is a relatively late acquisition – both in life and in human history – and in its best sense not at all to be taken for granted. It is, in fact, an achievement, given the powerful influence of socializing

pressures promising acceptance and support at the price of conformity. Personal identity emerges from communal identity only with effort and often longs to return. Sometimes personal identity changes and grows as an individual moves from one communal identity to another.

Emergence of the Personal

Human life begins within the mother and is so thoroughly dependent upon her bodily processes that a nascent human psyche can hardly be expected to distinguish its own experiences from those governed by the bloodstream and nervous system of its fleshly environment. Total dependency continues after birth in a different form, where the life, language and customs of the family environment provide the socially interpreted world within which the infant's consciousness is fostered and shaped. The smiling, babbling, exclaiming protolanguage shared by care-giver and infant are the foundation not only for language learning but also for socio-cultural indoctrination. A child begins to discover its individuality somewhat later, as disappointments and conflicts provoke conscious awareness of oneself and the unique otherness of each human mind.

As adults, we live in an environment that is tacitly structured by socially favored ideas, images and assumptions which go largely unnoticed and uncriticized. They are implicit in the news and entertainment media, in casual conversations, notions of politeness, etc., forming a collective consciousness that is taken for granted and that shapes even one's private thoughts. At bottom, communal identity is governed by a condition of *participation mystique* that provides security and belonging. Ritual and myth enact and articulate this largely unconscious foundation of communal identity.

Rites of Passage

In “traditional societies” – a loose phrase that describes communal life as it has been practiced over the vast course of human history – communal identity is ritually and mythically differentiated into life stages separated by rites of passage related to birth, maturity, reproduction and death. For example, childhood ends with puberty rites that provide the individual with a new adult identity and role in society. The consequences of such rites shape the daily lives and experiences of every member of a community. While the newly defined adult steps directly and finally into communally established responsibilities and roles that belong to maturity, every other member of

the community must relate to the new initiate as to a full-status adult; all interactions and expectations that concern that individual will have changed.

Rites of passage change a person's social identity, but always within a larger communal identity. True individuality is perhaps only possible in a more complex social world like that of the modern West, where communal identity in the traditional sense is no longer possible and where individuals are exposed to a variety of social customs, religious traditions, and the like, thereby revealing the less-than-absolute authority of any of them. Much of the meaningfulness of human existence is lost in the disillusionment that comes with modernity, one symptom of which is the longing to return to a simpler time with clearer definitions of what is right and wrong. Hence the recent rapid growth in fundamentalist religions.

Cultural Differences

Although modernity is disruptive, it lays down a challenge as well; for in the world as it exists today, religiously defined communal identities are no longer effective for most people. Consequently, each individual must find his or her own mythic foundation in the sense of what Jung has called one's "personal myth" and Kohut has described as "the self's nuclear program." Real personal identity is not a pose like individualism and not to be found in following fads. Rather it is discovered as one's own meaningful relationship to the universally human themes of the collective unconscious.

The tension between communal and personal identity may be quite different in the East, for many studies have shown that the Western model of individuality is not shared by the East. In the West, it is commonly said that the squeaky wheel gets the grease, whereas in the East it is said that the nail that sticks up will be pounded down. Similarly, figure/ground studies of picture interpretation have shown that the central figure in a scene is not perceived in the East as standing out from and opposed to the ground as it is in the West, but rather as standing in dynamic relationship with the ground. Evidently therefore, in the East, communal identity is far more important than personal identity.

Religions of the Dispossessed

Individuals and minorities within a society that have been labeled as deviant or irrelevant have historically reacted to their exclusion from an honorable membership in their

society by reinterpreting the symptoms of their unworthiness as signs of election to subgroups that pursue ecstatic experience – often direct experience of the spirit world through possession trance. Some 90% of worldwide societies have one or more institutionally recognized form of pursuing altered states of consciousness, while 74% have possession trance religions that offer an honorable communal identity to individuals whose personal identity is viewed as inadequate by the larger community. As a consequence of such new membership, their personal identity is potentially transformed and made honorable, although it must be pointed out that, again, such an individual's communal identity is stronger than her personal identity. (Women, for reasons of gender discrimination, are more apt to become trance mediums than are men.)

Evidence shows, however, that all societies have used religious rituals to alter the consciousness of their members at least since the Upper Paleolithic and very likely much further back in human history – indeed, ritual behavior has also been documented in primates in the wild. Communal rituals draw individuals together into an emotionally satisfying group identity, and are also used to reduce suspicions and hostilities between groups that need to cooperate with one another on behalf of common goals.

Communitas

John Eric Killinger

Introduction

From the Latin, *communis* (community, fellowship, condescension, affability), various meanings of *communitas* (a term taken up under the aegis of the Roman Catholic Church traditions) include joint possession in the hands of a religious community; stock-breeding society; land subject to rights of common; the whole of the clergy and the people; common property tax in mass; sworn association; urban commune; the commonality of the inhabitants of a city having the status of a commune (especially in connection with a military expedition); the Commons (estate of the realm); and the common people. This Latin term was taken and developed by cultural anthropologist Victor Turner (1920–1983) to describe a society during a liminal period that is unstructured or rudimentarily structured with a “relatively undifferentiated comitatus, community, or even communion of equal individuals who submit together to the general authority of the ritual elders” (Turner, 1969a: 96).

The Moment and Marginality of Communitas

Communitas is a “moment” in or out of secular structure. It seems to be possessive of an effervescence, making this moment one of religious creativity. One is reminded of the troubled waters in the pool of Bethzatha in John 5:2–9 (Aland, et al. 1998: 259–260). Turner’s work with communitas often goes hand in hand with concepts of pilgrimage, although recent anthropological studies on pilgrimage such as Eade and Sallnow (1991/2000) take issue with this idea with regard to pilgrimages to Lourdes. Nevertheless, it must not be overlooked that Turner’s work has greatly influenced countless anthropologists and the deepening of psychological understanding of human beings. The acquired sacred component in liminal space proffers a suitable container for empathic holding of woundedness and the bringing of notions of the divine into shared consciousness. Even such work with psychoidal realms as that of Raff (2000) indicate the creation of communitas for those undergoing the process of individuation.

Communitas emphasizes the marginal, the alien, the alien foreignness of ourselves (Kristeva, 1989/1991). It

is the emptiness at the center that can only be identified or apprehended through its hybridization, or in-betweenness, with social structure. Communitas, like liminality and hybridity, is often subjunctive in mood; that is, it thrives in the imaginal world of possibility rather than concretized fact. As a threshold, it possesses an immediacy akin to Bergson’s *élan vital*. One moves from structure into communitas and back to structure with renewed vision. Vision quests, *rites de passage*, contemplative prayer, spiritual retreats, and fasting are all part of the anti-structure of communitas; however, their purpose is to redirect, reframe, and re-vision the structures in which we live. Communitas is therefore viewed as cyclic, placed in a dialectic with structure in such a way that the revolutionary quality of communitas is summoned and participated in, structure is re-entered, and communitas is summoned again.

Turner’s Differentiations of Communitas

Turner (1969b) differentiates three types of communitas. The first of these, existential (or spontaneous) communitas, is often approached in the form of a “happening,” or noteworthy event typically involving audience participation.

A second type of communitas Turner designates as normative. This occurs when the spontaneous or existential communitas is organized into a lasting social system. Such a system might include a religious sect, such as the Branch Davidians, Heaven’s Gate, and millenarians. As with any structuring of movements, communitas tends to lose its anti-structural quality as it grows more organized as in, for example, an institution.

The third form of communitas is ideological. This is a utopian model based on existential communitas that can be expressed as an outward form of an inward experience of a happening. This is not unlike the question of the Westminster Larger Catechism (Office of the General Assembly, 2000), “What are the parts of a sacrament?,” to which the catechumenate replies, “The parts of a sacrament are two: the one, an outward and sensible sign used according to Christ’s own appointment [the water of baptism and/or the bread and cup of the Lord’s Supper (eucharist)]; the other, an inward and spiritual grace thereby signified” (p. 223). We could then say with Turner that structure is pragmatic and this worldly, whereas communitas is speculative and generates imagery and philosophical ideas. Taken further, if psyche is image, communitas is soul-making.

Turner’s spontaneous/existential communitas is equated with the community of Martin Buber’s (1947/2002)

“essential We,” or the I-Thou relationship built up in community. Tribal rites, vision quests, or other forms of invoked communitas are not for seeking the pleasurable company of relationship. Rather, in invoking communitas one is seeking transformative experience that goes to the root or core of a person’s being in a profound and shared (even sharable) fashion. Psychoanalysis as a sort of communitas rationalizes Lacan’s (2005) recognition in 1974 of the triumph of religion as a triumph of structure over movements. It is why he retorts that psychoanalysis will be around for while longer as there always needs to be a revolutionary component.

Providing optimal occasions for communitas are life in the fringes, interstices, and margins of structural forms. Communitas can also arise from inferiority, described as coming from beneath structure. The ability to give free rein to imagination, entertain, and hold the doubts, mysteries, and uncertainties of negative capability also provides the circumstances of and for communitas. This works well for individuals, but not necessarily for groups that consider themselves in situations of communitas.

Communitas occasionally is associated with visions or theories of world catastrophe. Examples of such perceived catastrophic consequences of communitas include the People’s Temple led by Jim Jones, the frenzy of the Y2k transition, and millennialist religious cults, sects, etc. Despite the infrequency of catastrophic associations with communitas, there remains the danger of severe discipline, the circumciser’s knife (as in the establishment of a mark of the divine’s chosen in the story of Abraham’s near sacrifice of Isaac).

There is the communitas of withdrawal, of retreat. This form of communitas involves partial or total withdrawal from participation in the social structures of the world. Examples include Jesus the Nazorean, the Buddha, the Prophet Muhammad, Gandhi, Nietzsche’s Zarathustra, even the Rose-beetle man of Gerald Durrell (1956/1984). Vision quests, hermitage, and retreat are also types of the communitas of withdrawal. Curiously, such examples as these either have a connection with or are possessed by the numinous.

Communitas offers a number of benefits. Among these mentioned by Edith Turner (2004) are joy and healing, the gift of “seeing,” mutual help, the experience of religion as religion – not just Jewish, Muslim, or Christian, for instance, but *religion* – and the gift of knowledge (*gnosis* as opposed to gnosticism). Other attributes might include long term ties with others as others, a humanistic conscience that supports, uplifts, accepts, sustains, and celebrates all of humanity (not just a small portion of it), and the ideals of human rights.

Communitas becomes structural when, like grace or the bestowal of favors, it becomes routinized. Turner (1974) notes the similarity between structural communitas and Freud’s repetition compulsion. Expressions of routinized communitas include monasteries, convents, initiation camps, and communes.

Not unlike the scholastic notion of *haecceity* (Duns Scotus) or the individuation process of Jung, communitas preserves individual distinctions. Despite sharing the same cognate with *communio*, communitas is not the same as communion because there is no merging. It’s more akin to synchronicity. It is not realizable, for it is a force, a dynamic. Turner (1987) argues that communitas is not being realized because “individuals and collectives try to impose their cognitive schema on one another” (p. 84).

Communitas is finally analogous, according to Turner (1983/1987) with flow, owing this understanding to the world of positive psychologist M. Csikszentmihályi. In this understanding, action and awareness are one, and Turner observes that there is no flow when we are aware that we are engaged in the act of flowing. As long as structural rules and framing crystallize out of the flow rather than are imposed upon it from without, communitas can be observed as taking place. Communitas is then viewed as an imaginal framework, a third space container suitable for an *Einführung* (a feeling into something) of holding, viewing, and bringing of notions of the divine into shared consciousness.

A Critique of Communitas

The theory of communitas has recently been critiqued (Eade and Sallnow, 1991/2000) in its associations with the practice of pilgrimage. The criticism argues that if aligned with pilgrimage, communitas is presented as a model of determinism, and this Eade and Sallnow see as limiting the usefulness of communitas. Sallnow’s assessment is that “the most helpful, pre-analytic image to hold in mind is a tangle of contradictions, a cluster of coincident opposites” (p. 52). This would align itself with the idea of the alchemical *massa confusa* (a.k.a. *prima materia*) and the concept of synchronicity, components the importance of which Turner acknowledges throughout his work. Another problem they view is that in identifying pilgrimage as communitas, a spurious homogeneity is imposed upon pilgrimage, prejudging its complex character as a phenomenon. While not finding fault with the value of the theory of communitas per se, Eade and Sallnow opt to neglect its capacity for and maintenance of negative capability that itself seems intrinsic to

the pilgrimage experience. Instead, they replace negative capability with the power of religious hierarchies to determine the outcomes of pilgrimage. A rebuttal in the form of reminding us that this critique is simply a return to structural *communitas* is given by Edith Turner (2004).

Despite the recent critique of *communitas* with regard to pilgrimage, it should be understood that *communitas* as anti-structure really means it is an inversion of the normal. In this respect, we are open to the play and fascination of mirrors as apophatic third eyes. *Communitas* thus extends our gaze, including our backward gaze or re-gard. We are negatively defined – not contradicted – as *neti. . . neti*: neither this nor that. We are thus opened up to new experience and meaning-making such that we can work and play well with Others as we see ourselves as Others, too.

Compassion

Krystyna Sanderson

The word compassion comes from Latin *com-* (with, together) plus *pati* (to bear, suffer). Compassion can be defined as “deep feeling for and understanding of misery or suffering and the concomitant desire to promote its alleviation” (Paiano, 1999: 1–291). Another source describes compassion as “the capacity to be attracted and moved by the fragility, weakness, and suffering of another” (Downey, 1993: 102).

Compassion in the Bible

The Hebrew word for compassion, *rahamim*, refers to the womb or uterus. Just as the womb is the source of biological human life, so God’s compassion is the source of life itself. God acts as a womb, and the place of birth is the vehicle of compassion (Trible, 1978: 55). Psalm 103 names compassion as a paternal attribute of God: “As a father has compassion for his children, /so the Lord has compassion for those who fear him.” And Isaiah 46:3–4 portrays God as a mother bearing the house of Israel.

The Christian Gospel refers to the coming of Christ as an act of God’s compassion (“For God so loved the world. . .” – John 3:16). In the story of the feeding of the four thousand, Jesus says, “I have compassion on the crowd, because they have been with me now three days, and have nothing to eat; and if I send them away hungry to their homes, they will faint on the way; and some

of them have come a long way” (Mark 8:2–3). Compassion is given a high priority in the parable of the Good Samaritan: “But a Samaritan, as he journeyed, came to where he was; and when he saw him, he had compassion, and went to him and bound up his wounds, pouring on oil and wine; then he set him on his own beast and brought him to an inn, and took care of him” (Luke 10:33–34). The parable of the Prodigal Son also highlights compassion: “And he arose and came to his father. But while he was yet at a distance, his father saw him and had compassion, and ran and embraced him and kissed him” (Luke 15:20).

Compassion in Psychotherapy

Psychotherapists and psychoanalysts must first look at their own suffering before they can join their patients as fellow sufferers and participants in the individuation process. The psychotherapist has to be compassionate toward self in order to be compassionate toward the patient. One’s own suffering can help one to soothe the suffering of another.

Genuine compassion is clearly differentiated from pathological symptoms that can mimic compassion but are only disguised forms of narcissism, projective identification, inverted envy, or even masochism, sadism or apathy.

Freud

Compassion clearly plays a major role in psychotherapy and psychoanalysis, but already in 1911 Freud had identified a hazard in the natural tendency of the analyst to frame, define and resolve the issues emerging in the course of therapy. Instead, the therapist should exercise *evenly suspended attention*, not imposing his own feelings and interpretations on the proceedings. “If he follows his expectations,” Freud wrote, “he is in danger of never finding anything but what he already knows.”

Jung and Kohut

Jung’s *unprejudiced objectivity* and Heinz Kohut’s *vicarious introspection* express related concepts. Jung believed that suffering is unavoidable and that what matters is how one responds to suffering. He saw acceptance of suffering as paramount in the developmental process that he called individuation.

Rogers

Carl Rogers’ *unconditional positive regard* addresses more directly the exercise of compassion in the therapeutic context. In Rogers’ view, it is not enough for the therapist to be a nonintrusive partner to the therapy. The therapist must *care* for the client with an active, positive concern. Such active concern, Rogers believed, created the most favorable setting for the client to employ their own internal resources for personal growth.

Both in psychological and theological terms compassion gives suffering meaning and purpose and is a vital connection between personal relationships and the relationship between the individual and God.

Complex

Craig Stephenson

Etymologically, the English word “complex” derives from the Latin *complexus*, “embrace” or “sexual intercourse,” from *complecti*, “to entwine,” made up of the prefix *com*

meaning “together” + *piectere*, meaning “to braid.” In the natural and social sciences in general, the word “complex” denotes a system composed of interconnected or related parts that, coming together as a whole, manifest one or more properties not evident from the properties of the individual parts. In mathematics, a complex number consists of a real and an imaginary part, either of which can be zero. In psychology, complexes are organized groups of ideas and memories that are, for the most part, outside awareness but that carry enormous affective power when activated, their presence significantly altering the psychic system as an entwined or braided whole.

Even though Freud and Breuer use the term “complex” in their early studies of hysteria, Laplanche and Pontalis, writers of the seminal *The Language of Psychoanalysis*, attribute its theoretical importance in psychoanalysis to Jung’s studies in word association. Freud regarded Jung’s empirical investigations with complexes (measured as delayed responses to stimulus words as well as by psychogalvanic response) as an important experimental corroboration of his theoretical concept of the unconscious. But Freud increasingly shunned the term “complex” after Jung and Adler placed complexes at the center of their theories as natural phenomena. That is to say, orthodox Freudian psychoanalysis regards complexes, including Freud’s Oedipus complex, as symptoms resulting from failed acts of repression, whereas Adler’s individual psychology and Jung’s analytical psychology do not theorize complexes as synonymous with neurosis.

Adler employs the concept of a complex to account for psychological strategies such as the “will to power” and self-aggrandizement which individuals adopt often to avoid difficult feelings of inferiority. Jung characterizes conflicts between ego consciousness and other complexes as painful but not necessarily pathological: “A complex becomes pathological only when we think we have not got it” (Jung, 1942/1954: para. 179). For Jung, a feeling-toned complex is an image to which a highly charged affect is attached and which is incompatible with the habitual attitude of the ego. Often attributable to a trauma that splits off a bit of the psyche or to a moral conflict in which it appears impossible to affirm the whole of one’s being, a complex is a splinter psyche that behaves with a remarkable degree of autonomy and coherence, like an animated foreign property within the sphere of consciousness. It can override will or volition and block memory; that is to say, the individual ego is relatively powerless in a conflict with an unconscious complex. In his essay, *A Review of the Complex Theory*, Jung explicitly describes this as “a momentary and unconscious alteration of personality known as identification with the complex,” although the

opposing phrase “assimilation of the ego by the complex” could just as appropriately convey the action (Jung, 1934/1960: para. 204).

Freud extended the work of Charcot and Janet with regard to hysterical symptoms when he realized that complexes as symptom-producing ideas rooted in unconscious affects needed to be abreacted. But Jung argues that psychoanalytic theory does not adequately convey the power and the positive potential of these symptom-producing ideas. Jung portrays Freud as wanting to unmake as illusion, to reduce to a psychological formula, what Jung describes in psychological terms as a “complex” but also, at other times, as a “spirit,” “god” or “daimon.” And Jung argues that his theory contributes to and corrects psychoanalytic theory by emphasizing the inherent ambiguity of complexes which the ego experiences as negative: “Spirits are not under all circumstances dangerous and harmful. They can, when translated into ideas, also have beneficial effects. A well-known example of this transformation of a content of the collective unconscious into communicable language is the miracle of Pentecost” (Jung, 1920/1960: para. 596). Jung employs a deliberately equivocal language of psychological “complexes” that are also “spirits,” in order to honor their ontological claim as un-lived potentialities of the personality. These forcefully seek to incarnate in time and space, and kinetically push the individual psyche towards a more genuinely integral organizing or entwining of its parts, a process which he calls “individuation.”

Jung argues that the technique of personification provides a psychotherapeutic means by which the ego can free itself from the affective power of an unconscious complex. In his memoirs, as well as in his theoretical writings, he describes his experiments with the personified image of the complex. Jung observes that if, rather than simply suffering the active complex’s often difficult affect, we deliberately enter a state of reverie and permit the complex to manifest spontaneously to conscious awareness as a personified image, then we depotentiate its power over ego consciousness and makes interpretation possible:

- ▶ The essential thing is to differentiate oneself from these unconscious contents by personifying them, and at the same time to bring them into relationship with consciousness. That is the technique for stripping them of their power. It is not too difficult to personify them, as they always possess a certain degree of autonomy, a separate identity of their own. Their autonomy is a most uncomfortable thing to reconcile oneself to, and yet the very fact that the unconscious presents itself in that way gives us the best means of handling it (Jung, 1962: 187).

Hence, an important component of psychotherapy focuses upon supporting the ego of the patient within the frame of the transference-countertransference relationship to the point that it can experience the autonomy of the unconscious complex as a splinter psyche and eventually reconcile itself to the contradictions inherent in psychic reality through a personified confrontation and meeting. Jung depicts the images and affects of a complex as clustering around an archetypal core which is both ambiguous and numinous. As a result, an archetypal aspect of the experience of the Otherness of the psyche may cause the analytical container to feel tinged with numinosity. As contradictory as this may seem, in order to address contemporary mental disorders cast in the secularized language of “mind” and “complexes,” the practice of psychotherapy needs to take into account a religious function in the experience of healing.

Post-Jungian theorists detach Jung’s definition of the religious function in psychotherapy from connotations of an esoteric system of belief. At the same time, they defend it from classical Freudian interpretation that sees it as a component of transference phenomena which constitutes resistance and an obstacle to the process of healing. Jung’s concept of synchronicity provides an important framework for understanding the numinous aspect of complexes experienced within clinical settings which is otherwise professionally considered taboo, and for considering the interaction of religious and scientific imagery. This is important because there are potential risks within the transference – and for the therapy in general – when the religious dimension of psychotherapeutic practice is either not processed consciously but acted out in the transference and counter-transference, or is only interpreted reductively, that is to say, as infantile and illusory. Jung argues that psychotherapeutic healing depends on the degree to which the therapist carefully considers the implications of this religious function when the Otherness of unconscious complexes manifests in the *temenos* of the therapeutic encounter.

Extrapolating from Jung’s theorizing, James Hillman’s archetypal psychology suggests that, by taking into account the inherent multiplicity and pluralism of the psyche, Jung’s theory of complexes compensates for the dangers inherent in the oneness of modernist Western cultures and the Western practice of an ego-oriented psychology of self development. The personification of unconscious complexes provides an effective means by which one adopts the paradoxical position of, on the one hand, claiming the personified aspects as one’s own and, on the other hand, experiencing their distinctness from ego consciousness and their autonomy. Furthermore, psychological complexes

demand a dramatically engaged and lived response to the unconscious as Other, in contrast to intellectualizing and conceptualizing unconscious contents which will not be psychotherapeutically effective.

Whereas psychiatry associates personification with the irrational and pathological hallucinatory phenomena of Dissociative Identity Disorder and psychosis, Jung normalizes it as a natural psychological process through which complexes manifest. This process is comparable to what psychiatrist Laurence Kirmayer, in his review of cognitive research on dissociation (1994), designates as a component of “reverie.” Indeed, Kirmayer (1999) describes the recent psychotherapeutic work of Witztum and Goodman precisely in terms of split-off aspects of the self which are experienced as supernatural entities and spirits. Witztum and Goodman report that patients, addressing their suffering through reverie and a manipulation of symbols rather than through abreaction and reductive developmental-based work, effectively reorganize cognitive schemas, unconscious dynamics and interpersonal interactions.

Jung’s theory of complexes proposes a looser definition of personhood than Western thinking traditionally promulgates. Jung describes this theoretically in terms of “the serious doubt [which the existence of complexes throws] on the naïve assumption of the unity of consciousness” (1934/1960: 96), and also personalistically in the last words of his memoirs wherein he acknowledges “an unexpected unfamiliarity with myself” (1962: 359). When psychoanalysts such as Goldberg (1980, in Samuels, Shorter, and Plaut, 1986: 32–35) write that “a person is a collective noun,” they affirm Jung’s theory of complexes, of a multiplicity of conscious mental functioning, as well as aligning contemporary psychoanalytical theorizing with current research into the inherent dissociability of normal cognitive functioning.

Compulsion

Dianne Braden

Etymology

The noun, compulsion, generally means the state or experience of being compelled. It is the irresistible urge to act, regardless of the rationality of the motivation. In its verb form, compel expands qualitatively to include meanings such as force, drive, constrain, and sway. It comes from the Latin verb *pellere*, (past part. *pulsus*) meaning to push, drive or strike. The extended form *pelna*, comes from the Latin verb *appellare*, to drive to, address, entreat, appeal, or call. Each and all of these contribute to psychological and religious interpretations of compulsion.

Elaboration

Compulsion, referring to repeated, irrational action (distinguished from OBSESSION involving repetitive thought) is a phenomenon that by its very nature bridges more than one domain. Although this experience is neither exclusively physical, psychological nor spiritual, it manifests powerfully and problematically as all three. As a physical experience, compulsions fall under the category of addictions of all kinds. Specialists in substance abuse disorders range in focus from alcohol, drugs, food, gambling, shopping, sex, love, and relationship; and this list is not exhaustive. Caught in a compulsive cycle to re-experience the original pleasurable exposure to the substance, people become trapped in a whirlpool of cyclical agonies. In spite of negative

consequences, the compulsion to repeat a certain action dominates the will of the individual and a pattern of predictable, yet irresistible actions follow.

In the realm of psychology, Sigmund Freud's first observations about compulsion include the curious desire in the psyche to repeat experience even though the return to it could not possibly be pleasurable (Gay, 1989: 602–). Referring to this as the “repetition compulsion,” Freud noted that his earlier thinking surrounding the seeking of pleasure and the avoidance of pain could not explain a need to revisit experiences that cause suffering.

Object Relations theorists and analysts focused on the internal objects in the psyche and addressed compulsions as rooted in the inescapable desire to possess, reject, or relate to the object. Michael Balint talks about artists and performers of all kinds as ultimately serving a need to be seen by and thereby possess the object (Balint, 1959). This gives new meaning to the saying that “the show must go on.” Perhaps the need of some of the great painters, like Claude Monet, who painted more than one hundred paintings of the lilies, answered a similar call.

But it was Carl Jung who first ventured into a spiritual understanding of compulsion's dynamics, thinking first that certain compulsions bore witness to a lack of moral restraint. While early therapy met with such compulsive behaviors more confrontationally than is acceptable today, Jung touched on the necessity of the analytic relationship to challenge a moral deficit. “Unless the doctor and the patient become a problem to one another, there is no cure” (Jung, 1961: 142).

Later, and more specifically, Jung addressed the problem of alcoholism in a letter to one of the founders of Alcoholics Anonymous. He had come to see compulsive drinking as a spiritual quest of deep proportions, a destructive cycle without the possibility of cure if there is no spiritual component to the recovery (Adler and Jaffe, 1972: 623–625).

Compulsion thus spreads its wings over the physical, the psychological and now reaches into the spiritual experience of the “call.” Religious history the world over describes the individual compelled to move beyond their ordinary circumstances to take up the demands of a larger existence. St. Francis of Assisi quit the trappings of nobility and a career-driven life to minister to the poor. His devotion to the faith revealed to him in a series of visions moved him to the founding of a new religious order and later canonization. Joan of Arc would have died an obscure French peasant had she not heeded the voices of saints that came to her in a vision, “calling” her to lead her country's army to victory against the British after the Hundred Years' War. Compelled, surely beyond reason

at the time of the Inquisition, Joan held to her beliefs and was burned at the stake for following a compulsive service to a larger authority.

Compulsion presents a dilemma in terms of how to view it. For some, perhaps it is no more, nor less, for that matter, than the physical experience of addiction. Based on a compulsive need to re-experience the initial pleasure, the negative consequences are outweighed by even the hope of finding it. For others, perhaps it is a psychological coping mechanism to manage anxiety over the loss of the original object. Or at depth, compulsions herald movement toward an enlargement of the personality. And finally for others, compulsion could answer a larger call of divine proportions; a response to a certain kind of destiny that effects the larger community and culture (Braden, 2008).

Confession

Morgan Stebbins

The act of confession either begins a process of reparation or affirms the subject's relationship with the transpersonal. That is, one can confess wrongdoing or confess one's faith. In most religious traditions the former is accomplished through ritualized admission, absolution, and repair, while psychologically it begins the formation of therapeutic trust and unburdens the subject of poisonous secrets. The confession of faith can occur at moments of trial (martyrdom), or of ritual inclusion (initiation), and in the secular world can take the form of moral statements or even scientific stances which are determined

by unconscious assumption rather than a rational or integrated practice (see especially Nietzsche, 1992).

The word confess is made up of the Latin *com* (together) and *fateri* (to acknowledge), indicating that a process of change begins both *with* another person and by *admitting* that which is in error. A confession of faith can be seen as an acknowledgment of a relationship with the transpersonal. Both modes experientially parallel the psychoanalytic encounter.

In the Catholic tradition, penance is a sacrament of the New Law instituted by Christ in which forgiveness of sins committed after baptism is granted through the priest's absolution to those who with true sorrow confess their sins and promise to rectify them. The whole process of confession is referred to as a "tribunal of penance," because it is seen as a judicial process in which the penitent is at once the accuser, the person accused, and the witness while the priest pronounces judgment and sentence. The church father Origen is explicit: "[A final method of forgiveness], albeit hard and laborious [is] the remission of sins through penance, when the sinner... does not shrink from declaring his sin to a priest of the Lord and from seeking medicine, after the manner of him who say, 'I said, "To the Lord I will accuse myself of my iniquity"' " (Origen, *Homilies on Leviticus 2:4* [A.D. 248]). The Council of Trent (*Session Fourteen, Chapter 1*) quoted John 20:22–23 as the primary scriptural proof for the doctrine concerning this sacrament, but Catholics also consider Matt. 9:2–8, 1 Cor. 11:27, and Matt. 16:17–20 to be among the Scriptural bases for the sacrament (The Catholic Encyclopedia). This multilevel mediation of sin can be thought of, psychologically, as the careful exploration of the scripture, or transpersonal psychic reality, inscribed in the mind of a patient and read, through translation of the symbolic material, in to an analytic session.

Protestant sects in general disavow the necessity of an intermediary between the faithful and God so that confession is a matter of a sincere admission of wrongdoing in prayer, and the asking of forgiveness. In practice this also can occur in a communal and ritualized form during service or to another person if he or she has been wronged by the sin committed. Jung interpreted this historical move away from mediation as quite precarious, since most people did not (and do not) have the necessary strength of character and interior conceptual equipment to directly encounter and live with the transpersonal, whether characterized as an archetypal unconscious, an instinctual inclination, or a social movement such as a political ideology or a new age spiritual system. Typically a subject without firm mediation is either overwhelmed by a psychic flood or reverts to some

type of collective response but without the benefit of *knowing and choosing* the system.

Various sutras encourage the Buddhist to confess to someone who is able to receive the confession (usually a superior in the temple, or a monk). The confessor should at a minimum understand the ethical precepts and ideally should have some experience in following them. The point of confession is to *experience remorse* and to reflect on the consequences of one's actions in order to *exercise restraint* in the future. In practice this results in a sense of relief. Confession does not absolve the Buddhist from responsibility for the actions committed. The *karmic* consequences of such actions will still manifest.

The following story illustrates the relative nature of confession in Buddhism (Sāmaññaphala Sutta - DN 2, various translations, but see also Macy, 1991). The king Ajattasattu had killed his mother and father and has usurped the crown. His conscience bothered him, and so he went to confess to the Buddha. The Buddha said to the king: "Indeed, King, transgression [*accayo*] overcame you when you deprived your father, that good and just king, of his life. But since you have acknowledged the transgression and confessed it as is right, we will accept it. For he who acknowledges his transgression as such and confesses it for betterment in future, will grow in the noble discipline."

The word *accayo* means "going on, or beyond," and in the moral sphere, means acting outside the established norms – so transgression is quite a good translation. However once the king departs, the Buddha says to the monks: "The king is done for, his fate is sealed, bhikkhus. If the king had not killed his father. . . then as he sat there the pure and spotless dhamma-eye would have arisen in him" (Walsh, 1995: 91ff). So it is quite clear that there is no hope for the King regardless of how many cycles of life he uses to work off his karma. Psychologically we can understand this as the harsh but all too common experience that some people are not going to get better (whatever the definition of getting better might be), regardless of treatment or effort. There is also in this story the aspect of appropriate teaching, meaning that for each listener, the king, the monk, and the reader, there is something quite different to integrate.

In Islam, confession in the sense of declaration of faith is very central, being one of the five pillars of Islam. Distinct from this is the act of seeking forgiveness from God, called *istighfar*. Confession of sins is typically made to God and not man (except in asking for forgiveness of the victim of the sin). It is one of the essential parts of worship in Islam. This act is generally done by repeating the Arabic words *astaghfirullah*, meaning "I seek forgiveness from Allah."

Again we can see that a concept of relationship between the subject and the transpersonal is central and that the locus of authority rests in the latter. This attitude is in stark contrast with the social and economic norms for most populations at this point in history.

In Judaism, like Islam, confession is an important part of attaining forgiveness for both sins against God and another man. In addition, confession in Judaism is done communally in plural. Unlike the Christian "I have sinned," Jews confess that "We have sinned." An early form of this confession is found most directly in Daniel 9:5–19, especially verses 5, 9, 18–19, where the supplicant acknowledges himself merit-less, and asks for God's forgiveness based only on God's own merit, and that God's name should not be tarnished among the nations.

For Jung, confession was the first of four stages or levels of the analytic process. In some cases, confession is all that is needed for a complete resolution of suffering, and it would be merely a personal agenda for the psychoanalyst to push beyond that. In other words, embedded in the symbolic material is a moral imperative specific to the movement of psyche itself, and it is this that forms the psychological imperative. However, if the analyst detects that further exploration is needed according to the symbolic communication from the psyche of the patient, Jung outlines three more stages of education, elucidation, and finally transformation (Jung, 1955).

Confession appears quite universally in religious traditions (this includes tribal cultures not specifically discussed, as presented for example in the journal *Mental Health, Religion and Culture*, May, 2007), so we can safely translate it as the psyche's need to both orient itself in terms of interpersonal and social norms (because another person is necessary and often the mistreated party must be addressed as well) as well as relate to those areas of transgression against the transpersonal center of meaning. For the latter, it is seen as critical that this practice of relating happen in a dyadic manner and in a protected environment. In this way the journey of insight and integration begins.

Confucianism

Jeffrey B. Pettis

Confucius was born 552 BCE in the district of Tsau, China during the 20th year of the reign of emperor Ling. Little is known about his childhood. According to one myth, Confucius' mother Chāng-tsâi gave birth to him in a cave on a hill as instructed a revelatory dream experience. The child was born in the night protected by two dragons who kept watch on the left and the right of the hill. At the time of the birth a spring of warm water from the floor of the cave bubbled up cleansing the child, who was extraordinary in appearance. At age 19, Confucius married a woman of the Chien-kwan family from the State of Sung. They had a son, Lî (*The Carp*) shortly after. According to an inscription, Confucius had at least one other child – a daughter who died at an early age. Confucius first worked as a keeper of public grain stores and public fields. He later served as a public teacher in his early twenties, never refusing a student who desired to learn, and eventually becoming teacher to students of the wealthy caste. In 501 BCE he was appointed chief magistrate of the town of Chung-tû, and his authority in the State continued to grow. He died 479 BCE. Some time afterwards public worship of Confucius began, including sacrificial offerings throughout the empire. The primary literary sources for Confucianism include “The Five *Ching*” and “The Four *Shu*.” The five *Ching* (“textile” connoting regularity and constancy) are thought to have been used by Confucius for study. The oldest text, the *Yi*, contains a system of symbols used to determine cosmological and philosophical order in what is perceived to be chance events. The *Shih* (ca. 1000 BCE?) contains 305 poems of folk songs, festive songs, hymns and eulogies. The *Lî Chî* dates possibly to 300 BCE and contains social forms and rites of the Zhou Dynasty (1122–256 BCE). The *Shû* contains the history of past Chinese heroes and Dynasties. Of its 58 chapters 33 are thought to be

authentic, dating to the sixth century BCE. Instruction in Confucianism mostly occurred through use of “*The Four Books*,” which became the core curriculum for the civil service examination in the Ming (1368–1644 CE) and Qing (1644–1911 CE) dynasties. “*The Four Books*,” is an abbreviation for “*The Books of the Four Philosophers*.” The *Tâ Hsio*, or “*Great Learning*” is attributed to Tâ Shān, a disciple of Confucius. Containing reflections on the teachings of Confucius by some of his followers, it represents the first step for learners and aims “to illustrate illustrious virtue, to renovate the people, and rest in the highest excellence.” (1) Knowing this place of rest may enable a “calm unperturbedness” and a tranquil repose. (2) Issuing chapters expand upon the aim for virtue through the comments of Tsāng. One is to allow no self-deception (VI.1), make thoughts sincere (VI.4), and cultivate the mind, thus not being under the influence of the passions which leads to incorrect conduct (VII.1). In matters of governing, the regulation and wellbeing of the royal family has central place: “From the loving example of one family a whole State becomes loving” (IX.3). Similarly, when the sovereign shows compassion toward the young and helpless, “the people do the same” (X.1). The *Lun Yü*, or “*Digested Conversations (Confucian Analects)*” consists of the sayings of Confucius compiled some time after his death. It gives instruction and guidance on how to be the “superior” person (II.2). One who loves virtue rather than beauty, serves his parents and his prince, and speaks sincerely with his friends is one who shows learning (I.VII). He is one who in wanting to enlarge himself seeks also to enlarge others (VI.XXVIII). He requires much of himself, and little from others, and so avoids resentment (XV.XIV). As a youth one should be filial in the home and respectful towards elders outside of the home. He should be earnest and truthful, overflowing in love and “cultivating the friendship of the good” (I.VI). Of the manner of governing – a subject often addressed, the “Master” says: “When a country is well-governed, poverty and mean conditions are things to be ashamed of. When a country is ill-governed, riches and honor are things to be ashamed of” (VIII.VIII). The *Chung Lung*, or “*Doctrine of the Mean*” is attributed to K’ung Chî, the grandson of Confucius. Not unlike the *Great Learning*, the *Doctrine of the mean* has a primary focus, which is the “path” called “instruction.” It is never to be left for an instant (I.1–2). Attention to the path yields the states of equilibrium and harmony, and in its furthest reaches it contains secrets unattainable even by sages (XII.2). It is never far from a person, and the practice of reciprocity – “What you do not like when done to yourself, do not do to others” – is evidence of being near the

path (XIII.3). One who is superior embraces this course; one who is mean lives contrary to it (II.1). One who is superior “stands firm in his energy,” cultivating a friendly harmony without being weak, and standing erect in the middle, without inclining to either side (X.5). The fourth writing consists of the writings of Confucius’ successor, Mencius (372–289 BCE). The book contains dialogues between Mencius and various Chinese kings. Distinct from the concise manner of Confucius’ teachings, Mencius’ discussions are more elaborate and extended. The Four *Shuú*, along with the Five *Ching*, relate the cultivation of heightened consciousness through disciplined and considered practice of detailed and focused instruction. This orientation aims toward the experience of a tranquil, orderly state of being, one which is founded upon the implicit relationship between the individual and the collective. Self-control and socio-political regulation are essential means toward a desired harmony, and thus there occurs the emphasis upon the *praxis* of teachings and values. Confucianism in this way, at least in its beginnings, is not so much a religion as it is a teaching about how to live according to philosophical principles and reflections. As such, it sets forth initially little notion of deity worship. It is based upon life experience and observation of the natural world. In the Four Books the forcefulness of “conscious” existence appears to occur at the expense of the recognition and embrace psyche-soma movements such as *coniunctio*.

Conscience

Kate M. Loewenthal

How has conscience been seen in religious traditions? How has it been understood by psychologists? What do we

know about the psychological processes involved in the links between religion and conscience?

Religious Views of Conscience

The divine “still, small voice” (I Kings 19, 12) has often been used to depict conscience, the spiritual inner voice offering and urging the morally and spiritually correct path for the individual. Conscience in traditional Western religion is a given part of human constitution, but one that may be drowned by bad habits, temptations, poor upbringing, bad examples, and lack of moral education and direction. Conscience is sometimes depicted the “good inclination,” arguing with the “evil inclination,” both striving for the attention and obedience of their owner (Shneur Zalman of Liadi, 1796/1973). Current writings on religious education are often informed and made complex by current psychological understandings of the nature of conscience, of moral growth and of philosophical issues (e.g., Astley and Francis, 1994).

Psychological Views of Conscience

There have been important psychological contributions to the understanding of conscience. This selective overview will mention the contributions of Freud, Erikson, Frankl, Kohlberg, and Gilligan. A more detailed discussion of conscience from the perspective of the psychology of religion may be found in Meadow and Kahoe (1984).

The controversy surrounding Freud’s views have masked the force and accuracy of some of his observations. He was one of few twentieth century psychological writers to give attention to conscience, an important topic otherwise widely overlooked. Freud (1924, 1940) suggested that young children experience specifically sexual feelings towards their opposite-sex parent. The wish to possess the parent is foiled by the knowledge that the parent is already owned, and by fear that the same-sex parent will seek jealous retribution on the child. This so-called Oedipal situation is resolved by the child’s identification with the same-sex parent. This gains the approval of both parents, and enables the child to gain vicarious possession of the opposite-sex parent. Aspects of this theory remain controversial, although few would argue with young children can experience intense need for control, intense attachment to their parents, or that intense positive and negative feelings can be experienced by young children and their parents. Freud’s account of girls’ development is particularly fraught with difficulty.

The key point however is that, however identification with the same-sex parent comes about, there is an internalization of the parent-figure which becomes the foundation of the G-d image. Parental attitudes are introjected, forming the basis of the super-ego, experienced as the conscience. This may have a strongly punitive character, and a distinction is sometimes made between the harsh, introjected super-ego, and the inspiring, internalized ego-ideal.

Frankl (1975) trained in Freudian psycho-analysis but developed a very distinctive variety of psychotherapy, sometimes known as existential therapy. In Frankl's view, the over-riding motive is the will to meaning. The guide in the search for meaning and purpose is the conscience, of transcendent origin, and the therapist's role is to support the client in their search for meaning, a search which is fundamentally spiritual (Wulff, 1997).

Like Frankl, Erikson (1950) was a European-trained psychoanalyst, who moved the USA and developed very distinctive ideas about the nature of psychological health and growth. Erikson was probably the most influential twentieth-century psychologist to give attention to *virtue*. He put forward an elaborate – and plausible – account of psychosocial development as continuing throughout the life-span, with virtues resulting from the successful negotiation of the challenges at different life stages. Potential psychopathology occurs if emerging capacities are not nurtured and supported. Erikson described eight stages in all, and it is during the third stage – from approximately ages two to five – that conscience and guilt make their appearance. As the understanding and use of language develop, along with the capability of independent action, the child may experience guilt as a consequence of adult reactions to aggressive and uncontrolled actions. Guilt may become destructive, resulting in inhibition and self-righteousness, or it may impel the child towards worthy ideals, constructive initiative and purposeful action.

We have seen that both Erikson and Frankl emphasized sense of purpose and focus on ideals as important functions of the healthy conscience. Both Freud and Erikson indicated the psychopathological functioning of the conscience whose development has been instilled too coercively or punitively. Finally, we have seen that Freud and Frankl see a close relationship (or identity) between the conscience and G-d.

We turn now to developmental theories of morality, considering Kohlberg (1976) as an exemplar. Kohlberg (1975) traced the development of moral thinking from the stage at which morality is bound by utilitarian considerations (what is good for the self), and then by prescribed rules, then through stages in which social welfare

and social justice are the highest considerations, to a stage (probably not widely attained) in which an autonomous, individualized morality is concerned with universal ethical principles. In this developmental scheme, an intrinsic conscience is a feature of the stage involving autonomous morality. Kohlberg suggested that women were less likely than men to attain the higher stages of moral development, being more bound by social welfare considerations. This view attracted a strong response from Gilligan (1982), who suggested that while men are concerned with justice, which is inflexible and abstract, women's primary ethical standard is care for others, which is flexible and context-sensitive. Belenky, Clinchy, Goldberger, and Tarule (1986) emphasized the importance for women of connected knowing, which is non-evaluative, whose motive is to understand another person in order to live together in harmony in spite of differences. These and other writers have directed attention to variations in the ways in which conscience and morality are governed, indicating the importance of gender, social factors, and cognitive development.

What, empirically, is known about the relations between conscience, religion, and psychological factors?

It is generally found that religiously-identified and religiously-affiliated people behave "better" than do others. This is consistent with the possibility that religious identification and affiliation promote knowledge of moral rules and the self-monitoring of behavior in accordance with these rules. So for example, religious people are less likely than other to engage in criminal behavior (Baier and Wright, 2001), and extra-marital sexual behavior and recreational drug use (Rostosky, Wilcox, Wright, Randall, 2004; Mattila, Apostolopoulos, Sonmez, Yu, and Sasidharan, 2001). Religious people are more likely than others to engage in charitable activity (Inaba and Loewenthal, 2009), and in deliberate moral practice and moral expertise (Rossano, 2008). The effects of religion are not always straightforward, for example the effects of religion may vary with gender (Rostofsky et al.) or with style of religiosity (Batson, 1976).

The effects of religion on moral behavior are broadly consistent, and we might ask whether this is because religious people have greater knowledge of moral rules, because religious people feel greater shame at the thought of wrongdoing, or religious people feel greater guilt.

Shame is normally defined as the result of social anxiety, the experience of others' knowledge that one has done wrong and/or is bad. Guilt is individualized moral anxiety, the experience of ones own knowledge that one has done wrong and/or is bad (Freud, 1926; Meadow and Kahoe, 1984). Work on religion in relation to guilt and shame suggests that guilt may

be higher among the religiously-active, though findings are mixed (Hood, 1992). Shame is not higher among the religiously-active compared to others (Luyten, Corveleyn and Fontaine, 1998). Maltby (2005) has shown a complex pattern of relationships between different styles of religiosity, and different types of guilt, for example intrinsic (“sincere”) religiosity may be linked to healthy guilt. These findings have been produced in western, generally Christian cultures, and we know little as yet about guilt, shame and religion in other cultural and religious contexts.

This overview has suggested three broad conclusions. One is that we may distinguish between two aspects of conscience: a harsh, introjected super-ego, and an internalized, encouraging and inspiring ego-ideal. Second, empirical work broadly supports the view that religion is generally associated with “better” and more moral behavior. Third, religion may generally promote guilt but not shame. The psychological processes involved in understanding the relations between religion and conscience deserve closer study, for example effects in different cultures and religious groups, the influence of religious role models, and the development of different styles of religiosity and their relations to conscience.

Consciousness

F. X. Charet

Introduction

The term consciousness has acquired several meanings but it is generally associated with “the experience of awareness” though there is no consensus as to its cause(s) or extension. In the closing decades of the twentieth century the phenomenon of consciousness attracted a considerable amount of attention from persons working in a variety of areas but especially in the neurosciences and cognitive sciences. While various theories have since been advanced to account for the phenomenon of consciousness none have gained sufficient support to amount to more than proposals. The shared and seemingly reasonable assertion of the dependency of consciousness on

neurophysiological processes has largely held the day though even here there is a range of opinions and some concerns about the limitations of such an assumption. In view of the aforementioned, what the precise relationship is between everyday consciousness and what can broadly be termed religious or transpersonal remains unclear and offers a rich field for future exploration and research.

Historical Development

There is an earlier, cross-cultural and continuous history of reflecting on consciousness as well as various techniques and practices to bring about its alteration and extension that has been insufficiently explored and evaluated. These are largely to be found in the religious and spiritual traditions of the planet. In the modern west, the first systematic and rational examination of consciousness begins with the distinction, commonly associated with Descartes (1596–1650), between the physical and the mental. Cartesian dualism set the agenda for subsequent discussion and debate as to its legitimacy and this continues until today. Variations of mind/body dualism, psychophysical parallelism, immaterialism and materialism held sway among philosophers in Europe over the next century. An increasing inclination towards empiricism can be found in thinkers like Locke (1632–1704) who distinguished between outer sense and inner sense, the former having to do with the experience of things and the latter with the experience of the experience of things. Such ideas along with interests in making correlations between, and attempting to localize, mental processes in the brain laid the groundwork for an empirical psychology. Nevertheless, Kant (1724–1804) undercut such optimism by denying the possibility of an empirical psychology on the grounds that while the brain could be systematically studied, mental phenomena were subjective and therefore inaccessible to the scientific method. This distinction between objective and subjective is mirrored in contemporary discussions of the problematic relationship between third person (scientific) and first person (subjective) approaches to consciousness and the so-called “explanatory gap” that is a consequence (Shear, 2000; Velmans and Schneider, 2007).

Psychological Perspectives

Subsequent developments in the study of human physiology and especially the anatomy of the brain and nervous system led to an increasing emphasis on measuring and correlating physiological and mental processes, the latter increasingly perceived as being dependent on the former.

The outcome of this was the founding of a laboratory based, experimental psychology by Wilhelm Wundt (1832–1920) that William James (1842–1910) well understood but found so abhorrent. James’ own contribution was to widen the margins of an increasingly narrow physiologically based psychology to include the possibilities of a multifaceted approach to the study of consciousness, utilizing a number of methods and inclusive of transpersonal experiences as canvassed in his *The Varieties of Religious Experience* (1902). His ambitious proposal for the exploration of consciousness was not implemented after his death and with the consolidation of experimental psychology and the emergence of the behavioral school in the following decades, consciousness was effectively removed from being a plausible focus of academic attention and research (Taylor, 1996).

Largely outside of academic psychology, a number of different but related developments occurred that would have significant consequences for an understanding of consciousness and especially consciousness beyond the margins of everyday experience. This took two forms: the investigation for purposes of treatment of various mental states that were determined to be mildly to severely pathological and the investigation of exceptional mental states that appeared to be non-pathological and of a parapsychological or transpersonal nature.

The first of these is exemplified by the psychoanalytic school associated with Freud (1856–1939) that led to a psychology that interpreted abnormal mental states as indicative of psychological dysfunction and illness and extended this to religious and transpersonal experiences. For the most part, Freud understood consciousness as biologically determined and the consequence of sense perception even if it functioned to mediate between the outer and inner world, the latter being largely unconscious and of a psychosexual nature. Any claims that attempted to legitimize religious belief or a more expansive consciousness were deemed evidence of regression to an earlier psychological state and indications of neurosis or a more serious psychotic condition. Psychoanalysis effectively eclipsed most other interpretive models of the psyche and psychodynamic processes and discouraged any views of consciousness as extending beyond the perceptual reality of the ego. Like behaviorism, its own ideological limitations prescribed its views on what constituted consciousness. Remarkably, psychoanalysis, once the dominant and seemingly unassailable technique and reigning theoretical force in psychotherapy, has since suffered what appears to be an irreversible decline in the mental health professions (Paris, 2005). Its status in the current debates about the cause, nature and purpose of consciousness appears to be correspondingly peripheral.

The second approach is to be found in the investigation of exceptional mental states that were deemed to be non-pathological and was undertaken by researchers associated with the Society for Psychical Research. F. W. H. Myers (1843–1901) can be taken as the chief representative of this group. His work is rich and suggestive in offering a way to accommodate a broad range of experiences of consciousness and, not least, his notion of “subliminal self,” a larger sphere of consciousness housed in the recesses of the personality that James considered potentially revolutionary for the understanding of consciousness beyond the margins of everyday (Gauld, 1968). The investigations and theoretical proposals about the nature of consciousness coming from this group were almost completely overshadowed, if not discredited, by the rise and dominance of psychoanalysis. More recently, with the decline of psychoanalysis and the emergence of an interest in a broader view of consciousness, Myers’ work has come under detailed reexamination, providing a theoretical framework for the possibility that though consciousness is correlated with, it is not necessarily entirely dependent on, neurophysiological processes (Kelley and Kelly, 2007).

Another related perspective should also be mentioned at this point and that is the one associated with C. G. Jung (1875–1961). While initially a colleague of Freud’s, both Jung’s formation and the range of his interests and originality of his ideas place him in an independent light. In many ways, he brings together the psychodynamic approach and a vision of consciousness that extends well beyond the personal and pathological. This is embodied in his conception of the psyche as a self-regulating system consisting of consciousness, the personal and the collective unconscious, and with a drive towards greater consciousness that Jung termed “the process of individuation.” The deeper archetypal structures of the unconscious and the relationship between psyche, spirit and matter that preoccupied Jung’s latter work is rich in insights and theoretical possibilities for an understanding of religious and transpersonal experience (Main, 1997). The significance of Jung’s psychology for the understanding of consciousness has been largely ignored in academic circles and hence yet to be adequately assessed. Along with James, he is one of formative influences in the emergence of Transpersonal Psychology (Cortright, 1997; Daniels, 2005).

Current Discussions

The so-called cognitive revolution in the neurosciences in the second half of the 20th century has sparked

considerable interest in the relationship between brain function, cognitive processes and the issue of the origin, nature, and purpose of consciousness. This interest has largely occurred among neuroscientists and persons working in the areas of cognitive science and philosophy of mind. The shared perspective of most working in these areas is rooted in the assumption that a scientific approach to the study of consciousness is the one best suited to attain dependable results. A second shared assumption that is widely acknowledged is that consciousness is dependent on and the outcome of as yet understood neurophysiological processes (Velmans and Schneider, 2007).

After decades of research, speculation and discussion it appears that the phenomenon of consciousness has not yielded to the various attempts to explain its cause(s) and purpose in scientifically acceptable terms. In fact, the extensive literature on consciousness indicates that for all the effort and theory making, it now appears that an exclusively scientific approach has so far fallen short of coming to terms with the “hard problem” of accounting for phenomenal experience and bridging the now famous “explanatory gap” between first-person and third-person approaches to consciousness. In other words, the determinedly third-person scientific approach in its bid for objectivity has not come up with a satisfactory explanation for what causes the subjective first-person experience of consciousness. This quandary has occupied much recent discussion but there is still optimism that a detailed correlation of third person observation and first person experiences, utilizing the sophisticated technologies of brain imaging and other techniques, will eventually lead to more dependable data upon which a theory could be built. Not all share this view. In fact serious questions have been raised about the need to reexamine some of the assumptions that inspire such optimism, such as the exclusive dependency of consciousness on neurophysiological processes, that are implicit in what has passed as the normative scientific approach to the phenomenon of consciousness (Kelly and Kelly, 2007). Moreover, it would seem to be reasonable, given that subjective experience is essential to consciousness, to consider exploring the neglected phenomenon of the experience of first-person consciousness, a by no means easy task (Varela and Shear, 1999).

To undertake to develop a rigorous methodology of first-person empiricism presents a considerable challenge, and not least because of the claim that objectivity and the conventional scientific method are the only means of attaining any degree of certitude. Yet, arguably, without first-person input, there is the risk of accomplishing little more than measuring ever more precisely the outside of

the fishbowl of consciousness. And while arguments have been made about the limitations of introspection for the attainment of insight, it is becoming increasingly clear there are traditions of disciplined introspective analysis, developed in various cultures over the ages that have attained a remarkable degree of understanding about the geography of the inner landscape of consciousness. These mental disciplines and contemplative practices could be of considerable value in exploring and excavating the inner world of consciousness (Shear, 2006). And in the contemporary West, techniques and approaches have emerged that have contributed to the mapping of the inner realm, such as Jungian and Transpersonal Psychology, both of which offer methods of disciplined introspection and analysis, largely ignored or dismissed by current neuroscience and those working in the philosophy of mind (Cortright, 1997; Daniels, 2005). If research into these techniques is pursued, in the course of time, a sufficient amount of accumulated experience and data could make a significant contribution to understanding the phenomena of consciousness and eventually lead to the bridging of the “explanatory gap” between third and first person consciousness (Lancaster, 2004).

Yet, admirable as this proposal is, it nevertheless still confers on science a position of authority and even sovereignty over the entire field of consciousness that begs for examination. The qualifications and even reservations that are worthy of consideration have to do with the degree to which the scientific model remains implicit in the proposal of supporting first-person empirical approaches in the study of consciousness. This ignores the fact that there are other, equally valid ways of knowing (Gadamer, 1989). Moreover, undue privileging of the first-person perspective and especially assimilating it to a scientific model may, once again, end with limiting knowledge and truth to the control of the scientific method. In the case of religious or transpersonal events, this has the unfortunate consequence of reducing the spiritual and transpersonal to personal experience, uncoupled from the context of the traditions and communities that nurture such experiences. The result is to make such events vulnerable either to turning into extravagant forms of isolated beliefs and practices or being subsumed by an exclusivist scientific understanding, both to the detriment of the wider culture. The upshot of this is to require that religious and transpersonal knowledge claims be deemed valid or falsified only if they can or cannot be evaluated and replicated through various forms of strictly controlled disciplined methods of introspection (Ferrer, 2002).

If such an approach claimed the high ground, it would be a further step in the direction of what has been called

“the empiricist colonization of spirituality,” something that many transpersonal theorists have been unknowingly working towards in spite of their intent and claim to do otherwise. There are other ways to include the spiritual into a transpersonal model of consciousness, and one is to follow the tracks of the religious traditions and cultures themselves that, after all, provide the sources and context for most of the spiritual experiences people have. Instead of the experiential and empirical approaches and their limitations, perhaps a participatory perspective that is inclusive and pluralistic and is expressed in personal, interrelational, communal, and place-based ways would be more adequate (Ferrer, 2002).

To conclude, it would seem that a multifaceted approach to the study of consciousness would have the value of freeing researchers from the hegemony of scientific empiricism, as well as providing a way to steer cautiously through the channel of first-person consciousness and transpersonal experiences. After navigating these areas, a foundation could then be laid for a multidisciplinary and even transdisciplinary perspective where a disciplined pluralism would pervade and all parts of the spectrum of consciousness would be given due consideration, including perspectives from other cultures and times, religions and spiritualities.

Contemplative Prayer

Ann Moir-Bussy

Contemplative prayer, sometimes known as Centering Prayer, Meditation and Mindfulness has a long history of practice within both Western and Asian religious and metaphysical traditions. Christian, Buddhist, Taoist, Hindu, Greek, Jewish and Islamic sources all have examples of varying forms and practices of contemplation. Contemplation is the focusing of the mind on a single theme, idea, or spiritual concept. Through contemplation what is focused on gradually reveals its depth and secrets to the mind of the meditator, who gradually becomes aware of the whole of which he or she is a part. Contemplation is about silence and stillness, about receptiveness, listening and love “Be still and acknowledge that I am God” (Psalm 46:10). In the Christian tradition the early Desert Fathers referred to HESYCHIA: stillness, quiet and tranquility, the purpose being to create a solitary place where one could still the mind and focus in love on God or on God’s word within. Contemplative Prayer is seen as a relationship with God. It is an opening of one’s mind and heart to the Ultimate mystery and goes beyond thoughts and emotions. It is in this receptive silence and listening that one finds contact or relationship with the Indwelling Trinity.

Mystical Traditions

Many of the mystical traditions use meditation or contemplation to reach transpersonal states of non-duality. Benedict, in the sixth century, developed a particular way of contemplating the scriptures – *lectio divina*. Eastern Orthodox practice used the Jesus Prayer for contemplation

and this is well described in *The Way of the Pilgrim*. John of the Cross also wrote extensively about the way of contemplation leading to divine union (see Arraj, 1986). From the Christian West many mystical writers emphasize the effect of the contemplative’s encounter with God as one in which the Spirit of God becomes one with the subject. Thomas Merton could be described as perhaps the most prominent Christian contemplative of the twentieth century and he classified Christian contemplation into three types. First from the teaching of the early Greek Fathers: active contemplation, natural contemplation and mystical theology or “infused” contemplation (Rothberg, 2000). Other authors who brought renewal of contemplative practices to modern times include M. Basil Pennington and Thomas Keating (Scotton et al., 1996).

Mindfulness

Both the Buddhist and Taoist traditions speak of mindfulness – a wakeful awareness or presence to both the internal and external workings of oneself, again for the purpose of opening one to an inner consciousness. Thich Nhat Hahn, a Buddhist, sees the purpose of mindfulness as the development of what he terms “interbeing” – being in touch will all aspects of one’s relationship to others and to the universe. This includes inner and outer relationships, a connectedness, in the present moment.

Individual and Awareness

Carl Jung’s psychological teaching about the stages of life has a direct relevance to Christian prayer. Jung’s focus on the symbolic life and the need to journey inwards with focus and attention to bring what is in the unconscious into consciousness is similar to the contemplative journey, Jung’s term for the God archetype in a person was the Self and the journey to individuation was a process of integrating all aspects of one’s person and being governed by the Self. For him it was also a reciprocal relationship. Edinger (1984) comments on Jung’s notion of Christ’s incarnation being a ‘continuing’ incarnation, and that “in psychological terms, the incarnation of God means individualization” (p. 84). In other words, the incarnation takes place within each individual. This process requires awareness of the trans-personal self within one’s psyche and then living as one with the self. This transformation can be achieved through contemplative prayer, mindfulness and meditation.

Psychological Effects

Cortwright (1997) summarises research that has been done on meditation used in psychotherapy as having five possible effects: relaxation and self-regulation strategies; uncovering repressed unconscious contents; revealing higher states; reciprocal inhibition and growth of new consciousness and transformation. While the focus in Christian contemplative prayer was not on these effects but more on a deeper knowledge of God, all contemplatives from the Desert Fathers through to modern day contemplatives experienced varying phases of the above. In striving for stillness and in listening to the Word within, they encountered many aspects of themselves both frightening and repulsive (unconscious contents), both conflict and struggles; they strove for self-emptiness of a nihilation of self (in Buddhist terms), till transformation was achieved. Psychotherapy can enhance spiritual practice and conversely a spiritual practice such as contemplative prayer and mindfulness can enhance one's psychological wellbeing. From a Freudian psychological perspective, contemplation is similar to the technique of free association in that the latter leads a person to a progressively deeper understanding of what is significant and meaningful (Cortwright, 1997). It leads, as noted above, to a greater unfolding of the self, an opening of intuition and creativity.

Conversion

Benjamin Beit-Hallahmi

Conversions are dramatic turning points in life, tied to external or internal events (personality processes and traumatic events), and leading to the re-assessment of one's life, then to identity change, and then a biographical break with the past. It is higher self-esteem, or self-love, which allows us to define the new identity. During times of stress and crisis, as during times of individual distress, there is a regression to “artistic,” religious, or magical ways of thinking. When realistic coping fails, magical thinking takes over. When realistic coping seems to be failing or futile, individuals may turn to magical or religious ways of coping. When all hope is lost, these ways of coping do seem worthwhile.

Magical gestures that aim at reaching a conscious break with past and the shedding off of one's identity, include name changes, body changes, and “sex change.” These magical or symbolic gestures are not usually sufficient for a real metamorphosis in personality. A name change does not lead to personality change, and a new nose does not do it either. Even a “sex change” often fails to bring about happiness, and these intentional scripts often end in disappointment.

Testimonials of conversion tell us of a miraculous transformation, from darkness to a great light, from being lost to being found. There is a sharp contrast between earlier suffering and current improvements. The conversion narrative always includes a wide gap between the past and the present, between corruption and redemption. The power of transformation through enlightenment is proven through this gap. In many religious traditions pilgrimage, leading to conversion, is the magical route to achieving private salvation and healing.

Every religion tells us stories of miracles and transformations. For most people, they remain stories about events that happened long ago and far away. For others, they become part of their own personal history, which they are ready to share with us. These cases of rebirth should command our most serious attention, because what they represent are indeed immensely positive transformations, which are impossible under any other conditions. The lame do not start walking, and the blind do not enjoy the sweet light of day; these miracles do not often happen. But those who find themselves psychologically lame, self-destructive and desperate, sometimes emerge from darkness and belie everything that happened earlier in their lives.

In all conversion stories a past of doubt and error is transformed into a present of wholeness in one great moment of insight and certainty. This is a new birth, leading to a new life. And the new birth often follows reaching the lowest depths of despair, and consists of (in the words of William James) "... an unexpected life succeeding upon death... the deathlike terminating of certain mental processes... that run to failure, and in some individuals... eventuate in despair." And the new birth creates a wider belief in "... a world in which all is well, in spite of certain forms of death, indeed because of certain forms of death – death of hope, death of strength..." (James, 1902/1961).

Since William James, and even before, students of religion have looked closely at the phenomenon of conversion. First, because it is dramatic in the phenomenological sense. We have reports of "mystical states," visions, hallucinations, and voices. These may all be regarded as psychotic symptoms, but they are tied to even more dramatic events. The convert reports a cognitive illumination, a sudden apprehension, and a comprehension, of a divine plan for the cosmos and for individual destiny. The emotional reactions accompanying such a momentous revelation can then be easily justified and accepted. What the individual experiences is a true revolution.

The descriptions offered by James focuses on the subjective report of identity change and conscious mood change, which follows a narrative formula. It can be regarded as a literary or folklore genre, a miracle narrative so easily predictable, and so tend to doubt it. The convert's autobiography is divided into Before and After. Life until the moment of epiphany is described as wasted, a total mistake.

This formula is reminiscent of the death-rebirth idea, basic to initiation rites in tribal societies. Death and resurrection are claimed by the convert as his path to salvation, and his movement closer towards the sacred

realm. There is another level, beyond the dramatic subjective "experience": objective reports which indicate a change in behavior and functioning, a true miracle cure, putting previously uncontrollable drives under good control.

A small minority within the small minority of converts in this world (99.9% of believers follow their parents' teachings) consists of those whose conversion has been followed by dramatic changes for the better in their lives. How do we account for successful, stable, conversions, which we might think of as "overachieving." There are cases involving a real sea-change in actual behavior, as sinners become not always saints, but productive members of society, self-destructive behaviors are dropped, and a lifetime of failure and hate is changed into garden variety (or better) love and work.

In these cases the self-reported identity change is tied to a role change, a victory, maybe temporary, over pathology, subjectively viewed as a victory over destiny. Because many of the people undergoing transformation are deeply disturbed, even a temporary improvement, as it happens in many cases, is impressive.

The religious career of a seeker, or a convert, is a totally modern idea. In many cultures today, religious identity is still determined by kinship, and considered immutable, like "race". It is a matter of birth within a certain family. The idea of individual choice and voluntary change is in itself a relatively novel idea, tied to secularization and individualism.

Conversion experiences start with conversion dreams. Salvation stories appear in response to dreams of a new self, a new society, a new world. We have to approach the phenomenon of the religious imagination, and the inevitable collisions between religious fantasies and reality. The phenomenon of fantasies about self-transformation and world-transformation, which is so common among humans, plays a major role in the history of religious movements. An examination of salvation dreams should start with the individual search for security and wholeness and with the general idea of self-transformation.

Susan Sontag, in an interview on the BBC, on May 22, 2000 said that the American dream is to reinvent yourself, be born again, but this is not just an American idea, it is a universal modern dream, and possibly a universal human dream. The broadest frame of reference we can use is the common human phenomenon of attempts to escape and transcend destiny and identity. I include here any attempt to redefine biography and identity against "objective" conditions defining that identity. Such attempts at rebirth, at identity change through private salvation, may be quite common in certain historical situations.

We may speak about a private utopia, as collective utopias are less and less in vogue. Dreams and actual attempts at escape and rejuvenation should be examined on the basis of context, content, or consequences, and point to a whole range of possibilities. The fantasy of escaping one's destiny, the dream of identity change is all too human. So many people see their lives so far as a first draft. We all dream of being of becoming somebody else and something else, breaking with our destiny. This is the dream of private (and collective) salvation. More or less often we feel "I am stuck in this life situation but I should be somewhere else". Behind the explicit, outspoken fantasy of a new self or a new world lie unspoken processes, which always parallel to those on the surface.

The source of self-reported rebirth is found in internal, conscious and unconscious, conflicts. These conflicts are solved and a balance is reached through an attachment to a set of beliefs, specific ritual acts, changes in everyday behavior and functioning, and support by a group structure. The problem with psychological rebirth is its inherent instability. Real transformation is hard to come by. The illusion of rebirth may lead to good outcomes, but is often insufficient to maintain balance inside a personality system long beset by disharmonies and imbalances. This is clear when a variety of purely secular strategies, from psychotherapy to plastic surgery, are followed on the road to self-transformation.

Every successful case of individual rebirth is the result of an internal truce among opposing personality elements. One possible interpretation assumes that in conversion we see what is called a "super-ego victory". An internal conflict between the conscious ego-ideal and the unconscious, archaic, parental, introject is won by the latter. The child becomes more parental, and this often happens in post-adolescence, as the child grows older.

Another interpretation of successful conversion uses Freud's concept of moral masochism. According to classical psychoanalysis, the super-ego is formed as sadistic impulses directed at the parent are recoiled and internalized. Then the super-ego, parentally derived, commands self-effacement, if not self-sacrifice, as the punishment for aggressive fantasies. In moral masochism, the super-ego is satisfied through submission and humiliation. The outer peace and happiness observed in many converts is the result of this final peace between ego and super-ego, which releases all the energy that was put into the conflict for productive use. This may be the source of many positive, altruistic behaviors. The yearning for peace and wholeness is met by religion through the internal peace between super-ego and ego. At the conscious level this is experienced as acceptance by God or Jesus, forgiveness

and love, reported by converts ever since St. Augustine of Hippo. Freud suggested that what is achieved through super-ego victory is a reconciliation with one's father and with all paternal authorities, including father gods. We forgive our parents and are forgiven by them in turn. Of course, this happens in fantasy, and we are not talking of real fathers but imagined ones, consciously and unconsciously.

Another possible explanation is that the convert has gone through the internalizing of a loved and loving imaginary object, which then supports the whole personality system. This internalized object may serve as a new super-ego, supplying the ego with a control system, which has been missing, and making possible a real control of destructive impulses. A similar process may take place in secular psychotherapy. Early infancy splitting of the mother into good/bad object operates in converts who reach a state of complete euphoria, denying negative impulses and negative realities, which are bound to resurface nevertheless.

But at another level, a psychological analysis may direct us to noting that cases of rebirth actually represent a way of expressing hostility towards one's parents. In terms of individual and family dynamics, every identity change is a rebellion against one's parents, who usually created the earlier identity, and against one's past. When a young individual, who grew up in the average family, joins a new religion, he is declaring a revolt against his parents. He may rebel also through finding a new, better parent in his secular psychotherapist, and psychotherapists are always better parents. The message of a child's conversion is often one of denouncing parental hypocrisy and shallowness. On a collective, generational level, finding new identities is a total ideological rebellion. The new religious identities constitute in many cases a rejection of the faith of the parents, and of the parents' everyday lifestyle. At the same time, the rebellion against the parents may also mean the assumption of the parental role.

What should we make of all these different and sometimes contradictory speculations? Only the realization that in cases of true self-transcendence, something important and far-reaching must be going on beneath the surface. The process is one of accepting authority, loving authority, or internalizing a loving and supportive, (but still demanding) authority. What happens in these conversion miracles is an experience of love, both giving and receiving of love. On a conscious level, this is the unconditional (or maybe conditional) love of God, and St. Augustine has already reported on that. On an unconscious level, it is the unconditional love of a father, a mother, or a total parental image.

Conversion (Islam)

Ali Kose

Islam makes a distinction between conversion to Islam and conversion from Islam. The former is called *ihtida* or *hidayah* (divine guidance), whereas the latter is *irtidad* (apostasy) (Watt, 1980: 722). Islam introduced the concept of *din al-fitrah* (innate religion) to express that everyone is endowed at birth with a natural ability to know God. The Qur'an states that every soul before creation was asked the question by God "Am I not your Lord?" and the souls answered "Yes!" to it. Thus, Muslims consider all children as Muslims until they reach puberty. The tradition of the Prophet puts that "children are born possessing the *fitrah*, and it is their parents who turn them into Jews, Christians or Muslims" (Faruqi, 1979: 92). Therefore, by converting to Islam one turns to the religion which is already present in him by nature. It is for this reason that some converts to Islam prefer the word revert to convert (Kose, 1996: 101). In Christianity one cannot have a conversion experience unless the Will of God is involved (John 6: 44). In Islam, likewise, the act of conversion is attributed to the Will of God (Qur'an 10: 100).

How to Become a Muslim

There is no specific procedure or ritual for joining Islam. The only condition for the person who converts is to

declare, usually in presence of two witnesses, the *shahadah*: "I bear witness that there is no God but God (Allah) Himself, and I bear witness that Muhammad is His messenger." Anyone who says this credo is considered to be a Muslim. However, one is recommended to undergo the greater ablution (*ghusl*) to purify the body symbolically of the earlier ignorance or disbelief. The new Muslim is supposed to believe in such basic creeds of Islam as the accountability in the afterlife and all Prophets (Qur'an 2: 136), and also commit himself/herself to keeping the five pillars of Islam (praying, fasting, giving alms, etc) as well as abstaining from alcohol, pork, and adultery.

It is believed that one's sins, upon embracing Islam, are forgiven by Allah and having the purification of the greater ablution signifies this belief. On embracing Islam one may or may not select a Muslim name unless his present name has an un-Islamic trait. Circumcision is not obligatory upon adult (male) converts. The act of conversion to Islam should be voluntary, conscious, and out of free choice, relating to what the Prophet said: "declaration by tongue and affirmation by heart." There is nothing to prevent a person from becoming a Muslim; no conditions are imposed, none is debarred for Islam considers itself a universal religion.

A Muslim man has the right to marry a Christian or a Jewish woman (Qur'an 5: 5). A Muslim woman cannot marry a Christian or a Jewish man according to Islamic jurisprudence though there is not a Qur'anic prohibition. It is forbidden for a Muslim man or woman to marry someone who does not believe in God or an idolater or polytheist (Qur'an 2: 221).

The Propagation of Islam

Great religions of the world may be divided into missionary and non-missionary based on the definition that in missionary religions the spreading of the truth and the conversion of unbelievers is considered to be a sacred duty by their founders or scriptures. Buddhism, Christianity, and Islam may be classified as missionary while Judaism, Hinduism, and Zoroastrianism fall into the category of non-missionary (Arnold, 1913: 1).

The propagation of Islam is called *tabligh* or *dawah* (literally means call or invitation). Both words are used in various verses in the Qur'an. *Tabligh* means to make available to non-Muslims the message of Islam. The Qur'an (16: 125) commands the Muslim to enable others to share and benefit from the religious truth. The word *dawah* is used in the sense of the religious outreach or mission to exhort people to embrace Islam as the true

religion. *Dawah* also covers the mission directed at fellow believers (Denny, 1987: 244). The primary aim of *dawah*, if directed to the Muslims, is to remind them of the teachings of Islam. In the case of the non-Muslims, the objective is to enlighten them about Islam. However, Islam does not have an institutionalized form of missionary work if missionary means the deliberate activity or to send representatives to win converts. Islamic mission is regarded being a duty of every Muslim rather than being an option. Thus, Muslims are charged with the responsibility of being the model of right conduct for all mankind. The absence of clerical order imposes on every Muslim the obligation to understand the message of his/her religion and to convey by precept and example to non-Muslims who inquire about Islam (Qur'an 16: 125). It is the Muslim's responsibility to pave the way to reconcile non-Muslims to Islam. For example, The Qur'an (9: 60) demands Muslims to render the legal alms (*zakah*), levied on every Muslim who is wealthy to the people whose hearts have been recently reconciled, namely converts or potential converts, among others (Hamidullah, 1979: 155).

However, Islam has made it explicitly clear that the diversity of ideologies and creeds is natural to mankind. The Qur'an (2: 256) states clearly that there is no compulsion in religion. Many Muslims today believe that the age of proselytization is gone and Islam, being a fairly well-known faith, needs no active mission to attract converts. To them, the stability of Muslim family life, the absence of drinks, drugs, etc., and the overall discipline of Muslims, in particular those who live in the West will itself send powerful signals to non-Muslims. Studies reveal that converts to Islam enter into the fold of Islam by various means and for a variety of reasons. Some accept it after studying it for a long time, and some enter it in order to be able to marry a Muslim or after marrying a Muslim. Many converts recount that their conversion was the result of the positive example of Muslims. Thus, both intellectual and emotional motifs play a great part in conversions to Islam, especially in western context (Poston, 1992; Kose, 1996).

Cosmic Egg

David A. Leeming

Cosmic Egg in Creation

The cosmic egg motif is a major symbol in creation myths, occurring in all parts of the world.

Ancient Egyptians saw the cosmic egg as the soul of the primeval waters out of which creation arose. In one story the sun god emerged from the primeval mound, itself a version of the cosmic egg resting in the original sea.

One Chinese creation myth describes a huge primordial egg containing the primal being, the giant Pangu. The egg broke and Pangu then separated chaos into the many opposites of the *yin* and the *yang*, that is, into creation itself.

The Satapatha *Brahmana* of India contains the story of the desire of the original maternal waters' desire to reproduce. Through a series of prolonged rituals, the waters became so hot that they gave birth to a golden egg. Eventually, after about the time it takes for a woman or a cow to give birth, the creator, Prajapati, emerged from the egg and creation took place.

The Pelasgians of ancient Greece explained that it was the original being – the goddess Eurynome (a version of the Greek Gaia) – who laid the world egg and ordered the cosmic snake Ophion to encircle it until it hatched the world itself.

The later Orphic cult in Greece preached that in the beginning there was a silver cosmic egg, created by Time that hatched the androgynous being who contained the seeds of creation.

In Africa a Dogon myth says that in the beginning, a world egg divided into two birth sacs, containing sets of twins fathered by the creator god, Amma, on the maternal

egg. Some say that Amma was the cosmic egg and fertilized himself.

The Polynesian Tahitians have a myth in which the god Taaroa began existence in an egg and eventually broke out to make part of the egg the sky. Taaroa, himself, became the earth.

The practitioners of the Bon religion in Tibet sing of three cosmic eggs, which led to creation.

As an object prone to fertilization, the egg is an appropriate symbol and metaphor for the idea of potentiality. It is pre-creation chaos waiting to become cosmos. In psychological terms it is the pre-consciousness of the given culture – the collective being waiting to be made conscious of itself. To quote psychologist Marie Louise von Franz, “we can easily recognize in it the motif of preconscious totality. It is psychic wholeness conceived as the thing which came before the rise of ego consciousness, or any kind of dividing consciousness” (von Franz, 1972: 229). In short, the egg is a symbol of pre-differentiation, differentiation being the essence of the creation of anything. The egg contains within itself male and female, light and dark, all opposites in a state of union. It is perfect entropy and signals the existence of creative power from the very beginning. By extension, the cosmic egg is a symbol of the individual’s pre-conscious state before the process of individuation allows for the hatching of Self.

Creation

Rod Blackhirst

In a religious context the word “creation” refers to the cosmogonic moment or cosmogonic process or else, as a

noun, to the manifest world. In modern terminology we might speak of the former as the formation of the world or universe (usually in scientific terms from the “Big Bang” or some similar cosmic event) and the latter as the “environment.” In pre-scientific worldviews it was usual to hold that life, humankind, the Earth and the heavens were created in their original form by the action of a deity or deities, and the world at large was referred to as “the Creation,” the product of that Divine act.

The modern scientific worldview, and especially the theory of evolution, has undermined the simplest versions of these traditional beliefs, but religious people still understand the origins of the world and humanity in mythic terms, often along with rather than as antithetical to the scientific worldview. However, among some people these matters are still controversial and they insist upon a literal understanding of religious creation myths along with the outright denial of scientific theories. This view is usually styled “creationism.” Conversely, believers in the scientific accounts of the origins of man and the universe often regard these as a conclusive refutation of traditional religion and the existence of God. This controversy has been especially acute in the United States where proponents of creationism have challenged the teaching of evolution as an unquestioned truth in schools. Such proponents are usually guided by a literal reading of the account of the creation of the world in the Bible’s Book of Genesis.

Leaving aside literalist creationism, traditional religious and spiritual cultures use myths and symbols to explain the great mysteries of life. Mythic and symbolic accounts of creation abound. The creation may be a deliberate act by the gods or it may be the result of an accident or miscalculation. It may occur in stages, as in the Genesis account of creation over 6 days, or it may take place in a single act, as in the Islamic account where God (Allah) merely makes a decree (kun = the verb “to be”) and it comes to pass. The creation may stem from nothing (creatio ex nihilo) or it may be presented as order being brought to pre-existing, chaotic materials. It may be regarded as a gratuitous act by the Divine in which case the creation is said to be utterly other than the deity or it may be regarded as an act of Divine self-disclosure or self-externalization (emanationism). Very often in mythological forms found throughout the world the creation is the result of a sexual, generative act such as the copulation of a Sky-god with an Earth-mother or sometimes by an autoerotic (masturbatory) act by a single deity or else instantaneous parthenogenesis. In other cases analogies are taken from the animal realm, such as the primordial “World Egg” of the Orphic cults of ancient Greece. In some traditions a primordial god

vomits up the creation or it results from some other bodily elimination.

In more philosophical cosmogonies the root of creation might be sound or it might be light, it might be auditory or it might be visual. In the Hindu, Jain and Buddhist religions the creation extends from the sacred, primordial syllable AUM (Om) which, like a seed, contains all things within it. Similarly, in Christianity, the Gospel of John proposes that “in the beginning was the (Divine) Word.” Alternatively, in many myths, there is first darkness and the creation comes about when a light (or fire) is kindled in the darkness, the darkness is dispelled and the forms of the world appear. The idea that light is the creative stuff of the cosmos is very ancient.

There are, in any case, countless variations and often diverse accounts within the same tradition. In the ancient Egyptian tradition, for instance, there were numerous creation myths existing side by side and it would be wrong to suppose that the Egyptians favored any one more than the others; each reveal different understandings that are complementary to each other and present different aspects of a total theology. Even in the Bible’s Book of Genesis textual scholars identify two accounts of creation taken from two earlier sources. In fact, the familiar account of creation over 6 days with which the Book of Genesis begins (called the Priestly account) is the latter of the two. The older account, now embedded in the second chapter of Genesis, is the story of the creation of the garden of Eden and of Adam and Eve. Some reckon the story of the Flood as another type of creation myth taken from Mesopotamian sources now found woven into the Biblical narrative. Many creation myths have water as the creative element; life and the world emerge out of the creative waters. According to some interpretations such myths are related to human genesis from the waters of the womb. More generally, many creation myths depend upon parallels between human and cosmic birth.

Commonly, in many traditions, the deity who creates the world is presented as a lesser deity or a lesser aspect of the Supreme and transcendent deity, in which case he is usually called the “demiurge,” a divine craftsman who crafts the world from raw materials according to a celestial model. In dualistic systems this demiurge is often portrayed as evil since he brings into being the world of suffering and decay. In more positive accounts, he is said to be perfectly generous and the creation is a result of his overflowing generosity and beautiful handiwork.

In psychological terms, the point of creation represents the moment of ultimate potential and unlimited creativity. There are some modes of therapy – such as Arthur Janov’s “primal therapy” – that propose a

psychological return to the moment of birth, or even conception. In the arts, artists will often seek an experience in which they feel connected to the moment of cosmic creation. A famous instance of this can be found in Samuel Taylor Coleridge’s celebrated visionary poem Kubla Khan where the poet – under the influence of opium – is transported to a “fountain of creation” that is the source of creativity.

Criminology

Jessica Van Denend

Criminology is the state of “being” a criminal, a designation generally accompanied by social stigma. A criminal is someone who commits a crime, or in other words, breaks or fails to comply with a law or rule. Implicitly then, is the presence of a governing authority dictating law and enacting punishment for failure to adhere to it. The word crime originates from the Latin root *cernō* and Greek κρινω = “I judge.”

How social criminality relates to breaches of divine law or covenant – sin in Judaism, Christianity, Islam, or *pāpa* in Buddhism and Hinduism – has been complicated and contentious through the centuries. Roman Catholic canon, Puritan moral law, Islamic sharia, and Jewish halakah are examples of religious legal systems which claim absolute and all-encompassing jurisdiction over their adherents, and yet must still navigate with political power structures and power-sharing with people from other or no faith. One has only to look as far as contemporary politics

in the United States to see the line of demarcation between civil and moral law, debatably able to be held as an abstraction, grow complicated and even become erased in practical application as pathology, moral wrongdoing, and criminal activity become blurred: legal prohibitions against alcohol-consumption, miscegenation, and homosexuality, being some historical and not-so-historical examples. Depth psychology complicates the matter even further, undermining the simplicity of legal and moral judgments by raising the possibility of motivations and impulses for criminal activity that lie outside the conscious self. What is one's culpability or moral responsibility for actions that result from forces outside one's conscious control, outside one's, in religious terms, free will? Despite his wisdom and incredible intellect, it was not his own decision making but a bigger fate – announced through a prophecy given by the Oracle at Delphi – that eventually dictated Oedipus's path and led to his tragic crimes.

A lot of energy has been put forth in psychological studies towards a new definition of criminality that incorporates the unconscious; the criminal and his/her unconscious has become a fascinating object of study. All of these accounts must stake their place within the nexus of biological, psychological, and sociological factors. Cesare Lombroso, a fin de siècle criminologist, thought criminality could be detected as biological degeneracy, which would appear in particular physiognomic features. Others were more inclined to see criminality as housed within psychic reality. It was this view that made Wilhelm Stekel optimistic that criminality could be cured or even eradicated through psychoanalysis, stating, "Perhaps this change of the social order will go so far that in times to come criminals will be analyzed instead of being punished; thus the ideal of a world without a prison does not appear as impossible to us as it did to a former generation" (1933).

Freud gave the famous and still clinically utilized depiction of the "pale criminal," who commits crime out of an unconscious sense of guilt that expresses itself as a "need for punishment" (1916, see also Reik (1925) and Fenichel (1928)). Anna Freud discusses criminality that results from defused aggression (1972), while others (Alexander and Staub, 1956; Bromberg, 1948; Stekel and London, 1933) will talk about criminality as the opposite end on the scale as a neurosis – a too-lenient superego that cannot control criminal tendencies from the id. Melanie Klein will directly contradict this: rather than weak or non-existent, she says, the criminal's super-ego is overly strict, which causes the criminal to feel persecuted and seek to destroy others (1988/1934). Another tendency is to place criminality in an earlier, infantile stage of psychic development, whether in pre-oedipal rather than oedipal processing of guilt (Klein, 1988/1927), a pre-genital

narcissism that is guided by wants and entitlement (Murphy, 1967), or a fixation in the anal-sadistic stage (Chasseguet-Smirgel, 1978; Simmel, 1920). Others, including Simmel, Westwick, and White add an increased emphasis on the impact of physical and social environments, making room for an understanding of criminality as social protest. D. W. Winnicott links the criminal back to the deprived child, who once had and then lost something good-enough from the environment (1984, 1987). Object-relations school will look at criminality in terms of the nexus of family and social relationships (Buckley, 1985; L'Abate and Baggett, 1997). Criminal acts have been speculated to as both transitional phenomena that attempt to create communication and dependency, (Domash and Balter, 1979) and as a impasse-creating defense against emotional contact and relationship (Ferro). According to Lacan (1966) the criminal is one who mistakes the symbolic for the real. Lastly, new understandings of shame (Gilligan, 2003) and of trauma have also fed into criminological studies and a more complex understanding of how victims become victimizers; Sue Grand discusses the "catastrophic loneliness" caused by "malignant trauma" that perpetuates evil (2000). A tangential piece of these studies has been the evolving studies on the criminality of women – back in interest these days in the US due to rapidly increasing rates of female incarceration.

Analysis

These studies, while useful towards increasing understanding and implementation of the knowledge of the unconscious, are at their weakest when they profess a definitive characterization of the criminal; taken in their entirety it seems obvious that the question of what we do with the bad in ourselves and how we contain or act on urges to hurt others are as unique and individual as (and connected to) Freud's Oedipal gateway or Jung's process of individuation. What is not unique, depth psychology and religion suggest, is that they are present. The earliest founding story of the Abrahamic traditions, that of the fall from the Garden of Eden, although interpreted differently by different traditions, is based in the concept of a primal crime, inherited by all people. (Freud too, in *Totem and Taboo*, narrates a creation myth in this vein). According to most interpretations of these stories, who we are as people is born out of a criminal act, and in effect, in religious terms, our "fallenness," as well as the potential for further criminality, lies in every one of us. In the words of Ferenczi: "I must look for the cause of my own repressed criminality. To some extent I admire the man who dares

to do the things I deny to myself” (qtd. by Costello, 2002) Or Dostoevsky: “Nobody in the world can be the judge of the criminal before he has realized that he himself is as much a criminal as the one who confronts him” (1957). Or Jesus: “And why do you look at the speck in your brother’s eye, but do not perceive the plank in your own eye?” (Luke 6:41–42, NRSV).

Seeing the criminal as an object of study, then, has the potential to reify him/her as a subjective other, separate and quantitatively different from the investigator. It is important to ask what function morality is serving, who is doing the judging, and when do those human authorities benefit from remaining unquestioned or invisible or equated with the divine. Also, there is further thought to be done on the process of transformation from crime (action) to criminal (person) – when actions designated as “good” or “bad” designate people as inherently “good” or “bad.” DeGrazia writes that society has a stake in maintaining the clear split between “good” and “bad,” arguing that we need the preservation of order and of our ability to make decisions based on knowing who is bad and who is good (1952). Perhaps, yet we cannot pretend that we live in world without principalities and powers. William A. White writes that “the criminal becomes the scapegoat upon which [man] can transfer his own tendency to sinfulness and thus by punishing the criminal be deludes himself into feeling a religious righteous indignation” (1966, see also Menninger on the desire for vengeance). Neil Altman lists criminality, along with exploitation, greed, unrestrained sexual passion as displaced by white people on to persons of color.

Lastly, studies focusing solely on the individual criminal can have the unhelpful consequence of obscuring the equally if not more relevant criminality of groups, societies, and nations. Jerome Miller criticizes psychologists and other social scientists for their complacency towards an emphasis on individual pathology, being willing to provide “the labels necessary to proceed with the most punitive recommendations available” (2001). Even some laws may in fact be criminal, as advocates against segregation, apartheid, systems of colonialism would historically attest, and as opponents of, for example, the Rockefeller Drug Laws in New York State would argue today.

Religion must answer to Freud’s criticism of it as an agent of moral repression; it must decide how much of its function is indeed in reinforcing prohibitions or how much it also has a stake in providing a new space with which to evaluate the power structures, a separate authority that may trump improper usage of power and inequitable power structures. Historically, it has been the mechanism by which good and bad are kept far apart,

and inequities are maintained, as well as the voice of conscience that, for example, led a few pastors to resist Nazi power, even by becoming criminals. Perhaps there is something to be said for breaking the rules. Jung took issue with religion aligning itself too much with the “good.” Freud (1910) criticizes him for suffering from the “vice of virtue.” He writes, “One must become a bad character, disregard the rules, sacrifice oneself, betray, behave like an artist who buys paints with his wife’s household money or burns the furniture to heat the studio for his model. Without such a bit of criminality there is no real achievement.”

Crucifixion

Krystyna Sanderson

Crucifixion (from Latin *crux*, cross) is a method of execution in which the condemned is tied or nailed to a cross, pole or tree and left to hang until dead. It was employed in ancient Rome until Christianity became the state religion

in the fourth century, and has been used, less commonly, in various places around the world to the present day.

Christ's crucifixion is described in all four gospels, and is pivotal to the Christian understanding of redemption. The Apostle Paul wrote to the church in Corinth, "For I decided to know nothing among you except Jesus Christ and him crucified" (1 Cor. 2:2). In Christian faith, Christ overcame sin and death on the cross; hence the cross becomes for Christians the symbol of life and hope.

Psychologically understood, crucifixion can be seen as the acceptance of personal suffering and the consequent realization of one's own individuation, when the ego becomes a part of the self. When Jesus on the cross cries out in the words of Psalm 22, "My God, my God, why hast thou forsaken me?" he portrays, in psychological terms, a crucial phase of individuation. Jung wrote, "Since 'the soul is by nature Christian' this result is bound to come as infallibly as it did in the life of Jesus: we all have to be 'crucified with Christ,' i.e., suspended in a moral suffering equivalent to crucifixion" (Jung, 1953).

Cultural Psychology

Halina Grzymała-Moszczyńska

Cultural psychology represents a middle stage of psychological reflection between cross-cultural and indigenous psychology. All of them to various degrees take into account the fact that the cultural context in which an individual operates makes a difference for their perception of the surrounding world.

Migration and Acculturation Strategies

The cultural diversity of the world represents an obvious fact for any observer. This fact becomes even more salient

when people of different backgrounds meet through both voluntary and involuntary migration. Migration implicates acculturation changes that result from the fact that people of different cultural background come into face to face contact. These changes pertain to both groups. Different theoretical approaches stress the fact that cultural groups involved in acculturation might display different level of agency, as well as the fact that the acculturation process might be unidirectional or bidirectional (Sam, 2006; Rudmin, 2003). They are four general strategies of acculturation: *assimilation* when individuals adopt a new culture and simultaneously abandon the original cultural identity; *integration* when individuals opt for maintaining the original culture and also adopting the new culture at the same time; *separation* when individuals maintain the original culture without seeking contacts with the new culture; and *marginalization* when no contact with the original culture is maintained and when contact with the new culture is possible. No matter what acculturation strategy is selected or possible, individuals involved in the process experience both shared similarities and marked differences between themselves and others.

Reasons of Bias in Academic Psychology

In spite of this reality psychology as an academic discipline is mostly pursued from one specific perspective i.e., that of western scholars. Such a situation leads inevitably to ethnocentric attitude towards encountered diversity. The concept *ethnocentric* has been introduced by William G. Sumner in 1906 (Berry et al., 2002). It describes the tendency for using norms of one's own group as the model for perceiving other groups. The behavior of others gets evaluated and judged via one's own system of standards for what is deemed correct and proper. The assumption is supported by what is sometimes referred to as the principle of "psychic unity" of humankind i.e., the conviction that there is a central processing mechanism inherent in all human beings and therefore that perceived diversity between people is inconsequential. The central processor remains context and content independent. Such a perception of human nature is supported by the reality of who and where the majority of psychological research takes place.

A recent content analysis study of the "*Journal of Personality and Social Psychology*," has clearly pointed to the fact that 99% of the articles were written in the West, with 92% of the articles coming from the United States and Canada (Quinones-Vidal, Lopez-Garcia,

Peneranda-Ortega and Tortosa-Gil, 2004). Theories, data, and research methods are also rooted in Western tradition. One might say that research is conducted on samples drawn from a population which is nontypical for the majority of the world's population, or even more so it can be considered as anomalous because of the differences related to wealth, individualism, and secularism. Analysis of articles in leading psychological journals in the 1994–2002 period in which culture appears as one of the key-words demonstrates that in journals devoted to experimental and cognitive psychology this is the case for 1, 2% of the articles, in journals for clinical psychology 4, 3%, for developmental psychology 4, 3%, and in journals for social psychology 4, 8% (Norenzayan and Heine 2005).

Psychologists became concerned about the underestimated role of culture in their discipline in the 1960s. Concept of culture "usually refers to a particular group of people and includes their values, or guiding principles, and behaviors, or typical activities. Those values and behaviors are symbolized in the things that the group of people produces, such as art, music, food, and language. All those things are passed down from generation to generation" (Mio, Barker-Hackett and Tumambing, 2006: 6).

Approach from the Perspective of Cross-Cultural Psychology

The beginning of a new field of psychology, cross-cultural psychology, which started to take seriously the cultural diversity of humanity, can be linked to the first journals in the field: *The International Journal of Psychology* in 1966 in Paris, and *The Journal of Cross-Cultural Psychology* in 1970 in United States. The main questions raised by psychologists representing this field pertain to the problem of to what degree western psychological theories describe accurately experiences and behaviors of people who are born and raised in other cultures, and whether there are any culture-specific psychological constructs.

Cross-cultural psychology conducts research on the similarities and differences of people coming from different cultural and ethno-cultural groups. It also analyses relationships between psychological, sociocultural, and biological factors, as well as changes in these factors (Berry, Poortinga, Segall and Dasen, 2002). Research conducted from the perspective of cross-cultural psychology is comparative. It is conducted in two or more national, ethnic, or cultural groups. Differences found in these groups are explained by cultural characteristics of the groups. Cross-cultural psychology uses two kinds of

concepts: *etic* (universal) and *emic* (local). *Etic* represents concepts which are universal in all cultures (all cultures have some kind of language, art, family structure, mythology, rituals) while *emic* represents elements which are unique to a given culture. For cross – cultural psychologists culture serves as an explanatory tool for encountered differences. A major concern of cross-cultural psychology is to find research methods that allow for the “psychic unity” of humanity to be revealed in spite of cultural differences between people living in different contexts. Lots of efforts are placed in finding test materials and research tasks that can be used across cultures.

Approach from the Perspective of Cultural Psychology

Cultural psychology represents an attempt to take culture more deeply into account. In contrast to cross-cultural psychology it does not presume the premise of “psychic unity” that to some extent permeates approaches of cross-cultural psychology. According to Richard A. Shweder: “Cultural psychology is the study of the way cultural traditions and social practices regulate, express, transform, and permute the human psyche, resulting less in psychic unity for humankind than in ethnic divergences in mind, self, and emotions” (1991, p. 1). For cultural psychology humans are constructing meanings in a socio-cultural environment. This environment becomes an intentional world. Objects existing in the world are receiving meaning through human involvement with them and reactions to them by members of given culture. “Cultural psychology is a study of intentional worlds. It is a study of personal functioning in particular intentional worlds” (Shweder, 1991, p. 3) An individual can be understood correctly only in the surrounding of her environments. The role of the psychologist is to discover both the meaning which gets attributed by an individual to her environment and the influence of this environment on the individual. What cultural psychology shares with its predecessor cross-cultural psychology is the fact that the majority of the research has been conducted by western scholars, applying western-based psychological concepts and theories assuming a universal character (Gregg, 2005).

Approach from the Perspective of Indigenous Psychology

Criticism of universality in psychological theories came from psychologists from Africa, Asia, Latin America, and

the Middle East, who had been trained in the West. Upon returning to their countries of origin they faced problems and numerous difficulties when attempting to apply supposedly universal theories in their home setting. These difficulties have stimulated a desire to create more adequate means and methods based on the understanding “that each culture should be understood from its own frame of reference, including its own ecological, historical, philosophical, and religious context” (Kim, Yang and Hwang, 2006: 5). A review of various definitions of indigenous psychology points to the fact that... “the definitions all express the same basic goal of developing scientific knowledge system that effectively reflects, describes, explains, or understands the psychological and behavioral activities in their native contexts in terms of culturally relevant frame of reference and culturally derived categories and theories” (Yang, 2000: 245–246). Indigenous psychology advocates a descriptive approach according to which it is necessary to first understand how people function in their natural context. The need for such an approach comes from the fact that some of the cultural facts present in a specific cultural context cannot be understood correctly unless analyzed from the perspective of that cultural context. An example of massive decline of church attendance of Polish immigrants after their arrival to Great Britain (statistics provided by the Polish Catholic Mission in Great Britain claim that only 8% of Polish immigrants practice their religion while in Britain, with the remaining 92% loosening their ties with Catholicism) cannot be correctly understood without analyzing the cultural differences in which religious practices are taking place in Poland and in the United Kingdom. The important aspects here of being in a new cultural context are: multiculturalism and religious heterogeneity in Britain as contrasted with cultural and religious homogeneity in Poland; flexible and private patterns of religious practice amongst the native British population in contrast to the strong pressure in Poland to attend religious services because of a feeling of national identity based on religious affiliation (Poles-Catholic) and boredom and lack of understanding for Poles when experiencing English-language church services in Britain, instead of services conducted in the mother tongue in Poland. In conclusion, for both research on and psychological clinical services that address human religiosity taking place in different contexts, both cultural psychology and indigenous psychology seem to offer a much more promising ground than cross-cultural psychology.

Culture Heroes

David A. Leeming

Most cultures have culture heroes. Typically, the culture hero assists the creator by living with the newly created humans in the world and teaching them religious rules and ceremonies and ways of survival. In short, the culture hero, unlike the warrior hero or the questing hero, establishes the community's institutions and traditions; he literally establishes "culture." This is not to say that the culture hero cannot also become a warrior or a questor. The culture hero sometimes takes the side of the people

against the creator. In the interest of his people and their survival he can, for instance, steal fire, as Prometheus does from Zeus. Or he can be a trickster who sometimes introduces unpleasant aspects of human life. Coyote, in a Maidu Indian myth, brings death. In matrilineal cultures the culture hero can be female, as in the case of the sisters "Life-Bringer" and "Full Basket," who teach the Acoma Indians how to live.

Often the culture hero's powers can be attributed to divine origins. He can be conceived miraculously through divine intervention in the human world. This is the case with Jesus and the Buddha, both in a sense culture heroes, as they teach the people new ways of survival, albeit spiritual rather than material survival. Culture heroes make their societies safe by struggling against monsters and can even die for their people, sometimes transforming themselves into food that will ensure survival, as in the case of Jesus, who becomes spiritual food, or the many Native American versions of Corn Mother or Father, who become sustenance for the body.

The culture hero, then, nurtures the given culture and, metaphorically, *is* the culture, the ultimate embodiment of what the culture is. It is this fact that leads to the psychological meaning of the culture hero. The culture hero embodies the very soul of a culture. He represents much more than the Ego, the central reference point of the collective consciousness of the culture. Rather, he is the embodiment of the culture's Self, i.e., the collective totality of the culture's unconscious and conscious psyches, fighting the monsters that live within us all and establishing the balance and reason we need to survive in the world. To give an example, Carl Jung wrote of the Christ as the symbol of Self, and insofar as Jesus can be seen as a culture hero he becomes for Christians the Self, the wholeness which individuals and the culture as a whole strive to discover within. The same could be said of Muhammad for Muslims or Manabozho for several Native American groups, or the Buddha for Buddhists. Ultimately, the culture hero is who we are or who we could be. The culture hero is Self knowledge.

Cupid and Psyche

Alice Mills

Myth of Cupid and Psyche

The myth of Cupid and Psyche (Cupid is sometimes known by his Greek name, Eros, and is sometimes called Amor, meaning “love”) is a story within the longer story of Apuleius’ *The Golden Ass*. This longer story is a witty, obscene and ultimately religious tale of bodily and spiritual transformation. Within it, the story of Cupid and Psyche ends with the transformation of the human princess Psyche to goddess. Psyche was the youngest daughter of a king and queen who offended Venus, goddess of beauty and sexuality, by claiming that she is no more beautiful than their child. Venus sent her son, Cupid, to make Psyche fall in love with the worst of men, but he fell in love with her instead. Apollo’s oracle prophesied that she would marry a monster and when her parents left her on a mountain-top to meet her fate, Cupid had her brought to his palace where they lived blissfully. Psyche never saw her husband and only met him at night in bed. If she had been able to endure this condition until she gave birth to their daughter, it would have been lifted and she would have become a goddess. Psyche’s two jealous elder sisters visited her and persuaded her that she was married to a monstrous snake, which she must kill. Psyche took a lamp and knife, but when she saw the glorious god asleep in bed, she fell deeply in love with him, wounding herself on his arrow. She burned his shoulder with a drop of oil from the lamp and Cupid left, reproaching her for her disobedience. Psyche sought the aid of the gods to find her beloved Cupid, but in vain, until the angry Venus set her the task of sorting a heap of seeds, an impossible task for a human that was achieved for Psyche by some helpful ants. Then Venus ordered her to fetch some wool from her lethally aggressive golden sheep. A reed of the stream advised Psyche to wait until evening when the sheep were calm, and then she picked up the wool that the sheep had lost in the field. The next task was to bring water back from the source of the Styx, fatal river of death, and here Psyche was helped by Jupiter’s eagle. Finally Venus sent her to the underworld to bring back a box of beauty from Persephone. This time Psyche was helped by a tower which told her how to enter the underworld and leave it safely, taking coins for the ferryman and bread for the guardian dog, Cerberus, and instructed her not to aid the dead who would plead for her help from the waters

of the Styx. Following this advice, Psyche gained the box but opened it along the way and fell unconscious. She was brought back to life by Cupid and Jupiter raised her to goddess. Their child was Voluptas (“pleasure”).

Neo-Platonic Interpretation

Apuleius, who wrote this story in the second century AD, was educated in Platonic philosophy at Athens and deeply interested in the Egyptian mysteries of Isis and Osiris; the main story ends with initiation into these mysteries. Apuleius’ tale of Cupid and Psyche has long been understood as a neo-Platonic allegory of the ascent of human consciousness from earthly to divine love. In another of his works, the *Apologia*, Apuleius speaks of two Venuses, one the goddess of carnal love and the other of a higher form of love. “Psyche” is a Greek word which had by Apuleius’ time become roughly equivalent to the Christian term, “soul.” Classical representations of Psyche show her with butterfly wings, alluding to her transformation to goddess. To interpret the whole myth of Cupid and Psyche in terms of the neo-Platonist ascent of human consciousness, however, divests it of *The Golden Ass*’s sexual urgency. His Cupid is a splendidly embodied deity who bears the weapons that inflict compelling sexual desire as they wound, and there is little evidence that Psyche gains enlightenment or moves from her earlier state of sexual desire to a spiritual form of love at the end of her story. In fact she commits more than one act of disobedience to the gods and is ultimately rescued by Cupid rather than gaining him as the ultimate prize in a hero-quest.

Christian Interpretation

The neo-Platonic interpretation of Apuleius’ tale proved easy to adapt into a Christian framework where Psyche was equated with the soul. Again the tale had to be desexualised in order to fit the neo-Platonic preference for the ideal and spiritual over the material and bodily. Psyche’s malicious revenge on her sisters (whom she sends to their deaths, telling them that Cupid is in love with them) is censored from this kind of interpretation, as is the birth of Voluptas. Instead, neo-Platonic Christian interpretations focus on the ordeals and Psyche’s close encounters with death, and identify Cupid with Christ as the God of love. This process of desexualising the myth is comparable to the allegorising of the Old Testament’s equally sexual Song of Songs as a celebration of Christ’s love for the Church.

Jungian Interpretation

Apuleius' story has drawn the attention of two eminent Jungians, Marie-Louise von Franz and Erich Neumann, both of whom interpret it as depicting the development of consciousness. For Neumann, Venus is the archetypal Great Mother; Psyche must differentiate her consciousness and take responsibility for her own actions. Psyche's true act of heroism is to disobey Cupid and look at him by lamplight. Von Franz speaks of Psyche as an anima figure within a man's unconscious: in this interpretation, it is the man who must differentiate his consciousness. As Betsy Hearne points out, both of these Jungian interpretations run into trouble when Psyche achieves apotheosis, joining what for Jungians would be the collective unconscious of the Olympian pantheon. As with the neo-Platonic interpretation, there is also the issue that Psyche does not display very much wisdom along her path of ordeals. Instead, she despairs and disobeys, ultimately sending herself into a sleep of death from which the god must awaken her rather than achieving an enlightened state of consciousness.

Freudian Interpretation

Apuleius' myth is a forerunner to the fairytale, Beauty and the Beast. As a Freudian interpreter of fairytales, Bruno Bettelheim pays close attention to the sexual implications of Beauty and the Beast in his *The Uses of Enchantment*. In his reading, this fairy tale alludes to the pubescent girl's anxious fantasies of sex with a man, which she imagines as bestial. Such a reading of Cupid and Psyche would give full weight to the birth of Voluptas and also to the jealous sisters' fabrication that Psyche has inadvertently married a monstrous (phallic) snake. Bettelheim's discussion of Apuleius' myth, however, accords surprisingly well with those of the Jungians, understanding it as an allegory of the gaining of higher consciousness. Bettelheim sums up the story as dealing with "the difficulties man encounters when the highest psychic qualities (Psyche) are to be wedded to sexuality (Eros)" (Bettelheim, p. 293). This reading runs into exactly the same problems as before, that Apuleius' Psyche exhibits suicidal despair and disobedience but can hardly be seen as a model of the enlightened consciousness.

Curanderismo

Sana Loue

Origins

Curanderismo is a healing system that is prevalent throughout Latin America. Although reliance on this system of care by individuals of various Latino heritages in the United States has been documented, the prevalence of its use is unclear. This approach to healing has often been referred to somewhat disparagingly as "folk medicine" or "folk healing."

Healing activities within the tradition of curanderismo are performed by (male) *curanderos* and (female) *curanderas*; all three terms derive from the Spanish verb *curar*, meaning to heal. (The remainder of this discussion will utilize the term *curandero* to refer to both male and female healers in this tradition.) Curanderos are to be distinguished from *parteras*, women who serve as midwives, although they are most frequently not registered as such; *yerberos*, who heal exclusively through the use of herbs; *sobadores*, practitioners who devote their attention to sprains and muscle aches; and *hueseros*, or bone-setters. Individuals who practice any of these traditions are believed to be endowed with a *don*, or gift, of healing; adherents believe that the *don* is bestowed on the individual by God, while opponents of the tradition believe it is conferred by Satan.

Scholars have asserted that, as practiced by some believers, curanderismo often reflects six major influences: Judeo-Christian traditions, early Arabic medicine,

beliefs associated with European witchcraft, Native American healing practices, current beliefs relating to spiritualism, and modern medicine. The resulting system of healing is premised on religious beliefs relating to the maintenance of harmony between nature, the self, and spirit. Disease or illness is viewed as the result of a lack of harmony between the individual and his or her environment; the curandero is charged with the task of removing this imbalance and restoring harmony.

Illness Causation and Healing Practices

The lack of harmony between the individual and his or her environment may result from physical, psychological, social, and/or spiritual causes. Illnesses are recognized as originating through the action of natural agents, as is the case with tuberculosis disease, or through the action of a supernatural agent (e.g., a *bruja*, or witch), as may be the case with unemployment, marital difficulties, and alcohol dependence. Curanderos can address the presenting problems and effectuate healing using any of three levels, or avenues, of treatment: the material, or physical, level; the spiritual level; and the mental level.

Healing targeting physical illness at the material level often relies on rituals involving the use of herbs, fruits, eggs, and oils. Treatment may also include massage or prayer; a minority of curanderos will provide vitamin injections. In situations in which the illness is believed to have resulted from an imbalance of hot and cold properties, the curandero may attempt to restore balance by prescribing a treatment that will eliminate the excess or augment the deficiency. The “hot” or “cold” nature of a condition or treatment is an inherent property. Family members and individuals within the client’s social network are often enlisted to aid in the healing process.

Healing at the spiritual level requires that the curandero enter into a trance in order to establish a connection between the material and spiritual domains. The curandero essentially functions as a medium through which the spirits can work to effectuate the requested healing. The spiritual forces are able to cause, diagnose, and cure illness on the spiritual level.

Less commonly, the curandero may effectuate healing on the mental level. This requires that the curandero channel mental energy from his or her mind directly to that part of the client in need of treatment. It is believed through this focused mental energy, the curandero is able to halt the growth of the illness-affected cells in the client’s body and promote the healing process.

Common illnesses for which individuals may seek treatment from a curandero include *empacho*, a digestive blockage that is often treated with teas made from specified herbs; *bilis*, an ailment thought to be caused by excessive bile resulting from extreme anger that can be cured through the use of prescribed laxatives; and *mal ojo*, or “evil eye,” for which treatment may be effectuated through a ritual involving a raw egg.

Several illnesses for which curanderos may be consulted are clearly psychological or emotional in origin. These include *susto*, or “fright,” and *nervios*, literally translated as “nerves.” *Susto* is believed to result from a single specific incident, such as witnessing a death or accident, being involved in an accident, or being suddenly surprised or frightened. Crying, trembling, and insomnia are common symptoms, but *susto* may also present as a lack of appetite or vomiting. Prayer, herbs, and massage are thought to be beneficial.

Depending upon the particular Latino subgroup, *nervios* may refer to the disease *nervios* or to specific symptoms of an illness. Women, sensitive individuals, and older adults are believed to be particularly susceptible to the disorder. *Nervios* can be brought about by family problems, worry, stress, and anger, and may be manifested by headache, depression, yelling, worry, pacing, high blood pressure, insomnia, and loss of control. Treatment may consist of counseling, pills, prescribed teas, speaking to another person, and/or calming oneself.

Benefits

Individuals with serious medical problems are often referred by the curandero to Western medical providers. Depending upon the nature of the illness, however, patients may also consult with curanderos as well. Clients may rely on both approaches for various reasons. First, clients may be unable to afford the cost of a medical doctor and will delay or avoid such care unless the illness is perceived as a serious one necessitating such attention. Second, because curanderismo views the mind and body as inseparable, and illness is to be addressed by examining the total context in which it occurs, a curandero may focus on elements of an illness that may not be attended to by medical doctors, such as the underlying stress that is giving rise to the client’s headaches. Third, the curandero’s reliance on rituals to address the supernatural origins of a situation may help to restore the client’s hope, such as in the case of unemployment or marital disruption.

Consultation with a curandero brings other advantages as well. The attribution of the illness to an external source, whether natural or supernatural, relieves the individual of blame for his or her condition. The curandero's enlistment of the client's family and friends to assist in the implementation of the treatment helps to create a loving and supportive environment through which the client can progress towards healing. In situations in which the illness does result from the client's own actions, the curandero can invoke the aid of spiritual forces, thereby providing the client with an additional source of strength, support, and hope.

D

Daimonic

Stephen A. Diamond

The contemporary term “daimonic” (Latin spelling *daemonic*) is based on the archaic Greek word *daimon* (*di-mone*). The genesis of the daimon idea is decidedly difficult to pin down. Empedocles, the fifth-century BC pre-Socratic Greek philosopher, employed this term in describing the psyche or soul; to be even more precise, he identified daimon with self. Some classical scholars say “daimon” was used by writers such as Homer, Hesiod, and Plato as a synonym for the word *theos* or god. Still others point to a definite distinction between these terms: “daimon” referred to something indeterminate, invisible, incorporeal, amorphous and unknown, whereas “theos” was the personification of a god, such as Zeus or Apollo. The daimon was that divine, mediating spiritual power that impelled one’s actions and determined one’s destiny. It was inborn and immortal, embodying all innate talents, tendencies (both positive and negative), and natural abilities. Indeed, one’s daimon manifested as a sort of fateful “soul” which spurred one on toward good or evil. The earliest pre-Christian conception of daimons or *daimones* considered them ambiguous – rather than exclusively evil – beings, and predates even the great philosophers of ancient Greece. Minoan and Mycenaean daimons were seen as attendants or servants to deities, rather than as deities themselves, and were imagined and represented as half human/half animal figures, such as the fearsome Minotaur of Crete.

It was believed during Homer’s day (circa 800 BC) that all human ailments were brought about by daimons. But daimons could also cure, heal, and bestow the blessings of good health, happiness and harmony. Plato (428–347 BC) alluded to the daimonic realm in his writings, deeming the daimon the noblest aspect of the psyche present in everyone, and referring to the great god of love, Eros, as a powerful daimon: “All that is daemonic lies between the mortal and the immortal. Its functions are to interpret to

men communications from the gods – commandments and favours from the gods in return for men’s attentions – and to convey prayers and offerings from men to the gods. Being thus between men and gods the daemon fills up the gap and so acts as a link joining up the whole. Through it as intermediary pass all forms of divination and sorcery” (cited in Diamond, 1996: 69). According to Plato, seeking spiritual wisdom and truth honors one’s daimon, while inordinate preoccupation with worldly matters desecrates it. Perhaps the most famous example of the daimon in action is found in Plato’s story about the treasured *daimonion* of Socrates: a supposedly supernatural, metaphysical (i.e., spiritual) inner “voice” or intuitive knowing which dissuaded Socrates since childhood from making mistaken decisions but, ultimately, brought about his indictment, trial and demise for teaching students “false daimonia.”

C. G. Jung (1968) points out that “the Greek words *daimon* and *daimonion* express a determining power which comes upon man from outside, like providence, or fate, though the ethical decision is left to man” (cited in Diamond, 1996: 70). The original Greek word *daimon*, notes Jung’s disciple M. L. von Franz (1985), “comes from *daiomai*, which means ‘divide,’ ‘distribute,’ ‘allot,’ ‘assign,’ and originally referred to a momentarily perceptible divine activity, such as a startled horse, a failure in work, illness, madness, terror in certain natural spots” (cited in Diamond, 1996: 70). She points out that “in pre-Hellenic Greece the demons, as in Egypt, were part of a nameless collectivity” (cited in Diamond, 1996: 66–67). In the words of another insightful scholar, “Plutarch reveals to us the function of these *daimones*. They are the source in us of emotions good and bad” (cited in Diamond, 1996: 69). The implications of this statement for the practice of psychology and psychiatry are profound.

Daimons, Demons and Devils

Daimons, at first, were potentially both good and evil, constructive and destructive, depending in part upon how the individual would relate to them. But one of

Plato's pupils, Xenocrates, separated the gods and daimons, shifting the destructive aspects of the gods onto the daimons. Thus began the gradual degradation of the daimon into our modern misunderstanding of the demon as exclusively evil, and the ascendancy of the Judeo-Christian conception of the Devil as evil incarnate. Indeed, our modern English terms "demon" and "demonic" are derived from the Latin spelling of this classical Greek concept popularized during the Middle Ages: *daemon* and *daemonic*. During "the Hellenistic and Christian eras," surmises May (1969), "the dualistic split between the good and evil side of the daimon became more pronounced. We now have a celestial population separated into two camps – devils and angels, the former on the side of their leader, Satan, and the latter allied to God. Though such developments are never fully rationalized, there must have existed in those days the expectation that with this split it would be easier for man to face and conquer the devil" (cited in Diamond, 1996: 70–71). Around the rise of Christianity, the old daimons started to disappear, their ambiguous Janus-like nature torn asunder. "Evil" and "good" were neatly divided, and the daimons, now isolated from their positive pole, eventually took on the one-sided, negative identity of what we today refer to as "demons."

For millennia, the enigmatic concept of the daimonic lay lost in relative obscurity, recognized and valued only by a few astute artists and philosophers. But the daimonic as a vital psychodynamic model was resurrected in the twentieth century by contemporary theologians and psychologists, notably C. G. Jung, Paul Tillich, and Rollo May. Psychologist Rollo May (1969), following the lead of existential theologian Tillich, defined the *daimonic* as

- ▶ any natural function which has the power to take over the whole person. Sex and eros, anger and rage, and the craving for power are examples. The daimonic can be either creative or destructive and is normally both. When this power goes awry, and one element usurps control over the total personality, we have "daimon possession," the traditional name through history for psychosis. The daimonic is obviously not an entity but refers to a fundamental, archetypal function of human experience – an existential reality. . . . (cited in Diamond, 1996: 65).

For May, much like the earliest Greeks, Egyptians, Hebrews and Hindus, the daimonic is an essentially undifferentiated, impersonal, primal force of nature incorporating both the *diabolic* and *divine* aspects of being – without deeming them mutually exclusive.

Evil, Creativity and Spirituality

This numinous, archetypal, transcendent *coniunctio oppositorum* of the daimonic resurfaced in contemporary culture in art too, as in the case of Hermann Hesse (1965) describing the paradoxical deity Abraxas in his book *Demian*. And the intensely passionate creative and destructive drives of the daimonic on the individual can be most clearly observed in the lives and works of prodigious artists such as van Gogh, Beethoven, Picasso, Melville, Jackson Pollock, Richard Wright, and Ingmar Bergman among many others. Indeed, there has always been a direct link between creativity and the daimonic, as described by Jungian analyst M. Esther Harding (1973), who writes that

- ▶ the poets of all times have felt themselves to be filled with a divine influx. . . . For a short space of time such an individual feels himself to be made whole through submitting to possession of his being by a power greater than himself. . . . There is no doubt that life is renewed through contact with these instinctive depths, dangerous though such a contact [can be]. . . . Individuals who have had such experiences assert that they attained a sense of redemption. . . . through such a consummation of union with the daemonic force, which they conceived of as God (cited in Diamond, 1996: 136).

The archetypal notion of the daimonic, while remaining unknown to most moderns, subtly informs much of what we today refer to as "depth psychology" (see Depth Psychology). For example, C. G. Jung's Analytical Psychology is founded upon and incorporates the original ambivalent quality and possession-prone nature of the daimonic, as evidenced in his definition (1945) of *demonism*:

- ▶ Demonism (synonymous with daemonomania = possession) denotes a peculiar state of mind characterized by the fact that certain psychic contents, the so-called complexes, take over the control of the total personality in place of the ego, at least temporarily, to such a degree that the free will of the ego is suspended. . . . Demonism can also be epidemic. . . . The epidemic form includes the induced collective psychoses of a religious or political nature, such as those of the twentieth century (cited in Diamond, 1996: 97–98).

Jung's classic conception of the "shadow" is closely related to that of the daimonic in its connection to destructive possession, creativity, and spirituality. The daimonic undergirds, transcends and remains closer to Jung's earliest conception of the shadow insofar as it is a unified paradigm incorporating (but not clearly

differentiating between) the popularized Jungian doctrine of the shadow together with Eros, Thanatos, the id, libido and the archetypes of anima, animus, and the Self, while retaining “the decisive element, that is, the choice the self asserts to work for or against the integration of the self” (May cited in Diamond, 1996: 105). Like the shadow, the daimonic only becomes evil (i.e., demonic) when we begin to deem it so, and subsequently suppress, deny, drug, or otherwise strive to exclude the daimonic from consciousness. In so doing, we unwittingly participate in the *process of evil*, potentiating the violent eruptions of anger, rage, social destructiveness, and assorted psychopathologies that result from the daimonic reasserting itself, with a vengeance, in its most negative forms.

However, the daimonic, unlike the demonic, is as deeply involved in the process of creativity as evil. As May (1969) explains, “the daimonic was translated into Latin as *genii* (or *jinni*). This is a concept in Roman religion from which our word ‘genius’ comes and which originally meant a tutelary deity, an incorporeal spirit presiding over the destiny of a person, and later became a particular mental endowment or talent” (cited in Diamond, 1996: 262). When we consciously choose to constructively integrate the daimonic into our conscious personality, we participate in the metamorphic *process of creativity*. This movement toward what Aristotle termed *eudaimonism* – the capacity to live happily and harmoniously with the daimonic – is also an essential aspect of any authentic spiritual development. Spirituality, indeed, can be fundamentally defined as a capacity to love the daimonic. This *amor fati*, as philosopher Friedrich Nietzsche phrased it, is a spiritual achievement of the highest magnitude. “For God,” Diotima tells Socrates in Plato’s *Symposium*, “mingles not with man; but through a spirit [daimon] all the intercourse and converse of god with man, whether awake or asleep, is carried on. The wisdom which understands this is spiritual” (cited in Diamond, 1996: 290–291).

Dalai Lama

Paul Larson

The Dalai Lama is the most widely recognized Tibetan religious figure. The current one, born in 1935 as Tenzin Gyatso is the fourteenth in the succession of tulkus, reincarnated lamas, to hold his title. The name “Dalai” (Mongolian for “ocean”) was conferred in 1578 by Altan Khan, a Mongolian ruler who was seeking an alliance with Tibet. There had been two previous incarnations in the lineage, so the one so named (Sonam Gyatso) became known as the third Dalai Lama, and the two previous ones taking this title posthumously.

The young boy Tenzin Gyatso was recognized as the incarnation of this lineage in 1937, but as he was only 2 years old, a regent ruled in his place until 1950. Tibetans have viewed themselves as independent of China, but have had a close political relationship with China for a long time as well. In 1950 the Communist government of the People’s Republic of China asserted its claim over Tibet and enforced it with military occupation of the country. The Dalai Lama cooperated with the Chinese at first, visiting Mao Tse Tung in Beijing in 1954, but he fled to India in 1959 in the wake of an unsuccessful revolt and now resides in Daramsala. He is considered to still be the leader of the Tibetan people in exile.

Spiritually, the Dalai Lama is considered an incarnation of the Boddhisattva Avalokiteshvara (Tib. Chenrezig), the embodiment of compassion. It is this quality that has

marked his diplomatic efforts to both assert Tibet's claim of autonomy as well as find a realistic accommodation with the Chinese government. His efforts on behalf of his people as well as his leadership efforts toward inter-faith communication resulted in his being awarded the Nobel Peace Prize in 1989. The current Dalai Lama has also become involved in dialog with some of the leading neuroscientists through their shared fascination with the nature of human consciousness.

Of all of his predecessors, the other one most widely studied in the West is the fifth Dalai Lama (1617–1682), known as the “Great Fifth.” He was the first to have significant civil authority over Tibet and constructed the Potala Palace in Lhasa, which was the seat of the Dalai Lama until 1959. Under his rule, the Gelug lineage prevailed as the leading one of four major lineages.

Dance and Religion

Jennifer Amlen

Dance generally refers to human movement either used as a form of expression or presented in a spiritual, social, or performance setting. Dance is also used to describe methods of non-verbal communication as forms of body language between humans or animals. Animals use dances such as the bee dance or mating dance. Movements convey specific information.

Dancing, combined with musical accompaniment, is one of the oldest rituals in religion and circle dancing has been one of the most common ritualized dances throughout the history of time.

During the Egyptian Pre-Dynastic period (5500–3100 BC) there were depictions of female figures, probably of Goddesses or Priestesses, dancing with their arms raised above their heads. The act of dancing was an important component of celebration and ritual in Ancient Egypt. Dance was much more than just an enjoyable pastime in Ancient Egypt.

The earliest known form of dancing was done in a line or chain referred to as chain dancing. The ritual of chain dancing is believed to have first appeared over three thousand years ago, possibly in Ancient Greece. In Greek mythology the God Apollo was called the Dancer, the God

of medicine, music, and poetry. In Sparta, a province of ancient Greece, it was the common law that parents were to teach their children to dance beginning at 5 years of age. The types of dance were also used in Israelite society. This included the circular or ring dance as well as the processional dance. These dances were often used to celebrate specific events, such as David and the people of Israel dancing before the Ark of the Lord, which represented the presence of God.

It is written in Sanskrit that the Hindus believe that the whole Universe was brought into existence as the manifestation of Nataraja-the Supreme Dancer. In Hinduism, there are 23 celestial beings called Apsarases, who dance to please the gods and express the supreme truths in the magic of movement.

In the thirteenth Century, Sufism was established by Rumi, the Persian poet. Sufism was a mythological off spring from the Muslim religion. “The Whirling Dervishes” believe in performing their dhikr in the form of a dance and music ceremony. The Mevlevi were a well established Sufi Order in the Ottoman Empire, known for their dance which was performed as a form of worship. During the Ottoman period, the dance of Mevlevi Sufism spread into the Balkans, Syria, and Egypt. The Sufi dance and tradition is still being practiced in many countries.

Chain dancing was the original form of dance in pre-Christian Europe. During the early middle ages in Western Europe, Christian carols and hymns were sung and danced in “stanza.” The original meaning of “carol” is to dance. Carol is believed mean “dance circle,” and it is accompanied by singers. The definition of stanza is to halt or stop. The worshippers stood still in a circle with their attention to the center of what was being celebrated. From the 1150s to the 1350s the carol was a popular dance and song performed throughout Europe. Priests danced with the parishioners during the early medieval period. The purpose of the dance was to allow the souls to get lost in the majestic rhythms. However, by the eleventh and twelfth centuries the dance became controversial, and the hierarchy began to ban the dancing for the common people.

Over an 80-year period, from 1774 to the 1850s, the Shakers in America developed a repertoire of dances ranging from spontaneous shouting, falling, skipping and turning dances. They danced in patterns of squares, lines, and circles, performed with precise and unison hand gestures.

In 1890 the Ghost Dance was a religious movement that was incorporated into numerous Native American belief systems. The traditional ritual in the Ghost Dance was also a circle dance, in which participants

gathered without partners in a circle to dance to musical accompaniment.

Commentary

In 1916 Jung categorized dance/movement as a form of expression from the “active imagination.” Jung emphasized the importance of balance and harmony, and attested that modern humans rely too heavily on science and logic. He suggested that it was more beneficial to integrate spirituality and incorporate the unconscious realm into one’s life. Jung incorporated a variety of approaches for the use of active imagination, and this technique has expanded to include nonverbal expressions, such as dance and movement. Jungian movement therapy addresses psychosomatic disorders concerning the body-mind interrelationship and the flow of energy. The use of the Jungian technique of active imagination through authentic in-depth-movement, is a gateway for the unconscious to communicate the process and direction of one’s therapy. Active imagination is neither dreaming nor guided fantasy; rather, its purpose is to build the bridge between the passive, receptive awareness of the inner unconscious material responding to the conscious in any form. Jung understood that “wholeness” resulted from establishing a working relationship between the conscious and the unconscious levels of the psyche.

The most common type of therapy today incorporating dance is called Dance Therapy.

In dance therapy the primary belief is that the body and mind are interrelated, and the state of the body can affect the mental and emotional wellbeing both positively and negatively. Dance therapy explores the nature of all movement. Dance therapists have been able to diagnose and help solve various psychological and somatic problems through observing and altering the kinesthetic movements of a client. Gestures such as standing still, sitting down, or moving one’s hands in protest, are considered an expression of movement in dance therapy. There are several different forms used in dance therapy, including encouraging and observing one’s authentic movement in individual or group sessions. There are often various forms or gestures suggested by the therapist.

Marian Chace, who was a modern dancer in the 1930s, officially developed dance therapy. She decided to stop her professional dancing career and teach dance instead. In her classes, she noticed that some of her students were more interested in the emotions they expressed while dancing (fear, loneliness, anger, etc.) than in the mechanics of the moves they made. She began encouraging them

to express themselves by emphasizing more freedom of movement rather than technique. By the 1940s, she started the profession of Dance Therapy.

In the 1960s Mary Whitehouse developed an approach to dance therapy by combining the use of active imagination and analysis. The purpose was to acknowledge all the material that emerged from unconscious levels, and to then carefully move the patient towards greater balance, health, and creativity. In ego psychology, the “observing ego” is needed only to maintain a coherent sense of self, so that one is not overcome by overwhelming uncontrollable emotions from the unconscious. It exercises a selective function, choosing what it wants to attend to, and deciding when and in what way to act. Thus, the conscious and unconscious levels of the psyche enter an ongoing dynamic relationship with each other, in which both are essential. Gestalt therapy and bioenergetics also incorporate movement and physical expression of the non-verbal content. Lowenian- Bioenergetics is a type of therapy that combines working with the body and mind to move beyond emotional blocks, and is based on energy flows. In Fritz Perls- Gestalt Therapy, one strives to become more whole and creatively alive, to be free from the blocks and unresolved issues that diminish fulfillment and growth. Both these types of therapy incorporate the body, mind and energy that one is experiencing in the present moment, just as any form of rigorous dance does.

Dark Mother

Kathryn Madden

The primordial Dark Mother and her values of transformation have existed in the human psyche since ancient times. Her image is specifically apparent in the Black Madonna, Mary Magdalene, Hecate, Demeter, and numerous other female divinities of the earth.

The Dark Mother, as a figure of mythology, is created at the collective archetypal layer of the psyche. Her image appears in all cultures: African, Hindu, Christian, Egyptian, Greek, Roman, and countless other cultural and religious sources. In 15,000 BCE, Africans sketched fifteen figures of the dark mother in red ochre on the walls of the *Grotto dei Genovesi* in the Egadi islands south of Palermo, Italy. The images existed fifteen millennia before the common era (Birnbaum, 1993: 26–28).

Black Mother: Ibla Nera

The characteristics of *Ibla nera* or black Ibla, a contraction of the name of the Anatolian (ultimately African) goddess Cybele brought to Sicily by traders from west Asia, were transferred, in the Christian epoch to the Black Madonna. These images are speculated to have been found in this cave dwelling 100,000 years ago when *Homo sapiens* migrated out of Africa. Archeologist Marija Gimbutas gathered the evidence of the civilization of the goddess in Old Europe (Gimbutas 1982, 1989, 1991).

Figures of the Dark Mother found in France, Italy, Switzerland, Austria, Germany, and Eastern Europe, dated

25,000 BCE were located along paths of paleolithic migrations out of Africa and are located near post-Christian sanctuaries of Black Madonnas (Cavalli-Sforza, 1994, 1995). The origin of her veneration can be traced to the Sinai where Africans created the oldest religious sanctuary in the world in 40,000 BCE at Har Karkom, later called Mount Sinai (Birnbaum, 2001). Sanctuaries of *Ibla nera* have been found in Sicily as well as in the later rituals of sibyls and priests of the Dark Mother who reflect the impact of violent Indo-European invasions (Gimbutas, 1991, Chapter 10).

Archaeological artifacts and sanctuaries of the Dark Mother found in Italy, Spain, France, Switzerland, Germany, Czechoslovakia, Poland, and Russia, were evidence of cultures of women, peasants, and others who were negated by the dominant patriarchy as “dark.” Historically, these cultural regions retain evidence of religious heresy and were sites of uprisings for justice and equality in which women were persecuted as witches. The cultural folk wisdom about justice found its roots in the collectively-inherited ethic of justice in the African culture of Isis who was venerated throughout the known world in the first centuries of the common era.

During the time of the Spanish Inquisition and Counter Reformation (fifteenth–eighteenth centuries) power was consolidated by persecuting “dark” others: Jews, Moors, heretics, and women. Catholic and Protestant clergy continued to identify certain women with the devil. The *Malleus Maleficarum*, the handbook of the Inquisition, was used as a reference to put women to the stake who differed from the *status quo* of church, civil law, and societal custom.

Compensatory Rituals

In an atmosphere that persecuted and repressed the earthy, fecund, and sexual nature of women, various rituals and festivals arose to compensate for the one-sidedness of the dominant culture. The values of the Dark Mother – justice and equality – were kept alive by godmothers whose rituals resisted patriarchy. Celebratory experiences such as *Carnavale* evoked spontaneous eruptions from the unconscious of the common peoples, enabling European peasants overtly to express feelings of defiance towards church and state.

During the fifteenth–eighteenth centuries, the church persisted in associating the color white with purity and the color black with evil and the devil. In contrast, the rituals of the common people interpreted the color

black as good (Guastella, 1887: 68ff). In most Old European traditions, black was associated with fertility and the womb of life (Gimbutas, 1989: xix–xx, 198). Dreams, the messages of the unconscious, so threatening to the Church and doctrinal codification, were believed to reveal divine messages. In dreams that came to the fore during *Carnavale*, a black egg signified fecundity; a dream of a white egg represented loss, sadness and tears. In general, the color black in dreams was considered a good omen.

Numerous rituals continued throughout the early centuries representing memories, feelings, and images held deep in the unconscious heart of the culture. Regular pilgrimages were made to the Dark Mother, most typically represented by the Black Madonna. During these pilgrimages, the participants wore masks. A group of women covered with black silk capes, their faces hidden except for one eye, would sing and dance while carrying torches, representing the act of Demeter searching for her daughter. As the journey toward the edge of town continued, revelry ensued that lasted throughout the night. The procession of pilgrims would reach the statue of the Dark Madonna at dawn. There, they would behold an image of the great mother Cybele which was sculpted into the mountain (Guastella, 1887: 125).

Psychological Aspects

The chthonic aspects of the Dark Mother and the other feminine figures can be explored psychologically and symbolically from the perspective of the archetype of the Great Mother as described by twentieth century Jungian analysts Carl Jung and Erich Neumann. Drawing from primordial and collective origins, the dark and the chthonic – chthonic pertaining to dark, primitive, mysterious and primal instincts that come to us directly through nature – balance the viewpoint of human consciousness that respects only the light and spiritual aspects of an archetype.

As an archetype, the Dark Mother represents life, death, earth and sexuality, and deep transformational energy. She has been associated with nurturing, birthing, caring for children, the sick, the elderly, and the dying. The Dark Mother is often represented in myth as the Queen of the Underworld or one who travels to the Underworld. The Underworld does not necessarily represent Hell but more a place where souls reside between lives; thus, a space, or interval of liminality.

One figure who is typically associated only with the light and spiritual aspects of the archetype is Mary the

mother of Jesus. Mary, however, is a paradox. If her unconscious values are truly explored, she creates a powerful dynamic by incorporating body as well as spirit, power and vulnerability, the value of death, as well as life and rebirth.

The official presentation of Mary has been as an object of veneration emphasizing qualities of an over-spiritualized, submissive model of a woman ignoring the normal desires and aspirations of flesh-and-blood women. Throughout the centuries, the sketchiness of Mary's scriptural features has been filled in with cultural content that has emphasized such opposite qualities as stature and humility; courtly elegance in contrast to her solidarity with the poor. Yet, as an historical and symbolic figure, her maternity is central.

Jung called Pius XII's proclamation of the dogma of the Assumption on 1 November 1950 "the most important religious development for 400 years" (Jung, 1973: 567). The importance of the proclamation was that it gave expression to what he called "a spiritual fact which can be formulated as integration of the female principle into the Christian conception of the Godhead" (Jung, 1973: 8). The proclamation represented official ecclesial sanction for an idea that had been rooted in popular piety, as witnessed in the veneration of the Dark Mother, for many centuries. The Assumption signified the living archetype forcing its way into consciousness. Jung concluded that "the symbol in the Catholic Church is alive and is nourished by the popular psyche and actually urged on by it. But in Protestantism it is dead" (Jung, 1976: 8).

Jung earlier had criticized the one-sided masculinity of the Trinity [see Trinity] and had suggested that the psychic approach to the Christian godhead might be conceptualized more appropriately by a quaternity, with Mary as the fourth "person." He believed that the two Marian dogmas (The Immaculate Conception, proclaimed by Pius IX in 1854 as well as the Assumption) confirmed Mary's status and function as incorporating a feminine element in the human understanding of the nature of God.

Jung's enthusiasm for the Marian doctrines has been received reluctantly on two principle fronts: church officials, both Protestants – many of whom regard Marian devotion as close to idolatry – and Catholics, who deny the proclamations about Mary's divinity and insist that worship, as opposed to veneration, must be reserved for the triune God alone.

Analytical psychologist Mary Daly maintains that the Mary symbol has been a two-edged sword. The symbol has a power that "the most oppressive of the

Christian churches has captured and used. . .tamed and domesticated [through] the plaster statues, the saccharine prayers, sermons, poems and hymns and the sexist theology that has explained it” (Daly, 1973: 83).

While a study of variations of the Great Mother throughout history reveals that images of Mary are clearly adaptations or reworkings of earlier mythic figures such as Ishtar, Astarte, Isis, Cybele, (c.f. Harding, 1955: 99), Daly argues that Mary is not only connected to the ancient collective past but is also a prophetic figure. Mary conveys female autonomy and also an integrated relatedness. Daly credits Jung with recognizing the corrective of the dogma of the Assumption. Jung succeeded in “raising” matter and unconscious evil – so often attributed throughout history to woman or “dark otherness” as material or earthly-to divine status. Jung thereby contributed toward healing dangerous splitting and projective activity, although we still are witness to such projections in many contemporary cultural arenas.

The figure of Mary, in her symbolic potential to heal the gap between personal and impersonal in a feminine approach to the divine, “recover[s] to full consciousness. . .the tangible reality of women’s experiences and the symbolic reality of the feminine” (Harding, 1955: 124). She does so by making us conscious of qualities and attributes of the Great Mother as also having also a “Dark” or elemental, earthly nature that has not been acknowledged in official theology and only partly recognized in popular piety.

Archetypal Aspects of the Positive and Negative Great Mother

Jung and his student Erich Neumann expand upon the paradoxical elements embodied by the figure of the Great Mother. Archetypes are aspects of the collective unconscious, a vast transpersonal realm which remains hidden from direct observation but may be inferred or hypothesized through psychic ideas or images as they are expressed in dreams, fantasies, delusions, myths, stories and symbols. Archetypes have an innate propensity to order experience along certain patterns.

One crucial archetype that can be inferred from behaviors and ideas that emerge and develop from birth onward (or perhaps before) is that of the mother. The mother archetype generates and releases certain patterns and perceptions from the child’s unconscious so that the child develops behaviors, feelings, and activities that form

a “mother” pattern within the child’s experience of reality. These images can be positive or negative depending upon how the child is mothered in reality and upon his/her cultural and social context.

Gradually the child’s experience of a personal mother is augmented, refined and fleshed out by other aspects of mothering by grandmothers, godmothers, nannies; social institutions and ideas such as “mother country,” and cultural constructs such as myths, fairy tales, and religions. Jung calls this intricate interlacing of feelings and experiences the “mother complex” (Jung, 1969, para. 156–198). Although the contents of the mother complex are supplied by the child’s experience of self and other, these contents are activated and shaped by the generative, numinous archetypal core at the unconscious center of the complex.

In *The Great Mother*, Neumann analyzes the “symbolic polyvalence” of the mother archetype. Extracting from the wealth of images, symbols, beliefs and rituals that cluster around the Great Mother, he is able to formulate the structure of this archetype.

Neumann explains two feminine “characters”: elementary and transformative, each of which has two aspects: positive or negative. He sets up two sets of antinomies: fixed versus fluid, light versus dark, illustrating the various characteristics and activities of the Great Mother as ranging along a series of concentric circles built around these axes (Neumann, 1963: 82). The elementary character is at the core, and the successive stages of transformation radiate outward from it to the farthest circle from the center, which represents extreme spiritual fluidity. Yet, within each stage or circle there is a degree of coloration, shading from light to dark, that represents the positive/negative range.

By means of his conceptualization, on the “positive” side, the elementary maternal character of fixity can represent nurture, containment, safety, peace. On the “negative” side, fixity becomes entrapment, devouring, death. Analogous to developmental maturation and spiritual growth, these opposites can become fluid and transformative. The transformative maternal character can range from the highly evolved spiritual ideals such as wisdom and immortality. An untransformed, undeveloped maternal character results in an experience of entrapment, dissolution, diminution, even madness and death.

Neumann uses the figure of the Virgin Mary as virgin and mother to depict “high” and “light” in his diagram. Along with such figures as Demeter and Sophia, Mary the God-bearer inhabits the realm of good nurturing

and spiritual wisdom. These are the aspects that have been presented by the official church and that have inspired much about her that is virtuous, moral, and noble.

Yet, an excess of only sweetness and goodness can produce a conscious imbalance, an overly-idealized image. In a religious symbol, such one-sidedness can lead to psychological lifelessness. As Jung noted in his introduction to *Women's Mysteries*, an archetype only presents itself in a numinous way if it is clothed in symbolic language, in adequate symbols.

The Great Mother that is transformative – elementary, negative as well as positive, gives us an integrative whole that is timeless and numinous. We need the personal and archetypal elements of the mother archetype, inclusive of the qualities of the Dark Mother, to become conscious in us. Any archetypal symbol of transformative significance incorporates body as well as spirit, power as well as submissiveness, death as well as life.

Dark Night of the Soul

Kathryn Madden

John of the Cross was a Spanish poet, Roman Catholic mystic and a Carmelite priest in the sixteenth century who said “you cannot find the light unless you enter the darkness.” As a founder of the Discalced Carmelites of the Catholic Church and a friend of Saint Teresa of Avila who became his spiritual director, John attempted reforms of the Church for which he antagonized the religious and political hierarchy and was imprisoned in 1577. In his prison cell he wrote the *Spiritual Canticle* and began *Songs of the Soul*. After escaping from prison in 1578, he went to Andalusia, where he wrote prose on mystical theology, notably *Ascent of Mount Carmel* and *The Dark Night of the Soul*.

The Contemplative "Dark Night"

John spoke of the *Dark Night of the Soul* as a period of passive purgation that the soul undergoes once having transitioned from active to contemplative spirituality. The Dark Night is a purging purification before one is brought into the full ecstasy of mystical union with God. John described this purgation as drawing one's spirit away from its ordinary sense of things so that it can become completely aware of its divine senses. Although it is difficult conceptually to describe mystical experience with God, the phrase “dark night” can be understood as a metaphor for John's spiritual journey. His “soul's flight” entailed an experience of the privation of light as the necessary deprivation of everything that comes between a human being and the perfect love of God.

John defines this experience specifically in *Dark Night of the Soul*:

- ▶ This dark night is an inflowing of God into the soul, which purges it from its ignorances and imperfections, habitual

natural and spiritual, and which is called by contemplatives infused contemplation, or mystical theology... Inasmuch as it the loving wisdom of God, God produces striking effects in the soul for, by purging and illuminating it, God prepares the soul for the union of love with God's being (Peers, 2005, Bk. II, ch. 5).

In the dark night of the soul, the soulful essence of the individual experiences suffering and there is intense longing for God. If an individual has relied upon a prayer life, the reliability and consistency of traditional prayer suddenly becomes labored and unrewarding. The person experiences isolation and abandonment by God. This period of acute desolation, which is a transitory state, feels "dark," frightening, and even life-threatening.

Other descriptions of the dark night refer to at one extreme as holy, and at the other extreme as spiritual madness, spiritual emergency, or spiritual crisis. Any of these terms can equally relate to the unique experience in which, from a religious perspective, the soul encounters an ultimate test of faith, endurance, purification, and surrender on the path to finding God. Those who have passed through this "night" express a sense of spiritual emergence and freedom.

In contrast to being a negative event, the dark night of the soul is thought by those whose practice contemplative prayer to be a stage of growth in which an individual achieves a deeper level of contemplation: growth from verbal prayer to mental prayer.

One experiences a closer relationship to the divine. Although the wait makes one feel extremely vulnerable, fearful, and temporarily out of control; in the end, the former self with its old assumptions dies. For some, the dark night is a long, slow, painful, and repetitive process. For others, the dark night is intense and rapid. The length of time most likely relies upon the individual psyche and what needs to be examined and surrendered to God toward change.

Psychological Analogues

Psychologically-speaking, the dark night is a profound experience that strips away our false self and brings to awareness deeply buried traumas or developmental failures that can be integrated toward individuation: a mature sense of wholeness. Regardless of whether we consider the dark night to be a religious or psychological experience, or both, if the person is able to endure it, his or her life will be extremely changed toward a newly-centered consciousness; in psychological terms

toward a realignment of the ego with the Self, the central archetype of order.

In the development of the ego-Self alignment, the ego will no longer be the center of its own universe but will be dedicated toward this new center of being with a confidence that something larger is working within the individual toward accomplishing things for the greater good. As this new center emerges, the temporary state of "spiritual madness" fades. Gratitude and joy abound.

We surpass the "depressive position" of psychoanalytic thought and live from a more truly authentic self. Purged of false projections and unfounded beliefs about ourselves and others, our life-path becomes guided by a series of synchronous events: simultaneous occurrences with no discernible casual connection. These synchronous occasions give us a new sense of freedom. The limited view of the ego is no longer the sole guide of our destiny. Our real mission in life begins to unfold. Spiraling ever deeper into a dimensional labyrinth inclusive of psyche, soul, body, and spirit, our consciousness expands to include greater intimacy with that which is transcendent and eternal.

Because of the abyssal emptiness and feelings of desolation of the dark night of the soul, it has been compared to the psychological manifestation of madness or depression: what Carl Jung called "the Night Sea Journey." Still others believe that the dark night leads us into the most intimate sanctum of the soul, to that primeval pre-existent "gulf" that was the soul before it became incarnate on earth.

Regardless of perspective, what we do know is that the dark night of the soul is a painful and lonely process during which our consciousness is clouded with uncertainty. The entanglements of the ego seem, however, to have some purpose in their unraveling: unveiling a new center. The process in which this disentanglement occurs can appear, psychologically-speaking, as a form of depression. Yet, this depression is purposeful in that the psyche is striving toward the goal of soul-retrieval. From this perspective, perhaps there are spiritual aspects of depression.

Soul Retrieval

As a play on the well-known phrase of John of the Cross – *Dark Night of the Soul*, is it possible that occurrences of depression, at least some forms of it, are a necessary first phase in the retrieval of soul? Are there instances in which soul that has become lost, isolated, devoid of meaning in our modern, stressful world purposefully

succumbs to forms of depression that are necessary for greater wholeness?

From an analytical perspective depression is not always perceived as a disease in need of fixing. Depression is a matter of coming home to the soul. It is not an illness to be cured. It is the cure.

Carl Jung claims that, along with a withdrawal of libido from *consciousness*, what occurs is “an accumulation of value – for example, libido – in the *unconscious*” (Jung, 1966: para. 344). An example of this would be a person whose conscious world “has become cold, empty, and grey; but [whose] unconscious has become activated, powerful, and rich” (1966: para. 345).

Analyst Esther Harding expands upon this, explaining that one hallmark of depression is that “all energy disappears into the unconscious” Depression, whatever its degree, “depends on a withdrawal of libido into the unconscious” (1970: 1). Harding makes an even more provocative observation by claiming that the withdrawal of energy or libido from the person’s conscious world comes about because some unconscious content, some unknown element has risen up into consciousness and has exerted an attraction upon it” (Harding, 1970: 3). In other words, there are certain aspects of depression that are being driven by the force of the central regulating factors of our psyche. Something unconscious is striving to be integrated. Harding calls this purposeful activity on the part of the psyche a “creative depression.”

Dark Night: Creative Depression

From a Jungian orientation, the notion of creative depression is outlined by John Weir Perry, an analyst known for his work on spiritual emergencies. Perry summarizes the process of working through the dark night of a creative depression. He uses the term “acute episode” to describe the stages of creative depression (Perry, 1999: 63–64):

1. A reordering or reorganization of the ego, in which we mostly deal with the alienated parts of our ego; a crisis in growth and development.
2. A charged feeling of death and rebirth.

The reference here is to a symbolic death and rebirth not about actual death.

During an acute episode, the feeling is of great ambivalence, doubt, feelings of alienation, depression, and recurring dreams. These symptoms are signs that the unconscious is trying to get our attention.

Jung would say that this activity is being directed by the central core of the psyche, which he calls the Self. According to Jung, “The archetype of the Self is the primary ‘ordering force in the unconscious.’” It is the archetype of the center which evokes primordial images similar to the universal motifs of religions and myths. These images are emotionally powerful, and they most often appear in our dreams and fantasies. Like all the archetypes, the Self is part of the deepest layer of our unconscious the layer which Jung calls “collective” or “objective.” Although we experience the Self as existing within our subjectivity, it is not our property. The Self possesses its own independent life.

3. A third aspect of the acute episode is the feeling of regression. Regression serves to bring something unconscious into our conscious awareness.
4. Forth, the transcendent function is a crucial factor in the acute episode.

We can identify the workings of the transcendent function when we experience intensified conflicting polarities or opposites within ourselves. We find ourselves wrestling with feelings and images that are at great odds. The human psyche works through this function toward a synthesizing resolution in which the two opposites are resolved into a “uniting third.” The uniting third brings new growth to the personality.

5. Fifth, in an acute episode there is an abundance of imagery which is powerful and numinous. Numinous pertains to images that are wholly other. These images tend to break in and shatter our typically one-sided conscious perspective. Numinous imagery often has to do with an aspect of the god-image.

When an acute episode occurs, the first images to emerge are usually persecutory or fearful images such as thieves, devils, inner saboteurs, ferocious animals, or reptilian images. These images feel as if they are trying to destroy anything positive or life-giving.

6. Sixth, eventually the person settles down into a state of coherency and clarity with a new vision and identity. The ego’s experience of dying finally gives way to the idea of being born or giving birth. This birth “is the fundamental ground of the whole experience” (Perry and O’Callaghan, 1992: 4).

For instance, a patient in treatment might suddenly become terribly agitated, restless, distraught, confused, and tearful, as if wrestling with his or her fears in an internal dialog that is difficult to externalize. If the person is a religious person, he or she might pray for hours, finally regressing and curling up into a ball, alone, worn down

with tears. Guilt, shame, and depersonalization may come to the fore. The persecutory part of the psyche begins to drown the ego in a spiraling vortex of self-blame.

The person increasingly withdraws inward, feeling traumatized, abandoned by figures whom he or she had trusted. In the middle of these feelings, the person finds herself or himself in the throws of an acute episode. Initially, it may feel like an overt panic attack or a nervous breakdown. The ego, as the central aspect of conscious identity, may be convinced that it is dying.

Some people have described the initial symptoms as if they are crumbling apart, cracking out of their skin, finding it difficult to breathe. The walls of the ego's defenses are disintegrating. As the contemplatives have demonstrated, prayer, journaling, or any form of writing or expression helps to give an outlet for these strong feelings.

It is strenuous for the ego when the Self intentionally draws psychic energy back into the unconscious, but this is necessary so that the otherness of the transcendent function can function. As the transcendent function begins to function, points of view arise in the person's dreams and waking fantasies that are contrary to whatever position their ego holds. It is as if two voices are in dialog, each with contrasting points of view.

Conflictual Opposites

Great inner conflicts can arise around moral stance. The opposites within can polarize to an extreme: hedonism versus morals, one political stance over another. Moral confusion, especially in medieval times, was equated with the devil and possession. The internal voices thrash back and forth, each justifying an opposing position. The disparate voices thrash back and forth.

What becomes apparent in an acute episode is that what the values we have been so assured of have been primarily according to the ego's point of view. Tremendous indecision ensues. The ego flounders. In its confusion can become identified with both sides of the opposites.

On the one hand, we regress back into the world of the biological parents and struggle with unresolved developmental issues. On the other, we are dealing with the primordial and symbolic parents of the archetypal realm. This clash of forces can feel as if we are in an ideological, spiritual, or cultural battle with the entire collective consciousness, as John of the Cross felt he was in the time of Reformation.

Keeping up the dialog – inner or outer – is important because the opposites must be separated first before they can begin to integrate. Both positions of conflict need to become conscious. This tension of opposites makes room

for the transcendent function. Each position is given freedom of expression to justify itself without consciously forcing a resolution.

As the preliminary thrashing of opposites subsides, the contrary positions begin to settle. The person may undergo an intense period of melancholy with apparently no relief. Yet, eventually spirit breaks through. As one patient described:

▶ a lantern of intense light rose up behind my eyes. It illuminated my thoughts. I suddenly had access to deep insights. This light was so positive and good. Images flashed before me of sexual activity that I had identified with the devil. I fell into sorrow over the object of my lost-love – my once idealized biological father. Then an image of Christ came to me. I was filled with certainty! Christ: a reality! I started reading the Bible even though I had not been to church in seventeen years. Certain words lifted off the page and were three-dimensional. Bliss! I slept easily feeling safe and contained.

In this brief clinical example, we can see how an acute episode of a creative depression can bear the potential of soul-retrieval in which the symbolic death that a person undergoes is something like gazing into a dark night. Yet, as Jung discovered among the Latin writings of Desiderius Erasmus: *Vocatus atque non vocatus, Deus aderit*. Bidden or unbidden, God is present.

Daseinsanalysis

Todd DuBose

Daseinsanalysis, the German word for “Existential Analysis,” is based on the phenomenological anthropology of Martin Heidegger (1889–1976), and the subsequent development of his thought for clinical endeavors in the 1940s by two Swiss psychiatrists, first, Ludwig Binswanger (1881–1966) and then Medard Boss (1903–1990). Differentiating from both psychoanalysis and other styles of existential therapy, Daseinsanalysis is distinctive in its analysis of *Dasein*, or quality of “being there” in the world.

Martin Heidegger proposed that human existence has an ontological, or general and foundational, structure that is expressed in “ontic,” or concrete, ways of living out unique compartments in the world (Heidegger, 1962). Yet, Heidegger argued that understanding these concrete and specific ways of living in the world requires a prior awareness of how these unique ways of being-in-the-world relate to the broader understanding of human existence as an ontological whole. Heidegger distinguished between an analysis of *Dasein*, and Daseinsanalysis as a clinical practice, seeing the former as a philosophical anthropology on which the latter is based. Daseinsanalysis addresses particular ways each human being moves in the world in the light of the larger ontological structure of human existence.

Heidegger wanted to leave the word, “*Dasein*,” untranslated in order to avoid the inaccurate equation of “*Dasein*” with concepts such as “person,” “ego,” or “self.” *Dasein* is not a “thing” or a fixed and encapsulated entity, but a phenomenological *process* in which cleared space and the lightening of existential constriction and burden allows for the possibility of phenomena to “show themselves.” *Dasein*, both concealed and revealed, discloses itself through existential givens, which are inherent conditions all human beings live out in our everyday existence. They are, specifically, temporality, spatiality, coexistence, mood or attunement, historicity, bodyhood, and mortality. Moreover, *Dasein* discloses itself within the equiprimordiality of human existence. By saying that human existence is equiprimordial, we mean that we all simultaneously live our lives within three modes of Being: the *Umwelt*, *Mitwelt*, and *Eigenwelt* (Heidegger, 1962; May, Angel, and Ellenberger, 1958; Boss, 1979).

The *Umwelt* is our biological and environmental existence. Our *Mitwelt* is our “with-world,” or relational world, which entails the quality of “being-with” in our

relationships (i.e., close, distant, conflictual, etc.). Our *Eigenwelt* is our lived experience, which is the unique ways we experience ourselves living through situations. No one mode of existence dominates and takes priority over any of the other two. No one mode of existence can be extracted from the other two. Pain, stress, and hypertension are examples of how the three modes of existence mutually shape and are shaped by the other two. Our integrated, equiprimordial comportment through our everydayness always and already finds itself within the integrated existential givens in the world. The world is not a place to locate persons and things, but a web of meaning and backdrop against which aspects of our lives come to make sense to us, come to disclose themselves to us.

Through embracing inherent limitations in each moment, that is, our finitude, facticity, and contingency in existence, which Heidegger called our “thrownness,” we can more authentically live out our “ownmost” possibilities in the world. Relinquishing this call towards our ownmost possibilities, and instead, succumbing to being defined by culture, the status quo, or just allowing life to carry one along and define us without claiming one’s own life as one’s own, is a life of inauthenticity. Existence, in its ontic sense, is a perpetual movement between authenticity and inauthenticity, as well as between freedom and finitude. Meaningful experiences in life are those that occur within the embrace of one’s limitations in the search for immanent possibilities.

Binswanger, Boss, and other Daseinsanalysts align with psychoanalysis around the value of a human existence coming to know itself through the movement from concealment to disclosure, but differ significantly from psychoanalysis regarding its more mechanistic understanding of mental processes (Binswanger, 1967; Boss, 1963, 1977, 1979). As such, key constructs of the psychoanalytic project, such as the psyche, the unconscious, transference, and projection are jettisoned outright, or, at least significantly altered in their meaning. Furthermore, Boss believed the therapeutic question guiding clinicians should not be the psychoanalytic persistence on a determinative past as expressed in the word, “why?,” but, instead, should be the more hopeful, future-oriented, and more inviting question, “why not?” Our future impacts us as much as our past, as Daseinsanalysts see it, and both our lived future and lived past disclose themselves in the present, or, here and now, comportment in the world. Boss, and other commentators of Boss’ work, have argued, then, that Daseinsanalysis is “purified” psychoanalysis, having rid itself of unnecessary metaphysics and engineering conceptualizations of mind

that are not phenomenologically experienced anyway (Stadlen, 2005, 2007).

In relation to other existentially-oriented therapies, Daseinsanalysis also differentiates itself by insisting on the “thrown” nature of our world situations. We are never *absolutely* free, as some more humanistically bend existentialists may argue, but lean into our possibilities within *situated* freedom. Likewise, Daseinsanalysis does not see the person as an ego, psyche, or any kind of “thing-hood,” but sees the person as inextricably interwoven in the world. The person is how one moves in the world. What is seen in the world is not a static “it,” but a process of being, a comportment through situations. The relationship of Dasein and the world is coconstructive, as the world is disclosed as it is only in light of the presencing of Dasein being “all there.”

Commentary

Spirituality is an inherent aspect of Daseinsanalysis and is understood as transcendence within and through immanence (Driver, 1985). One’s experience of transcendence, understood as the experience of unfolding and living through one’s ownmost possibilities, is enframèd by embracing one’s being-unto-death, or embracing one’s situational and ontological limitations, including, of course, but not exclusively our the end of our biological existence. One’s “thrownness,” though, is an everyday and every moment phenomenon. Several theorists have tried to compare Heidegger’s work to other religious traditions, such as Taoism, Christianity, Buddhism, Hinduism, and Judaism, which is evidence to the universality Heidegger’s work could offer to such diverse life worlds, as the impulse to comparisons is predicated on qualities that may easily be deemed “spiritual,” in the existential way, that are embedded within both the ontological and ontic expressions of *Dasein-in-the-world*.

The very ontological structure of *Dasein* is what Heidegger called, “solicitude,” or care. This is not primarily a feeling of empathy, but an inherent intending and enacting of significance. Each moment of experience intends and responds to his or her world’s call to significance. We are always and already attuned, intending, called by and responding to, meaningful encounters in the world. I call this approach “pastoral” in that its focus is on clearing space and lightening burdens such that disclosures of possibility can show themselves. It is “pastoral” in its alignment with one’s own most possibilities within the tragic dimension of life’s “thrones,” or finitude. This approach is very

incarnate and finds transcendence by courageously enacting one’s own most possibilities while embracing one’s death amidst the tragic dimension of life.

Daseinsanalysis values meditative releasement, as Heidegger’s calls it, or letting-go while exploring phenomena, rather than a habit of calculative manipulation and control of situations and persons. Letting-go shows itself in uncovering, clearing, unburdening, disclosing, and releasing phenomena to show themselves as manifestations of *Dasein’s* being-there, and never being-elsewhere-beyond existence. In other words, transcendence does not occur outside of existence, for the Daseinsanalyst, but within it. Transcendence, however, is the heart of Daseinsanalysis, where the therapeutic questions and goals are on freedom towards how one would like to be in the world, and what seems to be constricting their freedom to be so. Hence, rather than fall short of a true integration of psychology and religion through incomplete comparisons and contrasts, or juxtapositioning of one against the other, Daseinsanalysis provides us with the possibility of a discourse and language that could provide a true integration of our present day separatism, if one agrees that transcendence is found in and through immanence. In the clearing of space and the lightening of burdens, modes of being-in-the-world are uncovered and truths of existence show themselves in ontic particularities. What is also interesting to consider is how Daseinsanalysis can provide a foundation for multicultural considerations, given that we all live through equiprimordial and existential givens in the world simply by being human beings, but take up those experiences in very unique ways. We then could celebrate a true communion of diversity.

Daseinsanalysis is practiced around the world, and is centralized in the International Federation of Daseinsanalysis, including countries such as Brazil, Greece, Belgium, France, Hungary, Austria, Canada, England, The Czech Republic, and, of course, Switzerland. Originally having its training headquarters in Zurich, which was originally limited to medically trained psychiatrists, the apparent exclusivism sparked points of contention among some Daseinsanalysts (Stadlen, 2005, 2007). Today, though, Daseinsanalysis is growing in appreciation in the United States and is taught in the human science oriented doctoral programs in psychology. As it continues to spread in awareness and appreciation, more and more clearings will provide space for freeing us all to live more into our ownmost possibilities.

Death Anxiety

Bonnie Smith Crusalis

Definition

Fear of death can be defined as the anxiety experienced in daily life caused by the anticipation of death. It can be the result of facing death through illness and aging, or experiencing circumstances that force a confrontation with the idea of death. It can also include many aspects of dying, such as pain and suffering, feelings of abandonment, loss

of dignity, and of “non-being,” not living up to one’s potential (May, 1983; Heidegger, 1962).

Denial

“. . . No one believes in his own death. In the unconscious, everyone is convinced of his own immortality” (Freud, 1953–1966).

Ernest Becker, the author of Pulitzer Prize winner, *The Denial of Death*, maintains that death denial is a basic human motivation and a universal biological need. The terror of death is so overwhelming, he says, that man conspires to keep it buried in the unconscious network of defense mechanisms where it is repressed.

Irvin Yalom, noted American existential psychiatrist, would agree that death anxiety is a basic tenant of human existence. Rarely though, Yalom maintains, do clients present in therapy settings with the complaint that they fear death. Instead, they appear with a variety of death anxiety-avoiding coping mechanisms and denial-based strategies that are not effective.

Boundary Experience

Regardless of Yalom and Becker’s contention that fear of death underlies anxiety in general, death anxiety is not always buried. Columbia University’s Dr. David Forrester discusses a “readiness” or Mortality Stage in which a physically healthy, cognitively intact individual reaches the end of the emotional denial of death, and becomes acutely aware of his or her own mortality. The Mortality Stage is so distinct that all of life prior to this stage can be subsumed under the rubric the Immortal Stage. Experiences that trigger the Mortality Stage can be any loss, or events such as war, terrorism, famine, genocide, pandemics, or even minor accidents. A “boundary” experience is Yalom’s term for this heightened awareness, which he defines as an event or urgent experience that propels one into a confrontation with one’s mortality.

Death Gives Life Meaning

Because the heart of existentialism and existential therapy is the attempt to resolve the conflict or tension created when an individual confronts one of life’s ultimate concerns such as death, existential therapy, essentially an exploration of one’s life meaning, has been used successfully to integrate

spirituality into end-of-life care (Breitbart, 2004). Prior to the public awareness and acceptance of the work done by Elisabeth Kubler Ross, end-of-life care was primarily concerned with symptom control and pain management. Following Kubler-Ross' *Death and Dying*, palliative care literature began to emphasize a need for a greater emphasis on spirituality and meaning along with interventions to help patients examine these areas of their lives. It is this examination that offers an individual the potential to live purposefully by embracing the inevitability of death.

"Though the physicality of death destroys us, the idea of death may save us" (Yalom, 2002: 126). English existentialist Emmy van Deurzen agrees: "Life and death are two sides of one coin. They cannot be had without each other, they should not be kept apart and in isolation."

Defenses

Giorgio Giaccardi

Defenses are ways by which the psyche aims at avoiding threatening affects, above all anxiety. The notion of

defense was introduced by Freud with reference to hysteria (Freud, 1894: 47). The defense mechanism involved in hysteria is repression, which causes the expulsion of a painful affect or idea from the conscious ego. During the following 30 years Freud would use the term repression with reference to defensive processes in general. This special status of repression was due to its role in the constitution of the unconscious as such. In 1925 however Freud reintroduced the concept of defense as an inclusive category encompassing not only repression but also other mechanisms which he had been identifying in the meanwhile (Freud, 1926: 163). The analysis of ego defenses was to become subsequently a major theme in psychoanalysis, thanks also the pivotal study on the topic by Anna Freud.

A subsequent line of development, which paralleled the extension of psychoanalytic theory and practice beyond neurosis and its application to borderline, narcissistic and schizoid personalities, consists of the analysis of primary defenses (also named primitive, dissociative, archaic, psychotic and archetypal).

Ego Defenses

When the ego experiences distressing affects resulting from the perceived incompatibility of an experience, idea or feeling, it succeeds in defending itself from the related anxiety by "turning this powerful idea into a weak one" and "robbing it of the affect – the sum of excitation – with which it is loaded" (Freud, 1894: 47). The sources of anxiety are superego demands, external situations, overpowering or conflicting instincts (Freud, 1936: 54–65). Neurosis occurs when a defense mechanism fails to ward off anxiety or when other portions of the id claim a "compensation" – in the form of a symptom – having being damaged by the operation of a mechanism of defense (Freud, 1924: 183). Exceedingly rigid defenses loosen the relation to reality and hold up the emotional development of the individual (Winnicott, 1985a: 168).

Freud also regards religion as a form of collective neurosis based on regression to infantile dependence on the father, rooted on child-like feelings of impotence and defending against superego anxiety. Specific defense mechanisms employed are obsessive ceremonials, devaluation of intellect and altruistic surrender, all in the service of repressing instincts thus avoiding related guilt and anxiety. Freud notes that the impulses that religions strives to suppress are not merely of a sexual nature, but concern any instinct that "springs from egoistic sources" (Freud, 1907: 127). One typical defense against such instincts was identified by A. Freud as "altruistic

surrender” of “our own instinctual impulses in favor of other people” (Freud, 1936: 11–134).

A. Freud lists nine basic mechanisms of defenses: repression, regression, reaction-formation, isolation, undoing, projection, introjection, turning against the self and reversal into the opposite, to which she also adds sublimation as a more sophisticated and complex defensive activity of the ego (Freud, 1926: 44). However this list is far from exhaustive, as A. Freud herself goes on to describe further mechanisms such as identification with the aggressor and denial. All aspects of mental life can serve a defensive function. For instance, McWilliams (1994: 117–144) also includes intellectualization, moralization and sexualization among the defenses of the ego. Jung’s notion of regressive restoration of the persona (Jung, 1966: 163–168) may also be regarded as a defense mechanism against anxiety.

Defenses may be classified according to the nature of the mechanism which protects from anxiety, which might either affect the instinctual process itself (like displacement, reversal and turning round upon the self) or merely prevent it from being perceived by the ego (like repression and projection). Bowlby suggests that the operation of defense mechanisms can be spotted when patterns of behaviour, thought or feeling “[are] carried out under pressure, absorb an undue proportion of the person’s attention and [are] visibly undertaken at the expense of something else” (Bowlby, 1980: 66).

Jung often refers to repression of psychic contents as the process constituting the personal shadow. He views confrontation with the shadow as a moral problem and an essential task in the process of individuation – a viewpoint which underpins his aim of “treating” Christianity by showing the importance of integrating the repressed, or “missing fourth,” into its conscious attitude (Stein, 1985: 171). However, Jung is also of the opinion that as long as a defense works it should not be broken down as the patient may need it as a protection against overwhelming experience. This is particular so in the case of defenses with a religious content, like the “Catholic defense” (Jung, 1958a: 45), on which Jung writes: “If the patient is a practising Catholic, I invariably advise him to confess and to receive communion in order to protect himself from immediate experience, which might easily prove too much for him (. . .) I reinforce a means of defense against a grave risk, without asking the academic question whether the defense is an ultimate truth” (Jung, 1958a: 44). But if the patient’s dreams “should begin to destroy the protective theory” Jung feels that he has “to support the wider personality” of the patient (Jung, 1958a: 45), in other words work on his/her individuation. This latter aim

cannot always be pursued, as the need to maintain the defense may be paramount: “People may have to go back to the Church when they reach a certain stage of analysis. Individuation is only for the few. . .” (McGuire and Hull, 1980: 394).

A concept related to (but distinct from) defense is resistance, which is the force that protects the work of defenses and its accessibility to the conscious ego. Overcoming resistances is for Freud one of the cornerstones of the psychoanalytic enterprise. In *Analysis Terminable and Interminable*, he identifies five types of resistances, of which three derive from the ego (repression, transference resistance and resistances which proceed from secondary gains), one from the id (repetition compulsion) and one from the superego (unconscious guilt and need for punishment) (Freud, 1937: 238). The latter two account for what Freud came to recognize as sources of an intractable resistance to the analytic cure (negative therapeutic reaction). In particular, the archaic superego in Freud’s late view takes on split-off aggressiveness and thwarts recovery by attacking the ego. This new understanding proved pivotal in the development of the study of primary defenses.

Primary Defenses

According to Melanie Klein, primitive defense mechanisms are aroused by two forms of anxieties that derive from the activity of the death instinct (or fear of annihilation), i.e. depressive and persecutory anxieties. Defenses against the former are manic ones (omnipotence, denial, triumph and contemptuous control), while the main defenses against persecutory anxieties are splitting and projective identification. All these are called primitive defenses because, as Freud noted (Freud, 1926: 164), they are employed before the separation of ego and id and the formation of the superego.

Winnicott examined in detail manic defenses, which use external objects “in the attempt to decrease the tension in inner reality” (Winnicott, 1975: 132), specifically by denying depressive anxiety and guilt. Ultimately, manic defenses use reality as a reassurance against the experience of death. Any form of psychological organization (including psychosis itself and the experience of oneness with God/universe) which effectively defends against the threat of breakdown and annihilation may work as a primitive defense.

Winnicott also suggested that the ascension of Christ could be seen as an instance of manic defense of an “ascensive” nature, psychologically akin to light-headedness and

elation: “Each year the average Christian tastes the depths of sadness, despair, hopelessness, in the Good Friday experiences. The average Christian cannot hold the depression so long, and so he goes over into a manic phase on Easter Sunday” (Winnicott, 1975: 135). Another example of manic defense in religion is when an aspect of reality is not acknowledged as internal, like “a preacher [who] feels as if God speaks through him,” but denies his own “parenthood of the internalized object” (Winnicott, 1975: 133). However, in line with Jung’s position of respect for defenses, Winnicott also emphasizes that “in the analysis of the most satisfactory type of religious patient it is helpful to work as if on an agreed basis of recognition of internal reality, and to let the recognition of the personal origin of the patient’s God come automatically as a result of the lessening of anxiety due to the analysis of the depressive position” (Winnicott, 1975: 133). On the other hand, anti-religious attitudes could be seen as manically defensive too: people in analysis “jeering at religion (. . .) are showing a manic defense in so far as they fail to recognize sadness, guilt, and worthlessness and the value of reaching to this which belongs to personal inner or psychic reality” (Winnicott, 1975: 135).

Archetypal Defenses

Kalsched offers a post-Jungian formulation of primary defenses in which they are referred to as “archetypal defenses” and “defenses of the self” because they “seem to be coordinated by a deeper center in the personality than the ego” (Kalsched, 1996: 17). They cause a split in the psyche between a progressed part that protects “whatever is left of true selfhood” (Kalsched, 1996: 174) and a regressed part that encapsulates what Kalsched names the “personal spirit” of the individual. Splitting allows disconnecting from unbearable affects and annihilation anxiety, at the cost of blocking individuation, i.e., the incarnation of the self in life. Both parts are experienced by the ego as “daimonic objects” through which “divine activity could be glimpsed – either for good or for evil” (Kalsched, 1996: 148). Kalsched envisages in the ultimate anti-life character of these defenses a “compelling image of what Jung called the dark side of the ambivalent Self. (. . .) The damage to the inner world is done by the psyche’s Yaweh-like rage, directed back upon the self” (Kalsched, 1996: 17).

Kalsched’s formulation mostly draws upon Winnicott’s false self (Winnicott, 1985b), Bion’s attack on linking (Bion, 1984), Stein’s archetypal defenses (Stein, 1967) and Fordham’s defenses of the self (Fordham, 1974),

which Kalsched amplifies and develops by delving into the archetypal perspective. Fordham, in particular, observes how defenses of the self oppose and undo any potentially developing link and aim “to keep the way open to regression, or maintain it as it is” (Fordham, 1974: 193). The direction of this regression is towards “an infantile perverted state of mind” (Fordham, 1974: 198). As Marcus West argues throughout his recent study of narcissistic disorders (West, 2007), this form of regression is particularly enticing for people whose ego-functioning is so underdeveloped that they constantly need a vicarious self-regulating other. In this process – in which projective identification is the main defence mechanism involved – they experience very intense affects, of a positive sign if sameness is registered and negative if this expectation is frustrated. In both cases, emotions may have an ecstatic and numinous quality which however, as West concludes, may militate against the development of the ego thus further enhancing recourse to primary defenses.

Hillman’s take on defenses brings a different understanding of the psychic processes regulating instincts and affects. He draws upon Jung’s contention that the archetypal image and the instinct belong together in the same archetype, the images being regarded as self-portraits of the instincts. Jung already recognized the connection between defences and images: “Instinctive defence mechanisms have been built up which automatically intervene when the danger is greatest, and their coming into action during an emergency is represented in fantasy by helpful images which are ineradicably imprinted on the human psyche” (Jung, 1958b: 345). Hillman further elaborates this idea by arguing that any archetype has in itself an instinct-inhibiting power, which does not deny or displace or reverse the instinct, but makes full experience of it through its related images and may influence instinctual behavior by reflecting on and transforming the images. This form of defense differs from sublimation because it maintains the connection to the original instinct, while allowing alternative outlets other than compulsive action or flight. Hillman exemplifies his argument by showing the self-inhibiting properties of instinctual phenomena linked to Pan, like panic and masturbation (Hillman, 2000). Similarly, Murray Stein refers to the self-inhibiting properties of the archetype as “healthy paranoia” (Stein, 1983: 95) and maintains that both the drive to meet the unconscious and the protection from it stems from the same god, Hermes. In this approach, instinct regulation, psychological reflection and pursuit of wholeness – which has a numinous quality, because active and conscious encounter with the unconscious is “an

essentially religious struggle” (Stein, 1983: 105) – are intertwined in a way which is quite far from the Freudian conceptualization of a trade-off between instinct and civilization. The implications of this position on religion are far reaching, particularly on the importance for religious images, symbols and rituals of remaining in touch with the instincts which they also have the function to inhibit and contain.

Deism

[Deus Otiosus](#)

Deity Concept

David A. Leeming

Deities are created by humans – usually in their image – to express our sense of where we came from and to express a sense of significance and protection. Deities are believed to be aware of us and our needs. They are ultimate progenitors, ultimate parent. Psychology has taught us how important our mental depictions of and memories of our parents are to any real understanding of our own identities. As far as we can tell, the concept of divinity has almost always been present in human consciousness and human life. We have indications of the concept at least as early as the cave paintings, rock carvings and other artifacts of the Paleolithic. Deities of many sorts have arisen over time. Sky gods, mother goddesses, fertility deities, tricksters, storm-weather gods, creators, warrior gods were ubiquitous in the ancient world. Baal and El reigned in Canaan until the Hebrew Yahweh replaced them. Hera and Zeus ruled the heavens in Greece until they were turned into mere statuary and literary characters by the Christian God. Many ancient deities still rule. Devi, Vishnu and Shiva still dominate the temples and shrines of India. Spider Woman and the Great Spirit still have power in the sweat lodges, dances, *kivas*, and mountains of Native North America. Nigerian Binis have their separated Mother Earth and Father Sky. The Japanese have their sun goddess Amaterasu, the ancestor of their emperors. There are gods who are said to have become incarnated as humans – Jesus as the Christ or Messiah, Lord Krishna; and the other

avatars of the great god Vishnu; and some would say the Buddha.

There are many possible explanations for the concept of deity. A significant proportion of the human race argues that divinity first revealed itself to humanity in the form of personal beings. Others have seen deities as metaphorical expressions, symbols of the mysteries of the universe, reflections of our sense of the numinous, our sense of a realm of existence that is beyond the physical, beyond our understanding. For some, gods, being immortals, are the embodiment of our instinctive drive to establish a permanent order in the universe, of which we, as the allies or offspring of deities, can be a part. A universal theme reflected in the archetype that becomes our many versions of divinity is our need to feel that we are meaningful inhabitants of a meaningful universe, that we are ultimately “parented” as cultures and as a species. In this sense, divinity is a metaphor for the furthest extension of which the human mind is capable at any given time. Not surprisingly, then, deities change with the times, taking ever new forms, even as the essential archetype remains constant, veiled in its eternal mystery.

A generally accepted truth of psychology, itself the source of one of the dominant myth systems of the modern era, is that we are what and who we are not only because of our genes but because of our “background” experience, an important part of which is our parenting. Creation myths are collective stories of parenting by deities. In these myths, our worlds, our cultures, and we ourselves were created by the original deities. When we are asked about these parents there will inevitably be limitations on our actual knowledge but also, as the myths of psychology teach us, on what we are able to “face.” And, of course, our parents – actual and cosmic – are themselves the products of their own past. The understanding of deities and their role in our lives, like the memory and evaluation of parents, involves a complex process of delving into the past and overcoming strong forces of “denial.” It often means seeing our parents’ limitations and the inadequacies of our visions of them as well as their positive traits.

Deluge

David A. Leeming

Flood myths are ubiquitous. They are found in Native American and African cultures, in ancient Greece and Egypt, in India, Oceania and South America. More often than not flood myths are outgrowths of creation myths. Typically, the creator is dissatisfied with creation, usually because of the sinfulness of humanity. In order to make a fresh start, the creator floods the world, destroying everyone and everything in it except, in some cases, for a flood hero, who is sometimes accompanied by his family and representatives of various animal and plant species. These survivors live to populate a new world. The oldest extant version of the flood myth is that of ancient Mesopotamia, contained in the Gilgamesh epic. This is a version remarkably close to the biblical version contained in Genesis.

Perhaps the best way to understand the psychological significance of the flood myth is to suggest an analogy to the rite of baptism, or purification by water, as practiced by many peoples since early times. In baptism the individual is symbolically drowned by submersion in the water only to be “reborn” into a religious community as he or she emerges. The individual dies to the old life and is reborn into the new. The waters of baptism are analogous to the maternal primal waters of creation. In the flood, humanity is collectively baptized, as it were; we die to the old creation and are reborn, through the flood hero, into the new creation.

In another related sense, then, the flood ritual represents the ever existing hope for a second chance, for a new beginning. The flood hero, whether the biblical Noah or the Sumerian/Babylonian Ziusudra/Utnapishtim, is the representative of that hope within us. Locked in the ark of survival, Noah is the collective psyche on its Dark Night of the Soul, moving through darkness to the ever hoped for renewal that is wholeness.

Delusion

Lorna Lees-Grossmann

Delusions can be defined in a general sense as a belief that is false. The more rigorous definition implies that the belief is the result of some sort of pathology, and that it adheres broadly to the conditions laid out by Jaspers: certainty, incorrigibility and the impossibility or falsity of its content. The belief must be held with absolute certainty; the holder must be unable to be swayed by any counter-argument or evidence to the contrary, no matter how compelling the evidence; and the content of the belief must be such that it would be unbelievable under normal, non-pathological circumstances. Delusion is distinct from beliefs arising from disorders or trickery involving perception: delusional beliefs do not arise from incomplete or false perceptual information, rather perceptual information may be manipulated or interpreted to bolster the delusional belief.

Jaspers

The DSM-IV definition retains a broad similarity with Jaspers' criteria:

- ▶ A false belief based on incorrect inference about external reality that is firmly sustained despite what almost everybody else believes and despite what constitutes incontrovertible and obvious proof or evidence to the contrary. The belief is not one ordinarily accepted by other members of the person's culture or subculture (e.g., it is not an article of religious faith).

In spite of this general definition's broad acceptance, counter-examples have been produced for all of these criteria, the most notable being labeled the Martha Mitchell effect: a belief may be labeled delusional because of its apparent falsity, although it may in fact be true. Martha

Mitchell, wife of the attorney general at the time of Watergate, was labeled delusional when she persisted in asserting that there was illegal activity going on inside the White House. The leaking of information from the White House later proved the truth of her claims.

Further to the Martha Mitchell effect is the impossibility of ascertaining the truth-value of some statements. Religious beliefs fall into the category of beliefs with no determinable truth-value. The distinction between ordinary religious beliefs and delusional beliefs with religious content is that of shared-ness: a religious belief that is shared by many is not classifiable as delusional, whereas a similar belief held by one or a very small number of people may be thus classified.

Munro

Munro (1999) suggested a more rigorous series of criteria to separate delusions from false beliefs. A delusional belief is expressed and held with unusual conviction, and the holder is particularly unreceptive to contrary evidence. So far Munro is in line with Jaspers, however the further criteria include a strong emotional investment in the belief, with a concomitant over-sensitivity, suspicion or hostility to questioning of or about the belief. Normal behavior and logic patterns are generally unaffected, except in areas of the believer's life that are affected by the delusion. The internal logic of the belief may be preserved, although the resulting behavior may be out of keeping with the normal social context.

There are some delusional beliefs that allow a person to continue their lives in a reasonably normal fashion. In the main, however, with the lack of universal agreement about what precisely constitutes a delusional belief, the key criteria used for psychiatric diagnosis are practical: a belief should be considered delusional if it is definitively bizarre, is held with excessive conviction, especially if the believer is not amenable to counter-arguments against it, and if the belief causes distress to the holder. If a belief meets the criteria for a delusional belief, and yet causes no distress or even improves the believer's quality of life, then some psychiatrists would prefer to allow the belief to remain unexamined. As with Freud's categorisation of religious belief, some untrue or unprovable beliefs are helpful to the believer, and their loss may cause further, unnecessary distress.

Demons

Craig Stephenson

The Middle English word “demon” derives from the medieval Latin *demon* and the Latin *daemon*, from the Greek *daimon* meaning “deity,” that is to say, a god or goddess. Inherent etymologically and historically in the English word is an ambiguous mixing of the ancient Greek notion of spiritual beings in addition to the gods and goddesses, not necessarily evil, with the postexilic Hebrew thought of harmful spiritual entities, the Persian notion of conflict between light (Ahura Mazda) and dark (Angra Mainyu) forces, and the Synoptic Gospel accounts of Jesus exorcising evil spirits that had invaded human beings, causing mental and physical illnesses (e.g., Matthew 8:28, 12:22, Mark 5:1, 3:22, Luke 8:26, 11:14). The contemporary use of the English word “demon” is for the most part skewed negatively to suggest one of an army of negative supernatural entities under the leadership of the devil or Satan, despite attempts to reintroduce the more positive connotations of an attendant daimonic attendant spirit.

The Hebrew word *shedim* meaning “demons” inscribes a hierarchy of evil forces in Jewish religion. In the Talmud, the *mazziqim* or “harmful spirits” are governed by a king named Asmodeus and a queen called Agrath bat Mahalath with 10,000 demonic attendants. Some medieval commentators such as Maimonides and Menahem Meiri either ignore the Talmudic references to demons or read references to evil spirits allegorically as describing, for instance, a bedeviling and persistent melancholy. However the medieval Kabbalistic movement further develops Jewish demonology, mapping a vast realm of demonic powers which parody the sacred. In Islamic tradition, maleficent entities such as *djinns*, led by a Satan-like Iblis, test the faith of true believers; those who

fall prey to such deceiving demons are treated in the Koran as liars and hypocrites. In similar ways, Buddhism describes demons functionally as forces that obstruct the achievement of nirvana. Hence, the Christian notion of demons as legion (i.e., “or we are many” is the demon’s name in Mark 5:9) but occupying a lesser position within a cosmological hierarchy of beings, finds correspondences in other cultural contexts.

The relative subservient position of demons in these hierarchical cosmologies carries important implications for how we deal with the distress they cause. For example, investigating demon possession within the Karava caste community of Galle, Sri Lanka, anthropologist Bruce Kapferer (1983/1991) finds Sinhalese demons occupy a less powerful place in the vertical hierarchy of being than deities and humans, but demons cause illness by creating the illusion that they can tyrannize and thereby disorder human beings. Kapferer characterizes the demonic as “a false oppressive totalitarian world which refuses possibility” and a possessed Sinhalese person as fragmented, reduced, and alienated (suffering from *tanikama*, meaning “aloneness”). Through the ritual process of exorcism, the Sinhalese differentiate between demons and deities who also have the power of generating illusions, but only for some ultimately edifying purpose. Kapferer argues that Sinhalese exorcism publicly affirms the given cosmological structure and at the same time presents the suffering individual with an opening into the possible. On the one hand, *yaksabhuta cidyava* as “exorcism” literally denotes taking the demon out of the possessed patient and transferring it to the basket, from there to the exorcist, and finally to a cock as sacrificial scapegoat. On the other hand, *yaksabhuta vidyava* as “the science of spirits” enacts the diagnostic problem of differentiating demons from deities, and addresses the suffering of the possessed individual by reordering what the demonic has disordered: “In the *vilakku pade* the dancers place torches at the demon palace, lighting it up and opening it to view. The demon palace is revealed in its full completed objective meaning as not just the place of demonic disorder, but also as the place in which the deity resides” (Kapferer, 1983/1991: 281). Kapferer emphasizes that the Galle Sinhalese differentiate between demons and deities who both create illusion, but for different ends. Demons cannot be transformed or reconstituted at a higher level in the cosmic hierarchy; they can only intensify the chaos of lower-level orders of the cosmic whole. Sinhalese exorcists, as “scientists of spirits,” light up the demon palace and thereby alter the sufferers’ perceptions of their suffering, emphasizing not so much the exorcising of the tyrannical spirit as the placing of the demonic in context

with the divine, illness in relationship to health, disorder with order.

Freud wrote a psychoanalytical interpretation of a historical case of demonic possession (1922). A Bavarian painter, Christoph Haitzmann, came to Mariazell near Vienna in 1677 to ask for deliverance from visions and convulsions caused by a pact with a devil which was coming to term after 9 years. This case begins with the death of Haitzmann's father and with the metamorphosis of his image into the demonic. In a series of paintings, Haitzmann portrayed his dead father gradually transformed into a demon with breasts and holding an open book in his hand. Through the rites of exorcism, Haitzmann felt himself released from two pacts he said he had signed with his demon. In the end, however, he chose not to return to his work as a painter but to enter the monastic life. Freud reads the case as a neurotic evasion of the ambivalent image of God-the-Father in which Haitzmann unconsciously defended against feelings of abandonment and deprivation. Freud portrays Haitzmann as having avoided the necessary mourning of the natural father and interprets the selling of his soul as a neurotic attempt to recast himself as son and obedient subject to a nurturing father-figure, to remain within the classic Oedipal complex rather than live his adult life bereft. By submitting himself through the pacts to the father-as-demon, Freud argues, Haitzmann employed a "feminine attitude" by which he neurotically preserved his threatened status as "son" for a period of nine years. For Freud, Haitzmann's demonological neurosis permitted him to continue to feel contained within the inferior status of vassal-like "subject" and "son," even though at great psychological cost and with much suffering from convulsions, visions and creative blocks, culminating after nine years in a crisis and eventually a shift into another form of containment, the holy orders. Freud knew well medieval textbooks on witchcraft such as *Malleus Maleficarium* and wrote to Fliess about the correspondences he could see between a possessed demoniac and a hysterical patient, between an inquisitor/exorcist and an analyst, between demons and repressed affects. In terms of psychological economies, he theorized that maintaining neurotic solutions such as Haitzmann's takes a terrible toll, repression stealing libido that would normally be accessible to the ego.

Furthermore, in "Mourning and Melancholia" (1917/1984), Freud describes how a bereaved ego "cannibalizes" and "incorporates" a lost object in order to deny its death. In healthy mourning, he argues, the ego needs to both internalize and eventually expel this incorporated object. In melancholia, the ego finds itself destructively supplanted

and ruled by this increasingly obstructing object with no possibility for change. Clearly, for Freud, Haitzmann incorporated and thereby resurrected the lost father, his ego suffering under a subsequent demonic tyranny for 9 years until he sought deliverance from his symptoms through exorcism. For these reasons, Freud considers Haitzmann's subsequent maneuver out of his subjugation and into the order of the brethren as perhaps progressive but still evasive, neurotic and, by implication, diabolical, the neurotic splitting perpetuated by the decision to enter a cloistered order rather than to take up again his vocation as painter. Lacan would read this psychoanalytically as a failure to endure a confrontation with the Otherness of the "réel": "that before which the imaginary falters, that over which the symbolic stumbles, that which is refractory, resistant" (Lacan, 1966: ix-x).

In a definition of demonism for the *Schweizer Lexikon*, Jung (1945a/1954) accounts for the phenomena of demonic possession by referring to his theory of complexes. At the same time, his definition introduces a collective component. For instance, he describes the demonomania of the Ursuline nuns at Loudun as an epidemic comparable to what he calls the "induced collective psychoses" of the twentieth century; as a result, any interpretation of an individual's suffering such as that of the Mother Superior Jeanne des Anges should take into account not only the possibility of trauma and the activation of repressed contents in the personal unconscious but also the effects of the collective unconscious. In other words, Jung would argue that Jeanne des Anges's demonological neurosis psychically infected the other Ursulines, polarized Loudun, and drew crowds from across Europe because her possession articulated not only a personal repressed conflict but a social dilemma in which the collective unconscious was active. Curiously, in his definition of demonism, Jung doesn't refer to evil or to his theory of the shadow, an inferior part of the individual personality and of the collective which, he would claim, can be integrated only in as much as it can be realized and suffered. Elsewhere, in connection with evil, Jung argues that while conscious constructs tend towards ternary forms, natural totalities form fours, the implication being that any teleological movement towards wholeness would require the inclusion of a fourth element which consciousness is inclined to abhor or reject; so, he observes, "In the case of the religious triad the Fourth is obviously the devil, a metaphysical figure missing in the Trinity" (Jung, 1973, 1: 412). Jung's short definition of demonism also doesn't explicitly mention his notion of a positive "daimon," but this is perhaps implied in his references to trance, shamanism, and spiritualism.

Freud and Jung were addressing not seventeenth century but twentieth century Western problems in which psychological disturbances manifested more in terms of organic illnesses than of gods and demons. In an essay written in 1945, Jung makes this comparison explicit:

- ▶ Psychology has discovered where those demons, which in earlier ages dominated nature and man's destiny, are actually domiciled, and, what is more, that they are none the worse for enlightenment. On the contrary, they are as sprightly as ever, and their activity has even extended its scope so much that they can now get their own back on all the achievements of the human mind. We know today that in the unconscious of every individual there are instinctive propensities or psychic systems charged with considerable tension. When they are helped in one way or another to break through into consciousness, and the latter has no opportunity to intercept them in higher forms, they sweep everything before them like a torrent and turn men into creatures for whom the word 'beast' is still too good a name. They can then only be called 'devils'. To evoke such phenomena in the masses all that is needed is a few possessed persons, or only one. Possession, though old-fashioned, has by no means become obsolete; only the name has changed. Formerly they spoke of 'evil spirits,' now we call them 'neuroses' or 'unconscious complexes'. Here as everywhere the name makes no difference. The fact remains that a small unconscious cause is enough to wreck a man's fate, to shatter a family, and to continue working down the generations like the curse of the Atrides. If this unconscious disposition should happen to be one which is common to the great majority of the nation, then a single one of these complex-ridden individuals, who at the same time sets himself up as a megaphone, is enough to precipitate a catastrophe (Jung, 1945b/1954: par. 1374).

Jung's use of the words "primitive" and "primordial" to account for the phenomena of demons leaves him vulnerable to charges of primitivism when he discusses other cultures, but here he applies the words to twentieth-century Western European culture in order to contradict its rational bias:

- ▶ I use the term 'primitive' in the sense of 'primordial' and... I do not imply any kind of value judgment. Also when I speak of a 'vestige' of a primitive state, I do not necessarily mean that this state will sooner or later come to an end. On the contrary, I see no reason why it should not endure as long as humanity lasts. So far, at any rate, it has not changed very much, and with the World War and its aftermath there has even been a considerable increase

in its strength. I am therefore inclined to think that autonomous complexes are among the normal phenomena of life and that they make up the structure of the unconscious psyche (Jung, 1934/1960: para. 218).

Clearly, Jung locates his definition of demonism in the present tense and in parallel with contemporary events.

Depression

Kate M. Loewenthal

What is depression? How is it seen by psychological, psychiatric and religious authors? How is it related to religion and religious factors?

What is Depression?

Depression is a term referring to a disabling and prevalent psychiatric illness, major depressive disorder (unipolar depression). But the term also refers to a number of other,

related states. Unipolar depression must be distinguished from (1) depressed mood, which is a normal emotional response to adversity, especially involving loss, which if transient is not considered a clinical problem, (2) bipolar disorder, a relatively uncommon psychiatric condition involving uncontrollable swings from elated manic phases, to low, depressive phases, (3) Dysthymic disorder, a milder disorder involving the symptoms of clinical depression, but as few as two such symptoms (plus depressed mood) qualify the sufferer for the label dysthymic. There are a number of varieties of major depressive disorder and dysthymia, for example seasonal disorder. Further, in clinical research, the term depression is sometimes used to refer to a measured dimension, varying in the number and sometimes intensity of the symptoms of depression.

Returning the commonest meaning of the term depression: major depressive disorder is considered present (American Psychiatric Association, 2000) if at least five of the following have persisted for at least 2 weeks, of which at least one is depressed mood or loss of interest or pleasure:

1. Depressed mood most of the day, every or nearly every day
2. Diminished interest or pleasure in all or nearly all activities
3. Significant weight loss or gain
4. Insomnia or hypersomnia
5. Psychomotor agitation or retardation
6. Fatigue or loss of energy
7. Feelings of worthlessness, or excessive or inappropriate guilt
8. Difficulty in thinking or concentration, or indecisiveness
9. Recurrent thoughts of death or suicide or suicide attempt

Although there may be some biological predisposition, the most popular view of the causes of depression involves a diathesis model, in which a causal event or difficulty involving loss precipitates depressed mood, which can become a clinical condition in individuals who are vulnerable. Vulnerability factors may include early experience of loss (such as death of a parent), inadequate social support, low self-esteem, and heavy caring responsibilities, and there is some evidence of cultural variation in the factors that make people vulnerable to or protect them from depression (Brown and Harris, 1978; Loewenthal, 2007; Butcher, Mineka and Hooley, 2007). Widely-used treatments include medication and psychotherapy, for example cognitive-behavioral therapy. It is worth noting that of all

psychiatric conditions, depression has perhaps excited the most controversy. It has been a prime example for the anti-psychiatry movement, led by Szasz (1974), arguing that it cannot be regarded as an illness, though it involves great suffering. Szasz argues that the illness model of mental illness leads to medication, custodial care and other treatments being wrongfully and coercively applied. In spite of Szasz, the view of (clinical) depression as illness remains dominant.

This essay will look at views of depression in religious sources, and some of the effects of these views. The essay will consider the widely-cited claim that religious people are less prone to suffer from depression, and will consider the factors which may be involved in this effect. Finally we will consider recent attempts to deploy religious and spiritual factors in the therapeutic process.

How Has Depression Been Viewed in Religious Sources? What Are the Effects of these Views?

In religious writings, it has been suggested that melancholy may be a spiritually valued, possibly chosen state (see Frost, 1992), and even if not chosen, depression and melancholy may be viewed as opportunities for spiritual growth, increasing religious trust (Loewenthal, 1992). Much recent work in positive psychology has offered evidence in support of these pious hopes: post-traumatic spiritual growth has now been empirically affirmed as a possibility. Thus Shaw, Joseph and Linley (2005) concluded from their systematic review of published empirical work that religion and spirituality are usually, although not always, beneficial to people in dealing with the aftermath of trauma. Traumatic experiences can lead to a deepening of religion or spirituality, and positive religious coping, religious openness, readiness to face existential questions, religious participation, and intrinsic religiousness are typically associated with posttraumatic growth. Positive psychology in general has been advanced as effective in the treatment of depression and as harmonious with a number of core religious teachings and spiritual values, such as the practices of helping, and of forgiveness (Seligman, 2002; Joseph, Linley and Maltby, 2006). Such religiously-encouraged practices are now found to have beneficial mental health effects.

Although in religious writings, melancholy and depression have been generally viewed as normal responses to adversity and loss, and as foundations for a deeper faith, lay religious persons may regard depression as a failure of religious faith (Cinnirella and Loewenthal,

1999). For example: “Sometimes we assume that depression can always be overcome through prayer – that good Christians don’t suffer from depression” (quoted in Schroedel, 2008). Greenberg and Witztum (2001) quote several rabbinic leaders who suggest that prayer, religious song and other religious coping methods may be sufficient. Indeed they may be in some cases, but where they are not, the cloud of depression thickens. In spite of the frequent helpfulness of religious ideas in coping with the miserable psychological consequences of adversity, religious coping may not always do the trick, and there is an ongoing concern that when religious coping fails, this may be seen as a personal failure, inadequacy of the individual, leading to deeper depression.

It is also important to note that clergy are often trusted as resources for mental health care, generally more so (by their congregations) than the mental health professions. Thus religious teachings about depression and coping, as delivered by the clergy person, may be an important resource. A minority of clergy may actively mistrust the mental health professions, and warn their congregants against the use of professional help (Leavey, Loewenthal and King, 2007).

This religious teachings on depression have been mixed, and have had mixed effects – depression itself may have some spiritual value as a springboard for spiritual growth, religious faith, religious practices and religious leadership may be helpful in coping with depression. However the failure of religious coping can have a damaging effect on a person who is already depressed, and the advice of the minority of religious leaders to avoid professional mental health practitioners may not always be in the best interests of those suffering from depression.

The Association Between Religiosity and Low Levels of Depression

It has been widely concluded that there is an overall, consistent relationship between indices of religiousness and lower levels of depression (Worthington, Kuru, McCullough et al., 1996; Koenig, McCullough and Larson, 2001; Loewenthal, 2007). In spite of inconsistencies in the assessment of religiosity, and of depression, the relationship is fairly reliable, though not strong, and not always consistent. What are the factors involved? Three kinds of effects have been identified:

1. *Social support*: religious groups endorse and encourage helping in times of adversity. This includes in-group as well as out-group helping (Inaba and

Loewenthal, 2008). Additionally, the existence of a social circle of friends and sympathetic listeners can be an important protective factor. Thus Shams and Jackson (1993) found that unemployed Muslim men in the North of England were less likely to become depressed if they were religiously active, meeting regularly in the mosque for friendship and support, as well as prayer and religious study.

2. *Religious coping*: religiously-active people are likely to engage in religious worship, study and prayer, and this will develop a repertoire of religiously-based coping beliefs which are drawn on in adversity, such as “this is all for the best,” “I feel that G-d is supporting me,” “there must be a reason for this even if I can’t see it now” (Loewenthal, MacLeod, Goldblatt, et al., 2000). The study of religious coping has been effectively established by Pargament (1997), who has reported a number of robust effects. Particularly important is the effect that good psychiatric outcomes (in adversity) are associated with positive religious coping beliefs, such as those listed above. Poor psychiatric outcomes are associated with negative coping beliefs, such as “G-d is punishing me (because I am bad),” “There is no purpose in this,” “G-d has abandoned me.”
3. *Lifestyle factors*: Religions endorse and encourage aspects of lifestyle which can have an important impact on wellbeing. Thus for instance religious Jews and Christians have been shown to report fewer disruptive life-events – particularly, they report fewer family-related disruptions, less arguments, family violence and divorces. Disruptive life events are strongly associated with the onset of depression, and thus the lower prevalence of depression in the religious groups studied may be (at least partly) traced back to the religiously-supported value placed on harmonious family life and marital stability (Prudo, Harris and Brown, 1984; Loewenthal, Goldblatt, Gorton et al., 1997).

The finding that religious coping can have an impact on clinical outcome – sometimes positive and sometimes negative – has led to the development of exciting attempts to bring spiritual and religious factors into stronger focus in the course of psychotherapy. After many years of excluding religion and spirituality from the psychological therapies, Pargament and his colleagues have introduced a wide range of suggestions about how religious and spiritual factors may be included (Pargament, 2007). Spirituality – defined as “the search for the sacred” – is central for many clients in psychotherapy, and therapists need the tools and the sensitivity to address the spiritual

dimension in a systematic way. Spiritual coping may be used to conserve, protect and develop the sacred, it may lead to growth, it may lead to decline, it may be part of the solution, and it may be part of the problem. For example, one woman was in despair because she felt she had committed an unforgivable sin. The therapist was able to liaise with the client's priest, and the priest, therapist and client were able to develop a successful reconciliation. A strong merit of the work led by Pargament is the emphasis on an evidence base for findings, which may do much to enhance the scientific acceptability of clinical work involving spiritual and religious factors.

This essay has defined depression, considered how it has been viewed in religious writings, considered some of the ways in which it may be affected by religious factors, and finally, the ways in which religious and spiritual factors have been brought to bear in therapeutic work.

Depth Psychology and Spirituality

Lionel Corbett

Introduction: A Spiritual Approach to Depth Psychology

For many depth psychologists with a spiritual orientation, psychology and spirituality are two perspectives on an identical reality, because the divine manifests itself by means of the psyche. Dourley (1981) has pointed out that the psyche is sacramental, since it is a medium of connection to the sacred and it has its own transpersonal dimensions which reveal the sacred or the holy. The depth psychological approach to spirituality appeals to direct, personal experience of this level of reality, and eschews reliance on doctrine, dogma, religious tradition or religious authority.

This approach claims that the personal and transpersonal dimension of the psyche are inextricably intertwined, so that when we study sacred experience we invariably study the structure and dynamics of the psyche at the same time. Similarly, transpersonal elements are invariably present even in what seems to be purely personal material, even if we are unaware of them. Therefore, to separate spirituality and psychology is largely a convention based on habit, cultural preference, and academic turf. Here I make the usual distinction between religion as an institution with prescribed beliefs and practices, and spirituality in the sense of a subjective relationship with the sacred or with the divine in a traditional sense. Or, based on our personal experience of the transpersonal dimension, our spirituality is our acknowledgment of spiritual forces at work beyond human understanding, or simply our personal way of dealing with life's ultimate questions.

Soul in Depth Psychology

From antiquity until the early nineteenth century and the subsequent rise of psychology as an academic discipline, what we now call psychology was understood to be a science of the soul. This is again the attitude of many contemporary depth psychologists. Although there is no agreement on the meaning of "soul" in their literature, for many depth psychologists the words "soul" and "psyche" are roughly synonymous terms. Psychotherapy, for instance, is understood in the etymological sense of that word as service to the soul. Most of these psychologists agree that whatever might be the nature of the psyche or the soul, it can be thought of operationally as an ontologically a priori, spiritual essence within the person, not necessarily in the traditional theological sense but as the deepest subjectivity of the individual, that level within us that gives meaning and significance to our lives.

Most depth psychologists would object to attempts to reduce the psyche or soul to an epiphenomenon of brain, because, as Jung (1964/1970) puts it, we assume that the psyche is a domain of existence in its own right, indeed a cosmic principle coequal with physical being, and that the psyche arises from an unknown spiritual principle (1960/1969). Indeed, many depth psychologists believe that spiritual reality contains and organizes what we refer to as material reality. One has to address in one's own way the potential problem of dualism that arises here. One can for example simply bracket the traditional soul-body or mind-brain dilemma for practical psychotherapeutic purposes, or one can think of these as two aspects of

the same reality, experienced in different modes because of the limitations of the human perceptual apparatus. One can use a personally appealing metaphor to avoid dualism, for example by thinking of psyche and body as a gradient of different densities of emanation from a unitary source. The physical body is at one end of this spectrum, while consciousness is at a more subtle level of the same energetic process.

Archetypes as Spiritual Processes

The depth psychological approach to spirituality views the psyche's intrinsic organizing principles, what Jung called the archetypes, as spiritual principles within the psyche. This allows depth psychologists to see archetypal processes as spiritual "organs" within the psyche that perform different functions, just as, in antiquity, these forces were personified and thought of as gods, goddesses, or spirits. Archetypal patterns contribute to the structure of the individual psyche because they form the core of intrapsychic structures or complexes, so that there is always a transpersonal aspect to our psychological life, including our psychopathology. That is, spiritual elements are important in forming the structures of the personality, so that to study these structures psychologically is at the same time to study the dynamics of the sacred within the personality. Thus, rather than envision the transpersonal dimension as entirely transcendent, for the depth psychologist it is located deeply within human subjectivity. Traditional theologians are concerned that this perspective reduces a supra-psyche divinity to a purely psychological phenomenon. However, if the psyche is real and the holy manifests itself thereby, no reduction is implied.

The Religious Function of the Psyche

Because of the psyche's intrinsic religious function, which means its ability to either generate or mediate numinous experience, the psyche is a continuous source of personal revelation. Many traditional religionists believe that revelation is restricted to events such as the handing down of the Torah at Mt. Sinai or by means of the life of Jesus. For Christian fundamentalists, revelation ended with the completion of the New Testament. In contrast, the depth psychologist believes that numinous or mystical experiences as described by Rudolph Otto (1958) continue to occur to all of us in dreams, as waking visions, through the body, as synchronistic events, in the natural world, during creative work, during periods of physical illness or

psychopathology, induced by entheogens, or spontaneously for no apparent reason (Corbett, 1996, 2007). Typically, the eruption of the numinosum into ordinary consciousness is more likely to occur when the hegemony of the ego is relatively weakened by severe stresses.

Experiences of the *mysterium tremendum et fascinans* may or may not take a traditional form. Biblical examples are the experience of Moses hearing the voice of God speaking to him from a burning bush (Exodus 3: 2–6), or the experience of Saul on the road to Damascus, blinded by a bright light as the voice of Jesus speaks to him (Acts 9: 1–9). However, numinous experiences may be completely novel, and may not be related to the religious tradition of the subject, in which case their content may be difficult to understand, even though their emotional quality is unmistakable. Even when they do not have a traditional content, they are recognized by their emotional quality; they are awesome, dreadful, uncanny, making one feel that one has been addressed by something not of our ordinary world. Often we feel humbled, captivated, perhaps blessed by them.

Of most importance to the depth psychologist is that numinous experiences are usually intimately related to the psychology of the subject, which is why Jung stressed their healing quality. Sometimes they address the subject's immediate existential problem, while at others they speak to a developmental difficulty, an emotional problem, or they affect the course of the individual's individuation process. They may produce a religious conversion experience or prevent suicide, although it is important to note that in fragile personalities they may trigger a psychosis or a "spiritual emergency."

Because of their emotional intensity, numinous experiences have a self-authenticating quality; they produce a subjective conviction of their ontological reality that is difficult to deny. Nevertheless, for the materialist, whether psychoanalytically or biologically oriented, such experiences are typically reduced to some form of psychopathology by dismissing them as hallucinatory, hysterical, the result of residual primary narcissism, a regressive merger with mother, or due to a pathological brain process. In contrast, for the depth psychologist, as for Rudolph Otto, these experiences are *sui generis*, and not reducible. For the depth psychologist, they can be considered to be the experience of direct contact with the archetypal dimension of the psyche. Either they originate in what we refer to as the unconscious, or the unconscious acts as a medium of transmission of the numinosum which originates "beyond" the psyche. This epistemological problem cannot be definitively solved, but it is not important for practical psychotherapeutic

work, which requires that we discern the significance of the experience for the subject's life, relate it to the subject's psychological structures, and assist with its integration if necessary.

Spirituality as an Integral Aspect of Human Psychology

There is evidence (from burial practices, cave paintings, stone monuments, and the shamanic traditions) that our early human ancestors practiced various forms of spirituality for tens of thousands of years prior to the advent of the monotheistic traditions. Obviously there are several ways to interpret this fact. There are "explanations" for the origin of religion from all schools of psychology, while biologists believe that spirituality developed with the evolution of brain structure, although there is disagreement about whether religious belief was directly adaptive or whether religion is just a byproduct of our evolution. However, to have a scientific explanation for a phenomenon does not mean it is not real. The psychologist can legitimately argue that human beings have a spiritual sensibility because there really is a spiritual dimension, and we are drawn to it because it is an essential level of our being, just as thirst would not have evolved if we did not need water.

If spiritual experience is the experience of something both real and important to us, and our spiritual sense is a source of human motivation, spirituality is properly part of the province of psychology. It may be argued that for the depth psychologist to study spiritual experience smacks of an encroachment on theology. But this would only be the case if we were to speculate on the origin of this experience or on its absolute nature, whereas we simply accept this genre of experience as an empirical reality. Its source – for example whether it may originate in a divinity beyond the psyche – remains a matter of faith.

The depth psychological approach suggests that we have no need to tie our spirituality to any particular religious tradition. The established religious traditions have long insisted that the sacred may only be approached in their terms, using their rituals, sacraments, sacred books, and so on. However, many people experience the sacred in personal ways that may have little to do with the ways in which our religious traditions insist that it manifests itself. Our contemporary consciousness, influenced by advances in quantum physics, cosmology, and depth psychology, requires that we approach the sacred with these developments in mind.

Edinger (1984) has suggested that our culture is beginning to experience a new dispensation, a new means by

which divine grace emerges into the world, and a new God-image. The ancient Hebrews experienced the divine handing down law cast in stone, followed by the Christian experience of Christ as the incarnation of the God of love. Our felt sense today is that we are in relationship with the transpersonal psyche, which incarnates in everyone and communicates through personal experience of the numinous rather than by means of a set of laws or a particular savior. It is too early to tell if Edinger is correct, but if he is, the depth psychological approach to spirituality will be one of the pillars of this emerging spiritual form.

Descent to the Underworld

Kathryn Madden

In Christian theological doctrine, Christians affirm in the Apostles' Creed their belief that Jesus descended into Hell (Gk. κατελθόντα εἰς τὰ κατώτατα; L., *descendit ad*

inferos, or underworld), on the Saturday between the Crucifixion and the Resurrection. His descent is understood as an act of liberation of the unredeemed souls who had been banished to hell from the beginning of time. It is believed by most Christians that Christ raised with him those from all previous times who were deemed by God to be worthy to enter the kingdom of eternal life. Although this declaration of faith is made in the Christian Apostles' Creed, there is no specific mention of the event in the gospels other than some inferences in Acts 2:24:

- ▶ But God raised him up having freed him from death, because it was impossible for him to be held in its power.

Acts 2:31 further states that:

- ▶ He was not abandoned to Hades, nor did his flesh experience corruption (The New Oxford Annotated Bible, 1991).

John 2:6 describes Jesus' death as three days and three nights in the heart (*en te kardia*) of the earth. The apostle Paul draws in Romans from Deuteronomy 30:12–13 and Psalm 71:20 to describe the death of Jesus as a plummet into the abyss (*tis katabesetai eis abussion*) and the ascent of the resurrection as a rising from the dead (*ek nekron anagagein*). As forecast in the Old Testament, Hebrews (2:14–16), Jesus was to encounter the actuality of death as the only course by which his divine being could conquer evil.

In the Jewish tradition, beginning with the early Hebrew peoples, Hell was referred to *Sheol* [sh'ól], the common place of the dead. *Sheol* was an underground abode comprised of numerous levels. The dead were tortured according to the degree of their earthly sins. There below was also Gehenna, the lake of eternal fire where the fallen were forever tormented by flames.

The theme of human descent to the underworld does not exist in the Old Testament except in how God rescued people from death (Psalm 9:13; 30:3; 86:13; Isa 38:17; Deut 32:39; 1 Sam 2:6; 2 Kings 5:7). For example, when Saul summoned the prophet Samuel through the witch of Endor to consult the dead (1 Sam 28:3–25) there an indication of bridging the realm of life and death. In general, the notion of human descent was censured by Old Testament Law. In modern Judaism, an increasing distinction arose between the place in which the unrighteous dead dwelled (Hades) and a separate place in which the righteous dead resided (Luke, 16:22–23).

The late Hebrew literature of the apocryphal texts contributed to how the notion of descent was conceptualized in the Apostles' Creed. These included the apocryphal *Gospel of Nicodemus* and *the Acts of Pilate* (ca. 3 AD).

The *Gospel of Nicodemus* prophesized that Jesus would raise the dead in Hell just as he had raised Lazarus. Apocryphal literature often referred to the *Decensus Christi ad Inferos* which portrayed a conflagration between Christ and Satan, the god Hades.

In the second and third centuries, the early church fathers Tertullian, Clement, and Origen treated Christ's descent as literal. Their authoritative testimony anchored the event in Christian belief although it was not entered in to the content of the Apostles' Creed until around the seventh century.

The concept of the descent to the underworld derived from numerous oral traditions, legends, and literary forms borrowed from antiquity, which undoubtedly influenced the writers and redactors of scriptural literature. The myths recorded by Homer, Hesiod, Aristophanes, and Virgil featured a protagonist's heroic return from the underworld that involved transforming evil into good, death into life, torment into faith in relation to a salvific figure. Many of these legends became living religions lasting thousands of years.

In the literature of ancient Egypt, Hades, or Amenti, pertained to the place of the hidden god. The Egyptian *Book of the Dead* attests to specific rites and rituals in which an initiate would venture into the underworld with the goal of transformed consciousness. The Egyptian rituals inspired the Greek Mysteries, Eleusinian Mysteries, and Mithraism, which were liturgies of symbolic death and rebirth that emulated the earlier worship of Osiris. The discourse in Colossians 2:9–15 of the New Testament pertaining to *The Lord's Descent into Hell* may imitate these earlier traditions. The ritual of baptism became representative of symbolic death and rebirth.

In ancient Greece Hades [Gk. unknown, unseen, hidden], became known in various cultures as Gehenna, Tophet, Abaddon, Naraka, jahannan [Hind.], Aralu [Babylonian], Hel, Nifhel [Norse], the inferno, the pit, the abyss, the nether world, the region of the dead, the abode of the damned, the place of torment, visitation with the shades (ancestors) below, or limbo, the realm of departed souls. The descent typically involved a confrontation or encounter with the god who ruled the terrain of the underworld.

One of the most celebrated initiates connected to the Greek Eleusinian Mysteries (seventh century BCE), was Persephone, the daughter of Demeter who was seized by the god Hades and taken into the underworld. The myth of Persephone and Demeter remained in the collective culture as a religion for over two thousand years.

Another descent myth of the Greek Mysteries was the Orphic Mystery. Orpheus had a beautiful wife, Eurydice,

[Εὐρύδικῆ, Εὐρυδική] as well as a talent for playing the lyre. One day while dancing in the fields, Eurydice was bitten by a poisonous snake and died. Orpheus ventured to the underworld in an attempt to bring her back to human life. One version of this legend tells of Orpheus playing his lyre so enchantingly that Cerberus, the sentry of Hades, fell asleep. Orpheus then entreated the god Hades to return the soul of Eurydice to life. His wish was granted with the qualification that Orpheus must walk ahead of his wife and never look back until they had returned to the world of the living. Orpheus failed. He was never to see his beloved wife again (Guthrie, 1993: 171 ff.).

Christ's descent into Hell and subsequent Resurrection corresponded with the rituals and themes of these ancient civilizations. In early cultures, the triumph over death often coincided with the harvesting seasons of the agricultural year. The Greeks understood Hades as fork in the road where one might enter *Tartaros*: an existence of endless punishments; or, at best, one could be ushered into a paradisaical existence where their loved ones awaited – the Elysian Fields.

Until approximately 500 AD, the descent ritual was an inherent part of a sect of secret teachings known as the Greek Mysteries. The initiate's descent was both symbolic and literal. One was isolated in an underground cave or hollow in order to confront an internal universe. Analogous to modern analytical psychology, the symbolic quest, like C. G. Jung's mid-life challenge, was a *telos* (Gk. *telete*), an end goal and ultimate completion of one's potential for psychological and spiritual development.

In every culture of ancient civilization the collective psyche gave birth to initiates who made the descent and were magnified into the heroes of myth, for example: Gilgamesh, hero of the Babylonian epic; Ishtar who descended into Aralu; the goddess Astarte of Phoenicia and her consort Adonai who journeyed into the Akkadian Hades; the Great Mother Cybele of Asia Minor with her consort Attis. Others included Dionysos, Herakles, and Krishna.

A consort, guide, master teacher, high priest or priestess prepared the initiate for the journey, similar to the modern role of the psychotherapist where one descends into his or her unconscious, internal world and is accompanied by the presence of a therapist. The role of this consort was also to warn an initiate about the possible disintegration of the personality during the process and potential madness upon return.

There was an emphasis upon preparation for "going deeper," and a series of pre-trials to pass successfully including fasts and purification rites. One needed a strong

constitution, a sturdy ego, and a maturity of character. The initiate was trained to relinquish memory, desire, and will so that the physical self and personal psyche could succumb to a temporary death-like state (Apuleius, 1984, *Metamorphoses*, XI, 21, 23) which was often described as darkness. Plutarch, too, underwent an initiation ritual describing the proximity of *teleutan* and *teleisthai* – *to die* and *to be initiated* – (Plutarch, 1987, *Fragments*: 178). In the depth of this slumber, the mysteries of life and death might also be revealed. In the Egyptian Mysteries, Apuleius exclaims this experience of illumination: “at midnight I saw the sun shining with a splendid light” (Plutarch, 1987, *Fragments*: 23).

If not sufficiently prepared, the participant could experience a threshold of annihilation. Face-to-face with the god of the underworld, – what in modern psychology C. G. Jung would call an encounter with the archetypal shadow – the individual only could endure only with the qualities of humility and willingness. If the seeker was able to make it beyond the more dangerous stages, the reward was a beyond death experience of immortality.

The Egyptian myths, the Mystery Religions, and the apocryphal texts of Early Christianity were sources for accounts that followed throughout the centuries in various genres, for example, the English Mystery Plays of medieval times, which centered on the theme of the Harrowing of Hell and of Dante’s *Inferno* (Canto X. Circle vi).

Inspired by Virgil’s *Aeneid*, philosopher Dante Alighieri wrote about the descent into Hell in “The Inferno” from his *Purgatorio*. In this work he speaks of the lowest Hell replete with “malicious and furious demons” as the City of Dis [cf. Dis]. Dis is the most abyssal abyss of ultimate despondency. This underworld represents the bowels of the universe and the bleakest recesses from anything alive or life-giving. In Dis, there is no promise of hope or of a caring and sustaining divinity; only evil and despair.

As represented in Dante’s illustration of unconscious life, those who reside in the darkness of Hell are forever alive, yet spiritually dead. What greater cruelty to human consciousness and to the uniqueness of an individual than to be completely unknown, and unconscious. In the abyss of Dis, there is no possibility of the life of the soul without the redemption of another. For Dante, at the end of time, the forgotten non-souls who have not “known” Christ, are lost forever to the possibility of being known within the unity of the divinity. These are individuals who have turned their focus toward the sterility of selfish egotism in contrast to offering gratitude for their very being. Control, power, greed and envy relinquish them to an eternal Hell of non-being.

Psychology

Analogous to the Nekyia, or night sea journey of Carl Jung the descent into the underworld has powerful and purposeful psychological intent [cf. Abyss; Dark Night of the Soul]. The ego falls into the unconscious for an extended time to eventually emerge as a person reborn. The transformed individual seeks to “obey a higher will.”

Jungian analyst Edward Edinger concurs that this “fall” or plunge into the psyche represents the ego’s intentional descent into the unconscious because the ego has been “beckoned.” The awareness of the conscious ego is, in the interim, eclipsed and carried into the lower world where it rescues certain contents of the unconscious and even conquers death itself. For Edinger, the death and resurrection of Christ is an archetype that exists in the collective psyche that is analogous to the process which lives itself out in the individual seeker (initiate). The collective God-image must necessarily undergo death and rebirth throughout certain periods of history, he tells us, thus, the continuing necessity of willing initiates to bring forth “the godhead.”

Jung views this prolonged “disintegrative” encounter as the psychological equivalent of the integration of the collective unconscious, which is “an essential part of the individuation process” (Brome, 1981: 159). The unconscious underworld needs ego consciousness to raise it (Brome, 1981: 39). What Dante called Dis represents all that is yet unknown to human consciousness. Dangerous components of the shadow aspects of human consciousness exist externally and dangerously so, as long as the projective nature of the psyche remains shut away within the crypt of the individual and collective psyche.

Drawing from anthropologist and scholar Mircea Eliade, Marie Louise von Franz (1975), likens Jung to the shaman whose “main function is the healing of personal illnesses and disturbances in the life of the collective” (Eliade, 1964: 8 passim). Like the shaman or medicine man, certain individuals are forced into a particular inner way as a result of the collective culture around them. As the person feels summoned, “he sets himself apart, turns contemplative; often he receives his call through a dream experience” (Eliade, 1964: 21). Readiness is crucial to survive the dying of the old self, the former ego, and the emergence of a new self.

The individual is carried off to the underworld where he or she is often dismembered or suffers other tortures. Like the duel-possibility of the Greek path of the underworld, one may also be carried off to heaven where instruction is received from a divinity, a female figure, an invisible heavenly spouse, or a magical anima

(von Franz, 1975: 100) The central element is always the same: death and symbolic resurrection (Eliade, 1964: 5, 56).

Contemporary Jungian analyst, James Hillman agrees with Jung in *The dream and the underworld* (1979b), that it is Psyche who beckons us into the depths. Being polytheistic in contrast to monotheistic, Hillman is more synchronous with the worldview of antiquity: there are many gods and goddesses in the psyche personified as archetypal manifestations, but there is not necessarily anything divine or transcendent beyond the psyche. Spirit reveals itself in image from the depths of the soul, which Jung, Edinger, Dante, and the masters of the Mysteries would agree with. Yet, for Hillman and the Greeks, images *are* the divinity.

In contrast to Jung, Freud's classical perspective views images, dreams, or waking dreams of descent into the underworld, as Oedipal themes related to castration anxiety. Freud emphasizes incestuous content with the repeated theme of the psyche's need to destroy phallic symbols (Boss, 1973: 273). For instance, a patient might dream of a church tower, an image that dream by dream becomes more differentiated. A Freudian psychoanalyst working with such a dream most likely will interpret reductively the increasing specificity of the church tower as a collection of images that relate back in the patient's developmental life. The image becomes reduced to that of genitalia or "to a preconceived unconscious complex, thus paying a disservice to the spirit" (Robbins, 2008).

What is crucial when working with the deeper layers of the psyche (the underworld), the patient, with the analyst's guidance, will begin to amplify dream images in a non-pathological manner, giving the individual the opportunity to dig more archeologically into the collective underpinnings of the psyche at large, which often not only produces religious or spiritual images, but a feeling of confidence that one is connected to very deep roots with a supra-personal divinity. One discovers that religious dreams and symbols have their fundamental origin in archetypal structures that are universal, timeless, and shared in common with all people.

Regardless of the psychological school of thought, the chthonic and instinctual of a psychological complex need to be given as much primacy as the spiritual and transcendent, therefore avoiding abstractions or over-intellectualizations. A Jungian perspective can lean too far toward "spirit," with a tendency to universalize a patient's imagery. This inclination can be reductive in if there is an essentialism underlying the image.

A balanced discernment means that one truly descends into the depths of "pathos," or one's pathology,

and yet, does not remain imprisoned in the darkness, enmeshed with the god of Hades, Hell, or the archetypal shadow – for this would certainly flag a potential psychosis that would need spirit and sustenance to pull one out of this psychotic morass.

The word pathology is comprised of pathos and logos. The logos of pathos exists in an ever-precarious balance. One can succumb to the instinctual nature of soul but miss the logos of spirit. The logos of spirit pulls one back into the world of the living, into the light with a renewed sense of direction and purpose fueled by the experience of spirit *in* the body. This experience is shared by the ancients and the moderns – when it occurs, it will never be forgotten for one will be forever changed. The marriage of pathos and logos gives life to the soul which endures forever.

Deus Absconditus

Meredith Lisagor

Evolution and Variants of a Theological Concept

Ancient Egyptian and classical Western mystery religions can be said to rest upon the inscrutability of deity, but a concept of god as partially knowable yet ultimately inaccessible by any sort of mediation is the fruit of the Judeo-Christian tradition. Various detailed by different theologians as early as Clement of Alexandria (ca. 150–215), notions about god as hidden, or Deus Absconditus, generally take their biblical warrant from Isaiah 45:15, “Truly, you are a God who hides himself.” Old Testament injunctions against seeing or looking upon god and New Testament recapitulations (e.g., “No man hath seen God at any time; the only begotten Son, which is in the bosom of the Father, hath declared Him.” John 1:18) may also have influenced discussions of deity’s purposeful invisibility. But the crafting of theology based on the hiddenness of God would not occur until the Protestant Reformation.

Cited chiefly in context of the indefinability of the one transcendent god in words, concepts, or images, *hiddenness* was significant to early Christian thinkers only as it was implicit to the direct self-revelation of a personal god. In short, while God had revealed something of His personal nature in Jesus Christ, whatever was not known he had chosen to hide.

Clement, a polite opponent of Gnosticism, proposed that through illumination by Christ as the incarnate Logos, humanity, being made in God’s image and likeness, could and was even meant to gradually understand God, the otherwise “Unknown.” For his pupil Origen (ca. 182–254), humanity’s likeness to the divine pointed to a kinship between them. And God’s Logos, revealed in Christ, then hidden again after the resurrection, was “an example,” imitation of which would make the faithful proper “partakers of the divine nature” (Origen, 1979: 319) at Parousia.

However, John Chrysostom (ca. 347–407), in vehement rejection of the Anomean Arians’ presumption that they understood God’s very essence, proceeded from the conceit that God was in truth wholly other, utterly

“unapproachable” as stated in 1 Timothy and “unsearchable in His judgments” as declared in Rom 11:33. In this, Chrysostom apprehended the psychic consequences for the individual in relationship with such divinity, and, according to theologian Rudolf Otto, spoke to the very core of the creature’s experience of the numinous, which is unrational, terrified, and yet drawn to it in fascination.

Augustine (ca. 354–430) engaged the idea of God as hidden and unknowable in His essence, but emphasized the way in which God’s visible miracles draw one toward Him through the love and faith they inspire. Pseudo-Dionysius (ca. fifth century), adumbrating the mature Christian mysticism of the high Middle Ages, envisioned the possibility of ascending to the very “ray of the divine shadow” (Pseudo-Dionysius, 1978: 135), however, only by “renouncing all that the mind may conceive [about God]” (Pseudo-Dionysius, 1978: 137). Nicolas Cusanus (1401–1464) elaborated on the nature of such renunciation in his *Dialogue on the Hidden God*. But it was Martin Luther (1483–1546), driven by recurring bouts of self-doubt, guilt, and despair, who gave the most trenchant and exhaustive attention to the notion of Deus Absconditus.

Luther’s life-long emotional and psychosomatic sufferings, which he termed *Anfechtungen*, made him question whether they were assaults by the devil or God Himself, who though all-loving had nonetheless subjected His only begotten son to the extremity of suffering. If the latter, Luther concluded, “God hides his eternal goodness and mercy under eternal wrath, righteousness beneath iniquity” (Luther, 1972: 62). Thus, everyone will know periods of rejection by Him, as had Christ on the cross where God was simultaneously revealing His redemptive love. Indeed, the godhead embraces all contraries, and its justice – in wrath or grace – is hidden from reason. Only through faith in Christ crucified, insisted Luther, can one approach God’s true nature, and “believe him merciful when he saves so few and damns so many. . .” (Luther, 1972: 62).

With the Age of Reason, concern about God’s hiddenness waned. At the dawn of modernity, the last notable reflection on the topic is to be found in the *Pensées* of mathematician and Roman Catholic-convert Blaise Pascal (1623–1662). In these reflections he proposes that God hides Himself so that humanity might come to Him by an act of will; to be fully revealed would make Him a matter of fact, requiring no commitment from the believer.

God and the Splitting Phenomenon

Among modern thinkers, Martin Luther’s doctrine has occasioned much critique, both theological and psychological.

Erik Erikson, in a definitive biography, sees Luther as achieving in the construct of institutional religion “a living reformulation of faith” that points one back to “basic trust” (Erikson, 1962: 257), a feature essential to the healthy emergence of ego that is often impaired by the censure of the later developing super-ego. Luther’s *Anfechtungen* were, psychologically speaking, reactions to a highly charged super-ego forged in the milieu of a censoring father. According to Erikson, by conceding that behind God’s wrath and prior to it exists compassion, Luther not only approached a resolution to his personal struggles but also rehabilitated religion’s capacity to reaffirm the beleaguered “basic trust” of the faithful.

While theologians debate the nuances of Luther’s exact meaning in his highly varied use of Deus Absconditus, Rudolf Otto credits the reformer with revitalizing rational theology by identifying his personal terror and fascination with experiences of the divine. C. G. Jung, who asserted that the “only statements that have psychological validity concerning the God-image are either paradoxes or antinomies” (Jung, 1953: 11n), affirms that Luther had grasped a critical nonrational truth when he spoke of God’s dark side: His doctrine can be said to hold up the numinous, disowned shadow material of the collective unconscious, which must always be considered the natural habitat of contraries.

A truth, then, that both Luther’s theology and personal history illuminate from the Object-Relational vantage point is the inherent – to be sure, essential – tendency of the human psyche toward *splitting*. Luther’s God could easily symbolize the psychic field on which an ego that cannot tolerate ambivalence keeps internal objects separated into good and bad, comforting and punishing – God as the compassionate beloved, a representation of the cosseting mother who reflects the infant’s goodness back to it; God as persecutor, hostility split off, and projected. Harry Guntrip, discussing the splitting of ego itself – into *libidinal*, *central*, and *antilibidinal* – notes how an individual will both repudiate (through the antilibidinal ego) and defend a weak libidinal ego against “outer world pressures and inner world fears” (Guntrip, 1992: 184) by hiding it behind central ego aggressiveness, obsessive self-mastery, addiction to duty, and physical illness. Despite Erikson’s characterization of his triumph, Luther – renowned for volatility, hyper-scrupulosity, and an assiduous work ethic – never overcame periodic depressions and psychosomatic crises.

It must be acknowledged that the phenomenon of splitting is implicitly central to any conceit of Deus Absconditus, for regardless of the interpreter – and whether or not God is envisaged as the thing of which humanity is Its image and likeness or a screen for human

projections – God hidden represents half a perennial debate: the Godhead’s immanence versus Its transcendence. In their delineations of the ways in which the Hidden God might be known, Clement and Origin, Augustine and the Christian Mystics all point to Christ as signifying a reconciliation of these modes and mooted, if not resolving, the issue of hiddenness. In psychodynamic terms, what they intuited was that Christ represents a well-integrated psyche, the still point at which good and bad objects stand in healthy tension. At the same time, he models the ways in which *introjection* and *projection* facilitate development and relationship: Where Jesus as human was awakened to his divinity, he may be said to have introjected the Father (divine or personal), making Him indeed immanent even immediate and available as a building block of ego and an internal-object world; while Jesus ascended becomes the projected image of an ideal, transcending (or eluding) the domain of the ego yet remaining in relationship with it.

An Affect Regulation Take

A suggestive point arises at the convergence of Object-Relations and Attachment theories in recent discussions of neurobiology and affect regulation. The elusive-but-desired or (as in the case of Luther) unpredictably present-but-critical “God” might be identified with an unconscious internalized object that resulted from neurologic imprinting caused by experiences of “self-interacting-with-a-misattuned-dysregulating-other” (Schore, 1974: 473) – *mother or father*. That is to say, the consequences of a primary caregiver whose affect fails to reflect the infant’s enthusiasms at critical junctures (and/or meets the infant with impatience, disdain or anger) are not only psychic storage of self- and other-representations corresponding to the misattunement, but also orbitofrontal cortex development primed for future affective replications: A psychobiological expectancy for consequent relations – unto a relationship with a God – to recapitulate the affective experience in the original misattuned dyad. Otherwise put, Deus Absconditus could be hardwired.

Freudian and Jungian Takes

Perhaps nothing speaks more potently to the concept of the Hidden God than Freud’s theory on the origin of religion as the murder of the primal father by sons who wanted unimpeded access to the primal mother (*Totem and Taboo*, Freud, 1957). The father’s elevation to the status of a god is a sublimation aimed at palliating

guilt and eradicating the crime from racial memory. In this context, a fantasy of a Hidden God might be considered a redoubling of the sons' effort to shield themselves from return of the repressed memory. And Isaiah's assertion that God "hides himself" would be a disingenuous displacement of responsibility – since it is we who have done the hiding. Returning to Luther, his Oedipal conflict with a harsh and disapproving father, which lasted a lifetime, could be said to have made him less able to combat the repeated "return of the repressed," and more highly identified with Christ as the son who suffered to atone for collective sin (the disguised primal murder). To go this far, however, is to be obliged to suggest Luther's subjective identification with Christ as exalted in resurrection to equal status with the Father; which Freud could say any Christian does vicariously in the transformed totem meal, the Eucharist, where God is present but hidden. The Christian, thus, stirs the repressed memory of an archaic crime in regular ritual; and, theoretically, we could say that he or she may never be able to fully outgrow the regressive ambivalence of the Oedipal drama.

In Pascal's contention that God is purposefully hidden, we also find classical psychoanalytic implications. Certainly, the thesis suggests the voice of the super-ego: God, or something higher in the human makeup, has expectations of the believer; and trust as an accomplishment of good ego consolidation is more valuable (to the internalized father and the ego) than an act of memory which does not engage the individual's value assessing capacity. Placing the thesis, then, in the context of the primal murder, Pascal may be thought to have unconsciously recognized that the internalized father wants the faithful to recognize the primal crime and to atone through an act of character, with consciousness and volition – and he is not going to make it easy. More practically speaking, the super-ego wants the ego to recognize its obligation to master the impulses of the id.

For C. G. Jung, the realm of the instincts, the unconscious, calls the ego to acceptance and humility. Its task is not so much to subordinate drives as to negotiate with them, and to learn as best as it can their symbolic language. Neither, however, is the ego to be subordinated by the unconscious. It should learn that it is itself archetypal and elemental of the greater psyche represented by the *Self* – the correlate of totality, wholeness, the impersonal God, whose center is everywhere and circumference nowhere, as St. Augustine observed. Augustine was also able to approach the idea that we shall not know God in His essence, but rather by as much of the instinctive numinosity as consciousness can metabolize. And such is the

wisdom that informed the Pseudo-Dionysus when he saw that one might understand something of divinity only after one renounces what the mind (thinks it) knows. Jung would say, perhaps, that God's very nature is hiddenness and it is only through letting go of qualifying and quantifying intelligence that consciousness experiences the true intimations of wholeness.

Deus Otiosus

David A. Leeming

In many religious traditions the creator god essentially retires from the world he has created and leaves it to others to run – to humans or lesser gods. In short, he does not interfere with the world once he has created it. His mythological relative is the Deus Absconditus who more actively absents himself from his creation. For the purposes of psychological interpretation, the two types can perhaps be considered to be synonymous. Many African creator gods leave creation to tricksters or to their sons. Sometimes, as in Greek, Anatolian, and Indian mythology, the old high god is forced out and is replaced by young upstart deities. Christian theologians, such as Thomas Aquinas and Martin Luther, have used the hidden god concept to emphasize that God is unknowable but that we can know God through the tangible “living” Christ, Jesus. Deists, on the other hand find in the Deus Otiosus – the clock-maker God who made the world, wound it up and then left – simply a rational explanation for life as we know it.

The psychological importance of the Otiosus/Absconditus is complex. For some peoples it expresses a “family” that senses desertion by the father and the consequent trials and tribulations of life. For others – Aquinas and Luther, for example – it signifies the gift of the God revealed or embodied in the Christ with whom the worshipper seeks emotional and psychological unity. Mystics of all traditions would find positive psychological energy in the “hidden” god within with whom the individual achieves perfect union or Self. For Deists the God who withdraws gives the gift of psychological and moral independence and self reliance. For the atheist the Deus Otiosus is a myth used to excuse the evils of life. For those who doubt but long for a better life the hidden god is an inner security longed for but painfully absent.

Devil

Jeffrey Burton Russell

Origins

The word “devil” derives from Greek *diabolos*, meaning “adversary.” In Jewish, Christian, Zoroastrian, and Muslim traditions, the term applies to a single spirit of evil whose function is to oppose the will of the good God. In Zoroastrian tradition, and in the Manicheism that derives from it, the Devil, named Ahriman, is a god of evil and darkness in opposition to the god of goodness and light, Ohrmazd. The two gods struggle against each other until the end of the world, at which Ohrmazd will triumph and annihilate Ahriman. In Jewish tradition the Devil is most often identified as Satan, though he also has many other names. In the Old Testament (Hebrew Bible) Satan’s role is usually unclear, and often the term “satan” is used as a generic term for an opponent. When the Hebrew scriptures were translated into Greek about 200 BCE, the term *diabolos* entered scriptural usage. Though only marginal in earlier Hebrew thought, the Devil, under various names, became of much greater importance in Jewish pseudepigraphical literature (materials falsely claimed to have been written by ancient Biblical figures such as Enoch) from about 100 BCE to about 150 CE. The mutual influence of Hebrew and Zoroastrian thought is still unclear, but in any case the Devil was a hugely more sinister power in the pseudepigrapha than in the Hebrew Bible.

Christianity

This is precisely the period in which Christianity arose, and the power attributed to Satan in the New Testament and in other early Christian writings, though less lurid than in the pseudepigrapha, and never as great as that in Zoroastrian texts, is nonetheless a huge threat to Christ, to the Christian community, and to Christian individuals. He is tempter, accuser, tormentor, and jailer of the

damned in hell. In addition to the canonical Christian writings, a number of allegedly Christian but actually Gnostic texts, mainly from the second century CE, derived their ideas from the pseudepigrapha and took the power of the Devil to almost Zoroastrian extremes. For most of the gnostic sects, the cosmos was a battleground between the God of light and spirit on the one hand and the Devil, lord of darkness and matter on the other. Thus the gnostics created a matter/spirit dichotomy, which they melded with the Zoroastrian good spirit/evil spirit dichotomy. Such a dichotomy was explicitly and firmly denied by orthodox Christianity, in which the Devil's power, though great and fearful, was always weaker than that of Christ. Anyone calling on Christ against the Devil would be saved, and at the end of the world, Christ would cast Satan and his fellow demons forever into hell. Belief in the existence of a Devil as the personification of evil has never been a necessary Christian dogma, but tradition, based on the New Testament, assumed his reality, and in certain periods of history, notably the second to fourth centuries CE and the fifteenth to seventeenth centuries CE, his power was widely believed to loom large. In the latter period, terror of the Devil was the motive force behind the witch craze.

Islam

Muslims, unlike Jews and Christians, believed that their scripture, the Qur'an, was dictated word for word by God through an angel to the prophet Muhammad. Thus no word of the Qur'an could be ignored, so the existence of the Devil (called Iblis or Shaytan) could not be denied. However, Islam differed from Judaism and Christianity in another important sense: the will of Allah prevails in every place throughout all time. This means that opposition to Allah either by humans or by spirits was limited entirely to what God wills to allow.

Polytheism

As opposed to the religions above, most religions recognized no single spirit of evil. The problem of evil was solved in a number of different ways. Some religions posited deities combining good and evil in themselves, such as Quetzalcoatl in ancient Guatemalan religion and Vishnu in Hinduism, where he was both creator and destroyer. Another solution was "doublets," pairs of gods in which the good side has one name and the evil side another, as with Hathor/Sekhmet and Horus/Seth in

Egypt. Yet another solution was to have groups of generally constructive deities at odds with groups of generally destructive ones, as in the asuras and devas in ancient Persia and India. Another was to have gods who are amoral or at least very inconsistent in their morality, as in Greco-Roman religion, where the traits assigned to each deity were wide and varied. Artemis/Diana, for example, was patroness of childbirth and virginity, animals and the hunt, the moon and the underworld. Still another way, in some Hindu and Buddhist thought, was to deny the existence of any real evil, considering good and evil part of *maya*, the illusion that anything in this world is real, an illusion that must be transcended in order to reach enlightenment.

Romanticism

In the West since the nineteenth century, alternative approaches to the Devil multiplied. That century was marked by the esthetic movement known as Romanticism, which emphasized feelings over reason and rebellion over tradition. For Romantics such as Victor Hugo, the Devil became a hero symbolizing the revolt of the human spirit against secular and religious authority. The Devil as hero re-emerged in the late twentieth century in Satanism, a cult whose followers tended not to take their beliefs seriously; those who did take Satan seriously held the meaningless view that a being whose concept was *invented* to represent evil is actually good.

Modern Criticism

Much more dominant in the late-nineteenth and twentieth centuries was the growth of physicalism, pragmatism, and deconstruction. These brought about a re-evaluation of evil and thus of the Devil. Physicalism was the philosophical belief that only material things that can be quantified are real, and so the spiritual exists only as an illusion. In such a view evil itself is only an outdated metaphor for antisocial behavior. Twenty-first century psychiatry tended strongly to the view that most, if not all, psychological problems are the result of genetic, hormonal, and even molecular malfunctions. Freudian psychoanalysis, which dominated from the end of the nineteenth past the middle of the twentieth century, held that evil sprang from the repression of sexual and other strong feelings into the unconscious, which distorted the repressed feelings into ideas and behaviors that the conscious was unable (without analysis) to deal

with. Freud of course dismissed the concept of the Devil as unhelpful and even harmful, as people often projected their hateful feelings onto other people. Psychoanalysis was inherently pragmatic in its goal of helping people adjust successfully to their environment. Jungian analytical psychology took the Devil more seriously as one of the archetypes that the universal human mind invented (or perhaps inherited) as a way of understanding evil, which Jung took seriously itself.

Deconstruction, which dominated philosophy the last three decades of the twentieth century and the first decade of the twenty-first, maintained that every human concept was an infinitely malleable construct. There being no absolute truth or, indeed, any truth at all beyond what the individual constructs for himself or herself, each concept can be infinitely deconstructed. Thus the Devil exists or does not exist depending on what you believe, and his characteristics were whatever you think they are. Along with the Devil, evil itself was deconstructed to mean whatever an individual found inappropriate or repulsive. No concepts, even scientific, logical, or mathematical ones, were excluded from deconstruction, so that, *a fortiori*, fuzzier theological and philosophical views such as the Devil were swept away. Deconstruction mated with pragmatism to produce the dominant view that no concepts were true, so that good and evil were merely constructs that those with power force upon those they dominate and manipulate.

Still, the first decade of the twenty-first century saw a large religious revival in many parts of the world, and Christians and Muslims who remained true to their theological traditions took the Devil seriously, as a supernatural entity or at least as a powerful metaphor of the existence of radical evil.

Dionysos

Alexandra Krithades

Dionysos (*Bacchos* in Latin) is the son of Zeus and Semele. He was twice born, and the special circumstances of his birth indicate his unusual nature and the special place he occupies in Greek mythology and religion.

His mother Semele (possibly a goddess of Phrygian origin) was tricked by the jealous goddess Hera into requesting Zeus to appear before her in all his radiance. He reluctantly did so, and she was incinerated by the fire of his lightning. The baby, of six months gestation, was rescued from his dying mother's womb, and sewed into Zeus' thigh, to be gestated a further three months. When Dionysos was born, he was brought to the mythical Mt. Nysa to be raised by nymphs. This aspect of his history echoes his father Zeus' early origins. His life threatened by his devouring father Chronos, the infant Zeus was spirited away by his mother to be raised by nymphs on Mt. Ida in Crete.

The Orphic version of Dionysos' beginnings also includes a "twice born" element. According to this tradition, Dionysos was the offspring of Zeus and Persephone, and became the fourth ruler of the world, after Ouranos, Chronos, and Zeus. The Titans were jealous of the child, and plotted to destroy him, perhaps, with the incitement of Hera. They distracted the child with a mirror and other toys, then killed him and tore his body into seven pieces. Apollo, on orders of Zeus, collected his limbs and took them to Delphi. Athena saved the heart, and brought it to Zeus, who then enabled Dionysos to be reborn. In a rage, Zeus killed the Titans with his lightning. They were burnt to soot, and from this soot a substance was made from which humans were fashioned. Since the Titans had ingested some of the god, mankind is seen in the Orphic religion as part divine and part Titan.

His survival of fire, and/or dismemberment point to a key psychological aspect of Dionysos. His myth expresses

the inevitability, even necessity, of destruction within the psyche, as well as the psyche's ability to be reborn in the face of such destruction. The experience of dismemberment is something that most people who enter psychoanalysis or psychotherapy feel to some degree. In the beginning of analysis, analysts often have dreams with dismemberment motifs. The work of analysis involves the dismantling of personality structures, attitudes, and adaptations that no longer serve the individual or his/her life force.

Dionysos' survival of these experiences is an expression of the indestructible aspect of life itself, not on the level of the individual, but life as a force of nature, that is larger than our egos alone.

Dionysos is seen as having both masculine and feminine traits. He is associated with various animals, including the bull, the lion, the snake, the leopard, and the dolphin. He is depicted as both young and old, and is the most elusive of all the Greek gods. In the plant world, he is associated with the grapevine, ivy, the pine tree, and the wild fig.

His myths and cults are always a challenge to established social order, and often have a violent or bizarre element. He effects radical change through his epiphanies. To the rational ego, he represents a magical, enchanted realm. He is depicted as being always on the move, revealing himself in many different epiphanies, more than any other god in Greek mythology.

Dionysos in antiquity was principally the god of wine and intoxication. In addition, he presided over ritual madness or ecstasy (mania in Greek). The mask was a significant symbol of his presence, and thus ancient drama was devoted to Dionysos. Dionysos' nature was to transcend boundaries. The normal, conscious identities of his followers are subverted. His presence is fluid, full of illusion, and contains the opposites. He effects transformation, both negative and positive, from the viewpoint of the human ego.

Though scholars for years thought that the cult of Dionysos originated in Thrace, and was brought more recently into ancient Greece, the discovery of the name Dionysos on Linear B tablets from Mycenaean Pylos, dated circa 1250 BC indicates that he was present in mainland Greece well before. In Homer's *Iliad*, he is referred to as a "joy for mortals" (*Iliad*: 14.325). And in Hesiod's *Theogony*, he is described as "he of many delights" (*Hesiod's Theogony*: 941). Dionysos is seen in Greek religion as having invented or discovered wine, and given this "ambivalent" gift to mankind, much as Demeter gave the gift of the grain to mankind.

In ancient Greece, wine festivals were held in many areas. The oldest of these seems to be the Anthesteria, held in Athens each spring, when the new wine was drunk. It also celebrated the mythic arrival of Dionysos from across the sea. Other festivals included the performance of tragedy and comedy. Festivals that celebrated Dionysos were characterized by revelry, which included licentious and obscene behavior, the reversal of social roles, and cross-dressing by males. Processions of phalluses were paraded through the streets, though there are no extant depictions of Dionysos with an erection, unlike Hermes or Pan.

While alcohol intoxication is one of the darker aspects of Dionysos' gift to mankind, the ritual madness associated with his myth and cult was not associated with drug or alcohol use. The initiates in his cult, the maenads, were "seized" or possessed by the god. They behaved ecstatically, dancing wildly on remote mountaintops, and their rites were seen as "mad" only by those uninitiated. Most of the participants were women. In vase paintings, Dionysos and his followers tear apart live animals with the bare hands and eat them raw. We do not know if this actually occurred as part of the cultic practice, however, it reiterates the tearing apart of the young Dionysos by the Titans.

The worship of Dionysos had a very important psychological function. It emphasizes the value and importance of excess. In allowing for the suspension of the structures of everyday life, it enabled individuals to contact the darker, more irrational aspects of their nature in a ritualized way; to let go of ego control and space/time constraints and engage in mystical experience; and thus have access to the deeper non-ego realms of the psyche, what Jung calls the Self, for the purpose of inner transformation. His rites promoted the dissolution of differences, and the experience of a primordial unity with others, with nature and the mystical realization that life and death are one.

Thus, we see that Dionysos was also associated with death. Heraclitus, the fifth century philosopher famously said that Hades and Dionysos are one. His myth includes a story of descent to the underworld to bring his mother Semele back from Hades. Tombs were very frequently decorated with Dionysos and his maenads in the ancient world.

From a psychological perspective, it makes sense that Dionysos is associated with death, because the ecstatic, transgressive experience he brings happens through the temporary suspension of ego functioning, and individual identity. Dionysos brings an otherness of experience. He is considered the most epiphanic of all the Greek gods,

bringing metamorphosis and transformation. For those who bring a negative attitude, it is a dark, frightening experience, but for those who bring a positive openness, it is transcendent.

Discernment

Elisabeth Koenig

Introduction

To discern means to separate or distinguish between or among things. In religion, generally speaking, discernment, sometimes called discernment of spirits, means skill in discriminating between those influences that enhance or lead to a fuller relationship with God or transcendent reality; or, where no belief in transcendent reality is held, to fuller appropriation and implementation of one's value system. Psychologically, discernment is an intentional practice which develops the ability to act in accordance with those agencies that are conducive to integration of the personality, and which avoids or resists those influences that would bring about psychic fragmentation or disintegration. For the purposes of discernment, influences within the subject, such as dreams, images, and thought processes, or without, such as relationships with others and political or social context, are understood to have equivalent value and effect. Although meanings vary among traditions, discernment may be characterized as a

process that encourages seeing clearly enough to make well-considered decisions which take into account and integrate the multiple dimensions of life, i.e., intellect, affect, body, relationships, principles, values, work, income, expenditures, play, creativity, religious community, etc., with a particular concern for God, transcendent reality, or a unique system of values. Moreover, discernment's clarity of vision is most often linked with detachment from the promptings of inordinate desire which muddy the waters and make clear discernment unlikely or impossible.

Research into discernment can play an important role in today's debates about the nature of religious experience, especially where a tension is felt between the individual and the collective, the mystical and the prophetic, or the personal and the political. Eschewing an isolating emphasis on personal experience, the process of discernment is understood to unite dimensions of the human witness that are, *at once*, objective and subjective, e.g., historical, textual, moral, theological, aesthetic, political, economic, and communal, *and* personal, psychological, visionary, spiritual, particular, and perspectival. The interpretative strategy called discernment predisposes individuals both to appropriate for themselves and to contribute to the meanings of the historical and communal realities of which they are a part.

Judaism

Discernment is a biblical term with a long and complex history. In the Old Testament (Hebrew Scriptures), King David was reputed to have a divine gift of discernment: a wise woman of Tekoa exclaimed of him, "The word of my lord the king will set me at rest; for my lord the king is like the angel of God, discerning good and evil" (2 Sam. 14: 17). Job claims discernment for himself: "Is there any wrong on my tongue? Cannot my taste discern calamity?" (Job 6: 30) The Lord, when worship of him has become superficial and empty, threatens to punish the people by taking away a self-professed, but false ability to discern: "The wisdom of their wise shall perish, and the discernment of the discerning shall be hidden" (Isaiah 29: 14). Finally, and of great significance for our discussion, wherever several different Old Testament prophets professed to speak for God and disagreed with each other, the ancient Hebrews recognized that a moral and spiritual awareness which could distinguish between the authentic and the counterfeit was of utmost importance. Among the prophetic books, Jeremiah focuses the most on the problem of discernment because his witness to God was more

directly contested than that of the other prophets. Thus the classic discussion of the criteria for critical discernment of prophetic authenticity is in Jer. 23: 9–32, where false prophets are identified by their worship of false gods, including Baal; their promise of good news rather than judgment; false claims to have received a word from God or to have had visions or dreams; immorality; and absence of counsel from the Lord (Moberly, 2006).

Christianity

Although the New Testament gospel narratives depict a process of discernment whenever a decision for or against God or Jesus is made and when demons are cast out by the power of God incarnate in Jesus (cf. *inter alia*, Mat. 8: 31; 12: 28; Mrk 3: 22; 16: 9; Luke 4: 33; 8: 2; 8: 35, etc.), they do not develop the meaning of the term. However, there are passages, like Matt. 5: 8, “Blessed are the pure in heart for they will see God,” which suggest that the topic was uppermost in these authors’ minds. More to the point, the First Letter of John enjoins, “Beloved, do not believe every spirit, but test the spirits to see whether they are from God; for many false prophets have gone out into the world” (4: 1). But it is Paul, more than any other New Testament author, who explicitly engages the concept of discernment and he does so for the sake of building up the community of the church. For Paul, discernment (he uses several different words to denote the process: *dokimazein* = test oneself out in practice; *diakrinein* = discern; *anakrinein* = discern, examine; *aesthesis* = discernment, perception) is a gift of God’s Holy Spirit (1 Cor. 12: 1–11). Paul makes a distinction between the “unspiritual” (*psychikos*) and the “spiritual” (*pneumatikos*), where the “unspiritual” would have natural abilities not specifically related to the agency of the Holy Spirit: “Those who are unspiritual do not receive the gifts of God’s Spirit, for they are foolishness to them, and they are unable to understand them because they are spiritually discerned (*anakrino*)” (1 Cor. 2: 14). Moreover, Paul links discernment with love: “And this is my prayer, that your love may overflow with knowledge and all discernment (*aisthesis*) to help you determine what is best” (Phil. 1: 9). (Loving as a prerequisite for accurate knowledge or discernment became a favorite theme among medieval theologians.) Finally, for Paul and the patristic authors who interpreted his letters, Christian discernment hinges on a felt participation in the paschal mystery: it is believed that true discernment only happens when a situation is viewed through the lens of the cross of Jesus. This ability is enhanced through dramatic reading of the gospel

narratives and through participation in the eucharist. Paul speaks of baptism into Christ’s death as the condition for Christian adulthood (Rom. 6: 5f.). Practically speaking, discernment as governed by the cross means that Christians try, by God’s grace, to neutralize the natural effects of envy and strife with a spiritual humility that graciously gives up its own will, desire, or honorific place to the other. Moreover, there is a spiritual seeing, or discernment, that accompanies such submission (Johnson, 1983; McIntosh, 2004; Moberly, 2006).

The patristic period saw a real flowering of the concept of discernment. *The Life of Antony* by Athanasius (c. 295–373) shows Antony out in the desert, struggling for decades with demons who have tried to compromise his relationship with God. In time, these external entities came to be viewed more and more psychologically as dynamics within the soul. For example, Evagrius Ponticus (346–399) in his *Praktikos* and *Chapters on Prayer* speaks of “eight evil thoughts” that afflict monastics and need to be overcome by prayer and other spiritual practices, such as fasting and vigils. John Cassian (c. 365–435), while believing with his predecessors that both good and evil spirits really exist, is more interested, in his *Conferences*, to teach his monks that the near objects of discernment are not actually external spirits, but movements within the soul, like thoughts, images, feelings, and judgments. For Cassian, discernment is a coming-to-terms with these inner movements that results in a state of equilibrium, as it did for Antony, Origen of Alexandria (c. 185–254), Evagrius Ponticus, Diadochus of Photike (mid-fifth century), and many others (Sweeney, 1983). Theologians of the medieval period were also drawn to the discernment tradition. Julian of Norwich, for example, in her *Book of Showings*, correlates discernment with growth in contemplation (Koenig), and Catherine of Siena’s *Dialogue* is replete with teaching on discernment. For Thomas Aquinas, the concept of discernment gives way to an emphasis on prudence which relies more heavily on the rational faculty and is less integrative than discernment.

But it was left to Ignatius of Loyola (1491–1556) to gather together the patristic teachings on discernment and codify them in usable form. His *Spiritual Exercises*, which are decisional and concern the discernment of religious vocation, are the *locus classicus* for Christian training in discernment. In the form of a 4-week retreat, the training progresses through stages of purgation and sorrow over sin to the “Contemplation to Obtain Love” in the fourth week where the retreatant sees all of creation as God’s expression of love to his creatures. With a profound sense of giftedness and acceptance of a God-given liberty or free will, that person is encouraged to return the gift

to the giver through cultivating an attitude of magnanimity toward God which is dedicated to serving him. Most distinctive of Ignatius' teaching on discernment are the two sets of so-called "Rules for the Discernment of Spirits," appended to his *Spiritual Exercises*, in particular the suggestions made there concerning the felt alternation between states of "consolation" and "desolation." These are technical terms in Ignatius' vocabulary, referring to the raw material that people must judge through if they are to make an appropriate choice. He describes "consolation" as "that which occurs when some interior motion is caused within the soul through which it comes to be inflamed with love of its Creator and Lord." It includes "tears of grief for one's own sins," and "every increase in hope, faith, and charity, and every interior joy which calls and attracts one toward heavenly things." "Desolation," by contrast, Ignatius calls "everything which is contrary [to consolation]; for example, darkness of soul, turmoil within it, an impulsive motion toward low and earthly things. . . . These move one toward lack of faith and leave one without hope and without love. . ." Discernment, then, is a process of keen observation of these affective states that leads to deep familiarity with both their energy for integrative authenticity and their potential for disintegrative deception. Most important, for Ignatius, discernment enables individuals to recognize and avert the beclouding influence of inordinate desires (*afeciones desordenadas*).

Islam

Discernment is a central concept in Islamic tradition, although the term does not appear in English dictionaries and encyclopedias of Qur'anic terms and concepts. The word *furqan*, usually translated as "criterion" or "distinction," conveys the notion of one thing as set apart from another. Both the Hebrew *Torah* and the *Qur'an* are referred to as *furqan* (the former in *Qur'an* 2: 53 and 21: 48; the latter in 3: 4 and 25: 1) because each book was revealed in order to assist human beings in their judgment of the difference between truth and falsehood. Muslims believe that, at the last time, there will be a decisive victory after which truth will reign in a manifest and uncompromised form. In Islam, the concept of discernment is also conveyed by the notions of "guidance" (*huda*) and "misguidance" (*dalal*). God is the only source of guidance (2: 120; 7: 178) in that God shows the human being both the right and wrong paths, leaving him or her free to choose between them (76: 3). Guidance comes in three forms: *instinctual*, where God has given the human being

an instinctual sense of "its evil and its good." (91: 8); *rational*, where God-given reason enables one to consider rationally one's place in the universe; and *revelatory*, an infallible guidance bodied forth in both the *Torah* and the *Qur'an*, although the latter is understood to provide the best guidance (17: 9). "Misguidance" also takes place at God's behest, but God only misguides those individuals who already have chosen evil. In a sense, they have asked for misguidance, and God obliges them by misguiding them in order to punish them for their sins (7: 155) (Mir, 1987).

Sufi tradition especially emphasizes a process of discernment. Here human beings are viewed as microcosms of the cosmos so that there is a correspondence between them and all the levels of existence, including the Divine Reality beyond the cosmos. Muhammad said, "There are seventy thousand veils of light and darkness that separate us from God, and they constitute the universe," and "The person who knows himself/herself knows his/her Lord." Thus, the "goal of the spiritual life is to be able to lift up the veil of outwardness so as to behold the inward and subsequently come to know the outward in light of the inward" (Nasr, 2007: 49). This is a process of ever-deepening interiorization, for the veils only will become transparent to the reality beyond them after a person has penetrated to his or her own center and lifted the veils within. The inner vision, which results from God's guidance and one's faithfulness to devotional practice, ultimately will be able to distinguish the real from the counterfeit at every level of the cosmos.

Psychological critique. Psychologically, discernment denotes an intentional process that seeks to render unconscious material available to consciousness for the sake of making healthful and appropriate decisions. For example, it is possible to pose a series of questions about an issue to be discerned, or about a dream, to see what "comes up," thus becoming more self-aware and capable of making choices that suit who one really is, rather than what others expect one to be (Wolff, 1993; Gendlin, 1986). The result can be that energy is released, healing made possible, and integration facilitated. However, such a discernment process is never easy: one's conscious attitude dominates every effort to interpret anything. The unconscious always remains unconscious, and the capacity for self-deception is infinite. Therefore, most people interested in discernment these days speak of the need for well-seasoned spiritual directors, and communal discernment is preferred to a process undertaken in isolation. Moreover, increasingly, there are applications of classical discernment practices and traditions to political and corporate situations (Brackley, 2004; Libanio, 1982; McClain, 1988; Urena, 1979; Delbecq, 2002).

Various schools of psychology offer ways to evaluate what is going on in discernment. For example, the attempt has been made to correlate the Ignatian *Rules for Discernment* with stages of ego development, with highly suggestive results (Liebert, 1992). Jung's notion of the progression and regression of psychic energy assists our understanding of consolation and desolation, the former signaling the uprush of energy and heightened awareness following successful appropriation of a previously unrecognized psychic content, and the latter indicating the loss of psychic energy that occurs when there is a retreat into the unconscious in order to discover or retrieve hidden psychic potential. Desolation may be equivalent to psychological deflation when it provides a corrective to inauthentic consolation (i.e., inflation). Thus consolation and desolation operate in contrary or compensatory relationship, and in this way impel forward the process of individuation or spiritual development (Sweeney, 1983). Cognitive psychology's labeling of cognitive distortions, such as "all-or-nothing thinking," "overgeneralization," "mental filters," and "disqualifying the positive," etc., Burns (1980) has parallels with ancient and medieval descriptions of the effects of evil spirits, or thoughts, and its method of talking back to these and proposing alternatives has much in common with ancient practices (Ponticus, 1981) and Ignatius Loyola's method depicted in his *Autobiography* and *Spiritual Exercises*. Self-psychology can make a very special contribution to understanding what is necessary for authentic discernment, especially in its insistence on full, conscious mourning for what has been lost in life as a prerequisite for "analytic access" to the dynamics of the unconscious and, hence, for a self-knowledge that approaches accuracy (Homans, 1989). Finally, systems theory, with its insistence on grasping how the role one has been assigned by one's family of origin, conditions one's perception of all reality; its distinction between the "thinking process" and the "feeling process"; and its strategies for encouraging differentiation; all offer clarification for undertaking a psychologically well-informed process of discernment (Kerr, 1988).

Dismemberment

Alice Mills

Definition

Dismemberment means the taking apart of a body and the removal of one or more body parts. At one end of the scale is the tearing apart of a whole body, resulting in death, as in stories of the early Christians being fed to the lions and Greek myths about the tearing apart of Dionysus by the Titans. The other end of the scale is harder to determine. Forcible removal of eyes, as in St. Lucia's decision to take out her eyes to discourage her pagan suitor, probably counts, but does either castration, as in Origen's self-castration "for the kingdom of heaven's sake" (Matthew 19.12) or circumcision, as enjoined on the Jews in the Old Testament? Bodily injuries such as the piercings and flagellation wounds of penitents and the scarification of Australian aborigines undergoing initiation do not involve the removal of a body part and hence should not qualify as dismemberment; nor should such phenomena as stigmata manifesting on the palms and feet of some saints.

Bodily Wholeness

With the obvious exception of the loss of body parts that occurs accidentally, or for medical reasons, or in secular hostilities, dismemberment of the living is generally understood in a religious context as indicating the presence of a deity or dedication to the service of a god or a ritual of initiation. Opposing this tendency, however, is the

emphasis on whole bodies without blemish where service to a deity is concerned. In the Bible, for instance, the book of Numbers abounds with instructions that animals chosen for sacrifice must be "without blemish," and in Leviticus the same requirement is made for priests:

- ▶ And the LORD spake unto Moses, saying,
- ▶ Speak unto Aaron, saying, Whosoever *he be* of thy seed in their generations that hath *any* blemish, let him not approach to offer the bread of his God.
- ▶ For whatsoever man *he be* that hath a blemish, he shall not approach: a blind man, or a lame, or he that hath a flat nose, or any thing superfluous,
- ▶ Or a man that is brokenfooted, or brokenhanded,
- ▶ Or crookedbacked, or a dwarf, or that hath a blemish in his eye, or be scurvy, or scabbed, or hath his stones broken (Leviticus 21. 17–20).

Christianity

For Christians, the wholeness of the body has been important not only in the case of priests but also for each human being after death, as the body awaits its resurrection and the Last Judgment; hence the Catholic church's centuries-long ban on cremation. As Michael Bryson points out, the Biblically based Christian understanding of Jesus as head of the Church, which is the body, reiterates the great importance of wholeness. Schism and heresy function as the dismemberment of the body spiritual.

In this context, the fate of Christian saints both before and after death is paradoxical. After death, some saints' bodies have been dismembered to provide relics for as many altars as possible – sometimes, many more substantial body parts than any human body could possibly provide. Before death, violent acts of dismemberment have become emblematic of sanctity for those saints who were also martyrs, as with St. Oliver Plunkett (whose head can be viewed in Drogheda), or St. Bartholemew, who was flayed. The bodily sufferings of the martyrs are considered an *imitatio Christi*, willingly undergone with Jesus' sufferings and death as their model. These sufferings of Jesus before and during crucifixion, including flagellation and the piercing of his side, do not constitute dismemberment. It is, however, theologically debatable whether, for those branches of Christianity that believe in transubstantiation, the breaking and eating of the host constitutes a form of dismemberment.

Ancient Egypt

While Jesus' status as a dismembered god is disputable, there are abundant examples in other near-Eastern and classical religions. The most prominent of these deities is the Egyptian Osiris, whose body was taken apart by his jealous brother Set and pieced together by his devoted wife Isis (his penis was irrecoverably lost). The dismembered and re-membered god of fertility and civilization then became lord of the dead, and the mysteries of Isis promised their initiates a similar resurrection to eternal life. The practice of mummification in ancient Egypt was performed to ensure eternal life by keeping the physical body as intact as possible. While some mummified bodies appear to have been dismembered, interpretation of this procedure is much debated: were the spirits of the dead being urged to depart, was the mummification done poorly or was this deliberate dismemberment in honor of Osiris' fate?

Shamanism

The experience of being dismembered, though not its literal enactment, is a well-attested part of the Siberian shaman's initiation into spiritual power as he gains access to the worlds above and below. To become a shaman is to experience, while still a living human being, the dismemberment and resurrection of a god.

Punishment

Dismemberment before death, for a human body, is thus in a religious context usually a mark of closeness to the divine. Such closeness is not always a mark of divine favor, however. In Greek myth, offending a god can result in being torn apart by the god's possessed followers, as in *The Bacchae*, or falling and being dragged behind a hurtling chariot to one's death, as in *The Hippolytus*. Dismemberment after death is an indication of the deities' disfavor. For the ancient Egyptians, the sun-boat carried the dead to the hall of judgment, but along the way the wicked would be taken, torn apart and eaten by monsters. The carefully gradated horrors of Dante's Christian hell include the splitting apart of bodies that then grow back together, only to be resplit, and the incessant devouring of the skull's contents. Buddhist hells are similarly stratified with punishments such as having one's eyes gouged out or being disemboweled.

Psychoanalytic Theory

Psychologically, dismemberment of the body, whether of oneself or another human being, or the urge towards dismemberment, is considered a symptom of serious mental illness. There is no scope for the interpretation of dismemberment as part of a spiritual ascent or as penitential self-sacrifice in current psychological models of the world. Psychoanalytic theory is more hospitable to the concept of dismemberment. For Melanie Klein, the infant splits the mother into "partial objects," representations that must be combined for the child's psyche to become whole. For Lacan, human beings' sense of their own identity is founded on a false equation in the mirror phase which entails that ego consciousness is always unauthentic. Psychic integration is thus impossible and early ego development includes fantasies of castration and dismemberment. While Klein and Lacan postulate a sense of the body as split in the young child's psyche, in *Totem and Taboo* Freud postulates the long-ago dismemberment of an actual body as the origin of human civilization. He asserts as literal fact the story of the primal horde in which the sons, eager to gain access to their father's women, slew him and ate the flesh they had torn apart. It is guilt at this primal murder and cannibal feast that still powers human civilization, according to Freud. The dismemberment that for many devout Christians and initiates into the mystery religions has borne a joyful message of resurrection to eternal bliss, is for these psychoanalytic theorists in their different ways an uncanny substratum to all human beings' understandings of who we are and can be in this world.

Dissociation

Jessica Mitchell

Introduction

Dissociation is a normal part of the psyche’s defensive process, severing connection between categories of mental events that are normally integrated. Streams of thought or consciousness are kept apart and communication between them is restricted, resulting in a discernable alteration in thoughts, feelings, or actions.

Dissociation is an unforeseen partial or total disruption of the normal integration of conscious functioning, a means by which typically integrated streams of thought or consciousness are segregated and resulting communication restricted. This default defense can take place as a consequence of repeated or overwhelming trauma. The ability to dissociate can begin with self-hypnotic declarations such as, “I am not here; nothing is happening to me. I am not in this body.” This deceit then becomes a structuring dynamic within the personality (Mollon, 2002).

Historically, dissociative states have been associated with psychological and physical trauma, healing practices, and religious experience in nearly every culture. Dissociative states have knowingly been reached by hypnosis, meditation practice, prayer and shamanic practice. Ritualistic behavior during worship or meditative practice can allow the individual to enter into both overt and implicit dissociative states. Those held hostage or in captivity develop trance capabilities and become adept in the practice of dissociation during isolation and confinement (Herman, 1992; van der Kolk, MacFarlane and Weisaeth, 1996).

For more than a century the effects of pathological dissociation have intrigued clinicians. The emergence of distinctive dissociative disorder diagnoses is closely intertwined with the development of contemporary psychiatry. More than a century ago, Janet (1889) is credited

as first to identify this essential pathology: alternation in consciousness, as “dissociation.” Breuer and Freud (1895/1955) followed by defining these same altered states as “double consciousness.” Both Janet and Freud concluded that unbearable emotional reactions to traumatic events produced an altered state of consciousness, which in turn induced hysterical symptoms. Both recognized the essential similarity of altered states of consciousness induced by psychological trauma and those induced by hypnosis (Herman, 1992).

Janet asserted that memory is an act of creative integration by which we encoded and characterize experience into preexisting cognitive schemata. When an event in the life of an individual is too overwhelming to fit into these already existing schemata, he believed that it was split off from consciousness into separate systems of subconscious “fixed ideas,” untouched by the rest of individual experience. Individuals with hysteria were those who had lost the ability to integrate the memory of overwhelming experience (Daves and Frawley, 1994; Herman, 1992; Janet, 1889).

From an etymological perspective, the word dissociation is derived from “dis” which means split two ways, or “in twain” and is comparable to the Greek “dia” as in “diabolic”—the opposite of “sym-bolic.” There is more-over an implication of negation or “reverse,” undo a spoil as in discount, disown, or disable and the notion of “to strip off” or “expel from” as in disbar, disenfranchise, disempower. In Latin compounds, “dis” was commonly the reverse of “com” or “con” as in concord versus discord. Another meaning is to render a whole into parts, therefore the sense of apart, away, asunder, as in disperse, dissident, distance, dispossessed. Association is derived from – link, organization, connection, relationship, bond (Kalsched, 1996, 2005: 31).

Dissociation is the defensive process that typically results in the loss of interrelationship between various groups of mental processes with an ensuing, nearly independent, functioning of the one group that has been separated from the rest. Dissociative discontinuities can comprise a wide range of phenomena frequently found in both the immediate and long-term response to trauma. Primary phenomena include: depersonalization, derealization, identity confusion, and identity alteration. Individuals may experience bodily detachment, numbing, distorted time perception, fragmentation of the coherence of sensory experience, tonic immobility, forms of extreme passivity, disruption of memory and amnesic states. Finally, in the case of severe trauma, all connection can be severed between an actual occurrence and permanent symbolic, verbal and mental representation

(Daves and Frawley, 1994; Mollon, 2002; van der Kolk, MacFarlane and Weisaeth, 1996).

Dissociation exists on a continuum including normal biological forgetting, daydreaming, abnormal biological amnesia following a concussion, to abnormal psychosocial dissociation that coexists with trauma including multiple personality disorder (Putnam, 1989; Ross, 1989). While this segregation of mental processes from the rest of the psychic apparatus is most often subtle and transpires unnoticed, other more dramatic manifestations of dissociation can occur among child and adult parts of the personality, between true and false self structures, sane and psychotic parts of the mind, and different phases of life. Dissociation as a defensive strategy can obstruct emergence of coherent meaning in correspondence to the concept of “attacks on linking,” (Bion, 1959) Learned dissociation can be considered an internal flight response when external flight is not possible (Mollon, 2002; van der Kolk, MacFarlane and Weisaeth, 1996).

In direct contrast to repression, a horizontal division into conscious and unconscious mental contents, dissociative experience involves a vertical splitting of the ego that can be organized and independently functioning. Under dissimilar internal and external circumstances, two or more ego states alternate in consciousness. These dissociated states remain unavailable to the rest of the personality and, as such, cannot be subject to psychic elaboration (Daves and Frawley, 1994: 31). However, dissociative states allow external life to go on but at a great internal cost. Psychological sequelae continue to haunt the inner world, making their presence felt in dreams and waking consciousness by way of recurring intrusive images with violent or symbolic content, enactments, flashbacks, enigmatic somatic sensations, recurrent nightmares, anxiety reactions, mental images split from affect and somatic conditions. Memory has holes; a full narrative history cannot be told by an individual whose life has been disrupted by trauma (Kalsched, 1996).

Divination

Paul Larson

Divination is the act of using contact between the supernatural world and the mundane world for the purpose of guiding human action. It is commonly thought of as an act of foretelling the future, or even dismissively termed “fortune telling,” but this view is simplistic and ignores the social context of divination. In all situations where divination is practiced there is a person, a “querant,” who has a need for guidance about what course of action to take with regard to a particular situation. The occasion of the divination generally comes at a specific time for a specific reason. When proffered as an amusement, as in a boardwalk fortune teller, it may be done with little commitment to using the outcome. But the skill of the diviner lies in finding something that the querant can take away from the encounter that makes them feel value was given for the experience.

The nature of divination is a spiritual process of obtaining some contact between the two basic orders of reality, the spiritual realm and the mundane one. There is an implicit assumption of some sort of “realm beyond” that speaks in the moment and reveals information not otherwise available to the querant. Usually, the medium is the messenger. That is, the person of the oracle uses a state of trance possession to contact a spiritual power or entity and convey a message to the querant. The classic example of that is the pythia, the oracle of Apollo at Delphi who spoke as the voice of the deity while in a trance. The oracle

can also read portents in random events (e.g. clouds) or use specific devices (e.g. tarot cards, runes, etc.). A modern psychological explanation would typically involve some reference to unconscious processes accessing archetypal images relevant to the question posed by the querant.

It is simplistic to think that people view the pronouncements of the oracle as predicting the future in a mechanistic way. People vary in the degree to which they view events as beyond their control, but implicit in the social relationship between the diviner and the querant is the proffering of advice for a course of action in the face of the problem for which the divination is sought. There is nearly always a gap in time between the pronouncement and the ultimate outcome; time enough for the person to act upon the advice. If the feared outcome doesn't happen, the advice was helpful; if it comes about anyway, the person failed to heed the oracle's warning. The critical feature is not whether the degree of certainty about the final outcome, but to what extent counsel is taken and plans or actions initiated, changed, or aborted. Divination is action oriented advice giving.

There are a variety of physical media of divination. Among the most popular in the west are the Tarot cards, the reading of lines on the palm, or the pattern of tea leaves in a cup. The Chinese oracle book the *I Ching* is also widely used. In previous eras animals were sacrificed for the occasion of the oracle and the patterns in their entrails was interpreted. Among the oldest artifacts from Mesopotamia is a ceramic figure in the shape of a sheep's liver with different areas marked out for their interpretive significance. There was probably an oral teaching or a cuneiform tablet now lost which catalogued the various meanings.

The interpretation of dreams is also a form of divination. The "incubation" of a dream by the god Asklepios was a major part of the ritual healing process in the ancient Greek world. The deity would come to the sufferer during a special sleep inside the inner sanctum of the temple, or abaton. The priests would interpret the dream the next day and prescribe the mode of healing to be undertaken. Both Artemidorius and the Sophist Antiphon are reputed to have authored a book of dream interpretation, with the title *Oneirocritica*. When Freud wrote about the value of dream interpretation, he was reviving an ancient tradition, albeit with a different theory of hermeneutics or interpretation.

In a more contemporary vein, divination is the old term for the act of diagnosis. In all clinical contexts one of the most important functions of the therapist is to provide an explanation for the troubles the client brings to therapy. We may use modern psychometric instruments,

further dialog or some combination of the above plus outside collateral information, but at some critical point early in the relationship the professional presents the client with a summary view of the nature of their problems and the implications for course of treatment.

Divine Child

David A. Leeming

The myth of the divine child is ubiquitous in religious traditions. The child is a potential savior for a society in need. He or she represents radical change, the possibility of a new beginning. As such, he is a threat to the status quo, and the representatives of the status quo – wicked kings, demonic monsters – therefore fight the child.

To represent the idea that the child is associated with divine intentions, his father is often divine. To emphasize that he is also of this world, he must be born of a human female. But the conception of the child is often miraculous – out of the ordinary – to signify his divine nature and to suggest that he belongs to the whole society rather than to any one family.

In ancient Egypt the so-called Delta cycle of the Osiris myth contains the story of Isis conceiving a son, Horus, by her dead husband, the god-king, Osiris. Isis flees the usurper king, Seth, the brother and killer of Osiris, and gives birth to Horus in the hidden swamps of the Delta. One day, while Isis is away in search of food for her child, Seth comes in the form of a serpent and attacks the child. But the divine child, stomps on the serpent, thus surviving to continue his father's struggle against the forces of evil.

In a later tradition Gautama, the future Buddha is conceived by a white elephant in a dream experienced by his mother, Queen Maya. The Buddha's potential as a savior is challenged in his boyhood by his father, the king,

who shelters the child to keep him from the harsh realities of life. And later, the youthful Buddha is unsuccessfully challenged by Mara the Fiend, who tempts him with the vanities of the world.

Moses, the Hebrew divine child and future savior is threatened at birth with the other Hebrew children by the Egyptian Pharaoh and is hidden in bull rushes. He is saved and lives to lead his people out of Egypt to the Promised Land.

Jesus, the future savior, is miraculously conceived by God through the Holy Spirit which enters the Virgin Mary's womb. Soon after his birth in a hidden place the child is threatened with other Jewish children by King Herod and has to be carried off into Egypt.

The Hindu man-god Krishna, the most important avatar of the god Vishnu, who contains the universe and the possibility of salvation within himself, is miraculously conceived through Vishnu, with the help of Maya ("Divine Illusion") in Devaki. But when the wicked king Kamsa learns that a child of Devaki will one day kill him he orders that any child of Devaki be killed at birth. To prevent this tragedy, Maya removes the embryo of the divine child from Devaki's womb and places it in the womb of Rohini.

These are only a few of the many stories of the divine child. Others examples can be found in the biographies of such figures as Herakles, Dionysos, Theseus, Zoroaster, Quetzalcoatl, and Cuchulainn.

The theological purpose of the divine child as future savior or embodiment of divinity on earth is clear enough. But the archetype resonates psychologically as well. For Carl Jung, the divine child – as opposed to the regressive puer aeternus – represents the urge within us all for individuation. This drive can be confronted from birth by what to it can be negative forces – parents, school, religion, the status quo and its expectations. And the drive for individuation is confronted within the unconscious itself. The divine child in the womb is the pre-conscious hero – the Self – waiting to be realized. Once born, he is the individual who enters the quest for individual wholeness.

Doubt

Ingeborg del Rosario

The experience of doubt can be understood relative to faith and to belief. Doubt is commonly perceived to be inimical and opposed to, even erosive of one's faith, as an absence or significant lack of affective confidence and trust in God, in the divine-human relationship, and in divine nature and power. The one who doubts is seen to be weak in faith. Relative to beliefs, doubt can be defined as an absence or significant lack of assurance and certitude, even an active dissent and questioning of religious doctrines and practices that traditionally provide structure and meaning to the faith experience. The one who doubts is seen as an unbeliever, unwilling or unable to acknowledge, assent to and embrace the truth of religious tenets and teachings.

Religious beliefs provide a way of articulating, conceptualizing and providing meaning to the faith experience, that is, to the individual's experience of God and their relationship. Beliefs are about putting the faith experience into words. While beliefs support and facilitate a deepening engagement in the faith experience, they do not constitute it. The faith experience is not primarily about beliefs, but about a vital relationship: trusting and believing *in*, relying *upon*, entrusting *to* an Other. Being relational, the faith experience is not static but ever unfolding and developing, in need of an evolving process of understanding, interpreting and speaking about this experience. Unfortunately, many religious communities and churches resist the maturational development of beliefs. Dissent and doubt of beliefs are often equated to a lack of trust and confidence in God: one who questions beliefs is perceived to be without faith.

The book of Job in the Old Testament or the Hebrew Scriptures is a classic scriptural illustration of how a

believer is often perceived to be lacking in faith because of the doubt and questioning of traditional religious beliefs. Conventional Israelite wisdom upheld the doctrine of divine retribution: the one who does right prospers while the one who does evil is punished. A person who is afflicted must have sinned and so, suffers. The character of Job as a man who was upright and blameless, who did not sin yet suffered grievously, called this moral teaching into question. While Job's friends defended religious tradition as sacrosanct in their dialogues with him, Job vigorously resisted and challenged this inviolability. While the friends chided Job for his lack of trust and confidence in God's power and the divine will, Job confronted the paradoxical nature God. In Job's experience, God was both enemy and friend, oppressor and redeemer, adversary and judge. Following the God's speech out of the whirlwind that addresses Job, the book ends with Job acknowledging that he has "uttered what (he) did not understand, things too wonderful for (him), which (he) did not know" (Job 42:3), and God upholding Job for he had spoken about God what is right (Job 42:8).

This story provides an apt paradigm for reflecting upon the experience of doubt in relation to faith and belief. Religious beliefs function to provide order and structure, purpose and meaning to life and relationships. As did Job, individuals often begin to call into question these deeply ingrained and cherished normative beliefs following an experience of trauma, grievous loss, life-threatening illness, unrelenting crisis or some wanton encounter with violence and evil. In the face of tragedy, the faith-questions of believers often revolve around a need to understand and make sense of the event ("What did I do to deserve this?" "Why did this happen?"); the presence, will and agency of God in this event ("Where is God?" "How could God allow this to happen?"); and the consequent dissonance between one's God-image and the occurrence of this seemingly senseless reality ("How can a loving God allow this suffering?" "What kind of God would let this to happen?") Certitude collapses and doubt ensues when beliefs about God's nature and power cannot contain and support, provide order and structure, nor give sense and meaning to the believer in the midst of tragedy's ensuing chaos and disorder, instability and disorientation. Uncertainty and questioning of long-held beliefs might also occur in the face of less devastating personal experiences, with maturational challenges inherent in life-stage processes such as adolescence and midlife, as well as in times of critical social developments.

The place and function of doubt in one's life, faith maturity and personal development is more easily

appreciated with the understanding of how representations of God are formulated and internalized. Core metaphors and images of God are the foundation upon which religious beliefs are constructed. Religious traditions, creeds and beliefs are built around God images and representations which originate primarily from parental sources or the impact of experiences with primary caregivers, as well as from influences of social groups, peers, formal and informal religious education and cultural conditions. The pioneering work of psychoanalyst Ana-Maria Rizzuto illustrates how representational traits attributed to God and the divine nature are shaped by childhood engagements, specifically by early parent-child relations and self-experiences. Images and metaphors of God as critical father, punishing judge, distant deity, or of God as loving and merciful, gentle and understanding, compassionate and protective evolve for the child by way of transference as a function of projective identification, from idealized wishes and fantasies that stem from significant parental interactions, as well as from the consequent introjection and self-mirroring images reflected by these experiences. With a growing self-image and individual maturation, increasingly expanding and intricate interpersonal and social engagements, challenges and demands of life experiences, the deepening of self-awareness and broadening of relational consciousness can come a corresponding evolution and refashioning of early God representations from childhood.

For many individuals, however, these God images formed from early on remain essentially static, rigid and unchanged. Much psychic pain and emotional distress ensue when adult religious patients confront the complexities of crisis and tragedy with undeveloped childhood God representations and with religious beliefs and practices that are built upon these unexplored and unrefined divine images and metaphors. Doubt and questioning of religious beliefs founded on archaic God representations that are a result of early unprocessed transference parent-child experiences can thus be healthy and growth-provoking, purifying and transformative. Religious patients may be invited to inquire into how a particular belief or early God image had functioned for them and explore how it has promoted wellness or contributed to a lack of well-being. Similarly, the religious patient might look into fantasized consequences of doubting traditional beliefs or questioning deeply ingrained God-images while the therapist might explore how inquiry and exploration, doubt and questioning can also function to enable wellness as well as maturity in the life of faith.

The de-idealization of early God representations and working through of parental transferences onto the divine

image in the therapeutic process, while difficult, painful and grief-filled, also enables a reflective challenging of religious conformity and compliance that are part of the false self and facilitates movement into greater spontaneity, freedom of self-expression and creativity of exploratory play which constitute a release of and reconnection to the true self. As the sense of authentic self grows, expands and deepens, so can the sense of God. The experience of God is released from restrictive and static constructs, freed from becoming a container of transference and projection material, idealized wishes and desires. While creeds, traditions and practices might remain unchanged, new and deeper levels of meanings may evolve. The adult believer becomes more open to the myriad possibilities of divine mystery and of encountering God as God, found in, yet always beyond, all form and image, concept and representation. The adult believer is more able to hold and contain the awe-full prospect of a God who cannot be held and contained, nor grasped with absolute knowledge and understanding.

As with Job, the mature believer is left with the terrifying yet liberating realization that, about God, one can only utter what cannot be understood, speak of things too wonderful that cannot be fully known. Profound confidence and trust in the divine-human connection, life-giving faith and right speech about God imply the continuing need for doubt of limited, limiting divine representations and questioning of static, archaic beliefs that cannot acknowledge the limitless breadth of the divine experience; the ensuing recognition of the vulnerability of words and language to articulate the creativity and mystery of divine-human relatedness; the contemplative entry into reverent silence and reflective exploration of the God engagement which, like the true self, cannot be contained or confined by efforts to capture the radically free, ever-gratuitous process of unfolding and becoming towards a fullness of being.

Dragon Slaying

Ronald Madden

While dragons are imaginary beasts to be found in the mythology of cultures throughout the world, the concept of *dragon slaying* is unique to the myths of the West. From St. Michael in the book of Revelation in the Christian New Testament, to Beowulf in the eighth century Anglo-Saxon epic poem of the same name, to Sigurd in Norse mythology (or Siegfried in Richard Wagner's retelling of the story), to Bard the Bowman in Tolkien's *The Hobbit*, dragon slayers engage in a heroic fight to the death with a large and powerful beast that threatens a community, or the very balance of spiritual forces in the cosmos. These heroes become honoured in the myths and legends of their culture and are symbolic of the victory of good over evil.

The word dragon comes from the Greek δράκων or *drakon*. Dragons appear throughout mythology as magical creatures with great physical and/or spiritual powers. Depending upon the culture, the dragon may be airborne – a great reptile with wings – or more worm- or serpent-like. In general, dragons of the East are powerful but benign creatures that are wise and revered by the people. In cultures of the West, dragons are often depicted as evil guardians of a treasure or horde which has been stolen from the people. The theft of this treasure has led to their decline and the return thereof will re-establish their vitality and/or the spiritual balance of the cosmos.

It is perhaps not unsurprising, then, that the concept of dragon slaying is a singularly Western phenomenon and is to be found in that most enduring and powerful sacred scripture of Western culture: the Christian *Bible*. The following excerpt poses the dragon as the embodiment of Satan and St. Michael as the conquering hero in the name of Christ.

- ▶ And there was war in heaven: Michael and his angels fought against the dragon; and the dragon fought and his angels, And prevailed not; neither was their place found any more in heaven. And the great dragon was cast out, that old serpent, called the Devil, and Satan, which deceiveth the whole world: he was cast out into the earth, and his angels were cast out with him. And I heard a loud voice saying in heaven, Now is come salvation, and strength, and the kingdom of our God, and the power of his Christ: for the accuser of our brethren is cast down, which accused them before our God day and night (KJV, Revelation 12:7–10).

With St. Michael as a prototypical hero, numerous Christian saints from the early church have been depicted in legend as slayers of dragons (*inter alia*, St. Mercurialis, St. Margaret of Antioch, St. Clement of Metz, and St. Martha). St. George, probably the most heralded, killed a dragon who was terrorizing a city in ancient Libya. The people had been feeding sheep to the dragon to appease it, but when the sheep no longer satisfied the hunger of the dragon, they began to feed it their children. The victims were chosen by lottery and, one day, the daughter of the King was chosen. St. George happened by the lake where the dragon dwelled just as the daughter was being offered to the dragon and gravely wounded him with his lance. St. George and the princess led the dragon into the city and promised to slay him if the people were baptized into Christianity. Twenty thousand were promptly baptized and the dragon was slain (de Voragine, 1993: 238–240).

In the eighth century Anglo-Saxon epic poem of the same name, Beowulf traveled to help an aging king rid his kingdom of a terrorizing troll named Grendel and his avenging mother. Beowulf then returned to his people and reigned as king for fifty years until a dragon threatened to destroy his kingdom. The dragon guarded a rich treasure that was kept in a burial mound, but was angered when a single drinking cup was stolen from the hoard. Beowulf and a young chieftan attacked and killed the dragon as it sought to lay waste to the kingdom. Beowulf was mortally wounded in the fight, but, before dying, he bequeathed the dragon's hoard to his protégé, Wiglaf (Willis, 2006: 205).

A prime example of the restoration of a treasure that had been stolen and guarded by a dragon can be seen in Richard Wagner's nineteenth century retelling of the ancient Norse legend of the hero Siegfried (Sigurd) and the dragon Fafner (Fafnir). The story is of a magical ring, forged of twice-stolen gold, all of which ends up as a hoard in the lair of the dragon and is eventually returned to its keepers, from whom it was originally stolen, after dragon is slain by Siegfried. This retrieval of the ring and the gold and its return to the rightful owners – the central plotline of Wagner's grand operatic tetralogy, *Der Ring des Nibelungen* – takes the audience on a journey which restores the disrupted spiritual balance of the cosmos while at the same time destroying those who have stolen these precious and magical items, only to use them in a quest for their own greed and power.

In J.R.R. Tolkien's *The Hobbit*, the main antagonist is the dragon Smaug who destroyed the town of Dale and captured the mountain Erebor with all its treasure. Smaug's belly was encrusted with the hoard's "gems

and fragments of gold from his long lying on his costly bed" (Tolkien, 1984: 199), rendering him practically invulnerable to attack. When Bilbo Baggins, the main protagonist of *The Hobbit*, encounters Smaug sleeping in his lair, Tolkien (with a nod to *Beowulf*) causes him to steal a "great two-handled cup" from the hoard. One place on his left breast was left unprotected, allowing Bard the Bowman to slay Smaug with a black arrow when he came to destroy the lake-town of Esgaroth. The hero, Bard, was elevated to the first king of Dale, restored after its destruction by the dragon, Smaug.

In Western mythology dragon slaying represents the act of the questing and conquering hero to destroy an evil creature that guards a hoard or threatens a people with its powers. Dragon slaying refers, then, to the act of killing this creature, or subduing its power, so that life may go on. In a psychological sense, dragon slaying can be thought of as the subduing or integration of powerful internal forces of opposition which can tend to overwhelm the ego and destroy psychological and spiritual equilibrium, the repair of which is necessary to achieve individuation or wholeness.

In the realm of psychology, the dragon in need of "slaying" may be a constellation of unconscious, shadowy energies that have been rejected by the ego. Even though cast off, these energies may control the conscious life or may be projected outwardly onto others who then hold both our rejected parts and our rejection of them. This inner dragon "guards," or keeps from us, a treasure of wholeness which can only be realized by neutralizing its power. As C.G. Jung writes, "[t]he treasure which the hero fetches from the dark cavern is *life*: it is himself, new-born from the dark maternal cave of the unconscious. . . ." (Jung, 1990: 374).

Slaying of this dragon constitutes making the unconscious parts of the ego conscious. Jung continues, "[t]he hero who clings to the mother is the dragon, and when he is reborn from the mother he becomes the conqueror of the dragon. . . [he] represents the positive, favorable action of the unconscious, while the dragon is its negative and unfavorable action—not birth, but a devouring; not a beneficial and constructive deed, but greedy retention and destruction" (Jung, 1990: 374–375).

The process of individuation, or achieving psychological wholeness, is not unlike the hero's journey. As Joseph Campbell describes in *The hero with a thousand faces*:

- ▶ the mythological adventure of the hero is a magnification of the formula represented in the rites of passage: *separation—initiation—return*: which might be named the nuclear unit of the monomyth. Prometheus ascended to the

heavens, stole fire from the gods, and descended. Jason sailed through the Clashing Rocks into a sea of marvels, circumvented the dragon that guarded the Golden Fleece, and returned with the fleece and the power to wrest his rightful throne from a usurper (Campbell, 2008: 23).

This formula is observed in myths and legends of the ancient past. It is seen in more contemporary retellings of hero journeys, such as *The Hobbit*, in which Bilbo Baggins descends into the dragon Smaug's lair and retrieves a treasured drinking cup. J.R.R. Tolkien subtitled his contemporary myth, *There and Back Again* (Tolkien, 1984). Dr. Franz Winkler writes, each of us "has a dragon in his subconscious mind, which he must overcome lest he fall victim to the forces of darkness within" (Winkler, 1974: 44). The inner voyage taken in depth psychology or spiritual direction, a descent away from a "false, exterior self," leading to the discovery of a "true, interior self," can be a treacherous night sea journey or *nekiya* wherein one or more dragons are confronted and conquered before coming "back again." As Jean Shinoda Bolen states:

- ▶ The dragon fight can be with an addiction, regression, depression, or aggression, or any destructive complex in the psyche that keeps a person from growing. The dragon fight can also be enacted with real people who are in intimidating, devouring, or abusive. . .Some inner dragons must be fought because we are already in their grip, some stand in our way and prevent us from growing, and others lash out through us at others. Even when the dragon seems to be a real person or a chemical addiction, it is the susceptibility to be overcome by this kind of person or substance that makes it dangerous (Bolen, 1999: 115).

Dreams

Louis Hagood

Up until the time of Aristotle, dreams were divine – messengers from the Gods or spirit world with the power of prophecy or healing. Priests or shamans were the intermediaries for these messengers, and in ancient Greece a network of temples, dedicated to the half God Aesculapius were popular sites for dream healing. Aristotle declared that dreams were not from the Gods and were not prophetic but leftover sensory impressions from waking life.

At the beginning of the twentieth century dreams were not only mortal but crazy as well. Freud published his *Interpretation of Dreams* in 1900 not only to distance dreams from the divine, but also to rescue them from insanity. Dreams had meaning, and he demonstrated how the meaning was disguised. Freud was a product of classical science with its reductionism and determinism, and his dream work follows that tradition, one that had no place for the mystical or the divine. His was a one-person model with forces both outside and inside creating dreams. As the twentieth century progressed, classical science was challenged by new physics and its theories of relativity and quantum mechanics, which challenged the old.

Jung analyzed the dreams of the physicist Wolfgang Pauli, and found the new physics more compatible with his mystical inclinations. His theory that dreams were a compensation for an unbalanced conscious position coming from the collective unconscious was like the quantum concept of a particle emerging from the sea of infinite potential. The collective made Freud's one-person dream model into a group phenomenon.

The group phenomenon has been utilized by Montague Ullman in dream sharing. In a group the dream is not interpreted as in Freudian or Jungian therapy, but responded to as if it were the dream of each respondent.

Thus the dream is truly no longer a one-person experience, but communal.

Dreams in the Old Testament

Erel Shalit

All in all there are about a dozen dreams in the Hebrew Scriptures, the Old Testament (of the dreams in the New Testament, five, in Matthew, pertain to divine guidance of the Holy Family; in Acts 2:17, Peter quotes Joel 3:1, and in Matt. 27:19 Pilate's wife shares with her husband a frightening dream, and tells him to spare Jesus). However, what exactly constitutes a dream may be hard to tell. The distinction between dream and vision is not always apparent.

Besides Jacob's well-known dream of the ladder, we find the main elaboration on dreams in the book of Daniel, with Nebuchadnezzar's two dreams, and particularly in Genesis, with Joseph's dreams and interpretations.

The attitude towards dreams in the Bible is ambiguous. While Daniel and Joseph are celebrated dream interpreters, in other instances warnings are voiced against the deceit and falsehood of dreams. In Jeremiah, God ridicules and warns, "I have heard what the prophets said, who prophesy lies in my name, saying, I have dreamed, I have dreamed," (Jeremiah 23:25) a warning repeated in other instances as well, for example in Zechariah, "For the family idols have spoken vanity, and the diviners have seen a lie, and the dreams have told falsehoods; they give empty comfort" (Zechariah 10: 2).

In spite of the relatively few dreams in the Bible, and the warning against dreams as possibly deceitful, their absence may be a bad omen. This is the case with Saul,

the first of the Hebrew Kings, who in despair before the battle in which his three sons are killed and he commits suicide, cries out, "God has departed from me, and answers me no more, neither by prophets, nor by dreams" (1 Sam. 28: 15). Saul had expelled the sorcerers from the country, and was now cut off from the mediums, the channels of unconscious and transcendent communication with him.

Two kinds of dreams can be distinguished in the Bible; those which sound a command, message or guidance of the Divine Voice, as with Abram and Abimelech, and the more symbolic dream, as we find with Pharaoh and Nebuchadnezzar.

Abram's Vision

In Genesis 15: 1 Abram, prior to God's changing his name to Abraham, has a nightly vision, which opens in a rather typical way for divine messages to prophets; "the word of the Lord came to Abram in a vision." Abram is bewildered, but God tells him, "Fear not, I am your shield, and your reward will be great." God then brings Abram out in the night, tells him to look toward heaven and count the stars, promising a large offspring.

While in the Bible this is called a vision, some authors believe it to be a dream theophany, i.e., the visible, embodied appearance of God in a dream (Bar, 2001: 148f.). After the sun has set, Abram makes a sacrifice and falls into a deep sleep. God then makes his first covenant with him. This is the first Biblical instance of dream incubation.

The Dream of Abimelech

The first reference in the Bible of a dream concerns King Abimelech. Abraham and Sarah had journeyed to the Negev, and Abimelech, king of Gerar had sent for Sara and "taken her," believing her to be Abraham's sister. "But God came to Abimelech in a dream by night, and said to him, Behold, you are but a dead man, because of the woman whom you have taken; for she is a man's wife" (Gen. 20: 3). The king declared his innocence, not having been aware that Sara was Abraham's wife and, furthermore, he did not sleep with her. While still in the dream, God answers Abimelech, "Yes, I know that you did this in the integrity of your heart; for I also kept you from sinning against me; therefore I did not let you touch her" (Gen. 20: 6).

Abimelech listened carefully to what he was told in the dream, and sent Sarah back to her (half-) brother

and husband, inviting them to live in the land. He was consequently rewarded with the renewal of life; the wombs of his house that previously had been closed up were now opened, and his wife and maidservants became pregnant.

Jacob's Ladder

The Bible's perhaps most well-known dream is Jacob's dream of the ladder (Gen. 28: 12). Jacob had set out on a journey to his maternal uncle Laban in Padan Aram. When night arrived he lay down to sleep and dreamed of angels ascending and descending a ladder that reached to heaven. Above the ladder stood God, promising to protect Jacob and to bring him back safely. When he woke up, he decided to call the place Beth-El, the House of God.

The dream ladder may be a metaphor for the connection between heaven and earth, divine and human, or, within man's psyche, the connection between the personal ego on firm ground and the sense of divine presence in man's soul, the god-image, or the Self. The angels, as messengers and intermediaries, wander this vertical axis. In fact, ladder (*sulam*) is a *hapax legomenon*, appearing only once in the Bible, possibly originating in the Accadian word *simmiltu*, stairway, believed to be used by the gods to travel between different realms; at the top of the stairway was the entrance gate to the dwelling of the gods.

Jung referred to the theme of the ladder as pointing to "the process of psychic transformation, with all its ups and downs" (Jung, CW 12, 1968, para. 80). Later, Jacob has another dream, in which he is told by an angel to return to his native Canaan.

Solomon's Dream of Wisdom

When inheriting the throne, King Solomon sets off to the sanctuary at Gibeon, north-west of Jerusalem. He presented burnt offerings, and went to sleep to incubate at the sacred precinct, whereupon he dreamed a dream in which God appeared to him (1 Kings 3: 5ff.). With Abram's vision, this is the Bible's most prominent case of dream incubation. In his dream, Solomon asked God to give him "an understanding heart to judge your people, that I may discern between good and bad." It is worthwhile to notice that the Hebrew says "a hearing heart;" the root of the word "hearing" [sh-m-a], is also the root of the word "meaning." That is, he asked for wisdom, and the wisdom of judgment, which he was granted.

Immediately upon his return from Gibeon to Jerusalem, Solomon is asked to decide who of the two harlots is the mother of the living child, and whose is the child that has died. He judged wisely that the one willing to forfeit the child rather than have it slain by the king's sword, is the mother.

Nebuchadnezzar's Troubled Dreams

Four centuries after Solomon built the Temple, the one hand of Nebuchadnezzar rebuilt the city and the civilization of Babylon, while with his other hand he destroyed the Temple and the walls of Jerusalem. He told his magicians, "I have dreamed a dream, and my spirit is troubled," and demanded they interpret his dream, without even telling it to them. Unable to do so, Daniel was called upon, and in a vision of the night God revealed the mystery of the dream to him. Daniel explicated the king's dream, in which he saw,

- ▶ A bright, awesome statue, head of gold, chest and arms of silver, belly and thighs of bronze, its legs of iron, its feet of iron and of clay. And then, a stone was cut out, but not by human hands. It struck the statue and the iron, the clay, the bronze, the silver and the gold were broken to pieces and became like the worthless straw on a threshing floor in summer. The wind swept them away without leaving a trace. But the stone that struck the statue became a huge mountain and filled the whole earth (Daniel 2: 31ff.).

Daniel told Nebuchadnezzar that his kingdom, his power, his strength and his glory came from God. "You are the head of gold," he said. Then there will arise a kingdom of silver, inferior to yours, and yet another one of bronze, which will rule over all the earth, Daniel tells the king. A fourth kingdom, as strong as iron – strong, oppressive, crushing and shattering, however "partly clay and partly iron, it will be divided" – powerful, yet frail, would then arise. At the end, the eternal, indestructible kingdom of heaven will crush and put an end to all these kingdoms, Daniel tells the king.

Daniel interpreted the four metals of the statue as four successive kingdoms. Nonpsychological interpreters have seen it as a dream that links the history of worldly empires, and it has thus been perceived as a prediction of the historical succession from the kingdom of Babylon to Medo-Persia and Greece, and on to Rome, from where the Kingdom of God would rise again.

Other scholars have compared the dream to Hesiod's stages in the moral decline of mankind. Psychologically, it may reflect the relentless process of increasing

functionality, an increasingly strong ego, until the ego swells and is overcome by the transcendent, as represented by the stone “cut not by human hands.”

However, Nebuchadnezzar remains arrogant, a “classic case of megalomania,” writes Jung (CW 8, para. 163). His second dream, in which the tree in the midst of the earth, reaching to heaven, is cut down, and the king turned into a mad beast for seven years, may be considered as compensatory to this inflated condition.

Joseph, the Dream Interpreter

The dreams of Joseph, the butler and the baker, and then Pharaoh, constitute the Bible’s most prominent dream series. There are three sets of two dreams each. Joseph’s second dream essentially repeats his first, and Pharaoh’s dreams are identical to each other.

The doubling of dreams indicates the vital meaning ascribed to them, “that the matter is established by God” (Gen. 41: 32). While the dreams of the butler and the baker are similar and dreamed the same night, they are interpreted by Joseph as predicting their opposing destinies.

Joseph told his brothers that in his dream, their sheaves gathered around his and bowed down to it, and in his second dream, the sun and moon and eleven stars bowed down to him. He thus further aggravated his already angry brothers. From a psychoanalytic viewpoint, these dreams have been considered as a narcissistic manifestation of Joseph. Standing in the center of the earth’s harvest and of heavenly counsel may then be understood as compensatory to his feeling of being rejected by his brothers.

The second set of dreams is those of his fellow prisoners in Egypt, Pharaoh’s butler and baker. The butler dreamed that he gives Pharaoh to drink from the grapes that he pressed from a three-branched vine. Joseph told him this means he will be restored within three days to his former rank. From the position of Pharaoh, which means “the great house” and has been referred to as a metaphor for the ego, whose spirit we are told is troubled (Gen. 41: 8), it may indicate a renewal of the flow of wine, a necessary rejuvenation of spirit and consciousness. The positive interpretation of the dream makes the baker come forth, as well, to ask Joseph to interpret his dream as well.

In the baker’s dream, the food for Pharaoh in the uppermost of the three baskets on his head is eaten by the birds. This time Joseph’s interpretation is less agreeable, “The three baskets are three days; And within three days shall Pharaoh lift up your head off you, and shall hang you on a tree; and the birds shall eat your flesh off

you” (Gen. 40: 18f). That is, in contrast to the flow of wine and the symbolism thereof, the produce of the earth will not reach the great house of Pharaoh.

Then, the meeting of the two protagonists – the Egyptian King who does not yet realize his kingdom is threatened by famine, and the Canaanite hero whose rise into royalty came to be followed by his people’s fall into slavery – becomes the lysis of the dramatic series of dreams.

In his dream, Pharaoh saw seven thin and ugly cows come out of the river and consume the fat ones, without getting fatter, and seven thin and damaged ears spring up and replace the seven good ones. Prosperity is replaced by famine, like autonomous complexes may drain the ego of its resources (cf. Shalit, 2002: 68ff.). However, a conscious attitude may enable taking necessary precautions, as suggested by Joseph, who is appointed viceroy to prepare the land for the years of famine. Psychologically, an ego that attends to the manifestations of the soul by listening to dreams, can apply conscious means of coping.

The name Joseph means “the added one.” Besides interpreting Pharaoh’s prospective dream, he added wise counsel. Pharaoh renamed him *Zaphnath-Paaneah*, understood to mean “through him the Living God speaks,” or, psychologically through him the voice of the self speaks. Literally, the name means the one, who “deciphers the encrypted message,” thus acknowledging Joseph’s gift of dream interpretation.

In summary, dreams are sometimes considered false and misleading (e.g., Jeremiah and Zechariah) in the Hebrew Scriptures, at other times they describe the vertical axis between man and divinity (or ego and self; Jacob’s ladder, or the statue and the tree of Nebuchadnezzar); sometimes Biblical dreams are divine visions, and sometimes they predict a person’s fate or serve as spiritual guidance.

Drewermann, Eugen

Matthias Beier

The primary function of religion is to be therapeutic. This thesis lies at the heart of the influential work of German psychoanalyst, theologian, and philosopher Eugen Drewermann. Widely read around the globe since the 1980s, he aims to free religion from its anxiety- and violence-producing projections and to interpret the rich symbolism of religions in ways that promote healing and wholeness for individuals and communities. Author of more than eighty volumes revamping theology in particular and religious studies in general in light of psychological, neurological, ethological, socio-cultural, and natural science research, Drewermann radically challenges the implicit and explicit use of traditional conceptions of God by religious, political, and economic authorities to justify psychospiritual suffering and socio-cultural forms of violence. He argues that religion needs psychological mediation to free it from literalistic rigidity and objectifying coercion, and that psychology, in turn, needs religion in order to safeguard the human person against behavioral, socio-cultural, genetic, economic and other forms of reductionism, dissolution, and exploitation.

Four basic interrelated ideas of Drewermann's work will be highlighted in this article: first, that the purpose of religion is to calm uniquely human forms of anxiety and that the measure of healthy religion depends on whether it increases or calms human anxiety; second, that a hermeneutics of religious texts and experiences is needed which pays equal attention to the evolutionary roots of religious symbols and to the vicissitudes of the subjective, historical human experience of self-reflection; third, that healthy religion is essential to a resolution of the human propensity to inflict psychological and physical violence; fourth, an exploration of the emergence of the notion of God as a person and its relation to the emergence of the human experience of personhood.

Born June 20, 1940, in Bergkamen, then a mining town in the Ruhr area of Germany, to a nominally Lutheran father working as a mining official and a devout Roman-Catholic mother working as a homemaker, Drewermann was the youngest of three siblings and exposed to lasting impressions of Allied air strikes that destroyed most of his hometown in the final years of World War II. Ordained as a Catholic priest in 1966, he soon found himself confronted as a diocesan priest in a German spa town with congregants suffering from psychosomatic illnesses and ethical

dilemmas for which seminary training had ill-prepared him. Thus motivated to enter psychoanalytic training at the Göttingen Psychoanalytic Institute, Drewermann's psychotherapeutic work confirmed the inadequacy of what he called a superego-oriented form of religion (1989) and argued for a religion oriented around the person-based experience of the I (*Ich*) or self. Simultaneously he began doctoral studies in theology at the University of Paderborn and philosophy at the University of Münster, earning a doctorate in systematic theology in 1976 with a dense three volume interdisciplinary study of Gen. 2–11 (1977–1978). Upon *habilitation*, Drewermann taught as *Privatdozent* for systematic theology at the Catholic Seminary of the University of Paderborn while continuing to work as a priest.

Integrating exegetical, psychoanalytic, cultural-anthropological, ethological, philosophical and systematic-theological methods, the multivolume works *Strukturen des Bösen* (1977–1978) and *Tiefenpsychologie und Exegese* (1984–1985) provide the methodological foundation for Drewermann's prodigious output of commentaries and interpretations of biblical texts and pieces of world literature: more than two dozen volumes of depth psychological commentaries on biblical texts, including each of the four gospels (1987–1988, 1992–1995, 2003, 2008–2009), the Luke infancy stories (1986, Engl.: 1994a), texts for Advent and Christmas (1990, Engl.: 1991c) and Lent and Easter (1991a, Engl.: 1994b), and most books of the Hebrew Scriptures (1994c, 1998c, 1999b, 1999c, 2000b); popular depth psychological interpretations of two dozen of Grimm's fairy tales (1981–2007), Anderson's "Little Mermaid" (1997), the Indian myth Milomaki (1991b); a historical novel on Giordano Bruno (1992), the Renaissance philosopher burned at the stake by the Inquisition; and interpretations of pieces of world literature such as Saint Exupery's *The Little Prince* (1984, Engl.: 1993b), Hermann Hesse's writings (1995), Dostoevsky's writings (1998a), Goethe's *Fairy Tale* (2000a), and Melville's *Moby Dick* (2004). His most recent series of volumes on the question of God in light of neurological (2006, 2007), anthropological (1998b), biological (1999a), and cosmological (2002) research have made him a public focal point of the science and religion debate in Europe. A prolific author gifted with the memory of a genius and the oratory skills of a Cicero, Drewermann is frequently featured on German speaking TV and radio talk shows and presents some hundred lectures annually while continuing his clinical practice.

Turning to the first basic idea, Drewermann's synthesis of psychology and religion centers around the function of religion to calm uniquely human forms of anxiety.

He distinguishes broadly three basic dimensions of human anxiety: the biological fear of death, the psychological/social fear of separation and insignificance, and the existential fear of non-being. In the face of the inevitability of death, existential anxiety raises biological and psychological/social anxieties through the self-reflective capacity of the mind to uniquely human absolute levels, as described by existential philosophers or psychologists from Kierkegaard and Sartre to Boss, Laing, May or Becker. The human capacity for self-reflection consciously or unconsciously opens the abyss of nothingness to the personal ego, stirring absolute levels of anxiety the ego forever seeks to calm. Such anxiety often remains unconscious and may then manifest itself in character structures as petrified anxiety which, on the outside, seem socially adaptive to the group, e.g., the routinely obedient fulfillment of the duty of a soldier in World War II moving prisoners to concentration camps or of another soldier to engage in carpet bombing while calmly drinking a cup of coffee in the cockpit of his bomber plane. Since the abyss of nothingness is absolute and, Drewermann maintains in contrast to other existential writers such as Sartre, Camus, or Becker, can never be bridged by anything less than absolute, all attempts to bridge it with anything less than absolute, such as temporal achievement, relative cultural symbols, allegiance to institutions or leaders including religious ones, or clinging to self and others, inevitably fail to calm and, often, inadvertently increase absolute anxiety. Based on this analysis, Drewermann argues that interpretations of religious texts, doctrines, and experiences need to be guided by attention to the basic interpersonal alternative between anxiety and trust. In this context, he developed diagnostic formulations of key theological dynamics in the experience of depression, hysteria, obsessive compulsion, and schizophrenia (1982–1984, 1993a).

Drewermann's work is best-known for his analysis of unhealthy forms of religion which led to his being officially silenced by the Roman-Catholic church at the behest of then-Cardinal Joseph Ratzinger, now Pope Benedict XVI, who wrote with alarm in a 1986 letter to the local archbishop that Drewermann's work had caused "grave concern" in the Vatican and instructed the bishop to take all "necessary measures" (Beier, 2004: 17). Informed psychologically by Freud, Jung, Reik, Fromm, Kohut, Klein, Boss, Laing, Stern, and others, Drewermann expounds through interdisciplinary analysis dynamics that turn religious doctrines, beliefs, and institutions into the opposite of their original function: from calming anxiety and sublimating aggression to being the source of anxiety and violence, thus paradoxically blocking the

way to a solution of both (1989, 1993a). "A reactive atheism due to disappointment" (2007: 425; 1999a: 737) is the inevitable and even necessary response to this poisoning of religion by fear. When Drewermann added to his depth psychological hermeneutic of religious texts an analysis of the Vatican's clergy ideal as practically requiring the sacrifice of the clergy's own personhood through complete identification with the office and called for radical therapeutic reforms of clergy training in his most controversial book, *Kleriker* (1989), he was, despite massive protests throughout Europe reminiscent of the Küng affair, stripped in 1991 of his license to teach Catholic theology and suspended in 1992 from his priestly duties. In the wake of a reunified Germany, Drewermann emerged as a cultural icon for a democratic and non-dogmatic form of religion and has since been regarded in the public's eye as a "new Martin Luther" (*Time International*, August 24, 1992). Drewermann left the Roman-Catholic Church on the day of his sixty-fifth birthday in June 2005.

The second aspect of Drewermann's work addresses the nature of religious symbolism and its relation to historical reality and truth claims. Historical criticism, comparative religious studies, psychoanalytic theory, and recent brain research provide insurmountable evidence that stories collected in sacred texts, for the most part, do not report objective "external" historical facts but rather poetic and narrative retellings of significant "internal" subjective experiences which, Drewermann, attempting to address the imageless Protestant vacuum created by the demythologization of the Bultmann school and dialectical theology, argues, are by no means less historical than physical events but rather more so because they transmit what a powerful experience meant to the people who experienced it or who were touched by it. The story of the virgin birth of Jesus, for instance, aims not to declare Jesus' mother Mary to be biologically a virgin but rather uses a motif resembling Egyptian mythology, where Pharaoh is declared as eternally being born of a virgin and son of God only from the day of his enthronement, to convey that the people who encountered Jesus experienced him as someone whose authority as a person was not born from humans but from God. As such, the symbol of the virgin birth became a democratic symbol expressing the belief that every person receives a place and right to exist in the world directly from God, thus relativizing all oppressive human authority, both internally and socio-culturally. In the course of Christian history, however, this mythic symbol turned into the exact opposite when historicized and metaphysicized by Christian institutions as a "belief" to be accepted about the external

historical state of Mary's sexuality and thus used to control the private lives of people.

While Drewermann's analysis focuses primarily on Christian symbols and dogmas, it always takes place within the comparative study of religions (2000c). Such study shows that the *content* of key symbols of Christianity, such as virgin birth, cross, resurrection, ascension into heaven, walking on water, or transfiguration is not unique to Christianity but is shared among the world's religions. The uniqueness of Christianity must be sought not in the content of its symbols but in the *way* those symbols function(ed) to express the process of calming unique human anxiety through an encounter with the person of Jesus who, as evidenced by the signature phrase "Do not be afraid," portrayed God ultimately as the one who can be absolutely trusted and need not be feared. The Christian use of what Freud, Jung, and their varied followers recognized as universal images or archetypes of the psyche, and what ethology terms "innate release mechanisms" is decisively therapeutic. The universality of psychic imagery, albeit in socio-cultural variations, allows stories from the past to be read as personal stories in the present. Central to Drewermann's thought is that the message of Jesus aimed to heal religion itself from the ambivalent projections into the God image and from the violence so often done in the name of God intrapsychically, interpersonally, and between groups.

This leads to the third key aspect of Drewermann's work: his analysis of the violence of religion and of religious motivations involved in waging war. Following a scathing eco-theological critique of the exploitation of outer and inner nature due to the anthropocentrism of the Judeo-Christian world view (1981) and a radical critique of Christian ideas which inadvertently promote a culture of war (1982, 1991d), Drewermann emerged during the first Gulf War as the most outspoken German anti-war activist. He received the 2007 Erich-Fromm Prize for his tireless efforts to fight war and anti-Semitism and to promote peace and social justice. He calls war a disease and sees it as an attempt to solve by material means conflicts that can only be solved by addressing the absolute fears around needs of recognition, existence, and shame that fuel wars and lead to compensatory cultural God-like claims to absolute moral superiority, truth, and power. In war, an abstraction from feelings of empathy takes place and reason goes mad with fear while creating rationalizations for a supposed necessity to inflict violence in order to fight violence. In addition to the analysis of economic, historical, socio-cultural, and political reasons for wars, an analysis of what is spiritually at stake in violent conflicts is essential. Efforts at peace and social justice so

often fail because they are guided by moralistic splitting of the world into absolute good and evil in which the "good" feel justified to use all means possible and thus inevitably come to perpetuate the cycle of violence by trying to solve it through further self-righteous violence. Jesus' message of peace as well as Ghandi's and Martin Luther King's non-violent calls for civil disobedience guide Drewermann's own vision for an active and psychologically convincing form of conflict resolution (1996).

In a postmodern world leaving behind the early Christian councils' Greco-Roman speculations about the divine cast within a type of thinking in terms of metaphysical being or substance as well as the Thomistic theological pseudo-rationalism, Drewermann argues in light of neurological, biological, and cosmological research that popular conceptions of the soul or spirit as a kind of substance or energy and of Christ as a being or substance ruling from above are no longer tenable (2006, 2007). Similarly, tempting as it may be, God can no longer be thought of in natural philosophical terms of a principle of explanation for first causes nor for why the world is as it is. Modern sciences, as atheists like Dawkins or Dennett have argued convincingly, do not need the God hypothesis in order to explain anything in the universe. Religion, and specifically belief in God, does not *explain* the world, but rather emerged anthropologically and is needed existentially philosophically to *interpret* the world so that humans do not go mad in the face of the cruelty, indifference and senseless suffering in nature. Discussing the alternative approach of Buddhism on how to deal with suffering and nothingness, Drewermann argues based on neurological research on consciousness and self-awareness and on modern infant research conducted by Daniel Stern and others that the conception of the divine as a person is indispensable in a therapeutic form of religion. While Drewermann agrees with the analysis of existential philosophers and psychologists on the radical nature of anxiety, he argues that "ontological insecurity" (Laing) requires a genuinely religious answer in which religious symbols become catalysts for a calming of existential anxiety in an unconditionally accepting encounter with an absolute person, called God in religions. This experience occurs through the interpersonal human experience of love and then extends to our encounter with the non-human world in form of compassion. It need not necessarily involve God-language to occur. Without an absolutely accepting person in the background of the world, all religious symbols remain open to ambivalent uses for purposes of oppression. The idea that God must be imagined as a person is not meant to make an objective statement that can be abstracted from personal, subjective experience.

Applying the notion of therapeutic transference developed by Freud and his school (rather than Girard's notion of mimesis), Drewermann holds that for humans any calming of personal anxiety at the deepest level inevitably occurs by means of the psychic language of the personal dimension. To humans, God becomes most personal in form of a person. In this sense the religious is always personal and the personal is always religious. It is religion's function as a remedy for anxiety that requires humans to conceive of the absolute as an absolutely trustworthy person, God. Only in this context can the Cross, so often interpreted in sadomasochistic ways when conceived projectively as something God did to Jesus or as Jesus sacrificing himself to God for humans, become a symbol for working through human aggression by placing it where the cycle of violence can be broken: onto God who is conceived of as being able to suffer the aggression without feeding the cycle of retaliation and counter-violence. Though God, Drewermann argues with Kant, can never be proven to exist objectively as a person apart from subjective human experience of the divine but is in a way always bound to the projective mechanisms of the human mind and thus remains a postulate, the subjectivity of this experience does not exclude an objective reality corresponding to it, just as all of our experience is by definition subjective in the sense that we are the experiencing subject of it and yet can at the same time correspond to an objective reality beyond our senses. Religion only becomes mere projection in the sense of the Feuerbachian critique when it is used by external religious or quasi-religious secular institutions to alienate humans from themselves rather than enabling them to truly unfold freely as unique persons in relation to each other. Experience of God, for Drewermann, is by definition poetic and the attempt to explain the existence of God by objective means would be equal to confusing explanations about hormones with the ecstatic experience of love or explanations about syntax with the rapture experienced at the reading of a poem.

Drives

Stefanie Teitelbaum

Introduction

Drive (*Trieb* in German) is a cornerstone of Freudian theory of human nature, combining the components of biological instinct and psychically determined patterns of behavior.

Freud used the words instinct (*Instinkt* in German) and drive (*Trieb*), often interchangeably. Dualism is a core component of Freud's thoughts about instinct, in both the nature of the instinct itself and in the mind body problem, wherein the instincts are the province of the body and the drives, psychically determined are the province of the mind. In a monadic or religious view, the distinction between instinct and drive is one of semantics.

Drive, as used in Freudian psychoanalysis, does not have a distinct role in religious literature. Religious texts, addressing the motivational forces of the Divine in human nature, refer primarily to instincts.

Psychoanalysis

Freud grappled with psychical agencies whose task was to tame, alter, neutralize and renounce the pressure of the

instincts which were threatening to the preservation of the species, individuals and civilizations. These agencies, however, are also instinctually motivated. Included are the Reality Principle (1911b), the internalization of the Primal Father (1913/1962), the Ego Ideal (1914/1962) and the Super Ego (1923b/1962). The Death of the Totem Father was specifically positioned as the innate mechanism enforcing the taboo against incest. The Super Ego and Ego Ideal however, contain implications of conscience which may be viewed as significantly different than the innocent, amoral vicissitudes of the instincts, (1915/1962). Thus forces creating Super Ego and Ego Ideal Super Ego and Ego Ideal might be considered to be motivated by a psychical drive rather than a biological instinct. Yet, the Oedipus Complex and the prohibition against incest may also be viewed as an instinctual protection of the species.

Commentary

Seminal texts on Freudian psychoanalysis often translate the German *Trieb* as instinct. Kernberg (1992) summarized the differences of the terms concluding that instinct represents a biological pressure and drive represents a psychically determined force of human nature. The differences exist in a mind/body dualistic schema. The instincts are proactive and reactive to the demands of the life and death of the body. The drives appear to take on a life of their own, related to the demands of psychical life and death. LaPlanche and Pontalis, (1967/1973), used instinct as their preferred term, with drive secondary, consistently translating *Trieb* as instinct in their major classifications. Rappaport (1961/1996) spoke of instinctual drive. Psychoanalysis speaks of drive derivatives, those aspects of a human personality which retain their instinctual character and have not been adequately altered by various psychical civilizing agencies.

The distinction between instinct and drive appears to be of interest to psychoanalytic theorists, and even in those circles, an arcane interest. This psychoanalytic concept of drive does not appear in significant religious texts: that which analysts refer to as drive is seen as the force of the Divine or the Devil. The Talmudic concept of the *Yetzer Tov* and the *Yetzer Hara*, the inclination towards good and evil are implanted by God and their interplay form the basis of human nature. The internal voice of the *Yetzer Tov* is thought of as the voice of God and of conscience. The Christian virtues Virtues and Deadly Sins might well be viewed as children of the *Yetzers Tov* and *Hara*. These motivational forces are uniquely human and value laden, which might put them in the category of a drives if one uses the term as in the psychoanalytic concept.

Dualism

Hillary S. Webb

Dualism Across the Domains

“Dualism” (from the Latin *dualis*, meaning “containing two”) refers to a philosophical system or set of beliefs in which existence is believed to consist of two equally real and essential substances (such as mind and matter) and/or categories (such as being and nonbeing, good and bad, subject and object). Dualism contrasts with *monism*, the theory that existence ultimately consists of only one thing or essence, and also with *pluralism*, the belief that existence is made up of many things or essences (Ajaya, 1983; Gordon, 2005).

Although the term can be applied to much earlier philosophical and religious traditions, “dualism” as an ontological designation was first used in 1700 by the

philosopher Thomas Hyde as a means of describing religious systems that conceive of God and the Devil as co-eternal (and therefore equal) principles. The term was later introduced into philosophical discourse by the German Idealist Christian Wolff as a way of categorizing philosophical systems that conceive of mind and matter as distinct and irreducible substances. Rene Descartes further separated mind and body within what came to be known as “Cartesian Dualism.” After this, the term “dualism” as a philosophical concept became most frequently applied to issues surrounding the “mind-body problem” – a philosophical conundrum that considers how the seemingly distinct substances of the immaterial mind and the material body causally interact (Gordon, 2005; Stoyanov, 2000).

While in Western philosophical dualism the fundamental debate centers on the primacy of mind versus body, when applied to the field of religious studies, “dualism” is most widely used in regard to belief systems that either conceive of two supreme and opposing principles such as “God” and “Devil” or those that create a sharp distinction between the “profane” (the world of day-to-day physical existence) and the “sacred” (an intangible, transcendent, and – in some cases – more “true” or “essential” reality). The Western world’s study of the human psyche has likewise created various splits or dualisms, including (but not limited to) the relationship between society and the individual, nature and nurture, and mind and body. In the seventeenth and eighteenth centuries, Wolff divided the study of the soul into “rational psychology,” which examined the human soul and argued for its immortality, and “empirical psychology,” which aimed to identify psychological principles on the basis of the soul’s worldly experiences. Later on came the division of psychological disorders into “organic” (biologically-based) and “functional” (mental-emotional) pathologies, with the former orientation emphasizing the explanation, prediction, and control of behavior or cognition, with the latter focusing on the subjective experience of the individual as a means to understand and treat psychological distress (Teo, 2007).

A Preoccupation with Polarity

It has been argued (Levi-Strauss, 1963; Maybury-Lewis, 1989a; Needham, 1973) that all cultures across time and space identify and make meaning of the world through “binary oppositions” – dyads of complementary or opposed elements such as male-female, good-evil, spirit-flesh, and so on. Some (Levi-Strauss, 1963; Maybury-Lewis, 1979, 1989a, 1989b; Needham, 1973)

believe binary opposition to be the most fundamental category through which the human mind organizes itself, and that the frequency with which this form of classification arises within and across cultures is evidence that “bipartization,” or the impulse to conceive of the world as split into a duality is hardwired into the human psyche. Given this “preoccupation with polarity” (Maybury-Lewis, 1989a: 6) it has been suggested that much of human consciousness is devoted to trying to understand and mediate the relationship of the opposites.

The way in which a culture envisions the relationship between the polarities is one of the most significant and distinctive features in any ontological model. Within religious traditions exhibiting an *antithetical dualism*, one side of the pair is often seen as being responsible for the creation and preservation of the cosmos with its opposite being the “negative” or “evil” aspect that seeks to unmake creation. Stoyanov (2000) split religious systems of this type into several categories based upon the extent to which (and the ways in which) this opposition manifests. For example, he noted that within systems that exemplify an *absolute dualism*, the antithetical relationship of the opposites is, as the term implies, absolute, in that the opposing forces representing good and evil are believed to have originated from two independent, co-eternal principles that always have been and always will be separate. Classic examples of *absolute dualism* are the “dualist monotheisms” of Zoroastrianism and Manichaeism, two early religious systems that made the antagonistic struggle between good and evil the fundamental principle of their religion. However despite both being forms of absolute dualism, Manichaeism and Zoroastrianism show significant differences in how this antithetical struggle is played out. For example, in Zoroastrianism it is believed that the physical world, including the human body, is an expression of the positive aspects of the “good” principle. This belief is referred to as *cosmic dualism*. Manichaeism, on the other hand, as an example of *anti-cosmic dualism*, equates the profane world and its manifestations with the principle of evil (Stoyanov, 2000).

In contrast, other systems exhibiting an *antithetical dualism* subscribe to a kind of *moderate dualism* in which one of the two opposites – typically the “evil” side of the equation – is considered to be a secondary principle; one that has its origins in the primary and more supreme principle. Some of the classic Gnostic movements are included in the category. Despite these ontological differences, philosophies of *absolute dualism* and *moderate dualism* both share the fundamental belief that the aspect considered to be “negative” or “evil” should be rejected and/or destroyed. It has been noted (Ajaya, 1983) that

within this context, the human experience is perceived to be an unending struggle to distinguish that which is the “good,” “creative,” or “real” aspect and that which is “evil,” “destructive,” or “illusory.”

While a philosophical model based on an *antithetical dualism* accentuates the struggle and antagonism between the opposites, other systems of thought perceive the polarities as being ultimately *complementary* in nature. Within a dualism of complementary terms, the underlying ontological belief is that everything has a counterpart without which it cannot exist. Philosophical and religious systems based upon forms of complementary dualism (for example, Taoism and many indigenous, “shamanic” belief systems) maintain that existence is dependent upon the tension and balanced interchange between the polarities. Because they are interdependent and mutually supportive, resolutions or disturbances occurring in one side of the equation evoke a sympathetic response in the other. Therefore, if one side is destroyed or denied, the other will suffer to an equal degree (Hertz, 1973; Maybury-Lewis, 1979, 1989a; Needham, 1973; Tuzin, 1989; Watts, 1969).

While certainly acknowledging the tension created by the opposites, philosophical models based on a complementary dualism are marked by their dedication to maintaining an equilibrium and harmony between them. Maybury-Lewis (1989a) stated that, “[Complementary] dualistic theories insist that these antitheses do not tear the world apart, and humankind with it, because they are part of a cosmic scheme in which they are harmonized” (p. 14). Within these cultures, “complementarity” becomes the major organizing principle within all aspects of community life, from the social to the spiritual.

Dualism in the Psyche

It has been noted (Jung, 1953/1956; Myerhoff, 1974; Tarnas, 1991; Watts, 1969) that Western philosophical and religious systems have historically tended towards a dualism of antithetical terms, with a corresponding belief that the tension created by the polarities can be resolved only through an elimination of the undesirable aspect of the pair. Myerhoff (1974) reflected, “Unfortunately, we westerners have come to feel that enduring this sort of tension is not really necessary, but somehow it is possible to allow one pole to exist and prevail without its opposite. We see good without evil, pleasure without pain, God without the devil, and love without hate” (p. 102). Likewise, Watts (1969) noted that, “By and large Western culture is a celebration of the illusion that good may exist without evil, light without darkness, and pleasure without

pain, and this is true of both its Christian and secular, technological phases” (p. 48).

The Western world’s devotion to what Jung (1953/1956) referred to as “neurotic one-sidedness” (p. 42) is evident in a certain intolerance of the complexity of the psyche, one that often results in a compulsion to eliminate all paradoxes and seeming contradictions of the human condition. A 2007 *Time* magazine article, entitled “What Makes Us Moral?” gives an example of this. The article begins with the following sentiment:

“If the entire human species were a single individual that person would long ago have been declared mad. The insanity would not lie in the anger and darkness of the human mind – though it can be a black and raging place indeed. And certainly it wouldn’t lie in the transcendent goodness of that mind – one so sublime, we fold it into a larger ‘soul.’ The madness would lie instead in the fact that both of those qualities, the savage and the splendid, can exist in one creature, one person, often in one instant” (Kluger, 2007: 54).

According to this article, it doesn’t matter which we choose – either the “splendid” or the “savage” – as long as we align ourselves thoroughly and completely with that one side without deviation. Only then can we be considered healthy and sane. While over the years there have been a number of Western thinkers who have argued for the necessity of balancing the opposing forces within the psyche (Jung and Watts most notable among them) the dominant Western psychological perspective tends to be that the individual must choose between the opposites – either the splendid or the savage – and align oneself thoroughly and completely with it without deviation.

Duende and Psychoanalysis

Claudia Bader

Duende is a term used to describe artistry empowered by the awareness of death. It has similarities to the idea of “soul,” in art and life, but although both share the sense of tragedy or pain moving the creative energies, duende is libidinally charged, having more fire and drama in it.

The term duende comes from popular Spanish culture, created from the phrase – Duen de Casa – Master of

the House. This refers to a poltergeist-like trickster figure that makes a general irritation of its self by hiding things, breaking china, and making noise. However there was another usage of the term that comes from Andalusia, where great artists are said to have duende, inferring they are in contact with this force. Great bullfighters, singers, and dancers are graced with this description. Duende becomes a personification of, and resonates to, daimons, muses, and/or demons; it is an energy that moves through the body and soul. It is described as a possession as much as a talent. In this guise duende takes on a chthonic quality, pulling inspiration from the depths and bursting through the artist to the audience.

Awareness of death is an intrinsic aspect of duende. Destructive and creative energies are very close to each other when the duende is invoked. The whisper of death suffuses their art, and this awareness of it drives life. Thus, Manuel Torre, who was a great flamenco singer, can make the statement that “all that has black sounds has duende” (Torre, quoted by Lorca, p. 49, 1933). The thrill and terror of contact with death, the ultimate mystery and realm of the unknown, is what brings depth of expression and allows the performer and the audience to soar.

The person responsible for bringing the concept of duende out of Spain onto the international stage was the Spanish poet and playwright Federico Garcia Lorca (1898–1936).

A charismatic figure, Lorca was deeply involved in the intellectual and creative life of the time. He had close relationships with Bunuel and Dali, and was an influence on Pablo Neruda. Lorca was obsessed with his death, and would even stage mock funerals for himself with his friends.

The idea of duende as an artistic force was integral to his thinking from at least 1922 when he gave a lecture, “Deep Song,” at a music festival for the for musical genre called Cante Jondo – deep song.

His ideas about deep song became the foundation for his poetics.

The time in between 1922 and 1933 he was in New York writing “a Poet in New York,” listening to jazz, blues, African–American spirituals and studying English at Columbia.

In his contact with professional singers (cantaos) and dancers (bailaors) of Spanish music Garcia Lorca came to appreciate the difference between a good and bad performer.

The difference was simple. . . he said that good performers have duende, bad ones never, ever, achieve it. The good singers sing with their whole body, the sound moving from the chest, not the throat. Good dancers pull the energy up from the earth. These performers with duende have “black sounds.”

Black and its various symbolic variants are crucial for duende, and this relationship to the dark and its gifts and trials is crucial for psychoanalysis as well.

The source of the symbolism related to black is rooted in the fact that we are diurnal animals. We humans are most dependent upon our sense of sight. If we go back in time to our experience in nature before artificial light, night is the most dangerous time for us. We are at our most vulnerable in the night, for without light we can't see. When we sleep, things go dark, and we are helpless at that time. We are unconscious and enter another reality. Additionally, the association of death with black comes naturally since in death we are unconscious permanently. As with all symbols, individual associations to black evolve dependent upon a combination of archetypal factors and a person's individual psychic structure and experiences.

Duende's relationship to death resonates with psychoanalytic concepts. Freud coined the term death instinct. He wrote about this in *Beyond the Pleasure Principle* (1920). The death instinct is more commonly called thanatos.

Freud was always close to an organic orientation, and when he formulated the idea of the repetition compulsion and its stubborn adherence to early patterns, to NOT changing, Freud came to the conclusion that the fundamental aim of all instincts is to revert to an earlier state, a regression.

He came to see a battle in the psyche that he felt was based in biology, of the life, libidinal, forces pitted against the drive to death and entropy. They evolve into more of a drive quality when Melanie Klein developed the theory.

Melanie Klein was deeply influenced by the idea of the death instinct and saw it as an active, intense force in the psyche in contrast to Freud who saw it working in the background. In Klein's work with children she observed intense destructive levels of aggression in their play that outbalanced the loving, joyous, positive libidinal aspects of play. She elaborated on the power of the death instinct by describing “envy,” an early state in which aggression directed against the life of the subject is directed against anything that supports or is a source of life.

It is difficult to observe thanatos in its pure form in reality, but art can create images where we might actually get some sense of what the pure form might look like. Mythological monsters and demons, crazed villains in movies and plays open us to the raw expression of the darkness.

A common thread in these villainous character is their grandiosity and narcissism. They strive to annihilate all difference, because the only thing allowed to exist is

themselves. Drenched in Klein's envy, they want to destroy life. This kind of character resonates to the myth of Saturn/Kronos, who, upon hearing a prophecy that one of his children would overthrow him, ate his children.

In this kind of world, there cannot be an other; without an other, no relatedness and no object relations. When there is no relatedness, death can result. Spitz discussed this in relation to "hospitalism." He reported that infants did not thrive, and some died that were not cuddled, held, and related to, even if they were fed and changed.

The body is important in duende; Lorca quotes an unnamed virtuosic guitarist describing duende as climbing up from the soles of the feet. Resonating in the body, the singing comes from the chest and belly, not the throat. Duende's black sounds emerge from deep feelings. Mourning, rage, love, the forces of destruction and creation, are closely connected. An artist with great duende contains and expresses these.

In psychoanalysis, appropriate mourning and grief are crucial in healing. Psychoanalytic work demands great presence in the face of extreme affect states. The analyst needs to create the container in the rhythm of time and contact in order to help negotiate and midwife real mourning.

Christopher Maurer describes four crucial elements identified as Lorca's vision of duende: irrationality, earthiness, a heightened awareness of death, and a connection to the diabolical.

In these four elements, more aspects of working psychoanalytically come up:

1. *Irrationality*: working with feelings and impulses
2. *Earthiness*: as a recognition of mortality, that we are in a body that dies; then, the channel of expression through the body. The cantaor (singer) with duende sang from his chest and not his throat
3. *The Awareness of Death*: the death instinct, and the contrast of the drive for life. The importance of mourning in the process of healing
4. *Connection to the Diabolical*: allows for aggression, sadism, all the thanatos-driven feeling states

Duende and Projective Identification

Another aspect of duende resonates with the psychoanalytic concept of projective identification, the condition where the patient, unable to tolerate their own feelings, cuts them off and projects them into the psychoanalyst. In this case, the psychoanalyst feels the feelings of the patient.

Duende, in its guise as a daimon/muse/demon, is described as seizing both the performer and the audience.

It is a right brain experience, beyond intellect. This seizing is an excellent description of what projective identification feels like. However, in this case, the resonant effect is a result of the presence of duende, and the performer is not cut off from feeling.

Duende and the Alchemical Mercury Archetype

Duende can be understood as an aspect of a larger archetype, mercury. As in all alchemical imagery, the symbols start with the actual chemical substances and processes used in alchemy. Mercury has a special place in these, for mercury is described as both the alchemical process as well as the goal of the process. Both duende and mercury are paradoxical: a "who," and a "what;" destruction and creation.

In descriptions of mercury in alchemical texts, mercury is seen as a combination of substances, having many different qualities which all refer back to the properties of quicksilver. This is called "common mercury." Chemically speaking, this comes from the fact that quicksilver served as a universal solvent.

However, mercury is often called "Our Mercury;" In this manifestation mercury gains a capital "M," and takes on a different character. "Our Mercury" is substance, source, and process all at once. "Our Mercury" is transformation its self, intrinsic, coming from the matter that is undergoing the change. In the transformation it devours its self and then recreates its self. The name, "Mercury," is given to all stages of this death/rebirth cycle.

The juxtaposition of destructive and creative process fits duende. Duende is referred to as both a presence, the duende, in its guise as daimon/muse/demonic earth spirit, and a process, what is being expressed emotionally and spiritually in performance or in creative process. This slippery quality that encompasses both process and presence is also a way of conceptualizing psychoanalysis. As psychoanalysts hold the space for patients with their therapeutic presence, and they also facilitate process occurring. So there is both stillness and movement in the same space. This combination of process and presence resonates with themes from the alchemical mercury archetype as well as duende.

Dunbar, Helen Flanders

Curtis W. Hart

Dunbar's Life

Helen Flanders Dunbar was a medieval scholar, a seminary graduate, and a practicing psychiatrist with an abiding interest in psychosomatic medicine. She was born into a well-to-do family in Chicago in May of 1902 and suffered from a variety of illnesses of unclear origin as a child. She was raised primarily by three strong women who invested a great deal in her. They were her mother, her aunt, and her grandmother all of whom anticipated great accomplishments in her future. She graduated from the Brearley School in New York and went on to attend college at Bryn Mawr where she majored in both mathematics and psychology with an interest in psychology of religion in particular. Dunbar then undertook graduate studies in Comparative Literature at Columbia and attended Union Theological Seminary at the same time. At Union, she met Anton Boisen who engaged her interests in the clinical training program for clergy and seminarians that he was starting at Worcester (Massachusetts) State Hospital. Dunbar went to Worcester in the summer of 1925 where she worked tirelessly in the department of social work studying symbols and symbolization in schizophrenia. Her interest in the clinical training she received with Boisen and others at Worcester combined

with her curious and idealistic nature, led her to become the first Medical Director of what was then called the Council for Clinical Training for clergy, even as she went on to complete her medical studies at Yale.

A practicing Episcopalian, Dunbar retained a connection to both the church and the medical establishment. As a physician, she showed herself to be an adept institutional politician and an outstanding theorist in the area of psychosomatics. She had a central role in and became the founding editor of the highly esteemed professional medical journal *Psychosomatic Medicine*. She completed a major study *Emotions and Bodily Changes* (1935) that went through several subsequent editions. She held several prestigious positions in the dialogue between religion and medicine and maintained an ongoing interest in furthering the formal, scientific study of the relationship between faith and health. Never one to avoid controversy, Dunbar became involved in confrontations and controversies with male colleagues in both medicine and religion over issues of gender, power, and authority as much as they had to do with theory and professional practice. Dunbar was not actively involved with the clinical pastoral movement and Anton Boisen in particular much after the late 1930s but her commitment became rekindled just prior to her untimely death in 1959 from drowning in a swimming pool following a heart attack at her home in South Kent, Connecticut in 1959.

Dunbar's Legacy

Dunbar's legacy is complex in both medicine and religion. Her writing displays an erudite and sophisticated appreciation for the interplay of mind and body, psyche and soma. She was greatly interested and expended considerable effort investigating the role of symbols in explaining and understanding illness. Her own study of medieval literature, and Dante in particular, informed her therapeutic approach. The book she wrote arising out of her doctoral thesis at Columbia, *Symbolization in Medieval Thought and Its Consummation in the Divine Comedy*, was first published in 1927 and was republished at the time of her death in 1959 and remains a classic in its field.

It was out of her thinking and writing in theology and medieval studies that she came to understand the depth and power of symbols as they relate to medical and psychiatric symptoms. Symbols potentially provide structures for meaning about the relation of body, mind, and spirit. For Dunbar, symbols call attention to the whole that is always greater than the sum of its parts – a person with a family and a history or life narrative that develops

or displays signs of dysfunction at a specific time in life and is under the influence of both inherent predispositions and immediate life stressors. Dunbar's views in these matters reflect a thoroughgoing sense of organic and holistic thinking, where for her the parts or dimensions of a person are not separate or discreet entities but interdependent and dynamically related components affecting one another. Her views on these matters anticipated by a generation in medical education and practice what is known as the "biopsychosocial model." Her understanding of healing in medicine and psychiatry was informed by what is often thought of as the property of a medieval world view known as the "organic functional ideal." Dunbar's views are at the same time a reflection of the powerful influences upon her of both John Dewey and Alfred North Whitehead. Dunbar was a challenge to the medical world as well as to those she encountered in the ministry and the religious establishment both because of her gender as well as for her highly original perspectives. She could persuade, charm, and confront others. She was known to be a gifted and much sought after therapist. Her ideas were informed as much by her theological and medieval and literary studies as by her medical and scientific endeavors. Helen Flanders Dunbar thus remains a prophetic and intriguing figure in the dialogue between medicine and religion.

Dying and Rising Gods

Lee W. Bailey

An ancient text says, as James Frazer worded it: "Heracles on his journey to Libya had been slain by Typhon and brought to life again by Iolaus, who held a quail under his

nose: the dead god snuffed at the bird and revived". (Frazer, 1922: section 224).

This is a short version of the many accounts of gods and semi-gods who were said to have died and been resurrected, well-documented in the eastern Mediterranean region. This one is associated with the migration of quails who descend in hordes on Palestine/Israel in spring to breed.

James Frazer

The classicist James Frazer (Cambridge University), in his 1890–1915 encyclopedic *The Golden Bough*, collected a mass of reports of ancient authors and nineteenth-century travelers about archaic rituals, myths, and traditions. It is a classic compendium of fascinating material, highlighting the dying and rising god theme, but he organized it according to lax, speculative nineteenth century standards.

Frazer's overall thesis was that archaic magic gave way to religion, which has now given way to science. This theme was soon proven wrong when twentieth-century religion continued to flourish alongside science. He also practiced the risky speculation of armchair scholars, by hypothesizing grand organizing themes without adequate study of the details of each culture (he traveled only to Italy and Greece). This conflict between those exploring large universalist themes and those restricting research to culturally unique specifics has continued, and is active in the discussion of the "Dying and Rising Gods," which was the most controversial schema that Frazer proposed.

Frazer reviewed the ancient texts and recent studies of eastern Mediterranean gods and demi-gods such as Tammuz, Adonis, Dido, Hercules, Melquarth, Attis, Marsyas, Hyacinth, Osiris, Dionysus, Demeter and Persephone. He interpreted their deaths and resurrections primarily as primitive magic carried over into religions of deities, having the purpose of assuring the fertility of the earth's reproductive systems. Not understanding the natural processes of growth, he proposed, these ancients believed that they had to magically help fertility happen by imitating the seasonal process, thereby facilitating it. So the death (or descent into the underworld) of a god or goddess was symbolized in part by a ritual of planting seeds, and the resurrection was an image of plants sprouting and animals being born.

Many variations developed, including bloody sacrifices, such as the initiates into the cult of Cybele imitating her beloved Attis by castrating themselves and throwing their blood (life-fluid) and testicles onto a statue of the goddess, apparently to assure her impregnation and

Dying and Rising Gods. Figure 1 Osiris rising from his bed in a floating position. His wife Isis standing on the left. From the Osiris temple at Dendara; see Mettinger (2001:173). Published originally in Mariette, A. (1870). Denderon. Vol. 4. Paris.

subsequent fertility in the plant and animal world. Attis was said to be born of the virgin Nana, and initiates were said to be baptized with the blood of a bull (the *taurobolium*) (Frazer, 1922:403–413). Frazer interpreted this all as promoting fertility among hungry people groping with agricultural practices in a world they saw as filled with spirits. The ancient high death rate may have also been in the background. Women were reported to grieve the death of Adonis, plant gardens of Adonis, and celebrate when the seeds sent up shoots (Frazer, 1922: 376–403). He notes an Egyptian inscription that shows the dead Osiris lying prostrate, rising up and standing with Isis (Frazer, 1922: 436; drawings in Mettinger, 2001: 171–174). He also argues that in addition to vegetation magic (naturist), some resurrections were intended to be social, assuring the continuation of the life force of the king (euhemerist), and that some myths (e.g., Osiris) were intended to assure eternal life.

Now all this is fascinating, but Frazer has been accused of excessive speculation, especially in the category of the Dying and Rising Gods as symbols of vegetative growth. Several scholars have rejected his broad universalist category and stressed the particular differences among the accounts of the gods, semi-gods, or humans and textual

difficulties, although some scholars support the Dying and Rising Gods theme (Mettinger, 2001: 215).

Jonathan Z. Smith

The critical particularist reaction by Jonathan Z. Smith (University of Chicago) in 1987 (2nd ed, 2005), in Eliade's *Encyclopedia of Religion*, swept aside this Dying and Rising Gods typology as “largely a misnomer based on imaginative reconstructions and exceeding late or highly ambiguous texts” (Smith, 2005: 2535). Smith holds the data to strict standards of empirical historical research, and finds it lacking. He argues that some of these gods or semi-gods are said to disappear, not die. His typology is that some deities return but have not died, and that other gods died but do not return. His thesis is that “There is no unambiguous instance in the history of religions of a dying and rising deity” (Smith, 2005: 2535).

In one text about the Syrian/ Babylonian/ Greek god/ hero Adonis, for example, in Ovid's *Metamorphoses*, Adonis is killed by a boar, but does not rise from death [except as the anemone flower – Book 10: line 737]. Apollodorus' *Library* (III. xiv. 4) describes Adonis' alternation between

the upperworld and the underworld, but, Smith interprets, this offers no explicit suggestion of death and rebirth (Smith, 2005: 2535–2536). Smith (like some Christians) suggests that late post-Christian myths of Dying and Rising Gods were likely influenced by Jesus' resurrection. Attis, for example, in a late text, is said to be resurrected, but Smith says he is not here a dying and rising deity, nor is he a deity at all, but a human (Smith, 2005: 2536). Other myths of resurrection, Smith argues, fail to fit his strict category, such as Baal and Marduk. He says that the text “so-called” *Death and Resurrection of Bel-Marduk* is most likely an Assyrian political parody (Smith, 2005: 2537). Osiris, he argues, cannot be said to be risen, “in the sense required by the dying and rising pattern,” since his resurrection after dismemberment sent him to be the Lord of the underworld land of the dead, imparting a new permanent life to the deceased (Smith, 2005: 2538). Thus he defines resurrection as literally returning to mortal earthly life, excluding continuation as plants or in an immortal state, and rejects the motif of going to the underworld and returning as symbolic of death and resurrection.

Smith is right in pointing out many discontinuities among the supposedly dying and rising gods. The vegetation gods, such as Adonis, differ from the royal kingship gods and the gods of immortality after life, such as Osiris, who combines all three types. Smith's particular readings are rooted in his empirical hermeneutic and logically astute analyses, inspired by empiricism's distaste for speculation. But Smith's readings are selectively speculative and too literalist for such symbolic literature. This contrasts with a symbolic, more phenomenological hermeneutic, which would read important images differently. For example, the underworld is clearly the ancient abode of the dead, and Adonis is relegated by Zeus to spend half his year there with Persephone (goddess of death), and half above ground with Aphrodite (goddess of love) (Apollodorus III, xiv, 4). This seems clearly to symbolize a dying and rising god able to appear on earth, yet partake in immortal forces that overcome ordinary death (*athanatoi*), thus being able to be resurrected, although perhaps not in a literal earthly body.

Smith focuses on the male dying and rising gods, and neglects the importance of the goddesses. For example, an Inanna text that clearly states that *she* is a dying and rising goddess: “My father. . . He gave me descent into the underworld. He gave me ascent from the underworld” (Wolkstein-Kramer, 1983: 16). Inanna/Ishtar is clearly the dying and rising goddess (c.f. Persephone) in this Sumerian/Akkadian tradition, and seeking evidence for only the male figures distracts from the feminine traditions.

While she descended into the underworld, life above stopped (“Since Ishtar has gone down to the Land of no Return, The bull springs not upon the cow, the ass impregnates no the jenny. . .” lines 6–7), and when she returned, it began again with resurrection (“May the dead rise and smell the incense” last line, Pritchard, 1958: 80–85).

Smith is not only un-feminist here, but he seems loathe to accept the idea that return from the underworld to be sufficient to mean rising from the dead. But in ancient myth the underworld is commonly the abode of the dead, and rising from it commonly symbolizes return to life on earth or the place of immortality. “Rising” from death need not mean an empirical return to normal bodily life, but could easily mean a more poetic, mystical passage of the spirit of the ancestors into the upper world, which was a common theme in ancient Egyptian and many other religions. Smith focuses on Ishtar's lover Tammuz, and, with a reading claiming a mis-translation, says that “in the Akkadian version, Tammuz is dead and remains so” (Smith, 2005: 2539). Yet the complete reference at the end of the Sumerian and Akkadian texts gives a different picture. When Ishtar returns to the upper world from the land of the dead, she says:

- ▶ As for Tammuz, the lover of her youth,
Wash him with pure water, anoint him with sweet oil;
Clothe him with a red garment, let him *play* on a flute of lapis,
Let courtesans *turn* [his] mood. . .
On the day when Tammuz comes up to me,
When with him the lapis flute (and) the carnelian ring come up to me,
When with him the wailing men and the wailing women come up to me,
May the dead rise and smell the incense (Pritchard, 1958: 85).

On the surface, Ishtar/Inanna's successful battle with Erishkigal, Queen of the Dead, and return to the upper world with her deceased lover Tammuz/Dumuzi is the symbolic cause of the conquest of death resulting in resurrection. To focus on the death of Tammuz, saying that here he is only being “treated as a corpse” and to highlight the ritual wailing about his loss, is to ignore this clear reference to his subsequent return to life, as in the reawakening the erotic instinct of reproduction (“Let courtesans turn his mood.”) Smith simply refuses to read numerous symbols of resurrection as meaningful. To privilege an earlier or later text over another version does not necessarily grant it more authority. Nor does it make sense to claim that Dumuzi/Tammuz cannot return to life, without sending a replacement to the land of the dead, refute the deity's rising to life for half the year; it simply denies the importance of

the “rising” in the life half of the cycle of the deity’s tradition (Smith, 2005: 3190).

Smith’s readings of the Dying and Rising gods texts is a useful re-examination, but finally a one-sided, narrowly speculative hermeneutic, curiously suppressing the symbolic and poetic sensibility basic to religions. “Rising” may be read as a poetic expression of some form of overcoming death, not just the literal return to a human body. The return of a god from the land of the dead to a spiritual realm associated with the resurrection of the human dead need not be discarded as irrelevant in contrast to a demand that the definition of a rising god include returning to an empirical human body on earth. Smith does this with Osiris, who returns from death to become not a human, but the Lord of immortal souls, with the repeated ritual formula clearly indicating resurrection: “Rise up, you have not died” (Smith, 2005: 2538).

Tryggve Mettinger

A recent study by the Swedish Hebrew Bible scholar Tryggve Mettinger (University of Lund), *The Riddle of Resurrection: Dying and Rising Gods in the Middle East* (2001), does not accept Smith’s conclusions. In a careful textual and linguistic analysis, he accepts more images showing the validity of a variety of dying and rising gods. He does not want to hypostatize a specific type of deity, but stresses the different types of gods with similar patterns (Mettinger, p. 218). He concludes, for example, as pictured in the Egyptian Dendara Temple of Osiris inscriptions, that Osiris “both died and rose . . . he rose to continued life in the Netherworld. . .” (Mettinger, 2001: 175). In response to the idea that some ancient texts may have been read through a Christian lens as implying resurrection, he reminds us that several gods are said to die and return long before the Christian era: Dumuzi, Baal, Melquarth, Adonis, and Osiris.

Christianity

The major question whether early Christians borrowed the theme of the dying and rising god in interpreting their experiences of Jesus is obviously the critical issue. Frazer puts the question in his boldly speculative way:

- ▶ When we reflect how often the Church has skillfully contrived to plant the seeds of the new faith on the old stock of paganism, we may surmise that the Easter celebration of the dead and risen Christ was grafted upon

a similar celebration of the dead and risen Adonis. . . (Frazer, 1922: section 217).

Now it is true that Christianity, like many other religions, did borrow many themes from other religions, such as baptism and virgin birth. But many religions commonly borrow themes from earlier faiths. The Hebrew term for “my Lord” *Adonai*, is very similar to the name of the ancient Phoenician/ Syrian/ Greek divinity, Adonis, having the same linguistic root. Mettinger says that dying and rising deities were well-known in Israel in New Testament times. Adonis was known in the Hebrew Bible to be “beloved by women” (Bible, Daniel 11:37). The earlier resurrection of Melquarth-Heracles was celebrated in Tyre (where Jesus visited – Bible, Mark 7:24–30).

But looking at particulars, there are some differences with Jesus. The earlier figures were legendary ancient divinities, whereas Jesus was a living human. For the disciples and Paul, Jesus’ resurrection was a one-time historical event, not an annual, mythic ritual tied to fertility or kingship. And Jesus was more an ethical prophet than the ancient vegetation or royalty deities. There is no evidence of the ancient dying and rising gods suffering to forgive sins, as was said of Jesus. There also is no specific evidence that Jesus’ resurrection account drew on ancient traditions (Mettinger, p. 221). Do such particulars negate the overlapping cross-cultural themes?

Symbolism

Psychologically, resurrection is highly symbolic. It incorporates themes needed by many to deal with the terrors of death, as Carl Jung says, describing the [divine] hero who conquers death and brings back the promise of eternal life. Like Osiris, he/she psychologically becomes the “greater personality in every individual (like the Johannine Christ), viz. His *teleios anthropos*, the complete (or perfect) man, the self” (Jung, *CW* 18: para. 1567). In Jesus’ time the ancient gods had lost their power to the superficial, concretized state religion of Rome that divinized the Caesar for political reasons. A similar situation exists today, Jung says. The authority of traditional religions has been weakened by empirical science and power politics, and there is a need for a spiritual counterbalance to awaken the divine self in each person, a force that takes the soul beyond the vicissitudes of the life-death struggles of time and space. The Dying and Rising Gods theme must be read with such a psychological, poetic eye.

Eclipses

Jeffrey B. Pettis

Pliny the Elder (23 CE–79 CE) in his *Natural History* refers to the eclipse (Greek, *ekleipsis*, “abandonment, failing of power”) of the moon and the sun as “the most marvelous and indeed portentous occurrence in the whole of our observation of nature” (1944, II.VI.46). He notes how the sun and moon “retaliate on one another” as they cross paths, the rays of the sun being taken away by moon and earth (1944, II.VI.47). Pliny says that for a long time people in the ancient world have dreaded an eclipse as a portent of crime or death, and how the dying of the moon meant that “she was poisoned” (1944, II.viii.54). In his *Tetrabiblos*, the Greek astronomer Claudius Ptolemaeus (ca. 100 CE–ca. 178 CE) refers to the eclipse as the first and most potent cause of the general conditions of countries or cities (Ptolmey, 1940: ii, 75). He interprets the meanings of the colors of eclipses or formations such as light rays (*rabdōn*) and halos. Black colors “signify the effects” (*phanenta sēmantika*) of the cooling, drying influences of

Saturn. White colors indicate the temperate powers of Jupiter, and red colors have a hot, burning influence. Color and illumination are predictive of events and earth-conditions to occur in particular geographical locations (1940: II, 90), and the position of the eclipse on the horizon tell when and with kind of intensity an event will occur (1940: II, 77). In the Hindu myth of the primordial battle between the Titans and the gods the eclipse represents Rahu’s inability to drink the elixir. Although he is able to steal a sip of the substance, the cup passes easily through his mouth and out again through his throat. The eclipse is also seen to represent apocalyptic events. In the Gospel of Mark Jesus predicts that the sun will be darkened (*skotisthēsetai*) and moon will not give its radiance (*pheggos*) as a sign of the time of world tribulation (Mark 13.24; cf. Matt. 24.29–31; Luke 21.25–28; Isa. 13.10; Joel 2.10; 3.4; 4.15). In the Gospel of Luke the sun “dies out” (*eklipontos*) at the death of Jesus on the cross (Luke 23.45), in this way marking the death of Jesus as someone who is significant and important. In his sermon at Pentecost Peter speaks of the sun which will be changed into darkness (*metasraphēsetai eis skotos*) and the moon into blood on the day of the Lord (Acts 2.20). The sixteenth century alchemical text “*Consilium coniugii*” speaks of the changing and thus corruptive nature of the moon and its pernicious relation to the sun. The text refers to the poisonous quality of the moisture of the moon in its eclipse of the sun “when she [moon] receives his light and slays the sun” (Jung, 1963: 28). At death the two parents [sun and moon] “yield their souls to the son, and die and pass away.” Symbolically this means that the moon as the feminine aspect receives the sun-masculine aspect through which dying and re-birth occur. Penetration into the unconscious world is both exhaustive and formative, and there is sacrifice involved to yield the New. The new creation – the birth of the son as hermaphrodite – resolves the conflict of the parents. According to the text, the son eats the parents who “are the food of the son” (c.f. the “god-eating of the Aztecs; the parent-eating soul of the Egyptian Pyramid text of Unas) (Jung, 1963: 30).

Ecstasy

Jo Nash

Definition

The word ecstasy is derived from the Greek “ekstasis” meaning “beyond or outside the self,” and has different meanings depending on whether it is used in a religious or psychological context. One definition that can be used to underscore these different ecstasies might be “an experience of blissful non-duality.” This involves an experience of dissolution of ontological boundaries between an internal sense of self and external otherness, leading to an intense affective experience of oneness or union of rapturous intensity, called *ecstatic*.

Religious Perspectives

Religious accounts of ecstatic experience are present in the mystical wings of most major world religions, including the Abrahamic, Dharmic and “indigenous” traditions, (also known as shamanic or pagan faiths). Accounts of ecstatic experience are common to charismatic and contemplative Christianity, the Sufis of Islam, the Kabbalists of Judaism, the Vajrayana practitioners of Buddhism, Tantric Hinduism, and the mystics of Sikhism. Ecstatic experience in a religious context derives from the devotional practices and contemplative disciplines used to dissolve the boundaries between one’s sense of an enclosed separate “self,” or “I” and the godhead (Yahweh, God, Allah, Brahman, Nam), omnipresent awakened mind (Buddha) or other divine source of being, such as the nature spirits of indigenous and shamanic traditions. Religious ecstasy may be evoked by the affective intensity of the

practitioners devotional fervor; expressed in chants, dance, song, poetry and other physical practices such as fasting, ritual and so on; or the cognitive space and stillness of contemplative discipline, comprised of meditation or prayer. In many cases a mixture of both active devotion and contemplative stillness is used to achieve the dissolution of dualistic perceptions and evoke the non-dual experience of ecstatic bliss. This experience would be deemed desirable by most religious practitioners and indicative of spiritual progress. However, the understanding of ecstasy from a psychological perspective is somewhat different.

Depth Psychology Perspectives

From an object relations psychoanalytic perspective, a loss of boundaries of this kind would imply the dissolution of the ego and a possible regression to a manic defense against separation (Klein, 1940), first deployed by the infant in denial of the absent breast, and so a kind of hallucination that defends against unbearable loss of original oneness with the mother’s body. Re-experienced in adulthood, an unmediated, boundariless state of bliss could indicate at best a defensive denial of depression, at worst a psychotic mood disorder of the manic or bi-polar kind. The one exception to this pathologising of ecstasy would be the bliss of orgasm experienced during sexual climax with another person, and the ensuing sense of intersubjective merging deemed necessary for a healthy intimate relationship.

From an archetypal psychology perspective the understanding of ecstatic experience is different again. Jungian psychologist Robert A Johnson’s book *Ecstasy: Understanding the psychology of joy* (1987) proposes that Western civilization has repressed an innate human ability to experience this “oneness,” due to guilt and alienation from our bodies at the heart of modern consumerist society, now harbored by the western collective unconscious. He calls for us to return to the days of Dionysian celebration of the pleasures of the body and the senses, and reclaim our birthright to a regular experience of cosmic bliss and ecstasy. This enables human beings to retain vitality, joy and a sense of being alive that is absent in the lives of so many Western adults. A loss of ritual celebration has occurred with secularization, causing a kind of exhaustion at the heart of a culture that prohibits this need for periodic Dionysian play and wildness, says Johnson. This exhaustion may be partly responsible for the pandemic of depression and anxiety plaguing secularized western societies.

Neuropsychology Perspectives

However, a neuropsychological analysis of ecstasy uses scientific studies of brain activity to explain the phenomenon of blissful, non-dual experience. Neuropsychologists Newberg and D'Aquili (2000) write,

- ▶ During certain types of meditation. . . We have proposed that as the hypertrophic state creates a state of oceanic bliss, the ergotropic eruption results in the experience of a sense of a tremendous release of energy. . . activity is so extreme that 'spillover' occurs. . . This may be associated with the experience of an orgasmic, rapturous or ecstatic rush, arising from a generalized sense of flow and resulting in a trance-like state (255–256).

This “spillover” is comprised of the co-activation of both hemispheres of the brain. Meditative techniques that deploy certain kinds of cognitive strategies alongside focused breathwork enable maximal simultaneous stimulation of the causal and holistic operators, that then evoke an existential experience of non-duality, selflessness, or “oneness” with all that is conventionally experienced as “other.” The result is ecstasy.

Psycho-Spiritual Explanations

The above accounts have implications for understanding both the psychology and spirituality of ecstasy as an aspect of an experiential ontology of nonself. Far from being a grandiose, elated sensibility associated with the delusory highs and hallucinations of manic psychoses, rather it may indicate that a sense of a bounded self has been lost or relinquished. This may have both positive and negative results psychologically and spiritually. It may well indicate a regression has taken place but it may also indicate that egocentric object relations have been surrendered, as reported by mystics describing the experience of union with the godhead of monotheisms, or merging with the deities or spirits of polytheisms. It may also indicate that the conceptual and ontological boundaries associated with doctrines of the self have been ruptured entirely, as occurs with progressively subtle realizations of “emptiness” experienced by advanced Buddhist practitioners. Outside the context of religious experience ecstasy may also be evoked by experience of pure immanence, a kind of blissful integration as depicted in non-theistic post-structural thought of Deleuze (1995/2001).

The key to assessing the function of ecstatic experience must be observation of the effects. Whether it indicates a psychotic regression or a form of spiritual integration, or

just a temporary “peak experience” (Maslow, 1964) will be revealed by the longer term effects on thought, affect and behavior.

Ego

Benjamin Beit-Hallahmi

In classical psychoanalysis, the human personality contains three parts: id, ego, and superego. The id is defined in terms of the most primitive urges for gratification in the infant, urges dominated by the desire for pleasure. Ruled by no laws of logic, and unconstrained by the resistance of external reality, the id uses what Freud called the primary process, directly expressing somatically generated instincts. Through the inevitable experience of frustration, the infant learns to adapt itself to reality. The resulting secondary process leads to the growth of the ego, which follows what Freud called the reality principle, in contradistinction to the pleasure principle dominating the id. Here the need to delay gratification in the service of self-preservation is slowly learned in an effort to thwart the anxiety produced by unfulfilled desires. What Freud termed defense mechanisms are developed by the ego to deal with such conflicts. These mechanisms are a set of unconscious ego activities aimed at maintaining an internal equilibrium inside the personality. Repression is the most fundamental defense mechanism, but Freud also posited an entire repertoire of

others, including reaction formation, isolation, undoing, denial, displacement, and rationalization.

The ego is the central and the executive part of the personality. It is the only part which is in contact with reality, and one of its major tasks is reality testing. Moreover, it has to balance internal demands, coming from the id and the superego, with the demands of the outside world. The ego is the locus for our subjective consciousness and its operations. It thinks, speaks, sees, makes decisions, and controls our body. Through the ego, the personality deals with reality. But there is another level of unconscious processing, which really determines observable behavior on the part of the person. At the unconscious level, the ego copes with unconscious anxiety coming from within and caused by the id and the superego.

The imagination is a major area of the ego's activity. It creates the person's dreams, as well as art, science, and culture at every level. Religious beliefs are created by the ego's activity, prodded by internal anxiety and outside reality pressures. In psychoanalytic interpretations of religion, various defense mechanisms in the ego have been suggested as contributing to religion and to religious experiences, such as splitting, denial, projection, and repetition compulsion. The ego creates religion and then uses it for its own support and adaptation to reality.

Elan Vital

Ruth Williams

1. Term coined by French philosopher Henri Bergson (1859–1941) to denote the essence of life, or life energy.
2. Charity promoting the work of Prem Rawat (1957–), otherwise known as Maharaji (previously known as

Guru Maharaji). Prem Rawat travels the world talking about inner peace and his method (known as Knowledge) whereby one may tap into the experience of which he speaks.

There is a period of learning involving listening to Prem Rawat's talks to gain an in-depth understanding of the process involved before one is taught the four techniques of Knowledge. This process is not of gaining a cerebral knowledge, but is more akin to an ancient period of incubation to steep oneself in the process, or a therapeutic process of immersion.

Prem Rawat took on the mantle of leader from his father at the age of 8, having given his first public address to an enormous audience at the age of 4. At 13 (in 1971) he traveled to the West to introduce his message to a wider public.

Elan Vital was previously known as Divine Light Mission and attracted considerable negative publicity during the 1970s and 1980s when it was thought to be a cult. It has subsequently adopted a less evangelical stance and dropped the trappings of its Hindu origins.

The teachings are non-denominational and appeal to people of all religious persuasions and none.

Eleusinian Mysteries

David A. Leeming

The mystery cult of Eleusis had roots in ancient initiation rituals of the divine child, in the person of the *pais ap'hestias* ("boy of the hearth"). In the myth of Demeter and Persephone, after Persephone is abducted by Hades, her mother, Demeter, allowed the earth to become infertile and barren as she searched everywhere for her lost daughter. In Eleusis she disguised herself as a nurse maid and cared for the child Demophon, son of the king there. When she attempted to give the child immortality by dipping him into fire she was discovered and had to reveal herself as Demeter. A temple was built for the goddess at Eleusis and in time the mystery cult evolved there. By sometime in the sixth century BCE the cult was taken over by the city state of Athens and involved secret initiation rites in an inner sanctum facing which was a magnificent hall. A priestess of Demeter lived in the sanctuary.

The rites began with a ritual bath and 3 days of fasting, followed by a procession to Eleusis led by a statue of the god Iacchos, a form of Dionysos. Rituals still essentially unknown then took place in the inner sanctum, rituals that in some sense signified or were meant to ensure fertility, in keeping with Demeter's role as the goddess of fertility. It seems that the initiate spent a night in total darkness and was finally awakened at daybreak by the light of a great fire.

Psychologically, the initiate is the divine child waiting to be released in each of us. Through the process of the dark Night of the Soul, the journey into unconscious, we can achieve the illumination represented by the light of the fire that awakens the initiate, itself representing the fire into which Demeter dipped the child in the myth. So immersion in fire becomes a baptismal rite of immortality or rebirth, full initiation into the clan of those who have experienced the mysteries.

Eliade, Mircea

Robert S. Ellwood

Mircea Eliade (1907–1986) was a Romanian-born historian of religion who did much to shape that discipline and make it an intellectual force in the twentieth century. Eliade graduated from the University of Bucharest in 1928, then in 1928–1931 studied Indian philosophy at the University of Calcutta and yoga at an ashram in Rishikesh. Returning to Romania, he earned his Ph. D. in 1933 with a dissertation on yoga which, after later revisions and translations, became his *Yoga: Immortality and Freedom* (1958). Eliade joined the faculty of the University of Bucharest in 1933, where he taught history of religion and Indian philosophy, as well as becoming a

widely-read author of fiction and journalistic commentary in the 1930s, somethings being spoken of as a major voice of the younger generation of Romanians.

In those troubled times for Romania and Europe, toward the end of the decade Eliade became involved in the rightist politics of the fascist Iron Guard movement; when the King, Carol II, turned against that body in 1938, the young professor was arrested. After his release, well-placed patrons helped him to escape his increasingly desperate homeland in 1940 by securing his appointment as cultural attache to the Romanian legation in London and, 1941–1945, in Lisbon, Portugal. After the Axis defeat Eliade, unable to return home because of the communist take-over of his country, became a professor at the Sorbonne in Paris, and then in 1957 at the University of Chicago, where he remained until his death. His prolific postwar work, containing little overt political content, has been largely devoted to understanding the history and meaning of religion.

Basic Ideas

Eliade's basic ideas are concisely expressed in *The Sacred and the Profane* (1959) and *Cosmos and History* (1954; also published as *The Myth of the Eternal Return*). In the former, the fundamental assertion is that, for *homo religiosus*, the traditionally religious person, reality is “non-homogeneous,” split-level, divided into sacred and profane spheres. “Sacred space,” the space of the shrine or temple, the pilgrim's goal or the site of a divine “hierophany” or manifestation such as Moses' burning bush or an apparition of Our Lady, has a distinct atmosphere or “feel” different from the ordinary, profane world. “Sacred time,” the hours of a festival or religious rite, likewise is set apart inwardly and outwardly from the profane. Both sacred space and time are likely to be demarcated by symbols. One attuned to it is instinctively aware of the Sacred, likely to speak in a hushed voice and tread with reverent step in its presence.

Sacred space and time, in Eliade's interpretation, are like recapitulations of *illud tempus*, “that time,” the primal time recited in the culture's myths of creation and salvation, when divine powers were strong. Temple and rite provide memory of *illud tempus* and a means of access back to it. (For example, the sacred time and space of the Eucharist offers the Christian *homo religiosus* a way once again to be with Jesus and present on the night and day of salvation; cf. also Passover, Chinese and Japanese New Year's, Wesak, etc.) Symbols of the *axis mundi* (pivot of the world), the sacred tree, pillar,

or mountain which connects heaven and earth (the cross, the Christmas tree, Mt. Meru) are especially important.

The Sacred can also be “interiorized,” found within, and so it is in shamanism, yoga, and authentic mystical and religious experience generally. One finds ways to access inner space and time, even an inner *axis mundi* (e.g., the spinal column in some schools of yoga), through appropriate techniques, and often after appropriate initiations. These are discussed in Eliade’s *Yoga* and in *Shamanism: Archaic Techniques of Ecstasy* (1964), as well as elsewhere. In the latter work, the author presents a discussion, which has proved influential in psychology and literary criticism as well as history of religion, of the shamanic initiate’s passage through several stages of call, “initiatory psychopathology,” and interiorization of spirit guides before becoming a proficient.

Cosmos and History

In *Cosmos and History* Eliade proposes that traditional religious history presents two stages, cosmic religion and historical religion. The former, essentially that of archaic hunters and farmers (Paleolithic and Neolithic humanity), though with some continuities down to the present, has little sense of linear, historical time, but finds and expresses sacred meaning in aspects of nature – the turn of the seasons, sacred rocks or trees – and in human life in the social order and the life cycle of birth, maturation, and death. Its festivals are those of New Year’s, recapitulating the creation, and annual seedtime and harvest. An “Other World” of gods and spirits stands over against this world here and now; shamans are especially adept at contacting it.

Historical religions, such as Buddhism, Judaism, Christianity, and Islam, differ in that the *illud tempus*, the “strong time” on which the religion is based, was not so much the creation as a moment *within* the stream of linear, historical time: the time of the Buddha’s Enlightenment, of the Exodus, of Jesus (“the hopes and fears of all the years/are met in thee tonight”), of the revelation of the Holy Qur’an. While these faiths retain considerable admixtures of cosmic religion (Passover and Easter as Spring as well as historical-event festivals), the major focus is on religion and salvation as historically-conditioned, and this greatly affects the nature of religion.

Eliade did not conceal his own “nostalgia for the sacred” and for the sacred world of cosmic religion, when the Sacred infused nature and the world could be renewed every year. He spoke of the “terror of history” wrought by the discovery, religious and otherwise, that we humans live in irreversible historical time, not cosmic

“eternal return” time. Yet he was well aware that moderns cannot undo modernity; we can at best only complete our own humanity through awareness of that other human possibility which he hoped study of the history of religion could unveil; that was the import of the significant article, “The History of Religions and a New Humanism,” with which he inaugurated the journal he helped found, *History of Religions* (reprinted in *The Quest*, 1969).

Other important works of Eliade’s include *Patterns in Comparative Religion* (1958), *Myths, Dreams and Mysteries* (1960), *Rites and Symbols of Initiation* (1958), the three-volume *History of Religious Ideas* (1978–1985), and his editorship of the *Encyclopedia of Religion* (1987). There are also several volumes of fiction and of interviews and autobiography.

Criticism

Eliade has been criticized for the selective use of data to support his models, for being an “essentialist” towards religion and the sacred (that is, holding it has an objective, unchanging nature), and as an anti-modernist. Some have associated the last with his youthful political views. In response, one could say that has often tried to make clear that his accounts of the sacred are intended to show how the world *seems* to *homo religiosus*; that he believed we need to understand and appreciate the religious past but not to live there; and that the universalism of his history of religions project would appear at odds with the fascist drive to sacralize just one nation and people.

In any case, there is much in Eliade that religious psychology can use: the “non-homogeneous” character of experience of the religious world; the importance of finding inner and outer ways to get in touch with sacred space and time, whether through places, music, sacraments, or meditation; and the significance of initiatory experience. He has aided many estranged moderns in grasping the inner significance of archaic spirituality.

Elixir

Jeffrey B. Pettis

Elixir (Greek, *xērion*, “healing powder”) is a drug or substance which has life-prolonging properties. Throughout history the elixir has been sought as an antidote to illness and the human desire for *athasias*, “immortality.” There are a variety of texts and symbols having to do with the elixir. In the ancient alchemical text “Isis to Horus” the prophetess Isis procures what she calls the *pharmakon tēs chēras* (“drug of the widow”) (16). This is the secret revelation which she gives to her son for immortality. The secret revelation consists of the regenerative potency of nature, *physis*: “nature enjoys nature and nature conquers nature” (*hē physis tēn physin terpetai, kai hē physis tēn physin nika*) (7). In ancient mythology Isis herself is the arcane substance and elixir, glistening with the white of the moon, her crown bounded by serpents, and her cloak deep black and gleaming” (Apuleius, 1989 *The Golden Ass*, II.3). She is the “dew” and “water of life” (*aqua permanens*) which heals and unites the dismembered parts (Jung, 1959/1968: pars. 14). In the ancient Mithras Liturgy found in the Greek Magical Papyri the supplicant speaks of the juices of herbs and spices and of the mysteries handed down to gain immortality for an only

child (PGM IV.477). The sixteenth century physician and alchemist Paracelsus taught that all substance – mineral, vegetable, animal – contain *quinta-essentia*, or “virtue.” Even the smallest amount when extracted can be used for its life-giving, healing properties (Paracelsus, 1951: 164). The alchemical symbol of the “fish” as the arcane substance becomes understood to be the *lapis philosophorum* – the *elixir vitae*, something going back to early Arabic alchemy. Senior (Zadith ben Hamuel) the tenth century Islamic alchemist identifies Christ with the *homo philosophicus*, the Microcosm and One who does not die and brings life to anything dead” (1566: 71; Jung, 1953/1993: 392). The first century Christian martyr Ignatius of Antioch refers to the Eucharist as the *pharmakon athanasias* “the medicine of immortality,” something perhaps reaching back to *kipsu* offerings of bread and water in the Mesopotamian cult of the dead. According to Ignatius, the Eucharist is an antidote (*antidotes*) “that allows us not to die, but to live in Jesus Christ at all times” (Eph. 20). Compare also the life-enhancing forbidden fruit (Hebrew, *pry*) in Gen. 3.2. Mandala centers containing figures such as the Buddha Amitabha or Avalokiteshvara are thought to have elixir properties according to the Taoist text the *Golden Flower* (Jung, 1968: 98). A certain life force may also be perceived to have generative potency such as the *Yesod* of the ninth *sefirah* of the Kabbalah tree in Jewish mysticism. It is the flowing together of all cosmic energies. Compare the Astral Light in transcendental magic (Leví, 2001), and also *chee* as the vital spark of life in Taoism. With all of these texts and symbols the elixir is understood to result from unconscious processes being made conscious and involving the union of opposites which yields the regenerative New. The elixir as the quintessence of that processing is precious, valued and guarded. It may be both life-giving and life-taking, healing or poisonous depending upon how it is used.

Emergentism

Joe Cambray

In contradistinction to psychoanalytic theories and methods that are essentially reductive in nature, Jung's approach attends to the whole person. The integration of the personality is the central feature of Jung's view of psychological health and maturation. His notion of individuation involves a lifelong dialectic process between conscious and unconscious dimensions of the personality. This goes beyond ego adaptation to reality as the goal of psychological development found in other schools of analysis, but requires on-going examination and even struggle with whatever aspects of one's personality are activated by inner and outer experiences in life. Over the long term this results in a decentering of the personality with regard to the ego together with the emergence of a new center, the self, which includes transpersonal dimensions. The self is envisioned by Jung to encompass the whole of the personality, conscious and unconscious, personal and collective; it is center and circumference. As such it does not lead towards perfectionism but in striving for conscious expression it necessarily remains unfinished; the approach is towards completeness, with its positive and negative features. It is the achievement of a lifetime. The vision here is radically holistic. What are the roots of this vision?

Mythic and Historic Background

Prior to the advent of modern science, holistic perspectives were an integral part of cultural life. As a part of the pre-scientific worldview, the entire world was seen as animated, and often so portrayed in mythologies. Within these traditional cultures tales of emergence are a usual feature of creation myths. Prime ancestors are typically

envisioned as emerging from earth or water, or of the world itself emerges from the waters of chaos. Stories of this sort are found throughout history and across cultures. Examples are plentiful, as from ancient Egyptian and Assyrian sources, in tales from Melanesia and the indigenous peoples of the Americas, as well as the better known Norse, Greco-Roman and Judeo-Christian variants. Mythically emergence displays a transcultural or archetypal pattern, symbolic of birth or re-birth. This mythic strata forms a deep background for subsequent elaborations of emergence on a more conceptual level.

During the seventeenth century with the rise of the scientific paradigm, a new precision was brought to the concept of "emergence." The term began to appear in scientific language as when Newton described experiments in optics, e.g., referring to the refraction of light through a prism he notes "the incident refractions were...equal to the emergent" (Newton, 1676: 555). Perhaps most interesting of the new conceptual use of terms related to emergence was that by G. W. Leibniz (the co-discoverer of calculus along with Newton). Leibniz was the first person to employ the term "supervenience" in a way similar to its modern use by philosophers of mind. For Leibniz this indicated a synchronous, non-Cartesian relationship between bodies and minds, consistent with an emergentist perspective as has recently been discussed (Cambray, 2005). This view of the mind/body relationship, of a pre-established harmony, was the one Jung identified as the primary precursor for his idea of synchronicity.

Leibniz's insights into supervenience were so far ahead of his times that they languished in obscurity for almost 250 years before being revived by the emergentist movement of the late nineteenth and early twentieth centuries. Philosophically descriptive emergentism was seeking to reestablish a view of science based on holistic principles. One of the most significant figures in this movement for the development of Jungian thought was Conway Lloyd Morgan. His 1896 book *Habit and Instinct*, with its entomological examples such as the leaf-cutting ant and the yucca moth, was a major source for Jung's formulation of archetypal theory (Hogenson, 2001). Morgan's 1922 Gifford lectures on "*Emergent Evolution*" included recognition of Leibniz's foundational role in this paradigm.

Due to the speculative, philosophical nature of this paradigm at the time (it lacked a more solid experimental base), it could not compete against the empirical data from the growing field of biochemistry and especially the finding arising from the advent of molecular biology in understanding biological systems. With the triumphal articulation of the structure of the molecular base of

genetics, in the form of the biopolymer DNA, revealed by crystallography in 1953, a more reductive, strictly deterministic philosophy came to dominate many of the biological sciences. There was a counter movement in general systems theory and cybernetics also developing during this era but applications were limited. Jung himself was interested in cybernetic principles and saw the human psyche as a self-regulating system.

Complex Systems

The study of systems has been greatly aided by the availability of high speed computers. Remarkable breakthroughs in modeling systems that could not be analyzed by conventional, reductive means due to their complexity began to draw attention starting with the study of “chaos theory.” This was first popularly applied to the investigation of weather patterns. More general exploration of systems made up of numbers of parts capable of interacting with one another showed that certain kinds of interactive systems could produce aggregate properties and behaviors which were not discernable or predictable from the known attributes of the parts. These high order, non-reducible traits are explored in the new science of “complexity.” Complex systems are non-linear, small variations, as in initial conditions can generate large changes (the well known butterfly effect).

A particularly important subset of these systems are those that open to the environment, under selection pressure, capable of dissipating energy and generating increased internal order – they have significant adaptive capacity and are referred to as complex adaptive systems marked by self-organizing properties. The higher order phenomena associated with the self-organizing features of these systems are termed emergent. There are a number of traits generally associated with emergence: novelty, irreducibility, non-linearity, unpredictability, and synergy; some researchers also include coherence and historicity.

Emergence in Analytical Psychology

Emergent phenomena have become a distinct area of study for systems scientists. They have been shown to most likely occur at the edge of order and chaos and are seen as the site for coming into being of life, the psyche and the mind, remarkably consistent with and affirming of the mythopoetic stories referred to earlier. Emergence has been found through out nature and the human world: from the organization within clusters of subatomic

particle all the way to the clustering of galaxies; in biological systems such as the behavior of social insects, the organization of and interactions within the body and brain from which mind emerges; to networks of human interactions producing economic and cultural behaviors. Emergence spans, transgresses and links the many disciplines studied by humans. In recent years the study complex systems and emergence has been effectively used to reconsider a variety of Jung’s ideas: archetypes, complexes, the self, synchronicity as well as his analytic methods (see Cambrey and Carter, 2004 together with the references therein). Other schools of psychology have also begun to adopt systemic thinking to their approaches. Within the psychoanalytic community the intersubjective and relational schools have been most active in developing applying these ideas to their analytic models.

Although during his lifetime Jung only had studies on self-regulation to draw upon (complexity theory had not yet been developed), he was able to intuit various principles of self-organization and emergence. In applying these ideas to psychological problems and their transcendence he comments:

- ▶ I had learned that all the greatest and most important problems of life are fundamentally insoluble. They must be so, for they express the necessary polarity inherent in every *self-regulating system*. They can never be solved, but only outgrown. I therefore asked myself whether this outgrowing, this possibility of further psychic development, was not the normal thing, and whether getting stuck in a conflict was pathological. Everyone must possess that *higher level*, at least in embryonic form, and must under favorable circumstances be able to develop this potentiality (Jung, 1967: para. 18, my ital.).

Similarly Jung’s theory of compensation with the importance it stresses on the emergence of a “third” position as a transcendent reality that allows overcoming difficulty without attempting direct solution of problems can be seen as based on an emergentist perspective. This view also allows a reformulation of psychopathology in terms of fears of, or resistance to emergence. For Jung then human suffering as well as its transcendence is embedded in a profoundly systemic worldview.

Because Jung’s model of the self has an interactive, transpersonal dimension to it, the emergentist aspect of this has been noted. Similarly there is an inherent holism in Jung’s self: “As an empirical concept, the self designates the whole range of psychic phenomena in man. It expresses the unity of the personality as a whole” (1971: para. 789). The spiritual features of Jung archetypal model of the self have often been discussed; here it serves as part

of the linkage between psychology and religion that has entered some of the emergentist literature. Thus philosopher Philip Clayton's discussion of levels of emergence beyond mental causation associated with mind, derived from biological systems, seeks to make such bridges. In this, collective intelligences of various sorts are drawn upon to point towards phenomena of the spirit (Clayton, 2004, chapter 5: "Emergence and Transcendence"). The growing interest in emergentism in many fields of human endeavor will perhaps allow a deeper appreciation of Jung's psychological genius and a fuller reconsideration of his model of the psyche.

Emotional Intelligence

Ryan LaMothe

Emotional intelligence is a relatively recent term that has significant implications for understanding religious experience and faith. Before defining emotional intelligence and explaining its relevance to religious faith it is important to first set the stage by offering a brief definition of the term emotion and an overview of how it

has been understood and used in philosophical and theological thought, as well as in the human sciences.

Defining Emotions

There is considerable debate among researchers, psychologists, and philosophers about what emotions are and how they differ from feelings, sentiments, and moods (see Frijda, 2000). "Some researchers," report Parrot and Spackman, "conceive of emotion in an undifferentiated manner, investigating the effects of overall arousal, excitement, agitation, or drive without any distinguishing among different types of emotional states. Others treat emotional states as varying along two or more continuous dimensions, such as arousal and valence. The third and most common approach to emotional states treats them as discrete categories" (Parrot and Spackman, 2000: 476). For our purposes, emotion comprises (1) complex mental processes that are innate or pre-organized, which may not be conscious or experienced as distinct feelings, and (2) discrete categories of feeling states such as anger, sadness, fear, hate, etc. Moods are different from feelings in that they are global and not necessarily directed toward an object or result from a particular object or event (Jacobson, 1957: 73–113).

Overview of Emotions in Philosophy and Science

The notion of emotion vis-à-vis reason, will, and religious faith has varied in meaning and significance in Western philosophy and theology (Solomon, 2000: 3–15). Aristotle, in his *Rhetoric*, recognized that emotions are necessary for rational appraisal and the good life (See Sorabji, 2000: 23–26). Rational appraisal for Aristotle includes a person's ability to assess accurately a social context and to act with the appropriate amount of emotion. After Aristotle, the Stoics offered a slightly different perspective on emotions. Sorabji noted that the Stoics identified four emotions, namely distress, pleasure, fear, and appetite (Sorabji, 2000). They claimed that every "emotion involves two distinct value judgments. One that there is a good or bad (benefit or harm) at hand, the other that it is appropriate to act" (2000: 29). Posidonius, a later Stoic philosopher, criticized the intellectualism of other Stoics, arguing, "that the examination of things good and evil, the examination of goals, and the examination of virtues depend on a correct examination of emotions" (p. 95). Posidonius also said that there are occasions when we

experience emotions that are not connected to value judgments (e.g., being moved by music), suggesting that there are irrational or unconscious processes at work; in modern day parlance, there are emotional experiences that are tenuously connected to the prefrontal cortex. Emotions, for the Stoics, also involve imagination and attention. That is, we can increase the intensity of emotion by way of our imagination.

Solomon argued that, as the Hellenistic philosophers gave way to Christian theologians, several significant changes occurred regarding how theologians conceptualized the relation between reason and emotion. In general, emotion was split between those that led to vices and those that led to virtues. Desire and passion were seen as distorting the will and reason, which gained expression in the seven deadly sins. The good emotions were love, hope, and faith and these were “often equated with reason” (Solomon, 2000: 6). Emotions linked to the passions and desires were suspect, needing to be eradicated or controlled through spiritual disciplines. The elevation of reason and suspicion of intense emotions were yoked to how theologians conceptualized gender and power. Men were viewed as having greater capacities for reason and women and children with less, making them more susceptible to emotions (passions).

Some modern philosophers have been critical of Cartesian and Christian philosophical traditions that elevate, if not glorify, reason and ignore or minimize emotions in reason and faith (Fuimara, 2001; Furtak, 2005). John Macmurray, who seemed to take one of his cues from Spinoza’s view that rationality and irrationality are qualities of emotions, was one of the first modern Western philosophers to argue forcefully that reason plays a role in emotional life and that reason is contingent upon emotion. “Any inquiry,” he wrote, “must have a motive or it could not be carried on at all, and all motives belong to our emotional life” (Macmurray, 1992: 3). Macmurray believed that we “can only begin to grow up into rationality when we begin to see our emotional life not as the center of things but as part of the development of humanity” (1992: 14) For Macmurray, a dynamic interdependence exists between reason and emotion. Thus, we must cultivate both.

While ancient and modern philosophers debated questions about the significance of emotions vis-à-vis knowledge and religious faith, scientists were interested in studying (1) emotions in humans and animals, (2) emotional expressions and meanings across cultures, and (3) emotion vis-à-vis the brain. In the nineteenth century, Charles Darwin studied emotions in human beings and animals (Darwin, 1972). In the United States,

philosopher-psychologist William James rooted emotions in human physiology, arguing that emotion is caused by physiological sensations (James, 1884). He later explored the relation between emotions and religious experience (James, 1958). His Viennese counterpart, Sigmund Freud, developed a complex theory of the mind and its relation to anxiety, a central emotion in human life (Roose and Glick, 1995). More recently, there has been an explosion of research regarding emotions and intelligence in relation to psycho-social development, psychopathology, and neuroanatomy (Ekman, 2003; Shore, 2003). This research demonstrates the (1) existence of a feedback loop between physical expressions of emotions and a person’s conscious experience of emotion, (2) centrality of emotions in perceptions and the organization of experience (the interconnection between the limbic system and the prefrontal cortex), and (3) importance of parents’ recognition and appropriate responses vis-à-vis their child’s emotional assertions in his/her developing the capacities for emotional self-regulation, empathy, and social confidence.

Emotional Intelligence

This research has increased interest in moving away from measuring intelligence solely in terms of cognition. The ideas of interpersonal and emotional intelligence have been proposed, not to replace the intelligence quotient, but rather to deepen and expand our understanding of the complexity of intelligence in human life. Gardner argued that intelligence comprises interpersonal and intrapersonal intelligence:

- ▶ Interpersonal intelligence is the ability to understand other people: what motivates them, how they work, how to work cooperatively with them. Successful salespeople, politicians, teachers, clinicians, and religious leaders are likely to be individuals with high degrees of interpersonal intelligence. Intrapersonal intelligence. . . is a correlative ability, turned inward. It is a capacity to form an accurate, veridical model of oneself and to use that model to operate effectively in life (Goleman, 1997: 39).

Both interpersonal and intrapersonal intelligences, Gardner claimed, include the abilities to recognize, differentiate between, and appropriately respond to the desires, aims, emotions, and moods of other people. This requires persons’ ability to notice and respond appropriately to social-emotional cues, all of which may take place outside of awareness. Similarly, emotional intelligence, which has various definitions and emphases, refers to an array of cognitive-emotional capacities whereby a person

is able to recognize, monitor, and regulate his/her own feelings, as well as the feelings of others. This is accomplished through awareness and appraisal of one's own and others' tone of voice, facial expressions, body posture, and gestures, as well as an individual's and group's ability to think about or reflect on their emotions (see Taylor, Parker, and Bagby, 1999: 339–354).

Daniel Goleman has done much to popularize the term emotional intelligence. Citing and summarizing Salovey and Mayer's work, he identified five capabilities related to emotional intelligence, namely, (1) knowing one's emotions, (2) managing one's emotions, (3) recognizing emotions in others, (4) motivating oneself, and (5) handling relationships (Goleman, 1997: 43). In a later work, Goleman narrates the discussions between scientists and Tibetan religious leaders about destructive and constructive emotions (Goleman, 2004). In these conversations, scientists identify research that points to the effectiveness of religious meditation practices in increasing the capacities of emotional intelligence.

Emotional Intelligence: Implications for Religion and Faith

Since Goleman's book, there has been a rise in the literature on emotional intelligence, ranging from scholarly articles to popular self-help books for parents, teachers, leaders, and business people. Some of this has spilled over into the area of religious faith, though the implications of the idea of emotional intelligence for understanding religious faith development are still being realized, in part, because researchers and clinicians continue to rely on cognitive and psychodynamic theories and models of development (see Lyon, 2004: 269–284). These psychological perspectives tend to relegate emotions to the background, suggesting that the primary focus of faith development is the regulation of emotions. Instead of relegating emotions to an adjunct position, we might wonder how the notion of emotional intelligence alters views on faith, faith development, and religious experience. How, in other words, does the idea of emotional intelligence inform our understanding of religious faith and experience? Does faith depend on cultivating emotions? If emotional intelligence is necessary for individual and social health, do religious practices and beliefs contribute in any way to the development of emotional intelligence? By contrast, what religious practices and beliefs obstruct emotional intelligence?

While there is growing interest in addressing these questions more directly (Reich, 2003: 1–32; Emmons,

2000: 3–26), Goleman and others note that religious practices and beliefs can contribute to the development of emotional intelligence. Goleman points to research that shows how Tibetan religious beliefs in loving kindness, gentleness, and compassion – coupled with the practice of meditation – contribute to emotional intelligence. Similarly, Christian beliefs such as loving one's neighbors, showing compassion for others, as well as religious practices that aim to embody these principles can lead to the development of emotional intelligence and a living faith. One may conclude that (1) the development of emotional intelligence is necessary for the development of a religious faith that embodies compassion, empathy, and loving kindness and (2) particular religious practices and beliefs can lead to the development of emotional intelligence. This said, faith researchers also recognize that human beings can be deliberately cruel and destructive. Traditionally, theological concepts such as idolatry, sin, and evil have been used to account for human destructiveness. The idea of emotional intelligence can be used to reinterpret theological concepts (e.g., sin and idolatry) and expand our understanding of maladies of faith or religious experience.

Research on emotions and the development of emotional intelligence adds to our understanding of human life. This offers theologians, researchers on religious experience and faith development, and ministers of all faiths opportunities to re-conceptualize and expand upon their theological anthropologies, their theories on faith development, and their practices of care.

Enlightenment

Wing-Shing Chan

Enlightenment generally refers to phenomena involving a significant change of consciousness regarding the self, others and the universe with accompanying physiological, perceptual and conceptual changes that result in significant spiritual or moral changes. It is commonly used in Chan (Zen) Buddhism to refer to the experience resulted from accomplishment in practice, meditation or insight that is synonymous as seeing the Buddha nature or self-nature, or discovering the true or original mind.

That the experience of enlightenment is a critical step of spiritual change toward Buddhahood instead of exercising ritual practice, performing philanthropy, observing ethical disciplines or merely cultivating calmness meditation, had been an emphasis of the Chan school beginning

from Bodhidharma. The emphasis on the practice and concept of sudden enlightenment began to gain ground and become the mainstream with the systematic and institutional propagation by the school following the Six Patriarch Huineng.

Definition and Critical Stages

Enlightenment is an experiential realization of the Buddhist philosophy of no-self and the liberation from inner vexation leakages. The sense of self versus others is broken through with the dissolution of the subject-object duality due to the cessation of the mind's uncontrollable discursive and illusive thoughts. It is sometimes being described as the experience of the "shedding of the body and mind" or "the falling off of the bottom of a paint pail." Whether there is any experience of light or some specific exalted blissful feeling is not its primary concern.

The development of enlightenment may be most easily understood through the Ten Ox Herding Pictures (Sheng-Yen, 1988). They represent the successive stages from beginning practice to helping others after full enlightenment. The story describes the journey of an ox herder, a practitioner, looking for his lost ox, the enlightenment mind. Some milestones are (1) The third picture – Seeing the Ox: It refers to the first discovery of the true mind with no illusive thoughts. This can be regarded as the initial enlightenment experience, seeing Buddha nature or kenso. (2) The seventh picture – Ox vanishes man exists: Gross practice is no longer necessary to sustain the enlightened mind but mindful awareness as subjective consciousness still exists. (3) The eighth picture – Both vanishes: An empty circle is left without the ox and the man. Subject-object duality vanishes with the forsake of any minute effort of mindful awareness. This is usually regarded as great enlightenment. (4) The ninth picture – Return whence they came: Water is boundless; flowers are red. The objective world is perceived same as before, but the mind is unshaken by the world in evolving vexations. This can be regarded as full enlightenment.

Cultivation, Gradual Enlightenment and Sudden Enlightenment

Meditation can be distinguished as mere cultivation or enlightenment prone by whether it is just an exercise of concentration or whether it is a universal mindful awareness without a fixed concentration focus (Chan, 2004). Cultivation through concentration leads to calmness or

samadhi. The release of concentrated contemplation as being crucial for attaining enlightenment is emphasized by Chan schools such as sects of Ox Head or Caodong (Soto) that employ mainly the method of meditation for enlightenment.

Enlightenment can be classified as being gradual or sudden. Meditation works by concentration is not enlightenment prone and should be classified as being cultivation instead of the often misclassified gradual enlightenment. Gradual enlightenment practice should be capable of leading to enlightenment, although taking on a gradual unfolding path. The Ox Head and Caodong sects are examples of the gradual enlightenment schools. Sudden enlightenment schools, derived from the Huineng school, flourished with Master Mazu's masterful enlightenment initiation (see the chapter on Enlightenment Initiation in this volume) methods like twisting a disciple's nose or kicking down an enquiring disciple by the chest; emphasized the attainment of sudden enlightenment instead of extended meditation cultivation. Sudden enlightenment can be understood as a sudden glimpse of Buddha nature when the barriers of illusive thoughts are suddenly dispersed. Often it is only available to people who have adequate preparation of practice and more often than not people need to continue practice, such as daily mindful awareness, after sudden enlightenment. There can only be differences in the comprehensiveness and stage of enlightenment experience, but there is not a priori difference between enlightenment reached by gradual or sudden approaches (Chan, 2008).

Methods of Enlightenment

Enlightenment may be set off by some environmental stimulus, or purposely being initiated by act or speech of a Chan master when the person's mind is at a pre-enlightenment stage, often being still with little or no illusive thoughts due to practice or meditation. Systematic methods are employed for attaining enlightenment, like Silent Illumination or Shikantaza meditation and the practice of Huatou or gongan investigation. The meditation methods still the mind by universal mindful awareness without meditating at a fixed focus. The enlightened mind unfolds when the mind is emptied of all tiny dust of disturbance by illusive thoughts through mindful awareness meditation. The investigation methods use a phrase or episode of a former enlightenment case and the practitioner repeatedly brings up mentally the phrase or episode and attends to the part of the mind before the case is raised. Continued practice of attending

to the non-discursive part of the mind will lead to a conglomeration of the discursive thoughts to become what known as the "great doubt." When such great doubt bursts through, the enlightened mind clear of all illusive thoughts unfolds.

Intuitive insight is often enhanced in the enlightened mind that is unobstructed by discursive or illusive thoughts. However, conceptual and logical thinking are not in principle contradictory to the enlightened state. Only when enlightenment is being examined, as by Chan masters; direct and spontaneous response are more representative of a disciple's personal experience of enlightenment than prolonged conceptual investigation.

If attachments of the self and on the world can be regarded in Buddhist philosophy as the origins of suffering and evil, then enlightenment that involves a dissolution of the self and hence a lessening of attachments will lead to spiritual goodness and salvation of the person and the world.

Enlightenment Initiation

Wing-Shing Chan

Enlightenment initiation refers to the events, either natural or by human that directly lead to a person's enlightenment. The Buddha is reported to be greatly enlightened when he watched the appearance of a brilliant star while meditating. Throughout the history of Chan (or Zen) thousands of people were enlightened while

triggered by some natural events such as kicking a tile onto a bamboo strip or seeing one's reflection on water; or being initiated by their masters through being hit upon or reprimanded.

The mystery of these enlightenment initiation events can be understood if we understand what enlightenment is involved and the mechanism that may lead to enlightenment. Enlightenment can be analyzed to be the realization of our Buddha mind (nature) when the barrier of illusive and discursive thoughts in the mind is being removed. Enlightenment experience can occur when either the barrier of illusive thoughts in the mind is completely dissolved or when such barrier can be temporarily halted or bypassed. Sudden enlightenment as often represented in Chan consists of a temporary halting or bypassing of the illusive thought barrier of the mind. In some instances, enlightening experience can also occur when a significant part of a person's strong attachment of the self or of the world is being detached due to enlightenment initiation (Chan, 2008).

Enlightenment can be broadly classified into two types (Chan, 2004): (1) Initial enlightenment – initial enlightenment occurs when illusive or discursive thoughts are either stopped, halted or bypassed resulting in the revelation of the non-discursive mind. (2) Complete enlightenment – enlightened mind is sustained indefinitely without any application of concentration and illumination effort.

Common Techniques for Enlightenment Initiation

Common enlightenment initiation techniques are described in the following ways (cf. Suzuki, 1949):

1. *A verbal or behavioral shock that bursts open a concentrated mind.*

Meditation or practice generally leads to a concentrated mind devoid of discursiveness. Enlightenment takes a step further by dispersing the internal effort of concentration to become a self-sustained enlightenment mind of no discursiveness. A verbal or behavioral shock or a natural occurring stimulus applied at the appropriate moment can burst open a concentrated mind and reveal the enlightenment mind. Many gongan (koan) examples include Master Dahui initiated enlightenment in his students through shouting or hitting and Master Mazu enlightening Baizhang through twisting the latter's nose with pain.

2. *Entanglement or short-circuiting of the illusive mind.*

Some of the illogical or incomprehensible verbal statements spoken by Chan masters to their students are not to be interpreted by either Buddhist or common knowledge; they are just meant to be a way of entangling or short-circuiting the conceptual or logical habitual thoughts that are often dominated by activities of the illusive thoughts. Enlightened mind can sometimes reveal when the illusive thoughts are being entangled to a halt.

It was asked: "Does a cypress tree have Buddha nature or not?" The master (Zhaozhou) replied: "Yes." "When will it become a Buddha?" The master said: "When emptiness falls onto the ground." "When does emptiness fall onto the ground?" The master replied: "When the cypress tree becomes a Buddha."

3. *Bypassing the illusive thought barrier by forcing the illusive mind with no way to turn.*

Chan masters are commonly known to hit their students for thirty sticks for a yes answer and yet gain thirty sticks for a no answer to a question. By creating impossible positions on either side, Chan master forces the student to forsake the conceptual mind already defiled by illusive thoughts and passes into the non-illusive mind, which is the enlightened mind. Master Guishan once was given a test, his master Baizhang pointed to a cleaning vase and asked, "Do not call it a cleaning vase, what would you call it as?" Guishan kicked off the cleaning vase and went out. He received the confirmation.

4. *An apparent irrelevant or illogical answer that helps stop the illusive mind.*

Chan gongans (koans) are known to be full of irrelevant or illogical statements. The function of many such absurdity or non-sense is to make the illusive mind impossible to carry out its thought process and being forced to stop, which gives a chance for the non-discursive enlightenment mind to reveal.

A student asked, "What is Buddha?" Master (Zhaozhou): "That inside the sanctuary." "Isn't that inside the sanctuary a clay statue?" Master said, "Yes." Student: "What is Buddha?" Master said, "That inside the sanctuary."

Eventually the querying of such puzzle had itself developed into a method of practice known as "cangongan" (querying a public enlightenment case) or "canhautou" (querying a phrase of an enlightenment case). A very popular method of gongan or hautou derives from the following gongan of Zhaozhou. It developed into the popular gongan method of querying "Why does dog have no Buddha nature?"

A student asked, "Does dog has Buddha nature or not?" Master said, "No."

5. *Directing the mind from conceptual reasoning to non-conceptual insight.*

Ordinary people's conceptual thinking is defiled by illusive and discursive thoughts. It is not useful as a direct means to approach the non-illusive enlightened mind. Thus non-conceptual insight is often adopted by Chan masters to help bypass the illusive thoughts into the non-illusive enlightened mind.

Accordingly masters had adopted methods that are speechless but requires insight such as turning into complete silence, raising or lowering the master's stick, walking from east to west or vice versa, presenting a symbol of a circle, raising the eyebrow or blinking the eyes, calling the name of the student, etc. When these symbolisms are used in a suitable context, they may elicit insight from the student that resonates with the nature of enlightenment. An example:

Yunyan came to seek advice, Master (Guizhong) showed the gesture of drawing a bow. Yan was motionless for a while, and acted the gesture of drawing a sword. Master said, "It happened all too late."

6. *Pointing out the misapplication of the student's mind while seeking enlightenment.*

Chan masters often point out the wrong direction or assumptions of the student's application of their mind in seeking enlightenment. When the student stops looking or going into the wrong direction, they may have a chance to encounter directly enlightenment in the appropriate application of the mind.

For example a monk asked Master Yuanmen: "Not giving rise to one thought, is there still any fault or not?" The master said: "Mount Xumi!"

Mount Xumi, an extremely enormous legendary mountain in Buddhist literature, here refers to the extremely wrong position of equating enlightenment with complete dispense of thoughts, logic or conceptual thinking. Enlightenment is the purification of the mind from illusive or discursive thoughts, not to arrive at a mind that cannot think.

A monk asked, "How is the state of quiescence with no reliance?" Master Xuefeng Yicun: "It is sickness still." "What becomes of after turning?" Master: "A ship down Yangzhou."

The state of quiescence with no reliance seems to be the meditative state with no discursiveness or concentration effort. This initial enlightenment experience is still sickness compared to great enlightenment, when enlightenment is completely self-sustained with completely no meditation or contemplation effort; and when the mind can be vigorously functioning

with no fixation and simultaneously without any discursiveness, likened to the ship that flows freely down toward the city of Yangzhou.

7. *Direct symbolic representation of the enlightenment realm.*

Chan gongans are filled with symbolic representations of the enlightenment realm spoken by various Chan Masters. Because enlightenment cognition contains simultaneously unification and differentiation, it is often not describable clearly in ordinary dualistically opposed logic or conceptualization. Symbolic representations are often used to express (1) the internal state of the enlightenment mind with regard to no illusive thoughts, (2) the enlightenment cognition of simultaneously unification and differentiation; which can be used to stimulate and induce insight from the students.

When the states of mind of the Chan students are close to the said symbolic representations, a resonance can occur that reveals the enlightenment mind and that becomes an enlightenment experience.

Example of representation (1) is "A sunny sky without a cloud in ten thousand miles"; and (2) is like "Holding a plough with empty hand, riding an ox while walking; Man walks across the bridge, the bridge flows without water flowing."

8. *Display of speech and action in congruence with Buddhadharma truth, e.g., Middle Way or non-attachment.*

Chan masters display Buddhadharma truth, such as Middle Way position or non-attachment, through their speech or actions. Middle Way position refers to the non-attachment of either the form or emptiness of things. Such speech and action coming from an enlightened mind can sometimes resonate and awaken another near-enlightened mind if that is about ripe. Examples of the Middle Way and non-attachment positions are listed as follow:

There is a gongan about an old practitioner believed to be a transformation of a fairy wild fox, came to Master Baizhang to receive instruction about the question of whether a great practitioner would fall into cause and effect or not. Baizhang replied, "Obscure not cause and effect!" By this the wild fox appeared and was transmigrated and liberated.

Patriarch Huineng was asked who could get the rope and bowl from Bodhidharma. Huineng replied, "Who he knows Buddhadharma can get it." And the question followed, "Do you know Buddhadharma or not?" Huineng said, "I don't know Buddhadharma."

9. *De-attachment of Buddhism and the Chan Master.*

The vital theme declared by Buddha for liberation of suffering is de-attachment. The religion of Buddhism requires not only the de-attachment to the

worldly cravings, but also to the religion of Buddhism and the religious master in order to gain ultimate liberation. Thus in Chan there are often themes about renouncing the Buddhist principles and the upsetting of the master by the student. A popular Chan saying says, “With seeing self-nature the Buddha remains not; in great enlightenment the Master exists not.” There are cases about burning a wooden Buddha statue to keep warm and the hitting back to his master by Linji. Chan master can also purposely create a situation for de-attaching the student’s residual attachments to Buddhism and the master so that the student can attain ultimate liberation.

For example, when his student Lingxun was about to graduate, Master Guizhong asked him to come to receive the teaching of the supreme Buddhadharma. Guizhong told Lingxun to come closer and he went closer. Guizhong said, “Season’s cold, take good care of your journey.” When Lingxun heard upon this, he forgot at once his previous (intellectual) understanding.

Epiphany

Kelly Murphy Mason

Epiphany is the ecclesiastical feast that falls 12 days after Christmas. It marks the arrival of the Magi in Bethlehem to behold the Christ child; it also marks the end of Christmastide. The weeks following it that lead up to Lent are called Epiphany Season, which has a variable length in the liturgical calendar. Etymologically, epiphany is derived from the Greek term for “manifestation.” The holiday was originally celebrated by the Eastern Church,

to commemorate the angelic announcement of the good news of Christ’s birth, but later focused more on Christ’s baptism. The Nativity came to be understood as one instance of Theophany, a showing forth of God. Accounts vary between the Gospels of Matthew and Luke, the only two gospels to include Jesus’ birth narrative, but in each, people are immediately led to understand the momentous import of the birth: “Glory to God in the highest heaven and peace on earth and God’s favor to men” (Lk 2.14). Much later, epiphany was used generically to describe instantaneous insight; it was a frequent literary device in modern English literature, where it usually featured as a formative experience in a character’s development. For the purposes of psychology, an epiphany signals a breakthrough that allows a person to apprehend something more fully than before. It has an almost mystical quality to it, an intuitive veracity.

Erikson, Erik

Lynn Somerstein

Erik Erikson (1902–1994) was a developmental psychologist and psychoanalyst whose theory presaged Ego Psychology and Interpersonal theories of psychology as well. Erikson emphasized the interaction between the individual and society, placing great importance on the positive influence that religious and cultural values exert on individual development. Religion and its associated rituals provide a pattern, goal and ideal for the individual life cycle. In his view, a religious life is part of the successful, healthy development of the individual, and begins during the stage of Basic Trust, when faith has its start. Erikson writes, in *Young Man Luther*, “One basic task of all religions is to reaffirm that first relationship” (1958: 118–119).

His early life was difficult. He was born out of wedlock and raised by his mother as a single parent until she married

his pediatrician, Dr. Theodore Homburger. It is believed that Erikson's real father was a Gentile, but Dr. Homburger and Erik's mother, Karla Abrahamsen, were Jewish, and led an active religious life together with their family. Although Dr. Homburger eventually adopted Erik, he was not able to convey his total emotional acceptance to Erik as his son.

Identity was an important personal question for Erikson. He never learned who his real father was, but he believed that he looked like him. Erikson was tall and blond. He was criticized for looking like a gentile when he was in Synagogue and for being a Jew when he was in school, so he effectively did not fit in anywhere. He solved some of his identity conflict when he became a Christian after his marriage to Joan Serson, whose father was a minister. His confusion about who he was and where he had come from may lie at the bottom of his belief that the "identity crisis" is a normal event.

He is also famous for his Epigenetic Theory, which uses the stages of fetal development as a template for personality development. Successful passage through the early Stages of his Epigenetic Theory yields later success, but problems that begin early ineluctably affect later development. The stages and their associated tasks are as follows:

Stage One: Oral-Sensory: from birth to one, trust vs. mistrust, feeding;

Stage Two: Muscular-Anal: 1–3 years, autonomy vs. doubt, toilet training;

Stage Three: Locomotor: 3–6 years, initiative vs. inadequacy, independence;

Stage Four: Latency: 6–12 years, industry vs. inferiority, school;

Stage Five: Adolescence: 12–18 years, identity vs. confusion, peer relationships;

Stage Six: Young Adulthood: 18–40 years, intimacy vs. isolation, love relationships;

Stage Seven: Middle Adulthood: 40–65 years, generativity vs. stagnation, parenting;

Stage Eight: Maturity: 65 years until death, integrity vs. despair, acceptance of one's life.

His most important published works are:

- Childhood and Society 1950
- Young Man Luther 1958
- Insight and Responsibility 1964
- Identity: Youth and Crisis 1968
- Gandhi's Truth 1969
- Dimensions of a New Identity 1974
- Life History and the Historical Moment 1975
- The Life Cycle Completed 1987, with J. M. Erikson

Eros

Kathryn Madden

Eros [Latin *Erōs*; Greek *Ἔρως érōs*], refers to passionate love, sensual desire and longing. In the personified form of Greek mythology c. 1386, Eros was the god of love, related to desire of an unknown origin. In the early creation myth, the *Theogony* of Hesiod (700 BC), Eros was a primal god, son of Chaos, the original primeval emptiness of the universe. Eros emerged from the primordial groundlessness of Chaos together with Gaia, the Earth, matter, and nature, and Tartaris the underworld, creating a dichotomy of being. Some legends attribute Eros as the

scintilla of desire that united Uranus (Heaven) and Gaia (Earth) from whose union the entire material world came into being. In early legends, he was the firstborn Light that was responsible for the fertile and creative coming into being and ordering of all things in the cosmos.

Later tradition depicted him as the son and attendant of Aphrodite, goddess of sexual love. Together, as gods, they harnessed the primordial force of love and directed it into human beings. In Greek poetry, Eros was often portrayed as a willful, playful, charismatic and often impish god. In later Greek thought, Eros as a primeval deity transformed into the one who embodied the compelling energies of erotic love as well as the urgent force of ever-flowing nature.

His Roman mythological counterpart was Cupid (Latin *cupido*), or Amor, meaning desire, or love. In Roman literature and art he became increasingly more youthful, eventually represented as the son and companion of Venus. Eros was portrayed as a handsome winged youth prepared to shoot into the heart of an unsuspecting victim with his bow and arrow. He carried two kinds of arrows: one was golden with dove feathers that caused instant love; the other was leaden with owl feathers and was purported to cause indifference in those it pierced.

In the early Greek and Roman civilizations, the phenomenon of love was commonly understood as a kind of madness from the gods that involved the sometimes reckless and careless aim of Eros' love's arrows. His arrows were thought to not only pierce and wound the person's heart, overwhelming the individual with love at first sight, but often to promote the antithesis: pleasure accompanied by pain. The notion of passionate love at first sight was commonly believed to lead to unrequited love, impelling the lover into depression, pining, and sorrow.

Eros in Psychology

Eros was initially defined in Sigmund Freud's *Beyond the Pleasure Principle* (1920) as a life instinct, sexual drive and unifying force. Eros referred further to the urge for self-preservation, and the desire to create life and productive work. Freud conceptualized that all human beings undergo an instinctual dualism with Eros and Thanatos. Thanatos is the destructive force of the death instinct, the psychological polarity that can lead to the disintegration, dissolution, and negation of all that exists. The underlying force beneath both energies is libido.

Analogous to Hesiod's notion of Eros emerging from the nothingness of Chaos, Freud posits that Eros is present in incarnation of matter out of inorganic material (Freud, 1920: 61). Freud does not reference the work

of Hesiod but demonstrates familiarity with the doctrine of the Greek physician and philosopher Empedocles of Agrigento (c. 490–430 BCE), for whom the production of all things results from the interaction between two primary instincts: attraction and repulsion, love and conflict. Eros represents an increase in tension. With Thanatos, we find an eradication of all tensions. For Freud, the domination of libidinal Thanatos can result in neurosis, the propensity toward masochism, and suicidal tendencies. The domination of Eros fuels our sexuality and promotes creativity. Ideally, we strive toward a psychological balance between the interplay of these two energies.

Freud revised his drive theory over his years of psychoanalytic practice. Eros became a fundamental concept referring to the life instincts of narcissism. The immature ego is relegated to isolated self-love. The libido of the mature ego is directed toward object relations, connection, and relationship. Eros is rooted and has "aim" that takes psychological work to get at. As we become more aware of the aim, we experience something moving toward us and we may feel this something pulling us toward it. At first, the aim may appear as a desire for food, sex, a professional position, a published book, finding a partner, becoming pregnant, becoming closer to God. Eros leads us beyond ourselves to connect with the aim or goal that is trying to become conscious. At the level of society, Eros leads toward kinship between individuals, groups, and nations.

Freud's theory of mature love implied "the all-inclusive and all-preserving Eros of Plato's *Symposium*" (Freud, 1925: 218). Plato's concept of Eros included initial desires toward a person but also an aesthetic and reflective appreciation of the beauty within that person.

Eros and Carl Jung

Analytical psychologist, Carl Jung, understands eros quite differently than Freud. Jung views libido as vital psychic energy that includes the body, sex, aggression and also divine pneuma (spirit). More than our bodily desires, eros has to do with our subjective being in a body and with something we must do before we die. Eros is full of sighs: sighs of relief, sighs of what we long to achieve, whom we wish to unite with or be closer to, as well as sighs of mourning.

Jung used the term *eros* to represent his primary theory of feminine psychology, specifically the psychology of the anima, or feminine soul. The anima (or animus as masculine soul) is the center of the archetype, a dominant image in the unconscious mind that varies for each of us.

The anima or animus is a figure opposite to one's ego gender and position. Jung tells us it is an entry point to the deeper unconscious. The anima/mus is the mediator between the ego the Self, the Self being the central archetype of the objective psyche. The Self is process and content, originator and goal of our psychological life. The experience of the Self for Jung is numinous and feels like a river flowing toward its source.

In contrast to eros, Jung spoke of *logos* as the decisive principal ascribed to men. In modern culture, we could think of *eros* as psychic relatedness, and *logos* as objective interest (1959, CW X: 123, 255). In Jung's writings, he specifies gender in relation to these concepts, and yet, the feminine principle is relevant to men as well as women in terms of sexual identity. In fact the notion of Eros of antiquity was revered by the name *Erotes*, the plural of Eros which pertained to all attractions that induced love and desire, whether heterosexual or homosexual attractions. More often for the Greeks, Eros was the benefactor of masculine enticements.

Drawing upon the legend of Eros and Psyche, (cf. Cupid and Psyche), Jung applied these two opposites to his theory of the anima/animus syzygy, or conjunction, of male and female psyches. Jungian theory claims that men possess the anima in their unconscious (images of the feminine soul, breathe, inspiration). These are qualities and representations of the feminine *eros*. Personal individuation, or the journey of integrative wholeness, requires male consciousness to confront their anima on many levels by accepting *eros* not only at the projected ego level (i.e., the merely sexual and visceral object), but also by assimilating more mature layers of the feminine principle into conscious being.

Jungian analyst Eric Neumann explains the developmental integration of the anima in the legend of Cupid (Eros) and Psyche. The relationship of desire between Psyche and Eros begins in an uroboric state, as self-containment in which there is not yet individual unconsciousness. Psyche initiates an encounter with Eros and intentionally brings him into the light. Her act represents the undertaking of making the unconscious conscious. In this act, the unconscious bond between them is dissolved, transforming mere objective attraction to genuine love and promoting individuation – the ongoing incorporation of unconscious contents that occurs both in the development of the collective and the individual human being (Neumann, 1956: 90).

Making the unconscious conscious has risks; yet, we need to bring our desires into consciousness. Eros wants to step over into visible life to be expressed. If eros is not

allowed to become visible and to incarnate, its energies will fasten onto any of a range of addictions, or to a social cause that lacks the fullness of en fleshed foundations. Eros needs the body to express itself: through dance, art, music, writing, creative activity and the love of children. Without such expression, we can fall into illness, somatization or, on the religious side, fundamentalism or shallow and projective social justice righteousness.

Psychologically, eros can lead us toward what is hiding in the lost parts of our selves that wants to be found, that wishes to act out, to become incarnate. In psychological practice, we track these lost parts of the self, regardless of school of thought, by paying attention to the desire inherent to eros and not necessarily to its object. We study desire and where desire leads, observing what it ruthlessly seeks, acknowledging what object it is projected upon or images that it is linked with. If we follow the red thread of eros, we also may discover what object desires us.

At this juncture, we cross into the territory of religion or spirituality. Eros can be defined as desire in relation to spirit. Our personal desires and wishes collect around an obvious theme. If we pay attention to its movement and its images – its feeling tone, its colors – we take on a motif, a gathering together of something principle, a coloring. We begin to question who or what is pulling us toward this need for combining our energies, our self, our bodies, our ideas, with another person, activity, or relationship.

Unfortunately, in the history of the Judeo-Christian tradition, biblical literature leaves the feminine presence of Sophia behind – a personified presence in the late Hebrew literature – and we find an increasingly exponential split between spirit and eros. Instead, we find a predominantly male, rationalized emphasis upon the notion that somehow spirit is superior to desire when, in fact, prospective desire leads to spirit and spirit attracts desire. Inherent to an anagogical reading of scripture is the lavishing of the “first thing,” about God. Eros, then, is about having a passionate, all out loving. In the biblical book of Hebrews, such loving is described as “fire.” Eros also flows into the biblical second commandment in that it underlies the efficacy of how social justice works. Otherwise, we just try to fix the world.

In the analytical arena, eros as passion grows bigger because it comes into a fuller reality as it meets its opposite. What becomes evident and necessary for passionate love to break through is the prerequisite of a weak spot, a vulnerability in us. Something happens that shakes us loose from settled attitudes and creates a response that transforms vague longing into intense passion. The recognition may be so profound as to be ineffable and experienced as a gap,

or a void. Passion is the thrust that leaps across this abyss. Passionate love becomes so concentrated at the particular point where it strains against unknowing that it can break the defended barriers, ushering us into a new sphere of experience in which love is given and received. Received, it is returned in response, equaling an exchange. Such passion does not require knowledge and intellect, only willingness. This process is one of self-giving, across a gap of unknowing toward an intensely desired wholeness (Haughton, 1981: 18–46, 58–61).

Wholeness links us with spirit and brings the body into the spirit. This fact is what distinguishes C. G. Jung's analytical psychology: we need desire and eros to find God. God incarnates in the flesh of the psyche. We are innately possessed with the capacity to be conscious of the deity. When eros aligns with the right object, this connection can link us to a life of relatedness. From Jung's view, depth psychology intends to point us toward religion as a container for the life of the unconscious.

The syzygy of anima and animus is an important factor in an individual's faith tradition because the images and affect that these images carry participate directly in the actual process of the transformation of the God-image (Jaffe, 1999: 25). Out of this inner marriage that Jung speaks of come images of the Self. Self material is shared, it's not personal. There is a social aspect: if we do not share it, we lose it. Eros can breed a rich sense of interdependence in our work and in our communities, as if we are all connected. Eros, as it bridges soul to spirit inevitably includes other people and constellates a "body" evoking us to ask: Is there a God? What is it that we love and that we are living for? What are we really summoned to? Are we living as a carbon-copy of someone or something else, or are striving toward being an original? In order to answer these questions, we need to listen in the desert-place, the place of the still, small voice. We have to internally address any conflicting desires we find inside and to really grind down on the marrow to find what is addressing us.

In both psychology and religion, our goal is to pay close attention to this inner movement. How is Eros manifest? In our relationships, our groups, our communities, our creative projects? What does it ask of us? What eros asks of us in relation to spirit often has to do with what the entirety of our mature lives will be about. First, however, we must find soul in relation to spirit. Jungian psychology offers a map for religion to follow in light of this transformation. We take what images we find under the authority of the psyche seriously, follow the thread of eros, and eventually find the meaning and intention of

our individual lives. Then our desires lead us to the body and to the spirit and through the spirit to the body.

Eros, approached, amplified, and understood from the literal to the symbolic, without the negation of the bodily and the real can lead to the secret of transformation and renewal. From the perspective of religion, eros has to do with the first commandment, putting the first things first and offering these things up to God. In our faith traditions and rituals, the giving of our desire and eros is the giving of the most precious thing that identifies us as individuals. Transformation and wholeness requires of us that we sacrifice that which is most dear to us, offer it, give it up, disidentify from *it*. We are yielding our ego-claims to the "beyond ego." Jung would say this is initiated by the Self. Something comes into our ego-neighborhood. We feel impelled by internal reasons.

As we offer up our desire, all the bits of ourselves begin to be collected and come into a more cohesive image. The Self too is changed, freed from unconscious projection into conscious focus. The Self sacrifices itself in the abstract to the ego. The unconscious Self becomes humanized just as the ego is spiritualized. Hence the God image is transformed and changed, and we too are transformed by being taken into the center, the Self where we can live from. We can live from this center and the unconscious does not control us. In essence, if we pay attention to eros, we arrive at where we belong.

Eschatology

Emily Stetler

The etymology of “eschatology” is ambiguous; the Greek root may be either *eschaton*, “end time,” or *eschata*, “final things.” Eschatology is more commonly described using the former understanding, and thus defined as “the study of the end time.” In practice, though, eschatology encompasses the latter sense, as well. Particularly in Catholic theology, eschatology has traditionally been defined as being concerned with the so-called “four last things”: death, judgment, Heaven, and Hell. (To these four are sometimes added purgatory and the resurrection of the body.)

Beyond this, though, eschatology also provides the venue for religions to speak of their *hope* both for the afterlife and for the here-and-now. Increasingly, eschatology also has come to imply a theology of history, as well.

As a theological field, eschatology covers a wide array of topics; for it is concerned with the ultimate fate of the cosmos and of humankind. The unfolding of this drama varies widely, however, across and even within faith traditions. In general, though, two basic understandings of the eschaton exist: in one, the world comes to a culmination inherent in nature; in other, the world ends violently, under assault by seemingly external or supernatural forces. The first is immanent, *within* history; the latter is an *escape* from history. This latter interpretation of eschatology is labeled *apocalyptic*. These distinctions are related, but not identical, to the further distinction between *realized* and *futuristic* eschatology. Futuristic eschatology looks toward fulfillment in some transformation – though not necessarily an apocalyptic one – at the end of time, whereas realized eschatology emphasizes that the present life has already been transformed through the sanctification of history.

A single faith can have both immanent and apocalyptic elements in its eschatology. For example, in Zoroastrianism, creation is oriented toward the *frashokereti*, the refreshment or renewal of the world, in which all is perfected; and devotees of the creator-god Ahura Mazda can precipitate this renewal through their actions. The prophet Zarathustra’s emphasis on personal responsibility underscores that, through their own righteous behavior, individuals participate in the vanquishing of evil and restoration of the world to its right state. Ultimately, though, the final restoration must be accomplished by the divine himself; Ahura Mazda must enter into his

creation from outside of it and direct the final battle against evil, a cosmic liturgy in which the evil principle Ahriman is banished to hell.

Indeed, violence, war, and disturbance of the natural world often characterize apocalyptic eschatology, as both Jewish and Christian apocalyptic narratives demonstrate. Yahweh tells the prophet Ezekiel that he will manipulate Gog, king of Magog, to invade Israel. God, in his anger, will rain down destructive fury: the earth will quake; mountains will crumble; the sky will rain fire and brimstone. The war and tumult will culminate in the destruction of God’s enemies and the exaltation of Israel (Ezekiel 38:1–39:29).

In the New Testament, Jesus informs that, at the end times, there will be wars and natural disasters, and the persecution of Jesus’ followers; the Temple at Jerusalem will be desecrated. Following these things, the Son of Man – a title found in the prophets, as well – will return, accompanied by cosmic disturbances: the darkening of the sun and moon, falling stars. The angels will gather the peoples, and the Son of Man will sit in judgment (Matthew 24:4–25:46, Mark 13:5–37). John’s vision, as recorded in the book of Revelation, also includes wars and heavenly signs, but the battle is much more explicitly one between good and evil, at the end of which Satan is ultimately consigned to a lake of burning fire, while Christ, his martyrs, saints, and church (portrayed as his bride) rejoice in heaven for all eternity.

Apocalyptic accounts also typically feature a heroic figure that marks the penultimate stage of the conflict between good and evil. In Zoroastrianism, it is the final *saoshyant* who restores peace before Ahura Mazda returns. In Islam, Jesus (Isa) returns to vanquish Dajjal, the anti-christ. In Shi’a Islam, he is accompanied by the Madhi, the twelfth Imam, who went into occultation as a child to return at the end times. In Hinduism, Kalki the tenth and final avatar of Vishnu, eradicates the impiety that has infected the world in the Kali yuga (the dark age) in order to prepare for a repetition of the first age, the age of righteousness (the Satya yuga).

Eschatology, however, does not concern only narratives of the end times; it also describes the objects of a religion’s hope. Jewish eschatology, thus, relates fundamentally to the restoration of the kingdom of Israel and the Davidic dynasty (Jeremiah 33:14–18). This doctrine develops chiefly in the prophetic books of the Bible, attributed to the period leading up to and during the fall and exile of Israel and Judah. The prophets foretell a time when the Lord will lead the people back from exile; and Yahweh’s anointed servant, the messiah, will reestablish the Davidic line and usher in an era of everlasting peace

(Isaiah 11:1–16, Isaiah 2:1–2, Jeremiah 23:1–8). The holy city of Jerusalem will be rebuilt, and true worship at the Temple will be restored (Jeremiah 31:38–40, Ezekiel 40:1–44:31).

Since Christianity assumes that Jesus is the Messiah, it looks, therefore, toward the Messiah's *second* coming and believes that, when he returns, Jesus will bring a spiritual rather than a political restoration. Christians look toward Christ's return – the *parousia* – as the time when the dead will be raised and they, along with the living, will be judged by him. Those deemed righteous will enter into eternal life in Heaven, and those found unjust will be relegated to eternal damnation. Likewise, Muslims hold Heaven, Jannah, as the object of their hope. Jannah is a place where the righteous both enjoy sensual delights – flowing rivers (Sūra 2:25), virgins – and participate in glorifying God (Sūra 10:9–10).

Since Buddhism does not conceive of a permanent enduring self, its eschatology takes a different form. The individual concern is not the attainment of heaven, but rather release from suffering. The Buddhist hopes to extinguish desire and the passions and thus end suffering, ultimately breaking free from the cycle of *samsāra* – birth, death, and reincarnation, in the attainment of *nirvana*. Pure Land Buddhism differs, however; here, the person desires to be reborn in the Land of Bliss, a heavenly land created by the Amitābha Buddha.

To be sure, disagreement over eschatological details has resulted in doctrinal division within religious traditions. To take an example from Christianity, Revelation 1:1–10 tells of a thousand year period during which Satan will be chained in the abyss and the martyrs will reign. After these thousand years, Satan will be released and will once again lead people of all nations astray before his final defeat and his eternal torment in the lake of fire begins. Whereas Catholic and most main line Protestant churches deny a literal millennium, other Christians affirm it. Within this latter camp, there is a division between those who believe that Christ's second coming will precede the thousand years (premillennialists) and those who believe the millennium will occur before his return (postmillennialists). In general, those subscribing to millennialist eschatologies have a strong belief that Christians must, during the reign of Christ, work to establish his kingdom on earth. Nonetheless, Christians are united in their belief in an afterlife, although even in this realm, there are debates. The Catholic Church holds that only saints go immediately to Heaven; others must be cleansed in Purgatory before going to Heaven. Protestants deny the doctrine of Purgatory, claiming that it is unbiblical and that it mitigates the salvific work of Christ.

Commentary

Perhaps more than any other doctrinal category, eschatology has reflected the historical and scientific concerns of the time and, likewise, has absorbed its anxieties. Thus in late antiquity, we see Christian theologians pondering the resurrection of the body, with their primary concern being *how*, precisely, God will reconstruct, at the resurrection, a body that has decomposed, or even been eaten by another creature. While this particular question may strike us as naïve, it is certain that religious traditions that espouse belief in a bodily resurrection must wrestle with what the ramifications are for treatment of the human body, living and dead, and for the precise relationship of body and soul; for a religion's eschatology reflects, in many aspects, crucial aspects of its theological anthropology.

Following World War I, philosophers and theologians confronted a loss of optimism about history and its developments; World War II and the Shoah heightened this sense. In the wake of this pessimism, eschatology emphasized new themes as theologians attempted to reinvest history with meaning. For some, including the Protestant Jürgen Moltmann and the Catholic Johann-Baptist Metz, both German, this meant infusing eschatology with a call for praxis. Both Moltmann and Metz were influenced by the revisionary Marxist Ernst Bloch and demanded concrete engagement with history in its actuality, rather than merely through theory. Moltmann has focused on the necessity of hope in the face of suffering. Metz has presented an extremely intersubjective eschatology; all persons must become subjects, he asserts. Yet one person's achievement of subjectivity does not compete with another's; rather, each person's subjectivity *depends upon* the actualization of every other person's subjectivity. Without explicitly engaging it, Metz theologically parallels social psychology's understanding of the self as at least partially socially constructed.

Rudolf Bultmann, on the other hand, developed his eschatology out of an engagement with existentialism. For Bultmann, humanity's orientation toward the future demands that the person resist the idolatry of security and instead embrace the freedom and risk of the present.

Beginning in the latter twentieth century, eschatology has increasingly entered into dialogue with science. This conversation has led, on the one hand, to a renewed emphasis on the significance of the environment in the eschatological process. Additionally, the introduction of brain science into the eschatological discussion has raised the question of what, precisely, *is* the soul that endures beyond death and how much of it is reducible to the brain.

Additionally, in the latter twentieth century, psychologist Robert Jay Lifton has engaged depth psychology to suggest that the human search for immortality need not imply an actual life beyond death. Instead, Lifton suggests, immortality can also be achieved biologically (living through one's descendents) or through the production of enduring creative works.

Esoteric Buddhism

Paul Larson

Esoteric Buddhism is better known as Vajrayana Buddhism, from the Sanskrit meaning “Diamond way.” This is the major form of Buddhism in Tibet, Mongolia, in the Russian states of Buryatia and Kalmykia. It is also a minority group within Buddhists in Japan (Shingon school). This is generally considered a third “yana,” or

“vehicle” in Buddhism. The other two are the Hinayana (“lesser vehicle”) and the Mahayana (“greater vehicle”). The classical schools of the Hinayana tradition ceased to exist and also the somewhat pejorative implication of lesser versus greater have resulted in the current preferred use of the term “Theravada” for that branch of Buddhism. All of the varieties of esoteric Buddhism share much doctrine with the other two schools, especially the Mahayana schools, and to that add influences from the Pan-Indian spiritual movement known as Tantrism.

Tantrism was a development in Indian spirituality that came in reaction to the asceticism and restraint of typical Hindu or Buddhist practice. It is sometimes known as the left-hand path, for its use of activities or symbolic activities that are normally prohibited, especially sexuality. Snellgrove (1987) discusses how early and literal enactment for forbidden dietary practices, intoxication and sexual activity was used as a way of breaking out of the dialectic of moral categories and using pure experience as a vehicle for direct gnosis. Over time, the degree of actual enactment diminished and was replaced by symbolic enactment. Westerners have been particularly attracted to the sexual aspects of Tantrism in either actual practice or imagery work. Numerous popular redactions of Tantric practices in the West tend to pitch it as a way of heightening one's sexual pleasure through withholding orgasm, among other techniques.

It can be said, however, that Tantrism is one of the few places where the sexual act itself is sacralized and used as a vehicle for spiritual development. In most religious contexts, sexuality is seen as a rampant desire that needs to be controlled in order for spiritual development to proceed. This stems from a root philosophy common to both East and West, that the body and the material plane of existence is inferior to the mental, psychic, and spiritual planes, which being non-material are therefore higher in the spiritual nature. This idea is not inherently anti-sexual, though it lends itself to that emphasis. There are examples within both Indian and classical pagan spirituality of positive views of sexuality in moderation and restraint, while still recognizing the superiority of the spiritual realm.

Be that as it may, sexual imagery is a foundational aspect of Tantric practice. The divine is typically portrayed in physical forms of both male and female, and often in sexual union. If one chooses not to use a physical partner, Tantric practice involves generating imagery, identifying oneself with one aspect of the deity and visualizing various manipulations of spiritual energy in that form. At the conclusion of the practice, the image is dissolved and one sits in meditation. In Buddhist forms of Tantrism this is linked to the basic Mahayana doctrine of emptiness (Skt. “*shunyata*”).

At its heart, Tantric practice is the working of high magic. There is a great deal of similarity between techniques used by Tantric adepts and those who are initiates in Western occult or magical traditions. That is, the basic spiritual practice involves generating spiritual energy and in a disciplined manner going through several transformational rituals that manipulate that energy and put it to one or more usage. Thus meditation practices in esoteric Buddhism make extensive use of multi-sensory phenomena in trance work. Visual imagery, use of physical gestures (Skt. “*mudras*”), chanting either aloud or silently, mantras, or verbal formulas, repetition of a variety of prayers, and the invocation of divine presence (similar to “drawing down the moon” in Western occultism) are all found in the various “*sadhannas*” or sequence of events that are made part of daily spiritual practice.

The ability to draw down the divine force into direct embodiment goes back to the earliest shamanic practices before the evolution of larger world religions and spiritual movements. In this sense, Tantric practice makes connection to the earliest layer of human spirituality while filtering it through a more evolved theology. Magical practices continued even as civilizations resulted in the bureaucratization of religion and the development of theologies with elaborate logical and explanatory structures.

Because of the intense nature of the imagery and or actual practices, as well as in keeping with the elaborate formalism of ritual, a direct connection between a student and a practitioner is emphasized. The “guru” and “chela” relationship found in both Hindu and Buddhist traditions is deepened by the requirement of secrecy of teachings, and the rite of initiation into a set of mysteries and practices through a gradual and sequential curriculum. The instruction in correct practice of the meditational and ritual practices is a key element. The many texts of Tantric practice were originally kept secret, but now one can find most of them published in both the academic and popular press. Initiates are still generally instructed to keep things like mantras and detailed instructions private; to not disclose to those not initiated in the tradition. To support this privacy there are often admonitions about the hazards of unauthorized practice.

In Tibetan Buddhism, these initiations are termed “empowerments.” Each of the many deities has their own particular “*sadhanna*,” or practice. A qualified lama will generally give empowerments as well as less ritualized and more public talks about Buddha Dharma (Buddhist teachings and practice). Disciples accumulate several or even many empowerments over the course of their involvement in the spiritual community. Each empowerment comes with its own commitments to develop the practice and integrate it into one’s daily spiritual work,

though the more one takes on, the less it is possible to pursue any one in depth.

Esoteric Buddhism emerged in the first millennium of the Common Era. It was heavily influenced by teachers from Nalanda, the greatest Buddhist monastic and scholarly community. This was the principal school for Buddhism from the seventh through twelfth centuries in India. Its destruction in 1193 presaged the disappearance of Buddhism from its native soil until the late nineteenth century, when a Buddhist revival began and the twentieth century when the Tibetan diaspora fed the growth of Buddhism in India. Among the most influential teachers was Nagarjuna (150–250 CE). He expanded on the doctrine of emptiness as found in the Perfection of Wisdom sutra (Skt. “*prajnaparamita*”), one of the earliest Mahayana sutras. That doctrine is a healthy counterpoint to the heady mixture of imagery and concentration which is part of any ritual based practice; realizing that, in the end, one has to come back from the “high” of the energy at its peak to the same dispassionate awareness of momentary experience, including suffering which is part of mindfulness practice common to all forms of Buddhist meditation.

Ethics and Ethical Behavior

Claudia Nagel

Introduction

Human beings are constantly judging their own actions and those of others. God and evil, moral and amoral, or

conscienceless are the respective judgments whereby we implicitly assume that “one” knows the basic difference between good and evil. Moral conduct is thus always attributed to an individual, who is regarded as being responsible for his actions and held accountable for these, i.e., he has to answer to himself, his own conscience or an external authority or institution. Moral behavior therefore presupposes the concept of voluntariness and freedom. Conscience, freedom and responsibility are central concepts of moral behavior and ethics as the philosophical doctrine of morally relevant behavior (Moral Philosophy).

Ethics as a philosophical discipline dates back to Aristotle, who also pursued earlier approaches, as those of Plato and Socrates. The term ethics is derived from the Ancient Greek “ethikos”: custom, habit, or tradition. Although the adjectival or adverbial forms of moral and ethical are frequently used synonymously, here the following differentiation – outlined by Anzenbacher (1992a) based on Kant’s definition – is made: an action is moral if it is judged in dependence on the individual conscience of the agent, while ethical also means according to convention and is thus placed in a social context. It is therefore open for discussion, on the basis of which norms an action is ethical.

Guided by the idea of a meaningful human life, i.e., a morally good and just life, philosophical ethics attempts to make universally valid statements about good and just behavior in a methodical manner – without reference to political and religious authorities, or the well-tryed. It is primarily concerned with an answer to the questions “What shall I do? Who do I want to be, how do I want to live? What is a successful, succeeding, and happy existence?” complemented by questions like: “In what kind of social and political environment do we want to and shall we live?” (Höffe, 1999).

Major Contents and Methodological Positions of Ethics

The Ethics of Morality was first defined by Aristotle. It describes the respective historically and socially relevant norms and values as the basis for virtuous moral conduct, these shall be realized sagaciously.

The autonomous Ethics of Reason is subject to a rigorous principle of morals and posited primarily by Kant. Norms have to be verifiable with the aid of a procedure which claims universal and categorical validity. The categorical imperative is of the highest order and demands with consideration of our respective subjective maxims (life principles) to: ‘Act only according to that

maxim whereby you can at the same time will that it should become a principle of general law.’ The decisive factor is alone the individual’s good will guided by reason. This approach has therefore also been discussed as an Ethics of Conviction. Kant asks for the conditions of the possibility for moral action.

Utilitarian Ethics, an approach posited by J. Bentham and J. St. Mill is concerned with ‘the greatest happiness of the greatest number,’ and serves as a guideline for weighing the utility of an action and its consequences. As a result of the utility principle the wellbeing of the individual comes after that of society as a whole, and a rational examination of the action is performed against the background of its concrete, foreseeable results (Lang, 1992).

In Scherer’s phenomenological approach to Value Ethics a hierarchy of tangible values which possess an objective quality (pleasure/pain; approve/disapprove; love/hate) is developed, where an action is described as moral when the respective highest ranked value is realized (Pieper, 2007).

In contemporary philosophy the *Discourse Ethics of Habermas and Apel* (developed as Ethics of Reason) plays an important role. They attempt to determine a rational foundation of reason by asking what we need to presuppose to conduct meaningful argumentation. The starting point is the discourse, the argumentation in speech. Everyone who argues has always implicitly committed himself to uphold four validity claims: understandability, truth, rightness, and truthfulness/frankness. These commitments are moral in a two-fold sense: In the sense of an ethics of truthful communication they commit the subject to reason and represent a criterion for the negotiation and evaluation of moral norms. All norms upon which an agreement is reached by common consent in a discourse without constraints are morally binding (Lang, 1992).

Alternative contemporary approaches to Discourse Ethics are anti-universalistic and relativistic as, e.g., the *Usualistic Ethics of Odo Marquard* (1981, 2007). His position is characterized by a skeptical stance and the renunciation of an ultimate moral standard, and is oriented towards the concrete moral horizon of the “usual.” He thus arranges himself in a skeptical position between absolute knowledge and absolute ignorance in the sense of the Aristotelian doctrine of mesotes (extremes are to be avoided) (Lang, 1992).

In addition to the described differences in terms of content, systematic differentiations also have an important role regarding the question as to the content of ethics. Differentiations are made between Descriptive Ethics, which is concerned primarily with the examination, description and explanation of the phenomena of morals

and conventions; Normative Ethics, whose principal concern is the critical analysis of prevailing morals and the reasons for forms and principles of right and good actions; and Meta-ethics, which attempts the critical analysis of linguistic elements in moral statements.

Based on the Ethics of Responsibility the individual considers all possible consequences of a specific action in the evaluation of his decision to perform this action, while Ethics of Conviction is oriented alone towards the good intention, the good will.

The differentiation between Formal and Material Ethics, which is related to the differentiation between Deontological (obligation oriented) Ethics and Teleological (goal oriented) Ethics is indebted to Kant. Formal Ethics (Ethics of Reason) is based on the universal idea of duty and moral laws. These have the character of unconditional, universally valid claims based on the transcendental view of obligation “from the universal concept of the reasoning being as such.” Exclusively applied are the precepts of rationality and the respective test procedures. It is the self-willing and determining reason which constitutes morality. Material ethics bases the concept of morality on the understanding, willing and pursuit of good purposes or values (e.g., Virtue Ethics, Value Ethics). Material ethics is frequently viewed as a complement to Formal Ethics in as far as it holds the criteria which serve to examine the moral value of goals and contents (Höffe, 2002).

Central Questions of Ethics

Despite the different approaches and groupings, ethics is essentially concerned with three different topics, which are also significant from a psychological perspective, because they are of basic relevance to all human experience:

1. Happiness
2. Good and evil
3. Freedom (Pieper, 2007).

It is in the nature of most humans to strive for happiness. Ethics expounds on this natural striving of man for happiness and asks if and how this can be morally justified. While one school of moral philosophers claims that happiness represents the highest normative principle (Hedonist, Utilitarian, Eudemonistic, Egoistical Ethics), another puts the principle of duty before happiness; the striving for virtue, morality and reason are given priority (Plato, Spinoza, Kant). It is, however, crucial that happiness cannot be achieved directly, but only through concrete goals, whose attainment holds the promise of satisfaction and thus of happiness. Furthermore,

happiness does not simply occur, but needs to be actively pursued in a practice, which contributes to a meaningful life when successfully accomplished.

The Good in itself is one of the central principles of ethics. In Greek philosophy and metaphysics the Good is the essence of all being, the goal toward which all striving is directed, and through which man becomes wholly himself (Plato, Aristotle). Something is morally good, which is good in itself and not with regard to something else or, for something else. Kant states: “Nothing can be thought anywhere in this world, or even outside the same, which can unreservedly be regarded as good, except the good will alone . . . The good will is not good through that which it effects or accomplishes, nor through its usefulness in achieving a certain purpose, but it is good through the willing only, good in itself” (Kant, 1995b – *Groundwork of the Metaphysics of Morals*: 180f).

Joined in the concept of the highest Good, in which consummate personhood is reflected, are the three topics of ethics: happiness, freedom, the Good (Pieper, 2007). “It is a priori (morally) required to achieve the highest Good through the freedom of will, . . . In the highest for us practicable – i.e., realizable through our will – Good, virtue and happiness have to be thought as necessary and connected” (Kant, 1995b: 173).

The term freedom has repeatedly occurred above and is, in fact, of even greater importance to ethics, because it implies both precondition and goal. Today the question arises based on recent findings from neurobiology, attachment research and psychoanalysis how free the human being is in his actions. Were behavior – as it is understood by some behaviorists and neurobiologists – completely predetermined, there would no longer be a need for a science of morals.

While freedom was seen as self-evident in antiquity, it has assumed great importance in the reflections of modern ethics since Kant. As a “natural being” man is other-directed as a result of his sensuality, i.e., his drives, instincts, feelings, passions, needs and interests (heteronomy). Even if he can not invalidate the laws of nature, he can decide what he can want, shall want or not want, i.e., he can act self-determinedly (autonomy). Because he can free himself from the constraints of nature and determine autonomously what he can want, he uses his moral freedom. In contrast to unconstrained freedom, arbitrariness, moral freedom refers to the freedom of others and acknowledges this as a principle. The contradiction between unconstrained, absolute freedom and freedom which delimits itself with consideration of the freedom of others characterizes moral freedom. Moral freedom is

the basis for freedom of action. Freedom of action, which means not merely to want the Good, but to do it, is always limited by the prevailing circumstances.

Inherent in the concept of freedom is also one of the limits of ethics. As a theory it cannot be its own practice, because the realization of freedom lies outside itself. The individual is moral through will; it is not ethics that renders him moral. In addition, because freedom is one of its presuppositions, ethics cannot develop a material catalog of norms. It can, however, substantiate formal norms whose critical application functions as a standard for material norms. The critical evaluation and application is ultimately left to the acting individual (Pieper, 2007).

The goals of ethics, which are of importance to humans from a psychological standpoint, may be summarized as the reflective enlightenment of the acting individual in regard to the moral conditions of his actions. With comprehension of freedom as an essential element for the human being, the critical power of judgment of moral actions, i.e., the critical differentiation between good and evil before the background of freedom as an unconditional principle, has to be practiced. A third crucial element represents the acquisition of moral competence and social responsibility (Pieper, 2007).

The Psychic Development of Moral Competence as the Basis for Moral Conduct

Two significant directions can be identified regarding the development of moral competence: the psychoanalytical view of Freud, complemented by several aspects from Jung, and the theories of developmental psychology ranging from Mead to Piaget and Kohlberg to Gilligan.

Kohlberg's theory of moral development (Kohlberg, 1984) is based on both Piaget's stages of cognitive development and his division of moral development into a pre-moral, a heteronomous, and an autonomous stage analyzing the child's changing awareness of rules. Founded on the results of his empirical research, Kohlberg added three additional stages to those of Piaget and summarized these in three levels (Table 1).

These described stages of moral development may also serve as an indication of current social and historical development where moral conscience increasingly appears to be moving towards the discourse today (Lang, 1992).

Kohlberg's stages of moral development are based on the conception of a moral of justice as proposed by Carol

Ethics and Ethical Behavior. Table 1 Stages of moral development

Level	Stage	Moral orientation
I. Pre-conventional level	1	Obedience and punishment orientation
	2	Self-interest orientation
II. Conventional level	3	Interpersonal accord and conformity
	4	Authority and social order maintaining orientation
III. Post-conventional level	5	Social contract orientation
	6	Universal ethical principles orientation

From Garz (2006: 102)

Gilligan (1982). She has elaborated Kohlberg's theory of moral development by introducing the concept of moral of caring, starting from the premise that both attitudes to morality are in a dialectical relationship. This approach is of particular interest because it complements the so-called "male" abstract moral with a "female" moral of human-caring (Garz, 2006: 117).

Freedom and Psychoanalysis

Prior to Kant, psychology was a branch of Special Metaphysics. In contrast to General Metaphysics, i.e., ontology (science of the nature of being), psychology was regarded as Special Metaphysics concerning itself, as the "science of the soul," with questions of self-knowledge, identity and oneness of consciousness. The focus of psychology has since then been on concrete psychic experience (Pieper, 2007).

In addition to the development of moral competence, the question as to where the conscience or morality can be located in the human psyche is of interest from a psychoanalytical perspective. In his theory of psychic structure Freud names the superego as the judge or censor of the ego. The superego's functions comprise the conscience, self-observation, and ideal formation. This term therefore designates the presence of internalized values, commands, and prohibitions. The superego develops in the child after an extended period of need for support with the Oedipus complex and as a result of the fear of loss of paternal love. From a philosophical viewpoint this would be expressed as follows: "The demand of the conscience (superego) may thus be seen as the advice to act wisely: Act in

conformity with your conscience or you will lose the goodwill of the one whose protection and help you need” (Anzenbacher, 1992: 207). Freud (1999) views morality as a strategy, in which culture, indirectly also serving the pleasure principle, attempts to defend itself against the destructiveness of aggression. Culture virtually installs the superego in the individual to serve as his conscience which constrains the ego; this leads to the development of a sense of guilt and the need for punishment and thus to the diminishment of aggression.

Freud considers the quest for the highest Good, the purpose in life, as emerging from the pleasure principle, which takes priority over everything else. This would, however, completely instrumentalize reason and cannot become practical as pure reason in the sense of Kant. This, in turn, would from the first result in the leveling of an independent meaning of morality (Anzenbacher, 1992).

Jung (1995, § 825–857) asserts that ethics and moral are innate, because without the ability of the psyche to experience guilt there can be no sense of guilt. Furthermore, the omnipresent opposites are thereby raised to conscious awareness. Ethos is thus understood by Jung as a “special case of the transcendent function” which connects the unconscious with the conscious. Only in the conscious, reflective examination of one’s own actions can what appears to be moral conduct be changed into ethical conduct. From a religious standpoint he defines this as the establishment of a connection between reason and grace.

In relation to the principles of ethics, psychotherapy and psychoanalysis as applied psychology also have an important role. Psychotherapeutic and psychoanalytic methods essentially consist of the dialogical working-through of the patient’s emotional history. It is the aim of the therapy to free the individual from psychic constraints through the bringing to consciousness, emotionally working through and processing of complex and conflict charged events that prevent him from living life as a truly human being liberated on to himself. This is a moral aim in a two-fold sense, as it also requires the analyst to be conscious of his own responsibility. However, in contrast to ethics, psychology does not aim to reflect on the conditions of moral conduct, but wants to enable the human being to act morally. Through cognitive insight and emotional experiences, i.e., through self-knowledge, the individual shall recognize and integrate the constraining factors to achieve the capability of interaction. The discourse ethicist Habermas connects morality and psychoanalysis as follows: “Since the analysis imposes the experience of self-reflection on the patient, it calls for a ‘moral responsibility for the content’ of the disorder.

Because insight as the aim of analysis is only this, namely that the *ego* of the patient is to recognize itself in the other represented by the disorder as his alienated *self* and identify with it. As in Hegel’s dialectic of morality, the offender recognizes his own destroyed being in his victim, an act of self-reflection through which the abstractly separated entities perceive the devastated moral totality as their common ground *and through this* are able to return to it. Analytic knowledge is, at the same time, moral knowledge” (Habermas, 1968: 288).

In contrast to Habermas, Drewermann (1982) who as a moral theologian, church critic and psychoanalyst attempts to establish a connection between religion and the unconscious, describes psychoanalysis as inherently amoral. Psychoanalysis is essentially concerned with the confrontation with never questioned, internalized contents of the superego and so to decide against prevailing norms. “Every psychotherapy renders a bit more conscienceless, egomaniac, unscrupulous. Every psychotherapy is therefore a kind of seduction, a lesson in immorality” (Drewermann, 1982: 83). While he views this in one respect as positive in that it implies an increase in individual freedom, it is also from a Hegelian perspective a risk, because self-consciousness can be achieved only in a life and death struggle. At stake in this struggle are the concepts of free or not free, self-determined or other-directed, but not of good or evil. In the course of the struggle the Old has to be cast off and combated, the subjectively accomplished acknowledgment of morality, i.e., the awareness of morality through a process of becoming conscious gained against the background of personal freedom can be reintegrated only in a second step according to Hegel. The New is then frequently identical with the cast off Old, although now it is chosen self-determinedly and consciously. In the sense of Hegel, the moral dilemma would then be resolved. It remains, however, open to question if in the phase of self-discovery of the analysis the second step is actually taken, i.e., if the reconnection to the prevailing morality is achieved or should even be achieved. This, in the sense of the goal of freedom, shall not be the aim of psychotherapy or psychoanalysis. If ethics were “repealed” and humans in their being good or being active would no longer find a justification for being or developing, there would nevertheless need to be another reason for the justification of being. Drewermann’s stance is that this can be found in man’s being held in the grace of God. For him it is God who is the ultimate reason for man’s being, while the Moral is not the definitive measure of humanness. The aim of psychotherapy would then be the – humble – acknowledgment of one’s own being and the assumption of responsibility for

one's own life as a gift of God. His position is thus contrary to the basic principles of ethics, to find determinants for moral conduct outside of (religious) authorities.

Ethics of the Fathers

Lynn Somerstein

“Ethics of the Fathers,” called, in Hebrew, Pirkei Avot, and more properly translated as “Chapters of the Fathers,” is known as “Ethics of the Fathers” because of its content – a collection of laws, aphorisms and guides to ethical behavior – wisdom literature that is over two thousand years old. It asks and tries to explain what makes a good person, and how to get along with family members, teachers, the neighbors. Pirkei Avot is concerned with down to earth, hands on, practical living – like an early self-help book.

The emphasis is on doing, embodying the religious life even in every day actions. This accessibility makes it very popular, so it is included in many prayer books. Some famous teaching examples are:

- Shammai: “Say little and do much” (Shapiro, 2006: 15).
- Hillel: “Don’t judge your fellowman until you are in his place” (Shapiro, 2006: 21).
- Ben Zoma: “Who is wise? He who learns from every man. . . . Who is a hero? He who controls his passions” (Pirkei, Ch 4, Minsha 1).
- Hillel: “If I am not for myself, then who will be for me? And if I am only for myself, what am I? And if not now, when?” (Shapiro, 2006: 15).

Hillel’s question, “If I am only for myself, what am I?” (Shapiro, 2006: 15) underlies individual human development – the search for the self, and understanding who the self is in relation to others. Psychotherapeutic interaction concerns itself with searching deep within to find what is true for the individual, and then finding ways for the individual to make contact with others, a process leading from a narcissistic engagement with the world to a fuller, open, mature being, whose everyday life embodies a full engagement with God and the world.

Etiological Myth

Alice Mills

Etiological myths are those myths that explain origins and causes. Creation myths are etiological, explaining how the universe or the world or life in the world came into being. Etiological myth does not have to situate itself at the beginning of all things, it can account for the creation of a new entity or activity within the established order of creation, just as much as for the creation of an ordered world out of primal chaos.

Religion

Religions can be set along a spectrum from those primarily focussed on beginnings, on events within an established universe and on endings. Although “aetiological” is a term derived from classical Greek (*aition* meaning cause), the belief systems of classical Greece were oriented more to the after-life, and most of their etiological myths concerned particular places and rituals. The Roman poet, Ovid, collected a large number of etiological myths of transformation in his long poem, *The Metamorphoses*. Such myths as Daphne’s transformation into the laurel were popular material for medieval and Renaissance writers and artists to interpret allegorically as intimating Christian truths. The Bible stories span the whole spectrum from creation to last things. The first part of the Bible, *The Book of Genesis*, offers etiological explanations for the creation of the world and its inhabitants, the origin of death, fear and hatred of snakes and the pangs of childbirth, and the Noah story explains the origin of the first rainbow. An example of a religion tilted almost totally towards etiology is the Australian Aboriginal people’s Dreamtime, whose stories provide explanations for the origins of features of the landscape, its inhabitants and their behaviours. While

Dreamtime stories speak of a time outside chronological time, those who still hold them sacred believe that the beings of which they speak still inhabit the land. Dreamtime etiological belief is taken into serious consideration by contemporary Australian Governments in legislating for commercial and recreational use of the land.

Science

While the origins of the universe are currently not fully explicable in scientific terms (and perhaps never will be), such phenomena as the rainbow, geological features of the earth and lunar eclipses have been well understood scientifically, so much so that scientific explanations have long been used as weapons to discredit myth in general via its etiological function. Romantic poets such as Keats and Wordsworth bewailed this triumph of the rational mind over what the poets saw as the truths of the imagination and soul. In the nineteenth century, believers in the literal truth of the Bible struggled with the challenges offered by science. The battle between proponents of the Darwinian theory of evolution and the creation story in Genesis still rages.

Psychology

Psychologists who claim that their discipline belongs among the sciences have no interest in exploring etiological questions about the psyche, preferring close observational and experimental scrutiny of the ways in which children develop. Most psychoanalytic theorists also focus on the development of the individual psyche rather than its mysterious prehistoric origins. Post-Jungians tend to ignore Jung’s own speculations about the prehistoric development of human consciousness. With the exception of Julia Kristeva, who terms this part of his work the “Freudian fable,” post-Freudians say as little as possible about Freud’s own etiological mythmaking in *Totem and Taboo* and *Moses and Monotheism*, where (with some proviso about the difficulty of exactitude) he offers as literal truth a tale about the primal horde, the first slaughter of a father by his sons and the guilt-ridden origins of sacrifice. Freud regards all later religions as attempting to resolve the filial sense of guilt. His primal horde tale offers an etiology not only for world religions but also for all human civilisations and the neuroses that afflict the human psyche.

Evangelical

Elisa Bernal Corley

The term evangelical is a derivative of the Greek work *euangelion*, which literally means “good news” or “gospel.” It is used to identify the four books of the New Testament that narrates the good news of the life, death, and resurrection of Jesus Christ. The earliest usage of the term “evangelical” seems to be from Tertullian’s writings (c.155–222), where he referred to the “evangelical and apostolic writings” as authoritative for the life and practice of the church.

Historically, the term evangelical was first used to refer to those who were part of the reforming parties in Europe before 1529. In the 1520s, it became popular in the polemical writings of early Reformers. During the Reformation period, an evangelical is one who believes that the Catholic Church should return to the beliefs and practices supported by New Testament Christianity. An evangelical emphasizes piety and righteous living, expressed in strict ethical codes, instead of adherence to external legal rules enforced by the Church.

Contemporary evangelicals share basic convictions inherited from their Reformation family, including the authority and sufficiency of the Scriptures, the necessity of salvation in Jesus Christ because of human sinfulness, the doctrine of the Trinity, belief in the resurrection and divine judgment, and the urgency of evangelism.

While the face of Christianity is rapidly changing, with the center of evangelical Christianity moving towards Asia, Africa, and Latin America, perhaps the strongest expression of modern-day evangelicalism is found in the United States. Because of the swift transplantation of evangelical

beliefs and practices to the colonies, in Anglo-American history, the term evangelical now refers to a wide variety of groups, ranging from the major Protestant denominations like the Baptists and Presbyterians, to Roman Catholics, and to evangelical associations like the Billy Graham Association. In many parts of Europe, Asia, and Latin America, the word is often used synonymously with Protestant groups as distinguished from Roman Catholics.

Commentary

While present-day evangelicals share basic beliefs, interpretations may vary depending on where they locate themselves along the evangelical spectrum. When nineteenth century science began to challenge the authenticity of the Bible and the credibility of Christian teachings, evangelicals found themselves divided. In response to what was perceived as a scientific onslaught on the Christian faith, traditionalists separated themselves from those who adopted a critical approach to the study of the Bible. Those who tried to adapt to the larger and more pluralistic culture, believing that there is no quarrel between the truth of religion and the discoveries of science, were considered liberals and modernists.

Each group adopts a distinct approach to answering the question of how one enters into and remains within the Christian life and communion. Although they share the belief that entrance into the Christian life is through faith in Jesus Christ, within the conservative branch, especially among the self-described “born-again Christians,” a conversion experience is the definitive moment of entrance into the Christian life and the Kingdom of God. Conversion happens through repentance of one’s sins and the acceptance of the forgiveness through Jesus Christ.

A definitive conversion experience meant that a person’s identity is changed by God’s grace. It is reshaped and transformed from the “old” into the “new.” With the new identity comes the adoption of new ideals and practices, which are often expressed in strict moral lifestyle, immersion in the life of the community, and fealty to religious teachings. Furthermore, this transformation of identity is accomplished through continuous participation in the ritualized practices of the local community like prayer, bible studies, small-group fellowships, and corporate worship.

Even though conservative evangelicals are found to hold disparate, nuanced, and diverse views on political and social issue, in general, they view the teachings of the Bible as sufficient to answer life’s problems and questions. The believer recognizes and submits to the authority of

the Bible and the ordained leaders of the church. Because biblical teachings are authoritative for Christian life and practice, and because of the belief that the Holy Spirit guides the believer into obedient faith, conservative evangelicals are distrustful of any naturalistic explanation of human experiences. If human psychology could explain and improve human behavior without the need for spiritual intervention, then belief in the power of God to influence human life becomes expendable.

The authoritative and supernatural place of the Bible and the role of the Holy Spirit in the life of the community also serve as inoculation against outside criticism. Since there is an external source of authority to which members defer, the believer tends to have a diminished sense of personal autonomy and power. Questioning a belief or doctrine using other intellectual tools may also produce guilt. Finally, even though there is evidence that active participation in church life and commitment to religious tradition promotes a believer's psychological well-being, adherence to the prescribed moral code of the community could make it difficult for a believer to adapt to situations or subcultures that do not share her beliefs.

Meanwhile, evangelicals who had been influenced by the American civil rights and antiwar movements, as well as the advances in higher education, had come to adopt liberal views on political issues. Evangelical scholars who are interested in engaging the human sciences can also be found in some evangelical colleges. Many of these modern-day evangelicals have assimilated several central features of the dominant American culture, especially those pertaining to individual autonomy and tolerance of diversity. With a more positive view of cultural and other human disciplines, they are therefore more comfortable with engaging the broader culture while at the same time maintaining close communion with their religious communities.

Within this multi-vocal evangelical community, there are those who welcome the use of cultural and scientific approaches in the examination of their faith. In exploring the Christian life, evangelicals with liberal leanings accept the complexities of human personality and development. Although the Bible remains authoritative, they do not expect it to provide the solutions to all of the unique challenges of modern living. They feel free to evaluate life-choices using other tools for analysis and moral reasoning that extend beyond obedience to religious authority or tradition. They welcome the help of clinical therapists, for instance, with difficult issues like abortion, marriage, sexuality, work, and various psychological illnesses. Attempts toward the integration of theology and psychology reflect the openness of modern evangelicals to a progressive approach to the study of human development. Examples of

such undertakings are expressed in publications like the *Journal of Theology and Psychology* and the *Journal of Psychology and Christianity*.

Evil

Lorna Lees-Grossmann

There are two commonly accepted types of evil: first the cosmic or natural evils such as fire, flood, earthquake, hurricane or epidemic, the sort discussed in the Biblical *Book of Job*. Secondly there is interpersonal evil, man's inhumanity to man, on an individual or a large scale, murder or genocide. The first sort has a metaphysical cause and blame cannot be ascribed: these things happen and one must accept them. The second has connotations of innate malignancy and is bound up with theology and psychology, and is the one under discussion.

Evil has an archetypal quality: theistic religions have an inherent dichotomy between good and evil. Loki's malice

brought down the Norse gods; Lucifer's hubris brought about his expulsion from heaven and man's expulsion from Eden. What characterizes the religious explanation of evil is that the agent chooses the course of action that leads to whatever undesirable result awaits. Evil requires deliberate choice and action, whereas accidents are caused by an unwitting, non-deliberate agent. We can see this echoed in legal circles today in the distinction between murder and manslaughter and the relative leniency of sentencing for the latter.

Relativism

The modern convention is that evil is relative. As Hamlet says, "There is nothing either good or bad, but thinking makes it so" (Shakespeare, *Hamlet*, Act II, Scene 2). The question is whether evil is a necessary or a contingent attribute. Is it the person, or the action, which is evil? The social construction of evil permits anyone to perform an evil act, but whether that action renders that person irredeemably evil is open to debate. From social experiments like Milgram's experiment and the Stanford Prison experiment we can see that ordinary people have the capacity to perpetuate evil acts, and that the likelihood that they will do so is increased if they are given implied or articulated assurance that they will not bear responsibility. Authority may be diffused so that the giver of the order takes sole responsibility and thus absolves the actual agent of blame, or the target group may be de-individualized ("the prisoners") or de-humanized, as with Rwanda's "cockroaches," as the Tutsis were labeled during the genocide. On the macro scale, genocide can be perpetuated through the socialization of the next generation to hate the target group and the dissemination of propaganda to ensure that hatred is continuous.

Necessary Evil

M. Scott Peck articulates this non-equation of evil actions with necessary evil. He defines evil not by the committing of evil actions – because if this were the case, he argues, we would all be evil – or by the magnitude of evil committed. What makes a person inherently evil is self-deception and a lack of self-control; in psychiatric terms pathological or malignant narcissism – evil is a form of mental illness. It is doubtful whether evil can be so neatly pigeonholed, and there is an obvious case for labeling all psychopathology as entailing evil because it also entails deliberate and serious human suffering. The other problem with this interpretation is that it does not allow for the possibility

that a person who performs repeated and deliberate acts of evil may also be capable of performing repeated and deliberate acts of good.

A more humanistic interpretation can be found in Rollo May, who offers a construction of evil in terms of agency. There are contributory factors such as war and interpersonal relationships or pressure at play, and there may indeed be an inherent evilness in each human – Jung's "shadow" or the daimonic – but what is key is the role the individual takes in choosing to perform the act. While psychopathology might entail evil as a necessary feature, human psychology allows for contingent, temporary evil.

Existential Psychotherapy

Stephen A. Diamond

Existential psychotherapy is based upon the principles of both humanistic and existential psychology, the latter being a movement with roots in the existential philosophy and writings of Heidegger, Husserl, Merleau-Ponty, Ortega y Gasset, Dostoevsky, Kafka, Camus, Kierkegaard, Nietzsche, Sartre, Tillich, Buber, and others. Otto Rank, Medard Boss, Ludwig Binswanger, Karl Jaspers, Eugene Minkowski, Ronald Kuhn, V. E. von Gebattel, J. H. Van Den Berg, H. J. Buytendijk and G. Bally were among the first to apply existential principles to the practice of psychotherapy (calling it *Daseinsanalyse* or existential analysis) in

Europe, followed prominently by Viktor Frankl (Vienna), R. D. Laing (London), and Rollo May, J. F. T. Bugental, Thomas Szasz, Frederick “Fritz” Perls and Irvin Yalom in the United States. It was psychoanalyst Rollo May along with psychiatrist Henri Ellenberger who, in 1958, introduced the European existential analysts to American clinicians in their groundbreaking book, *Existence: A New Dimension in Psychiatry and Psychology*.

Existential therapy is often misperceived as some morbid, arcane, pessimistic, cerebral, esoteric orientation to treatment. But in fact, it is an exceedingly practical, concrete, positive and flexible approach. On any given day, an existential therapist might deal with mundane matters such as the patient’s financial crisis, marital problems, health issues, addictive behavior or psychopharmacological needs, while at other times working with dream material, archetypal motifs, spirituality, grief, anger or the patient’s creative process – all depending on the practitioner and what is most existentially pressing in the moment. Existential psychotherapy, despite its popularity in the decades after importation to the United States, declined toward the close of the twentieth century, a victim of the psychopharmacological, cognitive, and managed care revolution in mental health. But as consumers are increasingly confronted with the very real limitations of what managed mental health care, psychopharmacology and cognitive-behavioral treatment can provide, existential psychotherapy is enjoying a recent renaissance.

While existential psychotherapy is commonly seen as synonymous with the brooding, dark, despairing, nihilistic, atheistic intonations of European existentialism, it is crucial to differentiate the two: Existentialism is a philosophical movement, whereas existential psychotherapy is a psychological treatment. Existential psychotherapy was never intended to be a specific school unto itself, but rather a pragmatic, humanistic, holistic, corrective orientation to psychotherapy in general. “Existentialism,” explains Rollo May (1986), “is not a comprehensive philosophy or way of life, but an endeavor to grasp reality” (p. 59). The existential movement in psychiatry and psychology arose as a reaction against the reductionism, determinism, dogmatism and hyperrationalism of both psychoanalysis and behaviorism. As May (1986) indicates, whenever you perceive a person merely as a particular diagnostic disorder, biochemical imbalance, genetic predisposition or “as a composite of drives and deterministic forces, you have defined for study everything *except the one to whom these experiences happen*, everything except the existing person himself” (p. 25).

The objective and subjective revelation of one’s own existence, the “I am” experience or sense of self, is an integral part of the process of existential psychotherapy.

While the techniques of existential psychotherapy can include Freudian, Jungian, Gestalt, cognitive, behavioral or other methods, the fundamental technique shared by all existential therapists is *phenomenology*. Phenomenology is based predominantly on the philosophical work of Husserl and Heidegger, and refers to the setting aside or bracketing off of preconceptions, interpretations, expectations, bias and rote intervention in an effort to discover the patient’s actual, unadulterated subjective experience, his or her being-in-the-world, existence or *Dasein* (being there). It is through this phenomenological refraining from forcing the patient onto a Procrustean bed of preordained theory or methodology that the true experience of the patient at any given moment can be understood and appropriately responded to by the therapist. In its purest form, “the existential-phenomenological view does not construct any explanatory models but tries to understand situations by exploring the immediate experience [of the patient]” (Cohn, 1999: 43). Dogmatism and doctrine are excluded as much as possible, and the focus of treatment is primarily on the present, the here-and-now, the current circumstance, rather than on past traumatic or other formative influences, as in Freud’s psychoanalysis.

Choice, personal responsibility, integrity of the personality, and authentically facing rather than habitually avoiding existential or ontological anxiety and guilt (which results in what Sartre termed *mauvaise foi* or “bad faith” with oneself) are central features of existential psychotherapy. The existential therapist is not limited to the passive and interpretive role of the psychoanalyst, though such a stance may be taken when called for. But the *courage* and *commitment* to truly and genuinely *encounter* each unique patient is required by the therapist, who must not defensively avoid his or her own anxiety by hiding behind a rigid professional *persona* or distancing screen of therapeutic technique. Carl Jung, who was quite existential in his own approach, acknowledged the inherent mutuality and crucial role of the therapeutic relationship, recognizing that “in effective therapy a change occurs in *both* the therapist and the patient; unless the therapist is open to change the patient will not be either” (cited in May: 22). In existential therapy, the human relationship between patient and therapist takes precedence over technical tricks, and, as now confirmed by research, is the primary healing factor in any psychotherapy.

Existential Depth Psychology

Over the years, there has been a gradual theoretical trifurcation in the evolution of existential psychotherapy.

Existential and humanistic psychology (sometimes so closely affiliated they become conjoined as “existential-humanistic”) developed simultaneously in America, under the influence of Maslow, Rogers, and May among others. Both humanistic and existential psychology object to the dehumanizing application of the psychiatric medical model in the diagnosis and treatment of so-called mental disorders, proposing a less mechanistic, biological and deterministic, more positive, humanistic paradigm for personal growth and psychotherapy. But Rollo May’s own philosophical world-view and depth-psychologically informed psychotherapy differed fundamentally from the anti-psychoanalytic, overly optimistic, perhaps even *pseudoinnocent* or naïve “human potential” crusade embodied by Carl Rogers, and, as an extension of European “existential analysis” and Sartre’s *Existential Psychoanalysis*, is best described as an *existential depth psychology*.

Otto Rank, a close disciple of Freud and one of the seminal figures in the development of existential depth psychology, “accepted the categories of Freud, Jung, and Adler – mechanisms, patterns, and types – but found them useful only up to a point, after which they impeded therapy and even theory” (Lieberman, cited in Diamond, 1987: 10). “Depth psychology” (*Tiefenpsychologie*) addresses the phenomenology of the “unconscious,” the “not known” contents of the psyche. Existential and depth psychology seem antithetical and incompatible to some (especially certain members of the Society for Existential Analysis in London, a third tributary led by Emmy van Deurzen-Smith, Ernesto Spinelli, and the late Hans Cohn, who practice a purist version of “philosophical counseling” or “clinical philosophy”), but are reconciled as complementary in existential depth psychology. The Freudian notion of the unconscious is eschewed and rejected outright by many existentialists as a fragmenting, reified doctrine that diminishes integrity of the personality, free will and personal responsibility inimical to existential therapy. However, while fully aware of these theoretical and practical difficulties, existential depth psychology appreciates the necessity of acknowledging the phenomena of repression and unconsciousness. Therefore, the phenomenological fact of the unconscious is retained in modified form by American practitioners of existential depth psychology such as May, Bugental, Yalom, Perls, Schneider, and Diamond.

For Rollo May, the unconscious is existentially redefined as “those potentialities for knowing and experiencing which the individual cannot or will not actualize” (1983: 18). Moreover, May, unlike Rogers and others in the humanistic movement, held that “constructiveness and destructiveness have the same source in human personality. The source is simply *human potential*”

(in Diamond, 1996: xxi). This conception of human potentiality as a double-edged sword informs May’s controversial theory of the *daimonic*: his phenomenological modification of the unconscious, similar though not identical to Freud’s “id” (see *id*) or Jung’s “shadow,” and eminently useful for comprehending the human potentiality for psychopathology, destructiveness, spirituality and creativity (see Diamond, 1996). The daimonic, as May (1969) defines it, “is *any natural function which has the power to take over the whole person*. Sex and eros, anger and rage, and the craving for power are examples. The daimonic can be either creative or destructive and is normally both” (cited in Diamond, 1996: 65). In existential depth psychology, the daimonic is an existential reality, the dynamic ground of existence, the indivisible source of vital, psychobiological energy or power. When chronically repressed, the daimonic becomes pathological, but when properly related to, can contain valuable positive potentialities. Existential depth psychology embraces May’s model of the daimonic, encouraging its constructive integration into consciousness, *but never to the point of dogmatism*, and is not “defined by duration of treatment, technique or frequency of sessions *but rather by the degree to which it directly addresses the daimonic and the various other existential elements of life*” (Diamond, 1996: 219).

As May, who was a Protestant pastor prior to becoming a psychologist explains, “I do not believe in toning down the daimonic. This gives a sense of false comfort. The real comfort can come only in the relationship of the therapist and the client or patient” (in Diamond, 1996: xxii). Indeed, “it is only by moving through this suffering consciously, willingly, and developing a more philosophical or spiritual stance toward it, that patients approximate anything close to a ‘cure’ in psychotherapy” (Diamond in Hoffman et al., 2005: 197).

Nihilism, Anxiety and Spirituality

Spirituality entails the capacity to see life as it is – wholly, including the existential realities of evil, suffering, anxiety, and the daimonic – and to love life nonetheless. This *amor fati*, as Friedrich Nietzsche phrased it, is a spiritual achievement of the highest magnitude” (Diamond in Hoffman et al., 2005: 197). It is in this regard, and in some of the striking parallels between phenomenology, Taoism, Hinduism and Zen Buddhism, that existential depth psychology can be correctly called a secular spiritual treatment for the postmodern *condition humaine*. While not inherently a religious approach, and indeed in some ways anti-religious, existential psychotherapy addresses many of the basic questions and problems that concern

traditional religions of all kinds: death, meaninglessness, loneliness, loss, suffering, imperfection, finitude, insecurity, anxiety, guilt, freedom, responsibility, evil, etc. These are the bare existential facts of life, what existential theologian Paul Tillich called “ultimate concerns.” *Nihilism* – the rejection of religion, spirituality, meaning, purpose and value in life due in part to the presumed negating finality of death – is often associated with existentialism. Yet, nihilism is clearly neither the goal nor intended consequence of existential psychotherapy, but on the contrary, its starting point.

Equally important to the practice of existential therapy in general is the phenomenon of anxiety, in both its normal or ontological and neurotic or pathological aspects. Kierkegaard (1844) called anxiety “the dizziness of freedom” that inevitably accompanies recognizing our human potentiality and responsibility. Following Kierkegaard and Tillich, May defines anxiety as the “*experience of Being affirming itself against Nonbeing*” (1977: xxi), positing that when we chronically avoid existential anxiety it only becomes more neurotic, destructive and debilitating. In existential psychotherapy, neurotic anxiety is a pathological product of normal anxiety, and both are utilized in the therapeutic process rather than merely suppressed psychopharmacologically or otherwise. To a significant extent, existential psychotherapy is the psycho-philosophical treatment of postmodern nihilism, anxiety and existential crisis, manifesting as depression, stress, addiction, anger, rage, and other all-too-ubiquitous symptomatology. Viktor Frankl’s idea of neurosis resulting from an “existential vacuum” which human nature abhors due to a deeply rooted “will to meaning” is extremely relevant here. Fulfilling the will to meaning is one way of counteracting nihilism: “Meaning – given, found or created – enables one to love life and live it. We create meaning because we cannot exist without it” (Lieberman, cited in Diamond, 1987: 2). Thus, the stress on the sense of *meaning* and *purpose* in existential therapy.

Creativity, Courage and Acceptance

Creativity can be another antidote to the toxicity of nihilism, and provides a constructive channeling of anxiety. Hence, the purposeful focus in existential psychotherapy on creativity and the creative process: the creation of meaning, the creation of art, and the creation of self. The existential spotlight on “will” as central to the creation of self and a constructive, meaningful life was pre-empted by Rank, who held in his notion of the *artiste manqué*, that “the individual creates his own personality by creative willing, and that neurosis is due precisely to the fact that the patient cannot will constructively”

(May, cited in Diamond, 1987: 2). And, whether or not one agrees with Yalom’s (1980: 482) premise that “meaning, like pleasure, must be pursued obliquely,” his strong accent on *engagement*, encouraging the patient’s commitment to and investment in life, is well taken: “Engagement is the therapeutic answer to meaninglessness regardless of the latter’s source” (1980: 482).

Finally, existential therapy encourages the patient’s heroic acceptance of life’s inevitable anxiety, suffering, and death’s inexorable reality. “Courage,” writes Paul Tillich, “is the power of life to affirm itself in spite of. . . [its daimonic] ambiguity, while the negation of life because of its negativity is an expression of cowardice” (cited in Diamond, 1996: 309). Freud’s own existential (but not formally religious) attitude can be seen in his misunderstood, seemingly cynical, pessimistic comment that the goal of psychoanalysis is to transform neurotic misery into common unhappiness: like death, some suffering in life is existential, ontological and inescapable. “Nowhere in religious. . . [symbolism] is this spiritual principle of accepting life’s suffering and acceding to one’s divine destiny more dramatically, movingly and elegantly illustrated than in the Crucifixion” (Diamond in Hoffman et al., 2005: 199). But, with or without religious faith, one can still freely choose the attitude taken toward such stark existential facts, a “willing affirmation of the must” to employ Rank’s felicitous phrase, which is itself a type of spiritual transcendence. “It is,” says Tillich (1952), “the happiness of a soul. . . ‘lifted above every circumstance’” (cited in Diamond, 1996: 292). Paradoxically, along with the courageous affirmation of existence and its vicissitudes, including anxiety, alienation, insecurity, suffering, finitude, meaninglessness and the mystery of death, comes a deeper appreciation of life, a fuller capacity to care, feel and love, and a heightened sensitivity to joy and beauty.

Existentialism

Todd DuBose

Early Foundations

Existentialism began in the early nineteenth century with the writings of Søren Kierkegaard (1813–1855), though forerunners of existential themes can be traced centuries

earlier to Sumerian mythology, Judaic Wisdom literature, and early Greek philosophy. Existentialism arose and continues to address and challenge dualisms, abstract and mechanical ways of addressing human concerns, as it focuses on agency, accountability, and the discovery and/or creation of meaning. Although many histories have been written about existentialism, in this essay I will focus on the religiosity inherent in the tradition that extends beyond the typical differentiation between theistic and atheistic existentialism. I argue that even within atheistic existentialism lies the religious question as disclosed in the dance of nihilism and meaning.

Søren Kierkegaard proposed the rallying flag for existentialism with his pronouncement and commentary on truth as what is experienced, not systematically thought out, when living subjectively in the world. Addressing the experience distant abstraction of Hegelian systemics, as well as the institution of the church, Kierkegaard called for more authentic accountability for one's beliefs and comportment in everyday existence. What matters, for Kierkegaard, is the lived experience of individuals in their lived situations, rather than any presumptions about life discerned through abstract objectivity, particularly those of rationalism, empiricism, and/or speculative metaphysics.

These themes were furthered by existentialists too numerous to cover completely. One of the difficulties presented to any researcher in this field is that existentialism is notoriously slippery when one tries to define it as a movement. Walter Kaufmann, perhaps the most well-known commentator on existentialism, aptly noted that by definition existentialist resist collapsing or subsuming uniqueness into generic systems of creeds and other cannons of civility (Kaufmann, 1975).

Kierkegaard (1813–1855), Friedrich Nietzsche (1844–1900), Martin Heidegger (1889–1976), and others warned against the fade into an undefined existence, co-opted by the crowd, the “herd,” or the “They.” One escapes to the crowd to avoid facing the call of existence to define oneself, to “stand out” in Heidegger's language. Standing out in existence includes face to face encounters with dread, boredom alienation, the absurd, nothingness, as well as freedom and commitment. Through such encounters one comes to understand the significance of one's life, not an easy task, and either accepts or rejects calls to more meaningful and fulfilling relationships and projects in life. Life is meaningful as we live it out. We do not first find meaning and then decide to live out our lives. Our “essence” is discerned only in our “existence,” as Jean-Paul Sartre (1905–1980) noted (1943/2003).

Existentialists are divided among themselves as to the authenticity and legitimacy of belief in God, as well as to

what one means by the term, “God.” Theistic existentialists highlight the inevitability of our inherent tendency toward Otherness and understanding of ourselves in our situations in life in light of those encounters. Atheistic existentialists argue that displacement of one’s responsibility onto an external entity in hopes for deliverance from the complexities of contingent existence is a manifestation of moral cowardess.

Existential Approaches to Psychology and Religion

Existential approaches to the field of psychology and religion have attempted various ways of resolving what they see as an unnecessary antagonism between atheism and theism. Paul Tillich (1886–1965), known primarily as a theologian, wrote extensively on the existential condition as well as on the psychotherapeutic care within those conditions (1952; 1957; 1966). Most particularly, Tillich called for our “courage to be” in spite of anxiety or our impending non-Being and call to freedom. Erich Fromm (1900–1980) and Rollo May (1909–1994) furthered these concerns, albeit in different ways (Fromm, 1941; May, 1972). Viktor Frankl (1905–1997) established Logotherapy as a result of his own lived experience within a concentration camp in which he saw how the power of the will to live if there were a reason or person for whom to live. Karl Jaspers (1883–1969) wrote of “boundary situations,” “the Encompassing” and communication almost in a sacramental way. R.D. Laing (1927–1989) brought the insights of existential-phenomenology to humanize modes of psychiatry’s more instrumental qualities. Contemporary existential psychotherapist, Emmy van Deurzen (1998), has written of the *Überwelt*, or the spiritual and encompassing world in which we discern our meaning. One could say that each one of these individuals above addressed the notion of “God” in less than orthodox ways, they all nonetheless saw the centrality of spirituality as essential to a meaningful life, albeit a spirituality that found within existence, rather than as an escape from it.

Commentary

One of the misconceptions to clarify about existentialism is the claim that it is too individualistic. No doubt schizoid ways of being-in-the-world have bolted onto the existential tradition, which is understandable given a central theme of inherent loneliness. When existential thinkers refer to such concepts as subjectivity, loneliness,

“standing out,” and so forth, one must understand these concepts as calls to distinctiveness and ownership of one’s lived, conditioned existence and comportment in the world rather than as statements about physically measured isolation. Subjectivity does not mean an isolated privation of existence, but a committed risk of being “all in” a particular situatedness, exercising agency amid and released by inherent limitations. What truly matters is experienced when taking this stance in relation to others. A true and authentic encounter comes from shared “all-in-ness,” that is nonetheless respective of the incomparable stances taken by communal participants. A call to living a distinctive, differentiated, and accountable life is not an opposition to living a relational life. The existential position is not opposed to the sociology of others, but warns against a qualitative erasure of unique “callings to be” amidst the counter pull to forfeit one’s incommensurability. In fact, we are ontologically relational. Our existence is foremost and forever a “being-with-ness.”

Another issue meriting commentary is the apparent antagonistic relationship between existentialism and religion. The relationship between existentialism and religion is more integrated than one may presume. Certainly the Nietzschean hammer against slave morality, as he saw reinforced by Christian morality, and even the theist Kierkegaard’s attach on Christendom, have led to suspicion of the institutionalization of the spirit.

Theistic or not, however, freedom, transcendence, and meaning are cornerstones of this tradition. In spite of theistic existentialists throughout the history of this philosophical position, this approach to human meaning and significance is seen by some readers of this tradition as carrying an inauthentic and irreconcilable oxymoron. One can point to the broad strand of atheism or emphasis on the human person’s responsibility to create his or her own meaning, so often expressed in existential literature, as cases in point. Yet, theistic and atheistic existentialists would agree that transcendence is not an escape from existence and impossible to accomplish anyway. The project of doing so discloses a “bad faith” (Sartre, 1943/2003), “inauthenticity” (Heidegger, 1962), and foreclosure on accountability for the burden of one’s existence. Nevertheless, the counter challenge has its legitimacy as well: movement into the mystery of otherness, even if paranormal, may be the most challenging Kierkegaardian leap of faith. Not being open to what is beyond our comprehension and control is another form of retreating into anonymity or herding.

I suggest an existential understanding of psychology and spirituality holds possibilities for the field’s deepest foundation and most promising future. As human beings

we are *homo religiosus*, or inherently religious, in which life is transcendence, meaning, purpose, and significance. Doctrinal and creedal statements of belief and ritual practices found in religious traditions are expressions of, or creations of, such experiences of meaning (Gilkey, 1976). The absence of propositional assent to God as an entity need not nullify atheistic intentionality and “aboutness” that motivates movement through situations in one’s daily existence—a secular faith. Moreover, an existential-phenomenological understanding of Otherness is nonetheless still an existential *human* experience. This point grounds an understanding of existentialism as religious. This is an experience that is neither otherworldly nor merely created by the “thrown” person in the situation; we find ourselves in situations partly due to our agency and mostly a convergence of an infinite number of decisions and compartments beyond our control (van den Berg). Furthermore, emphasizing otherness as the context of meaning, and relationship as the necessity of self-understanding incarnates Otherness within existence. An existential-phenomenological understanding of religious experience as encounters with Otherness from situated stances testifies to the radical immanence of transcendence (Driver, 1985). Transcendence, then, occurs with each possibility of transformation within the graced limitations of our co-existence.

Exodus

Ingeborg del Rosario

The Exodus is the second book of the Jewish Torah and of the Old Testament of Christian Scriptures. From the Greek word *exodo*, which means “a road out,” the Exodus refers to the journey of the Israelites who were led out of Egypt by Moses after many years of oppression and slavery. While rooted in historical events, the Exodus story is primarily a foundational faith experience, the core memory upon which the spiritual identity of the people of God is formed. Crucial to this testament of faith are the experience of a living, liberating God who hears and answers the cry of the poor, enslaved and oppressed, and the faith commitment of a people who live in remembrance of the divine redemptive activity.

The story of Exodus as a journey of moving away from enslavement and oppression into greater freedom and fullness of life also provides a template and guiding narrative for the individual in the continuing process of a search for identity and authenticity of self, wholeness and integrity, healing and transformation. The beginning of the journey is marked by the recognition of the magnitude of suffering, the coming to consciousness of the intolerability of the anguish and agony of enslavement,

the deep longing for an end to its ruthlessness and devastation. In the *Book of Exodus*, the story of divine activity begins with the cry of the Israelites, who “groaned under their slavery and cried out” (Exodus 2:23) and of the divine response, God who “remembered . . . looked upon . . . and took notice of the Israelites” (2:25). The experience of enslavement can be external in nature, of an economic, political, social or cultural dimension. Enslavement can also be internal, intra-psychic and relational in nature. Depression and anxiety can enslave. Inadequate developmental environments and neglectful or erratic attachment dynamics in childhood can create psychological impoverishment and hardship in adult life and relationships. Trauma and abuse can grossly impede freedom of self-attunement and quality of engagement with others. Individuals can live many years without a conscious awareness of their being constricted by significant formative experiences in the past. They are unfree, estranged and alienated from a sense of their true self, reacting from the protective defenses of the false self, relating consistently from a place of pain, an internal space of emotional vulnerability, psychic distress and spiritual emptiness. The process of beginning the exodus journey of self-transformation involves the emergence of this pain and distress into consciousness, the “groaning and crying out” that expresses an overwhelming longing to be freed from this enslavement, thus signaling the genesis of a commitment to the process of inner change and liberation.

The process of moving towards freedom, authenticity and transformation will naturally meet internal resistance, especially after years of having lived with restrictive yet familiar dynamics and behavior patterns. The Israelites, after leaving Egypt and wandering through the wilderness, expressed this longing for the familiar ways of enslavement. When faced with fear and anxiety that accompanied the unknown, they complained to Moses: “What have you done to us, bringing us out of Egypt? Is this not the very thing we told you in Egypt, ‘Let us alone and let us serve the Egyptians’? For it would have been better for us to serve the Egyptians than to die in the wilderness” (14:11–12). Relational ways are long-standing, habitual and familiar. Even if they have become maladaptive and self-damaging, they had provided a sense of security and comfort. New ways of perceiving, feeling and doing involve venturing into a space of uncertainty. While health sustaining and life nurturing, these ways may paradoxically feel frightening and disorienting, seemingly overwhelming and out of control. The desire for newness and freedom can meet repeatedly with the yearning for the old and familiar. The pull to authenticity and health can

oscillate with the wish to return to what is accustomed and habitual.

While the process towards freedom and wholeness involves ongoing inner work and effort towards engaging newness, it also presumes the need for active waiting that allows healing to happen. The words of Moses to the Israelites respond to their fear and anxiety around the demands of the exodus journey: “Do not be afraid, stand firm, and see the deliverance that the LORD will accomplish for you today; for the Egyptians whom you see today you shall never see again. The LORD will fight for you, and you have only to keep still” (14:14). The exodus journey calls for determined movement and committed effort towards greater freedom and authenticity of self. At the same time, the exodus journey necessitates the capacity for steadfast and quiet presence, the strength of reflective stillness that enables insight to be internalized, change to be metabolized, and self-transformation to take root. The process of healing from inner enslavement and oppression to authentic freedom and liberation of self happens with both movement and stillness, the dual dynamic of active and passive strength that both enables change and trusts the healing process to evolve, allowing transformation to happen in oneself.

The Exodus story teaches that the journey out of enslavement into freedom does not happen with immediacy. Traumatic wounding is multi-dimensional and extensive. The movement from psychic oppression and constriction takes the gentle respectfulness of time and patient hopefulness in the promise and imminence of newness and liberation. This process of healing from brokenness towards living from a space of authenticity and coming to a firmer sense of self-identity and fulfillment unfolds over one’s years. The Israelites, freed from slavery in Egypt travelled for forty years, wandering in the wilderness and sojourning to the land promised them. Their evolution of spiritual and communitarian identity as a people began with the liberation from slavery. Its shaping, consolidation and development continued over time.

As the myriad challenges of journeying with hope towards wholeness and freedom are faced, the role of remembrance is essential. The story of Exodus began with the Israelites crying out to God who remembered the covenant and heard their cry. With their liberation from Egypt, their spiritual identity as God’s people is grounded in their remembrance of this saving act. The commandment and laws of the covenant have their wellspring in this redeeming memory: “I am the LORD your God, who brought you out of the land of Egypt, out of the house of slavery; you shall have no other gods before me” (20:1–2). The act of forgetting, of denying this

foundational experience, creates internal fragmentation and spiritual disconnection from the space of self-authenticity and identity. When the Israelites did not remember their redemptive experience and their liberation by God from slavery in Egypt, they fashioned a golden calf (Exodus 32). Remembering the experience of redemption keeps alive hope and enduring trust that one's cry will not go unheard, that the suffering from one's past will not eradicate the promise of change and newness in the future. Forgetting brings a loss of trust in and connection to one's self and the consequent despair when journeying through the demands and challenges of life. Remaining connected to the integrity of the true self and holding on to the belief that healing into life and authentic relationship are possible, in spite of the bondage of internal oppression and psychic enslavement, is the contemporary psychological echo of the redemptive memory that is the heart of the Exodus story, the pulse and energy that fuels the human journey to freedom of life.

Extra-Sensory Perception (ESP)

C. Harry Hui

Extra-sensory perception refers to the alleged processes of precognition, telepathy, and clairvoyance that take place via channels other than the sensory system that biologists and psychologists have been researching with scientific means. Precognition is knowledge of future events obtained not through logical reasoning but through dreams or other psychical awareness. Telepathy is the sending and receiving of message over a distance, through

nonphysical means. Clairvoyance is the perception of an object that is out of normal sight. Some records exist of people who have such experience of anomalous information transfer. Goulding and Parker (2001) claim that 25–45% of the western population may report some form of ESP or other paranormal experiences.

Some clinical psychologists regard such experiences as delusion, and therefore associate them with mental disorder, while the more new-age oriented psychologists do not agree with this correlation (Targ, Schlitz, and Irwin, 2000). Besides the psychopathological explanation, some cognitively-oriented experimental psychologists attribute the experience to the experient's cognitive bias or defective probabilistic reasoning. Biological psychologists, on the other hand, search for brain dysfunctions. Needless to say, the ESP experience can also be veridical.

Besides anecdotal evidence reported in the popular press, empirical evidence of the phenomenon are being gathered in more rigorously controlled conditions (Bem and Honorton, 1994). Using the “ganzfeld procedure,” the researchers shielded participants from visual and auditory stimuli. They then asked some to “send” to others one of four images, which was correctly received about one-third of the times. Bem and Honorton (1994) regarded this as better than chance, which is 25%. However, a more recent meta-analysis that included additional studies suggests that the effects are small or statistically nonsignificant (Milton and Wiseman, 1999).

Déjà vu experience is sometimes included in the class of ESP. This strange sense of familiarity with a place or event apparently new to a person (“been there before”) is regarded by some as evidence that people have previous lives before the present one (an idea that originated from eastern religious beliefs in reincarnation). According to some psychologists, this phenomenon can be explained naturalistically. Brown (2004) listed at least 34 psychological explanations that are rested on neither parapsychological nor psychodynamic presuppositions. These explanations include subliminal exposure (in which a person had actually been there before, but was never made aware of that) and differential neural transmission (in which there is a slight separation between two messages of the event received through two channels).

Besides investigating ESP in its own right, some researchers are interested in measuring people's belief in ESP. Paper-and-pencil instruments have been developed (see, e.g., Goulding and Parker, 2001; Tobacyk and Milford, 1983). We do not, however, know much about how belief in ESP might correlate with other psychological constructs. Future research may examine Myers' (2006) suggestion that the belief in ESP despite the lack

of evidence could be due to flawed processing of information and a hunger for wonderment.

Extraversion

Adele Tyler

A psychological term formulated by Carl Jung in his book *Psychological Types* to describe the flow of psychic energy

toward the outer world of people and things or “object.” The word extraversion comes from the Latin words *extra* and *vertere*, meaning to turn outward. Jung theorized extraversion and its’ opposite, introversion, as two fundamental, innate, and equally valid attitudes of people toward the outer world. Extraversion and introversion describe theoretical polarities on a continuum, with all persons using some degree of both attitudes in reality. Jung defined extraversion as a movement of psychic energy, or libido, outward from the subject to the object, with one’s energy and interest being drawn as if by magnetic force from oneself to the outside world. People with a preference for extraversion both use and renew their energy by focusing outward and can feel drained by too much time alone or in reflection. Some general characteristics of an extraverted attitude include talkativeness; speaking quickly and with confidence; being demonstrative, expressive, and gregarious; and a tendency toward boredom and distraction. Extraverted forms of religious expression seek God in communion with other people through practices of group worship, oral teaching and study of the spoken word, discussion of religious concepts, and acts of service. Extraversion, like introversion, offers both gifts and challenges, and self-awareness of one’s preferred attitude can enable a person to function more in accordance with his nature and better achieve his potential.

F

Faith

Philip Browning Helsel

Faith, *fides* in Latin and *pistis* in Greek, can be understood within a spectrum ranging from the content of a particular set of beliefs to the act of trust, usually in a particular community, doctrine, or deity. In fundamentalist religions, the understanding of faith leans toward an emphasis on the content of belief, especially one's assent to a certain set of *beliefs*. In these contexts, faith has a noetic quality and is fixed within boundaries to define what is inside or outside its scope. To assent to the appropriate propositions of religion means to have faith, and to be outside these limits is to be unfaithful (or an "infidel," a term which derives from the Latin root of *fides*).

On the other side of the spectrum, faith is simply characterized as synonymous with trust, an attitude of believing, and thus refers more to the act of trusting than to the specific content of one's beliefs. Within this pragmatic emphasis, the psychological effects of comfort and release from anxiety and insecurity seem to be highlighted, even to the extreme of a marked absence of noetic content.

Most expressions of faith seem to exist in the middle, including an act of trust, with the corollary of the promise of hope, and some particular content in which one's trust is placed (i.e., Deity, religious community, and sacred text). For both religion and spirituality, faith seems to have some particular, specific content that is reflected in the trust of believers. In Buddhism, the believer takes the "refuges", stating that "I take refuge in the Buddha, the *dharma* (Buddhist teaching), and the *sangha* (the community of monastics)." This tri-fold affirmation of faith points to the importance of the divine figure, the doctrine, and the community as the component location of spiritual strength and protection. In this affirmation, the individual/community dichotomy is addressed, in that the individual makes the affirmation of faith, placing trust in that tradition, in the midst of the tradition and in continuity with it.

Commentary

Freud explained belief in a Deity as meeting the needs for a projected father-figure, in service to cultural ideals of control and manipulation (Freud, 1928/1961: 21–22; Freud, 1957). Freud was critical of the potential for faith to be used as denial, and suggested that the more mature person would face fate (which he personified as the Greek goddess *Ananke*) without recourse to divine escapism (Rizzuto, 1998: 170). Jung more positively identified with faith, but without an emphasis on its social or doctrinal aspects. He understood it primarily in terms of *gnosis* (literally "knowledge"), as directly apprehended spiritual knowledge which the individual encounters and which brings about psychic healing through reconciliation of the opposite poles of one's experience (Melanson, 2002: 168). Object relations theorists modified Freud's theories about projection and understood faith as arising from the liminal space between the mother and child in which the child creates and is grasped by transitional objects.

Perhaps no one used Freud's theories with a more sympathetic eye to faith than Erik H. Erikson, whose developmental theories, formulated from his work with children and based upon a revised Freudian schedule of child development, led him to conclude that basic trust was the result of a positive resolution of the first childhood developmental struggle, between trust and mistrust. He concluded that an adult who had developed basic trust in this first stage would be more likely to have faith than one who did not. Therefore, the early experience of a child set the stage for a positive experience of religious faith in adult life.

Understood as a transformative experiential encounter of the individual, faith had strong significance in William James' influential *Varieties of Religious Experience*. He suggested that persons who were divided, or troubled by psychic conflict, were more likely to experience surrender of oneself to an outside "something MORE" (James, 1902/2007: 441). Faith can be seen, in Jamesian terms, as a resolution of a divided self through self-surrender, and thus a source of contentment and joy.

However, faith often occurs alongside doubt, and it could be suggested that the two belong in a dialectical tension. If these are seen in fruitful tension, faith can often be an expansive, life-giving experience. However, faith can also include a great deal of anxiety, about the potential for continuing in the faith and about being outside the limits of faithfulness. The Protestant Reformation can be seen as a way that this anxiety was addressed historically, with profound cultural and religious implications.

Faith Development Theory

Curtis W. Hart

Faith Development Theory: An Overview

Faith Development Theory is an interdisciplinary approach to understanding the evolutionary process of the development of religious/spiritual values and behavior in the human life cycle. The articulation of faith development theory began in the 1980's with the work of James Fowler and colleagues and it has found a significant place in theological discourse and in some cases cultural studies as well. Its genesis took place when Fowler was involved in his doctoral studies and was immersed in the work of theologian and ethicist H. Richard Niebuhr. Niebuhr's prototype of a faith development paradigm had in turn

been stimulated by his contact with a portion of the work of Alfred North Whitehead. Fowler's theory is typically taught to theological students and is shared with practicing clergy and interested laypersons as a means of providing a process based understanding of the way that faith changes and transforms in the lives of individuals. Feminists and others have criticized Fowler's theory for its perceived patriarchal bias and its dependence of on an exclusive Christian framework and anthropology. Application of faith development theory arose originally in the analysis of important historical figures and the life narratives of individuals who undertook to describe how their own religious/spiritual perspectives, values, ideals, and ethics had evolved over the course of time. Faith development theory has also been the subject of cross cultural study investigation and comparison as well. It has been of considerable value to religious educators and pastoral supervisors for seminarians both of whom are engaged in offering guidance and promoting insight in matters pertaining to spiritual formation.

Framework of the Theory

The framework of faith development theory is organized along developmental lines and phases. It actively employs Erik Erikson's epigenetic principle, Lawrence Kohlberg's theory of moral development, and Piaget's theoretical observations regarding cognitive function and development. Briefly stated, the process of faith development must be understood both theoretically and functionally as different form "belief" as that term denotes assent to propositions, traditions, rituals, ways of thinking, and hermeneutical approaches to sacred texts of a more or less consistent and often sectarian character. Faith, according to Fowler and colleagues, is a process that may or may not draw on a number of resources within and outside a tradition. It may have a traditional theistic focus or it may not. Faith development theory may be understood as a highly naturalized concept of revelation that attempts to describe how a person moves through a series of psychospiritual conflicts and challenges needing to be engaged, if not resolved, and sometimes revisited. It is best understood as fluid and organic as it evolves over time in the direction of a non static, though coherent, whole. While not teleological in a formal sense, faith development theory retains a retrospective epistemological methodology that may sometimes uncover patterns and intentions that are at once illuminating and may also be viewed as ontologically significant.

It is important to note that Fowler's theoretical framework has been modified over the years and yet has maintained its essential character. The theory begins with what Fowler calls "undifferentiated faith" that occurs in infancy. It is felt to be a pre-stage in that it is pre-conceptual and largely pre-linguistic. Fowler here relies on Ana Maria Rizzuto's description of the way self knowing first experienced in infancy shapes the information of consciousness and awareness of the other. Its conceptual value lies in its locating the basis of mutuality, strength, autonomy, and hope or their opposites that underline or undermine what takes place later on in the life cycle. It mirrors Erikson's understanding of *basic trust* and Winnicott's notion of *transitional space*. Stage 1 in the faith development paradigm is called Intuitive-Projective faith (ages 3–7) and is a fantasy-filled period whose emergent strength has to do with imagination. Stage 2, Mythic Literal Faith, is identified with childhood until adolescence and is the occasion for the enhancement of the child's imagination through story telling. It often demonstrates a tendency toward literalism and a moral sense that sharply divides "good" from "bad." Stage 3 is called Synthetic-Conventional faith and is identified with growth into adolescence. In fact, some individuals may not progress much beyond this point. Here persons form an individual "myth" in self understanding in relation to both self and world. It is understood as a "conformist" phase where a person becomes more or less comfortable and avoids looking critically at their motivations, attitudes, values, and religious/spiritual commitments. Stage 4, Individuative-Reflective faith, describes the transition from late adolescence to young adulthood. Here relationships to others and commitment to vocation become central and there may be a necessary re-evaluation of values and attitudes rooted in the thinking and behavior of adolescence. Perspectives of other traditions on matters of spiritual and ethical significance may likewise become important. Conjunctive faith (stage 5) represents the potentially transitional experience of mid to late adulthood where one reviews, reworks, and rediscovers one's past. There may emerge, according to Fowler, what the philosopher Paul Ricoeur calls a "second naivete" which requires a fresh look at symbols and stories formed during earlier periods of life. It is highlighted by an opening to the voices of a deeper self. This review and reworking of symbolic meanings and commitments resembles some of what William James meant by one's becoming "twice born." It results in a willingness to expend oneself in actions and relationships that embody the ethical norm of "respect for persons" and in an overarching responsibility in the caring for others. The last phase is what

Fowler calls "universalizing faith" (stage 6) and it is extremely rare. Persons who reach this stage become "universalizers" of ideas and movements that come to have lives of their own. "Universalizers" become persons endowed with a "special grace" that makes them even more revered once they have died or passed from the world scene. And they often die or are eliminated by those they most wish to save or help. Their number might include such persons as Malcolm X, Dietrich Bonhoeffer, and Martin Luther King.

Conclusion

Even though faith development theory is transparently psychological, it remains possible to connect Fowler's stages to religious/spiritual terms, ideas, symbols, texts, and historical figures outside the boundaries of its Protestant and Christian origins. The challenge to faith development theory is to help persons from a wide variety of backgrounds and traditions make these connections. The theory is both pragmatic as a tool or "map" though the life cycle even as much as it is a methodological and theoretical challenge to more traditional and academic theological anthropologies.

Fall, The

Jill L. McNish

Orthodox View

The term given to the mythical event described in Genesis 3:1–24 in which God cast Adam and Eve out of the paradisaal Garden of Eden because they had disobeyed God in eating the fruit of the tree of the knowledge of good and evil. In casting Adam and Eve out, God said that

in so eating the forbidden fruit, humankind had become “like one of us, knowing good and evil.” Although God had told the primal couple that if they ate the forbidden fruit they would die, instead God banished them from the Garden of Eden declaring that thenceforth Adam would have to work hard to produce food from the earth and Eve would be subservient to her husband and undergo great pain in producing offspring. The orthodox Augustinian interpretation of this event is that Adam and Eve’s condition in the Garden of Eden was one of paradisaic perfection but that their rebellion against God led to a separation from God and hence a “fall” into sin, pain, and death. This theology understands the present reality of sin, evil, suffering and death as flowing from this first dramatic rebellion – the exercise of the first humans’ God-given “free will” in disobedience of God. In a related line of thought, Augustine also developed the theology of Original Sin, contending that sin was transmitted from generation to generation through the act of procreation, beginning with Adam and Eve. It is often contended that Paul’s writings (Romans, 5:12–21; 1 Corinthians, 15:21–22) lend scriptural support to Augustine’s understanding of the fall of humankind.

Feminist Reframing

Because Eve was first tempted by a serpent to eat from the tree of the knowledge of good and evil, with Adam eating the fruit only after Eve had already done so and offered it to him, ancient Christian fathers blamed Eve – the first woman – for original sin and hence all evil, sin, suffering and death since the Fall. This reading of Genesis 3:1–24 has been zealously contested by contemporary feminist theologians who contend that this is a misogynist reading of the story of the primal couple. Rosemary Ruether lambasts Augustinian theology of the Fall and Original Sin as “patriarchal anthropology” (Ruether, 1993: 94–99). Reframing the story of Adam and Eve has sometimes led to an understanding of Eve’s action in eating the fruit as being a sign of creativity, curiosity, and initiative and the beginning of culture (see generally Susan Niditch, 1992: 14 or Mary Daly, 1973: 44–68).

Other Views

Although the orthodox theology of the Fall and original sin have descended from Augustine through Aquinas to Catholicism and into Protestant orthodoxy, there have

been many other detractors and alternate lines of thought. For example, Irenaeus, the second century Bishop of Lyons (c. 130–202) saw Adam and Eve not as perfect beings who “fell” into sin, but rather as imperfect, immature creatures who were at the very beginning stages of a long process of moral development which would eventually be brought to perfection by God. This approach was later developed by the German theologian Friedrich Schleiermacher who believed in a progressive development of God-consciousness in humankind from a mere potentiality to a reality in the future. A prominent contemporary proponent of this line of thinking is John Hick (1977), who contends that humankind, “created as a personal being in the image of God, is only the raw material for a further and more difficult stage of God’s creative work. . . . God’s purpose for [humankind] is to lead [it] from human *Bios*, or the biological life of [humankind], to that quality of *Zoe*, or the personal life of eternal worth, which we see in Christ. . . .” (pp. 256–257).

Paul Tillich saw the mythical eating of the fruit by the primal couple as the end of “dreaming innocence.” Prior to the Fall, he contended, “freedom and destiny are in harmony, but neither of them is actualized” (Tillich, 1957: 35).

Psychological Perspectives

Harold Ellens points to the array of Freudian symbols in the story of the Fall: “the serpent, virgin, flaming sword, nakedness, anxiety, shame, the phallic deity, and the initially nonphallic humans.” However, Ellens’ primary interest is in the use of developmental models of Piaget, Kohlberg, Erikson and Fowler to understand the story of the Fall as paradigmatic of “human growth from the childlikeness of Eden to mature kingdom building and cultural responsibility. In that growth process, the story plays the role that has equivalents in the human growth process of birth and adolescent disengagement from parents, both inherently healthy processes, and the subsequent independent adulthood” (Ellens, 2004: 32).

Another line of thinking regarding the mythical significance of the Fall is that the mythic episode of Genesis 3:14–24 represents the developing human animal’s first experience of the *shame* affect which, through the process of evolution, became part of humankind’s hardware script (McNish, 2004).

Fate

Todd DuBose

The concept of fate is as old as there is recorded literature about human interactions with the gods, crossing multi-disciplinary boundaries. Whether natural phenomenon is anthropomorphized as shapers of life directions, or belief in supernatural providence as an explanation for wonders and woes, the experience of how one's life unfolds and of who or what (if anyone or anything) orchestrates it must certainly rank as the most primary of questions for human beings across history and culture. Embedded in any account of fate, Homeric, Shakespearean, sacred literature, or otherwise, is an accompanying declaration or puzzlement about fate's relationship to choice, agency, and freedom (Anonymous, 2150 BCE/1960; Eliade, 1959; Homer, 600 BCE/1999; Shakespeare, 1623/1937). Moreover, fate is usually discussed with a melancholic intonation signifying the limitations of averting tragedy, perhaps a hasty conclusion that could overlook liberating factors that ease the burden of existence when fated in the world.

Fate was originally understood as the pronouncements of the gods about how one's existence was to proceed. Along with this preordination of task and vocation came a melancholic resignation believing that fate equaled doom. Fate was either discerned through premonition, such as in dreams, or was an interpretation of one's life offered retrospectively, the latter process, of course, establishing a frame of reference for understanding future projections of existence.

There are several important points to explore about fate that are central to the field of psychology and religion. Some of these points of discussion include the place of freedom in fate, the possibilities of alternative views of fate other than despair over impending doom, and the relationship of ancient understandings of fate to more contemporary expressions of fate. The latter issue necessitates addressing whether or not existence is fated by macrosystemic, biochemical, or genetic determinants: our postmodern pantheon of gods.

An original pondering on whether or not we have freedom in the face of fate is what the ancient world considered as the "idle argument" in relation to illness and remedy. One can seek the care of a physician by choice, but if one recovers or not, the seeking of the physician is irrelevant. Recovery or illness is fated, no matter what one does in response to it. The same conundrum can be found in various theological positions related to predestination and providence, and in how one views developmental theory. Are events the result of random chance or are they predetermined? Are they *absolutely* determined, even if one's development includes tragedy and suffering, and, if so, what would this imply about the gods? Is development, and the place of divine – read as Otherness in various ways – intervention in that development a compromise between moderate determinism and free will?

These are ancient questions. Wisdom literature, Homeric literature, the Muslim will of Allah, Shiva's dance or Vishnu's Maya, ever present and directing God, and the will of God the Father are only a small list of fateful descriptions that include wrestling with what seems to be fated. Struggling with what seems to be fated presupposes, as disclosed by the struggle itself, that one can argue with God, disobey the gods, or accept one's fate. The latter advice is what came to be known as *amor fati*, or the admonition to love one's fate. Acceptance, though, is a choice, even if the aftermath of one's choice is inevitable or not. Fate, though, need not be explained as the effects of historical causality, and, instead, can be described as the factual givens of our "throwness" in any given situation, to use Martin Heidegger's (1889–1976) language (1962). Our existential givens as human beings situate us in each moment of our lives.

One may think that since the rise of scientism and logical positivism, and thus, the jettisoning of imaginal worlds populated by the gods as dictators of our daily happenings, we must be rid of external controls of freedom. On the contrary, causal displacement continues in full force. We are who we are as a result of: our neurochemistry, our familial upbringing, our social

construction, our unconscious, among other unmoved movers and newer gods in our present situation. Moreover, there are fated aspects of choice itself. Jean-Paul Sartre (1905–1980) speaks of the condemnation to choose and the inescapability of deciding (1943/2003). Martin Heidegger (1962) wrote of the omnipresence of the call of conscience and the necessity of response, even if the response is an inauthentic privation of our projected being-in-the-world. Most importantly, for Heidegger, we are fated to die, which paradoxically invites a choice to live more fully. Life becomes full in our embrace of our situatedness.

It is paradoxical indeed when that which is given brings forth one's ownmost possibilities. Hence, despair need not be the only attunement to one's limitations and doom need not be the only outcome. Situatedness relieves us of our aspirations to be as the gods, which may be where most of the frustration lays for those whose like in kind projects are frustrated by fate. Even the gods fated to be as gods struggled with wishes for "more than" what was available to their situation. The irony, then, is that perhaps the most fated aspect of our lives is the inescapability of our freedom.

Resoluteness, for Heidegger (1962), is a comportment of agency within fated throwness. Yet, fate, from this perspective, is not a causally driven phenomenon. It is created in my very resoluteness. I commit with openness, thus authentically embracing my historicity. We are fated by our thrown situations in history, but we are also "fating" in our decisive and authentic commitments to and Sartre allegiances with our given existentials as human beings. This kind of *fait accompli* is not merely an acknowledgment of where I find myself as a recipient of throwness, but also as one called to respond, and thus, historicize ones accomplishments. To be fated is to be historical, and to be fating is to be free and able to own our ownmost possibilities amidst our limitations as well as to co-create our situatedness through our resoluteness.

Commentary

The central aspect of discussions about fate related to the field of psychology and religion rests on the ancient understanding and critical redaction of how fate is a quality of relationship between the gods and humankind. Misunderstanding the meaning of being in this mythology and reducing these interactions to bicameral mindedness, as Julian Jaynes (1920–1997) (1976/2000) saw it, has not ceased politics with the gods – now understood as any external force that is presumed to determine one's destiny:

neurology and macro-systemic influences being the two most prominent gods today. We now know of the plasticity of the brain and that its dendritic branching re-wires itself throughout our lives, particularly in dialogue with how we make sense of situations. As much as we find ourselves fated by existential givens, we can also create fate that is not there, as when we disown accountability for our moment to moment decisions in co-construction of our various situations. Liberation from oppression would not occur at all without the capacity to descend, overthrown, or cease participation in hegemonic patterning.

Therapeutic responses to fatalism need not find themselves pinned between the false dilemma of free will versus determinism. Theologically, those in therapy speak of providential intervention in their lives, and most often not explicitly using that word. Instead, we hear statements signifying varying degrees of providential influence with comments such as, "there is a reason for everything," or "why did it have to happen this way, and why me?," or "this is simply not fair," and finally, "It's all my fault." We are still talking with the gods. When all is said and done, however, we are recipients of fate as much as we shape it. One could say that fate is surely co-constructed, even in each novel occasion's invitation to create life as Alfred North Whitehead (1861–1947) would put it (1929/1979). Moreover, there are more available responses to us regarding our situatedness and historicity than hopeless resignation to impending tragedy, an interpretation made by our ancient predecessors to retrospectively make sense of traumatic experience. Even in the worst of traumatic experiences we still have the burden or beauty to respond, and in doing so we find ourselves phenomenologically – though paradoxically – fated with freedom.

Father

Philip Browning Helsel

Ancient Significance

Symbols of male and female parentage have been connected with the structure of the universe in religious and mythical imagination. In the understanding of many ancient cosmologies, the sky is seen as the father and the earth the mother, corresponding to the impregnation of the ground with rain, and the earth's generative capacities in producing plants (Jackson, 1983: 88). In other ancient mythologies, the sun represents the male figure, while the moon represents the female (Jung and Kerényi, 1949: 130). This identification of the terrestrial and heavenly forces with parental figures shows the importance of the original imprint of the parent upon the psyche of the culture.

However, the influence of the father has also come under close scrutiny. In discussions of pre-historical understandings of parenting, the debate has centered on questions about the father's role in procreation. On the one hand, some scholars suggest that the father had no understanding of his role in the conception of children, and women were seen as having mythical powers which sustained humanity, and that "man's part in this process was not as yet recognized" (Stone, 1976: 11). Such a perspective is reflected in the Christian narrative about the birth of Jesus, in which the ostensible human father plays no procreative role. On the other hand, some scholars insist that the lack of understanding about biology in

ancient times lent itself to the interpretation that men were the sole progenitors of children, women being simply receptacles for the man's creative powers (Morton, 1985: 35–36). This interpretation is reflected in Zeus' conception of Athena from out of his head, or the birth of Aphrodite from a severed phallus. As speculative as these debates have been, they reflect the ambivalence surrounding the relationship of the male parent to his progeny.

The Changing Images of Fathering

In modern times, the father's role in the family has been equally uncertain. Moving away from a unified idea of masculinity, the current period is experiencing flux as traditional patriarchal societies around the world come under challenge (Morgan, 2002: 280–281). The significance of the father has changed with the shifting involvement of fathers with their families and the cultural conditions in which the father interacts with a particular family. Psychology and culture are interrelated, as repeated patterns of fathering have psychological effects that produce sons who father in similar ways (Chodorow, 1978: 36). Nevertheless, significant shifts have also occurred over the last several centuries in how men in the United States father their children (Lamb, 2000: 338).

In the early history of the United States, the father's primary responsibility was "moral oversight and moral teaching," namely, the cultivation of education for the purpose of studying of Scripture (Lamb, 2000: 338). Many Asian cultures continue to retain the image of father as moral guide and authority, with strong meanings associated with fatherhood and obedience (Zhao, 2007: 72, 128). In the United States, this vision of fatherhood changed as industrialization moved fathers out of the home with their primary role becoming that of providing financial support. As many Black American men had to travel long distances to work in northern cities, this created a "father absence" for the sake of this breadwinning role (Lamb, 2000: 338). The 1940s brought a new understanding of fathering which depicted the necessity for fathers to be a "sex-role model, especially for [their] sons" (Lamb, 2000: 338). This interpretation, and the literature which it spawned, highlighted the "presumed or declared inadequacy of many fathers" (Lamb, 2000: 338). Finally, as a result of the feminist movement, there has been a stronger emphasis on the nurturant roles of fatherhood. This has corresponded with more actual involvement of fathers in the lives of their children, especially when both parents work outside of the home (Lamb, 2000: 338–339).

All four of these images of fatherhood continue to play significant and often interchanging roles in the actual practices of fathering. Fathers often feel pressure both from within themselves and from the wider culture to exhibit aspects of these fathering styles that are consistent with cultural expectations of fatherhood.

Psychological Views of Father and Religion

Freud believed “God” reflected the projection of a wished-for father figure, so that “the longing for the father was the root of the need for religion” (Freud, 1927/1961: 28). Freud calls God a “father substitute. . . a copy of the father as he is seen and experienced in childhood,” before one’s ideal image of one’s father is challenged (Freud, 1923/2001: 46). This need for a father-substitute came with a great deal of ambivalence, as can be seen in the mythology that Freud proposes. He suggests that in ancient times the “primal horde” of brothers conspired together and killed the father, and that his power entered a totem animal that was sacrificed and shared so that his power could be distributed to all participants (Freud, 1927/1961: 28–29). In a similar vein, Freud suggested that Moses, as the father figure of the Jewish faith, was actually murdered by the Israelites, and that his invention of monotheism was the great act of religious genius through which the image of the “repressed” primal father who had been killed could again be returned to consciousness (Rizzuto, 1979: 20). This theory was a direct reflection of the oedipal drama, a “competitive sexual and aggressive conflict” in which the boy desires to take the place of the father in the family constellation (Mitchell and Black, 1995: 47). The ambivalence which attended the psychic representation of God the Father required that the “Devil” appear to absorb those qualities of envy and fear which were not adequately addressed in worship of a single God (Rizzuto, 1979: 20).

Freud’s original hypothesis has been revised in a variety of directions by subsequent psychoanalytic thinkers. Most agree that the father becomes represented in the psyche in an important manner which is reflected in the person’s image of the Divine. In one case, David Bakan highlighted the father’s ambivalence about his children, including his fear of being rejected by them, suggesting a hidden theme of infanticide in the book of Job (Bakan, 1968: 110, 116). Ana-Marie Rizzuto claimed that Freud’s religious ideas were based upon the projection of his own disillusionment with his father, and described how the God representation should be able to transform beyond

the image left by a particular parent (Rizzuto, 1979: 46–47; Rizzuto, 1998: 51–52). In a quite different approach, Jung saw the male element and female element as universal oppositional principles within the personality that needed to be reconciled (Jung and Kerényi, 1949: 130). For Erik Erikson, the absence of a father to idealize led to his emphasis upon identity and the challenges that interfere with its formation, a theoretical agenda which found its fullest expression in his treatment of Martin Luther’s father complex (Capps, 1997: 210; Erikson, 1958: 70).

With the advent of ego psychology and object relations theory in the middle of the twentieth century, the emphasis within psychoanalytic psychology shifted from the oedipal phase to the pre-oedipal, and increasing significance came to be placed upon the mother (Mitchell and Black, 1995: 47). The significance of the shift cannot be separated from the sociocultural factors of the postwar period, in which the enshrinement of ‘motherhood’ was connected with an effort to preserve the stability of the nuclear family within society (Chodorow, 1978: 5). One result of this was that fathers were seen to have little place in actual caregiving, but were a ‘third’ element, which introduced the child to the outside world, establishing the gender identity of sameness with the boy child (Mitchell and Black, 1995: 257). Recent psychological discoveries have shown that fathers may have a more important role in the development of children, even in the pre-oedipal period (Phares, 1999: 26; Lamb, 2000: 340).

Implications of Changing Views of Father

The Judeo-Christian religions have traditionally portrayed God as a male father-figure, but the hegemony of this imagery is breaking up. Accordingly, fathers are in the midst of a shifting position, both in terms of their gender roles and self-definitions. As cultural trends continue to move toward equality between genders, fathers are increasingly providing care for children (Lamb, 2000: 339).

The historical legacy of fatherhood has emphasized competence and power outside the home, but immaturity, weakness, and volatility at home. Fathers are frequently portrayed as incompetent in their fathering by the media, and they often seem to struggle with an internalization of this image (Mackey, 1985: 126). Fathers also contend with issues of rage and abuse, as the cyclical patterns of violence are handed down disproportionately by men (Cooper-White, 1995: 165).

With all of these indictments admitted, not enough attention has been paid, especially in depth psychology, to the significance of the father’s expanding caregiving

role in the lives of his children or the manner in which this caregiving becomes a part of the father's identity (Lamb, 2000: 339). Positive psychological outcomes are associated with high involvement of fathers in caregiving practices (Lamb, 2000: 340). With the increase of caregiving behavior among men in our society, along with a refashioning of traditionally patriarchal religions through an encounter with feminist thought, it remains to be seen whether the personal influence of fathers in the home will lead to a transformation of both psychoanalytic theory and the forms and symbols of religion.

Feeling

John Ryan Haule

The conscious registration of an emotion or affect. Emotion is a physiological state of arousal governed by the brain's limbic system that places the body in an attitude of fear, rage, lust, disgust, etc. Emotions are automatic responses that occur before an individual has a chance to think about what is going on. Feeling occurs as the conscious recognition that an emotional state is already in effect.

In Jungian psychology, feeling is – along with thinking, sensation, and intuition – one of the four “psychic functions” for apprehending the two worlds, inner and outer. While “sensation” (the five senses) determines that something is there before me and “thinking” determines what it is, feeling *evaluates* the people, situations, and objects that I meet. Feeling establishes that something is attractive or disgusting, benign or threatening, gratifying or enraging, etc.; and it does so on a hierarchical basis, determining which object is more lovable or inspiring than another. Because it sets the world in order, Jung calls feeling a “rational” function, along with thinking. Sensation and intuition are “irrational” in that they only register the psychic facts that come before one, establishing no order among them.

In using the rational, ordering capability of feeling, an individual may remain self-possessed and take charge of the circumstances that present themselves in the moment. By contrast, emotion occurs as a psychological “shock” that lowers the level of mental functioning and narrows the field of awareness. Adequate everyday living, therefore, requires a capacity to use one's feeling in order to survey in detail the full world-picture unfolding before one without the distortion of an overwhelming emotion. A differentiated and dependable “feeling function” is essential for satisfying and nuanced interpersonal relations and for social behavior, in general.

All schools of mysticism devote significant attention to training their students in differentiating the “introverted” aspect of the feeling function – that is, in applying the feeling function to make accurate assessments of one's own states of consciousness. Eastern schools take prominent note of the fact that an unmitigated emotional response always involves an attachment to a certain outcome or favored states of affairs. In training for detachment and the cultivation of equanimity, they make the differentiation of the feeling function possible. Meanwhile, most

Western mystical traditions place “discernment” among the most valuable tools for advancement. For example, St. Ignatius of Loyola’s “Rules for the Discernment of Spirits,” employs a detached feeling-evaluation of one’s own recent mental states – whether they are relatively “consoling” or “desolating” – to assist one in removing obstacles to advancement and in determining “the will of God” for one in the present moment.

Feeling is arguably the most important psychic function for every religion, from the decisive experiences of its founders to everyday decisions in the lives of its adherents. Longing for succor and transcendence; awe, fascination, and trembling before that which is Wholly Other; bliss in union; abasement in shame, guilt and unworthiness – at bottom, it is feelings like these that characterize religious attitudes and inspire mythic narratives, theological constructs, and ethical codes.

Female God Images

Annette Peterson

Female God images can serve to balance the predominantly male God images of Western monotheism. Women who have not been equally supported to see themselves in personal relationship with the divine may need to express anger at the dominant religious paradigm and explore alternative images that express their sense of connection to the divine as female.

The lack of feminine God images in contemporary Western society is a common stumbling block for women’s spiritual development. Religious historians wonder why God is so commonly depicted as male when feminine God images are as prevalent throughout history and may actually precede masculine ones (Baring and Cashford, 1991; Leeming and Page, 1994; Billington and Green, 1996). Those who seek images of the feminine divine discover an abundance of goddesses and female archetypes in the historical record. Ancient images of the divine are frequently primitive art celebrating generativity and birth. Archaeologists have uncovered pottery and cave art of the round fecund female figure, earthy and full of life. In countless early paintings, a pregnant female body gives birth to the family tree. Finds like these substantiate the claim that the divine feminine was worshipped prior to a shift towards masculine images of God (Edinger, 1996).

In Eastern religious traditions, goddess images are still abundant. In Hinduism, there is Devi, Shakti, and Kali. In Buddhism, the goddess Tara has a variety of faces and traits. In the ancient West, the Egyptian goddess Isis and Sophia, the Gnostic goddess of wisdom enjoyed popular appeal. In the modern West, female God images have dwindled. As the West coalesced into the major monotheisms, Judaism, Islam and Christianity, God became a unified male figurehead.

The lack of female God images in the Judeo-Christian West dates back to Biblical times. Female references to God in the Bible never occur as names or titles for God. They occur only in the form of similes (Isaiah 66:13), metaphors (Numbers 11:12; Deuteronomy 32:18), analogies (Isaiah 49:15), or personifications (Proverbs 8).

It appears that although the goddess Sophia had a rich lore surrounding her, Jesus and the male Logos later supplanted her identity and role. In *Mirror of His Beauty: Feminine Images of God from the Bible to the Early Kabbalah*, historian Peter Schafer (2002) asserts that both Jewish and Christian traditions have wrestled with the question of God’s feminine nature from the time of the Scriptures throughout the Middle Ages. Schafer argues that Jewish mystical conceptions of wisdom and God’s femininity share attributes with Gnostic Christian writings, and even reveals cross-pollination of ideas between the religions. He identifies similarities between the Christian cult of Mary and the Jewish Bahir, which stresses the feminine nature of *Shekhinah*, God’s earthly presence.

Female God images tend to focus on the maternal role, rather than other sexual/personality gender differences. Propagation and nurture are emphasized. For example, Virgin Mary is preserved as a maternal rather than a sexual female figure. Erich Neumann (1955/1963), a

Jungian analyst, believed that there were two major characteristics intrinsic in the archetype of the Great Mother: the elementary (belly/womb) and the transformative (breast). These images call to mind the fertility icons of ancient civilizations and do little to bring sources of feminine identification outside the traditional role. Women have been traditionally linked with the body and the earth, thus representing humans' lower functions. Because of this, women have often been associated with the dark, irrational or corruptible aspects of our personalities, such as the Genesis story depicting Eve's role in the Fall of Man. Yet it seems appropriate and natural to link feminine images to the earth and to God's indwelling presence in the world. Fecund and sensual, women and earth share generative capabilities in acts of creation and renewal, giving birth and bearing fruit.

Although feminine God images have likely existed for as long as religion itself, in Western culture they represent an undercurrent rather than the mainstream. Cults of the Goddess thrive in pagan or nature religions. Goddess imagery is willing to acknowledge the sexual power of women and the sex that leads to motherhood.

Feminist authors have provided resources for the exploration of the divine feminine in books such as *The Feminine Face of God* (Anderson and Hopkins, 1991), and *A God Who Looks Like Me* (Reilly, 1995). These authors challenge our indoctrination into a masculine theology. Reilly proposes that the masculine God image, culturally dominant for centuries, leaves a damaging legacy for women. That legacy is a learned belief in the exclusion, inferiority and dependency of their gender. Girls imprint these cultural mores at an early age: Boys can be like God; girls cannot. Girls can be part of mankind, but not the part that is mentioned. Without available identification with God, girls can grow up feeling second-rate. This legacy of male religious privilege enjoys mutual reinforcement with patriarchal political and familial power dynamics, perpetuating a culture of gender inequality.

For example, in the Catholic Church, where exclusively male priests preside over the Mass, girls and women are deemed unfit for the Church's highest calling. Traditions of male leadership serve to reinforce the maleness of Jesus and God the Father, who together are the ultimate creator, authority and redeemer. In contrast, the female Catholic icon, Virgin Mary, is in a comparatively peripheral support role, valued mostly for her maternal function. Since both the Father and Son of the Holy Trinity are male, girls may learn to believe that females need men to save them. When these girls become women, they may chafe under these gender dictums and seek the balancing, corrective experience of female God images.

Many find that female God images offer a warm acceptance that sets them at ease, feeling cosmically protected and cared for. Good mothering makes children feel nurtured and accepted, and as adults, we can derive a sense of safety and security from a protecting maternal God. Some people have replaced the doctrinal male God with a warmer, more maternal personal God. Perhaps surprisingly, this shift often occurs without leaving the community offered by their organized religion; instead, a quiet internal knowledge of the feminine nature of God is carried within. This occurs either consciously, for women who are tired of bearing an indirect image of God, or unconsciously, as men and women call upon God for maternal comforting and understanding.

Commentary

When a person cannot feel a sense of identification with her God image, her sense of self is weakened. Many women have been raised with a masculine God image that may have felt patriarchal, distancing and demeaning. A God image with characteristics of both genders is part of a healthy, balanced spirituality. The preeminence of masculine God images can be dangerous and destructive to religious culture as well as our larger society.

While a man can relate to a male God by identifying with an idealized God image, a woman's relation to the deity is more indirect and even implicitly sexualized. There is a once-removed complexity to being a woman in relation to God when God is a gendered male, requiring a mother, daughter, or lover relationship instead of a simple identification. In the Gospels' Jesus narratives, women such as Mary Magdalene are hailed for their support roles, but not for their leadership. These traditional examples are offensive to many contemporary women for the way they influence current and future gender roles.

It is interesting to examine the roots of this gender inequality. In *The Alphabet versus the Goddess: The Conflict between Word and Image*, author Leonard Shlain (1998) proposes that the written word is essentially a masculine enterprise, based on its "linear, sequential, reductionistic and abstract" characteristics, thus all "writing subliminally fosters a patriarchal outlook." In contrast, our mental images are perceived wholly all-at-once, as a synthetic gestalt, which Shlain identifies as essentially feminine. Evidently, our methods of perceptions and communication is as influential as its content.

Do writing and the alphabet cause or reflect the masculine skew of the collective psyche? Shlain argues that his

causal theory is the most plausible explanation for the correlations he reveals between alphabetic writing and patriarchy. Although it would be extreme to suggest that language is a tool of the patriarchy, Western language patterns reflect a clear masculine skew that affect all people's psychological constructs.

In therapy, if gender issues are behind a woman's negative relation to her God image, it is helpful to examine the sources of this alienation on the larger culture. The therapist can then point out some alternative images, examples of the divine feminine that are present in the culture of the individual experience of the client.

Culture and religion, whether consciously or unconsciously, are engaged in mutually reinforcing gender bias. Influences of the ambient culture shape the individual's religious expression. This helps us understand why many Christians unconcernedly attribute feminine traits to the male-gendered God images, subsumed under a masculine Godhead. A common example is the tendency to credit a masculine God for acts of creation and generativity, ignoring the feminine nature of these important roles. Rather than subsuming feminine traits within the masculine identity of God, it is psychologically healthier to acknowledge and celebrate the presence and contribution of both the male and female aspects of the divine.

Femininity

Elizabeth Welsh

Introduction

Femininity or womanliness refers to the physical and behavioral qualities characteristic of and considered appropriate for women. In recent years, these attributes have fallen under the label of socially-constructed "gender" and as such have been distinguished from the biologically-determined features of the female sex. This view has attempted to argue for an androgynous psychosocial quality of human nature and to relocate masculine and feminine functions in all human persons. However, in Western cultures femininity and masculinity have been treated as the two opposite ends of the spectrum of human personality and furthermore that the former resides in females while the latter resides in males.

Current Views on Femininity

In general, the popular understanding of femininity is made up of an amalgam of factors. In the biological category, femininity or femaleness consists of genitalia, high voice, less body/facial hair, less muscle mass and more fat (though thinness has become a new desired characteristic), and more estrogen than testosterone. In the category of parenting roles, femininity is associated with mothering which consists of providing nurturance, warmth, and care. In the social sphere, femininity is associated with the public role of worker (as opposed to boss) and the private role of wife and mother. Finally, in the personality category, feminine behavior has been associated with emotional expressiveness, feminine attributes have been generally classified as soft, tender, and vulnerable, and feminine attitudes have been characterized by more subjectivity than objectivity. While these comparative differences between femininity and masculinity are relative, Western cultures have generally reinforced conformity to these dichotomous norms.

The fact that some of the above characteristics of femininity are purely biological, while others have clearly been socially designated has had a confounding effect on colloquial designation of what is female (or male). Thus, beginning in the 1970s, the term "gender" has been used in psychological and sociological research to refer to the non-biological traits, norms, and stereotypes that are

considered typical and desirable for those who are designated as female or male. Since then, the academic literature has made efforts to clearly separate the terms “gender” and “sex” although colloquially they frequently continue to be used synonymously. While it may not be possible to fully separate the biological aspects of human identity and experience from the social, cultural, and psychological ones, many attempts have been made to discriminate between them so as to understand the relationships between them and to correct the misrepresentations of women and men that have been at the root of much of history of oppression and violence towards women.

While some of the representations of femininity can vary from culture to culture, such as the specific physical features as well as behaviors that are considered desirable, certain common themes, such as beauty, gentleness, and nurturance appear to underlie its diverse expressions. In recent years, the concept of femininity has come under the close scrutiny of feminists who have pointed out that the cultural prescriptions for ideal feminine qualities have been carefully scripted to serve the perpetuation of the patriarchal order. As such, the complex aspects of the feminine gender which appear to be mysterious and threatening to the established male order are split off and rejected and replaced with seemingly benign ideals of feminine docility, domesticity, and conformity. However, such restrictions have in fact been violently suppressive and have engendered oppressive attitudes towards women as well as men who do not conform to the traditionally patriarchal stereotype of masculinity. More recently, feminists have sought to challenge any universal definitions of femininity since no matter how empowering they may seem to be, they can always be turned into oppressive labels and scripted roles that ultimately restrict women’s freedom.

The Role of Religions in Shaping Femininity

Since religious beliefs and rituals have always played a crucial part in the formation and transformation of culture, their influence on sex and gender roles cannot be overstated. In the ancient polytheistic world, goddess worship was widely practiced. Some scholars have argued that goddess worship began much earlier, during the prehistoric era when matriarchal social systems are also believed by some to have existed. However, while there is not any clear evidence of a single “Great Goddess,” in cultures outside the Judeo-Christian traditions, the Feminine Divine was an intuitive and prevalent concept and some cultures have maintained it to this day under different names and shapes (Schaup, 1997).

A cult of a prominent goddess as well as her loving union with a male god was present in all ancient Oriental religions. In ancient Egypt, the Goddess Isis was the creator of the world and her sacred wedding with the male god, Osiris, was believed to hold the secrets of life and death. In the southern Mesopotamian civilization of Sumer, the goddess Innana was worshipped and her union with Son-Lover Dumuzi, and later the Assyrian-Babylonian Ishtar and Tammuz. The goddess Kybele was revered in Asia Minor and in Rome under the name of Magna Mater, the Great Mother. The main goddess of the Phoenicians, Philistines, and Moabites was Astarte or Asherah whom some of the Israelites worshipped as well. The Greeks had the powerful goddess of fertility and transformation, Demeter, as well as the Greek Goddess of Wisdom, Pallas Athene, and the jealous and vengeful goddess of marriage, Hera.

The goddesses worshipped represented a myriad of associations which indicates that the ideas about femininity in the ancient world were quite diverse. One goddess alone could serve a variety of functions. For example, in Egypt, the goddess Isis was the goddess who gave birth to the heaven and earth, the source of pharaoh’s power, patron of nature as well as magic, the goddess of orphans, slaves, and the downtrodden, as well as the goddess of simplicity. Corresponding to these powerful and influential goddesses, women appeared to have the opportunities to hold positions of honor such as in ancient Egypt where women could be traders, craftswomen, priestesses, and queens.

The semblance of a goddess appears in the Old Testament as the concept of Wisdom – Chokhma (Hebrew) – Sophia (Greek), an autonomous female figure which emerges in the books of Proverbs, Ecclesiastes, Job, as well as the apocryphal books depicting the Wisdom of Solomon. The Wisdom tradition featuring this female figure developed after the Babylonian captivity which seems to support the view that she was an adaptation of the foreign customs of the cult of the Goddess practiced in Babylon. This Divine Wisdom is depicted in the biblical text as authoritative, gracious, lovely, powerful-in-action, a beloved of God and of mankind. At times she is portrayed as a divine person in her own right (Proverbs 8, Wisdom of Solomon, 7–8), but at other times she represents instruction, admonition, and fear of the Lord (Proverbs 2). Although the Old Testament authors could not conceive of a distinct Feminine Divine as in the old religions, they did however apprehend of a certain feminine Divine Wisdom which was close to God, sat besides God’s throne and would decide for him what to do, was implicated in creation, loved human beings, and bestowed bountiful gifts on them. Overall, one may observe that this feminine figure wavers

between a godlike figure endowed with attributes of regal power and loftiness and the image of a homely housewife, virtuous and industrious, a model faithful fulfillment of the law. Some have pointed out that a split took place; on one hand the idea of Great Goddess of the ancient religions, the source of all life and wisdom, continued to exist in the biblical figure of Wisdom, but on the other hand she was modified and reduced by Old Testament authors to narrow morality, submission, and prudence. Furthermore, in an implicit fashion, on one hand the feminine idea depicted in the Wisdom literature has divine qualities, but on the other she is depicted as rotten, the beginning of all sin (the “foreign woman,” the harlot, the idolatress, the temple prostitute, and other derogatory terms that were used for the priestesses and other female worshippers in the temples of the pagan goddesses).

The case of Lilith is a possible illustration of this split. Lilith, Adam’s first wife, was the woman who rejected her position of sexual and social subjection to man. While originally she represented female strength and autonomy, over time, Lilith incorporated a myriad of dreadful qualities and thus became the shadow of the Feminine which Israel was no longer able to integrate because it had split off and rejected along with the entire cult of the great pagan goddesses. Lilith became the antithesis of Eve, the submissive helpmate of Adam and positive model of a Jewish wife. From an interpretive standpoint, for the Jewish men in captivity, Lilith raised potency fears and threatened to endanger the physical survival of the nation in exile. She was henceforth transformed from a figure of female autonomy to one of purely evil qualities so as to make her abhorrent to women (one who murdered children and pregnant women) as well as men (the woman who withholds herself and causes semen to be spilled). The myth of Lilith entered many cultures under various forms from witch to a beautiful seductress.

The split between an ideal virtuous femininity and a sexual, desiring, mysterious, and powerful woman was perpetuated in Christianity through the veneration of the Virgin Mary. As various feminists have pointed out, the image of the desexualized, suffering, and silently loving Virgin Mother who is lifted into heaven continued to pose problems for ordinary women since it constituted an ideal that alienated women from their real selves and from the realities of the misogynistic cultures in which they lived. The mild, gracious, and ethereal Madonna could only offer women redemption and access to heaven through suffering motherhood, suppression of all negative emotions, and complete disembodiment of sexuality.

Commentary

From a psychological standpoint, the patriarchal disparagement of the feminine figure in all of her complexity reveals a deep-seated male fear of the mysterious and uncertain aspects of female sexuality and personality. The archetype of the “evil anima” as well as the subdued “Mater dolorosa” (suffering Mother) reflects the disturbed relationship between man and woman. This alienation and hatred is explained in part by the historical suppression of the pagan goddess through monotheism as well as by the cultural subjection of women through the establishment of patriarchy. The evil anima archetype is an expression of man’s fear of the feminine revenge, a fear that may be rightly justified, while the altruistic, asexual mother poses as the benign ideal of femininity that provides for the emotional needs of men but has no life of her own, and as such poses no threat to the established patriarchal order.

For contemporary women, the psychological implications of the culturally-inherited constructions of femininity have led to the dilemma between their desire for societal competence and their fulfillment of the feminine roles expected of them in their personal lives but devalued in society. Those who attempt to juggle the demands of both competence and sex-role identity are met with the burdens of physical and psychological burnout that accompany the efforts to embody the colloquial “Superwoman.” Feminists have argued that women need a redefinition of femininity (some have proposed a plurality of meanings, of “femininities” and “sexualities,” rather than any one universal definition) as well as of cultural expectations for competence which will necessarily have ramifications for definitions of masculinity and societal expectations of male competence. Finally, since cultural concept of God has been shown to form the underlying connection between patriarchal religion and a society of violence, many have argued that no social, scientific, or ecological paradigm shift can take place unless the theological shift occurs which moves away from exclusively patriarchal images of God and includes the feminine aspects of the divine.

Folk Magic

David Waldron

Common to most, if not all pre-industrial cultures, is a vibrant tradition of folk magic and ritual tradition closely linked to established mythology, folklore and archetypal associations. These traditions vary enormously and are closely linked to a variety of social, historical, cultural, political and economic factors. The many and complex networked structures of belief, ritual and mythology that coalesce in magical traditions have long been studied and documented by anthropologists and folklorists.

From an analytical psychological perspective, one of the key ingredients of folk magical practices and rituals is that they serve as *prima facie* expressions of emotion. Malinowski, in his analysis of folk magic in Melanesia, argues that magical ritual is invariably constructed in patterns that evoke emotion and resonate symbolically within a culture. In this sense, emotion, and thus psychology, is at the heart of magical ritual (Malinowski, 1948). The ritual serves as a symbolic representation of the desired ends and the emotions that led to it are rendered symbolically through powerful and pervasive archetypes in that culture and thus directly relate to the social, cultural and political issues that led to the rituals perceived necessity. Subsequently, each type and form of folk magic is derived from its own network of social formations and cultural forms and is fundamentally

integrated with localized politics, social structures, conflicts and economic uncertainties. This localized experience also serves to distinguish folk magic from ceremonial magic in that it is not born of an attempt to create abstract structures granting access to divine power, in a philosophical manner, but is an organic socially derived network of practices and beliefs relating to deeply felt anxieties (Jung, 1964).

However, while there are a vast array of bewildering forms, rituals and beliefs surrounding folk magic practices, it is generally accepted that there are certain universal features and commonalities between varying magical traditions. One key issue identified by Frazer is that folk magic practices are often *sympathetic* in nature. That is to say, the items and rituals used in magic typically either symbolically resemble the target of the magical practice (*law of similarity*) or have come into contact with them and become ritually polluted with their essence (*Law of Contagion*) (Frazer, 1922). From a Jungian perspective, these forms also relate closely to symbolic archetypes, whereby the symbols, the target of the magic and its ritual practice are linked through archetypal association in the collective unconscious. Subsequently, these magical rituals also serve as a means to grapple with complex psychological issues and serve as an avenue into the unconscious (Jung, 1938).

In this sense, folk magic is both derived from the heritage of past traditions and mythology and is also a living tradition which creates its own body of myth and folklore. Thus folk magic is an intrinsically organic construct that both shapes and constructs its own mythology and folklore, yet is profoundly influenced and shaped by its contextual mythological base, politics and culture. Consequently, the rituals, symbols and cultural artifacts of folk magic serve as a powerful avenue into the complex interconnections of the conscious and unconscious aspects of the psyche as manifested in lived experience within the social, cultural and physical worlds.

Forgiveness

Everett L. Worthington, Jr. · Jennifer S. Ripley ·
Don E. Davis · Benjamin T. Wood

Every major religion endorses forgiveness as a virtue. The religious perspectives have brought forth numerous practical and theoretical understandings of forgiveness for centuries. In the last 20 years, the field of psychology has pursued the scientific study of forgiveness (Worthington, 2005). Can this study add to what millennia of religious thought and practice has taught humankind?

Science as a New Tool

Peter Galison (2003) has put forth an understanding of scientific revolutions that attributes the seeds of change to the development of new tools. The invention of the telescope paved the way for observing phenomena that were not observable in Newtonian physics. The new data eventually created problems for the old paradigm. According to Galison, a revolution in a scientific field is due more to applying new tools to a phenomenon than simply to providing a re-conceptualization of the phenomenon.

The study of forgiveness has brought a new tool to its study and practice – the method of careful, analytical science. Science forces us to define variables precisely, and then subject the understanding of relationships among variables to empirical testing. Whereas theology and philosophy are likewise careful at defining concepts and test their definitions against logical criteria, authoritative texts, and teachings, science relies on a different source of authority – empirical observation.

Basic Definitions

The results of the scientific study of forgiveness have been astounding. From 58 empirical studies identified in a review of the literature in 1998 (McCullough et al., 1998), the studies have grown to over 900 by 2005 and continue to proliferate (Scherer et al., 2005). Our understanding of forgiveness has become more precise as science has focused on it. Transgressions (i.e., violations of psychological or physical boundaries) are appraised as to the amount of injustice inflicted – called the injustice gap. The injustice gap (Worthington, 2006) is the difference between the way a person would like to see a transgression

resolved (i.e., “I’d like to see her come crawling on her knees begging my forgiveness”) relative to the way the situation is perceived to be currently (i.e., “She’s so cold. She seems to have no remorse at all, and I’m afraid she’ll betray me again”). Bigger injustice gaps are harder for the person to resolve and are related to more unforgiveness. Unforgiveness is a complex combination of negative emotions, like resentment, bitterness, hostility, hatred, anger, and fear, rolled into an emotional experience interpreted by a person’s working memory as feeling unforgiving.

A person can reduce the injustice gap (and hence reduce unforgiveness) in many ways that do not include forgiveness (for a summary, see Worthington, 2006). The person might inflict vengeance (i.e., a kind of vigilante justice), see justice done societally, observe a person getting her just desserts, or see an authority like the courts administer justice. Or the person may reduce the injustice gap through passive acceptance. For example, the person might also simply accept that “stuff happens” and move on with his or her life. The person might forbear, suppressing negative emotions, or turn the matter over to Divine justice or simply relinquish the matter into God’s hands.

Forgiveness is one way of reducing the injustice gap and unforgiveness. Forgiveness involves internal changes that recognize the offense but choose not to hold it against the offender and (perhaps) to seek more positive feelings and motivations toward the offender (Enright and Fitzgibbons, 2000). There may be related interpersonal experiences around forgiveness, such as the offender asking for forgiveness, the victim communicating forgiveness to the offender, or either party telling others of the forgiveness. Thus, the context of transgressions is intrapersonal, but forgiveness is intrapersonal. Forgiveness is often confused with reconciliation, but forgiveness occurs within the skin of a person, while reconciliation is the restoration of trust between two people, through trustworthy behavior by the parties.

Forgiveness is of two types (Worthington, 2006). *Decisional forgiveness* involves making a decision to change behavior intentions from negative to positive. It is not motivation, for the person can be motivated for revenge but still adhere to behavioral intentions to treat the person positively. Likewise, decisional forgiveness is not actual behavior, for a person could forgive a dead parent, but no longer has the option to act directly with benevolence or conciliation toward the parent. *Emotional forgiveness* involves the experience of replacing negative unforgiving emotions with positive other-oriented emotions toward the offender. The replacement emotions most commonly discussed among forgiveness researchers are empathy, sympathy, compassion, and love. The

replacement emotions begin by neutralizing unforgiveness, gradually reducing it. Usually, that is where people stop trying to forgive – especially in unilateral forgiveness, which is forgiveness where the transgressor is either dead or no relationship continues. However, when a relationship is expected to be ongoing (i.e., interpersonal context), then people often continue to seek to experience more positive emotions in the relationship in order to make it “stronger in the broken places.” Decisional and emotional forgiveness may occur independently, but generally they affect each other. Thus, it is possible to forgive decisionally but not experience full emotional forgiveness, and to forgive emotionally but never to have made a conscious decision to forgive. However, usually the two are psychologically linked.

Full forgiveness is usually better talked about as full decisional forgiveness, which usually occurs at a moment of decision. The person might ponder, for minutes or years, whether to make a decision to forgive, but usually the decision is dichotomous, like switching on a light. Or a person might experience full emotional forgiveness, which might involve merely getting to a place of neutral feeling toward the offender (in unilateral emotional forgiveness) or getting to a net positive experience toward the offender (often in interpersonal forgiveness). In contrast to decisional forgiveness, emotional forgiveness happens piecemeal, or more herky-jerky, as emotions are gradually replaced and influenced by the ebb and flow of any ongoing interactions with the offender. There is a time course within which most emotional forgiveness occurs. Usually, much forgiveness occurs early after a person begins to try to forgive, and then the rate of emotional forgiveness tapers off.

Self-Forgiveness

When concepts of forgiveness are applied to the self, self-forgiveness often does not parallel forgiveness of others (Fisher and Exline, 2006; Hall and Fincham, 2005). When one transgresses and experiences shame, guilt, and self-condemnation, typically, one sees oneself more as an offender than as a victim. Namely, before dealing with self-condemnation, people should seek to make things right with the Sacred (as one understands the Sacred). Then, one needs to try to make restitution with those harmed. Then, the person might forgive himself or herself for the wrongdoing. However, forgiveness might still not take care of the self-condemnation because self-condemnation might be due more to a failure to accept oneself as a flawed person than to guilt for a specific

wrongdoing. For example, if a person steals money from the coffee room at work, the person might confess the crime to God, make restoration to the coffee fund, and forgive the self. However, even though self-forgiveness is complete, the person might still be self-condemning because before committing the theft, the person was not a thief. Now, the person is. Accepting a new self-definition might lead to self-condemnation even though the person has forgiven himself or herself for the actual theft.

Religions and Forgiveness

The various religions treat forgiving differently. These cultural differences affect how forgiveness is understood and practiced.

In Judaism, forgiveness is usually seen within the context of *tseuvah*, or repentance of the offender (Rye et al., 2000). If an offender demonstrates true repentance – usually undergoing a series of demonstrations of sincerity of change and return to the path of God – then a victim is obligated to forgive. One tenet of Judaism is that victims must grant forgiveness, and forgiveness cannot be granted on behalf of the victim. Thus, logically, one who has murdered will never obtain forgiveness from the victim.

In Christianity, forgiveness is the centerpiece of the religion. Jesus’ crucifixion is said to have paid the full demands of justice for the injustices against God, and God compassionately and lovingly forgives a person who accepts that forgiveness (Rye et al., 2000). This is usually termed as Divine forgiveness, and it refers to the adoption of a person as a child of God. Jesus tied Divine forgiveness of individual sins to a person’s forgiveness – probably what we now think of as decisional forgiveness – of the transgressions experienced at the hands of others. In Christianity, God requires decisional forgiveness, and desires emotional forgiveness.

In Islam, God is seen as the all-forgiving God, and forgiveness figures prominently in the Qu’ran (Rye et al., 2000). However, generally justice is seen as one’s due, and forgiveness is seen as virtuous. It is reward-worthy if one wishes to forgive instead of exacting the justice that is one’s due from a transgression.

In Buddhism, there is no explicit word for the concept of forgiveness in original Buddhist texts (Rye et al., 2000). Nevertheless, the notion of forgiveness is inherent in compassionate responses to wrongdoing or mindful responses to wrongdoing. Forgiveness is also a concept that is employed in order to help promote loving-kindness during meditation.

In Hinduism, forgiveness is valued (Rye et al., 2000). While there are a variety of understandings of forgiveness,

it is generally seen as in line with dharma, the path of right living. It is often associated as a means to drive away sin and transgression.

Thus far, we have focused mostly on forgiveness within the bounds of organized religions, briefly alluding to the largest religions. Many people, however, consider themselves as spiritual and not religious (Zinnbauer et al., 1997). Spirituality can be rooted in an elevated view of humanity or attunement with nature. Thus, transgressions against oneself or perpetrated by oneself can disrupt the person's sense of harmony. This disrupted sense of harmony can motivate a drive for forgiveness or seeking forgiveness to restore a sense of positive spirituality.

A curious finding has been uncovered in the relationship of religion and forgiveness. People who are more religious, as a group, report themselves to be more forgiving than do people who do not endorse religion. However, when asked to recall a transgression, they often are not much better at granting decisional forgiveness or experiencing emotional forgiveness than are people who do not endorse religion (McCullough and Worthington, 1999). There are methodological reasons that such a finding occurs. Generally, people are asked to recall a hurt and they most easily recall one that is still an open transgression. It has been shown, however, that if people are asked to recall several hurts and the amount of forgiveness is aggregated over the variety of hurts, then the more religious a person is, the more likely he or she is to forgive individual hurts deeply and quickly (Tsang et al., 2005).

Promotion of Forgiveness

Applied psychological science has shown that people who struggle to forgive can be helped to forgive faster and more deeply by participating in individual forgiveness therapy, couple therapy to promote forgiveness, or psychoeducational groups to promote forgiveness (Malcolm et al., 2005; Wade et al., 2005). Most interventions have been aimed at experiencing empathy and greater understanding of the offender's perspective. The more deeply empathy is experienced, the more deeply emotional forgiveness is experienced. Effortful thinking about forgiveness is generally needed to forgive, which puts some due stress on the self. In examining over 40 groups that sought to promote forgiveness, there was a strong dose-response relationship between the mere amount of time trying to forgive and the amount of emotional forgiveness a person actually felt (Wade et al., 2005).

Forgiveness is truly a concept that now can be claimed by both religions and psychology. The tool of psychological science has provided more nuanced understandings of forgiveness than was available a quarter of a century ago.

Forgiveness and the Brain

James G. Emerson

The decade of the brain in the United States – 1990–2000 unleashed remarkable work on the dynamic of brain activity. It has remained for those in England to focus on the implications of brain studies for the dynamic of forgiveness. A major center for this work is the Sheffield Medical Center in Sheffield England. Key names in this work are those of Thomas Farrow, PhD and Peter Woodruff, PhD.

The development of brain studies moves at a pace that one can hardly keep up with it. Although one could reference books, the Internet appears to be the best resource for keeping in touch with the discussion.

Common to all these studies is first the discovery that the act of forgiving involves certain areas of the cerebral cortex – mostly in the left side of the brain. In what might be called the “executive” section of the brain, there is action that deals with feelings and dynamic activity in all of the brain – including healthy brains or brains afflicted with problems such as schizophrenia. The particular area where there appears to be the most activity when forgiveness becomes active is the left superior frontal gyrus, the orbitofrontal gyrus, and the precuneus.

Also common to all these studies is the discovery that the dynamic of forgiveness leads to certain degrees of health or improvement.

Across the world spectrum of religious or theological writings on the area of the brain and forgiveness, case after case has developed of the positive effect of the teachings of Jesus and Paul.

From a theological standpoint, two cautions, however, need to be noted in relation to these studies: the first is the fact that Paul seldom uses the word “forgiveness” and more often speaks of “freedom in Christ.” The second is that there are cultures in African and south Asian parts of the world that do not have the word “forgiveness.” Therefore, when talking about the experience of forgiveness, as Feldman of the University of California has observed about all neurological discussion, precision is required. For the purpose of discussion, this article recommends the view of Dr. Farrow that we follow the definition of the Oxford Dictionary “Forgiveness is ceasing to feel angry or resentful to another.” To this we also do well to add, “forgiveness of self means a ceasing of being angry with oneself.”

Today, some of the most profound work in relating brain studies and religious practice is that guided by the current Dalai Lama. In that work, guilt and forgiveness get little if any mention. Yet considerable attention is given to meditation and processes that contribute to our understanding of the use of forgiveness in such matters as forgiving oneself and accepting the forgiveness of others – including God.

Frankl, Viktor

Haddon Klingberg, Jr.

Viktor Emil Frankl, MD, PhD (1905–1997) is founder of *logotherapy* – meaning-centered psychotherapy. He is best known for his short book, *Man’s Search for Meaning (MSFM)*. It was released in 1946 by Deuticke, Freud’s Viennese publisher. It appeared in English in 1959 as *Death Camp to Existentialism*, and for more than half a century it has remained an international best seller, published in over 30 languages, numerous English editions, audiobooks, and Braille. In 1991 the United States Library of Congress/Book-of-the-Month Club survey of lifetime readers named it one of the 10 most influential books in America. Karl Jaspers labeled it “one of the great books of mankind”; Gordon Allport called it “a compelling introduction to the most significant psychological movement of our day.” Of Frankl’s 32 books, others have been translated into multiple languages, including English.

Frankl first visited the United States in 1954 at the invitation of Norman Vincent Peale. Frankl lectured at Marble Collegiate Church, New York, where Peale had arranged for Christian symbols to be covered with drapery out of respect for his Jewish guest. From that beginning, Frankl made 92 speaking tours to the United States

and lectured worldwide – at 209 universities and to large public audiences on all five continents.

Life and Context

Viktor Frankl was born March 26, 1905 at Czerningasse 7 in Leopoldstadt, the mainly Jewish quarter of Vienna. His parents were humble, pious Jews. At that time, the city was seat of a great empire and an international wellspring of music. The University of Vienna was a hub of creativity and at the forefront of medical science. But there was also a strong and longstanding current of anti-Semitism in the city.

In the year of Viktor's birth, 50-year-old Sigmund Freud was living near the University. Alfred Adler (1870–1937) was a founding-member of Freud's inner circle and was living and practicing medicine at Czerningasse 6, right across the street from the Frankl home. Today tablets on the two buildings note the famous former residents.

When Viktor Frankl was a little boy, an obscure Adolph Hitler – in his 20s – was living in a men's hostel in the next district. No one could have imagined the future for Jews in Vienna, certainly including the Frankls and the older Freuds. Both lost close kin and friends to the Holocaust.

Sigmund Freud, Gabriel Frankl (Viktor's father), Alfred Adler, and eventually Viktor himself all attended the same high school in Leopoldstadt. Viktor was captivated by Freud's theories and writings, even introducing his classmates to psychoanalysis. All four of these men, in turn, attended the University Medical School; only Gabriel could not afford to finish. Though Viktor met Freud only once, they did correspond with one another; and when Viktor sent one of his high school papers, Freud published it in the *International Journal of Psychoanalysis*.

While still a medical student, Frankl almost joined Freud's Vienna Psychoanalytic Society, but already he was becoming disillusioned with psychoanalysis. Freud became intolerant of Adler's criticism and inventive ideas and had excluded him from the Society. The young Frankl joined Adler's new Society for Individual Psychology. But in the end, when Frankl expressed his own novel ideas, Adler expelled him. So Jung (who had parted with Freud in 1913), Adler, and Frankl started their own rival psychological movements. But of course the creative influence of Freud on them, on psychology and psychiatry, and on Western civilization was enormous.

By the time Hitler and National Socialism seized Austria and engulfed Europe, Frankl already had established his practice in neurology and psychiatry. But for the Frankls and for millions, life as they had known it came to an end.

In September 1942, Viktor and his wife Tilly, his father and mother, and mother-in-law were forcibly deported in one of the ongoing trainloads of Jews from Vienna. During 2 years in the Theresienstadt ghetto, Frankl's father died from illness. The rest of the family were transferred to Auschwitz in October 1944, where Viktor and Tilly were separated and where his mother Elsa was sent immediately to the gas chambers. Viktor's brother and other family and friends met their deaths in the camps. He did not know the fate of his mother or of Tilly, who died at Bergen-Belsen, and he held out hope that he would be reunited with them after the war.

Frankl spent three days at Auschwitz (in Poland), then seven months at Kaufering and Türkheim in Germany, where he nearly died of typhus. After two and a half years in the four camps, he was liberated from Türkheim by American forces in April 1945. On his return to Vienna, he learned that his loved ones had perished.

Now alone, Frankl threw himself into reconstructing his first book, *The Doctor and the Soul*, and wrote his second, *MSFM*. These tasks kept him going for a time. Then he married a young dental assistant, Elly Schwindt, at the Polyclinic where he had become chief of neurology. For more than 50 years, Viktor and Elly lived as spouses, parents, and colleagues in logotherapy, corresponding, writing, traveling the globe, and seeing the endless stream of visitors coming from around the world. Viktor died in Vienna following open-heart surgery in September 1997 at the age of 92.

Logotherapy and Existential Analysis in Context

Frankl's thought was shaped not only by the psychologists of Vienna, but by great philosophers – the ancient Greeks, Nietzsche, Kierkegaard, Heidegger, Marcel, Jaspers, Buber, etc. – and a number of the contemporaries he knew personally. What Frankl created, starting in the 1930s, is what he eventually called “logotherapy and existential analysis” (Frankl, 1986, 1992, 1997, 2004; Gould, 1993; Klingberg, 2001). “Existential analysis” in his scheme referred to its philosophical foundations in contrast to psychoanalysis, and “logotherapy” to its therapeutic methods. When the term existential analysis was adopted by others and used more widely, Frankl simply used logotherapy to identify his body of work.

The Greek *logos* connotes, among other things, *meaning* – hence, therapy through meaning. By 1948 Wolfgang Soucek had identified logotherapy as the third Viennese school of psychotherapy, a designation that

endures. The first school is Freud's psychoanalysis, marked by the "the will to pleasure" and by Freud's ingenious expedition into the unconscious and its sexual and aggressive forces – "depth psychology." The second is the individual psychology of Adler, distinguished by the "will to power" – striving to overcome feelings of inferiority in our relations with other people, to achieve success and status. While Frankl acknowledged the work of Freud and Adler as foundational to his own, he asserted that the unique and most significant human motivation is the *will to meaning* – "height psychology." Frankl was fond of quoting Nietzsche: "He who has a *why* to live can endure almost any *how*" (Frankl, 1992).

This cornerstone of logotherapy was tested in the crucible of the death camps. Frankl never claimed that simply having a reason to live could keep a prisoner alive against the odds. In *MSFM* he identifies many factors in his own survival in addition to his desire to see his loved ones again, to write his books and lecture again on logotherapy (Frankl, 1992; Klingberg, 2001). But he did insist that having a reason to live helped to keep up one's spirit, and finding meaning in suffering could help one to bear it. Meaning was necessary but not sufficient for survival and could – all other things being equal – make the difference between life and death.

Logotherapy aims to help by assisting people in finding meaning in their lives. Frankl identified three primary ways to discover personal meaning. First, by *doing a deed*. This may include creating art or music, nursing a child, baking a pie, accomplishing a task, loving another person. Second, by *experiencing life*. One can enjoy the art and music of others, witness a sunset, accept a kindness from someone, rest in the affection of a loved one.

The third path to meaning is an anchor point of logotherapy: *meaning through suffering*. To suffer for nothing, to suffer when there is no point to it is unbearable. But if one can find a meaning in unavoidable suffering, it becomes possible to bear it, even to rise above it (Bulka, 1998; Frankl, 1978, 1992; Klingberg, 2001). This helps to explain why so many people in life-threatening circumstances turn repeatedly to *MSFM* and give copies to others who are suffering. Logotherapy is complementary to other psychotherapies and fills a gap for people who no longer can take action to change their circumstances or who face an unavoidable fate.

Transcendence is a unique aspect of human nature, making it possible for us to rise above ourselves and our circumstances. Logotherapy has techniques that may apply to particular psychological disorders and mental illnesses (Frankl, 2004). But it directly addresses the despondency of living life without meaning, especially

amid setbacks and disappointments. The emptiness experienced by many in our time is what Frankl called "the existential vacuum." And he insisted that despondency over the meaninglessness of life is no mental disorder at all, but rather a sign that one is truly human, by nature summoned to tasks, causes, and relationships beyond self. This, then, is the opening for faith.

Logotherapy and Religion

Logotherapy has a distinctive affinity for religion and for people of faith. But Frankl steered away from the sectarian, striving to make logotherapy useful to all people, religious or not, since the quest for meaning characterizes human nature. Individuals find meaning for themselves in many ways, and faith in a Supreme Being or adherence to a particular religion may be paths to meaning. So psychotherapy should respect this, as well as other paths to what he called *ultimate meaning* (Bulka, 1979; Frankl, 1997; Tweedie, 1961). It never prescribes a particular meaning for another person, but rather assists and encourages each person to pursue and discover both ultimate meaning and the moment-by-moment meanings of life.

Early on, Frankl identified the characteristics of being human: spirituality, freedom, and responsibility. Frankl clearly intended that those who choose faith in God be affirmed and assisted in bringing religious resources to bear upon their lives and struggles. Frankl's own writings reflect his openness to religion, though he remained steadfastly private as a person of faith. (Only a few very close to him knew of his daily prayers – without fail – from the time of his liberation from the concentration camps to the day of his death.)

Regarding human nature, Frankl rejected the negativity of psychoanalysis. He also criticized the unbridled optimism and self-centeredness of the American "human potentials movement" inspired partly by Adler. Ever since the Holocaust, Frankl has been reproached as too forgiving of the perpetrators and for his repeated assertions that good people and bad people are found in *every* race, *every* nation. All individuals and all groups are capable of great good and great evil, and we must be on guard against all evils, holocausts and "ethnic cleansings."

Frankl stands out among European psychologists of religion for placing *transcendence* at the center of logotherapy. Erich Fromm (1950), himself a Marxist atheist, asserted that both Freud (1961) and Jung (1938) had missed the point on religion. For Freud, the unconscious is the worst that is in us; for Jung, the unconscious is the

best that is in us. For Fromm, the unconscious is simultaneously the best *and* worst in us, neither “a God whom we must worship nor a dragon we must slay” (Fromm, 1950). In contrast, Frankl’s insistence on transcendence leads away from unconscious processes toward the human ability to take a stand toward circumstances and to rise above them, as well as to address faith in transcendent terms. That is, the fact of transcendence in human nature points away from self and circumstances toward something or someone, some cause *other* than oneself, *beyond* oneself, and *greater* than oneself.

Thus, from Frankl’s perspective it can be said that Freud, Jung, as well as Fromm – and William James (2002) and others, for that matter – *all* miss the point. Frankl might characterize them as reducing religion to merely psychological phenomena – to experience, conscious or unconscious; and ignoring the transcendent nature of human spirit, which may address or apprehend – or be apprehended by – a transcendent God existing in reality beyond. Frankl insisted that to find meaning, a person *must* go beyond oneself to a purpose to fulfill, a cause to serve, a person to love, or a God to trust if they so choose. And in transcending ourselves we become fully human and find meaning in our lives that carries us even above suffering.

Freud, Sigmund

Benjamin Beit-Hallahmi

Sigmund Freud (1856–1939) is most often mentioned today in relation to psychology and psychiatry, but he had little no training in these fields. In reality he was a well-respected neurologist who developed an approach to human behavior known as psychoanalysis. Freud was a man of enormous learning and huge capacities and talents. His writings, which fill up about 30 volumes, cover all aspects of human experience, culture, and history.

The creation of psychoanalysis offered at once a theory of the human psyche, a proposed treatment system for the relief of its ills, and a method for the interpretation of culture and society. Despite repeated criticisms and rejections of Freud’s work, its influence remained powerful well after his death, and in some fields far removed from psychology as it is narrowly defined.

Freud was trained as a physician and was drawn to neurology and psychiatry, but he was always more interested in theory than in practice. After starting his work with neurotic patients, he came to believe that many mental disorders are the product of unconscious conflicts. Freud suggested that humans are born with sexual and aggressive instincts, but starting early on in life, they must repress such desires, driving them away from conscious awareness. Some repressed desires do not disappear but unconsciously haunt our behavior and thoughts. Dreams, slips of the tongue, and neuroses are, Freud argued, distorted reflections of repressed desires that originate in childhood. Psychoanalytic practice aimed to uncover such hidden mental processes. Thus, dreams are the disguised expression of wish fulfillments. Like neurotic

symptoms, they are the effects of compromises in the psyche between desires and prohibitions in conflict with their realization. Slips of the tongue and similar everyday errors, Freud claimed, had symptomatic and thus interpretable importance. But unlike dreams they need not betray a repressed infantile wish yet can arise from more immediate hostile, jealous, or egoistic causes.

Another kind of everyday behavior Freud analyzed was humor. Seemingly innocent phenomena like puns are as open to interpretation as more obviously tendentious, obscene, or hostile jokes. The powerful and joyful response often produced by successful humor, Freud contended, owes its power to the release of unconscious impulses, aggressive as well as sexual.

Two assumptions were suggested by Freud to characterize his approach. The first states that all psychic processes are strictly determined (no accidents, chance events, or miracles can be referred to as explanations), the second that unconscious mental processes exist, and exert significant influences on behavior. These unconscious forces shape much of the individual's emotional and interpersonal experiences.

We all are ready to admit momentary, fleeting, childish, irrational thoughts, but we consider these experiences marginal. Psychoanalysis claims that they may be much more than trivial or marginal, and that unconscious processes are possibly the main determinants of observable behavior.

The emphasis on unconscious processes in personality can be summed up as follows:

1. Large parts of the personality are unconscious, and these are the more important ones.
2. Unconscious memory is the repository of significant early experience.
3. In an adult, unconscious ideas are projected, creating severe distortions of reality, especially interpersonal reality.

Freud did not invent the idea of the conscious versus unconscious mind, but he certainly was responsible for making it popular. The conscious mind is what you are aware of at any particular moment, your present perceptions, memories, thoughts, fantasies, and feelings. Working closely with the conscious mind is what Freud called the preconscious, what we might today call "available memory:" anything that can easily be made conscious, the memories you are not at the moment thinking about but can readily bring to mind. No one has a problem with these two layers of consciousness. But Freud suggested that these are the small and marginal. The largest part by far is unconscious. It includes all the things that are not

easily available to awareness, including many things that have their origins there, such as our drives or instincts, and things that are put there because we cannot bear to look at them, such as the memories and emotions associated with trauma.

According to Freud, the source of our motivations is unconscious, whether they be simple desires for food or sex, neurotic compulsions, or the motives of an artist or scientist. And yet, we are often driven to deny or resist becoming conscious of these motives, and they are often available to us only in disguised form.

Freud devoted much attention to the development of sexuality in the individual. He described how this development is prone to troubling maladjustments if its various early stages are unsuccessfully negotiated. Confusion about sexual aims or objects can occur at any particular moment, caused either by an actual trauma or the blockage of a powerful urge. If this fixation is allowed to express itself directly at a later age, the result is what was then generally called a perversion. If, however, some part of the psyche prohibits such overt expression, then, Freud contended, the repressed and censored impulse produce neurotic symptoms. Neurotics repeat the desired act in repressed form, without conscious memory of its origin or the ability to confront and work it through in the present.

One great insight we were led to by classical psychoanalysis is that the child is totally confused by the notion of parenthood and family relations. Learning that we have two parents and that father and mother are also man and wife is beyond the child's comprehension at first blush. This Oedipal confusion stays with all of us forever, processed, accepted, and sometimes denied. The denial of birth is no less important than the denial of death in the making of cultural fantasies. Both lead to much psychic tension, and sometimes to real violence.

Focusing on the prevalence of human guilt and the impossibility of achieving unalloyed happiness, Freud contended that no social solution of the discontents of mankind is possible. The best to be hoped for is a life in which the repressive burdens of society are in rough balance with the realization of instinctual gratification and the sublimated love for mankind. But reconciliation of nature and culture is impossible, for the price of any civilization is the guilt produced by the necessary thwarting of man's instinctual drives. Psychoanalytic ideas have been immensely influential in Western thought over the past one hundred years, since the inception of this intellectual movement by Sigmund Freud.

Psychoanalysis is a theory of struggle, conflict, and compromise, assuming the dynamic nature of human

behavior, always resulting from conflict and change. Additional assumptions reflect the idea of over-determination, and the multiple functions of behavior. The over-determination assumption states that any segment of behavior may have many preceding causes. This is tied to a developmental, or historical emphasis, leading us to seek first causes in any individual's personal history and unique experiences.

Psychoanalysis proposes a universal sequence of psychological development, which becomes a basic epistemological ordering of the world and of individual personality, culture, and humanity. The universal experience of the human infant includes a developing awareness of three realms, always in the following order: first, one's body and its experienced needs. Second, awareness of the existence of another human. Third, knowledge and emotional investment in relations between itself and other humans. All further experiences must be based on these early experiences, acquired in that order, and will be assimilated into that order. The existence of such a universal sequence cannot be challenged, and therein lies the attraction of psychoanalysis for those wanting to understand not only the human personality, but also human society and culture.

The problem of childhood is a central issue defining psychoanalysis. The infant's unrealistic drive for wish-fulfillment is supposed to be left behind by the adult, but childhood is always alive behind adulthood facade. The legacy of childhood is far from marginal, and it is co-existent with adult functioning. We can observe it on both the individual and the cultural levels.

Freud's ideas about development focus on what has come to be called psychosexual development, that is, the transformation, molding, and sometimes perversion of biologically determined erotic drives in early childhood. The focal point of psychosexual development is the Oedipus complex, woven around the child's attachment to its parents as love objects or identification models between the ages of 3 and 6. Early childhood experiences serve as historical precedents in every individual's life, and in the life of every human culture.

The psychoanalytic view of human motivation is often regarded as utterly pessimistic, but we have to admit that it is realistic. Judging by their conscious and unconscious drives, humans are undeniably nasty and brutish, aggressive, and infantile. However, beyond this bleak picture of immorality and perversity lies the capacity for sublimation, love and cultural creativity.

The psychoanalytic view of maladaptive behavior emphasizes its continuity with adaptive behavior, and leads to viewing pathology as a useful analogy of cultural structures. Moreover, maladaptive behavior is analyzed through the detailed recognition of defensive sequences,

that is, not only the final outcome – symptoms – but the internal sequences leading to it are carefully outlined.

The theory presents us with an ideal of flexibility and moderation which is presented, as opposed to rigidity which is pathological, but inevitable. Rigidity in the form of rituals and ritualized defenses become one the sources of analogies for religion. The analytic starting point of symptom and syndrome, and their unconscious background, serve as the model for looking at religion.

Psychoanalysis assumes the psychic unity of mankind, which is significant when we deal with cultural traditions. Universality is found at the most basic level of body, birth, sex, and death. This working assumption has a particular relevance to the phenomenon of religion. Universal themes in religious mythology, are the result and reflection of the psychic unity of mankind, which in turn is the consequence of common psychological structures and common early experiences shared by all mankind. The same basic psychological processes and complexes are expressed in individual products (dreams, stories, day-dreams), and in cultural products (art, literature, folklore, wit, religion, law, science), because these complexes are basic and central to human experience.

Freud's writings are among the most ambitious attempts in history to present a comprehensive interpretation of religion. The topics Freud dealt with include, first of all, a developmental theory of religion, for humanity as a whole and for each individual. Freud also attempted to explain the functions and consequences of religion, for both society and the individual.

Freud's theoretical explanation for the origin and existence of religion is based on certain presumed universal psychological experiences and processes: the universal experience of helplessness, the tendency for compensation through fantasy, and the experience of early relations with protective figures. Every individual is psychologically prepared by these universal experiences to accept religious ideas which are obviously culturally transmitted. The question about the world of spirits is: Does this world exist "out there" and if it does not where is it. The psychological answer given by psychoanalysis is that it exists within, in our own mental apparatus and our own mental abilities to fantasize and project. The world of spirits, the supernatural world unseen and somehow felt in religious experience, is a projection of the internal world. Psychoanalytic theory explains both the origin of supernaturalist ideas and their specific contents.

Freud's theory does not suggest that the individual creates his religion on his own, out of nothing, but that childhood experiences within the family prepare the individual for the cultural system of religion. Belief in omnipotent gods

is a psychic reproduction of the universal state of helplessness in infancy. Like an idealized father, God is the projection of childish wishes for an omnipotent protector. If children can outgrow their dependence, he concluded with cautious optimism, then humanity may also hope to leave behind its prevalent and immature fantasies.

Psychoanalysis has had more to say about religious actions than any of the various traditions in academic psychology. It is the one psychological approach to the understanding of religion which has had a major effect on both religion as an institution, and on the study of religion. Psychoanalytic approaches to the question of culture and religion, and to the question of individual integration in society, have affected all social science disciplines. The psychoanalytic study of religious beliefs and institutions has drawn considerable attention on the part of scholars in the fields of religion, history, sociology, and anthropology. Psychoanalysis is the only major psychological theory which offers an explanation of religion as part of a comprehensive theory of human behavior, in which religion is presented as an instance of general psychological forces in action.

In this area, as in many others, Sigmund Freud's writings offer a rich variety of hypotheses regarding various religious beliefs and practices. Some of the better-known hypotheses derived from psychoanalytic theory are the father-projection hypotheses, i.e., the idea that the images of the gods are derived from childhood experiences with paternal (and maternal) figures, and the super-ego projection hypothesis, i.e., the idea that the gods are a reflection and echo of the unconscious and severe conscience which all humans share.

Judging by their immense influence in all the academic fields which study religion, psychoanalytic ideas seem to be of truly enduring value for the psychological understanding of religion. We really have no other theory that matches the scope of psychoanalytic interpretations of culture and religion. Enlightening, that is the greatest compliment we can pay psychoanalytic ideas and that is exactly what psychoanalytic approaches wish to be. They represent the continuation of Enlightenment tradition in regard to human activities around ideas of spirituality and the sacred.

Freud, Sigmund, and Religion

Lorna Lees-Grossmann

Freud was notorious for his anti-religious stance. He seems to have gone out of his way to offend believers, referring to the “barbarous god of volcanoes and wildernesses whom I grew to dislike very much” (Freud, 1970: 102). Despite this, he accepts that in some cases the mild neurosis of religion was preferable to a more complex and distressing disorder, and argues the parallels between religion and psychoanalysis are striking.

Neurosis

Religion itself for Freud is a form of madness (Freud, 1995 SE XII: 269). He draws an analogy between the faith-based belief of the religious believer and that of the paranoid, who clings to his or her paranoid delusion in spite of any and all evidence to the contrary. He draws another between the ceremony and ritual associated with religious practice and the obsessive's need to engage in repetitive behavior. Religion can rescue people from an individual neurosis, although it does not cure them: it merely substitutes a universal neurosis for a personal one:

- ▶ In view of these similarities and analogies one might venture to regard obsessional neurosis as a pathological counterpart of the formation of religion and to describe

that neurosis as an individual religiosity and religion as a universal neurosis (Freud, 1995 SE XII: 11126–11127).

The distinction between religion and what is commonly accepted as neurosis is merely in the numbers of participants involved: the paranoiac indulges in a *folie à un(e)*, the religious in a *folie à tous*. The ritual inherent in religion makes it an obsessional neurosis: as a result of the unresolved Oedipus complex in the adult, the rituals of religion are aimed at propitiating the father and preventing his anger. Alternatively, religion can be seen as illusory: a wish-fulfilment through projection. A strong desire can be externalised and become a belief in the same way that, when we sleep, a strong wish-fulfilment is projected as a dream. In the case of Christianity, the prospect of eternal life is a fulfilment of the wish not to die.

Freud's assertion is that the Oedipus and Electra complexes are at the psychological core of all human beings. This sort of incestual tension necessarily has a negative effect on the family, and so the tension is neutralised through the transference of the desire for the parent onto a less divisive recipient.

In Christianity, God replaces the father figure, and Mary the Mother of Christ the mother. The desire to kill the parent and thus escape the threat of castration is also accounted for in Christianity, argues Freud, through the crucifixion of Christ as part of the Holy Trinity. Christianity also allows for the expiation of guilt through its transference onto Christ, the perpetual sacrificial lamb. Religion is a sign that the Oedipus complex has not been successfully overcome.

Transference

The key issue at hand here is that of transference: it is the mode of healing in both psychoanalysis and religion. Jung wrote of his first meeting with Freud: "Suddenly he asked me out of the blue, 'And what do you think about the transference?' I replied with the deepest conviction that it was the alpha and the omega of the analytic method, whereupon he said, 'Then you have grasped the main thing'" (Jung, 1954: 8).

In transference in psychoanalysis, the analyst takes on the role of the parent, which is the role taken on by God in religious belief. This parallel was not lost on Freud, who despite his avowed disdain for religion recognised its potential as a healing mechanism as well as a symptom of neurosis.

Freud's letters imply an uncertainty in his criticisms of religion that are not reflected in his work: he comments in a letter to Ferenczi that "I regard [*The Future of an*

Illusion] as weak analytically and inadequate as a self-confession" (Jones, 1962: 587). Also, when he found analogies to be insufficient proof against religion he searched for historical proofs, and delayed the publication of *Moses and Monotheism* because he was unable to find them and was therefore displeased with the work: "there is also the consideration that my contribution does not seem to me well founded enough nor does it please me much. So it is not the right occasion for a martyrdom. Finis for the time being" (Jones, 1962: 622).

Freud attempted to dismiss the historicity of religion *a priori* with no regard for any information he might have received suggesting alternative theories to his already-concluded conclusion. For Freud, the belief in God is understandable to an extent, although he considered the belief to be unworthy of modern human beings and "to be understood on the pattern of the individual neurotic symptoms familiar to us" (Freud, 1995 SE XXIII: 58):

- ▶ We understand how a primitive man is in need of a god as creator of the universe, as chief of his clan, as personal protector . . . A man of later days, of our own day, behaves in the same way. He, too, remains childish and in need of protection, even when he is grown up; he thinks he cannot do without support from his god (Freud, 1995 SE XXIII: 128).

What he found objectionable was not that these early and primitive people chose to accept the existence of a powerful God who would protect them, but that the character of that God was changed to suit their own changing purpose.

- ▶ [T]he Persian government of Egypt (of the fifth century BC) conveyed information to them of the new rules of worship issued from Jerusalem. Going back to earlier times, we may say that the god Yahweh certainly bore no resemblance to the Mosaic god. Aten had been a pacifist . . . No doubt Yahweh was better suited to a people who were starting out to occupy new homelands by force (Freud, 1995 SE XXIII: 63).

Fundamentalism

Louis Hoffman · Erica Palmer

The term fundamentalism has been associated with a variety of meanings since its inception into the English language during the early twentieth century through Christianity. At the outset, it was intended to convey a belief in the need to return to *the fundamentals of faith*. Increasingly, fundamentalism has been associated with a narrow, rigid approach to religious belief across various world religions. Fundamentalism, once a Christian term, can now rightly be applied to Islamic, Buddhist, Jewish, Hindu, and other forms of fundamentalism. When used in popular culture today, it often is intended to have a pejorative connotation to it.

Fundamentalism as a Reaction to Modernism

Fundamentalism has often been understood as a response to modernity and the secularism that accompanied it. Several threats to religion accompanied modernity (Hoffman and Kurzenberger, 2008). First, religion was displaced from its privileged position. In premodern times, the church and religious authority retained the most influential positions of power in shaping the masses. As modernism emerged, scientists, academics, and politicians emerged as the new sources of influence. Fundamentalism, in part, can be understood as an attempt to reclaim an authoritative place for religion.

Second, religious ways of knowing, which were generally based in claims of revealed knowledge from God or an ultimate authority, were called into question. In premodern times, religion did not need to defend its ways of knowing; they were a given. Fundamentalism served as a way of clearly defining what should be a given, or a fundamental of faith, that does not need to defend itself against scientific scrutiny.

Third, religion was changed by modernity. In premodern times, faith was sufficient. However, in modern times

faith needed to be supported by science and rationalism. Systematic theology was replaced by apologetics. During modernity and into postmodernity, there was an increasing popularity in creationism and popular books, such as *The Case for Christ* by Strobel (1998), which claimed scientific evidence of the truth of religion. Although fundamentalism often incorporates selectively chosen scientific evidence to support its position, it also generally claims that there is no need for such evidence.

The September 11, 2001 Terrorist Attacks and Fundamentalism

Although fundamentalism had already begun accumulating many negative associations, the terrorist attacks on the Pentagon and World Trade Center Towers in the United States on September 11, 2001 powerfully impacted the way fundamentalism was understood. The terrorists were labeled “Islamic fundamentalists” and “Islamic extremists” by many in the news media and academic community. Through this, extremism and fundamentalism united as synonymous terms. The number of individuals who would self-identify as fundamentalists since this time has decreased.

The contemporary usage of the term fundamentalism is often used to distinguish a particular way of being religious or type of religiosity. Psychological measures, such as Fundamentalism Scale-Revised and Religious Fundamentalism Scale, have been developed to identify fundamentalism (Hill and Hood, 1999). In these, fundamentalism is conceived as more absolutist and rigid. Fundamentalism is defined as being related to a less critical and more literal interpretation of sacred texts, more antagonistic and critical views of other religious groups, defensive of the correctness of a particular religious group or belief, and increased evangelistic fervor.

Research on Fundamentalism

Since September 11, 2001, psychological theory and research attempting to understand and explain fundamentalism has become prolific. Most of this research can be seen in two broad categories: social-psychological research and personality research. Common to both approaches is the assumption that fundamentalism is often personally and socially dangerous and that fundamentalism often is a product of social and psychological forces more than religious factors.

Social psychological research emphasizes the role of the group or culture (Rogers, Loewenthal, Lewis, Amlot,

Cinnirella, et al., 2007). Terror management theory, one social psychological approach, suggests that mortality salience (i.e., reminders of death) increase in-group identification; these in-groups are often conservative or fundamentalistic. Friedman (2008), for example, found an increase in fundamentalism associated with mortality salience. Self esteem, however, is conceived as an intervening variable. Low self-esteem increases the influence of mortality salience while high self-esteem serves as a buffer therefore lowering the impact. From the social psychology perspective, various personal factors such as psychopathology, tendencies toward conformity, and self esteem may interact with contextual factors, such as mortality salience, to increase the likelihood of one developing a fundamentalist perspective.

Hood, Hill, and Williamson (2005) represent one of the most thorough perspectives from the individual or personality side of fundamentalism. This is a more balanced perspective on fundamentalism, recognizing both the positive and negative sides of fundamentalism. From a more sympathetic viewpoint, fundamentalism often is part of a search for meaning and community. In general, however, fundamentalism has been associated with more negative concepts including authoritarianism, a rigid cognitive style, narrow-mindedness, and defensiveness against doubt (Spilka, Hood, Hunsberger, & Gorsuch, 2003).

Empirical research has also associated fundamentalism with a number of outcomes. For instance, it is generally thought that fundamentalists have more oppressive patriarchal worldview, increased likelihood of prejudice, and domestic violence (Spilka, Hood, Hunsberger & Gorsuch, 2003). As has already been discussed, there is also a frequently hypothesized link between fundamentalism and terrorism.

Conclusion

A complete understanding of fundamentalism must take into consideration the personal, social/cultural, historical, and religious factors that contribute to the development of fundamentalism. From scholarly and ethical viewpoints, it is necessary to take into consideration both the positive aspects of fundamentalism as well as the potential dangers of fundamentalism when associated with more extremists and militant groups.

G

Gardens, Groves, and Hidden Places

David A. Leeming

Gardens, Groves, and other such “hidden” places are often sacred in religious stories. Gardens and Groves and other hidden places can represent an earthly paradise, as in the Garden of Eden of the Book of Genesis in the Hebrew Bible. Like temples and walled cities, they are protective places, metaphors for cosmos, against ever-threatening chaos. They are places of birth or rebirth. Jesus is born in a humble stable; the Buddha is born in a grove. Muhammad receives revelation in a cave, the Buddha finds enlightenment under a tree in a grove, and Jesus prepares for his passion in the Garden of Gethsemane.

Psychologically, the sacred space in question may be said to represent the pre-conscious mind, the center of the world for the individual, the place where the ego resides and in which it achieves revelation or awakening to Self. It is also the place that can be threatened by outside forces such as those represented in the Abrahamic tradition by the Devil, who, in a sense, shares the garden – the psyche – with the individual.

Gayatri

Fredrica R. Halligan

One of the most ancient of Hindu goddesses, known to have been worshipped as “the Mother of the Vedas.” She is extremely powerful and is depicted with five heads (for the five elements of creation: earth, water, fire, air and ether) and ten arms. In Hinduism goddesses are important because they represent the power (*shakti*) of their male counterparts.

The *mantra* (q.v.) dedicated to *Gayatri* is said to be the most potent of all *mantras*. It is 14-word prayer for enlightenment and is also spoken whenever a devotee is endangered. Because of its power, the *Gayatri mantra* should not be treated casually.

Psychologically, *Gayatri* and her *mantra* can be beneficial for twenty-first century spiritual feminists both as a feminine god-image and as a source for prayer and/or meditation.

Gender Roles

Philip Browning Helsel

Gender roles refer to the social roles with which a person identifies relating to their gender. As social roles, they are “shared expectations that apply to persons who occupy a certain social position or are members of a particular social category” (Eagly, 2000: 448). Gender roles exist at the intersection between subjective experience and cultural understandings of what it means to be a man or a woman, referring to a set of conditions that are broadly consensual within a culture. As such, gender roles are “injunctive norms” which depict how persons should behave, “[producing] social disapproval and efforts to induce compliance” if they are broken (Eagly, 2000: 449).

However, gender roles imply more than rational self-conscious participation in societal patterns. They also include “general mannerisms, deportment and demeanor; play preferences and recreational interests; spontaneous topics of talk in unprompted conversation and casual comment; content of dreams, daydreams, and fantasies; replies to oblique inquiries and projective tests; evidence of erotic practices, and finally, the person’s own reply to direct inquiry” (Rudacille, 2005: 105).

Gender roles have a close, but not equivalent relationship to gender identity. Gender roles fluctuate between the poles of identity and action, self-identification and the way one is defined by others. The concept of gender roles refers not strictly to whether one thinks of oneself as male or female, but the way this conviction is played out in the cultural arena, including “situational constraints” that can maintain behavior that “seems fitting” to men and women (Rudacille, 2005: 56). These cultural patterns tend to reinforce the needs of a particular society. Societies frequently cultivate “natural” explanations of gender which can be seen to shore up certain social practices. This tendency has been called the “sexual division of labor,” and has been linked to wider economics needs and interests (Chodorow, 1978: 3).

“Natural,” or essentialist, explanations of gender tend to describe men and women as possessing fixed qualities which inevitably lead to certain kinds of behaviors. In this “sex/gender scheme...[people] identify sexual difference with both biological/physiological dimensions (sex), and dispositional/psychological and social characteristics (gender)” (Jones, 2000: 27). The common epigram “anatomy is destiny” is a well-known distillation of this concept. The

primary challenge to this view has come from the feminist movement in Western societies at the end of the nineteenth century and beginning again in the 1960s (Rudacille, 2005: 43). The critique of gender has varied in degree, with some suggesting that the “raw material” of biological sex is the fundamental baseline which is then shaped by culture and circumstance. According to these theorists, the biological basis remains an “unalterable...given” that is fixed at a “chromosomal and genetic” level (Jones, 2000: 35). Others suggest that the cultural construction of gender is even more thoroughgoing than this, and that, on an epistemological level, culture determines everything we know about being man and woman. At this level, the self is seen as a “space through which cultural constructs move...are contested and changed” (Jones, 2000: 37).

Commentary

Psychoanalysis has placed a strong emphasis on the psychic impact of the memory traces of parents upon the development of the child. These memory traces are laid down through the activities of care for children and maintenance of the home, a province of activity that is adjudicated by gender roles (Bollas, 1987: 24). The traditional oedipal story, which involves a boy’s desire for his mother and rivalry with his father, has been expanded in a variety of directions as gender roles have become more flexible, with the understanding that this earlier model depended upon the father as the breadwinner and the mother as full-time homemaker (Mitchell and Black, 1995: 257). More recent psychoanalytic explorations of oedipal conflict and sexual orientation have suggested multiple permutations of this myth, based in part upon rapid changes in gender roles in Western societies (Chodorow, 1994: 42). Psychogenic explorations have demonstrated the manner in which gender roles are internalized through the “production” of men and women by the kind of parenting that they receive as children (Chodorow, 1978: 36).

The parents’ practical activities of childcare contribute directly to their child’s image of God. In Freud’s projection theory, the image of God arises out of our experience of and ongoing need for the idealized father of childhood. Freud calls God a “father substitute...a copy of the father as he is seen and experienced in childhood,” before one’s ideal image of one’s father is challenged (Freud, 1923/2001: 46). D. W. Winnicott shifted the psychic weight from father to mother, suggesting that religious belief was created in the same environment of care that transpired between the mother and child (Winnicott, 1953/

2005: 18). Ana-Marie Rizutto agreed that attachment to one's parents is reflected in one's images of God, but insisted that Freudian theory must leave room for religious images to develop as one's understanding of one's parents change (Rizzuto, 1979: 43). Scholars such as Diane Jonte-Pace and Margaret Hebblethwaite have contributed to the understanding of God that derives from the experience of motherhood, in direct contrast to Freud's emphasis on the Divine Father (Miller-McLemore, 2001: 453, 466).

It seems that further work must be done, following feminist thought, which would take into account the impact of shifting gender roles upon the psychological health and religious beliefs of modern persons. It has been demonstrated that mothers are spending more time away from the home, with fathers increasing their active care of children, even if not enough to compensate for the absence of the mother (Lamb, 2000: 339). If mothers are less involved in childcare and fathers somewhat more involved in both childcare and caring for the home, what might be the psychological and religious consequences for the development of children? Recent research points to the fact that children who are raised in more androgynous environments experience "increased cognitive competence, less sex-stereotyped beliefs, and a more internal locus of control" (Lamb, 2000: 340).

As guarantors of societal order, traditional religions have frequently reinforced gender roles through appeals to the authority of tradition and scriptures. In such mythology, men have been deemed as spiritual, while women seen as carnal, with bodies that need to be managed and controlled by religious authority (Hawthorne, 2007: 1255). Women have only begun to be allowed into leadership positions in these religions in the last half of the twentieth century (Hawthorne, 2007: 1254). In recent decades, "smaller religious bodies with more conservative convictions about the roles of women (such as the Jehovah's Witnesses, some Reformed churches, Anabaptists, and Mormons) [have been] marked by the greatest inequality between men and women" (Christiano, 2000: 53). At the same time, in Mexico, religion has been an avenue for freedom from abuse and exploitation, as women have found an opportunity in religious communities to develop identities separate from their alcoholic or abusive husbands (Fortuny Loret De Mola, 2000: 365). Furthermore, women have frequently been involved from the inception in new religious movements, and invited to take quite active roles within them (Hawthorne, 2007: 1255).

Gender roles are changing in many societies around the world, with women experiencing more freedom and education, and men more involved in activities such as

childcare and the maintenance of the home. These changes lead to a sense of uncertainty, especially since gender roles reflect deep-seated beliefs about the nature of reality. It has been argued that for men and women, more gender flexibility means an increase in mental health and well-being, as well as a decrease in involvement in fundamentalist religion. At the same time, even in societies where women have increasing rights and responsibilities, they are often faced with "different expectations" than men even in the "same workplace role" (Eagly, 2000: 448). While fathers are becoming more involved in the care of children, they still often take less responsibility for children than mothers, and placing women in the difficult position of juggling responsibilities at work and home (Lamb, 2000: 339). It is still far from clear how these changes will be adjudicated in a rapidly shifting society.

Genesis

Ingeborg del Rosario

The book of Genesis is the first book of the Jewish Torah and Christian Scriptures. The word “genesis” is of Greek etymology, meaning origin or birth, and refers to the first verse of the book: “In the beginning, when God created the heavens and the earth. . .” (Genesis 1:1). *The book of Genesis* has 50 chapters, which are generally divided into two sections: primeval history (Genesis 1–11) and the narrative cycles of Abraham, Isaac, Jacob and Joseph (Genesis 12–50). Genesis 1–11 contains the well-known accounts of the creation story (Genesis 1–2), the fall of Adam and Eve (Genesis 3), the murder of Abel by his brother Cain (Genesis 4), the story of Noah and his ark, the great flood and the divine promise against destruction of every living creature symbolized in the rainbow (Genesis 6–9), and the confusion of languages around the building of the tower of Babel (Genesis 11).

While authorship of the *book of Genesis* was popularly attributed to Moses, biblical scholars recognize it as a redaction from four different sources or traditions. Taken as a whole or a single work of literary unity, the *book of Genesis* encompasses universal themes of creation, the existence of envy and hatred, sin, and strife, violence and evil, wholeness and brokenness, intimacy and isolation, independence and reliance, work and rest, call and response, security and sojourn, conflict and resolution, faith and doubt, hope and despair, the sacrifice of life and the promise of life restored, the destruction and fecundity of generations, birth and death. The existence of the *book of Genesis* acknowledges the totality of universal experience, the breadth and depth of human reality. It embraces the presence of the Divine Who creates and sustains, accompanies and wrestles with, is angered by yet remains constant and faithful to humanity that is formed in godly image and likeness.

The recognition of origins and beginnings in the *book of Genesis*, of creation from chaos, of evil, sin and

destruction, and the divine promise of faithfulness, resonates with the depth understanding of human dynamics as shaped and rooted in early personal history and developmental origins. While some therapeutic interventions may focus on the here-and-now of current thoughts, feelings and behaviors, the psychoanalytic perspective recognizes the fundamental importance and value of encountering the genesis of the individual and attending to sources of childhood wounding and root experiences of trauma, noting how these contribute to the complexity of the dynamics of the individual’s life experience. The *book of Genesis* focuses primarily on the story of one lineage, recounting the history of first generations and their descendants. A psychodynamic orientation to treatment regards the historical dimension of self with comprehensiveness and depth, considering family of origin influences on the formation and development of the individual. It also acknowledges the reality of trans-generational and intergenerational transmission of trauma, addictions, psychological wounding and illness. The *book of Genesis* presents the Divine Being neither absent nor distant but present, at times in the space of silence and attuned rest yet always creatively emotionally and relationally engaged in the journey of the spiritual ancestors. The *book of Genesis* also recognizes the interweaving congruence and evolution of past, present and future. Movement and progression in psychoanalytic treatment involves often intense and complex processes of working through transference and counter-transference in the safety of the holding environment and consistency of frame of the therapeutic relationship. The space of silent yet attuned presence held by the analyst holds and receives communication that is verbal, at times non-verbal, with unsymbolized expressions often reenacted from unconscious or fragmented relational dynamics of the client’s past. Analytic listening is creative and engaged, relationally sensitive, aware of and wrestling with varied nuances and symbols, dreams, fantasy and imagery, the multiple layers of meaning and yet unformulated experiences, all the while attuned to the being of the client, past unfolding into present, and the limitless play and possibility of the self-becoming in the future.

Genetics of Religiosity

Gilbert Todd Vance

The field of behavior genetics is concerned with identifying genetic and environmental effects, which are sources of individual differences in behaviors and traits. While it may at first appear that religiosity would not be influenced by genes, studies have shown that genetic effects contribute to individual differences in a wide array of traits and behaviors, including social attitudes, personality, vocational interests, IQ, and religiosity. The idea that religiosity is a heritable trait is not a new one. In his 1869 book *Hereditary Genius*, Sir Francis Galton wrote that “. . . a pious disposition is decidedly hereditary” (Galton, 1869/1978: 274).

Twin studies, which are one method of observing genetic and environmental effects, take advantage of the fact that monozygotic (MZ) twins share 100% of their genes, while dizygotic (DZ) twins share on average 50% of their segregating genes and are no more alike genetically than non-twin siblings. Therefore, differences in MZ twins provide evidence of environmental effects whereas differences in DZ twins can result from the effects of genes or the environment. A greater similarity in MZs than DZ twins is generally seen as evidence for a genetic contribution to the observed behavior or trait. In twin studies, the variance observed in a trait can be partitioned into the latent variables additive genetic effects, common environmental effects, and unique environmental effects. Common environmental effects are those environmental effects that make twins more similar (e.g., a shared upbringing in the same household) while unique environmental effects make twins different from one another (e.g., an experience had by one twin but not the other).

Behavior genetic studies have shown that nearly all psychological traits, including religiosity, are moderately to substantially heritable. A small number of twin studies

to date have shown that the degree of observed genetic influence on religiosity is affected by variables such as age, sex, and what aspect of religiosity is being measured. Specifically, at least one twin study has found less genetic influence on religiosity at younger ages and a larger genetic influence on the expression of religiosity in adults. Several twin studies have reported differences in the magnitude of genetic effects on religiosity in females compared to males. Unfortunately, there are not enough twin studies to make definitive conclusions about the relationships between additive genetic effects and age and sex on the expression of religiosity. The degree of genetic influence on the expression of religiosity also appears to be influenced by what specific aspect of religiosity is measured. Studies examining certain single-item measures of religiosity such as religious affiliation (i.e., whether one is Protestant, Catholic, Jewish, Muslim, etc.) have found little or no evidence for genetic effects. On the other hand, studies that have used multiple items to more broadly measure the religiosity construct have typically found evidence for genetic effects.

These findings must be viewed within the context of the limitations of twin studies. First, very large sample sizes are typically needed to detect common environmental effects, that is, the effect of those experiences that make twins similar, also called the family environment. Most twin studies are underpowered to detect the influence of the family environment. Furthermore, two twins may experience the same environmental event but respond differently to the event. This event would be represented in a twin study as a unique environmental effect, although it was experienced by both twins in the same environment. Despite these limitations, a small number of studies to date suggest that certain aspects of religiosity are influenced by additive genetic effects.

Genitals and the Cult of Fertility

Sex and Religion

Glossolalia

Kenneth L. Nolen

Glossolalia is derived from two New Testament Greek words: *glossai* meaning “tongues” or “languages” and *lalien*, “to speak.” Glossolalia or speaking in tongues has most often been identified with Pentecostal and

Charismatic faith traditions. Glossolalia is usually but not exclusively a religious phenomenon. Glossolalia consists of words and utterances made by an individual that resembles a language unknown to the person speaking. Individuals practice glossolalia in private or public worship settings in which the speaker may also be in an excited psychological state or may enter into a blissful and peaceful meditative or prayer like stance. Groups within Pentecostal and Charismatic movements agree that Glossolalia is a manifestation or gift of the Holy Spirit, but disagree as to whether or not it is the certifying initial evidence of baptism in the Holy Spirit.

Pentecostals and Charismatics believe that through the influence and direction of the Holy Spirit they are speaking a spontaneous and unpremeditated heavenly language praising God or giving a prophetic word. They teach that glossolalia or speaking in tongues is a distinctive gift as a result of the baptism in the Holy Spirit. What they do not agreed upon is whether Glossolalia is the initial evidence proving baptism in the Holy Spirit or if it is a distinctive and desirable gift but that other manifestations may indicate that a person has been baptized in the Holy Spirit.

Glossolalia and the doctrine of the Baptism in the Holy Spirit are based on events occurring on Pentecost as recorded in Acts 2:1–4. This event was predicted by Jesus to the assembled men and women in the Upper Room (Luke 24:49) and again just before he ascended into heaven (Acts 1:4–5; and Acts 1:8). When the day of Pentecost came, the disciples were meeting together when the foretold event occurred. The author of Acts states that, “Suddenly a sound like the blowing of a violent wind came from heaven and filled the whole house where they were sitting. They saw what seemed to be tongues of fire that separated and came to rest on each of them. All of them were filled with the Holy Spirit and began to speak in other tongues as the Spirit enabled them.” (Acts 2:2–4).

Glossolalia and the charismata, spiritual gifts, of the Holy Spirit were paramount in the birth and growth of the fledgling church during the first and second centuries. By the time of Origen in the third Century and Augustine in the late fourth and fifth, it is clear that Church leaders considered the charismata as attributes only for the early Church. Augustine established the belief held by many today that the charismata, including glossolalia, ended with the deaths of the original apostles.

Notwithstanding Augustine’s belief, there is evidence of the continuation of glossolalia and the charismata of the Holy Spirit throughout the more than 2000 years of Christian Church history. However, the start of the modern Pentecostal movement is generally credited to Charles

Fox Parham and the students of Bethel Bible College in Topeka, Kansas in the early 1900s. From Topeka across the United States including the Azusa Street revival held by William Seymour, a new Pentecostal revival had begun.

The most significant tenet of faith derived from the revival at Topeka and reaffirmed at Azusa was the verbalization that glossolalia or speaking in tongues was the biblical initial evidence of Holy Spirit baptism. This monumental doctrine offered an objective criterion for the seeker of the baptism in the Holy Spirit and others to determine whether that event had occurred or not. This doctrine shaped the modern Pentecostal movement as it spread across denominational lines, establishing new denominations and non-denominational faith groups until it is now the largest and fastest growing Christian religious movement worldwide.

Commentary

Glossolalia is not limited to Christianity or to religion. Ecstatic utterances similar to those used in the first century church at Corinth were also found at the oracle of Delphi, a shrine of the Greek god Apollo. Some consider the chants of voodoo witch doctors, African animists, and the Tibetan Buddhist Monks, the prayers of Hindu holy men, and the basic primeval sounds produced by others in their religious setting as glossolalia. Many of these worshipers make sounds and utterances that approximate purported languages found in the glossolalia of Pentecostal and Charismatic worship services. The difference is source and content. Pentecostals and Charismatics believe that any glossolalia not originating from the Holy Spirit and not worshipping God and Jesus to be a demonic counterfeit.

Glossolalia can occur in some known psychiatric conditions such as schizophrenia and manic-depressive psychosis or as the consequence of neurological disorders. Earlier psychological studies viewed glossolalia as a byproduct of an unhealthy mind or a personality disorder. Some researchers viewed glossolalia as hysteria, mass hypnosis, regression, an altered state of consciousness, or a learned behavior. Recent psychological studies have successfully challenged these views and have shown that glossolalia is a legitimate religious activity and not psychopathological. Generally, Pentecostals who speak in tongues have a healthy and normal personality and speaking in tongues may be conducive to good physical as well as mental health. Some practitioners claim that glossolalia may relieve psychopathology. However, a major study of religious glossolalia concluded that there is no consistent evidence supporting curative effects.

Linguists in recent years have made studies of glossolalia with some claiming that Pentecostal glossolalia are languages that can be understood by anyone who knows the language. Other linguists maintain that the sounds and utterances of glossolalia are actually unrelated syllables of the speakers own known language and are not a true language. Early Pentecostals believed that glossolalia was given to the Church for the purpose of world evangelism. Many of them left for foreign mission fields fully expecting the Holy Spirit supernaturally to give them the language of the native peoples. This initial expectation and the resulting experience was a bitter disappointment to aspiring missionaries who did not want to invest years in language study. Most Pentecostals have come to the realization that it is not God's divine purpose to bestow languages for missionary work and have had to reevaluate the biblical understanding of glossolalia. Glossolalia is not a human language and cannot be interpreted or studied as a human language. Glossolalia is a language of faith. The person speaking in tongues is speaking in an unknown language from the soul or spirit directly to God.

Gnosticism

Marta Green

Origin of Gnosticism

The word “Gnosticism” derives from the word *gnosis*, the Greek word for knowledge. Gnosticism has its roots in pre-Christian Jewish and Hellenistic pagan thought that emerged around the Mediterranean in the first centuries CE. Christian Gnosticism is based on the belief in secret knowledge as a means to salvation, not the death and resurrection of Jesus. This belief made Christian Gnostics heretical in the eyes of the early church.

When the Gnostics spoke of knowledge, it was specifically the knowledge of God to which they were referring. They refer not to an objective knowledge of God, but a profoundly subjective knowledge in which the knower is radically transformed both by God and by the very experience of knowing. German philosopher, Hans Jonas (1903–1993) wrote one of the first texts on Gnosticism: *The Gnostic Religion* (1958) written before he had access to the Nag Hammadi scrolls. He writes:

- ▶ “Knowledge” is not just theoretical information about certain things, but is itself, a modification of the human condition, charged with performing a function in the bringing about of salvation. . . the ultimate “object” of gnosis is God: its event in the soul transforms the knower himself by making him a partaker in the divine existence. Thus in the more radical systems like Valentinian the “knowledge” is not only an instrument of salvation but itself the very form in which is the goal of salvation, i.e., ultimate perfection, is possessed (Jonas, 2001: 35).

Theology of Gnosticism

The main theological tenet of Gnostic thought is the radical separation of the all-good, all-light transcendent God from the dark, evil world. The transcendent God did not create the world, nor intervene in it. The cosmos was instead made and governed by rulers or Archons who ruled humans, body and soul, entrapping them in natural passions so that they would never escape their power by returning to the Transcendent God. Archons were often named by the Hebrew names for God: Iao, Sabaoth, Adonai, Elohim, El Shaddai. The name of their leader

was the Demiurge, who was “often painted in the distorted features of the Old Testament God.” The name for the tyrannical world-rule is *heimarmene* (Jonas, 2001: 44–45).

Such a theology could not help but lead to a radical dualism. Though the Archons ruled humans body and soul, making them unconscious of their true nature, there was the chance that humans could be enlivened through a *pneuma* or spark from the Transcendent God. The spark could not leave the Transcendent God directly because this God does not intervene in human life, but the Gnostics believed there was a messenger able to leave the Transcendent and plant a spark in the human soul. This is a Being of knowledge and light, in existence even before the beginning of creation that is able to enter the world as a messenger, outwit the Archons and bring knowledge to slumbering humanity. We see references to this concept in the personification of “Sophia” (Proverbs 3:13–20) in the Hebrew Scriptures, the hymn of “The Word” in the prolog to the Gospel of John (John 1: 1–18) and, of course, the person of Jesus of Nazareth. When humanity receives this knowledge, then they are able at death to escape the powers of the Archons and to rise to the Transcendent God (Jonas, 2001: 44).

As Gnosticism was a theology of emphasizing how the evil gods governing this world separate humans from their true home with the Transcendent God, much of Gnostic literature was concerned with the question of how humans got separated from the Transcendent God in the first place. One of the best known pieces of Gnostic literature is the *Hymn of the Pearl* which describes the journey of the soul as a royal child’s journey from heaven to retrieve a pearl in the bottom of the sea. The pearl is round and thus whole, luminous and created by layering over an irritant; thus the perfect symbol of the self. When the child retrieves the pearl, he returns to his true home in the sky where he is lauded and given his rightful place.

The Gospel of Thomas

For centuries Gnostic literature was known mostly through early Christian polemics against it, but in 1945, 12 jars containing scrolls were found in a cave in Egypt. These texts have come to be called the *Nag Hammadi Library*, written about 350–400 CE and probably hidden in the cave at a time of persecution. The library contains a number of theological texts, alternative gospels

and poetry such as, “Thunder Perfect Mind.” The best known writing from the Library is the Gospel of Thomas, a Gospel purportedly written by Jesus’ twin brother. There is some debate if this is actually a Gnostic text, because it contains no cosmology, which dominates many Gnostic writing, but the Gospel of Thomas does proclaim salvation by knowledge and never mentions the passion and death of Jesus. The Gospel includes much material found in the synoptic Gospels, plus additional material, often about knowledge. For example: #5 “Jesus said, Know what is in front of your face, and what is hidden from you will be disclosed to you. For there is nothing hidden that will not be revealed.” Probably the best known passage from the Gospel: #70 “Jesus said, ‘If you bring forth what is within you, what you have will save you. If you do not have what is within you, what you do not have within you [will] kill you’” (Robinson, 1990).

Gnosticism and Psychotherapy

Gnosticism is no longer an active religion, but the search for the secret knowledge that will transform informs studies in philosophy, theology and psychology. Gnosticism holds in common with psychotherapy the belief that meaning is internal, that words of themselves can alter the human condition, and that secret knowledge, be it spiritual or psychoanalytic, transforms. Both Gnosticism and psychotherapy undertake the inner journey to find the self.

God

David M. Moss III

The word “god” is an Anglo-Saxon term of Teutonic origin meaning “one who is greeted” as the object of religious worship. The conception named God is an analogical expression pointing directly toward incomprehensible mystery. That mystery is to be greeted as the inconceivable ultimate Being who ignites all life. God is the creative source of existence within and beyond time and space. God is self-sufficient, absolute spirit, eternally transcending and pervading every dimension of reality.

Philosophy

In western philosophy there are three classical arguments for the existence of God. (1) The Teleological Argument asserts that the universe exhibits both design and purpose. Objects, persons and events have an aim or goal. Their relationship is fashioned by God who guides and directs them toward the fulfillment of their natural directions. That is to say, God exists as the purposive cosmic designer of all that has been, is and will be. (2) The Cosmological Argument contends that the universe could not have come into existence by itself. There is a first cause of all existence, a cause that is uncaused. This primary cause must be God because nothing but God could exist without being caused. (3) The Ontological Argument insists that God is the most perfect being possible and, since that which is perfect but lacking existence is less than perfection that does exist, God exists. Barrels of medieval ink have saturated countless volumes on each of these arguments – many in refutation. In general, modern philosophy believes that the existence of God cannot be proven or rationally demonstrated.

Anthropology

The discipline of anthropology studies religion as belief in a supernatural or non-empirical force, and the action patterns related to that belief. God, as an object of religious worship, is evolutionary. Anthropology, with the support of archeology, suggests that the basic conception of God lies in the awareness of numinous which developed into primitive tribal animisms and sympathetic magic. These tribal beliefs and practices became more articulate as polytheisms developed. The Graeco-Roman

pantheon is a prime illustration of the view that there are many gods affecting human history. Henotheism is a species of polytheism exemplified by ancient Judaism. It is the belief in one God in the presence of many others. The worship of such a god is monolatry.

Monotheism developed as a reaction to polytheism. For instance, classical Jewish monotheism developed out of henotheism as did its derivatives, Christianity and Islam. The foundation of Islam is a conviction that there is no God but Allah and Muhammad is his prophet. Muhammad drew upon Jewish and Christian resources in the design of a monotheistic belief system for Arabia to spread worldwide. He differed radically from Jesus the Nazarene in that Muhammad never claimed to be God or expected that he would be resurrected by Allah. On the one hand, Islam claims Muhammad, though not divine himself, was divinely inspired more than anyone in human history. He was also the driving force of *jihad* (an internal effort of reform) and, most importantly, Allah's secretary for the Koran. On the other hand, Christianity claims that the God of the Jews was physically articulated in the historical Jesus whose resurrected personality or Holy Spirit became a Real Presence directing people toward the mindfulness of love, as well as the value of collective worship in the assembly called church – the metaphorical house of God. Conceptually, this monotheistic Trinity was strongly enabled by Greek philosophy which clarified “substance,” or *ousia*, so that a model of three persons of the same property or nature reveal God, like expressions or manifestations of water in liquid, ice and steam. This unity of Three-in-One and the One-in-Three is eternal and immutable. Christianity claims that Jesus' relationship with God and the Holy Spirit is a monotheism of metaphysical unity. God became a specific man who lived through and beyond death leaving his Holy Ghost or personality to guide disciples into the mindset of God's will or kingdom.

Psychology

Philosophy and anthropology are components of psychology, a science that concentrates on the mind and behavior of living beings. As a perspective and a discipline, psychology centers on the mental and behavioral effects of believing in God. In this instance, it is the conceptual reaction or belief that matters and not the reality or nonexistence of a deity. For Freud, the founder of modern psychology, belief in God could be explained via problematic relationships with father figures. His argument rests on an illusionary model of God growing out of the Oedipus Complex. Many depth-psychologists disagreed with this reductionism. In general,

psychiatry, psychoanalysis and psychology now agree that God concepts develop out of a matrix of intrapsychic and interpersonal components. As a result, most social sciences approach the subject of God with less anthropomorphism than ever before. This is most evident in the growth of spirituality as a dimension of strength and comfort embraced by modern Health Care services and contemporary pastoral theology.

Theology

The current emphasis on spirituality is not a unique insight of postmodernism. In many respects it is a consequence of God being the object of intractable religious customs and symbols. When religion attempts to define God literally, faith is subordinated to reason. Anthropomorphism and idolatry are common results, as well as descriptions of God that may or may not be logical. God, in such instances, is usually portrayed as a noun who sustains mankind in the face of threats and tragedies. This mindset commonly fails to recognize God as a verb revealed in ethical mindfulness and humane behavior.

Theology, as a discipline, seeks to articulate dynamics, properties, characteristics or attributes of God that personally involve human beings whether they know it or not. However, these divine traits are not definitive. To acknowledge God as the “creator,” “redeemer” and “sustainer” is a descriptive interpretation but not a definition in any complete sense, for God cannot be comprehended. Yet there are characteristics of God that are absolutely central to traditional theology.

For a theist, the three essential characteristics or properties of God are: (1) omnipotence, or God's infinite power to create, conserve and destroy anything, anywhere at any time; (2) omniscience or the knowledge of all that is possible to know; and (3) omnipresence or being everywhere without spatial necessity. These absolute properties, along with God's timelessness and perfect freedom, naturally raise questions around events of tragedy, illness and death. Such queries are the focus of theodicy, a dimension of Natural Theology that attempts to justify God's benevolence and justice in a world where misery and evil exist as constant challenges to human development and moral growth.

The fundamental component of theodicy is Providence, a belief system that confronts the tension between ideal good and the ever present reality of evil. God, in this sense, can be recognized as evil turned against itself. Such recognition offers faith that mankind is not a natural accident in a purposeless universe. For God is to be greeted as the essential vitality of all existence – physically, psychologically and spiritually.

God Image

Bernard Spilka

A basic, apparently innate, feature of our mental apparatus is the formation of images of reference objects wherever possible. In Western nations subscribing to the Judeo-Christian heritage, one is socialized when young to imagine God as an old bearded man sitting on a throne in Heaven which is located somewhere in the sky. God is invariably male and is pictured as overlooking our planet and its population in such a way that “he” knows everything about everyone. This statement mixes two idea patterns together, a descriptive set of images and certain cognitive and behavioral characteristics. Strictly speaking, God image refers to the former; the God concept is the latter. Concept also includes divine intentions and purposes. These generalizations have unclear limits, hence in specific work, they seriously overlap. Commonly, writers indiscriminately mix the two realms. Where relatively little research has been conducted on the images, a massive amount of study has been directed at God concepts for over a century. Certain widely employed terms seem to share both concept and image features. For example, God as male or God as Father bring to the fore physical and psychosocial traits. These also vary by age of the respondent (Harms, 1944). Overwhelmingly, this work has been conducted on children and adolescents. To adults, drawings of God usually are indistinguishable with regard to gender or parent, but these concepts are provided by the child depicors themselves.

Another conceptual avenue that ties image and concept together derives from Freud (1928) and his psychoanalytic successors. Even though these ideas are popular,

hypotheses about parental roots have not always eventuated in God-father association. This literature has also yielded God-mother and God-self imagery. Strong cultural influences obviously enter into and muddy this research.

A fine overview of research in the area up to 1977 is Pitts bibliography, *The God concept in the child*. More exacting, but still inclusive of both realms is the work of Ladd, McIntosh and Spilka (1998) which deals with the God image drawings of almost 1,000 children.

Though a few projective image analyses stressing personality have been attempted, exacting, reliable treatments of God drawings are largely yet to be reported. Piedmont and Muller (2006) have, however, opened that door conceptually and methodologically. They tie God image to Object-Relations psychodynamic theory and God concept to cognition. Though they appear to have derived many direct God image measures these are not discussed in relation to their indices of God concept. Still, indirectly, they claim a moderate relationship between the two. This, however, has not been detailed or clarified. Until their findings are fully reported and confirmed by others, the significance of distinguishing God image from God concept must be considered indeterminate.

God Image and Therapy

Annette Peterson

The God image, rich in myth and symbolism, is a door to the unconscious, providing a wealth of material for

the psychotherapist. At face value, a client's God images reveal his or her relationship to transcendent reality, and is a factor in psychological stability. By examining God images in depth, a therapist can symbolically interpret a client's religious projections as expressive of psychological needs. As a diagnostic tool, God image can be useful for therapy. Therapy can also help a client's God image by disabling a limiting God image or regulating an imbalanced God image. The consideration of God image in therapy can help mental health professionals and their clients gain valuable insight into the client's inner psychological and relational world, and can lead to improved intrapsychic and interpersonal functioning.

God images are strongly influenced by early parental relationships. Therefore, they have vast therapeutic relevance and potential. God images can be explored for insight into a client's self image and early relational environment.

God images can have a positive or negative psychospiritual function. Psychotherapy can draw upon the strength of a beneficial relationship with God, or address negative, conflicting or one-sided God images in a variety of psychotherapeutic forums. It is important to work with the God image according to the client's particular relational matrix, developmental history, and level of psychic balance and integration.

Every person has internalized images of God that undergo developmental changes over the life course based on individual, cultural and spiritual influences. Our God images are mirrors of ourselves. Clinical studies reveal that a person's experiences of God and self are related and mutually influential (Benson and Spilka, 1973; Francis, Gibson, and Robbins, 2001; Greenway, Milne, and Clarke, 2003). Therefore, it makes sense to use the God image in the psychotherapeutic effort to understand and improve the self.

The God image occupies a transitional space between the internal self and the external other. In this transitional space, God is both found and made. Martin Buber's *I and Thou* (1970) recognizes the relational space between self and other as a spiritual place, where God exists in "the between" of relationships, and seems to be at once both self and other.

In *Playing and Reality* (1971) Donald W. Winnicott implied that God could be seen as a transitional object that changes with a person's needs and desires. Winnicott's theory of transitional objects has become a core component of the object relations theory of God image. Winnicott advises the therapist to "play" with the client by joining in exploration of the intermediate space between reality and fantasy. Similarly, Moshe Spero (1992) states

the importance of being able to find a way to buy into a client's God image, thus preserving the therapeutic alliance and allowing God image to be a part of the treatment process, and opening pathways to greater understanding of the God image and its psychic functioning.

Our relational expectations limit our experience of God and our ability to live full, balanced lives in harmony with our environment. By expanding our relational paradigms, therapy can alter God image without being an overt topic of treatment. The therapeutic relationship offers an affirming selfobject function that is paramount to the success of therapy, resulting in a realignment of the personality's deep relational structure. In the course of treatment, the client's interaction with the therapist affects the client's other relationships. Due to the strong interdependence between the client's relationships with therapist, God image, and self image, a successful treatment will improve all aspects of the client's relational matrix, including the God image, without direct focus on the God image.

Therapeutic methods that incorporate direct access and conscious exploration of God images can facilitate the process of psychospiritual insight and maturation. Interventions may seek to strengthen positive God images and improve or limit the damage done by negative God images. The current use of God image theory in psychotherapy is mostly focused on mitigating damage of negative God images, but it is also used in identifying and improving relational patterns – with others, self and God.

God images can first be evaluated during psychotherapeutic assessment. "[C]areful exploration of the subjective description of an individual's God representation and the vicissitudes of the relationship with God may reveal precious information about the type of psychic and interpersonal events that led to the particular characteristics attributed to God. In this sense the God representation has the potential of a projective test" (Rizzuto, 1991: 56).

Even if the relationship with God is not a presenting problem or an easily identifiable source of distress or impairment, ambivalent or conflicting God images exact a psychic toll on the whole person. Strongly negative God images exacerbate psychological problems and inhibit recovery, and therefore require clinical intervention. Healthy and helpful God images are a powerful source of psychological resilience and can be drawn upon to enhance coping and facilitate healing.

Psychotherapists can look for the source of God images in early parental relations, other significant relational experiences, religious history, and religious paradigms shared by the larger culture. God image, self-image

and world view are all developed in the context of our early relationships and continue to be mutually influential throughout the life course. The relationship between God image and the client's relational patterns can be explored in therapy for their mutual influence on a client's current relational functioning. Interpretive gains may be made "by concentrating on a person's felt bond with the sacred and conceptualizing that bond as a reflection of the inner object world and by listening through that bond for echoes of internalized affective patterns of relationship" (Jones, 1991: 110).

The work of therapy often brings the client's adult understanding to attend to the repressions of his or her inner wounded child. Similarly, when images of God are openly discussed, a current mature understanding can shed light on past and present relationship with the divine. Therapist and client may identify multiple or conflicting God images that cause enduring psychospiritual conflict and/or distress. Conscious beliefs and unconscious expectations of God may collide. The damaging weight of repression and its dangerous backlash can result in an underlying suffering that is not understood. This may mean that early religious images and beliefs should be unearthed, even if a client believes they are irrelevant and no longer believes in them. Therapy can examine the implicit assumptions we have about God and facilitate greater balance and individuation.

The therapist invites the client to be curious about the psychological function and/or fallout of his or her God images. By taking a religious history and attending to religious associations, the therapist may identify a pattern of psychodynamic motives. The God image can be used in the service of regression, progression, avoidance, resistance, companionship, or as an Oedipal object (Rizzuto, 1993: 27–29). The God image can be a link to a sense of divine mystery or an obstacle/false idol that prevents a healthy and helpful relationship to God. Disavowed God images may indicate the existence of restrictive or implausible God images that preclude the possibility of spiritual experience. Dysfunctional God images need to be examined and deconstructed to make room for healthy God images that are relational and dynamic, balanced, functional and relevant.

God image therapy can take place in a religious or secular therapeutic environment. There are situational advantages to each, and both seek to promote self-reflection and insight, healing and development. People often take religious problems to religious counselors because they feel more understood by someone with a similar background or belief structure. When an insider may be too close to a problem, an outside perspective can

be helpful. A secular therapist with no religious predispositions may offer a client more freedom for doubt and exploration.

Spiritual counselors have the unique benefit of clients who are interested in working directly on their relationship with God. Spiritual counseling and spiritual direction focus primarily on the client's relationship with God, whereas secular therapy will examine a client's inner psychic structure and ways of relating to God, self and others. Both techniques will affect a client's God image and self image by altering the client's sense of place and purpose in the world, as derived from his or her relation to God.

Mary Lou Randour notes, "But not all religious and spiritual experiences are God-centered, although I would argue that all are object relational" (Randour, 1993: 4). Sometimes a client is faith-based or spiritual without being God-centered. In this case the client's object relations with spiritual reality or background of faith can be examined for the client's underlying existential safety net, or for the conflicts or dilemmas that prevent its formation. In clinical cases where it is evident that the concept of God is a central guiding cognitive structure, God images are clearly worth examining directly. However, focusing on religion in therapy could worsen emotional crises if a client has a strongly negative God image. Alternatively, if a parental interpretation of a client's relationship with God is felt as explaining away a deeply held religious belief, the clinical relationship could be jeopardized.

The respectful consideration of God image in therapeutic assessment and treatment requires the therapist to maintain neutrality and prevent his or her own beliefs from interfering with the client's. The therapist needs to inquire into the dynamic meanings of God images and conflicting images without attempting to modify religious ideation.

Spiritual and psychological experiences are linked because they share the goal of integration, the coming together of the fragmented self. Psychological and spiritual development can occur in tandem, mutually aiding or hampering each other. In therapy, as images of self, others and God are examined, rethought, and rearranged, it becomes difficult to ascertain whether psychological health influences perceptions of the divine or vice versa. In some cases, increased self-acceptance permits the belief that God also cares, and a new sense of self demands a new God image to go with it (Jones, 1991: 73–85). In other cases, new possibilities for whom or what God is can loosen the hold of a judging, rejecting God image from early childhood that restricts adult development.

Commentary

Just like religion, the God image is neither good nor bad, but depends on how it is used. It can be the source of problems or their solution. By recognizing what is helpful and harmful about our God images, therapy can work through psychological issues from our religion, improving relationships with God, others and ourselves.

Some may question whether religious beliefs and/or spiritual practices are within the purview of the psychotherapist, and may argue that God should be left in the hands of religious leaders. However, traditional religious instruction may not foster a progressive developmental direction, and can create a one-sided religious faith that results in psychological imbalance. Organized religion tends to resist a dynamic God image, preferring a stabilizing one. With its emphasis on goodness, religion can shame and vilify lesser impulses, exacerbating psychic rifts. Religion should not be an escape from the unconscious, seeking to focus on the good and repress the undesirable aspects of our psyches. At their best, religion and spirituality represent the culmination and completeness of life. Healthy God images are relational and dynamic, functional and mature, balanced and unified, integrated and encompassing. These God images stabilize and perpetuate psychospiritual health and well-being.

A therapist's neutrality can aid a client in the exploration of his/her own beliefs, providing a therapeutic environment for rediscovering and strengthening, or for questioning and reformulating the client's theological system. In any work with the God image, it is important to balance psychological attention to the God image with the spiritual reminder of God's transcendence of our understanding. Our God images are not God, but they mediate our ability to experience and relate to divine reality. "Much can be learned from our particular route to or away from God, from our projected images, as well as about the God we let reach us through our projections" (Ulanov, 2001: 105).

God Image in Dreams

Annette Peterson

Dream characters and images are reflections of ourselves and our images of God.

Sleep gives the brain the opportunity to process and store information from the day. It also provides the opportunity to anticipate the future and practice behavior and decision-making in a variety of contexts.

According to Freud, dreams provide wish-fulfillment of impulses left over from conscious waking life. Freud wrote that dream material is based in "residues of daytime life...struggle for expression during the night" (Freud, 1965: 593). These residual impulses come from what we have failed to deal with consciously, due to circumstance, our own limitations of capacity or capability, or our unconscious struggles that are rejected or suppressed in the daytime.

God images, like self images, are ubiquitous in the form and frequency they take in dreams. The dreamer may

encounter a dream character, object or place that evokes the sublime, an experience of awe, or a sudden epiphany of peace or understanding. God may be directly called upon in dreams, with miraculous results.

Dream images of a cosmic struggle between good and evil reflect internal discord and existential fear. In nightmares, dreamers frequently report being pursued by an evil person or entity, bent on hurting or destroying the dreamer. Although the dream image may be that of an anti-God, or demonic figure, the dream content is still religious in essence, in that it seeks to come to terms with our unconscious demons and the presence of evil in the world.

In psychotherapy, dream images are examined and interpreted for symbolic significance and the thoughts and feelings they evoke. Cultural archetypes are explored for personal resonance. Scriptural parallels may be discussed. Connections are drawn to the present context in order to widen the client's understanding and deepen the personal meaning of his or her God images. When the dream image is considered in light of the client's present situation, client and therapist become aware of significant patterns or underlying conflicts that can now be consciously explored.

Frequently, clients report dreams in which they felt surprised by God. Some dream material did not reflect the client's conscious God images, and they felt disturbed enough to bring the dream into therapy. The dream image can provide the opportunity for the examination and expansion of consciously held God images, furthering the developmental maturation of the client's God images.

Commentary

Dreaming "changes the channel" of our particular everyday reality, therefore dreaming expands our personal horizons and may even be practice for death and what may exist beyond this life.

Golden Bough, The

Lee W. Bailey

James G. Frazer

The Golden Bough: A Study in Magic and Religion, written by the Scottish anthropologist and classicist James George Frazer (1854–1941) at Cambridge University, was a culminating comparative study of world religions seen through the eyes of major themes in nineteenth-century European scholarship. Macmillan published it in two volumes in 1890, in three volumes in 1900, and expanded it in the third edition into 12 volumes by 1915. Due to its wide popularity, a one-volume condensation has been published since 1922. Frazer's originality is that no one before him had ever dug up so many of the "primitive" elements of the religions of Greece, Rome, and the eastern Mediterranean. More boldly, he first compared these on a global scale with the religions of "savages." His work was part of the Enlightenment project of studying one religion not as self-evidently true, but as one of many religions uncovered since the world expanded after Columbus. From the start, *The Golden Bough* was generally a critical and popular success, yet it expressed the sunset of the confident European speculative, imperialistic view of superiority over earlier world cultures. The Greek and Roman classics, long the core of European education, were soon dethroned and world cultures were slowly admitted to the academy via anthropology.

The title "Golden Bough" is taken from the small evergreen plant mistletoe, which, when dried, turns a golden color. It seemed magical to ancients because it grows on the branches of other trees, high above the ground, green when the host tree is bare in winter. Its seeds are carried from tree to tree by birds, and grow as parasites on the branches of larger trees. According to classical authors such as Pliny and Virgil, mistletoe, believed to hold divine fire sent from the gods by lightning, was carried by Aeneas to the underworld, and was

cut from oak trees with a golden blade by Druid priests for magical purposes (Frazer, 1922, Ch. LXVIII).

Science and Primitives

The *Golden Bough* is a leading exponent of the naturalist, empiricist, skeptical philosophy of the Enlightenment, led in Scotland by David Hume. Its avowed purpose is to treat religion in a “scientific” way, seeing it as part of the evolutionary view of the crude, ignorant savage society over the centuries evolving into an enlightened rational Victorian culture. In a positivist fashion, Frazer reduced religion to a kind of deluded intellectual speculation, but he was often really doing psychology, as when he saw terrified fear leading even to bloody sacrifices as major motives for magic and religion (Frazer, 1922: 111). This was unlike others, such as William Robertson Smith, who saw in religion the work of more benevolent emotions, such as love and gratitude (Smith, 1889/2002). Frazer sought evidence for the emotions and motives of ancient pre-historical peoples, and his psychology was rather individualistic rather than social. In nineteenth-century fashion, Frazer assumed the heroic great-man principle of historical change. He assumed that humans seek primarily to control nature, and have, throughout history, tried three major methods.

Frazer’s cultural development scheme has three stages: magic, religion, and science. Each was essentially an intellectual system, the first two clumsy and superstitious, the last triumphant. But evolutionary theory dictated that each corrected some errors and built on other surviving elements of the earlier one, notably the annual quest to assure the continuing fertility of life. The *magical* cultures, which Frazer thought were illustrated by the Australian Aborigine cultures, he proposed, evolved elsewhere into *religious* cultures, characterized by gods and goddesses. This was not enough, however, for as each system’s flaws in dealing with nature and society emerged, *science* was bound to replace the earlier, outdated systems (Frazer, 1922, Ch. LXIX).

The colonialist reports of global indigenous cultures brought back to Europe gripping accounts of practices and beliefs that challenged Western cultural assumptions, and stimulated many scholars like Frazer to seek to explain these strange cultures to a fascinated audience, condescending to relegate the stranger customs to an inferior, barbaric position, a “low mental stratum” (Frazer, 1922: 64). Frazer’s Victorian goal was to explain how “primitives,” desperately seeking food, health and security, terrified of death, childbirth, and destructive weather, badly misunderstood the world. The logic of

religious evolution in this schema is not valid, however. The priest and ethnologist Wilhelm Schmidt (1868–1954) argued that religion was earlier in evolution than magic, and he saw in primordial high gods the seeds of monotheism (Schmidt, 1926/1935). And today, amid a largely scientific culture, we see hints of “survivals” of magic in rituals such as video games, the continuation of religion in mega-churches, and new age spiritual developments. And even behind the intellectual principles of science we can find psychological roots, such as the belief in domination over nature, that have led to the ecology crisis. As we are seeing in the effects of global warming, one-sided industrial “progress” was blindsided by the neglected environmental factors that are now biting back. Frazer’s view that the purpose of these three systems is to dominate nature is flawed; while magic and science may seek this goal, religion has other purposes, such as ethics, morality, social cohesion, refining instincts, and beliefs about life after death.

Early anthropologists like Frazer called their method of comparative religion “scientific,” meaning a neutral approach to religions not favoring their Christianity, and the method of hypothesis-testing with empirical data. But, by later standards, their early efforts at applying scientific principles to religion, and its social and psychological meanings found in global societies, were sloppy. Frazer’s idea of the comparative study of religion was to make wild leaps to similar practices in other cultures around the world, but without carefully examining the cultural contexts that might have shown a different interpretation. Plus, his theories were not always consistent. He waffled on the question of whether ritual precedes myth, and the question whether myths are diffused from one source or spontaneously arise in many locales. But his themes were captivating, as belief in “progress” peaked before World War I’s devastations.

His encyclopedic collection of “savage” practices, blended with accounts from classical literature, was pulled together in a grand theory that followed in the tradition of comparative religion. This method of comparing the religions of different cultures was as old as Herodotus’ (c. 484–c. 424 BCE) *Histories*, where he compared the Egyptian and Greek religions, arguing that the Greeks had borrowed many Egyptian religious themes (Herodotus, 1954: 116–135). After Columbus, this method exploded as local doctrines lost their certainty, and by the nineteenth century, grand theories of comparative religion had developed, such as those of Tylor, Müller, and Mannhardt.

Edward Tylor (1832–1917) developed comparative anthropology along the lines of a theory of a cultural evolution, “animism” or the belief in soul in nature.

He also assumed the idea of “survivals” of archaic practices still present in tribal cultures, and the global uniformity of human nature. He explored the question of cultural diffusion versus independent origins of similar themes. He viewed myths as crude efforts at reasoning, rather than symbolic expressions, and tried to extract historical nuggets from their narratives (Tylor, 1994). Frazer adopted these general themes.

Max Müller (1823–1900) virtually created the newer discipline of comparative religion, aided by his remarkable 50-volume collection of translations of *Sacred Books of the East*. He stressed philology or a linguistic basis for comparative religion, showing how the words for common things such as numbers were very similar from India to Europe. For example he says that word for “one” in Sanskrit is “*ekas*,” in Greek “*eis*,” and in Gothic “*ains*” (Müller, 1869: Vol. 1, p. 51). He interpreted myths and religions as personifications of natural forces, especially the sun (Müller, 2002). Frazer’s version of comparative religion was not linguistic, but rather focused on rituals, followed by myths, that he saw as intellectual, rather than symbolic, and euhemeristic, or revealing factual historical events, rather than psychological. Both of the latter are largely flawed assumptions.

Wilhelm Mannhart (1831–1880) was a folklorist who studied archaic tree and grain cults whose indwelling spirits (*korndämonen*) had to be annually helped in producing fertility by magical and religious practices, which was a key theme adopted by Frazer (Mannhardt, 1868/1978).

The general shift in the academic effort to understand world religions was away from the dogmatic, exclusivist certainties of familiar faiths and toward evolutionary theories and sociological analysis. Today we view these theories as early, hasty generalizations of “armchair” anthropologists, rather than the careful field studies characteristic of current anthropology. Indeed, the overzealous generalizations of these Victorian theorists, while popular, stimulated twentieth-century anthropologists such as Franz Boas (1858–1942), although friendly with Frazer, to reject hasty, broad generalizations in favor of living among the people he studied and limiting his theories to the cautious boundaries of observed societies (Boas, 1994). In view of such critiques, we see today that the themes explored in Frazer’s work still have some explanatory value, but not the universal implications that he proclaimed.

Blood and Fertility

From his chair at Cambridge, Frazer mused over a riddle that had long fascinated classical scholars. The Greek

geographer Strabo told of a temple near Rome where a runaway slave who killed the former priest-king became the next priest-king. Macaulay’s poem “the Battle of Lake Regillus” tells the riddle:

- ▶ From the still glassy lake that sleeps
Beneath Aricia’s trees –
Those trees in whose grim shadow
The ghastly priest doth reign,
The priest who slew the slayer,
And shall himself be slain – (Fraser, 1990: 33)

Frazer devoted most of his life to collecting parallels from travelers, mentally leapfrogging around the world, seeking to make sense of this nugget of mystery. His theory turned into a major popular epic that concluded the Victorian era’s bold but reckless efforts to sweep world religions into a single dustbin of superstitions that fall before the powers of science. Nevertheless, this kind of work was a beginning for the study of world religions with a neutral eye.

If you follow Rome’s Ancient Appian Way out of the Porta Sebastiano south-east out of the city for about ten miles, passing through a dry land with ancient Roman gravestones lining the road, you will come to a hill on the left. At the village of Genzano, you can follow the road around the base of the hill and ascend to the settlement called Nemi. Here classical scholars knew, from classic texts such as Strabo and Ovid, that this place long ago was a sanctuary of Diana. Now a few remaining columns overlook a lake nestled in a volcano’s remains, called “Diana’s Mirror.” Beneath the surface of contemporary small farms of olive, grapes, and strawberries, was once a sacred shrine where have been found numerous votive statuettes and an image of a goddess, including one with an inscription to Diana: “as blessing men and women with offspring, and granting expectant mothers an easy delivery” (Fraser, 1990: 5).

With a flourish of imaginative rhetoric, Frazer undertook to explain the meaning of what he thought took place long ago on this site: a “barbaric” custom in the sacred precinct related to a goddess-queen, in which a priest-king, once a runaway slave, must constantly carry a sword and be on the lookout for attacks. Any man who can pluck a bunch of mistletoe high in the sacred tree, then kill the ruling priest/king, can assume his role, but he will then be doomed to the same fate. Frazer argued that similar rituals were practiced far and wide, expressing patterns of human nature and society, sinister, sensuous, and bloody. His psychology was an empiricist, rationalist effort to reduce passionate themes to past nonsense, but ironically, the undertone was an unconscious collective fascination with these passions – killing the king, mating with the queen, mingling with the natural world.

Frazer's thesis unfolds as he conjectures that the King of the Wood at Nemi, Virbius, was likely the mortal lover and king of the goddess Diana (Artemis in Greece), whose spirit was to be found in the tree he guarded. Comparing this pair to other moral men and goddesses such as Adonis and Venus, Hippolytus and Phaedra, and Attis and the Cybele, Frazer proposes that the ritual at Nemi recapitulates the known mythic accounts of the goddess of fertility taking a lover who dies as in the annual death of planted seeds and is magically reborn in their rebirth as new vegetation. His theory is that the ritual led to myths about the annual cycles of vegetation, its winter death and rebirth in the spring that needed to be magically helped along by bloody and erotic human rites. The sacred marriage custom of priest-kings mating with priestess-goddess figures was the ritual of ensuring the fertility of the land. Diana was not known as a goddess of fertility, however. Her predecessor in Greece, Artemis, was a virgin huntress, but other more fertility-related goddesses such as the Greek Demeter and Gaia, the Babylonian Ishtar, Egyptian goddesses, notably Isis, and others that Frazer describes, he offered as testimonies to this practice as characteristic of archaic societies.

From the writings of world travelers, Frazer assiduously tried to link all this to other strange, far-away customs, such as those described by Captain James Alexander, Fifth Duke of Hamilton, an adventurous Scottish sailor who had wandered from the Cape of Good Hope to India and Japan for 35 years. In 1728 he published his *New Account of the East Indies*, where he reported kings committing suicide before their term of rule had expired. Another king at the end of his 12-year reign would throw a jolly feast for 12 days. If any of the guests could fight their way through his thousands of guards and kill the king in his tent, they would become the new king (Fraser, 1990: 50–52). This apparent parallel to the Roman conundrum excited Frazer and became one of his many examples of what he claimed to be widespread practice of slaying the king and thereby grabbing his throne (Frazer, 1922, Ch. XXIV; Hamilton, 1728). Just under the surface of the supposedly rational concern lurk psychological fascinations with fear and blood, political rule, religious sacredness, and erotic fertility.

Taboo and Totem

Frazer elaborated on the reports with the concept of taboo, the sacred or cursed thing or person, like an electric force field, for example, possessing a king that spread from his person to whatever he touched, sending divine

power that promotes the growth of life on earth (Frazer, 1922, Chs. XIX–XXII). Taboo was a concept fascinating to nineteenth-century anthropologists that Frazer used to help unify his collection of cases of “the king must die, long live the king.” It first appeared in English in the journal of Captain Cook, who stumbled onto the exotic practice of forbidden things in the Tongatapu Islands in the South Pacific (Cook, II, xi 1785: 410). Soon “taboo” came to describe many things, found also in the Bible, that were sacred and cursed, both unclean and untouchable, strong yet vulnerable, such as kings, blood, and corpses. Taboo was expanded to explain several practices, including the biblical scapegoat (Bible, Leviticus 16), used to ritually expel threatening evils from a community.

The totem was another recently uncovered practice that fascinated Europe. In 1885 John McLennan, the Scottish author of *Patriarchal Theory*, having discovered totems “thick under the feet” in the Arabic peninsula, lectured at Cambridge. Frazer was in the audience, and he quickly integrated totemism into his theories. He saw it in various ways as this thought developed. In his “depository theory,” he interpreted totems as containers for one's soul that kept it safely separated from the body that might be killed. This was expanded into the chapter on the External Soul (Frazer, 1922, Chs. LXVI–LXVII). He saw the mistletoe, or “golden bough” as a totem hanging high in the oak tree above the king who was defending his rule from attack. His view of the golden mistletoe as a totem he connected to the reports of the Celtic Druid priestly ritual of cutting the plant with a golden sickle. But it is an imaginative stretch to portray the same sense of mistletoe, or any mistletoe, in an Italian shrine.

Studies of the Australian Aborigines shifted the interpretation of totemism toward the idea of a totem as an image of a clan's founding ancestral spirit. It was used in the initiation of young men into adulthood in the outback, and was part of the emphasis on exogamy, where a man could only marry outside his totem's social group. A man might say of his totem that it is his brother, meaning his eternal soul participates in the same species as that totem animal, thus defining what he can kill. Hunters are typically forbidden to kill their totem animal, since it is a relative, except for special sacred occasions, Frazer explained (Frazer, 1922: 799).

Fertility Religion

Frazer's vegetation deity theory agreed with that of William Robertson Smith (1846–1894), co-editor of the ninth edition of the *Encyclopedia Britannica*, who had a

large impact on Frazer, and invited him to write articles for it. Smith saw primitive religions as social institutions for the preservation of society, not as individual creeds for the saving of souls. This debate between those who see myth and religion as primarily social or as more psychological continued between the anthropologists (Boas, 1994) and psychologists (Jung, 1979). Smith also stressed the literalism of primitive religions, where tribal beliefs believed the people to be literal descendants of a fatherly god in whose blood his descendants participated. He believed that primitives saw gods not as remote and transcendent, but as limited to specific earthly places – grand trees or mountains. Such gods need not be anthropomorphic, but could be portrayed as plants or animals. Smith envisioned religion developing from demons to totems (such as the Semitic Arabic *jimns*), to local gods, to national gods, to universal gods. Smith's use of the comparative religions method was to take a specific example, such as the *jimns*, then draw on other, perhaps far-reaching, parallels to confirm his theory (Smith, 1889/2002).

Smith saw ancient sacrifices as the food of the gods. He insisted that sacrifices are not gifts to bartering gods, but communion between people and spirit beings. Quite unlike Freud, he saw this communion unstained by notions of sin or guilt, but as positive relations with a spirit. Unlike Hume, Frazer, and others, Smith argued that religion is not based on fear, but on a happy sharing of the sacrificial food with the spirit being and with the community. The notion of sacrifice as atonement for sins developed later, he thought, when sacrificial animals (or humans) came to be seen as property to pay a divine debt (Smith, 2002).

The priest-king was a role known to classicists such as Frazer for some time. Greek kings in Homeric literature were seen as sacred or divine, Frazer says, and that the rule of a good, healthy, strong king would bring fruitfulness to the land – wheat, sheep, fish, and babies would multiply plentifully. The principle was that if a king lost his virility, became sick or unable to father children, the land's fertility would suffer. The next step was the belief in the need to kill a weakening king and transfer his power to a stronger successor before the power faded. Frazer believed this to be illustrated in the riddle of the priest at Nemi, anxious to protect his life from attackers (Frazer, 1922, Ch. XXIV).

Now we approach the core of Frazer's theory. As he expanded his research and the number of volumes of *The Golden Bough*, he increasingly strengthened his central thesis that the core of "savage" magic and religion was the obsession with assuring the continuing cycle of divine powers for the growth of vegetation and animal

reproduction (Frazer, 1922, Ch. XXVIII: 349). His thesis was centered on a vegetation religion – not a tribal totem religion, not a spiritual, transcendent god of morality religion, but the first rituals he thought to be repeatedly enacted to assure the fruitfulness of life on earth by keeping strong the divine powers of the priest-king. Frazer amplified his argument with similar cases worldwide, as well as the development of the sacrifice of a substitute for the king – humans, animals, plants, or other valuables. The divine energy could be shared in the people's feasts following the ritual, which came to be called sacramental meals:

- ▶ The worshipful animal is killed . . . that each of his worshippers may receive a portion of the divine virtues that are supposed to emanate from the dead or dying god (Frazer, 1922: 623).

This suggests that the "other" religions who sacrificed and ate foods such as pork, opposed by "our" religion, might give our priests a way of forbidding us from joining them by making their sacramental foods taboo for us. Thus Jewish and Muslim taboos on eating pork, for example, may come from the priests who saw their neighboring "pagans" eating pork sacrificed to Demeter in Greece, and to Baal in Canaan.

Dying and Rising Gods

Still controversial is Frazer's argument that there have been numerous examples of dying and rising gods. He had no trouble finding examples in classic studies of eastern Mediterranean cultures: Adonis, Attis, Osiris, Dionysus, Persephone, and the "Corn-Mother or "Corn-Spirit" (corn = grain) in plants and animals worldwide. Building on Wilhelm Mannhardt's theory of the *korndämonen*, Frazer interpreted these and many others as examples of his core theory: a. the divine force behind the planting of seeds seems to die underground, b. the growth of the plant is a resurrection of the apparently dead divine force, and c. the rituals and myths of the dying and rising gods and goddesses express this fervent belief:

- ▶ Under the names of Osiris, Tammuz, Adonis, and Attis, the people of Egypt and Western Asia represented the yearly decay and revival of life, especially of vegetable life, which they personified as a god who annually died and rose again from the dead (Frazer, 1922: 378).

Frazer's critics, such as Andrew Lang, rejected the centrality of the vegetation spirit practices (Lang, 1901), broadly attributing illogical archaic myth, ritual and

religion to the pre-modern failure to distinguish between humans and other things in the world (Lang, 1887, Ch. 3). Lang and others also rejected the comparative method, saying that he glossed over too many details that make the cases different (Boas, 1994), thus making the concept of dying and rising gods impossible (Jonathan Z. Smith), but others today argue that the similarities are strong enough to make the comparative method valid and the dying and rising gods a convincing concept (Mettinger, 2001).

Heady Non-Psychology

Frazer sought to find an over-arching logic, however mistaken, in pre-scientific magic and religion. He tied the vegetation spirit theme into wider practices: the expulsion of evil in the scapegoat (Frazer, 1922, Chs. LV - LVIII), the winter solstice fire-festivals in Europe (Frazer, 1922, Chs. LXII-LXIII), including burning human sacrifices or effigies, and the myth of the death of the Nordic Balder by mistletoe (Frazer, 1922, Ch. LXV). This heady mixture made for a sweeping theory, pulling a vast range of ritualized phenomena into his single theory of the vegetation deity's annual cycle.

Frazer's theory was daring and exciting to Europeans waiting for explanations of other cultures' strangely erotic and bloody practices. In the guise of a thoroughly pragmatic, materialist theory that assured the fertility of the crops and animals, Frazer in theory rejected any role of emotion – no social or psychological motives are necessary, Frazer thought. But then he would hint at deeply psychological motives such as fear in this frothy mixture of bloody murder, political domination, erotic rituals, and life overcoming death, all happening among the “others,” just beneath the proper surface of his Victorian consciousness. Denying psychology, he elaborated on in with a flourish.

Though he was friends with and initially inspired by Frazer, Bronislaw Malinowski became a leader of the new, more empirical, field-oriented, revealing functionalist, twentieth-century, anthropology that rejected the old-style reckless armchair comparative speculations and insisted upon careful observations of behavior, limited to the context of an observed tribal society. His ethnography in the South Pacific set a new standard because he learned the language of the natives he was studying, became friends with some, and developed the classic theory of participant observation, a new anthropological methodology (Malinowski, 1948). This development soon made Frazer professionally irrelevant among anthropologists,

although the themes that he explored remained fascinating to them.

The myth and ritual school, a group of classicists, also called the “Cambridge Ritualists,” was influenced by Frazer, notably in their quest for the primitive roots of classical Greek ritual, drama, literature, society, and the theory of the priority of ritual to myth. They included Jane E. Harrison, Gilbert Murray, A. B. Cook, and Frances M. Cornford (Ackerman, 1991).

Sigmund Freud

Sigmund Freud soon picked up on the unconscious elements in Frazerian themes, such as totem and taboo, with his Oedipal interpretation, but gave more credit to the power of unconscious incest dynamics. In *Totem and Taboo* (1913/1950) Freud saw totems as ancestral fathers. But for him this was a continuation of the historical events in his speculative theory of the “primal horde.” The strongest male mated with as many females as desired, and as his sons grew into puberty, lacking women, they killed him and mated with his wives. Thus they were able to become men themselves, but felt terribly guilty, so set up a sacred totem animal as a substitute to be revered for the murdered father. The guilty sons felt the need to atone and reconcile with the dead father. So the sacrifice of the totem animal expresses both sides of the ambivalent totem psychology – anger and reverence, echoing the primal murder and penance for it down the generations. The whole ritual was saturated with Oedipal guilt and is thus filled with taboos. The strongest taboos in this situation are the taboos against disrespecting the fatherly ruler and dealing with corpses. Freud sees these taboos as Oedipal guilt aversions. This was an elaboration on Freud's theory that unconsciously, God is nothing more than an exalted father (Freud, 1913/1950: 147), an extension of the primal totem, and so Christian communion is an unconscious repetition of the guilty primal murder of the father. Freud's venture into anthropology was at least as reckless as Frazer's, both extending the daring speculations of nineteenth-century thought. Freud fares better in the realm of clinical psychology, where unconscious dynamics are openly acknowledged (Freud, 1913/1950).

Carl Jung

Carl Jung's archetypal psychology of the collective unconscious shares some themes with Frazer, such as the

comparison of motifs from cultures around the world. But Jung is interested not in grand theories of history based on myth, nor in evolution, magic, or fertility, but in healing. He focuses first on the patient's feelings and dreams, his unconscious production of images that have parallels in collective images, such as the ego, the lover (*anima/animus*), or the shadow (Jung, 1979 *CW*, 9ii, para. 1–42). Jung's comparative method is much more focused and disciplined than Frazer's speculations, even when he ventures into cultural reflections. Jung developed a strong theory of archetypal images that has had a major influence (often unacknowledged) on psychotherapeutic psychology, such as his archetypal image of the introvert and extravert typology.

For Jung the divine is not Frazer's vegetation spirit or Freud's exalted father, but a far more refined archetypal experience that he named the "Self" (Jung, 1979 *CW*, 9ii: para. 43–126). Subsequent Jungian analysts refined Jung's thought even further. Jungian feminists corrected Jung's pre-feminist views, exploring the goddess archetypal images (Bolen, 1984). James Hillman criticizes Frazerian theories that portray themselves as doing science, and revisions them as imaginative mythologies. While anthropology was striving to become more factual, Hillman's archetypal psychology re-visioned old nineteenth-century concepts such as Tylor's animism and Freud's Oedipus complex into archetypal mythologies (Hillman, 1975: 12, 18).

The development of Frazer's theory took place in the context of the development of the rise of Protestantism's higher biblical criticism, originating in Germany. Frazer came out of the Calvinist Presbyterian and Free Church struggles in Scotland and the debates in England, where Christianity was wrestling with issues such as the importance of a state church versus the need for non-conformist independent churches. Also the German-based free-thinking biblical criticism that was taking the Bible apart as a historical document, heavily indebted to the customs of its time and editing processes, challenged the literal readings of the Bible (Kee, 1997). This was consistent with the rise of comparative religion.

A fascinating blend of highly imaginative literary speculations with a page-turning effort to plumb the depths of the mysterious practices of societies strange to proper Victorian England, *The Golden Bough* has been thoroughly deconstructed, but still carries some cultural impact. The 1922 condensation has not yet gone out of print. Although (or because) Frazer never traveled beyond Greece and had no interest in actually meeting a "savage," his book resonates in the collective unconscious of Western culture. It still carries a fascination that Cambridge Classicist Mary Beard recognized as a

"metaphorical voyage into the unknown, the wild, the Other" (1992: 221). Much of its appeal has to do with its effort to separate European knowledge from the new societies appearing in the Europe's expanding horizon, and to affirm the certainty of European epistemologies by denigrating the magical and religious practices of the "savages." Its oversimplified and shocking exposés served as a reassuring effort to legitimize European imperialism (Beard, 1992: 217). It allowed readers to fantasize scandalous, dramatic, bloody and fantastic rituals while striving to keep them at a distance as alien superstitions, by shoving their psychology into the unconscious.

Yet Frazer's work is not just a charming, tawdry antique. It has serious implications for the interpretation of Jesus' death and resurrection that the study of world religions inevitably brought forth. If the dying and rising god theme was indeed common in Jesus' time, this was not the only account of a god on earth who died and was resurrected. But, the argument goes, the earlier cases were strictly vegetation deities, and Christ was a moral and spiritual reformer, not an image of the life-death cycle of plants. This of course, was not enough for church leaders, who saw his theory as an intolerable attack on traditional Christianity's view of Jesus' resurrection as unique. Though an agnostic or atheist, Frazer attended church and had an uneasy conscience and a naïve sense of the powerful impact that his kind of work would have on religions. He saw himself as a scientist who must seek truth despite the social consequences or sentiment, yet he held on to a conventional Christianity (Sharpe, 1975: 87–94; Fraser, 1990: 134).

Although his material and methods have stimulated many, such as Freud and Jung, Frazer's preliminary use of the comparative method has become an easy target of criticism of the comparative studies of religion in general (Boas, 1994; Malinowski, 1948; Smith, 2005). Thus his research provides a major locus for exploring the value of that method in the study of world religions. However, the *Golden Bough* is a monumental compendium of material, accurate and inaccurate, recklessly speculative, naïvely rationalistic and blandly confident in the archetypal mythology of "progress." Not unlike Freud's achievement of revealing the unconscious in psychology, and Jung's archetypal psychology, Frazer roughly sketched in broad outline many of the deep archaic roots that trouble contemporary society, far more erotic, bloody, mysterious, religious, and fascinating than the modern rational veneer that has developed since those dark, passionate rituals flourished. Subsequent psychological interpretations of the dramas that he described take a deeper approach. How Frazer's material might help us understand

“irrational” behavior in current politics, society, and personal life remains an important topic of debate. For the study of world religions using the comparative method, the question lingers whether this method will undermine religion or generate new religions and new “ecumenical” tolerance.

In 1959 Theodor Gaster published an updated, abridged version called *The New Golden Bough*, that sought to eliminate unreliable field reports and updated others, and modified Frazer’s theory somewhat in view of recent scholarship (Gaster, 1959). But it was seen as a “misguided facelift,” not the needed critique (Hyman, 1959: 439).

Frazer inspired many artists, such as James Joyce (*Ulysses*) and T. S. Eliot (“Wasteland”). In 1959, Stanley Hyman’s book *The Tangled Bank: Darwin, Marx, Frazer and Freud as Imaginative Writers* interprets Frazer’s work as literature, which Frazer himself acknowledged, while still trying to cling to a scientific method (Hyman, 1959: 244). Hyman points to Frazer’s “vast argument from analogy” (1959: 237), using root metaphors, such as cultural evolution (1959: 247) the mystical communion of “savages” as philosophers sharing in the spiritual powers of nature (1959: 224), the image of explosives and electricity to describe the power of a king’s tabooed energy (1959: 251), nature as a machine (1959: 235), and the military metaphor of the long, slow war against superstition (1959: 251). Hyman also pointed out the inconsistency of Frazer’s waffling theory of myth as intellectual, historical, or ritual in origin (1959: 239). Frazer certainly did write in the literary style that combined what was thought of as science in his time with the flowery rhetoric of an English gentleman. He could not describe a scene without elaborating on it artistically.

Mircea Eliade later developed a more careful and refined comparative study than Frazer’s, using the newer phenomenological method, blended with more reliable anthropological and historical studies. In his *Patterns in Comparative Religion* (1958), Eliade explored “hierophanies” or appearance of the sacred in phenomena such as the sky, sun, moon, water, stones, earth, fertility, temples, time, and myths. He echoed Frazer dimly in his studies of vegetation and rites of re-generation in agricultural fertility cults. But for Eliade, “there has never been any real vegetation cult, any religion solely built upon plants and trees” (Eliade, 1958: 325). The cycles of death and life are evident, although rooted in sacred hierophanies, not efforts to manipulate nature, which to science is mechanical. Eliade edited the first edition of the classic *Encyclopedia of Religion* (1987, 2nd ed. 2005) now the standard encyclopedia for the study of world religions. He was

criticized, mostly from the empiricist anthropological side, for over-generalizing and lacking sufficient observed support. But, having closely studied Hindu Yoga, for example, he believed that the symbolism of experiences of the sacred is based on reality (however it may be misinterpreted), not illusion. This was offensive to critics committed to the non-spiritual, non-symbolic scientific metaphysic (Smith, 2005).

The debate continues over comparative religion’s value, wrestling with these themes. On the one side, how much should scholars of world religions acknowledge the reality of the sacred for believers, and how much should they find some truths in symbolic, poetic language? On the other hand, how much should they use more scientific methods that do not acknowledge the reality of the sacred, even for believers, and emphasize the higher value of detailed, logical, more literal language and anthropological studies of specific societies? This is a major hermeneutic, methodological debate in our culture. Jonathan Z. Smith’s rejection of Frazer’s category of “Dying and Rising Gods” represents those who seek a more “scientific” method for comparative religion. Kimberly Patton’s *A Magic Still Dwells* represents those who think that meaningful symbolic comparisons can be made based on authentic experiences of sacred realities which cannot so easily be discredited by the scientific hermeneutic. Even scientific and post-modern skepticism about truth claims are not neutral, she argues, since they are based on imaginative and metaphysical presuppositions [such as the human right to dominate an alien nature], not simply evidence. Nevertheless, situating general themes in various social contexts far more carefully than Frazer did, as well as carefully examining truth claims, is essential as comparative religion continues.

Good and Evil Conflict

► Sin

Grace

Krystyna Sanderson

Grace seems to be a particularly Christian concept. The Incarnation itself is commonly referred to in Christian writing as an act of God's grace. "For the law was given through Moses; grace and truth came through Jesus Christ" (John 1:17). Grace as an element of Christian faith denotes God's unmerited favor toward all people, and though a free gift with "no strings attached" is often linked with the human will to do good and seen as the means by which a person is empowered to make right choices. There is however no coercion in grace: it may be accepted or rejected by the one on whom it is bestowed.

In St. Paul's commentaries on faith, the necessary exertions of the will are displaced from seeking to keep the law to accepting, through grace, the salvation that is freely given by God: "For by grace you have been saved through faith; and this is not your own doing, it is the gift of God – not because of works, lest any man should boast" (Eph. 2:8–9).

In psychological terms grace can be seen to be the matrix within which healing energies can pass between psychotherapist and patient. It is grace that allows the patient to safely express any and all life experiences with the assurance that they will be accepted and not harshly judged. It is also grace that enables the therapist to maintain professional detachment and not become destructively involved with the patient when the patient emotionally attacks, challenges and tests the psychotherapist in the course of transference.

Great Mother

David Waldron

The Great Mother Archetype

From a psychoanalytical perspective, the Great Mother is the archetypal manifestation of the collective cultural experience of childhood development. More specifically, the influences exerted on children are not so much the product of the mother herself, as an individual, but rather the product of the archetypal mother image rooted in the collective unconscious. As such the image of the Great Mother reflects both the feelings of maternal support, comfort and love for a child and the negative capricious experience of vulnerability, helplessness and dependence experienced by the child in development. In this sense the archetypal image of the mother is nurturing and loving but also capricious, mysterious and linked to feelings of vulnerability and seduction (Jung, 1968).

Thus there is an intrinsic duality to the archetypal representation of the Great Mother. The imago of the divine feminine is paradoxical, serving as an archetypal manifestation in the collective unconscious but also, precisely because of the power of the symbol in the human psyche, as the focal point of a vast array of projections from both men and women. The Great Mother is seductive and capricious,

virginal and pure, mothering and supportive yet mysterious and cruel. Jung commented on this sense of a fractured and split symbolic configuration of the Great Mother, observing that such splits are common in powerful symbolic representations and furthermore that as a fundamental part of childhood development a child has to come to terms with their biological mother as a fully formed human being and reconcile these contradictory perceptions within the infant mother dyad if they are to fully develop into psychological adulthood and relate to their mother as an individual rather than as a symbol. Closely linked to this experience of reconciling divergent symbolic forms associated with the archetype of the Great Mother is Jung's hypothesis that the Great Mother is experienced differently by males and females. Jung argued that the intrinsic alien qualities of femininity to a masculine psyche would lead to the representation of the Great Mother being more deeply impressed in the unconscious aspects of the psyche of a male and thus would exert a far deeper influence. Similarly, the feminine experience of the Great Mother is far more closely linked to a woman's conscious representation of the self and thus exerts less of a hold on the unconscious (Jung, 1968).

It is this sense that the symbolic manifestation of the Great Mother in the form of Mother Goddesses is perhaps the most illuminating. The breadth and depth of Mother Goddess representations and worship through history and across cultures is remarkable. Mother Goddesses, as the symbolic manifestation of the Great Mother archetype are associated with all major aspects of life such as death, birth, initiation, fertility, agriculture, warfare reproduction and wisdom. Indeed, the sheer diversity of Mother Goddess representations closely aligns itself with Jung's paradoxical union of opposites intrinsic to the Great Mother archetype (Jung, 1968).

The Great Mother in Goddess Worship

Whilst a full discussion of the manifestation of Goddess worship or deification of the archetypal Great Mother and the complex and often controversial claims surrounding claims of neo-Lithic widespread Goddess worship is beyond the scope of this article, it is worth noting some common themes that resonate throughout cultural patterns of deification or sacralization of the Great Mother archetype. Sacred images of the Great Mother archetype range through the vast proliferation of the Goddesses of antiquity and contemporary Hinduism to the sacralization of the Virgin Mary in many catholic traditions to the Gnostic veneration of Sophia. Despite this proliferation there are certain common themes and distinctions in the way the

feminine imago is manifested. Typically these themes also reflect the varied and diverse associations of a reified femininity as experienced in cultural life (James, 1983).

The Great Mother and the Holy Virgin

The manifestation of the Great Mother is commonly associated with Virginity. Perhaps some of the most visible representations of this model of reified feminine sacrality are the iconic figure of the Virgin Mary in Catholicism and the Hindu Goddess Kannagi who is goddess of both chastity and the sacredness of motherhood. Similarly, Mother Goddesses are typically associated with nurturing, protection and healing. Overtly this relates to the aforementioned experience of childhood and infancy combined with the socially ascribed role given to women in most cultures. However, it also relates to anthropological notions of pollution and taboo through which the purity associated with motherhood or the sacred virgin serves to purge people of corruption and contamination. Goddesses in general tend to be attributed with nurturing qualities serving as the symbolic wellspring of life. Similarly, images of the sacred feminine are commonly constructed in local mythologies as wives and consorts of gods, also linking the role of the Great Mother with established social structure and practice. Conversely, The Great Mother is also commonly associated with violence and destructive power as illustrated by the triple aspect Celtic Death Goddess the Morrigan and the Balinese Goddess Rangda and the Hindu Goddess Kali. These Goddesses, whilst having nurturing sides and loving sides to their personas, can also be represented as capricious, destructive and cruel. This pattern closely reflects Jung's notion of the Great Mother as represented archetypally in religious forms, having a distinct duality which reflects the sense of helplessness and vulnerability experienced by infants in development and growth.

The Great Mother and the Earth Goddess

Goddesses are also commonly linked with the earth and with natural phenomena. A contemporary manifestation of this is the Earth Goddess of many neo-Pagan traditions or James Lovelock's Gaia hypothesis. Developing in the nineteenth Century, this notion of a universal Mother Goddess linked to the earth has become widespread in western culture (Hutton, 1999). However, while Earth Mother goddesses are very common there are numerous exceptions to this rule of feminine Mother Goddess and earth

association. For example Egyptian goddesses are rarely Earth Mothers; indeed Sky Goddesses and Earth Gods are more common, as in the Japanese Shinto tradition. The Venus figures found by archaeologists in the neolithic period are often taken to represent a universal monotheistic Earth Mother religion preceding a later degeneration to patriarchal religious traditions. However, while there is evidence for this, the Paleolithic Earth Goddess hypothesis has come under severe historical critique due to the often indiscriminate manner in which various symbols were uncritically configured as intrinsically representative of an Earth Goddess while contemporary use of similar figures by indigenous peoples rarely corresponded with the Great Goddess hypothesis. That being said, many of these images and artworks clearly relate to examples of ritual use of feminine images and artwork and indicate the importance given to the sacred feminine in the ancient world (Gimbutas, 1982; Hutton, 1993).

The Great Mother as a Religious Manifestation

The Great Mother as a religious manifestation is demonstrated throughout history and across cultures and continues to undergo renewal and redevelopment within many new and well established religious movements. The Mother Goddess image has played an incredibly important role in prehistory, throughout the development of agriculture and contemporary civilization and in urban life, and continues to play a significant role in all religions and cultures. Nevertheless, it is important to evaluate the significance and symbolic import of these representations within the context of the culture and society in which they operate. It is also worth noting that, from a Jungian perspective, whilst the Great Mother serves as the archetypal source for a host of religious representations it is not the same as the deified images of femininity and motherhood that exist across cultures. For Jung the fundamental nature of the mother child dyad meant that the Great Mother as an archetype would be a universal symbol within the collective unconscious. However this is a far cry from reifying the cultural manifestations as existent manifestations of a universal deity (Jung, 1968).

Guan Yin

Minqin Wang (王敏琴) · Lee W. Bailey

Guan Yin is one of the most popular deities of East Asia. In China she is known as *Guan Yin* (also *Kuan Yin* or *Kwan Yin*), She is a Bodhisattva also called *Guan Shi Yin* (观世音), *Guan Zi Zai* (观自在), or *Guang Shi Yin* (光世音), meaning “She who hears the voices in the world crying for help.” Cantonese variations are *Kwoon Yam*, *Kwoon Sai Yam*, or *Kwoon Chi Choi*. In Japan she is known as *Kwannon Bosatsu* or *Kwannon Sama*, in Viet Nam as *Quan Am*, in Korea as *Kwan Seum Bosal*. In *Daoism* *Guan Yin* is called “*Ci Hang Zhen Ren*” (慈航真人) “Immortal of the Benevolent Ship,” “*Guan Yin Da Shi*” (观音大士) or “*Ancient Buddha of the Southern Sea*” (南海古佛). The male Bodhisattva *Avalokiteshvara* was brought from India to China, and his name was translated to the Chinese as *Guan Yin*. Then it was slowly blended with uniquely indigenous Chinese elements. Although often over-simplified as simply an emanation of *Avalokiteshvara*, *Guan Yin* is actually a uniquely Chinese goddess who synthesizes Buddhist, Daoist, Confucian, and indigenous shamanic elements.

History

Buddhism was first introduced to China during the Han Dynasty (206–220 CE), and *Guan Yin* soon appeared as a male Chinese version of *Avalokiteshvara* in art as a monk with a thin mustache. Then, over the next several centuries, *Guan Yin* was widely transformed into a woman. As early as 483–493 CE an emperor had a vision of a feminine *Guan Yin* (Stein, 1986: 23). This presents a problem: some scholars cannot explain why the masculine changed into

the extremely popular feminine *Guan Yin* in China. This feminine transformation must have come from somewhere with good reasons. The answer has both historical grounds and psychological, social, and spiritual reasons among the people who made her so popular. Of all the imported Buddhist deities, *Guan Yin* was the only one to become a genuine Chinese figure. Many Chinese are not even aware of her Buddhist roots (Yu, 2001: 223).

Although *Guan Yin* is now commonly regarded as a female deity, she may still appear as a man or a woman. For example, the current Dalai Lama is said to be an incarnation of *Guan Yin*. In Buddhism today, when a person becomes enlightened, they may become a Buddha, no matter whether the person is a man or woman. Similarly, when a Buddhist swears to serve people heart and soul without any selfish desires, the person becomes a Bodhisattva, regardless of their gender, because ultimately the *Buddhamind* is beyond gender, although humans connect to the transcendent strongly through gender characteristics.

One historical reason for her popularity is that during the fourth through the sixth centuries, invaders from the north (“*caitiffs*”) invaded China and forced the government south into the Yangzi River valley. Amid this chaos, when traditional Confucianism struggled to maintain order and civility, people likely welcomed the warm, compassionate, saving spirit of *Guan Yin*, who was portrayed as responding immediately to sincere cries for help from people in desperate situations. *Guan Yin* miracle tales spread, telling of her saving people from warriors, drowning, sickness, infertility, often stressing a conversion experience (Campany, 1996).

Psychologically and socially, *Guan Yin*’s modern Buddhist egalitarianism goes against the ancient Confucian views of women as inferior, even polluted. Chinese goddesses helped remove women’s supposed pollution related to reproduction. Their followers might seek purity by resisting marriage, not consummating their marriage, living in celibate women’s communities, or providing their husbands with a concubine. Belief in goddesses still supports mothers and sisters who want to reduce family conflicts, such as paternal domination. The more inclusive goddesses also help unite various village territorial groups (Sangren, 1983: 11–17). These important social and psychological functions of goddesses like *Guan Yin* give many women a counter-cultural social group and goals outside family.

Spirituality

The Buddha told Inexhaustible Intention Bodhisattva, “Good man, if any of the limitless hundreds of thousands

of myriads of *Kotis* of living beings who are undergoing all kinds of suffering hear of Guanshiyin Bodhisattva and recite his name single-mindedly, Guanshiyin Bodhisattva will immediately hear their voices and rescue them (Kuo-lin, 1997). This is different from the traditions emphasizing study or meditation. This also goes against the ancient hierarchical traditions of Asia, in which the high gods were allied primarily with royalty. While celestial, *Guan Yin* is also very close to people. *Guan Yin* and the Bodhisattva *Da Shi Zhi* (大势至) are two important assistants of *Amita* Buddha. The three are called “Three Saints in the Western Paradise.”

For Chinese Buddhists, Buddhas and Bodhisattvas do not only exist in the spiritual world. Nor are they just the statues in the temples or pictures in the altars. Some old gods were deified government officials exercising imperial territorial rule. But Buddhist deities are universal and “present” among the common people in daily life, and emphasize individual salvation. But unlike some Buddhist practices that suppress the senses, *Guan Yin* is more Tantric, appearing in sensation, in sight, touch, hearing, and fragrances. *Guan Yin* was the first Chinese deity to leave heaven and appear with saving powers when people were in crisis (Campany, 1996: 256).

Guan Yin. Figure 1 Retrieved from “Forum/bbs” at <http://qiankunzhiyi.aa.topzj.com/forum-3926-1.html>.

Buddhas and Bodhisattvas have many forms, including appearing as common people, giving spiritual guidance, and performing miracles (including resurrections) (Yu, 2001: 190–191). Accounts of miracles and divine wonders were well known in China before *Guan Yin*, but many of hers contained the new Buddhist psychological emphasis on conversion to a new Buddhist life. The first known compiler of eye-witness accounts of *Guan Yin* miracles was Fu Liang (374–426).

Iconography

Guan Yin is said to have 32 forms. Some of these were imported with *Avalokiteshvara* (such as the thousand-armed image), and some were indigenous Chinese images (such as giving a child):

1. the oldest known indigenous Chinese image is of the “Water moon *Guan Yin*,” white-robed with a large moon halo (Yu, 2001: 184).
2. *Guan Yin* holding a willow branch and a narrow vase of her “sweet dew” of compassion and healing
3. *Guan Yin* with a fish basket, indicating *Guan Yin* saving people in ocean storms (and in life)
4. *Guan Yin* with a lotus flower (a traditional Indian image of beautiful new life on water, growing from mud [life’s messes] yet remaining pure) indicating that she always helps people to become enlightened
5. *Guan Yin* in white (pure) clothes, indicating *Guan Yin* going to the secular world to help people
6. *Guan Yin* in red clothes, indicating *Guan Yin* staying in the temples to help people
7. *Guan Yin* with four arms or eleven faces on her crown, or one thousand hands and eyes, indicating her many powers (a traditional Indian image)
8. *Guan Yin* standing on a dragon (a traditional Chinese image), indicating her great powers to redeem sea animals.
9. *Guan Yin* with a horse’s head, indicating her going to the animal world to redeem animals
10. *Guan Yin* with a child, indicating her sending children to infertile women
11. *Guan Yin* seated in the casual “Royal Ease” pose, with legs apart and one arm resting on a knee raised high (like Hindu royal images).

But *Guan Yin*’s forms are countless. That is why there is a saying “If you be humble and modest, you will meet *Guan Yin* everywhere.” You can see *Guan Yin* even in an oyster. In ancient times, there was a king who was very cruel and killed a lot of people and animals. He liked to eat oysters

very much. In order to persuade him to love others, *Guan Yin* made his/her image into all the oysters he got. So when he opened every oyster, he found the image of *Guan Yin*. Then his Buddha nature was evoked and he realized *Guan Yin's* intention, so later he became a very good king.

Festivals and Pilgrimages

There are three annual *Guan Yin* festivals. In the Chinese lunar calendar, February 19th is *Guan Yin's* birthday, June 19th is her day of receiving *Dao* (becoming enlightened), and September 19th is her day of achieving *Dao* (having the ability to apply the *Dao* perfectly to help others). Celebrations are held in each temple, and monks or nuns lead ceremonies such as: singing “Praising Incense,” reading the names of many Buddhas, reading “Da Bei Zhou” (大悲咒) (Mantra of Great Sympathy), singing “Praising of *Guan Yin Da Shi*,” reading “Poems of Bodhisattva *Guan Yin*,” returning the benefits of prayers to Buddhas and Bodhisattvas, to parents, children, relatives, friends, even one’s enemies in previous and present lives. *Guan Yin's* Ritual of Repentance and Forgiveness is also popular (Yu, 2001: 263–265).

Guan Yin's Dao Chang (道场) (main place of spreading the *Dao*) is on *Pu-tuo* mountain in Ningbo, Zhejiang province, in the bay south of Shanghai. *Pu-Tuo* was a Daoist haven from the first century BCE Han period. It has been destroyed by wars and pirates and rebuilt repeatedly. It became Buddhist by the eleventh century. It is a busy pilgrimage island where people seek blessings and visions at temples, monasteries, rocks, and caves full of surging waves. It is one of the traditional four major holy mountains in China. It is part of *Guan Yin's* connection to China’s South Sea, where miracle stories tell of her appearing in light or floating on a cloud to save drowning sailors.

Hang Zhou has also been a major *Guan Yin* pilgrimage site. In 1987 an estimated two million pilgrims went there for her birthday. At such temples, pilgrims typically light incense and candles, chant and pray, burn spirit money to ancestors, and incubate dreams to be interpreted by monks. Pilgrims may beat on a hollow wooden “fish,” and chant a *dharani* such as *Na Mo Da Ci Da Bei Guan Shi Yin Pu Sha* (Homage to the greatly compassionate, greatly merciful Guan Shi Yin Bodhisattva) (Blofeld, 1977: 26).

Texts

There are numerous *Guan Yin* texts, notably “The Universal Gateway,” which is the 25th chapter of the *Lotus*

Sutra. The oldest version we have of this was translated by Dharmaraksa in 286 CE (Yu, 2001: 161). Later it was translated from the Sanskrit into Chinese by Kumarajiva. It stresses how that people in need can call the name of *Guan Yin* and they will be assisted immediately. It promises deliverance from swords, chains, demons, bandits, and offers sons to women who call out to her. There is some debate about her name’s translation from the Sanskrit to the Chinese, but this is traditionally the text where the name for *Avalokiteshvara* was translated to *Guan Shi Yin*, meaning “Lord who perceives the cries of the world.”

Early texts were found in a sealed cave at Dunhuang in northwestern China – wall paintings and banners of *Guan Yin* saving people from distress, 1,048 copies of the Lotus Sutra, and almost 200 separate copies of the *Guan Yin Sutra* (Campany, 1996: 83). Another cave at Fang-Shan, near Beijing, revealed a treasure of hidden texts, stone slabs and art about *Guan Yin* (Yu, 2001: 111). They showed that ancient kings often had *dharani* (invocations) carved on stone steles with sculptures, erected them around the country, and ordered monastics to memorize and chant them, seated in front of a *Guan Yin* image.

A very popular text is the Ming Dynasty (1368–1644) novel called *The Journey to West*. This long, multi-volume, historically-based legend blends a Buddhist picture of *Guan Yin* with indigenous Chinese local gods, Daoist *Xian* spirits, and various folklore scenes of dragons and monsters. The novel is based on the journey of the historical Tang (618–907) monk *Xuanzang*. His autobiography records a seventeen-year round-trip journey along the silk road from China to India to get the Dharma in sutras to take back to China. In the Ming novel he is called “Tripitaka”, which is an honorary title for a monk. The story was made into a popular 1979 Chinese television series. *Guan Yin* plays a major role in the tale. First she is sent by the Buddha to China to find a suitable messenger to come and get the Dharma. She chooses Monkey (symbol of ego), who struggles on his way with various monsters (shadow beasts). *Guan Yin* graciously appears and converts each one – Sandy, Pigsy, and Dragon – with forgiveness for their sins and their vows to behave and help along the journey. The highly allegorical and action-filled adventure shows *Guan Yin's* refined Buddhist theme of psychological conversion.

A famous ancient *Guan Yin* text was inscribed on *King Kao's Guan-Shih Yin Sutra* stone votive stele (550–577), now in the Asian Art Museum in San Francisco (Yu, 2001: 110). *Lu Kao's More Records of Kuan-shih-yin's Responsive Manifestations* (in Chinese) is a typical collection of miracles stories (Yu, 2001: 579). A series of *Guan Yin* poems

are used in divination, such as this one telling of her role since the beginning:

- ▶ From the beginning of Creation, everything had meaning:
The lucky day brings everything fruiting to ripeness. . .
Then revelation comes – and don't take it lightly –
The pure-hearted will be graced by the Divine One
(Palmer, Ramsay and Kwok, 1999).

Background

Guan Yin's background is multifaceted. The Buddhist tradition of the shift from a male to a female divinity needs historical and psychological explanations. *Guan Yin* traditions are clearly rooted in Buddhist goddesses such as *Tara*, archaic shamanic Chinese goddesses such as The Queen Mother of the West, and Daoist goddess such as *Ma Tzu*; in these historical roots and current practices are several psychological factors, such as women's pollution relief.

The representations of *Guan Yin* holding a child are rooted in the archetypal maternal desires expressed in China as early as archaic Neolithic (c. 500–2500 BCE) Chinese female figurines, called “fertility goddesses,” and temple ruins found in Mongolia, with female names on buried shamanic oracle bones and later bronze vessels. This feminine side of Chinese culture was absorbed into *Guan Yin*, who is invoked to grant pregnancy, easy deliveries of both boys and girls (Yu, 2001: 127–140).

The popular legend of *Miao Shan* (“Wonderful Goodness”) had a powerful role in feminizing *Guan Yin* (Yu, 2001: 349). The oldest known account was carved on a stele in Honan in the eleventh century. With many variations and psychological implications, the story is that *Miao Shan* was a princess who refused her father's command to marry (a refusal of filial piety, an Oedipal/Jocasta conflict, and a feminist assertion of Buddhist celibacy and archetypal purity). He pressured her and she retreated to a convent. He angrily burned it down and her spirit ascended above (transcendent function). Then her father fell ill (psychosomatic illness) and heard from her in disguise that the only medicine for him would come from a person who had never been angry (transformation of archetypal shadow). He sent for it and she returned him a medicine made of her arms and eyes, willingly sacrificed. When he healed and learned of her astonishing filial sacrifice (submission of ego to higher Self), he took the family to her and they all took refuge in the Buddha (submission of ego to higher Self). She was *Guan Yin* in human form all along (presence of transcendent in daily

life). The dominant themes of are conflicting: Buddhist celibate opposition to marriage, women's resistance to traditional roles, yet Confucian filial piety and her self-sacrifice to heal her father. Self-sacrifice with a slice of flesh (*ke-ku*) to heal parents was a known practice in ancient China, although Confucians officially opposed it (Yu, 2001: 333–334). Pious Chinese were thereafter often named *Miao Shan* (Yu, 2001: 303). Many Chinese deities are described like her, either as humans later deified or as deities in human disguise.

The image of *Guan Yin* holding a Fish-basket is based on a legend also known as “Mr. Ma's Wife.” In the Tang Dynasty (809 or 817) the story emerged that one day a lovely woman appeared in a village carrying a basket with a carp in it. She attracted many men's marriage proposals. Her selection process was a contest – who could memorize the entire *Lotus Sutra*, that she carried under the fish, in three days. Only a Mr. Ma could do it. But just before the wedding, she mysteriously died. They buried her and later a monk came and showed that her bones were linked by a golden chain, indicating that she was a great sage, and he carried her up to the sky, as in a resurrection. Many were converted to Buddhism and she was recognized as *Guan Yin*.

The archaic Queen Mother of the West (*Xi Wang Mu*, 西王母), also known as the Eternal Mother (*Wu Sheng Shen Mu* 无生神母, *Yao Chi'ih*, *Wang Mu Niang Niang* 王母娘娘) is an ancient goddess who never appears on earth (thus remaining pure), and grants children. She was adopted by the Daoists, and gives the gift of immortality and the secrets of eternal life. She is worshiped by both the elite and the masses. She was the most famous Chinese goddess before *Guan Yin*, and may well have been a model for *Guan Yin* (Yu, 2001: 480). She provides the best archaeological evidence of archaic goddesses – bone carvings from the Shang (1760–1122 BCE) (Despeux and Livia, 2003: 25; Yu, 2001: 409). During a drought in 3 BCE she was worshiped by masses of people with straw manikins of her singing, dancing, drumming around fires (Yu, 2001: 410). She rules from the mythical Mt. Kunlun; she saves people and dispenses peaches of immortality, notably to emperors. Her cult involves ecstatic spirit possession. The Queen Mother is the essence of cosmic and bodily *Yin* and teaches how to balance *Yin* and *Yang* in life, including sex, and thus live a long life and become enlightened (Despeux and Livia, 2003: 25–47).

An important Daoist goddess is *Ma Zu* (*Ma Tsu P'o*, *Mazipo*) was a fisherman's daughter from Fujian (Perkins, 1999: 319–320). She refused marriage and developed her spirituality until she was able to project herself and influence nature. She used her powers to rescue her brothers

and father, who almost drowned. She died early but continued to safeguard fishermen and traveling traders. She is also known for granting children and is very popular in Taiwan (Sangren, 1983: 8). Integrated into the Daoist pantheon in the fifteenth century, she is still a popular deity in southern China. Like *Guan Yin*, she remained celibate, made a vow to rescue all, and in her immortal form she responds to the sincere chanting of her name (Despeux and Livia, 2003: 65).

Tara (“eye”), originally a Hindu goddess, in south Asian Buddhism is one of the primary emanations of *Avalokiteshvara*, born from his tears or a ray of light from his eye. The white *Tara* reveals her compassionate side. Whether called a Bodhisattva, Buddha, or deity, she is a savior who hears the cries of those suffering in *samsara*. *Tara* appears in art at the side of *Avalokiteshvara*, and *Tara* and *Guan Yin* are also called “sisters of *Amitabha*” (Stein, 1986: 35). The eye appears in *Guan Yin* art also. John Blofeld sees *Tara*, who comes to the aid of needy mortals, and *Guan Yin* as identical, although *Tara* is not well known in China (Blofeld, 1977: 53–64, 40–41). Many important themes from her predecessors were woven into *Guan Yin*’s tradition.

Psychology

Exploring why *Guan Yin* became feminine, we must look at traditional Chinese gender relations. Does *Guan Yin* offer a psychologically tame balance for the ancient traditional role of women as subservient, portrayed in the saying “I was born a woman because of evil karma in a previous life” and the scornful relegation of women to an impure role in life due to their reproductive functions (“The Blood Bowl Sutra” – 1194 CE)? Women were taught to detest their bodies and could only hope to be escape Hell by being reborn a man (male repression of shadow by projection onto women).

Or does *Guan Yin* function as a more bold, compassionate, saving contrast to that repression, even a feminist opponent to that? The answer is that both themes are offered, as in the story of *Miao Shan*, who rebels against women’s subordinate position in marriage demanded by Confucian filial piety, by seeking to become a nun, but then sacrifices her own flesh to save her father, which shows loyalty to filial piety, as well as her Buddhist role as savior (Boucher, 1999).

Daoism also views the feminine in an ambivalent way. It sees the *Yin* energy as a positive cosmic force in women, but in contrast with a strongly patriarchal view of *Yang* from the Confucian tradition that suppresses women and

sees them as polluted by their reproductive functions. The strong Confucian preference for a son to carry on the family name is a social denigration of girls not easily overcome by a Daoist balance of *Yin* and *Yang*.

Male-dominated Han Dynasty (206 BCE–220 CE) rulers and their formal heavenly gods pushed aside the goddesses and subordinated women, so, despite women’s stronger roles in Daoism, and ancient traditions such as the Queen Mother of the West, their needs went largely unmet until they were filled by *Guan Yin*. The personal and more inclusive needs of men and women of all classes were also met by *Guan Yin* (Yu, 2001: 412–416). Goddesses cannot assure the political empowerment of women in a patriarchal society, but they can provide deep-seated spiritual guidance, comfort, and some amelioration of patriarchal authority. The Maoist revolution did free women from much ancient oppression, and now religions in China are expanding.

Avalokiteshvara is primarily a Bodhisattva of compassion and a cosmic savior from perils, but was also commonly identified with royalty in southeast Asia and Tibet. In imperial China the emperor was legitimized by the Confucian “Mandate of Heaven”. By contrast, *Guan Yin* was not identified with any kings or queens, although she does appear in a royal court in the novel *The Journey to the West*. People of all social classes, especially women, and even great sinners, knew *Guan Yin* more for her mercy and kindness. No one native Chinese goddess before *Guan Yin* had all of her qualities (Yu, 2001: 5).

Chinese spirituality is highly syncretic and unique, and spread across east Asia. Sometimes people do not even realize that they are blending Buddhist meditation, Confucian filial piety, Daoist Yin-Yang exercises, and archaic ancestor or *Xian* worship. Therefore, it is not surprising the *Guan Yin* is a syncretic blend.

Guan Yin is a strong goddess who helps balance ancient patriarchal traditions, providing women with access to divine power, giving them pride (ego strength) and counteracting patriarchal assertions of pollution (shadow projection). She provides a more egalitarian alternative to Confucian hierarchical class traditions. She helps women wrestle with ancient Chinese versions of Freudian family dynamics (filial piety and conflict). She helps people of all parts of society transform their shadow archetypal patterns (monsters, tyrants) into higher spiritual devotions to the Buddha. She is a warm, maternal spirit of divine compassion.

Unlike remote divinities or sages who appeared long ago, *Guan Yin* is very “present,” in methods of bringing the unconscious depths to the surface through ritual and spontaneous altered states – chanting, singing, fasting,

dream interpretation, and visions. The numerous reports of her saving miracles continuing into the present show an active openness to numinous powers available at any time. This contrasts with the “disenchantment” of industrial societies that seeks to strip the world of transcendent wonder. Accounts of her conversions emphasize not just her overwhelming power, but people making decisions to change their lives, which in Western Jungian terms, maintains free will as the divine savior archetypal image transforms the ego. *Guan Yin* follows the ancient Asian Tantric pattern of Kundalini as she transforms the shadowy effects of the lower chakras by moving them upward, as in the “Monkey” conversions of dragons and monsters into devoted seekers of the Dharma, and in the lotus image. *Guan Yin* is a widespread, uniquely Chinese goddess with a Buddhist core and background of Daoist and indigenous goddesses.

H

Hafiz

Ali Ayten

It is an Arabic word used to identify the one who entirely memorizes and recites the Qur'an, the holy book of Muslims, which is over 600 pages with more than 6,000 verses. The word *hafiz* is also used for those who memorize the sayings of Prophet Muhammad in certain numbers, but these are rare.

The first to memorize the Qur'an was naturally Prophet Muhammad as the Qur'an was revealed to him. Given that the Prophet was an unlettered man, his early followers eagerly recorded and memorized each new revelation as it was revealed. By the time the Prophet passed away, many had memorized its entirety. This custom has been kept up throughout the Muslim world, and hundreds of thousands have memorized it. Although the number of those who endeavor to memorize the whole Qur'an seems to have been decreasing in the age of computerization, it is still one of the highest goals in Muslim life to become a human repository of the Qur'an. Being hafiz is still one of the most rewarded honorifics in Muslim society. The *hafiz* feels a psychological pressure on himself/herself to be a committed, decent, and virtuous member of the society as s/he is believed to bear a sacred trust in his/her mind.

Prophet Muhammad encouraged his followers to read and recite the Qur'an, if not to memorize its entirety and cherished such followers. In the first centuries of Islam, mosques were used to memorize the Qur'an but later special courses in *madrasas* (Islamic school) or a special school called school of memorizers (*dar al-huffaz*) were opened. In the beginning, teachers developed various techniques of their own, but these have been evolved into specific methods over time. Some asked students to memorize verses in fives first before going into the next ten. Some favored memorizing page by page to

repeat the already memorized page the following day. Students begin memorizing the Qur'an at very early ages and many memorize the whole Qur'an before adolescence.

Hajj

Ali Ayten

Hajj is an Arabic word meaning to face and visit a sacred place. It is one of the five pillars of Islam. The *Ka'bah*, in the city of Mecca, Saudi Arabia, the house of God (Allah) built by Prophet Abraham and his son Ishmael, is the only pilgrimage site in Islam. It is a duty of Muslims to visit the Ka'bah once in a lifetime if one can afford it financially and physically. Currently, three million Muslims make hajj every year.

The ritual of hajj is performed on certain days of the year, the first days of the twelfth month (*Dhul-hijjah*) of Islamic calendar, followed by the Festival of Sacrifice. Visits to the Ka'bah at other times are called *umrah*. The obligatory rituals in *Hajj* are to circumambulate the Ka'bah for at least seven times and stay at the hill of Arafat, not too far from the Ka'bah, for some time on the 9th day of the twelfth month. Other rituals include symbolic pebble throwing at an effigy of Satan as well as walking quickly between two locations called *Safa* and *Marwa*, also in Mecca, between which Hagar, the wife of Prophet Abraham, searched for drinking water for her son Ishmael. One who performs the hajj is called "*haji*" (pilgrim), a highly respected title in the Islamic world, which encourages one to live a moral and religious life by keeping away from sinful acts. All pilgrims are supposed to wear white garments (a pilgrim's special dress called

ihram) during *Hajj* which represents the fraternity of all races and nations.

The ritual of *hajj* is supposed to affect the pilgrim deeply and transform him/her spiritually. It covers many symbolic and sentimental acts. The white gown, having no other belongings, represents physical and spiritual purity to make the pilgrim feel humble and that s/he is nothing but an ordinary being ever dependent on the Lord. It also symbolizes that the person is bereft of worldly desires and ready to return to the Creator as s/he was born. Millions from every color, race, and nation meet around the Ka'bah to feel united in a spiritual ambiance leaving all differences behind. Pilgrims place their hands on the black stone (*Hajar al-Aswad*), which is believed to have descended from heavens, located on the corner of the Ka'bah, at every turn of circumambulation to renew their submission. Pilgrims walk in patience between the hills of Safa and Marwa renouncing unwanted habits. By throwing pebbles at an effigy of Satan, they symbolically remove themselves from Satan, who endeavors to lead humans astray. And they finally slaughter an animal to show that they are ready to sacrifice what they have for the sake of their Lord. *Hajj*, more than anything, is a practice for the Day of Judgment with millions of people from all over the world gathering around the house of God. Pilgrims therefore feel the imminence of the Day of Judgment when they will account for their acts in this world.

Hallucinations

Nicholas Grant Boeving

Numerous theories have been put forward to account for the origin and persistence of hallucinations among the human species. Historically, endogenously arising hallucinations were seen as evidence of either divine or demonic possession – usually the latter. Orthodox psychodynamic theories view hallucinations as unconscious projections of neurotic conflicts or as externalized wish-fulfillment fantasies, while biologically situated theories interpret them as dysfunctions of the brain – typically involving the neurotransmitter dopamine. Hallucinations may occur in any sensory modality – visual, auditory, olfactory, gustatory,

tactile, etc., with auditory and visual being the most frequent, and the most frequently associated with psychotic disorders such as schizophrenia.

Hallucinations may be stimulated exogenously with the imbibition of certain psychoactive substances. Pharmacologically classified as hallucinogens, these substances would come to be known in common culture as psychedelics (mind-manifesting), and later as entheogens (god-manifesting). Regardless of moniker, the constellation of effects produced by compounds belonging to this group include altered perceptions of reality and self, intensifications of mood, visual and/or auditory hallucinations, distorted sense of time and space, and an enhanced sense of meaningfulness. Modern pharmacology distinguishes psychedelic agents from other classes of drugs in their unusual ability to produce the aforementioned effects that are known only to occur in dreams or “times of religious exaltation.” Prevalent medical models reductively view hallucinations as the result of disrupted information processing in cortico-striato-thalamo-cortical feedback loops that facilitate the filtering of external stimuli.

Entheogens maintain an important, albeit controversial, place in the history of religions. There is ample evidence to suggest that mind-altering compounds have been used since remotest antiquity by virtually all peoples of the Earth to induce altered states of consciousness. Particularly important in the shamanic context, the ritual consumption of substances (*ayahuasca*, *peyote*, *mescaline*, *salvia divinorum*, etc. – all plants and plant extracts which generate powerful hallucinations) extends across all cultures and throughout all times, including Siberia, Asia, Europe and North and South America. Approximately 150 psychoactive plants have been identified in recent ethnographic research as still being used in indigenous religious customs today.

As the academic study of religion began to develop at the dawn of the twentieth century, efforts were redoubled to apprehend the historical opacity of religious texts and to link the mythic places and potions of the past with physical locations, actual plants, and historical people.

The amateur ethnomycologist R. Gordon Wasson is perhaps best known for his work on the ancient Vedic god Soma. In a book as internationally reviled as it was universally lauded, he put forth the theory that Soma was one in the same with the fungus known as *amanita muscaria* – or the fly agaric – which, once imbibed by the officiating priests, was then passed through the body and voided by the bladder only to be drunk again, the process resulting in dramatically altered states of awareness. He theorized that the entirety of Eastern religion

owes its modern philosophical orientation to the ecstatic visionary states that Soma produced once consumed.

In a later work written in conjunction with Albert Hoffman, discoverer of LSD, he put forth the theory that the beverage known as *kykeon*, an intoxicating brew central to the rites of the Eleusinian Mysteries, was, in fact, a fermented derivative of barley containing ergoline alkaloids from the ergot fungus, from which LSD was originally synthesized.

In a similar vein, the Pythia of Delphi is believed by some to have entered states of ecstatic trance after inhaling the noxious and hallucinatory fumes rising from the fissures of her subterranean abode before offering oracular advice. The alleged identities of these vapors have spanned the entire spectrum of hydrocarbon gases, but most authorities agree that ethelene, which has been empirically confirmed as producing trance-like states in persons exposed to sufficient quantities and concentrations, is the most likely candidate. These are but three of many such theories attempting to link the intoxicants of antiquity with known mind-altering compounds of the present.

The Post-Enlightenment lenticular structures of the modern age have been brought to bear on the issues of entheogens. Inquiries from fields as disparate as psychology, neurology, theology, and medicine have all made significant impacts in advancing our collective understanding of these perplexing substances and their even more perplexing effects. Beginning in the 1950s, government sponsored research projects on psychedelics ranged from efforts to “cure” schizophrenia (as the effects were seen to temporally mimic psychotic states) to the treatment of alcoholism. More existentially-oriented projects such as psychedelics’ effects on quality of life as well as exploration into how transcendent states are neurochemically mediated were soon to ensue.

Psychologists were quick to take note of the transformative potential of psychedelics, particularly of how a confrontation with death in a ritual context could lead to a reduction in the fear of mortality. Timothy Leary, Ralph Metzner, and Richard Alpert, all on faculty at Harvard, began a series of experiments investigating the effects of LSD on initiating transcendent mystical experiences. This psychologization of spirituality would prove to be inextricable from the transmission of Eastern religious traditions to the West, although this indebtedness to entheogenic sources would remain infrequently acknowledged.

Research was to effectively cease in 1963, when access to these substance became restricted, making them nearly impossible to procure. Due to the incendiary rhetoric surrounding the dangers to both society and self that

hallucinations purportedly posed, public interest soon subsided along with the Academy.

Commentary

Presently, entheogenic research is enjoying a scientific recrudescence. Experimental treatments for addiction using ayahuasca, psilocibin, and ibogaine have already been met with impressive success. New research on ketamine and the inducement of Near Death Experiences (NDE’s) holds much promise for the continued unlocking of the mysteries of the mind. Perhaps the most beguiling question of all becomes, then: how can we understand alleged alterations of consciousness without first understanding consciousness itself? This crucial question is central to the concerns of both psychology *and* religion and will continue to unveil progressively deeper accounts of these mysteries as inquiries of this nature continue to unfold within the fields of psychology, religion, and the meeting of the two.

Hanging and Hanging God

John Eric Killinger

Deriving from two Old English words *hangian* and *hon*, and supported by the Old Norse *hengja/hanga*, “to be suspended,” *hanging* is also influenced by the Sanskrit *sankata*, “hesitate” and the Latin *cunctari*, “to delay,

defer, suspend.” Despite the fact that the terminology “hanged” is usually reserved for legal language, the word has also extended into metaphoric usage (e.g., *I’ll be hanged, hang-up, and hanging out*). There are affinities in Hebrew (תָּלָה, *tālā*, “hang up, let down, dangle, put to death by hanging,” Genesis 40:22, 2 Samuel 21:12; Esther 9:14) and Greek *kremamai* and *kremannymi* (Κρήμαμαι in the LXX (Septuagint), but seven times as Κρεμάννυμι in New Testament, referring to dependence on the entire law and the prophets (Matthew 22:40), execution of the two crucified with Jesus (Luke 21:39), and specifically to “crucifixion” in Galatians 3:13, even though it is derived from the Deuteronomic code (תָּלָה, *tālā* ‘al in Hebrew for “hanging after execution”). With the prepositions *around* and *on*, this Greek usage also literally meant *hang*, as in the millstone hung around one’s neck (Matthew 18:6) and the snake that bit Paul on the hand (Acts 28:4), respectively. Hanging upside down, as St. Peter reputedly suffered, is a mark of humiliation and derision, a reversal of what the person stood for prior to being hanged. Such a method of hanging was called “baffling” (Spenser, 1978: 956).

Hanging was, according to the Old Testament, allowed, but seems to have occurred *after* a person was executed. In compliance with Deuteronomic law, the body was to be removed before nightfall so as not to pollute the land given by God as an allotment. Even as early as the story of Joseph in Egypt, hanging consisted primarily of beheading followed by the displaying of the decedent’s head on a pike. King David’s eldest son Absalom caught the long locks of his hair in the low branches of an oak tree during his flight and was left hanging “between heaven and earth.” Disregarding the order to spare the king’s son, Joab, David’s chief general, kills Absalom with three spears to the heart (2 Samuel 18:9–15).

A liminal feature occurs in hanging. This is particularly true with regard to hanging gods such as Jesus the Nazorean who claims oneness with God, Odin the Norse All-father, Attis, and Osiris, who prior to his Dionysian dismemberment hung like Jesus for three days. According to Frazer (1914/1936, 1922/1996), the Phrygian satyr of Lydia, Marsyas, along with Adonis, Artemis and even the fair Helen, ought to be included in this list of hanging gods. We might ourselves include Herman Melville’s Captain Ahab who had a crucifixion in his face (Melville, 1967: 111) and the twelfth card of the Major Arcana in Tarot known as the Hanged Man. This liminal feature is *intermundia*, a state of being suspended between worlds suffused with death and rebirth – it is the presence of the absence of *ananke*, or necessity. It is not-space space and not-temporal temporality in much the same way as the alchemists called the *lapis philosophorum* the

not-stone stone, or *lithos ou lithos* (λίθος οὐ λίθος). Cicero (2000), in his *De natura deorum*, translates Epicurus’ term *intermundia* as *metakosmios* (μετακόσμιος), the place wherein he consigns the Greek pantheon. *Metakosmios* is derived from the verb *metakosmeō* (μετακοσμέω), *rearrange, modify, and changed in aspect*. Metaphorically it is a new arrangement, a change of condition, even a change of character, indicating its transformative aspect.

Hanging, this pathos of the god, even human hanging, often occurs outside the city wall. Jesus was crucified on the green hill of Golgotha outside of Jerusalem. Odin underwent hanging on the wind swept World Ash Tree, Yggdrasil, away from human and divine contact, yet rooted to all and none. Osiris was encased in Set/Typhon’s beautifully wrought sarcophagus that became hung up and further entombed in the trunk of a tamarisk tree after floating down the Nile, which is also “up” as it would be northward, for as above, so below. Attis, who in alchemy is synonymous with the Egyptian god Osiris, performs his self-mutilation under a sacred pine tree, and in accordance with later ritual, is portrayed in effigy and hung on the pine tree as the officiating leader of the Attis-Cybele rite sheds his own blood to promote the fertility of the crops for the coming year. The Attis-Cybele myth is linked to the Artemis-Actaeon myth (and that of Isis-Osiris) and those of the respective fragmentations of Dionysos and Orpheus, whose misogynistic “madness” causes the Thracian maenads to tear him apart. The spirit of union not yet extracted is still part of the greatest dilemma of human beings today, according to Schwartz-Salant (1995). This is the “conclusion” to the problem and recognition that fragmentation, rather than repression, has a greater significance for development and pathology. Thus, being wounded to the point where one is branded a heretic or even an apostate necessarily moves the soul to action.

Prayers and other cultic acts carried out in the hope of fertile land and crop abundance occur in the rites of Tammuz. Ezekiel 8:14 refers to the lamentation of the women over the death of Tammuz (תָּמֻז, Θάμμουζ) as an abomination to the Lord in the kingdom of Judah. Tammuz, or Dumuzi (whose name means “proper son [or child]”), was the Sumerian shepherd who married Inana, died, and was resurrected by her. Even Inana must be executed and hung like a piece of rotting meat in the underworld. When she ascends, she gives up Tammuz in her place. He escapes, then is captured, only to be freed by the love of Inana. Like Persephone, Tammuz is to spend half the year in the underworld, the other half upon the earth. The mythology of Inana–Tammuz is reckoned to date back to 3,000 BCE and encroached upon ancient Palestine, being given some recognition in various circles of the culture of Jerusalem. Ezekiel’s astonishment is at

seeing the lamentations of the Tammuz cult infringe upon the sacred center of Jewish religion. Despite such lamentations being viewed as supplementary to the worship of YHWH, the abomination of it lies in its being an insult to the “living God,” and nothing short of apostasy.

Tammuz is related to Osiris and also to the mythology of the Phoenician Adonis, whose origins are not of the Greek classical period but semitic. According to Zimmerli (1969/1979), the lament of the death of Adonis (the Phoenician vegetation god type) is also attested in the Septuagint versions of 1 Kings 14:13 and Jeremiah 22:18 (242). Adonis’ name derives from *adon* (אדון), meaning “master, ruler, lord.” *Adōn* is the aleph and tav, alpha and omega, the one who was, is and *is to come*. The Masoretic text of the Hebrew Bible (Old Testament) uses *Adonai* to refer to the tetragrammaton YHWH, and this would connect Tammuz/Adonis/Osiris with Jesus in this respect. Not only this, it freights the reading of Ezekiel 8:14 with difficulty, imbuing it with a kind of fundamentalist repression, for example, “If you are not with me, you are against me.”

The liminal state involved in hanging may be long or short. The unusual swiftness of Jesus’ execution, which only lasted a matter of hours, comes as both a surprise and astonishment. Performed as a deterrent against rebelliousness, many Roman crucifixions lasted as long as three days. Jesus was forced to carry the *patibulum*, or crossbeam (also “dungeon,” “torture”), probably several hundred meters to the execution site where the seven-foot-tall stipes (vertical beam) would have been erected and awaiting him. Curiously, the vertical pole, called *stipes* in Latin, means both “tree trunk” and “instrument of torture.”

The chronicling of Osiris the great Egyptian god of resurrection, found primarily in Plutarch (1936), had nine watchers and nine mourners, aligning it with Odin’s nine whole nights and nine songs. Like the division of the uroboros in the *Pistis sophia* into twelve aeons, Osiris’ night realm was divided into twelve parts. In Kabbalah, the number twelve represents the philosopher’s stone. Twelve also is represented by the Hebrew letter *lamed* (ל). Lamed is the heart and central letter of the Hebrew alphabet. Because it towers over the other letters, it represents the King of kings, an attribute also given to the Hanged Man, the twelfth trump of the Tarot’s Major Arcana. The poles of this Tarot card could refer to the Egyptian two-fingers amulet that was placed either in the swaddling of the mummified remains of the deceased or loose in the coffin. These amulets represented the two fingers of the god who helps Osiris ascend the Ladder of Rē.

The Norse god Odin’s hanging lasted nine whole nights, according to the *Hávamál* of the Poetic, or Elder, Edda. Like Jesus, Odin suffered impaling with a spear, screamed as he reached for the runes, which might perhaps have

been tinged with the horror of forsakenness (as he received no bread or drink filled horn), and sacrificed himself to himself. In the process, he learned nine powerful songs. As his wisdom grew he came to know eighteen powerful charms or runes, the twelfth of these, curiously, concerning the freeing of a hanged man for conversation. This death of god to become god is not unlike the death of Jesus on the cross. It is the death of God effected *in* God, the breaking of old patterns that bind, limit, or restrict one’s nature – the interface of *religare* (religion as tied or bound back to a previous state of existence) punishing *religere* (religion as embodiment of reflection and connection) or remembering versus unforgetting, as in the alchemical representation of the winged and wingless birds forever attached to one another. Odin, like Tiersias goes through a purgation through suffering in token of new insight. Thus the metaphor of hanging as transformative act demonstrates that the hanged god moves through a transition from knowing about to becoming being, as in the movement from knowledge/curiosity to unknowable ultimate reality (K → O).

Like Odin, the Hanged Man card of Tarot’s Major Arcana is often depicted with his head deep in the earth, seeing its secrets as Odin saw the secrets of Yggdrasil. With the card turned upside down, the hanged man appears to be dancing in the abyss over which he had been suspended. This curiously links Odin with trickster associations. Connected with this is the sense of eutony (εὐτόνέω, *eutoneō*), meaning “having or possessing faculties.” Its shadow aspect includes the meaning “distension.” Kestenburg (1978) describes eutony as a stretching out, “transsensus.” Characterized as breathful flowing, eutony/transsensus is similar to the diaphragmatic breathing practiced in yoga and tai chi, as well as choral and opera singing, and the playing of wind instruments that spiral us back to the Phrygian satyr Marsyas and the vanity of his musical challenge of Apollo. As a follower and comforter of Cybele following the death of Attis he was renowned as a flautist, and because of his fame he provoked Apollo into a musical contest. Marsyas would have won had not Apollo dared Marsyas to play his pipes upside down. Marsyas lost the duel, with the result that Apollo hung and flailed him upon a pine tree.

Such suffering, then, is helpful to us. It can indeed, as Moltmann (1974) asserts, be spiritually healthy. Despite being vulnerable, afraid, and alone, we wait for what will come and we are on the verge of something greater than we can know or about which we can think or attain through action. That is beginning to experience a new level of consciousness without preventing the advent of what can come, if indeed it is on its way.

Happiness as a Goal

Mark Greene

Two questions require attention at the outset. First, whose goal is this? Second, what exactly constitutes a working definition of happiness? This entry does not attempt to address the second question in its short form due to the many assumptions inherent in the use of the word across all cultures and in all languages. The Chinese word for happiness, for example, is made up of two other words “open” and “heart.” As poetic and evocative as this usage may be, it does not aid in arriving at an actual definition. The term happiness must then be bracketed.

That happiness is a conscious goal at all seems to be a product of the Enlightenment. One such famous example can be found in the United States Declaration of Independence which groups the word among what modernist discourse deems to be basic rights by guaranteeing everyone in America (excluding slaves and women) the right to “life, liberty and the pursuit of happiness.”

To begin to address the second question, a definition of happiness must be both deepened and broadened. Abraham Maslow's Hierarchy of Human Needs provides an excellent model with which one can address the psychological experience and physiological requisites that might form such a definition. By classifying five categories of needs in ascending order (physical, security, love/relationship, esteem and self-actualization), Maslow overlays humanist assumptions with universal needs. This parallels the generally held assumption that happiness as a goal is a universal phenomenon. Maslow goes one step further by proposing that self-actualization, the highest level in his hierarchy, is a need just like any other (water, food, sleep) but one that the individual is unlikely to address until all of the needs underlying it have been met.

Hasidism

Kate M. Loewenthal

What is hasidism? How has it been related to psychology and to the psychology of religion?

What is Hasidism?

The term “hasid” occurs quite widely in Jewish texts, particularly those concerned with ethics, generally referring to righteous individuals. Hasidism also refers specifically to the pietist movement which developed in eighteenth century Ukraine under the leadership of Rabbi Israel Baal Shem Tov (literally “master of the good name,” sometimes abbreviated to BeShT). Hasidism raised morale after the ills of the seventeenth century: the 1648 Chmielnitzki pogroms, which destroyed many communities, and the

religious disorientation caused by the antinomian Shabbatian movement. Hasidism is often seen as an attempt to dismantle the elitism of Eastern-European Jewish life, in which prestige accrued to religious study and to wealth. Hasidism asserted the spiritual worth and potential of every individual. The movement spread rapidly, as the Baal Shem Tov and his disciples traveled with the purpose of freeing poverty-stricken Jews imprisoned for debt, disseminating Jewish teachings including the “inward” aspects, based on kabbalah (Schneerson, 1980). Leadership passed to the Magid of Mezritch, and then branched out into a number of schools each headed by a hasidic Rebbe emphasizing a particular style of divine service. In the second and third generations the movement was opposed by the *mitnaggedim* (lit. “opponents”) who obtained the support of the famous Rabbi Elijah Gaon of Vilna, himself a kabbalist and a recluse. He thought hasidism was yet another form of an antinomian movement. Around 1800 a distinction emerged between the Habad school, which emphasized the primacy of intellectual understanding in order to arouse spiritual feelings, and the so-called Hagat style, which emphasized the primacy of emotional fervor in worship. The term “Habad” is an acronym for the intellectual divine attributes: wisdom (Hokhmah), understanding (binah) and knowledge (daat). “Hagat” is an acronym referring to three first of the seven emotional attributes: kindness (hesed), severity (gevurah) and beauty (also understood as mercy) (tiferet). Hasidic teachings can be seen as the latest stage of the Jewish mystical tradition (Scholem, 1941).

By the late nineteenth century it was estimated that well over half of Eastern European Jewry were identified as followers of one or other hasidic Rebbe. Eastern European Jewry was particularly devastated by the holocaust, but post World War II has seen the revival of hasidic life particularly in Israel, the USA, and Europe, also in Australia and South Africa. Habad hasidim have been particularly active in deploying emissaries to hundreds of Jewish communities world-wide, forming nuclei of outreach activity. Other schools of hasidim live in enclave-style communities, and such communities have proliferated and enlarged in Israel, Europe, the USA and elsewhere. Hasidism is a salient force in so-called “*haredi*” (strictly-orthodox) Judaism, although *mitnaggedic* and other non-hasidic styles of strictly-orthodox Judaism are also important.

The twin themes of hasidism are love of G-d and love of fellow humankind. In practice this involves scrupulous and inspired maintenance of the divine commandments (*mitzvot*), religious study, including the “inward” aspects of Jewish teaching (especially among Habad), and care for others. Dress is distinctive: black frock-coats or suits for men, hats and sidelocks; for

women, modest dress including sleeves below elbows, skirts below knees, and hair covering.

Other strictly-orthodox Jews adhere to a similar dress code, and scrupulous observance of the commandments. What distinguishes hasidism is the close adherence to the charismatic and inspirational leader, the Rebbe, whose advice and blessing may often be sought, which entails a close-knit social community.

As mentioned, hasidism is informed by kabbalistically-based teachings, the so-called “inward” aspects of Jewish teaching. A classic text is *Tanya* (Shneur Zalman of Liadi, 1796/1973), which is of considerable interest to psychologists of religion. Features of this work include a description of the human spiritual yearning to be united with the divine, the incessant spiritual struggle between the good impulse, based on the divine soul, and the animal impulse, towards selfish comfort. Hasidic teaching is not strictly-speaking ascetic: the material world is to be used appropriately, according to Jewish law, and in this way the divine speaks that are trapped in creation will be raised to G-dliness. The soul has a natural desire to be united with its divine source, and this can be achieved in prayer, and in right action. Particular emphasis is placed on charity and kindness to others. Hasidic psychology is thus underpinned by strong moral and spiritual themes. Human psychic structure is a microcosm of the macrocosm, which involves a progressive down-chaining of creation from its divine source, through the four “worlds” of emanation, creation, formation, and action, each comprising the ten divine attributes (wisdom, understanding, knowledge, and seven emotional attributes), until practical action is achieved. This scheme derives from Lurianic kabbalah, and expounds the cosmic significance of individual actions.

Hasidic teaching is not addressed solely to Jewish audiences. Rabbi Menachem Schneerson thought that the second section of *Tanya*, which presents a system of contemplation of the spirituality of existence, has universal relevance. He taught that “right living” involves the performance of those commandments obligatory on the particular individual, and for non-Jews this involves the seven commandments of the descendants of Noah (see Clorfene and Rogalsky, 1987; Cowen, 2003), including belief in the unity of G-d, the practice of sexual morality, honesty, and avoiding cruelty to animals.

There have been a number of attempts to apply hasidic insights into the practice and understanding of psychology, some written for lay audiences, others for academic and professional clinical audiences. The latter genre includes Rotenberg (1995), Weiss (2005) and Berke and Schneider (2008). These authors have used and examined hasidic and kabbalistic teachings and concepts in relation to psychological and psychoanalytic

understanding of behavior and feeling. Rotenberg for example suggests that the kabbalistic paradigm of creation may lead to a less assertive-aggressive style of communication, sexuality and communication compared to the Western norm.

Another genre has been the psychological study of hasidism and its distinctive features of social organization and spirituality. Schachter–Shalomi (1991) has examined the dynamics of the relationship between the hasidic leader (Rebbe) and the follower (Hasid) in the one-to-one encounter (sometimes known as *yehidut*) in which the hasid seeks advice and blessing. Winston (2005) has studied young men and women who have chosen to leave the (Satmar) hasidic lifestyle; Satmar is often said to be particularly strict in its outlook. El Or (1994) has studied the beliefs and values of hasidic women from the Gur group, in *Educated and Ignorant*, in which women emphasize the value they place on their role as the center and foundation of the home. Other studies of hasidic women have often focused on the outreaching Lubavitch group, for instance Loewenthal's (1988) study of religious development and commitment in this group, and Levine and Gilligan's *Mystics, Mavericks and Merrymakers* (2003), a study of adolescent girls.

A striking feature of hasidic life is the high value placed on family size: bearing and rearing as many children as possible is a feature of strictly-religious Jewish life, with an average of six children per family. Children are seen as a blessing. Family size has an impact on the well-being of the women, men, and children concerned, and this impact is often positive, as has been the impact of the value placed on marital and family stability (e.g., Loewenthal and Goldblatt, 1993; Loewenthal et al., 1995; Frosh, Loewenthal, Lindsey and Spitzer, 2005).

In conclusion, it may be stated that hasidism, a pietist movement within Jewish orthodoxy, has inspired considerable interest, not only among those looking for New Age-style spirituality, but among academic and professional psychologists. Its intense spirituality and kabbalistically-based teachings have important psychological content, in which human psychology is depicted as driven by spiritual and moral striving. Aspects of hasidic life have been studied by social scientists and psychologists, and there is clearly scope for further work.

Healing

Thomas St. James O'Connor

Introduction

Healing is a concept and experience that is used by many world religions and professional disciplines including medicine, psychotherapy, pastoral counseling and family therapy. Parsons (2002) defines healing as the “restoration to wholeness.” Graham (1990) includes body, emotions,

mental functioning, family and social relationships and spiritual life in this restoration to wholeness. In the Hebrew Scriptures, healing is related to *shalom* (peace) and results from righteous living in accordance with the covenant (Graham, 1990). Healing is linked to salvation. God is the author of all healing. Often sin is linked to illness and healing of illness occurs when there is reconciliation with God. The *Book of Job* in the Hebrew Scriptures is the exception to the notion of illness as a result of sin.

Some Religions and Healing

Within Islam, healing is based on the Qu'ran and is holistic, i.e., involves the whole person and includes the moral aspects of living (Isgandarova, 2005). Muslim physicians were highly trained in the art and science of medicine and included the spiritual in their care for the patient. Avicenna (980–1037 CE) is one such doctor. The traditions (*hadiths*) of the Prophet Muhammad required the building of hospitals and care of the sick. Prayer and reading from the Qu'ran are important Islamic practices of healing. In Hinduism, healing is seen as the restoration of balance. The science of medicine is known as the “science of longevity” (*ayur veda*). Illness occurs when the different elements of the body and one's life get out of balance. Healing is achieved through restoring balance involving the use of herbs and other remedies. In Taoism, illness is connected to the context and healing requires the achievement of integration both internally and externally.

In the Christian Bible, the ministry of Jesus involves healing. Many healing miracles stories are presented in the gospels. Pilch (1998), however, challenges the view that the healing miracles of Jesus are about cure. He argues that these healings are about new meaning and restoration of the ill person to the community. Healing in the Christian context involves the whole person as well as relationships in the community. Christians in the early centuries established hospices to care for the sick and pray for miracles. The focus was not on cure but on care. There is the belief that sin brings illness. Dedication to God and keeping the commandments brings health. However, there is also the notion that sickness could be part of God's plan and the ill were urged to offer their trials for their own sanctification and the sanctification of others. Some Christian denominations such as Roman Catholic and Anglican developed sacraments of healing (Sacrament of the Sick) to heal the sick both physically and spiritually.

Medicine and Family Therapy

As medicine developed in the Enlightenment period, a split took place between body and soul based on the philosophy of Descartes and Newton. Medicine addressed the body and religion addressed the soul and both sought healing. The physician brought the cure of the body and the priest the cure of the soul. Clebsch and Jaekle (1967) note that healing is an important function of pastoral care and counseling within the Christian church. In modern medicine with the advance of antibiotics and other medical interventions, healing became synonymous with cure. The dualism of body and soul began to break down. Medicine became interested in the whole person and the view developed that the emotions, mind and spirit are all integrated in the human person and could influence the health of the body. Sagar (2005) and Koenig and colleagues (2001) see religion/spirituality as offering healing to the body and mind. O'Connor and Meakes (2005) document an explosion of research and publication on the relationship between spirituality and health in healthcare Journals. Medical research agrees that religion/spirituality can be an excellent coping mechanism for challenging health conditions. The more controversial issue is whether religion/spirituality can be a determinant of health and bring healing.

In family therapy, healing is viewed as restoring family relationships. Family therapy emphasizes a systems approach which sees the human person as part of a vast web of relationships. The focus is not so much on the individual but on the relational. Abuse, addictions, violence, disrespect can damage the web of relationships. Healing in these family relationships means striving to facilitate the I-Thou articulated by Martin Buber. Healing involves listening to each other, not being reactive, seeking the good of each other and forgiving. Strength-based and solution focused approaches assume that there is a healing process within families that is part of their experience (Walsh, 1998). Spirituality is one means to facilitate such healing (Walsh, 2009). Rovers (2005) uses the theory of Bowen and Bowlby to heal the wounds between couples and spirituality plays an important role.

Childhood Pain and Healing

There is some skepticism about healing the wounds that are experienced in childhood. Therapy and life experience can uncover these wounds. The therapeutic relationship is one way of healing the pain and hurt. Bowen and Bowlby addressed the deficits in childhood that resulted from

family relationships. Both though therapy could be helpful but did not believe in total healing. The goal is to manage the pain and seek to develop better relationships as an adult. Pargament (1997) uses the term coping instead of healing in describing the impact of religion on challenging experiences. Coping involves conservation of one's identity and transformation of identity. In psychiatry, the development of new drugs has helped persons cope with depression, schizophrenia, mood disorders, etc. This biological approach is not viewed as healing the illness but rather helping the person manage and function with the illness.

In our post modern era, healing is experienced in multiple ways: psychotherapy, medical interventions, meditation, walking the labyrinth, prayer, reading sacred texts, talking to friends, exercise, rituals, family therapy, diet, using alternative medicines, silence, belonging to a community, etc. One of the challenges of our age is healing the animosity between groups. Religion and spirituality can work effectively with psychology and science in facilitating the restoration to wholeness (healing).

Heaven and Hell

Morgan Stebbins

Heaven and hell seem, at first glance, to be ubiquitous to religious systems. However there are many ancestor and spirit-based religions in which there is no such term and in which there is no concern for what happens after death or as a reward or punishment (Boyer, 2001). However, in the major religious traditions with developed cosmologies, heaven and hell are described as both cosmological regions (the heavens, the abode of God) and representative of religious consequences. Psychologically heaven and hell refer to experiential states and can be found in common sayings such as “war is hell.”

Although the description and function of heaven and hell vary widely with religious tradition, heaven is usually thought of as peace, bliss, or happiness, and hell of course with suffering and punishment.

In the Hebrew Bible, the closest thing to a reference to hell (heb. *Sheol*) can be found in Isaiah (38:18), the Psalms, and Job (7:7), although since there was no concomitant conception of heaven (apart from as an abode of God and the heavenly beings), and since *sheol* can well be translated as grave, there was not a highly differentiated idea of heaven and hell.

In the Hebrew bible, ideas of heaven and hell developed only very late, finding final form only in the Book of Daniel. Early on, Job comments scornfully that the dead “lie down alike in the dust” (21:26), indicating that it's all the same after death. This conception changes slowly, until Psalm 73 identifies moral categories: the false are dispatched “far from thee” and the loyal “near God.” Finally in Daniel we find the introduction of the resurrection (12:20) and differential consequences – the good enjoy everlasting life, while evildoers suffer everlasting defeat. This all changes with medieval Jewish mystical speculation, especially in the Zohar. With the introduction of Kabalistic traditions we find a complex system of multiple heavens and their attendant angels.

By the time of the New Testament, however, Zoroastrian speculation had changed the vocabulary of heaven

quite a bit. Not only that, very different types of places or experiences are implied by the different usages. For example in the Gospels heaven is referred to in different places as “the great reward,” the “abode of the Father,” “life everlasting,” “paradise,” “the city of God,” “the kingdom of God (or Christ, or heaven),” and “the joy of God.” We can see in this a huge variety of meanings, especially when Jesus alternately refers to this state as “within you,” “among you,” and “according to your deeds.” (cf. the kingdom of heaven (Matthew 5:3), . . . of the Father (Matthew 13:43), life (Matthew 7:14), life everlasting (Matthew 19:16), the joy of the Lord (Matthew 25:21), great reward (Matthew 5:12), the kingdom of God (Mark 9:45), the kingdom of Christ (Luke 22:30), the house of the Father (John 14:2), city of God, (Heb. 12). From a psychological point of view we see the beginning of great differentiation of inner states which finds its apex in Dante’s *Divine Comedy*. In this work, Dante is concerned not so much with punishment, but the mystery of how we injure ourselves (this is also the psychological meaning of sin). A saying in the Talmud runs, “The evils others do to me are as nothing compared to the evils I do to myself” (Blumenthal, 2009). From this perspective hell is the experience of betraying ones self and the price that is paid in the moment, not at some future point.

Other major religious traditions have very developed ideas about heaven and hell as well. There is a huge geography of heavens in Buddhist tradition. The *vinaya* sutra describes 7 hells and 26 heavens, each specific to a type of karma (not unlike Dante’s formulation). A central Buddhist concept (illustrated by the Bhavacakra mandala) involves the 6 worlds of rebirth – each represents the results of karmic past and run from the horrific world of hungry ghosts, to that of demons, animals, humans, titans, and gods. Although being reborn as a human is not the highest karmic reward, it is the only realm from which one can attain nirvana (Webb 1975). This implies, psychologically, that being fully human is the optimum place from which to grow – regardless of idealizations or collective values.

In Chinese mythology, the concept of heaven was understood on one hand as a synonym of *Shangdi* (supreme deity) and on the other hand as a synonym for nature, especially the sky. Heaven was a state both attainable and manifested in the world and its rulers. The Chinese word for heaven, *Tian*, is a cognate of the name of the supreme deity, and Confucian theorists such as Mozi understood that while heaven is the divine ruler the son of heaven (the King of Zhou) is the earthly ruler. In fact, heaven would be manifest on earth to the extent that the ruler lived according to the *Tao*.

The Qu’ran explains that good deeds lead to an afterlife in Eden. Heaven itself is described in the Qu’ran in verse 35 of Surah Al-Ra’d: “The parable of the Garden which the righteous are promised! Beneath it flow rivers. Perpetual is the fruits thereof and the shade therein. Such is the End of the Righteous; and the end of the unbelievers is the Fire.” Since Islam rejects the concept of original sin, Muslims believe that all human beings are born pure. In Islam, therefore, a child who dies automatically goes to heaven, regardless of the religion of his or her parents. Furthermore, anyone who has worshipped no other god but Allah will go to heaven, thus including all Christians and Jews. However there are many levels of Paradise depending on how righteous a person is on Earth. The highest level that all Muslims are encouraged to ask for is *Jannatul Firdaus* (*The belief in Heaven in Islam*, 2/10/09).

The collective projection of what human behaviors lead to suffering changes over time and is always developing. The Vatican recently clarified the gender difference in the experience of heaven and hell. Men, apparently, will go to hell for the sin of lust and will suffer from burning brimstone. Women, on the other hand, will go to hell for the sin of pride and will be broken on the wheel.

In all of these traditions we find a veritable taxonomy of psychological experience as well as a prognostic system: some hells are harder to recover from, some people are less likely to develop in this life, or will not develop at all. The question to ask is why these nearly ubiquitous other realms have been so widespread. There may have been a time when people genuinely feared the threat of eternal damnation, but a psychological view would look toward a combination of the world-shaping power of the imagination and the innate dissociability of the psyche as the factors which allow human beings to experience and describe very subtle or vague aspects of mind and to offer them in salient, that is usually concrete form. This also explains why there is no end to metaphysical speculation, since there appear to be an ongoing (and so far untapped) geography of inner states.

Heidegger, Martin

Todd DuBose

Martin Heidegger (1889–1976) is considered by many as the founder of existential or hermeneutical phenomenology. Heidegger's work has been a meeting place at the interstices between Daseinsanalysis (Binswanger, 1967; Boss, 1963, 1979), continental philosophy of religion (Caputo, 1978; Crowe, 2006), and existential theology (Tillich, 1966; Bultmann, 1953; Macquarrie, 1999). Given how his work provides the convergence of these disciplines that result in an existential approach to psychology and religion, it behooves us to attune to Heidegger's influence and inspiration for this field of study. What is more, Heidegger's work is thoroughly inspired by his life story, a story that is a tapestry of religious moments and happenings that belie presumptions of his apparent atheism. Martin Heidegger's place in the field of psychology and religion may surprise others who are more likely to consider him as a continental philosopher.

Martin Heidegger was born in Messkirch, Germany and raised as a Roman Catholic. His father was a sexton in the local parish. He studied theology at a Jesuit seminary in Austria, and then at the University in Freiburg. Putting together his foundation in theological reflection with the genesis of his commitment to phenomenology as it relates to philosophical psychology, Heidegger wrote his dissertation, entitled, *The Doctrine of Judgment in Psychologism*, and later finished a thesis on Duns Scotus.

Although presumed to be an atheist, religiosity as a phenomenological experience was central to Heidegger's entire being and works. John Caputo (1978), John Macquarrie (1999), and more recently Benjamin Crowe (2006), have all written extensively on the mystical and religious elements in Heidegger's thought, as a biography about his life that also highlights this religious dimension

for Heidegger appropriated titled, *Martin Heidegger: Between Good and Evil* (Safranski, 1999).

The relation of Heidegger's work to other religious traditions beyond Christianity may also be surprising. Heidegger contributed to the translation of the Tao Te Ching, and much has been written about Heidegger's work in relation to Buddhism, Taoism, Hinduism, Christianity, and Judaism (Caputo, 1978; Crowe, 2006). Heidegger's contextual understanding of both situations or events and human existence was ripe for these kinds of comparisons between Heidegger's thought and the deep richness of the world religions. It was out of his religious interest that he came to philosophical psychology and the philosophy of existence, and it can be soundly argued that his religious interests never dissipated; they only morphed over his life as he continually tried to clarify them. His journey was his own variance of faith seeking understanding, but not a faith in propositional or doctrinal beliefs. Heidegger's faith was a waiting for the gift of Being's disclosure.

Much of Heidegger's work was written in his small hut lodged on the hillside of Todtnauberg in Germany's Schwarzwald. There, Heidegger grew more and more appreciative of, and adopted, the simplicity of a peasant's lifestyle. He wore peasant clothing, cut his own wood, and believed the lack of distractions provided the best atmosphere for doing phenomenology. Not only did he write about dwelling *as* building, he lived it. In the *habitas* of his obvious ascetic proclivities, Heidegger's radical or hermeneutical phenomenology, and its subsequent destruction of metaphysics, offers profound implications for a deeper understanding of *homo religiosus*.

Hermeneutical phenomenology, pulsating with an ability to open up experiences beyond our typical ways of seeing events and things, offers an existential transcendence from static, mundane and profane conceptions and compartments in existence to a more open and unfolding of Being. It is not just what one discovers that is transcendent, as the very *process* of interpretation itself that discloses authentic existence, or *Dasein*. *Dasein* is the showing of Being's presence in its coming to "be there" each moment of our lives (Heidegger, 1962).

Dasein is not a fixed object or thing, as the ego or self is often understood, but the process of "clearing" in which human existence is understood. *Dasein* finds its ownmost possibilities when confronting its own death. By accepting one's finitude, facticity, and what Heidegger called, "thrownness," we are freed to value and respond to harkenings for us to stand out in our own specificity and uniqueness in the world. Our ways of being-in-the-world

find their significance in light of the circumstantial webs of meaning in any given instance, with each subsequent happening or event carrying its ownmost possibilities for us as enframed by our ever present and inescapable being-unto-death.

Two Swiss psychiatrists, Ludwig Binswanger (1881–1976) and Medard Boss (1903–1990), brought Heidegger's work on *Dasein* to the attention of psychiatric medicine and later to clinical, phenomenological psychology in what became known as Daseinsanalysis, or existential analysis (Binswanger, 1967; Boss, 1963, 1979). Daseinsanalysis is practiced around the world, and has its organizational home in the International Federation of Daseinsanalysis, that includes countries such as Brazil, Greece, Belgium, France, Hungary, Austria, Canada, England, The Czech Republic, and, of course, Switzerland. Moreover, it is not uncommon these days to see various international conferences addressing Heidegger's thought in relation to religious phenomena.

What is even more interesting from an existential-phenomenological understanding of the psychology and religion field is Heidegger's infamous "turn" during the period of his latter thinking and writing that led him away from a focus on *Dasein* in the world toward an analysis of *Ereignis*, or happening, event, or circumstance that gives rise to *Aletheia*, or the disclosure of truth. Truth, however, for Heidegger, is the very disclosure of Being itself. One can hardly ignore the similarities with theological reflection on revelation. Furthermore, Heidegger's asceticism shows itself again in his invitation toward a meditative rather than calculative approach in understanding phenomena. *Gelassenheit* is called for, or release-ment, thus allowing things to unfold in their time and uniqueness.

At the same time, admittedly, an initial view of Heidegger's being-unto-death certainly seems to preclude any otherworldly understanding of spirituality as the possibilities of metaphysical entities residing in a dualistic world. Yet, hermeneutically, even reflections on otherworldliness arise from the circumstantial "thrownness" in which we come to think of such matters. Nevertheless, I do believe Heidegger opens for us another understanding of spirituality that influenced many existential theologians, including Paul Tillich (1966), Rudolf Bultmann (1884–1976), John Macquarrie (1999), and Langdon Gilkey (1976), among others.

In one, concise summation of his relationship to spirituality, Heidegger believed that it is only through an understanding of transcendence do we come to a proper experience of *Dasein* (Heidegger, 1977). This conviction which locates him squarely, even if unwittingly, within the

field of psychology and religion, albeit altering much of what we have heretofore understood about this field. Through Heidegger, we are offered a Daseinsanalytic perspective of psychology and religion.

Commentary

Perhaps Heidegger's typical absence from historical accounts of psychology and religion, apart from his destruction and overcoming of metaphysics, may be due to a cautionary ambivalence felt by most people regarding his unfortunate membership and participation in the Nazi party during World War II. Heidegger was strangely silent on this matter both during his membership and up to his own death. Nevertheless, Heidegger's position on these matters is notoriously complicated as he had deep and committed relationships with a variety of prominent Jewish scholars during this time, for instance, Hannah Arendt, Herbert Marcuse, Karl Lowith, and Hans Jonas, and he refused to appoint Nazis officials to administrative posts while rector at the University of Freiburg, and openly disagreed with Nazi ideology on racial genetics and other matters, which resulted in being monitored by the Gestapo (Burston and Frie, 2006). Heidegger eventually resigned from his appointment as Rector at the University of Freiburg, and withdrew from politics and much of public life, remaining silent on the whole affair. Nevertheless, it is hard pressed to find how Heidegger's life work on how the authentic life is lived by *not* succumbing to *Das Man*, or The They, could in anyway suggest a pro-fascist position. Again, similar to how Nietzsche's *Übermensch* was grossly and tragically misunderstood as a Aryan proposal, Heidegger's disclosure of *Dasein* in the event of existence was not a inaugural trumpeting for the Third Reich, the latter movement being the opposite of *Dasein* and more ominous than Heidegger himself even foresaw.

Heidegger leaves us with the possibility of understanding the field of psychology and religion from a Daseinsanalytic perspective. Paul Tillich's (1966) use of Heidegger to shift our understanding of God as *a* being to *Being* itself need not leave us with a false dilemma of choosing theism or atheism. For Heidegger, ontotheology has long since confused the ontic with the ontological or concrete things with the life that clears space for things to be-in-the-world. His destruction of metaphysics, as Benjamin Crowe (2006) has pointed out, may very be influenced by Martin Luther's thought, particularly after Heidegger's break from Catholicism.

What is specifically significant is the influence of Luther's *destructio* both on Heidegger's insistence on humanity's "thrownness" as a conditioning of freedom, and of the necessity of clearing space beyond the distractions of *Das Man*.

Finally, Heidegger shows us the inescapability of what I call our "enactments of significance" that are lived out every moment of our lives, which returns us to the hermeneutics of religiosity as well as the religiosity of hermeneutics. When we are left in situations in which Heidegger himself agreed that "only a god could save us," we can be certain that the saving god will be-in-the-world, clearing space and unburdening the heaviness of constricted existence so that we may share in *Dasein's* call toward authenticity and uniqueness.

Heresy

Clodagh Weldon

From the Greek word *hairesis* meaning choice (and by implication that which is chosen by a faction of believers), heresy is that which emerges within the Church which is contrary to orthodox teaching as it has been revealed by God and is thus rejected by the Church as false or "heretical." Aquinas (1224–1274) describes heresy as a "species of infidelity" in which believers corrupt the dogmas of Christianity. Functioning like a gangrenous disease which infects the body, heresy subverts the faith of the Church and, from an orthodox standpoint, must be removed. Excommunication, military action, inquisitions and burnings at the stake all feature as means of combating heresy in the history of the Church.

The New Testament exhibits a concern about emerging factionalism within the Christian movement and is replete with warnings about "heresy". Paul talks of divisions among early Christians in Corinth (1 Cor. 11:19), and warns the Church of Philippi "Beware of the dogs!," a reference to those who mutilate the faith. He warns believers in Jerusalem of "savage wolves," men within their group who "will come forward perverting the truth" (Acts 20: 29–30). Peter also warns of "false teachers" who introduce "destructive heresies" and thus bring damnation upon themselves (2 Pet 2:1). In Tit 3:10, purportedly from Paul, we read of what should be done with a heretic: offer a first and second warning and then break of contact with the person. They are "perverted and sinful" and condemn themselves.

The word "heresy" gains ascendancy in the writings of the Church Fathers. In the second century, for example, Irenaeus of Lyons used the word "hairesis" to describe opponents whom he categorizes as those who did not hold to his "orthodox" beliefs.

Multiple examples of heresy emerge in the early Church, most of which focus around exaggerations of either the humanity or the divinity of Christ, the second person of the Trinity. The Docetists, condemned as heretics by Ignatius of Antioch (DC 107) taught that Christ was divine and only *seemed* to be human. Representing orthodoxy, Ignatius noted that if Jesus were not fully human he would not have been able to save humanity. The Ebionites (also known as Adoptionists) taught that Jesus was the adopted Son of God. In response, Irenaeus of Lyons (DC 200) said that if Jesus were not "of God" he could not have saved us. Arianism taught that Jesus is of like substance (*homoiousios*) to God the Father. The Council of Nicea (325 AD) condemned the Arian heresy and proclaimed that Jesus is

of the same substance (*homoousios*) as the Father. As can be seen from these three examples, the emergence of heresy within the Church led not only to a condemnation of heretics, but to a clearer articulation of Christian doctrine. This articulation finds its expression in the Creeds of the Church. An excerpt from the Nicene Creed, for example, reads “We believe in one Lord Jesus Christ, the only son of God, eternally begotten of the Father, God from God, light from light, one in being with the Father. . .” The response to the heresies of Adoptionism and Arianism is clear: Jesus is not adopted, he is “eternally begotten of the Father, God from God”; he is not *like* God in substance but “one in being with the Father.”

Commentary

Freud has little to say about heresy, other than that it was condemned and punished by the Catholic Church. For Jung, on the other hand, heresy is much more important. He believed that heresy (as that which is rejected) needed to be reincorporated (“reintegrated”) in the interests of wholeness. He thought, for example, that the Christian doctrine of a Trinitarian God who is the *Summum Bonum* was deficient because it neglected the shadow side of the God image. Thus for Jung, that which had been rejected by orthodoxy as heretical because not in accord with revelation – such as the dark side of God – needed to be recovered and brought back to the whole.

Hermeneutics

Todd DuBose

Hermeneutical Origins

Hermeneutics is the art and science of interpretation. Originally used to interpret texts, initially Biblical texts,

and then extended to other texts, hermeneutics evolved into not only a way to interpret literature, but also a way to interpret any human experience. In fact, hermeneutics became known as a way to describe how existence works as a whole in that life is an undulating dance between concealment and revelation.

The etiology of the word, “hermeneutics,” is based on the mythical character, Hermes, the messenger, who delivered and interpreted messages from and between the gods. As hermeneuticists and historians Richard Palmer and Norman O. Brown have pointed out, Hermes was a trickster as well, and known for his deception and thievery. Hermes stands in liminal space that is neither here nor there, but a bridge between one place and another – though not identified with either one (Palmer, 1969; Brown, 1969). This description of Hermes is apt given the profound potential for bestowing blessings or wrecking havoc as a result of the interpretive process.

Hermeneutics, although addressed by figures as early as Plato and Aristotle, originated as a more formal practice with Rabbinic and Early Church Father concerns for how to interpret sacred scripture. Central to this debate was whether or not scripture should be interpreted literally or allegorically, particularly when application to contemporary concerns was an issue at hand. Adjudicating between conflicting allegorical understandings led to “rules” established for interpreting texts, thus leading to an exegetical approach to interpretation. Historical, contextual, literary, and grammatical frameworks became privileged as essential contexts in which texts should be understood.

Medieval thought and debate led to the continuation of exegetical and allegorical analysis of symbolism, with annotations accompanying interpretations, thus facilitating better possibilities for lifestyle applications. During the Renaissance and Enlightenment, further exegetical tools were developed for use in interpretation, though this time expanding the purview of textual material to any secular text. Hermeneutics continued in this vein until the thought of Friedrich Schleiermacher (1768–1834). Schleiermacher saw the central task of hermeneutics as a guard against misunderstanding between the author’s intentions and the interpreter’s grasp of textual meaning. Empathy for the author’s intention, and aligning one’s own intentions and experience with that of the text, Schleiermacher thought, would lead to better understanding of the text’s meaning (Schleiermacher, 1977).

Wilhelm Dilthey (1833–1911), though, proposed that understanding is best achieved when actual life situations are the focus of hermeneutical analysis. Hence, he saw hermeneutics as a method by which one could

understanding the inner meanings of artifacts, actions, products, and experiences of others within human existence, and consequentially, argued that hermeneutics should be applied beyond texts to any human experience (Dilthey, 1989). Dilthey also brought to our attention how mediated experience is for us, and held firm to his conviction that we cannot understand inner meaning and experience related to any person, artifact or text without moving through linguistic and cultural filters. These convictions prepared the ground for further developments in hermeneutics.

Martin Heidegger (1889–1976), one of Edmund Husserl's (1859–1938) students, was highly influenced by Dilthey's work, shifted the focus of hermeneutics beyond being a functional tool of interpretation, for texts or human experiences, and, instead, saw the hermeneutical process as descriptive of Being itself (Heidegger, 1962). The interpreter's very existence is an enactment of interpretation. The truth of one's existence unfolds in the interplay of call and response, of seeking to understand while also disclosing oneself to be understood. We are called to our "ownmost" possibilities, and discover them only when we allow ourselves to be interpreted and delimited by our limitations, contingencies, and finitude in each moment of our lives. From the moment we rise from sleep, or even during sleep, we are perpetually interpreting experiences happening around us as well as unfolding ourselves to others in light of their inquiries and engagement with us.

Each significant piece of writing, text, expression, experience, action, or otherwise, gains its disclosed meaning when seen against the backdrop of one's historicity, or immediate enactment of one's life story. Moreover, Heidegger, furthering the Augustinian focus on faith seeking understanding, argued that only through our risked and invested pre-understandings within the delimitations of our horizons can we come to know anything. What can be known, though, is not something that can be isolated and held static, as being is perpetually becoming itself through the undulation of concealment and disclosure. Existence only partially discloses itself in any given moment, and depends on solicitude, or care and concern, to clear space for its further disclosure – which is never complete.

Hans-Georg Gadamer (1900–2002) integrated Heidegger's emphasis on the situatedness of meaning and Schleiermacher's emphasis on the importance of the interpreter's psychology for interpretation, and saw the hermeneutical project as facilitating the meeting of horizons. Horizons are the capacities one has to understand, communicate, meaning make, and exist within the given historical and cultural traditions demarcating one's

lived experience and perspective (Gadamer, 1989). Horizons are inherently limited, thus necessitating dialog for truth to disclose itself. Hermeneutics-as-Being, then, always and already discloses existence's inherent relationality.

Among other seminal figures in the history of hermeneutics, two other names stand out: Paul Ricoeur (1913–2005) and Jürgen Habermas (1929–). Ricoeur's utilized hermeneutics to integrate the field of semiotics with religious experience (Ricoeur, 1967). More specifically, Ricoeur sought to understand the existential modes of existence embedded in and mediated through religious symbolism, particularly symbols of sin and evil. Jürgen Habermas (1975), working from within the Frankfurt School of Critical Theory, utilized the power of hermeneutics to critique oppressed social structures and practices.

Hermeneutics in Psychology and Religion

Michel Foucault (1926–1984), Jacques Derrida (1930–2004), John Caputo (1940–), Hans Koezler, and Charles Winquist (1944–2002) have all offered various critiques and developments of hermeneutics. Foucault critiqued and reframed how power operates in discourse and relationships through genealogical and archeological analysis of various practices of control. Derrida deconstructed presumptions that discourse could fully represent meaning and experience, by exposing all that is missed in "presencing" practices (Derrida, 1980). John Caputo further radicalized Derrida's deconstructive project by viewing deconstructive analysis as a type of religious experience that functions much like a type of negative theology or apophatic mysticism (Caputo, 1987, 2000). Hans Koezler, a contemporary critical hermeneuticist, combines Foucaultian genealogy and Gadamerian hermeneutics to establish a critical hermeneutics that exposes oppressive power practices in relational patterning and dialogical discourse, thus allowing for horizons to meet without domination or submission. Finally, Charles Winquist established a practical hermeneutics in which he invites pastoral practices toward depth relating with others in contemporary cultural situations by allowing interpretations of story and symbol to take us towards deeper dimensions of existence (Winquist, 1980).

Commentary

It is important in the field of psychology and religion that prior to hermeneutics being a way of interpreting texts or

human experiences, this art and science was, and still it, a process of “discernment” in general, and a “discerning the spirits” in particular. Similarly, “diagnosis” is an art of “completely seeing through or into” another person or situation and also predates contemporary diagnostic practices by hundreds of years. Hermeneutics, therefore, is itself a sacred activity in that its very process unfolds being itself. What is often forgotten is that “divining,” from which the word “divine” arises, is an interpretive process. One could say that the divine, or sacred, is the process of hermeneutics itself. In this way, the experience of grace, then, is the experience of being truly understood.

Hermeneutics is not a mere “cognitive” activity of neocortical executive functioning, but a holistic comportment of desire that intends communion via the mutual grace of understanding and of being understood. What makes us *homo religiosus* is our never ceasing desire to understand, as Bernard Lonergan (1904–1984) noted, so that we can become discerning, interpreting, responsible and loving human beings toward one another (Lonergan, 1973/1990, 1957/1992).

Hermits

Paul Larson

A hermit is a person who lives a solitary life as part of their spiritual path. The etymology comes from the Greek “eremos,” meaning desert. This reflects the history of the hermit in the Christian tradition. The first Christian hermits sought out the solitude of the desert. Hermits generally live a monastic life, though not all monks are hermits. Some modern hermits in the Roman Catholic Church are lay people living solitary lives in their own apartments in the city.

Western hermits began living in desert regions in the third century of the common era, in Egypt and Syria. St. Anthony (251–356 CE) is among the most famous of the early desert fathers and mothers, men and women whose life of seclusion and self-denial marked the first Christian monastic tradition. Most, but not all contemporary hermits are part of recognized monastic order in Christianity.

Judaism, with its emphasis on marriage and family life, does not have an eremitic tradition. Islam, also does not have many hermits, though some Sufi mystics were known to be solitary wanderers.

In Eastern religions, there is also recognition of the value of the solitary life. Hindus have several orders of

monasticism. “Sannyasa” refers to those who have taken vows to give up the secular household life and live celibately in community, and sometimes in solitary states. The “sadhus,” are among the most widely known of sannyasi who often take up life as a solitary hermit. Buddhists also have monks who live off in long-term meditation retreat, but are attached to the larger monastic community for their basic support. They periodically come out of retreat and engage in teaching meditation to monks in community or lay devotees. Taoism was founded by Lao Tzu who reputedly left his work, *The Tao Te Ching*, with a border guard as he walked off into the wilderness alone. So it’s founding figure was a hermit and through the ages others have followed his path of solitude. Confucianism, like Judaism and Islam, emphasizes the importance of family life, so it does not support a tradition of hermits.

It is difficult to live completely alone and be able to sustain oneself. Thus, most hermits are attached to either a lay community or a monastic community for sustenance and support. In the Christian tradition this is the difference between an anchorite (hermit) and a cenobite (monk living in community). But as much as possible the hermit seeks solitude.

The eremitic life is a continuum of self-denial, or asceticism, which can range from simple living with some comforts to strict discipline and practices involving self-mortification of the body. After practicing such harsh disciplines, Siddhartha Gautama decided that a middle way of ascetic practices was better, and thus struck a new path as he became the Buddha, eschewing extreme practices but seeking simplicity and non-attachment.

The hermit was portrayed in the Rider-Waite Tarot deck as holding a lamp to illuminate his and other’s paths. This symbolism affirms the primacy of the role of seeker after wisdom which is associated with gnostic traditions in the West as well as the more orthodox Christian forms of solitary life. There is a long tradition of solitary practitioners of Hermetic spirituality, including magicians, rosicrucians, and others in the Western esoteric tradition.

Hero

Robert A. Segal

The “Great Man” View of History

It is commonly said that where in the twentieth century impersonal forces were believed to make history, in the nineteenth century heroic individuals were believed to make history. The epitome of this nineteenth-century outlook was the English man of letters Thomas Carlyle (1795–1881). Carlyle opens his *On Heroes, Hero-Worship, and the Heroic in History* (1841) with a statement that has come to epitomize the “Great Man” view of history: “For, as I take it, Universal History, the history of what man has accomplished in this world, is at bottom the History of the Great Men who have worked here” (p. 1).

Carlyle’s concern with outward accomplishment sharply distinguishes his conception of heroism from that of the German philosopher Friedrich Nietzsche (1844–1900) in his *Thus Spoke Zarathustra* (1883–1885) (see part 1). The achievement of Nietzsche’s *übermensch*, or “overman,” is personal, not societal. Rather than praising the *übermensch* for changing his society, Nietzsche praises the society that produces him.

Carlyle’s most vitriolic contemporary critic was the pioneering English sociologist Herbert Spencer (1820–1903), for whom the attribution of decisive events to the talents of individuals rather than to the fundamental laws of physical and social evolution is a hopelessly primitive, childish, romantic, and unscientific viewpoint. In Spencer’s famous summary phrase in *The Study of Sociology* (1874), “Before he [the great man] can remake his society, his society must make him” (p. 35).

The twentieth century has spawned still stronger skepticism toward the impact of heroes, even in the face of the seemingly all too real impact of dictators like Hitler and Stalin. Defenders of heroism nevertheless remain. Best known is the American philosopher Sidney Hook (1902–1989), author of *The Hero in History* (1943/1955). Hook argues for a sensible middle ground between crediting heroes with everything, which he assumes Carlyle to be doing, and crediting them with nothing.

Modern Heroes

Some heroes, or kinds of heroes, fit only certain periods. For example, it is hard to imagine an aristocratic hero like

Don Juan surviving into the twentieth century. Other heroes do survive, either because their appeal continues or because they are protean enough to adapt to the times. Heracles, the greatest of ancient heroes, was by no means confined to the crude image of him as Rambo-like – all brawn and no brains – but on the contrary has been depicted as the embodiment of wisdom, the exemplar of virtue, a tragic hero, a glutton, and even a romantic lover.

In the twentieth century, as in prior centuries, not only have traditional heroes been transformed, but new heroes and new kinds of heroes have emerged. If distinctively nineteenth-century heroes were the romantic hero (Byron's Childe Harold) and the bourgeois hero (Flaubert's Emma Bovary), distinctively twentieth-century heroes include the ordinary person as hero (Miller's Willy Loman), the comic hero (Roth's Alexander Portnoy), the schlemiel as hero (Singer's Gimpel the Fool), and the absurd hero (Beckett's Vladimir and Estragon). Far from divine, the contemporary hero is hopelessly human – mortal, powerless, amoral. The present-day hero is often lowly even within the human community – more the outsider than the insider, more the loser than the winner, more the villain than the savior. The contemporary hero is not a once great figure who has fallen but a figure who never rises. Sisyphus, not Oedipus, let alone Heracles, epitomizes contemporary heroism. Yet Sisyphus is still to be commended for never giving up. Persistence replaces success; survival replaces achievement. Old-fashioned heroic virtues like courage and duty give way to new ones like irony and detachment. Today's hero, for example, is heroic in persisting without success.

Yet it would surely be going much too far to argue that traditional heroism has died out. Present-day heroes in sports, entertainment, business, and politics are admired for their success, not for their mere persistence, and the acclaim conferred on them often reaches the same divine plateau as in times past. They are “idolized” and “worshiped.” At most, the notion of heroism as persistence has arisen alongside the traditional notion of heroism as success.

Hero Myths

Stories of heroes take the form of myths. The study of hero myths goes back at least to 1871, when, in *Primitive Culture*, the pioneering English anthropologist E. B. Tylor argued that many of them follow a uniform plot, or pattern: the hero is exposed at birth, is saved by other humans or animals, and grows up to become a national hero. In 1928 the Russian folklorist Vladimir Propp, in

Morphology of the Folktale (trans. [1968] 1958), sought to demonstrate that Russian fairy tales follow a common biographical plot, in which the hero goes off on a successful adventure and upon his return marries and gains the throne. Propp's pattern skirts both the birth and the death of the hero.

Of attempts not merely to delineate patterns but also to determine the origin, function, and subject matter of hero myths, the most important have been by the Viennese psychoanalyst Otto Rank (1884–1939), the American mythographer Joseph Campbell (1904–1987), and the English folklorist Lord Raglan (1885–1964). Rank later broke irreparably with Sigmund Freud, but when he wrote *The Myth of the Birth of the Hero* (1909) [trans. 1914], he was a Freudian apostle. While Campbell was never a full-fledged Jungian, he wrote *The Hero with a Thousand Faces* (1949) as a kindred soul of C. G. Jung. Raglan wrote *The Hero* (1936) as a theoretical ally of James Frazer. Because Raglan's approach is non-psychological and even anti-psychological, his will not be considered here.

Otto Rank

For Rank, following Freud, heroism deals with what *Jungians* call the first half of life. The first half – birth, childhood, adolescence, and young adulthood – involves the establishment of oneself as an independent person in the external world. The attainment of independence expresses itself concretely in the securing of a job and a mate. The securing of either requires both separation from one's parents and mastery of one's instincts. Freudian problems involve a lingering attachment to either parents or instincts. To depend on one's parents for the satisfaction of instincts or to satisfy instincts in anti-social ways is to be stuck, or fixated, at a childish level of psychological development.

Rank's pattern, which he applies to thirty hero myths, is limited to the first half of life. It goes from the hero's birth to his attainment of a “career”:

- ▶ The hero is the child of most distinguished parents, usually the son of a king. His origin is preceded by difficulties, such as continence, or prolonged barrenness, or secret intercourse of the parents due to external prohibition or obstacles. During or before the pregnancy, there is a prophecy, in the form of a dream or oracle, cautioning against his birth, and usually threatening danger to the father (or his representative). As a rule, he is surrendered to the water, in a box. He is then saved by animals, or by

lowly people (shepherds), and is suckled by a female animal or by an humble woman. After he has grown up, he finds his distinguished parents, in a highly versatile fashion. He takes his revenge on his father, on the one hand, and is acknowledged, on the other. Finally he achieves rank and honors (Rank, 1990: 61).

Literally, or consciously, the hero, who is always male, is a historical or legendary figure like Oedipus. The hero is heroic because he rises from obscurity to the throne. Literally, he is an innocent victim of either his parents or, ultimately, fate. While his parents have yearned for a child and abandon him only to save the father, they nevertheless do abandon him. The hero's revenge, if the parricide is even committed knowingly, is, then, understandable: who would not consider killing one's would-be killer?

Symbolically, or unconsciously, the hero is heroic not because he dares to win a throne but because he dares to kill his father. The killing is definitely intentional, and the cause is not revenge but sexual frustration. The father has refused to surrender his wife – the real object of the son's efforts. Too horrendous to face, the true meaning of the hero myth gets covered up by the concocted story. Rather than the culprit, the hero becomes an innocent victim or at worst a justified avenger. What the hero seeks gets masked as power, not incest. Most of all, who the hero is becomes some third party, a historical or legendary figure, rather than either the creator of the myth or anyone stirred by it. Identifying himself with the literal hero, the myth maker or reader vicariously revels in the hero's triumph, which in fact is his own. *He* is the real hero of the myth.

Literally, the myth culminates in the hero's attainment of a throne. Symbolically, the hero gains a mate as well. One might, then, conclude that the myth fittingly expresses the Freudian goal of the first half of life. In actuality, it expresses the opposite. The wish it fulfills is not for detachment from one's parents and from one's anti-social instincts but, on the contrary, for the most intense possible relationship to one's parents and the most anti-social of urges: parricide and incest, even rape. Taking one's father's job and one's mother's hand does not quite spell independence of them.

The myth maker or reader is an adult, but the wish vented by the myth is that of a child of three to five. The fantasy is the fulfillment of the Oedipal wish to kill one's father in order to gain access to one's mother. The myth fulfills a wish never outgrown by the adult who either invents or uses it. That adult is psychologically an eternal child. Having never developed an ego strong enough to master his instincts, he is neurotic. Since no mere child

can overpower his father, the myth maker imagines being old enough to do so. In short, the myth expresses not the Freudian goal of the first half of life but the fixated childhood goal that keeps one from accomplishing it.

Joseph Campbell

Where for Freud and Rank heroism is limited to the first half of life, for Jung it involves the second half – adulthood – even more. For Freud and Rank, heroism involves relations with parents and instincts. For Jung, heroism in even the first half involves, in addition, relations with the unconscious. Heroism here means separation not only from parents and anti-social instincts but even more from the unconscious: every child's managing to forge consciousness is for Jung a supremely heroic feat.

The goal of the uniquely Jungian second half of life is likewise consciousness, but now consciousness of the Jungian unconscious rather than, as in the first half, of the external world. One must return to the unconscious, from which one has invariably become severed, but the ultimate aim is to return in turn to the external world. The ideal is a balance between consciousness of the external world and consciousness of the unconscious. The aim of the second half of life is to supplement, not abandon, the achievements of the first half.

Just as classical Freudian problems involve the failure to establish oneself in the outer world, in the form of working and loving, so distinctively Jungian problems involve the failure to reestablish oneself in the inner world, in relation to the unconscious. Freudian problems stem from excessive attachment to the world of childhood; Jungian problems, from excessive attachment to the world one enters upon breaking free of the childhood world: the external world.

Just as Rank confines heroism to the first half of life, so Campbell restricts it to the second half. Rank's scheme begins with the hero's birth; Campbell's, with his adventure. Where Rank's scheme ends, Campbell's begins: with the adult hero ensconced at home. Rank's hero must be young enough for his father and in some cases even his grandfather still to be reigning. Campbell does not specify the age of his hero, but the hero must be no younger than the age at which Rank's hero myth therefore ends: young adulthood. While some of Campbell's own examples are of child heroes, they violate his scheme, according to which heroes must be willing to leave behind all that they have accomplished at home, and violate even more his Jungian meaning, according to which heroes must be fully developed egos ready to encounter the unconscious

from which they have largely become separated. Campbell's heroes should, then, be adults.

Rank's hero must be the son of royal or at least distinguished parents. The hero of the egalitarian Campbell need not be, though often is. Where Rank's heroes must be male, Campbell's can be female as well, though Campbell inconsistently describes the hero's initiation from an exclusively male point of view. Finally, Campbell's scheme dictates human heroes, even though many of his examples are of divine heroes. Rank's pattern, by contrast, readily allows for divine as well as human heroes.

Where Rank's hero returns to his birthplace, Campbell's marches forth to a strange, new world, which the hero has never visited or even known existed. This extraordinary world is the world of the gods, and the hero must hail from the human world precisely to be able to experience the distinctiveness of the divine one. The hero has sex with the goddess and marries her – the reason the hero must here be male. He clashes with the male god and defeats him – the additional reason the hero must here be male. Yet with both gods he becomes mystically one and thereby becomes divine himself.

Where Rank's hero *returns* home to encounter his father and mother, Campbell's hero *leaves* home to encounter a male and a female god, who are neither his parents nor necessarily even a couple. Yet the two heroes' encounters are seemingly akin. But in fact they are not. Because the goddess is not the hero's mother, sex with her does not constitute incest. And the conflict with the male god is resolved.

When Campbell writes that myths “reveal the benign self-giving aspect of the *archetypal* father,” he is using the term in its Jungian sense (Campbell 1949, 139–140). For Freudians, gods symbolize parents. For Jungians, parents symbolize gods, who in turn symbolize father and mother archetypes, which are components of the hero's personality. A male hero's relationship to these gods symbolizes not, as for Freud and Rank, a son's relationship to other persons – his parents – but the relationship of one side of a male's personality – his ego – to another side – his unconscious. The father and the mother are but two of the archetypes of which the Jungian, or collective, unconscious is composed. Archetypes are unconscious not because they have been repressed but because they have never been conscious. For Jung and Campbell, myth originates and functions not, as for Freud and Rank, to satisfy neurotic urges that cannot be manifested openly but to express normal sides of the personality that have just not had a chance at realization.

By identifying himself with the hero of a myth, Rank's myth maker or reader vicariously lives out in his mind an

adventure that, if ever directly fulfilled, would be acted out on his parents themselves. While also identifying himself – or herself – with the hero of a myth, Campbell's myth maker or reader vicariously lives out in the mind an adventure that even when directly fulfilled would still be taking place in the mind. For parts of the mind are what the myth maker or reader is really encountering.

Heschel, Abraham Joshua

Mark Popovsky

General

Born in Warsaw, Abraham Joshua Heschel (1907–1972) was designated from his youth as the heir to the great Hasidic court of Apt over which his father and grandfather

before him had presided. Following a rigorous traditional Jewish education, Heschel enrolled at the University of Berlin in 1927 where he earned a doctorate in Bible while simultaneously studying at a liberal rabbinical college devoted to the critical study of religious texts. Heschel remained in Berlin through the 1930s writing poetry in Yiddish, publishing scholarly works in German, and teaching at a number of Jewish institutions during the rise of Nazi power. German officials deported Heschel to Poland in 1938, where he taught briefly before escaping to America via England. His mother and two sisters were killed in the Warsaw Ghetto in 1941. Heschel moved to New York in 1945 where he taught for the remainder of his life at the Jewish Theological Seminary, publishing several major works of theology both in Hebrew and English.

Theology

Heschel believed in a God intimately concerned for human beings. He rejected the Aristotelian view of God, which had entered Jewish thought through Maimonides, as a Prime Mover who himself is not moved. Instead, Heschel laid out a theology of divine pathos in which God is deeply affected by human actions. God, in Heschel's view, reaches out to form relationships with human beings, but humans often ignore God's overtures, blinded by arrogance and a fatal underestimation of our own limitations. Faith begins with humans recovering a sense of awe – an awareness that God is present around us and challenging us to appreciate the ineffable mystery of existence.

Heschel elevated theological concepts such as awe, wonder and mystery in his writing. Consequently, he was profoundly skeptical of social sciences that selectively ignore those aspects of human life not easily quantified or described in scientific language. He criticized the psychology of his day for its "empirical intemperance" which dismissed questions about ineffable dimensions of existence. He also rejected the idea that religion reflects human beings' need to believe in God. Conversely, Heschel wrote that religious feelings arise as individuals become aware of God's need for them. Heschel consistently maintained that evil acts were rooted in human egocentricity. He accused psychology of "intellectual narcissism" to the degree that it placed ultimate confidence in the power of the mind, dismissed questions of morality and professed that man can attain his own salvation without resort to God.

Heschel also strongly critiqued religious orthodoxies which mistakenly view ritual piety as an end in itself. While Heschel was traditionally observant in his own life and wrote several moving works about the importance of

observances such as prayer and the Sabbath, he understood religious rituals as a spiritual tool to help one continuously redirect his or her attention back towards the mystery of God's presence. Heschel simultaneously argued that ritual observance itself, even in the absence of belief, can help to open the individual's consciousness up to God's intimate love for humanity. Heschel famously wrote that Judaism does not demand a leap of faith but rather a leap of action.

Heschel refused to interpret the Bible as a document describing historical events. He wrote that scripture is not the object of divine revelation but rather a human commentary on revelation itself. The biblical text represents not what God said but rather a human effort to render into words a genuine experience of the divine which far transcends logic and language. Heschel read the prophetic message as demanding that individuals actively engage in a relationship with God by behaving morally and by developing an awareness of the sacred. In his own life, Heschel interpreted this to require his active participation in the American Civil Rights movement and his protest of the Vietnam War.

Hestia

Susan Wyatt

In Greek mythology, Hestia was the firstborn of Cronus (Saturn) and Rhea. Since it had been prophesied that one of his sons would overthrow him, Cronus swallowed each of his children; first Hestia, then Demeter, Hera, Hades, and Poseidon. When Zeus, her third son, was born; the infuriated Rhea hid him and gave Cronus a stone to swallow. When Zeus grew to manhood he forced Cronus to disgorge his brothers and sisters. Hestia, the first to be swallowed, was the last to be released.

Hestia, like her Roman counterpart Vesta, is best known as the Goddess of the Hearth. While she was sometimes portrayed in human form, she was more

often represented by images of flames or glowing coals. She had the most awesome responsibility of the Olympian gods. She became involved in none of the caprices and disputes that characterized her family because she was the one charged with keeping the flame alive, reminding us of the critical dependence of early humans on fire. It was Hestia who invented the art of building a house as a place to safeguard the flame and contain its light and warmth. She eschews the blood sacrifice; her preferred offering is sweet wine. She obviates the need for humans to steal fire because she gives it freely as a gift.

Hestia is one of the Goddesses that Jean Bolen used in her explication of archetypal feminine patterns. She represents an inward focus in a woman's psyche. Her identity is not tied to external circumstances or to outcomes. She looks inside herself to find meaning, peace, sanctuary, and the sense of being related to others in a common spiritual bond. Her focus is on the inner flame, her own values and what is personally meaningful to her. Her concern is with the spiritual, with being centered and being connected. She stays in the background, seeking anonymity, tranquility, and solitude.

As the Goddess of the Hearth, Hestia represents the relationship of women to the domestic sphere of life for whom household tasks are a central activity. She also has a social role as the hearthkeeper for the temple of the collective. Just as Hestia's flame is an image of the spirit that animates a home, it also represents the spirit that sustains the life of a culture. Her role, like that of the priestesses of Vesta in classical Rome, is to hold the soul of her culture, steadfastly to keep the flame alive whatever the turmoil of the outer world. Her inward search for meaning is not for herself alone, but to sustain the spirit that gives meaning to the culture. Sometimes this task requires her to sacrifice her tranquility and anonymity and step out of the background to remind her culture of who they are, what they value, and what they have forgotten.

As well as the flame in the domestic and communal hearths, the Homeric Hymns identify Hestia as the fire at the center of the world in Delphi. While Apollo made himself the presiding deity of the Delphic oracle, Hestia is the fire that ignites the prophecy. The flame is often used to symbolize psychic processes such as inspiration, intuition, and imagination and Hestia represents these ways of knowing that were celebrated by Ovid in his hymn to Vesta. The story of Hestia's wooing is an image of a feminine way of balancing the tension between conscious and unconscious. She was desired by Poseidon, who as God of the Sea is often taken to represent the power of the unconscious; and by Apollo, who is an image of rational thought, art, science, and language. To keep peace in

Olympus, Hestia vowed to remain a virgin. She is ever poised between the two gods and, between the rational and the irrational, yet ever complete in herself. In gratitude, Zeus declared that the first and last libations would always be hers and, in Greek religious rituals, Hestia was always the first god to be honored.

However, Hestia lost this honor when a new god, Dionysios, was born. To make way for him among the 12 places on Mount Olympus, Hestia, weary of intrigue and arguments, gave away her position, knowing that she would be welcome wherever she chose to settle. In this ending of the myth, the Greek religion and Western culture suppressed an element of the feminine spirit and moved into the dualistic patriarchy defined by Nietzsche in terms of the polarity between Apollo and Dionysios.

Hierophany

Paul Larson

Hierophany is a term for manifestation of the divine. It is a broader term than the more familiar term, theophany, because it allows non-personal forms of the divine to become manifest. The term was popularized by the noted scholar of comparative religion, Mircea Eliade (1907–1986). His major thesis (1959) is the distinction in human experience between the sacred and the profane modes of life. Our ordinary lives are profane, but he does not use this in a pejorative sense, but as simply the opposite of sacred. When we are in contact with the divine ground of being we are in “sacred space and sacred time,” and when we are out of contact we are in a profane or ordinary mode of existence. Whether it is in a formal worship service, or a private experience of mystical communion with the divine, we have the capacity to enter into a new and more profound

mode of being in the world. In this world of the spirit we experience some type or degree of communion with the divine. Hierophany is the unfolding of that experience of contact, connection or communion with a transcendent power or person.

For many people it takes the form of a feeling of warmth, love, connection to and receiving inspiration from a deity. For others, there is a “dark night of the soul,” a profound experience of suffering, unworthiness and alienation. Either the positive or negative inner and private experience we associate with mystics is what Rudolf Otto (1917/1958) referred to as the experience of the numinous. Even the relatively frequent experience the normal worshiper has of connection with the divine during the act of worship is an example of hierophany. Experience of and with the divine does not have to be dramatic and earth shattering, it can be quiet and secure. The experience of oneness with nature while in nature, likewise, can be the basis of a spiritual connection. This was articulated by such writers as the American Henry David Thoreau, whose spirituality centered on a sense of connection to the natural world.

In the Western religions, hierophany is experienced as theophany, since the divine takes on the form of a person. Buber (1958) characterizes this as an encounter of an “I” with a “Thou,” the highest quality of relationship that one can aspire to. There can be experiences which involve only part of senses, “auditions” for example, are the experiences of voices of the divine or their angelic representatives, “apparitions” are the visual manifestations of the divine or angelic beings. The many appearances of the Virgin Mary are examples of this type.

Another type of hierophany is revelation. This can be dramatic and life changing. The classic example is the experience of Saul, who on the road to Tarsus experience an epiphany and turned from being a persecutor of Christians to become St. Paul, one of its most effective missionaries. Muhammed, likewise experienced the dramatic visitation of an angel heralding the beginning of the revelations that became the Q’uran.

Hierosgamos

John Eric Killinger

Introduction

Hierosgamos is a composite of two Greek words ἱερός (*hieros*) and γάμος (*gamos*), meaning “mystical marriage” or “sacred ceremony.” The word occasionally appears transliterated as two (*hieros gamos*) as it is presented in Greek. Often used interchangeably with *coniunctio*, the hierosgamos is recognized as the highest form of the union of opposites (e.g., King and Queen, Sol et Lunae) in the alchemical opus. Hierosgamos is found chiefly in the literature and theoretical work of analytical (Jungian) and archetypal psychology; nevertheless, it may possess implications for acting out of Oedipal vicissitudes observed in Freudian and psychodynamic psychology.

Hieros means “filled with or manifesting divine power, supernatural, holy.” Of this latter meaning, the word refers to the sense of being hallowed or consecrated, for example, holy scripture, even *hieroglyphics*.

Gamos, on the other hand, means “wedding,” “marriage,” even “wedlock.” Pythagoras uses *gamos* as a name for the numeral *three*, which is masculine frequency. This would account for the motif of the divine child (produced by the union of the king and queen, Sol et Lunae, gold and silver) being usually male, e.g., Christ, Marduk, etc. The usage of *gamos* for the number three allows for the realization of the hierosgamos as the divine third. In this sense it is connected with the Trinity in much of the writing of C. G. Jung.

Whereas Pythagoras designates *gamos* as three, Plutarch uses *gamos* for the number *five*. This immerses us into the symbolization of the marriage aspect of the hierosgamos as it is the combination of the feminine aspect (even frequency, i.e., two) and the masculine aspect (three, or odd frequency). Rendering *gamos* as “five” could also refer to the alchemical *quinta essentia*, the quintessence that is the fifth element or red tincture that is indexed to the Void or chaos encircled by the tail devouring serpent, or uroboros (q.v.).

Further usage of *gamos* reveals it to denote the number *six* as used by Iamblichus (1998). In this sense, $1 + 2 + 3 = 6$, where six is viewed as a symbol of harmony or balance. It thus fits Islamic alchemist ibn Umail’s projection of the *coniunctio* in his *Hall ar-Rummuz*: one equals the observer of the hierosgamos, two equals the feminine aspect, and three equals the masculine aspect.

For ibn Umail, six therefore symbolizes the union of polarity which thus creates balance and harmony.

The Prominence of Hierosgamos

As the highest form of the *coniunctio oppositorum*, or union of opposites, hierosgamos is the spiritual wedding of matter and psyche. We see this in the Babylonian *Enuma Elish*, wherein Âpsu and Tiâmat are not simply the ancestors of the pantheon of gods, but they are also matter and divine spirit united and coexistent.

Often used as a metaphor in reference to the union of two divinities, the hierosgamos can also refer to the union between a human being and a god or goddess, as in the Sumerian story of Tammuz (Dumuzi) and Inanna (Ishtar/Astarte), Zeus and Leda, the Holy Spirit and Mary. Even Christian mystics such as St. Teresa of Avila and Hildegard of Bingen describe such experiences in their ecstatic visionary writings. The hierosgamos can also refer to a ritualized public sexual union between a king and a *hierodule*, or sacred prostitute, as a reenactment of such stories as that of Tammuz and Inanna. While popularized in *The Da Vinci Code* (2003), such reenactments were believed to increase potency not only of the king but of the land's continued fertility. The alchemical text known as *Rosarium philosophorum* (Smith, 2003) depicts the hierosgamos that occurs during the alchemical opus in the creation of the homunculus (little man). This homunculus is the divine child resulting from a more often than not incestual pairing within the hierosgamos. It is the potential for the hierosgamos to be incestual that leads an analytical relationship toward being inflationary (a wedding of the gods) or to sexual acting out – and that may have Oedipal ramifications.

Religious literatures are replete with the imagery of the hierosgamos. We have already noted its depiction in the Sumerian account of Tammuz and Inanna, which is wrought in erotically charged language. The hierosgamos occurs within reenactments of the Egyptian Osiris dramas of death and rebirth, which again has affinities with fertility cult rites. Union of the Kundalini (as Shakti) with Shiva is also equivalent to a hierosgamos. The Babylonian genesis account, *Enuma Elish*, presents the hierogamynous aspect in its depiction of Âpsu and Tiâmat. In Kabbalah, we find the hierosgamos in the union of Yahweh with the Shekinah, who is often portrayed as Sophia (Wisdom). In *Sefer Zohar*, we find in the thought of Adam as an androgynous being that without a hierosgamos, without male and female being one, God does not place God's abode in their midst (Matt, 2004: 314). Adam is the primordial

image of the hierosgamos. Interestingly, though, Adam in the Old Testament represents the *imago Dei*, whereas the hierosgamos reflects the godhead. It is the genius of *Sefer Zohar* to point out that even the *imago Dei* is linked to the godhead, for male and female God created *them* – not *him* – and God called *them* Adam.

It is within the corpus of New Testament literature we find more allusions to this sacred marriage. In Matthew 25:1–13 (Aland, et al., 1998: 71–72), for example, we have a hint at a hierosgamos in Jesus' parable of the wise and foolish virgins. The hierosgamos itself psychologically indicates a hostile, emotional outbreak of the divine element which destroys the world of consciousness – Jesus' coming to bring not peace but a sword is indicative of this; however, the deeper significance of the sacred marriage implicated within this parable is that the anima is made pregnant and initiates a new birth, that is, a further and more comprehensive incarnation with God. This is the psychological meaning of the need to be born from above in the exchange between Jesus and Nicodemus in John 3 (Aland, et al., 1998: 252–254). It is an archetypal incest in which the god must join with the *imago Dei* in order to produce a new creation. Such an irruption of the hierosgamos and the devastation it causes is not unlike the irruption one encounters when Lacan's Real forcefully breaks into one's consciousness. Such devastating irruptions implicate the difficulty many Protestant Christians have with religious vocation, as the call to become (and be) a minister of God – let alone a religious – means at least metaphorically being wedded to the divine and not to the immediate environs or the world.

The potential unity of the cosmos is indicated in the seed motif (cf. the Christ's image of having as much faith as would fill a miniscule mustard seed in Matthew 17), but it also possesses an intrapsychic meaning as the germ of conscious realization of the self. Whereas this takes fertility rites such as those practiced in Osiris cults to deeper and higher levels – for as above, so below – such seed motifs were apparently abused. As reported by Iranaeus, the gnostic sect known as the Marcosians celebrated a hierosgamos as a sexual initiation of women into their fold, a sacred marriage both inflationary (of the gods) and incestuous in its acting out. The *Corpus hermeticum* relates that God sows virtue, reason, and *gnosis* in the human mind, and the thirteenth treatise describes the inner rebirth of man from intelligible wisdom (Sophia) and the seed (*spermata*) of goodness that comes from God (Scott, 1993).

It is in the apocalypse (Revelation) of John in which we witness more hierogamynous imagery. For

example, the banquet of Christ alluded to in Revelation 3 (Aland, et al., 1998: 639) has been interpreted as a hierosgamos with God. And in this sense the celebration of the Eucharist (Lord's Supper) furthers the image of our union with God to bring about and perpetuate the vision of the new heaven, new earth, and new Jerusalem. A similar image of the banquet occurs in the pseudepigraphal *Odes of Solomon*, and its precursor is to be found in the Sumerian story of Inanna/Ishtar's descent to the underworld.

As the Sol et Lunae joining, the hierosgamos results in not just an inner reality. It is total reality according to the fifth parable of the alchemical text of the *Aurora consurgens* (von Franz, 1966, attributed to St. Thomas Aquinas). The *Aurora's* vision of the union of Sol et Lunae is no doubt influenced by its appearance in Revelation 21:9 (Aland, et al., 1998: 676) in which the pair is joined in the image of the Sun-Moon Woman. She gives birth to the *complexio oppositorum* (complex of opposites), the uniting symbol which is a result of the union of the god and human sacred marriage. What is born is tantamount to a $\chi\rho\iota\sigma\tau\omicron\upsilon\ \chi\rho\iota\sigma\omicron\varsigma$, a “not-Christ Christ” (not-Messiah Messiah), who not only separates/fragments, but also unites.

The phenomenal popularity of *The Da Vinci Code* (Brown, 2003) has prompted much speculation and debate on the hierosgamos relationship between Jesus and Mary Magdalene, even including the grail mysteries' sexual reenactment of the hierosgamos to insure the Magdalene's rose, or blood, line. This subject has been previously broached in other texts such as Kazantzakis's *Last Temptation of Christ* (1960), not to mention the inferences contained in the gnostic texts of the Nag Hammadi, Berlin, and Tchakos codices. The question has been raised regarding the figure on Jesus' right in Leonardo's fresco of the Last Supper. Is it John who is the beloved disciple or the woman, Mary Magdalene, since she it is Jesus loves best? It is known that male youths were often painted with female attributes, perhaps as a nod to the inner feminine, and in early Christianity John was occasionally referred to as “maiden” (*parthenos*, i.e., “virgin” or “chaste man”). He is indeed Lacan's *jeune homme*, a *sinthome* – playing on the words *saint home* – possessive of rejuvenating qualities. In the gnostic Acts of Peter and the Twelve Apostles, John is charged to be a doctor of souls, a healer of the heart (Meyer, 2007: 365). Perhaps it is no mistake, then, that transliteration of the Greek $\dot{\iota}\epsilon\rho\omicron\varsigma\ \gamma\acute{\alpha}\mu\omicron\varsigma$ transitioned from two separate entities (*hieros* and *gamos*) to become one: *hierosgamos*.

Still, the transference field posited by the hierosgamos within guided image therapy and active imagination, or

even its context within the relationship between analyst and analysand or therapist and client brings to bear all the rich symbolism of this *coniunctio* or sacred marriage, awakens our awareness of the unconscious connection, and allows us to witness firsthand the numinosity of *coniunctio*. Balance and harmony must be stressed, for on the one hand, conscious evolution of the symbolism of the hierosgamos' numinosity can have very creative and releasing consequences; on the other hand, the shadow side of the unconscious development of this same symbolism can have deleterious and destructive consequences. The hierosgamos is thus linked to the uroboros as life-giving/renewing qualities as well as for its ability to take and/or destroy life.

Hillel

Lynn Somerstein

Rabbi Hillel (born in Jerusalem, traditionally c.110 BCE–10 CE) was a famous Jewish religious leader and scholar associated with the development of the Mishnah and the Talmud. He was renowned for his love of learning and his compassion.

He asked “If I am not for myself, then who will be for me? And if I am only for myself, what am I? And if not now, when?”

Hillel’s question, “If I am only for myself, what am I?” underlies individual human development— the search for the self, and understanding who the self is in relation to others. Psychotherapeutic interaction concerns itself with searching deep within to find what is true for the individual, and then finding ways for the individual to make contact with others, a process leading from a narcissistic engagement with the world to a fuller, open, mature being, whose everyday life embodies a full engagement with God and the world.

Hillel also said: “What is hateful to you, do not do to your fellow: this is the whole Law; the rest is the explanation; go and learn” (Shab. 31a). With these words Hillel recognized as the fundamental principle of the Jewish moral law the Biblical precept of brotherly love (Lev. xix. 18).

He is also reputed to have invented the “Hillel sandwich,” many centuries before the Earl of Sandwich, who is more commonly held responsible for that culinary morsel. The Hillel sandwich is eaten at the Passover Seder. Ashkenazi Jews eat horseradish on matzoh as part of the Seder meal, and call that the Hillel Sandwich.

Hillman, James, and Alchemy

Stanton Marlan

It has been said often that James Hillman is one of the most original American psychologists of the Twentieth Century. He is the founder of Archetypal Psychology, considered by some to be an orientation or school within the larger context of Jungian analysis and by others as a radical departure from it. In its own regard, Archetypal Psychology has had wide influence both in the United States and internationally and has impacted not only psychology, analysis, and religion, but also the wider range of the cultural imagination as well. Hillman’s work on alchemy is an important part of his overall vision and has its origins in the work of Carl Jung.

Jung’s Psychology of Alchemy

Jung, too, had thought about alchemy in a way that few others before him had imagined. Rather than understanding alchemy as a protoscience of chemistry, he concluded that the alchemists were speaking in symbols about the human soul and were working as much with the imagination as with chemical materials. In short, the gold that they were trying to create was not common gold, but an *aurum non vulgi* or *aurum philosophorum*, a philosophical gold (Jung, 1963). For Jung, “alchemy represented the projection of a drama both cosmic and spiritual in laboratory terms. The opus magnum had two aims: the rescue of the human soul and the salvation of the cosmos” (Jung, 1977: 220). This move brought our understanding of alchemy into the realm of both psychology and religion. A vital part of Jung’s work soon began to address these disciplines. In and through his work on *Psychology and Alchemy* (1953/1968), his essay “Paracelsus as a Spiritual Phenomenon,” and other works, Jung was led to discuss alchemy as a form of religions philosophy (Jung, 1963: 209).

As Jung continued to grapple with his personal experience of alchemical transformation, questions continued to surface and shed light on his ongoing relation to Christianity. For Jung, Christianity was of central importance for the Western psyche, but he also felt it cast a collective shadow that needed to be addressed if it was to

remain vital to the spirit of the times and relevant to modern men and women. Jung's attempt to bring analytical psychology into relation with Christianity ultimately led to the question of Christ as a psychological figure. From Jung's alchemical view, Christianity had depreciated the body and "the feminine" and, in so doing, ultimately had devalued "nature." Alchemy, with its emphasis on matter, compensated for this lack in Christianity and thus offered the possibility of the further development of the religious psyche.

Hillman's Alchemical Psychology

While Jung critiqued Christianity via his alchemical vision, for James Hillman, Jung's psychology was still overly influenced by Christian psychology, its images and its metaphysics. This led Hillman to make a distinction between a psychology of alchemy and an alchemical psychology, the former representing Jung's views and the latter Hillman's. For Hillman, the transformation of the psyche must be differentiated from the Christian idea of redemption. For Hillman, images speak more directly when their Christian and metaphysical coverings are set aside; then the "level of the collective consciousness can be peeled away, so that the material may speak more phenomenally. Then pagan images stand out: metals, planets, numerals, stars, plants, charms, animals, vessels, fires and specific locales" (Hillman, 2003: 101).

In short, alchemy's curious images are valuable not so much because alchemy is a grand narrative of the stages of individuation and its conjunction of opposites, nor because of its reflection on the Christian process of redemption, but "rather because of its myriad, cryptic, arcane, paradoxical, and mainly conflicting texts [which] reveal the psyche phenomenally" (Hillman, 2003: 103).

For Hillman, imagining alchemy within the narrations of metaphysics, Christianity, and Jung's psychology led to a "psychology of alchemy," a psychology in which the powerful images of alchemy were reduced to generalized abstractions. He, on the other hand, proposes an innovative move away from a "psychology of alchemy" to an "alchemical way of psychologizing." In so doing he hoped to restore an alchemical way of imagining, that could rematerialize our concepts, "giving them body, sense and weight" (Hillman, 1980: 37–39).

- ▶ The work of soul-making requires corrosive acids, heavy earth, ascending birds; there are sweating kings, dogs, bitches, stench, urine, and blood I know that I am not composed of sulfur and salt, buried in horse dung, putrefying or congealing, turning white or green or

yellow, encircled by a tailbiting serpent rising on wings. And yet I am! I cannot take any of this literally, even if it is all accurate descriptively true (Hillman, 1978: 37, 39).

Through the use of the alchemical imagery and concrete metaphor, and by seeing through them, his alchemical psychology seeks to find those qualities of human life which act on the very substance of personality.

Development of Hillman's Perspective

This move toward concreteness was present in Hillman's earliest lectures in Zurich in 1966 and continued to run through his papers beginning in 1970 with "On Senex Consciousness." In 1978, Hillman published "The Therapeutic Value of Alchemical Language," which set the stage for his continuing reflections.

What followed were a series of papers: "Silver and the White Earth, Parts I and II" (1980, 1981a), "Alchemical Blue and the Unio Mentalis" (1981b), "The Imagination of Air and the Collapse of Alchemy" (1981c), "Salt: A Chapter on Alchemical Psychology" (1981d), "Notes on White Supremacy: The Alchemy of Racism" (1986), "The Yellowing of the Work" (1991), "Concerning the Stone: Alchemical Images of the Goal" (1990), "The Seduction of Black" (1997), and "The Azure Vault: The Caelum as Experience" (2006), which is a revision and elaboration of his paper "Alchemical Blue." Hillman is in the process of organizing his alchemical papers which will be published in the Uniform Edition of his collected works as Volume Five, to be titled *Alchemical Psychology*. To his published papers to date, he is adding "Rudiments: Fire, Ovens, Vessels, Fuel, Glass," which will complete his texts on alchemical psychology. Like alchemical texts themselves, the content of these papers is complex and difficult to summarize in any unified narrative, but if there are any themes that run through them, it is in his turn to the nuances of language and image, the importance of the imagination and attention to alchemical aesthetics, and to color as an organizing focus for reflection.

Hiltner, Seward

James G. Emerson

If one line would describe the contribution of Seward Hiltner (1910 to November 19, 1984) it would be this: he put the “theology” into practical theology. In Dr. Hiltner’s work, developed at the University of Chicago in the 1950s, the personality sciences and the theological or religious field came into dialog.

Pastoral Theology Defined

For many the phrase “practical theology” meant simply techniques of doing ministry. For some the techniques

had to do more with manners than with the practice of care – proper dress and appropriate behavior rather than the “care” or “cure” for the parishioner. Seward Hiltner saw pastoral theology as the theology of the practice of ministry.

Every science has a method and the method for the personality sciences, especially when related to religion, was the “perspectival method.”

The Perspectival Method

Therefore, to understand Dr. Hiltner’s approach, one must first understand his concept of perspectives and the perspectival method. As early as the 1950s, he developed “the perspectival method” of research and evaluation. Today the perspectival method has been picked up by people such as Jerome A. Feldman (2006) in the field of cognitive theory.

For Dr. Hiltner, there were three perspectives from which to look at the total work of the pastor – the communication perspective, the organizing perspective, and the shepherding perspective. The “shepherding perspective” he identified with pastoral theology.

In his basic book, *Preface to Pastoral Theology*, Dr. Hiltner gave a review of the development of the “cure of souls” – care of souls – that preceded what became pastoral care and counseling. To develop his approach he dipped into history and the work of an Ichabod Spencer – a nineteenth century pastor in Brooklyn who, according to Dr. Hiltner, was among the first to develop case studies of his pastoral work. It was in Spencer that Dr. Hiltner came to focus on pastoral care as the province of the shepherding perspective.

The Shepherding Perspective

The significance of this perspective lay in not identifying pastoral care just with counseling or times of calling on the sick. The perspectival approach meant that one could look at preaching, church administration, and Christian education as much from the shepherding perspective as much as the moment when someone said, “Pastor, I have a problem.”

Dr. Hiltner, therefore, identified pastoral care as related to the shepherding perspective. He saw this perspective as particularly a function of the parish minister in practice. Although his work resulted in a profession of pastoral counselors and of pastoral counseling centers, that development was never his intent. Dr. Hiltner understood this shepherding perspective as strictly part of a pastor’s pastoral ministry in the context of the parish congregation itself. The

ministry was not something done outside of the parish in a context unrelated to a particular parish.

Pastoral Counseling Centers

Dr. Hiltner's approach laid a foundation for bringing science and faith together as the cornerstone of the work of the pastor. Contrary to his expectations, the clarity with which this foundation developed in Hiltner's books resulted in people who developed a specialty in such a ministry just as others developed a specialty in Christian education. As a result, this specialty soon broke out of the congregational realm and became a free standing profession in itself. Ministers with a specialty in pastoral care and counseling soon became members of church staffs. More than that, centers of pastoral care and a profession of pastoral counselors emerged.

In some instances, these centers were adjuncts of congregations. More and more, however, the profession of pastoral counseling broke off into its own discipline with standards of practice and criteria for both certification and evaluation of pastoral counselors. In several instances around the United States, counseling centers emerged. One such example is the Lloyd Pastoral Counseling Center connected with San Francisco Theological Seminary in San Anselmo, California.

This major diversion some see as a contribution of Seward Hiltner. Yet Dr. Hiltner himself always saw pastoral care and counseling as in the context of the pastorate, not the context of a center unrelated to a congregation.

This matter of context was not just a passing interest of Seward Hiltner. In a book authored with the late Rev. Dr. Lowell Colston entitled *The Context of Pastoral Care* (Abingdon Press, Nashville, Tennessee), the picture was given of the contrast between counseling done at a Center and counseling and care in the context of a parish community. The argument was made that there is a basis for seeing the counseling done in the context of a congregation as having, for many, a greater rate of success in healing than in a setting where there is no relation to a community of people.

The other two perspectives that Dr. Hiltner identified with the work of ministry are "organization" and "communication." Note that he did not speak of preaching, counseling, educating or administration as perspectives. Each of those he saw as a *function* that could be viewed from the three perspectives. One could ask, "what is the shepherding dimension of preaching" just as one could ask, "what is the communicating dimension of pastoral care?"

Seward Hiltner represented the second generation of leaders in the movement of pastoral education who

related the insights of the personality sciences – especially individuals such as Freud, Jung and Adler – to the professional practice of ministry. The fountainhead or "father" of this direction was Anton Boisen of Boston.

In the course of time, Seward Hiltner was ordained a Presbyterian Minister. He became the secretary for the department of Religion and Health of what became the National Council of Churches. His first book related to the interplay between the personality sciences and religion. He then wrote on *Pastoral Counseling*, and *The Counselor in Counseling*. The very title of the encyclopedia in which this article appears would not exist without the pioneering work of Boisen and the key "disciples" that moved out across the United States and developed what they had learned.

In 1950, Seward Hiltner was tapped by the Divinity School of the University of Chicago to join with Dr. Ross Snyder in developing a doctoral program. No longer was pastoral care seen as a technique. The University of Chicago called the field, "Religion and Personality." Because "personality" referred to personality studies such as psychology, psychiatry, sociology, and anthropology, subsequent years saw changes in the title. The breakthrough came, however, in that first program that pioneered the field of pastoral care as an academic discipline and as seen at the doctoral level.

Under Dr. Hiltner's leadership, the program involved not only the Divinity School but the Medical School of the University of Chicago and the Counseling Center of the university established by Dr. Carl Rogers.

The impact of the program was tremendous. Of the first graduates who earned the PhD, most went to establish similar departments in divinity schools and seminaries across the United States, in Australia and New Zealand, and in the United Kingdom.

Dr. Hiltner himself wrote ten books and over 500 articles. Those who graduated from his and similar programs around the world have added much. Whole sections of libraries in both secular and theological schools now have space to hold the work of this relatively young theological discipline that relates science and theology in the academic world.
