Thus it is not surprising that scholars have reason to believe that shamanism remained a living tradition in the most northern parts of Europe, especially in Denmark, Norway, Sweden, and Finland, even into the seventeenth century, as the entry "Nordic Shamanism" discusses. Moreover, if one holds that the essential characteristic of shamanism is a direct mystical visionary experience of the spirits or the Otherworld through an out-of-body journey, often induced by a psychoactive sacrament or a technique of ecstasy, the various Gnostic sects of the early Christian Church, perpetuated, despite persecution, and repeatedly reintroduced by the Crusaders from the Holy Land, would qualify as European versions of shamanism. Examples would be Marcionism, Valentinianism, and Carpocratianism, heresies of the early church, and Manichaeism, a rival of the church in those early centuries. In the Middle Ages, the most famous of these sects was known as the Albigensian heresy, from its center in the town of Albi in the south of France. The founders and ritual functionaries of these sects were certainly shamanistic, in the sense that they were charismatic healers, spiritual guides, and teachers, as was the pagan Apollonius of Tyana, as noted in the entry "Classical World Shamanism (Ancient Greece and Rome)," and indeed the Jesus described in the Gospels, as discussed in "Christianity and Shamanism."

At the time Christianity became the official religion of the Roman Empire, Mithraism had long been an important religion, especially in the imperial army. The worshippers of the Persian god Mithras, through the seven stages of initiation, a common theme in Eurasian shamanism, sought to reverse the taking on of evil associated with coming into human birth and free the soul to rise past the planetary gates to the outer rim of the Universe for a transcendent vision, the common aspiration, according to some, of Stoicism and all the Gnostic sects, as noted in "Classical World Shamanism (Ancient Greece and Rome)." Mithraism, with its psychoactive sacrament of *haoma* (the soma of the Indian Vedic tradition) persisted in the East as Zoroastrianism, including a "Eucharistic" meal of bread and an entheogenic potion. Christianity easily assimilated motifs from the sacramental religions it replaced because of its essential similarity, including its own version of the Eucharistic meal, which was originally psychoactive and continued as such for certain of the elite. Thus the great medieval mystics like Hildegard von Bingen and Teresa of Avila could be considered shamans, as could many others of those canonized as saints by the Catholic Church. Shamanistic paganism has been seen as persisting, as well, in the occult sciences, through the practices of the alchemists, highly respected in their time, who claimed to know the secret of the pliable botanic stone of the philosophers and the drinkable gold, the elixir that conferred ultimate knowledge and the experience of rebirth in a liberated state. Similar secrets cemented the bond of societies such as the Knights Templar and the Freemasons. The Grail legend is a perfect example of the syncretism and forced esotericism of "shamanism" after the triumph of Christianity.

All of these traditions, however, were mysteries, with their carefully guarded secrets divulged only to the initiates. Hence, deprived of the evidence presented by the great religions and sciences prevalent in early postclassical and medieval Europe, the scholar must seek indications of European shamanism in a reexamination of antique rites and religions, such as the great Eleusinian mysteries of ancient Greece, as noted in "Classical World Shamanism (Ancient Greece and

Rome)," and from surviving traces of the once thriving tradition that still persist in bizarre rural customs, funeral rites, witchcraft, magic, herbal/traditional medicine, folklore, and folktales. Such traces of these traditions still persisting are discussed in the entry "Witchcraft in Russia," and noted in the taboos and esotericism of certain marginal peoples such as the gypsies, often from the fringes of the more developed centers of European civilization, hence, in Russia, or among the Lapps, as discussed in "Nordic Shamanism." They are also covered in the entry "Finno-Ugric Shamanism," which describes these traditions among the northern Finns and their Hungarian ethnic brothers in the Carpathian mountainous forests. Moreover, more recent phenomena include the pagan revivalism of the literary elite, as discussed in the entries "Neo-Shamanism in Germany" and "Paganism in Europe," and attempts to restore the original sanctity of witchcraft, as discussed in the entry on "Witchcraft in the Modern West." Fortunately, much of European "shamanism" survived deeply enough, due sometimes to a late conversion or strong resistance to Rome and the Church, so that its mythos could be recorded, as noted in the entries "Paganism in Europe," "Finno-Ugric Shamanism," and "Russian Shamanism Today."

The Celts were Indo-Europeans who spread through the main areas of Europe, including Ireland. In Ireland, which remained beyond the reach of the Roman Empire, their ancient shamanic traditions persisted most strongly, even after the Christianizing of the island, as recorded in their great epics and in their folklore, discussed in "Celtic Shamanism." Druid priests were so named as "seers" (from the root **wid-*) of the sacred "oak," *drus,* which is host to the psychoactive mistletoe in its branches and the sacred fungus at its base. Certainly there seems to be no question that the root **wid* is present. Interestingly, that root is present both in words for seeing and in words for knowing (in Greek the verbal root for "seeing" [*widein,* Latin *videre*] is also the root for "knowing" [*eidenai* or *we-widenai*] as the condition that results from seeing), suggesting how basic visionary shamanism is to the Indo-European tradition of knowledge. Thus an idea is something archetypal that is seen *(widea),* and along the same lines, a theory *(theoria)* is an expedition to go someplace to see a sight, as in a theater.

In Celtic lore, as discussed in both the entries "Celtic Shamanism" and "Paganism in Europe," this world is coexistent with another, nearby and overlapping, subterranean, into which one may suddenly drop, the Faerie land. The entry "Fairies and Shamanism" explores a comparison between some European fairy tales—French, Scandinavian, and Scottish—and shamanistic concepts. These common characteristics may include the election of the hero by a fairy, similar to the election of a shaman by the spirits; the curing of illnesses by a spiritual journey; and the alliance of human beings with nature spirits or shamans to achieve a needed spiritual connection. This older European fairy tradition can be seen to have its continuance in modern concerns related to the search for identity and a connection to the natural environment. The other realm gives meaning to this, being the universal shamanic source of nonordinary power and wisdom. Celtic shamans, like the heroes of classical myth, are expected to journey to the other realm through magical gateways to bring back inspired information of incalculable value to their society, opening the pathways between the realms upon which the continuing stability and health of the people depends. In both traditions, knowledge is achieved through ecstatic rapture, with the poet bard originally experiencing inspiration as possession by an overmastering mind, or Muse.

Carl A. P. Ruck

"CELTIC SHAMANISM": PAGAN CELTIC SPIRITUALITY

The Celts in general and the druids in particular were averse to committing their own important lore to writing, and their formal memorized oral transmission was broken long ago. We therefore know very little about the pagan religions of the ancient Celtic tribes. In any case, it could not be strictly accurate to speak of "Celtic shamanism," as the terms *shaman* and *shamanic* properly refer only to the Tungus people of Siberia. However, magico-religious elements that can be recognized as "shamanistic," or reminiscent of shamanism, and which are furthermore common to many cultures, can indeed be found in the pagan Celtic spiritual traditions. Celts occupied a great deal of Europe by the fourth century C.E., but only in the British Isles did any substantial body of literature survive. This entry will therefore mainly focus on that area, especially Ireland.

We do know that the Celts had a complete system of magic, one that was highly respected by the ancient world. Diodorus Siculus and the great second-century Christian teacher Clement of Alexandria said the Celtic priests of Gaul trained with Pythagoras in mystical philosophy. In the first century C.E., the Greek rhetorician Dio Chrysostom equated the Celtic Druids with the Persian Magi, Indian Brahmins, and Egyptian priests.

What we currently know about Celtic spirituality and magical practice is based on Greek and Roman descriptions, a few works by the early Celts themselves (mainly from Wales, Ireland, and Scotland), folksongs and fairy tales, and a great deal of imaginative invention. These sources prove troublesome due to their limitations. The Greek and Roman texts are mainly observations by members of invading armies based on political encounters with the tribes of southern Gaul. Folktales may be changed by each storyteller. Some details of "Celtic spirituality" as represented in numerous contemporary popular books were originally recovered through *analepsis* (spontaneous ancestral memory) by more modern writers such as Iolo Morgannwg and Robert Graves. Finally, the story cycles and poetry that tell the history of the Celts were recorded years after the events recounted by Christian monks, who may well have felt hostility toward—or at least discomfort with—the pagan worldview.

Despite these difficulties, however, shamanistic elements can easily be discerned in the sources we have. These elements include descriptions of practitioners and patterns of magical initiation; magical practices such as spiritual healing, harming, and warfare; uncanny abilities such as enchantment, soul flight, distance viewing, shapeshifting, animal transmogrification, and understanding the speech of birds and animals; the employment of wise judgment through insights gained by trance, divination, and prophecy; the use of magical tools; the experience of deep mystical inspiration and understanding; and a pervasive theme of deep relational connection to all beings and the processes that tie them together.

Celtic Magic and Spirituality

Pagan Celtic spirituality perceived that the supernatural Otherworlds lie so close to this one that they often overlap, and that the magical, the numinous, was present in every aspect of their lives and surroundings. The pagan Celts keenly observed nature to obtain understanding of her deepest secrets in both the physical and metaphysical sense, without the aspect of torture, violence, penetration, or dismemberment in order to get to knowledge that we find in later Western inquiries.

The land itself was considered animate and conscious, quite aware of human activity but of course quite other in its needs and nature. The ceremony for investing a new *Ard Ri,* or Irish High King, involved a marriage of mystical dimensions with the land as goddess, thus binding the people to the place through kinship. Should this relationship be betrayed—for example, through disrespectful tribal behavior toward the land, trees, water, and so on, or

through loss of personal honor because of some lack in such qualities as generosity, bravery, or beauty—he could no longer serve as king.

In many folk stories collected between the eighteenth and early twentieth centuries, nothing is merely as it seems to the physical eye. Woods, wells, rivers, and trees all are sacred places that might house gateways into the Otherworld, both glorious and dangerous. On an ordinary walk home, a person might fall into a fairy mound and spend years there, which would feel like mere hours. Stones speak; a stranger or a bird might be God in disguise; music has the power to kill or maim. The greatest knowledge in the world is held by a fish. The fairies, or "good folk," leprechauns, and brownies are neighbors; and brownies, if treated well, might do your housework.

There is an intense practicality to the Celtic mystical worldview. Things tend to go better in fairy encounters for those who are generous with their labor, time, and material goods, and for good musicians. Irish scholar Jeffrey Gantz (1981, 1) observed that all Celtic art is characterized by a "tension between reality and fantasy." It is "romantic, idealistic, stylized and yet vividly, even appallingly, concrete." Further, there are no distinctions made between the natural and supernatural worlds in their potential for holding divine wonders. These tales clearly suggest a shamanistic worldview, with no separation between the physical and the metaphysical aspects of life.

We can turn to indigenous Celtic languages for clues to their speakers' thoughts about their magical arts. The noun used to describe a spell or spoken word of magic in both Scots and Irish Gaelic is *bricht,* which is related to the Icelandic *bragr,* "poetry or magical rhyme." The word *eolas,* "knowledge," is used to describe magical ability. And a Gaelic term for any sort of sorcery or magical act is *druidheachd.* From these words, we can glean that Celtic magic was practiced by Druids, that "knowledge" implied something much more than factual data, and that poetic inspiration expressed through the voice was commonly employed as a magical tool.

Pre-Celtic Works

It is easy for a casual observer to confuse Celtic with pre-Celtic artifacts. Although the druids may have used the great megaliths such as Stonehenge, Dol, and Carnac, and the tumuli at Newgrange and Gavr'inis, they did not build them. Standing stones were the work of peoples who inhabited these regions long before the first Iron Age Celts arrived around 500 B.C.E.

However, if we take the patterns of later immigrations as an example, some pre-Celtic spiritual knowledge may have been passed down to, or appropriated by, subsequently arriving peoples. The Irish *Book of Invasions* describes a much later wave of "indigenous druids" struggling with a newer tribe's chief druid over the right to kindle a fire that was ceremonially important to both.

Many prehistoric sites are found lined up in rows. Five or more sites in a row are known as a *ley,* and are believed by some to mark a natural earth meridian or channel of energy, a ley line, similar to the ch'i-filled "dragon currents" the Chinese recognize in feng shui. Modern mappers of these pathways, or ley hunters, believe that certain special places where two or more ley lines cross are full of power, which can be drawn upon in magical practice. Some researchers speculate that one such line, colloquially known as the Old Straight Track, was a road map to be used from the air during soul flight. Others believe that the leys reflect zodiacal patterns, as elements of passage-grave construction posit strong evidence that recurring astronomical phenomena were emphasized in the spiritual practices of Bronze Age Ireland and Britain. A third hypothesis is that the sites lie over hidden underground springs of water, and that the particular spiral flow of such an aquastat may serve as a healing force. Spirals do appear with extreme frequency in early Celtic art.

Spiritual Practitioners

The Roman historian Strabo lists three classes of learned Gaulish spiritual practitioners. The *druids* are described as philosopher-theologians concerned with both the immortality of the soul and natural phenomena. *Bards* were poets, storytellers, musicians, and singers who chanted histories, eulogies, and satires. And *manteis,* or *vates,* were naturalists and experts in divination through auguries and sacrifices.

Before the first millennium B.C.E., however, all of these abilities were attributed to druids, as the separation between these specialized functions was not so absolute. For example, in the

Tain bo Cuailnge it is noted that the bards, or "sweet-mouthed harpers," of Cain Bile were also druids of great knowledge. And in the Welsh tale of Gwion Bach as told in the *Mabinogion,* the witch Cerridwen is described as being a master of all three of the great arts: magic (the province of the druidic class overall), enchantment (a later specialty of bards), and divination (assigned to the manteis). Her facility in all three sub-branches of learned spiritual practice points to the fluidity of those categories. Some speculate that the separation into specialized functions occurred for political reasons involving the overall strength of the druidic class.

Despite the common portrayal of a druid with a flowing white beard, references to both male and female adepts can be found. Women were accepted in pagan Celtic cultures as military leaders, as queens in their own right, and as magical practitioners. Tradition refers to "sunset isles of women," where groups of female druids lived apart from their families for parts of a year. Examples include the Ile de Sein off the coast of Brittany, where a sisterhood of nine miracle-working healers worked, and the Isle of Avalon, which gained fame in the Arthurian saga as a training ground for sorceresses and healers.

Most scholars today agree with Pliny the Elder, who regarded the Old Irish name *druid* as originating with the Greek word for oak tree, *drus,* combined with the Indo-European root word *wid-,* to know (Piggott 1985, 103). Druids held their spiritual ceremonies in open groves of oak, preferring these natural cathedrals to any human-built structure. Place names involving the Gallo-Britonic word *nemeton,* which means both a clearing in a wood and a shrine, or sanctuary, were very likely once the sites of druidic practice and education.

At one time, a network of formal schools for generations of druids crossed the Celtic lands, the most important of which was located on the Isle of Mona (modern Anglesey). According to Julius Caesar, a druidic education—which could easily take twenty years—encompassed science, law, practical religion, philosophy, and history. Because writing was mistrusted for storage and transmission of important information, all of the information involved had to be memorized. Details of the education have unfortunately been lost, and we do not know how, or whether, magical initiation was formally conferred. Instead, we repeatedly find very human tales of somebody making an innocent blunder that turns out to have tremendous magical repercussions. The ordinary and the numinous sides of the world are so close together that they can shift places in a moment, and one small deed can catalyze great change. In the biographical tales of both the Welsh chief bard and seer Taliesin and the Irish tribal leader and warrior chief Fionn MacCumhaill, shamanistic initiation was not sought but came upon the recipient through terrifying accident. Very little in the Celtic magical world seems to take place as planned through human volition.

Druidic and Bardic Powers of Enchantment

Inspired poetry, regarded as a vital skill of the pagan Celtic seer, fits in with the shamanistic tenet that one must bring back any information gained from the Otherworlds to benefit the people. One challenge in carrying out this mission is that visions wildly pouring forth while in deep trance can easily be forgotten during the return to ordinary waking consciousness. They are much more likely to be retained and recalled for later use when placed in some sort of pattern that the cognitive mind can hold onto. Through the use of rhyme, alliteration, meter, repetition, and tune to this end, the crafts of music and poetry became intimately connected with magical practice and otherworldly power and knowledge in the Celtic world.

Besides voicing deep and otherwise hidden wisdom gained while in an altered state, bards used sound to harm, heal, and alter moods and probability. Poetry and music were not considered beaux arts by the pagan Celts, but tools of raw magical power. Scorching satirical poetry known as the *briarmon smetrach* was intended to "puncture" and to publicly destroy reputations. Well-aimed, the poetic form known as *glam dicin* was used to drive out rats and to disfigure or even kill an opponent. The Irish cattle-rustling epic *Tain bo Cuailnge* describes the bardic warfare employed by Queen Medb against her enemy Fer Diad: "Then Medb sent the Druids and satirists and harsh bards for Fer Diad, that they might make against him three satires to stay him and three lampoons, and

that they might raise on his face three blisters, shame, blemish and disgrace, so that he might die before the end of nine days if he did not succumb at once" (Kinsella 1969).

Bardic incantations could also be used to end hostilities. Diodorus Siculus observed this magical use of sound in the late first century B.C.E.: "Frequently when armies confront one another in line of battle with swords drawn and spears thrust forward, these men intervene and cause them to stop, just as though they were holding some wild animal spellbound with their chanting" (Diodorus Siculus 31, 2–5, as cited in Ireland 1986, 181). Tacitus describes the effect of this weaving of enchantment against Roman invaders on the Isle of Mona in 60 C.E.: "On the shore stood the opposing army with its dense array of armed warriors, while between the ranks dashed women in black attire round the Druids, lifting up their hands to heaven and pouring forth dreadful imprecations, scared our soldiers by the unfamiliar sight so that, as if their limbs were paralyzed, they stood motionless and exposed to wounds (Tacitus 1989, 30).

Finally, bardic powers could also be used to heal—as when a master harper restored speech to the dumb prince Maon through his music. Bards often employed the small harp as a magical tool. Part of the Celtic harper's toolkit was working knowledge of the *Adbhan Trireach,* "Three Noble Strains," attributed to the chants for childbirth sung by the god Dagda's harp Uaithne. Each strain was not only entertainment but a form of enchantment: *Sorrow- or Lament-Strain,* which could reduce listeners to tears; *Joy-Strain,* which could turn tears to laughter; and *Sleep-Strain,* which could soothe listeners' hearts into deep sleep. Gaining songs of power from spirits is a common element occurring in many shamanistic cultures.

Shapeshifting, Glamour, and Invisibility

Trickery achieved through enchantment, or the shifting of seeming reality, is a theme commonly found in literature detailing observations about indigenous magical practitioners of the Americas. It is also found throughout Irish texts and the British and Gaulish Arthurian literature.

The magical manipulation of weather by druids appears prominently in Irish sagas, often employed as one weapon in the arsenal for ordinary tribal warfare. Strong winds and tempests were raised by the Tuatha de Danaan people to keep the first Milesian invaders from landing on the shores of Ireland, and the druid Mog Ruath sent storm-spells and magic fire against King Cormac and his druids in order to drive them out of the area. Weather could also be called up in order to conceal people or to get their enemies lost and confused. Heavy snowfalls, thick mists, dense fog, thundershowers, and sudden darkness were all employed.

Another commonly found druidic practice is the manipulation of events through magical impersonation. For example, the Irish warrior Cuchulainn was once deceived by a sorceress, who took the form of a trusted lady in order to get near him and goad him onto the field of battle. Sexual themes are quite common. In the Arthurian cycle, the wizard Merlin enchanted Uther Pendragon, making him look like the husband of Igraine so that she would gladly sleep with him. Merlin knew through augury that this mating would conceive the child who would later become King Arthur. One tool for accomplishing such shapeshifting was the spell known as *fith-fath,* used to transform one object into another and also to confer invisibility.

A classic motif in Irish folktales is the nonhuman Fair Folk "casting glamour" upon an unwitting passer-by, who thinks he is being invited into a grand home to enjoy a fabulous feast, a gift of gold, and a night of love with a beautiful woman. Instead, in the morning when he wakes, he finds himself lying in an open field with dew on his coat and a pocketful of yellow leaves, holding a rotting corpse in his arms. Such tales could be seen as illustrating spontaneous and shamanistic soul flight with otherworldly aspects of travel, uncanny beauties and terrors, encounters with strange beings, the element of later finding one's body elsewhere, and great time discrepancies.

Animal Transmogrification

Ties with other animals are extremely strong in ancient Celtic tradition. The deepest wisdom in the world is held by the ancient Salmon of Knowledge. The appearance of crows foreshadows the coming of the war goddesses Morrigan and Badbh. Gwyrhyr, "Interpreter of Tongues," exhibits the ability to communicate with wild animals.

This shamanistic motif of mediating between human and other animal forms may also take the form of transforming into them. The druid Uath was said to change himself into any form he wished. In a conversation with the ancient Hawk of Achill, Fintan describes his history of transformations into an eagle, a hawk, and a salmon. And instead of dying, Tuan MacCarell repeatedly finds himself alive and vibrant in a new young animal form. In the last days of his final human life, he relates the entire history of Ireland as witnessed through his many different eyes, most of them nonhuman, to the Milesian invaders.

These mystical biographies, and those of the bards Taliesin pen Beirdd, Oisin, and Amergin, comprise some of the most powerful examples of shamanistic elements in the Celtic world. Each changed into animals and other forms (including waves, winds, a spear, and a seed), lived significant amounts of time in each form, then came back to the people with useful knowledge gleaned from their time spent in nonordinary reality. By leaving the ordinary human form, the poet-seer gets to understand divine nature through many lenses, learns to wield natural forces, and becomes unafraid of death.

If we can take the oldest extant mythological cycles as evidence of worldview, practitioners were also considered to be able to change the shapes of others. The story of the Children of Lir describes their cruel transformation into swans by their jealous and magically adept stepmother. Beings in the Welsh *Mabinogion* such as the hunted boar Twrc Trwyth, who was once a human king, and the lady Blodeuwedd, who is actually an enchanted owl combined with flowers, were similarly changed without their consent.

The Celts also live closely with beings who belong to both the human and other-than-human realms. Legends of seal-people, or *selchies,* abound in the outer islands such as the Hebrides. It is said that at certain times of the year such as the solstices, these seals shed their skins and go dancing on the rocks as human beings. Some of them are captured or captivated by "real" humans and mate with them. There are families in these islands who deem themselves to be part seal-blood, having descended from just such pairings. One benefit of this lineage is that these people seem to have better luck with the fishing and the waves: They have an intuitive knowing of where the fish will be, or when and how a storm will come. Their relatives below will also help them by herding fish toward their boats. Selchie legends comprise one of the most palpable variations of the shamanistic theme of transformation: Both the human and seal people learn of another perspective, and mediate between the worlds of land and sea, by literally and metaphorically living in the other's skin.

A personal connection through lineage could also determine behavior. Conary was forbidden to hunt birds, since his father came to his mother Messbuachalla through the window as a great bird, who threw off his plumage to make love to her. Ossian was forbidden to eat venison, as his mother Saar gave birth to him while transformed into the shape of a deer. Cuchulainn, whose name literally means the "Hound of Culainn," was under a *geis,* "taboo," against eating dogflesh.

Such relational protection is a common thread in Irish tales, and may connect back to earlier tribal totems. There is clearly a tie with other animals that far exceeds romantic sentimentality; it is an animistic view about one's relatives. Early Celtic tribes were named after these connections: *Epidii* (Horse People), *Cornavii* (People of the Horn), *Brannovices* (Raven Clan), *Taurisci* (Bull Folk). In early Celtic culture, the shamanistic elements do not generally center on individual human psychology as they tend to in modern Neo-Shamanism; instead, they illustrate tribal relatedness to a magical, completely alive and sentient, world of nonhuman and spirit equals.

Mantic Powers of Divination and Soul Flight

Divination and prophecy were integral parts of the pagan Celtic druids' or manteis' repertoire. They divined to see deeply or to travel into the "other nature" of seemingly ordinary things. This traveling could be done through ecstatic poetic trance, observation of natural forces for correspondences, or soul flight to other realms.

The twelfth-century Welsh historian Giraldus Cambrensis describes the Welsh magical poetry specialists known as *awenyddion* (people inspired) as going into deep ecstatic inspirational trance with the body in frenzied paroxysms, chanting wildly. Cambrensis says that when the inspiration came upon them, they

roared mightily, and the listeners had to pick out the useful bits from the mass of unintelligible gibberish around it. Both the Welsh awenyddion and the Irish poet-seers had to be violently shaken awake after their forays into this other state of consciousness. Cambrensis reports that the awenyddion felt as though they had sweet milk, honey, or writing poured onto their lips from the spirits.

The greatest-known magical practitioner from the Arthurian saga, the wizard Merlin, was so accustomed to soul journeys into nonordinary realms where space and time are different that he was reputed to "live backwards in time." It is said that he could prophesy easily because for him prophecy was not a matter of divination but simply of remembering the future.

Celtic prophecy was undertaken for practical purposes. In Irish sagas, we find the druids or manteis called upon to augur whether a particular day was auspicious for some important undertaking, such as births or battles. Mothers would sometimes artificially hold off delivery of their babies until a day the druids found would foster greatness in the child. The Irish druid Cathbad prophesied that whoever would take up arms on a particular day would have a short life with eternal fame. The young boy Cuchulainn seized the moment, and later went on to become hero of an entire cycle of Irish sagas.

The druids may have used a detailed divinatory calendar. Bronze calendar fragments found at Coligny in France form the oldest extensive document in a Celtic language, having been dated between the late first century B.C.E. and the early first century C.E. Thought to be a product of the Gaulish druids, the document uses Roman lettering, but its content is distinctly different from the Roman calendar. Each month in it is marked by either the abbreviations MAT (good) or ANM (not good). Similar methods were used in Babylonian and Jewish calendrics and can still be found today in Indonesia, where healer-seers and even everyday folk use them to plan events around particular days and even certain hours, due to their attributed characteristics.

Divination through Nature

Druids and manteis observed the patterns in nature for clues to the patterns surrounding human events. Fedelm in the *Tain* practiced crystal gazing. Scottish Highland seers discovered meaning by throwing the scapula bones of sheep. The first-century B.C.E. historian Strabo reported that periodically, in earlier times, a particularly chosen human being was stabbed in the back with a dagger to foretell the future from his convulsions. Smoke rising from a fire, the placement of the stars, the auspiciousness (or not) of particular days and hours, the placement and shapes of clouds—all could be looked to for advice. Asking nonhuman beings and the spirits of the beloved dead for help is, of course, a classic aspect of shamanic inspiration and practice.

Animal allies figured especially prominently in pagan Celtic divination. Parts of the bull could be eaten or worn to invoke divinatory aid. In the first century C.E., the Iceni warrior queen Boadicea used a hare for foretelling and to help ensure her tribe's victory against the invading Romans. The direction in which the hare ran off foretold to the assembled people whether or not the battle would go well. Many animals and birds were watched closely for clues, for it was deemed quite possible that some were actually humans or deities temporarily taking on that form.

Cave paintings by Bronze and Iron Age Celts that portray ravens speaking to humans have been found in the Camonica Valley of northern Italy. Augury by ravens appears commonly in the British Isles. The system is remarkably like that found in contemporary Tibet. Ravens are watched for omens of luck, approaching visitors, and the like. Oral poetry collected in the nineteenth-century *Carmina Gadelica* still includes tales in which approaching ravens are taken as an omen of impending death. Observation of both the raven and wren involved their various cries, direction of flying, and bodily position in the sky relative to the questioner. Diodorus Siculus observed that the early Christian saint Columba differed from his Druidic teachers in that he paid no heed to the voices of birds. The Welsh word for wren is *drui-en,* "druid bird," clearly alluding to its role as magical helper.

Journeys into the Otherworld

The definitive shamanistic act in many cultures is "soul flight." The shaman deliberately goes into trance, her soul temporarily leaving her

body, in order to gain deeper knowledge and understanding. The Celtic literature that has been translated to date describes other lands which are clearly not part of ordinary reality, seeing at a distance through both space and time, and details of methods used to leave the body.

The *Vision of Rhonabwy* describes seeking inspiration by going alone to a remote place and wrapping oneself up in a bull's hide at night. The Gaelic name for such a bullhide wrap was *taghairm,* which literally means "an echo," a response from a distance—in this case, perhaps from the Otherworld. Lacking bullhide cloaks, later generations similarly wrapped their plaids about their heads to cover their eyes in the dark, in order to see better. The *imbas-forosnai,* "divination by holding the cheeks," involved the seer eating the flesh of a white bull and then going to sleep holding onto his cheeks, with four druids continually chanting over him. In one imbas-forosnai, the dreamer had a vision of the man who was to be made king. He saw where the man was and what he was doing at that exact moment. This seems to be an example of distance viewing and prophecy, through the mechanism of soul flight.

The historical-mythological cycles are richly embellished with episodes of shamanistic trance. A scene in the Red Branch cycle describes the druid MacRuith rising up with the fire into the air of the skies, dressed in his magical garb of a bullhide cloak and *enchennach,* "bird dress," and soaring above the heads of the opposing army to scout their position. A *tugen,* "feathered cloak" has also been mentioned as worn by certain Irish poet-seers. The wearing of feathers is common in the shamanistic costumes of many peoples, intended to further soul flight, spiritual power, and magical insight or inspiration.

Tales involving travel into nonordinary realms abound in the British Isles, such as Pwyll's meeting with Arawn in the Underworld; the surreal voyages of Brendan, Peredur, and Maelduin; Ossian's return from Tir na n'Og after spending three centuries there; and Lancelot's crossing of the Sword Bridge in search of the abducted Guinevere. Other classic shamanistic elements in the latter include Lancelot's forgetting who he is and being confused as to whether he is alive or dead, his deliberate removal of his armor to cross the swords and his subsequently being cut up by them, and finally, the sudden disappearance of the fearsome leonine guardians he'd perceived guarding the far banks.

Shamanistic portals to other realms appear in Celtic tradition as they do in other cultures. Lancelot's sword bridge is a good example of an object that holds meaning in both ordinary and nonordinary reality, and can serve as a literal bridge between the two. Descriptions of narrow bridges that initially defy the promised passage to a magical place also occur in Irish literature.

Trees, which appear worldwide in shamanistic practices as a means of reaching other spiritual realms, are of central importance to druidic magical practice. Pliny observed that the druids "perform no rites without the foliage of the oak," and that they revere the mistletoe because "anything growing on oaks . . . is a sign that the tree has been chosen by the god himself" (Pliny, *Natural History,* 16, 249–251, as cited in Ireland 1986, 183). Perhaps the presence of the mistletoe designated a particular tree as a gateway into the gods' realms.

Certain hills in the British Isles are considered to be hollow inside, containing or leading to nonordinary realms called Faerie. Such realms have their own rules of time and space, their own unique weather patterns and natural laws. The perception that both space and time work differently in nonordinary reality is well documented cross-culturally. As in the case of Thomas the Rhymer, a traveler returning home from a journey of a day or two spent in the hollow hills of Faerie can find that in this reality, years have passed: his house has gone to rot, loved ones seen a few days ago as children have now long been dead, and nobody is left who knows him. As in the Irish tale of Oisin, who spent years in the Land of Youth, the journeyer's body may also be preserved in its original youthful state, but upon touching the mortal ground of this world, it may suddenly age to catch up with the years here, or even turn to dust.

Folk stories of adventures in Faerie give clues to avoiding dangers when journeying to the Otherworlds or accidentally coming upon spirits in this world. One should behave as befits a good guest: not stealing objects found in their homes; not intruding upon private dances or ceremonies; not playing bad music at their parties. It's best to avoid accepting food or drink in the Otherworld, as this could mean becoming their prisoner. The Queen of Faerie has a repu-

tation for stealing away mortals she finds beautiful, interesting, or useful. Brave attempts to retrieve beloved human souls from this thief involve trials by fire, shapeshifting terrors, riddles and other trickery, and the threat of dismemberment—all classic shamanistic elements.

Besides trees and hills, the Irish also viewed certain waterways as entry portals to the Otherworlds. The *Dinnshenchas* (History of Places—early Irish literature) describe many rivers being under the watchful care of particular female spirits or deities. Thermal springs in modern Buxton were once called *Aquae Arnemetiae,* the connection with the Brythonic word *nemeton* showing that these waters were once an important site of Druidic practice. W. Y. Evans-Wentz recorded the belief that the Faerie realms could be reached by entering through a well: "It was by passing under the waters of a well that the S'dh, that is, the abode of the spirits called Sdhe, in the tumulus or natural hill, as the case might be, was reached" (Evans-Wentz 1911, 431). Wells were widely known to be sacred places, each inhabited by—or being itself—a spirit. Many Christian shrines found in Celtic lands today, including the great cathedral of Chartres, were built on the sites of druidic wells.

Influence on Celtic Christianity

Christianity entering the Celtic lands became heavily informed by the animistic spirituality and Druidic practices that preceded it.

Some argue that Christianity came into Ireland so easily because the tenets of Christ were the same as those already held by the Druids. Themes common to both Druidry and Christendom include the saints' exhibition of healing abilities, the building of most churches over wells and facing east to greet the sun, the creation of monastic centers of learning, and the long teacher-student relationship in these monasteries. Monkish manuscripts like the exquisite, illuminated gospels of Echternach and Durrow, which portray the four Evangelists as animals (a bull, a lion, an eagle, and a man), reflect a deep syncretic correspondence between Ezekiel's Biblical vision and Irish animism.

Druidism also left its unique mark on the incoming religion. Some of the earliest Irish Christian saints, such as the well-loved warrior-monk Columba, were trained by Druids in magical practice. Druidic themes incorporated into the Celtic Christian Church include the sense of filial intimacy between humans, other beings, nature, and the Divine, the emphasis on the Trinity, the uses of poetry and song, the zoomorphic and knotwork illustrations on their illuminated scrolls, the snakes found curling on the end of early crosiers, and a sense of the sacred as immanent in all things. A lingering animistic sensibility can be seen in the distinctly non-Christian ornamentation found on many old Irish churches. These include images of the Green Man, whose beard and hair are made up of rich leafy foliage, and the Sheela-na-Gig, a grinning, naked, bald female figure gleefully holding open her huge vulva. Finally, the people have traditionally had a pragmatic relationship with Jesus, God, Mary, the Holy Spirit, the angels, and the saints and turn to them for practical aid with problems in their lives, just as they had done with previously known spirits.

As a result of this syncretism, Celtic Christianity differed significantly from the forms found in Rome and other places on the mainland. Ireland in particular remains unique, as it was the only part of the Celtic world that was never invaded by the Roman Empire.

Modern Movements

Many people across Europe and America still perform a vestige of pagan Celtic ritual every year through the celebration of Halloween. The autumn fire festival Samhain was considered a time when the veils between the worlds were thinner than usual, and spirits, including those of the dead, could move freely among the living.

The principles of modern Druidism were set down in the early 1700s, counting among its disciples the poet William Blake. It was then that groups of practitioners began the work of unearthing and reconstructing the tenets of Druidic practices and spirituality. These new groups, known as groves, conferred a romantic tinge on Druidry that can still be seen today.

Following in their footsteps, many contemporary Pagan, Wiccan, and Celtic Reconstructionist groups are experimenting with a creative fusion of ancient and modern elements to create a spirituality that can work for people today. These vary widely in depth, intent, and au-

Modern-day Druids gather for a summer solstice ceremony within the Ring of Trilithons at the ancient site of Stonehenge, in Wiltshire, England. The site was constructed over a period of 1500 years beginning around 3000 B.C.E. (Adam Woolfitt/Corbis)

thenticity, with a wide range of creative output. Some serious ritual groups exhort learning Celtic languages and planting trees as an integral part of their spiritual practice.

The Celtic traits of "high imagination" and conscious relationship with the spirit and nonhuman worlds persist in these movements. Like the druids before them, many practitioners are now taking on the vital responsibility of serving as ecological mediators and spokespeople. As such, they are fulfilling a primary role of shamanic practitioners worldwide—to help their people, and the other-than-human world they depend upon and are kin to, continue to live.

CLASSICAL WORLD SHAMANISM (ANCIENT GREECE AND ROME)

Classical scholarship at first accepted a very narrow definition of shamanism as a priestly practice restricted to the Tungus peoples of Siberia, from whom the term was adopted. Only those Greeks who appeared to have made contact with that or derivative cultures, sometime after the seventh century along the shores of the Black Sea in the regions of Scythia and Thrace, were recognized initially as perhaps themselves also shamans, displaying such common traits as bilocation, animal familiars, healing powers, spiritual journeys, soul recovery, divination, and trance states (Meuli 1935). Lacking was any awareness of the involvement of psychoactive sacraments in the ecstatic practices of both the northern shamans and their Hellenic imitators; nor was there any consideration given to similarities of religious experience between these oriental Siberian shamans and corresponding rites worldwide that went by other names in the Greco-Roman world. Such sacraments are now commonly termed entheogens.

Within this very limited definition, the sixth-century seer Abaris, who showed up in Athens and Sparta to banish plagues and predict earthquakes, was supposedly a Hyperborean priest of Apollo, which meant that he came from the otherworldly paradise "beyond the North Wind" in the central Asiatic highlands that the Greeks remembered as their mythological Indo-European homeland. His manner of travel was upon a golden arrow, not an implausible way for an ecstatic shaman to journey between this and other worlds, since the word for "arrow" *(ios)* is homonymous with "toxin"; similarly, *toxic* is derived from the Greek word for "of the bow" *(toxon)* and the arrow traditionally was drugged or poisoned, suggesting the metaphor of entheobotanical intoxication (Ruck 1986; Ruck and Staples 1994). Shamans, moreover, often indulge in psychic excursions on their arrows (Dodds 1951).

Aristeas, on the other hand, journeyed in the opposite direction from Greece to the Hyperboreans while "possessed by Apollo," apparently as a raven, the god's sacred familiar. Aristeas claimed Proconnesus in the Sea of Marmara as his native island. Nevertheless, it would obviously be extremely naive to consider

this shuttling back and forth in trance states reported of Abaris and Aristeas, trance states during which they reportedly appeared dead but claimed they had traveled as birds or arrows to Apollo's Hyperboreans, as evidence that either of these men had actual physical experience of the Scythian or Thracian lands. In any case, the shamanic paradise lay far beyond those lands. That otherworldly Garden of the God was supposedly peopled by Gorgons and creatures with a single eye, the Arimaspeans; its plants, guarded there by griffins, were called golden fruits or flowers of gold and subterranean honey. All of these can be understood as metaphoric for the Siberian entheogen *Amanita muscaria,* the fly agaric mushroom (Ruck, Staples, and Heinrich 2001). There the god's original name was known as Abalus, cognate with the medieval Avalon, the "Apple Island" (Dodds 1951); red "apples" are what these "tree mushrooms" are also called, since they grow only in symbiosis, as mycorrhizal symbionts, like the fruits of certain trees (Ruck, Staples, and Heinrich 2001).

The connection with the Hyperborean homeland was ritually commemorated in the classical period each year by a secret offering of the "first fruits" that came supposedly from this mythical Otherworld to Apollo's sacred island of Delos to celebrate the god's conversion from his earlier pre–Indo-European manifestations in the Aegean world as the recipient of human victims. Thus the first ambassadors with the offerings died and were buried on Delos, and the transition was reenacted by the annual ritual of the troupes of dancers, twice seven pubescent males and females, sent by each Greek city to the sacred isle, where their lives were at the last moment spared; they were only flagellated as they danced about the god's altar and bit upon the trunk of his sacred tree, the olive, that now represented the entheogenic mushroom's tree (Ruck 1986). The so-called Shining Island of Delos itself was a transposition into this world of that otherworldly isle that beckons as the departed soul's destination.

Hence the Hyperborean connection is not an indication of any imagined actual contact, but a metaphor for the shaman's descent to the past to reestablish the quintessential vertical pathways upon which the culture of the present is founded. Thus another Hyperborean visitor was Olen, who not only was said to have composed certain hymns on the subject of the original sacrificed ambassadors, but was claimed as the founder of the god's oracular site at Delphi (Ruck 1986). Such a role for Olen indicates that shamanism was not something foreign on the fringe of Greek religion, but central to its most important pan-Hellenic sanctuaries, the very basis of their common identity as a people. Not only Delos and Delphi, but even the great sanctuary of Zeus at Olympia betrays shamanistic origins, for the hero Herakles planted there the sacred grove of olive trees that he imported from the Hyperborean Garden. Here again the olive tree represented the sacred mushroom, and the grove of trees planted by Herakles was described metaphorically as the golden horn of a reindeer, an animal often associated with fly agaric and the ecstasy induced by its toxins.

Nor were Abaris and Aristeas alone in displaying the traits of a shaman. Epimenides of Crete was called the Maiden's youngling, which indicates that he was associated with Persephone and the Underworld; as a continuation of the pre-Hellenic traditions of the Minoan Goddess, he had lain asleep for fifty-seven years in her sacred cave. He could wander out of his body; he appeared in Athens in the fifth century, performing purificatory rites and prophesying. He, too, had an entheogenic secret, for he was said to subsist totally on a special herbal compound, taught to him by the nymphs, which he stored in a "bull's hoof," the bull being another metaphor for fly agaric (Ruck, Staples, and Heinrich 2001).

Epimenides believed that he had lived before and had once been the legendary Aeacus, king of a race of ant-men, the Myrmidons, and one of the judges in the Underworld. These Myrmidon people probably reflect some awareness of his native Cretan traditions: The ancient Minoans had metaphoric matriarchal societies of insects, and the symbolism of the bee-maidens depicted in their art involves the bee's nectar-gathering herbalism, which yields both honey and the poison of their sting. Here it was other entheogens that were involved, Persephone's "narcotic" *narkissos,* as the psychoactive sea-daffodil, *Pancratium maritinum,* was called, as well as the opium poppy (Ruck, Staples, and Heinrich 2001). Clearly shamanism was practiced in the worship of the Goddess, well established before the arrival of the Indo-Europeans with

View of the Tholos of the Sanctuary of Athena at Delphi, Greece. (Archivo Iconografico, S.A./Corbis)

their own traditions of shamanism. A version of the Apollo god, with his Goddess who later became his sister Artemis, presided over the bull-dance offering of human victims enacted in the central courtyard of the great sanctuary of Minos, another one of the judges in the Underworld, at Knossos. This god, whose homeland was remembered as among the Lycian people of southern Asia Minor, was assimilated with the Hyperborean Apollo. It is that transition that is remembered in the myth of Theseus's encounter with the Minotaur and his celebration of the victory with the first performance of its pacified version on Delos around the altar that marked the god's conversion into a son of Zeus (Ruck and Staples 1994). At Delos, the victims now were merely flagellated as they danced around the altar, instead of the deadly dance with the bull at Knossos. It is highly likely that psychoactive plants (such as wolfsbane and mistletoe) prepared the human offerings to accept their fate, and even in the pacified substitutes, the entheogen made certain ordeals bearable.

It is also characteristic for a shaman to experience, as Epimenides did, the soul of a dead shaman entering into a living person to reinforce the sources of power and knowledge. Similarly, generation after generation of prophets claimed to be the fabled Boetian seer Bakis, for the hero-shaman commonly attains divine cultic status. Thus the fifth-century Pythagoras claimed that he had formerly been the shaman Hermotimus, as well as Aethalides, another shaman, said to have been granted the privilege of rebirth. Reincarnation is reportedly often an ability limited to shamans. Originally from the island of Samos, Pythagoras settled in

southern Italy, where he established a religious community of women and men devoted to dietary and spiritual practices, such as descent into caves for a spirit quest, that would assure that they would achieve metempsychosis, as well as induce the ultimate vision of the numerical purity upon which this world of appearances is based. The religious nature of this monastic society is indicated by the equal rank afforded the women, who apart from sacred roles, were ordinarily sequestered from and subservient to men.

We have an eyewitness account to the shamanism of a contemporary of Epimenides, Empedocles, as well the entheobotanical claims of the man himself. Empedocles says that he knows of all the drugs and can teach that knowledge to his initiates, for he has drunk fire from an immortal potion, and now can summon storms or calm them at his will, and can lead souls back up from Hades (Kingsley 1995). Such shamanic soul retrieval is described in the myth of Orpheus and Eurydice, and the Orphic religious communities claimed that their founder, too, had a special dietary regime and a "smoke" (incense inhalation); he was a priest of the "northern," or Hyperborean, Apollo and could summon beasts, and was apparently consubstantial with his god, for after his death he was himself compounded by ecstatic women into a potion, and his "head" alone continued to prophesy. His devotees believed that the body *(soma)* was a tomb *(sema)*—that this life was a deadly incarnation of the soul, which was liberated upon death, to be judged and recycled through metempsychosis for a series of further testings, until achieving a final celestial stasis. Nor was this shamanic idea of a detachable soul limited to Orphic doctrine. It underlies the literature of the classical age, in which the soul is considered most alert and free in sleep, and in dreams and trances, during which time it acquires some of the knowledge it will attain upon the final liberation of death. This soul could speak through gifted clairvoyants like the Sibyl, the "pythons," and the "belly-talkers" *(engastrimythoi)* whose voice seemed to rise from deep within them. These last, however, can probably not be distinguished from the "tongue-in-bellies" *(englottogastores),* a fabulous people, like the "Shade-foots" *(Skiapodes)* implicated in the profane use of the Eleusinian sacrament (Ruck 1986). These fabulous peoples are all anthropomorphized versions of the divine spirit that resides in the sacred plant.

The fifth-century philosopher Parmenides, from the region around Olympia, left an account of his soul's journey, while still in this life, to the gateway between night and day, where he met a goddess who imparted her teaching of the gnostic vision. He was said to have produced the laws of his city after a vision quest in a cave. Often these caves were sacred to Apollo, the most famous being the one on Mount Parnassos, the original site of the oracle. He and Pythagoras were not alone in achieving visionary knowledge. Plato explicitly claims that his dialogues are only the preparation for a vision of the Ideal, or archetype of reality, which will come only after an extended regime of spiritual practices, open to both males and females, for which he employed the famous metaphor of the Cave and a Mystery initiation. Thus shamanism is also at the heart of what we have come to call Greek philosophy. Sophists and philosophers were probably all shamans, at least in the common mind; a sophist, after all, is nothing other than a *sabio* or *sabia* ("skilled in an art"). It was from a wisewoman, the famous Diotima, who was also adept at banishing plagues, that Socrates learned the metaphysical nature of love that he expounds in the *Symposium.* Aristophanes parodied Socrates as a sophist-shaman, first in *Clouds,* where his community of disciples was shown digging up special roots in a profanation of a Mystery initiation and hallucinating on clouds. And later, after the actual scandal of the Profanations, when certain prominent Athenians were discovered to have used the Eleusinian potion for recreational purposes at their drinking parties, he was shown in the *Birds* again profaning the Mystery, this time in a shamanic rite of necromancy, as he summoned up spirits of the dead through the medium of his entranced companion Chairephon, squeaking like a bat (Ruck 1986). As Socrates claimed in *Apology,* this was the real crime of alleged impiety for which he was finally brought to trial at the end of the century. His execution with the hemlock potion indicates the sophistication of ancient pharmacology; he was advised not to waste a drop with a libation, for the exact dosage had been prepared: Hence the symptoms of his peaceful death are totally at variance with the observed effects of hemlock poisoning.

As is clear from the monastic communities of wise men like Pythagoras, Plato, and the Orphics, shamanism could be practiced as a group experience. The great Eleusinian Mystery involved an experience of this type, a shamanic initiation, in which the initiates journeyed in the soul to the Otherworld in order to experience personally the opened pathway between the realms, in a religious ceremony that ratified the transition from its Minoan precedents to the Hellenic manifestation and assured their own beneficial accord with the goddess and her son. The Eleusinian Mystery originated in the middle of the second millennium, indicating the antiquity of the concept of a detachable soul. The vision here was induced by a sacramental potion for which the primary psychoactive agent was derived from ergot, a fungus that grows on grain, for the religion also celebrated the social structures that evolved with the arts of cultivating grain. The Eleusinian ceremony was only the best known of similar mysteries, such as that of the Kabeiroi, enacted at various other sites, which is known from potion cups in museums.

Such communal shamanism was also the basis of the maenadism of the women devotees of Dionysos, which celebrated the previticultural antecedents of the god's vinous potion. Periodically the females of the city deserted their homes for a mountain revel, where they enacted herbalist rituals, gathering the toxic plants symbolized by *kissos,* "ivy," the wild vine that was considered the primitive intoxicating antecedent of the cultivated grape and the inebriant grown upon its juice. For the women, it was a return to past times and the former solidarity of the Minoan sisterhoods. They experienced ecstatic union with the god and his spiritual troupe of goat-men, or satyrs. It was a rite that was considered essential in order to honor the god's wild and primitive world, balanced by the civilized ritual drunkenness practiced by the men in the drinking party, or symposium, within the city. The god's wine is properly described as a vinous potion since, like the balanced rites of maenadism and symposia, it, too, mediated between the wild and cultivated versions of the god by incorporating, in addition to the alcohol grown through fermentation, commemorations of the vine's antecedents, a variable mixture of entheogenic herbal additives (Ruck 1986; Ruck and Staples 1994; Ruck, Staples, and Heinrich 2001). Such spicing of the wine with other inebriants is a common practice even today, and Greece perpetuates the ancient tradition with its retsina, or resin-flavored wine. This reconciliation with primitivism was also enacted by the wife of the king-archon (Basileus), who, after the conversion of the city's political organization into a democracy, perpetuated the former priestly role of the city's ruler, its shamanic founder. Each year this queen united "sexually" with the god in a temple that was considered a bull's stall, for she was enacting the old metaphoric bovine epithet of the Goddess and the taurine entheogenic sacrament of her spiritual consort.

Dionysos's most cultivated manifestation was in his patronage of the theater. Drama began as a shamanic experience, with the entranced narrator evoking the spirit of a dead ancestor from his tomb to impersonate his story. As it developed in the sixth and fifth centuries in Athens, it became a mediation of the rural and urban peoples and of wild antisocial and civilized tendencies (seen, for example, in the pairing of comedy with tragedy), as well as strengthening the vertical pathways linking the present to the past and the ancestors. The actors became possessed by the spirits they were impersonating, and that enchantment radiated out, like a magnet's field of force, to the entire audience, who participated, linked like iron filings, in the perpetuation of the myths that indoctrinated them into their identity as a people. To place them in the properly receptive mind, the members of the audience drank a special vinous potion throughout the several days of performances. Nor were the poets in their "right" minds when they became inspired. It was probably more than a convention that they testified that the tale spoke through them, for they become possessed by the Muse. It was said that Aeschylus never made a drama except with his mind well wined; and Euripides is said to have composed in a cave on Salamis, certainly an unlikely place except for shamanic rituals.

Our evidence is most abundant for the city of Athens, but similar rites were occurring elsewhere. The Spartans never went into battle without their shamans; and their presence in warfare is attested by the Homeric poems. The induction and initiation rituals of the Spartans also involved entheogens, either to induce the proper visions or to make the demanding expe-

rience endurable. Entheogen-induced trance states can also be traced to the terrifying rites of incubation through which healings were effected (Ruck, Staples, and Heinrich 2001). Music, drums, chant, and dance, of course, can induce a receptive state of mind without help, but probably entheogens, at least in the form of the vinous potion, were always involved, as in the orgiastic dancing of the reputedly drunken Korybantes (Crested Dancers) and warrior cults like the Kouretes (Youths), or other ecstatic rites of catharsis.

The traditions of shamanism and their entheogens, however, derived not only from the indigenous pre-Greek religions of the Goddess, assimilated with the religious rites of the immigrant Indo-Europeans. It was not only in Scythia and Thrace that the Hellenic peoples could have encountered foreign shamans; there was frequent contact with the Persians, in addition to the two great invasions of the Persian king's armies at the beginning of the fifth century. Exiled Greek leaders often sought asylum at Persepolis. The king, moreover, like the Spartans, never traveled without his magi, his shaman-priests. The Persian king Xerxes was entertained by the father of Democritos as he passed through Thrace in his campaign against Greece; and the young "sophist" Democritos, who later expounded the visionary atomic theory, learned astrology and theology from the king's magi. It seems likely that he also learned about their haoma sacrament (soma in the Sanskrit ṚgVeda is haoma in the Persian Avesta). If not, he is unlikely to have missed it as soma when he later mingled with the gymnosophists, "naked sages," the shaman priests of the Indian Brahmans at their monastery in Egypt (Heinrich and Ruck 2001). So, too, did Alexander converse with the gymnosophists on his Indian campaign.

The Indian and Persian rites, moreover, persisted among the early Indo-European immigrants to Mesopotamia and were assimilated by the Semitic and other peoples, passing on into ancient Judaism (Hoffman, Ruck and Staples 2001). By the Hellenistic period, such rites were well established among monastic communities like the Mosaic Therapeutai, in the desert outside of Alexandria, and the Essene brotherhood on the shore of the Dead Sea, which appears to have inspired many features of early Christianity (Ruck, Staples, and Heinrich 2001). Trade routes with the Orient facilitated the mingling of ideas, and the magi were visitors to Greek cities, performing their shamanic rites even in the Athenian marketplace. Moreover, the port cities, like the Piraeus of Athens and Rome's Ostia, had multiethnic populaces, with sanctuaries of their foreign rites. Journeying in the opposite direction, the shaman Apollonios of Tyana, a contemporary of Christ and also declared a god, was actually initiated into the soma rite by the Brahmans in India (Ruck, Staples, and Heinrich 2001). The Christian version of the rite was suppressed by the dominant church or reserved for its elite, but it persisted in various Gnostic sects condemned as heretical, notably in the East as late as the seventeenth century among the followers of Mani, although even in Europe Manichaeism and occult mysteries like alchemy persisted or were repeatedly reintroduced by travelers from the Holy Land.

The prevailing philosophy of the Roman Empire was Stoicism, founded by the Asiatic Zeno. Like Neo-Pythagoreanism, Neo-Platonism, and the other Gnostic Mysteries, Egyptian, Hellenistic, and Christian, this philosophy, too, was based on a visionary experience, and is in fact quite unlike what is usually said of it. The initiate strove to rise to the outer edge of the cosmos and look back down upon the universal perfection in which the individual is destined to play its part, as in the *Somnium Scipionis,* the "Dream of Scipio," which Cicero substituted for Plato's Myth of Er in his version of the *Res Publica.*

The main religious rival to Christianity in the later empire was Mithraism, so similar that with the conversion of Constantine, it was merely a matter of replacing one foreign god with the other. Mithraism assimilated Stoicism and was the way that the Persian haoma sacrament persisted and was spread throughout the empire, probably replacing local, and similarly entheogenic, mystery rites. It admitted only males to its congregations, which met in restrictively small subterranean chambers. The members were taken through seven stages of ascending initiations, patterned on ancient shamanic grades of metempsychosis (transmigration of the soul), beginning with the fiery soul's incarnation as a thirsting raven in the moisture of matter and culminating with its release from the Orphic tomb of the body to

burst out of the confining cavelike chamber and journey to the celestial rim, in imitation of the heroic role of the Solar Charioteer, Phaëthon, the son of the solar Father, whose sacrificial fall, like Christ's Crucifixion, was expected to occasion the final Stoic conflagration and collapse of the whole cosmos inward, only to expand again for an Age of the Second Coming. This highest grade of initiation was achieved by a banquet of Mithras and the Sun upon the flesh of the solar bull, actually a "Eucharistic" bread and an entheogenic potion drunk from a *rhyton,* or bull's horn. This fellowship of Mithraic initiates was the cohesive bond that united the soldiers and bureaucrats that administered the entire empire (Hoffman, Ruck, and Staples 2002).

FAIRIES AND SHAMANISM

The role of fairies in the various European traditions has many shamanistic features, providing support for the existence of a European version of shamanism. Actually the central theme of European folk tradition is the relationship to spirits, such as nature spirits or spirits of the deceased; the central figure in this tradition is the fairy. This relationship to spirits, at least in the oral folk tradition, continued until the beginning of industrialization; moreover literature, particularly medieval literature, developed rich thematic material from the relationship to spirits.

Mircea Eliade defined some characteristics of shamanism as found among the Indo-Europeans: He described shamans as able to rise to the sky, to go to the Underworld to bring back a diseased soul or to escort the dead, to evoke the help of spirits in performing an ecstatic journey, and to master fire (Eliade 1989, 396–400). He also argued that the presence of one or several shamanistic elements is sufficient to prove that shamanism is the main characteristic of a religion. As European shamanism has

not been studied extensively, it is impossible to discuss it in an exclusively European context; one must compare the elements of the European traditions with the elements of other traditions. Thus Bertrand Hell wrote about "a common substratum of the representations" and of "shamanism beyond the diversity of the rituals" (Hell 1999, 24). If we use this broader basis, it is possible to establish that several similarities exist between the fairy lore of Europe and shamanism as a belief system.

To take one example, some characteristics of the election of the future shaman can be seen in the story of Melusine. In shamanism, the spirits designate the future shaman. In *The Chronicle of Melusine* by Jean d'Arras (written down in 1388), whose origin is in folklore, the fairy that the hero meets, elects him, in the sense that she chooses him, and becomes his wife (d'Arras 1979). The spirits appear in the same way to the future shaman saying, "I will be your wife" (Hamayon 1990). A condition accompanies this declaration. If the spouse disobeys, he risks death, which reminds us of similar taboos in legends, in which the hero, for example, must not see his wife on a Saturday, or the legend of Beauty and the Beast, in which she is prohibited from looking at her husband (the Beast). The legends of fairy brides and loving intercourse between mortals and these supernatural beings are plentiful in European folklore. Roberte Hamayon points out that matrimonial alliance between the shaman and a spirit is fundamental to shamanism in Siberia. Moreover she states that the supernatural being adopts a natural form, which is the case of the fairies, who come from the Otherworld in the guise of a human.

Both the harm and the good deeds attributed to fairies are similar to those attributed to the spirits in shamanism. Illnesses are considered to be the result of a meeting with a spirit. This concept is common to all European folklore; for example, in some parts of England it is said that fairies provoke rheumatisms, contusions, and cramps (Briggs 1976, 25). To cure illness, the shaman must travel into the Otherworld and negotiate with the spirits. Auxiliary spirits, which assume an animal form, help the shaman, as the animals that accompany fairies help the fairies. For example, Melusine attracts the hero by sending a doe for him to follow. Deer serve very often in medieval literature as intermediaries between the human natural world and the supernatural world, as they do in the world of Siberian shamanism. In tales and legends, animals help the hero to find his way or to find an object that he needs. The journey of the fairies, who come from the supernatural world, and their transformation can also be seen as the journey of the Double in the supernatural world. It recalls the *fylgia,* the spiritual double of the individual, of the ancient Scandinavians as analyzed by Claude Lecouteux (1992). He described the journey of the hero in the lay as an ecstatic journey of the kind undertaken by shamans, presented in literary form (88).

In shamanism, an illness is often seen as the result of a debt owed to the Otherworld, a debt that has not been paid. Similarly, in European tales and legends, when the fairies are displeased because some obligation has not been met or some taboo has been violated, they give a punishment. Shamanism also involves the employment of appropriate dances and feasts; otherwise the spirits will send disease and misfortune. Similarly, when fairies are not properly honored, they will show their discontent. For example, in the tale of Sleeping Beauty, when one of the fairies is not invited to the baptism of the princess, she causes the princess to prick her finger on the spindle of a spinning wheel and fall into a deep, century-long slumber.

Spirits influenced fertility and fecundity: In hunting societies, shamans dealt with spirits to obtain abundance. In Europe in the nineteenth century, society was still rural, and fairies played the same role: In Scotland they helped the miller to produce a greater quantity of flour, and in France they protected pastureland and helped all sorts of trades, with one sole purpose—promoting abundance (Sébillot 1983). The evidence of this kind of alliance with the fairies is a recurrent one.

Sometimes a fairy will play the role of a shaman rather than of a spirit, curing and prophesying as do shamans. In this way Vivian, the Lady of the Lake, and Morgan le Fay came to play different roles in literature. From fairies, understood as nature spirits, they became enchantresses, perhaps by a psychological process of rationalization, as some specialists have theorized (Aguinario 1993, 19). Such fairies may travel from one world to the other as shamans do, in order to preserve the order of the world.

The recurrence in European folklore, and the literature based on it, of alliance between na-

ture spirits and the human sphere raises the question whether all rural societies are not based on a shamanistic relationship to the world and how this relationship was transformed with urbanization. Today a shamanistic relationship to the world is expressed in New Age experiences and the individual's search for contact with his or her auxiliary spirit. It is not a question of community, except in the case of Findhorn, an experiment begun in the 1950s in Scotland, when a couple grew vegetables, fruits, and plants by asking the spirits for their help (Chryssides 1999). Their farm became a community, the origin of the ecovillage network.

Just as there has been a renewed interest in shamanism in the twentieth and early twenty-first century, so too there has been a renewed interest in fairies, seen in the New Age movement and in movements such as Wicca or Druidry. Both reflect a reaction against modern materialism, taking the form of a quest for a way of life rooted in the past and in environmental concerns.

FINNO-UGRIC SHAMANISM

Finno-Ugric shamanism is a belief system of northern Eurasians, with a foothold both in Europe and in Asia. Elements of Siberian shamanism as well as European folk and mythological motifs, especially European ideas of animism, are found in Finno-Ugric shamanism. One explanation might be that these cultural traits spread along the trade routes of Baltic amber.

The Finno-Ugrians

The Finno-Ugrians, those peoples who speak languages belonging to the family of Uralic languages, are divided into five groups: (1) Ugrians, made up of Hungarians (Magyars), and Ob'-Ugrians, that is, Voguls (Mansi) and Ostyaks (Khanty); (2) Baltic Finns, made up of Finns, Estonians, Karelians (including Olonets and Luds), Ingrians (Izhors), Veps, Vots, and Livonians; (3) Lapps (Sami), of dubious ethnic origin; (4) Finno-Permians, made up of Zyrians (Komi) and Votyaks (Udmurts); (5) Finns living in the territories of the Volga, made up of Cheremis (Mari) and Mordvinians (Moksha and Erzya peoples).

The Hungarians of course for the most part live in Hungary, but Hungarian minorities are found in Romania, Slovakia, Croatia, Austria, and Ukraine, and in other Slav countries in the South. The Voguls are located mostly between the Urals and the lower Ob' (an important river in Siberia); to the east, and also along the central Ob' and its tributaries, is the territory of the Ostyaks. Their capital is Khanty-Mansiysk.

The Finns occupy Finland, with a limited number living in Russia. Small Finnish com-

munities dwell in Siberia, northeast of Omsk and south of the Tuy (a tributary of the Irtysh).

The Estonians reside mainly in Estonia; in Russia some are found near the shores of Lake Peipus. Estonian communities inhabit the same areas of Siberia where the Finns settled and also more to the east, near the middle reaches of the Chulym (a tributary of the Ob').

The Karelians are located in Russia to the east of Finland. Groups of Karelians are found in the lands around Kalinin, where their ancestors moved in the years following the peace of Stolbovo in 1617. Some groups settled to the west and north of Kalinin.

With regard to the Baltic Finns of the southeast, the Ingrians are based along the southeastern shores of the Gulf of Finland, to the east of Estonia, the Veps to the east of Lake Ladoga and toward the southwestern shores of Lake Onega, the Vots to the south of the Ingrians toward Saint Petersburg, and the Livonians in villages on the north coast of the peninsula of Kurland.

The Lapps are situated in the Kola peninsula and the northern regions of Sweden, Norway, and Finland.

The Zyrians inhabit the areas of the Vychegda and its tributaries the Vym' and Sysola, the Mezen' and its tributary the Vashka, and the Pechora and its tributaries the Usa and Izhma (capital: Syktyvkar). The southern Zyrians, or Permyaks, live in the region of the Upper Kama (capital: Kudymkar). The (rare) presence of Zyrians is documented in the vicinity of the confluence of the Tura and Tobol. The Votyaks reside in the areas between the Kama and Vyatka (capital: Izhevsk) and to a lesser extent near Kirov and Perm' and, to the south, in the territories of the Mari, Tatars, and Bashkirs.

The Cheremis inhabit mainly the areas defined by the Volga, Vetluga, and Vyatka; others live with the Bashkirs in the lands between the Belaya and Ufa, others again, in smaller numbers, in the lands of the Tatars and Votyaks. Their capital is Yoshkar-Ola. The Mordvinians are very scattered: most do not live in the districts around their capital Saransk, but elsewhere in the territories of Ul'yanovsk, Nizhniy Novgorod, Saratov, the river Samara, and Orenburg, and in the Chuvash, Bashkir, and Tatar areas; some Mordvinian groups live in Siberia, at great distances from each other. The autonomous western ethnic group of the Moksha is situated along the river Moksha, the eastern group of the Erzya, along the Sura. However, to the east of the Volga the territories of the Moksha and Erzya alternate freely, with no areas reserved for one or the other.

Finno-Ugric Belief System

The rules of organization of the most ancient Uralic society were tightly connected to animistic and totemic concepts applied to the natural habitat, the only source of sustenance. It seems that the word for shaman was already known in the Proto-Finno-Ugric era (Hajdú 1973, 87); the shaman was the medium who, thanks to knowledge acquired by his double, or "free soul," in his extracorporeal journey, maintained humanity in harmony with the mysterious forces of nature and animals, elevated to the level of spirits. Totems, conferring sacral dignity on tribal communities, were conceived mostly in animal forms and were considered as being endowed with qualities superior to those of man. The totem in bird form was particularly frequent and much reproduced in distinctive signs of ownership belonging to individual clans (Hoppál 1978, 390). Belief in the rebirth of all beings subject to decay was common and perhaps influenced by the rebirth of nature in spring. What was reborn was the double (or immortal soul) attributed to every component of earthly reality. By reincarnation a man's soul could transmigrate into a physical reality different from the human one (for example, in the Lappish area the belief became rooted that the soul of a just man would be reincarnated in a bear). Because of the animistic worldview, the boundaries between the material, vegetal, animal, and human worlds and between earth, heaven, and the land of the dead were not seen as absolute. Spirits were believed to live in families of the patriarchal and monogamous kind, just as humans did. According to popular Votyak and Cheremis tradition, trees and lakes could actually be transferred from one place to another, depending on the needs of their respective spirits. The concept of the double gave more room to the belief in metamorphosis, which was modeled on the cyclical changes of nature: To become clear to a human being, the immortal soul had to assume one of the forms of visible reality. The idea of an ambivalent (potentially both beneficent and evil) twofold

reality (visible and invisible) became increasingly more clearly defined; this twofold reality implied a relationship of complementary opposition that is the basis of the coherent flexibility of the whole shamanic system of beliefs. Thus, free from the rigidity of the models of the great religions (Hoppál 1984a, 227) and political ideologies, it managed to adapt itself to these to survive.

The practice of shamanism lasted varying lengths of time among the various Finno-Ugrian peoples; even in the east, however, where it has lasted longest, it is by now limited and localized. The great sacrificial ceremonies are no longer practiced: Among the Cheremis the last ceremony took place in the early 1920s (Bereczki 1977, 238). The characteristics of original Siberian shamanism were especially preserved among the Ob'-Ugrians and Lapps. Various processes of cultural integration and assimilation, occurring particularly among the Hungarians, Finns, and Baltic Finns of the southeast, have not erased memories of common traditions in the distant past. These memories are very clear, for example, in the *Ancient Songs of the Finnish People* (*Suomen Kansan Vanhat Runot*), collected by the Society of Finnish Literature (1908–1948), in the Finnish national epic (*Kalevala*), the Estonian epic (*Kalevipoeg*), or the fables of magic in Hungarian tradition. The sacred eagle, white horse, and miraculous stag as celestial guides in the legends of the origins of the Hungarians are related to Siberian totemism. The heavenly stag (representing Jesus), often with the sun and moon between its antlers, appears in the early legends of the Hungarian saints and with analogous symbology in the texts of the ancient propitiatory songs (*regölés*) of Christmas and New Year. These songs, though contaminated by Christian elements, reveal a shamanic cultural substratum. There are bird spirits; there is an evocation of the ox, into which the double of the *táltos,* a sort of magic priest, was transformed; the ritornello *haj, regülejtem, regülejtem* ([and its variants], in which the recurrence of the ancient root *reg-,* the base of some Hungarian verbs indicating the act of hiding), probably alludes to the trance during which the *táltos* "hid" and his double traveled in the world of the invisible (Diószegi 1958, 414–416). The use of "hiding" behind masks by the *regösök,* the singer of the regölés, was analogous to the practice of covering the face in the shamanic rituals of divination, rituals that occurred on the same days, to obtain greater identification with the dead, who returned to the earth during that period.

Cosmological Concepts

In the cosmological concepts of the Finno-Ugrians, the earth (represented by the Lapps in the form of a sleigh, and by the Ob'-Ugrians as a flat disk surrounded by a chain of mountains, the Urals) was considered to be in the sea, supported by one or more pillars or floating on the back of a gigantic whale or prawn, which caused earthquakes as they moved. Evil was concentrated in specific areas of the cosmos, such as the terrible marine whirlpool, called *kurimus,* and according to Finnish belief situated in the north, in the center of the sea, a meeting place of the conflicting forces of the universe. The cosmos was divided into three layers (one for the gods, one for men, one for the dead), through all of which extended the tree (or column, or mountain) of the world, the *axis mundi* (axis of the world). The three worlds might also be thought of as standing next to one another in a horizontal dimension and crossed by the river of the world.

The sky was a rotating dome held up at the center by the tree of the world, or the tree of life, or by a cosmic column or mountain, at the upper end of which was the Pole Star. The tree, called in Hungarian fables "the tree reaching the sky" (Berze Nagy 1984), was also envisaged with roots submerged in the water of life (Hungarians, Ostyaks, Mordvinians) with the supreme god on top; among the Ugrians he appeared as a griffin with his young, or as an eagle. For the Voguls the cosmic tree, and for the Ostyaks the column or mountain, had seven sections, indicating the various layers of the sky, related by the Ostyaks to destiny. With the exception of the Ob'-Ugrians, the cosmic tree was represented with the sun and moon in its branches, since it was situated in the center of the world, where the sun does not set and the moon always appears full.

In contrast with Tartar and Greco-Roman mythology, the Voguls and Lapps, as well as the Finns and Cheremis, imagined the sun as a female principle, a mother, while for the former the moon was male, a father (Hoppál 1978,

377). The symbolic association of water with the sun has left eloquent traces in the tradition of throwing into the water and retrieving small ritual objects (combs, symbols of solar rays at sunset, or swords, emblems of solar rays at sunrise) to favor the star in its journey of death (sunset) and rebirth (sunrise).

As the Hungarian representation of the archetypal tree as a revolving castle on a duck's foot (a symbol of the hereafter) clearly underlines, the cosmic tree also represented the tree of death. This concept is found, for example, in the archaic Finnish practice of planting a tree near the house on the death of every member of the family. The hereafter was placed more vaguely: It might be thought of as in a celestial area (like the Radien-ájmuo of the Lapps, kingdom of the illustrious dead, forming part of the myth), or in an isolated place (like the luminous Sájva-ájmuo of the Lapps, where dead shamans went), or in the dark, cold north, or under the earth. However, the idea, also conceived by the Indo-European peoples, that the kingdom of the dead was beyond a river, in an imprecise area, was probably already widespread in the Uralic epoch.

Some similarities (especially in the field of sacred flora) between Indo-European and Finno-Ugric beliefs can be explained in the light of the common cultural world of ancient Eurasia, the result of direct or indirect reciprocal prehistoric relationships. Among the first agents of shamanic diffusion in western Europe were the merchants who travelled along the eastern and western Baltic amber routes and peoples like the Celts, Anatolian Phrygians, and Thracians, as well as the Scythians and their descendants the Ossetes.

The Soul

For the Finno-Ugrians the souls of the dead could reach the hereafter by flying like birds, mostly palmipedes (web-footed), along the horizontal line of the Milky Way, called the Way of Birds, or by crossing a river, a lake, or the sea in the form of an aquatic animal (swan, gander, reptile, or fish), or by completing both initiatory journeys. For the Voguls the soul of the deceased, heading for the hereafter in the form of a bird, had to pass through a small hole in a rock where the sky touches the earth; there it broke its wings trying to pass through seven bird nets placed before the entrance, then fell into the water and was transformed into a fish to overcome the obstacle of seven fishing nets, after which it finally arrived in the hereafter (Hoppál 1978, 384–385). Sometimes to reach the hereafter the souls of the dead had to cross dangerous narrow bridges with sharp blades (Hungarians, Baltic Finns), or climb up trackless mountains with the help of their nails and hair (Ob'-Ugrians, Lapps, Finns, and Karelians). Water was linked with the hereafter, as can be seen from the veneration of certain rivers as tribal totems. As a shamanic initiatory vehicle, water was considered a source of grave risks: Supernatural spirits were feared because they ate human flesh. Saliva was also dangerous in its negative power, because it was like water; it was connected by the Mordvinians with the source of illness, since it came from the spit of the Evil One.

The concept of the soul as a force with both physical-intellectual and spiritual functions (mutually nonconflictual prior to Christian influence) was dual-pluralistic: In addition to one or more souls that died on the death of the body, there were "second souls," or "free souls," or "soul-shadows" (attributed to the dead) that survived, including the one subject to reincarnation. The latter ensured the continuity and multiplication of the stock (for the Ob'-Ugrians the soul of a woman entered two or four babies, that of a man three or five).

In Hungarian, words connected with the concept of the multiplicity of the soul have disappeared; there remains as a generic term for the soul, *lélek* (Vogul *lili,* Ostyak *lil,* Komi-Zyrian *lol, lov,* Udmurt *lul,* Finnish *löyly,* Estonian *leil,* Livonian *läul*), which initially meant "soul-breath," destined to die on the death of the body. In the past terms were used such as *elme,* "soul, mind," *jonh,* "soul, the inner, stomach," or the dialect *íz* (*ísz, isz*), "cancer (illness)." The latter probably originally meant "soul-shadow" (similar to the corresponding Vogul *is*), then an illness-bringing evil spirit, and finally the illness itself (Büky 1989, 130–131). The Ob'-Ugrians attributed five souls to males and four to females: the "soul-shadow," which followed the corpse to the tomb, but could return and trap the living; the "soul which goes down (on the river)," which could leave the body temporarily and after definitive detachment from it with the name *urt* (corresponding to Cheremis *ört,*

Zyrian *ort,* and Votyak *urt*) descended toward the mouth of the Ob' heading for the hereafter; the "soul of sleep" or the "bird of sleep," which returned into the body during sleep and after its owner's death continued to live in his clothes (which were hung on a tree); and the soul identified with strength, attributed only to males (Chernetsov 1963, 5–24). The Finns, after they were Christianized by the Swedes, conceived of a single soul (*sielu*), but before that time they believed in the "soul-breath" (called either *löyly* or *henki,* the former subsequently meaning sauna steam, the latter the spirit of the deceased, and then the deceased himself) and in the double, or *haamu,* "form, shadow, spirit of the dead." The Estonians substituted the independent idea of "free soul," attributing to ancient corporeal souls *vaim* ("vital soul," generally) and *hing,* "soul-breath," meaning souls that survive the body, opening the way to the Christian idea of a single soul (in ecclesiastical usage the meaning of spirit was attributed to *vaim* and soul to *hing*). A similar process was seen with reference to the two bodily souls of the Livonians (*jeng* and *gara*), while the Vots completely unified the concepts of soul-breath and free soul, using both terms to mean the undesired spirit of the deceased returning to earth (Paulson 1965, 246–247). The Lapps must also have had a dual-pluralistic concept of the soul; once influenced by Christianity, they distinguished in man the body, the soul, and the spirit. The original soul-breath of the Zyrians (*lol, lov*) and the Votyaks (*lul*), with its accompanying soul-shadow (*ort* and *urt*), were also modified following the imposition of Christian-Orthodox monism. The Mordvinians distinguished the free soul from the soul-breath, but the latter, influenced by Orthodox monism, was also considered as surviving death. The Cheremis, on the other hand, preserved a marked dualism between the free soul and the two bodily souls.

The importance of the head and hair as the seat of the free soul is highlighted in folklore ornaments, in funeral practices reserved for the skull, in reproductions of funeral dummies made of lasting material (Ob'-Ugrians) (Dienes 1980, 93), and in the belief that possession of the skull or scalp of the enemy meant seizing their power. The free soul temporarily left the body when the person was asleep, unconscious, or in a trance, adopting the form of a small animal. If it went to the hereafter, it could not eat the food of the dead or it would become definitively part of their nature. When the free soul entered a baby, on the appearance of the first teeth, the Ob'-Ugrians kept it in a small receptacle to protect it from evil spirits, and for the same reason they gave a false name to a baby, keeping secret the real name, that of the ancestor reincarnated in the baby.

The Finno-Ugrians took precautions to favor the departure of the soul-shadow at the moment of death, and to disorient it and obstruct any return, they made the coffin leave through the back opening of the tent or a hole opened in the wall for the occasion. They feared haunting by the evil force, and they also believed that the "double" of uncorrupted bodies was not able to detach itself from the corpse and reach the hereafter, and then be welcomed into the community intended as a complex of the living and the dead. Therefore, they helped the decomposition of corpses by exposing them to air or humidity. Furthermore, they practiced the ritual of "second burial" to test or assist the decomposition of the corpse, reexhumed before definitive burial. During the ritual they purified the bones to ensure a resurrection; to this end the Mordvinians not only washed the bones, like other peoples, but burned them slightly (Gasparini n.d., 110–111). Feasts were held for the recently deceased so that they did not feel neglected and did not send negative influences on the earth. The cult of the dead and the ancestors (cultural heroes of the clan and its protectors) involved collective autumn or spring feasts and the observance of numerous taboos.

The presence of evil, however, could be exorcised: In its continuous and complementary relationship of twofold reality with the good, it was regarded as an integral part of the whole cosmos, from the upper celestial world to the earth and the hereafter. According to a version of the cosmogonic myths, it was the evil being itself in the form of a "diving bird" that helped the demiurge to create the world. White shamans, although for the most part beneficent, also inevitably had a relationship with evil (their witchcraft, called *rike,* was feared by the Finns). Similarly, evil could be sent by blacksmiths (cf. Estonian *Kalevipoeg*), already respected by the Uralic peoples, who had learnt to work metals from Iranian peoples (Hoppál 1978, 391–392), as well as by initiates and ma-

gicians in close relationship with shamans (Eliade 1956), represented as ancestors by the Ob'-Ugrians. Black shamans (rare, socially excluded, and endowed with hereditary powers), such as the Votyak *vedün,* and the more negative spirits could also be neutralized by those who were helped by the superior forces of good.

Sacrificial Practices

Offers and sacrifices of animals (whose meat was eaten) to the spirits, held on the occasion of regular festivities or calamities, were practiced in sacred places (such as the small clearing, or *lud,* for the Votyaks) or in the so-called sacred groves (such as the *keremet* of the Cheremis), fenced off and tabooed, preferably near a lake or spring, in front of the sacred tree (which the Votyaks stripped of leaves). The Zyrians, Votyaks, Mordvinians, Cheremis, and Lapps separated the sacred places for the cult of good spirits from those associated with evil ones, spirits that caused illnesses. The Hungarians very soon abandoned sacrificial practices: References occur in medieval chronicles to the sacrifice of a white horse in honor of the sun, at which the *táltos* performed the function of sacrificer. The Votyak *tuno* (an elderly person), who performed the tasks of shaman in four or five villages, was helped in directing the ceremonies dedicated to the common ancestor by some assistants (chosen in ecstasy at the appropriate time) in the role of sacrificers (perhaps originally reserved for the tuno). Among the Cheremis there were the *kart* sacrificers who, even if they exercised this mandate all their life, had to be formally designated by the people for each sacrifice, in order to represent the common will, a condition indispensable for being listened to by the gods.

The ancestor cult among the Ob'-Ugrians was practiced in sacred huts, along with the surrounding territory, a collective inviolable asset belonging to a determined group. Whereas domestic idols of wood, leather, or cloth were rather rudimentary, those for the collective cult in wood, stone, or metal were more finished and well clothed. The Ostyaks and Zyrians insulted and beat their domestic idols when their prayers were not fulfilled. The Finno-Ugrians had a similar attitude toward the icons of the saints imposed on them by the Orthodox clergy. The separation of idols worshiped by men from those worshiped by women, particularly evident among the Ostyaks and Lapps, reflected the ancient rivalry between the world of the hunt and that of the home, also confirmed by the Lapp practice of reserving the back entrance of the tent for rituals connected with hunting, practiced exclusively by men.

The Finno-Ugrians made offerings to rivers and lakes, resorting to the regenerative and purifying force of water in most of their rituals, although mention has been made of occasions when water or saliva could be dangerous. The bathroom was a sacred and tabooed place: Here childbirth occurred, the dead and ancestors were commemorated, illnesses cured, and sacred beer produced. Furthermore it was believed that immersion in water caused healing and water could not be entered by evil people. Saliva also had healing properties: Cheremis magicians practiced a ritual of benediction, accompanied by the relevant magic formula, appropriately called sputum (*šüvedeme*).

Sacrificial blood, red like the color of regeneration, a taboo for women, connected with the magic properties of water, fire, and the sun, was used to bathe idols, sacred rocks (on which wheels, symbols of the sun, were drawn) and the ground (Mordvinians). It was thrown directly on the fire in honor of the sun, or fire itself (Estonians, Livonians, Finns). It was necessary to offer the blood of specific animals to the sun and the gods: The Votyaks dedicated a white bull's blood to Inmar, a celestial god in their pantheon; the Lapps offered the blood of a white reindeer to the sun. In archaic Hungarian tradition blood was used to seal pacts.

In the celebration of certain festivals it was a frequent ritual practice (of which traces still remain) to use twigs, in connection with goddesses as protectors of vegetation, life, and fertility. Erzya Mordvinian girls held birch twigs in their spring visits in honor of their maternal goddess Ańǵe-pat'aj. The title *Nyírfa Kisasszony* (Miss Birch), for the propitiatory bunch of birch twigs given to Hungarian children in some localities on Saint Nicholas' Day (6 December) was probably connected with this goddess (Barna 1879, 70). The Lapps believed that beating with birch twigs caused the deceased's resurrection before his or her double reached the hereafter.

Fire (a female spirit), associated with the symbology of the sun and the vegetal world,

was venerated and used as a powerful remedy against evil. From this was derived the practice of warding off evil by ritual leaps over bonfires or circling the fire in the purification rituals of hunters or in propitiatory rituals for a new bride. For the Ob'-Ugrians, fire incorporated the soul of the tribal ancestor, and its crackling was interpreted as the language of the dead.

In the ceremonies dedicated to the dead, officiators wore clothes inside out, because things in the world of the dead were imagined as the reverse of things in the world of the living. The tree was considered a communicating bridge with the hereafter, as can be clearly observed in the Karelian practice of hanging offerings for the dead on commemorative trees in cemeteries.

Among the animals revered as ancestors the bear was particularly predominant, being divine or semidivine in origin, called by periphrases and nicknames because it was too powerful to be called by name. The generative relationship between bears and human beings is confirmed in traditions like that of the Koltta Lapps, who believed they were descended from the union of a girl and a bear, and also in various women's taboos related to the meat of the bear. Another especially significant family ancestor was the domestic snake (connected with regeneration through the sloughing of its skin) or the water snake, on which the destiny of the head of the family depended, according to Finnish belief.

Supernatural Spirits

The mythical scenario from which the shamanic system of beliefs was derived was characterized by a rich pantheon, a hierarchy ranging from countless nature spirits to superior divinities and the chief god, the so-called Sky God (Finnish: Jumala, Estonian: Jumal, Cheremis: Jumo, Mordvinian: Jumi[ši-paz], corresponding to Vogul: Numi-Tōrem [Superior/High-God/Sky], Ostyak: Num-Tūrem), a probable divinization of the soul of the heavenly vault, not nameable in invocations. To the lower space occupied by the air was attributed another celestial god (the Finnish Ilma[rinen], Estonian: Ilm, Votyak: In[mar], Zyrian: Jen, Livonian: Ilma).

There was a very ancient cult, which lasted a long time in the Zyrian and Ob'-Ugrian area, of the mythical Golden Woman, or Sun Woman, or Dawn Goddess, personification of the sun at its rising. The Voguls, who represented her accompanied by children, called her Kalteś or Sorńi-Kalteś (Gold Kalteś) and considered her the daughter (or wife or sister) of the Sky God. One of the seven sons of the latter was Mir-susne-χum (World-Surveyor-Man), who, on his father's order, had planted the cosmic tree. When the cold arrived, as Gander-Prince, a swan or crane, he guided the dead in bird form in their migration along the Milky Way toward the south (Róheim 1966, 18). Survivals of similar myths include the Erzya Mordvinian swan sent by Nišk'e-paz (firstborn of the Creator) on the earth to watch over the life of men, or the Magyar myth of the fairy Ilona who flew along the Milky Way transformed into a swan or crane. The swan's importance (as a matriarchal ancestor) has also left signs in material culture (the Ob'-Ugrian swan-shaped harp, the wheel associated with the swan, a sun symbol, decorating the greaves of Hungarian warriors, and others).

Vogul mythology clearly exemplifies the characteristics of the ancient Finno-Ugrian system of gods. The complementary opposition of Sky God (male, positive, above) and Mother Earth (Mā-āŋkuw) (female, positive, below) is well expressed in the tradition in which the phratry (a grouping of clans within a tribe) of *moś-χum* (*moś*-man), heavenly people, ate raw meat and sacrificed white horses to the Sky God, while the phratry of *por-χum* (*por*-man), earth people (practising witchcraft in alliance with evil Underworld spirits) ate cooked meat and sacrificed black or brown horses to Mother Earth. The divine trinity corresponding to three cosmic levels was completed with the figure of Xul'-ōter, Lord of the Underworld (male, negative, below) (Hoppál 1978, 380, 385).

The gods mainly honored by the Finno-Ugrians were those connected with nature and its phenomena and the fundamental moments of human life, such as Bieggolmai, the Lapp wind god, Tapio, the Finnish forest god, Peko, fertility god of the southeast Estonian Setu, and Sárakka, the Lapp goddess assisting in childbirth, who gave the baby his or her ancestor's soul. Gods like the Mordvinian Šajtan, Zyrian Kul', god of water and death, or the Lapp god Rota, Lord of Rota-ájmuo, kingdom of the souls of evildoers, were considered exclusively evil.

The supernatural spirits guarding the home and related buildings were very important and often coincided with spirits of the ancestors (in archaic thought new buildings required human sacrifices), and the hearth, or "sacred corner" (Finns and Karelians), was dedicated to them.

Fantastic natural beings, manifestations of the spirits of the dead, were considered superhuman entities influencing man. These included bird-spirits of the dead; dwarfs (like the Finnish one who felled the mythical Great Oak [Iso Tammi], which had grown so high as to obscure sun and moon), and the giants; the Lapp elves connected with the cult of the *seite* stones placed on sacred mountains or the *sâjva* (originally sacred "lake," then sacred place), among whom were the auxiliary spirits of the shamans or the shamans' spirits themselves and the guardian spirits of humanity; Baltic Finnic wood spirits with hair, beard, or clothes green in color (like vegetation), symbol of death and rebirth. At times wood spirits made fun of earthlings, trying to mislead pedestrians.

Certain spirits underwent a demonization process: For example, among the Lapps the *Ulda,* masters of magic, composers of sacred songs, and helpers of stronger shamans, were depicted as kidnappers of babies in their cradles, and the giants *Stallo,* healers like their wives, were considered evil shamans, killers and devourers of children and adults.

The Shaman

Although there were some female shamans among the Finno-Ugrians, most of the ethnological literature refers to these shamans as male. Hence, in what follows the male pronoun is used. Shamanhood was reached by heredity or vocation (a gift of the supernatural spirits). Birth with the "shirt" (amniotic membrane), one tooth (like the Hungarian táltos), or extra teeth or bones was an indication of predestination. A refusal of the spirits' "call" caused misfortune (madness, mutilation, death) for the chosen one and his relatives. Signs of initiation (which was generally achieved in childhood) were visions, convulsions, mental confusion, and long sleep, usually followed by illness or retreat from the world. The candidate's double had to face struggles against other shamans or other painful trials while climbing a tree (ladder), a projection of the archetypal tree, or crossing water, a projection of the river of the world, where the double could be swallowed by monsters. In these trials the candidate's ritual death was enacted (involving quartering and reduction to a skeleton so as to verify the possible presence of the physical attributes of predestination). The candidate met spirits (making him very hot) in a timeless mythical dimension and from them learned the origins of phenomena and nature's secrets, including the language of animals. The candidate's rebirth was imagined as happening through the bones of the skeleton (reproduced in the so-called X-ray motif in the popular decorative art of peoples like the Ostyaks and Lapps, especially on ritual drums). For the Votyaks the future tuno, who at night managed to jump and dance on the strings of a zither on the banks of a great river before the supreme god Inmar, would have had the latter as a spirit guide.

The power of shamans was not uniform, but depended on their gifts and those of their spirit guides or spirit helpers (often in animal form) and on how many spirits aided them. The representations of spirit helpers, frequent on the drums of Lapp shamans, had already appeared in ancient Finnish rock paintings (Siikala 1992a, 65).

The difficult trials of resistance to pain during initiation could discourage the badly motivated shaman candidate or even cause his death, while arousing in the neophyte who succeeded in overcoming them a loyal engagement toward his own community, which he had to maintain in his behavior, constantly judged by the group. When, during séances, the shaman, in ceremonial costume and accoutred with liturgical accessories, went into trance, he faced a similar experience to that of the initiation. The shaman helped his ecstatic "doubling" by drinking eau-de-vie, chewing benzoin resin, taking small quantities of the mushroom *amanita muscaria,* or fly agaric (drinking milk was an antidote), or dancing and beating the drum. The Lapp shaman facilitated his own trance by hammering a bronze serpent and frog on an anvil (Corradi Musi 1997, 60–61), linking up with the celestial myths of the blacksmith, the active principle of creation and transformation.

Evidence is preserved of the drum's importance as one of the shaman's basic elements of ceremonial equipment. Made from the wood of

the sacred tree and often painted with cosmological and totemic symbols and arrayed with pendants (metal figures representing spirits, little rattles, arrows, bows, and knives), it functioned as a vehicle in ultraterrestrial journeys, that is as a "boat," or "horse," as in the Siberian area. In Hungarian fables it was called "horse táltos." The drumstick was an important magic element, considered by the Lapps a receptacle of the souls of dead shamans. The shaman's instruments also included the magic wand, arrows with bells attached, a hatchet, and special sticks.

Historical and social reasons and the secrecy of the rituals have obstructed the preservation of documents (including photographic reproductions) concerning the distinctive attributes of shamanic costume: the feathers or horns of the headdresses (symbolizing the zoomorphic beings into which the shaman's double was transformed), the ribbons or fringes (reproducing the feathers of totemic birds), and metallic pendants (in which the spirit helpers resided). Among the Ob'-Ugrians masking with zoomorphic headdresses and ornithomorphic plumage (which lasted a long time in anthropomorphic pantomime masks with zoomorphic attributes) was used in ancient times, probably in dances or ritual pantomimes. In travelers' accounts and ancient folk songs, faint records are preserved of the decoration of the clothing and headdress with zoomorphic elements among Lapp shamans. When the Lapp shaman went to the gods in the sky, he adopted the appearance of a bear (the mythical ancestor shaman) to increase his strength. It was his custom on certain occasions to cover his face with a handkerchief, both to concentrate and to better identify with the invisible spirits, making himself part of a different dimension. Finnish and Karelian shamans enhanced their dignity by wearing belts, which could be ornamental, increasing their symbolic magic power. Finno-Ugric shamans, especially Ob'-Ugrian, kept away (during ceremonies) from metal objects, to which spirits were averse. The magic power of metal pendants (of which rare samples remain) was believed to be controled by spirit helpers. Shamans also turned their clothes inside out if necessary.

The shaman was a professional capable of keeping alive the tradition (Hoppál 1984a, 227) allowing him contact with the spirits, "a social functionary" (Hultkrantz 1989, 46) who acted for the good of the group and its individuals through trance and enlightenment provoked by the arrival of the auxiliary spirits (Hultkrantz 1978, 42). Fundamentally, he was "wise," as shown by the Finnish *tietäjä* (sage), the term used in popular tradition instead of *noita,* "shaman." He functioned as diviner, psychopomp (a person who guides spirits or souls to the Otherworld), and healer of illnesses caused by loss or theft of the sick man's soul or by a change in his state due to insertion of an evil spirit into his body (the Lapp shaman, the *noaide,* also liberated people pursued by spirits). The breaking of a taboo was considered a cause of vendetta by spirits.

If it was not enough to recall the soul or offer prayers designed to ward off evil to domestic idols or to resort to appropriate exorcism, healing by the shaman required trance. Shamans often predicted the future by staring at water or eau-de-vie. The Lapps had professionals specializing in each of these functions. Shamans also had ritual struggles (in animal form) with shamans from neighboring communities to influence crops and the weather; they also celebrated sacrifices and prayed at annual feasts of thanksgiving for powerful spirits. In sacrificial rites Vogul shamans hung victims on a personal sacred tree, a copy of the cosmic tree: Climbing on the tree they delivered them to Mir-susne-χum, who carried them to heaven. At times the Lapp shaman, to decide on the appropriate sacrifice to the gods, made a bronze frog jump on the images of animals on the drum. An animal of the same kind as the one on which the frog landed was sacrificed.

Despite their common shamanic beliefs, not only each ethnic entity but also each group within it tended to practice its own distinctive rituals, thus allowing each group to preserve the characteristics of its cultural identity. Thus it is possible to learn much about the distinctive cultural identity of each group through research on the unique symbols and features of its ritual.

In the Finno-Ugric field, apart from the shaman, there were other people endowed with supernatural power (such as the sage [*tudós*], or magician [*garabonciás*], or the one who sees the dead [*halottlátó*] of the Hungarians), but they were considered inferior to the shaman, mainly because they could not establish, as he could, direct contact with the spirits and the gods.

NEO-SHAMANISM IN GERMANY

Neo-Shamanic trends and activities have become an important part of the esoteric and New Age scene in German-speaking countries. Workshop participants are taught shamanic techniques enabling them to go on "shamanic journeys" for themselves, for the purpose of self-exploration, self-help, and self-healing. Such a journey involves entering altered states of consciousness willingly and in a controlled way in order to communicate with other "beings" in nonordinary reality. Additionally, there are practitioners whose purpose is to go on a journey for others, that is, to work with clients and patients. Here, shamanic practitioners fulfill a function similar to that of counselors, spiritual healers, and other practitioners of alternative methods of healing. The aims of shamanic practices are to aid the healing process in cases of physical disease, to encourage personal development, to uncover hidden potential, to provide counseling on important issues in life, and to develop concepts about leading a good life.

The meaning of the term *shamanism* in this popular context is broad, and the term is not clearly defined. Still, two main directions can be identified: Core Shamanism and what may be called ethno-shamanic approaches.

Core Shamanism

In 1982 there was a conference on "Shamanism and Healing" in Alpach, Austria, the first international conference in Europe on this field. At this conference Michael Harner, founder of the Foundation for Shamanic Studies (FSS), met the Austrian journalist Paul Uccusic. After this conference, Paul Uccusic became a student of Michael Harner's and later founded the first European section of FSS. His book *Der Schamane in uns* (The shaman within us) (Uccusic 1991) made Core Shamanism known to many interested readers in German-speaking countries. Furthermore, Paul Uccusic and his collaborators regularly offer workshops in Germany and other European countries. Galina Lindquist (1997) and Merete Demant Jakobsen (1999) have provided detailed information on introductory courses and shamanic journeys following the method of Core Shamanism. For many neoshamans in Germany, these courses represented a gateway to their practice. Some participants in these workshops meet afterwards in so-called shamanic drumming circles to practice and to perform healing sessions. These drumming circles are often led by experi-

enced neoshamans. There are no reliable data available as to the number of shamanic practitioners and drumming circles, since many cases remain unreported. At the moment it can be assumed that there are about 50 to 100 drumming circles and at least a similar number of shamanic healers.

Ethno-Shamanic Approaches

Those who follow what are known as ethnoshamanic approaches dislike the label *Neo-Shamanism.* In their view this label has a negative connotation and stands for a lack of authenticity and depth (such a view is also common among contemporary practitioners of traditional shamanism). Nevertheless, since there is no clear demarcation line between authentic and inauthentic shamanism, ethnoshamanic approaches have to be seen as part of Neo-Shamanism (broadly understood). In contrast to Core Shamanism, which offers, according to its own Web site, "the near universal methods of shamanism without a specific cultural perspective" (Foundation for Shamanic Studies www, 2002), ethno-shamanic workshops emphasize the authentic, culturally bound background of experts. Native shamans transmit their individual experiences to a Western audience. Alternatively, initiated Westerners who have undergone a long period of training with indigenous peoples communicate the knowledge they have acquired. Both native shamans and representatives of the Foundation for Shamanic Studies disapprove of some of the neoshamanic offerings. The main complaint is that such events represent cultural exploitation.

The Institut für Ethnomedizin (Institute for Ethno-medicine) (ETHNOMED) and the Arbeitsgemeinschaft Ethnomedizin (Ethno-medicine Union) (AGEM) attempt to treat foreign cultures and native shamans with respect. These two closely collaborating organizations are interested in examining and appreciating ethno-medical approaches to healing, with regard to how they function, to their effectiveness and transferability. Their aims are, on the one hand, to expand the scope of healing methods in Western culture and, on the other hand, to strengthen and preserve these methods in their countries of origin, where they are threatened by the influence of Western medicine. The position native shamans hold in their own countries becomes strengthened by the attention they receive in Western industrialized countries. Whereas AGEM emphasizes theoretical and scientific approaches, ETHNOMED emphasizes practical applications by offering workshops and seminars.

European Origins

Although most interested central Europeans first approached shamanism in the context of Siberian and North American cultures, many people understand the new flourishing of shamanism in Europe as a reimportation. They believe this "new" shamanism to be a rediscovery of old knowledge deeply embedded in their own European culture. Accordingly, evidence is sought in archaeology, mythology, and folklore. Neo-Shamanic authors use archaeological findings (e.g., cave paintings in southern France and northern Spain) and an understanding of shamanism as a "religion of the stone age" to confirm the hypothesis that shamanic practices constitute a universal cultural feature. Historian Tom Cowan presented Celtic religion as a kind of "primal form" of shamanism and stated that there are "striking parallels between the patterns of Celtic tribal life and that of Native Americans" (Cowan 1993, 6). According to him, these can be found in the way they lived together, their religious beliefs, practices and their "earth-centered spirituality." Others have found evidence of shamanism around the Mediterranean, above all in Greek mythology. Reports on the cults of Dionysus and the Eleusinian mysteries have pointed to structural similarities to the shamanic matrix (e.g., ecstasy, experiences of dissolving and dismemberment, the controlled induction of altered states of consciousness in order to connect with nonordinary reality). These claims have been harshly refuted by anthropologists and archaeologists (Francfort and Hamayon 2001).

Other Uses of Shamanism

In Germany further approaches can be found, either focusing on certain persons or as specific forms of shamanism. Huna shamanism (based on Hawaiian traditional practices), for example, has a special position among neoshamanic trends. It offers practical advice on how to cope with life and uses magical approaches and div-

ination techniques. American psychologist Serge King created a popularized version of this magic system for the esoteric and New Age scene and placed it in a shamanic context (King 1990). To do this, however, he needed his own definition of shamanism—one that excluded the shamanic journey. In adapting the notion of shamanism, King related it to recent methods of psychological training and aimed to develop strategies for coping with personal and job-related problems. Whether the term *shamanism* is justified here is beyond the scope of this article.

The Huna system also illustrates that the area known as shamanism has widened considerably. The terms *shaman* and *shamanism* have appeared in the most unexpected contexts. There are outsiders and members of cultural minorities for whom a "shaman" represents someone who "really" knows what's going on, who confronts society with uncomfortable truths. In youth culture, the charismatic disc jockey, a "master of trance," is described as a shaman who, by the use of sounds and rhythms, exerts control over the induction of altered states of consciousness.

The Attraction of Shamanism

Since the beginning of the 1980s there has been a considerable increase in scientific research and general literature on shamanism and Neo-Shamanism, a development that has its roots mainly in the counterculture of the 1960s. The hippie movement was directed toward territories at the furthest possible remove from ordinary life: Trips into psychedelic states of consciousness as well as to exotic countries served the longing for an alternative lifestyle. India, for example, offered spiritual alternatives to established religious practices. Similarly, the indigenous population of Central and Latin America had established an easy and everyday way of dealing with altered states of consciousness induced by psychotropic substances. In the more recent interest in shamanism, Carlos Castaneda's books play an important role. A German version of *The Teachings of Don Juan: A Yaqui Way of Knowledge* was published in 1972. But only with the powerful growth of the esoteric and the New Age scene, which in the 1980s started to extend beyond the counterculture, were conditions created that allowed for the rise of a neoshamanic "scene" in Germany.

The current interest in shamanism in German-speaking countries can mainly be attributed to three factors: (a) a fascination with indigenous cultures and a longing for a simple life close to nature; (b) a return to a magical way of thinking as a form of criticizing contemporary culture and its materialistic orientation; (c) the efficiency of shamanic techniques. For many people shamanism means a life embedded in intense, primal, and powerful rituals, which stand in stark contrast to the customs of a civilization that cherishes security and comfort.

Clearly the adherence to an animistic worldview and magical thinking implies a criticism of enlightenment as propagated by modern science. Science is steadily demystifying the world, and this has led to a call for a re-enchantment of the world, because, despite increasing scientific knowledge, people have not become any more liberated from their spiritual fears and ills.

A further reason for the recent popularity of shamanic techniques is that they are easy to learn, while being at the same time highly efficient and flexible. Whereas most spiritual paths require a long time of disciplined practice before one can gain an intense and significant expansion of consciousness, inexperienced people can gain this experience even in their first shamanic weekend workshop. This efficiency also serves the needs of our culture, which is geared toward instant success, with ever more exciting events being sought. The flexibility of shamanism arises from its not being a religion but rather a set of techniques that can be adapted to various cultural and spiritual settings.

The easy access to modern Western shamanism notwithstanding, leading teachers—such as Jonathan Horwitz from the Scandinavian Center for Shamanic Studies (Copenhagen)—claim that the shamanic path is as difficult and enduring as other spiritual techniques, since the shaman is an apprentice to the Spirits.

Shamanic Elements in Psychotherapy and Complementary Medicine

Whether consciously or unconsciously, shamanic elements have been incorporated into several new psychotherapeutic approaches. In the esoteric milieu that has influenced recent psy-

chotherapeutic approaches, these elements appear in various forms and in different contexts, and they are used in a rather eclectic way. No systematic research has so far been done in this field. Hence, only a few hints can be given here. Transpersonal psychotherapy offers a variety of techniques: trance induction through holotropic breathwork, imagery, symbolism, and ritual work. But structural similarities to shamanic methods can be found also in psychodrama, dance therapy, and music therapy, and in the Bert Hellinger approach for systemic solutions with families.

A considerable percentage of participants in shamanic workshops come from the healing professions (Mayer 2003). The range covers psychotherapists, medical doctors, health practitioners, and nurses, most of them dissatisfied with traditional Western medicine. They criticize the way human beings are seen, the underlying concept of illness, and also the claim to be in possession of the only valid approach to healing. In their opinion, shamanic practices should become part of complementary medicine, aiming to heal on a different level and to accelerate the healing process. In the present health system this can happen only more or less covertly, since these methods are not acknowledged, and are even massively rejected, by the scientific mainstream.

The Worldview of Shamanic Practitioners

Shamanism cannot be reduced to the acquisition of certain techniques. Many practitioners see it as a spiritual path characterized by a specific relationship to nature, which scholarly analysis traces back to nineteenth-century nature philosophy (von Stuckrad 2002, 2003). In-depth interviews with shamanic practitioners for a study on Neo-Shamanism in Germany showed, however, that there was no strong affiliation to an ideology represented by either a guru or a certain school (Mayer 2003). This may be due to the individualistic and experiential approach of Neo-Shamanism. All practitioners interviewed spoke of having a strong relationship to the earth and a commitment to shamanism, and of rejecting "guruism." They also shared many experiences corresponding to the shamanic matrix. These experiences were, however, accompanied by individual forms of experience that led to personal methods and interpretations. This combination illustrates that even in Neo-Shamanism or Core Shamanism individuals report authentic and deep personal experiences. Furthermore, it illustrates that in modern culture a practical approach to reality can exist together with, and easily fit into, an animistic view of the world. The participants' communication with "beings" in nonordinary reality seems very easy and does not lead to any problems of adjustment. Experiences that can be seen as paranormal and that would sound like fantasies to people outside this field can in most cases readily be integrated into everyday life. So can altered states of mind.

Obviously, there is no specifically German neoshamanic scene. Influences from other cultures are strong, as is the exchange between different cultures. There are also controversies on an intracultural as well as an intercultural level, mostly with respect to the question as to which form of shamanism represents a more authentic or adequate shamanism. Reproaching neoshamanic practitioners with practicing "plastic shamanism" seems unjustified, as does the reproach of postcolonial exploitation. Both phenomena certainly exist, but they may be undesired, and unavoidable, marginal effects of approaches that on the whole may be called trustworthy and fertile. Shamanism has once again proved its ability to adapt to various religious systems and cultural contexts.

NORDIC SHAMANISM

Within the area of the present-day states of Denmark, Norway, Sweden, and Finland, shamanism was a living tradition until the seventeenth century, at which time the Reformation and the establishing of Evangelist-Lutheran churches led to an attempt to eradicate the earlier Catholic as well as ethnoreligious cultural elements from the social life of village communities.

At the heart of northern shamanism—as of shamanism generally—was the assumption, or rather the experience, of the reality of spirits and souls "beyond" both the natural, material world and the human, social world. *Shaman* (in Saami, *noai'de;* in Finnish, *noita;* in Inuit, *angākoq,* plural *angākut*) was the name given to the specialist in souls, whose domain of expertise comprised both parts of the natural world: the visible and the invisible. In the Eurasian north, from Greenland to the Bering Straits, the shaman was a person who possessed the necessary technical competence, traditional knowledge, and psychic tendency to enter into an ecstatic trance and to establish contact with the spirit world posited by the particular religious system. By falling into a trance and separating the soul from the corporeal body, the shaman of the northern peoples cured the sick, escorted the souls of the dead to the Underworld, foretold the future, and transcended time and space, as well as the boundaries between the living and the nonliving, in order to find something lost or to assist hunters in tracking down and killing their quarry. The shamanistic ritual enacted by the community was in principle a means of control over life, whereby a passage was kept open between the visible and the invisible reality. This passage was needed in order to find answers to economic problems and questions of justice, and above all in order to heal the sick (see, e.g., Siikala 2002).

Among the northern peoples, the dominant explanation of illness was that it was the result of the loss of the soul, with both spiritual and somatic symptoms. The shaman's objective was to restore the soul to the individual, and at the same time revitalize the life powers that form the foundation of spiritual and physical integrity. The conception of illness as the loss of one's soul entailed the belief that the soul had been stolen by the spirits of the dead. To recover it, the shaman had to undertake a spiritual journey to the other side. Belief in this form of soul loss was prevalent among the Saami of Norway, Sweden, and Finland. Among the Greenland Inuit, shamanistic diagnosis generally involved the violation of a taboo. In such a case, the shaman had to undertake a spiritual journey, for instance to the bottom of the sea, to appease the female Spirit of the Sea. (Siikala 1978; Merkur 1985).

The Saami Shaman Drum and the Shamanistic World View

In northern shamanic practice, the most characteristic tool of the ecstatic trance technique was the drum, by means of which the shaman entered into a trance and gained access to spirit helpers, who took animal form. It was only with

the support and help of these spirits that the shaman was able to penetrate or attack the territory of those powers that, according to the local mythology, threaten the individual or the community, in the form of disease or other misfortune. The drum, whose surface membrane was divided into three parts corresponding to the shamanistic cosmology, was generally described as a means of transport, for instance a horse or a boat. The rhythmic drumming created a form of "sound bridge" that allowed the shaman's soul to transcend the boundary separating the levels of the universe. Drumming, dancing, spells, singing, voices, costume, rattles, and pendants of bone or metal were part of the shamanistic trance technique, by means of which the shaman moved at the level of the spirit between the human world and that of nature (cf. Rydving 1991; Siikala 2002).

The drum of the shamanistic ritual can be compared to the altar in sacrificial religions. As an instrument of metamorphosis it formed a center of symbolic communication, offering a means of both visual and aural expression for the transmission and reception of messages. But the drum was not used merely to summon spirit helpers; it also functioned on the shaman's spiritual journey as the animal helper's body, to which the shaman's soul attached itself.

In various cultures the fabrication of the drum was a carefully regulated ritual procedure. For instance the wooden frame of the drum had to be made from a particular species of wood and from a tree growing in a particular location. The various components of the edges and handle of the drum frame were called by the names for the parts of the living body: The drum had "ears," "lungs," and an "artery." The shaman's function required certain spiritual equipment, which allowed the shaman to enter into the natural world. This equipment was based in part on the novice's psychic constitution, in part on a tradition that had been handed down through the process and act of initiation. The initiation of a shaman followed to a great extent the pattern typical of spiritual metamorphosis: the response to a call, withdrawal into solitude, submission as a pupil to a master, and metaphorical death and rebirth. To become a shaman, the neophyte followed a path of visions, dreams, or illness. Through these processes, the novice's cultural knowledge and physical, motor behavior took on new forms; the mythology that underlay community membership, its systems of ritual activity, and the mythical helpers were activated as the foundation of the shaman's thinking and way of processing information (Anttonen 1994; Siikala 2002).

The other world, however, did not open itself up merely because the shaman beat the membrane of the drum and read its figures as a map to the Underworld. Shamanism also involved the way in which the local community read the natural environment—the forest and the northern wilderness—and endowed it with significance. Salient natural features and locations were perceived as boundaries, edges, crossroads, openings, and fissures, as places where a channel from this world to the other one could be opened up (Anttonen 1994). In the Saami tradition, the clear fell lakes, with no outflow rivers, were perceived as double-bottomed *saivo* lakes, linked by a "breath hole" (the same word denotes both "breath" and "spirit"). For the Saami shaman, the noai'de, this opening offered a way into the Underworld, the world of the dead—the *jabme,* or *saivoaimo* (Rydving 1990). In Inuit shamanism, the boundary might be located, for instance, at the line between the ice and the open water.

The Northern Shamanistic Tradition in Finland

The roots of Finnish shamanism can be found in the word *noita* (Modern Finnish "witch," "wizard"). The word can be traced back to the original Uralic name for practitioners of an ecstatic trance technique. In Finnish the word is linked to the oldest religious stratum of the prehistoric hunting culture, characterized by its use of Comb Ceramic pottery, in a subarctic taiga environment. The cognates of noita in certain other Finno-Ugric and Uralic languages are the Saami noai'de and the Ob-Ugrian Mans *näjt.* It was originally the name given to a holy man, honored by the community. This was not the same noita who from the Christian Middle Ages onward was persecuted as an enemy of the Son of God and as the embodiment of evil, and of whom illustrations were painted on the ceilings and arched vaults of medieval churches as a warning to the people. Material evidence of the tradition of the noita as a shamanistic figure who goes into a trance to heal illness can be

seen in the horned human figures and stags painted on sunlit rock faces, as for instance at Astuvansalmi near the town of Ristiina in Eastern Finland. These rock paintings date back to a period extending from the Late Comb Ceramic period into the Bronze Age (3200–1700/1500 B.C.E.). The direct material evidence available in the form of artifacts, however, dates back only to the seventeenth century; it is from this time that Saami shaman drums have been found in graves, along with the remains of decorations and amulets made from bears' teeth (see Haavio 1967; Siikala 2002).

Information about the noita institution in Finland, however, is conveyed above all by the oral folk tradition. Shamanistic traits emerge from the traditional epic poems of the Kalevala cycle, above all narratives of origins and heroic legends from the Viking era, with their mythical themes emphasizing the importance of other world. Väinämöinen, the central figure in Finnish-Karelian folk poetry, was a *tietäjä,* a "man of knowledge"; similar to the figure of Odin in Scandinavian mythology, Väinämöinen was linked to the motif of a visit to Tuonela, the world of the dead. Where Odin took the form of a snake to creep into a rock to drink mead, the mythical culture hero Väinämöinen set out to the dark Pohjola to acquire the necessary magic words in order to complete the building of his boat. A distinctive shamanistic feature was the account in the poem *The Visit to Tuonela,* describing how Väinämöinen took the form of a lizard or worm and swam across the river of Tuonela to the world of the living. A lizard, worm, or snake were among the common forms a shaman was thought to assume (Anttonen 2000b; Siikala 2002).

The ancient Finnish folk poetry *(Suomen Kansan Vanhat Runot)* was recorded in the nineteenth century in the White Sea Karelia by the collectors of the Finnish Literature Society. It was on these narratives that the Finnish national epic, the *Kalevala,* was based; the first version, the *Old Kalevala,* was published in 1835, and the *New Kalevala* was published in 1849. The main mythical actor was the hero Ilmarinen, who created the Sampo. Ilmarinen was depicted as a blacksmith who forged the mysterious artifact in the mythical Pohjola, that is, in the land of the departed. Kalevala-enthusiasts and academic scholars alike have offered answers to the riddle of the Sampo, seeking its meaning as an abstract concept or concrete object from historical and mythological contexts believed to be described in the songs. The Sampo has been interpreted as a human-made replica of the mythical world pillar, represented in a sacrificial context in a community cult. This supposition was based on the evidence of shamanistic practices not only among the peoples of northern Eurasia, but also among the ancient Germanic and Saami tribes. According to the established scholarly view, prehistoric peoples needed the symbolic representation of the mythical world pillar, supporting the heavens by the north Star. The idea of a ritual pillar was based on the shamanistic tree of the northern peoples taking the form of a passageway linking heaven and earth. This idea was inherited by the pre-Finnish agriculturalists (see Anttonen 2000b; Siikala 2002).

The idea of inheritance was also related to the Väinämöinen's mythical instrument called the *kannel,* interpreted as a Finnish-Karelian version of the drum of the shamanistic hunting culture. Väinämöinen, in addition to his role as a creator god, was also the first singer of spells and maker of hymns, creating a foundation for the institution of the man of knowledge. In Finland, these wise men raised and strengthened their powers by drinking water or spume from the foaming waterfall, or by standing naked on a rock during a thunderstorm and pouring the rainwater caught in holes in the rock over their heads (Harva 1948).

The Old-Norse Seiðr Cult

In the Nordic ethnographic literature on shamanism, it is reported that places that shamans employed to exit and re-enter the world of ordinary reality were holes and openings in the ground, caves, and fissures between rocks, that is, places that had been marked off and set apart as sacred (Anttonen 1994). It was the shaman's task to address the powers in terms of which socioeconomic values and the physical and mental integrity of an individual community member were conceived. In traditional Norwegian Saami culture, there was a semantic category of the *seiðr,* denoting both natural rock or stone formations and man-made wooden columns around which ritual actions are organized. In Old Norse the term

seiðr was also used to denote witchcraft. Most seiðr objects are stone formations, erratic boulders, weathered rocks or stones, or conspicuous, anthropomorphic stones on the banks of a river or a lake. Seiðr stones contain cracks, hollows, excrescences, and flat "shelves" due to weathering. These functioned as altars, on which reindeer, deer, and fish were sacrificed. Likewise the indigenous Saami gods were believed to have their abode on the seiðr.

The seiðr sacrificial sites were closely connected with economies based on reindeer pastoralism, hunting, and fishing. Depending on the specific location in the territory of the individual Saami groups, observances at the seiðr sites were performed either by several reindeer-herding communities (designated as *sii'dā*), by members of a family, or by individual persons. In the Saami language the attribute *bāsse* (sacred) was used as a territorial marker to set apart topographically anomalous sites. Saivo mountains (in the Norwegian Saami area) and saivo lakes (in Finnish Saami territory) are other conspicuous points in the terrain that were described as bāsse (sacred) and that contained a seiðr stone as their distinctive marker. It was believed that saivo lakes had two bottoms, which were connected by a hole. Fish could come up and disappear through the hole. The noai'de entered upon his soul journey to the Underworld through a hole (see Rydving 1987; 1990).

In distinct geographical areas where shamanic practices survived, the very corporeality of its ritual systems came to be viewed as a threat to the theologically legitimated social order. In seventeenth- and eighteenth-century Scandinavia, Lutheran priests systematically uprooted shamanic traditions by destroying the drums of the Saami shamans and by denying the value of the indigenous ethno-religious traditional elements which had dominated their social life for centuries, especially the close interplay between the living and the departed members of the family (see Rydving 1991, 1993). In ritual performances, the drums were not only auditory vehicles for inducing a shamanic state of consciousness but formed the nucleus around which the corporeality and territoriality of the shamanic institution and the whole indigenous religious tradition revolved.

PAGANISM IN EUROPE

The pre-Christian, indigenous religions of Europe are often referred to under the general name *paganism.* Though European pagan religions cannot be said to be essentially shamanistic, they do display shamanistic elements of great interest. Paganism was suppressed by medieval Christian authorities, but in recent times, there has been an effort by individuals and groups across Europe and beyond to reconstruct the pagan religions of old, including their shamanistic practices.

The term *pagan* dates from the late Roman Empire. The late Latin *paganus,* derived from *pagus,* meaning "country or rural district," originally denoted a dweller in rural regions outside the city. As Christianity gradually became established in the cities of the Roman Empire from the second century C.E. onwards, it was in the rural areas that pre-Christian Roman religions persisted, until they were finally driven underground or survived only in folk rituals. They were defeated, at least in the central Mediterranean lands, by the combined forces of Christian Church and Roman emperor in the late Roman Empire. It was this combination of political, religious, and demographic factors that caused rural locations to be associated with non-Christian religious identity, and *pagan* to become a blanket term for all non-Christians of the Roman Empire and beyond.

The rise to supremacy of Christianity in the region of the Roman Empire brought an end to the pagan religious traditions of ancient Greece and Rome. In other regions of Europe, particularly to the north, pagan religious traditions persisted into the Middle Ages and are today undergoing a partial revival under the auspices of various small organizations. The general tendency across Europe for pagan religious deities, beliefs, and practices to be preserved in folklore as folk song, stories, art, and holiday customs or to be combined with Christianity at the level of popular religion created a repository of pagan tradition, which the pagan revivalists of recent times have been able to draw upon in their efforts to reestablish the religious traditions of the European past.

The Indo-European Foundation

The pre-Christian pagan religions of Europe were polytheistic and diverse, with worship of deities representing both forces of nature, such as earth, sky, rivers, ocean, and fertility, and aspects of culture, such as poetry, law, arts, war, and commerce. In the pantheons of the different national traditions, certain striking similarities in function and myth have been found, not only among most European pagan religions, but also among a number of other religions to the east of Europe, particularly the Zoroastrian religion of Iran and the early Hindu religion of India. These similarities follow upon the linguistic affinities that have been shown between certain languages of Europe, Iran, and India, such as Greek, Latin, Lithuanian, Old Norse, and Old Irish, on the European side, and Avestan (an early Iranian language) and Vedic Sanskrit (an early Indian language) on the Asian side. This linguistic continuum is known as the Indo-European language family, and on this basis, scholars of comparative religion and mythology such as Georges Dumézil, Jaan Puhvel, and J. P. Mallory have dubbed the set of related European and Asian religious traditions the Indo-European religions. The vast majority of European nations, and their pagan religions of pre-Christian times, can be classified as Indo-European, but Finland, Estonia, Hungary, and the Basque nation have non-Indo-European language and origins.

One of the most striking common features of the Indo-European religions is a three-way division of divine functions between gods of wisdom and sovereignty, war and physical force, and peace and fertility. These divine functions are seen as the model for human social order. To use the Norse or Scandinavian pantheon as an example, Odin represents the function of wisdom and knowledge, related to the elite social class of kings and priests; Thor represents the function of war and force, related to the social class of warriors; and the twin deities Frey and Freya represent the function of peace and fertility, the model of farmers, fishermen, artisans, and laborers—in short, the social class of producers of goods and services. To a greater or lesser extent, these same three functions are found in the other European pagan traditions with Indo-European roots.

European pagan religions also contain many gods and goddesses whose character and function lie outside of the tripartite, Indo-European structure. European pagan religions are generally composite traditions that mix imported Indo-European elements with others purely local to the regions in which the religions are found. The composite nature of pagan religious traditions is most probably the result of a cultural and religious fusion that combined an Indo-European immigrant population with a non-Indo-European, indigenous population at an early point in each nation's history—somewhere in the neighborhood of 2000–1000 B.C.E., in the reckoning of most Indo-Europeanists.

There is much about European pagan religion that cannot be determined with full certainty, for the reason that the Christianization of Europe involved the large-scale destruction of sacred sites and objects and the prohibition of pagan ritual activities and community gatherings. Because pagan religion was primarily preserved and transmitted through oral tradition, there were few written documents to serve as records of paganism, once a given community or nation had ceased to maintain the oral traditions of the pre-Christian past. Many of the documents that did survive were set into written form by Christian clerics, presenting to the modern reader the considerable difficulty of separating Christian perspectives from pagan traditions. Comparative analysis of pagan texts helps to obviate the problems inherent in the source materials. Where similar themes and motifs occur across traditions widely separated in time and geography, this demonstrates both the authentic, pre-Christian nature of the themes and motifs under discussion and their common derivation from ancient Indo-European traditions.

Shamanistic Elements in European Mythology

There are, in the surviving documents of European paganism, a number of features that strongly suggest shamanistic practices and beliefs. Quite a few myths in the different pagan traditions refer to the ability to communicate with the spirits of the dead and divine or otherworldly beings, either by journeying to their realm and returning back again with special knowledge obtained from the Otherworld, or by opening a channel of communication with the dead or divine beings without leaving the ordinary, earthly realm of existence. Such otherworldly journeys and communications can be viewed as allusions to the shaman's stock-in-trade, the ability to maintain controlled contact with gods and spirits for the benefit of his or her community.

It is said of the Norse god Odin that he is forever journeying restlessly, seeking new knowledge from the inhabitants of diverse worlds and testing his own knowledge against those whom he meets. Odin is described as being able to change his shape or leave his body, the better to travel freely between the different realms of the Norse cosmos. In the Old Norse poem *Voluspá,* Odin uses his magic to charm a dead seeress into rising from her grave to speak with him and give him insight into past and future events from the creation of the world through to its destruction. It is not difficult to see Odin's ceaseless journeying and intimacy with the world of the dead as a reference to shamanistic activities.

Shamans typically undergo a process of initiation in which the putative shaman imagines or experiences the agonizing dismemberment of his or her own body. At the conclusion of this violent process, the shaman receives enhanced knowledge of spiritual matters. A similar process can be detected in the poem *Havamál,* which relates the myth of Odin slashing himself with a spear and hanging on a tree for nine

days and nights, with no food or drink to refresh him or ease his suffering. At the conclusion of the nine days, Odin gains access to the knowledge of the Norse writing and divination system known as runes. He also acquires the power of healing, one of the key shamanistic abilities. In another myth, Odin tears out one of his eyes in exchange for a drink from the magical well of Mimir whose waters contain special knowledge. Such myths of self-immolation fit the shamanistic pattern quite well.

There are also myths of other Norse gods that display shamanistic features. The goddess Freya possesses a magical feather-coat, which Loki borrows to fly through the air, like Odin on Sleipnir. The god's use of a goddess's clothing is reminiscent of the transvestitism and bisexuality attested to in a number of shamanistic traditions. In the humorous poem *Lokasenna,* Loki and Odin accuse each other of performing magical spells dressed as women. The goddess Freya is herself renowned for her magical lore, including the ability to speak with the dead. Freya's magic is called *seiðr,* and Odin is said to have learned it from her.

The myths of other pagan peoples contain similar figures and incidents. The Greek god Hermes is, like Odin, able to pass at will between the lands of the living and the dead and serves as a guide to the spirits of the dead. The Greek hero Odysseus sails to the house of Hades, where the blind sage Tiresias and the other dead dwell; there he must make a blood sacrifice so that Tiresias, something of a shamanistic figure in his own right, can drink of the blood and speak the truth to him. The sacrifice enables Odysseus to communicate with the dead seer and many others besides. A third Greek example is the hero Orpheus, whose enchanting music allows him to both enter the Underworld and leave again, still alive, and whose head continues to sing after it is severed by the angry Maenads. The music of Orpheus resembles the use of chanting and drumming in many shamanistic traditions, just as his mutilation resembles the violent initiation undergone by many shamans.

The Lithuanian hero Sovius sacrifices a boar and feeds its nine spleens to his nine sons, after which he is able to enter the land of the dead through the last of nine gates. He returns to his people with new knowledge of the ritual of cremation, much as a shaman would bring back to his or her people valuable information from the beyond. It may be that the killing of the boar with its nine spleens eaten by nine sons, leading to passage through the ninth gate, is a variant of the same tradition, which is expressed in Norse myth as Odin's nine days of hanging on the tree, with the killing of the boar a corruption of the motif of shamanistic self-immolation.

Journeys to the Otherworld are a major theme of Celtic myth in both its Irish and Welsh variants, and such episodes often involve visits to the land of the dead. These otherworldly journeys are of two types: ocean voyages to far-off islands populated with fabulous beings, and travels into the Otherworld via the magical hills known as *Sídhe,* which are also grave-mounds. On the night of the feast of the dead known as Sámhain in particular, the Sídhe hillsides open to allow passage into the dangerous realms of the beyond, from which Celtic heroes rarely return unscathed. In the prologue to the Irish epic, the *Táin Bó Cuailnge,* the poet Muirgen visits the grave mound of Fergus mac Roich and chants a poem to summon the fallen king. Fergus appears in a mist to recount to Muirgen the full version of the epic, much as the Volva narrates past and future events to Odin in the *Voluspá.*

Entheogens and Intoxication

European pagan mythology also contains numerous references to rites of intoxication, which open the way to the beyond. R. Gordon Wasson and Carl A. P. Ruck have written extensively on elements of Greek myth and religion, such as the Eleusinian mysteries, which may contain coded references to the ritual use of hallucinogenic substances, which they term *entheogens* (Wasson and Ruck 1986). The wine-god Dionysus, who inspires his followers with divine frenzy, seems the very personification of mystical intoxication. Wasson and Ruck have argued that the wine of Dionysian myth and drama was very likely a concoction of mind-altering ingredients.

In Norse mythology, Odin steals the mead of poetic wisdom from Suttung, a hostile giant, and flies off in the form of an eagle to bring the mead back to the gods. A few drops fall to earth and give humans the power to compose poetry—a critical aspect of culture for the preliterate, pre-Christian Scandinavians, who kept

their laws and lore in oral, poetic form. Here, Odin is very much in the role of the culture-hero shaman, bringing beneficial knowledge from the beyond. With reference to the wine-that-may-be-more-than-wine of Dionysus, it is of interest that Odin is described as needing no food as nourishment, living by drinking wine alone. In another Norse myth, the gods Thor and T˝r go on a quest for a kettle large enough to serve as the gods' beer brewing vessel, which they take by force from the giant Hymir, much as Odin stole the mead from the giant Suttung.

In Celtic mythology, there is the Well of Connla, near which grew nine hazelnut trees containing powers of wisdom and poetic inspiration. Dropping into the well, the nuts endowed the waters with these powers, which then passed on to whoever drank from the well. This is quite reminiscent of the Norse myth of Mimir's Well mentioned above. It is also known from archaeology that the Celts of Ireland, Britain, and continental Europe revered numerous springs, ponds, and lakes as sacred sites.

Shamanism in Literary and Ethnographic Accounts

Surviving accounts of European pagan religious practices contain certain incidents highly suggestive of shamanistic activities. The Norse Saga of Eirik the Red tells of a woman named Thorbjorg, known as "the Little Sybil," who is a practitioner of seiðr, the shamanistic magic associated with the god Odin and the goddess Freya. Thorbjorn performs a shamanistic ritual in a Viking community in Greenland. With the crucial support of several other women chanting spells, Thorbjorg enters a trance and is then able to make contact with hidden beings from beyond and provide predictions about future events (Blain 2002, 17, 31–33).

In the funeral rites of a Viking chieftain observed by the Arab ambassador Ibn Fadlan, a female slave, chosen to join her master in death, is first made to drink an intoxicating beverage. She then claims to be able to see into the afterlife and behold her master waiting for her. The graves of Viking chieftains, kings and queens have often been found to contain elaborate drinking vessels, leaving no doubt that these were prestigious and important items. Whether they were intended for ritual use beyond mere revelry is a matter of conjecture, but the mythic associations with wisdom and poetry are suggestive, as is the tale of the slave woman. Archaeological excavations in Celtic regions have also disclosed drinking and feasting vessels, most famously the exquisitely crafted Gundestrop Cauldron, richly decorated with sacrificial motifs.

In Greek tradition, the Pythia (the priestess) of the Oracle of Delphi was believed to gain the ability to predict the future by entering a trance state, thought in past times to have been induced by inhaling the vapors of a chasm in the earth. Geological research has disproved the theory of psychoactive vapors rising from the depths, but does not rule out the ingestion of other mind-altering substances. The sources describe the Pythia as preparing for her trance by drinking the waters of a mysterious sacred spring that flowed into the temple, and also by chewing bay leaves. It is obviously possible that she might have drunk more than simple water and eaten more than mere bay leaves. A mixture of bay leaves, barley, and possibly other substances would also be burned throughout the rite, again raising the possibility of entheogen use. Other oracles, such as those of Klaros and Didyma, also involved trance states associated with the waters of sacred springs. As at Delphi, the ingestion of entheogens can neither be proven nor ruled out, nor can the possible use of other techniques.

Druids, the spiritual leaders of the ancient Celts, are sometimes seen as shamanistic figures. Unfortunately, because the Druids insisted on keeping their spiritual knowledge in the form of oral tradition, there is little that survived Christianization. It is known from the accounts of Julius Caesar and others that the Druids performed sacrifices and practiced divination, but it is unclear if such procedures may have included encounters with spirits or divine beings as in the typical shamanistic trance journey.

The Sami, or Lapp people, whose nation is divided across northern areas of Norway, Sweden, Finland, and Russia, deserve special mention as a European ethnic group with non-Indo-European language and origins who possess a very rich and continuing shamanistic tradition that has never been broken by Christianization. Chanting and drumming are used to induce trance states in Sami shamans, and Sami shaman drums, known as "troll drums," are

elaborately decorated with mythical references, which constitute a virtual map of the Sami spiritual universe for the aid of the journeying shaman. Scholars of Norse myth and religion of the Viking age and earlier have often pointed to Sami shamanism as a likely influence on the shamanistic elements found in the myths of Odin and elsewhere in Norse tradition.

It is tempting to conceptualize two different categories of shamanistic practices in European paganism: shamanism that relies upon rhythmic techniques, such as chanting and drumming, and shamanism that is achieved via chemical agents or entheogens. This distinction should not be overemphasized, however; as in any given pagan tradition, either or both techniques of spiritual enhancement may have come into play, and in any case, extant sources are inadequate to permit a definitive judgement.

Recent Revival Movements

In recent years, many neo-pagan, or pagan religion revival movements have developed in different regions of Europe. Among the most prominent neo-pagan associations are the various Norse revival movements, often named Ásatrú, which have arisen in the different Scandinavian nations, with kindred movements in the United States, the United Kingdom, and Australia. There are also Celtic neo-pagan movements such as OBOD (the Order of Bards, Ovates and Druids, formerly the Ancient Druid Order), Greek neo-pagan groups such as the Supreme Council of the Gentile Hellenes, Baltic neo-pagan organizations such as Dievturi, in Latvia, and Romuva, in Lithuania, and Slavic neo-pagan groups such as Pravoslavya (the Society of the Ukrainian Native Faith) in Ukraine, and the Slavic Communities Union in Russia. There is also Wicca, the less ethnically based and more eclectic form of neo-paganism that originated in the United Kingdom but has won many adherents in the United States and worldwide. It should be noted this brief list provides only a small sample of hundreds of such organizations, which can easily be located through Internet sites and numerous publications.

Umbrella organizations such as the Pagan Federation, centered in the United Kingdom, and the World Congress of Ethnic Religions, centered in Lithuania, have arisen as support networks for neo-pagans across Europe and beyond. To varying degrees and in different ways, in response to different social and cultural contexts, all of these associations attempt to revive and restore such past beliefs and practices as are known from myth, folklore, family traditions, local customs, and other sources. Because of the past efforts by Christian authorities to erase all knowledge of pagan religious traditions, modern neo-pagan groups resort to various means of filling in the gaps in their religious beliefs and practices. Baltic neo-pagans, for example, have found it instructive to borrow certain elements from the Vedic-Hindu religion of India, building on the Indo-European foundation of much pagan religion. Other neo-pagans have looked to other sources, including their own intuition and creativity. The balance between fidelity to past traditions and the creation of new ones is a challenge that each neo-pagan group works out in its own way.

Just as *neo-paganism* signifies many and varied efforts by individuals and organizations to adapt pre-Christian European pagan religion to modern life, the term *Neo-Shamanism* is often applied to the modern revival and reinterpretation of ancient shamanistic traditions. There are both neoshamans who follow an eclectic "Core Shamanism" detached from ethnic roots, and those who follow shamanistic practices rooted in specific ethnic traditions. The eclectic form of Neo-Shamanism draws freely on a wide range of shamanistic traditions from around the world. This borrowing has prompted complaints by Native Americans, Sami, and others that their ancestral traditions have been plundered by outsiders and exploited for commercial use, calling attention to the question of the ownership of particular shamanistic techniques and the larger issue of indigenous people's spiritual rights.

The more ethnically based schools of Neo-Shamanism avoid this sensitive question of indigenous rights by focusing on recreating the shamanistic traditions of specific ethnic and cultural contexts with which the majority of its practitioners and participants are in some way affiliated. Scandinavian Neo-Shamanism derives its spiritual concepts and shamanistic techniques from the shamanistic lore of Old Norse literature, particularly the practice of *seiðr* associated with the god Odin and the goddess Freya.

It is to be expected that as the ranks of people involved in neo-paganism continue to grow in Europe and beyond, so will the numbers who engage in shamanistic practices add to the growing phenomenon of Neo-Shamanism, with continuing debate and dialogue between adherents of eclectic, nonethnically based traditions and others more strongly rooted in particular ethnic traditions.

RUSSIAN FOLKLORE AND SHAMANISM

In the Russian Federation, classic shamanism appears only among the Asiatic indigenous peoples, yet the focus of this entry is on European Russia, referred to simply as Russia here, and its traditions. It is important to note the geographical location of European Russia: It is at the center of several territories where it is clear that shamanism is the traditional technique, if one accepts Andreas Lommel's perspective that shamanism is a technique, one that can appear within the framework of any religion (Lommel 1967). It is impossible to be certain that Russian society was in past times a shamanistic society, but some elements in Russian folklore indicate that this hypothesis is a plausible one. Support for the hypothesis can be found in an examination of the relationship to nature and to nature spirits seen in Russian folklore, as well as in an analysis of the structure, motifs, and themes of specific folktales. The basis of this analysis can be found in works by Mihály Hoppál (1984), Anna-Leena Siikala (Siikala and Hoppál 1998), and above all Mircea Eliade (1989). Some comparisons with the shamanism of the Asiatic peoples of the Russian Federation are made in order to understand shamanistic elements or aspects of Russian folklore.

Even as late as the first years of the twentieth century, beliefs about the relationship of human beings to nature were still strong in Russia, beliefs that revealed the sense of a close connection to the surrounding world, a world deeply animated by the supernatural. Despite Christianity, some ancestral rites and festivals continued to exist.

The Russian oral tradition is rich and includes several modalities: incantations, tales, ritual songs, historical songs, lyrical songs, and epic songs. The epic songs, called *bylins,* contain shamanistic motifs from central Europe, as several researchers have pointed out (Pocs 1995; Siikala and Hoppál 1998). The bylin *Volx, Vsieslavl's son,* an archaic, even prehistoric song (Gruel Apert 1995, 193–196), tells how the hero was born from his mother and a snake. Eva Pocs pointed out that "from among the wizards with shamanistic abilities the figure called *zmej, zmaj, zmija, zmajevit covek* ("snake," "dragon," or "winged man") is relevant in this context. His

existence is well known in Bulgaria and East Serbia." The name Volx itself comes from *volxv,* "the magician" (Pocs 1995). The hero knows the language of birds, snakes, and wild animals, and is able to transform himself into all kinds of animals and then to fight in this form. This last ability of transformation is one of the most characteristic aspects of shamanism. Comparison with Hungarian folklore also shows some elements linked to totemism: "Battles in animal-shape as well as magical animals have been linked up to totemic ideas (Solymossy, Diószegi, Balazs, Gunda, de Fernandy)" (Fazekas 1967, 100). It is also the case that in various traditions the shamans know the language of the animals, and, using that knowledge, they are able to communicate with the spirits (Eliade 1989).

Another bylin, the story of *Iliya Muromets and the Brigand Nightingale,* is full of shamanistic motifs (Gruel Apert 1995, 217). This figure, whose origin is probably in the north of Kievan Russia at the time of Vladimir, the end of the tenth century, incarnates the strength of the Russian people. Ilya is a knight and rides through the forests. He uproots the oaks to open up the way. He comes to a river and sees the brigand Nightingale seated on nine oaks. Nightingale whistles like a nightingale, hisses like a snake, roars like a ferocious animal, and shouts like a valiant knight. The horse falls, and Ilya flies into a rage. The horse then gets up again and rises from Mother Earth into the air. Ilya comes still closer to the brigand and adjusts the arrow of his bow. He pronounces a spell in which he tells his arrow to go even higher above the forest to reach the brigand's right eye. The brigand falls from the oaks, and Ilya hangs him up on one of his stirrups. Mother Earth is shaken. The hero comes to Vladimir's Court. The brigand reappears at the court and again whistles, hisses, and roars. Ilya takes him to the plain and finally cuts him to pieces, leaving the pieces there for the ravens to pick and the wolves to tear.

The horse is of course an ordinary means of transportation at the time of this bylin, but it is also commonly used as a shamanistic vehicle to travel to other worlds. Thus Ilya's horse is able to rise from the earth into the air. Moreover the hero comes through the forest, often a symbol of the threshold area between this world and the next. The brigand sits on nine oaks, perhaps an allusion to the nine levels of the cosmos, connected by the cosmic axis of the world tree, which the shaman climbs in various Siberian traditions (Eliade 1989); the oak often figures in Slavic mythology. It reminds us also of the initiation ceremony in the Buryat tribes, which employs several birch trees. The three levels of this axis are symbolized by Nightingale himself: He whistles like a bird, suggesting the celestial level; he hisses like a snake, suggesting the chthonic level (the Underworld),; and he roars like a ferocious animal, suggesting the terrestrial level. The choice of the creatures itself relates to shamanism, as they are known as helping spirits in several shamanistic traditions and are frequent in European folklore.

It is significant that Ilya shoots an arrow: The arrow is connected with the rainbow, and both of them function as bridges between the worlds and allow ascension to the Upper World. The Samoyeds called the shaman's drum a bow, as its magic projects the shaman like an arrow toward the sky (Eliade 1989). The arrow is aimed at the brigand's eye: The sacrifice of the eye is a frequent motif in the search of knowledge. The dismemberment of the brigand at the end looks like the dismemberment of the future shaman. Thus this bylin can be interpreted in at least two ways: It can be seen as the story of an initiation in which Ilya is the initiator of the brigand, or it can be seen as the story of the initiation of Ilya, who becomes a shaman after initiation rites. It is recounted in another part of the story that Ilya was ill until he was thirty years old, a characteristic of future shamans. The bylin could also be seen as a description of a battle between two shamans.

The bylin tradition is rich and has its origins in different parts of Russia. The stories are often interpreted in terms of history, but it seems clear that another interpretation is possible. The Russian folktale, whose tradition is also very rich, shares some common characteristics with the bylin. One of the most important and famous figures in the Russian folktales is the "witch" Baba Yaga. The basic plot is almost the same in each tale: The hero or heroine must go to look for an object. He or she travels through a forest and comes upon a small hut surrounded by stakes surmounted by skulls. The hut is often perched on a chicken bone (Afanassev 1988, 95, 99, 105, 112). The hero must face an ordeal; he must succeed in escaping Baba Yaga. Her vehicles are a broomstick

and a mortar. When she moves, the earth shakes. In the hut or just before going into it, the hero finds magical helpers. Baba Yaga is always associated with the forest.

The etymology of the name Baba Yaga has been analyzed in several ways: A. N. Afanassev links it with the snake (Afanassev 1992). In that case, the name would recall the link between woman, snake, and fertility; Claude Lecouteux wrote on this subject that the snake is an earth symbol, and even is the personification of the earth (Lecouteux 1982, 56). Marija Gimbutas linked the etymology of "Yaga" with the Proto-Slavic *yaga,* which contains the idea of "illness" and "fright." She states that Baba Yaga is the old Slavic goddess of death and regeneration, well preserved in the tales, but under the altered form of a witch (Gimbutas 1989, 210). Baba Yaga is also present in some incantations, here against drought: "There is in the field the oak Sorontchinskoï and under the oak Sorotchinskoï there are twenty-seven young girls. The Baba Yaga comes out from under this oak and lights twenty-seven fires from oak logs"(Cerepanova 1983; author's translation). The motif of the cosmic axis is present. Baba Yaga appears here as the mistress of fire, a common shamanistic ability. So her image is ambiguous—not totally positive, and not totally negative.

Another figure of the folktales is interesting: Kacheï the Immortal. The term comes from the Turkish language and is linked to the idea of captivity. The hero must bring back a princess from Kacheï's kingdom. (Afanassev 1990, 7, 15). In the first tale, "The Most Beautiful among the Beautiful Young Ladies," the hero, the czar's son, awakens every three days and at the end of the nine days wants to be married to the most beautiful among the beautiful ladies. He takes his horse and rides. Three times the same scene happens: He discovers a hut that looks like a palace and ties up his horse to a ring. The first one is a copper ring, the second silver, and the third golden. An old woman, each time older, serves him a dinner. So the hero comes from one realm to another one. The old women know how to speak with the animals and ask them advice for him to find his way. The third time he rises into the air on the back of a female bird. He cuts off his calves and gives them to the bird to eat. She reconstitutes them at the end of the journey. After some fighting, he finally gets engaged to the most beautiful among the beautiful ladies. But then he sleeps for nine days, and Kacheï steals his fiancée. He tracks her down and discovers her in Kacheï's kingdom. Three times he asks Kacheï where his death is hidden. It is hidden within an egg, which is hidden within a female duck, hidden under a stump that floats on the blue water. The hero leaves and meets some animals that help him find the egg. At the end of the story, the hero breaks the egg and comes back to his own kingdom.

This folktale shows an initiatory journey with a progression, use of the motif of dismemberment, and several uses of the theme of initiatory sleep that lasts a symbolic length of time. Two other elements are typically shamanistic: In the Yakut legends, each shaman has a mother bird, which shows itself twice during life, at the spiritual birth of the shaman and at his death. It takes the shaman's soul and dismembers his body when the soul is mature. After the bad spirits have eaten the pieces of the body, the bird replaces the bones (Eliade 1989, 36). The part of the story in which the female bird takes the hero is very similar to this description. A second Yakut legend tells that a mother bird settles on a tree in the north. It lays eggs that contain the shamans' souls. The great shamans are born at the top of the tree, whereas the inferior ones are born at the bottom of it (Eliade 1989, 37). The parallel with the death of Kacheï is striking. Both bylins and folktales may be interpreted in several ways, among which the shamanistic interpretation is possible. It is also interesting to mention that in Central Asia, the first shamans were reputed to be able to really fly on their horses, but their descendants are unable to do the same, which is interpreted as decadence (Eliade 1989, 190–200). The bylins and the folktales may be a reminder of this old ability.

The traditional cosmology of the Russians seems to have some shamanistic elements. Sometimes the Earth is considered as an open space, but at other times it is depicted within a structure dominated by the image of the world tree with three levels. This image is a constant one in shamanism, as Eliade noted. Incantations against illness collected at the end of the nineteenth century still refer to the cosmic axis, which is localized on the mythic Bujan isle. The elder bird is seated on green sedge.

A raven, the elder brother of all the ravens, lives there and also a whale, the mother of all the whales. There is a sacred mountain where an old man lives, while seven other old men live under the oak. The Bujan isle is a center where all the creative force of nature is concentrated, the seed that will fecundate the earth. These images, which have shamanistic elements, of the primal center of the world give information about the mythical structure as the ancients perceived it.

People's folklore beliefs were still very strong at the end of the nineteenth century and the beginning of the twentieth century in the countryside. The world was seen as full of forces that it was necessary to conciliate. It was a mix of pagan and Christian beliefs called *dvoeverie,* "double faith," by the scholars. The representations of the nature spirits, although demonized, were particularly rich: the *lechii,* the forest spirit, was known for his tricks. It was difficult to see him but easy to hear him. As the master of the forest, he ruled and protected the animals. When he liked someone, he would grant a good hunt (Tokarev 1957, 83). The *polevik,* the field spirit, was depicted anthropomorphically, with herbs instead of hair and walking naked. The peasants brought him an old cockerel and some eggs to persuade him to favor a good harvest (Tokarev 1957, 84). Another type of feminine spirit is more complex: the figure of the *russal'ka.* People believed that she was the soul of a child who had died without baptism. This personage was generally represented as having the features of a beautiful woman with long green hair, who liked swinging on the branches of the trees. She had a close relationship with the fecundity of the earth.

Many other spirits were associated with various locales, in particular those places linked to fertility of some kind. Some places, such as crossroads, were greatly dreaded because they were reputed to be centers of concentration of impure forces. A well-known epic motif in Hungarian and other folk legends (Siikala and Hoppál 1998) tells of the crossroads, with its extraterritoriality, as the venue of an initiation rite, where the hero encounters frightening monsters and trials reminiscent of shamanistic initiations. The relationship to nature and surroundings was shamanistic in that there was a search for reconciliation with the spirits. Nothing was neutral in the peasant's universe of the last centuries. The whole environment had a meaning.

The kind of evidence discussed in this essay cannot establish with any certainty that pre-Christian religion in Russia was shamanistic. For one thing, it is difficult to determine where influences come from, and so to be sure which elements of Russian folk belief actually reflect the pre-Christian religion of Russia. What can be said is that Russian folk beliefs and traditions do contain some shamanistic elements, whatever their source.

RUSSIAN SHAMANISM TODAY

Shamanism in the Federation of Russia currently exists in a variety of forms, some of which can be considered Neo-Shamanism. The Neo-Shamanism is of two kinds: one similar to that encountered in Western countries and the other a kind of Neo-Shamanism linked to the Slavic pagan movements. Moreover, traditional forms of shamanism within Siberian ethnic groups have survived, though they have also been altered in the post-Soviet period under the influence of external forces and the importation of new ideas. These different forms and their relationships to each other constitute Russian shamanism today.

In the post-Soviet period, European Russia (ethnically Slavic) has had a different relationship to the world, and hence it might be possible to construe the emergence of shamanism as a new response to the new situation. It is, however, important to note that the belief in nature spirits remained alive in Russia, sometimes strongly, sometimes as a distant echo from the past, despite the Soviet period. One of the reasons is the role that grandmothers played in telling folktales to their grandchildren. Nevertheless, it is true that Neo-Shamanism is the predominant type of shamanism in the Slavic areas. Neo-Shamanism started in Russia with the publication of the books of Carlos Castaneda in the 1980s; this new phenomenon created many problems for those people who began to practice shamanism and took hallucinogenic mushrooms without regard for their personal safety. Today Castaneda is still read in Russia, but the Internet sites that mention his work warn about the possible dangers of the practices proposed. In the 1990s the Transpersonal Institute in Moscow published *The Way of the Shaman* by Michael Harner. Today this institute organizes sessions of holotropic breath work according to the Stanislas Grof method. Michael Harner represented the starting point of a form of Neo-Shamanism in many countries including Russia, and many people have begun their neoshamanic path after reading *The Way of the Shaman.* Michael Harner and his shamanic trainings remain the reference point for many people on different paths interested in the practice of shamanism.

Shamanism and its techniques are often associated with psychology in Western Neo-Shamanism, and the practice of shamanism is defined in terms of "energy exchanges." It is also presented as a prenatal phenomenon, the rhythm of the drumbeats being the same as the heartbeat in the mother's womb. The sources of this phenomenon include both North or South American shamanism and Siberian and Slavic traditions. Thus Neo-Shamanism is a mix of traditions and can be classified as a New Age phenomenon. Furthermore shamanism is defined as the universal protoreligion, the basis of every culture, in which each person can find a seed of this experience, the shamanic cosmos linked to the layers of the human psyche and levels of consciousness. But that does not mean that everybody is able to become a shaman. It is possible to make a distinction between holding a shamanistic conception of the world and practicing as a shaman.

Russia has seen the emergence of schools of magic that base themselves on occultism, pagan traditions, healing, and witchcraft, and also mention Slavic shamanism. Everybody is considered able to practice magic. The schools of magic suggest the use of techniques that they associate with shamanism. These techniques have a collective aspect when, for example, the drum, a traditional shamanic tool, is used to summon rain. Moreover, there is a kind of mystery and secrecy, as the teaching of such practices is presented as dangerous. Some other methods taught are only focused on the individual, such as learning how to feel oneself as air, water, or fire, or how to communicate with birds, animals, and trees. Very often, the question of health is at the center of the practices

proposed, and they are connected to the ancient art of healing. These schools of magic draw on a range of sources, from pre-Christian Russian beliefs to Shambala, an eclectic form of practice rooted in Tibetan Buddhism that originated in the 1970s.

We see here the same phenomenon as in the West: the New Age and its beliefs. People who attend the Neo-Shamanic seminars adhere to all sorts of beliefs. Today the phenomenon of Neo-Shamanism is found associated more and more with an urban way of life, an adaptation to modernity that is somewhat artificial. It seems that shamanism has become a business in some cases.

Neopagan groups take another approach to shamanism. Here again, the definition of shamanism can be wide, taking into consideration new criteria adapted to modern society. For instance, an issue of *Myth and Magic* edited by Anton Platov, one of the intellectual figures of contemporary neopaganism in Russia, presents a young leader of a musical group as a shaman. His music is a mix of tradition and rock and roll, and his vision of the world is typically shamanic, according to the journal. In an interview with him, this young singer asserted that sound allows the body and the soul to be in harmony with the cosmos.

No pagan group presents itself as practicing shamanism. The practice of shamanism remains an individual matter inside some groups, almost a secret one, and it is difficult to obtain information. Some practices consist of contacting the spirits to establish a link with them. Other practices use breathing techniques to reach an altered state of consciousness, which allows the participant to gain a sense of the power of an animal, such as the wolf. The participants try to incarnate the animal itself by imitating its cry. One person conducts the ceremony using a drum.

Among the pagan movements, one refers to the god Veles as the shamanic god. He is considered mainly as the god of cattle, though his origins and functions seem more complex (Zaroff 1995, 10). He was the guardian of oaths and inflicted disease as a punishment and was also linked to clairvoyance and prophecies. Today neopagans refer to the *Book of Vles,* a book that was found in the form of small wooden boards in 1919 by a Russian officer, which tells the story of the Slavic people in Russia.

If the success of Michael Harner did not really last in Russia, it has helped in some respects the revival of traditional Siberian shamanism, such as the shamanism of the Tuvan and Buryat peoples. Scholars of Siberian shamanism have noted the interplay of traditional and neo-elements in current practices, elements that it is often difficult to separate clearly. In the now autonomous republics of the Russian Federation, the situation of shamanism is complex, as it coexists with other religious beliefs and practices, such as Islam, Buddhism, and Eastern Orthodoxy. One of the criteria of authenticity of a shaman is hereditary transmission, which makes this practitioner different from other kinds of healers. Emphasis is also put on the language used in shamanic séances, since sound is a fundamental element of communication with the spirits.

Shamanism, after being almost eliminated in some areas, gained strength again as a form of resistance against the Soviet state and its domination. This resulted in the complex form of shamanism and Neo-Shamanism today, which is heading toward internationalization and becoming an object of consumerism. Tatyana Bulgakova has noted one problem with the new shamanism: "We have never heard about a traditional shaman who made up his mind to change the methods of his activity and to go on the stage. In our view it is impossible because all his activity is really connected with all traditional surroundings. Only some shamans-innovators and autodidacts can do that" (Bulgakova 2001). It also seems unlikely that the new shamanism will be able to help to preserve the identity of the northern peoples (the ethnic minorities) in Russia, as this shamanism is only one isolated element of a whole system and of a whole culture. It is questionable how effective it is to search for external recognition when the primary need is to strengthen internal cohesion. On the other hand, Mihály Hoppál has emphasized the political role of shamans as a natural extension of their traditional role; they enter the political arena as a new way of defending their communities. In the same way, one can say of Neo-Shamanism in Russia today, at least the kind that turns to shamans from the traditions of the northern peoples, that it is not only a question of individuals looking for personal salvation in a misunderstood tradition but also a question of new methods within tra-

ditional shamanism to guarantee the safety and security of the community in a modern world where the paradigms and conditions of life have changed. Moreover, it may also be a matter of adaptation to globalization.

Today some Russian shamans travel to Western countries, where they perform their ceremonies or invite people to see them, and some shamans perform rituals collectively, neither of which modalities are found in the tradition. Shamans also give initiations whose cost is relatively high for young Russian people. Shamanism has become a tourist attraction, exactly as in Latin America. This phenomenon is largely opposed by the elders. Furthermore, it seems that making a show of shamanic performances misrepresents the shamanic art itself, and it appears that some shamans or members of their family fall ill afterwards. These illnesses have been interpreted as a consequence of the discontent of the spirits. Demonstrations appear to be a betrayal, and the lack of respect for the sacredness of shamanic practice has heavy consequences (Bulgakova 2001). It is as if shamans who give demonstrations have sold their souls. The terrifying aspect of shamanism in its traditional form comes into play, an aspect of traditional shamanism that stands in strong contrast with the beneficence of Western New Age Neo-Shamanism.

There are other notable differences between traditional shamanism and Neo-shamanism: In the traditional form, people do not decide to become shamans, they are "elected," chosen by the spirits or an older shaman, in what is often described as a hereditary transmission. Just as traditional shamanism is not always the pleasant phenomenon often depicted in the Western version, the spirits may not be compassionate. They do not give the shaman a choice; the chosen shaman who refuses to shamanize falls ill. The neoshaman, on the other hand, seems to be in charge of his or her own destiny. The first concern of neoshamans is to cure themselves; if they succeed, it is their choice whether or not to become shamans.

This individual dimension does not exist in traditional Siberian shamanism. In that practice, shamans help people and serve their communities; they are linked to their particular locale and to the presence of their clan. Shamans work with the spirits of the land where they live and with their clans' ancestors. The shamans have to fight all their lives, often against evil spirits or antagonistic shamans, and their personal lives can often be very difficult. By comparison, the definition of shamanism has become very broad and adaptable in the West, where it is not a question of serving a community but of serving oneself. The distinction between shamanism in service to a community, versus self-realization, is a major difference between traditional shamanism and Neo-Shamanism.

Andreï Vinogradov (2002) has asserted that the difference between Neo-Shamanism in the West and in Russia is that the common goal of the shamanic practitioner in the West is the experience itself, which cannot really be judged as "authentic" or "inauthentic," since it is just an experience. Its value is measured subjectively or among the "interest group" and does not require any specific external reference (such as a traditional spiritual authority) for its evaluation. Clearly, the demand of proof of "authenticity" is much less rigorous than elsewhere. In Russia, even Neo-Shamanism that is most influenced by the West has an element not found in the West—it is part of a quest for national identity. As for traditional shamanism, it is true that it has evolved with societal changes, and the shamans have to adapt themselves to the new paradigms of societies that are undergoing profound change at all levels and are affected by many influences and tendencies. Andreï Vinogradov (2002) noted that, even as it was being revived, shamanism mutated into something quite different from its "classical" forms and began to fulfil new functions. Nevertheless, much remains that is clearly traditional. For example, many shamans think that most of the problems happening currently, in particular alcoholism, are the result of negligence: Spirits and ancestors are discontent because they have been neglected. The dead ancestors have not received proper treatment, and those who died violently continue to take the energy of the living.

One can also wonder if modernism itself does not prevent a true traditional shamanism. In the modern, or postmodern world, diseases are not considered the consequence of the action of a malevolent spirit. People seek to cure the symptoms of an illness, not to understand the real origin of it, and even if they do seek the origin, as in homeopathy, they do not acknowledge a spiritual dimension. In Russia, the situa-

tion is more complex as there are strong traditional elements that have survived as popular medicine in some areas (Magalova 1996).

Shamanism today in Russia consists of a disparate landscape. While traditional forms in Siberia evolve toward a kind of postmodernity, New Age forms are increasing in urban society, and on the contrary, although this is a marginal phenomenon, some shamanistic practices are emerging among the pagan movements, focusing on the past while searching for traditional roots and identity.

WITCHCRAFT IN RUSSIA

Witchcraft in Russia has always been an important phenomenon, as well as a complex phenomenon because of Russia’s geographical situation and history. Many influences, including Finnish, Mongolian, German, and Baltic, and even possibly the influence of later occult movements, have contributed to the formation of a popular witchcraft. It is difficult to define what is typically Slavic or typically Russian. But it is possible to discern a general framework with some shamanistic aspects.

Etymological and Historical Considerations

The etymology of the terms used in connection with witchcraft is a rich source of information for the varieties of functions and practices of ancient Russian witches. The vocabulary has connections with different domains from justice to magic, and they are all concerned with the idea of the supernatural, secrets, and mystery.

The terms *vedun* for a male witch and *ved’ma* for a female witch come from the root **wid-*, designating “knowledge” and “science” and also found in words connected with sight. From this root come the words *Veda,* the Hindu scripture that is considered the quintessence of knowledge, and *druid, *druiwid-*, “the very learned” (Guyonvarc’h and Le Roux 1986, 432).

This derivation suggests that the vedun and the ved’ma are those who “know” and also “see.” One could also say that the implication of these Russian words is that witches were originally seen as unique possessors of knowledge.

Another term is *koldun’* or *koldunja,* which indicates ancient sacrificial practice. The verb *koldovat’* means “to practice sorcery.” Nikolaevich Afanassev made the link with the ancient terms *kaldovati,* “to bring a sacrificial victim,” *kaldovanec,* “the sacrificer,” and *kaldovise,* “altar” (Afanassev 1869, 3, 423). Vladimir Dal’ interpreted the verb koldovat’ as “to practice sorcery, divination, to create charms” (Dal’ 1912, 1). The negative connotation of the terms koldun’ and koldunja for one who practices sorcery may well derive from the association of the terms with the practice of sacrifice, a practice that had come to be seen as pagan and evil.

The term for magician is *kudesnik.* The root of this word is *kud,* or *-cud.* The verb *cuditi* meant in the past “to purify,” and the *cudar* was the judge. There was a link between the idea of justice and that of purification. *–Cud* is also linked to miracles and the supernatural. The linguist Emile Benveniste made the connection between the Greek term *kûdos* and the Old Slavic term *cudo;* the first designated an irre-

sistible magical power, a monopoly of the gods, who sometimes concede it to a chosen hero. Those terms relate to the ancient gods and place the human being at the same level (Benveniste 1969, 2, 57–69). So it is possible to hypothesize that the kudesnik had an important religious function in the past.

Afanassev also mentioned *mara* or *maraja* as a name for witches in some parts of Russia (Afanassev 1869, 3, 567). *Mar–* is the Indo-European root that is present in the French *cauchemar* (nightmare) and English *nightmare,* whose origin is **mer-*, which is linked to death.

Thus the terms to designate witches are numerous and relate to a wide range of functions and magical means. It is important to mention that the belief in female witches was more prevalent in Ukraine and Belarus. The magical universe was more male in Russia at the end of the nineteenth century. Male witches were more tolerated because they were known for their healing qualities, whereas women were known for their malevolent actions (Krainskii 1900, 13).

Some professions, particularly shepherds and millers, were closely associated with witchcraft. Shepherds were reputed to have relationships with the spirit of the sheepfold (who gave good health to the livestock), and millers with the spirit of the river. They both knew incantations and magic rituals. Their functions were directly linked to the community's well-being. They were the guarantors of fertility. Thus we see here that if the terms designating the witches were related to a sacred function in their pagan and historical meaning, there seems to have been a shift. By the end of the nineteenth century, all magical acts had come to be considered witchcraft, and all the people practicing magic, or supposedly doing so, had come to be considered as witches.

The actual status of witchcraft and witches in Russia did not change much during the time for which records exist, despite the influence of Christianity. The situation is not comparable to the situation in the rest of Europe and the Latin countries in particular, where the Inquisition prosecuted witches. In the Slavic countries, Ivan IV (Ivan the Terrible) was the first prince to act against the witches. In 1649, under Czar Alexis Mikhailovitch, all practices associated with pagan worship were forbidden. In 1716, Peter the Great decreed execution for those who practiced witchcraft. In the nineteenth century, the last executions, which were most often vengeance cases, were registered. During this whole period, up until the Revolution of 1917, each village had both an official witch, or healer, and a Christian priest. People went to church, but they visited the witch when they had a problem.

The Practice of Magic

People were ambivalent about the practitioners of magic, who mixed pagan and Christian references in their incantations, but they were most afraid of hidden witches. There were several ways of recognizing hidden witches: For example, if a person lit a candle and it either did not burn or it fell, that person was a witch—likewise, if a person burst into tears when someone handling a knife said a prayer.

In general, though, the distinction between good and evil was not clear in witchcraft, as indeed it is not clear in nature. It was not only that witches were people of what specialists call double faith, who mixed pagan and Christian beliefs and practices. They were not as concerned with the distinction between good and evil; they saw everything in the world as animated by the life force, and their main concern was preservation of life force. This was especially true in the north of Russia: The magical power of the witch was held to depend on life force. Each person was believed to be born with a certain amount of it. Life force was seen as concentrated in some parts of the body: hair, teeth, nails, and the heart in particular. Witches and healers were held to be endowed with more life force than anybody else. When witches became old or lost their teeth, their life force was felt to be diminished and they could no longer practice. As the life force was seen as still unstable in the young, a teenager could not become a healer or a witch.

It is difficult to give a truly coherent image of witchcraft in Russia because there were different beliefs in different areas, some of which contradicted each other. Nonetheless, on the whole they were based on the centrality of the natural cycles of life and a conviction that some people had the gift to be intercessors between human beings and supernatural forces. One could say that witches were the leaders of religion in Russia, behind the scenes.

Russian witches practiced two basic kinds of magic: malefic and healing. Malefic magic comprised three kinds, *sglaz, zalom,* and *prozin.* Sglaz had to do with human beings and animals, causing bewitchment by the eyes. Zalom was a form of magic that caused harm to crops by twisting the wheat ears or spreading earth from a cemetery, believed to be the remains of decomposed bodies, at the roots of the plant. Prozin, which literally means "slit," involved bewitching scarab beetles and worms so that they would damage the rye or the wheat beside the road.

Healing magic was for humans and animals. Each illness was considered as an entity, and the healer had to chase it out of the body of the sick person. The removal of a spell cast against someone also belonged to healing magic. There was also love magic and domestic magic. This last protected fertility and ensured abundance. In the distant past, when ethnic groups were fighting, there were magical war rituals. Magic concerned all the spheres of existence, and the witch seems to have been the appropriate person to turn to in all circumstances. It seems that the order of society itself was based on the actions of witches.

The spells were very rich and the root of the magical act. Most of them were secret and lost their force if anybody else knew them. Their complexity varied. Magical remedies were based on animals and plants. Some of the remedies seem to have been common to European culture; for example, Russian witches used plants that Pliny the Elder mentioned as being used by the druids. Modern medicine has discovered, or rediscovered, the properties of certain plants or animals used in remedies. Everything was believed to have a meaning. Just as witches occupied a place between two worlds, so did the objects and the natural elements used in their remedies.

Russian witchcraft had some strong similarities to shamanism, as for example in the way one became a witch. Often it involved a crisis similar to the crisis that future shamans experience. Future witches would be melancholic and solitary, and then one day they would fall ill. Spirits would visit them, and sometimes someone in their family would guide them. They would realize that they had inherited a gift for witchcraft.

Their practices and attributes also often suggested a link with shamanism. The female witch used a broom in order to fly. Two words designate a broom in Russian, *metlo,* the simple broom, and *venik,* the birch broom. The birch was the typical shamanic tree in western Russia, and also in Siberia. The venik may well have been related to the shamanic tree, and the story of the witch's flight may have been a way of speaking of shamanic travel into other realms. In addition to her use of a broom made of birch, when a witch flew from her house, she used the chimney, suggesting communication between the sky and the earth and ascension into Upper Worlds.

Witches could also turn into animals, as shamans could, and leave their bodies. As Claude Lecouteux mentioned, in the Germanic tradition, the belief was that everybody had several doubles, which could assume a zoomorphic shape. The double in the shape of an animal would serve the person who knew how to use it. Lecouteux suggested that magic and witchcraft were believed to act on the double, not on the body itself (Lecouteux 1992, 142–143). This belief in the double and its functions is also present in shamanism, as Roberte Hamayon mentioned concerning Mongolian shamanism (Hamayon 1990). As for leaving the body, a fundamental belief in shamanism is that the soul is autonomous: It can leave the body without provoking death (Hamayon 1990, 329). The historian Carlo Ginzburg also linked witchcraft and shamanism (Ginzburg 1992). It seems reasonable, then, to speak in terms of shamanistic aspects of Russian witchcraft, though not shamanic aspects, since that would imply a shamanic society.

Although practices and beliefs have changed, so much so that the past tense seemed more appropriate for the description of witchcraft as it was documented over a hundred years ago, witchcraft never ceased to be used in Russia, even during the Soviet era: The leaders of the USSR had their healers. Everywhere in Russia the belief in witchcraft has never disappeared, even though witches no longer play the same role as during the past. In the early twenty-first century, witchcraft has entered what might be described as a New Age era, and the newspapers contain the advertisements of witches and mediums.

WITCHCRAFT IN THE MODERN WEST

Modern witchcraft overlaps with shamanism in various religious practices such as out-of-body experiences and altered states of consciousness. Many practitioners of modern witchcraft are involved with magic and see themselves as shamans, although there is debate whether witchcraft itself is a form of shamanism in the strictest sense.

Modern witchcraft, often referred to as Wicca, particularly in America, was essentially created in the 1940s in England by a British civil servant, Gerald Gardner, who published a series of fictitious ethnographies (e.g., Gardner 1982) of supposedly contemporaneous people practicing the rites of their pagan ancestors and worshipping the earth goddess and her consort in ceremonies beneath the full moon. Gardner claimed to have been initiated into one of these secretive groups, which he said had been hidden since the "burning times." He described their rituals as the practice of an ancient nature religion, the most ancient of religions, in which the earth was worshipped as a woman under different names and guises throughout the inhabited world. She was Astarte, Inanna, Isis, Cerridwen—the Great Goddess in her many aspects—and her consort was the stag god, or the god of the hunt. Gardner began initiating people in groups of three to thirteen members called covens, which were led by people called high priestesses and high priests. Covens bred covens; people wandered into the occult bookstore, bought Gardner's books and soon others, and created their own covens, first in England and then abroad. By now there are many different types of covens, some of which see themselves as direct descendants of his (they are called "Gardnerian") and some of which describe themselves as feminist, "faerie," and so forth. Although the number of practitioners is very difficult to establish, they probably number in the thousands in Europe and in America and undoubtedly in other parts of the globe (see Luhrmann 1989 and Adler 1986).

Covens in England vary quite widely in their style and custom, but most seem to share a common core of practice. They meet on (or near) days dictated by the sky: the solstices and equinoxes and the "quarter" days between them—Beltane (May 1), Lammas (August 1), Halloween (October 31), and Candlemas (February 1). On these days the groups typically perform seasonal rituals to celebrate the passage of the earth around the sun. These are called "sabbats." Covens also gather on the full moons for "esbats," typically meetings at which spells are performed in order to attain some earthly end (curing an illness, getting a job, and so forth).

It is possible that Gardner was, in fact, initiated into a group that called its rituals "witchcraft," although even that is controversial. However, if he was, that group was almost certainly not a direct descendant of people practicing witchcraft in early modern England. Current historical scholarship has concluded that there were no people practicing witchcraft in early modern Europe (Thomas 1971). "Witch-

craft" was an accusation flung at people for a variety of political and social reasons, and those condemned had different characteristics in different geographical areas as the source of social tension shifted. Indeed, the association of a practice called witchcraft with goddess worship seems to be primarily the result of Margaret Murray's much discredited account of those early modern witch trials, called *The Witch Cult in Western Europe* and published in 1921. In that book, Murray argued that the witch trials were an attempt to stamp out a pre-Christian nature religion that does indeed resemble Gardner's witchcraft; it is thought that he took the idea from her.

At the same time, modern witchcraft often draws on the imagery associated with the early modern witch craze: the naked woman, the horned god, the broom, and the cauldron. To an even greater extent it draws on the English representation of nature in the nineteenth century (Hutton 1999). Around 1800 a sacred earth mother emerged in Romantic literature as the embodiment of nature and the moon. By the end of the nineteenth century, the "corn goddess" was established in British anthropology, classics, and the study of prehistory as the dominant religion in all early societies. Much folklore in modern societies was understood to be its misinterpreted remnant. This goddess was the fertility of the earth, and the corn was her son and lover, killed each year in the harvest and reborn every spring. By the early twentieth century, historians and archaeologists had taken this vision of Neolithic spirituality and turned it into a looking-glass reversal of Christianity: female instead of male, earth instead of sky, nature instead of civilization. Modern witches read their Frazer, Neumann, Childe, and others and try to create for themselves the tone and feeling of an early humanity as these scholars described it, worshipping a nature they understand to be powerful, female, and mysterious.

Because of these romantic roots, those who practice modern witchcraft also often see themselves as modern shamans. There are certainly contemporary groups of people who call themselves shamans and who do not consider themselves to be witches, and not all people who call themselves witches see themselves as shamans. However, there is often a sense of kinship with shamanism among witches. In particular, the word "shamanic" is often used to describe out-of-body experiences. Those who practice witchcraft speak as if their spirits or souls leave their bodies during ritual practice and either travel around the world or allow their bodies to be occupied by some divine being. The witch priestess is said to become the goddess (and the priest the god) in a ritual of "drawing down the moon" (or the god of the hunt). What is experienced as "inrushing power" in this context may be called "raw and shamanistic" (Luhrmann 1989).

More generally, modern witchcraft shares with the religious practice of shamanism the cultivation of altered states of consciousness. Most of those practicing modern witchcraft see themselves as involved with magic. They are likely to argue that mind and matter are interconnected and that the mind can be used to manipulate those connections and to alter the world in ways unpredicted by mainstream science. In magical rituals, magicians sink into meditative states and visualize images described by the leader. The central image usually represents the ritual's goal, and the assumption is that group concentration on the image makes the goal more likely to be realized. The theory behind this practice is that subtle "energies" pervade the universe and directly influence the way events unfold. These interconnections are sensed and affected by the nonrational in human psychology: feelings, intuitions, dreams, and so forth. In a ritual, magicians deliberately try to bypass their "rational minds" and stimulate these nonrational responses. In using imagery as a focus for concentration, magicians think that they can alter the flow of these energies and interconnections in the directions suggested by the image: a good job, a healthy relationship, world peace.

To learn to achieve these ends, and to experience the more complex reality they understand to exist, practitioners tend to use two kinds of techniques: meditation and visualization. In a loose sense, meditation involves a "stilling" of the mind, in which the meditator concentrates on an object, or a word, or an image, or on thoughts themselves. The practical goal of the technique is to inhibit responsiveness to external stimulation, to have the mind's attention focused inwardly. There are a variety of more or less complex religious systems that teach meditation. Many people think of these as primarily Asian in origin, and there are many such sys-

tems from East and South Asia, but the monastic Christian traditions and some Jewish traditions also involve intense concentration practices. Prayer is a meditative practice, and while some people in Sunday services compose grocery lists during the silent prayer, those more involved in devotional pursuits are attempting to focus their attention inwardly and in effect to shut down the response to external distraction.

The goal of most serious meditational practices in which the meditator sits, usually neither speaking nor moving, for some period of time, is a significantly altered state of mind during that period, with perceptible physiological changes and changes in mind and body alertness in the hours after the meditation. The most dramatic of these states is a mystical experience, which is a highly intense, short-lived experience in which one feels suspended in space and time, immortal, at one with the universe, and often surrounded by light and love. Serious meditators rarely elicit this state through deliberate practice, although some do. Nevertheless they do experience very real physiological changes and what, for want of a better term, are often called "changes in consciousness" in which time passes more slowly and the individual feels distinctly different. Those who are well trained in the magical practice of modern witchcraft may be able to induce states that are rare, and usually spontaneous, in the wider population.

The second category of practice is visualization. Visualization is the ability to "see" mental images. Individuals vary widely in the pictorial clarity of their mental imagery. Some people experience themselves as "seeing" their hand; others experience themselves as thinking of the idea of their hand. For most, or perhaps even all, of them, it is possible to develop the precision, clarity, and intensity of the image with practice. Visualization is frequently involved in powerful religious experiences around the world and particularly in religious enterprises whose aim is the conversion of the neophyte. The Spiritual Exercises of Ignatius Loyola, for example, are identical in structure to the magical rituals of modern witchcraft, down to the involvement of the five senses, the narrative structure, and the emotional involvement of the practitioner within the imaginative frame. These exercises are intended to create a permanent spiritual conversion and seem, at least in part, to do so for some individuals.

The vision quest of the Native Americans, which is an initiatory experience, or the initial experiences of the South American shaman, which again are initiatory experiences, are used to involve the neophyte in the religious undertaking with a kind of skill that is then used within the religious practice. In modern witchcraft the most powerful visualization sequences are called pathworkings: One goes away, one arrives somewhere else in the middle of some story, one does something for oneself in the course of the story that is emotionally powerful for one, and one returns. Throughout all this one aims to see the images in the narration. Typically, a pathworking ritual will include sentences like this: "The boat bumps against the shore. We disembark, feeling the grass beneath our feet. Day has just broken, and the birds trill from the trees. We walk up the path. The stones scrunch as we move . . . The goddess appears from behind the temple . . . She gives you something of your childhood which you hide within your heart."

Visualization may also be associated with the out-of-body experience, in which individuals experience themselves leaving their bodies and then see themselves from outside of the body. This kind of phenomenon is reported in near-death experiences in the West, during which surgical patients, or people on the brink of death, will find themselves up in a corner of the hospital room looking down on themselves. Out-of-body experience may also be associated with shamanic religion around the world. At least in ideology, shamans are often described as leaving their bodies to travel to another layer of the world to retrieve missing souls, and in these ideologies the representation is quite visual. In modern witchcraft, practitioners presume that people may be trained to have out-of-body experiences, and the training technique relies on visualization. Practitioners focus on some image—a tarot card, or a geometric form—imagine it as getting bigger and bigger, and then step through it as if stepping through a door, like Alice through the looking glass.

In the end, many practitioners of modern witchcraft may not experience unusual states of consciousness. Some however undoubtedly do, and they do so through the use of these two techniques, which are common in magico-religious traditions throughout the world. Whether they actually experience unusual

states of consciousness or not, many practitioners of modern witchcraft clearly share with those interested in Neo-Shamanism the belief that it is possible to communicate with different levels of reality in a way that can serve both the individual and the larger world.

Overview

EURASIA

Although the term *Eurasia* literally means the entire continent of Europe and Asia, in this context Eurasia is generally used to refer to the northern and western part of Asia, mainly to the former USSR or present-day Russia and the northern part of China; thus this section includes shamanism in the Central Asian republics (Turkmenistan, Kirghizstan, Uzbekistan, Kazakstan, etc.), Siberia, Mongolia, and the Uyghur Autonomous Region in China. This vast landmass includes the frozen tundra of northern Siberia, forest and steppe regions stretching from the Ural Mountains to the Pacific, and the dry desert areas of Inner Eurasia. The northern forests were and still are inhabited by people who are hunters and gatherers, as well as reindeer herders of historically more recent development. The vast steppes—extensive grassland on the high plateaus from southern Russia to China—provide the most suitable terrain for a pastoral nomadic lifestyle, which developed when horses were domesticated in prehistoric times. Nomadism is a highly specialized economic and social system. Eurasian nomads live by herding, mainly sheep, horses, and reindeer, and move across the countryside according to the seasonal availability of fresh grass and water for their herds.

Eurasia consists of multiethnic regions, but widespread assimilation of different ethnic groups has not been fostered, due to their varied economies and specific geographical needs. Since antiquity, waves of constant migrations of various proto-Indo-Europeans, East Iranians, and Turko-Mongol peoples have constituted the most significant aspect of Eurasian history. Multiethnicity throughout Eurasia has resulted in a rich and diversified cultural heritage.

The Peoples in Eurasia

Most of the indigenous peoples in present-day Eurasia are Uralic and Altaic speakers. The shamanism of Uralic speakers such as the Finno-Ugrian peoples are covered under the section on Europe, but Uralic groups such as Samoyeds, Khanty, and Mansi are included in the "Siberian Shamanism" entry. Most of the people discussed under this section on Eurasia belong to the Altaic families: Turkic, Mongolian, and Manchu-Tungus branches. Originating from Mongolia, nomadic Turkic speakers, namely, Kazaks, Uyghur, Kirghiz, Turkmen, and Uzbeks, gradually became sedentary in Turkestan or Central Asia.

As Turkic domination began to decline in Mongolia, their power center moved westward; the Mongols reached the peak of their power in the thirteenth century under Chinggis (Genghis) Khan, who conquered most of Eurasia and established a world empire. Even after they conquered China in the thirteenth century, the Mongols largely maintained their nomadic lifestyle.

The most widespread language group in Eurasia consists of the Manchu-Tungus speakers, who are scattered in northern Siberia from the Pacific to the west of the Yenisey River and Lake Baikal in the south. The Evenki (formerly called Tungus) constitute one of the larger Manchu-Tungus groups who engage in hunting and reindeer raising in northern Eurasia. The Manchus, who origi-

nated from the northeast of China, later conquered China in the seventeenth century (the Qing dynasty), and their culture and language were eventually sinicized.

Historical and Religious Background

These Uralic and Altaic peoples are geographically dispersed in widespread regions of Eurasia, not only due to their nomadic lifestyle but also to a geopolitical impulse to gain or expand their new territories at various points in their history. The first such expansion of the Eurasian people to Europe was recorded in the fifth century. The Europeans were shocked by the invasion of the "Hun" people, as they were called, with high mobility and military skills, some of whom eventually established the Bulghar Khan Empire in the mid-Volga region of eastern Russia, an empire that lasted from the seventh to the thirteenth century. The Orkhon inscriptions (the earliest stone inscriptions in the Turkic language, found in the Orkhon River valley in Mongolia) and other Turkic inscriptions also attest to the historical presence of the early nomadic empires in Mongolia, which lasted from the seventh to the ninth century. These pastoral nomads formed great empires, which occasionally united the region and dominated neighboring territories. These Turkic inscriptions also recorded the spread of Zoroastrianism, Manichaeism, and Nestorian Christianity among these Turkic-Mongolian peoples.

The movement of the traders and goods along the Silk Road from early Roman times also brought Buddhism from India to East Asia through Central Asia. A complex history of conflicts and coexistence (or even mutual borrowings) resulted from the interaction between these major world religions and indigenous shamanism in Eurasia. The shamanism of the Turko-Mongol peoples was in general enriched by incorporating beliefs and symbolism of the imported world religions. Islam was also introduced in Central Asia around the eighth century and solidified much of Turkestan under Islam. Yet Islamic monotheism did not completely wipe out shamanism either, as indicated by some of the entries. (See "Sufism and Shamanism," for example.) In particular, the mystical experiences of Sufism can be associated with shamanic practices of trance. Most Mongols have adopted Tibetan Buddhism, a process that began in the seventeenth century. Russian Orthodox Christianity also spread, as Russian power began to penetrate into the region under czarism.

During the period when these regions were dominated by the former Soviet Union and China, shamanism, like other religions, was suppressed and persecuted by the Communist regimes. As some of the nations under the Soviets were granted independence in the 1990s after the fall of Soviet Communism, shamanism and Buddhism revived under the new governments, which have tended to promote their national solidarity by encouraging the traditional cultures of pre-Soviet times. As for the newly independent Central Asian republics, Islam is still suppressed by the Soviet-educated ruling class who fear Islamic resurgence, and shamanism continues to be buried as a countryside phenomenon under the disguise of Islamic veils.

Eurasian Shamanism

Although Eurasia is considered to be a prominent region for shamanism by most scholars, well-integrated studies based on extensive fieldwork only started to come out after World War II, and those mainly in Russian. This section includes entries regarding shamanism practiced by Turkic, Mongolian, and Manchu-Tungus peoples. The entries are based on the studies of indigenous Turkic or Mongolian scholars and Russian researchers who have conducted fieldwork in hard-to-access regions of northern Eurasia, as well as on the work of other Western and Japanese anthropologists or area specialists. These recent ethnological and archaeological studies bring out rather complex features of Eurasian shamanism, despite Eliade's narrow definition of North Asian shamanism based on his idea of ecstasy. Aspects of shamanism include the gender of shamans, use of specific musical instruments (drums or string instruments), collaboration of human or animal spirits, different cosmological considerations, and various types of ritual performances during the day or at night, as discussed in the following entries.

Mariko Namba Walter

Introduction to the Entries

The strength of shamanism documented in the modern period among Paleo-Siberian and Mongolic peoples has suggested to many observers that North Asian shamanism has ancient roots. Support for this position is drawn from rock art and, to a lesser extent, from mortuary archaeology of the Bronze and early Iron Ages across the Eurasian steppe and forest steppe. The entry "Ancient North Asian Shamanism," however, queries the context of relevant rock art imagery and the nature of mortuary finds and raises questions about whether they should be interpreted as evidence of shamanism.

Using archaeological evidence, the author of "Priestesses of Eurasia" discusses Bronze Age Eurasian priestesses; it has been noted that the earliest shamanistic figures were women, and rock art shows ritual dance and images that emphasize dominant female elements. Archaeological artifacts also show the transition from Bronze Age shamans to early Iron Age nomadic priestesses. The author points out that the Siberian Yakut worshipped Aiyysyt, the goddess of childbirth, and that the elements necessary for survival in a nomadic society, fertility, safe childbirth, and food procurement (animal hunting), were represented in this ritual to Aiyysyt.

The entry "Siberian Shamanism" gives a clear picture of the shamanic practices of the Siberians. Two distinct modes of life in Siberia—hunting in the forest and stockbreeding on the steppe—seem to be the key to understanding the different types of shamanism practiced in Siberia. Shamanic beliefs and practices are explained in this entry in terms of a reciprocal exchange relationship in these Siberian societies. Such symbolic partnerships exist between humans (as hunters and consumers of meat) and animal spirits in hunting societies. Similarly in pastoral stock-breeding societies in Siberia, the symbolic exchanges are to be made between humans (herders) and ancestral spirits who maintain the welfare of the herds. Siberian shamans mediate these exchange relationships through various rituals.

The entry "Evenki Shamanism" notes details of the Evenki shamanic complex, including items of costume, decorations, and drums. It includes descriptions of rituals, search for a lost soul, construction of a shaman's tent, and shamanic processes of sending off the souls of the dead. The Sakha (Yakut) people live in a similar environment and have been mainly horse and reindeer herders, as described in the entry "Sakha Shamanism." Their system of shamanism has been well described by various ethnographers; the entry here explores the initial stages of becoming a shaman, from the reception of the gift through the preparatory stage. It details the process of the initiation, including the disintegration ceremonial, when the spirits separate particular parts of the body from the bones. Body elevation and the initial *kamlanye* (often translated as "séance") ceremony are described as well as aspects of Yakut shamanic cosmology. The transformation of Sakha shamanism in the Soviet and post-Soviet period is also noted.

As for the entries "Manchu Shamanism" and "Sibe Shamanism (Manchuria)," *Manchu* was the term adopted indicating those Tungus tribes that were unified by Nurhachi (Qing Taizu), the founder of the Qing Dynasty, in the seventeenth century. The Sibe belong to the Manchu-Tungus branch of the Altaic peoples; they were conquered by Nurhachi and eventually recognized as an ethnic minority within the Manchu Qing Empire. As in other North Asian forms of shamanism, the Manchu had a concept of three worlds linked by a cosmic tree, and the shaman was seen as a healer, psychopomp (one who conducts spirits or souls to the Underworld), and mediator between the world of humans and the supernatural spheres. Associations with Chinese culture brought about "palace shamanism," notable for court shamanistic rites. Some aspects of this kind of shamanism are also known in the history of Mongolian shamanism, due to the historical and cultural contacts between the Han Chinese and the Mongols, who conquered and established foreign dynasties in China. More unique to Sibe shamanism is the fact that of the ten shamans known to have been practicing at the end of the twentieth century, the majority were women. The traditional initiation of the highest grade of shamans, described as passing the test of the "knife-ladder," has similarities to Mongolian shamanic initiation practices (the shaman had to climb a ladder of knives while in an altered state of consciousness) and also to Korean shamanism, where the female initiate dances on top of knives.

Siberian shamanic traditions are full of references to animal symbolism. The entry "Deer Imagery and Shamanism" outlines the use of deer imagery in shamanic belief and ritual in the Siber-

ian tundra and taiga zones. The deer referred to in the entry include the moose or elk, wild reindeer, and the Siberian *maras.* These animals provide strength to the shaman during his or her spirit journeys as helping spirits. The topic of animal symbolism in the whole of Eurasia is covered in some detail in "Animal Symbolism (Asia)." Throughout the area, animals and birds play a central role in shamanic beliefs and practices.

Many different aspects of Mongolian shamanism are covered by various entries in this Eurasia section. This is due to the fact there are more academic studies done on Mongolian shamanism than on other forms, especially by the Russians and Japanese, the former colonial rulers of the region. Both "Mongolian Shamanic Texts" and "Mongolian Shamanic Traditional Literature" draw on a body of literature produced by ethnographers in the field over the last century—documents that are readily available and that present a valuable picture of shamanism during the time period prior to the repression of shamanism in the twentieth century, specifically in the 1930s by the Soviets. Moreover, native Mongolian scholars who come from a shamanistic background, and thus are intimately acquainted with aspects of Mongolian shamanism, have been able to contribute entries ("Spirits and Ghosts in Mongolia" and "Darkhad Shamanism").

Other entries under Mongolian shamanism explore the differences between kinds of shamans in "'Black' Shamans, 'White' Shamans" and "Yellow Shamans." These distinctions, based on the understanding of the Mongolian peoples as well as of scholars, can be somewhat confusing, and have in fact changed over the course of time. For this reason, it was considered to be helpful to the reader to have a separate entry on black and white shamans, although these color-coded terms do also occur in some of the other entries on Mongolia. The original distinctions between white shamans (related to the Upper World, good spirits) and black shamans (associated with the Lower World, powerful evil spirits) do not always hold, as will be seen in the entries. Some cultural groups consider black shamans more powerful because of their association with more powerful deities; others consider white shamans more efficacious, since they have contact with the spirits of the Upper World. In addition, although *yellow shamans* (a term only used in Mongolia, with its association with Lamaism) were considered to have Buddhist aspects in their practice, currently the term *white shaman* is used in Mongolia for such practitioners. Some argue that these categories of white and black or yellow shamans were initially created by the scholars in the field and are not used by the local people.

Since 1990, it has become possible for non-Russian anthropologists again to do fieldwork in Mongolia and Russia without stringent Soviet controls, a situation that has also brought rich data on current as well as historical shamanism to the fore. Two of the entries under the Mongolian category ("Buryat Shamanism" and "Kalmyk Shamanic Healing Practices") describe in detail the historical and current practices of shamanism in these areas. Buryat Mongolian shamans are found in the eastern Dornod province of Mongolia, as well as in the Buryat Republic of Russia, around the area of Lake Baikal. This particular entry focuses on the Buryat shamans who live in Mongolia. As the author notes, the shamanism of the Buryat in Mongolia contains a number of elements similar to that of the south-Siberian population—the mythological background, the world concept, the important role of the initiation process and the types of shamans. Currently, Buryat Mongolian shamans have become very prominent in the regeneration of shamanism among the Buryat in Russia, and many of the concepts and practices described in this entry, such as the initiation rites relating to fertility and rebirth (father, mother birch trees, nests with eggs in the trees, a grove of eighty-one birch trees in the ritual place), have become important components of Buryat shamanism in Russia.

The entry "Kalmyk Shamanic Healing Practices" offers a historical and contemporary view of the practices of shamanism among these people, Oirat Mongols who migrated in the seventeenth century to Russian lands between the Volga and the Don. Despite their great distance from their original homeland in western Mongolia, they have maintained connections to their shamanic past, although heavily overlaid with aspects of Buddhism, a process that had already taken place prior to their emigration from Mongolia. The materials on the political repression of shamanism among the Kalmyks can be compared to the situation among the Sakha people.

Another group of Eurasian entries concerns those peoples who are primarily Turkic speakers in North Asia. Foremost among these is the entry on "Tuvan Shamanism." As is the case with Mongolian shamanism, there is a wealth of information on Tuvan shamanism, both historical and cur-

rent, due to a large number of ethnographers who interested themselves in this topic in the twentieth century, and also to the fact that shamanism was relatively less suppressed in Tuva than in the other republics of the former USSR, and currently is undergoing a vibrant and active revitalization. The shamanistic complex in Tuva partakes of many Siberian and Mongolian elements.

Khakass shamanism (discussed in the entry of that name) is closely related to Tuvan shamanism, since the republic of Khakassia is adjacent to the northern border of Tuva (in southern Siberia), and in recent times, the regeneration of shamanism in Khakassia has been somewhat influenced by the revitalization of shamanism elsewhere in Russia, particularly Tuva. Neo-Shamanic influences from the United States also are evident among some of the new shamans. As this entry describes, however, there was a vital shamanic tradition in Khakassia prior to the Russian Revolution, and many of the cosmological beliefs and practices were very similar to northern Siberian shamanism. The Teleut (discussed in "Teleutian Shamanism (Siberia)"), a small Turkic population who live in villages in the Kemerovo area of western Siberia, are also a Turkic people with a highly developed shamanic cosmology, which to some extent still survives, though there are no longer any practicing shamans. They divide the universe into five worlds and have a celestial world consisting of sixteen spheres. They had typical Siberian concepts of the shamanic gift, the "shaman's sickness," and dismemberment during an initiation journey. The shamans coexisted in Teleutian society with a number of other ritual experts who healed, told fortunes, and had special knowledge. As the author notes, many features of the Teleut shamanic cosmology and attributes are quite similar to those of other neighboring Siberian and Central Asian groups.

The entries on Kazak, Kirghiz, Uzbek, Tajik, and Uyghur shamanism describe phenomena in some ways similar, since all of these cultural groups have a strong overlay of Islam, which has influenced their practice of shamanism, unlike the Mongolian and Tuvan groups, where Buddhism is the predominant religion and has coexisted with shamanism since the sixteenth century. According to Vladimir Basilov, these Central Asian Turkic people are cattle breeders, and their shamans traditionally tend to be male. Yet Olga Gorshunova found that shamanhood was primarily a women's occupation among the sedentary Central Asian peoples, although both men and women could perform as shamans. These Turkic shamans use stringed instruments for their rituals, and their helping spirits often have Islamic names such as *jinns* or *pari.* Their rituals takes place after dusk, and during the séance shamans sometimes climb up a hanging rope to the Upper World. Hence it seems that Turkic Central Asian shamanism has preserved some shamanistic traditions similar to those of Siberia and Mongolia. Some modern Turkic folk healers, on the other hand, draw more from the aura of the Islamic healing tradition and Russian parapsychology, or New Age spirituality. It is notable that Islamic prayers and blessings and recitation of the Quran are very much a part of Central Asian shamanistic practice.

Uyghur ritual practices, treated in the entry "Uyghur Healers," concentrate on healing and related rituals. These practices are indivisible from Islam and the Muslim way of life. The influence of Sufism, an ecstatic form of Islam, is important, as well as the influence of what may be called a domestic cult, focused on the spirits of dead relatives and close family. Exorcism ceremonies and healing rituals designated to persuade harmful spirits to leave the body of the ill person, known as "making the *päri* dance," employ, among other elements, incantations to Islamic saints, other exorcism formulae, and Arabic prayers consisting of verses from the Quran.

The Kirghiz people are a Turkic-speaking nomadic group living in the Tian-shan and Pamir mountain areas. Described in the entry "Kirghiz Shamanism," their ritual practices are made up of many elements: Siberian Turkic and Mongolian shamanism have made contributions, and there are also Central Asian pre-Islamic and Islamic features. Currently there are both male and female shamans among the Kirghiz; they heal patients with the aid of ancestral spirits and, while in trance, often use a stringed instrument to summon spirits or whips to chase away evil spirits.

In contrast to Turkic Central Asian Shamans, Tajik shamans show rather different features. The Tajik are an Iranian people with an agricultural background, in contrast to the nomadic pastoral Turkic peoples. Tajik shamans are mostly women, and their helping spirits are human in form, not animal. They perform various rituals in the daytime and use a tambourine without a drumstick for their séance.

In general, due to Islamic influences, Central Asian shamans do not wear colorful costumes, nor do they use painted images of the spirits. Basilov noted that shamanism had become peripheral and lost many original functions by the early twentieth century in Central Asia, after the spread of Islam.

Eurasians, whether they are Mongolian, Turkic, Iranian, or Siberian, tend to have essentially similar shamanistic cultures, as the above-mentioned entries indicate. These entries show not only the general features of the shamanism of a particular ethnic group but also more detailed accounts of various aspects of shamanism, such as deer symbolism. As part of the search for commonality in certain rituals, the entry "Funeral Rites in Eurasian Shamanism" examines the nature and characteristics of death-related rituals among the Tuvan and Mongolian peoples—funerals of shamans among the Tuvan people are discussed, and Mongolian funeral procedures are described according to Russian archival and other sources. In Mongolia, the Buddhist lama seems to have largely replaced the shaman's functions; nonetheless, remnants of shamanistic beliefs and practices are still clearly evident in contemporary Mongolian and Siberian funeral rites.

Finally, as these entries demonstrate, not only is Eurasia an ancient and indeed seminal land for the development of shamanism, but also it is experiencing a revival and revitalization of shamanistic practices, adapted to modern times.

ANCIENT IRANIAN RELIGIONS AND SHAMANISM

In Iran, existing ethnological and archaeological sources do not permit the identification of tribes or population groups that actually engage in practices related to shamanism, or that have done so in the past. On the other hand, within the borders of countries speaking languages of the Iranian branch of Indo-European, there still are small tribes, in Nepal, Bhutan, and Tibet (Pommaret 1989), where shamanic culture persists. It is in any case undeniable that shamanic practices historically existed in Iran, concomitant with the Zoroastrian religion. This Iranian shamanism is evinced principally in legendary or historical literary data, in the accounts of extracorporeal journeys where the experience of the soul leaving the body occurs, both as the objective of the journey, as well as in its process of unfolding, as an authentic type of shamanic ritual.

Some traces in the Avesta (the book of the sacred writings of Zoroastrianism), as well as in the work of the ancient Greek historian Herodotus, reveal the existence of shamanism at the height of the period when Zoroaster lived, which most specialists today believe was around the end of the second millennium B.C.E. Several words, such as the names for henbane (in Avestan, *bangha*) and the sacred drink *haoma,* which can probably be identified with ephedra, designate plants having sedative, analgesic, and narcotic properties. Likewise, urine (in Avestan, *MūΘra*) is mentioned as a sacred beverage drunk by the creatures of Ahriman, the leader of the forces of darkness in Zoroastrianism. (Urine is sacred when it refers to the urine of oxen, which is an agent used in the purification ritual in ancient Iranian religions).

More clearly related to shamanism is the noun *vifra* (corresponding to the Vedic *vipra*), which is explained by its root, which means "to tremble, to shake"; it designates a person who shakes as he prepares to enter into trance and shamanic ecstasy (Gignoux 2001, 74). This personage (*vifra,* or *vipra)* is not a shaman but an "inspired" poet who is able to have visions of a shamanic kind. For example, suggestions of shamanism occur in the following account. According to the Yasht 5.61–65, the vifra named Pāuruua was shipwrecked and cast into the air by *Θraētaona,* who was in the form of a vulture. Over three days and three nights—in other words, the same length of time as the period after death during which the soul remains near the body before embarking on its journey to heaven or hell—the vifra was unable to descend to earth, but at the end of the third night, the goddess Anāhitā brought him back to the ground. Described as the *daēnā* (soul) who guides the soul in its postmortem voyage, this goddess was summoned by the vulture, who is the agent of magic flight and symbolizes the shaman, who usually dons a bird costume in order to go save a soul in danger. It is noteworthy that the account in question does pertain to a rescue operation. One also sees that in this episode, elements of a magic flight and a soul's journey are intermingled. Since the same rescue account is found in Indian sources, it is possible to infer that this narrative dates back to the Indo-Iranian period.

The bird feather costume so often donned by the shaman also seems to be used during Zoroaster's journey (see below). According to the account in the Avesta (Yasht 14: *Bahrām Yasht*), Zoroaster asked the god Ahura Mazdā how he could be delivered from a curse. The god told him to take a vulture feather and rub his body with it, because "no one can kill the man who carries the bones or feathers of the powerful bird" (cited in Gignoux 2001, 75). This allusion to the invulnerability of the shaman is rather eloquent and is certainly not accidental.

Extracorporeal Journeys

Zoroaster's journey as recounted by Bahman Yasht in the Avesta, is indisputably a mythic, or legendary, voyage: According to Widengren, the prophet would have used a technique of intoxicating himself in order to enter a trance state that resulted in his sleeping for seven days and seven nights. But this incident has more

the aspect of a dream or vision, rather than a shamanic experience from which Zoroaster obtained wisdom (Gignoux 2001, 67). No matter which interpretation is attributed to this passage, the journey of Vištāspa, the first person to accept Zoroaster's message, truly appears to be a shamanic experience, even if it lacks historical value. He had to submit to a test in order to join the Mazdean religion (Molé 1967). According to the *Pahlavi Rivayat* (Zoroastrian texts from the ninth century), which draws on book 7 of the *Dēnkard* (a ninth-century encyclopedia of the Zoroastrian religion), Ahura Mazda sent his messenger god Nēryōsang to Ardvahišt to tell him to give Vištāspa a mixture of henbane *(mang)* and wine, a narcotic beverage that causes lethargy or loss of consciousness. Vištāspa fainted, his soul was conducted to heaven, and then he was revived. These are basically the three phases of a shamanic voyage: apparent death caused by ingesting a narcotic, visions of the beyond, and a return to an ordinary state of consciousness.

The following are historical examples of shamanic experience concerning two famous personages from the third century. The founder of Manichaeism, Mani, was suspected of pretending to be dead in an incident of this type. According to a passage from the Manichaean Homilies, King Vahrām II ordered a close examination of his body in order to verify that the imprisoned prophet was really dead, because he feared that Mani had taken a drug in order to kill himself or to undertake a journey to the afterlife (Russell 1990). More clearly identifiable as shamanic is the vision of the high priest Kirdīr, a reformer and promoter of Mazdean religion under numerous Sassanian kings in the third century who acquired a highly important position in the court. In three of the four rock inscriptions that he had engraved in Fārs, the Ancient province of the Persian Empire, he described visionary experiences of a shamanic kind, which he claimed the gods had bestowed on him. It is true that narcotic use is not noted here, but the *Sar Mašhad* inscription that relates the event is rather incomplete, and above all, as the experiences of the female shamans of Bhutan demonstrate, it is not necessary to take a narcotic in order to have visionary experiences. In any case, Kirdīr explicitly describes his journey, guided by his *daēnā* (i.e., his soul, which is both a reflection of his virtuous moral life and a guide to the other world), which allows him to visit the afterlife, as he had requested from the gods as a reward for his piety and his efforts to spread Mazdaism. These motifs are but a literary manner of concealing what is a genuine shamanic voyage. The voyage itself might be a response to a legitimate desire to understand what happens after death, which could not be publicly admitted by a religious leader.

Another typically shamanic journey is recounted in the *Book of Ardā Vīrāz* (Vīrāz the Just), an account that perhaps is not legendary, but the historicity of which cannot be demonstrated either. This work, very popular in Iran, relates the visions of heaven and hell seen by a pious man sent to the afterlife. The entire ceremonial that is associated with shamanic journeys, and that is notably present in the narratives of Bhutanese shamans (Gignoux 1990), is described here in detail. One person was chosen among others, and his election was confirmed by an ordeal, which consisted of throwing a spear three times to verify that he respected the fundamental rule of Mazdean ethics: knowing how to conform to Good Thought, Good Speech, and Good Action. Vīrāz basically had to prove that he had the ability of a shaman. The man's seven sisters, informed of the dangers of the experience, were sure that their brother, who was also their husband, would return safely from the journey.

Then the location for the journey was determined according to religious and shamanic criteria: a place removed by thirty steps from everything pure, because even Vīrāz in his state of unconsciousness would inevitably become impure, permeated by the most serious kind of pollution, that of corpses. In addition, he had to wear new clothes, lie on a pure bed, and so on. All of these precautions are evidently prescriptions of the Mazdean religion and could be a way for the narrator to mask the authentically shamanic experience. Vīrāz drank a mixture of henbane and wine in three different cups, to conform to good thoughts, speech, and actions (Piras 2000). These three cups might also represent a triple dose of the narcotic that had to be absorbed. From that moment, having become unconscious, the soul of Vīrāz could leave his body and embark on its journey to the other world.

What he saw there might seem rather uninteresting insofar as the book for the most part describes the tortures and punishments of the damned. But how does the soul leave the body without leading to actual death? This is not possible unless, as in a shamanic worldview, the human being is constituted of many souls. This is certainly the case in Iran, where since ancient times, lists of many terms appearing in the Avesta reveal the multiplicity of souls and faculties within human beings. There are notably three immortal souls, which each have their role in the destiny of humans: the pre-existent soul (the *fravashi*), which, after death, rejoins the soul destined to immortality *(ruwān),* and the peregrinating (journeying) soul *(daēnā),* which is the mirror of the good or evil behavior of a human being during that being's life on earth and which guides the ruwān on the path to the next world. Acoording to some scholars, the daēnā is the feminine element given to the ruwān in "marriage" for life in the other world (Kellens 1995).

This multiplicity of souls in Iranian anthropology is attested to not only by modern scholars, but also in a literary text from the ninth century, *Anthologie de Zādspram* (Gignoux and Tafazzoli 1993). In a medical chapter of the work that analyzes the composition of the human being, the author twice asserts the existence of three souls: the soul in the body; the exterior soul, which, for Zādspram, explains dreams during sleep; and the soul in the world of spiritual beings *(mēnōg).* This tripartite division connects with the one articulated above: The soul in the body is the ruwān, the journeying soul is the daēnā, and the soul in the world beyond is the fravashi. If this theory principally serves to account for the fate of the soul after death and its voyage into the hereafter, it is reasonable to think that it might implicitly (since it would not have been acceptable to speak openly of shamanic experience in the ninth century) explain the mechanism of the shamanic journey into the afterlife. To further support this interpretation of literary information, it must be added that the human being also consists of a body *(tan)* and a vital soul *(gyān),* which leads to the conclusion that if the ruwān can leave the body without dying, it is because the soul or the breath of life remains in the body and supports it in life, although in an unconscious state.

It is well known that bones have great importance in shamanic ideology. They also have considerable significance in Iran, first because they are the seat of life, rather than the blood, which has that meaning for Semites. The seer Kirdīr speaks of a "bony soul," which is also understood in a gnostic context, as with the Manicheans (Gignoux 2001, 91). In Iranophone Central Asia, a bond between the bones and the soul is explicitly marked on the ossuaries. In addition, an ancient prescription exists in one of the six books of the Avesta, the *Vendidad* for preserving bones, so that at the resurrection the god Ahura Mazdā will be able to reconstitute the body of each person, which, in the strictest sense, is a "re-ossification." This evokes the initiation of the shaman, whose every bone must be carefully accounted for after he has been symbolically broken into pieces and then reconstituted.

If these Iranian accounts of journeys in the afterlife cannot convince the reader of the existence of shamanism in ancient Iran, it is nonetheless reasonable to ask oneself why this great country would have escaped this ideology, given that Iran was surrounded on all sides by cultures where the existence of shamanism has been confirmed: in Greece (Gignoux 2001, 80–82), in Scythia (Gignoux 2001, 78–80), in Nepal (Gignoux 2001, 76), in Bhutan and Tibet (Gignoux 2001, 76–78), and in India (Gignoux 2001, 74–76). An iconography of Iranian shamanism could exist, as John Russell believed, who suggested interpreting the bas-relief of Sar Mašhad as a scene from the journey into the afterlife of the seer Kirdīr, (Russell 1990). Representations of sorcerers on the Sassanian seals might also evoke the figure of shamans (Gignoux 2001, 86–88). In short, shamanism, which during thirty thousand years has impregnated so many cultures, and especially Siberian and Euro-Asiatic peoples up to modern times, despite Soviet efforts to eradicate it, logically cannot have been absent in Iran and Iranophone countries.

ANCIENT NORTH ASIAN SHAMANISM

Arguments for the existence of a prehistoric shamanism in the forest steppe, taiga, and tundra zones north of China have been overwhelmingly dependent on the interpretation of visual imagery derived from rock art found in open-air sites and burials. The Soviet archaeologist A. P. Okladnikov is unquestionably the single individual most responsible for establishing the interconnections between ancient North Asian art and shamanism. In an essay first published in 1964, Okladnikov used analogies between prehistoric rock art and ethnographically documented Siberian shamanic practices to conclude that Siberian shamanism emerged in the late Stone Age and came into full development in the Bronze Age (Okladnikov 1986). Okladnikov found shamanic significance in images of moose, horned figures, figures in boats, birds, and solar elements; he argued, moreover, that these images indicated the genetic relationship of ancient Siberian cults to those documented in Bronze Age Scandinavia and known more anciently in the Near East. Since Okladnikov's assertion of these connections, virtually every commentator has accepted his ideas and continued their elaboration. Analogical argument joining ancient imagery to modern ethnography has been almost universally accepted, without demur, among observers of the ancient art of North Asia (Rozwadowski and Kosko 2002).

Prehistoric rock art materials of a "shamanic" character may be divided into two categories. The first includes images understood to represent the shaman or one of his or her transformations. The second includes images that appear to refer to cults associated with shamanic traditions, for example, a cult of the dead and of tribal ancestors, or beliefs relating to the invocation of animal fertility, or related cults such as that of the sun.

Figures with animal or bird characteristics are generally associated with the late Stone and early Bronze Ages; they are interpreted as being images of shamans, or as "protoshamanic," (Devlet and Devlet 2000, 371). Frontal horned figures without delineated faces, with arms sometimes raised and knees bent, have been documented at Balya Sukhaya and Bol'shaya Kada on the Angara River (Okladnikov 1966)

and at Nizhe Tinnoi and At-Daban, on the Lena River (Okladnikov 1972). Some of the earliest such images are those from the badly damaged Baikal site of Sagan-Zaba, where frontal figures with triangular bodies, small, horned heads, and raised arms are interspersed with images of elk and birds (Okladnikov 1974). Similar figures are frequently represented in the rock art of Shalabolin, on the Upper Yenisey River (Pyatkin and Martynov 1985). At Bol'shaya Kada on the Angara, similar figures are treated in a skeletal, or X-ray, form (Martynov 1991, fig. 36). In such instances, the images are understood to refer to the process of a shaman's initiation, during which the shaman is dismembered by spirits, and his or her bones cleaned and reassembled (Devlet and Devlet 2000, 383).

A series of frontal, horned images from the Altai Mountains of Mongolia, tentatively dated to the early second millennium B.C.E., have been referred to as images of shamans. Like those from the Angara and Tom' Rivers, the images from the Mongolian site of Tsagaan Salaa/Baga Oigor are faceless, their arms—where they exist—are raised, and their bodies are either in the form of large bell-shapes or bodies within bell-shapes. Several of these figures, however, are associated with female deer, and at least one appears to be a birthing figure (Jacobson, Kubarev, and Tseevendorj 2001, vol. 2, plates 77, 105, 106, 207, 208). Other horned, frontal figures suggesting ancient shamanic figures are well known from painted and engraved slabs found in early Bronze Age burials at Karakol, in the Altai Republic (Kubarev 1988). Animal headed figures, both frontal and profile, from Upper Buret' on the Angara, Karakol, and Tsagaan Salaa IV suggest the merging of the shaman and his animal helper during the shamanic flight. "Feather-headed" figures from Karakol have been related to images known from late Neolithic stone slabs associated with the Okunev culture of the Minusinsk Basin, with feathered heads recorded at the Siberian site of Shalabolin, and even with images from the site of Tamgaly in eastern Kazakhstan. The rich imagery from the Karakol slabs includes frontal figures with large "wings"; at least one similar figure, which has been called a shaman, has been documented at Elanka, on the middle Lena River (Okladnikov 1972), but the antiquity of that image is debatable.

Masks are found at a number of rock art sites in North Asia, most notably along the Amur River (Okladnikov 1981), within the Tom' River sites (Okladnikov and Martynov 1972), and, in abundance, in Upper Yenisey sites such as Mugur-Sargol (Devlet 1980). Dated generally to the early Bronze Age, the masks from Murgur-Sargol are characterized by the rendering of "faces" and horns with unusual appendages. Some scholars see here ancient versions of ethnographically known shamans' masks (Devlet 1980, 244–259). A significant number of masks have been recorded in the Mongolian Altai sites of Khar Yamaa, Tsagaan Salaa, and Baga Oigor (Rozwadowski and Kosko 2002, 99–119). The dates of these images, as well as whether they are truly masks—and if so, what the term *mask* would mean in this context—or whether they refer directly to a spirit world remain open questions (Rozwadowski and Kosko 2002, 103, 104, 105).

Another type of figure, firmly dated to the Bronze Age, has also been referred to as representing a shaman or "shamanic elements" (Devlet and Devlet 2000, 294–306). These figures are found at rock art sites throughout the Altai and Sayan region; they are characterized by mushroom-shaped headdresses and long "tails" terminating in round forms. These figures are usually shown holding spears, staffs, or bows, engaged in a hunt, or—at Kalbak Tash and Baga Oigor IV—posed as if dancing (Kubarev and Jacobson 1996, figs. 429, 452). The mushroom-shaped headdress has been related to the use of the narcotic mushroom, the fly agaric *(Amanita muscaria),* in shamanic ceremonies; what has been seen as a "bull-tail" has been interpreted as indicative of the shaman's animal double or merged animal helper. Dancing figures have been understood as indicators of a shamanic ritual, and hunting scenes are considered to refer to rituals intended to assure the replenishment of the game on which the lives of the tribes depended (Devlet and Devlet 2000, 294–306).

A number of image types are seen as referring to cults associated with the emergence of shamanism—that is, as contingent indicators of either "proto-shamanism" or early shamanism in North Asia. These images include rows of "dancing" figures at such sites as Sagan-Zaba on Lake Baikal, Tiit-Ary on the Lena River, and the Second Stone Island on the Angara

River, with many examples from the Selenga drainage in the Transbaikal and northern Mongolia (Okladnikov and Zaparozhskaia 1970). Other images usually considered to be associated with shamanic traditions are those of profile, ithyphallic figures (Karakol, Kalbak-Tash, Tom' River) and figures in boats (sites on the Tom', Angara, and Lena Rivers and Shalabolin). These last are understood to refer to the journey of the dead to the Underworld (Martynov 1991, 36–38).

Images of water birds are integrated with horned "shamans" at Sagan-Zaba. Painted images of spread-winged raptors, dated to the Bronze or early Iron Age and associated with shamanic traditions are found ubiquitously on rock surfaces from the Selenga drainage (Martynov 1991, 36). Earlier examples of bird imagery that have been held to reflect shamanic traditions include those of a "bird-woman" with feathered body, exposed pubis, claw-like hands and bird-like head, found in late Stone Age or early Bronze Age imagery of Kalbak Tash and Chuluutyn-gol (north-central Mongolia) (Jacobson 1997). The association of the bird-woman at Kalbak-Tash with feathered figures, loop-headed anthropomorphs, and elk, and with bulls at Chuluutyn-gol, have suggested to some scholars a relationship to fertility cults and processes of life and death and, to others, patterns associated with shamanism.

Giants and monstrous images—at, for example, Shishkin (upper Lena River), Cheremyshnyi Log (Minusinsk Basin), and Kalbak-Tash––have also been understood as referring to the Underworld––the third world of the universal shamanic universe (Rozwadowski and Kosko 2002, 110–113). Images of great moose (usually female) have been attested throughout South Siberia, the most splendid examples being from sites along the Angara and Tom' Rivers, and at Shalabolin on the Upper Yenisey. These are generally dated to the late Stone Age and are associated with "protoshamanic" concerns for animal fertility (Okladnikov 1986, 45–55). Later images of elk from petroglyphic sites such as Kalbak-Tash and Shalabolin, or stylized elk with huge antlers—as on the Mongolian "deer stones"––continue that tradition down into the Bronze and late Bronze Age. They indicate to many scholars a shift in significance from a concern with animal fertility to one focused on solar cults associated with shamanic traditions (Martynov 1991, chapter 4). Images of large-antlered deer, rendered in bronze, gold, wood, and felt, indicate that the tradition of the "golden reindeer" associated with the prehistoric emergence of shamanism (Okladnikov 1986) continued down into the early Iron Age.

Shamanic traditions are often traced through the Early Nomads of the Scythian period by reference to the account by Herodotus of the Scythians' use of intoxicants in association with funerary rites (Herodotus, book 4). This account is of questionable value, however: Herodotus did not observe such ceremonies firsthand, and archaeological excavations of intact Central and North Asian Early Nomadic burials indicate that the so-called intoxicants were actually coriander—probably burned to disguise the smell of death. There is little else within Early Nomadic burials to assert or deny a shamanic element within their belief system (Jacobson 1993, 204–211). More certainly indicative of the emergence of a modern shamanic tradition are the bronze plaques associated with early medieval forest cultures of western and central Siberia (Martynov 1991, 90–94). Bronze plaques recovered from hoards found in the regions of the Irtysh and Tom' Rivers include moose, elk, birds, and syncretic and anthropomorphic creatures with horns, antlers, and wings. These images appear to prefigure some of the material culture of shamanism documented in the modern period.

The material evidence that has been and can be marshaled to support shamanism in prehistoric North Asia is extremely rich and varied. The "shamanic" conclusion, first asserted by Okladnikov, is not, however, without appropriate challengers (Francfort 2001). In the case of the earliest anthropomorphic representations, it is not possible to say with certainty what represents a shaman or a spirit, or where a true shamanism replaces a pre- or protoshamanic environment of belief. The mushroom-shaped headdresses worn by images from Pegtymel', Chukotka (Devlet and Devlet 2000, 300–301) have never been satisfactorily dated, nor has their context been explained. The much smaller "mushroom-shaped" headdresses found on human images of the Altai-Sayan uplands were probably fur hats worn by the people in this cold region of Eurasia rather than references to

the fly agaric mushroom. The "tails" worn by these images are likely to have been an early form of long tufted stick still used by native hunters in the Altai Mountains to hypnotize their prey. The "horns" one sees on the heads of many figures in late Bronze Age rock art probably reflect the animal heads still used by hunters to disguise their appearance and smell. Throughout the Altai and Sayan region, the many representations of such figures as hunters could as easily reflect lived reality or early heroic tales as shamanic references.

Images of great moose and elk, like those of bird-women, probably refer to cults of fertility and rebirth earlier than, and unrelated to, shamanism. The very association of bell-shaped figures from the Mongolian site of Tsagaan Salaa/Baga Oigor with female cervids (deer) or with birth-giving suggests that these images reflect a concern for the replenishment of game that does not require shamanism (Jacobson 2001). The representations of boats with figures and of birds may also refer to preshamanic cults of the dead and of the ancestors; or, more simply, these images may reflect the significant phenomenal world of their makers. Within prehistoric North Asian rock art, there are no clear representations of drums or "shaman rattles," arguments to the contrary notwithstanding.

The presumption of a prehistoric basis for North Siberian shamanism requires a careful dating of imagery; unfortunately, many of the most important sites (e.g., those on the Angara and Upper Yenisey Rivers) have been destroyed and can be studied today only through inadequate, drawn reproductions or poor photographs. Others, like Sagan-Zaba, are damaged beyond further scientific use. These several facts recommend caution in accepting established strategies for interpreting prehistoric North Asian art. At the least, the images and their pictorial contexts indicate that there may have been a much longer and more complex development of "preshamanic" and "protoshamanic" traditions than has generally been acknowledged, and that shamanism, as understood today, may be a later development than the materials it is used to explain.

"BLACK" SHAMANS, "WHITE" SHAMANS

The division of shamans into "black" and "white" is a creation of Mongolian and Russian scholars of shamanism, not a distinction clearly found among native peoples. The issue is controversial because there is insufficient data and no agreement among scholars; moreover, there is a category of black-and-white shamans. The distinction has nevertheless been applied to Buryat, Sakha (Yakut), Khakass, Tuvan, and Altai peoples in Siberian Russia (Anokhin 1924).

The most widely accepted current distinction is based on the ability of white shamans to travel to the Upper World while being prohibited from communicating with the Lower World. Not all black shamans travel to the Lower Worlds, however. While those among Yakut and Altai people do, Buryats go to the east for their *kamlanye* (shaman ritual).

In most respects, black shamans resemble white shamans, but they have been categorized according to the mythical cosmological duality of the universe, seen as divided into distinct moral realms of "good" and "evil." Thus black shamans receive their powers from demonic spirits, have considerable magical power to penetrate far into the Lower Worlds, and use sorcery. They are sometimes identified as sorcerers rather than shamans. They have often been described as acting in immoral ways, having a predilection for associating with evil spirits, and doing harm. For example, among the Nganasan, Tuvan, and Khakass peoples, black shamans may steal a healthy person's soul, killing him, to replace the soul of their patient. When treating sterility they do not appeal to deities but, instead, steal the soul of a child from a big family, killing a living child to allow another to be born (Tuvan and Khakass *chek kham,* "soul eaters"). Black shamans also initiate shamans' wars (*chek kham*), in which one shaman "eats" an enemy shaman's soul, killing him. In comparison, white shamans are comparatively weak and are unable to do harm.

Groups that do not categorize shamans into white and black may nevertheless distinguish them according to the worlds they communicated with, as reflected in the shaman's costume. For example, prior to the Soviet period, Urmiysk Evenki shamans who are *uginik tekechi* (having roots from above) performed kamlanye in a processed elk skin, while those having their origin in the Lower World (*harginik tekechi*) performed kamlanye in a bear skin dress. Transbaikal Evenki shamans had different types of breastplates: In contrast to the bare breastplate of a white shaman, a "dark" shaman's breastplate included metal anthropomorphic and zoomorphic effigies that represented the shaman's clan and animal helping spirits. However, a shaman could also have two dresses: one worn to travel to the Lower World, the other one for the Upper World, the choice depending on which ritual was to be performed.

Black shamans of these Siberian groups have assistant spirits, perform their kamlanye at night, use altered states of consciousness frequently, have a drum, and wear a specific costume, which shows their powers and protects them from harm. Most black shaman rites are propitiatory appeals to heavenly deities. These include animal sacrifice and publicly performed *algys* (shamanic hymn) accompanied by out-

door feasts. These most often take place in the spring and summer, usually in July. Vodka and *araky* (a mildly fermented drink) are prohibited; only milk from a white mare or from a cow milked by a virgin can be used, and a sacrifice of a white-colored animal, either a goat or sheep, is made. Sociologically, black shamans tend to be poorer and have lower social status. Since women were in the past considered impure, and could not appeal to heavenly deities, they were unable to be white shamans and became black shamans. This restriction no longer holds among contemporary female shamans in these areas.

By the early twentieth century, Buryat shamans connected their origins with either a "white" or a "black" root *(utkha),* a distinction whose meaning is now lost. The distinction might have been due to higher levels of society adopting monotheistic religions, or the black root might have implied kinship with ignoble clans. Buryat shamans with a white root (*sagaan utkha*) addressed themselves to the western *tengerin* (heavenly deities) during their rituals. Among the Buryats, white shamans could either be those with white shaman ancestors, or those who obtained a "sky root" directly from the power of gods: for example, when a near blood relative was struck by lightning, or when a "heavenly shell" (a Paleolithic or Bronze Age artifact) was found. Gradually shamans inheriting both black and white utkha appeared. Currently, in some areas, such as the Aginsk region, shamans receive black initiations as well as white ones, with one initiation conducted immediately after the other.

According to Buryat folklore, the first shaman was an eagle who sent good spirits to protect people from bad spirits. Since people did not understand his speech, they mistrusted him, so the eagle asked the spirits either to lend him human speech or to give his mission to a Buryat. The good spirits granted him his second request, and upon their command, the first shaman sprang from the union of the eagle with a Buryat woman (Nioradze 1925).

Buryat black shamans addressed their entreaties to eastern *tengrin* (deities) and maintained traditional techniques of rites and rituals, wherein magic, sorcerer's rituals, and illegal sacrifice were of major importance. For example, the black ritual, *khara khereg,* was a sacrifice to a spirit named Azharaj-bukhe, performed with a black sheep and factory-produced vodka on a moonless night. Azhiraj (literally, "devil") was a real person in the seventeenth century, a strong man who later became a protecting spirit of Buryat warriors. According to some sources, voluntary conversions of white shamans into black shamans took place, but Berngard Petri (1923) stated that the reverse conversion was impossible. Black shamans customarily wore a complex blue-colored dress and were buried in a blue fur coat *(orgoj),* whereas white shamans were buried in a white one.

In the case of the Sakha (Yakut), the situation was complicated by the so-called blacksmith shamans *(darkhan).* They were considered by some informants and scholars to be black shamans, connected with sorcery and evil spirits, wheras others subdivided them into black and white categories. Sakha black shamans *(abasy ojuna)* are contrasted with *algyschi* and *ajy ojuna* (white shamans). Their souls were milk-fed from nursing bottles in special cradles by Lower World spirits. Similar to Buryat black shamans, they had hypnotic abilities and did extraordinary feats while in altered states of consciousness—for example, they licked hard steel, inflicted and healed injuries, and levitated.

Among the Altai people, black shamans *(kara kam)* appealed to all the *töstör*-spirits, primarily to the spirits of the earth and to the master of the Lower World, Erlik. Kara kam dealt with the spirits of the west and sacrificed black animals, whereas white shamans *(ak kam)* did not appeal to Erlik.

The Kirghiz people did not make a clear distinction between black and white shamans. Distinguished *kara bakshi* (black shamans) were considered to be strong, yet weak by comparison to *ak bakshi* (white shamans). According to some references, Kazaks had *kara baksy* (black healers) who were considered to be weaker than *ak shajtandy baksy* (healers with a white devil), yet who performed as both shamans and *duagej baksy* (conjurers).

Tuvans have a complicated cosmology with a Black Sky *(kara deer)* situated beyond the upper sky strata, which controls global cataclysms. Only outstanding shamans can reach kara deer during kamlanye; both these shamans and the shamans who received their power from kara deer were considered as the strongest.

White shamans are not clearly distinguished from black shamans even among the Buryat and Sakha people, and there are differences between types of white shamans within these two groups. Sakha white shamans are connected with the cattle-breeding cult of heavenly deities *(aiyy).* White shamans *(yuryung ai oyuna)*—also called "summer" *(saingy)* since their rite was (and still is) held in the summer—were priests of the fertility cult *yysakh.* They appealed to the deities inhabiting the east: the protector of horse-breeding, Uordakh-Dzhesegei-Aiyy; the protectress of cattle, Isegei Aiyysyt; the master of the sun and fire, Ynakhsyt Khotun; the forefather of shamans, Khotoi-Aiyy (the eagle *khotoi*); and the protectress of procreation, Aiyysyt.

It has been suggested that Buryat white shamans originally were either shamans who belonged to, or worked for, aristocratic clans and the ruling clique, and that they emerged during social stratification to supplant previously existing shamans. Alternatively, they may have been priests of ancient tribal cults who appeared as the result of an earlier tribal system's disintegration and absorption by the Buryats. Among the Sakha (Yakuts) the process developed more slowly, and the original cult has elements that still exist separately from more recent shamanism. One example of this is the Yakut rite of obtaining children's souls *(Aiyyhye tardar).* Evidence of white shamans as representatives of aristocratic clans and priests of high standing comes from Chinese historians concerning the existence of court shamans among the Kidans and Mongols. They also wrote about shamans in the Chinggis (Genghis) Khan epoch, the early thirteenth century, called *beki,* or *zaarin,* who served the higher classes wearing white dresses and riding white horses (Cleaves 1982).

Among the tribal groups discussed above, it was customary that white shamans addressed heavenly deities in their rites. Most were men and wore light-colored or white dress or costume. By tradition, they were not allowed to come to patrimonial clan rites; for example, they could not attend prayers on the clan's mountains among the Khakass. When performing rituals the white shaman often did not use a drum, nor did they wear a shaman's costume or headdress. They did not need to enter altered states of consciousness. Moreover, experiencing "shaman's sickness" was not a necessary prerequisite to becoming a priest of the heavenly deities. When communicating with deities and spirits during a ritual, a white shaman did not travel himself but instead invited those beings to be present, a technique thought to be a recent development.

White shamans were highly respected and could make changes in the ritual practices and in the pantheon. The origin of white shamans *(algyschy)* is sometimes traced to the seventeenth and eighteenth centuries, at a time when a "white faith"—*Akh Chayan*—was known among the Khakass people. In the early twentieth century a nativistic movement known as Burkhanism arose in the nearby Altai region; it promulgated a cult of a white horse carrying a rider dressed in white. This movement, however, had nothing to do with white shamans; rather it struggled against shamanism, which it denounced as a "black faith."

Analogies have been drawn to some originally pagan cultures influenced by monotheism and now characterized by syncretism: In Slavic cultures, for example, there are healers and sorcerers whose practices are distinguished as either white magic (praying to God), or as black (communicating with Satan and pagan deities). Another parallel can be found in Sumatra, where *sibaso* and *datu* among the Bataks can be referred to as black and white shamans.

BURYAT SHAMANISM (MONGOLIA)

The Buryats are a Mongolian people who have lived in Outer Mongolia, primarily in several northeastern provinces and in the Buryat Republic of the Russian Federation. Although a somewhat larger majority of Buryats (about 300,000 people) live in the Buryat Republic, east and west of Lake Baikal, this entry focuses on Buryat shamanism as practiced in Mongolia presently. There is a close relationship between the Buryat Mongolians and the Buryat Russians, since prior to the establishment of the USSR there was free movement of these pastoral, herding peoples between Russia and Mongolia. The history of the area around Lake Baikal shows that by the eleventh century Mongol-speaking tribes were inhabitants of that area (Fridman 2004, 100). There has, however, been a lot of nomadizing back and forth from the southern areas of the Buryat republic to nearby lands in Mongolia. By the early twenty-first century, three larger Buryat groups (numbering in the tens of thousands all together), namely, the Aga, Khori, and Tunka, live in the following districts (*aimag*) of Mongolia: Khentei, Dornod, Selenge, Bulgan, and Hövsgöl. Some scattered families live in Töv, and of course there are Buryat Mongols who live outside these areas, in Ulaanbaatar, the capital, and other areas.

Subsequent to the collapse of the USSR in December 1991 and the opening up of Mongolia at that time, shamanism has regenerated and flourished in Mongolia, and the Buryat Mongolian shamans have been very active, starting with a conference at Lake Baikal in June 1996, in bringing shamanic traditions and ceremonial rituals to the Buryat shamans in Russia, who lost more of their traditional shamanic knowledge during the Soviet period. Although repression of religion and shamanism

was also very strong in Mongolia during this period (known as the Socialist period), because it was somewhat further from the centers of power, Mongolian shamanism has kept a more pure and traditional form. For further information on the regeneration of shamanism in the Buryat republic of Russia, see Fridman 2004, 89–209.

The Buryats were originally called forest people since their basic source of living was hunting, but at least since the beginning of the twentieth century, they have become cattle breeders. They have preserved numerous features of their hunting way of life even up to the present, among them hunting rituals, folklore, and a special kind of shamanism. Although the Buryats live in a Khalkh-dominated language and cultural environment and their own language and culture are strongly influenced by the Khalkh (eastern Mongolians who form the majority of the population of Outer Mongolia), their belief system still retains several original Buryat features.

The shamanism of the Buryats in Mongolia contains several elements similar to that of the population in the Buryat Republic, such as the strongly dualistic character of the mythology and of the world concept embodied in that mythology, and the important role of the initiation process, called *šanar.*

Types of Shamans

According to recent accounts, both types of shamans, the *xariin böö,* "black shaman," and *sagaan böö,* "white shaman," exist among the Mongolian Buryats. J̌. Coloo, who carried out fieldwork among the Buryat in the 1970s and 1980s, informed the author that there are also traces of the so-called *šariin böö,* "yellow shaman," or "shaman-lama" among the Buryats (personal communication). Beatrice Kümin mentioned in a recent article that most of the shamans are not pure black or pure white, but black-white or white-black, depending on their main protectors (Kümin 2001, 4–5).

White and black shamans use different paraphernalia (see Table 1). The black shamans have preserved the traditional type of garment, whereas the costume of the white shamans is similar to the Buryat traditional national costume and contains several parts of Buddhist origin. The headgear (*buumal cagaan orgoi,* "white headgear of the descended [god or spirit]") is similar to that worn by lamas during the performance of tantric rituals. Black shamans (or black-white shamans) use both drum *(xese)* and staff *(horibo)* during rituals, whereas white shamans use only the staff, which is different from that of the black shaman.

Mythical Background

The mythical background of shamanism among the Buryats in Mongolia is similar to the Buryat mythology, as noted by Taras Mikhailov (1987), with the opposition of the fifty-five benevolent Western deities under the guidance of Esege Malaan and Xaan Tyurmas, and forty-four harmful Eastern deities under the guidance of Ataa Ulaan (Birtalan 2001, 901–903). The deities are called *tenger,* a well-

TABLE I

Costume and Headgear	Black Shaman	White Shaman
headgear	(*maixabši*) mask with fringe; later: (*orgoi, duulga*) "helmet" or metal crown with antlers	(*buumal cagaan orgoi*) "white headgear of the descended god"
garment (degel)	made of skin of red-deer, with the imitation of skeleton, and heart, made of metal	made of blue silk (similar to the Buriat national garment),
Parts of Garment		
mirror	(*toli*) fixed to the bust of the garment	
a kind of cape	(*arxaali*) with lot of ribbons, bells, and two snake-shaped parts on the shoulders	
belt		(*büs*) silk belt
ribbon	(*jawdar*) ribbons made of brocade attached to the headgear (four pieces), to the backside of the garment (four pieces) etc.	
feathers	(*söd*) attached to the garment of shamans who completed twelve šanar-s	
idols	(*šagnuul*) lit.: "observer" a metal figure of a wild boar, worn on the right hip in order to observe the earth; (*turšuul*) lit.: "patrol" a textile figure of raven, attached to the garment in order to send ravens as messengers	
bell	(*belbegnüür xonx*) small bells of lion shape, attached to the garment, headgear, and knife	
Some Important Objects		
whip	(*bardag*) its handle is made of tamarisk and of horn of a three-years-old elk, and its thongs are made of skin of burbot fish, 9 or 10 symbolical weapons (such as arrow and bow, sword, pincers, hammer, anvil, etc.)	
drum	(*xese*) a round drum, covered with the skin of yellow goat, with nine metal pieces, and attached to it silk offerings (*xadag*)	
drumstick	(*toibuur*) made of birch tree and covered with the skin of matar (*sic!*) fish	
string of oval metal pieces	(*xolbogo*) is attached to the whip and the drumstick	
knife	(*hülder*)	
staff	(*horibo*) a pair of horse staffs, with metal pieces, ribbons, symbolical boat, paddle, tether, hobble	(*tayag*)
bell		(*xonx*) of different size
Jew's harp		(*aman xuur*)
rosary		(*erx*)
sabre		(*maxir selem or hülder*) for rituals, when the shaman demonstrates his deep trance with the licking of its edge

SOURCES: Gantogtox 1996: 79–80; Gantogtox, Kara, and Coloo 1998: 95–140.

known Central Asian designation among Mongolian and Turkic people. The division between good and bad deities in the sphere of the gods, the upper world, or sky, is reflected also in the sphere of the spirits, the middle (human) world. The Buryats, like other Mongolian groups, worship the so-called lords *(xan, noyon),* owner spirits *(ežen)* of the earth. Although the world of these spirits is divided, like the sky, the world of the gods, into benevolent Western and harmful Eastern parts, most of the spirits could be considered as ambivalent beings, in the sense that they can be offended by careless people and so made harmful. The world concept of the Mongols differentiates a third world layer (the Underworld) as well, under the guidance of Erlen Khan, but the phenomenon is strongly influenced by the Buddhist concept of hell.

One of the most important zoomorphic ancestor spirits of the Siberian Buryats is Buxa Noyon Baabai, the "Respected Bull Lord"; his worship can be found among the Buryats and also other Mongolian groups. The worship of the swan *(xun šubuun)* is important in the southern regions of the Buryat Republic and also among other neighbouring peoples (Manchu, Chinese), and it also plays a distinguished role among the Mongolian Buryats. Some shamans connect their šanar ritual with the return of the swans (Kümin 2001, 7). The world of spirits of the middle sphere is the central focus of worship, and the types of spirits mentioned above, along with the protectors, ancestors of the shamans, the *ongod* (plural of *ongon*), are also mediators between the shaman and the upper world of deities.

One of the main tasks of Mongolian and Buryat shamans is to pacify the angry spirits, and therefore all other activities, such as divination (including the finding of lost properties), healing, sending off the soul, and carrying out offerings for different purposes, are organized around this function (Birtalan 1993, 1–10). The numerous deities, especially the protector spirits, play important roles in the invocations used in rituals. The worship of a malevolent Eastern deity, Xisaan Ulaan Tenger (Red Khisan deity), is connected with a consecration ritual used for family purposes. This ritual does not require a bloody sacrifice; the chosen domestic animal, a red bausond (a piebald animal with white spots) ram, is marked with a piece of blue silk, a *xadag,* and is no longer used for work. It is forbidden to slaughter a consecrated *(heterlehen)* animal.

The Šanar

One of the most important rituals for Buryat black shamans is the šanar, which means not only "system (or chain) of initiations" (well described in the literature), but also a kind of purification ritual in a wider sense. (The initiation process of white or white-black shamans is called *šandruu.*) Thus the purpose of the ritual is double: The shaman receives a higher rank of initiation, and the members of the shaman's community can order purification rituals (usually on the third day of the šanar), in order to banish bad luck, illness, and the like. The Buryat term *čanar* (in written Mongolian *šinar,* in Khalkh Mongolian *čanar*) means "quality" in the written and spoken Mongolian languages; in this case it refers to improving the quality of the power and skills of the shaman. During the series of initiation rituals, the ability and the skills of the shaman continue to improve. Byambiin Rinčen, one of the foremost researchers in the area of Mongolian shamanism, was the first to describe the šanar initiation of the Mongolian Buryats (Rinčen 1961, 128–137), followed by G. Gantogtox (1996, 1997) and Kümin (2001), who have described the current form of the ritual. The following outline of the most important steps and the objects used in the ritual is based on the accounts of Rinčen and Gantogtox. Since there are of course many differences between the rituals in different territories, and even those done by different shamans in the same territory, this outline contains only the general features. (See also Tkacz, Zhambalov, Phipps and Khantaev 2002.)

The Ritual Place

The ritual place *(derbelge)* symbolically becomes a place for the rebirth of the shaman, a process that will be repeated twelve or thirteen times to complete a whole initiation, so that the shaman may become a *zairan* (highest degree of shaman). The ritual aims to keep and foster the shaman's agnation (clan lineage), the *udxa* (root). The dualistic principles associated

with the mythical background of Buryat shamanism appear in the ritual place, such as the cosmic principles and phenomena of ancestorship: the Sun and the Moon, the father and the mother, the old and the young, the animal and the human being. An important phenomenon is fertility and rebirth (father, mother, nests with eggs). Eighty-one (nine times nine) or twenty-seven or sixty-three birch trees *(xuhu)* constitute the frame of the ritual place, which is called *exe derbelge.* There are two more trees of larger size with roots in the ground (the rest are only put in the soil without roots) called father tree *(esege modon)* and mother tree *(exe modon).* One tree is set up to the west of the eighty-one trees, for the purpose of tying the horses of the invited spirits to it; it is called *serge,* "post tree." Although most of the symbolical paraphernalia is attached to the father and mother trees, in some cases there is a special tree for the nests called *üür modon,* "nest tree." The trees and the tent, a yurt *(ger),* are connected with a golden (or yellow) rope. Pelts and skins of different wild animals (squirrel, ermine, sable) and small axes *(tamruur)* shaped of birch bark hang on the trees. All the trees will be respectfully carried *(zalax)* to a distant place after the ritual, and will be put on a pure place such as the edge of a riverbed.

Behind the mother tree there is a tent (*xürž*) covered with felt, which is the place of the descending ongons. Between the tent and the temporary yurt built at the Northern edge of the ritual place there is a line of nine more birch trees. The yurt is built for the offerings; the nine trees are set up for nine children who are assistants *(yühenšin)* of the shaman.

Objects and Paraphernalia

Further objects and paraphernalia on the ritual place symbolize the cosmic background of the šanar; there is a red sun (on the father tree) and a white moon (on the mother tree) made of textile or silk. Three nests *(üür)* are set on the mother tree with three eggs made of wool in each nest (nine altogether), and four wedges *(šaantag)* are stuck at its roots (symbols of the four cardinal points of the world). There are some symbolic objects on the father tree too, representing the mount of the shaman: reins, made of elk's skin *(sumnaar).*

Time and Participants

The šanar is carried out in the first summer month and continues for three days.

The šanar, performed for the promotion of the shaman candidate, is conducted by another shaman of higher rank. Members of the shaman's community represent the clan ancestors and the shaman protectors: Two elderly people act as the spiritual mother and father *(exe, esege)* of the shaman, and nine children, three girls and six boys *(yühenšin),* represent nine protector spirits.

Offerings on the Occasion of the Šanar and the Process of the Ritual

Both bloody and bloodless offerings are performed during the šanar. A sheep of a blue-gray color will be offered for the šanar, and particular parts of the meat will be offered to the on-

Fragment of a Buriat Shaman Invocation to the Lord of the Drum

Xüügen n´üden	The pupil of (his) eye (is) told
Xüren er´een bürged güülen	to be (the) brown stripped (eagle)
Daiban xara xesiim	he descended governing
Ezeleže buuhan la.	my huge black drum.
Dalan želde daxahan la	Governing my seventy tongued
Dalan xeletei	drumstick
Toibuuriiyiim ezelže	that obeyed me for seventy years
Danžinai xübüün Bolod …	(you) Bolod, Danžin's son …

gons, and then consumed by the participants during the three days of the ritual. Apart from the meat, sacred white food *(sagaan idee),* consisting of some sugar, fruits, and homemade pastry, are part of the food offering. The guests and those who order a purification ritual also bring sacred pieces of blue or white silk, the *xadag,* as a kind of offering.

The ritual begins, as other shamanic rituals do, with the purification of the ritual place (with juniper, *arsa*) and the clothing of the shaman. The shaman puts on ritual garments (see Table 1) and starts a drumming invocation. In the meantime the nine child assistants also put on their special clothes and start the purification ritual, circumambulating the fire in the yurt. The šanar must start before sunset. The shaman and the nine children offer xadag to the spiritual father and mother, and the shaman continues the ritual, namely, invoking different deities and spirits. During the ritual the shaman and the nine children walk around the ritual place. Invocations and walking continue for three days. A fragment of one of the invocations used gives the flavor of this central ritual.

DARKHAD SHAMANISM (MONGOLIA)

Darkhads are an ethnic minority living in the northwestern part of the Mongolian Republic. The group is thought to have originated from Darhan tribes who lived in Barguujin, on the western banks of Lake Baikal. According to Khodöögiin Perlee, they moved to the banks of the Onon River in the second half of the twelfth century. Since the beginning of the thirteenth century, Black *(Uhaa)* Darkhads have lived on the eastern side of Lake Hubsugul, within the basin of the Chishged and Beltes Rivers. Darkhads retain a very strong tradition of shamanism, closely connected with their history and geography. Shamans treat the soul and mind and eliminate all obstacles by different types of tools and techniques. Since ancient times they have been healers and have helped people overcome bad luck and obstacles. Throughout Mongolia, shamans are divided into black and yellow. Traditional shamans, who retain the original shamanic worldview and traditions, are called black shamans. Shamans who have adopted Buddhist ideas and shamanize under the auspices of Buddhist monasteries are yellow shamans. Darkhad shamans have remained essentially black throughout the past 600 years and still have a leading position in Mongolian shamanism.

As noted in *The Secret History of the Mongols,* a classical work on Mongol history (Manlajav 1990), Darkhads were trusted servants of Chinggis (Genghis) Khan (120, 124, 219). When the Mongolian administrative organization was established, Darkhads were placed under the authority of two feudal lords close to Chinggis Khan, Boorchi and Muhulai. At the end of the seventeenth century, attempts were made to found Buddhist monasteries in the Darkhad region, but faced with the opposition of shamans, the monasteries were destroyed, and the lamas were chased away. In 1750 large Buddhist monasteries were rebuilt. Nevertheless, the isolated location of the Darkhads near the border and their privileged status as subjects liable directly to Bogdokhan (the Holy Grand Lama, ruler of autonomous Mongolia), a status that caused them to have a special "Darkhad Road" to the capital, became obstacles to Buddhist expansion. To increase Buddhist influence, Buddhists developed syncretic modalities rare in other areas of Mongolia, such as the initiation and worship of shaman *ongons* (spirits of deceased shamans) in a Buddhist manner by lamas, and the discovery of emerging lamas among shaman lineages. Simultaneously, Buddhist doctrine was propagated. Although the Buddhist monasteries were again destroyed in the twentieth century during the Communist period, shamanism remained alive among the Darkhad people. It is now limited to shamanizing on an individual basis, by invitation of a family or a sick person, but new shamans have again begun to study under older shamans.

Depending on the source of their power, Darkhads have traditionally divided shamans into three categories, depending on whether they used the power of human souls, in the form of ongons, water and nature spirits *(Lu),* or the Sky. At present, shamans who use the power of the Sky are absent, and shamans who are powered by Lu, or nature spirits, have become rare. Most contemporary shamans derive their power from the souls of deceased shamans, ongons.

In the cosmology of Darkhad shamanism, the world emerged as chaos. It collapsed, and was divided into Sky and Earth. Sky is the Creative Father, and Earth is the Mother. Together Sky and Earth formed all created substances. During the world collapse, fire emerged, surrounded by living forms. Fire is the father of light, acme of purity and symbol of power and regeneration. As do other Mongolians, Darkhads interpret the family hearth (*gal golomt,* which is both an actual location and a key symbol) as a part of the state hearth; that is, the fire-hearth of the state consists of the total of the hearths of all the families. Darkhad shamans have traditionally considered that every religion should be under the rule of the state; they respect the state to such a high de-

gree that they refer to it as the "High State." Darkhads worship the state standard (home of its tutelary genius), the white and black banners, and other emblems of the state, practices that developed among the Mongols at the time of the early formation of the state under Chinggis Khan.

Darkhad shamans perceive the world as divided into three strata, upper, middle, and lower. Human beings and animals live in the Middle World. In the Lower World, or Hell, are devils and demons, who spread evil and serious illness (Purev 2002, 79). The crown of the Sacred Tree (*axis mundi,* "the axis of the world") is located in the Upper World. The Upper World, also known as the High Continent, is the most sacred, and constantly struggles with the Lower World to protect the Middle World from misfortune and trouble.

As it was originally considered that Heaven had nine strata (nine being a sacred number), Darkhad shamanism has nine skies (sacred locations also considered deities). These consist of the State Tutelary genius, Heath, People, Father, Mother, Children, Cattle, Chattels (Goods/Materials), and Food. In common with skies of ongons, Lu, and other spirits, later concepts of Heaven stated that there were altogether ninety-nine skies, fifty-five of the west and forty-four in the east. Darkhads made libations of nine ritual sprinklings of milk by spoons with nine holes for those skies.

Black shamans also divide the universe into light and dark worlds. Our world is the Light World, whereas the Dark World is inhabited by spirits and souls. The Dark World is an empty space without destiny, attractiveness, or life. Shamans share a concept that ongons exist in the Dark World by radiating special light from their own bodies. The Dark World is understood as a lower stratum of Heaven, a space for both ongons and for human spirits. The shamans interact widely during their travel through the Dark World, meeting and talking with ongons, other spirits, and lords of that world, transmitting people's requests, desires, and wishes from the Light World to them and returning with replies and advice (Purev 2002, 127–129).

Mongolian shamans consider that people and animals have three kinds of souls. Two of these souls are mortal, but one is immortal. According to shamans, one soul comes from the maternal side (the soul that governs flesh and blood), a second is a bone soul from the paternal side, and the third soul comes from the spirits of Heaven. This third soul, transmigrated from other humans, is the vital soul. The flesh and blood soul is located in the muscles, migrating from one to another. It remains in the heart at the time of death. When the heart stops, this body soul vanishes. The bone soul is mortal, too, moving through skeleton bones. Its final location is in the pelvic bones, and it disappears when all the pelvic bones have decayed (Purev 2002, 138). The vital soul transmigrates from the Dark World to a baby in the womb, traveling through the ring finger of the infant's left hand to its spinal cord, and then migrates into the brain, spinal column, veins, and arteries. After death, it stays for a time between the first and second spinal cervical vertebra; later, seeing the light, it moves away to the Dark World and, eventually, to another fetus. Sometimes, because of fear or fright, a vital soul leaves the body or becomes lost after death, unable to find a person into whom it can transmigrate. Ordinarily, people cannot see the light of the vital soul, but some remarkable persons are able to see it. For example, in *The Secret History of Mongols,* Mother Alun-goo saw the soul of a being called the yellow lightning person (Manlajav 1990, 21).

Darkhad shamans believe that the Sky, Earth, Land, and Water each have their own master spirits. People are connected with Spirit-Lords, as well as with Khormusda (the chief of the thirty-three gods) and Lus (water spirits). After death shamans become ongons and are worshipped. Ongons are divided into home and field ongons. If within three years of his death, descendants of a shaman have enlivened his soul into an ongon by consecrating an idol and placing it for worship in the home, it is a home ongon. If, following the instructions of the dead shaman, the descendants build a special shelter in an open space and place there the artifacts of the dead shaman and there enliven the idol and worship it, those ongons are field ongons. Darkhads named such a shelter Ongon's Pavilion or called it Ongons with Pavilion. At the beginning of the twentieth century, there were approximately 600 pavilions on the eastern banks of Lake Hubsugul. During Communism most of them were burned, but some traces still exist. Peculiarities of location and

construction of the pavilions reflect differences of social organization of different Darkhad groups.

DEER IMAGERY AND SHAMANISM (SIBERIA)

Shamanic traditions of the Siberian taiga and tundra zones are rich in visual and symbolic references to deer, but the interpretation of those references faces several methodological problems. Information regarding Siberian shamanism is fragmentary or contaminated by other ideologies (i.e., Christianity, Buddhism, Marxist-Leninism); moreover, our knowledge of those traditions is necessarily dependent on the subjectivity of modern ethnographic research. Nonetheless, it is clear that references to deer, as well as to a variety of birds and to bear, were fundamental to the worldview that gave rise to Siberian shamanism. This discussion will offer the outlines of the use of deer imagery in shamanic traditions of belief and ritual within the Siberian tundra and taiga zones, using specific instances to illuminate what were certainly more general patterns.

The deer referred to here include, primarily, the moose (Old World elk; *Alces alces*) and wild reindeer (*Cervus Rangifer tarandus),* and secondarily, the Siberian maral (New World elk; *Cervus elaphus sibiricus*). Their significance within the shamanic tradition directly reflected the economic importance of moose and reindeer, both wild and tame, within the lifeways of peoples of the northern tundra and taiga zones. In areas bordering on open taiga and steppe, such as the Sayan-Altai uplands and Mongolia, the maral was also significant.

Whether in the course of his spirit journeys or within battles between shamans, the strength of the shaman and his success were directly related to the strength of his animal helping spirits (shamans could be either male or female). Powerful shaman spirits included wild reindeer, bull moose, and bear (Diószegi 1952). Ceremonies attending the tribal initiation of the shaman or the consecration of a shaman's costume and implements frequently involved the sacrifice of a deer. Among the reindeer-breeding Tofa of the eastern Sayan Mountains, the desire to drink reindeer blood was considered a sign of that individual's potential to become a shaman. The ceremonies for dedication of the shamans' implements would also involve the killing of a white reindeer and the drinking of its blood (Diószegi 1968, 247, 294).

The shaman's costume, including the gown with all its ornaments, boots, gloves, and headdress, was intended to recreate the shaman's protective animal, or the shaman as animal. In most cases, the primary animal referred to was a deer. Among the Nganasan and Ket, for example, by donning his costume the shaman was transformed into his spirit (deer) helper (Prokofyeva 1971, 15–23). The Ket believed that the deer was the embodiment of speed and lightness of flight; in this respect, the deer of the shaman was understood to be winged, like a swan (Anuchin 1914, 82). Among the Tofa, the gown of the shaman would be made from the skin of tame reindeer (stag or doe) killed in the summer, and most of the hangings, threads, and straps would also be taken from the skin or the hair of the reindeer (Diószegi 1968, 248–263, 289). The use of white reindeer hair for ornamental stitching was a frequent requirement in the ornamentation of the shaman's gown. Deer-

skin boots ornamented with visual evocations of the deer's skeleton also ensured that the shaman would assume the deer steed's speed and strength of flight (Graceva 1978, 323; Prokofyeva 1963, 143–145).

Another part of the shaman's costume, the breast cover, was often made of cloth decorated with stripes, straps, and other ornaments made from reindeer skin and sewn with reindeer hair (Diószegi 1968, 288). The Ket would use the whole skin of a bull reindeer, killed by the shaman, for the shaman's gown. The hot blood of the deer was used to enliven the iron hangings to be attached to the gown (Prokofyeva 1971, 18). Among a number of peoples of the Altai region, gowns, breast covers, gloves, and boots were frequently ornamented with sewn bands replicating a skeleton and with visual references to breasts or vulva. Some observers believe that these were references to the shaman's own skeleton (Ivanov 1955, 250; Diószegi 1968, 293), but it is more likely that the applied anatomical references reflected the shaman's animal spirit, or the animal itself.

On all parts of shaman costumes, references to deer were usually combined with indications of other animal helpers. Among the Selkup, visual references to the deer were combined with references to birds (Prokofyeva 1971, 22). The gowns of the Iukagir shamans referred to both deer and birds (59). Long strips of deer skin were often sewn on shaman gowns; these referred to the feathers or wings by which the shaman-deer was assisted in his flight (Ivanov 1955, 250–253; Diószegi 1968, 293). Strips and ornaments on the breast cover would refer back to the body of the deer as well as to birds, snakes, bear, and so forth (Dolgikh 1978, 343).

The shaman's headdress was a complex reflection of his or her protective animal spirits. In many cases, the clearest references would be to birds (e.g., Tofa headdresses, Diószegi 1968, figs. 59, 63, 70); in other cases, the headdress would be crowned by deer antlers, often in combination with bird feathers (e.g., Prokofyeva 1971, figs. 11, 13, 29; Djakonova 1978, 330–332). Among the Goldi and the Buryat, the shaman's headdresses were also crowned with antlers (Potapov 1935, 147). The front of some shamans' headdresses would be ornamented with stylized deer antlers, or a miniature saber, or even bear claws; these were the weapons with which the shaman would do battle with hostile forces (Prokofyeva 1963, 140–141; Anuchin 1914, 82–83). Such elements support the understanding that the shaman impersonated, or even became, his animal spirit in the process of the shamanic *kamlanye* (séance). The fusion of animals within the symbolism of the shaman's costume reflects the complexity of underlying mythology. Among the Yenisey Ket, for example, the deer was the embodiment of speed; during an earlier time period it was believed that the deer was winged like a swan (Anuchin 1914, 82). A Nganasan shaman's cloak collected by A. A. Popov combined deer, bird, and bear symbolic references; it thus endowed the shaman with those animals' strength (Graceva 1978).

The drum was the most important part of the Siberian shaman's equipment, since it represented the animal steed of the shaman, the means by which he or she would effect the journey to the ancestral spirits or to the Underworld (see Potapov 1968). In shamans' songs, the drum steed is referred to as a deer or a horse (Diószegi 1968, 302), although it appears that the deer reference is more archaic than that to the horse (Potapov 1935). Although the symbolic references carried by the drum and its ornamentation are multilayered and complex, the overriding reference, in most cases, is to a deer. Among the Tofa, for example, the drum would be covered with the skin of a specially hunted and consecrated deer, and its enlivening would also require the sacrifice of a special deer—often white and wild. In the course of the ceremonies of enlivening, the shaman would recount at length the life of the deer that became the drum steed (e.g., Diószegi 1968, 294–298). In the ceremony for the enlivening of Shor shamans' drums, the deer drum itself was said to whisper its story into the ear of the shaman; as the shaman recounted the deer's story, he acted it out with movement and songs (Potapov 1935, 141–142). The age of the drum was reckoned as the age of the deer, had it lived. Thus, among the Tofa, when the drum was considered to be fourteen or fifteen years old, the shaman would hang the drum skin on a cedar tree in the forest and have a new drum skin prepared (Diószegi 1968, 305, 321). The drums of Dogan, Vogul, Selkup, and Oroch shamans were also stretched with reindeer skin (Potapov 1935, 141).

Protuberances on the upper frame of the Khakass drum refer to the nipples of the deer steed, by which the shaman would be nourished on his long journey. Among the Shors and Yakut, these protuberances were understood as antlers, while the Selkup referred to them as "ears' (Potapov 1935, 141). The frame of the drum was no less important than the deer skin and was always taken from a specially selected and consecrated tree (Diószegi 1968, 268–281). As in the case of the drum skin itself, the life of the tree was understood to be transformed into the life of the drum. In the interconnection of deer (skin) and tree (drum frame) is glimpsed an intertwining of significant motifs that recur frequently within shamanic imagery and representations and that refer back to more archaic beliefs regarding the tree of life and its animal source. Trees bracketed by deer, often in combination with representations of the sun and moon, occur frequently on the backboards of Ket sleds (Anuchin 1914, 65–69). On a frequently represented shaman drum collected by A. V. Anokhin from the Altai, eagles are represented at the tops of deer antlers, or antler-trees (Potapov 1935, fig. 1). In this combination are joined three of the most important elements in Siberian shamanic and mythic traditions: the bird, the tree, and the deer.

The shaman's drumstick also often referred back to the deer. Among the Tofa, for example, the sticks would be made from the antlers of reindeer or maral, or the horns of wild goat or specially consecrated wood (Diószegi 1968, 281). Among the Oroch, the drumstick would be made from an elk's leg bone (Potapov 1935, 140–141), and among the Tuvan Soyot, the drumstick would be made from the antlers of the moose whose skin had been used to cover the drum (Vajnstejn 1968, 334). The shaman would also carry a staff or an iron wand; the wand was used in his spirit journey, in crossing icy or rocky paths, or to stave off demonic forces. The shaman's staff was also frequently ornamented with treelike projections, or with birds or bird claws, as well as with deer antlers (Anuchin 1914). Among the Enets, the staffs of the highest ranking shamans would end in a symbolic deer hoof, undoubtedly referring to the steadiness of the reindeer over ice (Prokofyeva 1963, 152–154).

Although the shaman's animal double was usually referred to as a male of the species, the same animal was also considered the mother, or animal source, of the shaman. This is reflected in the term, *grandmother,* used by Soyot shamans in speaking of their deer spirits (Potapov 1935, 139), and in the vital sustenance provided to the shaman by his deer steed in the course of his journeys to the land of the dead. The essential relationship between the shaman and his animal-double underpins the common belief that should the shaman's animal double be killed in battle with the animal double of another shaman, that first shaman will die (Potapov 1935, 150). The same intimate and vital relationship between shaman and animal double is reflected in the intertwining of the life of the shaman's drum (wood and deer skin) and the life of the shaman.

While modern observations indicate that in recent times the deer was simply the shaman's personal animal helper, such a conception must rest upon previous layers of significance, looking back to a time when the deer was first the spirit-ancestor of the shaman, and before that, the clan totem and source (Potapov 1935, 147, 149). Among the Yakut, even the moose spirits that would battle in the place of their shamans were considered to be mother animals; similar representations among other peoples of the Siberian taiga indicate that the shaman's protectors were conceived as the mother of the shaman (Diószegi 1952, 304–305). This relationship is, of course, symbolically reflected in the protuberances on the shaman's drum being seen as the nipples from which he drew sustenance during his journey.

Such a complex interweaving of the themes of impersonation and vital dependency reflects the many-layered cultural traditions underlying shamanic materials gathered in the last hundred years. Within the conception of the shamans' animal helpers may be glimpsed a progressive transformation of traditions: the most ancient formulation of the animal as clan progenitor, its evolution into a clan totem, and its reformulation as the mother source of the shaman. The most recent manifestation of this transformed animal source was embodied in the animal as helping spirit, or shaman protector (see Anisimov 1958, 1963; Diószegi 1952; Potapov 1935). In almost all cases, the constant elements in this evolving tradition are the deer (primarily moose but also reindeer), the bear, and a variety of birds. Among some Siberian peoples, the

power of the shaman's drum reflected this evolving role: The wood of the drum referred back to the tree that grew at the center of clan lands and at the place where the shaman's deer-source was born (Anisimov 1958, 156, 161–166). In its association with clan origins and conceived as both the shaman's steed and as the source of the shaman's nourishment, the drum suggests the existence of a deer of cosmogonic significance for both the clan and the shaman (Anisimov 1958, 156; Potapov 1935). The animal combinations—deer, moose, bear, and bird—reflected in the design and ornamentation of the shaman's gown, headdress, and implements doubtless reflect much more archaic levels of myth.

In surviving mythic oral fragments from the Evenk, for example, the beginning and end of life and the passage of time marked by the succession of day and night and the four seasons was held to be acted out nightly in the heavens. The movement of the Large and Small Dippers (the Great and Little Bear constellations) through the night sky were understood in cosmic terms. Nightly the cosmic moose, Kheglen, and her calf emerged from the heavenly taiga, only to be hunted down by the great hunter, Main. Within Evenk mythology, Main referred to the Master of the Upper World but also to the great bear ancestor, Mangi (Anisimov 1958, 68–72; 1963, 162–164). The repeated death of Kheglen marks the passing of night back to day; Kheglen is thus the source of both life and death; she is inextricably bound to the bear. The tensions between life and death, reflected in archaic understandings of the contrast between night and day and embodied in the opposing species of moose and bear, resurface in the ritual practices and beliefs surrounding the Siberian shaman. In this cosmological drama, we can understand the importance of the deer as embodied in the cosmic moose, Kheglen, to the belief system of the Siberians.

EVENKI SHAMANISM (SIBERIA AND MANCHURIA)

Shamanism has played a major role among the Evenki as far back as the historical record goes; many details about the practices of shamans are well attested in oral and written accounts. In addition, the material culture of Evenki shamanism—costumes, paraphernalia, drums—can be seen in museums in Russia. Even in the twenty-first century, traditional shamanism has not completely died out, although evidence of practice is difficult to find. More research needs to be done in this respect.

The Evenki are one of the ethnic groups who, in the late nineteenth and early twentieth centuries, were grouped together and called Tungus. The Evenki language belongs to the Tungus-Manchurian branch of the Altai language family. According to the 2002 census, the total population of 35,377 Evenki live in various areas of the Russian Federation in Siberia: in the republics of Sakha-Yakutia and Buryatia, in the regions of Krasnoyarsk, Khabarovsk, and Primorye, in the oblasts of Irkutsk, Chita, Amur, Tomsk, and Sakhalin, and in the autonomous districts of Evenki and Taimyr. The population of the Evenki in northeast China (Manchuria) and Mongolia constitutes about 26,000 (Census of China). The traditional lifestyle of the Evenki is nomadic or seminomadic, and their main subsistence economy is based on hunting ungulates and fur animals, seasonal fishing, breeding reindeer for transportation, and gathering. Different economic and cultural types are found among the subgroups of the Evenki, such as *Orochen* (reindeer breeders), *Murchens* (horse breeders), and *Birars* (hunters).

By the seventeenth century the Tungus people were organized into 360 fraternal clans (*T'eg'e*) of about 100 people each, although some Manchurian clans consisted of large groups—up to 1,000. Each clan bore the name of its founder with the ending *guir* (e.g., Shamaguir, "Shaman Clan") and was headed by the chief, the best hunter and warrior, sometimes a shaman. For example, the legend says that the Kindiguir was brought to the North Baikal by a shaman founder. Sometimes the clan was headed by a smith or a wealthy reindeer breeder. For decision making a council of elders *(Suglan)* was gathered. During hunting season each clan, consisting of many families, split into separate families or groups. In the nineteenth century, a typical Evenki family group consisted of four to twelve persons (polygamy occurred). In this period Evenki customs included vendetta, hospitality, and mutual help and cooperation, including *nimat*—an equal distribution of game meat among kinsmen.

The traditional religion of the Evenki was shamanism, with hunting and kinship rituals including ancestor worship, magic, and animistic beliefs that have been well developed and preserved. In the sixteenth and seventeenth centuries the Tungus population was converted to Christianity, and by the end of the nineteenth century Tungus people were registered as Orthodox Christians (although in fact they had syncretic religious beliefs, and some groups across Lake Baikal followed Lamaism). The Soviet period was characterized by suppression of and enforced alienation from any kind of religion, including such early practices as shamanism. Nevertheless, traditional shamans have survived until the twenty-first century.

According to Tungus cosmology, the universe consisted of seven worlds: three upper worlds (*Ugu buga*), one middle world, the earth (*Dulin buga*), and three lower underground worlds (*Hergu buga*), all interconnected by the

pillar in the center. Another belief suggested the existence of three, four, or five worlds communicating with each other through the world river called *Engdekit* (literally, "the place of the complete disappearance") into which flowed all the tributaries of the individual shamans, called *dolbony* (meaning "the night," which refers to places inhabited by helping spirits). Dolbony are connected with the earth through the river's whirlpools. The upper worlds, situated above the Engdekit, were inhabited by the supreme deities, the masters of nature phenomena, and the souls of the clan founders. The way to that world was through the polestar. The master of the Upper World, Amaka ("grandfather"; also called Main, Seveky, Ekmery, Boa Endury), controlled people's destinies.

At the foot of the Upper World was the world of the souls of unborn people *(ngectar)* and the world of the spirits of unborn deer *(kuturuk).* Above the mouth of the lower worlds were the charcoal darkness *(ellamrak),* the place of the center of the navel *(chunudek),* and a place called "toward the night" *(dolbonitky).* It was here that the souls of bad dead men, other hostile clan ancestors, and evil spirits resided. The souls of ancestral shamans lived on the rocks and the rapids of *engdekit kul'tyr, semilbe, urkel* (the doors). Only the most skillful shamans could travel during *kamlanye* (shamanic séance) to the Lower World, using the forty-ninth set of rapids in the Engdekit as a pathway, in search of a stolen soul *(omi, ille);* more often helping spirits were sent there. The interpretation of the shaman's death during kamlanye was that he traveled into the worst places of the Lower World.

The Evenki believed in spirits, and in the energy or will power *(musun)* inherent in all living nature. A shaman obtained musun from the master of the higher world for himself and for the sacred (taboo) reindeer. Gifted shamans and storytellers were considered to be the bearers of this power.

The term *saman* originates from the Tungus-Manchurian languages. These languages have preserved different interpretations of the terms *shaman* and *kamlat'* (shamanic rituals and practices). Terms include: (1) *yayan,* or *yaya,* the song that was sung as a prayer to the hearth; (2) *nimtsan* refers both to kamlanye (shamanic séance) and telling stories; (3) *sevenche* was originally connected with melting animal fat during rituals—*seven* means a helping spirit of a shaman; (4) *saman,* or *samaldy,* describes shamanic dancing. Fortune-tellers *(tolkin)* also played a special role. A clan could have several shamans who were different in strength. The strongest shaman (*hogdy*) of the clan was considered to be the leader who protected the clan territory and made *marylya,* a ritual of protective spirits. If a clan did not have a strong shaman, one could be invited from another clan. Women as well as men could be shamans, though since many shamans were men, the male pronoun has been used in this entry. The last well-known shaman in the North Baikal area (populated by the Shamaguir, Kindiguir, and Chil'chaguir) was an eighty-five-year-old woman from the Shamaguir clan.

It has been said that the Evenki still have an inborn aptitude for shamanism. In the past, it was noted that many children had extraordinary abilities and sometimes even had what were called shaman's seizures when at school. After the death of the clan's shaman, numerous diseases and deaths took place, a situation believed to be the result of the death of the *marylya* (the protective spirit), which died together with its master, leaving the clan territory unprotected. Then new candidates appeared for the position. As the process started of educating a prospective shaman, an education carried out by the previous shaman's spirit *(kankatcheran),* those who had become ill recovered. In some rare cases it seems that a choice between two candidates must have been made; each of the candidates must have had to prove that he was healthy and that it was he whom the spirits had chosen. There were also cases of direct inheritance of the shaman's gift through three or four generations (both on the father's and on the mother's side).

Those chosen by spirits were not necessarily young; people could become shamans at all ages. A spirit of the locality could enter a candidate suddenly while the candidate was in the *taiga,* and the candidate would start to go on a shamanic journey. When he returned, he recounted his experiences to others. He became the clan's representative to the spiritual worlds after the spirits of clan ancestors were embodied in him, and as a result the members of the clan recognized him as a shaman, and a formal sacrifice was made.

The big Evenki shaman Savej Vassiliev conducts a shamanic séance, Sakha (Yakutia) Republic, 2000. (The Center for Studying of Shamanism and other Indigenous Spiritual Beliefs and Practices, Moscow)

The development of a shaman included recognizing and getting command of the clan's spirits and learning the practices of kamlanye (shamanic séance). An elder shaman could provide help when the symptoms of an altered state of consciousness appeared: when, that is, a candidate started to tremble spastically for a long time. The teacher taught him to work with a drum, to develop a rhythm, and to fall into an altered state of consciousness. As a result, the young shaman received spirits, people recognized this, and then the status of a shaman was ascribed to the candidate.

It was commonly believed that the choice and the transmission of ancestral spirits *(havöns)* and helping spirits *(etans)* was the responsibility of the master of the higher world. The spirits entered the ears and the brain, and whispered shaman songs. The chosen one stayed alone in the tent or in the forest, and sitting in the same place he reproduced the whisper of the spirits. The spirits suggested that he kill one of the shaman birds (a loon or a cuckoo), cut it into pieces, and eat one piece each day. Thus the shaman was performing a ritual in which the etan (spirit) entered the shaman. As a result of a long isolation in the forest, a candidate felt and behaved as if he had been transformed into an animal—a wolf, a deer, or a wolverine—and then, imitating that animal, he returned to his settlement. The process of becoming a shaman could take quite a long time, often two to five years, and it might be accompanied by acute forms of hysteria.

In some localities a rattle was made during the final stage of the shaman's development. With his head covered by a scarf and the rattle upon the ground, a candidate sang shaman songs for as long as he could see the vision of the reindeer whose skin would be used for the drum. Kinsmen (often on the mother's side), following the description of the reindeer, killed it and brought it to the settlement. The drum could be made by the shaman himself, although young girls were assigned the task of preparing the skin for the drum. In order to bring the drum to life, the clan sacrificed a domestic reindeer. This ceremony solidified the status of a shaman and gave him the right to buy a shamanic costume.

The costumes of Evenki shamans had local peculiarities. The complete costume, based on a cloak or a caftan *(samasik, sevesik,* or *lombolon)* included a caftan, a breastplate, and a shoulder mantle, as well as, in some groups, a cap, footwear, and a crook. A shaman's costume was distinguished by the widening of its lower part by sewing in two to three wedges of different lengths and widths; it could also be extended with an additional piece in the form of a tail. Traditionally, the garment was made of the whole skin of a wild reindeer, an elk, a red deer, or a bear; the spinal part of the skin served as the caftan's back, the side pieces as the flaps (other tribal groups—the *Entsy, Nganasans, Kets,* and *Sel'kups*—had almost the same cut of garment). Incisions in the skin were made on the sides for the armholes. The top of the costume was separated from the widened lower part with an appliquéd belt. There were also other styles for these garments.

Decorations on the costume were abundant, with fringe, appliqués, metallic tubular pendants, copper brasses, plates in the form of a skeleton, hanging dolls made of cloth and stuffed with animal hair symbolizing spirits, fur and cloth strips, and embroideries with beads and reindeer neck hair. The most skillful and experienced shamans had a metallic plate with the imprint of reindeer antlers or golden eagle claws on the level of the scapulas. The images of attributes necessary for the shaman's travels were hung onto his caftan, and the long plaits that the shaman held onto during trance were fastened loosely to a ring on the back of the costume.

The breastplate was decorated with an embroidered strip *(turu)* bearing the image of a larch tree *(irekte)* and was necessary for the short kamlanye (ritual ceremony). Evenki in the easternmost regions wore a shoulder mantle *(arkalan)* made of one long piece of skin with a hole for the head instead of a breastplate. In contrast, those Evenki living east of Lake Baikal and along the Amur River had a crook, symbolizing a horse or a reindeer, since a shaman rode a reindeer to the Upper World, a horse to the world of the dead.

The headgear, which could be either a head scarf, a thin round cap of processed reindeer skin with fringe hiding the shaman's face, a soft crown or an iron crown with the image of reindeer antlers, differed according to the power shamans possessed or the locality. The footwear was of the same kind as that for everyday use, but decorated with bead embroidery, applications, and iron plates with the foot bone imprints. Evenki shamans who lived in the area east of Lake Baikal had a necklace *(belgantur)*—an iron circle with wooden anthropoid effigies sewn out of snake's skin. The costume represented an animal or a bird; a metallic skeleton attached to it symbolized the shaman's soul *(hargy).* A shaman could have two costumes: For example, the costume of a bird was used to travel to the master of the Upper World (for luck in hunting), and another costume was used in search of a lost soul.

There were different kinds of drums: (1) South Siberia type, Sayan-Enisey variant; (2) Middle Siberia type, Evenk-Yakut variant; (3) Far East type, Transbaikal and Amur variants. The typical Evenki drum *(untugun)* has an oval form, 1 meter in longitudinal diameter, with the circular rim reaching 15 centimeters. On the outside of the drum were bumps that created greater resonance and also resembled the tusks of an animal. The frame of the drum was covered with reindeer skin, sewn with venous threads to the rim, leaving a narrow skin strip. Big colored beads were added as embroidery to the outside of the drum, and inside an iron cruciform device with almost the same diameter as the drum was fixed on short belts; on the top of this device an iron image of a bird or reindeer antlers was placed. The center of the cross was framed by a double ring of flat iron circles, the bigger one of which had metallic pendants. On the inside rim four iron cramps with hanging rings and tubes were fixed diametrically. Occasionally on the outer side of the rim there was an iron loop. The rattle was made of wood, with one side covered by skin and the other by images. It could also be made of mammoth's tusks or wild reindeer antlers. The number of drums a shaman possessed increased as the shaman grew stronger.

The whole process of kamlanye (shamanic ritual) was associated with trance and ecstatic states, but these states were not induced by hallucinogens. The complicated techniques of working in altered states of consciousness were learned during the initiatory period, when the shaman traveled with the help of spirits; one variant of spirit embodiment consisted of yawning shamans who swallowed approaching

Protective amulets, details of an Evenki shaman costume, Siberia, Ethnographic Museum, Irkutsk, Siberia, Russia. (Courtesy of Eva Jane Neumann Fridman, Ph.D.)

spirits. In the Transbaikal region and in Manchuria there existed a technique for the embodiment of ancestor spirits using a profoundly altered state of consciousness and the loss of consciousness. This embodiment was under the control of the shaman but did not cause actual possession. In such cases the shaman was considered to be sick rather than in the state of possession.

Some shamanic rituals took the form of lengthy miracle plays. All shamans could perform a set of rituals: searching for and bringing back lost souls *(illemechipke),* seeing-off dead men souls *(tyrechupke),* consecrating a reindeer to divine service *(sevekinipke),* and communicating with the helping spirits *(sevenchipke).* Some additional rituals accompanied the major ones: obtaining babies' souls (in cases of infertility or infant mortality), stealing reindeer souls (when reindeer herds were afflicted by some kind of epidemic), and renewing the shaman's costume. Minor rituals such as obtaining musuns for luck in hunting, feeding ancestral spirits, and telling fortunes could be performed without the complete costume, but with the head covered by a scarf and with the use of a drum.

For many rituals a shaman's tent *(nymgandyak)* was constructed. It imitated the shaman's universe: It was situated in Engdekit (the world-river), had two galleries (the western one, *Onang,* leading to the Lower Worlds, and the eastern one, *Darpe,* leading to the Upper World). The effigies of havöns and etans (ancestral and helping spirits) were made and placed inside. They also made holes in the walls dividing the space in order to drag the body of a patient or carcasses of sacrificed reindeers through, for participants of kamlanye to come in, or for evil spirits to come in and go out.

Illemechipke (lost soul) rituals lasted for several days. A shaman lived in the patient's tent until he had a dream about the place where the lost soul was situated and figured out how to

take it away from the evil spirit who had captured it. Then he gave instructions for building a tent, to be constructed near the ordinary tent. Before kamlanye and searching for the lost soul, a shaman called for havöns and etans and listened to their advice, then gave them tasks; but in difficult cases he did not rely on these spirits but went himself. At the moment he departed, a sacrifice was made. The shaman made a deal with the spirit who had stolen the soul, or fought against that spirit. Then he came back with the soul of the patient and performed the ritual of purification. It was important to isolate the spirit of disease, and to mollify it with a sacrifice. Finally the soul was reembodied in its master's body or was sent to the temporary storehouse *(omiruk).* Sometimes prayers of thanksgiving to the Upper World followed, and Christian saints were also thanked.

Sending off the souls of the dead was an important ritual, one that did not depend on the wishes of the nearest relatives. The ritual was performed after the corpse had dried out, some time after the funeral, and only as a benefit for the spouse of the dead person, whose soul became embodied into a newborn child. Sometimes a shaman could send off several souls at once. These rituals used effigies made from a rotten tree that were dressed up and placed on bedding. Relatives brought food and left it before the "dead," and a shaman "fed" them. Then the relatives had a meal and a farewell with the souls of the dead people. In the process of kamlanye a shaman told his helping spirits to transport the soul to the world of the deceased. Then the shaman performed a rite of purification for all those present, and finally the effigy was undressed and discarded or hung on a tree.

In sevekinipke (the consecration of a reindeer to the service of the master of the Upper World), a shaman obtained musun (sacred energy), which he then implanted into a white male reindeer. The latter became the god's reindeer; it was not ridden, but was used only for transportation of sacred objects.

Although Evenki shamanism has not completely disappeared in the twenty-first century, it has been much attenuated due to the suppressions of the Soviet period and the loss of traditional knowledge. Further research may determine the present extent of Evenki shamanic practices.

FUNERAL RITES IN EURASIAN SHAMANISM

Funeral rites in Eurasia are the product of shamanistic beliefs, which may concern multiple souls and the afterlife, as well as ambivalent human feelings toward the deceased. Through participating in funeral rites, human beings are able to overcome or ease the fear of the physical state of the dead body and at the same time to maintain the close personal or social tie with the dead person in its family and communal settings. These seemingly opposing feelings regarding the dead, wanting to be set apart from the fearful corpse and yet desiring to continue to be close to the deceased, translate into rather complex ritual manifestations. Death-related rituals in shamanistic societies are not a creation of the shamans but the outcome of centuries-old practices and beliefs. Shamans do not necessarily function as priests who officiate at funerals, but they are strongly associated with the souls of the dead. For example, Altai shamans have nothing to do with the ceremonies for the rites of passage—birth, marriage, and death (Radlov 1893, 55). Yet the shaman is called in at funerals in order to prevent the soul of the deceased from returning, as the dead are supposed to go to the Underworld and not wander among the living. In many Eurasian societies, the shaman's role as a guide for the soul of the dead to the other world under trance is noted by scholars such as Mircea Eliade. Shamans, in their ability to control the spirit world (including the ancestral spirits), have an important function in leading and assisting the dead and with death-related rituals.

Examples of shamanistic funeral accounts in the ethnological literature are not abundant, especially for premodern times, before the introduction of the scriptural world religions such as Buddhism, Islam, and Christianity to the region. In this entry three different kinds of rites are discussed: the funeral of a Tuvan shaman, the Mongolian funeral ceremony for lamas and others according to historical Russian archives, and the Mongolian funeral ceremony as it is known from local records of folk customs. Although modern funeral rituals in cities show strong influence from the socialism of the former Soviet Union and its civil manifestation in funeral rituals, as well as from other imported religions, these archival accounts and accounts of folk customs are significant for showing the older shamanistic forms of the death rituals in Mongolia. Despite the level of penetration of Buddhism in Mongolia, funeral practices still have strong shamanistic elements.

Funeral Rites for Tuvan Shamans

Before the Soviet influence penetrated and suppressed shamanic practices, the Tuvans of Siberia buried a dead shaman *(kham)* with elaborate funeral rites. Shamans' funeral rites were considered to be important and needed to be done properly, since shamans were believed to have supernatural powers. If a proper funeral rite were not performed, various misfortunes would befall the community. For example, when a very powerful shaman called Dongak Kajgal Kham, as described in Mongush B. Kenin-Lopsan's study, died and did not receive proper funeral rites, a snowfall followed by a cattle disease plagued the whole region (Kenin-Lopsan 1978, 291–298). According to Kenin-Lopsan, the following stages of the funeral rites were reported by various informants from Tuvan communities.

First the dead shaman's body is removed from the bed in the east side of the resident tent (yurt) to the other side. The corpse is put on a felt spread on the floor, and a candle is lighted above its head. Then a shaman is invited to find out the whereabouts of the soul *(kūdel)* of the dead shaman. A fumigator is smoked, and a piece of cloth is used for the rite. The shaman finds and briefly communicates with the soul and points out the direction of the departure of the soul. After finding the destination of the shaman's soul, the place of burial is selected by the shaman or the lama, who is called for this specific task. There are no common shaman

graveyards, but the spot is chosen usually in a shallow depression or a glade in the steppe, but not in a mountainous area.

The lama puts a stake at the selected spot and draws a large circle of over 20 meters in diameter centered around the stake. A simple platform *(seri)* made of four wooden legs with Y forks to support the platform top is built to support the wrapped corpse. In winter, this platform is made on top of snow on frozen ground. The shaman's body is covered with a white cloth, and the head is placed on a round smooth stone, facing west. The right hand and its fingers cover the right ear, mouth, and right eye. The left hand is on top of the buttock. The eyes are bandaged with a white cloth. This covering is based on the belief that the nine openings of the body have to be closed after death in order to prevent any malignant spirit, or soul, from entering the body of the dead shaman.

The covered corpse is carried in an oxcart or on a horse from the shaman's tent to the burial platform with drumbeats. The drum belonging to the dead shaman is punctured, and this broken drum is used for the funeral march. This puncturing of the drum is to free the spirits residing in the drum into the air. Funeral attendance is from three to nine people or more, depending on the status and circumstance of the shaman, but it has to be an odd number. Women and children of both sexes are not allowed to participate in the funeral. (In some other Eurasian, East Asian, and African cultures, women take major roles in death rituals.) The dead shaman's drum, drumstick, and costumes are hung on the posts erected near the burial platform. His normal clothes and other belongings are distributed among the family, except for the most valuable possessions, which might be given to the lama or shaman who assisted the funeral.

After the funeral the shaman's bed in the tent is placed back again in the east side of the yurt. If the funeral rite is not performed as described above, the soul of the dead shaman might be hiding in the yurt or in another place and cause problems for the people. The actual funerals of shamans are not always done in a rigid prescribed manner but follow the basic ritual framework described above. The introduction of Tibetan Buddhism around the sixteenth century gradually replaced the role of shaman in the funeral rites over many centuries. Nevertheless, the basic outline of the rites and some of the details seem to reflect ancient Tuvan practices. These practices were shared by other neighboring peoples such as the Evenki (Tungus) of Transbailakia in Eurasia (Shirokogoroff 1935, 382).

The body of a deceased shaman was laid on a raised platform, and their belongings were placed either in the coffin or hung on a nearby tree. Several posts were erected, and carved birds were attached to the top of the posts. Birds probably signified the shaman's souls or vehicles to carry the soul off to the world of the dead. According to some Evenki in the north, traditionally a stronger shaman assisted in leading a dead shaman's soul to the other world. A shaman's funeral was not an extreme deviation from that of the other members of the community but tended to be more elaborate, due to the shaman's respected religious functions in the community. Moreover a shaman's body was treated with extra care, since a shaman's soul was believed to have strong supernatural power even after death in some cases.

Shamanistic Funeral Rites in Mongolia from the Russian Archives

The funeral ceremony was one of the most complex religious rituals of the Mongols. The Mongols considered that without the fulfillment of certain funeral rites, the soul of a dead person would not be able to find a new reincarnation, and therefore such a dead person might turn into a malicious ghost and remain on the earth, damaging living people.

Descriptions of the funeral rites of the Mongols can be found in a number of publications by Russian scholars interested in Mongolian history and ethnography: Alexei M. Pozdneev, Grigorij N. Potanin, Ivan M. Maiskij, and some others. For example, Potanin, who visited Mongolia in 1879 and subsequently published *Sketches on North-West Mongolia,* described in a general way the funeral rituals of the Altai people, Uriankhai, Darkhat, Derbet, and Buryat (Potanin 1883, 36–38). Some of his remarks suggest that he was an eyewitness of a funeral ceremony. For instance, describing a funeral ceremony of the Alar Buryat, he wrote about "a corpse in a fur coat," which might

mean that the ceremony occurred in winter (Potanin 1883, 37).

In general, the Russians described several kinds of burial ceremony in pre-Revolutionary Mongolia: Laypeople and simple lamas were brought to special places in the steppe and left there without coffins. However, in some cases notable people were buried in coffins. High-ranking lamas were cremated; their bones were ground into powder, and then, from this powder and their ashes, small monuments in the form of poles were made, to which people prayed.

Several aspects of the simplest form of funeral ceremony, leaving the corpse in the wilderness, were described by Pozdneev (1887) and Maiskii (1921, 58), who noted that being thrown out to be devoured by wild animals was the usual end of each Mongol, irrespective of rank or social position. Exceptions were made very rarely and only for those who were considered of special merit. Pozdneev noted that after a Mongol died, one of the dead person's relatives would visit a monastery. The lamas there defined who could prepare the dead for the interment, what religious services to conduct, what day was auspicious for the ceremony, at what time and in which direction it was necessary to take the dead body out of its lodging, and how the funeral ceremony should be accomplished. The correct decision of these questions was a subject of great importance for the Mongols (Pozdneev 1887, 462). They were solved (and are still solved now) on the basis of the data contained in the various astrological manuscripts. Pozdneev also wrote that in previous times the Mongols had strictly followed the instructions to commit deceased people to one of the four elements—earth, water, fire and air—but by the end of the nineteenth century they had simplified the funeral ceremony, only committing to the fire very few people, usually simply taking the body out onto the steppe and leaving it out in the open (Pozdneev 1887, 468).

An example of a burial of a lama was observed and described by Augusta D. Kornakova, an eyewitness who had lived since 1897 in Mongolia. In an article entitled "The Funeral of Khantszin-lama-geliun" written in 1903, she described the funeral of a lama. The manuscript of this work is kept in the Archives of Orientalists of the Saint Petersburg branch of the Institute for Oriental Studies, part of the Russian Academy of Sciences (Kornakova 1903).

The lama lived with the family of the shepherd Lubsan-Dorji at the river Iro in northwest Mongolia; Kornakova wrote of the man as "our" shepherd, which means that he worked for the Kornakovs and the families knew each other rather well. This would explain the fact that Kornakova found it possible to take part in the ceremony; such rituals were intimate, only participated in by the relatives of the deceased, and it was impossible for others to attend without a special reason.

When Kornakova arrived, she saw that the whole family, with all their utensils and furniture, had left the yurt. Some of the utensils were simply left in the open air, and the women were making tea there. What she wrote confirms the impressions of other authors, that the Mongols in general were very much afraid of dead people. (At the same time the Mongols as a rule were not afraid of death, believing as they did in the reincarnation of souls). She wrote that the dead man was tightly enclosed in the yurt in which he had died; even the doors of the yurt were closed with boards and tied up with cords. After Kornakova had requested it, the yurt was opened, and she, according to the custom, bowed and put down a *khadak* (a sort of a silk scarf) and a piece of white fabric (calico). She saw that the dead man was in a half-sitting position covered with a dressing gown; over him there was a big sheet of paper covered with characters and drawings. Above the head of the deceased there was an icon hanging that represented a *burkhan* (a spirit) in a sitting position (Kornakova 1903, 6). Kornakova noted that the Mongols mainly buried deceased people in a lying position, and only someone who had died in a sitting position or who was a very important lama would be buried in that position. Khantszin was not a lama of a high rank, but he had died in that position.

The coffin *(bunkhan)* was made of thin boards and looked like an armchair. As indicated above, not all the deceased were buried in coffins and with as much solemnity as Khantszin-lama was. Kornakova wrote that, by contrast, not far from the place where they lived an old woman had died, and her son

could not get a lama to read a prayer, as he had no money to pay for it. In about three days he had to bury her himself, namely, to attach the old woman by her legs and head to boards and drag her some distance away. Some days later the wolves ate her, and the son was pleased, since it meant she was not sinful.

The choice of the exact place for the funeral was of special importance. The participants of the ceremony, having approached the bottom of a naked stony mountain, went in different directions on their horses to choose the best place. Then they came back, and the main lama ran an arrow with a yellow khadak into the earth where his horse had just urinated. Then he sat down in front of the arrow and started throwing three dice in a cup. An even number was considered unfavorable. The lama tried to obtain the result of throwing an odd number three times. Only then could the place could be chosen. Having defined the place of the burial, the lama further specified where exactly in that area it would be possible to bury Khantszin-lama. Then the lama departed some distance to the mountain, followed by Lupsan-Dorji's wife. The lama took the khadak, lifted it with the both hands above his head, and started to pray. Then the lama knelt down, and the woman carried the khadak over his head and put it onto the ground. Having bowed to the ground, both of them came back to the arrow. Thus they were praying and asking the spirit of the mountain to accept the dead man (Kornakova 1903, 10–11). It is to be emphasized that a woman actively participated in that ceremony. The contact between the lama and the woman as they asked together that the soul of the dead man be accepted, along with the fact that they were asking the spirit of the mountain, indicates a specifically shamanic relationship between spirits of nature and human beings. It shows the syncretic nature of this ceremony, in which Buddhism is overlaid with shamanic ritual, or, indeed, harks back to earlier shamanic concepts and ceremonies.

Public prayer on the projected burial place had begun before the coffin with the deceased was brought there. After reading the prayer and singing, the lama, having taken a copper cup with milk in his hands, sprinkled with the fourth finger of his left hand alternately to the North, East, West, and South; thus he fed all four parts of the world, asking them to accept the deceased. Kornakova (1903, 14) wrote that, in general, the prayer signified buying a place for the deceased, and coaxing, treating gods and praying to them for forgiveness. In order to propitiate evil spirits, various figures of dough were sculptured, and then they were burned.

The coffin with the deceased soon arrived. Some time later a man who was called a *tszochi* came. Kornakova called him a shaman in her manuscript (Kornakova 1903, 17). He put on a yellow cap made in an unusual form, with several separated triangles and long black hair attached to it (possibly a face fringe), which covered his face and head. The tszochi began a shamanic performance, using a cup made from a human skull and a bone from a human arm, with three holes; he blew in that strange musical instrument, making unpleasant sounds, according to Kornakova. Then, holding a *damara* (a small double drum) in his right hand, and a bell in his left hand, he began singing in the same way lamas sang, quickly uttering words. He made various dancing steps, turning on one leg, alternately to the right and to the left.

The outfit of the man was similar to that of a shaman, but the odd musical instrument made from a human skull and an arm bone is like other Buddhist artifacts in Mongolia. Moreover, the practice of tantric Buddhism (an esoteric, specialized form of Tibetan Buddhism) makes use of caps with attached twisted fringes of black threads, which hide the face during ritual practice. It can be difficult to distinguish Buddhist from shamanistic characteristics, since both have been used together in this part of the world for centuries.

Potanin wrote that a shaman made his shamanic ritual at night, accompanying his performance with dancing and playing the tambourine; he wore a special garment for the ritual: a cloak and a cap. There were a lot of long narrow strips of cloth hanging on the front and back of the cloak, also from his shoulders and sleeves. The shaman called his cap *abugulda;* it was cylindrical and trimmed with yellow cloth, and there were various decorations on the cap band (Potanin 1881, 81–82). In Kornakova's description there are at least two elements that coincide with Potanin's descriptions—ritual dancing and a special gar-

ment. A tambourine was used in that case instead of a drum. A Mongol told Kornakova that the tszochi was not a shaman. "As I found out later from other lamas the life purpose of the adepts of the *tszochi* doctrine is to calm souls that wander on the earth and, with the help of known invocations, to make them enter a body of a deceased or his bones. . . . Women can be adepts of the *tszochi* doctrine as well as men" (Kornakova 1905, 27–28; translated by Boikova).

The participation of both a lama and a tszochi (in fact, a lama-shaman) in the funeral ceremony testified that alongside the Buddhist elements in that ceremony there were shamanist elements; a combination of pre-Lamaist and Lamaist components took place. During the funeral ceremony, the lama and the tszochi repeatedly performed simultaneously.

Another feature of the funeral ceremony about which Kornakova wrote was the presentation of eighty-one objects (nine times nine, a number sacred to shamanism), which were a payment to the mountain spirit for the ground used for the burial. These objects were as follows: nine cups with cookies, sugar, and dried fruit, nine khadaks (silk scarves), nine bead rosaries, nine packs of aromatic candles, nine pieces of silk, nine pieces of brick-tea, nine girdles, nine packs of needles with sets of buttons, and nine *tsugutsa* (small copper cups, four of which were filled with water, two with corn, one with flour, and one with weak tea, and in one of them a smoking candle was inserted).

Kornakova described the continuation of the funeral ceremony. The lama read, and the tszochi danced in a circular movement, making noises of crackling and tinkling. The coffin was brought to the predetermined place and put on the ground. Lupsan-Dorji's wife put a knapsack with some food under the coffin for the soul of the deceased. After that all the lamas, having stepped aside a short distance and turned their faces to the east, began singing, and the tszochi began to move in a circle around the coffin, and having made three big circles around it, he began to dance again (Kornakova 1905, 23).

Lupsan-Dorji's wife passed the khadak and a piece of red fabric *(dalemba)* to the lama and khadaks to all the other participants. Then she started walking around the coffin, and having made three large circles, she knelt down at the coffin, prayed, and put the khadak on a string over it. All the other participants did the same, concluding the funeral ceremonies. The next day in Lupsan-Dorji's yurt there was a public prayer, consisting of prayers for the deceased and for the well-being of the family. On the tenth day after the funeral, a public prayer, identical in format to the preceding public prayer, was repeated in Lupsan-Dorji's yurt. This account of a ceremony for the burial of the lama presents information showing a combination of shamanist and Buddhist elements, as well as the actual presence of a lama and a shaman participating in sending off the soul of the deceased for his journey to reincarnation.

Nowadays a funeral ritual of the Mongols combines both old ceremonies and new, borrowed ones. Since the beginning of the 1990s, the lama's role in a funeral ceremony has appreciably increased. Before the funeral ceremony, relatives of the deceased visit a lama. He chooses the date of the funeral and the place in the cemetery where the deceased should be buried. When the person who has died is forty-five years old or older, a lama also reveals that person's destiny after death. If a distinguished person dies, civil rites are arranged.

Funeral ceremonies are held on Monday, Wednesday, and Friday (recently mostly on Monday and Friday). In towns the dead are usually buried in graves at cemeteries. In the countryside, however, an old way is still continued—a dead person is left in the steppe out in the open space. In the countryside shamans may take part in funeral ceremonies, especially in the northern part of Mongolia, where there are quite a few shamans. After a funeral ceremony, its participants pass between two fires and wash their hands twice: "black" wash—against all bad things in life—and "white" wash—so that all in the lives of the living was good. After the funeral ceremony, commemoration for the deceased is arranged according to traditions.

Shamanistic Factors in Mongolian Funerals

To complete the account of Mongolian funeral rituals, a recent work on traditional rituals in rural Mongolia by Yūki Konagaya

(1999) is useful. As Konagaya pointed out, features of Mongolian funerals in the past and present differ, depending on the lifeways of the people who perform the rites: that is, on whether their means of sustenance is agricultural, nomadic, or of mixed economy (Konagaya 1999, 179). Buddhism brought the Indian method of disposal, cremation (in Mongolian, *gai-iyar degdegekü,* "to raise by fire"), to nomadic Mongolia, where exposure (leaving the corpse in the wild) had been their tradition. In Outer Mongolia, exposure (*Tngrid;* literally, burying in heaven) is still the predominant method of disposal. Burial (*Siroi-du Singgegekü;* literally, "to sink, or penetrate, into the earth") is common among agricultural people, especially in the area bordering on China. Regional differences are also reflected in some variations in death-related rituals. Nevertheless, as Konagaya has pointed out, based on Mongolian local records of folk customs in various regions, there are several common shamanistic elements in death rituals, as will emerge from the following discussion of four aspects of these rituals.

The Bonesetter (Barigchi, Yasuchin)

Bones were considered by the Mongolians to be the place where soul resided, and what the bonesetter did was to move the corpse to a certain posture at an early stage of the funeral preparation. Using the Tibetan Buddhist zodiac, a bonesetter was selected for the particular occasion by the lama who was in charge of the funeral. In the funeral the bonesetter wore his clothes in an unconventional way, for example putting a hat on the other way round, in order to indicate his shamanistic capacity to communicate with the dead. The bonesetter of an Altai ethnic group in southeastern Mongolia walked into the tent where the deceased was lying, whistling and making birdlike sounds, and like a shaman he instructed the dead to go to the Otherworld as he touched the deceased (Konagaya 1999, 171). Some bonesetters assisted the funeral at different stages, such as carrying out the body from the tent, when direct contacts with the corpse were required. As in the case of a midwife or shaman-healer, the bonesetter's skill was said to be obtained in a dream. The funeral seemed to be a male-oriented ritual in Mongolia, as the recorded cases of the bonesetters were mostly if not all male. Women did not even participate in the funeral procession.

Practice of Exposure

Leaving the corpse in a field to be consumed by animals and birds is called exposure, which is practiced by Mongolians and Tibetans alike. A corpse is wrapped in white cloth or a felt mat, or put into a sack and left in a field without a coffin. Unlike the Tibetan exposure practice, a corpse is not segmented in order to be fed to birds (namely, vultures), although Mongolians also desire quick consumption of the corpse by birds. Mongolians prefer birds, rather than wolves or other animals, for this purpose, since birds can carry the soul of the dead to the sky, or the Upper World, as they consume the flesh and fly away. When the corpse has not been eaten by wild animals or birds after a while, the people tend to believe that the deceased might have committed sins before death or is waiting for "somebody" or food. Accordingly food is offered, or the body might be moved to another location, hoping that the corpse will be eaten (Konagaya 1999, 175). Unless the flesh is eaten, the soul of the deceased will not or cannot go to the world of death.

This shamanistic belief in the soul was also apparent in the case of the death of infants and of pregnant women. When an infant died, a member (usually male) of the child's family put the dead infant in a sack or cradle and dropped it as he rode on a horse. Anybody who found and took out the baby from the sack would have the good luck of the birth of a child in the near future—a child who was considered to be a resurrection of the dead infant through the transmigration of the soul. In the case of the death of a pregnant woman, the fetus was removed from the woman's body and buried or cremated separately. This separation of the fetus was considered to be important in order to avoid the rebirth of the fetus as a demon. Taking out the fetus for a separate burial has also been practiced by the Ainu and other peoples in northern Japan, according to some historical ethnographic records. The tragic death of a pregnant woman caused high tension among her family and community members. Thus the deceased pregnant

woman tended to be cremated after the removal of the fetus, in order to make sure the souls of the fetus and woman traveled properly to the world of the dead. In shamanistic belief, the souls of the dead could be transformed into malignant spirits if they were not treated properly with certain rituals and offerings.

The Function of the Lama or Buddhist Monks

The function of the lama, as discussed in previous cases, varies according to region and period of time referred to. Shamanistic factors are much more evident in funeral rites in traditional rural nomadic settings, and lamas tend to have a more dominant role in urban areas, as well as in agricultural or semi-agricultural regions, such as some parts of Inner Mongolia, where both cremation and exposure are practiced. Nevertheless, a lama does not control the whole process of funeral rites. Nor does a lama's participation mean that the whole funeral is based on Buddhist rites. In fact a lama's recitation of Buddhist scriptures is often interpreted by the laypeople in a shamanistic way—as a prayer to direct the soul of the dead to the Otherworld.

Food Offerings

Food offerings at the deathbed and at the grave are necessary for the dead to complete the difficult journey to reach the Otherworld. Before the time of the spread of Buddhism, as Konagaya indicated, it is likely that a big feast to feed both the dead and the participants was held at the funeral, not at the end of the mourning period as currently practiced. This is due to the fact that any kind of communal meal in Mongolia involved the killing of animals for food on the spot. Although Mongolian lamas do eat meat, and Tibetan Buddhism does not forbid people from killing an animal for food in everyday life, killing animals at the funeral is refrained from in Buddhist countries. Instead of a funeral feast, some milk products are distributed at the funeral among the Khalkh Mongols.

The Broader Eurasian Picture

Thus Buddhist lamas have largely replaced shamans in funeral rituals in Mongolia and in other Eurasian societies; indeed in the Tuvan rituals for a shaman described in the first part of this entry, a lama was apt to play the leading role. Nevertheless, shamanistic functions and underlying beliefs are still evident in these societies. Moreover, though shamans do not direct funerals, some kind of shamanistic figure, such as the bonesetter, who is free from death pollution, functions like a shaman to some extent. The common task of both a lama and a bonesetter as well as a shaman is, in the eyes of the people, to successfully send the soul of the dead to the Otherworld.

KALMYK SHAMANIC HEALING PRACTICES

With the collapse of the Soviet system in 1991, it has become possible for the prerevolutionary belief systems, shamanism and Buddhism, to revive and take again a prominent place in the fabric of Kalmyk cultural life.

Historical Context

Historically, Kalmyk shamanism has been overshadowed by Buddhism, which can be traced back to the circumstances existent at the time when the Oirat Mongols left Mongolia in the late sixteenth and early seventeenth centuries and migrated with their flocks to the present area of Kalmykia, between the Don and Volga Rivers in western Russia.

A review of the history of the Kalmyks reveals several important factors. Since the Oirat Kalmyks came into western Russian lands as migrant nomadic tribes, they therefore were not indigenous inhabitants of the Russian landscape and had ties not only to other political entities such as Mongolia, but also to a foreign religion, Buddhism. Located within the Russian heartland, their relationship with their Russian and subsequently Soviet overlords was not only uneasy but often confrontational on the part of the superior power, culminating in their exile and loss of their lands in the 1940s.

Compared to the Buryats and the Tuvans, they were clearly the people who suffered the most at the hands of the Russians. Their relationship to their land was the most disturbed, in that there was massive settlement by Russians on their lands and great reduction in the number of their cattle already in the nineteenth century. The Kalmyks were organized in patriarchal clans. These clans structured the organization of their society; similar to the Buryats and Tuvans, there seems to have been a clear correlation between the organization of their society into clans, the pursuit of pastoralism as a means of subsistence, and the shamanic religious observances performed for the protection of their flocks and hearth.

As can be well delineated, especially from historical documents following the activities of a missonary lama from Tibet, Neyici Toyin Lama (1557–1653), in Mongolia in the seventeenth century, Buddhism overcame shaman-

ism, the final result being a kind of lamaized shamanism. It is interesting to note that the Neyici Toyin employed three methods of attack against the shamanists: (1) display of greater magic power, (2) economic inducements, and (3) greater efficacy of medicine. Therefore, the connection of religion and healing was well established at that time (Heissig 1953, 5, 519).

The old religion of shamanism did not become extinct, but rather was camouflaged under a mantle of Lamaism. Hence it was this strange mixture of Lamaist Buddhism and partially submerged shamanism that the Oirat Mongols took with them when they migrated to the lands of the Volga and the Don, a movement that took place at the time when Neyici Toyin was active in Mongolia. As evidence of the direct connection between Neyici Toyin's missionary activities and these Oirat Mongols, it can be noted that one of the migrating Oirat groups, the Dörbet, is specifically mentioned in the itinerary of Neyici Toyin between 1629 and 1644 (Heissig 1953, 27). The fact that it is possible to link the account of the seventeenth-century suppression of shamanism with one of the specific Oirat migrating groups underlines the connection between the development of religion in Mongolia at that time and the forms this syncretic Buddhism-shamanism took in the Kalmyk regions, brought there by these Oirat tribes. This connection is evident even in healing practices among the Kalmyk today that partake of both Buddhist and shamanist elements. In fact, Buddhism has always been the stronger of the two religions among the Kalmyks, and hence features of it are never wholly absent from the practice of shamanism.

The close interrelationship between Kalmyk Buddhism and Kalmyk identity as a people with a specific language, culture, traditions, and with a historical unity that has been maintained despite disruptions, is witness to the fact that these connections have deep roots. Shamanism, as the weaker religion, incorporated many aspects and gods of the Buddhist pantheon. Clear traces of this strategy survive in the present-day practice of shamanism, in particular, in the cult of the Old White Man, an important syncretic deity connecting human beings to the earth and its animate and inanimate forms.

Shamanic practices in the Kalmyk lands in the nineteenth and early twentieth centuries consistently showed traces of these traditional belief systems but also were related to and reflective of the lifeways and economic subsistence patterns of the Kalmyk people. At the time of the ritual known as Bulug Tyakxe (clear spring), which was observed at water sources, the Kalmyks would make a sacrifice of cattle, butchering the animals, cooking the meat, and eating it while drinking *arika* (milk vodka). The ritual Usun Arshan (mineral springs) was carried out at the beginning of September: Every Kalmyk arrived at the bank of a specific river or spring or well, gave three bows to the ground, and scooped up water and reverently tasted it. This practice of traditional religion, with its worship of the Old White Man, its sacred springs, tree cults, and nature rituals, as well as religious observances related to home and hearth, continued until its disruption and destruction by the Soviet power.

Evidence from laypeople, healers, and the occasional lama who survived the Soviet period indicates that deportation and exile almost destroyed the Kalmyk people. In the deportation and period of exile to Siberia, the Kalmyks suffered great loss of life and total separation from their native land. They were deliberately divided into small groups so that the sense of Kalmyk community and identity was greatly damaged. The Kalmyk language was forbidden, the practice of any religion was not allowed, and Buddhism and shamanism both went underground. There is some evidence that the shamanic traditions of healing were continued, occasionally and secretively, during that time. One account told of a rare exception, a shamanic ritual to the spirit of the waters that was performed on Sakhalin Island (Fridman 2004, 80). Buddhism, more strongly cherished and more bound to the identity of being a Kalmyk, was continued in a very subterranean manner, texts and artifacts buried if possible, taken into exile, and highly cherished.

The Post-Soviet Era

In the post-Soviet period, with respect to Buddhism, the regeneration of the religion not only has official state support, but also receives a great deal of input from the outside. The Dalai Lama has offered much help, and the current leader of the Kalmyk lamas, a Rinpoche (a Tibetan Buddhist Lama) from the United States,

Dedushka Arkadi, Kalmyk shaman healing. Elista, Kalmykia, Russia, 1996. (Courtesy of Eva Jane Neumann Fridman)

has brought in encouragement and a sense of renewal. In the deportation and period of exile to Siberia, the Kalmyks suffered great loss of life and total separation from their native land. They were deliberately divided into small groups so that the sense of Kalmyk community and identity was greatly damaged. The Kalmyk language was forbidden, the practice of any religion was not allowed, and Buddhism and shamanism both went underground. The data from the lamas in Kalmykia indicates that the regeneration of Buddhism has relied heavily upon assistance from the outside—from the Dalai Lama and from all the help that an institutionalized religion can bring to bear in the reestablishment of buildings for the practice of religion, schools, books, and objects of worship, many brought in from Tibet or Nepal via India to help assist the regeneration.

Shamanism, on the other hand, is renewing itself without assistance from any outside source. It was weaker to start with and more vulnerable to the Soviet destruction because shamanic practice was tied to the appeal to particular local spirits dwelling in specific water sources and trees, or the fire in the hearth, and hence when the people were torn from these sources, the religion lost its vital nourishment. The attachment of the Kalmyks to their homeland in Russia is very real and compelling—these people kissed the earth when they returned after years of exile.

Shamanism is, however, renewing itself in the form, not of rituals to nature or of offerings to springs, but of healers who are looking into water, doing energy massage, cutting black and white thread to bring blessings for the New Year, and dealing with all the mundane as well as magical problems brought by people who are living through difficult times and are anxious for help. The shamans are, moreover, often without training and without example, getting their strength from their connection to the spirits of nature—air, water, fire, and earth—and from deities they have traditionally turned to, such as the Buddhist deity Tara or the Old White Man, a syncretic figure. Shamanism, therefore, in Kalmykia, has limited itself as a re-

sult of suppression both by Lamaism and then by the Soviet power to the single function of healing.

More sensitive than Buddhism to the displacement from kinship clans, specific sacred locale, and attachment to the aspects of nature familiar in Kalmykia, shamanism has, comparatively, not made a strong recovery. However, healers have appeared in quite surprising numbers in response to popular demand, and are drawing their strengths from their connections with ancestral spirits as well as the spirits of nature and locale.

In the revived practices of traditional healing in the 1990s, shamanism plays a role in two ways, given the nature of the syncretism between Buddhism and shamanism. The essential point is that the syncretism between Buddhism and shamanism works both ways: Shamanic healers have incorporated a great many aspects of Lamaist Buddhism, but Buddhist lamas have also taken in some of the elements of the shamanistic worldview into their healing practices.

Lamas

The key difference between Lamaism and shamanism in the practice of healing in Kalmykia depends on whether the healer relies solely on Buddhist prayers, mantras, and chants to effect the healing activity, or whether there is an additional internal process whereby the healer calls upon spirits to offer assistance. Some lama healers rely primarily on Buddhist prayers and attributes, with minor shamanistic components in their healing practices, whereas others additionally call upon the spirits, entering a trance state often completely imperceptible to the observer. Indeed, it lasts for such a short period of time that it is almost a nonevent, except that the healer claims to have been able in this brief interval to make a meaningful connection with his helping spirit. Shaman-healers may be male or female, although female shaman-healers seem to predominate; lamas are always male.

This reliance on Buddhist prayers and attributes, while still having extremely short periods of altered states of consciousness for contacts with spirits, can be illustrated in the case of Bazarsad, a Buryat lama healing with Kalmyk methods. He has been working in Kalmykia as a healer since 1991 and says that although he is a lama, everything in his practice, except for the prayers, is shamanistic. That means he talks to spirits and can go into a trance. He has his protector, his guru, and the local spirits of sky, water, earth, and fire, which are helpful guides for him (Fridman 2004, 70).

For example, he did a ritual with black and white threads to bring good fortune for the forthcoming year for the young man who was his patient. He laid out one black and one white thread, and the young man twisted the thread together. Bazarsad chanted Buddhist prayers; he sat with his eyes closed, hands clasped, and chanted Tibetan prayers from memory. After the prayers were completed, he cut the black and white twisted threads with scissors into 1.5-inch strips. These little strips were folded into a paper. After his session with the healer was over, the patient was directed to go outside and light this paper with a match so that it would burn and the threads scatter in four directions. This is a ritual that strays over the boundary between Buddhism and shamanism, belonging in both camps by virtue of the fact that Buddhist prayers in Tibetan are recited while magical procedures are followed relating to the spirits of the four directions.

Other lamas who practice healing follow more traditional Buddhist methods, with some aspects of shamanistic thinking occasionally apparent, such as prayers to the Old White Man and Buddhist ceremonies outside on the steppe.

Shamans

Data from shaman healers interviewed in 1996 demonstrated clearly that what happened in the case of Kalmykia was a narrowing of shamanism so that it became limited to only one function, that of healing (Fridman 2004, 86). The reasons for this limited function of shamanism have to be sought in the history of the Kalmyk peoples themselves: in their migration a long distance away from their homeland, in their history of repression at the hands of the Russians with dissolution of their republic, a trauma repeated even more drastically during the Soviet period. Shamanism still, however, relies on a specific connection to a locale, to spirits of the place, in order to be performed. Some shamanic healing did take place in Siberia on Sakhalin Island, but the only example of a shamanic ritual

(which was performed to good effect) in Siberia, was done to specific water deities of the locale. In the post-Soviet period, healers have described communing with spirits of the place or of the locale of the patient in order to heal the patient, but admittedly specific instances of this have been difficult to record, due to the shamans' fear of revealing who these spirits are (Fridman 2004, 87).

The level of trance (altered states of consciousness) that these Kalmyk shaman-healers can achieve seems to be very brief. A few shamans have been trained by other shamans to do healing, and most of them have had ancestors who were bonesetters or could do shamanic healing. There is a well-established pattern in Siberia of a person who comes from shaman ancestry and receives a "call" to become a shaman, often through an inexplicable illness that does not get cured until the person accepts the "gift" of becoming a shaman and receiving spirits. Kalmyk shaman-healers do describe this pattern in their own personal histories, and since they all claim to go into an altered state of consciousness, albeit a very brief one, it is possible to classify them as shaman-healers. In terms of their social positions, they operate primarily in a modest way as alternative healers in a system where modern allopathic medicine does not function as well as it might. On the whole, the connection for the Kalmyk shaman-healers to the spirits of the locale has been revived in a weakened form, indicated by the fact that their practice does not include rituals in nature, but is limited to healing. Since healing was also attested to historically, the argument can be made for a continuity of practice since the seventeenth century. Reconnection to place, however, has been necessary and essential for shamanism to regenerate.

As examples, two of the shaman-healers can be briefly described. These accounts are based on fieldwork conducted by the author in 1996 (Fridman 2004). Even the more traditional shaman-healers, such as Alexandra Semenovna (Schura) have many important components of Buddhism in their practice. She was born in 1946 in the Krasnoyarsk region, in southern Siberia. A teacher of the Russian language, she began to do some healing occasionally; since 1986 she has been doing healing full time and has a busy healing practice, with an average of seven to eight people who come to her home every day for healing therapies. Schura began to heal people after she had been ill for many years. Typical of the calling to become a shaman, healers almost always suffer from chronic and incurable sicknesses until they finally give in to the spirit's demand that they become a shaman and practice this calling, whereupon they become asymptomatic. In addition, Schura had ancestors—her maternal grandfather, her father and her mother— who were healers. Schura says her mother is "clear-sighted," meaning she can foretell the future from prayer beads. Schura's spirit helpers include the Old White Man, the Buddha Maitreya, and the Medicine Buddha as well as the Green Tara, the Avalokuteshvara, or the Buddha of compassion, and the White Tara. She stressed the importance of the Old White Man, who is associated with special prayers to the earth and animals and has a shamanistic origin.

Schura has said that the soul of the dead person talks to her. She then conveys this message to the sick person: "He wants vodka, bouillon, food—you must go home prepare a hot tea, give it to an old woman or an old man and then they will remember this [deceased] person" (Fridman 2004, 77). She has said that she can look at the sick person and see clearly the spirit of the dead people as if they were alive. She knows that a specific spirit is the spirit of that specific person, and she even knows how he died and what catastrophe caused his death. She sees the various gods of that person—the god of the earth, little grandfather, *domovoi* (spirits of the house), and *xozzyan* (the master or caretaker of the house). Schura's practice as a healer is quite typical of Kalmyk shaman-healers in her use of massage, bioenergy concepts, and healing of physical as well as mental disorders. An integral component of her ability to do this healing is the strength she draws from her personal protective spirits and from Shamanist-Buddhist deities.

Lyubov Gavrilovna is a healer using both shamanistic and Buddhist methods who comes from a family of healers. She has been healing for forty-five years, much of it in secret. When she was eleven a special ritual was done for her because she had been ill with epilepsy; Kalmyks perform this ritual when they think a child will die. The shaman-healer will ask the Old White Man to come into her head and give informa-

tion; theoretically it is the spirit who is doing the healing, not the healer. After this ritual of the Old White Man was done by a shaman, a ritual for the White Tara (because Lyubov Gavrilovna, the patient, was female) was done for her by Dalga Aka, a lama, who also became her teacher. After this ritual she had to sit on a special mattress for prayers for forty-nine days and was not able to eat butter or meat. She put on a white jacket, then a chemise, and then a dress whenever she sat and prayed. She still continues to do these forty-nine-day prayers, sitting in a special white tent, and when this period is concluded she will offer a special prayer. Then she is able to eat sheep and grilled meat and butter.

Lyubov uses many Buddhist elements in her practice and has many shamanistic attributes. She learned prayers for healing from the lama who was her teacher and from a woman, Agdza-Ava, who was a powerful healer, a shaman who could heal people who had speech and hearing problems. Lyubov's daughter said that her mother learned many secrets from this woman, which she has revealed to no one but which she uses in her healing practice. She specializes in healing children who cry and have temperatures, but she can also heal people with mental problems by giving energy with her hands and reading secret shamanistic prayers she learned from Aka, her teacher. These prayers are so secret that no one knows what they are, but she must transmit this information before her death, or else she will end up in the Underworld.

The revival of shamanism in Kalmykia, although meaningful to the practitioners and their clients, is weak when compared to that in Tuva and Buryatia. In Kalmykia there are only individual healers, whereas in Buryatia a society of shamans has been formed, and in Tuva the Dungur Shaman Society already has a house where they do healing by appointment (having replaced the Buddhist Society that was formerly housed there).

KAZAK SHAMANISM

Few Kazaks, many of whom live in the Republic of Kazakstan, formerly a part of the USSR, have ever seen a shaman, but some of the elders retain vivid memories of healers in the early Soviet period who used ecstatic healing methods. Reports of Kazak shamans today are misidentifications of Muslim healers or fortune-tellers who display minor traits of shamanship.

In Kazak, a Turkic language spoken by 11 million people in Central Asia, the general word for healer is *emshi* (from *em,* "cure"). The emshi tradition once included a shaman-like figure *(baqsı),* who specialized in ecstatic rites of healing and divination. It still includes the mullah (*molda,* from Arabic *mawlā*), who heals by reciting the Yasin Sura and other verses from the Quran. The *täwip* (Arabic *tabib,* doctor), often a woman, emulates the Islamic curing style of the mullah, even when she lacks his Quranic knowledge. The Kazak shaman was one historical refraction of this emshi prism. When the Soviet cloud lifted, Muslim healers calling themselves molda and täwip, but not *baqsı,* reemerged into the light of day.

Many täwips are herbalists, specializing in the therapeutic flora of Central Asia, where native medicines are packaged commercially and available in pharmacies. Hallucinogens do not figure in Kazak healing practices.

Kazaks consult the *balger* or *palshı* (diviner) (from the Persian *fal,* divination) for prognosis of life's uncertainties, for example, the outcome of medical treatments, finding lost objects or people, or identifying a suitable marriage partner. The balger is often a woman and a public figure, plying her trade in the bazaars—unlike the mullahs and täwips, who stay at home and wait for patients to come to them. Like yesterday's shaman, today's täwip may be a balger as well. Prying into God's future is sometimes condemned by the mullahs, though they may proclaim themselves the best of all possible fortune-tellers.

History

In the fourteenth century a contest of spiritual power involving an ordeal of fire between a group of Sufis and the court shamans of Özbek Khan resulted, according to a legendary account, in victory for the Muslims and the conversion of the Golden Horde (DeWeese 1994). The story implicates shamans in the political structure of this Turko-Mongol state, from which the Kazak, Uzbek, and other Turkic peoples emerged. As the legend was embellished, the victorious Sufis were identified as disciples of the twelfth-century Sufi shaykh, Ahmet Yasawi, who is celebrated by the Kazaks as the wellspring of Islam on the Kazak steppe.

As Kazak clans became spiritual clients of the Qojas (Persian *khoja*), members of a Muslim honor group with roots in the Sufi tradition, shamanship lost its force. Though the Qojas are thoroughly Kazak in language and culture, they claim Arab bloodlines back to Ali and Muhammad and are therefore revered by the Kazaks for their healing powers. The shaman was a common healer with Kazak rather than Arab blood, socially inferior to the Qoja, who performed "Muslim cures" (*musılmansha em*).

In the 1860s the shaman was described by Chọkan Valikhanov, the first Kazak ethnographer (1985), and later by M. Miropiev (1888), Abubakr Divaev (1899) and Joseph Castagné (1930), whose works have been excerpted in a Kazak-language anthology on shamans (Däūrenbekov and Tursinov 1993). Russian scholarship treated the shaman as an obsolescent survivor of the nomadic cultural phase and thus encouraged the Soviet attack on the old healing arts. It also fostered the evolutionary idea that shamanism had once been the "nature religion" of the Kazaks. Taught in Kazakstan's public schools, this idea makes the shaman into the first Kazak environmentalist.

The Kazaks call the shamanic séance *oyın,* a Turkic word meaning play; they also call it *zikir,* from *dhikr,* an Arabic word meaning remembrance of God. According to the standard interpretation, Quranic terms were transferred to the shamanic context because the Sufis of the Yasawi tradition displayed ecstatic behavior that reminded the Turkic peoples of their own shamans; shamanism then infiltrated the Muslim world via the Sufis (Köprülü 1991). For example, the exuberant *dhikr-i jahr* (loud *dhikr*) was a Yasawian devotional rite that had a therapeutic counterpart and was compatible with native curing styles. A corollary view is that the shamans doomed themselves when they struck a deal with the Sufis and Qojas from a position of weakness, adopted Islamic terminology, and were absorbed by Islam (M.O. Aūezov, in Däūrenbekov and Tursınov 1993, 98f.).

An alternative interpretation is that, as Sufi rites were domesticated in Kazak life outside the framework of Sufi brotherhoods, the Sufi dhikr itself gave rise to shamanic performance. If that interpretation is valid, the Kazak shaman can be understood as a latecomer. Devin DeWeese (1997) argued against the view that shamanship in Central Asia was a coherent, archaic religion that survived by borrowing from Islam. Since the time the Kazaks became a distinct people in the fifteenth century, there is no historical data to support the standard theory until the "ethnographic shaman" comes to light in the nineteenth century. Glorified by Europeans who were entranced by Siberian shamanism, these latter-day Kazak shamans may have been little more than popularizers of Sufi and Qoja healing arts, especially among women. One strength of this theory is that it clarifies the origins of female täwips in Kazak culture today. Vladimir Basilov's belief was that men lost interest in a shamanic career that had sacrificed its social prestige to the spiritual power of Islam (1995, 11).

Modern folk healers in Kazakstan's urban centers draw more from Russian parapsychol-

ogy, New Age spirituality, and the aura of the Islamic healing tradition, than from shamanism. They are called *ekstrasens* (extrasensories) who use *biotok* (bioenergy)—Russian words without counterparts in the Kazak language.

Two Female Shamans

When the shaman is described in the Kazak language, the ecstasy of dance, musical performance, and ordeals of fire, self-piercing, and snake-handling are said to produce transformed physiognomy and visions of the shaman's helping spirits. Two testimonies recorded by the author in 1995 are examples of how the shaman is remembered:

Aybibi, a Kazak woman born in 1916, came from a long line of shamans on her mother's side. When she married she was taught the Islamic prayers and forced to abandon shamanship, but her mother was a shaman until she died in 1963. Aybibi said that there are no shamans left anymore, but she described them as follows:

> They would carry a *qobız* [a small stringed instrument] around on their back. They would sit in front of the sick person and play. They would go way up to the top of the house, to the smoke hole of the yurt. Their countenance would light up like fire. . . . The ancestor-spirits lifted them. . . . My mother was a shaman with her helping-spirit joined to her soul (*jan qıyılıs pirim baqsı*).

Musical performance and invocation of the spirits was said to produce levitation to the top of the yurt, where the shaman met his or her helping spirits. Healing occurred when they drove away the evil spirit oppressing the patient. Aybibi's maternal grandfather was a shaman also; shamanship could be passed from father to daughter (Privratsky 2001, 220f.).

Uljalġas, a Kazak täwip born in 1942, ridiculed the shaman's séance as a "jinn performance" *(jın oynaq),* but said her mother was one:

> Among all the ancestor-spirits the most fearsome are the jinn of the shamans. When they sit there moaning with their *qobız,* their spirits come. They romp, they don't stay in one place, they fly off, no matter how heavy their body. They fly off to heaven, skipping, their feet not touching the ground. The old shaman woman puts the coal shovel in the fire, heats it up, licks at it, then her whole face dries up, and then she performs. She puts the sick people in the middle and performs around them, leaping into the air. (Privratsky 2001, 221ff.)

Uljalġas's mother called her helping spirits "black giants" *(qara däūlerim),* from the Indo-European word for deity (Persian *dev,* Latin *deus*), also "black masters" *(qara pirlerim),* using a title for the leader of a Sufi community (Persian *pīr*), and she envisioned them in physical form as "black stud-camels" *(qara narlarım).* She also invoked "a floppy-eared swaggering snake, as tall as the door frame, with a face like the moon" *(kere qulaq, ker jılan, bosaġa boylı bop jılan, ayday aldı ay jılan)* (Privratsky 2001, 221ff.). In Siberia her camel-spirit and snake-spirit would be called the shaman's "animal mothers."

Current Healing Strategies

All Kazak healers today use non-ecstatic techniques that reflect Islamic ideas about the origin of illness. An enemy's curses, conveyed by means of the evil eye *(köz),* bitter tongue *(til),* or pointed finger *(suq),* or by sorcery *(ırım, dūa),* result in "blocked ways" *(baylaġan jol).* Sickness may also occur when one is "touched by cold" *(sūıq tiygen),* causing imbalance in the "hot" and "cold" properties of the body. This is the humoral theory of disease from classical Greece that was formalized in Islamic medicine by Ibn Sina (Avicenna) in the eleventh century and diffused across the Muslim world and Europe. The following methods are used by Kazak healers today:

1. Taking the pulse *(tamır ustaū),* because it is the body's barometer, by means of which the ancestor-spirits communicate a diagnosis to the healer by special revelation *(ayan)*
2. Divination *(pal ashū),* another way of seeking an intuitive diagnosis from the ancestor-spirits, either by casting forty-one sheep-dung pellets *(qırıq bir qumalaq),* or by scapulimancy (divination of the future by observation of the cracking of a mammal's scapula that has been

heated by a fire) *(jaūırın oqū),* or by reading tarot cards
3. Reciting the Quran (Koran) *(Quran oqıtū)* and breathing *(dem salū)* or spitting *(tükirū)* on the patient—a practice said to have been used by Muhammad himself
4. Exorcism *(jın alastaū),* commanding the evil spirit to leave in the name of the ancestor spirits
5. Massage
6. Herbal treatments
7. Dietary suggestions

The shaman's dancing and ecstasy have been replaced by Islamic folk therapies. Qojas and mullahs prefer the first, third, and fourth of these methods, sometimes the second, often rejecting the others as unspiritual. Täwips may specialize in any or all of them.

Ancestors and Helping Spirits

In the Kazak worldview every Muslim has ancestor spirits, or *arūaq* (Arabic *Ruḥ?,* plural *arwāḥ?*), but the healer has more spirits than other people have. The healer must have at least five, because the average person has four. Belief that the shaman had more spirits than other people occurs also in the Siberian and Native American traditions.

In Kazak the sacred essence, or animus, in people, natural objects, and places is traditionally called *kiye,* a concept similar to the Polynesian mana. The kiye of the healer is pitted against the *iye* (master) of the disease *(aūrūdıng iyesine adamnıng kiyesi qarsı qoyıladı).* The Kazak expression, *kiyesi qashadı* (literally: "his or her soul escapes"), which is now used figuratively to describe someone who is startled, suggests that sickness or derangement was once thought to be caused by soul flight. There is, however, no other evidence that retrieving souls was ever part of the Kazak healer's repertoire.

Kiye is seldom used in the noun form any more. Too impersonal for a Muslim people, it was overwhelmed by the Semitic ideas of soul *(jan)* and spirit *(arūaq).* The Kazak healer's helping spirits are his or her Muslim forefathers *(ata-babalar),* sometimes including foremothers *(ata-analar);* they are "pure spirits" *(taza arūaq)* because they were Muslims. Qojas are the most powerful *(kiyeli)* healers, and their burial grounds are sacred places *(kiyeli jer),* because their ancestors were Arabs, conferring Allah's blessing. Uljalġas described her spirits as gentle Muslim spirits *(momın arūaq),* unlike the shaman's jinn *(jındı arūaq).* This worldview makes her a Muslim täwip, self-consciously distinct from the baqsı (Privratsky 2001, 221ff.).

Domestic culinary rites are dedicated to the Kazak family's ancestor spirits. As in other Muslim societies, funerary meals are organized by the elders of the family and blessed by a mullah whom they have invited to recite the Quran in memory of the dead. In the historical record the shaman is never associated with these memorial meals. Although they are congruent with the Turko-Mongolian funerary tradition, it is an error to treat them as evidence of shamanism.

The Shaman's Sickness and Calling

The ancestor spirits "burn" in the Kazak healer *(arūaq jaġıp jüredi).* As she treats patients they "press" her *(arūaq qısadı);* her heart beats hard, and the spirits reveal a diagnosis. The healer's first experience of this pressure is life-transforming. Chronic illness raises the question whether the ancestor spirits are calling the sick person to become a täwip. A chronically ill person will be advised to start healing others to see if this will produce a self-cure. Although this replicates the well-known "shaman's sickness" (Basilov 1989), Kazaks take up a healing ministry as a kind of recommitment to the Muslim way of life—what I. M. Lewis calls the "therapeutic route to Islam" (1986, 98). A dream vision of the Muslim ancestor spirits, or sometimes of a local Sufi saint, or of Muhammad himself, certifies the vocation of the new healer, and the elders of the family give their initial, or "small," blessing *(kishi bata).* This beginning may be followed by an apprenticeship to a senior healer, who gives a final, or "pure," blessing *(aq bata).*

Therapeutic Paraphernalia

The Kazak healer's tool kit includes the Quran, the Muslim's rosary of ninety-nine beads, a horsewhip, a knife, and forty-one pellets or beads for divination. No shamanic costume is involved. While the patient's pulse is taken or the pellets are cast, the Quran and/or the rosary may be held in the healer's hand, because a diagnosis is being intuited from Muslim ancestor spirits. The whip and knife are waved ritually

over the patient to drive out demons or to suggest the cutting out of the thing that hurts. On the end of the whip there may be owl feathers to protect the healer, because the owl is *kiyeli,* a sacred animal. The disease stays with the feathers, so the disease cannot migrate to the healer.

Music

The *qobız* is a bowed stringed instrument specifically associated with songs that induce shamanic trance. The absence of musical performance distinguishes today's täwip and mullah from yesterday's shaman. The shaman's qobız and drum are idealized in Kazak folk memory but also feared—a contradiction that reveals the ambivalent place of the shaman in the social memory. Conservatory musicians who learn the qobız are viewed as treading on exciting but dangerous ground.

Miracles associated with shamanic music were recorded in the early ethnographies. One famous story features Qoylıbay Baqsı, who hung his magical qobız on a tree and challenged some cocky young men on horseback to beat his instrument in a race. The tree, empowered by the qobız, was lifted from its roots by a whirlwind and won the race, leaving the riders in a cloud of dust (Valikhanov [1862] in Däūrenbekov and Tursınov 1993, 38f.; Castagné 1930, 64f.).

However, the days of such miracles are over. When Kazaks need a healer, they go to a medical doctor, or, if the ailment appears to have a spiritual cause, to a täwip or a mullah, preferably one who is a Qoja with Arab blood. Resorting to a shaman is no longer an option, because "their seed has dried up" *(tuqımı qurıp ketti),* as an old Qoja said to the author. The shamans let themselves be interpreted through Islamic lenses and have lost their independent identity. Whatever they may once have been, today's Kazak healers think in Islamic terms and display therapies that are similar to curing styles in other Muslim societies.

KHAKASS SHAMANISM

The people called the Khakass, living in southern Siberia, including the ethnic groups of the

Kachintsy, Sagaitsy, Kyzyltsy, Bel'tyry, and Koibaly. Linguistically they belong to the Altai language family (the Khakass subgroup of the Uigur-Oguz group of Turkic-Mongol branch). Their original settlement was in the Sayan-Altai plateau, and the Khakass-Minusinsk basin, consisting of natural zones of taiga, forest-steppe, and steppe.

Historical Background

There are more than thirty thousand archaeological sites of different cultures within this territory. The valley of the Middle Yenisey River, the area known in Chinese chronicles as the Kirghiz State, whose population was called Yenisey Kirghiz or "Khyagasy"—the ancient name for the Khakass people—was known from a sixth-century C.E. runic script. There is little documentation of beliefs and practice from the period between the thirteenth and the seventeenth centuries. In the seventeenth century the Russians called the region the Kirghiz land. In 1703, 15,000 Kirghiz people were moved to Dzungaria (now western China); about 6,000 people were left from the original population of four *uluses* (principalities) (see Levin and Potapow 1964). In 1727 the uluses voluntarily joined the Russia Empire and became part of the Yenisey government region known since 1913 as the *volosts* (districts) Kizil, Kachinsk, Koybal, and Sagai. In 1923 the Khakass *uyezd* (district) was formed, and since 1930 it has been an autonomous oblast (province). In 1991 the Republic of Khakassia became part of the Russian Federation, with a territory of 62,000 square kilometers and the capital in Abakan.

In 1989, the Khakass population totaled 80,300 people, with 63,000 of these people living in the Republic of Khakassia and comprising less than 12 percent of the republic's population; 6,500 Khakass live in the Krasnoyarsk region, and there are 2,300 living in the Republic of Tuva; there are only 1,500 Khakass in Kirghiztan, Kazakstan, and Uzbekistan. Their main occupation was cattle breeding of a seminomadic type, hunting, and plough agriculture. The traditional shelter was a yurt, which could be dismantled and moved. In the summer the yurt was built from birch bark, and in the winter it was made of thick felt. Since the nineteenth century, yurts have been made of wood, and more recently, following the second half of the nineteenth century, the Khakass no longer used yurts and lived in wooden houses. In Soviet times, cities appeared, and currently only 10 percent of the population in the capital, Abakan, identify themselves as Khakass.

The traditional beliefs and culture of the Khakass were heavily influenced by shamanism. Ritual culture was well developed, with many folktales and songs. Musical instruments used for these songs consisted of percussion instruments, rattles, wind instruments, and string instruments (including some that use a bow); the most ancient of these instruments is possibly the drum, of which examples still remain. The shamanic drum *(tür, tüür)* is big (70x75 centimeters) and slightly oval; the circular rim is wide (minimum 12 centimeters), with at least six knobs on the upper part and a thong loop. On the inner side of the circular rim there are metal pendants. On the upper half of the drum there is an iron rod with pendants and ribbons. The handle is flat and made from birch wood. The drum is covered with the skin of the male Siberian stag with drawings of the upper and middle worlds. The drumming stick *(orba)* is made from the bone of the stag; one side is covered with a roebuck leg-skin *(kamus)* and on the other there are copper plates and a ring with ribbons *(chalama)*. The instrument is similar to the Shortsy type *(kachintsy, sagaitsy, bel'-tyry)* and to the Sayano-Yenisey types (part of the *kachintsy*).

A narrator *(khaidgy)* was charged with the narration of sacred folktales, which were accompanied by the *chatkhan,* a musical instrument with seven to eleven strings. Shamans wore costumes when they performed these dances and songs. Examples of these costumes still remain, some in Russian museum collections, such as those displayed in the Museum of Ethnography in St. Petersburg. Some costumes consist of short jackets or longer caftans from sheep, roe, or Siberian stag skin sewn with the fur side inside and covered with black cloth. Costumes are often decorated on the back with cowry shells, some small metal decorative objects, and long fringe, as well as a pair of bird's wings or paws with claws. The Kyzyltsy and Kachintsy costumes have additional shoulder capes—pieces of cloth that are most often red, with fringe, metal pendants, and cowry shells. Their headdresses look like steeple-topped cloth hats. The front side is decorated with cowry shells, and there is

A shaman woman without a drum conducts her shamanic séance, Khakassia Republic, Askiz region, 2002. (Courtesy of Valentina Kharitonova)

a long fringe that covers the shaman's face and chest. There is often a bunch of eagle-owl's feathers on the top and on the back a descending tail braided of textile ribbons, with small metal objects that sound like small bells ringing when they are shaken together.

Shamanism was denounced by the Russian Orthodox church, with missionaries prohibiting *kamlanyes* (shamanic séances) and burning the shamans' drums. Conflicts between those who practiced shamanism and Christianity have declined in the last two centuries, as Christianity has adopted more shamanistic practices and beliefs into its traditions in the area. At the beginning of the eighteenth century, many Khakass (both voluntarily and by force) converted to Christianity. The last baptism of the Khakass took place in 1876.

Some Statistics and the Decline

The number of shamans in the population is low. In 1885 a mere twenty-six people among the Sagai (0.2 percent of the population) identified themselves as shamans, two of whom were women. According to data collected in the period 1924–1925 in Khakassia, seventy-one people were shamans (0.2 percent), seventeen of whom were women. Among them thirty-nine people had drums and costumes, and fifteen were considered hereditary shamans. Of these people, forty-two said that they had received the gift of shamanizing after having been very ill, and fourteen became shamans on their own initiative.

Although relatively few people have identified themselves as shamans in the last hundred years, the number of shamanic séances performed and recorded has been high. In one seven-year period (1917–1924), 4,025 kamlanyes, or shamanic séances, were recorded. Shamans may have feared persecution and exile and because of this did not identify themselves as shamans, as data from the 1930s shows that many shamans were exiled. Three shamans who returned from exile in the 1950s (E. Kyzlasov, E. Saradzakov, K. Aryshtaev) openly renounced (in writing) their shamanic practices, and those

who did perform séances did so secretly until the 1970s. As a result of the exile and persecution of shamanism, there were very few shamans who could teach those who had been called to the vocation. This situation gave birth to a particular group of "shamans without drums," the representatives of which are still alive now (T. S. Burnakova, S. R. Maynogasheva).

Khakass Shamanistic Cosmology

In the shamanism of the Khakass, the world is understood as comprising three domains. The upper, Chayan-chiri, is the heavenly domain of the nine creators. The main deities are the following: Chalbyros-chayan, or Khuday-chayan; Kugurt-chayans, the thunderer; Chaltyrakh-chayans, the light creator; Ymay-iche, saver of child souls; and the goddess of fertility, Pulay–khan, who is responsible for morality and beliefs. The Middle World, Kunig-chir, is the world of human beings, also inhabited by plants and animals and spirits. The principal spirits are mountain spirits, known as *tag eezi;* their chief is Khubay Khan. The master of wind is called Childey Khan, and the master of the rivers is called Sugday Khan. The master of fire is called Khooray Piche, and the master of frost is called Khumdyzakh. In the western part of the Middle World is the palace of the protector deities and the head of all the shamans, Ada or Adam Khan (translated as "my Father Khan") with his spouse, Inem Khan. The road to the palace is watched by Kermes Khan. In the lower, nine-level world, Ayna-chiri, seven Underworld gods rule: Erlik Khan (or Chines Khan), his son Itker-Molat, and his daughter Ucham-Tolay, as well as the head of the kingdom of the death, Uzut Khan, who is the head of the last level of the Underworld kingdom, known as hell, or Tamy Khan.

The Underworld gods called the Erliks created the shamans, as well as evil, including diseases, and the protector gods created all the good. The struggle between good and evil takes place in the Middle World among people. The mediators between gods and people were the shamans, *khamnar,* who were divided into two categories. The most powerful were the great shamans called the *pugdurs,* who wore special costumes, possessed up to nine drums, and had many helping spirits (*tyoses* [*tös*]). They were believed to have made long shamanic journeys, even to the Arctic Ocean and the Mediterranean Sea, curing barrenness by getting the power of living from the goddess Umai, and preventing epidemics. In general these powerful shamans led sacrifices, accompanied funerals, and predicted the future. *Pulgos,* who were less powerful shamans, had one drum and wore a simple costume, and their journeys were restricted to nearby regions. Their predictions were less valid, and their rituals were less effective. There were also the *chalanchykhs,* magical healers and mystics who could cure using spells and were similar to shamans but were not initiated, and did not wear costumes or use drums.

Many shamans were called to the profession when they become very ill, and for many of them the suffering was not easy. The one chosen by the spirits usually had a severe psychosomatic form of illness, often in a form similar to epilepsy. One of the strongest experiences (similar to initiation) was a dream vision, in which the body separated from the skeleton and the joints disintegrated. In this vision, the body and its parts were ground by a stone mill, boiled in a bronze pot, and put through a copper sieve in search of the *artykh syook,* "extra bone" (considered to be the physical qualification to be a shaman). This vision signified the ritual death of the shaman as a normal human being. Having recovered from the illness, the future shaman was trained by an older, stronger, and very powerful shaman, *pastaan-paba,* in a secluded sacred mountainous place (often on Mount Sakhsaar), usually for a period of three months. The training included learning bioenergetics and ritual practices, song prayers, and *algys* (hymns).

If the future shaman refused the shamanic destiny, the shaman who was the trainer would conduct a séance to remove the spirits that prevented acceptance by sending them into the mountains or to the bottom of the ocean. Sometimes the tyoses became free after some time and besiege the chosen one again. A new shaman could be appointed through a certain rite. When a shaman died, if there was no one entering the vocation in the settlement, a replacement was chosen through a special rite that involved trying on a shamanic costume and taking a drum in the hands. The one whom the costume fitted well and who felt shamanic power inside was trained and then

started to practice. After training the chosen one would have to appear before Adam Khan to obtain the tyoses as a shaman gift. Kyormes Khan would meet the chosen one on the way and test the truth and purity of the new shaman's intentions. Adam Khan determined what costume and drum the new shaman should have and impressed his clan *tamga* (seal) upon the hexahedral black spruce at the khan's palace on Borus Hill. The chosen one could "see" Adam-khan as an unusual light. After the trip to him, a certain initiation rite, called *tirig taiy,* was conducted.

Spirits and Shamans

Some spirits prevented a shaman from accepting destiny, but others were helpers to the shaman. There were mainly two kinds of shaman spirits. There were the pure ones, *aryg tyoster,* which dwelt in heaven, in mountains, or in fire; they were depicted on the top of the drum. Then there were the impure ones, *purtakh tyoster,* which dwelt under the earth, in the water, or on the taiga; they were depicted on the bottom of the drum. Powerful shamans obtained the tyoses not only from Adam Khan, but also from stars, fire, lightning, and mountains. For example, the tyoses of a late shaman, *khara tyos* (black foundation), were doing their best to find a new host for themselves as soon as possible before catching Adam Khan's eye, because he could lock these spirits up inside a mountain. Tyoses could choose a new candidate to be a shaman, a person with an "extra bone"; the person who was chosen would contract the shaman's illness immediately. One who possessed the purtakh tyoster was considered a "soul eater," or black shaman, *chekh (cheyek) kham.* The shaman called his spirits his army, *khan sirii,* and they obeyed him. He could see these spirits as whirlwinds, animals, or birds. Some of them had specific names: Kyuchyun-tyos was in the shape of snake, Ynaigakh, a goose-like tyos. There was also a keeper tyos *(khagba),* and a tyos who checked shamans for the extra bone *(saigot).* Each item of a shaman's belongings also had its own tyos: *tyulbek-tyos,* master of costume; *tyuben,* master of the drum; *ochan,* master of the drumming stick.

Shamans were intermediaries between human beings and spirits, contacting spirits while in altered states of consciousness, evoked by the rhythm of the shaman's drum, ritual motions, chanting, and bioenergetic methods—all without the use of drugs. They functioned as priests, healers, and foretellers. The rituals used in public prayers were performed outside in an open space, and those needed for healing were performed inside yurts.

The public prayers, *tayig,* were held in summer with a sacrifice to the sky *(tegir tayii),* to the river *(sug tayii),* to the stone idols *(mengirs, inei tayii),* to the mountains *(tag tayii),* and to the birch tree *(khazyn tayii).* Prayers also occurred in the vicinity of as many as two hundred sacred places, such as stone idols *(inei tas),* rock inscriptions *(pichiktig khaya),* and piles of stones *(obaa).* A three-year-old birch tree, *pai khazyn,* was put on the ritual place and decorated with *chalama*—red, blue, and white ribbons. An altar, *altyn sireye,* and a tether for the *yzykh,* holy horse, were also placed there, and a bonfire was made. During the prayers every-

body bowed to the sunrise. Before the shamanic session *(kamlanye),* they placed the birch inside a yurt, prepared *araka* (milk vodka), and slaughtered a white lamb. Shamans called up their tyoses through the open door of the yurt, performed algys (hymns), and whistled. They poured araka for their tyoses and exclaimed "Syoyok!"; they used as incense *irben, bogorodskaya trava* (Our Lady's herb). The slogan "Khobat!" used during the session was not to be spoken out loud randomly because tyoses might take offense and harm the speaker.

According to the Khakassian worldview, the human being has up to seven souls: life is provided by *tyn* (the breath); eyesight, "the fire of the eyes," is provided by *chula,* which wanders at night as a luminous figure; *khut* is a vital force that by day resides under one's toenails and at night on one's head, under the roots of the hair. Each individual has a *hagba,* a guardian angel, and the shaman has an additional special soul called a *magyra.* There is a clan soul *(syook chulazy),* which resides in a clan tree.

Soul theft was quite common among the Khakass, and the most frequent kinds of theft involved cases in which children's souls (usually the vital force soul) were stolen by the black shamans, who used the souls to help patients recover from an illness. The person who loses the soul dies; in healing sessions the shaman sets out to search for the lost soul. In order to confront the situation, different black shamans were sometimes asked to gain back the lost soul. Such soul theft would cause shamanic wars between black shamans in neighboring regions, for example, between Khakass and Tuvan shamans.

KIRGHIZ SHAMANISM (WEST CENTRAL ASIA)

Traditionally the Kirghiz are a Turkic-speaking nomadic group in western Central Asia, who inhabit the mountain pastures of the Tianshan and the Pamir-Alai ranges. Their language is genetically related to the southern Siberian Altai language, but more recently it has converged with other Central Asian Turkic languages (Uzbek, Kazak) due to mixing and assimilation. Their ancestors moved to their present land from the Altai region, where Kypchak and ancient Yenisey Kirghiz groups had mixed before the Mongol invasion. Later they became part of the Chagatai ulus principality of the Mongol Empire. They moved southward, because the center of the Chagatai ulus was established between the Ili and Chui Rivers. The nomads mixed with the Mongols and even assimilated some of them. The Tianshan region was called Moghulistan by Muslim sources, and most of the inhabitants were nomads, who later came to be called Kirghiz or Kara-Kirghiz. Under the influence of the Uzbek khanate of Qoqan, Islam was first introduced to the Kirghiz in the seventeenth and eighteenth centuries. They also mixed with the sedentary Muslim populations of the Ferghana valley (Uzbek) and the Pamir (Tajik).

Although the Kirghiz were thus converted to Islam during the last three centuries, their popular beliefs and religious ideas continue to reflect the influence of Siberian Turkic and Mongolian shamanism, as well as Central Asian pre-Islamic and Islamic features. It is practically impossible to discern the various elements, an exercise that would in any case be meaningless, since for the Kirghiz themselves all these elements constitute part and parcel of their Muslim consciousness.

Prior to Soviet times the nomads had been able to practice their rituals and faith freely. This changed dramatically following the imposition of the new atheist ideology in the 1920s. During the years of Stalinist repression (1930s), many people were arrested for practicing their religion or even talking about it. Most of the mullahs (*molla*s; Muslim priests) and *bakshy-bübü*s (male and female shamans) lost their lives during the repression. The Russians assimilated the urbanized Kirghiz, who not only gave up their faith but also forgot their language and other customs. The nomads in the countryside kept up religious practices, but they had to do this secretly. Interestingly, seventy years of Soviet ideology had little impact on the faith of the nomads, who preserved their beliefs during these dark years. In 1985 the new policy of glasnost (openness) allowed people once again to speak more openly about their faith. New mosques were built in the place of ruined ones, and many "open-eyed" *(közü achyk)* believers started to engage actively in religious practice, which included praying and visiting sacred sites openly.

In 1991 Kirghizstan became independent, and Soviet ideology was replaced by the ideology of the free market. Since that time, popular religious practices have flourished, but of course not everyone has participated in this religious revival. At the same time Islamic fundamentalism and dogmatism have also gained some ground. Some mollas have started to speak out openly against visiting sacred sites and worshipping ancestral spirits as being contrary to the rules of Islam. They emphasize that only God (Allah) should be worshipped, but people remember well that the mollas, the upholders of orthodox ideals, themselves used to go to shamans before the revolution if they had problems.

As the author's long-term observations confirm, women may be credited with keeping up the veneration of ancestors, which has traditionally constituted a central tenet of Kirghiz religious beliefs. Among women, taboos *(tyjuu)* and superstitions *(yrym-džyrym)* continue to have currency. For that reason they often go to shamans, healers *(tabyp),* and fortune-tellers

(*balger* or *tölgöčü*). Men tend to be more interested in Islamic teachings. They often speak against superstitions, and many refuse to go to healers or shamans. Some of them even claim that no spirits should be praised, only Allah. On the other hand, there are men who take charge of rituals surrounding spirits, sacred sites, and saints, and regard these as part of their Islamic duties. No matter what they believe in, it does not cause tensions between husband and wife or within the family.

Among the most important features of Kirghiz popular beliefs, the following should be mentioned. Some tribes respect certain animals, especially the deer, and they even adopt their names as tribal names, for example, *bugu* (deer), *bagysh* (elk, or moose), and so on. The Bugu tribe venerate *müyüzdüü ene* (antlered mother) as their tribal totemic mother.

Some people believe in having totemic spirits *(koldoochu),* which can be summoned to help. Healers have strong helpers who are called during healing; they are usually animal spirits, such as camel, deer, wild goat, and eagle.

The cult of nature and its powers is also important. Veneration of the sky *(Tengir)* is rare in the early twenty-first century, but some people still praise the sky and the moon. Nowadays most people think that the word *Tengir* simply means God, and they even use it as a substitute name for Allah (or Khudai). Sometimes, instead of the sky, they pray to the powers of earth and water *(džer-suu).* Old people still remember the prayers *(kelme)* they used to say at a mountain pass. They also respect the fire and the fireplace *(kolomto)* as the protector spirit of the family. For that reason newly married couples are introduced to the fire *(otko kirgizüü).*

The *tülöö* (or *tilöö*) is a ritual during which people perform a sacrifice, read the Quran, and ask the powers of nature to help them in certain matters, for example to bring them rain. In older times they also used a magic stone *(džaitaš)* to bring rain, but that practice has become obsolete.

One of the most important features is the veneration of the ancestral spirits *(arbak).* Muslim saints *(sheit)* whose burial places *(mazar)* have become sites of sacrifice *(kurman)* can be found in every village. People go there to receive blessings, sometimes to be healed. These places are marked with small poplar trees *(terek),* upon which white ribbons are tied as votive offerings *(chüpürök, aktyk).* The most important of the ancestral spirits is Manas, the legendary forefather of the Kirghiz, who according to their epic led them from the Altai to the Tianshan. Telling epic stories (*dzhomok* and *dastan*) is also important in maintaining good relations with the spirits of the forefathers.

Ancestral and saintly tombs *(oluja/awlija)* are popular sites for pilgrimages, where childless women also pray to become pregnant. Closely related to the ancestral cult is the veneration of the spirit of the dead. It is believed that when someone dies, Allah takes the soul *(dzhan),* but the spirit (*arwakh,* the plural of *rukh* [spirit]) lives on. Mourning rituals *(ash)* are held to see off the spirit of the dead on the seventh and fortieth day following the death. This is connected to the shamanic belief that the spirit leaves the dead body on the seventh day, and leaves the family on the fortieth. A mourning widow used to make a wooden idol *(tul)* of her dead husband, dressing it in her husband's clothes; she was ideally expected to stay with it for one year without leaving her house. This custom seems to be extinct now.

The shamanic belief in the upper and lower worlds has all but disappeared, but beliefs in numerous spirits, good and bad, persist. One of the good spirits, a survival from Siberian culture, is Umai Ene (Mother Womb), who is the helping spirit of pregnant women and unborn children. Women pray to her to help them have an easy and blessed delivery. Following birth, every effort is made to hide the child from malicious spirits and other evil influences. Belief in mountain spirits *(kajyp-eren)* has become obsolete. The word *kajyp,* or *ghaib,* means "hidden" in Arabic, while *eren,* or *eeren,* is a word for idols in Tuva. But nowadays the Kirghiz use the term *kajyp-eren* for the wild goats and sheep this spirit was believed to protect in the mountains.

Among Central Asian traditions, knowledge of the forty helping spirits *(chiltan)* and various Muslim saints (e.g., *kydyr,* or *khidhr*) is particularly important. The word *pir* (elder), used elsewhere in Central Asia to designate Islamic patron saints, is also used as a generic name for the good spirits that protect livestock (e.g., Cholpon-Ata for sheep, Kambar-Ata for horses).

Numerous bad spirits, known as *džin-šaitan* or *adžina* (plural, *džin*) *džez-kempir* bear

A Kirghiz shaman uses two candles to find what evil spirit possesses a young man. Atush, Xinjiang, 2000. (Courtesy of Dilmurat Omar)

names that are common to the Islamized Turkic groups of Central Asia. Other names, such as *albarsty* or *albasty,* and *džel-moguz* have Siberian parallels (e.g., Yakut *abaahy,* Tuvan *albys, manggys*).

To prevent illness or an evil fate, the bad spirits that cause them must be chased away. Since they are thought to be the creatures of *šaitan* (Satan), the name of God (Allah) must be uttered to frighten them away. A similar effect is attributed to objects of sacred quality, such as the leaves of the juniper tree *(archa).* These are kept in houses, and sometimes burned while chanting *alas-alas.* This ritual is called *alastoo,* and usually takes place when somebody moves into a new home. A similar ritual may be performed at the spring festival, Nooruz, of Central Asia (Persian *navroz*).

There are all kind of healers and fortunetellers in Kirghiz shamanism, who are believed to have contact with the spirits who assist them in their work. When compared to the "classical shamans" of Siberia, they appear to have more limited power. The Kirghiz language distinguishes between a male and a female shaman, which is a new development. Males are called *bakshy,* while females are called *bübü* (or *bibi*), originally meaning respected or sacred woman. These shamans heal patients with the aid of ancestral spirits. In previous times the bakshys made use of a musical instrument called a *kylkyjak* (a string instrument) for summoning the spirits while in trance *(zikir saluu).* Nowadays males and females alike use whips *(kamčy)* and a special stick *(asa)* to chase away bad spirits. This stick, the so-called *asa-tajak,* is also used by Central Asian beggars (*divana,* or *dubana*), but this syncretic element also has Siberian parallels (e.g., Tuvan *üč-tajak,* Buryat-Mongolian *horibo*).

One Kirghiz ritual that can be observed even today is a shamanic dance held during the vigil observed on Friday night, the sacred day of the Islamic calendar *(dzhum'a).* The shamans (bakshy-bübü) start to dance around the patients in a house at midnight with their whips and sticks. It is called *džarga tüšüü* (*džar* means help

from God). Some healers talk with the spirits using a mirror (*küzgü,* Siberian *küzünggü*).

Another type of healer is the *kuuchu* (spirit chaser), who only has power over bad spirits causing illness. Usually people call the exorcist if somebody is dying. The kuuchu tries to chase away the bad spirit before the sick person dies. During the ritual called *badik,* the shaman hits the patient with a whip, chanting the badik-song. The kuuchu may also be called if a mother gets seriously ill after delivery. It is believed that such women *(kara/shaitan baskan),* as well as newborn babies, are particularly vulnerable to attacks of bad spirits within forty days following birth, because the "free soul" *(chymyn dzhan)* can easily leave the body.

Two other examples of shamanic and pre-Islamic features among the nomads may be given. To circle something is understood as giving or receiving the energy of that thing; for that reason people usually do not go around the house, the fireplace, or each other. Only the shaman or healer is allowed to do so, but people still say "Ailanaiyn" (let me go around you), when they want to help somebody, or just to express their sympathy. As elsewhere in the Islamic world, the belief in the power of the evil eye *(köz tijüü),* is strong, along with the belief that it can be prevented by putting charms (*tumar* or *köz-monchok*) around the neck of young children and animals.

Kirghiz shamanism displays many common features and parallels with South Siberian Shamanism, but an important difference is the use of Persian and Arabic terms by the Kirghiz:

	Siberian	Kirghiz (Central Asian)
shamanic trance	*kamlaar*	*zikir*
bad spirits	*körmös,*	*dzhin-shajtan aza, ajna*
good spirits	*ee*	*arwak, mazar*
shamanic song	*alkysh*	*du'a*
sacrifice	*tagyl,*	*kurman tajylga*

More importantly, shamans and other healers tend to make use of an essentially Islamic vocabulary, summon their helping spirits in the name of Allah, and recite from the Quran, all indications that for practitioners, healers, and patients alike, the various elements of their religious practices are integrated and form an indivisible part of their Islamic faith.

MANCHU SHAMANISM

The ethnonym *manju* (manchu), which was officially adopted in 1635 as a replacement for the indigenous term *jušen* ("jurchen," "jurced," "nüzhen," et al.), indicates all those Tungus tribes that were unified by Nurhachi (Qing Taizu, 1559–1626) and his son and successor Hong Taiji

(Qing Taizong, b. 1592, r. 1626–1643). These tribes later constituted the "Eight Banners," destined to conquer and rule militarily over the Chinese Empire (Qing, or Manchu, dynasty). Their various backgrounds and tribal origins, each expressed by a specific pantheon of protective spirits, coupled with their great mobility due to strategic and military needs, resulted in a differentiated evolution in their shamanic practices and beliefs. Hence, three distinct types of shamanism and shamans developed: Indeed, modern scholars distinguish between (1)"wild," or "witchcraft," shamanism (and shamans), *ye saman,* (2) "family-clan-domestic" shamanism (and shamans), *boigon-i saman / jia saman,* and (3) "temple" or "palace" shamanism (and shamans), *dorgi gongting saman.*

What united these three types of shamanism was their common worldview, that is, their subdivision of the universe into three distinct worlds *(jecen).* The Upper World, often said to be made up of nine or more strata, was the abode of more abstract deities such as Abkai Enduri (Heaven's God), the highest god in the Manchu pantheon, and of the divinized sun, moon, and stars. The intermediate world was the world of living humans, whereas the Lower World, inhabited by demons *(hutu)* and evil spirits *(ibagan),* was also the place of the dead and the abode where creatures expiated their sins.

This latter world was governed by Ilmun Khan (Sanskrit Yama) who, according to some texts, resided in the town of Fengtu, the land of the dead in Chinese mythology. Ilmun Khan was equivalent to the Buddhist king and judge of hell, Yama, whose myth was incorporated into Daoism. This third world, however, is not comparable to the Hell of Western Christian culture, since it was also the seat of the goddess Omosi Mama, who was responsible for the birth of human life. With her breath she infused life (i.e., the soul) into the bodies of humans about to be born, since they were seen as creatures molded from the soil. Moreover, this Underworld was also the domain of Banaji Emu-Eme (Mother Earth, clearly opposed to Abkai Enduri).

These three worlds were linked one to the other by a cosmic tree, the roots of which were in the Underworld, the trunk in the Middle World, and its nine (or sometimes seven) branches in the Upper World. The shaman had the capacity of either descending or climbing this tree, both in order to intercede with the gods as well as to eliminate evil influences (i.e., illnesses) by fighting against the Underworld spirits. For these journeys, the shaman utilized the drum, which acted as his vehicle, the drumstick, which symbolized the cosmological horse, and a headdress, often adorned with feathers and metal birds. Thus the Manchu shaman, besides being the storehouse of the cultural patrimony of his clan (myths, ancestral legends, historical facts), united in himself the faculties of healer, psychopomp (one who escorts souls to or from the world of the dead), and messenger between the world of humanity and the supernatural realm. The shaman felt, and dominated, the vital forces of the cosmos, according to the principle that each and every being and object was seen as animated by a "vital breath" *(qigong).* In order to become a true shaman, either due to a psychic predisposition or by being chosen, he had to pass an exam after an apprenticeship of at least two years. This exam was called *aoyun* in shaman technical language. During this test, the shaman in trance had to be able to ascend the cosmic tree in order to contact the gods (cf. the analogous ceremony of the *cakūran* ladder among the Sibe). The best example of wild shamanism is offered by the epic shamanic tale *Nišan saman-i bithe* (Book of the Nišan female shaman), which, however, bears traces of Buddhist influence.

Different from the role of the wild shamans, the role of the clan shamans *(boigon saman),* among whom males predominate, gradually came to focus on propitiatory rites and ancestral sacrifices. The séances of the boigon saman consisted—according to documents that have come down to us from at least the beginning of the seventeenth century—of sacrifices to various deities *(enduri),* protective spirits *(manni),* and malignant demons *(hutu, ibagan).* These rituals were performed as propitiatory night ceremonies and were celebrated in closed, dark areas *(tuibumbi).* These sacrificial acts were often done in order to obtain good harvests and as a way of achieving longevity and numerous descendants. The prayers and invocations that have come down to us, and which are still recited in some of the Manchu settlings in the Jilin province (People's Republic of China), reveal an accentuated uniformity in content and structure. Their rhythm and musicality is typically expressed by means of alliteration. (For in-

stance: "Tanggū aniya taran akū / ninju aniya nimeku akū"; "May we be for a hundred years without sweat, may we be for sixty years without sicknesses" (Pang 1998, 39). Nonetheless, a few clans exhibited differences in their invocations to particular spirits.

Palace shamanism (also known as templified shamanism, *dorgi gongting saman*) represented the last stage in the evolution of Manchu shamanism and was linked to the ascent of the Aisin Gioro clan, first as rulers over Manchuria (Aisin, or Hou Jin dynasty, 1616–1635, Daicing, or Da Qing dynasty, 1636–1643) and subsequently as rulers of the Chinese Empire (1644–1911). The fundamental characteristic of this type of shamanism was the transfer of the cult to a special building called a *tangse* (Chinese *tangzi,* "hall"). It was known already from the Jurchen period and was mentioned for the first time in Manchu sources in 1583. After the Manchu conquest of Peking in 1644, the tangse developed architecturally from a simple hall—as it was during Nurhaci's time—into a building complex of noticeable dimensions, which comprised, apart from the main temple *(ordo),* even a temple dedicated to the god Shangsi, a main sacrificial hall *(wecere deyen),* and an area reserved for sacred trees *(siltan moo).* The tangse of Peking and that of Shenyang no longer exist. The only traces of court shamanic rites can be observed in the Kunninggong Palace of the Forbidden City and in the Qingninggong Palace of the Palace Museum in Shenyang, where in the front courtyard it is possible to admire perhaps the sole original spirit's pole *(somo)* still extant in China.

Apart from the tangse, shamanic rites were also celebrated in selected court palaces, such as the Qingninggong in Mukden (Shenyang) and the Kunninggong in Peking. The tangse rituals were mostly of a political character: Nurhaci, the founder of the imperial house, used to resort to the tangse before any military expedition, whereas the ceremonies in the Kunninggong were more spiritual in nature, characterized by symbolic military performances and the ritual recollection of ancestral, heroic acts. As a curiosity, it is worth mentioning the fact that the rituals made in order to acquire strong horses (fundamental for any victorious army) were celebrated only in the tangse.

All the shamanic rites of the imperial court were codified at the order of Emperor Qianlong (1736–1796) and were completed in Manchu only in 1747 and later published in 1778 with the title *Hesei toktobuha Manjusai wecere metere kooli bithe* (Imperially commissioned code of the sacrifices to spirits and heaven). In 1782 its Chinese translation, with the title *Qinding Manzhou jishen jitian dianli,* was printed. This code, while elevating shamanism to a Manchu state cult, was strongly influenced by Chinese elements and also served as a model for the shamanic rites of other clans. It also eliminated the supremacy of the shaman over the political/imperial power, since only the shaman was able to interpret the secred forces of nature and to dominate the spirits he could ignore the wishes and laws of political power—a danger against which Hong Taiji had fought in the first half of the seventeenth century.

The rituals established by this code, though preserving some of the typical aspects of Manchu culture, show a strong influence of analogous Chinese ceremonies. The ritual movements of the female shamans and of the various participants in the ritual are often simply alluded to and by and large standardized. All shamanic rituals were assigned to twelve female shamans *(saman taitai),* who were helped by thirty-six "sacrificing supervisor women" *(sizu furen),* thirty-seven "bark grinder women" *(sidui furen),* and nineteen "incense supervisor women" *(sixiang furen).* These people all depended on the Shamanism Office *(Shenfang),* a division of the Office of Palace Ceremonial *(Zhangyi si)* of the Imperial Household Department *(Neiwufu).* These palace rituals continued to be celebrated even after the fall of the dynasty, until the last emperor was driven out of the Forbidden City in 1924.

Even though individual shamanic rites varied greatly from clan to clan, there existed nonetheless some common elements, which constituted the unitary base of Manchu shamanism in general. There were, for instance, some stereotyped formulations common to all prayers and invocations, both in form as well as in content. For instance, the prayers for attaining longevity were always based on the following formula: " . . . May the hair of the head become white, may the teeth of the mouth become yellow," whereas in order to attain a numerous progeny the typical reference was to "the numerous leaves and the profound roots."

Even the most important moment in a shamanic séance, that is, the offering of a pig to the deity, followed a ritual pattern that was fundamentally identical among all the various Manchu clans, the imperial clan Aisin Gioro being no exception. The first step in the sacrifice was the pouring of a glass of distillate *(jungšun)* into the ear of the pig, which was still alive. If the animal started shaking the head so as to free itself from the liquid—something that regularly happened—his movement was interpreted as a sign that the gods liked the offering. After killing the pig and collecting the blood, which would be used in other rites, the viscera of the animal were removed. The carcass was then sectioned according to precise rules and finally cooked. Once cooked, the single parts were reassembled so that they could be offered to the gods.

Besides these thanksgiving and help-request rituals, during which it utilized the "magic sword" *(halmari),* Manchu shamanism exhibited four other rites that were typical and common to all the clans: the "sacrifice to the willow tree" *(fodo),* the "sacrifice to the spirit or votive pole" *(somo),* the "sacrifice with extinguished lanterns" *(tuibumbi),* and the "sacrifice to attain strong horses." The "sacrifice to the willow tree" was almost always linked to the worship of Omosi Mama, a deity thought to protect children and one's descendants in general. Among the powers of Omosi Mama was that of averting particular kind of illnesses, especially smallpox. For this purpose, a willow tree was planted in a courtyard, and through a rope—to which a variety of symbolic values were attached—it was connected to the "throne of the gods" *(weceku-i soorin)* placed inside the house. During this ritual, the shaman utilized a magic arrow *(debse),* recited special auspicious prayers, and sacrificed a pig.

The "sacrifice to the votive pole" *(somo)* was generally linked to the cult of the ancestors. In particular, it was dedicated to the clan founder, from whom the community asked for help and protection. During this ceremony, the shaman and his helpers often recalled, through a "mystical performance" and often in a state of trance, the main incidents in the life of the ancestor in which an important role was often played by "protective birds" such as the magpie and the crow. To these birds were offered special parts of the pig's meat, which were placed in a vessel hung on the pole's top.

At the imperial court, these performances often took the form of actual plays. The "sacrifice with extinguished lanterns" (*tuibumbi*) used to take place in complete darkness, with doors and windows all closed. This ritual, meant to attain the protection of the spirits, seems to belong to the most archaic forms of Manchu shamanism; the prayers that were recited during it were often characterized by a constant and incomprehensible (magical) refrain. Finally, special rites were celebrated in order to obtain strong horses, proving the animal's important role in Manchu society. There were numerous variants of these rites, beginning with the presence of a "spirit's horse" *(shenma),* which after the rite could never be ridden again, up to the recitation of special prayers asking that the horses "may become strong when inhaling the wind, and may become sturdy when inhaling the fog" (Stary 1980, 19).

During the time when the shamanic rituals were performed, the participants had to observe twelve rules and/or prohibitions: (1) to clear the mind from all dishonest thoughts, (2) to behave in a faultless way, (3) to carefully clean all tools utilized during the sacrifice, (4) to never give way to anger, (5) to keep one's own clothes and hair in order, (6) not to indulge in vain talk, (7) not to laugh beyond measure, (8) not to behave disrespectfully toward the elders, (9) not to mistreat dogs, (10) not to make noise with knives or spoons, (11) never to leave the sacrifice room before the end of the rituals, and (12) when the ritual was performed in the courtyard, never to return to one's home before the end of the ritual.

Nowadays, shamanism is alive (or, perhaps better, has been revived) in what are for the most part Manchu villages in the Jilin province, and in the area of the Mudang River. Shamanism consists mainly in thanksgiving rituals for the autumn harvest, in very simple healing rites, and in other rituals meant to invoke the spirits' blessings. Today, there exist about seventy male shamans and fifty female shamans, the great majority of whom celebrate all rituals in Chinese.

MONGOLIAN SHAMANIC TEXTS

Text Collections and Monographs on Mongolian Shamanic Texts

Although shamanism is a religious phenomenon based on oral tradition, there are many written records of various Mongolian shamanic and quasi-shamanic texts. (It is important to use both these terms, because a clear distinction between real shamanic and nonshamanic ritual texts is still missing in the academic literature about Mongolian shamanic texts.) The first Mongolian shamanic texts were recorded only in the nineteenth century, although fragments of ritual texts are known from the beginning of the thirteenth century, when the great Mongolian Empire was established.

The first major source written in Mongolian (Mongolian text transcribed with Chinese characters, written probably in 1240), is the *Secret History of the Mongols* (*Mongqol-un ni'uča tobčiyan*), in which there are many references to the pre-Buddhist Mongolian belief system, to animistic and shamanistic conceptions. It tells, for example, of Genghis Khan himself performing an invocation to the Sacred Mountain, the Burqan Qaldun. Another part that contains possibly shamanistic elements is the speech attributed to Dshamuka (J̌amuq-a), Genghis Khan's closest ally, when he declared war. The commander's description of his preparation, including the putting on of a garment, the enumeration of weapons, and the sounding of the drum, is reminiscent of similar enumerative parts of shamanic texts. Supposedly, this fragment is one of the first texts that, rhythmically and also in terms of its motifs, is very close to shamanic texts.

qara'atu tuk-iyan sačuba bi
qara buqa-yin arasun-niyar
büriksen bürkiren büküi
dawutu kö'ürge-ben deletbe bi
qara qurdun-iyan unuba bi

I have sprinkled my standard visible from afar
I have beaten my drum with a voice, which is rumbling,
Covered with the skin of a black bull.
I have got me up upon my black courser.
(Cleaves 1982, 42)

Travelers (in the thirteenth century, Marco Polo), explorers, missionaries (in the thirteenth

century, Plano Carpini, Rubruquis, Julianus, Biridia, and others), and scholars (in the eighteenth and nineteenth centuries, Pallas, Bergman, Timkovsky, Potanin, Pozdneev, Bálint, and others) recorded valuable data about shamanic and folk religious rituals, but the first texts appear only in nineteenth-century materials.

Scholars at the beginning of the twentieth century, such as Aleksei Pozdneev (in 1900) and later Matvei Nikolaevich Khangalov (Khangalov 1958, 1959, 1960), the foremost student of the Buryat belief system, published invocations and other ritual texts that they collected. In the 1920s, the systematic gathering of shamanic and ritualistic texts continued. Sanžeev published his Alar Buryat shaman materials, inserting several texts in it (Sanžeev 1927–1928), and in the thirties Byambiin Rinčen published the largest collection of shamanic texts, in three volumes (Rinčen 1959, 1961, 1975). Parallel with him Walter Heissig worked among the eastern Mongolian tribes and published his results in a series of articles (e.g., Heissig 1944, 1959, 1966). Nikolai Poppe, working on Mongolian folklore, collected among other items several shaman songs, and published a valuable catalogue of shamanic texts (Poppe 1932).

In the 1960s, the elaborate work of B. Sodnom appeared, the basis for any textual or genre analysis of Mongolian shamanic texts (Sodnom 1962). Research activity was renewed in the 1980s and 1990s, when new texts were collected, mostly by Mongolian scholars, such as Dulam (Dulam 1992), Gantogtox, and J̌. Coloo (Gantogtox, Kara, and Coloo 1998), and new attempts to classify and analyze texts also appeared (Even 1988–1989; Hamayon 1990; Pürew 1999). In addition to these publications, there are also certain occasional publications containing shamanic texts and numerous works on the ritualistic texts, which are not real shamanic texts, but could constitute part of the repertoire of a shaman.

Genres of Mongolian Shamanic Texts

Ideally, in attempting to analyze such a difficult topic as shamanic texts, one should consider a number of significant factors: the text itself, its meaning and use, the performer, the circumstances of place and time, and the relationship between the performer, the audience, and the larger community. And in practice, all these aspects come into play in considering the genres into which the texts fall, according to their performers (the shamans and their assistants) and the community.

Different community members will describe the genre of a text in significantly different ways, depending on the extent of their awareness of tradition. The genres of shamanic texts (as the shamans and the shamans' assistants, family members themselves, distinguish them) can be classified into larger groups according to their use in various spheres of the ritual. This kind of classification is based on the designation, or title, given to the text by shamans and their communities, as well as on certain motifs that probably belong to each group. Although numerous motifs, forms, and expressions are not in fact bound to a certain genre or sphere of use, it is possible to distinguish three different groups of shamanic texts, according to their sphere of use:

1. Pure shamanic genres, which are used only for shamanic rituals
2. Genres that are used for other, non-shamanic ritual occasions as well
3. Genres that are mainly used for Buddhist ritualistic purposes and are therefore most apt to appear in the repertoires of "Lamaized" shamans (shamans heavily influenced by Tibetan Lamaism)

Shamanic Genres

The following genres are of the invocation and evocation type, and as such, were originally used only in shamanic rituals.

Duudlaγ*, Khalkh for "invocation"; in Mongolian,* **daudlaγ-a***; in Buryat,* **duurdlag.** This is the most common and widespread designation for shamanic songs. It literally means "calling"; if there is not any other specification for a shaman song, this term is generally used. It seems that this term may serve to replace a variety of other designations. In the newest collections, as in that of Dulam, in many cases the texts are given without any genre designation; only the name of the spirits being invoked serves as a title for the song: *Ozuuräš yum*, *Aγaräš xairxan*, and so on. There are several types of duudlaγ-s according to their content, for example: *ongod jalax duudlaγ*, "invocation

calling the protector spirits (the *ongod*, plural of *ongon*)"; *taxilgiin duudlaγ*, "invocation for offering," such as *gald deeǰ örgöx duudlaγ*, "invocation for the offering of the best part of food for the fire"; *sünsnii duudlaγ*, "calling the soul." The invocation usually starts with a description of the invoked spirit or god, origin, appearance, and attributes, and a description of the way the spirit arrives at the ritual place. In some invocations or in a later phase of the ritual the usual description could be shortened, and only the most important elements of the depiction appear. The following example from an invocation to a protector spirit called Nalǰig gives only the most important characteristic of the spirit (collected by the author in 1993 from a Darkhad female shaman called Bayir, and translated by the author):

Nariin cagaan Nalǰgaa
Xenii xereg yamar
Yanjaar yawna či ulaač min'?
Oh, Nalǰig you white and thin,
For whose task
In which manner do you go, my attendant?

Tamlaγ, ***Khalkh for "invocation-chant"; in Mongolian,*** **tamlaγ-a*****,*** ***from*** **tamala-** ***"to chant, to sing."*** This genre designation could be replaced by the duudlaγ, but the exact difference between the two genres must be ascertained by further research. In some cases the tamlaγ is used instead of a curse (*jüxel*). The following fragment describes the sending off of the invited protector spirit (*Xarmään xairxaniig bucaax tamlaγ* "Chant for returning the spirit Xarm xairxan"):

Mört taan' mörgölööb,
Süüdert taan' sögödlööb,
Mergen sarään šinede
Medeetää ödörään düüčinde uljaxabdi,
Türeyee, tarxayaa, xariyaa, bucaaya!
I bowed on your traces,
I fell down on my knees in your shadow,
At the time of the wise new moon,
On a certain day, we will meet again,
Now let us finish, let us leave, let us return,
and let us go back.
(Dulam 1992, 94; translation by Birtalan)

Daatgal***,*** ***Khalkh for "devotion"; in Mongolian,*** **daγadqal*****,*** ***from*** **daγadqa-*****,*** ***"to insure, to entrust one's fate to someone"; cf. Khalkh*** **daatgan jalbirax*****,*** ***"to pray earnestly or devoutly."*** There exists also a kind of invocation called *daatgaliin duudlaγ,* "devoted invocation." The following example has no indication of the name of spirit, to which entreaty is made to stave off bad luck. Presumably this type of shamanic text in certain cases could be performed not only by shamans, but also by authoritative persons in the family and the community:

Aexin ayuul ügüi,
Gadaa aduus maldn'
Xulγaa muu yum,
Xur möndör,
Xui sal'xi,
Galiin ayuul,
Galjuugiin amand
Daeraldaxgüi yawxiig
Tandaan daatxii!
Without danger of fear
Let the cattle in the open air
Not to meet the bad thief,
The rain and hailstorm,
Whirlwind and wind,
Danger of fire,
The mouth of rabid [wolf]
I pray for it begging to you!
(Rinčen 1975, 95–96; translation by Birtalan)

Genres Used Primarily in Nonshamanic Ritualistic Spheres

These genres could be used, for example for family, clan, and community feasts and celebrations, although they could be performed by shamans as well as part of their ritualistic repertoire.

Jüxel, xaraal, ***Khalkh for "curse, scold"; in Mongolian*** **ǰükel*****,*** ***from*** **ǰüke-*****,*** **ǰükü-** ***"to curse, swear, scold."*** The following example of a curse has been performed by a shaman, as evidenced by the motifs of shamanic paraphernalia (the shaman's headgear, the eighty-nine snakes, and the blood libation) appearing in the text:

Uuliin činee xürün ulaan orγoeγoon
Tawin suuγaad jüxii!
. . .
Nayan yösün xorton moγooegiitan'
Namiljuulan suuγaad jüxii!
. . .

Xar cusun serǰimeen
Yisön arxaar bürdüülen
Cacan suuɣaad jüxii!
I curse [you] putting down
My shaman's headgear of mountain-size!
. . .
I curse [you] making
Your eighty-nine poisonous snakes to wriggle!
. . .
I curse [you] filling up
Nine sacks with
My black blood libation!
(Rinčen 1975, 97–98; translation by Birtalan)

Magtaal*, Khalkh for "praise," in Mongolian* **maɣtaɣal** *from* **maɣtaɣa-** *"to praise".* Praise songs constitute a very common, vivid genre in Mongolian folklore, performed on ceremonial occasions, such as the national sport and game days (*naadam*), wedding ceremonies, and the like. For example, *ongodiin magtaal* "praise to the protector spirits" *Taraagii yawuulax magtaal* (Dulam 1992, 120) "praising for sending away spirit Taraa."

Emgen buural eeǰ-mni
Mört taan' mörgöläälä wišüüb,
Süüdrt taan' sögdlää wišüüb,
Üriigää ür xiigeeräät,
Ürläägää mori xiigeeräät,
Baɣ gertää baɣan wolǰ,
Balčir ürdää ülgää wolsan,
. . .
My grey-haired grandmother
I surely bowed on your tracks,
I surely kneeled down in your shadows,
Make the offsprings into descendants,
Make the three-year-old horse into a saddle horse,
You have been the pillar for the small yurt,
You became the cradle for the small child,
. . .
(Dulam 1992, 120; translation by Birtalan)

Cacal, sacal*, Khalkh for "libation text for the occasion of aspersion or libation of milk, milk tea, milk brandy for the deities"; in Mongolian* **čačuli, sačuli***, from* **saču-***, "to sow, strew, scatter, spread, to sprinkle; perform libation"; Oirat,* **Kalmyk cacl***; in Buryat,* **sasli.** This genre designates both the ritual text and the ritual itself, and is very common among the Mongols. The wives, who start their work with milking cattle, perform every morning a kind of libation with the first milk. This is the day-starting ritual of the Mongolian shamans, too. Those scholars who have collected shamanic folklore have considered texts of this genre, performed for Genghis Khan even nowadays in the Ordos region (in China), e.g., *Altan uruɣ-un sačuli,* "Libation for the Golden clan" (Rinčen 1959, 84–86).

Dallaɣ*, Khalkh for "beckoning fortune, ritual of inviting prosperity"; in Mongolian* **dalalɣa***, from* **dalal-***, "to beckon, wave the hand".* Many types belong to this genre, differing according to the occasion of the ritual. The following example is *šuwuunii dalalaɣ*, "beckoning fortune on the occasion of the birds' migration":

Qurui qurui ire qurui! O suvasati:
Sayin amuɣulang boltuɣai:
Anggir ɣalaɣun ireküi-dür
Altan dalalɣ-a abunam bui:
. . .
Delger čaɣ ireküi-dür
Deldeng čikitei töröküi-dür
Delengtü üniy-e saɣaqui-dur
Degǰirekü kesig-i dalalnam irtügei:
Qurui qurui ire qurui! Ohm, suvastai [sic!]
May happiness prevail.
When the mandarin-ducks come [back]
I perform the golden dalalɣa.
. . .
When the abundant time comes,
when the long-eared wild asses are born,
when one milks the uddered cows,
I beckon the prosperous benefit, may it come.
Qurui, qurui, come qurui!
(Chabros 1992, 241–242; translation by Chabros)

Xelelgee, xeleleg*, Khalkh for "saying"; in Mongolian,* **kelelge***, from* **kele-***, "to say".* For example, one such text is called *Xarmään xäirxanaa xeleleg,* "Saying to the merciful Xarm." Some of the texts designated with these names are similar to the benedictions (*yörööls*) of Mongolian folklore. An example is the following *xengereg surgax xeleleg,* "saying for the training of drum":

Oktorɣään saaral sara šige
Onɣom buural unaa wolaaraä!

Unasan ejääm bayasxaxa,
Omγolan xüleg bolaarää!
Sanasan xergiigi büteexede
Sal'xinaas xurdam bolaarää!
Like the grey moon on the sky,
Be a protector, silver-grey mount!
Let your owner be happy,
Be a proud mount!
In fulfilling the wishes
Be faster, than the wind!
(Dulam 1992, 162–163; translation by Birtalan)

Myalaalaγ*, Khalkh for "anointing, blessing"; in Mongolian,* **miliyaγud** *(in plural form), from* **miliya-** *"to anoint".* As in the case of the libation genre, some of the ritual texts associated with the cult of Genghis Khan, such as *Qulan qatun-u čomčuγ-un miliyaγud* (Rinčen 1959, 103), "Anointing for the ritual yurt of Queen Qulan," are counted among the shamanic texts of this genre.

Unšlag*, Khalkh for "incantation"; in Mongolian,* **ungšilg-a***, "reading".* Also known as *šiwšleg,* "whispered incantation," in Mongolian *sibsilge* from *sibsi-*, "to whisper," this relatively vivid genre includes songs that are used even nowadays by shamans during healing rituals and also during divination.

Genres That Originate from Written Tradition and Could Also Be of Buddhist Origin

Jalbiral, Khalkh for "prayer"; in Mongolian *ǰalbaril,* from *ǰalbari-,* "to pray". This genre appears in both the shamanic and Buddhist ritual repertoires and may be performed by a wider circle of performers, such as hunters and participants in *owoo*-rituals (Khalkh, *owoo,* "altar in nature"). The exact relation between shamanic and Buddhist types of prayer, and the origin of prayer, whether as a shamanist or preshamanist genre, need further research. The following example is the text of a hunting ritual; the hunter prays to the spirit lord of the beasts, Manaxan:

Xadaar xaalt xiisen,
Modaar buult xiisen,
Altam Manaxammin'!
Uuǰim xormäädan' xorγadasan
Xoǰgir tolγäämin' xonoktää bolǰ, üstää
Xoosam biyemin' xonoktää bolǰ,
Altam Manxanmin'!
You have made a hideaway for me from rock,
You have made a cover for me from trees,
Oh, my golden Manaxan!
You became a shelter for my bald head,
hiding in your wide hem,
You became a shelter for my hairy poor body,
Oh, my golden Manaxan!
(Rinčen 1975, 109–110; translation by Birtalan)

Öčig*, Khalkh for "appeal,"* **öčix üg***, "appealing words"; in Mongolian* **öčig***, from* **öči-***, "to appeal."* Examples would be *Ürs gargax öčig*, "Appeal on the occasion of the dropping of cattle young," and *Ongodtaa öčix üg*, "Appeal to the protector spirits" (Dulam 1992, 155–157). The following example is a fragment from a hunting ritual text chanted on the occasion of bear hunting. The hunter (or the shaman) appeals to the spirit of the hunted bear:

Qada-yin man-u qan babai,
Qarilčaǰu man-tai qanilaba ta.
Qartaγan morin-du mordaǰu,
Qadan-daγan amuran bučaγtun!
Our kingly grandfather in the rocks,
You have met and welcomed us.
[Now] riding on a wild horse,
Please, return to your rocks in peace!
(Rinčen 1975: 111; translation by Birtalan)

San*, Khalkh for "incense offering"; in Mongolian,* **sang***, from Tibetan* **bsang.** A large number of shamanic and Buddhist offering texts belong to this group. Both the lamas and the shamans performed using similar texts; obviously the language of the Buddhist practice was Tibetan, but there are also numerous Mongolian texts, translated from Tibetan—for example, *Ünegen sang,* "Incense offering for the fox," *Altayin sang* (Oirat), "Incense offering to the Altai Mountain," and *Zayaači tabun tenggeriyin sang* (Oirat) "Incense offering to the five destiny gods."

Serǰim*, Khalkh for "libation"; in Mongolian,* **serǰim***, from Tibetan* **ser-skyem***, cf. cacal,* **sačuli.** This genre is very close to the cacal, but the title indicates a libation text of Tibetan origin, a Lamaized text with numerous

Buddhist motifs. In some cases the text is the same, and only the Mongolian genre designation has replaced the Tibetan genre designation: See the following fragment *Böge-yin serǰim*, "Shamanic libation":

Ayaγan-du kigsen arǰa
Abuγad ergübel degeǰi,
J̌üngsen-dü kigsen jürǰi
J̌üg-tegen ergübel degeǰi.
The twice-distilled spirit, which is poured into the bowl,
Is the best part of food, while it is offered.
The orange, which is put on the dish,
Is the best part of food, while it is offered to the (right) direction.
(Rinčen 1975, 3–4; translation by Birtalan)

A Summary of the Genres and Their Provenance

To sum it up in a slightly different way, the suggestion being offered here is that the invocations *(duudlaγ),* the invocation chant *(tamlaγ),* and the devotion *(daatgal)* are or were pure shamanic genres; the appeal *(öčig)* and the prayer *(jalbiral)* appeared among the shamanic genres probably due to Buddhist influence. The curse *(xaraal, jüxel),* the blessing *(yönsöl)*, the incantation *(unšlaγ),* and the praise *(magtaal)* are traditional folk genres, which can be performed not only by shamans, but usually also by respected members of the community (although there are professional cursers and performers of incantations and praises). The texts of libation *(cacal* and *serǰim),* beckoning fortune *(dallaγ),* anointing *(myalaalaγ),* and incense offering *(san)* belong to the category of ritual texts, which can be performed by certain, authoritative members of the community and are accompanied with other important paraphernalia of the ritual.

Typology of Mongolian Shamanic Texts According to the Degree of Lamaization

The first attempt to systematize the shamanic texts, prepared by B. Sodnom (Sodnom 1962), was based on the content from the point of view of Buddhist influence. He divided the shamanic text-corpus into two major groups and several subgroups, according to the degree of Lamaization. Thus, he systematized the texts according to the types of shamans, namely, black *(xar jügiin böö)* and yellow *(šariin böö, šar jügiin böö)* shamans. According to the extent of Buddhist influence, there are the following categories (Sodnom 1962, 66–67):

1. Texts of black shamans without any Buddhist influence; texts of this type are considered to be original Mongolian ones.
2. Texts of black shamans, with motifs having to do with shamans' opposition to Buddhist monks. Thus, Buddhism appears in these texts only as the object of shamans' aversion.
3. Texts with new, Buddhist motifs added. The old, pure texts of black shamans are completed at their beginning or at their end with Buddhist phrases, but the main substance of the traditional content has remained untouched.
4. Texts with completely new Buddhist motifs and phraseology. These texts, as illustrated by the following example, are performed only by yellow shamans:

Budlangiin uul min'!
Burxan bagš jalarsan
Buruu nomtoi böö nar maniig
Bogdiin gegeen nomloson.
Awragč Ariyabal,
Awraldaa awdag Altangerel,
Soyorxogč Juunxaw,
Soyorxolodoo awdag sudar nom,
Jul xüǰee örgöǰ baina.
Oh my Potalaka Mountain!
The Buddha master descended [to us],
His Holiness, the Bogd gegeen taught us, the shamans-heretics.
I offer lamp and incense
to saviour Aryabalo [bodhisattva],
to the "Golden glance" sutra, which is received in the salvation,
to the merciful Cong-kha-pa,
to the books, and sutras, which are received in the mercy.
(Sodnom 1962, 66–69; translation by Birtalan)

Texts Used in the Rituals

The type of ritual, the point at which the text appears in the ritual, the categories of spirits invoked, and the whole repertoire, or the heritage

of a shaman can also determine the text-typology (cf. Even 1988–1989, 352–380):

1. The type of ritual, depending on when the text is performed (day ritual, night ritual, open-air ritual, and so on) as well as on its function (offering ritual, healing ritual, divination, and so on)
2. The phase of the ritual during which the song is performed (at the beginning, when the spirits are called, in the middle, when the spirits are at the ritual place, or at the end, when the spirits are sent off)
3. The categories of spirits invoked (lonely spirit, different groups of spirits, ancestor spirits, lords of nature, and so on)
4. Texts of a repertoire of a shaman (see above, the genre typology).

Textual Typology of Shamanic Texts

There are several aspects of possible textual typology of Mongolian shamanic texts; one very important distinction depends on whether the texts are traditional inherited texts or improvised occasional ones. The traditional texts fall into the genre typology given above; the improvised parts of the texts are usually formed in dialogues. This part of the text usually has most of the following characteristics:

1. An improvised dialogue with the *ongon*(s) indicates a part of the night and day rituals, as well.
2. It is a dialogue between the shaman and in the most cases several ongons, using as an important part of the ritual text the traditional invocations, prayers, blessings, and so on.
3. The text of the dialogue is improvised, according to the type of ritual and the requests of the clients.
4. The dialogue with the ongon(s) is not identical with the shaman invocations and prayers. It has its own patterns; it may follow rules of alliteration, but it does not have a narrowly definite text.
5. This improvisational part of the text contains animal sounds and a lot of distorted words; many of them cannot be identified, because several syllables have been added to the words for the sake of the rhythm.
6. This improvisational part of the text may contain fragments of other folk genres.

The following example was collected by the author in 1993 from the Darkhad female shaman Bayir. Bayir talked to several ongons:

—Tawan taldaa tarǰ
Arwan taldaa
Alga bolox čin' bolaa yuu?
—Ongon tawan tengertee
Sain jalbiraltai bai!
—You dispersed to five sides,
Disappeared in ten sides,
Why did it happen?
—You perform good praying
to the five ongon gods!
Then the spirit Mother Öjüür scolded Bayir:
– Ödör yaax geǰ böölöw či?
Xünees čin' yuu üxeew?
Malaas čin' yuu üxeew?
Why did you shamanize during daytime?
Who of your people died?
Which of your cattle perished?
Trying to pacify Mother Öjüür, Bayir said:
– Öndör šar Öjüür bayir min'
Örgön Xarmaa cengelt min'
Nartiin ornää xümüüs
Bügd amar sain baina!
Öjüür, my high, yellow place,
Xarm and Cengelt, my broad rivers,
All the people living under the Sun,
They all feel well!

MONGOLIA, SPIRITS AND GHOSTS

See Spirits and Ghosts in Mongolia

MONGOLIAN SHAMANIC TRADITION AND LITERATURE

In the majestic central Mongolian land of the ever wandering nomad, a steppe or grassland herder's wife bows down to go outside of their felt, circular tent called a *ger,* or yurt. As she surveys their new place, their sheep and goats grazing in the distance, she hopes for good grass, and with a sacred spoon she sprinkles the day's freshest milk to the four directions, to the spirits of the place and to the Munkhe Hucher Tengri, the "Eternal Blue Heavens" (from the author's personal observations in 1999). They are Kalkha Mongols, representing the largest Mongol ethnic group, and by this simple, reverent libation, the woman practices a shamanic tradition that is probably thousands of years old for protecting their new homesite and offering thanks to the transcendent spirits of nature.

Over 1,000 miles to the northwest in a high mountain pass ringed by a horizon of snow-capped, 10,000-foot peaks, a Darkhad Mongol circumambulates silently three times on

horseback around a 12-foot-tall pyramid of birch poles, twigs, horse skulls, wooden crutches, horsehair ties, royal blue silks fluttering in the mountain winds, vodka bottles, cigarettes, matches, sweetbreads, coins, and other offerings, all perched on a rising mound of stones carried up to the pass by shamanic devotees. As his horse plods with care around the sacred *obo,* he tosses coins upon the mound, walking clockwise in the path of the Sun, thanking the spirit master of this mountain pass and appealing to him for safe travel down to the far valley of his homeland. He personally does not know the name of this master, but if need be or if there is a problem in the days that follow, he can approach an old shaman lady in a neighboring valley. She will know. She will tell him what he must do. His father taught him to show respect in this way, and ever since he was old enough to remember he has been blessed by keeping up this family and ethnic tradition.

Even higher into the Sayan Mountains close to the northern border of Mongolia, Gombo, as he is called, belongs to the Dukha, or Tsataan, group, one of the smallest ethnic minorities in Mongolia. Today he and his Tuvan-origin family have just packed up all of their belongings. Their beasts of burden are reindeer—an animal well adapted to the high mountain tundra and taiga forest. Today, they will ride their reindeer and herd hundreds more over forty miles to a lower valley forest area where they expect to graze the deer and hunt and forage in the forest before moving on again five weeks later. But just before their unique caravan departs down valley, as his ancestors have done for over 3,000 years, Gombo, a respected elder, gathers up some *jodo,* high mountain juniper, and places a large number of the rich green branches in a pile about the size of a loaf of bread on a hewn wooden plank of larch. He then, under the watchful eye of his wife, sets the bottom of the juniper aflame with a Russian-made wooden match. Placing the wooden platform with the burning juniper in the middle of their now empty camp, he proclaims thanks as they have always done and leaves the spirits of this forest this gift of sweet-smelling smoke, slowly curling upwards.

As all these people carry out these shamanic traditions, involving blessings and the purification of place, their home life, and travel onward in their nomadic pathway is sanctified, and they can feel protected and live more hopefully and with calm minds.

Ancient Roots of the Mongolian Shamanic Tradition

A visitor to the endless grasslands of Mongolia, sitting under the still, high blue skies, can only guess of the ancient roots in time of the shamanic tradition of the Mongols. A shaman today with Buryat heritage, Sarangerel, notes in her recent book entitled *Chosen by the Spirits,* that in the "*gelab* time, many thousands and thousands of years ago," events took place that in effect were caused by the "ninety-nine *tengri* or heavens—of the east (black) and west (white) heavens" (Sarangerel 2001). Thus, by lore, tradition, and myth, the Mongolian form of shamanism, jointly with both Buryat and Tuvan shamanism, has most ancient roots.

The epic shamanic tale *Nišan saman-i bithe* (Book of the Nišan female shaman), a Manchu folktale hundreds of years old, is known to Mongol, Buryat, Tungusic, and other Siberian tribes. The tale recounts folklore that specifically identifies soul retrieval as an essential power of certain Mongol shamans, as well as describing the perils and dangers the shaman encounters undertaking such a task (Nowak and Durrant 1977). Likewise, the Buryat-Mongolian and Central Asian Geser epic, known for centuries, immortalizing the spirit incarnated as a god-man, Geser, identified significant shamanic attributes, ceremonies, and challenges throughout its thousands of stanzas. These folklore epics testify clearly to the depth and ancient heritage of shamanism in Mongolia and among the Mongolian peoples of the world.

Genghis Khan himself, in *The Secret History of the Mongols,* believed to have been originally written soon after the conqueror's death in 1227, is described as having been guided to victory through the divine intervention of supernatural powers, led by the Eternal Heavens, Munkhe Tengerik (Sarangarel 2000, 22). It was the supernatural powers attributed to the sacred mountain, Burkhan-Khaldun (*Burkhan* meaning specifically "spirit") that guarded the most famous of the khans, and he recognized local spirits as having only local impact, while the Eternal Heavens ruled supreme over the earth (Ratchnevsky 1992).

Mongols' Shamanic Worldview

The daily practices of the Mongol libation such as milk sprinkling or even the elaborate ceremonies of offerings to otherworldly powers recognized by Genghis Kahn for the Burkhan Khuldun only offer a glimpse into the complexity of the shamanism of the Mongols. Buryat ethnographer Y. O. Khundaeva suggested that it was a syncretism of "numerous native conceptions and ideas, concerned with the formation of various cults like that of the Sun, Sky and other natural objects of phenomena," which led over centuries to today's Mongol shamanism (Khundaeva 1996). Khundaeva identified the primary purposes for shamanic action of the Mongol practitioners throughout history and today as including healing illnesses, obtaining good fortune in hunting and livestock breeding, the removal of negative energies or spirits, and even entertainment.

In addition to basic shamanic purpose, tradition, and ceremony, Mongolian shamanism incites great debate among scholars due to its intrinsic complexity, highlighted in the conception of the *tengri,* "heavens." Fifty-five western heavens, or white heavens, and forty-four eastern heavens, or black heavens, make up ninety-nine spirit heavens having influence under the everlasting Munkhe Tengeri. Each of these heavens is named, holds certain attributes, and affects the order of the human, spirit, and Underworld universes. One of the main questions debated by scholars is the identification of the diverse spirits and whether the sacred black and white heavens should be seen as part of a fully monotheistic religious order recognizing the eternal heaven in its supremeness, just as Genghis Khan once did.

Buryat-Mongol ethnographer Irina S. Urbanaeva addresses this very issue in her abstract entitled, "Shamanism of Mongolian Peoples as the Expression of Central Asia Tengrian Esoteric Tradition" (Urbanaeva 1996). Resurrecting the esoteric symbology of the "tengri doctrine" as she describes it, Urbanaeva offers five primary core beliefs of the Mongol shamanic worldview:

1. Heaven and Earth have different and indeed opposed natures. Heaven is composed of subtle and highly organized matter, as opposed to Earth, which is composed of highly condensed and inert matter.
2. Heaven is the place of Belief, the source of Fire and indivisible Life.
3. Heaven is the sphere of freedom and the space where man evolves after death.
4. Heaven begins on Earth within the heart of man, as perceived by spiritual eyesight alone.
5. Heaven actively influences evolution on Earth through heaven-sent messengers; thus the great heroic epics, such as those of Abai Geser Bogdo Khan, Genghis Khan, Buumal Burkhad, and others.

The triumvirate recognition of the tengri in the supremacy of the eternal heaven, and through the beneficence and perturbations of the west (white) and east (black) heavens (which are not to be viewed as good vs. evil entities, but as opposite and complementary) become a core four-part cosmology when complemented by the Mongolian respect and reverence for the Earthly planes' most sacred four directions. It is through their actions in respect to the four directions under the watchful eye of the ever present, everlasting heavens, or Heaven-Father, and situated, living upon the feminine Earth-Mother that Mongols gain and maintain shamanic wisdom, power, and harmony.

Shamans of the Steppe and of the Forest

It is important to recognize that Mongolian shamanic practice is not the same in all parts of Mongolia, but differs, based on differences in ecosystems. Some ethnic identities and groups evolved to live nomadically with either steppe or grassland animals and livestock; others learned over thousands of years to domesticate the reindeer and live in its high mountain forest or taiga and tundra habitat. Forest dwellers, different from steppe dwellers, are traditionally hunter-gatherers and thus identify spirit or shamanic powers that affect them as having different origins than those Mongol peoples who have herded domesticated livestock on the grasslands.

Genghis Khan called upon both forest- and steppe-dwelling animal spirits; perhaps due in part to his youth as a forest dweller and hunter, and his dominance in steppe warfare. When appointing his soldier guards in a military encampment, as seen in *The Secret History of the Mongols,* he called upon his servants to have his

warrior named Hunan guard him, turning into an attacking wolf at night and a flying crow during the day. Genghis Khan apparently relied on shamanic transformation for protection and advice.

Shamanic Revivalism in the Land of Genghis Khan

Just as modern Mongolian scholarship has revived the image of Genghis Khan, challenging old Western beliefs about his character and sensibilities, so shamanism has revived in Mongolia, restoring old traditions as well as changing to meet new needs. Shamanism in Mongolia has not taken on quite the level of commercial and even state interest that it has in neighboring Tuva, but it is very much alive. Shamans practice even in metropolitan Ulaanbaatar, the nation's capital city, where a healing ceremony or private session is just as apt to be interrupted by the ringing of a cell phone as by an uneasy tengri spirit from the east.

Most shamans in Mongolia, however, still practice in their villages or gers or in the steppe countryside, far away from the hustle and activity of Ulaanbaatar. There has been a revival of shamanic practice among the shamans in Hövsgöl province—both among the Darkhad peoples in the area around Tsaagan Nuur (White Lake) and in the northern tribe of Dukha (Tsataan) reindeer-herding peoples. The family practice of each shaman can be seen in small meetings, or in community sanctification of sacred sites, healing practices, divinations, blessings, and invocations to the ninety-nine tengri heavens.

Shamanic séances are still conducted at night in the traditional manner; shamans, both male and female, fall into deep trances (altered states of consciousness), and traditional costumes and artifacts are used. Shamans say that they are meeting their spirits partway between the earth and the spiritual realms. In sum, the current practice of shamanism in Hövsgöl province is very traditional, often maintained by older women shamans. In the Dornod province, to the east, shamanism is also practiced very actively by Buryat shamans, who are actively initiating younger people into shamanhood. They have developed almost a whole industry of shamanic regeneration, using traditional shamanic implements and layout for the initiations, wherein birch trees play a significant role. Elements of Neo-Shamanism, imported from the Western world, have also entered into their practices, but powerful shamans are still able to go into a deep altered state of consciousness, thus still connected to the traditional features of shamanism.

OROQEN SHAMANISM (NORTHEAST CHINA)

The Oroqen, also called Orocen or Orochon (or Elunchun in Chinese), form one of the Tungus-speaking groups in northeast China. They live south of the Heilong (Amur) River, mostly in Tahe and Huma Counties of Heilongjiang province, and in Oroqen Autonomous Banner of Inner Mongolia Autonomous Region. (Legend tells that seven clans of the Oroqen migrated to the south of the Heilong River.) The Oroqen are one of the smallest officially recognized minority nationalities in China. The 1990 census documented 6,900 Oroqen persons, and the population numbered only 3,262 according to a 1953 census. The Oroqen believe that *Oroqen* means "mountain people." But linguists suggest that it may also mean "reindeer herders," because *oron* means "reindeer," and the Oroqen were historically recorded as reindeer herders.

The Oroqen do not have a written language. In the past, some Oroqen could speak and write Manchu because of the historical influence of the Manchu, the most powerful Tungus group. Today, most Oroqen in the concentrated areas speak their native language and Mandarin Chinese. Traditionally, Oroqen society was formed of patrilineal *mokun* (clan) organizations. Each mokun consisted of several *wulileng* (lineage or large family) units. Although a wulileng usually had a number of nuclear families, each living in a tepee, the property was communally owned by the wulileng. Exogamous marriage was the norm, and wind burial was practiced. Shamanism is the core belief system for the Oroqen. There is no evidence that they have been impacted by outside religions.

Once a nomadic group with hunting and gathering as the main subsistence economy, most of the Oroqen have become farmers and forest workers since they were permanently resettled in the early 1950s. The homeland of the Oroqen is rich in forests and wildlife in the mountains and rivers, though they are not as abundant as before due to logging and migration of other people into the area (E.G. 1983; Guan and Wang 1998; Xu, Sui, and Pang 1993).

Shamans of the Past and Present

The debate continues as to the exact origin of the Oroqen people and the historical development of their shamanic tradition. Although the Oroqen are mentioned in two of the best-known works on shamanism (Eliade 1964; Shirokogoroff 1935), their shamanic practice has not yet been described in detail in the English language.

According to Guan Xiaoyun and Wang Honggang (1998), and the data collected by Kun Shi and Richard Noll during their field research in the summer of 1994, the Oroqen elders recall that they have had male and female shamans as far back as they can remember. The Oroqen believe that the first shaman was a female, and female shamans once dominated the practice. In the two Oroqen townships (Shibazhan of Tahe and Baiyinna of Huma) in northern Heilongjiang, sixteen shamans (nine males and seven females) were practicing healing and other rituals at the time the Oroqen were permanently resettled in 1953. Most of the shamans survived through the 1980s, and two of them were still alive when Shi and Noll did their field research. The resettlement fundamentally changed their traditional way of life, and government-supported clinics and hospitals largely replaced the healing shamans. When the resettlement occurred, the influential shaman Zhao Liben took the lead in abandoning the practice by holding a "Farewell to the Deities" ceremony. Zhao later held local and regional official positions. Despite the ceremony, the shamans had a hard time adjusting, and many of them later had visions and spirit possession experiences. When that happened, they had to chant spirit songs and conduct a ritual to appease the deities and spirits.

Although the two living shamans may not openly perform healing rituals, they still remember the ritual procedures, ritual songs and chants, and myths of shamanic motif. One of them occasionally beats the drum and can communicate with the spirits. There is at least one healing ritual documented in 1995 (Guan and Wang 1998, 162–168), in which the shaman successfully healed a patient who had been ill for three years and had tried medical treatments of all kinds. The two living shamans have contributed, through folklorists and ethnologists, to numerous Chinese publications and video documentaries. The Oroqen scholars proudly regard them as living treasures of their people. However, unlike the Manchu shamans who still initiate young shamans, there is no sign yet that new Oroqen shamans will emerge, and the living shamanic tradition of the Oroqen may soon disappear with the two aging shamans. Even if this should occur, the knowledge of shamanism will survive, thanks to the efforts of researchers to document the tradition in print and audiovisual forms, and to the Oroqen elders who continue to sponsor the hunting and harvest ceremonies once associated with the shamans.

A recent publication on shamanism in China includes a photo of an Oroqen shaman in the Inner Mongolian Autonomous Region, without sufficient information to substantiate it (Guo and Wang 2001, 11). A study conducted in the 1950s (Zhao 1991) recorded thirty-nine Oroqen shamans in Inner Mongolia from 1900 to 1957, of whom twenty-four were female. It is not clear if any of those shamans are still alive. The records available so far do not indicate that there are living Oroqen shamans in the region.

Cosmology and Myths

The Oroqen world is divided into three levels. The Upper World is occupied by *bukan* (deities) and helping spirits; humans and living things inhabit the Middle World; and wandering souls and harmful spirits live in the Lower World. The Oroqen shamans are believed to be able to connect with the three worlds, to invoke deities from the Upper World for help, and enter the Lower World to retrieve the wandering souls of the sick or even the deceased. The number of deities and helping spirits is endless, from animals, plants, and ancestors to natural phenomena. Many of the deities and spirits are made into idols from wood, leather, and other materials. Some of the most important deities are described as follows (drawing on Guan and Wang 1998; Ma and Cui 1990):

Dilaha Bukan (Sun Deity): the benevolent deity of light and warmth, worshipped with offerings at an annual ritual during the New Year. He is believed to have the power to help resolve conflicts and diminish disasters.

Bieya Bukan (Moon Deity): the kind-hearted female deity worshipped at the

full moon of the fifth month. She is believed to watch over the animals at night; so if no animal is found after days of a hunting trip, a ritual is conducted to seek her help.

Aulun Bukan (Big Dipper Deity): a female deity in charge of food storage; she provides direction to travelers and hunters at night.

Onkulu Bukan: the deity controlling all diseases, and is helpful in healing rituals.

Bainacha (Mountain Deity): probably the most respected deity for the Oroqen because he is in charge of all wildlife in the forest. In order to hunt game animals or to show gratitude after a successful hunting trip, offerings are made in honor of Bainacha.

During the last two decades, numerous collections of Oroqen folklore have been published in Chinese (Xu, Sui, and Pang 1993). In addition to legends and folksongs, they include creation myths, human origin myths, and tales about shamans. For example, several stories in a collection describe how a female shaman revived the soul of the deceased from the Lower World and how women with shamanic power retrieved the wandering souls of their loved ones (Sui 1988). The following is a synopsis of the myth "Nican (pronounced *ni-tsan*) Shamaness" (variably called Nishun or Nihai shamaness; Xu, Sui, and Pang 2000, similar to the Manchu epic myth *Nisan Shamaness*) collected by Kun Shi from the female shaman Guan Kouni in 1994 in Shibazhan.

> Legend has it that the earliest Oroqen shaman was a female named Nican. Every super-quality was manifested in her: She communicated with the deities on behalf of her people; she was kind and worked hard; and she was a respected healer and soul retriever.
>
> One day, an old couple living in the deep forest lost their only son due to an illness. They wailed over the death of their son. The Sky Deity was moved by their loss and told them to seek help from Nican Shamaness. They traveled to the river at the edge of the earth, and met Nican Shamaness. Without hesitation, Nican Shamaness took her shamanic outfit and drum, and embarked on the journey to save the soul of the deceased boy. By then the boy's physical body had been dead for nine days. Nican Shamaness quickly started chanting and dancing amid drumming. Soon she fell to the ground, and her soul flew to the Lower World to retrieve the wandering soul of the deceased boy. The task was accomplished with the help of the powerful Eagle Deity. It was three days later when Nican Shamaness came back with the soul to revive the boy.
>
> Nican Shamaness' power and popularity caused jealousy; she was blamed for reviving a deceased person, and later was murdered by the emperor's followers. Although Nican Shamaness died, the shamans continued the tradition generation after generation.

Practitioners and Their Functions

Like the other Tungus-speaking groups in northeast China, the Oroqen call their shaman *saman,* which means "the knower." The Oroqen believe that the shaman is the medium between the human world and the other worlds above and below; the shaman is a healer and the master of their cultural tradition.

There are two kinds of Oroqen shamans: the *mokun* (clan) shamans and the *deleku* (roving) shamans. The former were traditionally fewer in number, but more powerful in healing and other rituals (Ma and Cui 1990, 129). The shaman's status can be identified by the number of antler forks on the headdress: More antler forks indicate more experience and higher status (Guan and Wang 1998, 115–116). The shamans are also successful hunters and craftsmen; they perform healing and other rituals not as a way to make a living, but as a duty because they are called or chosen by the spirits to become shamans and to perform the rituals. Often their service is compensated by gifts in kind.

Oroqen shamanship depends on spirit selection. Usually, when someone suffers from a serious and unexplainable illness (the sign of spirit selection), a master shaman is called in for a healing ritual, which often involves soul retrieval. The ill person recovers after promising to become a shaman. About a dozen shamans documented by Guan and Wang (1998) became shamans in this way. Then they learned from the master shamans and through their own visions, the skills to invoke helping deities, to enter into a trance state, to journey

to the Lower World for soul retrieval, and to conduct other rituals for the interests of their people. They acted as assistants of the master shamans during apprenticeship. According to witness accounts, when the shamans entered a trance state, they could perform extraordinary feats (such as licking red-hot iron or swallowing needles) without being hurt. The shamans could maintain an altered state of consciousness for days (lying on the ground without eating) during their soul retrieval journey to the Lower World. The shamans sometimes performed divinations (usually through reading animal bones), but other ordinary people can also perform divinations (Guan and Wang 1998; Ma and Cui 1990).

In addition to the healing ritual, which often includes soul calling and retrieval, shamans conduct rituals for every important event in people's social and economic life, such as annual rituals in honor of ancestors and deities, spring hunting rituals, autumn harvest rituals, fertility rituals, and funeral rituals. It is important to note that a funeral ritual is always held for a bear after it is hunted, because the Oroqen believe the bear is related to their ancestors. During the ritual, the shaman chants prayers; people should not use the word for death, and must call the bear *yaya* (grandfather) or *taitie* (grandmother). The bear's head is wrapped and placed in the forest for wind burial (Ma and Cui 1990, 129).

Whether it is a healing or other ritual, the shamans generally follow the process of inviting the deities (the more deities invited, the more powerful the shaman), welcoming the deities, dancing and chanting, entering trance, journeying to the other worlds, communicating with the deities, making offerings, and sending away the deities. The helping deities or spirits may include an animal, a sacred tree, an ancestor, or one of the *bukans* (deities) described above.

One important component of the Oroqen shaman's healing power is through the use of folk remedies from herbs and animal parts. A detailed description of the remedies is recorded by one of the living shamans (Meng 1990, 36–41). These healing remedies have been widely used by shamans and ordinary people.

The Shaman's Costume and Equipment

The shaman's outfit is elaborate and is always kept in a special place. It includes a headdress (made of a metal frame, antlers, strips of colorful cloth, a small mirror, little bells, and a curtain of beads blocking eyesight), costume (consisting of a gown made of leather, copper mirrors, strings of bells, strips of colorful cloth, embroidery work, small pieces of metal representing weapons, and a cape embroidered with beads and shells), and a pair of shoes embroidered with beautiful designs with leather soles. There are two kinds of colorful cloth strips or ribbons. One kind is called *deguke* in Oroqen and is attached to both sides of the costume. Deguke are presented by people healed by the shaman, so more strips mean greater success and power of the shaman. The shaman's costume and shoes are made by women, but the headdress and drum are made by men.

The shaman's drum is called *wutuwen* in Oroqen, meaning "round hand drum." It is single-faced, about 50 centimeters in diameter, and usually made of the skin of roe deer. The drum frame is made of wood, with numerous small metal bells or rings attached to the frame. They make a harmonious accompaniment when the drum is sounded. The drumstick is a half-meter-long wooden stick covered in the skin of a roe deer's leg and attached with strips of colorful cloth representing the colors of the universe. The other shamanic equipment includes a birch-bark box containing idols and a square-shaped stick that is marked to record the number of invited deities (Guan and Wang 1998; Ma and Cui 1990).

Unfortunately, most of the old shaman's outfits and drums were ruined after the resettlement in the early 1950s. The Oroqen Ethnic Museum in Alihe, the only one of its kind in China today, houses a small collection of original shamans' outfits, drums, and other equipment. The relatively new outfits of the Oroqen shamans and some rituals are recorded in photographs in a new book (Guo and Wang 2001, 7–12). Even though some of the scenes seem to be staged, these and other valuable visual images of the last living shamans and rituals are helpful to researchers and even to the young Oroqen, who may one day decide to learn the skills and carry on their shamanic tradition.

As a final note, the author is grateful to the two Oroqen shamans for sharing their knowledge in 1994. He wishes to express here his re-

gret over the recent death of one of the two, Meng Jinfu, the last master Oroqen shaman, which he learned of after this article was written.

PRIESTESSES OF EURASIA

Background

Eurasia in the Bronze Age

Around 900–800 B.C.E., prior to the development of nomadism (an economy based on pasturing throughout the year in various but generally fixed locales), small, sedentary Bronze Age populations inhabited the river basins in Eurasia. Because they had mastered horse riding, they were able to take their small herds further from their villages to pasture. Soon they were driving their herds farther into the steppes (prairies) or high into intermountain valleys. With the increased availability of better and more pasture, the stock multiplied, which in turn augmented the human food supply. By the middle of the first millennium B.C.E., nomadic tribes inhabited much of area of the Eurasian steppes.

Eurasia in the Early Iron Age

Historical sources identify the earliest known Iron Age nomadic tribes: the Scythians, located north of the Black Sea; the Sauromatians and Early Sarmatians in the southern Urals and along the Volga and Don Rivers; and the Saka in southern Siberia, western Mongolia, western China, and Kazakstan. Migrating horizontally across the steppes, or vertically into the high mountain valleys, the nomads were economically dependent upon horses, sheep, goats, camels, and in the higher altitudes, yaks.

Nomadic Lifestyle

In the centuries B.C.E. (as well as today), the *auls* (nomadic villages) were small, composed of four to six interrelated or extended families who traveled together, Each aul was headed by a chieftain, who might be female or male. The grazing lands were tribal property, allocated to each aul by the chieftain, but each family controlled its own wealth. The clans were patriar-

chal in the sense that inheritance was through the male line, yet they tended to be egalitarian (equally sharing tasks and responsibilities). Although men and women had specialized tasks, it was not unusual for either sex to assume the other's tasks or leadership roles

Nomadic tribes have always interfaced to varying degrees with sedentary populations situated along the steppe borders. A particularly strong relationship existed between the Scythians and Geeks; Saka were strong trading partners with the outlying *satrapies* (political divisions) of the Achaemenid Persian Empire and Han China. The Sarmatians traded with the Achaemenid Persians and later with merchants from the Roman Empire. In Central Asia, nomadic tribes gained control of the Silk Road, becoming exceedingly wealthy by extracting tribute.

Ethnicities and Languages

The early nomads were Caucasoids and spoke Indo-Iranian languages. Over time, however, ethnic groups began to integrate. By the third century B.C.E., Mongolian nomads were in southern Kazakstan. Around the sixth century C.E., Turkic-speaking peoples, also coming from western Mongolia, ultimately reached modern Turkey. Tribes formed confederacies, and languages were modified as Indo-Iranian gave way to Turkic and Mongols spoke a Uralic language. In the Middle Ages, nomadic tribes were united under the leadership of charismatic chieftains, or khans. Genghis Khan and his descendants, with massive forces at their command, mustered formidable military and political power as they successfully ruled the vast territories stretching from west of the Volga through Iran, Central Asia, Mongolia, and China.

Modern Eurasian Nomads

As the Russian expansion mandated by Peter the Great in the seventeenth century progressed, nomadic tribes were pitted against each other and ultimately forced from their original grazing lands. To avoid the Russian expansion, in 1755 Kazak tribes entered the western Chinese-held Jungar Basin, then later migrated into western Mongolia to escape pressure on their grazing lands as the warlike Oirat Mongols gained control of the region. In the 1930s, the Soviets forced nomadic Kazaks, Kirghiz, Bashkirs, and Tatars in Russia and Mongols and Kazaks in Mongolia onto *kholkozes* (collective farms), where the populations were frequently decimated. Following the collapse of the USSR, thousands of people in Mongolia returned to their traditional lifestyle of nomadism. Throughout the socialist era in specific autonomous regions of western China, Kazak and Mongol nomads continued their established way of life.

The Kazaks, Kirghiz, Bashkirs, and Tatars had nominally converted to Islam during the eighth century, and shamanism did not play a prominent role in their belief systems. This may be attributed to the fact that these were steppe tribes, while to the north the Mongols, Tuvans, and other populations lived in closer proximity to the forest-steppe and forests *(taiga),* where shamanism originated. Although they were Lamaistic (a form of Buddhism), strong elements of shamanism remained in the belief system, and shamanism was prevalent within the region.

Not only did the Soviet regime's atheistic policies suppress shamanism and Lamaism, but because the shamans had been political leaders of their communities extreme reprisals against them were exercised. In fear, the shamans abandoned their work, and the majority also destroyed their clothing and accoutrements. Recent research in the Altai Mountains of northwestern Mongolia (Bayan Ulgii and Uvs *aimags* [state]) (Davis-Kimball 2002, 83–88) and in the northern Mongolian aimag of Hövsgöl (Fridman 2001, 2002), both regions isolated from the central political power, indicates a resurgence of shamanism. Older female shamans, trained either before or early in the Soviet period by shamans as well as by an occasional lama, now are able to admit to their shamanic abilities, and some have resumed various ceremonies.

The women shamans *(udagan)* frequently began their training after manifesting an illness, often epilepsy, when they were thirteen to fourteen years old, although this could occur as late as their mid-twenties. It appears their vocation has strong hereditary tendencies as numerous shamans are found within the immediate family. As the costume worn during shamanic ceremonies is extremely powerful as well as telling,

most shamanic garb was destroyed during the Soviet period. To reveal the accoutrements of garb, a typical eighty-two-year-old shaman from Hövsgöl aimag described her outfit of the early twentieth century as follows:

The costume had eighty-eight snakes with their heads on her shoulders and eighty-eight strips of cloth. Little metal cones hung on the arms, back, and front of the outfit. Her headdress was replete with three sets of tall owl feathers and an attached fringe of black twisted cotton thread. The costume also had chain mail in front and back and a mirror on the chest. A bow and arrow inserted in a narrow belt served as weaponry against evil spirits. The drum was made from wild deerskin with a horse head and two opposing dragons, protectors of the sky spirit, painted on it. It was adorned with a metal arrow, bells, and eight birds hanging on either side (Fridman 2002, 303–304).

A shamanic ceremony begins with an altered state of consciousness brought about as the shaman drums, sings, or chants. Most female shamans have spirit helpers, such as power animals and birds; ancestors; and nature deities such as sky, water, and mountain spirits (Fridman 2002). Altai Mongols continue to pay homage to the mountain deity Khan Bukhanoion (Davis-Kimball 2002, 89–90) and men and women perform meaningful ceremonies around their individual *ovoos* (rock cairns dedicated to certain spirits).

In Hövsgöl, hidden in the taiga and isolated from state power, many shamanic practices remain unaltered from pre-Socialist times. Some shamans read fortunes and portent impending danger, while others are involved only in healing and curing, a ritual that has proven effective even when administered on the distant infirm (Fridman 2001, personal communication).

Bronze Age Eurasian Shamans

Russian ethnographers have noted, based on the fact that the same term for female shamans is common in many languages throughout Siberia, that the earliest shamans were female. The earliest recorded evidence of shamanism has been found at several Central Asian locations, including the important sites of Tamgaly, northeast of Almaty, Kazakstan, and Saimaly in the Kirghizstan Tien Shan Mountains. These were holy areas, where rock outcropping served as the canvas to record rituals dedicated to the reproductive forces of nature. Never inhabited, the sites witnessed the burials of body parts, ritual dancing, and ritual cohabitation at the base of the outcropping. Repeated over thousands of years, these performances, the ancients believed, were necessary for the survival of the tribe. The Bronze Age shaman representations are dressed in sheepskin costumes with copper or stone accoutrements hanging from the torsos. Other shamans wear massive sub-crescent shaped headdresses, arms upraised while performing a ceremony. Rock-cut images reveal shamans hovering over the back of ritually horned horses, or, having entered an ecstatic state, they inseminate ritually horned horses.

Bronze Age Priestesses and Ritual Dance

Dance, a means of purification, can also induce ecstasy, an altered state required to attain success in certain powerful rituals. In the Tien Shan Mountains of western China, Bronze Age ritual choreography was preserved in the Kangjiashimenzi rock grotto. After long and arduous travel on foot, the priestesses and priests ecstatically dance to become purified before entering into the annual ritual copulation. The scene carved on the stone wall depicts a chorus line of larger-than-life females (up to 3 meters in height), naked except for distinctive headdresses with two projections (similar to projections on Siberian shaman headdresses. Cf. Fitzhugh and Crowell 1988, 247). They dance in various stages of rapture; some are about to fall or have fallen into coma. Interspersed among the females are a lesser number of smaller, nondancing males, each with an enormous erect penis, some attempting to impregnate dancing females. The ritual dance is led by a bisexual shaman (far left) wearing a monkey mask, an ithyphallic female with accoutrements hanging from her body. Heat-generating red ocher encircles the shaman's chest and other parts of her body. Further to the right within a scene of impregnation, a line of small beings reveals the results of the annual fertility ritual. Some ithyphallic dancing priestesses (gender indicated by size, posture, and headdress), also display representations of priestesses' heads on their chests, an image that seems to further emphasize the dominant female element of the ritual. The ithyphallic female in the Kangji-

ashimenzi tableau not only reveals the antiquity of shamanic sex-changing, cross-dressing, and transvestitism at the command of the spirits, it also indicates that changed sex was fundamental to the procreation performance.

Eurasian Nomadic Priestesses

Ancient beliefs were transmitted from Bronze Age shamans to Early Iron Age nomadic priestesses. The shaman's role has been defined as a relationship with evil; the shaman's obligation was to defend others against evil (Fitzhugh and Crowell 1988, 246). The role of Eurasian priestesses, however, became expanded. Foremost among the rituals portrayed on petroglyphs and interpreted from artifacts are those related to procreation, divination, and rites of passage.

Eurasian priestesses frequently were not recognized as such by early archaeologists, as it was assumed that a female found in a male burial was a victim of suttee (the custom of a wife's killing herself upon the death of her husband). More recently, however, due to new excavations and careful interpretations of nomadic female burials excavated at Pokrovka in the southern Ural steppes in Russia (Davis-Kimball 1998), scholarly opinion has held that it is more likely that the female buried with a male was a priestess who had accompanied a chieftain to the Otherworld to continue providing divinations and required rituals (Davis-Kimball 1997b; 2002, 57–97).

One example, an excavation in the western Ural steppes in Russia dated to the latter half of the first millennium B.C.E. that the author examined, reveals the type of burial formerly considered to be suttee but in reality was that of a young priestess. Before the tunnel entrance *(dromos)* of a Sarmatian chieftan's burial, three people were buried. All three skeletons had similar trauma in the same location at the base of the skull. The two males, probably guards, had only a few items to take with them to the Otherworld. The young woman, in contrast, had a large bronze mirror incised with rosettes, a *kubok* (a small ritual vessel often of precious metal and bearing the image of an undomesticated animal-helper), and an eye bead that served as an amulet. An assortment of colorants, including ochre and cinnabar as well as black carbon and white chalk, were stored in a small box. These artifacts are of the type that is associated with priestesses (Davis-Kimball 1997/1998), and, therefore, it can safely be assumed that this young woman had been killed so that she could continue her prognostication work to aid the chieftain.

Craftsmen for nomadic tribes created portable art that included small metal plaques and felt and leather horse accoutrements. During the era of the Saka, Scythian, and Sarmatians, the majority of these artifacts incorporated zoomorphic juncture (combination of animal parts) to create fantistic animals whose multiplied force aided the bearer, often a priestess, in her quest. The most frequent mythical animal, one that was also tattooed on her body, was the mythical griffin: The beak and wings of a raptor were added to the body and legs of a lion. This creature-helper took the priestess on its wings to the Otherworld in search of lost souls and to see into the future; simultaneously, it was an all-powerful protector. Scrolls, a frequent tattoo motif, were incorporated into the griffin image, displayed as coiled beaks with more coils emphasizing the hip and shoulder joints. Similar spirals were a repeat design painted in heat-power red on woven fabric. Most likely this symbol represented infinity while providing energy and means for the priestess to communicate with the spirit world (Davis-Kimball 2002, 77–79; 96–103).

In the burial of the young priestess from the Ural steppes described above, another artifact, a leather appliqué that had been attached to another object (possibly a kubok) was cut in the form of repeating scrolls in silhouette; the artisan had designed the negative space to represent griffin heads. This creative appliqué also emphasizes the priestess's association with shamanic powers.

In the Eurasian steppes, the earliest nomadic priestesses are noted among Sauromatian tribes in the southern Urals beginning about 600 B.C.E. It is not possible to identify accoutrements used by the Bronze Age shaman, such as those seen on the Tamgaly portrayals, but those of the Sauromatian priestesses were excavated from their burials. These objects varied in type, quantity, and value, thus revealing priestesses of various statuses, each of whom had a distinct role within the community. The domestic hearth priestess were charged with guiding rites of passage

within her aul, such as birthing, celebrations marking the advance from puberty to adulthood, and marriage. The hearth was the center of the family and thus of the tribe; sacred oaths were sworn on the hearth. According to Herodotus, the Scythian goddess Tabiti was linked to the fire cult (Herodotus 1975). The dominance of Tabiti and other female deities in the Scythian pantheon not only indicates an earlier matriarchal society, according to some scholars (Ustinova 1999, 69ff), but also can be seen as providing additional evidence of the preeminent positions priestesses attained in nomadic societies.

Some Eurasian nomads became displaced to the north, where their customs are reflected among sedentary tribes, such as the Chukchi, Koryat, and Itelmen. Here, older women perform the shamanic activities. The Siberian Yakuts, who came from the south, worshipped Ayyysyt, goddess of childbirth. According to tradition, she lived in the east, to which the shaman raised a glass of koumiss in her honor. Seven days before the birth of a child, the goddess comes to the mother, safeguarding and speeding her delivery, and flying away three days later. A farewell ceremony takes place at the time of Ayyysyt's departure, a ceremony at which men cannot be present. For the ceremony, a pit is dug near the hearth, and a tent covered with birch bark is built over it. Images of elk and reindeer in birch bark are placed around the tent. The women sit around the tent dressed in their best clothes and a tall fur hat, as Ayyysyt is depicted in epic poems. After building a fire in the tent, a small child shoots an arrow into the representation of a reindeer. During the next phase of the ceremony, women dip a wooden spoon into a bowl of grease and smear the substance on their faces. Then without a word they begin to laugh. The one who laughs the loudest is said to be smiled on by Ayyysyt and will soon bear children (Okladnikov 1970).

The antiquity of the rite, dating to the era of the matriclan, is emphasized by the fact that men are not allowed to be present. The ritual pose of the women is the same as that found on Upper Paleolithic European statuettes of women who have been analyzed as representing conjurers of bewitched animals. Yakut women magically kill the reindeer—the child shooting the arrow is merely the executor, performing at the will of the women, who have cast a spell upon the animal. The three elements fundamental to the survival of a nomadic society—fertility, safe childbirth, and food procurement—are represented in the Ayyysyt ritual.

The skeleton of a young female warrior in situ. A leather bag containing a bronze arrowhead was around her neck (now visible on her chest), and a large boar's tusk amulet was near her feet. Her sword is adjacent to her right femur. Pokrovka Cemetery 2, Kurgan 8, Burial 4. (Courtesy of Jeannine Davis-Kimball)

The Yakut vessel holding the fat for ceremonial smearing may find its antecedents in the *kubok* of nomadic priestesses. Reserved for ritual use, this cup or bowl could never be used for profane food and drink. Made from a reflective precious metal such as silver or gold, the handle was in the form of a fantastic animal. The kubok ritual was similar to the Native American dream quest. After preparing herself with fasting and prayer, the priestess performed the dreamer rite by sitting in a darkened yurt, staring at the reflections of a burning oil light placed on the surface of water in the kubok.

The intent was to diagnose an illness or divine a revelation, which might affect the entire tribe or confederacy (Okladnikov 1970).

Swords and daggers, elaborately embellished with gold pommels and hilts with gold-foil animals displayed along the blood groove, were among the priestesses' ceremonial accoutrements. Other symbols associated with warrior-priestesses were also found among Siberian shamans' repertoire of magic. A. P. Okladnikov noted that tall, conical headgear worn by Yakut women in recent centuries was the attire of shamans during *kamlaniye* (shamanic performance), and that this headdress constitutes one of the most archaic elements of the steppe nomads' cultural heritage (Okladnikov 1970, 258). Not only was it worn by Caucasoid priestesses in western China, it later appears as the witch's hat in medieval Europe. Siberian shamans dancing, beating drums, and singing, along with the use of hallucinogenics, produced a self-induced trance. Eurasian priestesses utilized similar techniques, for they burned and inhaled the smoke from trance-inducing botanical seeds (Davis-Kimball 1997a; Rudenko 1970).

Body markings, paintings, and tattooing have been encountered on the preserved skin of priestesses who were frozen (Polosmak 1996; Rudenko 1970), as well as others who were mummified in Takliamakan Desert, in western China (Barber 1999; Davis-Kimball 2002). Geometricized tattoos or paintings on the temple or across the upper eyelids indicated the hierarchical order of the priestess and her particular calling. Some priestesses had the power to cast spells, or channel; some were seers, healers, or diviners. All would have worked under the direction of the high tribal priestess, who had been trained from childhood by the previous high priestess and had received her appointment before the death of her teacher.

Magical animals were also tattooed on priestesses, as well as being carved from wood and cast in gold. These figures took the form of snow leopards, deer, and birds and were worn on the priestesses' belts and headdresses. These special animals were not only badges of rank, they served as helpers to the healers.

The domesticated sheep and horses that played life-sustaining roles in the nomads' profane lives, with the exception of the ceremonial horned horse, were never portrayed in religious art and therefore remained in the realm of the profane. In contrast, wild, untamed animals, deer and reindeer, snow leopards, and birds, as well as the fantastic griffin, were maintained in a sacrosanct space. Legends of the Deer Man in which a woman (the earth mother) gives birth to a small deer, who eventually leaves her to join the father, abound among Eurasian peoples. Various aspects of the deer are included in priestesses' repertoire. As a shape-shifter, the creature may have been another link to the supernatural.

Large felines, especially the panther, leopard, and cheetah, have always been shamanic helpers. In Eurasia, the Tien Shan snow leopard was assimilated by an affiliation of priestesses; some of these animals were winged mythological creatures (Davis-Kimball 1999).

Mirrors, cast in silver or bronze and associated with priestesses, had a shiny, reflective surface, but were never used for the purposes of vanity. More Eurasian priestesses appear to have been qualified to use a mirror to contact the spirit world than to dream quest. The healing priestess carried a knife of stone or bronze as part of her tool kit, used to collect medicinal herbs for poultices, potions, or infusions.

In preparation for rituals, priestesses ground certain ores and minerals, particularly those that produced the heat-inducing color red (ocher and cinnabar); they also incorporated chalk for white and carbon for black. After grinding the ore on a small stone table or clay palette, they mixed the powder with milk or fat in a natural stone container or fossilized oyster shell before painting on cloth, and on their faces, arms, and bodies. Although the nomads had master wood carvers, a shell (or even a stone shaped as a shell) was preferable to a wooden bowl, as the latter still contained its energy, which would be transmitted to the ritual powder.

SAKHA (YAKUT) SHAMANISM (NORTHEAST ASIA)

The Sakha people have a long tradition of shamanism, which has survived attempts at Christianization, as well as the persecution of the Soviet state. Certain elements of continuity are evident, but much weaker by contrast with pre-Soviet Sakha shamanism when "Some of the most compelling séance descriptions in all of Siberian ethnographic literature" were recorded by Ivan A. Khudiakov in 1868–1869, citing dialogues between shamans and helper spirits (Balzer 1996, 306). As Marjorie M. Balzer point out, on the basis of her fieldwork in the Sakha Republic in the 1990s, "in the political and social climate of the Sakha Republic in the 1990s, only about seven Sakha, Even and Evank men and women are reported to be shamans. This number is sometimes disputed, with some believers emphasizing that no 'true' shamans are alive today, while others claim many folk healers are undergoing shamanic sickness and using shamanic techniques. For more people have made aspects of shamanism, especially soul and spirit beliefs, integral to their ways of defining themselves and their environment" (Balzer 1996, 310).

Sakha (Yakutia) is the largest newly independent republic in the Russian Federation. Having proclaimed its independence in 1990, the Sakha Republic occupies an area of 3.1 million square kilometers in northeast Asia, with more than 40 percent of its area within the Arctic Circle. It has a population of 1.7 million people (0.3 inhabitant per square kilometer), living within 35 administrative territories, called *uluses* in the Sakha language (which belongs to the Turkic family of languages). The ethnic composition of the Sakha Republic is complex, with more than eighty ethnic groups represented. The largest group are the Sakha (called Yakut by the Russians since czarist times), who comprise 40 percent of the population. The remaining 60 percent consists of many smaller groups from the north, including Evenki, Even, Dolgan, Yukagir, and Chukchi, as well as displaced people and immigrants and their descendants. The history and origins of the Sakha are obscure. Most researchers hold that the Sakha are of Turanian-Mongolian origin and that their migration from southern Siberia to the north follows the history of more general migrations in the regions of Central Asia and southern Siberia. The people of the Sakha Republic make a living fishing, hunting, breeding reindeer, and raising horses and cattle.

Sakha Shamanism: The Essence of the Sakha Religious System

The Sakha philosophy of life was formed by centuries of nomadism, a culture that created its moral leader—the shaman—who also imparted the cultural tradition. Sakha shamanism is a religion in which particular individuals are set apart from ordinary members of the com-

munity. These individuals fall into trance (usually artificially induced) and are credited with the ability to communicate with the spirit world. These people are the shamans, who fill the roles of healer, diviner, and priest. Theorists of cultural evolution hypothesize that Sakha shamanism originated from faith in the highest god in heaven. This faith created the need for a mediator who would maintain connections between heaven and earth. The shaman, as a person charged with mediation, ensured durable communication between heaven and earth, symbolized by the "ascension" of the shaman during trance. As the cult of the Supreme Being receded into the background, a multitude of lower-level gods acquired greater importance. Sakha shamans are distinguished by their ecstatic techniques, used during *kamling,* the séances that incorporate dancing, singing, drumbeating, and reciting.

Ignoring various discrepancies and minor local differences, the world of the Sakha shaman is divided into upper (heaven), middle (earth), and lower (underground). The Upper and the Lower Worlds divide further into many spheres. The higher spheres are seats of good spirits, with superior divinities situated in the highest heavens. Other spheres are occupied by the spirits of deceased humans and by spirits hostile to man. The Middle World (Earth) is inhabited by people, animals, and both good and bad spirits. Connection between the different worlds is via a cosmic tree, a mythical river, or a world column, used by shamans to contact spirits and divinities. The shaman mediates between the people of his community and the spirits, transferring requests from people to the supernatural forces, and communicates in return the will of the various supernatural beings who govern the human world.

The first shamans were appointed by the principal gods and acquired supernatural abilities unobtainable by ordinary people. Since that time, shamans have been able to contact both good and bad spirits. The shaman is considered by his community to be a person of strong character, extraordinary physical condition, and eminent intellect. Traditionally, most Sakha shamans have been men, so the male pronoun is used here. The classic description of Sakha shamanism that follows is based primarily on historical descriptions by ethnographers observing the practice of shamanism among the Sakha peoples at the end of the nineteenth century and the beginning of the twentieth century. Many of these practices and much of the belief system have been retained and revitalized in the post-Soviet period of the 1990s and first years of the twenty-first century. However, given the long period of repression from the 1920s until 1992, many of the elements of "classic" Sakha shamanism, as described below, are no longer as clearly in evidence.

The gift of shamanism is ordinarily inherited from notable ancestors, who are seen as choosing the person who will succeed them. The gift of shamanism is not, however, always determined by inheritance; it is also possible for a person whose family has no history of shamanism to become a shaman. When a child falls on its back at the time of birth (Sakha women traditionally give birth to their children while in a kneeling position), or is born with particular physical defects, such as the lack of a finger, these are signs that an extraordinary child, a future shaman, is born. Some of these children, considered by the community to be chosen by the gods, begin to feel their calling for the shaman's role while still young. This "feeling" may take various forms: ghostly dreams or nightmares, hallucinations, apathy, a loss of consciousness, or states during which the child rambles, becomes lost, or escapes into the taiga and reaches a state of physical exhaustion. Such symptoms, along with a general weakening of his mental and physical condition, sometime last for several months (or even years), and are considered by the relatives of the person to be an indication that the spirits have taken his or her soul to prepare it for its future role.

Traditionally, there was and still is a similar period of preparation prior to becoming a shaman, during which every candidate suffers a distinct pathological condition resembling mental illness, symptoms of which may include depression, fainting, convulsions, hallucination, and overexcitability. Someone who did not pass to the Otherworld, who was not acquainted with the secrets of death, who was not familiar with secrets unavailable to ordinary mortals, could not become a shaman. During this preparatory period there are stages that clearly define the initiation process: the separation stage, in which the candidate is separated from everyday living in the community; the transformation stage, including particular ac-

tions undertaken by the community, chiefly an experienced shaman imparting secret knowledge to his successor; the incorporation stage, involving his return to the community as a fully qualified shaman. These stages are repeated by the shaman each time he performs. From the time of his appointment, the shaman oscillates between death and resuscitation. His journey to the Otherworld, to the country of eternal suffering, is a metaphor for death. Although the shaman was born human, his human form must die for him to assume the role of shaman.

The shaman's journey to other worlds may be considered a peregrination into subconscious spheres of the psyche. These spheres are shaped by his culture and manifested in hallucinations, dreams, and visions during trance. The journey is not possible for ordinary people. Techniques for experiencing other realities include using hallucinogenic substances (toadstools, blueberries, a tea made form cedar bark, alcohol), playing instruments, and particular choreographic schemes of dance. Also employed are monotonous repetition of prayers interrupted by exclamations, the use of sharp objects, and finally, the environment: dusk, smoke from a damped fire, and the maximum concentration of those participating in the celebration. All these means enhance the shaman's power. They enable him to travel to the other worlds to contact spirits, to retrieve souls abducted by them, or to lead souls gently to the land of death, neutralizing the anger of gods, obtaining their goodwill, and satisfying human demands.

The ceremony leads to a general change in personality of future shamans, separating them from the profane and moving them into the sacred world, ensuring the shamans' ability to return to the profane along clearly determined paths. The shamans, during the initiation, have trespassed on the borders of another world. Therefore, the ceremony is partly mythological (including the participation of supernatural beings) and partly social (involving the community that is served). Shamans lose contact with profane reality (both mental and physical) and meet forces and languages unknown to ordinary mortals in their quest to reach sacred realities.

Another stage of the shaman's initiation is a waiting period, dangerous both for the shaman and for the community because the sacred power is heightened. The candidate is in direct contact with supernatural world—the good and bad spirits who will decide his future. Only "pure individuals" (i.e., young, unmarried people) are allowed contact with the candidate as the former shaman initiates the young adept. At this stage everyday actions are suspended. The initiated shaman, physically isolated in a place unavailable to ordinary people, is simultaneously inside and outside the social structure. Excluded from the community, he acts outside of the social reality and social time, in abnormal conditions marked with sanctity.

The next initiation phase is the return of the individual to the community in a new form with new status. The shaman is received as a person marked with sacred power. The shaman's mystical experiences in the first initiation journey, being a prologue to further "meetings" and "negotiations" with gods and spirits, bring better understanding of the supernatural world to the community. During the initiation journey the shaman symbolically dies and is reborn, learning the way to death as well as the way of return that leads to rebirth. Not all initiated men can return from their first journey. Some refuse to receive the gift and remain in the land of death, without any chance of return. Those among them who do return provide the community with proof that death may be overcome and the power of bad spirits affecting human lives may be subdued. During his first journey to the Otherworld, the future shaman (guided along dangerous paths by an experienced shaman), acquires shamanic wisdom. The first initiation journey is a kind of experiment, a process of discovering the secrets of the shaman's power and the geography of the world, and of acquiring skill in using the language of supernatural beings. The experiences acquired during the initiation are the first ordeal, preparing the candidate for subsequent professional journeys.

Shaman's Soul and Initiation

In the traditional belief system, it is thought that every human being has multiple souls, and during the period before initiation, the souls of a future shaman are called away. They may be called by the spirits of the Upper, Middle, or Lower Worlds, according to the nature of the shaman's future function. However, irrespective

of the sphere in which the souls are to be located, their education is performed in the nests of the shaman's familial tree. To the neophyte only a fully formed soul known as a *salgyn kut* (air soul) can return. The two other souls, the *buor kut* (earth soul) and *iye kut* (animal mother soul), are kept by the spirits and transformed into other beings: the buor kut into a fish, the iye kut into the shaman's animal mother. These souls never return to their owner, but in their new forms they protect the shaman. This is particularly the case with the iye-kut.

The education and initiation of a future shaman's souls are supervised by the spirits of his ancestors. The human soul changes, taking the features of a shaman's soul, and, consequently, when the future shaman receives his soul back, endowed by the grace of the spirits, he becomes a shaman and is no longer a man. The power the future shaman will have as a shaman depends upon the location where the soul is kept by the spirits. It is believed the shaman's familial tree has hollows, or nests, located at three levels. The lowest level is occupied by nests designed for the souls of future shamans endowed with the lowest power. The middle level is for ordinary shamans, while the nests situated the highest are reserved for the souls endowed with the most power.

The beginning of the future shaman's illness is marked by hallucinations and prophetic dreams in which the spirits of ancestors appear and announce the shamanic calling. The myths just recounted about how a new shaman is born now begin to shape the future shaman's empirical existence. It could be said that from this time the shaman thinks in myths and starts his mythical life. The future shaman's physical suffering before and during his initiation are explained as created by the torments of the birth of his new soul in the mythical shaman's tree. When the spirits consider the soul of the future shaman ready for a final test, they return it to the shaman-to-be, who awaits his second birth in a specially designed place—in a yurt, or in a specially erected *urasa* (construction) in the taiga.

The place selected for the initiation period is subject to many rules and prohibitions. The urasa has to be built by the future shaman himself or by young unmarried men near the shaman's tree. The place is subject to taboos, and nobody, besides those mentioned above, can approach it. Similar restrictions are imposed with regard to the place designated for the person awaiting initiation in a yurt. The future shaman can only be attended by young unblemished boys or "pure" girls or women (that is, boys and girls or women without sexual experience). The future shaman should, if possible, be isolated from the community and protected against the disastrous influence of any impure elements in the environment (people, animals, objects, or food). The neophyte, maintaining all these precautions, awaits the initiation. The initiation, called by the Sakha *ettetii* (the disintegration of the body), lasts three days. (The most powerful among future shamans undergo the ettetii thrice.)

During ettetii the future shaman lies in a stupor, with foam flowing from his mouth, blood flowing from all his joints, and his body covered with bloody swellings. This state reflects the sufferings experienced by the candidate during the initiation, characterized by the disintegration of his body. This physical experience is paralleled by the initiation process in the supernatural world, which consists of cutting the candidate's body into pieces. Then, when he gains the status of shaman, his body is made whole again. The disintegration and second creation of the body symbolizes the death of the ordinary man and the birth of a shaman. The spirits cut off the candidate's head and place it on a stake, to let it observe the activities performed on the rest of the body. Then the spirits begin separating particular parts of the body from the bones. These parts are divided into three piles. The spirits take each piece, chew it, and spit it out toward places where the spirits of the Upper, Middle, and Lower Worlds are present. Each piece is directed to the spirits representing various categories of sickness and, therefore, the particular part of the shaman's body becomes acquainted with the secrets of how to heal each illness, along with learning the secrets of the death and the ways leading to the Otherworld.

During the disintegration rite, future shamans are endowed by the spirits with particular qualities of their bodies known as *oibon* and *kiali. Oibone* is a hole in the body covered with skin, literally a "particular place." Historical accounts of Sakha shamanism describe these holes; the most powerful shamans had

nine such holes: at the fontanel, on the back, in the armpits, at the heels. These the shaman pierced with a knife in order to admit his assistant spirits into his body. Kiali is a certain place on the abdomen, through which the shaman during kamling can suck in the sickness of the patient. When the illness spirits admit the shaman to their secret world, the spirits dismembering his body scrupulously count his bones. The number of missing bones determine the number of the members of the family and closest friends (of the shaman) who will have to die. After having counted all the bones, the spirits regain from the illness spirits the parts of the body, put them on the naked skeleton (connecting them together with saliva), and, having reconstructed the body, replace the head on the trunk. In this way, the future shaman is initiated by the spirits. Every part of his body, every bone, has been given a special benediction by the spirits (see Elaide 1989, 113–114).

Inclusion of Shaman into Community

In this second stage of the ritual, the community has not been involved. The initiated person, excluded from the community and deprived of his normal status, has been subject to the authority of the spirits. He has surrendered to ritual death, expecting resuscitation, and his body has undergone a slow change. After this ordeal, the shaman is reintegrated into the community. Historical accounts relate that this inclusion act is effected through the ritual of "body elevation," celebrated by an experienced old shaman in the presence of the whole community. During the ceremony, the old shaman started kamling, to contact those spirits who "disintegrated" the body of the candidate and to obtain their permission for his resuscitation. During kamling, participants sang songs addressed to the spirits. At the same time, they raised the shaman, tied with a rope and fixed to a drum, from his bed. Once the elevation ceremonial concluded, the old shaman began the ordination ceremony of the neophyte, his presentation to the spirits of his ancestors. The old shaman sacrificed a horse to the spirits who have initiated his successor. He burned the heart and the liver of a horse in a fire and asked the spirits for permission for the first initiation-kamling of the newly initiated shaman.

After acceptance by the community, the young shaman, together with the old one, for the first time undertakes kamling to the spirits that have chosen him. He calls his protective spirits and, in the presence of all the gathered participants, repeats, after his guide, an oath in which he promises to be a guardian for all unhappy people, father of poor people, and mother of orphans. He vows to worship the demons residing at mountain summits, to serve them with his body and soul. Moreover, mentioning the names of the demons of diseases and all the disasters caused by them among the people, he promises to worship and give suitable sacrifices to appease them. Thus, after the kamling and the oath, the initiate is accepted into the community as a new shaman.

The culminating stage of the ritual of the future shaman's body disintegration and his symbolic death lasts three days, measured by a lunar calendar. The time is considered to be "living time." The shaman's existence, similar to the moon's, whose life cycles between birth and the death, is subject to the same rhythm. Appearance and disappearance of the moon is considered symbolic dismembering or disintegration. Death is overcome by cyclic regeneration.

Shamanic Cosmology

In Sakha cosmology, the world was formed when the highest god of the pantheon, Urung-Ayee-Toyon, created the Earth by obtaining it from deep waters by means of a *nur.* Afterwards, he created the first humans, leading to a conflict with his brother, Uwoo-Toyon. He expelled his brother to the netherworld and went to heaven. Another version, which perhaps refers to historical events, explains the formation of the peoples of Central Asia and Siberia. The universe was divided into three spheres (upper, middle, and lower) following a war among three nations under the command of Urung-Aar-Toyon, Uwoo-Toyon, and Arsan-Duoway. One element balancing such a world system, defined as the center of the world, is a cosmic tree, the roots of which reach down to the Lower World while its branches reach all levels of heaven. It is identified with the shaman's tree, and in its branches, nests, or hollows, the soul of the future shaman undergoes its initiation. The tree also serves the shaman as

a platform guiding him (during kamling) to the land of the spirits. Every shaman has his own tree (equivalent to the cosmic tree) in the taiga, from whose wood the hoops of his drum are made.

A near equivalent of the cosmic tree, which is the axis of the world, although not so prevalent in Sakha philosophy is the pole that is the "horse-tie" (a pole to which horses are tied) of the highest god Urung-Ayee-Toyon. The horse-ties placed near yurts are an extension of the heavenly horse-tie. They usually have a horse's head carved at one end. An interesting relationship between the horse-tie and the cosmic tree can be found in one of the Sakha epics, in which the hero, seeking to find where the tree branches reach, discovers that "the tree pierced through the azure of the Sakha sky, through the white shiny heaven, through tripartite white heaven and, at its Eastern part, becomes the main silvery horse-tie of the White Lord sitting on the milk-white throne." Trying to discover where the bottom part of the tree reaches, he found that "it serves the Dairymaid Lady as a pole for celebrating the *ysah.*"

In the Ysah ceremony, the connection between the horse-tie pole and the cosmic tree is made clear. The *ysah* ceremony, originating from an old tradition of the breeder-nomads (at present the *koumiss* feast, celebrated in spring and in autumn) was initially related to the cult of the good *(ayee)* gods: Urung-Ayee-Toyon, the heavenly god; Jasegay, the horse keeper; and Eenahset Hotoun, the cattle keeper. The actual connection made during the ceremony between the horse-tie pole and the cosmic tree with the heavenly sphere above reflects the bond between human being and the sacred cosmos. The main elements of the ysah ceremonial stage are the horse-tie poles—the number of which is restricted to the number of donors. Two birches with interlaced branches are tied to each pole. Between the poles and the birches, ropes decorated with colored rags and white horse hair are stretched. The Sakha consider the birch to be sacred. Hence, the poles and the sacred birch trees are connected literally in order to appeal to the spirits above. The sacredness of birches is reflected not only by the ysah, but also in other ceremonies in which shamans appeal to the heavenly gods with birches while kamling over an ill person.

The Middle World, Earth, plays an important role in the structure of the universe. It is inhabited not only by humans, but by many ayee and *abaas* (ghosts). These ghosts are the presiding deities, known as master spirits, of mountains, rivers, rocks, lakes, fire, and trees. The main figure of this world is the Earth Lady, a wise old woman residing in shapely birches. Her children are master-spirits of all plants. They live under bundles of grass blades and leaves, rejuvenating them in the spring with their warm breath. The gods inhabit old, shapely trees growing in open spaces. The Earth Lady protects all living beings (humans, animals, and the whole of nature) from bad spirits.

Every place has its master spirit. Some of the spirits may become gods. The area where a yurt is to be built is owned by a spirit, whose permission is necessary before establishing the yurt. Appropriate respect is due to all spirits, helping to avoid cases where they might be offended and punish the erring landowner. The most important of these spirits is that of the hearth. Fire is held by the Sakha in particular esteem. They believe it to have supernatural powers capable of neutralizing the activities of bad spirits.

Among the gods helping or caring for people, the Baay Baayanay, the god of hunters, often called the Spirit of the Taiga, is very popular in Sakha belief. He decides who will succeed in hunting, so hunters sacrifice to him before the chase. They make a fire and place offerings in it, including pieces of butter, fatty meat, and bread. Blood from an animal sacrificed to Baay Baayanay is spread on a previously prepared wooden figure representing the god.

Transformation of Sakha Belief Systems

The original belief system determined by shamanism was progressively affected by Christianity and the advent of the "political religion" of Soviet state atheism. The Siberian nations were subject to these influences, which led to important transformations of their belief systems. However, attempts to convert Sakha to Christianity were not related to widespread missionary activity. The main goal of the Russian Empire's colonial policy was to obtain money through taxation. Had the Sakha people been baptized, such a goal would not have been

possible, since such taxation was not levied on Christians. The situation changed at the turn of the seventeenth century with a policy instigated by Peter I (Peter the Great), who wanted to build close relations between the state, the Orthodox religion, and spiritual values. Devotion became an important principle of state power. Accordingly, the policy with regard to native peoples in colonized Siberia underwent a major change.

First, a decision was made to eliminate pagan beliefs and introduce Orthodox religion. Missionaries were dispatched with the idea that a sole God is in Heaven, and a sole Czar is to reign on Earth. There was compulsory baptism, and the state persecuted and sought to destroy traditional forms of religion. The bishopric of Irkutsk was established in 1731. However, though the Sakha accepted baptism, they considered it a change in citizenship rather than a change in religion.The newly baptized were given Russian first names and surnames. Moreover, acceptance of baptism offered a chance for a higher social status and provided material advantages. They were officially considered Christian once they were baptized, but the natives maintained their former traditional beliefs and values, which were not affected by the Orthodox Church.

By organizing medical help and pharmacies, the missionaries attempted to take over the shamans' functions, to lessen their usefulness and authority, but they met with little success. By the time of Russian subjugation, the Sakha had already gone through a critical stage of change, with the disintegration of the tribal community, but they had developed a strong political authority of *toyons* (leaders) and an equally strong spiritual authority of shamans. During the czarist period these institutions retained their roles. The toyons, using all possible means (even collaborating with the czarist authority), sought to maintain their influence, while the shamans remained spiritual leaders of the Sakha. Shamans were among the initiators and ringleaders of the 1642 Yakut insurrection, and in 1696, kamling was officially forbidden in the city of Yakutsk and its environs. Although the Orthodox Church had little success in changing the philosophical orientation of the people, it was instrumental in developing the national consciousness by enriching the Sakha language in the nineteenth century with the alphabet. This was the situation encountered by the Bolshevik authorities in 1917.

The revolution of 1917 accelerated social change among the Siberian peoples. The "gods" of the revolution were written into the folklore of the Siberian peoples as beings who had crossed the border from the profane to the sacred, heroes replacing the highest gods. One of the most difficult problems encountered by the new authority in its introduction of this "cultural revolution" in Siberian territory was the activity of shamans. The shamans, from the beginning of Bolshevik authority, proved hostile, even predicting a quick victory of the Whites over the Reds. They openly opposed the institutions established by the new authority and threatened vengeance from the spirits on those Sakha who applied, even for medical or veterinary help, to the "new colonizers." Consequently, shamans were considered by the Bolsheviks to be class enemies who deliberately impeded progress among natives. Shamans were forcefully deprived of their paraphernalia (including jerkins, headgear, drums, flappers, and staffs) and induced by threats of imprisonment to renounce their profession. The Sakha, faithful to their traditions, prepared new ceremonial equipment for their spiritual leaders and secretly celebrated in the traditional manner.

The new authority from the very beginning had no confidence in the Sakha because of their nationalism, their Turkish origin, and their dominant role with regard to other tribes. The failure of the Bolsheviks to destroy traditional forms of Sakha culture suggests that this lack of confidence was well justified. Various sociotechnical experiments were undertaken to destroy traditional culture. For example, important traditional ceremonial days were given new secular identities. Thus, the rite of ysah became not only the Feast to Celebrate the Beginning of Summer, but also War Veterans Day and the Leaders of Work Day, accompanied by typical Soviet ostentation and pomp, with meetings, awards of decorations and orders. A measure of how little effect these experiments had is the recovery of traditional cultural forms in recent years. Instances of returning to the shamans' genealogies and traditions as a base of national identity are ever more frequent.

SIBE SHAMANISM (MANCHURIA)

The Sibe, a people in northwest China closely related both linguistically and ethnically to the Manchu people, have preserved a living tradition of shamanism into the present day. Written texts from the nineteenth century also give insight into the nature of their tradition.

Background

The autochthonous ethnonym *Sibe,* generally rendered as Xibo (or erroneously as Xibe) in Chinese texts, indicates one of the fifty-five ethnic minorities officially recognized by the People's Republic of China. The Sibe originated in Central Manchuria. Linguistically, Sibe belongs to the Manchu-Tungus branch of Altaic languages.

The Sibe make their first appearance in history around the end of the sixteenth century, being mentioned among the enemies of Nurhachi, the founder of the Manchu imperial dynasty. The Sibe were defeated by Nurhachi and subsequently fell under the power of the Korqin Mongols, from the dominance of whom they were freed only after 1692, when

they were annexed within the structure of the Manchu Eight Banners. This late annexation into the social and military structures of the Manchu Qing Empire probably explains why the Sibe maintained a basic autonomy and, as a final consequence, obtained recognition as an "ethnic minority" *(shaoshu minzu)* clearly separated from the Manchus. After the destruction of the Dzungar Empire and the conquest of Turkestan (later called Xinjiang, "New Territories") by the Qing troops (1757–1759), the Peking court decided to send more than 4,000 Sibe families away from the Mukden area, today's Shenyang, into the newly acquired territories. The Sibe were given military control of the area and charged with the responsibility of protecting its frontiers from invasions. This mass transfer took place between May 1764 and September 1765, and it led to the separation of the Sibe people into two branches.

The Sibe who remained in Manchuria had to submit themselves (as did all Manchus) to Chinese influence—the most significant of which was that Chinese supplanted their mother tongue. The Western Sibe, who established themselves in the valley of the Ili River, due to their isolation and to local factors (especially the Turkish-speaking milieu), were able to keep intact both their language, which was considered a Manchu dialect or "spoken Manchu," and their original, shamanic culture. In 1954, Western Sibe territory was transformed into the "Sibe Cabcal Autonomous County," which extends from the southern banks of the Ili River up to the frontiers with Kazakstan.

Therefore, all references to Sibe shamanism are limited to the branch of the Sibe that moved to the Ili valley, that is, the Sibe Cabcal Autonomous County.

According to recent research (Qi Cheshan 1997), contemporary shamanic practices are performed by more than ten shamans, the majority of whom are women. Shamanic activity is limited to medical and psychological assistance, and to the performance of ancestral sacrifices. A person is thought to become a shaman due to a special calling, after having experienced some kind of illness or a psychological crisis. The chosen one is then instructed for several years by an old shaman, after which time the candidate traditionally had to take the test of the "knife-ladder" *(cakūran).* The Sibe still believe that it was only after passing the knife-ladder test that the candidate could become an *iletu saman* (enlightened shaman); those who failed the test were assigned a lower shamanic rank (see below). Owing to thirty years (from the 1950s to the 1980s) of persecution against shamans and shamanism, during which the knife-ladder ceremony could not be performed, very few of the higher-ranked enlightened shamans exist today. None of the contemporary Sibe shamans, as noted by Qi Cheshan (1997, 80), have climbed the knife ladder. Memories remain among the Sibe of famous shamans who did it in the past. The last great Sibe shaman, Mouisang (also known as Huk Saiuan, Lady shaman), died in 1976 (Qi Cheshan 1997, 71, 72).

The cakūran was a sort of ladder, made of a varying number of sharp knives, that the future shaman, in a state of trance, had to climb and descend without falling and without being hurt. At the top of the ladder, the candidate would meet with the supreme shamanic deity of the Sibe, Iletu Mama, to whom the person had to present himself or herself in order to receive her blessings and to be registered in a special book. The climbing of the ladder corresponded to the passing of eighteen "sentry posts" *(karun)* guarded by hostile spirits that the shaman had to overcome through the aid of guardian spirits. Those who passed this test attained the rank of enlightened shaman. Those who failed had to content themselves with an inferior status, that is, in the case of a man, that of *anelci/elcin* or *deoci,* or, in the case of a woman, that of a *xiangtong.*

Traditional Healing Practices

Traditionally, as is the case today, Sibe shamans have concentrated their activity mainly on therapeutic practices and less on ecstatic performances (such as journeys to the hells). As healers, shamans perform rituals of exorcism (sometimes on behalf of many people) for those who are mentally ill, or prepare medicines for the cure of specific ailments. Instructions for the performance of exorcisms, prayers, and magical formulas, as well as descriptions of initiation and ecstatic journeys, can be found, along with the healing remedies discussed below, in the two secret handbooks that became accessible in 1992 in two facsimile editions and in German translation (Pang 1992; Stary 1992).

One of the handbooks, a nineteenth-century "secret" handbook of a Sibe shaman (Stary 1992), reveals the existence of eight different types of ointments or syrups *(ijuyan),* all of which had as their main ingredients flour and animal fat. In order to cure a sore throat, antelope fat was mixed with hulled rice flour. In order to cure any disease of the tongue, the fat of the ox was combined with wheat flour. For illnesses of the mouth, the chaff of the wheat was reduced to a powder (milled) and mixed with boar fat. For illnesses of the nose, flour obtained from herbal seeds was mixed with pheasant fat. Rice flour mixed together with squirrel fat was used to treat heart diseases. Liver treatments involved the use of a mixture of sorghum flour and lynx's fat, whereas lung treatments required a mixture of fish oil and wheat flour. The spleen was treated with a mixture of veal fat and bean flour (Stary 1992, 86–87).

Mental illnesses (most often hysteria, "the demons' sickness": *ibagan nimeku*) were sometimes treated in "group therapy" rituals held at night, during which the ill person was forced to undergo constant physical strain. For instance, the patient might be forced to run around a wheel until exhaustion set in, while the shaman beat his or her drum and chanted rhythmically, and those present at the séance joined in. A typical performance for driving away evil spirits who have caused an illness is described in the secret handbook. It consisted of the recitation of a long invocation with an accentuated rhythm and two constant refrains, in which the shaman described extraordinary feats believed to cure the ill person, singing rhythmically about his or her journey to eight different places, in each of which he or she stole an animal (a camel, a horse, an ox, a pig, a goat, a sheep, a hen, and a duck, in that order). The shaman offered the meat of each of these animals to the protecting spirits. The bones were reduced to a powder and mixed with water to make a paste that the shaman used to fashion a kind of vessel to attract and then contain the evil spirits (a process described as giving hospitality). The shaman then prayed to three deities to take the evil spirit away, in order to effect a cure of the ill person (Stary 1992, 74–84).

The handbook informs us that in order to protect themselves from dangerous spirits, shamans used a magic formula that was to be handed down exclusively to other shamans. It was made up of unintelligible words that formed a spell: "Om basar batma / daring basuruda / hayang kiruwa / holt holt hom pat." The spell would only be effective if the shaman recited it for a period of a hundred days early in the morning before dressing. Then he or she had to sit down, bow three times, and blow upon himself or herself. The presence of other people during this recitation was strictly forbidden (Stary 1992, 53–54; 1993, 230).

Surprisingly, information in the texts concerning the afterworld and the realm of deities and shamanic spirits is quite scant. The texts simply mention the names of deities and spirits, and only from the context can one determine if they were evil spirits or the shaman's helpers. In very general terms, the Sibe pantheon can be divided up into four categories: the *enduri* (deities), the *manggin* (demons or spirits, both good and evil), the *ibagan* (monsters, evil spirits), and the *weceku* (family spirits). Following a well-known "shamanic chart" (*saman nirugan:* Stary 1992, 44–45), Sibe shamanic cosmology presents three circles governed by "Heaven" *(abka).* This Heaven, the residence of the deified sun and moon, is the abode of a divinity called Burkhan baksi and of other male or female deities: Some of these deities exhibit clear Buddhist influence. Below the celestial vault is the superior circle, abode of the highest shamanic deity of the Sibe: Isanju Mama (see above). By her side, we find a cohort of other deities and spirits, some of whom are in the form of animals such as snakes, tigers, wolves, and eagles. The inferior circle is the abode of spirits who have the function of guarding the doors leading to the transcendental world, such as the Selei Sain Janggin (Good Iron General) and the Wehei Sain Manggin (Good Stone Demon). This cosmic structure, however, is not uniform, but varies from clan to clan, due to the presence of specific protecting spirits, that is, of former famous shamans linked to specific clans and venerated by these only (See Qi Cheshan 1997, 85).

Types of Lower-Ranking Shamans

The *elci* or *elcin* shaman (male as well as female) acts as a mediator between humans and those spirits thought to cause illnesses, especially smallpox, believed to be brought by

Mama Enduri. The elci are not allowed to eat meat taken from the head, legs, or paws of animals. Moreover, they cannot be buried in a cemetery. When a hundred years have passed from the day the elci was born, his or her bones are gathered and burned (Pang 1994, 62).

The deoci shaman is usually a man, whose intervention is needed in case of mental illnesses. His therapy, described in part above, utilizes the recitation of magical formulas as well as shocking treatments, involving the beating up of the patient or physically exhausting the patient by forcing him or her to run in circles for many hours. Like the elci, the deoci must avoid eating certain parts of an animal, and must always avoid beef and mutton. The word derives from Mongol *doo* ("song"), and *deoci* means "singer"; *elci* is usually translated as "messenger," but its etymology is probably connected with Mongol *emci,* "healer" (Qi Cheshan 1997, 88).

The *xiangtong,* a female shaman, ranks below the deoci in her capacities as a healer. According to Qi Cheshan, this word clearly derives "from the Chinese xiangtou, literally 'incense head,' a title used for ritual practitioners throughout northern China" (1997, 89). Her aid is requested in the case of illnesses thought to be brought by the Fox Spirit, called by its taboo-name *has boo jaka* (animal of the storage room). For her healing practices, the xiangtong, besides other items, utilizes anthropomorphic paper figures and oracles represented by stones and branches. Her healing practice is thought to be successful if she is able to force the evil spirit into a box, which will eventually be taken into the open fields or to a cemetery.

SIBERIAN SHAMANISM

Siberia has a special place in the study of shamanism as the area where it was first recorded. The word *shaman* originates from the Tungus, a native people living in eastern Siberia. Its first occurrence is found in the *Record of Exile,* written in 1672–1675 by the Russian Orthodox archpriest Avvakum, who engaged in a weather prediction competition with a Tungus shaman: He considered him to be a rival serving the Devil instead of God (Narby and Huxley 2001, 18–20). The term *shaman* was then extended to all Siberian native peoples as the czarist empire's colonization proceeded. Thus Siberian shamanism has been documented, as well as undergone outside influences, for several centuries.

Background

Shamanism did not change much under czarism, since imperial policies were mainly directed at exploiting the natural riches of this immense territory (12,765 square kilometers). These policies favored settlers and imposed only superficial Russianization and Christianization on the natives, whose traditional nomadic way of life was preserved to a large extent. Changes

were more radical under the Soviet regime, which carried out general collectivization and atheist propaganda with the aim of eradicating shamanism along with other religions. The exchange of a nomadic way of life for a sedentary one, displacements, and interethnic marriages introduced additional changes. During the Soviet period, some private shamanic practices were, however, still performed clandestinely, and elements of collective rituals (such as sports and games) were integrated into local Communist festivals. Moreover, the belief in an intimate relationship between human beings and nature inherent in shamanism survived in popular thinking. Since the Soviet Union collapsed at the end of 1991, shamanism, along with other local traditions, has been reviving.

Sources

Data collected over more than two centuries allow inferences on the nature of shamanism and shamanic practice in the "traditional," pre-Soviet world. They include various kinds of sources such as local government and missionary accounts, travel records, Soviet atheist propaganda, ethnographical descriptions, and collections of folk traditions in both Russian and native languages. The references at the end of this entry, as well as the author's own research in Siberia, are the sources for the material that follows. The most important source for the author was Matvej N. Khangalov, who published a series of small articles in various periodical journals at the turn of the twentieth century. They were republished as its *Sobranie sochinenij* [Collected works] in 1958–1960, in three volumes, by the Buryat Institute of the Buryat filial of the Soviet Academy of Sciences. Other important sources have been various missionary periodicals read in Siberian libraries and publications by the first Buryat and Yakut intellectuals at the beginning of the twentieth century. But what was really determining for bringing to light the symbolic system was the analysis of Buryat oral literature, in particular the epics. Some have been translated into Russian, none into English.

Population

According to the 1989 census, native peoples make up 1.5 million, or 5 percent, of the 32 million total population of Siberia (compared with 870,500 people, 21 percent of 5.6 million in 1897). Apart from isolated small groups in the far northeast (Chukchee, Koryak, Nivkh), they mostly belong to two related linguistic families: the smaller Uralic family in the west (Khanty, Mansi, and all Samoyeds) and the larger Altaic family in the east, divided up into three branches: Turks (Yakut [Sakha], Tuva, Khakass, and others), Mongols (Buryat), Manchu-Tungus (Evenki), and others.

General Features

In general, it can be understood that shamanism varies according to the way of life, depending on whether it is based on hunting (in the forest, or taiga) or on stockbreeding (in steppe or tundra areas). Although small hunting groups also have domestic animals and larger pastoral groups also go hunting, these classifications hold. The Tungus who live on hunting in the Yenisey valley are more similar to the Selkups (Samoyeds), who also live on hunting nearby in the forest, than they are to those Tungus who practice extensive reindeer breeding in southeast Yakutia. The latter, who breed the same species as the one they hunt (reindeer), differ from the Buryat, who breed other species (horses, cows, sheep).

In small-sized, noncentralized societies of the Siberian forest that depend on hunting, shamanism is a central institution mainly aimed at obtaining good luck in hunting for the community through large collective rituals. The importance of shamanism decreases with the expansion of clan institutions in larger pastoral societies in steppe areas on the border of the forest, and it becomes more directed to private ends. Healing particularly becomes more important in the context of colonization, since it is better tolerated by the dominant power than religious rituals are. In the modernizing post-Soviet context, shamanism is claimed as a native ideology of harmony with nature, as one way of supporting ethnic identity. It also takes the form of a variety of private practices that reflect Western influence. Nevertheless, only the traditional background as described below can account for many features found today.

Shamanism in Hunting Life

Shamanism is central in hunting societies because of the beliefs they hold about hunting. In

their view, killing game and taking it away would be stealing from the animal realm. This theft would entail some kind of revenge from the killed animals' fellows, and to continue this behavior would eventually preclude any further hunting. Thus, members of hunting societies never say "to kill" but "to obtain" game. Only in the framework of an exchange relationship is "taking" legitimate and hence sustainable for future game. It is the purpose of the shamanic function to establish and handle an exchange relationship at a symbolic level. Animals are conceived of as animated by spirits in the same way as souls animate human bodies, which allows humans to engage in the same kind of social relations with animal spirits as with other humans. Thus, the notion of animal spirits makes living on hunting possible by turning it into an exchange in which the animal spirits serve as partners. The symbolic construction of "exchange with wild animal spirits" organizes social and ritual life much more highly than would be required to simply meet basic needs. The exchange law applies to society in relation to its vital environment, and it is carried out in collective rituals.

A Full Partnership between Hunters and Game-Giving Spirits

The exchange is conceived of as reciprocal and symmetric at the group's level. Just as humans live on game, consuming the meat and vital force of animals, so animal spirits are supposed to feed on humans, devouring their flesh and sucking the vital force in their blood. At the individual level, the exchange reflects the alternation of life and death, with a time lag between "taking" (associated with living) and "giving back" (perceived in terms of spirits' taking and associated with dying). The progressive loss of vitality linked to aging, like death, is considered to be part of the natural order of things: Humans naturally become quarry for animal spirits. Sickness, experienced as loss of vital force, and death are not only a kind of payment to the spirits for the food they gave, but also the prerequisite for the provision of food for future generations. Thus, life is perpetuated among both humans and animals, in the shape of an everlasting mutual consumption that brings death to both. The exchange law makes them partners as well as objects of exchange for one another: They are both hunters and quarry in a reciprocal hunt. Thus, humans are just one species among others, living in the same world as animals, and a link in the food chain like any other species.

This view makes a limited place for healing as a by-product of the main function, since the task of managing the whole exchange relationship includes that of ensuring that the human partner normally survives until natural death.

Souls are believed to be reused from generation to generation within the same human line. So are the spiritual components of animals in the same species, which is held to explain the periodic reappearance of game. This reuse should not be called reincarnation. It is simply said that another person of the same family or another animal of the same species as the dead one is born. As a rule, a soul normally returns for a new life only in the offspring of the one who has died. This is a good reason for the emphasis on having children. However, every newborn child is related to a dead member of his or her family, without being considered to actually be the dead person reborn. Souls are located in the bones in the same way as vital force is located in the meat (or flesh) and blood. Although vital force disappears with death, the soul remains attached to the bones for a certain time; then it is held in reserve until it can be reused in a new individual. For this reason, funeral rites consist in preserving the bones and treating them in such a way that the soul they convey can reappear in a new body for a new life. Similarly, the hunters take meticulous care not to damage the bones of hunted animals and to perform the necessary rites for them so that the soul they are held to convey can be revived in a new animal. Not to preserve the bones would be detrimental to the success of further hunting.

The exchange perspective is reflected in language and representations. In the course of hunting, animals are said to "give themselves" to the hunters. Upon dying, humans are supposed to be "taken" by spirits eager for human repayment. For this reason, someone who gets lost in the forest or drowned in a lake or river is not searched for. A place for offerings is eventually set up near a big tree or on the shore. Hunting societies praise this kind of death as a hunter's ideal death: going alone far away into the depth of the forest in order to be taken and

then eaten by the spirits. More an ideal than a real practice, it is well known in ethnographic literature as "voluntary death." It is absolutely forbidden for young people and exalted only for those who have two generations of progeny. It is clearly distinguished from suicide committed by people in or near their homes; the soul of such a suicide is considered vengeful and receives offerings dedicated to calming down its thirst for revenge.

The object of the exchange is vital force: It is conveyed by animal meat when taken by hunters from game, by human flesh and blood when taken by spirits from humans. Hunting rites are meant to reduce hunting to just "taking meat," along with precluding any idea of murder.

The Shamanic Management of the Exchange Relation with Animal Spirits

The rituals staging the exchange process are the main collective periodic rituals in hunting societies. They are often conducted by a shaman, but can be conducted as well by the hunters or by the whole group. The community invests someone as shaman, with the charge of conducting the ritual as its representative and under its control. In principle, anyone can become a shaman, but in these hunting societies, only male shamans may perform certain key rituals, and thus female shamans are confined to small private practices. Moreover, among male shamans, no one remains a shaman for his whole life; he has to requalify periodically. In Siberian languages, "shamanizing" refers to the ritual mode of behavior and is not reserved for the shaman.

The shaman's carrying out of the exchange at the symbolic level is conceived of as determining and foreshadowing the actions of the hunters at the real level. Thus the shaman's acting on spirits is a prerequisite for the hunter's acting on animals. In the words of Siberian hunters, the shaman's action is aimed at obtaining "good luck" for the hunting season to come, that is promises of game, in the shape of animal vital force. What is expected from the shamanic ritual performance is that the promises of game will become a reality for the hunters when they go hunting. Hunters hold the amount of meat they get to be the concrete expression of the amount of animal vital force previously obtained by the shaman from the spirits.

A Marriage Alliance with Spirits to Guarantee the Exchange Relationship

At first, the ritual proceeds to set the terms of the exchange. Siberian hunting societies consider a marriage alliance to be the most appropriate institutional frame for carrying out an exchange. Therefore, the shaman must "marry" a game-giving spirit's sister or daughter during the ritual: a female reindeer or moose in these areas where they are the game par excellence. He also marries a fish-giving spirit's sister or daughter if fishing is important for their living. Only in his capacity as husband (in contrast to an abductor) is the shaman entitled to rightfully obtain promises of game (or of fish) from his spiritual wife: His legitimacy as shaman comes from his marrying a spirit. Only male shamans may perform these essential rituals, either a wedding as such (in the Altai area) or a hunting party with one's in-laws (the way a marriage relation is ritually marked out among the Yenisey Tungus). Their symbolic contents account for the shaman's ritual behavior. They are explicitly stated in Siberian languages; no allusion is made to a particular "state of mind" or "trance."

Since the shaman's spiritual wife is thought of as an animal, he playacts his husband's part in a male animal's shape by assuming the role of the male of the same species: For example, he adopts a stag's appearance and mode of behavior. His costume is made out of the skin of a reindeer or moose. His headgear is a crown adorned with antlers. He jumps and prances, jerks and twists, moves his hips and shakes his head. He also bellows and snorts as a stag does when preparing to repel rivals and to mate. The vocabulary for his ritual behavior is derived from that associated with rutting (understood as both fighting against rivals and coupling with a female), the language used of wild horned ruminants or cock birds: rutting (Samoyed), leaping (Yakut), moving legs (Tungus), moving horns as if to gore (Buryat), and so on. Some of these verbs are also used for participants in these rituals and in other contexts. The Yakut root *oju-* (to leap) is used for playing. In Buryat, *mürge-* (to move horns as if to gore) is used for a type of hold at wrestling and

for a praying attitude in Buddhism, and *naada-* (to mate, particularly speaking of birds and fish) for a type of shamanic dancing and all types of playing. It is a compelling duty for all participants in these rituals to "play" (dancing and fighting) on the model of animals. These "games," isolated from shamanic context, were integrated in local festivals under the Soviet regime.

In addition to his basic role as a stag, the shaman also enacts the figures of his spiritual brothers-in-law, who are supposed to help him at hunting as ordinary brothers-in-law do in ordinary human life. The shaman's spiritual in-laws are various types of animals perceived as hunters themselves or as helpers in hunting (represented in the shape of iron figures attached to his gear). Thus he may mime a raven whose flight and calls indicate where game animals are located. At the end of the ritual, he lies for some time completely motionless on his back on a rug depicting a forest with wild animals, a time during which he is held to be devoured by spirits; afterwards he is ritually revived.

This part of the ritual, which symbolically unfolds in the realm of animals, has currently been referred to by scholars as the shaman's journey. The shaman relates its events after he is "back," revived.

In sum, during this type of ritual the shaman behaves as if he were an animal, first playing a stag's part by pushing his rivals away and copulating with his female spirit-wife, and lastly as self-offered quarry, thus completing the whole exchange process on his own. His symbolic self-offering is intended to serve as a token of the group's future repayment to the spirits. The ritual ends with a divinatory sequence, during which the shaman proceeds to determine the supposed life expectancy of the participants. Some of them may then be marked out for dying soon. Thus among the Tungus, from inside the hut the shaman shoots a small arrow through the smoke hole for each participant; if the arrow falls outside close to the hut, it means that the participant concerned will die soon. One's life expectancy is longer the farther the arrow falls from the hut. The shaman's personal feelings may prompt him to shoot with more or less strength. Any subsequent death will be interpreted in terms of payment to the spirits, like the old hunter's "voluntary death": It is necessary that some members die for the group to survive. Thus, repayment to the spirits is individualized, whereas the meat obtained from them is shared out among all members of the group.

The Duty of Trading with Animal Spirits and the Presence of a Play Element

Now, although absolute loyalty to the principle of exchange is compulsory (and there can be no substitute for human vital force owed to the animal spirits), this does not preclude the possibility of seeking to put the principle into practice in the most beneficial manner. In this perspective, the shaman is to try to take as much animal vital force as possible as soon as possible. In like manner, he tries to have the spirits take back as little human vital force as possible at the last possible moment. In other words, the shaman is expected to use the delay between taking and giving back to act both on the timing and the amount of human vital force to be repaid to the spirits. This explains why shamanic practice is not a highly prescribed liturgy to be carried out faithfully, but rather an art to be perpetually renewed in a personalized way, an art made up of seduction and cleverness, and allowing some trickery in applying the rule of paying the spirits.

This accounts for the presence of a play element in shamanism. Even the vocabulary is permeated with the notion of playing; performing the ritual for obtaining good luck is likened to playing a game—to playing it, moreover, so as to be the winner. In this framework various games, sports, and playing scenes take place so as to entertain and delight spirits, and thus to render them favorable to humans. In spite of differences among ethnic groups, these collective rituals are uniformly associated with "playing games" at several levels: dancing and wrestling, mimicking, enacting conventional gestures of reproduction and defense, and entertaining spirits to achieve victory over them. Playful rituals fit the view that humans may influence the course of events, as long as they leave room to trade with spirit partners.

Thus, taking comes first in the process. It is embraced as the ideal attitude and equated with winning. According to native folk literature, Siberian hunting peoples think of themselves as takers and perceive giving as losing.

While claiming a taker's position, they keep silent on the duty of giving back. For this reason the shaman lies motionless and speechless at the end of the ritual when he is devoured by spirits.

Cooperation and Redistribution within Society as Associated Duties

The primacy of taking makes redistribution into a duty. The moral connotation of the term *duty* is appropriate here. Not only must the taker not keep for himself a good taken from wild resources, but eating one's own game would be equated with committing incest. As a rule, the hunter passes on the game that he has obtained to his in-laws, who then divide it up. The hunter is also led to consider cooperation among hunters to be the most essential relationship within society: Marrying a wife is first of all perceived as acquiring in-laws with whom to live and hunt. In the same way, the shaman's ritual activity is destined for and closely controlled by the community—to the point that performing rituals for his own family is prohibited. In other words, the duty of the taker, whether hunter or shaman, is to act as a provider for the benefit of his group, while he is at the same time fully entitled to expect benefits from his fellows' takings.

Thus, the life-exchange process precludes any monopolizing and subordinates individual actions to collective interest. Individual shots provide the whole group with game, individual deaths repay the spirits on behalf of the whole group. While absolute solidarity prevails within the group, rivalry reigns between groups. For all these reasons shamanism in this type of society remains pragmatic, oral, based on ritual performance, sensitive to differences between individuals, and structurally incompatible with any type of political or religious centralizing power.

Shamanic Practices in Pastoral Societies

Changes occur with the vanishing of hunting as a way of life and the adoption of stockbreeding. The idea of a life-exchange process with spirits is still operative, but the nature of the process has changed. Food is no longer obtained and shared out but produced and possessed, in the sense that it is considered the property of the individual, to be used and accumulated by the individual and handed down to the individual's children. The relationship with the natural environment is modified. The impulse to the exchange process shifts from taking to giving, and this new approach gives rise to the practice of sacrifice.

Exchanging with Ancestors

The spirits involved in the life-exchange process are the souls of ancestors from whom herds and pasturelands have been inherited. Reference to ancestors is used to legitimate property rights and to control morality: Ancestors are supposed to inflict sickness on their descendants in case of violation, causing in particular skin diseases that are conspicuous and mark the person out for social disapproval. What is solicited from ancestors is protection from all that would hinder stockbreeding (drought, excessive cold wind, epidemics, wolves, thieves, and so on), not the domestic animals themselves. In a way, ancestors as governing the main economic activity are conceived of along the same lines as game-giving spirits: as providers of uncertain goods. The difference is that they are human spirits, and they are assigned a fixed superior position. Their help is expressed in a negative way (protection from any possible harm or hindrance) in contrast to the giving of good luck at hunting.

Prayer and Sacrifice

The exchange relationship is perceived as reflecting a fixed hierarchy in which positions are not reversible. Unlike hunters, who hoped to win in their exchanges with animal spirits, stockbreeders feel subordinate to and dependent on their ancestors. What they receive is not identical in essence and function to what they offer. They offer the fruit of their breeding activity to compel ancestors to grant their protection, along with addressing them prayers abounding in complaints and requests. They sacrifice domestic animals. Domestic animals occupy an inferior position because they are bred by humans, unlike wild animals, which were considered on an equal footing with humans. Thus, sacrificing animals in the pastoral way of life takes over from paying human vital force in the hunting way of life. The dynamic

of the exchange process is reversed: It is the act of giving that triggers the process and receives ideological emphasis.

There are variations within this general pattern. For some groups, sacrificing domestic animals is tricky, since it consists in replacing a human by a less valued being. Members of such groups are fond of stories in which shamans offer themselves when spirits have refused sacrificed domestic reindeer. Other groups consider sacrifice as a token of wealth in flocks, hence as a possible source of more wealth and prestige. All groups consider their shamans weaker than those of hunting societies, and all are more receptive to external influences. Their practices are permeated with Christian or Buddhist elements.

The exchange with ancestors is the aim of periodic collective rituals, which are conducted by clan elders. Elders fill a more priestlike function, while shamans have a small, although still specific part in these rituals. Thus, shamanism as institution and function is submitted to clan law. The elders' ritual action obeys a liturgical pattern of worship, while the shaman's rituals remain based on individual performance aimed at obtaining uncertain goods, as noted in the shift of the shaman's activities from hunting rituals to healing practices.

Treating Restless Dead Human Souls

While the role of the shaman in collective rituals has decreased in importance, shamanic activity has increased in the areas of private divining and healing in relation to the souls of dead people who have died a violent and untimely death. These souls are presumed to be vengeful because they died with no hope of progeny through whom to be reborn into a new life. Many types of sickness and misfortune are at-

tributed to their search for care. Shamans calm them down with invocations, offerings, and sacrifices to make them stop harming the living and start helping them. Thus it is by comforting the unfortunate dead that shamans heal the sick living. Under colonization of Siberia, healing became more important than collective rituals, and wandering dead souls were perceived as potentially more helpful than ancestors. In this situation, female shamans, whose legitimacy rests on an intimate relation to a dead soul, have tended to outnumber male shamans.

Shamanic Practices as Peripheral Counterpowers in Society

Healing and divining are occasional rituals for which shamans are paid. Theirs is a low-valued profession, allegedly opposing all types of power in society. However, whatever the context, shamanic practices are adaptive, more especially in periods of crisis and change, insofar as they consist in subjecting the factor of chance to symbolic action. They allow people to obtain types of goods thought of as uncertain and limited (since they cannot be produced and have to be provided for) from infinitely renewed supernatural providers. This category of goods, which extends to good health, wealth, happiness, and all kinds of success, may be characterized as encompassing all that is considered to depend on attracting good luck, or fortune, or repelling bad luck, or misfortune.

The Post-Soviet Revival of Shamanism

The revival of shamanism has taken on a full range of forms, from abstract evocations to concrete practices that are hardly connected with each other within the same region and, moreover, greatly vary from region to region.

In the whole of Siberia, native intellectual circles related to political power have attempted to restore shamanism as an ideology to support ethnic identity. In Yakutia, however, there has been a short-lived attempt to make it into a state religion with a written doctrine concerning all types of spiritual beings, and with shamanic schools and a House of Spirits. In most other regions, intellectual circles have confined themselves to encouraging cultural manifestations exalting shamanism as the specific religion of their people in former times. Everywhere shamanism is promoted as an ideology of harmony with nature, one that supports territorial claims and ethnic identity.

"Traditional" shamans are no longer found, except in a few remote rural areas, where they take care to remain hidden from all types of people foreign to the small group of kin and neighbors around them. They mostly perform private rituals, which are reduced in time, settings, and contents compared to pre-Soviet ones. These rituals are mainly intended to ensure or restore a family's welfare, especially in relation to its social and material plans. To this end, they include some kinds of purification and divination. If people can afford it, they will use biomedicine at hospitals for healing physical diseases. Traditional drums, headgear, and costumes made of animal skins are mostly found in museums and on stage in theaters, where shamanic rituals are exhibited as spectacles. Such items are, however, reappearing in the framework of newly recreated practices involving tourist relations.

New practitioners claiming shamanic heritage have emerged in the cities. Although self-proclaimed and taking fees from clients, they consider they "bring help to people" as former shamans did. Only rarely do they call themselves the traditional name for shaman in their language. They use the now worldwide term *shaman* or new terms such as *ekstrasens* in Yakutia. Only rarely do they retain something of former shamans' gestures and attire. They recreate mixed techniques with borrowings from various cultures. They mainly receive clients in professional offices.

A large number of such new shamans have also engaged in collective activities. They have created professional associations, Kut Sür in Yakutia, Xese Xengereg in Buryatia, Düngür in Tuva, often with financial support and under the influence of neo-shamanist Western private foundations. Along with promoting individualist concerns, these associations introduce the Western postmodern understanding of shamanism as a question of "states of consciousness." Their artificial basis and internal rivalries, however, deprive these associations of real impact on society. Some new shamans have attempted to restore former collective rituals dedicated to ancestors and to spirits of the local natural environment, although these two types of spirits are no longer relevant to social and economic life in present-day cities.

An aspect of shamanism that does not involve individual shamans seems to be more genuinely reviving: collective rituals and festivals based on games and more generally all types of performances implying imitation of animal gestures and sounds. Local authorities and intellectuals strive to re-create such festivals on the base of old descriptions along with modernizing their appearance, and to instill the ideal of harmony (or symbiosis) with nature in them. Such games are the basis of national festivals in most Siberian republics and districts today.

SPIRITS AND GHOSTS IN MONGOLIA

Although spirits and ghosts are a reality in Mongolia, they are nevertheless the object of a wealth of speculation and open to differing interpretations. The notion of what spirits and ghosts are depends to a large extent on the individual's dominant belief system, whether it follows one of the forms of the indigenous shamanic religion, or Buddhism, which was introduced from Tibet. According to shamanic belief, the term *spirit* is used to denote an ancestral or guardian spirit that has a protective function for families and society. These "master spirits," which often inhabit natural sites, are said to be reborn as human beings. A ghost, on the other hand, is regarded in shamanic society as the soul of a person who has died without receiving any love or respect from fellow human beings, and which wanders about lost and invisible in the human world, and perhaps will possess weaker persons.

For the people of Outer Mongolia, there is no question about whether spirits and ghosts exist or not, because not only is the concept of such entities rooted in their daily thoughts, they actually experience them as a concrete reality. People see spiritual and ghostly influence in their daily encounters, in people's behavior, in their troubles and adversities, and in their moments of good fortune, as well as in the ever-changing facets of the cycle of life about them. Everything in nature, from clouds and mountains to grass, rivers, and trees, is believed to be inhabited by a departed soul or "spirit master," which has the power to protect or harm, to bring peace and happiness, or even to bring about premature death for generations to come. These deeply ingrained beliefs also have very practical consequences in daily life: Failure to show due respect or to make an offering to a spirit of the mountains, for instance, or to walk three times around a shrine that is home to a particular deity, may result in stormy weather, flat tires, measles, or worse. A very concrete demonstration of these beliefs can be seen in the two hitching posts that Mongolians have outside their tents: One is for their horses, while the other, empty post is reserved for the horse of a spirit as a sign of welcome and respect.

Buddhist thought differs in that it makes no major distinction between ghosts and spirits, arguing that spirits are by no means all good, and that even an ancestral spirit may cast a curse on somebody through a shaman, which is the kind of deed a ghost would do. Accordingly, the categories *spirit* and *ghost* are therefore thought by Buddhists to be both profane and also to overlook the more important spiritual dimension. According to Buddhist practice in Mongolia, when a person dies the relatives must ask a lama for the reasons for his death, the time when the soul left the body (which may in fact be long before actual physical death), the attributes or people that the departed soul wishes to take with it, and where the soul is headed in the next life. This information allows special rituals to be performed that help the soul find the spirit world to which it is destined as determined by the good or bad deeds it performed during its mortal life. It is believed that souls can be reborn either into the human world, into a higher world called Asuri, or into Tenger, the world of the gods, or heaven. Alternatively, the soul may get lost in the human world without finding its way to the next; this usually occurs when the necessary rituals have been neglected. In such cases, the soul may overpower and possess the souls of loved ones by killing their owners, or it may return and haunt the places to which it was especially attached during its mortal existence, such as those connected with riches or sensual pleasures.

It should be noted that in both shamanic and Buddhist thought, the main difference between a soul and a spirit or ghost is that a soul is an entity connected with a living being, while spirits or ghosts are the soul transformed after death. Thus the various terms could be said to describe different states of the same thing. This is, however, a great oversimplification when we look, for distance, at Darkhad shamanism in the north of Mongolia, where it is claimed that a person has three souls: the "soul of the flesh," which comes from the maternal side, the "soul of bone," which comes from the paternal side, and the "soul of mind,"

which is bestowed from heaven (Tenger). These three souls reside in the heart, pelvis, and fontanel, respectively, and differ as regards their fate after death. When a shaman dies, the "soul of flesh" remains with the body until the heart has disintegrated, and the "soul of bone" watches over the corpse until that, too, has disintegrated. According to Darkhad shamans, this takes three years if the body is left unburied on the open ground, as is the normal practice. Only then will this "soul of bone" awaken the "soul of mind" with the help of water and land spirits (Purev 2002, 138–142).

With this awakening, the "soul of mind" of the dead shaman transforms into an ancestral spirit for the deceased's descendants. In this form it will visit and possess new generations of shamans as they enter into trance, and being truly ancestral it speaks the same dialect it had spoken in human form, which by contemporary standards will often be ancient and almost incomprehensible, and thus require the services of an interpreter. The ancestral spirit may call for food and drink after its long journey to the shaman, but then it will be ready to give advice and above all to effect cures by removing curses or reestablishing a lost balance between body and soul. Such sessions can prove very exhausting for the shaman host, not least when the sometimes capricious ancestor spirit feels at home and wants to stay, and flies into a rage at any suggestion that it should leave.

The system of the Buryat shamans from Eastern Mongolia is somewhat different, for they consider that people have five souls, comprising a "black soul," which is like the "soul of bone" of Darkhad shamanism and guards the body after death; a "white soul," which wanders after death, associating with the places and objects it loves until finally disappearing after forty-nine days; a soul that goes to heaven, and that equates with the shamanistic "soul of mind"; a "white soul" that is reborn in a human body; and a "lost soul" that has to endure "five kinds of hardship" to pay for misdeeds in its previous life. These five souls are in fact a syncretic mixture of both shamanic and Buddhist thought.

Buddhism in Mongolia likewise teaches that a dead person's soul remains close to where it lived during human life for a further forty-nine days in order to finish its affairs, leave messages, and dally among the things it loves; beliefs about it are similar to those about the white soul in its doctrine of reincarnation. Moreover, Buddhist thought also describes five kinds of hardship that can be faced by those who have left the human world through suicide or other inauspicious means, and still have to endure human sufferings. But ultimately the five different souls described in Buryat shamanism should be understood as different aspects of one and the same soul.

Essentially the notion of the soul is important to all these schools of thought because all actions in life, all states of happiness or suffering, adversity or good fortune, stem first and foremost from someone's soul. Thus if individuals fall ill their first action will be to consult a shaman or Buddhist lama to discover what is happening to their soul and what should be done to make matters right. Thus in both shamanism and Buddhism, a sickness will usually be healed by first attending to the person's soul, and only then to the body. While this might at first sight seem a rather dualist notion, it should be stressed that the general belief is that a person is defined as a human being with both body and soul. Thus the important role assigned to the shaman or lama in cases of illness or misfortune is to mediate between these two parts of the human, the visible and the invisible, to harmonize the connection between them, and to balance the specific influence each exerts on the individual person's fate.

In the same way, the shaman or lama is also called on to mediate between humans and the spirits and ghosts that reside in their surroundings or come to haunt them; in the case of shamans the mediation is in fact performed ultimately by a spirit, in this case by a departed shaman ancestor.

TAJIK SHAMANISM (CENTRAL ASIA)

Tajik shamanism is a relic of pre-Islamic, ancient Iranian culture. The Tajik people are one of the most ancient ethnic groups inhabiting Central Asia. The process of Islamization began after the intrusion of Arabs into Central Asia in the seventh century, and was accompanied by the destruction of ancient Iranian culture and by the replacement of the area's various former religions—Zoroastrianism, Buddhism, and Manichaeism, among others. Nevertheless, in the ninth–tenth centuries C.E. the Tajik founded the Samanid Empire, with its capital in Bukhara, where the Iranian culture and language prospered. During that time, the formation of the Tajik ethnicity became complete. The modern Tajik (originally *Todjik*) live mainly in Tajikistan (3,172,000), Afghanistan (3,700,000), Uzbekistan (934,500), and the Russian Federation (938,000). They are largely agricultural people, based on an extensive irrigation system and cattle herding.

The urbanization of Central Asia began at the end of the nineteenth century when the region became a part of the Russian Empire, and was especially intensive during the Soviet period. This urbanization has substantially transformed the traditional lifestyle of the Tajik in Tajikistan and in other republics of the former Soviet Union, but the majority of them (65–70 percent) are still engaged in agriculture. The Tajik language is essentially identical to Farsi (Persian). Most Tajik are Sunni Muslims; some are followers of Shiism; and Ismailism prevails among inhabitants of the Gorno-Badakhshan district in Tajikistan. Though Islam had a huge influence on cultural and religious life of the Tajik, Islamic ideology could not completely supersede Tajik culture's archaic religious belief and cults. Shamanism, widely distributed among Tajik, is one of these traditional religious phenomena.

History

Tajik shamanism is less studied than Kazak and Uzbek shamanism. Up to rather recent times, the prevailing scholarly opinion was that shamanic cults were not characteristic of agricultural peoples and that this tradition was borrowed by the local Iranian population from their Turkic neighbors. However, this theory was challenged by Olga Sukhareva, who in the 1930s discovered shamanism among the Tajik of the plains and proved that Central Asian shamanism has local roots going back to the traditions of the pastoral Iranian-speaking population (Sukhareva 1975). Subsequently Vladimir Basilov discovered differences in the shamanic complexes among the various Central Asian indigenous groups and marked out two different local variants of shamanism: Turkic nomadic shamanism and Tajik agricultural shamanism (Basilov 1992, 198–200). Among the Tajik, shamanism is primarily a woman's occupation, though both men and women can perform as shamans. If only modern history were considered, this phenomenon might be explained by the fact that during the Soviet period only male shamans were persecuted for their shamanic activities, since the Soviet political leadership generally left female shamans alone for various reasons. Some scholars insist that feminization of shamanic duties is rather a result of the influence of Islam, which reduced the social scope of shamanism and led in the late nineteenth and early twentieth centuries to the transfer of shamanic activity to the private, female sphere. However, female shamanism includes many archaic elements, which support the conclusion that female shamanism was in existence long before Islam appeared in the region.

Cosmology

As a result of Islamization, shamanic cosmology among the Tajik has almost completely lost its tradition. According to contemporary Tajik shamans the heavens belong completely to God and the angels, whereas the spirits inhabit this mundane world (mountains, caves, reservoirs, and the like). This view explains the fact that Tajik shamans do not travel to the other worlds during their trance rituals.

The Tajik believe that there are many different spirits, which cause both good and negative things in their lives. They do not have a generic term for "spirits" in their language, but the types of spirits are known by their specific names, such as *pari* or *chil'tans.* According to Sukhareva (1975, 5–93), these spirits' names and functions vary according to regions. In general there are three types of spirits believed to exist among the Tajik. The first type are the spirits of saints and ancestors, which reside in the *mazar* (tomb). Among them are *pir,* the saint founders of handcrafts in the Tajik myth, ancestral spirits, chil'tans and *arvokh* (spirits of the deceased or ghostly spirits), and mother spirits, *momo,* which are in charge of safe childbirth. The second type of spirits are evil spirits, which bring sickness and death. These are *albasty, adjina,* or *jin,* and *dev* (often represented as a snake or human monster), whose negative powers must be controlled by shamans. Shamans can affect these evil spirits so that they may act benevolently toward humans. The third kind are pari spirits, which sometimes fall in love with humans (male or female). If a human being ignores a pari's affection, the spirit gets angry and may cause sickness. If the person responds to the pari positively, then that person will receive supernatural powers to be a shaman from the pari. The chosen person could have some kind of sexual relationship with a pari in the dream or in the spirit world.

These and other shamans' spirits can change their appearance and turn into animals, birds, or plants. The pari spirit, for example, can turn into a bird, while the chil'tans may become flies. These metamorphoses probably reflect a stage of evolution when shamanism was still closely connected to nature, but the process of rupture had already begun. The adopted spirits are anthropomorphic and associated with concrete persons such as ancestors, shamans, and saints. Note that the Tajik distinction between good and evil spirits is not so clear. "Good" spirits can punish a person with illness or harm, whereas some shamans draw upon evil spirits as their helper spirits.

Shamans

There are several terms by which the Tajik refer to shamans. Alongside the widely spread word *bakhshi* (descended, perhaps, from the Sanskrit *bhikshu,* which initially designated the Buddhist clergy), a shaman may also often be called a *folbin* (combining the Arabian *fol,* "destiny," and the Tajik *bin,* from *didan,* "to see"). The term *bakhshi* may also have its origins in the Turkic word *bakmak* (to look, to see), and hence refer to someone who is able to see in a special way, or a "seer" of future knowledge. Some scholars also argue that Turkic *bakhshi* derived from the Chinese word for a learned person or doctor, *bo-shi.*

According to medieval sources, one of the most commonly used names of shamans at that time was the term *parihon,* coming from the Persian *pari,* "spirit," and the Tajik *hondan,* "to read" (Jarring 1961, 3–4; Sukhareva 1975, 79), but today this word is rarely used.

The hereditary transmission of shamanic knowledge is ubiquitous in Tajik shamanism. Though this way of becoming of a shaman is not the only one, it is widely believed that only a person who has inherited the shamanic ability from a relative or an ancestor can become a real shaman. The successor receives from the predecessor also her accessories and her helping spirits. These family spirits, passed from one family member to another, often are identified by the word for "family lineage." Ethnographic sources testify that the transmission of the shamanic tradition at the end of the nineteenth century was done mainly through women, that is, from a mother to her daughter or son, from a grandmother to her grandchildren, and so on. This tradition is preserved to this very day.

Irrespective of the way in which one becomes a shaman, the candidate should possess certain indicators proving that the spirits have chosen her. One of these is the "shaman's illness," which may show up in various forms (epileptic seizure, paralysis, infertility, blindness, deafness, and others). There is no special term designating the shaman's illness in Tajik shamanism. The person who shows this sign is called "one

touched by spirits." Dreams, hallucinations, and visions are also considered as summons by the spirits.

Among the Tajik, training does not play a significant role in becoming a shaman; each candidate, however, has a preceptor who blesses her and who manages the initiation ceremony *(chillia).* The initiation ceremony as a rule consists of two main stages. First there is a sacrifice of an animal (usually a black sheep), which customarily is done according to Muslim ritual. The animal should be drained of blood by cutting its throat; its head should be directed toward Mecca. The second part of the shaman's initiation is a forty-day seclusion that has special importance: Any candidate who omits this seclusion risks missing the opportunity to bring the spirits under her control. It is believed that during the first twenty days *(kichik chillia),* spirits attack the shaman, causing her strong spiritual and physical sufferings. The initiator's purpose at the moment is not only to sustain these tortures but also to acquire the skill of controlling the spirits. During the second twenty days, the candidate must gain an understanding of the spirits' "language"—bodily sensations and symbolic signs appearing in dreams and visions.

Amongst the Tajik shamans' materials, a drum holds the central place. Some of the archaic shamanic accessories and artifacts have been replaced with objects belonging to Islamic observance (the Quran, prayer beads). Although the shamans have lost their original costume, their dress still contains some traditional characteristics. For example, a female shaman usually wears a white dress, or veils her head with a white scarf. Up to rather recent times, some male shamans used female dress also. This ritual gender change, or transvestism, among male shamans has attracted the attention of many researchers, but the question of its nature remains in dispute. Some scholars explain this phenomenon by sexual relationships between male shamans and their female spirits, while others, on the contrary, exclude any sexual motives and assert that by changing his dress the shaman imitates his female helping spirits in order to facilitate his dialogue with these spirits.

Trance and Ritual

Today many Tajik shamans never enter into a trance, considering the ecstatic condition or trance as an illness provoked by the evil spirits or as evidence of an inability of a shaman to guide his or her spirits. Others, on the contrary, interpret this key moment of shamanic practice as proof of the shaman's power. Altered states of consciousness are particularly typical for collective rituals, sometimes called by the Arabic term *zikr,* which is a distinguishing feature of female shamanism. These rituals are carried out both for the initiation of a shaman and for the healing of patients. The shamans use various techniques to enter into a trance. Usually, this state of altered consciousness is created by repetitive drumming, or by monotonous chanting and singing.

Tajik shamans use a vast spectrum of methods and remedies for healing and divination: magic, reading the Quranic suras, or rational methods based on knowledge of the healing power of plants, minerals, and the like. The basic concern and ritual of the shamans, however, is directed toward exorcism, since it is believed that spirits cause various illnesses and misfortunes. In the Tajik language, the exorcism ritual is named by borrowed terms occurring from the Turkic word *kiochmak* (to run). In most cases the exorcism rituals include three main acts: animal sacrifice (a sheep, a young goat, a hen), "linkage" of the harmful spirits by means of amulets made by interlacing of seven multicolored threads, and the final procedure, *khaida* (exile). Throughout the exorcism, the shaman carries out various manipulations using the drum, fire, water, soap with needles thrust in it, and other means, in order to frighten away the spirits that caused the illness and to force them to leave a patient's body. In addition, the shaman often covers the patient's body with the sacrificial blood from the animal in order to feed and propitiate the invasive spirits. Even the sacrificial animal's bones come into play, serving in diagnosis, divination, and other purposes.

Coexistence with Islam

The social position of Tajik shamans is ambiguous. On the one hand, where strict Islam dominates, it condemns shamans, considering their activity as apostasy, and shamans have no formal status in the society. The shamans' authority is limited to the private sphere. Elsewhere, however, the shamans have kept their status in

the local Muslim environment, as Tajik shamanism has substantially adapted and linked itself to local "folk" Islam. The shamans' position is secure, because their specific functions are directed to the resolution of people's most vital problems. This factor is an important one, especially in rural areas where medical service is poor. By virtue of these circumstances, shamans are welcomed in Tajik society, and some of them have real authority in their communities.

TELEUTIAN SHAMANISM (SIBERIA)

Small as the number of Teleut still living in Siberia is, they have maintained a strong and distinctive shamanistic tradition. Though shamans no longer practice, they did so within living memory, and shamanistic beliefs are still common.

Background

The Teleut culture, one of Siberia's smallest native populations, consists of approximately 2,658 people (2002 census), living principally in villages of the Kemerovo area in the southern portion of western Siberia. The Teleut call themselves *telenget* and *tadar* in their own Teleut language and *teleuts* in Russian. Adjacent Turkic culture groups know them as *baiattar,* or *pachattar,* from the name of the Bachat River by which they live. Their Turkic language falls morphologically and lexically between the Shors and Altaic languages. The origin of the name *Teleut,* as well, probably, as that of several clans, dates back to the Tele peoples of the time of the ancient Turkic Kaganat during the second half of the first millennium C.E. Their ancient origin may reach even to the time of the Dinlin, first mentioned in ancient Chinese writings in the year 201 B.C.E.

The present-day Teleut community was formed in the nineteenth century on the basis of various groups that occupied the Kusnetsk valley (Ach-Kishtimi, Tulber, Togul, and others) and nomadic Teleut who invaded the region. From the seventeenth century to the beginning of the eighteenth century there existed a strong Teleut ethnopolitical union, including the princedom Teleng Orda, which was later destroyed by western Mongols. Until 1924 most Teleut peoples were governed within the Teleutian Volosts (smallest administrative division of csarist Russia) of the Kusnetsk district in Tomskaya province. They had no structural autonomy of their own during the Soviet years, and their ethnicity was ignored in their own official passports, which identified them simply as Tatars. Further, in USSR census accounts they were referred to as Altais. The national revival movement began at the end of the 1980s, and in 1993 the Teleut peoples were officially recognized for inclusion under legislation as members of the "Small [in number] Indigenous Peoples of the North" (Funk 1999, 115–116).

Cattle breeding and plow agriculture, along with hunting, fishing, and gathering, were the main livelihood traditions of the Teleuts during the nineteenth and early twentieth centuries. In

the second half of the twentieth century they faced transformation during a period of intensive Soviet-dominated industrial exploitation of the region; Teleut came to be employed in a range of industrial enterprises, though mostly in the burgeoning coal industry.

Even today, the ancient lineages, involving loyalties to the Teleut clan divisions, are traced back, with the most significant lineages bearing such names as Merkit, Naiman, Ochu, Togul, Todosh, Tölös, Tumat, Choros, Chalmalu, and Yuti. Teleut families are monogamous, with relatively few children, living typically at the husband's heritage settlement. Marriage within a related group united with the same surname is forbidden, as well as sometimes marriage within the limits of a clan (in technical language, they observe clan exogamy).

Since the nineteenth century, Teleuts have lived a stationary existence, and they settled in small villages. Their dwellings are both wooden and brick, of one or two stories. Modern dress is more the fashion today among Teleut men, though some women, typically in older generations, can still be seen wearing traditional Teleut garments. Teleut youth may wear traditional clothing only on special occasions, such as wedding ceremonies and festivals of Teleut folk art and music.

In both diet and preparation of meals, Teleut habits are quite similar to those of surrounding ethnic groups, in particular those of the long-established Russian population, although the tradition of cooking many national dishes of meat, milk, and flour products is still retained. Domestic crafts continue and are of high quality, including traditional sewing, weaving of belts, manufacturing of leather footwear, metalworking, and jewelry making, as well as composite weaving of rawhide belts. The practice of writing in the old script used in Teleut literature, which was based on the old Mongolian writing system, persisted in princely families until the end of the nineteenth century. Furthermore, Teleut oral folklore remains especially rich in traditional song.

The Teleuts, originally shamanists, were eventually influenced by Russian Orthodox Christianity in the eighteenth and nineteenth centuries. In the nineteenth century, so completely had they adopted Orthodox Christianity, the Teleut even helped evangelize the neighboring Altai indigenous population. The first members of the Altaic intelligentsia were in fact those people educated by Orthodox Christian Teleut, including the well-known Teleut writer Chevalkov and artist-painter Gurkin, for example.

The History of Teleutian Shamanism

In 1910, there were five known practicing shamans located across the two large Teleutian villages of Cheluhoevo and Shanda. Two years later only three aged shamans remained. By the 1930s all traditionally trained and practicing Teleut shamans were gone, and only certain gifted people periodically conducted healing or clairvoyant, future-sight ceremonies. Despite atheistic propaganda, the shamanic worldview of the Teleut and their belief in the spirits inhabiting it still remained, continuing even into the early twenty-first century, as well as beliefs about struggle with evil spirits, family and clan or guardian spirits, and the ritual of feeding the fire, to name a few. Neo-Shamanistic movements are not significant at present, and the start of 1990 saw an active movement for the revival of Orthodox Christianity, as expressed in the restoration of the ancient Orthodox Church in the Teleut village of Bekovo.

In the past, relations of the shamanic community with the Orthodox Christian Church were indeed complicated, though not always antagonistic. Perhaps the most recognized enemy of Christianity Orthodoxy and assimilative Russification could be found in the Teleut shaman Markel Mazhin, born in 1849. Furthermore, the shaman was not always recognized as the social leader of his clan or community. If the shamanic séance failed, or the shaman refused to help his neighbors, he might be abused by the people—even physically in some cases. To the present day, Teleut people tell different oral stories about the shaman's daily life and the shamanic practice of their famous ancestors—sometimes with pride, but quite often as well as with humor, recognizing their failures (Batianova 1995).

Traditional Cosmology

Teleutian shamanic cosmology is richly detailed, representing one of the most elaborate shamanic traditions when compared to that of other Turkic peoples of the region (Funk 1997,

33–91, 227–248). The Teleutian shamanic universe is recognized for both its profound verticality, as well as the fact that it is divided horizontally into five distinct worlds. The Teleut world *(pu t'er),* a plate, standing on four gray bulls, is inhabited by people and spirits of the local area's rivers, lakes, and woods *(iyiik).* This land is densely surrounded by the imagined land, "the earth way" *(t'er t'oli),* located between the horizon and the real land. To both the east and south of this land there live several dozen spirit beings called *paiana*—the spirits attuned most positively toward human beings. The real and the imagined land is enveloped or encapsulated in its entirety by the celestial sphere (*temir kapkak,* "iron lid"). Furthermore, far to the east of the land, above the "empty space," there are two lands of truth *(chin t'er),* where dwell the most powerful gods, Adam (Ada–kizhi) and T'öö–Kaan. Adam was considered to be the most powerful god, who could not only present a baby to childless families but also create celestial deities.

When a shaman during a ceremony reached the foundation of the sky, he went beyond it through one of two holes. Then by continuous rotation in one spot, the shaman turning round one hundred times, he imitated flight over space. People who have witnessed such shamanic séances saw their neighbors surrounding the shaman tightly to aid in the magic flight's success. When the *kam,* "shaman," stepped back on the ordinary earth, there was a sigh of relief among the participants and observers. The flight was concluded by the host who had asked for the shamanic séance, through the provision of wine to his guests.

According to the Teleut shamanic worldview, there are sixteen spheres, or layers. Inhabiting or haunting each layer, with the exclusion of first two, are certain deities commonly referred to as *Ulgens.* The name *Ulgen* is also a personal name. Mother Pai-Ulgen exists at the very height of the universe, though she is not the strongest or most powerful of the Ulgens. Importantly, the Ulgens are considered to be the true protectors and guards of the Teleut clans. Specifically, Pai-Ulgen serves as protector of the Tetper Clan, Totoi–Tengere of the Merkit Clan, Eksei-Meksei-Tengere (Adam Burhan–Tengere) of the Choros Clan, Kizigan-Tengere of the Tongul, Abiosh-Tengere of the Yuti, Tumat-Tengere of the Tumat, and so on.

Then there is the underground land, or hell, known as the land of evil *(t'er-aalis* or *taami),* which is less understood. According to data collected at the beginning of the twentieth century, this hell consists of nine layers, all of them underground. To signify the inhabitants of this land, Teleut use general names such as *körmös, edü, aina, saldi-nemesi, kara-neme, sokor-neme, kirik-nemesi,* as well as personal names.

The Shaman

Spirits came to shaman candidates in youth, when the candidates were fifteen to eighteen years old, and "pressed" them *(tös pasip t'at),* compelling them to accept the shamanic gift. The acceptance of the shamanic gift was accompanied by the "shaman sickness," lasting for a full year or longer. These transformative spirits literally recreated the shamans, boiling them in a pot seeking for an extra "bone." Were the extra bone of the shamans not found, the initiates might well die. There were, however, several cases that did not fit this pattern, cases in which shamans began to work with full power only after this so-called extra bone left their body. Such was the case with the recognized shaman Kanakai Chelukhoev, who passed away in 1914 (Direnkova 1949, 109–114). Mircea Eliade (1989) recounts a similar experience (having the body cut to pieces), which a Teleut woman underwent to become a shaman.

The relatives of the shaman played an important role during the shamanic sickness. Relations either sought to guard their kam from the coming spirits with magical means, or they invited one or two experienced shamans as experts in shamanic ritual. These experts, having helped the neophyte shaman to overcome his condition, then could go on to teach him the basic principles of communication with the Teleutian world of spirits.

Shamans during the nineteenth and twentieth centuries have had few ritual garments, often only a "cap," *astyuchke,* in the case of female shamans. The major ritual instruments for both male and female shamans was the drum *(tüür* or *chaluu)* and drumstick, or mallet *(orbu)* (Potapov 1963). Shamans who had just started their practice would hold the ritual without any drum, and others would not use a drum during their entire life in practice. The drumstick was made from *tavolozhnic* (a kind of willow tree),

which was typically covered with *kamus,* the skin of a wild goat's leg. The drumstick was then highly decorated with ribbons placed in honor of the most powerful spirits and shaman guardian spirits. The Teleut drum was oval in shape and approximately 180 centimeters in circumference or larger. With a non-anthropomorphic handle, *mars,* it belonged to the same group as the drums of the Shor, a portion of the Kumandin, the Chelkant, and some groups of Khakass. Drawings on the outer side of the drum leather cover varied little among different shamans. Some of the details on the drawings reflected shamanistic beliefs about the order of the universe.

A shaman might have three to nine drums over the course of a lifetime (and sometimes as many as twelve drums in certain cases), serving as a true measurement of the length of life of the shaman. After a Teleut shaman's death his or her drum was typically destroyed in ritual fashion. The skin of the drum would be poked through and cut into pieces, after which it was taken to the street, where it was trampled upon, finally to be hung on a birch tree in the forest where, eventually, it would wither away.

Another important ritual followed a shaman's death. Relatives or helpers would be required to break the backbone or some other bone of the deceased shaman's body. Failure to do so would inevitably lead to material problems, including illness, for the nearest descendants of the shaman. The funeral ritual of the shaman, held in the common graveyard, was not different from those of the rest of the Teleut population, but it was imperative to bury the shaman's body within a day after the death.

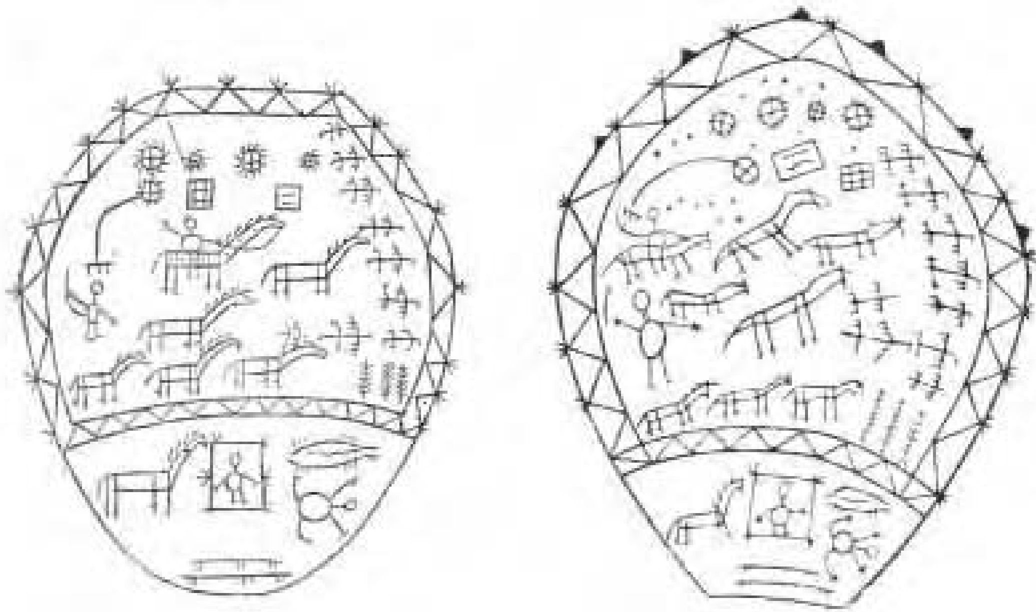
Unfortunately, little is known from either historical literature or the oral memories of elder Teleut that would reveal the experiential depth of shamanic trance reached during stages of the ceremony that involved altered consciousness. It is known that, among the Teleut, narcotic substances and mind-altering drugs were not commonly used. Typically, only light alcoholic drinks, such as a homemade wine called *abirtka,* were used in ritual.

Shamanic rituals were often conducted in honor of the most powerful spirits and deities, such as the *pozogo,* the spirit of the threshold, and the Talai–kaan, known as the spirit and the host of the sea (Funk 1997, 2004). These ceremonies, undertaken with predictably positive

Daily ritual practice among Teleuts, spraying milk from a spoon for the spirits. Kemerovo region, 1982. (Courtesy of Dmitriy Funk)

conclusions, had standard structures and used epic language and storytelling styles. These ceremonies were distinguishable only in the details of the shaman's journey, such as the journey undertaken by the *t'ula,* the "energetic twin," or double, of not only the shaman but also his assistant. The assistant also performed the function of interpreter of the shaman's visions and revelations to the participants in the ceremony. During a spectacular shamanic séance for the needs of the clan or the whole community, often including a mandatory sacrifice of cattle, Teleut shamans would simultaneously solve various community problems, find lost energetic twins, help heal the sick, and undertake foretelling of future events.

Shamans in Teleutian society coexisted with a number of other ritual specialists or knowledge bearers (Funk 1997, 15–17). These included many that were recognized and labeled: *chimirchi, chimirchil* (exorcists) (Funk 1996); *alkishchi* (experts in good wishes); *alaschi* (ex-



Two pictures of the Teleutian drum (made by hand by the Teleuts). (Direnkova, Nadezhda. 1949. Materials on Shamanism among Teleuts. Sbornik Muzeya Antropoligii i Etnografii, vol. 10.)

perts in cleansing ceremonies using fire); *t'ölgöchi, chabitchi* (various foretellers and fortunetellers); *kösmökchi, kösmökchil* (clairvoyants); *emchi, siimuchi* (healers); *iadachi* (magicians—exorcists of weather); *arbishchi* (sorcerers); and persons called *pilechi* (knowing). "Great shamans" possessed knowledge and skills that enabled them to carry out vital ritual functions above and beyond the majority of the other recognized specialists. Chimirchi (specialists in exorcism rituals, considered by shamans to be of lower rank) and arbishchi, sorcerers, were believed to struggle against shamans and thus are described in Teleutian folklore as being distinct from shamans.

Undoubtedly, many features of Teleut shamanic cosmology and attributes are quite similar to those of the neighboring Shor, Kumadin, and Khakass cultures, and other elements link Teleut shamanic practice with still other Siberian and Central Asian cultures.

TUVAN SHAMANISM

The Republic of Tuva lies at the very heart of Asia, a land of mountains, taiga (boreal forests), steppe grasslands, and mystery. Central to the Tuvan culture and its ancient history of nomadic, warring tribes lies a rich spiritual heritage of Tuvan shamanism.

Background

Tuva is a republic of the Russian Federation and lies directly adjacent to Mongolia, just west of the Russian Republic of Buryatia and the Lake Baikal region of Eastern Siberia. Comprising some 170,500 square kilometers, the country is home to approximately 330,000 people. Tuva was annexed only in 1914 to the Russian state and enjoyed autonomy as a republic until 1944, when it was downgraded to an autonomous area within the Soviet Union. It is now a republic within the Russian Federation. The relative independence it was able to maintain so long is testimony to the fierce independence of its people, who freed themselves from Manchurian domination in 1912 as the free and independent Tuva People's Republic. The native Tuvan people, identified ethnically as Turkic Uryankhai, are speakers of an ancient Turkish language and make up over 65 percent of the entire population; they are in fact the only indigenous people who are in the majority in their republic. Russian ethnographer Leonid Potapov expressed the belief that the Turkic-speaking Tuvans originated from peoples speaking Mongolic, Samoyedic, and Kettic (Fridman 2002; Levin and Potapov 1964, 380).

The majority of Tuvans are steppe pastoralists. The western steppe zone is varied in its vegetation; toward the southwest, in Mongun-Taiga, bordering on the sandy wastes of Mongolia, the climate is arid and the vegetation sparser, but in areas around river valleys vegetation is richer and can support horses as well as other pastoral animals. The western Tuvans were traditionally nomadic pastoralists with an economy based on the pasturing of herds—cattle, sheep, goats, horses and camels—somewhat dependent on the conditions of the terrain and climate. They lived in lattice-framed yurt dwellings covered with felt, which were moved seasonally according to the needs of the flocks. During the Soviet period, most Tuvans were "collectivized" and moved to houses in villages, but since 1991 there has been a gradual movement back to the countryside and a reengagement in pastoralism.

An Ancient Heritage and Traditional Shaman Paths of Tuva

Despite a turbulent history of varying powers—Turks, Chinese, Uyghur, Kirghiz, Mongols, Altyn Khan, Dzungarian, and Manchu Chinese—imposing their hegemony over the Tuvans, shamanism has remained a vital spiritual force. Even through the Stalinist repression of organized religion during the Soviet era (which repressed and murdered over 700 shamans as related to the author, Daniel Plum-

Kirgis Khavendaevich, Tuvan shaman, singing and drumming, calling his spirits to heal Rosa. Shagonar, Tuva, 1996. (Courtesy of Eva Jane Neumann Fridman)

ley, in 2002 by Tuvan ethnologist and author Mongush Kenin-Lopsan; see also Fridman 2004), Tuvan shamanism remained alive, vibrant, evolving, and often a significant spiritual aspect in the lives of many Tuvan families and communities.

On October 15, 1993, shamanism was established by a presidential decree as a health system for healing, thus recognizing shamanism as a profession and establishing old-age pensions for shamans; moreover, at the same time the government also established a Scientific Center for the Study of Shamanism in Kyzyl, the capital of Tuva. The Society of Tuvan Shamans, the Düngür (*düngür* means drum) Society, was formed in 1992, registering thirty-seven shamans. Each registered shaman receives a license with his or her photograph on it and also a document allowing the shaman to practice healing, do rituals, and foretell. The Dungur Society has a house in the center of Kyzyl where shamans can practice healing for a fee. In 1996 it was stated that there were about 100 shamans in Tuva, including old shamans in the countryside (Fridman 2002, 487; Fridman 2004, 248, 250). Since shamans are highly individualistic and often don't want to be counted, especially after a long period of repression, these numbers may be too low.

Male *(Zayran)* and female *(Udugen)* shamans of Tuva carry out many vital functions, linking human beings to the spirits of the Upper and Lower Worlds. Shamans are religious practitioners who, through accessing an altered state of consciousness (also known as a trance state), can divine and foretell the future, heal individuals who are suffering illnesses or soul loss, and perform rituals for the well-being of the community, addressing themselves to ancestral spirits and the spirits of nature. Historically, Tuvan shamans conducted essential ceremonies for their nomadic groups through the recognition of and respect for local spirit masters of mountain and valley systems, forests and steppe landscapes, rivers, lakes, and *arzhan,* "spring waters," that were found along the ancient ancestral and seasonal pathways of the Tuvan people.

The Tuvan shamanic tradition recognizes shamans of ancestral lineage who are gifted with healing abilities, foresight clairvoyance, or the ability to interact positively with the spirit world. The universe is divided into three primary planes. The Upper World, the Middle World, and the Lower World are all very real phenomenal places to which the Tuvan shaman may travel by drum, in an ecstatic state, to gain insight, answers to personal or community questions, or healing treatments. The human plane is the Middle World; spirits both helpful and harmful, animal and bird spirits, ancestor spirits and spirit souls of the dead can transcend the Middle World, inhabiting either the Lower or the Upper World, at home in both planes of transcendent reality and the phenomenal world.

Kenin-Lopsan has classified Tuvan shamans into five types: (1) shamans who trace their descent from shaman ancestors, (2) shamans who trace their origins from the spirits of earth and water, (3) shamans who trace their descent from the heavens *(deer kham),* (4) those who originate from the *Albys* (name of a beautiful

young woman spirit) spirits, and (5) those who originate from *aza* spirits (also called *kara kham,* or black shamans) (Kenin-Lopsan 1997, xxi). Shamans who have inherited their gift are considered the only true shamans. Kenin-Lopsan has categorized the main modes of shaman activity as follows: (1) shamanizing with a *küsüngü* (mirror), (2) shamanizing with a *khomus* (a mouth harp), (3) holding a séance with a drum and wearing ritual clothing (characteristic only of shamans of a high degree and traditionally performed only at night), (4) holding a séance with a shaman drum and *dayak* (staff). The three-headed staff is decorated with ribbons and was the first attribute Tuvan shamans received at their initiation (Kenin-Lopsan 1993, 26–27; 1997, xxi-xxii).

Traditionally, Tuvan shamans, male and female, have inherited the gift of becoming a shaman and have had shaman ancestors in their family. The signs of an incipient shaman, usually in adolescence, are that he or she suffers a "shaman sickness," *albystar,* during which the person becames hysterical and exhibits mental disturbances. This can only be alleviated by the family inviting a shaman to do a special *kamlanye* (ceremony). During the ceremony, the shaman would discover that the spirit of a particular shaman ancestor had settled into the patient, which meant that the patient had to become a shaman. If the patient refused the call to become a shaman, he or she would continue to be ill, and often incipient shamans refused the call until they finally understood it was necessary to accept it. Once the incipient shaman accepted his calling, his relatives prepared for him his attributes: ritual clothing, a drum, and a beater. The Tuvans in the eastern part gave the shaman only a dayak (staff) for his kamlanye, and then later gave him a drum. This drum would then be "enlivened" to become a horse, which he would ride into the Upper World during his séances (Wajnschtejn 1996, 260–261). These practices have continued in the post-Soviet period.

The Tuvan *Kamlanye* Ritual of Balance and Harmony

Although shamans speak of the loss of traditional powers, ceremonies of the traditional type are again being held in the early twenty-first century. Daniel Plumley has observed these ceremonies in his fieldwork in the area, and it is on his observations that the following account is based. Since the ceremonies he observed were carried out by female shamans, the feminine pronoun is used, though in fact Tuvan shamans may be male or female. Though different seasons require different shamanic actions or ceremony, perhaps the Tuvan kamlanye ceremony best typifies the Tuvan shamanic tradition of cleansing negative energy and bad spirits from people, while offering respect, thanks, and restored balance to nature. Most often, kamlanye are performed adjacent to rivers, lakes, or water sources like natural spring waters, arzhan. Participants are asked to sit on the earth, perhaps on skin or wool pads or blankets, and clear their minds of thoughts and mental hindrances. The shaman, in full dress that includes an ankle-length caftan with unique Tuvan symbols, begins the ceremony by raising a white, conch-like shell to her lips and blowing hard, a roaring trumpet sound that both establishes the ceremony's beginning and warns evil spirits, or negative energies, to leave the place. Guardian breast and back plates often form the sacred skeleton of the shaman, and small bells protect the shaman's back.

Unique to the Tuvan shaman's cape are the long, almost floor-length multicolored corded "snakes" of special fabric, tipped with leather and red cloth, that attach to the shoulders, arms, and waistband of the caftan. With each movement, with each step or twirl of the ensuing ritual, these sanctified snakes writhe and extend outward from the shaman's back, sides, and front, increasing their visual power and strengthening the spiritual protection they offer against harmful energies or spirits that might be stirred up during the shamanic activity. The spectacle is as impressive as are the symbols themselves.

The opening portion of the kamlanye is the ritual purification of the participants and the atmosphere and attributes to be used in the ceremony through the use of burning juniper, *artish,* in a small ritual ceramic, wooden, or at times shallow silver bowl, *piala.* Once the initial purification has been completed, the sacred fire can be lit. In order for the shaman to reach the spiritual world, she needs to move into an altered state of consciousness, where she can meet the appropriate spirits). The shaman may begin to coax ancestral spirits to the place first

Rosa, Tuvan shaman, blessing the spirits of nature, outside Kyzyl, Tuva, 1996. (Courtesy of Eva Jane Neumann Fridman)

through the strange twang of a small Tuvan khomus (mouth harp) or possibly, by the traditional Tuvan *khoomei,* overtone singing of *algyshes,* shamanic hymns. Both khomus and khoomei establish vital energetic vibrations that enable a connection with the transcendent energies needed for successfully achieving the goals of inter-world connection and collaboration that are the true purpose of the kamlanye ceremony. Ritually with guttural khoomei breaking forth from the shaman's lips, she spins behind the backs of the participants letting loose a two- to three-foot leather whip to lash their backs. As the whip slaps solidly against the back of a person to be cleansed, the shaman's voice rises in horrible protest, scaring away any bad demons both by voice and by the force of the lash itself.

Upon the close of khoomei singing, khomus playing and following the ritual lashing, the ceremony of calling and travel to the spirit world with the aid of the drum and libation to the sacred fire can begin in earnest. Trading her khomus and lash for her dungur, her drum, the shaman begins a methodical beating that increases in intensity and variability as she falls into an altered state of consciousness (trance) again and begins her own ritual singing. Shamans sing their own songs, often distinctly different depending upon the birthplace in Tuva of the practitioner and also the stage of the journey to the spirits. Those participants attending to be healed must supply their own libations of butter, rice, milk, wheat flower, tobacco, bread, and occasionally meats, honey, and other sacrificial foods. All are placed rever-

ently at the height of the sacred fire's flames as a most honored gift to the *tengeri,* heaven and its spirits.

To convey further spiritual benefit to those being healed, they may be invited to dip their hands and wet their foreheads and faces with milk sanctified by artish, juniper that has been kept near the sacred fire during the length of the ceremony. Such milk may also be used to "feed" the drum, which, as a living force of spiritual energy unique to each shaman, requires special and reverent care and is typically made by the shaman herself from the root base of a sacred birch or spruce tree.

The instruments used by the shaman form a veritable animist panorama of aids for spiritual practice in Tuva. The *orba,* "drumstick," is covered with the skin of a reindeer's leg and often has metal rattles that add cadence to the use of the drum. An *adig eereni,* a bear's paw with claws, may often be present among the shaman's spirit tools, and the use of the *ot kimchizi,* horse whip, speeds the shaman's travel to the Upper or Lower Worlds while lashing away bad energy or spirits from those who are being healed. Through these tools, Tuvan shamans encourage the helper spirits of horse, reindeer, and bear to aid in the transcendental work that allows the shaman to leave the known world and enter the spirit world.

Still other objects present even more mystical functions in the vital work of the Tuvan shaman. The *chalama,* or braided, multicolored cloth tails or snakes that hang from the shaman's robes provide sacred protection (Sljusarev and Oyun 2001). They may hang independently, as do the traditional tool or house *ongons* (protecting spirits), which often hang from the yurt or *chum* (tepee) rafters in the most sacred place—directly across from the south-facing door, though just slightly to the right.

In Tuva, the *tos-karak* (the nine-eyed spoon) holds a very special role for all shamanic practitioners, both shaman and layman alike. With this wooden spoon, into which nine small hollows or eyes are carved, sacred liquids of milk or vodka are traditionally offered to the earth spirits and the heavens upon reaching new grazing or nomadic home sites, prior to ritual healings at family or community feasts, and before important seasonal ceremonies. Libations with the tos-karak are gifts to the spirits and keep the balance with the blessings allocated by the real and the phenomenal *tos-der,* "nine skies" or "nine heavens," essential to Tuvan shamanic cosmology.

But perhaps no other tool or shamanic attribute, apart from the drum, holds such a valued place as the küzüngü, the shaman's spirit mirror of polished brass, steel, or silver. This opaque mirror in fact conveys no reflection in this middle world, but nonetheless provides the "seeing" shaman with insight into the questions of those seeking aid and healing, or needing advice and wisdom from the shaman on matters of life, health, family, love, and community. It also provides protection for the shaman, deflecting evil spirits (Wajnschtein 1996, 259). The word *küzüngü* means "opposition" in Yakut language and implies that the mirror will protect against the burning hot glance of evil spirits (Wajnschtein 1996, 287).

By passing her küzüngü mirror through the wafting smoke of the artish and through silent intention and the shamanic "sight," the Tuvan shaman informs participants of their future. One woman will face difficulties during forthcoming business travel and thus must protect herself with red string tied around her wrists and ankles, provided by the shaman herself. Another requires three months of protection wearing certain twisted colored threads as wristlets and must "feed" a small cloth satchel holding sacred rice grains with a drop of cooking oil weekly or with butter, in order to pass through a hard time without difficulty. Thus the participants gain both practical and spiritual guidance that creates a newfound respect for their place in nature and strengthens their linkage with their ancient Tuvan heritage.

A Future for Tuvan Shamanism

Tuvan shamanism, severely restricted and repressed during the period of the hegemony of the Soviet Union, has now returned to private families and communities alike the ritual of the kamlanye as well as the practices of healing. Shamanism has even gained official recognition as a state religion under governmental sanction, replete with licenses of registration recognizing shamans' status as healers. While most Tuvan ceremonies are held after dark, reflecting the years of persecution (as well as the most propitious time to call the spirits), a new generation of shamans following in the footsteps of the

formerly repressed and forgotten shaman leaders is evolving and invoking the old traditions. Moreover, they are incorporating new ideas and practices, some Neo-shamanic in nature, seeking to create a meaningful practice for the new post-Soviet period.

UYGHUR HEALERS (CHINA)

The healing practices of the modern Uyghur constitute a syncretic complex in which pre-Islamic elements and possibly the influence of other traditions are inextricably intertwined. Uyghur healing practices focus on spirit possession and display some common features with related practices elsewhere that can be associated with shamanism. The "old Uyghurs," ancestral people of the modern Uyghurs, historically originated from Mongolia, where shamanism flourished. Thus, the Uyghurs, like other Turkic groups in Central Asia, share many cultural elements with Mongolians, including elements of ancient shamanistic beliefs and practices, although such roots are not always explicitly recognized as such in the Islamic culture.

Background

The Uyghur are an officially recognized minority concentrated in the Xinjiang Uyghur Autonomous Region in the northwestern corner of the People's Republic of China. They speak a Turkic language and profess Sunni Islam. With approximately eight million people, the Uyghur of Xinjiang still constitute the majority population within the region, despite a recently accelerated influx of Han Chinese settlers and migrant laborers. In addition to the Uyghur and the Chinese, by far the largest groups, Xinjiang has eleven other ethnic groups, most of them Muslims. The term *Uyghur* was adopted as an ethnonym only in the first half of the twentieth century. It was first applied to Turkic-speaking nomadic groups that, having lost their hegemony in their previous homeland to the Kirghiz in what is today Mongolia, moved to the south and southwest. One large group dispersed in the Turfan oasis, where it developed a flourishing sedentary economy and culture, which survived from the mid-ninth century to 1250, the date of the Mongol invasion. In the complicated process of their ethnogenesis, an Indo-European substratum, as well as various Turkic, Mongolian, Tibetan, and other elements, all played a part (Hoppe 1998).

The Question of Shamanism

Given the complex ethnogenesis of the modern Uyghur and the exposure of the inhabitants of

the region to so many religious influences, it would be especially unfortunate to approach shamanism here as an integral system, with its own cosmology, religious hierarchy, and practices. The shamanic nature of the beliefs of pre-Islamic Turkic groups has been well researched, but the long history of Islamization, together with the lack of any indigenous conceptualization by the Uyghurs, renders the use of the term *shamanism* questionable. What some scholars (Basilov 1992, Du 1995, Garrone 2000) consider shamanism may be better described in the Uyghur case as a set of healing methods, methods that have been thoroughly integrated into local popular beliefs. Disapproved of by both representatives of the Islamic scriptural tradition (because "heretical") and by the socialist state and many Uyghur intellectuals (because "backward"), the healing ceremony and related rituals retain at least some of their force and, like other "traditional," popular practices, are regarded as indivisible from Islam and the Muslim way of life. These healing practices are predicated on the existence of a wide range of spirits, benevolent and harmful. Harmful spirits can cause illness, whereas benevolent spirits are summoned by the healer to help during the ceremony. Some healers classify harmful spirits according to their religious orientation and use different incantations to exorcise Muslim, Christian, Jewish, and "heretical" spirits. The protective spirits may be conceptualized as Islamic saints, especially the recognized patron saints of various professions.

Some scholars have argued that the survival of "shamanic" beliefs in Islamic Central Asia is due to its successful integration into Islam, more specifically Sufism (Basilov 1970, 1987, 1992; Garrone 2000). It is, however, misleading to regard shamanism as the backbone of a religious system while ignoring the centrality of what may be termed the domestic cult (Bellér-Hann 2001a; DeWeese 1994). The focus of the domestic cult is the spirits of dead relatives and close acquaintances, parents, grandparents, and others whom one knew during one's lifetime. Rituals surrounding death as well as other official and unofficial Islamic rituals preserve aspects of the veneration of the dead (rather than a true ancestor cult). They focus on ensuring their goodwill and thereby enlisting their assistance for the well-being and prosperity of the living. Central to this cult is the nourishment of the spirits with the fragrance of incense, the smell produced by hot oil in which ceremonial cakes are fried, and the accompanying praying. Spirits remembered through praying and sacrifice will assist their family, while neglected spirits may bring bad luck.

Healing Rituals

Healing rituals in this region have been sufficiently documented in detail only from the second half of the nineteenth century. Since little is known about recent practice, the past tense has been used in what follows; though the tradition is still alive, it has clearly changed to some extent. Indigenous sources and the observations of foreigners agreed that, before the ritual could begin, either the healer *(baxši/pirixon)* or another religious specialist, the diviner *(rämmal),* had to be consulted to make a diagnosis.

Although healers dealt with both physiological and social problems (love affairs, jealousy, finding lost objects), most cases seemed to concern people with physical and psychological symptoms. Sometimes the ritual was organized to ensure an easy delivery. Disease was generally conceptualized as inflicted by supernatural forces *(päri, jin, diwä, alwasti).* The exorcism ceremony aimed to persuade the harmful spirits to leave the body of the afflicted person and settle elsewhere. The transfer *(köçürüš)* of the demons to a specific place or to another living organism by threats or deception played a central role in the ceremony. The whole healing ritual was generally known either as "making the päri dance" *(päri oynatiš)* or simply "dance" *(oyun),* since the healer forces the evil spirits to dance and eventually abandon the patient's body.

Sources indicate that the ritual could last for several hours and might sometimes be repeated over several days. The most important elements were the fixing of a rope (*tuğ*) in the middle of a room in the sick person's house in a vertical position, from the ceiling to the ground. On top of it several kerchiefs were tied, and the patient was positioned at the bottom. Incense was burned, with which the healer fumigated the room as well as the patient's body and clothes. Tree branches (usually willow) were prepared to be used for hitting the patient. Candles were lit and sometimes placed in unleavened bread on the stomach or head of the patient. Singing and music (drums and stringed instruments) ac-

An elderly Uyghur shaman beating his drum. Turfan, Xinjiang, 2000. (Courtesy of Dilmurat Omar)

companied the healer's incantations, summoning helping spirits, and ordering the evil spirits to leave the sick body. This was achieved through repeated "dancing" sessions, during which the healer chased the patient around the tuğ, using a whip and a sable, sometimes the willow branches; sometimes the healer circled the recumbent patient, touching the patient with weapons, helped by the patient's spouse or by apprentices. Transferring the evil spirits elsewhere was accomplished by sacrificing an animal, often a chicken (sometimes a goat or a calf). The transfer was done by touching the dagger to the patient's aching body parts, and then to the chicken. Variations on this theme included beating the patient's body with the live chicken or with its lungs.

The ritual could include making the patient sweat, massaging the patient, or pressing a hot hoe against the patient's aching body parts. Spitting, blowing, and moving various objects (including the sacrificial animal) in a circle above the patient's head were also recurring elements. Fire as a means of purification was also important; dolls and hay that had been moved around the patient's head could be burned. Throughout the ritual, incantations that included the names of Islamic saints, other exorcism formulas, and Arabic prayers (Quranic verses, especially the *Fatiha* and the *Jin suräsi*) were recited. Many healers also possessed a small "manual" *(pirixon risaläsi)* with instructions concerning which prayers to use on different occasions. A full ceremony also included the preparation of sacrificial food, made of sweet fruit juices and other fragrant things, or alternatively of a spoonful of milk, the blood of the sacrificial animal, and some salt (in which case it was called blood sherbet). This mixture, known as the *çalxa qazan,* and several homemade dolls were taken to an abandoned place, an old mill, a tomb, the cemetery, an old tree, or where three roads met. Another formula was recited, in which the healer once again told the harmful spirits to leave the sick person's body, accept the sacrifice, and transfer themselves to the dolls and the abandoned place. According to the testimony of some magic formulas, the dolls were left to keep the spirits company. At this point the patient might be asked to repent his or her sins and to promise better moral behavior in the future.

The healer usually received a number of items used in the ritual as payment; these included the rope, the kerchiefs, the sacrificial animal, the ceremonial cakes fried in oil (the smell of which nourished the helping spirits), a set of clothes, and money. This ritual, however, was only one way of dealing with illness and other problems. Other specialists, such as the *daxan* or any self-appointed *mollah,* could be asked to recite ritual formulas and Quranic verses in the presence of the patient. These, however, did not make the spirits dance. Instead, these specialists "looked into water" (a common shamanistic practice of consulting the spirits by looking into water in a glass) and resorted primarily to prayers. Nevertheless, the underlying purpose of their activities was the same, exorcising the evil spirits. When other methods failed, the "spirits' meal" *(arwah aši)* was cooked, which included the preparation of a bowl of some cereal-based dough in the shape of lizards and frogs. The prepared dishes were partly consumed communally, and leftovers were taken in a bowl covered with a new scarf to a crossing and left there to be found by a stranger.

Healers

Healers could be either men or women, and they could learn their profession as apprentices, or their knowledge could be passed down within the family. Indications are that apprenticeship was often preceded by the healer having been "stolen" by the spirits, which manifested itself in a long and painful illness. Islamic credentials were an important part of most rituals, and many elements of the various rituals could be used by nonprofessionals, for example, by older women, as part of their domestic activities. No information remains about their ritual dress. It seems that the healer did not necessarily enter an altered state of consciousness, although some sources suggest that the substances used as incense could have an intoxicating effect.

In the reception of healing rituals, skepticism must always have played a part. S. E. Malov noted that, throughout the ritual, people laughed, made jokes and even rude remarks, and fell silent only when the healer was reciting an Islamic prayer (1918). The incantations used for addressing the harmful spirits describe them as beautiful creatures, and some show a close resemblance to love songs, which must also have lent the event a certain profane character.

The Present

Little knowledge of healing practices among the Uyghur of Xinjiang in the modern, socialist period is available, apart from the description of Du Shaoyuan (1995) and some general ethnographic accounts (Häbibulla 1993, 406–407; Raxman, Hämdulla, and Xus̓tar 1996, 172). The political climate in China still discourages "superstitious customs" and their investigation by scholars. In this atmosphere, a certain domestication and feminization of some communal activities may be observed (as in the case of the Barat ritual; see Bellér-Hann 2001a). Interviews with Uyghur refugees in Kazakstan and observation of local healers' practice indicate that a number of elements of the traditional healing ritual have been preserved, including the Islamic nature of the formulas and the importance of the sacrifice and fumigation; as in the homeland, these are creatively combined and constantly reworked (Bellér-Hann 2001b). Healing rituals among the Uyghur show a close resemblance to similar practices in neighboring Central Asian regions inhabited by Muslim groups (Basilov 1992; Garrone 2000).

UZBEK SHAMANISM

Shamanic practices still play an important role in the Republic of Uzbekistan. Uzbek minorities in neighboring countries also have healing practices, but no discussion of them is included here, since they show strong similarities to the practices of surrounding groups.

The preservation of shamanic practices in an Islamic form among the Uzbeks, the majority of whom are Sunni Muslims, is due, among other factors, to the ability of Islam to adapt to local conditions. In the consciousness of an average believer, shamanic beliefs manifest themselves as part of a complicated synthesis of pagan, pre-Islamic traditions and normative Islamic ideas. Another important factor is the strong spirit of monotheism, the austere simplicity of which may be judged as "insufficient" by ordinary people unfamiliar with the dogmas of Orthodox Islam. This second factor may also explain the popularity of Sufism and the complex ceremonies of the cult of saints. To regard shamanic practices in Central Asia merely as relics of the past is mistaken, because these practices have been thoroughly integrated into the contemporary belief system and zeitgeist (Basilov 1992).

Historically speaking, the shamanic practices of settled agriculturalists must have been considerably different from those with a nomadic past. By now these differences have almost disappeared, mostly due to large-scale adaptations to a settled way of life and to the homogenizing influence of Islam.

A special feature of modern Uzbek shamanism is that the majority of practitioners appear to be female. Orthodox Islamic practices do not cater sufficiently to the spiritual needs of individual believers, especially women, creating a gap that is conveniently filled by shamanic practices. This female domination is favored by the gendered division of social life among the Uzbeks; arguably, a feminization of such practices was also promoted by Soviet religious policy, which severely curbed Islamic practices in the public (male) domain but had little control over expressions of female religiosity in the domestic, private sphere. Economic conditions may have contributed to this feminization of shamanism: Throughout the Soviet as well as post-Soviet period, female employment in the public sector has lagged behind male employ-

ment, and women have often worked in badly paid jobs. For women, therefore, the practice of shamanism has been long regarded as an attractive additional income source.

The Uzbek language lacks a collective term corresponding to the concept of shamanism. But this does not mean that shamanism as defined by Vladimir Basilov (1992) does not exist in Uzbekistan. Rather, various words are used, which could be conceptually classified under the umbrella term *shamanism.* A female practitioner is known as *folbin* (from Arabic *falç* "fate," and Persian *bin-*, the root of the verb *didan*ç "to see"), *folchi* (Turkicized variant), in various Uzbek dialects *polbin, polmin, polwun,* and sometimes (Chorezm) *parkhon, parikhon* (literally a person in contact with a *Pari,* a beautiful helping spirit). A male shaman (a rare phenomenon) is known as *kushnoch* (magician), *qora-kushnoch* (practitioner of black magic), *bakhshi* (according to Bartold probably from Sanskrit *Bhikshu*) meaning wizard, fortune-teller.

These names suggest that the Uzbek shaman is a clairvoyant, a fortune-teller, a healer, or even a medicine man *(ṭabīb),* who perceives himself as a good Muslim, who has been selected by God (Allah, Khuda) to become a practitioner and, with God's help to serve her community. To achieve this end she uses her often unusual and unconventional abilities, acquired in various ways.

The old-fashioned assumption that a shaman is a person suffering from some kind of psychological disorder is not acceptable anymore. Neither can practitioners be regarded as suffering from inherited disease. Far more important is the role played by social context and tradition. Shamanism is transmitted through tradition, and it is essential to understand shamanism in the context of the specific traditions involved, because they determine how the group defines shamanism. In the Uzbek definition, psychological factors and physical suffering play a subordinate role.

There are three basic ways in which one can become a shaman. Shamanic abilities may run in the family, in which case it is perceived as inherited. Secondly, these may be acquired after one has been seriously ill; thirdly, one may become a shaman after experiencing an initiation dream. Nowadays the most common way is the first, acquisition of shamanic abilities through inheritance. Knowledge of shamanic practices are passed down from generation to generation, typically along the female line, by mature women with grown-up children. If a woman rejects taking on the role of shaman, it is assumed that she might become incurably ill. The illness, however, could be immediately cured, as soon as she consents to "shamanize." The second way involves the acquisition of special knowledge by becoming ill, a way that is shaped by the psychological profile of the person in question. Typically, a person may spend years suffering from an illness that cannot be cured by medical doctors and specialists. If in desperation at this point this person turns to a fortune-teller and healer, she may be advised to undergo a healing course (see below). If several such sessions bring no relief, the sick person may be advised to become a shaman herself, in order to be relieved from the suffering, even if her family has no history of shamanism. The third way occurs rarely. A person has a dream at night or a vision during the day in which she is ordered to assume the role of a shaman. The person who appears in this dream and makes this demand is typically an Islamic saint, a little-known local healer, or a deceased relative. The three possibilities may also appear in combination in the making of a shaman.

In whichever of these three ways a person has acquired the necessary knowledge, in order to become a shaman, she must receive a blessing, which consists of the recitation of the first verse of the Quran (the Fatiha, or Potakha). In different regions, depending on the degree of religiosity, the blessing may be given by a religious practitioner *(mullā),* a Sufi leader *(īšān),* or another shaman. In some regions of Uzbekistan, an animal sacrifice accompanies the blessing ceremony, during which, depending on the economic situation of the novice, a sheep, a goat, or a chicken may be ritually slaughtered. In rare cases the novice may decide that a blessing is not necessary because she has already received it in her dream by grabbing the hand of an authority figure.

Representatives of Orthodox Islam disapprove of shamanic practices and tend to discredit them, although in the first half of the twentieth century there were incidents in which some mullā made wide use of these practices in order to live up to their reputation of possessing supernatural powers. Attributed to

their unusually high level of piety, these supernatural powers enabled them to heal wounds and cure diseases through touching, praying, and other means.

Uzbek shamans perceive themselves primarily as healers and fortune-tellers, or seers. They work with the aid of helping spirits *(arwāḥ, arwāḥlar),* who are generally understood to be the spirits of deceased persons. The activities of the shaman may include the following:

With the help of God, through special ceremonies *(kochirma),* the shaman treats and heals various diseases (bodily and psychological disorders) and their causes. The disease may be attributed to the evil eye, to black magic caused by other shamans, or to spirit possession (that is, the sick person's body is seen as having been taken over by evil spirits).

The shaman may tell the fortune of the patient, thereby influencing it positively (*fol ochmoq*—fortune-telling).

The shaman may help her clients find lost objects (in rural areas also lost animals) (also *fol ochmoq*).

Through ritual action, the shaman may try to influence the emotions of another person toward her patient or toward someone else, for example, to evoke love toward the patient or indifference or hostility toward the patient's rival (based on the principle of *issiq-sowuq,* "warm and cold").

The healing *(kochirma)* involves the chasing away of evil spirits, or the averting of the evil eye or bewitchment caused by other shamans. This is achieved through various rituals, which have been thoroughly described and analyzed in the scholarly literature (Basilov 1992; Snesarev 1983).

The following is an example of a typical healing ritual, as observed by the author in contemporary Uzbekistan by female healers *(folbin)* in Tashkent and its environs. The patient is taken to the house of the folbin, who sits in a room specially used for healing. On a spread, which often simultaneously serves as a prayer rug, a drum is placed, together with a bowl half filled with water, a knife, a whip, and the Quran. The female shaman, wearing "Islamic" attire consisting of a white dress and headscarf, recites a prayer (usually the Fatiha and the Sura of the Jinn from the Quran) with closed eyes. Her attention is directed toward her inner self, while the patient listens in silence. The shaman stays in a sitting position, eyes still closed, and, still reciting Quranic verses, with the aid of her helping spirits she tries to identify the nature and cause of the illness. If it is caused by evil spirits, she starts to burp uncontrollably; the more she burps, the stronger the force of the evil spirits is. When she stops burping, the diagnosis is ready. With eyes still closed, she tells the patient which spirits are responsible for the sickness and promises to help the patient—with the support of God and her own helping spirits. She blows on him or her repeatedly *(kuf-suf),* while she is reciting prayers, and lifts a knife over the patient's head several times, as if cutting the invisible strings that connect the patient's soul to the evil spirits. Occasionally she may whip the patient's body lightly in order to chase away the evil spirits, shouting "Qoch! qoch!" (away, away). Throughout the ritual she repeatedly invokes the name of God, asking him to help the patient.

In the beginning of the ritual she may make use of the drum, which serves the purpose of providing a background rhythm. Sometimes she may get into an ecstatic state, but this is not an indispensable part of the ritual. The patient brings to the ritual a certain amount of tea and sugar, over which the shaman recites prayers and various magic formulas. The tea and sugar should then be gradually consumed by the patient, in order to strengthen him or her against the evil forces, the evil eye, and black magic.

Some male shamans were in the habit of wearing women's clothes during the ritual as late as the late 1960s. It remains uncertain whether this was a symbolic reversal of gender roles or a kind of transvestism. According to one theory, female helping spirits demand that the male shaman put women's clothes on, because then they feel more comfortable while temporarily taking possession of the shaman's body.

Uzbek shamanism has been primarily researched by Russian scholars (Basilov, Snesarev), though recently German researchers have increasingly worked in the area (Baldauf, Kleinmichel, Böhm), and as well as one French researcher (Garrone).

YELLOW SHAMANS (MONGOLIA)

The term *yellow shaman* (Mongolian: *sharin böö*) is a designation created by Mongolian scholars to identify those shamans who incorporate Buddhist rituals and beliefs into their shamanistic practices. In Mongolia, yellow signifies Buddhism, since most monks belong to the Yellow Hat school *(gelu'pa)* of Tibetan Buddhism, whose monks wear yellow hats during daily rituals and services. Shamans with little or no Buddhist influence have been designated by scholars "black shamans" *(kharin böö)* (Dulam 1992, 5), although indigenous people traditionally did not use such color codes for shamans. According to some Mongolian scholars (such as Otgony Purev and Sendenjav Dulam), yellow shamanism is practiced mainly by the Khalkh, the dominant ethnic group in Mongolia (Dulam 1992, 5). Yet the only evidence for such Khalkh shamans is contained in oral literature, which were recorded some decades ago. The shamanism of the Buryat, who live in Dornod province, eastern Mongolia, and in the Aga-Buryat Autonomous District, Russia, is also considered yellow shamanism by Dulam and others, because these Buryat shamans use Buddhist terminology and names of Buddhist gods in their ritual invocations and other shamanic rituals. Black shamanism is said to be practiced mainly by Darkhad, Uriankhai, and Tsaatan who live in Khövsgöl Province, northern Mongolia. Nevertheless it is questionable that such color-coding of shamans reflects the reality of shamanistic practice in Mongolia. For one thing, all Mongolian shamans incorporated Tibetan Buddhism to some degree. Even "black" shamans integrated Buddhist elements in their rituals, although they might not agree with Buddhist teachings and principles. Therefore these color categories of shamans are rather confusing to some scholars, although they do bring to the fore the complex nature of the interrelationship between Buddhism and shamanism among Mongolian peoples.

History of the Interaction between Shamanism and Buddhism in Mongolia

Buddhism began to penetrate the Mongolian plateau only after the sixteenth century, when the Mongolian emperor, Altan Khan, under the guidance of a Tibetan Buddhist, converted to Buddhism. Later, his grandson, Sumer tayiji, was declared a reincarnation of the Dalai Lama, strengthening the ties between Mongolian and Tibetan Buddhism (Heissig 1980). Under the support of the Qing dynasty, which had annexed Outer Mongolia (present-day Mongolia)

in 1691, Buddhism became the predominant religion throughout Mongolia, although the degree of acceptance varied among areas and ethnic groups. During the Qing dynasty, many shamans throughout Mongolia incorporated many Buddhist elements.

At the end of eighteenth century, however, hunting peoples in the northern part of Mongolia violently resisted the introduction of Buddhism and fought the Khalkh Mongols. The resistance by the minority hunting peoples against dominant Khalkh Mongols and their religion, Buddhism, resulted in the so-called black shamanism of the Darkhad peoples. The ethnic name Darkhad was created and given to the hunting peoples by the Buddhist Khalkh Mongols in the eighteenth century for administrative reasons under the Manchus (Shimamura 1998, 2000a).

In the early twentieth century, the People's Republic of Mongolia was established under the auspices of the Soviet Union. Under the Communist regime, any kind of religious practice, including yellow shamanism, was prohibited in Mongolia. Yet both Buddhism and shamanism began to revive and flourish when Communism officially ended in Mongolia in 1991.

The Birth of *Yellow Shamans*

Although the syncretism between shamanism and Buddhism had been referred to by many scholars, the term *yellow shaman* was first used by Sendenjav Dulam in 1992. This term has been borrowed by Otgony Purev, who is considered to be a "shamanist fundamentalist." Purev, whose ethnic origin is Darkhad, is the most prominent advocate of the concept of yellow shamanism, as he believes that Darkhad shamanism is the authentic Mongolian shamanism, with a continuous tradition from the time of Genghis Khan. According to him, yellow shamans were those who abandoned the original traditions of Mongolian shamanism and practiced rituals with Lamaist attributes, including prayers to Buddhist deities. He cited as an example prayers to various Buddhist deities made by a shaman from Khövsgöl province, northern Mongolia, born in 1926, "who made his yellow shaman rituals on behalf of the Gombo and put Dalan Tavan Mahgal Burhans as the gods on his head, Ulaan Jamsran on his left, Lham on his right shoulders, and Manla on his forehead" (Purev 2002b, 72).

At a certain point, according to Purev, yellow shamanism took on the organizational structure of Lamaism and came to center on Dayan Deerh monastery in the Khövsgöl province. All Khalkh yellow shamans were subordinated to the lamas of this monastery. Shamans were authorized to practice following a special test administered by the monks. Once every three years they gathered there to pray and renew their *ongon* (ancestral spirits). The main temple of the Dayan Deerh monastery was built in 1860; it burned down and was rebuilt in 1922. Nearby was a cavern and another temple, the whole complex forming the Dayan Deerh (heaven), a symbol of solidarity between Lamaism and shamanism with its two pantheons of *burkhan* (Buddhist gods) and ongons (shamanic spirits). There were two versions of the prayers and hymns, one on behalf of Buddhist deities, the other for shamanic ongons. Yellow shamans were divided into two groups: learned and unlearned (Purev 2002b, 72–73).

Nevertheless, it is misleading to generalize about the shamanism of the Khalkh people from case studies in Khövsgöl province alone. Khövsgöl province is situated near the Russian border, where the minority hunting peoples live. (These hunting peoples include the Uriankhai and Darkhad.) Yellow shamanism did not exist anywhere else in Mongolia, and now the tradition of yellow shamanism has ceased even in that province. It seems much more probable that yellow shamanism in the province was a temporary phenomenon resulting from the tension between Buddhism and shamanism, a phenomenon that reflected the dominance of Buddhism over the shamanism of the hunting people in the region. Historically, the Manchus of the Qing dynasty (1644–1911) in China used Buddhism to colonize Mongolia centuries before the Russian dominance over the region in the early twentieth century. Thus complicated historical and sociopolitical elements influenced this religious syncretism, having to do with the relationship between the dominant religion of the majority (the Khalkh) and that of minority tribal groups in the border region. Soviet Communism suppressed and almost exterminated both religions, but now Shamanism and Buddhism are both enjoying a revival. The yellow shamanism of

the Khövsgöl province, however, did not revive even in the post-Communist era.

Buryat Yellow Shamanism

The Buryat have traditionally lived in the Lake Baikal area, which was originally the northern frontier of the Mongolian world. They were invaded and ruled by the Russian Empire from the late seventeenth century onward. Territorially separated from other lands of the Mongols, the eastern part of the Buryat, including people in the Aga steppe, accepted Buddhism in the late eighteenth century. It is not clear when the Buryat acquired a Mongolian identity; it is probable, however, that they accepted Buddhism in the process of recognizing themselves as Mongols. There has been debate among scholars (Jukovskaya 1965, 1969; Klements 1910) with regard to the syncretism of Buryat shamanism and Buddhism.

In the nineteenth century, there were so-called black and white shamans among the Buryat who lived in the west; these shamans were quite different from today's shamans in Dornod province. According to Matvei Nikolaevich Khangalov and Nikolai Nikolaevich Agapitov, the white shaman appealed to deities for blessings, to give people happiness. Black shamans used evil deities to trouble people and cause misfortune (Agapitov and Khangalov 1883, 46). However that may be, the current practice of shamanism of the Buryat in Dornod no longer has such a simple dualism of black as evil and white as good. The Buryat in Dornod province do still describe themselves as having two different kinds of shaman, whom they call white and black, but the shamans who fall into these categories do not fit the descriptions found in the literature (Shimamura 2000b).

Contemporary black shamans appeal to their ancestral sprits (ongon) while drumming in a trance. They worship traditional deities, including the thirteen *oikony noyod* (the Thirteen Lords of Oihon [Ol'khon] Island in Lake Baikal) and other important deities such as Manjilai Tenger, Abagaldai, and Khoimoryn Khögshin. Black shamans are called *khar talynkh* (the blacks), or a black shaman may be simply *böö* (male shaman) or *udgan* (female shaman). Their main work is to connect people to ongon. Contemporary white shamans worship some Buddhist deities and cure people with "magically oriented" massage or bonesetting. These white shamans are called *sagaanii talynkh* (whites) or *bariash* (masters of massage and bonesetting). White shamans recite the Buddhist mantra *om mani padme hum* and use some Lamaist accoutrements when performing healing rituals. On the other hand, they wear shamans' headdresses and costumes that are almost identical to those of black shamans. The deities that the white shamans worship, Sagaan ubgen (White Old Man) and Burkhan garbal (Ancestor of Buddhism), are not found in the pantheon of Tibetan Buddhism. The former is a Buddhist deity who originated in Mongolia, and the latter a Buddhist deity created by the Buryat in the context of their shamanism.

There are no böö who work only as black shamans; all black shamans also hold the white position. Some böös explain that it is dangerous to become a black shaman without also holding a white position. Such black shamans are *khar sagaan kavsarsan* (sandwiched between black and white), a designation that might represent the dual identity of the Buryat as refugees in Mongolia. On the other hand, most bariashes (bonesetters) never hold the black position and generally do not enter a trance when performing rituals.

One reason for the fusion of black and white is related to the multilayered identity of the Buryat, created by their complicated history. At the beginning of the twentieth century, some Buryat escaped from the Aga Steppe of Russian Siberia to Dornod province of Mongolia to extricate themselves from the chaotic situation of the Russian Revolution. The Khalkh-Mongols purged the Buryat in the late 1930s, on the grounds that they were either remnants of the Russian White Army or Japanese spies. According to statistical surveys that had been taken by Imperial Russia in 1897, most Buryat in Trans-Baikalia (east of Lake Baikal) at the end of the nineteenth century were Buddhists (Mikhailov 1987, 198). This suggests that the shape of contemporary Buryat shamanism in Dornod was formulated only after the fall of Communism in 1991. Hence, what scholars have called Buryat yellow shamanism may have developed in the historical process of mixture and vacillation between identifying as Mongol (white, or Buddhist) or Buryat (black, or shamanist).

Overview

KOREA AND JAPAN

Geography and Language

The Korean peninsula separates the Yellow Sea in the west from the Eastern (Japan) Sea in the east. In the north, toward its powerful and vast neighbor China, the rivers Yalu and Tumen form a natural border. The eastern coast is lined by mountain ranges that fall steeply into the sea, but their western slopes open into narrow alluvial plains. Most of the peninsula is mountainous with only little space for arable land. In this respect it resembles Japan, but Japan is an archipelago that consists mainly of four major islands (Hokkaido, Honshu, Shikoku, and Kyushu), and the island group of the Ryukyus (Okinawa and others).

Linguistic evidence suggests a high degree of homogeneity of the Korean population as well as certain affinities with the Japanese. Both Korean and Japanese belong to the group of Altaic languages, together with, for example, Manchu and Tungusic languages. Although the grammatical structure of Korean and Japanese are quite similar, their phonology differs significantly. One factor that helped to separate Japanese from Korean in prehistoric times is probably the influence of Austronesian languages on the first. Chinese, on the other hand, was important for both languages in providing a writing system, though its influence on the spoken language remained rather limited because it was primarily used as a means for scholarly and literary expression by the intelligentsia.

In Japan, the Ryukyuan language is markedly different from the language spoken on the main islands, and Ainu, of which only remnants are left, is a different language again, but its linguistic situation is still not definitely decided. Today efforts are being made to revive Ainu as a spoken language. Although the linguistic landscape of Japan and Korea still leaves many problems unsolved, it suggests a significant relationship between the two countries. Other relationships are of a historical or cultural kind, yet none of these relationships have hindered the individual development of each area.

Historical Overview

Its immediate neighborhood to China and the continent shaped much of the Korean peninsula's history. The early settlers were probably of Manchu or Tungusic origin, but after about the fifth century B.C.E., the peninsula's culture and history came under Chinese influence for centuries. Korea was, however, never simply a minor replica of China; it adapted features of Chinese culture to respond to its own needs. For Japan, too, China was a source of political and cultural inspiration, but with the exception of the failed Mongol attempts at invasion of 1274 C.E. and 1281 C.E., China did not pose a physical threat to Japan's sovereignty or culture. Much of China's influence was mediated by Korea.

During the first century B.C.E. three kingdoms emerged on the Korean peninsula: Koguryo, Paekche, and Silla. By the seventh century Silla succeeded in bringing the peninsula under its rule

and introduced Buddhism to provide a backing for its rule. In the tenth century it was overcome in turn by Koryo, which introduced Confucianism for the sake of its ethical and practical principles. With the establishment of the Yi dynasty in 1392 C.E., which lasted until 1910, Confucianism finally became the dominant doctrine of the ruling classes, while Buddhism greatly declined.

Shamanism was most probably already an important part of the spiritual culture of the early inhabitants. Tangun, the mythic founder of the country, was believed to have been a shaman. Because of their tree-shaped decorations, crowns found in the tombs of early Silla in Kyongju suggest that the rulers of the time were shamans. Under the influence of Buddhism and Confucianism, however, shamanism's power gradually declined, though it remained an important factor in the beliefs of the population. In the course of its history shamanism became much refined in comparison with its original northern form and developed impressive artistic features.

According to Japanese mythology and Chinese chronicles of the late third century about Japan, there were shamans among Japan's early rulers, but it is difficult to confirm these reports. Where shamans are mentioned in Japanese documents, they appear to be common people. The historical development seems to have been similar to that on the Korean peninsula: After the introduction of Buddhism and Confucianism in the late sixth and early seventh centuries shamanism survived mainly among the common people. As far as their activities can be documented, shamans functioned at community rituals or performed rites for individual clients, but their position was often precarious in the eyes of the authorities and the representatives of official religion. Nevertheless, around the beginning of the nineteenth century shamanic personalities began to emerge who won a great following and became founders and leaders of new religions such as Tenrikyō or Ōmotokyō.

The performances of Korean and Japanese shamans are strikingly different. Ritual performances of Korean shamans are often dramatic and highly artistic events combining dances, songs, music, and colorful dresses. In contrast, the performances of Japanese shamans are mostly subdued, if not extremely simple, though they may cause strong emotional reactions. More important, however, are certain similarities between Korean and Japanese shamans. In both areas shamans were able to survive, at times even under strained relations with the official religions, because they responded to needs of the population not cared for by the official religions, especially the need to care for spirits and to control their activities. Furthermore, whereas official society was mainly managed by males, shamanism offered a means for women to express their world. This may explain why the majority of shamans in both areas are women. Finally, and most important, the dominant experience of shamans in both Korea and Japan is possession. A shaman may become a divine spirit, or a spirit may speak through her, but only rarely, if ever, does she experience soul flight to the other world.

Korean Shamans

Today it is nearly impossible to know with certainty about the shamans in the northern part of the Korean peninsula. Many of the shamans who had practiced there, displaced by politics and war, have found refuge in the south. It seems reasonable, therefore, to surmise that shamans in North Korea were (and perhaps are) of much the same type as those in the northern and central areas of South Korea. And since, in the northeast of their language area, speakers of Korean are neighbors of Manchu, they may also share in the tradition of Manchu shamanism. The following brief overview considers only the situation in the southern half of the peninsula; for more details see the entry "Korean Shamanism."

There are several terms for shaman in Korean, the most common being *mudang.* In its strict sense it designates a female shaman; a male shaman is called *paksu.* That *mudang* is used as a common term may reflect the fact that the majority of shamans are women. In a different sense, *mudang* is the term for a shaman by divine and individual calling, a type found in many areas on the peninsula, but characteristically in the northern and central regions. Shamans on Cheju Island contrast sharply with this type; there the office of a shaman, a *shimban,* is inherited within certain lineages and is not a matter of divine election, as noted in the entry "Cheju-do Island Shamanism." A similar type of hereditary shaman, known as a *tangol,* is encountered in the southern re-

gions of the peninsula. Hereditary shamans, especially the shimban of Cheju Island, cater to a particular village and its shrine, whereas a mudang gathers a group of personal followers.

The rituals of Korean shamans are rich in paraphernalia, dances, and dramatic performances. Rather than being solemn acts, they are often humorous, and generally both shamans and clients display a practical attitude. During her spirited performances, a mudang may become the deity that possesses her, whereas a shimban or tangol primarily pronounces a deity's message.

Japanese Shamans

Among Japanese shamans, truly dramatic performances are rather rare, although music may be an important part of a performance, as noted in the entries "Japanese Shamanic Music" and "Okinawan Shamans and Priestesses." In some cases, especially when incarnating a deity, the shaman may put on a special dress, but more often rites are performed in almost everyday attire.

The general technical term for Japanese shamans is *miko.* In ordinary parlance today, however, a miko is a young woman serving at a Shinto sanctuary without being a shaman. Persons who claim some direct relation with spirits are better known among the populace by local terms. Some of these, such as *yuta, itako,* and *gomiso,* have come to be used as technical terms for certain types of shamans. Although a special relationship with some spirit is the hallmark of all shamans, some types can be established by considering the way this relationship was originally established. More details can be found in the entry "Japanese Shamanism."

Basically there are two ways that somebody may become a shaman: either as a result of ascetic training or by divine calling. In the first case, the future shaman undergoes ascetic training either by his own will or by the will of relatives. In this manner mountain ascetics, called *yamabushi,* undergo austerities in order to acquire magic power over spirits. More details can be found in the entry "Mountain Priests—Shugendō (Japan)." The blind female shaman, *itako,* also undergoes a long ascetic training, at the end of which she meets he divine tutelary spirit who will assist her in her rituals, especially when she calls forth the spirits of dead persons. This kind of shaman usually does not experience an initiatory illness. The itako even shows a worldly attitude toward her activities, to which she refers as "business" *(shōbai).* In most cases she was compelled to become an itako because it is one of the few professions open to blind women. The entry "Tsugaru Shamanism" contains more details about a special area of northern Japan in which itako play a major role.

Initiatory illness is characteristically the first sign of the second way to become a shaman, as it indicates a divine calling. Once a person has acknowledged an illness as spirit induced, the next step is to engage in ascetic exercises until the spirit reveals its identity. Others may suddenly be possessed by their future helping spirit, and only later learn how to control their relationship. The yuta of Okinawa, about whom there is more in the entry "Okinawan Shamans and Priestesses," and the *kamisama* of Tsugaru as well as the gomiso, as these shamans may be called in other areas of northern Japan, are of the same kind. Among the Ainu of the far north of Japan, both the way of becoming a shaman and the terms used are so different from the rest of Japan that some have seen the elements of Eurasian shamanism as most significant here, as well as in Tsugaru. It was a rich tradition, as the entry "Ainu Shamanism" makes clear.

Two other factors are noteworthy for Japanese shamans. The first is geographical distribution. Shamans by divine calling may show local characteristics, but they can still be found throughout the country. The same may be said of the yamabushi, although, in practice, they form groups centered on a particular sacred mountain that is the place of their ascetic exercises. The itako, on the other hand, do represent a local type, since they are mainly found in northern Japan. The second factor is the role of mountains as the realm where divine spirits can be met. At a sacred mountain yamabushi acquire the power to handle spirits. Many future shamans, afflicted by an initiatory illness, go to a sacred mountain to pursue ascetic training, such as standing under waterfalls. As a result they encounter there the spirit that is the source of their illness.

Peter Knecht

AINU SHAMANISM (JAPAN)

Shamanism was at the core of the culture of the ancient Ainu of northern Japan. Both male and female shamans practiced, and numerous shamanic ceremonies and festivals were held throughout the year. Before traditional Ainu shamanism went into a decline after the eighteenth century, Ainu society was governed by a developed theocracy, which functioned through elaborate rituals, grounded in a complex belief system. In those days, shamans, especially male shamans, had political power as chiefs, and even led military forces in times of war. Over time a gender-specific division of labor developed: Male ceremonial masters conducted ceremonies and sacrifices, and female shamans managed practical dealings with the spirits. Shamans cured the sick through séances and traditional medicine, performed the roles of various deities in shamanic dramas, and gave prophecies while "possessed." Various rituals of Ainu justice, such as ordeal by hot water or burned rock, may have originated in shamanic practice. Ainu shamans, especially in Sakhalin, are also known to have performed magic tricks such as rope and/or net escapes (Chiri 1973b). Ainu shamanism as a whole is believed to have had deep historical roots and pluralistic origins, and to have gone through several transformations. The discussion on Ainu shamanism in this entry will focus on the Hokkaidō Ainu, with some reference to the Sakhalin Ainu and other related traditional peoples.

Geographical and Historical Background

The Ainu, a name that means *human beings* in the Ainu language, are at present the largest indigenous population of northern Japan officially recognized by the Japanese government. They are divided between Russia and Japan, and perhaps beyond, as the Ainu traditionally traveled great distances to trade in all directions. Although their population is difficult to estimate in the absence of full-scale census, especially given the historical process of assimilation, in the island of Hokkaidō alone it is believed to be considerably higher than 25,000, which is the number of Ainu associated with the largest Ainu organization, the Hokkaidō Ainu Association.

The Ainu language is distinct from modern Japanese, though, like many other languages of the Far Eastern region, including Japanese and Korean, its origin is unknown (Hokkaidō Ainu Culture Research Centre 1996, 2). However, Chiri Mashiho, a native Ainu linguist, has reported that the Ainu language exhibits vowel harmony, which might indicate a link to the Ural-Altaic language family (Chiri 1973d, 201–225). Ainu research has suffered from the lack of an interdisciplinary, international, collaborative framework and the lack of support for a native research initiative, and it is hoped that more knowledge will be gained about the Ainu and their language when such collaboration becomes less restricted.

The Ainu have a strong link to the original inhabitants of the Japanese archipelago, commonly known as the Jōmon population, who migrated there over ten thousand years ago after the Ice Age. Some of these populations developed large-scale sedentary communities in the northern part of the archipelago, which continued until the effect of migration and influence from Asian mainland became dominant there, beginning about 1,200 years ago. In recent years, however, cultural continuity from the Jōmon period has been stressed not only among the indigenous population in Hokkaidō, but also in the northern part of Honshū.

Three wars were fought in Hokkaidō that are sometimes considered central to the conflict between the Ainu and the Japanese: the War of Koshamain in 1457, the War of Shakushain in 1669, and the War of Kunasir-menashi in 1789. In earlier times, in northern Honshū, the main island of Japan, indigenous leaders bearing Ainu names, Aterui (Atoroi) and More (Morai), were executed by the Imperial government based in Kyōto in 802 C.E. Subsequently, much of the northern part of Honshū fell under Japanese rule; an exception was its north-

ernmost region, Tsugaru, while the northern island of Hokkaidō remained isolated from Japanese control for centuries.

Ainu lands and the Ainu people were exploited during the Shogunate period (1603–1867), and the feudal Japanese government gradually extended its control over the island of Hokkaidō. Conflict over control of trade coupled with the need for political control in the face of Russian threat, and the Japanese government annexed the island of Hokkaidō by 1807. As for the Ainu in Tsugaru, they were forced to participate in the Japanese family registry as "Japanese" by 1806 (Tanaka 2000).

At the Meiji Restoration, the "new" Japan established a family registration system where commoners in general became *heimin* (ordinary people), but social outcast groups and aboriginal peoples were sorted into special subclasses. The Ainu in Hokkaido were thus dubbed *kyūdojin,* "former aboriginal people." In 1898, the Hokkaido Former Aborigines Protection Act was put into force, and this discriminatory law lasted until 1997. In spite of the pressure of assimilation the Ainu and their culture continued in the 1920s and 1930s. A movement was started by the Ainu for self-improvement, resulting in the establishment of the Hokkaidō Ainu Association in 1946. The last three decades of the twentieth century saw an Ainu-led cultural restoration movement, along with renewed interest by the Ainu in asserting their aboriginal rights (Ainu Association of Hokkaidō n. d.; Siddle 1999).

Ainu place names, evidence of continued Ainu settlement, are densely found throughout Hokkaidō and northern Honshū, Sakhalin, and Kuriles. Nevertheless, within these traditional territories Ainu culture and language differ significantly (Hokkaidō Ainu Culture Research Centre 1996, 10–11; for Ainu place names in northern Honshū, see Yamada 1993). Some regions such as Tsugaru of northern Honshū, moreover, have developed a hybrid culture and a distinct indigenous identity, due to centuries of assimilation and contact with the outsiders (Tanaka 2000).

Ainu Cosmology

The Ainu sacred verses, *kamuy yukar,* contain expressions indicating the intimacy of the Ainu with the sky world, a sense of freedom from gravity, and the deep conviction that their true home is somewhere in the heavens among the stars. This sense of freedom may stem from the fact that the Ainu were once sailors and sea traders, not limited by the boundaries of the land. This seagoing outlook is ingrained in their traditional life. The name they give their hearth is related to the sea: The wooden frame around it, which is used for placing food from the large pot over the fire at the center, is called *i-nun-pe,* which means "to fish." In epic poetry, the ashes in the hearth are often compared to seawater (Chiri 1973b, 41).

The Ainu believe that the sun, moon, and stars are ships, traveling in the sky. The Ainu cradle, *shinta,* is also seen as a ship: One lullaby contains the verse "the sleeping ship has come down, *ho-chip, ho-chip*"; the refrain *ho-chip* is derived from *ho-chipo,* "row the boat!" The immediate presence of the stars and the sky, a kind of cosmic awareness, permeates traditional Ainu life, just as the sea currents and river streams do.

The *shinta* is also the spaceship of the gods who visit the Ainu land from the Upper World. In a sacred poem called Shower of Embers, a deity, son of the thunder god, or the dragon god, in high heaven, descends to the land of human beings riding a shinta. When he finds himself unwelcome in an Ainu village, he hits the "head" and "tail" of the shinta, and pulls its ropes fore and aft, sending down showers of rocks and burning embers, and eventually destroying the whole village (Kayano 1977, 264–266).

The sacred sites in different regions, where the divine culture heroes of various groups of Ainu descended from the sky or ascended back to it, also reflect the complex of beliefs about the sky. In the Nibutani area for instance, there is a sacred mountain that is believed to be the place of descent of the divine culture hero Okikurumi.

Another important set of beliefs concerns the origin of the Ainu people: They are the children of the fire goddess, *chi-kisa-ni-kamuy,* "we make firewood (witch elm)." The fire goddess is the closest of the *kamuy,* "spirits," to the Ainu, and she was the first kamuy who descended from the sky world to the human world when that world was created. The Ainu offer prayers to the fire first in all ceremonies and rituals, because they believe that the fire goddess can convey a human message to other deities, even

when the human power of expression is inadequate. Drinking water is also believed to be the breast milk of the fire goddess. Yet no matter how close she is to her worshippers, the fire goddess is among the most sacred of the kamuy. She is the goddess of light—the source of life—in charge of not only burning fire but also the warm rays of the sun. She is thus depicted as possessing a golden fan with burning sunlight on one side and the burning flames of fire on the other (Haginaka 1980, 25–28; Chiri 1973e, 364–365).

The Tusukur: The Ainu Spirit Medium

Ainu shamanism may have developed from an earlier system, in which shamans who specialized in soul flight coexisted with those who specialized in spirit possession, and the two kinds of shaman complemented each other, but in more recent times female trance mediums, commonly known to the Ainu as *tusukur,* have become the norm. *Tusu* means "shamanic practice of possession," and *kur* is an honorific meaning "person"; hence *tusukur* means "honorable person who conducts shamanic practices" (Irimoto 1997, 30). The tusukur diagnoses and heals diseases through trance possession, during which kamuy and ancestral souls can reside in her, and she possesses knowledge of the spirit world, taboos, and medicinal herbs. Some of them are also clairvoyants who search for lost things, fortune-tellers who interpret dreams, and midwives. Based on the documentation on Hokkaidō Ainu shamans, it seems that their role in modern times has been more or less confined to pragmatic issues such as curing the sick or locating lost things, and has not involved public performance or ceremonial matters.

Tanaka (2000) points out the problems inherent in the study of present-day Hokkaidō Ainu culture due to internal conflicts, fragmentation of traditional knowledge, stereotyping, and gender inequity. It has come to be widely believed among the Hokkaidō Ainu that it is inappropriate for Ainu women to pray to kamuy, and if they wish to do so they must ask Ainu men. Moreover, the Ainu, as a result of long suppression of their spiritual practices and beliefs, tend to deny the value of their shamanic heritage and the existence of living shamanic practitioners. Those who have studied the history of Ainu shamanism have concluded that the present male-dominated ceremonial and ritual practices of the Hokkaidō Ainu are a result of coming into contact with the feudal Japanese, who came under the influence of Confucianism and its patrilineal system during the Edo period (1603–1867). Despite that influence, a great Ainu female shaman like the late Aiko Aoki of Nibutani was especially revered by her own people because she preserved within herself an essence of Ainu heritage that could be neither commodified nor exhibited in a material way.

Ainu Terms for the Shaman

The Ainu may have borrowed the term *saman* directly from their northern neighbors, the Tungus-speaking peoples in Siberia. However, the word took on a different meaning among the Ainu. *Yai-sama,* for example, is a spontaneous oral poetry meaning "I-*saman* (I-sing-myself)." Again, the Ainu trial by ordeal of boiling water is called *saimon,* indicative of a link with Siberian shamanism. The otter is called *e-shaman* in Ainu, and Chiri suspects a link between the animal and shamanic divination techniques using otter skulls, called *e-shaman-ki* (Chiri 1973e).

Among the Ainu, persons with spiritual abilities are named according to the abilities they display. According to Nagai Hiroshi, the Nibutani Ainu recognize several varieties of spiritual ability: *tusu* (trance possession), *u-e-inkar* (clairvoyance), *u-e-potar* (incantation and curse), *tek-e-inu* (the healing hand), and *imu* (a kind of spontaneous trance). Of these, tusu and u-e-inkar are key attributes of a shaman, and therefore persons with these abilities are called *tusukur* and *ueinkarkur,* where the honorific *kur* means "person," as already noted. In practice a person may have more than one shamanic ability, as was the case with Aiko Aoki, who had all of the abilities listed above. (For documentation on Aiko Aoki's work, see Nagai 1983).

In short, when we ask what the Ainu term for a shaman is, we find something analogous to the Inuit terminology for snow: a paucity of general, overall terms, but a rich selection of more specialized vocabulary. Yet that does not mean that the Ainu failed to distinguish those particularly gifted and skilled in shamanic talents from the rest. It is simply that the people

most vital to the shamanic heritage are not necessarily given the most obvious label for a shaman, tusukur. Midwives, *i-ko-inkar-kur,* literally "it-that which-see-persons," played a crucial role in transmitting the spiritual and medico-physiological wisdom and skills of the Ainu people. Aoki Aiko of Nibutani was an expert tusukur, ueinkarkur, and a fluent Ainu storyteller, but what made her truly professional was her training as a midwife. Under this category, Aiko was master of the highly esoteric aspects of Ainu traditional medicine, permeated with both spiritual learning and biological and medical knowledge, including knowledge of pharmaceutical and neurological science. While the term *ikoinkarkur* does not designate an overall shamanic category, in practice midwives have come to be the most important and loyal keepers of the sacred heritage of the Ainu (Nagai 1983, Tanaka 2000).

Initiation and Training

Traditionally, every extended family relied on a tusukur; every community recognized spiritual experts, including midwives. Even though the use of shamans is no longer widespread, scholars still have been able to gather evidence from the early twentieth century of what was and is involved in the initiation and training of those who become shamans. An initial illness, termed *spirit illness*, may appear in some cases when a person becomes a tusukur; spirit illnesses may also come at a later stage in one's shamanic career. A life crisis due to physical illness or some other misfortune often contributes to the development of shamanic power, regardless of age. In Aiko Aoki's case, after a cancer operation in her forties she became ueinkarkur (clairvoyant) and no longer needed to undergo possession by spirits. Equally important in the development of shamanic power is training in dream interpretation, which may also involve a gradual process of learning, beginning with discussion among family members about the meaning of particular dreams. Those skilled at interpreting dreams are also said to have special spirit helpers (Nagai 1983).

Initiation and training appear to be a gradual process of learning tasks and responsibilities one by one. Initiation may be marked by prayers offered by a male elder or a relative, but there can be more than one initiation, as there is more than one ability or skill to master. Although it was customary in the past to involve a male elder in the initiation of a novice shaman, today, due to the shortage of male elders capable of fulfilling this function, female shamans do initiate novices by themselves, in the presence of witnesses.

Dreams

The Ainu still consider dreams to be manifestation of the sacred. Having dreams is essential to figuring out the course of things in general, but especially so for matters concerning subsistence, such as hunting. Traditionally, when Ainu men went hunting, *matagi,* their activities were guided by dreams they had in the mountains. Dreams are often interpreted in discussion with people around, such as other hunters or family members. If one wishes to have a message delivered during one's sleep, one prays to deities before one goes to sleep, so that one can have a meaningful dream (Fujimura 1982, 100–102). Not all dreams are equally valid; many resemble individual hallucinations and fantasies. But some dreams carry messages, and some are even targeted at other people, or the community at large. The most memorable and impressive dreams are considered "true" dreams, dreams that carry an important message.

Regional Variation

It has been noted that there were major regional differences in the practice of shamans between Sakhalin and Hokkaidō. For one thing, the persistence of male shamans among the Sakhalin Ainu can be contrasted with the near-monopoly of women in Hokkaidō. Male Sakhalin Ainu shamans clearly showed the influence of Siberian shamanism, not only in their shamanic regalia, characteristically Siberian, but also in their practices and beliefs. Pilsudski described in 1905 how they healed diseases, protected against epidemics, restored good fortune in hunting, identified thieves, and predicted the fortune of a journey. Some shamans were said to be able to quiet storms and transform rough waves into wind, while others could control rain, thunder, and storms. In general, Sakhalin Ainu shamans seem to have retained a more individualistic and impressive display of shamanic ability in a much

less constrained way than has ever been ethnographically recorded of the Hokkaidō Ainu tusukur. Their style of performance was showy: They announced the arrival of helping spirits by imitating the roars and cries of wild animals, or the sound of trees in a storm. The shaman walked around the fire while praying and chanting, with rhythmical, quick steps, through the smoke and the scent from the fire, on which elm branches were placed (Ohnuki-Tierney 1974, 110–115; Pilsudski 1909).

The Role of Ritual

Traditional Ainu shamanism featured dramatic performances of sympathetic hunting and farming magic, rain and wind sacrifices, and other incantatory acts, accompanied by songs, dance, and music. The legacy of these dramatic performances can still be seen in the Ainu bear sacrifice, the *iyomante,* and the owl sacrifice. But in the past, similar ceremonies were done on a large scale for sea creatures of major significance such as whales, and even for dogs.

The contemporary Ainu iyomante involves capturing a cub, raising it in the village, and then killing it, thus sending it back to its spiritual home. In the past it was also a winter hunting ceremony conducted in the hunting ground after a successful hunting. The iyomante, literally "it-let go," used to include the wearing of the fresh bearskin by a young villager who reenacted the bear's behavior during the ritualized hunt. This bearskin dance was also commonly performed by the Matagi in northern Japan as part of their bear ceremony. Chiri speculated that this rather bizarre performance is a legacy of older, more fully dramatized forms depicted in sacred verses. During these performances shamans put on a mask and costume to disguise themselves as a bear and acted out, through dance and songs, the whole scenario of the bear ceremony, beginning with the bear coming out of its cave, wandering in the mountains where it is hunted by the hunter, and finally returning to the spirit world with gifts from humans (Chiri 1973b, 10–11).

Traditionally, personal rituals have been considered equally valuable. Few Ainu still offer rice and sake to the ancestral spirits whose presence was felt everywhere; in former times, however, carrying a sack full of rice and a small container of sake at all times was not peculiar to shamans but a practice of many ordinary women. This way of thanking the kamuy and maintaining a good relationship with them was as frequent and ordinary an activity as cooking and eating, since according to traditional Ainu belief one never ate alone: The belief was that even when food was only served to you alone, you were sharing it with the kamuy.

Imu

According to Chiri, the word *imu* is also found in the Giliyak language, in which it means "trance state." Chiri identified three uses of the word *imu* in Ainu (Chiri 1973g). First, *imu* is a broad designation for a reactive response, such as jumping when surprised at something, speaking nonsense words, or the nonsense words themselves. These nonsense expression bear no apparent logical connection to the immediate context or situation. They vary individually, yet tend to be a vulgar expression such as *heppe,* "sexual intercourse." These are manifestations of a light degree of imu.

The second usage of the term *imu,* common among medical researchers, designates a spontaneous "hysteric reaction" found specifically among the Ainu. This reactive hysteria can be divided into two types: imperative negativism and echolalia, or mirroring. Imperative negativism is active defiance of external stimuli, such as responding by saying the opposite, left as opposed to right for instance. Echolalia is a repetition of the words, mirroring a mimicry of the actions of the communication partner or object of attention. Chiri reported that among the Sakhalin Ainu, the latter type of imu was more common. Reported examples from Sakhalin include cases where a hunter catching a seal on the ice imitated its writhings, and a person observing an airplane in the sky imitated its flight.

The third type of imu, semantically the oldest, describes the jumping in ecstasy a shaman automatically performs when entering an altered state of consciousness. This type of imu may be observed both before and after a tusu session. Imu was considered by the Ainu to be possession by a spirit and was seen as dangerous unless ritually controlled. The "jump" may or may not be manifested physically, but is often a brief possession phenomenon, as was the case with Aiko Aoki. It made her respond to ques-

Ainu men capture a bear and then threaten it with bows and arrows as part of the Ainu bear ceremony, Hokkaido, Japan. (Hulton-Deutsch Collection/Corbis)

tions in an altered state of consciousness. Aiko's imu included what she herself called *sakibashiri no imu,* the forerunning imu: She would often answer questions yet to be delivered, or speak words someone else was about to say. In this sense, tusu and imu can be very close; yet imu does not seem to produce a complete sung-narrative form as tusu does (Nagai 1983).

A woman who experiences the brief trance-like state called imu is called an imu woman, *imu-huchi,* "snake-possessed" old woman. If someone becomes imu, as becoming subject to such states is called, she has two choices: to become a tusukur or remain as an imu; and if she chooses the latter, she may go insane. In order to avoid this danger, an imu woman may become tusukur by means of a formal ritual involving the advice of a mature tusukur, or she may request the elders to initiate her as a tusukur. Thus, while the phenomena of imu and tusu can be quite similar in some cases, the persons who are identified with these functions have very different roles: one, the tusukar, is a divine healer, and the other is, at best, a "comedian." Irimoto concluded that "Ainu society has a structure for integrating all individuals into society by offering a specific social role to the *imuhuchi* who fail to become *tusukur*" (Irimoto 1997, 35–36).

Shamanic Verses

Ainu oral literature can be classified into two main categories, prose and poetry. Of the two, only the poetic forms are called *yukar,* originally derived from *yuk-kar,* "to imitate the prey." According to Haginaka Mie (1980), *tusu-sinotca,* the shaman's song produced dur-

ing the tusu, was considered the general basis of Ainu yukar. These tusu-sinotca were originally spontaneously delivered prophecies or divinations for specific occasions, but some of them enjoyed broad circulation and further refinement over time and entered the repertoire of Ainu oral literature in various epic styles, as *oyna* or *kamuy yukar* (Chiri 1973c, 239, Haginaka 1980). *Yukar* are further divided into two categories, *kamuy-yukar,* sacred verses, and *yukar,* epic poetry. Our discussion here focuses on kamuy-yukar, the most ancient and ornate form of all Ainu oral literature, created and transmitted primarily by women, which uses classical Ainu vocabulary and phrases, *atomute-itak,* "decorative words" (Chiri 1973a, 164).

Kamuy yukar can be broadly subdivided into two types, kamuy-yukar and oyna. Thus, they are both first-person narratives sung with refrains known as *sake-he,* but they have major differences. While the pivotal characters of kamuy-yukar are natural deities—animals and natural forces such as fire, wind, and thunder—those of oyna are half-human and half-god, culture heroes of the Ainu whose names vary in different regions. Kamuy-yukar thus reflect the beliefs that beings and forces of nature are equal to humans and that the two are kin, at least to the extent that a totemic relation can exist between them; and that the deities manifest themselves in various forms to the eyes of humans, though in another world they take human shape. Oyna, however, reflects a more hierarchical structure within Ainu society, in which the influence of a powerful man, a shaman-chief, can determine the well-being of the clan society. Thus Chiri considered the kamuy-yukar type to have existed prior to the oyna, since the latter assumes human superiority over kamuy, culture over nature (Chiri 1973a, 156–157).

It is possible that the concept of oyna was introduced to the Ainu from their northern neighbors and came to acquire a different meaning among the Ainu. Corresponding to the Tungustic word *saman,* Yakut has *oyuna* (Eliade 1964, 4). If the term *oyna* comes from *oyuna,* that may explain why sacred verses in general are called *oyna* among the northern Ainu, including those in Sakhalin.

Oyna is moreover linked to the act of crying, which is seen as a divine phenomenon, as evidenced in such expressions as *cishi-oyna-kar,* "to cry to become *oyna*" and *cishi-kamuy-kar* "to cry to become a god." Female shamans may have specialized in crying to gain divine power, as some yukar depict: Princess Moisam in a Sakhalin Ainu poem entered the shamanic state of consciousness via crying; shaking her head and body as she cried, she began singing divine songs (Chiri 1973a, 162). This function has been preserved in funeral services, as crying women, *ray-cis-kar-a,* literally, "for death-cry-continue" (Hokkaidō History Museum 1973, 6).

Shamanic Performance, Dress, and Instruments

There are two kinds of traditional Ainu dance, both with magico-religious functions. The first is a large shamanic procession to scare away demons, and the second is a shaman's dance on ceremonial occasions. Contemporary Ainu dances such as the *niwen-apkas* (confrontation walk), *tap-kar* (foot dance), *horippa* (jump dance), and *rimse* (circle dance) are all derived from shamanic processions. These dances characteristically emphasize heavy steps or jumping, in order to ward off demons and get the attention of the spirit guides, in cases of individual duels, war, natural disasters, and accidental death or injury. Indeed, these processions and dances often accompany ritualized cries that appeal to deities, such as "Whooooy! Wooooooooy!" and characteristically employ gestures indicating confrontation and jumping movements. On the other hand, the *hetchiri* (bear dance) and other animal dances trace their origins to the shaman's dance. *Tonkippo-harae* and *arahukkun* are descended from incantatory drama: The former is an imitation of war, performed originally at the farewell feast in anticipation of success, and the second is a dance to exhaustion by two women, a mimicry of a duel to the death between two warriors (Chiri 1973c, 241–243, 1973f, 34–47).

These dances and shamanic performances traditionally used drums, *kaco,* though in the more recent past only the Sakhalin Ainu appear to have maintained these. The women who play drums are called *kaco-ta-mat,* and there is even a yukar with that title. Drums have been conspicuous by their absence among the Hokkaidō Ainu. However, the Hokkaidō Ainu do beat the wooden frame of the hearth with

sticks, *rep-ni,* when they sing yukar, and beat the *sintoko* (a large lacquered round container for sake) with their hands as women sing and dance. Sometimes, in both Sakhalin and Hokkaidō, men lie flat on their backs and cover their eyes with one hand, and beat their stomachs as they sing (Haginaka 1980, 75–76).

The *mukkuri* (or *muhkn* in Sakhalin), a mouth-harp, is a common shamanic instrument in Siberia, and the sound it produces has a modulated vibration, making it sound like a heartbeat, or spirit voices; mastery of the mukkuri is considered a major accomplishment. To this day, Ainu handle a mukkuri very carefully, in the belief that mistreating it will bring bad luck.

The *tonkori,* a large three- or five-stringed instrument, is said to be from the Sakhalin Ainu, and it too has shamanic origins; today, however, it is played only by a few. The Ainu have also enjoyed Russian string instruments such as the balalaika (Ohnuki-Tierney 1974, 50–51).

It appears that the traditional Ainu had a clear idea of the costume appropriate for a shaman, which included a sacred hat, sacred dress, and sacred gloves. This is indicated, for example, in the manner in which their shamans are depicted in sacred verses. Okikurumi, an Ainu culture hero, is half-human and half-god, and he can be identified as such by the way he dresses: He wears an *atushi,* a cloth made of elm bark fiber with flames along the hems, the collar, the cuffs, and the lower hem, as well as the hem of the hat and the scabbard of his sword. As indicated by the name Okikurumi, "the one with shining fringes," his dress was fire-rimmed and decorated with *sep-piranka,* beautiful metal ornaments (Chiri 1973a; Phillipi 1982, 388).

Ainu dress, decorated in spirals and wave-shapes with bright colors around the neck, at the wrists, at the back, and at the bottom, is said to reflect the belief that they are the children of the fire goddess, *chikisani-kamuy.* Just as was the case with the dress of Okikurumi, these designs represent the invisible fire and sparks that protect the Ainu who wear them. Ainu designs include eyes to signify life, in front of the headband, *matanpushi,* or on the back of their dresses.

The props for the shamanic performance include tobacco or smoke, sake, *iku-pasui* (prayer stick), *tuki* (sake-bowl), and fire. *Inaw* (shaved wood sticks) are also used.

Sake is an important element in all ceremonies for the Ainu. To this day the making of sake is the responsibility of Ainu women. Before rice became regularly accessible, the Ainu used coarser grains such as millet to make their wine. Although today women tend to be barred from the ceremonial space where men offer prayers to deities, their significance as the servers of the intoxicant, sake, signifies their earlier, more prominent role: The female shamans may have used sake to soften the minds of men who were feasting, since feasts usually involved some kind of political negotiation.

Although Ainu today offer inaw to altars rather than using them in shamanic performances, in the past, at least in some regions, they held inaw in their hands as they shamanized. An inaw might be held in a shaman's left hand in Hokkaidō, or as was reported of the Sakhalin Ainu, the shaman might hold the inaw in both hands and move them in the air (Pilsudski 1909).

There is a story that the first inaw were a pair, male and female, given from heaven to the Ainu (Nevski 1991, 169–178). Another theory (Chiri 1973b, 27) suggested that the inaw was originally a wooden stick, with a power animal such as the snake or the owl attached to it at the top, so that a shaman could become that animal. The stick later became shaved wood representing a particular animal, and even though the function is no longer remembered, it may be reflected in the existence of inaw with shavings resembling owl head feathers.

However, a contemporary Ainu shaman may not need any of these accoutrements, since possession may be spontaneous, or there may not be any trance possession at all if the female shaman is clairvoyant. It is a mistake to think that shamans must conduct a séance in order to deliver a divine message, or that their shamanizing must signify an absolute departure from the ordinary sequence of things. The full set of regalia and instruments are certainly not required in every case.

Contemporary Practices

A critical review of studies of Ainu shamans reveals the highly complex nature of their present existence and historical evolution. In reality, the classifications the contemporary Ainu themselves make about shamanic practices are far

from rigid, and their discourse about shamans tends to be guarded, cautious, and allusive. This is understandable and justifiable, given the socioeconomic circumstances they have been placed in by the Japanese rule.

A New Life in Art

Religious practices that continue to this day thus tend to be justified in association with public ceremonials such as the iyomante, while those who adhere to traditional "magical" beliefs and practices, especially females, appear to be ostracized within Ainu community. Many of the shamanic heritage and customs discussed above can be observed in museums and through public events, yet their association with shamanic beliefs and practices may only be implicit in the explanations given of them by the participants, if not overtly denied (Tanaka 2000).

The iyomante is rarely conducted today, and whenever it is performed, it is conducted in the village with a captured cub rather than at the hunting ground. It has also come to be held during the winter, though it was originally a sacrifice offered to the mountain god at the beginning of the winter, probably around the time of the winter solstice. The iyomante is, however, acquiring a new life on stage as a musical drama performed by an Ainu fusion music group, Moshiri, which has been influential in the Ainu ethnic revival. In fact, it is through neutral, artistic expressions such as dance, music, and storytelling, that the majority of contemporary Ainu may retain the most immediate access to the transformative, magical power that permeated and enriched the lives of their ancestors, however fragmented such knowledge and activities may have become.

CHEJU-DO ISLAND SHAMANISM (KOREA)

Cheju-do Island is a large volcanic island that consists of the crown, cape, and spurs of majestic Halla Mountain, whose peak is at the island's center at almost 6,400 feet above the surrounding seas. This 700-square-mile, oval-shaped island in the northern reaches of the East China Sea, stands upon a granite ridge that stretches some 80 miles southwest from the Korean peninsula. Cheju Islanders speak a distinctive dialect of Korean, hardly understandable to the mainland Koreans. Due to its geographical isolation, Cheju Island has kept its indigenous culture and shamanistic heritage alive to some extent, even into the twenty-first century. Originally Cheju Island was the Tamna Kingdom, which managed to maintain autonomy until the early twelfth century, when it was subjugated by the mainland state during the Koryo period. The Choson period (1392–1905) saw the thorough colonization of Cheju Island. It was under the banner of Confucianism that Choson legitimated the violent subordination of the Cheju Islanders. The magistrates of Cheju Island implemented a restructuring policy for Confucian reformation of indigenous customs and religion. They degraded local shamanism as the barbaric superstition of an unenlightened folk and demolished the shamanic shrines. In 1702, a newly appointed magistrate, Lee Hyongsang, burned down 129 shrines and banished over 400 shamans to the countryside, where they were forced to labor on farms. Shamanic practices were subjected to these repressive measures, which were continued during the Japanese colonial period and most recently in the Anti-Superstition Campaign in the 1970s. Even though the old practices did to some extent die out, they were never completely destroyed, and since 1980 they have been revived, as will be explained more fully at the end of this entry. Hence, this is not only a historical tradition, but is also ongoing.

The people of Cheju Island have long been engaged in a struggle to maintain their indigenous identity as powers from the peninsula have encroached upon the island. The shamanic belief in the deities of village shrines, *tang,* and their myths, *ponp'uri,* reveal typically the indigenous sense of cultural autonomy and historical independence. The indigenous people perceive Cheju Island as a single universe where gods and spirits dwell. The shamanic shrine, tang, is the center of the religious life in the villages. Thus, in the native term, shamanism is referred to as "the belief in the shrine." There are several shrines in a village. The central shrine is the shrine for "the lord of the original land" *(ponhyang),* who is worshipped as a mythic ruler over the village land, holding the register of the births and deaths of the village people. The rest of shrines

are built for the deities who help in activities such as farming, fishing, and animal husbandry that form the people's livelihood or who heal children's diseases. These shamanic deities of village shrines are usually related to each other as a mythical family. The village people call the shrine deities with reverence and awe by the name of ancestors, *chosang* and believe themselves to be their descendants, *chason.* The ancestor-descendant relationship between the central shrine deity and the villagers embodies the territorial bond of supernatural nationhood centering on the shrines. As the shrine myths are recited regularly at the shrine ceremonies by the shaman, *simbang,* who is appointed by the villagers, the Cheju people themselves reconstitute the cultural identity of the shrine deity as the lord of their own ancestral land.

Cheju Island's shamanic mythology is a unique phenomenon to the extent that it preserves the perfect epic structure, which appears rather rarely in the shamanism of the mainland (Cho 1997, 49). There are three types of shamanic myths: general myths regarding the genesis of the cosmos, the human fate of life and death, and the afterlife; myths of village shrine deities; and myths of clan ancestors. Among them, it is the myths of village shrine deities, *ponhyang ponp'uri,* that represent the indigenous conceptions of identity and history. There exist around 270 shamanic shrines and accompanying myths on Cheju Island (Hyon 1992). The shrine myths reveal the genealogical relationship among the shrine deities and also the spatial relationship among the shrines. Shrine deities are divided into three genealogies that depend on their birth origin: Grandmother Kim Paekchu and her sons, Halla Mountain gods who were born by themselves from caves in the mountains, and Seventh-day or Eighth-day Goddesses who became the wives of Grandmother Kim's sons or the wives of gods or mountain gods. The titles of these goddesses stem from the day in the month on which ritual offerings are made to them.

The common motives of ponhyang ponp'uri are concerned with the founding of a mythical family and its division over generations. The male deities, who represent the indigenous people, marry the female deities, who are portrayed as foreigners from the mainland. Their offspring deities are characterized as exiles who were abandoned at an early age by parent deities but later triumphantly returned home. The epic story ends with the death of the parent deities and the establishment of a new social order by the offspring deities. The epic fate of the protagonists becomes congruent with the historical identity of the audience Cheju people as *exiles* from the mainland of Korea.

In terms of historical context, the mythical family's division over generations reflects the spatial diffusion of villages and their shrines. The congruence of the genealogical and spatial relationships among the shamanic shrines and deities is well delineated in the case of the shamanic myths of the Songtang village shrines. The shrine deities of the Songtang are considered as the apical ancestors in the mythical genealogy in the northern region of Cheju Island. They constitute the mythical family of mother Kim Paekchu, father Sochonguk, and their son Songguksong. Kim Paekchu's 18 sons, 28 daughters, and 378 grandchildren became shrine deities all around the island. This gradually multiplying number of descendants attests to the mythical figurations of an ideal portrait of Cheju Island as a single-genealogy community.

Cheju people believe that although the world is divided into two realms, this world *(isung)* and the Otherworld *(chosung),* they are continually reflecting each other. Chosung is the place dead souls enter, regardless of their personal merits during their lifetime. If the spirit of the dead does not go easily into the Otherworld, it supposedly bothers the descendants by possessing them. Shamanic rituals such as *kwiyang puri* (releasing an exile) and *chilchim* (clearing the roads to chosung) help to send the wandering ghosts to the Otherworld safely. During these rituals, all the ancestral spirits within the past five generations of a patrilineal family are invited to receive greetings from their descendants. Even in the Otherworld, the ancestors of the patrilineal kinship group continue to live together, and so they are called the Village *(maul).* Often chosung is portrayed together with the Buddhist Lotus Paradise *(kugrak).* In the case of chosung, however, there is no merit judgment in contrast to the Buddhist Paradise. Perhaps "the High Village in the Otherworld," where the ancestors enjoy a better life than in this world, might be the closest notion to the Lotus Paradise.

There are two types of shamanic rituals, one type based on the belief in soul loss and the

other type based on the belief in the will of spiritual beings. Soul loss is possible, people believe, because a human has three souls *(nok).* The case of soul loss frequently happens to children younger than fifteen years. When a child is frightened often during sleep or falls down, one of its souls is supposedly lost. The shamanic rite for soul return *(nok durim)* is performed in order to bring the lost soul back. If the rite of soul return is not effective, the shaman diagnoses the case as an affliction of evil spirits and conducts the exorcism rite, *p'udasi,* or appeases them with the pig sacrifice and the patient's trance dance, *younggam nori.*

However, the performative features of the shamanic ritual are best expressed in the *kut* rites, which combine various artistic forms of myth recitation, dancing, and orchestral percussion music. The *kut* rite is based on the belief in the benevolence of deities and ancestral spirits. The shamanic deities and spirits are hierarchically ordered in a pantheon, which is called a ceremonial ladder *(jet'dari).* The ceremonial ladder ranges from the cosmic deities such as Jade Sky Emperor and Buddhist Child Birth Grandmother to the specific local deities such as shrine deities, tutelary deities of clan, and ancestral spirits. The cosmic hierarchy of deities and spirits is reenacted in the ritual performances. For a grand ritual *(kun kut),* the shaman sets up altar shelves, *tangk'ul,* where the deities and spirits descend. The shaman hangs four wooden altar shelves from the ceiling, one for each of the four directions, in the central performance floor. Each tangk'ul represents a subcosmic world of four groups of deities and spirits: gods of heaven, the ten kings of the Otherworld, house and village tutelary deities, and the ancestral spirits of the sponsoring family. The four altar shelves together constitute a miniature cosmos.

The kut rite starts with the preparation of offering tables and the setting up of a high pole, a four- to five-meter bamboo tree with a white flag at one end. This pole is connected to the offering table inside the house by a long white cloth. Through the pole and the cloth, the deities and spirits descend from heaven and take seats on the altar shelves. After this preparation is done, the ritual performance begins with the invocation rite, *ch'ogamche.* Once all the deities and spirits are seated at the altar shelves, a single rite is performed in sequel for each deity following the ceremonial ladder: the Buddhist Child Birth Grandmother *(puldo),* the Sun and Moon *(ilwol),* the First Lord (*chokong,* or the tutelary deities of shamanic career), the Second Lord (*eekong,* or the manager of the magical flower garden in the Buddhist Western Land), the Ten Kings of the Underworld *(siwang),* the Third Lord (*samkong,* or the deities of human destiny), the Deity of Farming *(sekyung),* the House Guard Deity *(munjon),* the Deity of Original Shrine *(ponhyang),* and the Village (maul, or the ancestral spirits). Each individual rite is organized by the combination of three performance genres: myth recitation *(ponp'uri),* greeting rite *(maji),* and theatrical entertainment *(nori).* In short, the kut rite is organized in a precise order: the shaman explains the origin of the deities, greets them by purifying their way and treating them with offerings, appeases their anger through entertainment in order to alleviate human misfortunes, and in the end, sends them back to their original places (Hyon 1980).

The Cheju shaman is a hereditary shaman and thus does not use altered states of consciousness or drugs for shamanic powers. One becomes a shaman, a simbang, by inheriting this career from parents or their close kinship groups. The heir of the simbang career usually experiences initiatory disease and dreams as the sign of succession. Upon succession, the simbang receives a set of three divinatory implements, *sam maengdu* (the Three Bright Stars), which consists of a rattle, a set of a bronze cup and two coins, and two pairs of bronze knives 7.62 centimeters in size. Primarily they are used for divination, but they also symbolize the patron spirits of the simbang career. These divinatory implements are the genuine source of shamanic power, and thus revered as the simbang ancestor. The simbang sets up a personal shrine at home and keeps the divinatory implements inside it as if they were divine bodies. Along with the implements, the priesthood bound to a certain shrine and the client groups *(tan'gol)* are also inherited.

Usually the simbang novice starts apprenticeship training as an errand assistant and learns basic skills such as myth recitation and musical performance at the actual ritual ground. But in order to obtain the public title of simbang, the novice should have a formal initiation rite, *sinkut,* under the direction of a prominent sim-

bang who establishes a lifelong master-disciple relationship. During his or her lifetime, the simbang goes through three sinkut rites in order to become a fully qualified shaman with a respectable title as a "teacher simbang," whose name would be invoked at every shamanic ritual. Through this initiation rite, the simbang is also qualified as a "god-servant" *(sinchung)* who can enter *chosung sam hanul* (the Three Heavens in the Otherworld), a separate place reserved for the spirits of dead shamans in the heaven where the simbang's tutelary spirits, *sam siwang* (the Three Ten Kings of the Otherworld), reign. Sam siwang are the Otherworldly counterparts of the mythical figures, the Three Brothers of Straw Ashes, according to the myth of the First Lord. They are triple brothers born to a Buddhist monk sage father and a virgin mother from a noble family. By mythologizing their divine origin, the Cheju simbangs legitimize their separate identity as religious practitioners.

In spite of their divine origin, the Cheju simbangs hold an ambiguous social position in their society. While they are respected as priests, they are also looked down upon as village servants. The simbang's priestly role is manifest in the meaning of the term: *simbang*—the executor, or the agent, of divine rule. The simbang is primarily the deity's servant, but also serves the people on behalf of the deity. In the village society, the simbang is bound to the shrine, and the people respect the simbang as "the person who knows" how to worship shrine deities. However, this social respect for the simbangs is confined only to the ritual context. If the simbangs are the servants of shrine deities, it is assumed that they are also "the servants of villagers." In practice, the simbangs are socially isolated in the village life. They do not belong to any of the age or mutual aid groups, and they marry among themselves.

However, as contemporary democratic society banishes such social discrimination, the simbangs have begun to free themselves from their burdensome public status as shrine-bound priests and to dispense with the villagers' patronage. They prefer a freelance practice based on individual contacts with clients. The social ties between the simbangs and their clients have been superseded by individual contact for the resolution of private problems. Indeed, this process of secularization of the shamanic practice is closely related to the ongoing disintegration of the village community and the increasingly individualistic and materialistic value orientation of the clients.

Besides the impact of urbanization and tourism, two major historical events have influenced this historical change: the Cheju April Third Incident in 1948 and the Anti-Superstition Campaign during the national modernization movement in the 1970s. The April Third Incident in 1948 broke out initially as an armed uprising against the American Occupational Forces, but ended in massive destruction and civilian massacre (Kim 1989). During the incident, villages and shrines were burned down, and people were forced to leave their home villages. Even after their villages were rebuilt later on, few natives returned. Accordingly, the clientele of shrine worship dissolved, and the simbangs lost sponsorship and priestly authority. The Anti-Superstition Campaign in the 1970s accelerated this process.

It is quite a recent phenomenon for the Cheju people to rebuild their shrines and observe shrine ceremonies. In early 1980, the new government promoted the revitalization of folk culture. After the shrine ceremony at the Chilmori tang was designated as an Invisible Cultural Treasure in 1983, the village shrine ceremonies have been revived. Now the simbang has less priestly authority but enjoys more popular status as a cultural treasure. Whether or not contemporary practices preserve the "original" form of shamanic tradition, the Cheju simbangs continue to serve people. Cheju shamanism continues to persist, yet is refashioned in new ways according to the changing society.

JAPANESE SHAMANIC MUSIC

Japanese shamans and shamanistic practitioners have various names; they are called *itako, gomiso,* and *kamisama* on Honshu Island (the main island); *tsusu* in the Ainu culture on Hokkaido; and *yuta* and *noro* on Okinawa. In this article, the music of shamans in Honshu and Okinawa is described, specifically that of the itako and the yuta.

Itako are all women. The fundamental qualifications of an itako are that she must be blind, that she must be trained under a senior itako, and that she must be confirmed through an ascetic initiation rite. Because they are blind, itako do not possess marked visual or spatial concepts. Therefore, verbal and auditory expressions are central to their shamanistic practice. Itako are mostly known for their ability of *kuchiyose,* that is, of becoming possessed with spirits of the dead and then speaking out through the spirits of the dead. The spirits of the dead may be ancestors, close relatives, or children of the client. Itako may also be possessed by spirits of gods, living people, and animals. In their state of possession, besides kuchiyose, they practice faith healing, household exorcism, divination, prophecy making, locating missing articles, and spiritualism, as well as officiating at ceremonies.

Sutras Used for Itako Ritual

Uses of sound phenomena and/or music by itako alter according to the rituals observed. There are nearly twenty sutra chants. Some of these are used exclusively for healing, while others are used against illnesses, as well as for exorcism and other purposes. The different types of incantations and recitation sutras are listed below. (The word *sutra,* which usually refers to Buddhist scripture, is used for any incantation texts used by the itako shamans, although these texts are not necessarily related to Buddhism.)

1. Spirit talk *(kuchiyose)*
2. Incantations for Tutelary gods or Guardian gods of the local community *(ubusuna)*
3. Invocations for the gods *(kami-sandan)*
4. Sutra of man *(ningen kyō)*
5. Invocation of *Takamaga hara* Heaven
6. Chants for thirty-three *Kannon (sanjyu san Kannon)*
7. Rice-sprinkling sutra *(sango date)*
8. Counting of the shrines *(kuni gake)*
9. Invocation for curing illness (sutra for reducing fever)
10. Sutra for celebration of the New Year *(aratama)*
11. Epic of the god Oshira *(Oshira saimon)*
12. Sutra of Oshira *(Oshira kyo)*
13. Chants for the god Kompira *(Kompira Ichidaiki)*
14. The god Inari *(Inari-sama)*
15. Epic of the god Iwaki *(Iwakisan Ichidaiki)*

Sound World of the Itako

There are two categories of sounds produced by itako; one is vocal, and the other, instrumental.

Vocal Expression

Of vocal forms of expressions, three different styles can be differentiated: usual speech, parlando (a style of singing like speech), and melody. For the text settings, syllabic and psalmodic style is common, and even if there are prolonged tones at the ends of phrases, melismatic melodies are rare.

Rhythm. A basic, regular rhythm emerges when the string of the bow is tapped, prayer beads are rubbed, or a drum is struck. The number of syllables is organized corresponding to this basic beat. However, unlike European art music, no systematic meter is observed, which means that repeated groupings of beats by accented tone, such as 3/4 or 4/4 time, rarely occur. In some cases, the beats are arranged exactly according to the number of syllables of the words. When there is no basic beat, a kind of free rhythm emerges. This often happens in sections of *kudoki,* a speech by spirits of the dead.

The nature of the sutras is reflected in the tempo. *Hanako* is the sutra for calling the soul of a child who died young, and its melody is sad and the tempo is slow. *Hotoke okuri* is the sutra for sending off the soul to the other world, and the tempo is faster.

Tonal systems of Japanese shaman music. (Transcribed by Takefusa Sasamori)

Tonal System and Musical Melody. The smallest tonal system comprises three notes, of which the lower and higher notes form the interval of a perfect fourth. The largest tonal system contains seven notes; its lowest and highest notes form the interval of a minor tenth. Five different tonal systems are used (Ex.1).

Melodic Pattern or Phrasing. Melodic patterns are short. The combination of two or three patterns make a phrase, and the length of these phrases is also short. It has been noted that when such short phrases are repeated within five- to ten-minute periods, a hypnotic effect results. Some psychologists point out that long periods of recitation or chanting cause oxygen shortage in the brain, and hence can bring about hallucinatory imagery.

Intensity. Intonation is continuously flat and mumbled, with sudden, explosive bursts in a loud voice that occur when one or two syllables are uttered in a threatening way, especially occurring in sutras that are chanted to purify the physical body of evil spirits.

The vocal tone quality is generally tense and dark; a throaty voice is used.

Instruments

Itako use five kinds of instruments: (1) prayer beads *(jyuzu),* (2) a bow *(yumi),* (3) hand bells *(shakujyō),* (4) drums *(taiko),* and (5) smaller bells *(suzu)* that are attached to the Oshira god figures. The prayer beads are long, over two meters in length, wound twice around the hand. The required number of beads, typically Buddhist in style, is 324. Currently, the prayer beads of the itako are made of golden rain tree nuts. The beads are rubbed together, making sounds; in addition, various objects attached to them make rattling sounds. The sound-making objects include animal jawbones, skeletons, fangs, claws, horns, and old perforated coins. These objects are attached for the purpose of driving away evil and are thought to have a special spiritual power. The sounds they make produce unusual reverberations. The prayer beads are used by the Itako for keeping time, to mark the ending of a phrase, to imitate the sounds of nature, and to fill the pause between words or to cover up mistakes in the words. In addition to making sounds, they are also used to heal illness by rubbing them on the patient's body. After the spirit has left the itako's body, the itako uses the beads also on herself to purify impurities in her own physical body.

The bow is made of catalpa, mulberry, bamboo, or maple wood. Its string is composed of hemp, and includes three strands of female hair. Tapping the string of the bow with a thin

Itako shaman taps a bow (yumi) to call the spirits of the dead. (Courtesy of Takefusa Sasamori)

bamboo stick produces plopping sounds that call the spirits, who are said to be lured by such sounds. The hand bells (shakujyō) are a type of crosier, or pastoral staff. Several rings are hung onto the metallic frame. In the Buddhist ceremony, the long staff is used for walking, and a short staff is used to keep the metric rhythm when a sutra is recited. Itako use the short stick to drive evil spirits away. The drum, played in the same manner as a Shinto priest does, is used to drive away evil spirits by striking it particularly loudly and violently. The suzu, the small bells, are attached to the Oshira figure and make a clinking sound. They are shaken to cure illness; the timbre of the bells creates a mysterious atmosphere and produces a special effect on the patient.

Healing Methods

In order to cure illnesses, itako use a combination of three possible strategies: physical contact, the recitation of magical words, and chanting of sutras. Physical contact consists of massaging the patient's body with the prayer beads or patting the afflicted area with the Oshira figure. Itako have magical words, such as special words for taking objects out of the throat, words to take out poison when someone is bitten by a snake, or words for easy childbirth. It is not, however, the meaning of words but the manner of speaking and singing to the clients that is efficacious. By participating in a ritual held by the itako, the client can resolve his problems or find relief from physical pain. If a client absorbs the extraordinary sounds, both words and music, he will be able to hear the distant voices of the gods.

Okinawan Shamanism

Religious specialists in Okinawan shamanism can be divided into three broad categories: (1) noro, who preside over community-based ceremonies; (2) a group of shamans, called *yukinma, kudii, munchu-gami, umuringua,* and

kankakariya, who practice possession by spirit, and under the leadership of the noro, sing chants at community ceremonies; and (3) yuta, who are able to be possessed by spirits, and deal with family or individual problems; they are classified as a type of shaman in the narrow sense of the term. These three categories are the prototypical classifications, but in actuality, their roles often overlap each other. Therefore the music they perform shows various styles. The sphere of Okinawan culture is large, and it extends to the Amami Islands in Kagoshima Prefecture. This sphere is named the Ryūkyū Arc. Because of this geographic and historical diversity, only typical features of Ryūkyū Arc music will be discussed here. Music such as Omoro, Niri, Ayo, and others that are performed by the noro or *tsukasa* (a type of noro priestess) are omitted from this article. The focus will be on the yuta, who deal with shamanic work: (1) prediction and fortunetelling, finding causes of illness, misfortune, and disaster; (2) faith healing *(mabui-gumi),* done by bringing back a healthy soul that has escaped from the body; (3) Calling of the spirits of the dead, and spirit talk, which is called *mabui-wakashi* (literally, "spirit talk"); and (4) prayers for protection from the gods.

Yuta Vocal Expression

Yuta go into trance uttering sounds of groaning, straining breath, gasps, screaming, and shrieking, and not only at rituals or on religious occasions. These sounds are generally combined with strong body motions. Intonations of words and sentences change as the state of mind changes; the voice gets high and low, soft and strong, is uplifted in a speaking style, and then changes into musical melody. The melodic patterns in yuta singing are individualistic in character, generally consisting of repeated short phrases, the organization of which are arbitrary. The yuta of Amami Island sing to set textual scripts. Among approximately twenty known chants, two exemplary chants are *Basha-nagane* and *Omoi-matukane.*

Basha-nagane is a long epic tale about the process of weaving the *basha* fiber (Japanese banana plant), used for making shaman robes for a yuta. She becomes a yuta by wearing a robe of basha. To wear the special robe is the right of the initiated shaman. The *Omoi-matukane* chant relates the biographical story of the legendary founder of yuta, who was named Omoi-matukane. By singing this chant, a yuta unites with the spirit of the founder. To sing and become united with Omoi-matukane is also the right of the initiated shaman. These long chants are used for going into a trance. Usually in the midst of chanting, yuta go into trance and then proceed into the next ritual. Unlike itako, yuta use one chant for several different rituals. *Basha-nagane* is chanted for faith healing, spirit talk, and prayers for a rich harvest. *Omoi-matukane* is used for divination, initiation rites, and the blessing of fire. Several chants are used for one particular ritual. For kuchiyose (calling of the spirits of the dead), both *Basha-nagane* and *Kusa-nagane* are used.

The following examples indicate the prevalence of the pentatonic scale in yuta chants. In one case observed by the author, a yuta, while talking about her ancestral spirit, suddenly had convulsions, spoke meaningless words while raising the pitch of her voice, whistled, groaned several times, and started to sing, at first in a parlando style, then in a melody. She sang "Kamino na ya, kamino, kamino kokoro ya" (Name of god. Heart of god! Guidance by god!). The tonal system of the melody is seven-tone, an octave and minor third interval, in anhemitonic (a scale with no semitones; i.e., one of the four pentatonic scales or a whole-tone scale) pentatonic scale (Ex. 2). The intervals between the tones were not exactly evenly spaced, only approximately. On the occasion of her initiation rite, a rite repeatedly observed by the author, a yuta walks into the waves of the sea in order to cleanse herself with water, and then sings short phrases of melody repeatedly. The tonal system is three-tone, a perfect fourth interval, using the pentatonic scale (anhemitonic pentatonic): mi sol la, and la as the tonal center (tonic) and mi as subdominant (Ex. 3). In another example, a *kankakariya* (shaman) in Miyako Island sang a song on the occasion of a Bundami ritual; the tonal system was five-tone, a major sixth interval, anhemitonic pentatonic, with sol as the tonal center (tonic) and re as subdominant (Ex. 4). In sum, the tonal systems of yuta songs as well as the itako are all in the anhemitonic pentatonic scale; none of the songs are sung in the so-called Okinawan scale—that is, do mi fa sol ti do (Ex. 5).

Instruments

Instruments similar to those utilized by the itako appear in the practices of Okinawan shamanism. The drum is held in the left hand and played, usually in a fast tempo, with a stick held in the right hand. In addition, Eulalia stalks (*susuki* grass) are shaken up and down, or whirled around in the air so that the rustling sound produces a trancelike atmosphere. The branches of Ryūkyū-Aoki (a type of laurel tree) are used by the tsukasa in Miyako Island, in the same manner and with the same effect. Prayer beads, a string of beads in usual Buddhist style, are rubbed by both hands during initiation rites.

JAPANESE SHAMANISM

The term *Japanese shamanism* refers to Japanese beliefs in spirit entities and the various methods by which certain individuals become empowered by and relate to these entities for the benefit of their ritual activities. The spirit entities may be of nonhuman origin, such as divine beings or animal spirits, or they may be of human origin, such as the spirits of dead or living persons. The manner by which a relationship between a spirit entity and a particular individual is established is instrumental in determining what kind of ritual activities the individual can engage in and what kind of requests the spirit entity is expected to answer. Most commonly the person functions as a medium, relating the will of a spirit entity either to a single client or to a group. The relationship between a spirit entity and its human partner may often be established by the sudden intrusion of the spirit entity, but the relationship may also be gained as a result of an extended ascetic training.

Most of the mediums are women, but in some cases men are preferred. Usually they are called by terms specific to the area where they live, but more common terms are *miko,* meaning "child of a divine being," *fujo,* "female medium," and *fusha,* "medium." Some scholars prefer to use *fujo* and *fusha* instead of the term *shaman,* because they think those terms better reflect the character of Japanese mediums.

A Brief Sketch of the History of Research

Traces of the activities of miko can already be found in very old documents, but they only become clear during the Edo period (1600–1868) and in premodern times. Beginning with the Meiji Restoration (1868) the government made every effort to build a modern enlightened state. It conceived of the miko as promoting superstition and, therefore, as being a hindrance for the development of a new Japan. Scholars were eager to learn from modern Western science and apply its methodology and results in support of the government's efforts. Therefore, they had little if any interest in studying indigenous traditions such as that of the miko, which they saw as remnants of a backward world that had to be relegated to the past. Early in the twentieth century, however, the miko began to attract the attention of some scholars who were searching for forms of Japanese religion that predated the advent of foreign religions, such as Buddhism, and offered clues for the reconstruction of an original Japanese religion. In this vein, Yanagita Kunio, early in his career as folklore scholar, wrote a series of essays, published in 1913 under the title *Thoughts about Miko,* in which he distinguished two kinds of miko (Yanagita 1969). One filled an official position as diviner at the seat of government or at important shrines *(jinja);* the other, a later derivation of the first, became popular among the

common people as a roaming diviner and religious practitioner who could answer their needs for religious or secular support.

Nakayama Tarō adopted Yanagita's distinction in his *History of Japanese Miko,* but preferred to refer to the official type of miko as *kannagi miko* (miko serving a deity), and the popular type as *kuchiyose miko* (miko through whose mouth a spirit speaks) (Nakayama 1930). Nakayama had assembled an impressive amount of source material in support of his argument, but his uncritical attitude in handling these sources met with serious criticism. Nevertheless, both the names and the definition of the two types of miko as he had proposed them became standard until, in the wake of Mircea Eliade's seminal work on shamanism, the focus of scholarly interest shifted from the typology of miko to the features of their initiation process and their psychological state.

At about the same time as the earliest interest in the miko, when the early folklorists endeavored to trace the history and describe the functions and activities of the miko within Japanese culture, some ethnologists had already begun to look beyond the borders of Japan in an attempt to understand the possible relationship of the miko phenomenon with other forms of shamanism in East Asia. In 1923, Torii Ryūzō pointed out in *The Primitive Religion of the Peoples Neighboring Japan* that the miko of Okinawa showed strong affinities with Korean and also Siberian shamans (Torii 1976, 334–335). He also noted that Shinto itself exhibited many features similar to those of Siberian shamanism, for example the concept of a three-tiered structure of the world consisting of the heavenly plain, the middle country, and the dark netherworld. He further suggested that if one wished to know what early Shinto might have been like, one could not disregard this kind of similarity with northern shamanism. Oka Masao, trained before World War II at the University of Vienna in the culture-historical method, attempted to identify in detail certain features in Japanese culture that suggested that the origin of the two main traditions of Japanese miko could be traced to two different cultures. He advanced the hypothesis that the professional miko in an official position belonged to a patrilineal northern culture, sometimes labeled a horse-rider culture, and that the popular miko of the kuchiyose type belonged to a matrilineal southern culture (Oka 1979, 23–31). These ethnological studies were not without methodological problems, but they succeeded at least in introducing the idea that the question of the Japanese miko should be studied in relation to shamanism in other cultures of East Asia.

The greatest stimulus for a more in-depth study of the miko, one that involved comparing them with other shamans in Asia, was not, however, the work of Oka or Torii but that of Eliade. When Eliade first published his groundbreaking *Shamanism: Archaic Techniques of Ecstasy,* in 1951 [originally in French], he was aware of Oka's work, but he added a short section that included Japanese shamans only in the second edition. This book had a lasting effect, in that it provoked not only an immediate increase in both ethnographic and theoretical studies on Japanese shamanism, but also in that it is probably the reason that the terms *shamanism* and *shaman* came to replace indigenous Japanese terms such as *miko.* Hori Ichirō, the Japanese translator of Eliade's book, discussed the main types of Japanese shamans in the light of Eliade's arguments and came to the conclusion that the kuchiyose miko were not shamans in the strict sense because they did not experience ecstasy in their rituals (Hori 1975, 279–283).

As a result of the extensive fieldwork of Japanese scholars in mainland Japan, Okinawa, and the Amami Islands, it became necessary to broaden the concept of shaman in order to do justice to the variety of individuals who claim or are credited with direct access to spirits. It emerged in particular that possession and variations of it play a more important role in Japanese shamanism than ecstasy. These studies did much to help understand the initiation process, the circumstances of rituals, and the various types of shamanistic practitioners, but they were often mainly descriptive and confined to Japan. *The Anthropology of Shamanism* (1984) and some of the later work of Sasaki Kōkan is significantly different. His familiarity with the international discourse on shamanism and his fieldwork experience in many Asian countries enabled him to rethink the available definitions of shamanism and to point out that the categories *possession* and *ecstasy* are in considerable need of fine-tuning if they are to reflect the forms of contact with spirits practiced in Japan and elsewhere in Asia. In an effort to avoid creating an inappropriate image of Japanese

"shamanism" by using the "classic" term *shaman,* scholars in recent years are more and more returning to the use of vernacular terms because they find their meaning to be less ambiguous. These approaches have all mainly focused on the person in contact with spirits. An alternative and even more recent approach is discernible in social psychological studies like those of Ōhashi Hideshi (1998), who advocates the analysis of a shaman's function in society and what a society expects of a shaman.

Japanese Shamanism in Historical Perspective

It is said that shamanism is the basis of Japanese religious culture. There are hints in old documents that suggest a long history of shamanism, but the interpretation of such incidents is often problematic; in particular, one has to be careful not to draw rash conclusions based on direct comparison with phenomena observable today.

The *Kojiki,* the "Records of Ancient Matters" completed in 712, relate a famous episode that is said to have occurred in the eighth year of the reign of Emperor Chūai (192–200). Wanting to know the outcome of the campaign he was planning against the Kumaso, the emperor played the koto before the empress. The empress became possessed by a deity, who spoke through her mouth. The emperor, not believing the words of the deity, incurred its wrath and died shortly after the episode. This episode seems to suggest that high-ranking women at the imperial court could function as official diviners. It seems that for the purpose of divination they became possessed by a deity, who would make the requested pronouncements through them. The mediums would thus be in an official position and function as a means of imperial rule. Their official role as diviners was later continued by the miko active at the country's large and important shrines.

In medieval literature we encounter another type of miko, one who is active among the common people. The oldest reference to such a miko and her activity is said to be an episode in the *Eiga monogatari* (A Tale of Flowering Fortunes), a historical narrative from the eleventh or twelfth century. Fujiwara Norimichi, a court noble, has lost his wife in childbirth. Deeply distressed, his wife's mother and his wet nurse take a *konagi* (a miko) with them and go to a kuchiyose ritual, hoping to meet once more with the deceased. They are told through the konagi's mouth how sad it is for the wife to have had to die without being able to raise her child. Since the narrative notices explicitly that the two women went away in secret, this may be taken as an indication that women of high standing were not expected to resort to such a thing as kuchiyose, because it was something done by the common people. The scene differs from that of Emperor Chūai in that the spirit of a dead person speaks through the konagi, the medium, and there is no third person to call the spirit.

In medieval collections of tales such as the *Uji shūi monogatari* (A Collection of Tales from Uji) of the early thirteenth century we find narratives about still other spirits that reveal themselves in a human being. For example, there is a story about a person who was possessed by a spirit. A healer was called, and he transferred the spirit to a medium. When the spirit spoke through the medium, it disclosed that it was a fox and that it came to ask for some rice cakes. When the cakes were turned over to the possessed person and the healer had driven out the spirit, the person fell flat on the ground, and the cakes were gone. Here an animal spirit is transferred to a medium. Once there, it identifies itself and is then sent away, relieving the person from possession. In this case it is not the medium but the healer, a third person, who handles the spirit (Mills 1970, 218–219).

The examples mentioned share as a common feature that the spirit makes an ad hoc appearance. However, in certain regular ritual contexts, such as some shrine festivals or performances of *kagura* (ritualized dances), the appearance of a spirit is induced. At such occasions the divine spirit is expected to appear at a set moment in the ritual and to foretell the outcome of the harvest or to promise the villagers protection against any kind of misfortune. The spirit is made to come upon a person chosen and prepared for the occasion, and speak through it, but the person need not be a professional medium. These rituals may have a long history, but it is often difficult to determine how old they are, because they may have undergone significant changes in the course of time and the available documents may only reflect a stage in their development and not their original form.

Most of the miko of premodern times were not organized in groups. They operated rather as individuals, answering the various kinds of requests brought forth by their clients, or soliciting support for a particular temple or shrine. Many of them were not permanently settled. These *aruki miko* (wandering miko) appeared in the villages to stay a short while, then moved on. They were respected or feared for the services they could provide, but socially they belonged to the lowest sector of society. The mountain ascetics of *Shugendō,* the *yamabushi,* claiming to have acquired magical powers through severe ascetic training on certain sacred mountains, performed some of the services of the miko themselves, or they were sometimes married to mikos. A miko married to a yamabushi would often serve as a medium for a spirit in a ritual conducted by her husband. Different from the common miko, the yamabushi were organized into sects centered on a sacred mountain, such as Mount Haguro in the north, Mount Ōmine in the center of Japan, and Mount Hiko in Kyushu. It is also true, however, that Nakayama Tarō described large organizations of miko, such as schools represented by a head family, or even miko villages (1930, 607–635). These organizations fell victim to the efforts of the Meiji government to cleanse Shinto from Buddhism, magic, and superstitious beliefs. Yet miko did not simply disappear. Some of them joined a new religion, even if they did not believe in its doctrine, as a strategy for survival. Others, like the many miko in Iwate Prefecture who were organized into a group known as the Daiwashū, eventually formed their own religious group.

When government control disappeared after World War II, such tactical relations with recognized Shinto groups were quickly dissolved, and miko-type personalities became again leaders of their own independent religious groups. Changes in people's attitude toward religion and new economic opportunities caused the decrease of some kinds of miko, as for example the blind *itako* of northern Japan, while they made others adapt their activities to the new needs of an urbanizing society.

Characteristic Features of Japanese Shamanism

Japanese shamans, or miko, are mostly women. Japanese scholars generally agree that a miko is somebody, who in a special state of consciousness, is capable of entering into direct contact with spirit beings, and while in that state can relate a spirit's words and intentions, foretell the future, divine the causes of events, and heal certain illnesses. At times they may also perform rituals, serving in a priestly function. Each of these functions receives its special character from the nature of the spirit that is addressed, but the miko usually performs these functions under the general tutelage and guidance of a personal divine patron spirit. The spirit guide reveals itself in a climactic moment during the initiation process, and is often a *kami* (Shinto deity) or a figure of the Buddhist pantheon already known to the miko because it is widely known in the local area, but the spirit may also be a hitherto unknown kami.

The spirits a miko may have to deal with belong to several categories. First there are the kami. For certain rituals the miko may invite kami from the whole country, but often it is the kami of a local sanctuary or of a homestead. Compared with other spirits, a kami is often relatively easy to handle. Spirits originating from human beings pose more problems. Ancestral spirits, that is, spirits that are settled in the Otherworld, are very much like the kami, but other spirits cannot settle down because they harbor an intense grudge against another person or against their own fate, resenting the fact that they suffered a sudden or unnatural death. These spirits, *onryō,* are dangerous for the living because they try to take revenge for the treatment they received while they were alive by visiting on others similar misfortunes. Therefore, they are one of the most likely causes of death and all kinds of misfortunes.

A residual group of spirits of human origin are the *ikiryō.* These are spirits of persons who are still alive but whose spirit affixes itself to another person who is hated by the spirit's "owner," causing sickness or misfortune for the victim. There is a famous instance of this kind of possession in the episode from the *Tale of Genji,* the Lady Murasaki's great novel (ca. 1000), in which Aoi-no-ue, the young spouse of Prince Genji, is struck down by the ikiryō of Rokujo, the fatally offended lover. Finally, there are the spirits of animals such as snakes, foxes, and badgers.

Some of these spirits are imagined to be more benign than others, but they are all more

or less ambiguous in their attitude toward humans. Whether a spirit appears to be malevolent or well-meaning depends largely on human attitudes toward it. As long as a spirit receives the treatment it expects, it will repay by fending off evil and granting good fortune. If given what it wants, the spirit will readily comply with the miko's wish when called upon. A disgruntled spirit voices its displeasure by *tatari,* a curse, and then, when confronted by the miko, it will resist the miko's commands violently until it can strike a deal that satisfies its wishes. The miko has to find the manner in which to deal with an individual spirit with the help and under the guidance of her patron spirit. The relationship with this patron spirit is therefore vital for the miko.

Eliade's influence on the study and understanding of Japanese shamanism cannot be overlooked, but in recent years many Japanese scholars have concluded that his use of the term *shaman* is not appropriate for the understanding of the nature of miko because of his emphasis on the ecstatic experience of a mystic journey as the sign of a true shaman. For miko, contact with the spirit world is established through experiences of possession in various degrees of intensity. There are, however, vestiges of an experience of a mystic journey. The collection of miraculous tales *Nihon ryōiki,* the "Miraculous Stories of Karmic Retribution of Good and Evil in Japan," compiled by the monk Kyōkai in 822, contains a story about E no Ubasoku, known also as En no Gyōja, said to be the founder of *Shugendō,* the religion of the yamabushi mountain ascetics. The story tells how he submitted himself to ascetic training on the mountain Kisaragi, south of Osaka, and thus acquired the power to command the spirits of the mountain at his will and to fly to the world of the immortals (Nakamura 1973, 140–142). E no Ubasoku is widely believed to be the ultimate shaman of the yamabushi type, but it is difficult to judge today whether the above story reflects a real experience or not. There are also accounts by modern Okinawan shamans, *yuta,* who tell of a dream experience they had during the period of their initiation. In this dream they visited such Otherworlds as the netherworld, the land of Kara (China), and the sky (Fukuda 1997, 10–11). However, this is an isolated dream and not an experience repeated at the yuta's important rituals.

It is clear that the experience characteristic of the miko is some form of possession. This term, however, is sometimes used to refer to experiences that are closer to obsession. Full possession takes place when the miko summons either a kami or the spirit of a deceased person and has them speak in the first person through the miko's mouth. The first rite is called *kami oroshi* (calling down of a kami) and the latter *hotoke oroshi* (calling down of a *hotoke,* a dead person) or *kuchiyose* (calling into the mouth). In these cases the miko often claims not to remember what she has said because it has been the spirit who has spoken. It is the same for a person who becomes possessed at a shrine festival and then relates a kami's revelations to the community. In the yamabushi rite called *yorigitō* the situation differs, in that the yamabushi handling the spirit has it possess a medium, who need not be a miko but who serves as the mouthpiece of the spirit, as in the medieval story of the fox mentioned earlier. In these cases the possessed seems to participate in the nature of the possessing spirit.

In other cases the miko hears the spirit's voice, sees its figure, or intensely senses its presence in bodily sensations. When the voice is heard, the miko relates the words in the third person and can explain their meaning to clients. Such an explanation may happen when the miko is approached for counsel or asked to find the cause of an illness or foretell the future.

Yanagita and Nakayama used the term *kuchiyose miko* to cover all the miko active among the common people, distinguishing them from the official shrine miko. Shrine miko are mainly a formality today, but for the popular miko, research has first revealed significant regional differences, especially between the itako of north Japan and the yuta of Okinawa. However, the analysis of initiation processes has allowed scholars to isolate a few basic types and to show that these types are supraregional. No matter what course a miko's initiation process eventually takes, the cause that starts the initiation process is often some protracted sickness or social or mental hardship. The initiation process may then take one of two basic forms.

One is characterized by a divine calling or a choice on the part of the spirit. When sickness or other troubles do not respond to ordinary countermeasures, and hallucinations and dreams suggest unusual causes for them, the

miko candidate may consult with an established miko and begin to visit shrine after shrine in search of an answer. The answer may come as a consequence of sudden possession by a divine being (*kamisama,* or *gomiso* in north Japan), or by a compelling revelation from a kami, as among the yuta of Okinawa. At about the same time, people around the miko begin to notice the candidate's behavior, especially if the miko succeeds in foretelling an event or in

healing a disease. The success of this response, together with the establishment of a formal place of worship by the miko for her guardian spirit, is proof that a new miko is born.

In the other form of initiation process the initiative is with the human candidate. In order to overcome social or psychosomatic problems, the candidate may turn to religious exercises such as visiting famous sanctuaries, fasting, and standing under waterfalls, until the moment arrives when a divine being reveals its name. The candidate then installs this being at home, and gradually by word of mouth the candidate will be acknowledged as a new miko. In this case, too, there is no formal initiation ceremony, but it seems to be a quite common course of events for urban miko. The relationship of such a miko with the spirit being may be one of teacher and student, the miko receiving all necessary knowledge from the spirit. It may also be a relationship similar to that of a husband and wife; the miko may feel that she is living with a real husband (Bouchy 2000, 106–108).

The initiation of the itako of northern Japan is a variation of this second form. The factual cause for the itako's decision to become a miko is total blindness or severely impaired eyesight. In such cases, becoming an itako offers a way of life in which they can care for themselves and thus avoid becoming a burden for their families. Often it is the family that decides to give a girl into apprenticeship to an established itako. There, the girl acquires the necessary ritual knowledge as itako and the skills to eventually keep her own house. The climax of this apprenticeship is the ceremony of *kamitsuke* (attaching a kami), in which her guardian spirit is revealed. The ceremony is preceded by weeks of strict austerities. On the last day the girl is surrounded by older itako, who recite prayers for hours until the girl falls unconscious and suggests through her movements or in her murmuring what spirit being has taken possession of her. The ceremony is staged as a rebirth. At the conclusion of this ceremony the new itako will perform her first kuchiyose by having some of her ancestral spirits speak through her. The initiation ritual closes on the next day with a formal wedding ceremony, but no human husband is present. Although an itako may eventually marry, it is said that she does not need to perform another wedding ceremony.

In such ceremonies as the kami oroshi or the hotoke oroshi (or kuchiyose), a miko's function as someone who can handle spirits is most evident, because the spirits are made to speak themselves to the audience. But not all miko will perform both kinds of ritual. Itako can usually perform both ceremonies, but in the area where they are active they are especially known for their performance of kuchiyose for the spirits of the dead. Gomiso, or kamisama, the kind of miko who owe their status to a calling by a divine spirit, often do not like to perform a kuchiyose. For them, specializing as they do in dealings with pure kami, kuchiyose is a ritual that brings contact with the ritual impurity of death because it means calling spirits of the dead.

Today, the itako kind of miko is disappearing fast; there are practically no new apprentices for what the itako themselves call their *shōbai,* their trade. Some observers think that this might be the general trend for miko relying on possession for their contact with the spirits. However, the people concerned about how the spirits might feel, and who fear that the spirits might take revenge for certain frustrations they suffered, keep up the demand for miko able to deal with these spirits. Some leaders and members of New Religions attempt to respond to this demand. At the same time, there is also a new brand of miko. Working as individuals in cities and towns, they offer their services and counseling, not only to pacify the potentially troublesome spirits of unborn children, but also to put at ease the minds of clients who are tormented by the stressful demands of modern society. They might be called urban miko.

KOREAN SHAMANISM

One of the most vibrant forms of shamanism lives on, isolated on the Korean peninsula. Confucianism dominates Korean family customs, Buddhist temples abound, and Christianity flourishes; but despite long opposition from Confucianism, Christianity, and modern governments, shamanism still thrives. In 1983, there were approximately 43,000 registered shamanist practitioners, one for every thousand inhabitants (Guillemoz 1992, 115–116). Many young persons, even some well-educated persons, become shamans, or *mudang.* Different from shamans in many other lands, Korean shamans easily make their livelihood by shamanizing; moreover, the Korean government now recognizes certain mudang as Intangible National Treasures. Like shamanism elsewhere, Korean shamanism is hard to pin down as a subject of investigation. The present article highlights its noteworthy characteristics and discusses its rituals and belief system in the context of shamanism in other parts of the world and Korean culture in general.

The history of Korean shamanism is sketchy. A new year's rite called Welcoming the Drum was performed prior to the second century B.C.E. and recorded in the third century C.E.; but the record gives no indication that the officiant was actually a shaman (Chen 1985, 3:

841). The word *mudang* itself first appears in historical records with reference not to ritual performers, but to royal prophets active from the first century B.C.E. to the seventh century C.E. and recorded in the twelfth century (Kim 1983, 1: 287, 2: 87). Whether these mudang were initiatory or hereditary, male or female, mediums for the gods or prophets in their own right is not stated; nor is there mention of the trance or wondrous feats that are commonly said to characterize classical shamanist activity. In the Shilla Dynasty (57 B.C.E.–935 C.E.), the kings themselves may have had a shamanic role. A Confucian scholar later gives the earliest portrait, or rather caricature, of mudang as we know them today. In a poem written around 1200, he derides mudang as noisy charlatans whose followers are fools (Lee 1991, 46–50).

Becoming a Shaman

Far from the stereotype of wizened old men in age-old garments in the remote birch forests of Siberia, Korean shamans are as often as not elegantly dressed women performing rites in well-furnished urban dwellings wired for the computer age. Generally, though not always, women, they perform most rites, or *kut,* for a coterie of women. Like shamans in other cultures, they may be weak in schooling; but they are superior in intelligence, artistic and verbal ability, and good looks (Harvey 1979, 236). Toward the north around Seoul, a person becomes a shaman through the classic shamanist experience of social alienation and inexplicable "spirit illness," which leaves her with what are believed to be powers of contact with the gods and spirits (Harvey 1979, Kendall 1988). At the same time, however, a mudang commonly has a shaman in her ancestry; and some East Coast and Southwest mudang are so purely by inheritance. These experience no initiatory spirit illness, but learn shamanic skills as members of a shaman family. Still other mudang, such as the male shamans on Cheju Island, come from a line of shamans, but may also undergo initiatory experiences.

These days, some seek to become mudang; but most people dread the spirit illness and the hard life of a social outcast it leads to. In the eyes of the shamanist community, however, the inexplicable, unsought phenomenon of the spirit illness is a cogent sign that the spirits are at work for the community in a shaman's life. As in other shamanist traditions, essential to the mudang's life as a sign is the fact that she does not choose to be a shaman, but is chosen by the gods.

The initiatory Rite for the God's Descent (Naerim-kut) heals the spirit illness and ratifies this choice. The power of a god working within the "baby mudang" becomes manifest in some initiation rites when, dressed as the Spirit General, she "rides the blades." Doing dancelike movements barefoot on sharp, rice-chopper blades, she speaks the god's words for the first time.

A mudang serves as a healer for her community; but in the initiation rite, the community's belief in the mudang as one set apart by the spirits contributes to her healing. As in other forms of shamanism, the central role of the shaman is balanced in any rite by the radical role of the community. The community's faith, as much as the shaman's special abilities, empowers *kut* (ritual) words and actions. The rites ultimately derive their power from ordinary lives lived over the years in trusting faith in the working of the gods and ancestral spirits in everyday life.

Shamanist Ritual Activity

The mudang's ritual activity does not fit the classic definition of shamanism as a "technique of ecstasy" or that of a shaman as one who "specializes in a trance during which his soul is believed to leave his body" (Eliade 1964, 4–5). Korean shamans are not normally imagined as journeying to the spirit realm; rather the gods and spirits descend and speak through them. Nor do they often seem deeply entranced. As is the case with many shamans elsewhere, what gives authority to their rites is not trance, but their skills in musical and dramatic performance and the community's faith.

Rites may be held out in nature by a strangely shaped rock, old tree, spring, river, or the sea; but they are just as often held in the urban dwelling of the shaman or her clients (Walraven 1983, 246). Korean shamanism is rooted in the seasonal rhythms of rural nature, but even more in the rhythms of human family life—birth, sickness and misfortune, death. Animal gods, helping animal spirits, and visionary journeys to the heavenly realm of the gods found in classic shamanism have no significant

Shamans perform the rite of the Dragon King, Sea God, for healing purposes, ca. June 1993. Cheju-do, Republic of Korea. (Catherine Karnow/Corbis)

role. The traditional home constitutes as much a sacred realm as do phenomena of nature; and the spirits most urgently invoked are family ancestors. Like Confucianism, Korean shamanism preserves a sense of the continued presence of the ancestors, but in lively, women-centered rituals that run contrary to the rationalistic, hierarchical order of the dominant male-centered Confucianist culture.

The ancient new year's rite called Welcoming the Drum consisted of singing, dancing, eating, drinking, divination, and offerings to Heaven (Chen 1985, 3: 841). Such communal seasonal rites are still held today, especially in island and coastal villages, where sea fishing remains a risky business; but most kut are family affairs held at a time of family crisis. A rite may be the work of a lone person on a mountain beating a gong before a candle and simple food offerings. It may also be a lively, spectacular event performed for hours or days on end by a band of shamans and musicians in colorful costumes together with a crowd of actively participating family, friends, or villagers.

In each ritual segment, the officiating mudang takes the role of one or more spirits. She may do so in a stylized dance to the accompaniment of drum, small gong, shrill pipe, and stringed instrument. She may go into a mild trance, but always remains keenly aware of practical necessities and the psychological state of the sponsors. In the northern tradition around Seoul, she changes costumes for each spirit and works bedazzling feats that arouse mind-numbing wonder. She may "ride the blades" or balance a huge pig's carcass on the prongs of a trident. At the end of the segment, the spirit invoked quickly leaves.

Lively though a kut may be, it is far from the stereotype of shamanist ritual as frenzied behavior. In careful control of her actions, the mudang makes deft use of mimetic gesture, dance, song, and symbolic props to make the gods and spirits vividly present. She makes conscious use of a stage comedian's laughter to ease clients' mental pain and bring them to an awareness of the reality of their situation. In East Coast and Southwest rites, the musicians

employ sophisticated rhythms to control the mood. Throughout, the mudang manipulates not so much the spirits as the feelings and imagination of participants.

Village Rituals

Kut take various forms, depending on local custom and circumstances and the shaman's skill (see "Dramatic Performance in Shamanism" in the present volume and Kister 1997). East Coast village rites invoke the village ancestral god or gods. They center on what is believed to be a miraculous sign of the god's presence in the inexplicable shaking of a tall bamboo "spirit pole" held by a villager, who is sometimes entranced. They consist mainly, however, in the eating, drinking, song, dance, and divination that characterized the ancient Welcoming the Drum rite, enlivened by tear-jerking tales and farcical skits.

If East Coast village rites are held to exemplify what Korean shamanism is, it is a technique, not of ecstasy, but of sacred play. Performed by a skilled troupe of hereditary mudang, these rites constitute a festive village celebration aimed at entertaining both the villagers and their gods. The person holding the spirit pole may flail it around in a frenzied trance, but controlled artistic and dramatic activity dominates the festivities. Day and night, the pulsing rhythms of drum, pipe, and gong, high-pitched melodies, and animated dance, enlivened by bright paper-craft decorations and humorous skits, create a sense of communal harmony and playful prayer that reflects a typically Korean love of revelry.

A midnight Confucian ritual attended by a handful of ritually clean men from the village may precede a rite. But the rational, hierarchical order of Confucianism commonly brings it into opposition with the playful, sometimes ecstatic modes of communion with the gods found in shamanist rituals. In censoring such rituals, however, Confucianism censors the Korean urge for playful, chaotic participation in the gamble and mystery of life, an urge that seems historically and psychically more basic to the Korean mentality than the urge for controlled order embodied in Confucian rule.

Some performances of East Coast village rites bring out a tension between the villagers' religious belief and a keen Korean sense of skeptical realism. In line with traditional Korean myths, the rite welcoming the god in the spirit pole expresses belief in the harmonizing radiance of the God of Heaven shining in the world (Min 1994, 20–22). As has been said of other such seasonal rites, the festivities as a whole create a sense of union of earth and sky, sea and land, and human beings with nature, other human beings, and the gods (Eliade 1964, 99, 117). But the comic skits from village life that may end the festivities sometimes make a joke of the shaman's powers and call into question the powers of the gods themselves. As played by a male shaman, a hapless village official entrusted with the job of controlling unsettled spirits is grabbed by the ear and dragged about by the spirits in comic turmoil. In some versions, fishermen who pray to the gods when caught in a storm end up drowning, and a newborn baby boy suddenly takes sick and, despite the mother's prayers, dies (Ch'oe and So 1982, 303–305, 339–340, 350–351). The rites express a sense of trusting harmony with the gods, but with a sobering realism that recognizes that they do not answer all prayers.

The new year's rites honoring the village-founding god on Cheju Island also center on food, drink, song, dance, and divination; but they are performed in a sober manner that exemplifies a less playful, more ritualistic mode of kut worship. Early in the morning, each family sets out a small table of food offerings at a shrine, which may consist of a lava rock enclosure beneath huge hackberry trees. Dressed in simple yet elegant Korean dress, the principal shaman chants a welcome to the god while doing a solemn dance to the stately measure of bell, drum, and gong. When he places the god's clothes on the table of offerings, the god is believed to be present. The shaman then briefly addresses worshipers with words of concern, which they accept, with no unusual sign, as coming from the god. He verifies the god's presence by tossing two knives until both blades point in the same direction. On some occasions the dance welcoming the god may take an ever quickening pace and come close to entranced frenzy. But one experienced shaman has said that he has no felt experience when the god becomes present. The god is simply present once the chant and ritual actions have been performed. In the course of the rites, villagers share a meal of pheasant soup; at the end, the

shamans divine the fortune of the families present in grains of rice. If the common denominator of Korean shamanism is sought in these rites, it is neither trance nor play, but the ritual sharing of food.

Family Rituals

The family rites that constitute most kut activity today exemplify further forms that Korean shamanist ritual can take. These rites commonly seek healing—not so much physical healing, however, as the restoration of tranquility and family harmony at a time of crisis. They seek deliverance—not so much from the unclean spirits that are imagined as causing disease in some shamanistic traditions, but from concrete tensions and anxieties within the family. They seek release from *han,* the tangled sociopsychological tensions and rancor that constitute a preoccupation of the Korean psyche and are rooted as often as not in events of the past.

Many Seoul rites seek to create release through dramatic techniques that modern psychoanalysts have much to learn from. If these rites exemplify what Korean shamanism is, it is psychodramatic healing. As in other shamanistic traditions, however, the healing is not just a matter of clinical psychology. It takes place in a religious context of help from the gods; and it seeks healing of relationships not just among the living, but also between the living and the dead. Deceased ancestors' han-filled frustrations and bitterness toward life and the family are thought to give rise to a family's economic or other troubles.

After summoning various gods in a Seoul rite, the mudang moves on to what the family most eagerly awaits, reunion with the dead. Wearing a different suit of ritual clothes for each, the shaman takes the role of an interminable file of deceased aunts, uncles, cousins, grandparents, and finally father, mother, sister, or son. Some simply greet the family, offer brief words of encouragement, and leave. Others speak at length in encounters that arouse complex feelings—sorrow at separation, joy at temporary reunion, anger, and bitter frustration. In a kut held by a woman for a husband killed by his mistress, the atmosphere became deadly serious. In other kut, the atmosphere approaches that of a family reunion. In one rite, a family encountered numerous problems after the father's death several years earlier. His soul was thought to be unsettled because of the meager inheritance he left his loved ones. In another rite, a family's problems were thought to spring from the fact that it had abandoned its shamanic roots. A grandmother had been a prominent mudang; but when she died years before, a shaman encouraged the family to become Christians, which they did.

A mudang provides healing by bringing a family's troubled history and present fears out in the open, offering objectifying perspectives on their problems, releasing tension in tears and laughter, and reinforcing belief in the caring presence of the ancestors. Through the mudang, the gods and ancestral spirits sometimes give specific points of advice to clarify the family's situation and bolster its self-confidence. Often, however, they simply give general advice in set formulas: "Don't worry"; "I'll make everything OK."

In still another mode of kut activity, a Cheju rite seeking the cleansing of family history focused not on psychodramatic interaction, but on the manipulation of dramatic symbols. Its three-day rites included a healing ritual for a middle-aged son, a successful government office worker, whose soul had been "lost" after his father died two decades earlier in painful circumstances, with the result that the son had a history of free-floating anxiety. As the family gathered around in prayerful concern, the male shaman, with no hint of trance, sprinkled water over the man, covered his back with a piece of his clothing, and used a knife to press the vertebra where the soul is thought to return (Kister 1997, 28).

At another point in the kut, the shaman engaged the women of the family in a ritual game that amounted to a kind of preventive medicine to ensure the well-being of the children of the family. Taking the role of the *Kusamsung* Grandma Spirit who may snatch a child off to death, the shaman held before the women a lifeless plant. Folding back all but two leaves of the plant, he teased them with two possibilities of disease that threaten the children; but in the end, he folded back the last two leaves, removing these two threats. Then taking the role of the *Samsung* Grandma Spirit who protects and fosters young life, the shaman divined the children's future in two green sprigs of camellia, which were subsequently preserved in the parents' room (Kister 1997, 48).

The kut ended with a solemn ritual to cleanse family history once and for all by sending the father and other deceased family members to peace. A long stretch of white cloth marked off by twelve small bamboo gates symbolized the path to the Otherworld. In a ritual dance called Cleansing of the Road, the shaman, in the role of the Emissary Spirit from the Buddhist World of Darkness, swept and prepared the road. The shaman then took the role of the deceased, bidding farewell and passing along the cloth as the gates were dismantled and the cloth folded up in a rhythmical movement.

Cheju rites sometimes fuse family history with the history of the whole Cheju people. For decades they kept alive han-filled memories of atrocities committed in a 1948 Communist uprising on the island, memories that the government until recently tried to suppress. Along with private healing, shamanist rites provided the seeds of social healing by preserving public truth (Kim 1989, 234–237).

Rites for the Dead

With numerous local variations, shamanist death rites send the deceased member of a family to peace and heal the family's grief while inviting those present to experience death as the transformation of life's accumulated sufferings in an act of dignity and beauty. An East Coast kut for one who has drowned at sea begins at the seashore. To the rhythm of the waves and the beat of a gong, the mudang calls on the gods to send the deceased ashore. A family member holds a bamboo pole topped by a white flag, while an assistant entices the soul to shore by tossing a live chicken and covered bowl of rice into the sea and then drawing them back with cords. The shaman intones a mournful chant that echoes in the breaking waves: "Come to shore! Come to shore!" (Kister 1997, 50).

The spectacular feats of Seoul rites sometimes arouse naive wonder that amounts to little more than mind-numbing bedazzlement, but this simple symbolic event arouses a wonder in the face of human existence that is profoundly thought-provoking. It conjures up an unforgettable image of the enigma of human existence caught between the gods' caring presence and nature's destructive power surging beneath the movement of the waves.

As an East Coast rite unfolds, it provides an opportunity for dialogue between the family and the deceased, who may be symbolized by a small staff tipped with paper flowers, or who may be believed to speak through a possessed family member. An unmarried soul may be joined in marriage with another deceased villager, sometimes with the aid of dolls to represent the couple.

At one point, the shaman chants or enacts the myth of the Abandoned Princess *(Pari-Kongju).* Giving a feminine twist to the Confucian ideal of filial piety, this myth provides the imaginary history of the god who leads the dead to the next world. When the seventh daughter is born to a king with no sons, he has her cast out. The gods save her, however, and years later, she returns to aid her ill father. Dressed as a young man for safety, she undertakes an arduous journey to seek a magical remedy. In one version, the story takes a humorous turn when the spirit guarding the remedy takes a liking to his young visitor and asks him (her) to ritually bathe with him. He unmasks her, marries her, and they have several sons. When she finally returns home, her father has just died; but the remedy revives him. Joining her spirit husband in the heavens, she becomes the goddess who leads the dead peacefully to the "good place" (Tae-dong 1978, 52–57; Kister 1997, 54).

When events in the myth allow, the mudang may draw the family into the action. For visual effect, she may employ colorful Buddhist paper lanterns, a paper boat, and a long white cloth that symbolizes the watery path or bridge to the "other shore" *(p'ian),* a Buddhist term for nirvana. Eventually, she may take one of the lanterns and do a mournful dance, telling the deceased, "Ride the lantern up to the skies." Finally, assistants stretch out the cloth and pass the boat and other lanterns along its length. Saying, "Now let's go," the shaman uses the flower-tipped staff symbolizing the deceased to split the cloth, slowly, but firmly and gracefully. Composed equally of blossoming and splitting, this enigmatic but beautiful symbolic gesture invites those present to see in life's final, painful separation its flowering fulfillment.

The Shamanist Belief System

The Korean shamanist belief system focuses on blessings in the here-and-now—health, wealth,

long life, and fertility—not the afterlife; and death rites focus on the passage *through* death, not on what lies beyond. It has been said that kut bring peace by ensuring that the deceased attains ancestral status, with the right to be reverenced in Confucian rites (Ch'oe 1989, 102). Except when a rite includes a posthumous marriage to give young persons ancestral status, however, the symbols of the rites themselves do not suggest this. Sometimes the rites evoke a Buddhist paradise of ever-blooming flowers or a hell of pain and fire (Kim 1981, 309), but they do not necessarily take such imagery seriously. In a Seoul rite, the Emissary from the Buddhist World of Darkness tries to lasso a white paper symbol of the deceased and snatch the deceased's soul away to judgment and punishment; but frightening though he may be, he sometimes appears as a clown. Mouth grotesquely stuffed with rice cake and arms flailing a long cloth, he dodges family members, who gleefully fend him off in a ritual game (Kister 1997, 79).

The Korean shamanist belief system has no clear notion of the cosmos. It partly reflects the classic shamanist schema of a world divided into the plane of the spirits above and that of man below (Eliade 1959, 21ff.). Its gods include the Big Dipper and the Mountain Spirit; its rites often take place by a mountain, tree, or pole that points toward the sky; the gods commonly descend; and the dead are sometimes imagined as ascending to the sky. At the same time, however, the dead are imagined as crossing to the "other shore," which presumes a horizontal, not vertical schema of the world. In fact, Korean rites center not on cosmic patterns, but on moments of crisis and the life feeling aroused by the shrill chant, lively dance, and beat of the drum. In Western philosophical terms, they imply a Bergsonian vision of the world, not an Aristotelian one.

As in other shamanist traditions, the gods and spirits that inhabit the kut world are numerous. Outstanding shamans are called *manshin,* "10,000 gods," and Cheju rites speak of 18,000 gods. There are nature gods, national heroes, village ancestral spirits, and household gods, altogether with at least 273 names (Kim 1981, 285). The god of heaven has various titles, such as Okhwangsangje (Jade Emperor), Chesok (a Buddhist deity or god of heavenly light), and Big Dipper Spirit (Kister 1997, 45). Among the household gods, the playful T'oju Taegam (His Excellency of the Plot) watches over the house plot; and Songju spirit over the house itself. The Grandmother Spirit of Fertility is associated with the parents' room, where the family eats, children are birthed, and the deceased honored (Kister 1997, 35). One manshin has said, however, that the gods are all basically the same; they just have different functions. Kut worshippers often seem unconcerned, or unaware, about what god is invoked in a particular ritual segment.

Human beings traditionally know themselves through the images of their gods (Cassirer 1995, 199, 217–218). Invoking the Grandmother Spirit's care for the tender life of a child, shamanist believers no doubt become themselves persons who care for life. Invoking the Abandoned Princess to lead a family member to peace, they express their own loving care for the deceased. In the humorous antics of the Taegam Spirit, they assert their own love of play.

Both the gods and ancestral spirits have a down-to-earth quality. Like human beings, they are sympathetic and ready to help, but they are easily peeved and then need to be cajoled. The Korean shamanist imagination has the genius to envision contact with the gods in terms of lively Korean banter and play, which bring them down to the level of neighborly camaraderie. Nonetheless, the gods are to be feared (Kim 1981, 286). The memories that most Koreans have of kut seen in childhood are filled with fear.

As is no doubt the case in other parts of the world, Korean shamanist believers seek contact with the gods and spirits not as an end in itself, but as a means to deal with painful anxieties and evil tangles. Kut envision evil as an impure, binding force that threatens human life. A Southwest rite for the dead is called the Rite of Cleansing *(Ssitkim-kut);* and it reaches its climax in the Knot-loosening Rite *(Kop'uri).* In the graceful dance of this climactic ritual, the shaman releases loop-knots *(ko)* tied in a long white cloth to symbolize the bitterness (also *ko*) of kut-filled frustrations and tangled relationships that life leaves knotted in the heart. Kut manifest little concern about sin or guilt. Forces of impurity threaten life whether or not one is guilty, and the Kop'uri promises release whether or not one repents of one's sinful actions.

Shamanist practitioners in some parts of the world make naive claims that, with the help of

their spirits, they can make all well. In Korean shamanist rites, however, naive belief is tempered with skepticism. While taking their gods quite seriously, Korean believers have an innate urge to turn everything into a joke. In a Seoul rite for the dead, the antics of the Emissary Spirit as he comes to snatch the deceased to the World of Darkness arouse fear; but they make punishment in the Otherworld something of a joke. In the Cheju ritual game for a child's well-being, the ominous joking of the Kusamsung Grandma suggests that the gods not only care for human beings; they also play with them. In the comic skits that end an East Coast village rite, the shaman's power becomes comic nonsense, and prayers to the gods prove futile. Kut laughter tempers naive belief with a sense of realism, at times cruel realism, that the gods do not always make everything well. At some time in its history, Korean shamanism attained the kind of mature religious vision that exists when a people recognize that the gods they worship do not provide an answer for everything (Cassirer 1955, 139).

MOUNTAIN PRIESTS—SHUGENDŌ (JAPAN)

Mountain Priest is the Western term for practitioners of Shugendō, which is a syncretistic Japanese religious tradition of mountain-based ascetic practices that combines a wide variety of elements from shamanism, indigenous Japanese folk beliefs concerning mountains and spirits of the dead, Buddhist cosmology and practice, and Daoist magic. It has been described as "a specific religious practice which took the form of an organized religion about the end of the Heian period [circa twelfth century C.E.] when Japan's ancient religious practices in the mountains came under the influence of various foreign religions" (Miyake 1970, 1). The term *Shugendō* literally means "the way of cultivating supernatural powers" through ascetic practices in the mountains. Its practitioners were (and still are) known as *yamabushi* (those who "lie down" in the mountains, mountain priests) or *shugenja* (ascetics, "those who cultivate power"). Although their role evolved and changed over the years, these practitioners were expected to accumulate religious power through severe ascetic practices in the mountains, such as fasting, seclusion, meditation, the recitation of spells or Buddhist texts, sitting under waterfalls, gathering firewood, abstinence from water, hanging over cliffs to "weigh" one's sins, solitary confinement in caves, walking on fire or hot coals, performance of rituals such as fire ceremonies, and so forth. They were then to use these powers to provide services such as divination, exorcism, prayers, and guidance for pilgrimages, or for the performance of various religious rites.

Shugenja were not always Buddhist priests. Some were officially ordained Buddhist priests, others laypeople, others in a position that is difficult to categorize. The situation is complicated, since the activities and roles of the shugenja evolved and varied over time and place, and during much of Japanese history there was no clear distinction between Buddhist, Shinto, folk, and other current religious categories. Since *shugenja* is a general term meaning "ascetic," there are many paths to becoming or being one, not necessarily limited to institutionalized or organized forms or practices. Again, shugenja were mostly, but not all, male, in contrast to the predominance of female shamans in Japan. During some periods of Japanese history shugenja traveled as a male and female team involved in itinerant religious services. Some female shugenja traveled in groups, such as the Kumano *bikuni* (Kumano "nuns"), some of which were involved in various forms of "entertainment." On the other hand, there were many mountainous areas that were strictly off-limits to women (called *nyonin kekkai*) and thus used only by male practitioners. The few remaining sites in contemporary Japan that maintain this restriction are the source of some controversy.

Historical Development

The indigenous pre-Buddhist religious milieu of Japan included shamanistic trance practices and communication with spirits, the belief that mountains are the residences of the dead, and festivals and rites celebrating the descent of the agricultural deities from the mountains in the spring and their return to the mountains after the harvest in the fall, with a clear geographical demarcation of the sacred and the profane. As Buddhism was introduced and assimilated into Japanese culture in the sixth century (or even earlier), ascetics were entering mountainous areas for the practice of religious austerities. Such people were not necessarily Buddhist monks, but included various solitary hermits, diviners, exorcists, and wandering religious figures *(hijiri).* The most famous of these was En-no-Gyōja ("En the Ascetic"), or En-no-Ozunu (his personal name), the semilegendary founder of Shugendō and prototypical ascetic with shamanic powers. He is said to have practiced asceticism on Mount Katsuragi, west of the Yamato plain, and to have attained supernatural powers, such as the ability to command spirits and demons to do his will, or to bind them with a spell. According to the *Nihonshoki,* an early collection of Japanese records, a man named En-no-Ozunu was banished in 699 to the island of Ōshima in Izu on trumped-up charges of using his supernatural powers to control and mislead the people. Legend has it that, despite his exile, he would fly to Mount Fuji every night to continue his practices. En-no-Gyōja has been adopted by many groups as the founder of Shugendō, and stories of his activities are prominent at almost every mountainous area with an ascetic tradition.

By the early Heian period (ninth century), many Buddhist monks, especially those associated with the esoteric schools, were entering not only Mount Hiei and Mount Kōya (the headquarters of the Tendai and Shingon Buddhist schools, respectively), but also other mountains such as Mount Kimbu in the Yoshino region. Various Mountainous areas throughout Japan developed their own ascetic traditions, including Hakusan and Mount Fuji in central Japan, the Haguro Mountains in northern Japan, Mount Ishizuchi in Shikoku, and Mount Hiko in Kyushu. Each had its own religious history, its own set of deities, its own web of associations with other sacred sites, and its own community of Shugendō practitioners (Swanson and Tyler 1989). Shugenja from these areas provided a variety of religious services, including as pilgrimage guides to popular sacred sites such as Mitake and Kumano. These shugenja began to show an increasing tendency to organize by the middle of the Heian period (tenth century), usually in connection with the pilgrimages of retired emperors and aristocrats. Eventually Shugendō as an institutional religion formed two major organizations: the Honzan-ha headquartered at Shōgo-in and affiliated with Tendai Buddhism, and the Tōzan-ha headquartered at Kōfuku-ji and Daigo-ji and affiliated with Shingon Buddhism. Thus the older shamanistic and mountain ascetic practices were incorporated within the categories, teachings, and practices of esoteric Buddhism, and Shugendō came to represent a large part of the dominant syncretistic worldview of medieval Japan. In the early modern period (the seventeenth to the nineteenth century) the most common form of the shugenja shifted from that of ascetic wanderers to that of figures settled in local society, taking on roles such as *oshi* ("teachers," or "guides") and *kitōshi* (diviners who offer "prayers").

Shugendō in present-day Japan is only a shadow of its past glory. As a syncretistic mix of various traditions, it was outlawed in the late nineteenth century, as part of the attempt by the Japanese government to "purify" Shinto of its "foreign" elements. Shugendō organizations recovered their independence with the postwar declaration of religious freedom in the second half of the 1940s, and many pilgrimages and mountain retreats (such as the Yoshino-Kumano pilgrimage along the Ōmine Range, and the seasonal retreats at Haguro) have been revived by their former institutional centers. The ascetic practices in the mountains are not as severe as in the past, though at one time or another all of the practices listed above are performed. The shugenja of today visit the "Otherworld" in the sense that they go on retreats or pilgrimages to the mountains or other sacred sites. Some still "visit" the Otherworld in a trance. There are many instances of yamabushi or shugenja acting as shamanic mediums during the origin and development of so-called new religions (such as Tenrikyō) in the modern period, but it would be difficult to categorize current Shugendō simply as "shamanism."

Shamanistic Aspects of Shugendō

The shamanistic elements of Shugendō are reflected in its cosmology (particularly with regard to mountains), its religious rituals, and the worldview that underlies its ascetic practices.

The mountain has always played a central role in Shugendō, both in its religious symbolism and as the physical, geographical space where ascetic practices and religious rituals were performed. However, the meaning of the mountain has shifted and developed over the years. In ancient Japan the mountain was believed by many to be the land of the dead, a place where the spirits of the ancestors lingered (the dead were often buried, or the corpses left, in the mountains), and the dwelling of demonic forces. The mountains were also the land of the *kami* (gods). In the spring the "god(s) of the mountains" *(yama no kami)* descended to become the "god(s) of the fields" *(ta no kami)* to protect the agricultural process and provide a good crop. After the harvest festival the gods returned to the mountains to dwell there until the next spring.

In a broader sense the mountains were a "separate" realm, or at least the boundary between "this world" and "that world." Entering this realm provided the opportunity to communicate with the dead, the spirits, or the gods, and appropriate actions could allow one to tap the supernatural power of this realm. "Entering the mountain" was a kind of death, and emerging from the mountain a kind of rebirth, accompanied by the acquisition of spiritual powers. The death and rebirth symbolism is reflected in many of the practices of the

yamabushi, as well as in the names of specific geographical features in the mountains, and the process of death and rebirth is still a strong motif in contemporary Shugendō practices. For example, the Yoshino-Kumano mountain retreat involves passing through four gates (*shimon,* "the gates of death": *Shi* can mean either "four" or "death") to symbolize the death of the shugenja as they enter the mountain. Once they reach Mount Ōmine south of Yoshino, the shugenja enter and wind through a narrow cave called *tainai kuguri* (passing through the womb) to reemerge and be reborn. Some of the caves in the mountains were traditionally believed to be passageways to the realm of the dead or to the "separate" realm of the spirits or another world.

Mountains were also seen as the "cosmic pillar" (*axis mundi,* "axis of the world") that connected heaven and earth, this world and that world, the sacred and the profane. Mount Kimbu in Yoshino, for example, was also known as Kokujiku-san (Mount Pillar-of-the-Country). With the advent of esoteric Buddhism, this cosmic symbolism was cast in terms of Buddhist cosmology and imagery. Certain geographical areas (such as the Yoshino–Ōmine–Kumano mountain range, used for retreats, ascetic practice, and pilgrimage) were identified with the twin womb realm *(taizōkai)* and diamond realm *(kongōkai)* mandalas, with their vast array of symbolic figures, Buddhas, bodhisattvas, and other non-Buddhist guardian deities. In this way the mountains became symbolically identified with the body of the cosmic Buddha Mahāvairocana (in Japanese, Dainichi), and entering the mountains took on the added significance of becoming integrated with the Buddha, and thus attaining enlightenment. The idea of an axis mundi, and the role of the shugenja as a medium between "this world" and "that world," was also expressed through various Shugendō rituals. The *hashiramoto* (the source of the pillar) rituals, for example, still often performed, involve a ritual performance of the origin of the universe, wherein a shugenja is symbolically reborn as a sacred figure who can link and communicate between the realms of the sacred and the profane (Miyake 1985, 213–235). A shugenja who performs this ritual becomes a "pillar" who connects heaven and earth, and thus has the shamanic power to "visit" the spiritual world, become knowledgeable about both worlds, communicate between these realms, and use the power of the other realm to influence events in our own world.

The acquisition of spiritual power through the performance of ascetic practices in the mountains was reinterpreted along esoteric Buddhist lines in terms of attaining Buddhahood in this very life and body (*sokushin jōbutsu*) through integration with the cosmic Buddha Mahāvairocana, or with Fudō-myō-ō, a figure with a fiery and angry visage who represents an aspect of the cosmic Buddha as active in destroying the passionate afflictions of this world. Attainment of Buddhahood was achieved symbolically by experiencing and passing through the ten "realms," from the "evil" realms of "hell" (various physical and mental torments), "hungry demons" (suffering hunger and thirst), animals or beasts, and *asura* (constant conflict), to the "good" realms of human beings, divine beings, *śrāvaka* (disciples of the Buddha), *pratyekabuddha*s (solitary enlightened beings), bodhisattvas, and finally that of the Buddhas.

Shugendō rituals, and the worldview revealed therein, also have strong shamanistic aspects. Identification or integration with figures such as Fudō-myō-ō provided the shugenja with the power to perform various shamanistic functions such as rites of divine service, festivals for the kami, the art of the medium, prayers for calling down spirits for possession and communication with spirits through a medium, *goma* fire rituals, breaking of possession and rites of exorcism, magical charms, and incantations. Thus, in general, Shugendō rituals have been "means by which the *shugenja* spiritually identifies himself with the objects of worship, manipulates his subordinate deities, and ascertains the cause of misfortune to be the influence of evil spirits and evil kami. By removing such influence, exorcism of misfortune takes place" (Miyake 1970, 29, author's translation). These powers, activities, and worldview can be called "shamanistic."

More specifically, Miyake Hitoshi has summed it up thus: "The three motifs of identification, manipulation, and exorcism in Shugendō rituals are based on the following world view. First, the structure of the universe is such that behind the world of daily human life there is a separate spiritual realm that transcends yet controls our lives. Second, this spiritual

Yamabushi priest, 1998. Kyoto, Honshu, Japan. (Chris Lisle/Corbis)

world is inhabited by a syncretistic pantheon of various Buddhas, kami, deities, and so forth, which can be categorized into three types: those having a universalistic character, those having an individualistic or local character, and evil deities or spirits. Third, *shugenja,* by cultivating ascetic practices in the mountains, can attain spiritual identification with figures of universalistic character and directly utilize their power to manipulate the deities of individual character and control the evil deities and spirits to exorcise or remove evil influences" (Miyake 1993, 47). The deities that the shugenja call on are varied and depend on the ritual and needs of the occasion, and include a combination of Buddhist figures, Shinto gods, Daoist deities, and figures that are an amalgamation of all these individual traditions.

Shugendō, however, includes other components in addition to its shamanistic elements. Many shugenja never enter trance or serve as a medium for communication with the "other" world. Though shamanistic ideas and practices are prominent, the Shugendō tradition includes many other elements—such as Buddhist ethics, cosmology, and thought—that make it misleading to identify shugenja simply as shamans, or to define and discuss Shugendō only in terms of shamanism.

OKINAWAN SHAMANS AND PRIESTESSES

Okinawa (the largest of the Ryukyu Islands and the name of the Japanese Prefecture in which the Ryukyu Islands are situated) is of great interest to scholars of religion because of its unique identity as the only contemporary culture in which women priestesses are the official leaders of the mainstream, publicly funded religious system, and women shamanistic practitioners far outnumber men both in the villages and the cities.

Annexed by Japan in the late nineteenth century, Okinawan culture resembles Japanese culture in many ways, albeit perhaps more in appearance than in substance. The materials used in Okinawan ritual—incense, sake, rice, and salt—are used in Japanese rituals as well. Okinawa has also had long-standing cultural ties with China, and the Okinawan ritual repertoire has incorporated a variety of Chinese elements, such as geomancy. Despite centuries of intensive cultural contact with China and Japan, and the adoption of ritual elements from both cul-

tures, the meanings of rituals tend to be distinctively Okinawan, as does the prominent role of women in all parts of the Okinawan religious system.

The Okinawan ritual role that is commonly translated as "shaman" is that of the *yuta.* Although Okinawan yuta differ in significant ways from, for example, classic Siberian shamans, there are sufficient similarities to warrant consideration of Okinawan yuta in the study of shamans and shamanism cross-culturally. Although there are a small number of male yuta, the overwhelming majority are women.

Yuta are not the only ritual experts active in Okinawa. Aside from religious leaders who identify themselves as associated with an outside religious tradition (for example, the Buddhist priests who nowadays typically officiate at funerals), Okinawa is home to at least twenty different ritual specialist roles. Many of these roles are limited: A particular person or family is responsible for a shrine or for bringing a certain type of food to rituals. One of the most ubiquitous categories of ritual experts are simply referred to as "prayer *(ogami)* people"; these women are informally recognized as more skillful at prayer than their neighbors and may be called upon to help out other families by praying at ritual occasions; another name for these women is *utooto-obaa,* "praying grandmothers." Probably the most significant ritual specialists in Okinawan villages are the *kaminchu* (often called *kami-sama,* deities; this term is usually translated as "priestess" in English language sources). These women represent and embody the clan deities and ancestors and perform rituals that ensure the well-being of the clan or village as a whole.

The roles of and relationships among the various types of ritual specialist vary considerably throughout the Ryukyu Islands and tend to be quite different in villages as opposed to urban areas. The *yuta* role is currently in a state of transformation and seems to be more important in cities than in small villages, where priestesses are more highly regarded and more ritually active (for excellent discussions of yuta, see Ohashi, Sakumichi, and Horike 1984; Randall et al. 1989). In some villages there are no yuta at all; in others one or several yuta practice outside of the priestess-clan system. On Miyako Island today and also on Kudaka Island (but not Yaeyama Island), the yuta is a member of the village cult organization in her role as yuta, as told to the author (Masanobu Akamine, personal communication).

There is a great deal of debate in the literature regarding the role of yuta in previous times. According to historian George Kerr, during the late seventeenth century some Chinese Daoist practices crept into Okinawa's cultural repertoire. Specifically, "Fortunetellers known as *yuta* began to rival the *noro* priestesses in the eyes of the townsmen" (Kerr 1958, 219). In contrast, according to Kurayoshi Takara (1994), names of yuta appear in historical records from 600 years ago.

Some previous studies of Okinawan religion have treated yuta as part of a ritual framework separate from that of the clan and village priestesses and have given very little attention to ogami (prayer) people at all (Kamata 1966; Lebra 1966; Matsui, Horike, and Ohashi 1980; Ohashi, Sakumichi, and Horike 1984; Sakumichi et al. 1984). At least in the village in which the author conducted fieldwork during 1994–1995 (Henza Village; see Sered 1999), it is not possible to understand the meaning and role of yuta except in reference to priestesses and ogami people. Often there is a great deal of ambiguity regarding who actually is a yuta. Some women whom others consider to be yuta, and who are consulted by clients for their yuta skills, deny that they are yuta, either because they are afraid that the word *yuta* has pejorative associations for some Okinawans and Japanese, or because proclaiming oneself to be a yuta may be seen as bragging about one's special talents and abilities. Boasting is considered highly inappropriate in Okinawa. Some yuta say that they are ogami people rather than yuta, perhaps as a way of avoiding the label *yuta,* and some yuta say that they used to be "only" prayer people but that they have since developed more skills and are now yuta.

The essence of the work of yuta is mediation, or connecting between villagers and other aspects of the cosmos. Yuta are consulted by clients because they know how to ask the deities whether a particular woman should be a priestess or a yuta; they are able to transmit messages from deceased ancestors to living descendants; they can discern the reasons for misfortune; and they can tell if an upcoming move or change is a good one or not. Yuta may know how to consult books that tell whether

certain days or years are auspicious and which direction graves should be face. It is routine to consult a yuta after a death, to ask if the dead person is comfortable and if s/he wants to tell the living person something, such as to take better care of his or her tomb. Villagers do not consult yuta only in the wake of misfortune. It is common to consult the yuta regularly, perhaps once each year shortly after the New Year to ask the family's fortune for the year, much in the same way that many Westerners visit a physician each year for tests and screening. The fortune is not etched in stone—the purpose of the consultation is both to find out if there are problems and to use ritual means to clear them up. The yuta's work is called "doing *handan*" (*hanji* in Okinawan dialect). *Handan* denotes judgments and connotes diagnosis. Some yuta will help the client perform the prayers or other rituals needed to clear up problems; other yuta only diagnose problems, and then the client may ask an ogami person or another yuta to help out with the prayers and rituals. It is very common to consult several yuta in order to be sure that the answers that one has received are correct.

Most villagers bring someone with them when they visit the yuta. Families often come as a group, although it is usual for only the oldest woman to actually speak to the yuta; everyone else kneels quietly in the background. When the clients enter the room they bow to the yuta. The yuta may or may not wear a special jacket or robe. As in many other cultural settings, this shamanistic practitioner seems to work by the "law of accumulation"—collecting many and diverse ritual objects in order to maximize her efficacy (cf. Bastide 1978, 278). The yuta's altar will be full, with pictures, statues, a crystal ball, incense bowls, and amulets from various Buddhist and Shinto shrines.

A typical ritual at the yuta's house begins with lighting incense. Then the yuta asks the client for a list of family members, including the *eto* (birth year) of each one. The yuta writes these down on a piece of paper. She may eliminate names of people who are not living in the house, or who are not part of the client's close lineage. The yuta is careful to get the client's exact house address and the correct *kanji* (Chinese character) for the family name. During the session the yuta repeatedly consults the paper with this information. The ritual continues on which she has written the yuta saying "*Utooto*" (the way any Okinawan prayer begins) and then reciting family names and dates. Different yuta have different techniques, but a common one is to pick up pinches of rice while chanting in a monotonous voice. The yuta then counts the grains of rice to see if she has received a positive or negative answer. She will repeat the chanting and rice counting possibly a dozen or more times in one session. During the session her voice subtly alternates between her own prayer-chant and the information she is passing on from the kami-sama, or ancestor. She may occasionally stop her chanting to ask the client a brief question. On her table she may have a book of calendrical information based on the Chinese calendar. This book will be used at the end when she tells the client what and when to pray in order to clear up problems. The session may end with the yuta making a date to accompany the client to a grave or a shrine. The client hands the yuta money (typically 3,000 yen) and leaves, bowing deeply.

Unlike the performance skills that are de rigueur for Korean shamans (cf. Kendall 1996), the performance skills of Okinawan yuta take a far second place to their divination skills. Yuta wear plain white jackets, sit still, and murmur quietly. Yuta gain a great reputation for their "go through" ability—that is, for their ability to communicate with deities and ancestors, rather than for their performative talents. The ability to "go through" is seen as a matter of having a "clean heart" and of being born with the predisposition to "go through"; acquired skills, especially performative skills, are of minor importance and perhaps even frowned upon. Stories circulate of yuta who "act crazy;" that is, speak in odd voices or perform feats of strength; and the consensus tends to be that these are not "true" or "go through" yuta at all.

Each yuta has one or more kami-sama with whom she communicates regularly. She will probably have an altar for that kami-sama. Her special kami-sama will pass on to her information about clients' ancestors. Here is how one yuta in Henza Village has described her work to the author:

> First when I pray, when someone comes to see me, I pray to Mautugami [her special kami-sama]. And sometimes his wife, the one who is next to him, asks some questions, like

Priestesses praying at sacred well during Shinugu festival. (Courtesy of Susan Sered)

> in that family did this and such happen. So I ask the customer. The customers usually don't tell the whole family story, like that some family member committed suicide. First they say that there is no suicide in the family, but then I ask the *kami-sama* and the *kami-sama* tells me that there was such a child that you threw in the ocean and you didn't take out the soul and save it, and then the customer starts crying.

A session with a yuta tends to be cordial, and the yuta may briefly respond on a human level to problems brought by their clients, but in general yuta do not usually give the client much time to talk. The yuta may make quiet murmurs of sympathy, but there is no sense of this being a support group or a therapy session. Most of the yuta-client interaction consists of the yuta divining the source of problems, not discussing the content of the problems. The yuta role is not limited to private interactions in the yuta's own house or office. Many yuta spend a great deal of time on the road, taking clients to various public shrines to pray. Certain shrines are frequented by large numbers of yuta who bring clients with them from shrine to shrine.

Yuta can see things that ordinary people cannot see. This ability allows them to predict the future and to find and bring back lost souls. It also allows them to see if a foreign spirit, perhaps a dead grandmother, is "attached" to the client and thereby causing illness. Because the yuta can communicate with ancestors, they can "calm them down," and they can tell descendants about unfinished business that the ancestor had on earth, especially bad acts that need to be "cleaned up." The terms *clean up* and *clear up* are frequently used by yuta. Cleaning up and clearing up refer both to ancestral lines that have become confused and need to be sorted out properly, and mistakes made in the past that have left a trail behind them. In the case of ancestors who did something bad, their behavior will affect the descendants unless the descendants clean things up. Illness (in the broad sense of disruption to the normal har-

mony of the body, family, and village) is probably the most frequent manifestation of disorder that needs to be cleared up; therefore, healing is one of the tasks of the yuta. Yuta distinguish between real illness—which necessitates a doctor, and ancestral disorder—which is their sphere of expertise.

Okinawan yuta are not a close fit for classic notions of shamanism: Yuta do not lose consciousness, travel up to the sky in ecstatic journeys, experience a significant initiation ritual characterized by themes of death and rebirth, summon spirit familiars, or perform cures (Eliade 1964; cf. Hori 1968, 203–205, on Japanese shamans). Nor do Okinawan yuta have unique abilities to contact hidden realms of existence. In Okinawan cosmology kami-sama and ancestors are fully immanent and so accessible to everyone, not only to yuta. Okinawan yuta are simply regular human beings who have developed certain talents to a greater degree than have most people and so can more easily access the kami-sama and ancestors. Unlike shamans in many cultures, yuta do not seem to have much power over either people or spirits (although villagers may not always recognize that this is the case). The role of yuta is to transmit information and help people (dead and alive) negotiate better relationships; the yuta does not manipulate either spirits or people to the extent that shamans in many other cultural settings do.

Yuta do not seem to use their spiritual abilities to effect social or cultural change. Rather, they tend to teach mainstream or even elite cultural values to the common people. In Henza Village, for example, the author never heard a yuta say anything substantially different from what the village headman, priestesses, or schoolteachers said.

The mainstream role of yuta is exemplified by their relationship with the *hinu-kan* (the hearth deity). The hinu-kan is one of the most prevalent, prosaic, and ancient Okinawan ritual items. It is found in every home in Henza; indeed it represents the home, and it is prayed to regularly, not only at times of misfortune. When priestesses are asked to teach about hinu-kan, they typically refer to yuta, saying that the yuta is the person who knows about hinu-kan. Of course, priestesses pray at the hinu-kan, both in their roles as female householders responsible for the house's hearth deity, and in the priestesses' ritual sequence that typically begins with praying at the hinu-kan located in the clan or village *kami-ya* (literally "god house"; the building in which priestesses carry out many of their rituals).

The interrelatedness of the various ritual roles is well illustrated in the sequence of ceremonies surrounding the building of a new house. Six distinct rituals are performed during the process of building a house. The first involves checking with a yuta to make sure that the house is clear of malevolent influences and that this year is an auspicious one for the family to build. The second, usually led by an ogami (praying person), is done at the beginning of the building. This prayer announces that the building will begin soon, that stray spirits should go away, and that the family is building a new house for a good reason (for example, their current house is too old or too small). Partway through the building the chief carpenter conducts a small ritual when the roof is raised. When the building is finished, the ogami person returns and prays at the corners of the property. Her prayer goes something like this: "*Oharai kudasai* [go away please]. Lumber spirit, tree spirit, metal spirit, cement spirit, sand spirit—Go out of the house!" The ogami person will come back a few days later, on an auspicious day, to help transfer the hinu-kan from the old house to the new. Finally, at the conclusion of the building, the village priestesses come for a full-day ritual called *yanusuji,* in which the family gives the priestesses a lengthy and formal series of food offerings, and the priestesses pray for health for the family.

Despite some sense that there are some charlatans among the yuta population, yuta are not social misfits. Yuta's houses look like normal Okinawan houses, and yuta may be married, widowed, divorced, or unmarried (rare). If yuta stand out from other Okinawan women in any way, it may be that they tend to be more articulate (a trait that is admired in yuta and other ritual specialists). It is common to make a distinction between real yuta ("go through yuta"—yuta who "go through" to the ancestors or kami-sama) and fakes (especially those who only know what they read in books). Scorn is limited to the latter.

Okinawans may express ambivalent feelings about yuta. This ambivalence tends to be expressed in terms of fear: fear of the yuta's spiri-

tual gifts (she can see the dead and other potentially frightening beings) and fear of her ability to access intimate knowledge of the problems of village families. People say that they prefer to go to a yuta who does not know them, someone outside the village. The fear is not that the yuta will use her knowledge to do harm, but rather a general uneasiness with the power represented by the yuta's knowledge. The preference for a yuta from another village also reflects interest in empirical proof of spiritual matters. A yuta who can discern specifics about people she does not know is more likely to be respected. It is customary for villagers to consult more than one yuta. This custom significantly lessens the power of the yuta; no one yuta can obtain real control over the lives of her clients.

An additional source of ambivalence regarding yuta is the issue of money. The payment of the yuta is a business transaction, whereas the food given to priestesses is an offering. These two things are ontologically different; whereas the money payment to yuta may be treated with some slight unease in a society in which the use of cash is fairly new and closely associated with the economic imperialism of America and Japan, giving food to the kami-sama priestesses is ancient and venerable. Significantly, the yuta is paid with "naked" money (plain, unwrapped bills) in a society in which money given on ritual occasions (such as funerals, weddings, and so on) is always wrapped in a decorative envelope.

It is instructive to look at the axes around which Okinawans tend to organize the similarities and differences between yuta and priestesses. The priestess is the embodiment of one particular kami-sama (deity); she has a lifetime association or amalgamation with that kami-sama. Yuta, in contrast, can contact many different kami-sama, ancestors, and spirits. Yuta hear and see various entities, but they are not possessed by them. On the contrary, possession is the domain of priestesses, who *become* kami-sama during rituals.

Priestesses explain that they do not converse with kami-sama. It may be that the kami-sama (deities) do not talk to priestesses because the priestess *is* the kami-sama, or it may be that they do not talk because there is no reason for the kami-sama to pass on information to the priestess—there is nothing she needs the information for. The yuta, on the other hand, maintains an existential separation from the kami-sama (although she sometimes speaks in the kami-sama's or ancestor's voice); therefore she can hear and see kami-sama. Indeed, the ability to convey information between worlds lies at the heart of the yuta role. The ability of yuta to converse with kami-sama is what leads some priestesses to feel that yuta are spiritually "higher" than they themselves are; priestesses (in some parts of Okinawa) rely upon yuta to discern who among the village women is "born" to be a priestess.

The priestess *is* the kami-sama; once she understands that, the ability to do the kami-sama's role comes naturally. The spiritual gifts of the yuta, on the other hand, can be developed and improved upon. Yuta, for example, use books in their ritual practice, whereas priestesses do not. Unlike priestesses, yuta (and ogami) people describe long illnesses that made them dysfunctional; religious involvement functioned to ameliorate their illness and rehabilitate their social standing. Priestess is a semi-inherited role, and the preinitiation illness is mild—a mark or a stamp. A particular woman may not know from childhood that she will be a priestess, but she knows that the chances are high; her mother, aunt, or grandmother have been priestesses before her. Yuta need a great deal of persuasion to take on a role that is seen as strenuous, somewhat dangerous, and of ambiguous social status; a series of debilitating illnesses is just that sort of persuasion.

The following is an excerpt from a life history reported to the author by a yuta who was born in Henza but now lives in another village in the central part of Okinawa:

> About twenty years ago I got crazy. For one week I didn't eat but only drank. The two sides of my head were doing different things, one was crazy but one remembered. My legs swelled up. [At this point her husband joined the conversation and they talked at length about how crazy she was, and her husband said that he left the house to get away from her.] People would stare at the leaves on trees when I went by in order not to look at me, I was so crazy. I went to the hospital but the doctor didn't know what was wrong. But I figured out what was wrong when the kami-sama of Henza, the water kami, told me that I should be a yuta, that I should buy the book

[a fortune-teller, geomancy book that she identifies as Chinese].

When priestesses tell how they became priestesses, their narratives tend to describe episodes of weakness and bleeding. Yuta-to-be, in contrast, tend to suffer from problems with their heads—an appropriate training ground for a ritual expert whose work involves speaking with and hearing deities and ancestors. Yuta are independent practitioners. They work outside of any kind of larger system or structure, and illness is the way in which they become socially recognized ritual practitioners. As experts in human misfortune, a personal history of having overcome terrible illness and suffering is the best possible proof of their own ritual efficacy. Illness is their training, their university; via illness they learn their role. Priestesses, on the other hand, work within the clan system; they have no need to attract clientele or to show off their skills; and there is no suggestion that suffering makes them into good priestesses. All that the priestess needs is to prove that she is indeed the one who was born to sit in the kami-sama's place.

Priestesses are linked both to the village social structure (the clan organization) and to the village geography; priestesses are obligated to pray and simply to sit in certain sacred sites, especially the *utaki* (sacred groves). These sacred groves may be water sites, particular points along the coast or certain tree-groves. Priestesses often report that they cannot leave the village; perhaps they tried once to move to Tokyo or to a city in Okinawa, but their kami-sama made it impossible for them to stay away. In a sense, priestesses are not only embodiments of deity, they are also embodiments of the village or clan itself. The prayers of a priestess are meaningless and useless for people outside of her clan, and her ability to perform her role is inherently linked to her presence in the village. Yuta, in contrast, are mobile, flexible, and able to serve a wide clientele. For these reasons, yuta tend to flourish in the cities, and as Okinawa's population is becoming increasingly urbanized, there is some evidence that the yuta phenomenon is growing while the priestess phenomenon is shrinking. This evidence, however, must be taken with a grain of salt, given the history of suppression of yuta, which makes it impossible to know how many yuta practiced in the past. Another question that remains open is to what extent yuta are present in Okinawan immigrant communities in Japan, North America, South America, and elsewhere. Although there seems to be some variation, the usual pattern is to avoid publicizing the role of yuta out of reluctance to seem old-fashioned or in the face of the dominating (and sometimes oppressive) presence of Christianity or Otherworld religions. In some cases an Okinawan woman has joined another religion, but continued to consult or practice as a yuta, albeit under a different title. In other cases yuta are periodically flown in from Okinawa, or immigrants return to Okinawa to consult yuta. In general, yuta do not seem to be as widespread in immigrant communities as in Okinawa proper.

TSUGARU SHAMANISM (JAPAN)

Tsugaru people, the inhabitants of the northernmost region of the main island of Japan, developed a distinct indigenous culture as a result of the assimilation of the Ainu. While their shamanistic practices are influenced by Buddhism, Shintoism, and other nationalistic values, they still retain a strong link with those of the Ainu to their north. However, certain aspects of Tsugaru shamanism also share similarities with shamanistic practices found in Siberia.

Background

A peninsula in the prefecture of Aomori at the northwestern tip of Honshū (the main island of Japan), Tsugaru borders on Hokkaidō to its north. Among its earliest settlers were speakers of the Ainu language; according to a local tradition, the name *Tsugaru* was originally the Ainu *chupka-un-kur,* the "people at the base of the sun," or "Easterners" (Kanagi Kyōdo-shi [Kanagi local history] hensan iinkai [publishing committee] 1976). Tsugaru was the last stronghold of the Ezo/Emishi, "Indigenous Peoples," in Honshū, where they maintained open military resistance for more than a thousand years until the end of the sixteenth century.

Tsugaru Shamanism

Cosmology of the People in Tsugaru

According to some local oral traditions, the people of Tsugaru are the descendants of Asobe and Tsuboke, two different ethnic ancestors to the people of Tsugaru. Some of these traditions were written down during the Edo period by local families, and these "unofficial" documents are to this day much disputed. However, Shibata Shigeo argued that the name *Asobe* is a mispronunciation of the Ainu word *appe,* "fire," and that Tsuboke was originally *chupka,* "the sun."

One of the most striking similarities people in Tsugaru have with the Ainu in Hokkaido and elsewhere is their fundamental belief in mountains as the dwellings of the high gods and ancestral souls. It is believed in Tsugaru that when one dies, one's soul returns to the mountain, and an elaborate ritual structure has been preserved to this day. This worship is best exemplified by the practices concerning Mount Iwaki, which represent the "official" side of mountain worship, as well as the rituals carried out on the southeastern slope of Mount Akakura, which can stand for the less commercialized but equally significant "unofficial" component, made up of the kind of diverse shamanic cults celebrated on Mount Akakura.

Salmon Festival and Bear Ceremony

Salmon has been an important food and resource for Tsugaru people, and they have traditionally conducted an annual salmon festival at the end of the season in December. The salmon

kings that come up the river are twins called Osuke and Kosuke, "big one" and "little one," and they are believed to be brothers. It is said that Osuke represents the head, Kosuke the tail. When the twin salmon come up the river in the moonlight, no one is supposed to see them, or hear them talk. Villagers gather for a big feast and entertainment, so as to make sure no one hears the salmons' voices.

Until fairly recently, bear ceremonials, *kebokai,* were a common practice among the Matagi (*matagi:* "to hunt" in Ainu) of southwestern Tsugaru. Bear are still being hunted there, though such hunts are not very common at the present day. In essence, the Ainu and Matagi bear rituals developed from similar early forms into two different types, due to socioeconomic changes in the Edo period (1590–1868) (Ikeya 1997, 63). This development created certain differences in ritual between the Hokkaido Ainu and the Tsugaru Matagi. The Tsugaru Matagi, for example, conducted a bear ceremony when the bear was hunted, rather than capturing a cub and raising it in the village, which has come increasingly to characterize the contemporary Ainu bear ceremony. The influence of Buddhism, such as chanting Buddhist sutras, or hoping that the bear can enter Nirvana, was present among the Tsugaru Matagi, but absent among the Hokkaido Ainu. The bearskin dance was still practiced by the Matagi; however, Chiri Mashiho reported that among the Hokkaido Ainu it became a rare regional variant (Chiri 1973, 10–11). The "heart opening" in the bear sacrifice ritual is practiced by some Matagi in Tsugaru, but according to Ikeya Kazunobu it is not found among the Ainu (Ikeya 1999).

Itako and Kamisama: Blind Storyteller and Divine Healer

There are two major types of shamans in Tsugaru, the *itako* and the *kamisama.* The former is associated with blindness, often blindness from birth, and the latter involves an acquired divine spiritual power.

The primary characteristic of an itako is her specialization: transmitting the words of the dead in a state of trance. This is called *kuchiyose,* and itako gather at certain temple and shrine events to perform kuchiyose for the visitors, in addition to doing it at home or even visiting their clients. Itako also deliver messages from the deities and other beings, do divinations, exorcise, purify, and cure illnesses for those in need.

The itako heal the sick by the chanting of sutras and the handling of materia medica, such as *oshira* (a divine implement shaped like a doll), and rosaries. Sometimes the cause of illness is interpreted as being due to the evil spirit of a human being, an animal, a bird, a tree, a stone, or indeed anything in the world, dead or alive. The itako and her clients often interpret the causes of current misfortunes, tracing them back to ancestral misconduct, which has not been atoned for. The itako is responsible for the final diagnosis of the cause, and for prescribing compensatory measures (Sasamori 1997, 47–49).

The healing power of itako lies partly in the deep cultural faith in the spirit of language. Thus there are a number of sutras specifically used by itako for the purpose of preventing or curing illness; these sutras include what are called *saimon,* sacred epic poems, which developed from the local oral tradition. Many magical words, moreover, used by itako include words that protect a person from fox tricks, heal wounds, draw a thorn out of the throat, and heal a snake bite. Not only spoken words, but also written characters are believed to have magical power (Sasamori 1997, 48).

The other major class of spiritual practitioner in Tsugaru are the kamisama. *Kamisama* is an umbrella term for those shamans who are not itako: *gomiso, arimasa, noriki, ogamiya,* or *yori.* The major areas of practice and function, which differentiate kamisama and itako, include the following:

1. Kamisama are not blind.
2. Kamisama are self-declared and trained, but itako are apprenticed.
3. Itako specialize in *hotoke-oroshi* (literally, "bringing the dead down," possession by the spirits of the dead), but kamisama usually prefer not to perform this.
4. Itako are registered with special temples, which manage them, but kamisama are more independent.
5. Kamisama's séances and services are pragmatic and relatively mundane, and do not include the performance of elaborate sutras or epic poetry.

6. The itako's possessions (bringing down the dead) follow rules and taboos, but kamisama tend to bring down spirits based on demand. (Sakurai 1970)

Like itako, kamisama do divination and become possessed, as well as offering prayers and exorcisms. Most kamisama also worship oshira, but only a few do séances with them. Each kamisama believes in different deities, since each is protected by different spirit guides. When conducting a séance, they call on various deities for help, instead of chanting a sutra. Most of the time the séance is conducted at a kamisama's house but occasionally they cater their services, such as when doing purification ceremonies. The client's need for a kamisama tends to be more urgent, and a kamisama must respond to a greater variety of requests than an itako. Another important way in which a kamisama differs from an itako is that she does not necessarily experience "ecstasy" as part of becoming a shaman, or during her séances.

In the past, when medical practitioners did not need degrees and licenses, kamisama treated sick people on a broad scale. Their treatments were chiefly massage therapy and moxabustion, combined with prescriptions for herbal medicine and dietary advice. Their conception of illness was based on their understanding of the flow of bodily fluids and the impure elements that caused diseases. Thus, removing "old blood" was a major area of treatment, as it was with the Hokkaido Ainu (Eda 1970).

Recruiting, Initiation, and Training

In Tsugaru, the situation concerning the recruiting and training of shamans is complex and variable. At one end of the spectrum there is the itako system, with its basis in feudalism: Candidacy is defined by blindness and the parents' decision to apprentice a girl to a master itako, with whom she is expected to obtain ascetic training for several years until she receives her spirit guide through the initiation ritual. At the other end of the spectrum, there are nonspecialized individuals in remote villages who act as ceremonial masters and divine healers for the village, whose role and functions are transmitted through the mother's line to daughters, or to daughters-in-law. Between the two we have kamisama, who, like many shamans found in Siberia, often experience shamanic illness, obtain visions and spirit guides spontaneously overnight, and claim that they learn the divine way directly from the spirits. Family does not play a crucial role in transmitting a kamisama's status or power, but family succession does occasionally occur.

Shamanic Performance, Dresses, and Instruments

In Tsugaru, traditional shamanism is expressed through a multitude of different activities and accessories today, but it is still possible to recognize similarities with Ainu practice.

Itako. The itako's bow and the large *juzu,* "rosary," were already in use by female shamans in ancient Japan, and its presence signals a connection with Siberian shamanism. The string of the bow is tapped to evoke the spirit of the dead, and it is believed that the spirit will then remain at the edge of the bow (Sasamori 1997, 51). The itako's rosary is usually made of a combination of beads and various fetish objects received from Matagi hunters, such as animal fangs, claws, horns, and bones, as well as perforated Japanese coins from the early Edo period. These fetishes are believed to "protect people from evil spirits, expel harmful spirits, and purify the itako's body, which is stained due to possession by the spirits of the dead" (Sasamori 1997, 50).

Itako visit client families at their request in spring and fall to do *oshira-asobase,* "entertaining the oshira." The oshira are given new clothes called *osendaku,* and the itako chants oshira saimon to bring down the spirits. She wards off evil by writing a grid and pronouncing at the same time a formula that is written with nine Chinese characters, *kuji.* She then flourishes the oshira doll statues in the air with both hands.

Itako also use drums, large Japanese-style ones, which are placed beside their altars at home, and *shakujō,* stick rattles consisting of several small metal rings hanging on a metallic frame attached to the top of a wooden stick. *Gohei,* a sacred pole with pieces of cut paper attached, is used by Shintō priests; it is also an accessory for itako, who wave it in purification rituals (Sasamori 1997, 49–50). In Tsugaru,

pieces of Ainu shaved wood, *inaw,* have mostly been replaced by elaborate handmade paper versions, or mass-produced and simplified ones similar to those of a Shintō type.

Itako's other essentials for shamanizing include candles, incense, and sake. Yamada Hidezō reported, however, that some itako in eastern Aomori used a sacred lacquered prayer stick, similar to the Ainu *iku-pasuy,* when conducting ceremonies. They placed the stick over a large bowl, *tsuki,* filled with sake and consumed the sake while pressing the stick with the forefingers, as the Hokkaido Ainu do (Yamada 1982, 202).

Kamisama. In sharp contrast to itako, there are no fixed forms for the séance of the kamisama or her performance as a shaman. There are some kamisama who use a rosary and shakujō like itako, but the use of the bow is limited to itako. The use of drums is more common for a kamisama in front of her altar at home. Most kamisama are affiliated with some kind of religious organization, which gives them a license, Shintō or Buddhist, and thus they follow the procedures set by their licensee in their use of props. For example, a kamisama affiliated with the esoteric Shingon sect may use a mandala during her séance. *Gohei* are commonly used on the altar of a kamisama and for purification. Candles and incense are common, and so is sake (Tanaka 2000, 438).

Shamanic Dance. Neputa is a renowned festival of Aomori, which takes place in early August. It is popularly said to be a celebration of the conquests of the General Sakanoueno Tamuramaro, though there is no record of any visit by him to Tsugaru. Tamuramaro as a glorified conqueror is a common motif found in many myths and legends in Tsugaru. According to Ogawa Seikichi, education officer in the Hokkaidō Ainu Association, interviewed by the author in 1999, however, *neputa* is derived from an Ainu expression, *neputa ka kaputa,* meaning "what is that?" It is most likely that it had its origin in an indigenous war dance: When Ainu warriors confronted attackers from the south, they came down from their forts on the hills in full regalia, chanting and dancing, trying to ward off evil. This shamanic performance is the legacy of the final Ainu battles for independence, and its original nature can still be seen in contemporary forms, highly commercialized and modified.

The neputa dance is wild, hopping all the way through, commonly in a form of procession on the street, or as a circle dance in an open space. The powerful drumbeat, the sound of the flute, and the endless, repetitive chanting of "rasseyraa, rasseyraa, rasse, rasse, rasseyraa," creates an extraordinary atmosphere in the darkness. Fitfully illuminated by the light from the numerous floats, the dancers go on all night without much rest, and this is repeated for several days.

The traditional Ainu grand procession to ward off evil was characterized by one indispensable physical action: hopping and stamping. This type of dance manifested itself in various forms and on various occasions: war, warding off demons and disasters, and welcoming visitors who have come by boat. In Tsugaru, the hopping dance of the neputa similarly characterizes the descent of Mount Iwaki, and a variety of processions to ward off disease, evil, and disasters (Shindō 1970).

Sake is also a critical element in shamanism for both the Ainu and the Tsugaru people. These intoxicants are carefully brewed with specific instructions to ward off evil. In Ainu society, the production of sake is assigned exclusively to women. This has traditionally also been the case in Tsugaru, where the women in charge of making sake are called *toji* and are often ceremonial masters and shamanesses as well. Since sake has been the primary consciousness-altering substance for both the Ainu and the Tsugaru people, sake making is considered a sacred duty. In Tsugaru, in addition to rice, millet and barley are also used to make alcoholic beverages. It appears that wine making in Tsugaru has a long history prior to the introduction of rice wine, and its methods have much in common with those of the Ainu in Hokkaido (Fukuda 1999, 2–4). Today, the function of toji is preserved by female village elders known as *baba,* who also manage *kamado* and village duties, including shamanic rites.

Overview

CHINA AND SINO-ASIA

This section covers Chinese shamanism in Mainland China (both historical and contemporary) and Hong Kong, as well as on Taiwan (the Republic of China) and Singapore.

China has historically been an agricultural society, divided into the cooler northern and more tropical southern regions. The north is distinguished by the Yellow River, which links the highlands in the west to the East China Sea off the Shandong Peninsula. The south of China is defined by the Qinling Mountains and the Huai River, but the most famous river of the south is the Yangzi. Some parts of China present great obstacles to farming, such as the very dry landscape of the Western Xinjiang-Uyghur Autonomous Region and the Tibetan Autonomous Region, as well as the steppes of the Inner Mongolian Autonomous Region in the north. Shamanism of Turkic and Mongolian minorities in northern and northwestern China is discussed under the section on Eurasia, as the shamanism in these regions is substantially different. The shamanism of the Tibetans is covered under the section "South Asia, the Himalayas, and Tibet," for the same reasons.

As the official language of Mainland China, Mandarin Chinese has traditionally been regarded as a unifier of Chinese thought and culture. It is also spoken in all of the regions with entries in this section. However, beyond Mandarin Chinese and the Han Chinese culture associated with it, the regions in this section are linguistically and ethnically diverse, with approximately fifty-six ethnic groups. Some of these ethnic groups include the Zhuang, Uyghur (discussed in the Eurasia section), Hui, Yi, Tibetan, Miao, and Manchu. On the southeastern coast of Mainland China lies Hong Kong, with predominantly Cantonese, English (thanks to the British occupation from 1841 to 1997), and Mandarin Chinese speakers.

On the East Asian island of Taiwan (the Republic of China), the largest ethnic group consists of Hokkien, who speak the *min* language that is also spoken in Fujian province in Mainland China. Most of the Hakka, to use another name for the same people, came to the island from Guangdong province in Mainland China. Those who speak Mandarin Chinese (which is also the national language of Taiwan) are associated with the group of Mainland Chinese who came to the island after 1945. In addition, a very small percentage of the population are aboriginals, including the Atayal, Saisiyat, Bunun, Tsou, Paiwan, Rukai, Ami, Puyuma, and Yami. As a result of Japanese occupation from 1895 to 1945, many older people also speak Japanese. (See the section "Australasia and Oceania" for shamanism among these Austronesian speakers in Taiwan.)

Between Malaysia and Indonesia are the Southeast Asian islands of Singapore. Singapore became an independent state and republic in 1965. Here people speak Mandarin Chinese, English, Malay, and Tamil, and the main ethnic groups are Chinese, Malay, and Indian.

Shamanism in the Chinese cultural sphere has been influenced by (and has influenced) the religious traditions of Confucianism, Daoism, and Buddhism. Originally, Confucianism referred to the ideas of the teacher Confucius (traditional dates 551–479 B.C.E.). Over time, the term *Confucianism* expanded to include the disciples of Confucian thought and their philosophies, which emphasize order and virtuous conduct. Eventually, *Confucianism* became a term used to describe a

corpus of Confucian classical texts. It was also a state doctrine opposed to beliefs and practices associated with shamanism and spirit mediumship. To the Chinese diaspora, Confucianism still largely defines what it means to be traditionally Chinese. Early Daoism refers primarily to the texts of Zhuangzi (369–286 B.C.E.) and Laozi (mid-third century B.C.E.). Daoist religion is seen as developing out of these Daoist texts and the pursuit of immortality, as well as shamanic exorcism, healing, and spirit possession, during the latter part of the Han dynasty. Unlike Confucianism and Daoism, Buddhism is a foreign belief system coming from India and the teachings of Gautama Buddha (fifth century B.C.E.). Like Daoism, Buddhism offers rites for exorcism, healing, and the ending of disaster, sometimes employing spirit mediums.

Chinese Shamanism

Among the many kinds of practitioner that fall under the broad heading of Chinese shamanism are the spirit medium, spirit writer, and diviner of the spirit, along with other ritual practitioners known by various names: *bi, tâng-ki, fugei, wu,* and *paq.* There is some debate as to whether these individuals qualify as shamans in the "traditional" Siberian sense, or whether they are spirit mediums (see the entry "History of the Study of Shamanism"). Often the terms *shaman* and *spirit medium* are used interchangeably and without precision to describe religious functionaries within the Chinese cultural milieu who display abilities resembling those of shamans. As with shamanism in other regions and cultures, Chinese shamanism is so varied that it can be treated as a conglomerate of "shamanisms," with each belief and practice sometimes resembling and sometimes differing from those of more "traditional" shamans in Siberia.

Introduction to the Entries

The deep roots of shamanism within the Chinese cultureal sphere are revealed in the entry "Chinese Shamanism, Classical," which focuses on the historical role of those called *wu* and other names in Confucian and Daoist Chinese classical texts. These texts tell of the many ritual performers with shamanic abilities who were ritual bureaucrats, healers, spirit mediums, exorcists, rain dancers, soul summoners, and diviners.

The entry "Daoism and Shamanism" considers the significant impact of Chinese mediumship on the development of Daoism. Initially the entry discusses references to practices in texts classed as Daoist, such as those attributed to Zhuangzi and Laozi, as well as the *Elegies of Chu* and the *Classic of Mountains and Waters*. These practices include spirit mediumship, healing, divination, and exorcism. It then examines how Daoist religious movements gained popularity through the adoption of many of these shamanic beliefs and practices. In contemporary Daoist practice, it is the Daoist ritual master (as opposed to the Daoist priest) who continues to perform as a spirit medium, exorcist, and diviner.

"Chinese Shamanism, Contemporary," offers a glimpse of shamanism, or spirit mediumship, since the fall of the last Chinese imperial dynasty (1911). Spirit mediums have continued to offer services on matters related to health, wealth, family, and ancestors, in spite of Communist restrictions placed on shamanic practices in Mainland China between 1949 and 1979. The death of Mao Zedong (1976) and the rise of Deng Xiaoping (1978) and most recently Hu Jintao to power have brought new religious freedoms to the Chinese people, and although many shamanic activities continue to be officially banned, they are for the most part tolerated.

Contrasting traditional mediumship and shamanic traditions with those prevalent today, "Spirit Writing in Hong Kong" outlines the three general types of mediums who engage in various levels of spirit possession. The first two types of mediums, the *baisanpo* and the *manmaipo,* or *mangwaipo,* are older women, who become possessed by spirits and the souls of those who have died, respectively. While they are possessed, these mediums speak and sing the words of the deity or soul. The more prevalent kind of contemporary shaman is the male or female medium or spirit writer, whose hands only become possessed, by educated deities who are able to write.

The determination of who will become a shaman by the year, month, day, and hour of birth is important in both Nong shamanism and in the practice of spirit mediumship in Singapore, as the entries on these topics bring out. In Singapore, as the entry explains, spirit mediums (predominantly male) are those who are predestined to live shorter lives because of the year, month, day, and hour of their births (they have what is called a light eight-character fate). Becoming spirit mediums strengthens these people and allows them to live longer. These mediums practice self-mortification and speak the words of the possessing deity. The spirit medium enables devotees to receive advice from the spirit world on matters relating to health, exams, jobs, business, and relationships, and to receive protection from the spirit world. Among the Nong of southern China, the shaman is one who becomes possessed by a spirit called a *paq* and travels to a realm known as the Flower Garden to recover lost souls. (Shamans also perform exorcisms, heal, and offer counseling.) Young girls who have a "light destiny," as determined by the year, month, day, and hour that they were born, display this destiny by attracting a paq at a young age. Like the shamanic traditions discussed in the entry "Contemporary Chinese Shamanism," Nong shamanism continues to be practiced in secret despite government restrictions, promoting the cohesion of the Nong, and it still thrives today.

The performance aspects of Chinese shamanism and mediumship are the focus of the entry "Taiwanese Shamanic Performance and Dance," which discusses the performance element in both more traditional Taiwanese shamanism and a more recent form. In both forms, the performance takes place while the mediums are in trance. The more traditional Taiwanese shamans have a broad range of functions, ranging from exorcism to providing counseling on fengshui. Some use spirit writing, but others, mostly men, are associated with the martial tradition and practice self-mortification and, in trance state, participate as performers on festive occasions and during pilgrimages. A new religious movement has grown up on Taiwan that also involves dancing while in trance; in its performances, it shows the influence of the older performance tradition. The performers, many of whom are women, are called *lingji* (diviners of the spirit), and sometimes *lingxiu* (cultivators of the spirit), or *lingmei* (spirit mediums), and the focus is on *lingdong* (moving the spirit).

Although the ritual practitioners discussed in the entry "Qiang Ritual Practices" carry out some shamanic functions, their role is sufficiently different that it has been questioned whether they should be considered shamans at all. The shamanic beliefs and practices of the Qiang people of Sichuan Province in China have been influenced by Daoism and Buddhism, as usual in this area, and also by Christianity. Although shamans, called *bi* in the Qiang language (*duangong* in Mandarin), may be either male or female, female shamans are rare. The bi performs divination and fortune-telling and conducts rituals and ceremonies, sacrifices and blessings. To perform these tasks the bi carries a number of tools, for example, a white stone, a drum, a small gong, a horn, a dagger, as well as a holy stick used for exorcisms and a wooden board used for spirit writing. The bi does not, however, enter trance during rituals more often than other participants do, and does function as the community's intellectual and scholar, to a greater extent than is typical of shamans. Bis have helped to preserve the Qiang language and culture, but the tradition is in danger of dying out. In this way also the Qiang example is atypical, since elsewhere in the sphere of Chinese influence shamanism is thriving.

Alison R. Marshall

CHINESE SHAMANISM, CLASSICAL

In early China, some of the shamans, as described in early texts, performed for religious efficacy, acting as shaman kings, divining, praying, healing, dancing, and sacrificing themselves for rain. But other shamans appeared to be ranked bureaucrats and were not noted for their religious expertise.

According to modern scholars such as Chen Mengjia, Chang Kwang-chih, and Julia Ching, the kings of early China were shamans with the surname Wu and a special relationship with the divine. Shaman kings reigned during the Shang dynasty (1600–1050 B.C.E.), using divination and sacrificial rituals to connect with the spirit world. This connection is suggested in oracle bone inscriptions and animal-like designs in art (carved in bronze, jade, lacquer, wood) (Chang 1983; Chen 1937). In recent years, however, there has been growing resistance to the use of the term *shaman king* to describe the nature of early Chinese rule. David Keightley (1995, 33) has been the most vocal critic of the theory that wu were shaman kings of early China, noting that the wu could have been a spirit medium or priest and suggesting that more research has to be done to determine the precise nature of the wu's role.

Whatever the case during the Shang dynasty, it is clear that shamans were not kings after that time, but they did continue to perform roles as spirit mediums, healers, diviners, fertility specialists, exorcists, priests, and rain dancers. Until the Han dynasty (206–220 C.E.), shamans performed many of the formal ritual functions for the state, the ruler, and his family, some serving as ranked officials. However, writings of the Han dynasty convey a growing desire for the rationalization of religious performance and a distrust of shamans named wu, who were increasingly portrayed as foreigners noted for their expertise in the area of black magic *(wugu)* (Loewe 1987, 107; Lin 1988).

When discussing Chinese shamanism, scholars rely on two texts—*Discourses of the State (Guoyu)* and the *Shuowenzi,* a Han dynasty lexicon—to define and explain the practice in early China. *Discourses of the State,* being the earlier of the two and dating to the fourth century B.C.E., explained that in Chinese antiquity human beings and spirits relied on shamans to create a link between the spirit world and the world of human beings:

> Anciently, human beings and spirits did not mix. But certain persons were so perspicacious, single-minded, reverential and correct that their intelligence could understand what lies above and below, their sagely wisdom could illumine what is distant and profound, their vision was bright and clear and their hearing was penetrating. Therefore the spirits would descend upon them. The possessors of such powers were, if men, called *hsi/xi*, and if women, wu. They supervised the positions of the spirits at the ceremonies, took care of the sacrificial victims and vessels as well as seasonal robes. (Ching 1997, 14–15)

In the later *Shuowenzi,* the shaman is defined as a female dancer and priest and portrayed with two sleeves raised in dance posture. Among all the early rituals that shamans performed, rituals to summon rain were the most important and most coveted for proving a shaman's power (see the stories of King Yu and King Tang below). Many of these rain rituals involved the rain *(yu)* sacrifice, in which female wu and the cripple called the *wang* were burned either by fire or by the heat of the sun (Schafer 1951). Later rain rituals in the Han dynasty introduced different elements believed to improve the chance of rain during times of drought, such as the substitution of dragon effigies for the sacrifice of a human being (Loewe 1987).

Cosmology

According to myth fragments dating from the Warring States (403–221 B.C.E.), Qin (221–210 B.C.E.), and Han periods, Chinese culture

came into existence during the prehistoric era of the Three Sovereigns. In addition to the legendary Three Sovereigns, there were the five sage kings, traditionally esteemed for their embodiment of virtue, including the Yellow Emperor, Yao, Shun, Yu, and Tang. Among them, Yu and Tang's acts of self-sacrifice reflected the early shamanic nature of Chinese religion. Explanations about the origin of rain dances by a king, and in particular dances to abate heavy rainfall, rely on the myth of Yu, the flood controller. After China experienced five years of flooding and severe famine, Yu exhausted himself in his attempts to stem the floods. An illness following his successful efforts crippled him, and for the rest of his life, Yu walked with a limp, which history records as the gait of yu, or the shaman's gait.

Like the story about King Yu, the story of King Tang illustrates the combined role of king as political ruler and as shaman, and it became a precedent used to explain why later shamans performed the important rain prayers and dances. After several years of drought, King Tang assembled a funeral pyre in the mythical Fusang grove, and prayed to di (the name of the deity and nature spirits during the Shang dynasty) and ghosts. As King Tang prepared to burn himself, it began to rain, ending the need for the self-sacrifice. Rain rituals in which shamans danced and were placed in the hot sun or burned reflected the importance of self-sacrifice in rain rituals. Confucian texts praised King Yu and King Tang (as well as other legendary rulers) as sage kings with special relationships to the divine. This divine relationship that sage kings enjoyed is suggested by the Chinese character for sage (*sheng*), composed of the radical for ear, meaning to hear, the radical for mouth, meaning to speak, and the radical for ruler or king, meaning to rule. As such, the character refers to someone who hears what has been spoken by the spirits, communicates what has been heard, and because of this is the ruler (Ching 1997, 54).

Shamanism in Early Confucian and Mohist Texts

Shamans called wu appear often in early texts, including the *Rites of Zhou*, the *Record of Rites*, the *Analects*, the *Mencius*, and the *Mozi*, and are, for the most part, depicted as ritual bureaucrats and healers. The *Rites of Zhou* is a pre-Qin text containing "a blueprint for the government of a hoped-for unified Chinese empire" (Falkenhausen 1995, 285). Here, the highest ranked shamans were called the head shamans *(siwu),* overseeing the activities of the shaman (wu) office. The head shaman administered the orders given to the rest of the shamans, guided them in the performance of ritual rain dances in times of drought, and oversaw the funeral ceremonies in which unranked shamans invoke spirits. Head shamans also prepared the offertory caskets for sacrifices and ensured that spirits attended the funeral services. However, as head shamans were ranked individuals, they did not enter trance and become possessed by spirits.

The next in rank were the teaching shamans *(shiwu),* chosen from among the unranked male shamans and charged with the instruction of all of the other male and female shamans. The duties of unranked shamans were determined by gender. Male shamans performed the important sacrifices, as well as indoor and outdoor ritual exorcisms, and accompanied the king and priests on visits of condolence to the families of the dead. Female shamans communicated with spirits, performed rituals of purification during exorcisms held during the year, and performed the rain dances during drought. Like their male counterparts, female shamans also accompanied the queen and the priests on visits of condolence to the families of the dead. Beneath these unranked male and female shamans is another class of unranked shamans called the horse shamans *(mawu),* responsible for horse healing, in which shamans invoke ancestors of the sick horse and perform horse exorcism and horse funerals.

Shamans are also mentioned in the *Analects*, a book attributed to the teacher Confucius (traditional dates 551–479 B.C.E.). The first reference appeared toward the end of Book 13, in which Confucius repeats a southern saying about shamans: "The southern people have a saying: 'People without constancy cannot as such make shaman physicians.'" Confucius is a northerner who uses the words of a southerner to express that the shaman healer needs to be a calm person. His use of the saying may derive from an understanding that calm shamans make better doctors because they can withstand the stress of entering trance and communicating with deities in order to heal. The *Analects*'

other reference to the shaman is to an individual named Wuma (Horse shaman) Qi, a loyal Confucian disciple with a name suggesting he is related to the horse healers and exorcists described in the *Rites of Zhou.*

The *Mencius* is another Confucian classic that refers to the shaman as a healer. Here, the *Mencius* contrasts those who make arrows and armor with the shaman and coffin maker. The shaman and coffin maker heal and protect as opposed to the makers of armor and arrows, who profit from people hurting and killing each other.

Like the *Rites of Zhou*, the *Record of Rites* referred to the shaman as a minor ritual bureaucrat, but unlike that text it provided little information about the role of the shaman. Here there is the suggestion that the shaman had already become less important. Accounts in this text noted that the shaman's services were required during court, funeral, and ancestral ceremonies. Emphasis was placed on the shaman's physical position in relation to others in the ritual processions, such as the priest and the ruler and the ruler's son, and few details were given about the shaman's specific role as a spirit medium. While the others proceed into the temple, the shaman remained outside to keep the evil spirits away from the temple doors, indicating his or her position as a secondary religious figure, excluded from the inner activities of the religious ceremony. In addition, the *Record of Rites* included an account from an earlier text, the *Zuo Commentary*, in the section of the twenty-first year of Duke Xi, in which a duke proposed to burn a cripple, or *wuwang,* but was ultimately advised not to (Qiu 1983–1985). The *Record of Rites'* inclusion of this anecdote implied a comment on the former practice in which female shamans or sick children were sacrificed in ritual rain offerings. The anecdote suggests that instead of relying on the shaman to pray for rain, society was increasingly choosing secular ways to end drought that involved ritual propriety and repudiating the need for ecstatic religious possession.

Another text in which references to shamans are found is the *Mozi*, ascribed to the disciples of Mo Di (fifth century B.C.E.), who founded the Moist school of thought. The *Mozi* is a text coming from a school that was in some ways close to the Confucian school and in other ways critical of it, condemning the wastefulness of elaborate funerary ceremonies and criticizing the emphasis on ritual propriety. The *Mozi* stressed the shaman's role in rituals but often in a negative way, displaying contempt for the way the performance of ritual and the shaman's role as a ritual bureaucrat had evolved. Here the shaman was called a *zhuzi* and was portrayed as a spirit medium and ritual expert who ensured that the ritual was performed at the right time of year and that the offerings and animals sacrificed were good enough for the deity.

Elsewhere, the *Mozi* elaborated on the shaman's talent as a spirit medium and diviner, explaining that there were restrictions on what the shaman could communicate to the people while he or she was possessed by the deity. What the shaman said had to first be told to the official, who would determine whether the people could hear it.

According to Confucian and Moist texts, shamans were ritual bureaucrats, healers, spirit mediums, exorcists, and sometimes rain dancers. But anecdotes within these texts suggest that opinion about the shaman's role as a ritual bureaucrat was divided and that there was a growing trend away from using shamans who entered trance in formal state rituals. While these texts conveyed one perspective, texts now classed as Daoist revealed another perspective of shamanic practice.

Shamans in Early Daoist Texts

Zhuang Zhou, the reputed author of the *Zhuangzi*, is believed to have lived in the district of Meng within the State of Song near the border of Chu during the reigns of King Liang (370–319 B.C.E.) and Qi (319–301 B.C.E.). There are references to shamans (wu) in the *Zhuangzi*, but these individuals were not depicted favorably. They were portrayed as charlatans who fool people into believing they can divine the future, and as outdated practitioners of cruel sacrificial rituals. It was *Zhuangzi*'s ideal human beings who had many of the traits of shamans: they took spirit journeys, entered trances, were masters of fire and the natural elements, and demonstrated an extraordinary understanding of the Dao, or way. Many examples were given in the *Zhuangzi* of ideal human beings who were recognized by their names (the true man, the daemonic man, the perfect

man, the sage, the nameless man). They were also recognizable by their unusual appearances: hunched backs and skinny necks. Some of these individuals became shamanlike following an illness (Master Yü) or during a meditative trance (Ziqi of the South Wall).

In addition to the *Zhuangzi*, early texts often associated with Daoism include the *Elegies of Chu* (*Chuci*), and the *Classic of Mountains and Waters* (*Shanhaijing*). Wang Yi (d. 158 C.E.), an imperial librarian who wrote the earliest commentary on the *Elegies of Chu*, attributes the text to Qu Yuan (fourth century B.C.E.), a loyal official betrayed by his ruler and banished to the south of China. Although Wang Yi's commentary does not consider the shamanic origins of the songs in any great detail, modern commentaries and scholarship have mined the work for its information about shamanism in southern China before the second century C.E. (Hawkes 1959; Sukhu 1999; Waley 1955). One of the best examples of shamanism is found in the section called the Nine Songs. In the first song of this work, "Great One, Lord of the East," a *ling,* or shaman, performs a ritual dance to Taiyi, the great sun god. The shaman's dance to a cacophony of drumbeats, pipes, zithers, and the jingling of the jade pendants on her waistband sends her into a trancelike state that enables the deity to descend and possess her.

The authorship and dating of the *Classic of Mountains and Waters* (*Shanhaijing*), is shrouded in debate, with some saying the text was a traveler's guide or geographical gazetteer of the ancient Chinese terrain and others saying that the text is the work of shamans (Yuan Ke 1982, preface 1). The text describes shamans (wu) as healers who bring the dead back to life and travel to distant mountain summits in search of medicinal herbs. There is also the suggestion that shamanic practices were performed in connection with the snake cult and the worship of the Queen Mother of the West (Cheng, Cheng, and Thern 1985; Mathieu 1983).

CHINESE SHAMANISM, CONTEMPORARY

Shamanism and spirit mediumship have a long history in Chinese society and have proved ever resilient and adaptable to different epochs and locations. Throughout this history shamans have served as primary mediators between the world of the living and the spirit worlds. Though Chinese shamanism is not all of one piece, fragments of tradition, or rather a dialogue that evokes some sense of tradition, continue to be an essential aspect of the shaman's identity and calling. This connection to tradition is true even for the contemporary world, where many scholars have predicted that the forces of modernization, rationalism, and science would bring about the dissolution of traditional belief in gods, ghosts, spirits, and ancestors. But rather than bringing about the demise of Chinese folk religion and its practitioners, these practitioners have responded to the very economic and political changes that were to be their undoing by reinventing themselves and defining a new set of problems and resolutions, new identities and avenues for expression at the local level, both in the countryside and in urban areas.

The literature that documents shamanistic activities in the contemporary period is, not however, as extensive as that available for other aspects of Chinese society. This is partly due to the tumultuous history of China since the fall of the last dynasty (1911). The bulk of the early research on this topic comes mostly from Taiwan, Hong Kong and its territories, Singapore, and Malaysia. Yet it has really only been in the last few decades that more attention has been given to popular and folk religions even in those areas. As for the Communist-ruled Chinese mainland, its history is even more problematic with regard to this subject as the government's official stance toward popular religion and its practitioners involved a concerted effort to eradicate them. For most of the Communist period (starting in 1949), shamanism operated out of sight or not at all. It has only been since the death of Mao (1976), with the more liberal reform policies of his successors, that shamanistic activities have again resurfaced.

Chinese Folk Religion

In order to appreciate both the differences and similarities that may be seen across this landscape of contemporary shamanistic practices and beliefs, it is necessary to briefly address the nature of Chinese religions. Chinese folk religion has always had permeable boundaries and has incorporated many elements from diverse beliefs and practices that proved useful or practical for its purposes in different times and places. Some scholars have argued that such syncretism is a characteristic of settings in which religion does not achieve a centralized institutional status with a clerical hierarchy and titular head that challenges the power of the state. In traditional China, only the imperial government was allowed to exert such an authority and administer its rule through a hierarchy, while peasant beliefs were left to the outlying rural areas and represented diverse adaptations and interpretations.

This lack of an organized religion meant that the Chinese would turn to Buddhist specialists, Daoists, spirit mediums, and so on, for different services that had to do with everything from birth to death, matters of health, wealth and family, building construction, ancestral rites, marriage, dealings with ghosts, spirits, gods, ancestors, and so on. Moreover all these beliefs and practices informed and borrowed from each other. What was common to popular folk beliefs, however, was a notion that there was an intimate and ongoing relationship between the world of the living and the world of

A female shaman leads her clients in a group prayer at the village's shrine, 1994. (Courtesy of Hong Zhang)

the spirits. Traditional China was populated by a plethora of deities and spirits, ghosts and ancestors. Families kept an ancestral altar in their homes and had various other sacred images and symbols throughout their dwellings. There were also neighborhood, village, and city gods; gods of various guilds and occupations; protective spirits; and so on. Deities and spirits were associated with almost every activity in daily life. In addition there were evil spirits and ghosts that one needed to protect oneself and one's family against. In such an environment it was necessary to maintain a harmony between these worlds. If one did not propitiate the gods and spirits and honor the ancestors through rites and rituals and live a moral life, then illness, misfortune, loss, poverty, and even worse fates would befall one. One could fall prey to the dark side, lose one's soul, have it stolen or possessed by demons and ghosts.

Chinese Shamans

One of the primary conduits for communication between the worlds could be found in particular practitioners referred to as shamans (or spirit mediums) in the literature. In China shamans may be either male or female. They speak with the voice of a spirit or god and are sometimes associated with a temple, which may be Buddhist, Daoist, or Confucian; some practice on a smaller scale in the home, or travel from one village to another as itinerants. As mentioned above, the syncretic nature of Chinese religion makes it difficult to separate the influences of the various religions, especially as concerns the practices of local folk traditions. It is probably the case that various religious beliefs, folk beliefs, local myths, and legends influence the shaman, who, as a member of the society, must ultimately use a language that local people can identify with. What legitimizes the shaman's abilities is contact with the unseen world of the spirits, ghosts, ancestors, and gods.

A characteristic common not only to the Chinese shaman but to shamanism in other times and places involves a calling to the profession. This calling usually centers on an event of possession: A spirit or god descends upon or into the shaman, causing confusion and near insanity until the call is accepted and understood for what it is, a summons to act as a conduit to the other world in order to help others in this world. This recognition and its acceptance by others within a social context is absolutely necessary, and if one does not receive it, one is not seen as a legitimate healer (see Wolf 1992). The recognition is, therefore, simultaneously personal and social and often involves an apprenticeship with an elder shaman for a time, although this is not absolutely necessary. Shamans must also remain true to their calling or risk becoming vulnerable and losing their abilities. The shaman is said to enter a trance using various methods of induction, chanting or dancing or drumming. In this state the shaman acts as the intermediary between this world and the Otherworld.

Often, but not always, Chinese shamans are not individuals who have great wealth, social standing, or education. Most of them are part-time practitioners; members of local society who do not live solely from their shamanistic calling. In addition to journeying into the Otherworld and recovering the lost or stolen souls of his clients, the abilities of the shaman are wide ranging. Because of the power of the spirit that possesses the shaman, he is empowered to cast out evil spirits and demons from people, houses, streets, wards, and even entire villages. The shaman's spirits also bring him the ability to see the client's past and future, speak in tongues, use divining blocks, and engage in spirit writing (a form of automatic writing involving the use of a *planchette,* a Y-shaped tool

used to trace characters in sand). Some may use a variety of charms and other religious paraphernalia in curative rituals. Others have an extensive knowledge of herbal medicine, and many dispense psychological counseling and advice. Some may perform before massive temple gatherings or in group séances (described below), while others deal only with a small clientele within the domestic sphere. The range of abilities varies from place to place and from ritual to ritual.

Shamanism in Greater China: Some Examples

The early emphasis in the anthropological literature is on the variation of shamanistic practices that were and continue to be found across greater China, which included studies from Taiwan, Hong Kong and the new territories, Singapore, and Malaysia. Most studies on shamanism during the height of the Communist period were done by scholars working outside Mainland China, and it is these studies that we initially examine. It is impossible to find any distinction drawn in the Chinese literature on the subject between the idea of spirit mediumship and shamanism, and most authors of these studies use the terms interchangeably.

Shamanism in Taiwan

In Taiwanese villages shamans, *tang-ki* (a local term for shaman, called *jitong* in Mandarin), are the religious arbiters between this world and the world of the spirits. It is the tang-ki who are called upon to uncover the causes of conflict and the loss of harmony in the family or at the village level. Illness, misfortune, and death must have a causative agent; Wolf (1992, 105) described the problems brought to the tang-ki as "varied, ranging from illnesses in humans and animals to economic setbacks to marital disputes to fears of infertility." For the tang-ki this disharmony is a function of the relationships between this world and the world of the spirits. The shaman must identify what ghosts or malevolent spirits are responsible for the client's ills and prescribe a cure. They can exorcise harmful ghosts from the village and perform exorcisms on individuals, and they are considered to be the divine presence of their host god at temple rituals honoring that deity. Tang-ki may also engage in the rituals of self-mortification described below at festivals honoring their gods in order to demonstrate the power of their deities. They are protected by their association with the gods and hence neither feel physical pain nor suffer permanent damage from their wounds, which heal quickly. In one of the few studies in this area, David Jordan (1972) described how the tang-ki engage in rituals of pricking and stabbing their bodies in order to draw blood, which may be used for some magical purpose. Swords are also used to drive off evil spirits during the course of a performance. Tang-ki often have a ritual assistant who may help with the inquiries in those moments when the shaman is most caught up in a state of possession and is speaking with the voice of the deity.

The majority of these shamans are male or younger males, though this does not preclude women from practicing as shamans. Of the female shamans in Taiwan some are housewives who specialize in dealing with problems in the domestic sphere, that is, curing sick children, helping women who are unable to conceive children, dispensing various medicinal herbs, and providing emotional and psychological counseling and advice. Still others are professional spirit mediums, helping living family members communicate with the dead, relaying the messages and gifts of the living to the world of the ancestors. A common belief is that those called by the spirits and gods are those who were fated to die young; once they have been called, though, their lives are extended so that they can serve the public through their spirits. And it is imperative that they continue to obey their calling; if the tang-ki do not remain true to their calling then it is possible for them to be possessed by ghosts rather than gods. In this case the shaman loses credibility as a healer and can no longer function as one. It is therefore necessary that the tang-ki demonstrate purity with regard to their practice by not charging for their services. It is, however, customary for villagers to shower the tang-ki with gifts for the services provided for them.

Some authors have argued that this gift giving defines the social nature of reciprocity among villagers. The gift establishes and perpetuates ties of relationship and interdependence. Some tang-ki may refer illnesses that are clearly medical to a medical professional or

other problems to other ritual and religious specialists. The tang-ki is usually a member of the local society, which is highly attuned to the background of a client's history. Tang-ki may dispense a variety of cures and advice, ranging from herbal mixtures, incantations, charms and talismans, to psychological advice.

Katherine Gould-Martin (1978) described a tang-ki's trance session. The tang-ki, a man in his forties, had an image of his deity in his house; he went into a trance every evening after dinner. Others came to seek him out. He spoke with an image of his deity and then with the visitors. His assistant burned some paper money, thus sending it into the spirit world, and began to chant. As the chanting increased in frequency, the tang-ki began to convulse; suddenly his head hit the table, and the assistant then announced the identity of the questioner and the nature of the problem to the god. The tang-ki responded in a dialect that was supposed to represent the original language of the god he served. The voice was unnatural and incomprehensible at first but eventually became a deeper version of the shaman's own voice. The god might or might not become engaged in the problem and might move on to the next problem, shifting back and forth between his two voices as he moved from one client to the next. At the end of the session the shaman was brought out of his trance when his assistant burned more spirit money.

Mediums in Hong Kong's New Territories

Spirit mediums studied by Jack Potter in Hong Kong's New Territories (1978) had altars where they conducted their rituals. The altars contained various paraphernalia from the tutelary spirits served by the shamans for which they were responsible. The gods and spirits served might include the Jade Emperor (the ruler of the Spirit World), Guanyin (Buddhist goddess of mercy), and other traditional gods and spirits found in the Chinese pantheon. The shamans would also make house calls. Once a year they held a group séance during which they traveled to the Garden of Heavenly Flowers where every living person is represented by a potted flowering plant. During their journey they encountered the deceased relatives of many of the villagers and engaged them in conversation, speaking for them and allowing villagers to speak to them as well. In this way diagnoses of problems were made and various sentiments, gossip, and knowledge of village affairs were made public.

In Potter's examples almost all the spirit mediums were women who had been called into service by the spirits of their deceased children after a period of great personal loss and suffering. They resisted the calling for a time, acting out irrationally, engaging in seemingly insane behaviors, and speaking nonsense languages. They might experience their death (feel that they were dying) a number of times before they were redeemed through agreeing to accept their calling as spirit mediums.

The supernatural world of these villagers was divided into two realms; one benevolent and the other malicious and dangerous. The first was the province of benevolent ancestral spirits and the beneficent deities who brought prosperity, health, and good fortune, along with the perpetuation of the ancestral line. On the other side were malevolent spirits and ghosts, who because they were denied or taken away from the fulfillment of society's ideals in this life, returned to wreck havoc in this world. They were most often concerned with bringing sorrow, illness, and death to the most vulnerable and highly valued members of the family, that is, young children, especially boys, who were held most precious because they would continue the family line. In this sense the spirit medium who journeyed to the Otherworld to recover the soul that had been lost or stolen served to address the dark side and protect villagers against the intrusions of the malevolent forces. Since in this case the shamans were women and since they were called into the profession after great personal loss involving family members, gender played a significant role in reinstating them into the public world of the village, which is predominantly patriarchal. Their activities centered on righting what was wrong with society or protecting it against the world of malevolent spirits. It should be noted that in the south of China, where Potter did his field research, lineages were quite strong and that this was a factor in his interpretation of the above material. This characteristic, however, cannot be easily extended to other areas of China where lineages are weaker or even nonexistent. Shamanism in general can indeed be an avenue for the empowerment of women and

their voices in a society that has traditionally provided little space for women to speak and act in public.

Shamanism of the Underclass in Penang

Jean DeBernardi's research in Penang, Malaysia (1987), describes the dark world of the socially marginal and Chinese urban poor, whose subcultures eschew the dominant view of the social life and are often at odds and at war with society's officials and their enforcement branches. The shamans who are called upon by this segment of Chinese society reflect the idea that there are different deities for different levels of society. For instance, there are the patron spirits of officials and magistrates, and then there are those of prostitutes, gamblers, and martial artists. These "other" gods are celebrated in the rituals of "secret" societies, rituals in which they possess spirit mediums (shamans) who act as healers and teachers of the syncretic Buddhist/Daoist beliefs that are associated with various temples and their activities (DeBernardi 1987, 310–311). Such folk temples (which are a historical outgrowth of the Chinese Triads, groups formed in order to oppose the last imperial dynasty) have often been the locus of interaction and group identity for male members, who provide each other with mutual aid and protection. DeBernardi (1987) describes the way such "religious symbols and rhetorical strategies provide a means to invert social norms, to reinterpret the activities of the societies in light of a Chinese tradition of heroism and social banditry, and to elevate the hedonistic values of the underworld as a social ideal" (311).

An example of this kind of inversion can be seen in the image of the trickster Jigong (the Vagabond Buddha), who is the antithesis of purity and one of the primary deities who possess shamans in these societies: "The Vagabond Buddha . . . never fasts, eats meat, drinks, gambles, and steals . . . is dirty" (328). He inverts social norms and religious values, as a kind of contemporary social bandit reminiscent of Robin Hood. The spirit medium officiating at a temple gathering takes on the status of the deity possessing him and is thus able to subvert social norms because he stands above the social world of everyday life. Representing the group, the shaman in a trance speaks with the voice of a god and can directly challenge the society outside, create new norms and subvert conventional moralities. In this way a segment of society that is looked down upon by others can use that very status to articulate its own critique. Once again, one sees the shaman as mediator between this world and the other.

Shamanism in the People's Republic of China (PRC)

The Chinese Communists embraced a dogmatic Marxist position toward religious and spiritual beliefs and practices and had little tolerance for shamanistic activities, which were viewed as a threat to Communist rule and power and called superstitious, feudalistic, and even exploitative. Moreover for Communists the collective struggle took precedence over the concerns of the individual, the family, and the lineage, which had been the traditional space in which shamans practiced. In the "new" society the problems that shamans addressed would no longer exist. Shamans had no place there. Hence, persecution of shamans by Chinese Communists began as early as the Yanan period, which ran from the mid-1930s to the birth of the People's Republic of China in 1949. A number of documents available from that period describe how Communists went about reforming these exploitative shamans who, they argued, were taking advantage of the people for personal profit and fooling them through various ruses and tricks, or who were themselves poor and ill-educated and did not understand that the world of spirits was ultimately an illusion that kept them from seeing the real cause of their oppression and suffering. On the one hand they extracted confessions by force and required shamans to make a public display of these renunciations, explaining how they misrepresented themselves and their abilities for personal gain and material reward. On the other hand, they were reeducated in a Marxist materialist view of the world espoused by Mao and rehabilitated to become good citizens of the new republic.

After the Communist Party came to power in 1949, its attempts to reform society along political lines while transforming the nation's economic base led to a number of campaigns that proved damning for shamans as well as for all other elements that might resist the new society. The two periods of greatest upheaval,

A female shaman chanting over "fushui" (magic water), 1994. Later she will sprinkle the water over her patient/client (sitting next to her) as part of her healing process. (Courtesy of Hong Zhang)

during which countless innocents were denounced, tortured, killed, and imprisoned, or rehabilitated and forced to issue elaborate confessions, were those of the Great Leap Forward in the late fifties and the Cultural Revolution (1966–1976). These were high points in the articulation of Maoist extremism. The nature of the antireligion activities of the latter period can be seen in the actions of the extreme wings of the Red Guards, as described by Sulamith and Jack Potter (1990). This account also provides us with a sense of how pervasive the world of spirits was in traditional Chinese society and how ongoing and intimately available spiritual guardians, spirits, and ancestors were in the social spaces of everyday life:

> Every building in Zengbu was searched, and all evidence of religious activity was destroyed or confiscated. Ancestral tablets in private houses were taken from their altars. Statues of Guanyin, the Buddhist goddess of mercy, and Guangong, the deity and model of manly virtues, were also taken. The Red Guards stripped off the yellow-orange altar papers with the names of deities and the names of ancestors. The pictures of fierce guardian generals, pasted to the doors of houses in order to prevent evil spirits from kidnapping the souls of family members, were removed. The paper images of the kitchen gods, who watched over the behavior of the family and returned to heaven at the end of the year to tell the Jade Emperor what they had seen, were torn from their places above the stove. . . . The ancestral halls were taken away and the decorations were pulled down and destroyed. The village temples and their images were demolished. The village spirit mediums and the Taoist priest were ordered to stop exploiting the peasants by the practice of their false arts. The villagers were told that if they contin-

> ued to burn incense and worship the gods, they would be denounced at public struggle meetings. (86)

Communists denounced shamans as witches and brought many of them to justice, tortured, and reeducated them. Most practicing shamans today recall this period of political tumult as one of great personal persecution and suffering. Some even attribute the madness that overcame society as a whole to the destruction of temples and other religious sites and artifacts, which angered the gods, who turned away and would no longer listen to the plight of the people, thus allowing legions of demons to run loose upon the earth and possess them. Throughout the various campaigns against corruption and superstitious practices during the Communist period, shamans' careers were often brought to an abrupt halt.

Soon after Deng Xiaoping came to power (1978), there was a loosening of restraints on religion, and people were encouraged to pursue new economic policies emphasizing greater self-reliance and entrepreneurial activity. Collective enterprises were disbanded, and economic activity was returned to the individual family and its members. People were encouraged to go forth and prosper in the new economy. Unfortunately, many of the collective supports, including health care and various other activities supported by public funds, were eliminated for much of the Chinese countryside. In this new freer, somewhat depoliticized economic space, there were new opportunities for those who had been silenced. Throughout China there appeared what seemed to be a grand revival of tradition and traditional activities, although many of these activities were hardly a return to the past, affected as they were by the changes in the present.

It has only been since the early nineties that frequent reports of shamanism on the Chinese Communist mainland have surfaced. Research into these practices, however, is still a task of the future, owing not only to the continuing difficulties involved in conducting fieldwork in the People's Republic of China but also to the official policies still in place against such practices. The Chinese government requires government registration and permits for any and all religious institutions (i.e., Buddhism, Daoism, Islam, Catholicism, and Protestantism), their activities, and their personnel. And most regulations on the administration of religious activities contain the following clause regarding folk religion: "Feudal and superstitious activities, such as fortune telling, using exorcism to cure illness, summoning gods and ghosts to appear, lot drawing and practicing divination, practicing geomancy, pretending to be gods and ghosts, spreading fallacies to deceive people, and swindling people of their money and causing them harm are banned" (cited in Madsen 2000, 91–92).

Such regulations give the government great latitude in dealing with most Chinese folk religion, including shamanism. But in practice the government is not concerned with the activity of the shaman unless said shaman is stirring up unpatriotic sentiments and organizing local resistance to the government and its policies. In most instances the government looks the other way. And many shamanistic practitioners are quick to laud the new economic policies and the government in order to protect themselves from any possible political criticism.

Owing to the size of the Chinese Mainland and the diversity of its dialects and regions, as well as the fact that it contains many minority areas, it is not possible to provide a really adequate summary concerning shamanism in the most recent period. The following example is drawn from the authors' fieldwork in central China. More work needs to be done to gain a clearer picture of what this example means and to have sufficient data to describe the range of variation throughout the PRC. Nevertheless, tentative conclusions can be drawn. The following healing session was witnessed by the authors in the mid-nineties.

An old woman in her early sixties began to have recurrent dreams that seemed to indicate that her relatives would soon visit, yet she had no living relatives except her own children, who, though grown, were residents of the same village whom she saw everyday. The woman also developed a large lump on her wrist that the village clinic was not able to heal. Eventually villagers suggested that she might see the local shaman, so she went to seek her out. Upon hearing about her problems, Shaman Wang told her to return to her house, buy paper money, and fashion a paper house and paper suitcases. As night fell the shaman came to her house to help her. A dinner was prepared for the shaman

and the family and other visitors. Shaman Wang described how her possession involved a voice entering into her from her right hand and shoulder and speaking through her, allowing her to diagnose and treat her clients. She explained that the old woman's dreams were due to the fact that the woman's deceased parents, whom the shaman had encountered in the Otherworld, had been living under another's roof and had been chased out. Now they had to hang around their daughter's house because they had no food or home of their own. They were hungry and cold. The paper images that Wang had told her to prepare were to supply provisions for her parents in the spirit world.

When the meal was almost over Shaman Wang unexpectedly closed her eyes and began humming; then she let out three prolonged yawns. Someone exclaimed that she was possessed, and the old woman moved so as to sit next to her. Everything was quiet for a moment, and then Wang, her eyes still closed, started to sing and chant in a high-pitched, yet audible voice. The spirits had entered her body, and she was speaking in their voices. The voices told the old woman that there were several spirits present and that she should set up an altar to them to burn incense and pray to them. These spirits in her house (they were deities worshipped by the local people) were neglected and unhappy and had caused the lump in her wrist. By setting up an altar she would please the spirits, and they would protect her, bless her with good health, and heal her wrist. She was also told to worship her ancestors for three generations. Finally the spirits told the old woman that she should also do something for the shaman, that is, gather a jin (1.3 pounds) of cotton for her, as she was in need of it. Shaman Wang then yawned several times, and the spirits said they had nothing more to say. She yawned once more and the trance was broken.

The old woman then recalled her dream and interpreted it using the shaman's insights. The shaman instructed the woman to prepare a bowl of water, over which she chanted for about a minute; she then sprinkled this magic water over the old woman's wrist and began to massage it. The shaman's final task involved sending the prepared paper house and suitcases to the old woman's ancestors. Everyone went outside, where the paper items were set on fire. As the old woman threw some paper money into the fire, Shaman Wang chanted instructions to the spirit soldiers who were supposed to carry the paper house and supplies to the netherworld. When the fire died down the old woman tried to thrust a ten-yuan bill (Chinese dollars) into the shaman's hand. The shaman insisted that this was not necessary, but the old woman persisted until the shaman accepted the gift.

Like the descriptions from other parts of China noted above, this episode manifests the traditional Chinese belief that good health and good family fortune are manifestations of harmony achieved between this world and the Otherworld, which is inhabited by ancestral spirits and other deities. Discord, sickness, and irregularities come from the neglect by human beings of the spirit worlds, or the wrong exercise of human free will. To avoid misfortune and maintain harmony, human beings must make offerings (in the literal sense) to these spirits. If denied shelter and food, spirits will be hungry and dissatisfied, and they may become active in bringing evil to the world of the living. Thus, the parents of the old woman who sought healing from Wang had died during the Cultural Revolution, when burial rituals and ancestor worship were severely criticized, and she had not been able to engage in the appropriate practices for securing the happiness of her parents in the Otherworld. Since 1949, ancestor worship had been under heavy attack, and popular rituals such as offering food to the spirits had been considered backward, superstitious, and feudalistic and were suppressed in public. Such attacks reached their climax during the Cultural Revolution, when the suppression of popular rituals extended to the domestic realm. Family altars as well as village temples were dismantled and destroyed.

Shaman Wang's father was one of the first Communist Party members in his village to lead the attacks that helped to tear down village temples and destroy family altars that were used to worship the ancestors. According to Wang, the spirits left homeless by these actions became angry and hungry ghosts. Many years later, they had reentered her body and wanted her to speak for them and to heal patients; at the same time her father was stricken with cancer as a retribution from the gods for his actions. This connection between the acts of her father during the Maoist period and her pres-

ent shamanistic role further legitimizes and validates Wang's practice under the current regime, where the previous extremes of Maoist policies have been discredited. Wang had experienced a period of "madness" a number of years after the Cultural Revolution and was eventually led to a shaman in a neighboring village, who treated her and asked her to become her student. Wang apprenticed herself to this shaman until the early nineties, when she started to see images of the gods and hear their voices on her own. She then began to see patients. Her history prior to her calling was undistinguished. She had had some elementary education, had started working in the fields in her teens, and had married and had children soon after that.

Since the early 1980s the Chinese countryside has witnessed a flourishing of popular religious activities such as fortune-telling, temple rebuilding, temple pilgrimages, Daoist masters presiding over funerals, and feng shui (geomancy) masters hired to choose housing and burial sites. Shamans practicing in the role of traditional healers and as contacts with the spiritual world also seem to have joined in the array of religious activities that have resurfaced. Much of this return to tradition, though, must be reframed within the new space that has been created by economic reforms and prosperity on the one hand and a loosening of political control in local areas on the other. Since many of the shamans who are practicing today matured during the Communist period, it is inevitable that many of their practices are an amalgam of old and new, reinventions of tradition that respond to their own time and history. Nonetheless it is a reliance on some idea of a traditional belief system that allows individuals like Shaman Wang and her mentor to perform their acts of healing. It is the idea of the shaman as the mediator between this world and the other that seems to have proved resilient throughout greater China in all its diversity.

NONG SHAMANISM (SOUTH CHINA)

Among the Nong of southern China there is one kind of religious practitioner, entirely female, whose characteristics are close to those of a classic shaman. These shamans were able to continue practicing in secret even during the Cultural Revolution, and they still play an important role in the life of the Nong.

Background

The southern province of Guangxi in China numbers some 15 million Zhuang, and hence was proclaimed the Zhuang Autonomous Region in 1958. The term *Zhuang* appeared for the first time during the Southern Sung dynasty (1127–1279). This Zhuang minority group includes an ethnic mix of Thai speakers, including the Nong. This group occupies a territory located between the Xi River's two tributaries, the Zou and the You, in the southwestern part of the province. Following revolts led by chief Nong Zhi-gao in the eleventh century, a large proportion of the population took refuge in North Vietnam, where they can be found today, between Langson and Caobang.

The Nong practice *bu-luo fu-jia* (non-residence with the husband). The young bride lives with her parents until the birth of the first child, which must take place at the husband's home. Descent is patrilineal (according to the father's kinship). Inheritance concerns only the house and personal goods; the fields are not included in any division, since according to the laws of China "The land belongs to the entire people" (Cauquelin 1994, 19).

Professional religious practitioners among the Nong may be divided into five categories.

Mei mot, or *po mo,* is translated as "sorcery" when it occurs in Chinese texts. Richard Pottier explained: "The term *mo* designates, in Lao language, any individual gifted with a particular talent, knowledge or power, especially doctors, magicians, astrologers, soothsayers, musicians, etc." (Pottier 1973, 107).

Dao gong are priests, and always men. On the whole, they claim to follow Daoist practices, but some of them claim to be Buddhists. They are in charge of funerals.

Mot dao are also men. According to a survey done by the author, these men play the role of soothsayers, healers, and intermediaries between the population and Chinese institutions. During rituals, mot dao use the Nong language to call upon Daoist and Buddhist divinities, such as the Three Pure Beings, Buddha, and the like. They make their diagnosis using divining rods and heal the sick using oriental medicine. In some villages, they can replace the dao gong and accompany the soul, but to the southern rather than the western paradise. It seems probable that the mot dao are former healers who have lost their jobs to national medical practice, represented by small local dispensaries, and have taken on some of the rites practiced by the dao gong.

Mot nam are women. It appears that the rituals they perform are limited to the intoning of popular tunes known as *mot leng.* They do not possess any ritual objects and are probably subject to Daoist influence.

Mot nang ai are also women (*nang ai* here means "moon goddess"). During the moon festival, which takes place each year on the fifteenth day of the eighth month in Jingxi, two or three women are possessed by this goddess. They also reveal that they have been chosen by her, and undergo an investiture ritual. They are renowned for the recovery of lost souls.

Additionally, there is another kind of religious practitioner, known as a shaman, who also recovers lost souls, like the mot nang ai, but has other functions and is identified by the possession of a spirit-elector, the *paq.*

Becoming a Shaman

The Nong use the system of the "eight characters" (the four cyclic binomials that situate an individual's birth: year, month, day, hour) to determine each person's destiny. Only those who have what is called a light destiny "can travel into the supernatural world, and attract spirits," according to the Nong. "A light destiny" is the sign of spirits. Very early, children who have this destiny manifest strange behavior and sudden personality changes: For example, a silent child will become talkative; an-

other will remain white and drawn for hours. People fear a decrease in their own "breath of life" via contact with a "light-destined" person, and familiars keep their distance, while adopting a respectful attitude toward that person. Those with a "heavy destiny," on the other hand, have no contact with spirits, who are afraid of them.

Auxiliary Spirits

One can only be a shaman if one possesses a spirit-elector, that is, a certain kind of spirit who chooses one, the paq. The paq is allied to Maolang, the chief of the troop of auxiliary spirits, and reveals itself in the form of a horse, which the shaman uses during the ritual to reach the "Flower Garden," where the paq live with the other spiritual beings. The shaman's soul then crosses a bridge to enter this Flower Garden, where it goes to talk, and sometimes quarrel, with the spirits, or so it is said. Shamans say that in this place the houses are magnificent, the gardens are full of flowers and planted with great trees, and rivers wind through the beautiful landscape. Each paq has a personal name. A paq never dies. It is freed at the shaman's death and goes away to choose another person to begin a new life. The paq undertakes this step either as soon as the shaman dies, or a few years later. The Nong call this endless progression of the spirit elector from one shaman to the next, *mot tēt,* "transmigration of the *mot,"* (*te:t,* literally, "the spasms shaking the body before death"). This shamanic lineage is independent of kin relationship.

The Flower Garden where the paq and the other spirits live owes its name to the correspondence established between flowers and children's souls. Every child's soul has its double, a flower soul in the Flower Garden, and when the child reaches adolescence, this double becomes a star soul. On the ancestors' altar of every house, an offering bowl is dedicated to Grandma Flower, who watches over children. Grandma Flower does not look after adults, since their souls are taken care of by other spirits. The biological soul is lodged in the heart, and is reflected as in a mirror in its star-double in the sky. During dreams, illness, and nightmares, the soul flies out through the head, and the "reflection in the mirror is blurred"; the double becomes dull and ceases to shine. It is through this lack of light that the shaman discovers the illness. The temporary absence of the soul housed in the heart does not necessarily lead to death, and the shaman must recover it and reincorporate it in the patient's body.

At death, the star soul "falls down." The biological soul likes to wander. Some of its escapades require the intervention of a shaman to recover it, others, on the contrary, are voluntary: For example, during a ritual, a young girl may send her soul wandering into the invisible world. The diagnosis is obvious—this is the mark of a paq's presence.

Symptoms of Election

The Nong describe two forms of election, passive and active. In both cases, illness is the symptom of election by a paq, which occurs during adolescence.

Passive election is shown by disorders caused by the paq: illness, anorexia, repeated fainting fits, climbing cliffs, trees, or the roofs of houses, loss of sensations of cold and heat, unawareness of danger, and others. These first symptoms are followed by others that enable a diagnosis to be attempted, such as the recitation of ritual words, or the journey of the soul into the spirit world during a ritual. Most often the family circle tends to speak of madness. A shaman performs the ritual *sāiksi* to confirm the presence of the paq.

Active election also involves a disturbed girl, who meets a shaman during different rituals she performs. Sometime after being cured, this girl talks to herself and recounts in detail specific episodes of what she calls her life—in fact, of the life of a child who has died an early death in the region, even though, as far as anyone knows, she does not know either the child or the events of the child's life. Witnesses identify the child and are convinced that the child has chosen rebirth expressed through this girl.

Whatever the means of election, novices will all undergo the same apprenticeship and are in the same category. Their functions are identical; the only difference is internal, and it is not of interest to the population in general. Shamans, however, reply unambiguously if asked the question. The great majority of shamans have experienced passive election.

Apprenticeship

A girl chosen by a paq cannot escape her destiny as a shaman. Her family knows this and accepts it, and yet they fear complications. If the parents wish to postpone their child's destiny, they ask a shaman to "lock up the eight characters." The shaman "writes" (in fact, pronounces, since shamans do not know how to write) the girl's eight characters on a piece of red paper and locks them up in a jar, which she seals with a talisman. Then she asks the paq to immerse itself in a bowl of water, drinks the liquid, and sprays it onto the talisman. In this way, the paq loses track of the girl. This ritual requires the participation of a competent shaman, otherwise the paq resists. Parents do not oppose their daughter's fate, but simply wish her to be able to enjoy a love life before her investiture. As the Nong saying goes, "Shamans are often sterile."

Whatever curative treatment is used, after three or five years the paq becomes restless, and the ritual to "free the eight characters" must be performed and a teacher must be chosen. A girl who has experienced passive election listens to her paq, who guides her to the house of the shaman who will educate her.

If a girl has experienced active election, her biological and adoptive family (the family of the dead child having become her adoptive family) decide to send the girl to a shaman to celebrate the "wine rite," which, according to the Nong, resembles the welcoming ritual for a newborn baby. The shaman sits down in front of the ancestors' altar, holds her new disciple on her lap, chews some rice, and transfers it to the novice's mouth, as a mother does to feed her newborn child. Then the shaman leaves the girl on the mat, playing with her ritual objects like a baby with its toys. She becomes a disciple. The novice is reborn in the arms of her spiritual mother. The novice then calls her teacher paq. The close relationship between the shaman and her disciple is expressed in this term of address.

Whether chosen actively or passively, all disciples undergo three months of apprenticeship. The novice learns to sit in the lotus position for hours on end, manipulate her fan, ring the bells, memorize chants, and learn sign language. At the end of the first month, the girl's family goes to the shaman's house to celebrate the first-month ceremony; the novice can then follow her teacher and assist her in rituals. Once again, the disciple, like a baby, must wait for this ceremony before she can "go out."

The Investiture Ceremony

After three months' training, the disciple is free to leave her teacher. But she must first undergo an investiture ceremony. Her blood sisters prepare, at the shaman's house, the meal known as "the wine closes the belt," which may be translated as "the ceremony of the award of the belt." Her sisters must give the square of embroidered silk that covers the shaman's legs, the headband and veil, the embroidered shoes, and the ritual belt, which is tied around the new shaman's waist by her teacher. Her teacher presents her with the ritual objects: the fan, the chains, and the bell. The disciple becomes a shaman. She has gone through the different stages that will make her a professional, but her fame is not yet established, so she stays with the old shaman and assists her in rituals, playing a more and more important role. In all cases studied, incidentally, the teacher who trains the apprentice is not the one who revealed the paq's presence a few years previously to the passively chosen shaman.

Functions of the Shaman

Women shamans are responsible for the cohesion of the Nong group in the Jingxi region. They take care of all sociological and biological disorders and take charge of the souls of those dying an untimely death. During exorcisms, the shamans take these restless spirits home, place them under their altar, and "bring them up" as parents bring up their children, rendering them harmless. They also go in search of souls that have escaped through the top of the head; in this respect they seem to be in competition with the mot nang ai. However, they never take charge of funerals, which are reserved for the dao gong. According to the shamans, it is thanks to their paq that they have been able to survive the political upheavals in China. They remind us that a paq never dies, and so no temporal power, however repressive, can oppose its transmigration. During the dark years of the Cultural Revolution (1966–1976), the shamans practiced in secret. Their omnipresence and the recruitment of young

shamans is proof of their perseverance, their ability to not only survive but thrive in the contemporary world.

QIANG RITUAL PRACTICES

In a remote and mountainous part of western China lives an ethnic group known as the Qiang, Tibeto-Burmese language speakers, whose identity has been preserved and shaped by ritual practitioners who have some of the characteristics of shamans. The rituals of the Qiang, the practitioners who carry them out, and the language of the people are all in danger of disappearing with the urbanization and modernization of the region, but enough remains to provide an opportunity for studying a distinctive kind of ritual practice and the people who carry it out. Information in this entry is drawn from the author's interviews with the duangong Lao Beizhi (1995–1997) and Yu Yao Ming (1996–1997) in Sichuan, China.

Background

The Qiang people are one of the fifty-six ethnic groups living in China today. *Qiang* is a name given by the ancient Han Chinese to the nomadic people in western China. In their own language, they call themselves *Erma* people, meaning "our self." They inhabit the mountainous regions in the northwestern part of Sichuan Province in western China. The Qiang are recognized as "first ancestor" culture due to their ancient roots; evidence on bones and tortoise shells shows that the Qiang were living in communities in northwestern China during the Shang dynasty, circa sixteenth–eleventh centuries B.C.E. (Zhang and Zeng 1993, 144). Some Qiang were assimilated by the Tibetans, and some Qiang by the Han, leaving a small number unassimilated. This group gradually moved to the upper reaches of the Minjiang River and eventually became today's Qiang nationality, with a total population of about 198,000.

The Qiang people live in villages situated in difficult topography. The steep mountains with crisscrossing turbulent rivers prevent homogeneity or unity among the Qiang. Historically dominated by both the Tibetans and the Han Chinese, the Qiang have never been a unified political entity. The Qiang live in stone-fortress homes built on the mountain cliffs. There are also a growing number of urban Qiang, residing in Chengdu, the capital of Sichuan province, numbering about 600. Since the early 1980s, China has been opening to the outside world. As a result of efforts to modernize and promote economic development, enormous changes are taking place for both individuals and within the social body. These changes are influencing the ancient belief system and traditional customs of the Qiang culture. Although the Qiang people have their own language, most speak Mandarin Chinese, and a few are even learning English in the hopes of obtaining better jobs outside of the village. Therefore, the Qiang language could be considered to be an endangered species. More and more villagers, after obtaining changes in their household registrations—easier to achieve now, though it is still a rigorous process—are able to move to the county town, where they pursue a variety of jobs, sell their crops in the free markets, or perhaps open small shops. In the villages, they are primarily farmers, raising crops such as corn, buckwheat, potatoes, vegetables, apples, walnuts, tobacco, hemp, and livestock—pigs, chickens, goats, yaks, oxen, mules, and dogs.

In Sichuan province, the Qiang inhabit primarily the counties Maoxian, Wenchuan, Lixian, Songpan, Beichuan, and Heishui of the

Aba Tibetan-Qiang Autonomous Region, an area interspersed heavily with Tibetans and Hui (Muslims), as well as Han. Although this area was opened to outsiders in the 1980s and tourism is being actively developed, it is officially considered a minority area. Linguistically, the Qiang language is part of the Tibetan-Burmese branch of the Sino-Tibetan family. Qiang language is categorized into northern and southern dialects, with five and four subdialects, respectively. As mentioned above, most Qiang are bilingual, speaking Mandarin Chinese as well as Qiang, until recently an exclusively oral language. It is quite often the case that residents from villages twenty kilometers apart have trouble understanding each other, if they speak in the Qiang language. Beyond the very obvious aspects of language, this diversity among the Qiang is also evident in their customs, music and dance, and religious practices as well. Several years ago, Chinese linguists developed a script and educational materials in hopes of salvaging the Qiang language, and there are pilot language programs now in place in the village schools.

At the center of Qiang culture stands the shaman, *duangong* (in Chinese), called *Bi* in the Qiang language. The Bi is the keeper of the culture, the scholar of the community. Although there are several stories of female duangongs in the past, and there is no limitation as to gender, there are no living female duangongs at this time, and so in what follows the masculine pronoun is used. Among his many responsibilities, the Bi coordinates the relationships between human beings, spirits, and deities for the welfare of all the villagers. Like the Qiang language, the Bi's skills, knowledge, and wisdom—as well as his tools and implements and practices—traditionally transmitted orally from generation to generation, are endangered. Since a growing number of children and young adults today cannot speak the Qiang language, the duangong has also become a keeper of the language, and as he recites the chants and songs, the words themselves are emblems of the changing culture. The Qiang sutras have no written form and were memorized by the duangongs when they were youngsters. Yet it is the case now in more and more villages that only elders know the Qiang language.

Qiang Belief System

The Qiang's belief system has been influenced by Daoism, Buddhism, and even Christianity (via missionaries). There is great variety in spiritual beliefs, even between villages within close proximity. Generally, there is belief in souls and in spirits, ghosts, and demons. Some people have adopted the Chinese belief in three major souls and seven lesser souls (Graham 1958, 43). There is belief in reincarnation and fate as well as regular practice of ancestor worship. The Qiang believe in a large pantheon of gods; unlike the Chinese and the Tibetans, however, both of whom make images of their numerous gods, the Qiang have no holy images of their gods. There are two possible exceptions: AbaMulah, the original duangong, and the King of Demons, often carved on the duangong's sacred staff. The AbaMulah is a monkey skull wrapped in bundles of white or brown paper. Once each year, the AbaMulah is wrapped with another layer of paper.

The Qiang people hold a polytheistic belief system based on animism; basically, they worship gods associated with nature and ancestors who are believed to have become gods. People offer sacrifices to the gods of nature; the ancestor-gods are enshrined in the family house. There are five great gods and twelve lesser gods worshipped in each village (Graham 1958, 46) as well as a variety of other gods, such as mountain gods, tree gods, door gods, god of fire, god of domestic animals, a god of wind and rain, a god of births, occupational gods (hunter, stonemason, blacksmith), a god blessing women in their work, and a god blessing men in their work. Many Qiang people believe Chinese gods, such as kitchen gods and house gods, to be real deities and worship them regularly. According to Wang Kang and his colleagues, there are up to forty-eight kinds of gods. "All the gods, with the exception of *Abamubita* (God of Heaven), are of equal rank and assume social functions and duties within certain limitations. For instance, the god of a certain mountain can only govern this mountain; the god of a certain place can only rule that place. There are no degrees of seniority among the gods, nor are any statues of them given. People can choose any god(s) to worship according to their needs" (Wang, Li, and Wang 1992, 14).

The religious practices of the Qiang are the most complex aspect of Qiang culture. Their religious customs encompass a diverse and vast array of activities. Dress, food, residence, travel, marriage, funerals, festivals, daily life etiquette, and social contacts—all have strong links to the religious customs. Since the Qiang language has no written form and its spoken forms are quite numerous and distinct from each other, these religious customs vary greatly from locality to locality and even from village to village. Without question, the most visible and distinctive element of Qiang culture and religious practice is the white stone. Commonly found in all areas where the Qiang reside, the quartz stones are enshrined on roofs, towers, and mountains, in fire pits and field and forests.

The Duangong and His Artifacts

The duangong wears no special clothing and in fact lives an ordinary, everyday life, with family and fieldwork responsibilities no different from anyone else in the village. The duangong's tools and implements, however, are emblematic of the spiritual place he both holds for and carries within the community. The duangong is believed to have contact with the gods and spirits. It is believed that the duangong can prevent and heal diseases. He also calculates (through divination and fortune-telling) the best dates for important events in community life, carries out rituals and ceremonies, and conducts sacrifices and blessings. The duangong deals with spirits on three levels: upper, middle, and lower.

The tools and implements of the duangong are sacred, handed down from duangong to student after the teacher dies. There is great variety in design, though not in function, between the implements of the Northern Qiang and the Southern Qiang. Generally, it is believed that the tools hold supernatural powers, which increase with age. The Qiang have no holy statues for their numerous gods; even at shrines their positions are vacant, represented at most by white stones or incense sticks. It is important to note that most duangongs now practicing do not possess an entire kit of tools, and may even lack a tool kit altogether. Some items, or even the whole tool kit, may have been destroyed or lost. The most important tools of the duangong include the following:

The White Stone

The quartz stone is believed to provide protection. Such stones are often collected and placed on shelves above doors and windows on homes. There are many legends about the origin of the white stone. To the outsider's eye, the white stone is remarkable, set against the landscape of mountainsides covered with mudslides.

Language

As noted, language is included in the duangong's tool bag. Just as the hat is worn and the drum is played, the texts of the epics and chants are draped around the duangong. An indispensable element in the ceremonies and rituals performed by individual duangongs, language, which is subject to the restrictions and demands of the Han majority, is also used as a sign of identity by the Qiang community.

Monkey Skull

The AbaMulah, as discussed above, could be considered the most sacred item for the duangong. This is the only holy object worshipped and enshrined, often held in a special drawer.

Hat

For Southern Qiang, this is stitched together from a golden-haired monkey skin. In some cases, the eyes and ears and tail are left on. The hat is decorated with cowry shells and small round plaques, made of silver or brass or copper. For duangongs of the Northern Qiang, the hat is made out of leather, usually five rectangular boards stitched together, sometimes with painted images on each. In both the north and the south, the duangong's hat is considered holy and efficacious.

Drum

The Southern Qiang use a single-sided sheepskin drum constructed on a wooden frame and played with a drumstick, usually covered with monkey skin. A pair of copper bells may be

hung inside the drum on a wooden crossbar. The drum is often heated in front of a fire to tighten the head, a procedure that is useful in producing a pleasing timbre when the drum is played. For Northern Qiang, the drum is quite different: It is a small double-sided handheld drum on a stick, with small balls attached on a leather thong. The stick is held in the hand and twisted or rolled back and forth, and the balls, like a child's toy, bounce around, hitting the skins and producing a relatively high, tinny timbre.

Holy Stick

Made out of wood, this looks like a walking stick and has three parts: the handle, the middle wooden pole, and the iron tip. The handle often has a head carved into it, sometimes two faces and sometimes just one face. The head is also said to represent the King of Demons, useful for the rituals the duangong does to drive out the devils from a sick person. The staff is rugged and knotted, sometimes shaped like a spiral or coil.

Small Gong

This gong, made of brass or copper, with a leather handle, has a tapper inside. It is used to drive away demons.

Dagger

Used to kill the sacrificial goat or sheep or chicken, the dagger can also be employed to make small flags and straw men for ceremonies.

Magic Seal

Usually made from iron or bronze or brass with Chinese characters, the magic seal is used to print charms on paper.

Spell Board

The spell board is a wooden printing board with Chinese characters used to print charms on paper. Often the duangong has two, one long and narrow, the other wide and short. Spells printed with the former board are used to treat the sick; they are burned in open places or pasted up on walls or burned and then eaten by the patient. Charms produced by the latter board are used for the villagers' animals, pasted up on the pigsty or sheepfold to provide protection.

Sacred Bundle

The sacred bundle is a valuable item for Southern Qiang duangongs. It includes horns of wild animals such as mountain goats, seashells, bones of birds, shoulder blades, claws of hawks and eagles, small brass horse bells, Chinese coins kept as charms, and tusks of musk deer, wild boars, bear, leopards, and tigers. The equivalent for Northern Qiang duangongs is a holy necklace—heavy and long, with many of these objects strung on a leather cord.

Horn

Probably from an antelope, the horn is used to exorcise the demons. Both David Graham and Wang Kang and colleagues concur that the horn is used specifically in a water ritual to relieve pain in a patient. Holding the horn in a digging posture, perhaps even sticking the point into the ground, the duangong chants "Get out and go home" and then pours some water into the ground where the spirit was disturbed. The patient is then healed.

Divination Book

This is a reference book used to calculate the best dates for life events including marriage, to arrange funerals, and to predict good or bad luck in making big money. It contains folding pages of colorful images of people, constellations, and the twelve animals of the Chinese zodiac. When consulted, the duangong uses the pictures selected and gives interpretations.

At first glance, it would appear that the duangong is a shaman. As a holy priest, he plays a drum and is constantly sought out to heal the sick. He is believed to have mysterious powers and deals with the world of spirits, demons, and ghosts. Wang Kang and his colleagues make a convincing argument that the duangong carries out some functions of a shaman but that the duangong is, at the same time, quite different from a shaman (1992, 78). Briefly, their argument can be summarized as

follows: The duangong carries out several roles, including presiding over religious ceremonies (Graham labels him as priest), carrying out of magic spells to relieve people of evil spirits, acting as a wizard, as healer, doctor, and psychologist, treating patients for their sicknesses, and at festivals and major gatherings, organizing and performing the Qiang epics, myths, and legends, thus acting as the community's intellectual and scholar. At the same time, the duangong is an ordinary member of the village and never makes his living as a duangong professional. Although both shamans and duangongs deal with the spirit world, using magic and special chants and the drum, duangongs deal with a wide range of spirits and have the supreme AbaMulah god in common, while shamans often deal with a much smaller number of gods and each shaman has a personal protector god. Shamans generally have been chosen by the spirits to become shamans (often after a test or life-threatening event), whereas anyone can become a duangong as long as he completes the training and education. Often, shamans receive the spirits in a state of trance or possession; duangongs never do. Possession and trance do occur during some rituals, but this happens also with other people, often called *tongzi,* and hence is not an exclusive mark of a shaman.

SPIRIT WRITING IN HONG KONG

Spirit writing is one of the prominent features of shamanism in Hong Kong, a form of the ancient shamanistic practice in China. Shamanism in Hong Kong is derived largely from Cantonese religious traditions, given that Hong Kong, Kowloon, and the New Territories had been part of Guangdong province (of which Canton is the major city) prior to British colonization (1841–1997). There are three forms of "Cantonese shamanism": (1) The shaman's body is possessed by heavenly deities who speak and sing their messages to humans (in Cantonese, a shaman of this type is called *bai san po,* "grandmother who worships the gods"); (2) the shaman's body is possessed by departed souls who may or may not be in heaven and who also speak and sing their messages (in Cantonese, a shaman of this type is called *man mai po,* "grandmother who asks those who are lost," or *man gwai po,* "grandmother who asks the ghosts"); (3) the person's hands are possessed by spirits who choose to write their messages, rather than speak and sing (in Cantonese, the procedure is called *fugei*).

As indicated in the terminology, those in the first two categories of shamans are all older women, whereas the third category may be either men or women. In Hong Kong, the first two categories of shamans seem to be found only in the lineage villages of Hong Kong's New Territories, the area that abuts the mainland of China (see Liu 1995 and Potter 1974). The "lineage villages" here refer to the villages that consist of certain lineages and whose villagers are bonded under a traditional Chinese kinship system. Since these lineage villages have undergone massive restructuring in recent decades, with most of the original population having moved elsewhere, the traditional shamanism associated with such villages has also gone into decline. There is little evidence that such forms of shamanism have diffused into the more urban areas of Hong Kong, probably because of their specific association with lineage ideology and organization.

Thus the prevalent form of shamanism now found in Hong Kong is fugei, "spirit writing," whereby spirits send written messages to humans via the mediation of human "spirit writers." All spirits can speak, but only educated

spirits can write. Given the high value that Chinese people place on education, this makes spirit writing (pinyin: *fúji*) a superior form of shamanism.

Most shamans use voice to transmit messages between spirits and humans. Chinese spirit writers use a different method—a stick that writes messages from the spirit world. Spirit writing can now be found mainly in Hong Kong and Taiwan, although it was once prevalent also in Mainland China.

Spirit writing brings messages from powerful and wise spirits. These spirits are considered to be gods *(shen)* in the Chinese context, even though most of them were once humans before they ascended to heaven and became immortal. These spirits offer remedies for all kinds of problems to reverent petitioners. They may also deliver sermons on morality and virtue, along with veiled prophecies about the coming year, to small groups of worshippers who have gathered around a particular spirit writer.

The technology of spirit writing is simple. The spirit writing stick is usually Y-shaped, with one or two spirit writers holding the branched end of the stick and the stem tracing the characters. Some spirit writing uses a basket with a stick inserted through it. The stick traces characters on a table or tray, which is usually covered with a layer of sand. If sand is used, the tray is scraped after each character has been identified and recorded, to prepare for the next character.

Spirit writing is a collaborative enterprise, and requires a minimum of two persons: one to write the spirit messages on a table, calling out each character as it is written, and a second person who serves as the scribe and writes each character on a piece of paper or in a notebook for later use and study. The mood in sessions with only two participants is often casual, with no obvious manifestations of trance. However, the person doing the writing—the spirit writer—claims not to know what he or she is writing. Rather, the spirit is guiding his or her hands, which are thereby possessed. It is this partial spirit possession of only one part of the body—the spirit writer's hands—that makes this ritual less intense than full-bodied spirit possession entailing trance states. As a result, spirit writing does not look very different from an outpatient clinic where a doctor receives patients and writes out prescriptions (except that the petitioner will often kneel before a statue of the god while the spirit writer is busy producing the god's message).

In this type of spirit writing operation, the petitioner writes down the question on a specially prepared piece of paper provided by the organization that sponsors the sessions. The questions are answered patiently by the spirit writer, one by one, and the scribe hands each petitioner a copy of the message or prescription provided by the deity for that particular question or problem. The spirit writer is not supposed to know the content of the question—only the spirit knows—but at some sites the spirit writer and the scribe retain the paper containing the original question and may discuss it after the petitioner has left. The next time the petitioner comes for a consultation with the deity, the spirit writer probably knows the type of question that the petitioner will ask. In any case, these sessions are calm, quiet, and businesslike. But some sessions involve a larger number of participants in the spirit writing, and these sessions are usually more intense.

The number of persons who collaborate in the spirit writing session indicates the seriousness with which an organization's members devote themselves to this practice. The most complex form of the procedure was observed by the authors at a session in a small temple near one of Hong Kong's satellite towns in April 2002. About thirty people attended the session to watch the messages arriving from the spirit world and to seek instructions and guidance from the spirits. There were seven persons involved in the actual spirit writing: two persons to hold the writing implement (in this case, a basket with the stick protruding from the bottom of the basket), two others to announce the characters and to check that each announced character had indeed been written by the stick, a fifth person who scraped the tray of sand after each character had been written, and two scribes who separately recorded each character in the message to be sure they did not miss anything. The members of such organizations are fervent believers, who look forward to the god's messages and study them carefully later.

What do people seek from these spirit writing sessions? In Hong Kong, as elsewhere, spirit writing is mainly devoted to personal and medical problems. Petitioners come to the spirit writing sessions to ask about various difficulties

in their lives and to seek remedies and prescriptions for their ailments. Spirit writing sessions may also produce pronouncements about morality and righteousness. Like other forms of spirit mediumship (Lewis 1989), spirit writing can provide the focus for a sectarian worship group (Jordan and Overmyer 1986) and can occasionally lead to the development of a new cult (Lang and Ragvald 1998). In the past, spirit writing has also played a role in the founding of new temples and in justifying the migration of god cults to other cities (Lang and Ragvald 1993).

Medical problems are the simplest of the questions that petitioners bring to these sessions. When city dwellers ask for help with a medical problem, there are several possible responses. The most frequent response from the spirits is to prescribe Chinese traditional medicines, available from any local Chinese-medicine shop. The spirit writer produces the list of ingredients, along with instructions for preparing them. Some of the persons who serve as part-time spirit writers actually work in the area of Chinese traditional medicine, as shop owners or herbalists. Thus, they are familiar with traditional remedies for various ailments.

Petitioners also ask about distressing family problems. For example, at a large public Daoist temple in one of Hong Kong's satellite-towns, on a hot Sunday afternoon, a middle-aged woman named Stella (a pseudonym) came to the temple to ask for guidance. Stella had previously asked the deity for help through spirit writing for her medical problems. She was taking Western medicines but had experienced unpleasant side effects, and with the deity's apparent approval she stopped taking the medicine and switched to Chinese herbal remedies. Stella's problems, however, were much deeper. She had come today to ask the deity, for the second time, about her marital troubles. Her husband, like many other Hong Kong men who travel regularly to Mainland China on business, had taken a mistress, or "second wife," across the border. (On the second-wife phenomenon in southern China, see Lang and Smart, 2002). Deeply distressed, Stella came to ask the god whether her husband had left his mistress (as he had apparently claimed) or whether he still secretly lived with the mistress whenever he traveled to China for business. In a previous visit to the temple, Stella had asked the same question, and had received the following reply: "In the midst of the fog, the sun's rays are shining through at an angle; after you recover what should return to you, the responsibility is not ended." Stella interpreted this message approximately as follows: "Your husband is now charmed by the 'second wife,' but their relationship is going to end. When your husband returns to you again, you will still have to be attentive."

On this day, Stella asked whether her relationship with her husband was good enough to survive these difficulties. The deity replied: "When you strike the plank, that constitutes a fact; when you reach the time, then it is easy to settle the matter." The deity seemed to be saying: "The facts cannot be changed. When everything has settled down, it will be all right." But Stella was not quite certain what the deity was trying to tell her. She really needed someone's help and advice, and the deity provided, at best, ambiguous answers. Nevertheless, Stella had returned for more counseling and reassurance from the god. Such poignant stories can be heard at any spirit writing shrine in the territory.

Spirit writing may also be used to provide a deity's comments on current or imminent events. This is rare, and not many spirit writers have the courage and the skill to do it successfully. There are many risks in such an enterprise: Making a mistake about impending events, or offending some patrons with the wrong analysis, are the most obvious risks. However, Chinese spirit writing, like shamanism and spirit writing in many other societies, is occasionally used for such purposes. Shamans use their roles as intermediaries with the spirit world to analyze the struggles within their own societies (Vitebsky 1995, 116–119), and Chinese spirit writers also cannot resist the call of such events. For example, in 1989, around the time of the June 4 events in Beijing, during which hundreds and perhaps thousands of civilians were killed by soldiers attempting to clear Tiananmen Square, a private spirit writing session in Hong Kong produced a message that electrified those attending with the opening words, "The blood of the ignorant children is running as a river . . ." (Lang and Ragvald 1993, 158). The members of this private temple later printed the full message to demonstrate that their god had foreseen the tragic events.

Another small spirit writing operation, headquartered in a suburban Hong Kong temple, now produces a number of predictions in March of each new year and publishes these messages on the group's Web site. In 2001, for example, this spirit writing operation produced the following message from a Chinese deity: "The East will rise, and the West will sink; such are the affairs of the gods." They printed this message and posted it on the wall in the shrine, accompanied by their interpretation of the message. They believed the message had predicted the following: "China will enter the WTO [an event that occurred later in the year]. The economy of China will continue to grow, while the economies of the Western powers will decline." The prophecies in March 2001 also included the following: "The bing-shen month [September] will cause the qi [energies] to be in discord; the sky will clash with the earth, and evil people will arise; everyone at this time will feel panic, and the six spirits [of the household] will be in disarray; in the middle of the night, orphaned souls will cry." After the terrorist attacks on the United States on September 11, 2001, they decided that this statement from the spirits had been a prophecy of those events. Alas, the prophecy was too subtle to provide forewarning.

SPIRIT MEDIUMSHIP (SINGAPORE)

Chinese spirit mediumship in Singapore is derived historically from religious traditions in southern Fujian province, where the ancestors of most Singaporean Chinese came from. (See de Groot 1886 on religious practices in southern Fujian in the nineteenth century.) Spirit mediumship of this type is also practiced in West Malaysia and Phuket in South Thailand. (See, for example, Cheu 1988 and Cohen 2001).

Why are some people spirit mediums and not others? It is commonly believed that spirit mediums are people fated to have short lives. This belief is expressed in the Chinese term used for referring to mediums, *dangki* (in the Minan dialect spoken by Singaporeans of Fujianese ancestry) or *tóngji* (in its Putonghua equivalent, although it is doubtful whether this term is found outside southern Fujian). Significantly, this term literally means "child medium." Those with the fate of a short life are described as having a "light eight-character fate" (*pàzi* in Putonghua)—the "eight characters" being the symbols for the year, month, day, and hour of birth. When spirit mediums are possessed, their bodies are intermittently occupied not by their own souls, but by the possessing deities. This intermittent suspension of their souls from their bodies enables the spirit mediums to live longer lives, by spacing out their limited amount of soul over a longer period of time. For this reason, spirit mediums claim to have no recollection of what happens

during the time when their bodies are possessed by the gods. They cannot remember because their souls were absent; only their bodies were present. It is also for this reason that older spirit mediums are said to be particularly *líng* (powerful). Their age is taken as proof that the gods have truly possessed their bodies, thereby enabling their originally fated short lives to have to been prolonged.

The belief underlying Chinese spirit mediumship is that the medium's body becomes the physical embodiment of a deity, as the image of a deity does, with the difference that the god embodied in the medium can talk and move. Mircea Eliade's differentiation between shamanism and spirit mediumship is relevant here (Eliade 1964). Whereas shamanism is associated with mastering spirits, spirit mediumship is associated with being possessed and controlled by spirits. In Chinese spirit mediumship, however, this logic of possession is limited to the medium's body, and it does not extend to the medium as a person. Outside of the periods of spirit possession, the medium is seen only as a devotee among other devotees.

How is it possible to tell that a medium has been possessed and is, for that moment, no longer himself or herself? The state of possession is ritually demonstrated by signs of loss of control over one's body, such as intense shaking, ritualized violence self-inflicted upon the body without getting hurt (also called self-mortification), and unintelligible speech uttered during possession.

By inflicting ritualized violence on their bodies without getting hurt, mediums demonstrate that they are, for that moment, more than mere mortals. This is done in standard ways, including licking burning joss-sticks (incense), cutting one's tongue with a sword, sticking metal skewers or a wooden pole through one's cheeks, striking one's back with a ball of spikes, climbing a ladder of knives, or bathing in a cauldron of boiling oil. While possessed, the medium utters unintelligible speech, which is supposedly the divine tongue of the deity. This requires translation by an interpreter blessed with the ability to understand. From a devotee's point of view, utterances in this divine language are the most important manifestation of the deity's presence, as these express the divinations and advice that the devotee should heed.

There is a gender bias in Chinese spirit mediumship. It is apparent that there are more male spirit mediums than female spirit mediums. In Chinese symbolism, the male body is regarded as yang (and so belongs to light), while the female body is yin (and so belongs to darkness). Because most of the possessing gods are believed to dwell in heaven, which is the realm of light, they prefer to occupy male yang bodies, rather than female yin bodies. However, spirit possession as such is not gender-specific. Female gods may possess the bodies of male mediums, and male gods may possess the bodies of female mediums.

A typical spirit medium session is a collective activity at a designated place of worship, such as a temple, the site of a festival or the home of the spirit medium. For everyday consultations, regular sessions are held at least once a week. Festivals are organized at least once a year.

A session generally proceeds in the following manner. The medium lights three joss-sticks and prays to an image of the possessing deity on an altar. At this initial stage of the session, a male medium would be dressed only in a pair of Chinese silk trousers, with his upper body left bare. A female medium would be dressed in a Chinese blouse and trousers.

The medium sits on a red wooden armchair, painted with dragons, facing the possessing deity on the altar. In the meantime, a ritual assistant—invariably a man—proceeds to light a thick bunch of joss-sticks, which he holds, while using a thick rope to whip the four corners of the site of worship. This is to chase away evil spirits. The joss-sticks are placed in an urn on the altar. Then several ritual assistants (all male) start to beat loudly on drums and gongs, and to chant an invocation, inviting the deity to come. After a while, the seated medium starts to shake, first the legs, then the whole body. The medium's head rotates, slowly at first, then increasingly faster. This shaking is interpreted as a sign that the deity has started to take possession of the medium's body. The medium starts to rise from the red chair. The ritual assistants quickly dress the medium in the clothing appropriate to that possessing deity. After being dressed, the medium manifests behavior characteristic of that deity. For example, a medium who has been possessed by the Monkey God may jump onto chairs and tables.

At this point, the deity-in-the-medium may begin to speak in an unintelligible divine tongue. However, at least one of the ritual assistants will be fortuitously blessed with the ability to interpret this language. The deity-in-the-medium may ask for joss-sticks and a sword. When these items are handed over, the medium would start licking the lighted joss-sticks and cutting his or her tongue with the sword. This is minimal ritualized violence, which may be manifested in both male and female mediums. This level of self-inflicted violence tends to be the norm for everyday sessions. It is only during festivals that extreme acts of ritualized violence are carried out, such as skewering one's cheeks or striking one's back with a ball of spikes. Extreme acts of ritualized violence tend to be the prerogative of male spirit mediums. It is believed that if a menstruating woman were to touch an instrument of ritualized violence to be used by a medium, such as a cheek-skewer, she would bleed to death. Female spirit mediums tend to inflict only minimal ritualized violence on themselves. How then is their possession by gods demonstrated? They have to rely on speaking in a divine tongue. Sessions with female mediums thus tend to consist more exclusively of verbal exchanges between deity and devotee.

Mediumship sessions are held to enable devotees to seek the help of the possessing god. These devotees are usually well informed about the time and place of the regular mediumship session, either because they frequent a particular place of worship or have been brought there by someone who knows. Generally, they gather together before the session begins. If the crowd is large, the ritual assistants may distribute queue numbers, so that the devotees can consult the deity in turn. During the session, the devotees play no role in invoking the possessing deity or enabling the deity's possession of the medium's body. They merely stand around as witnesses to the ritual spectacle, including the acts of ritualized violence. It is only after the deity has demonstrated possession of the medium's body, through the acts of ritualized violence, that any communication is established between the deity and the devotees. This is done with the deity-in-the-medium sitting on the red chair, using the altar as a writing desk. The consulting devotee approaches the deity-in-the-medium and poses a question. Some devotees put their hands together in a gesture of worship while approaching the deity. Others simply approach the deity as they would someone in an official position, such as a government official or a doctor. The deity-in-the-medium is addressed as that particular god—the Monkey God, the Goddess of Mercy, the Third Prince, and so on.

The devotee presents a problem, which may involve health, examinations, jobs, business, relationships, or almost anything else. The deity-in-the-medium gives advice in a divine tongue, which is interpreted by a ritual assistant for the devotee. Sometimes, before giving advice, the deity-in-the-medium may ask for further information, thereby engaging in conversation with the devotee, with the help of the ritual interpreter. Apart from verbal advice, the deity-in-the-medium may give ritual prescriptions. This is done by writing (unintelligible) divine characters on red charm papers. The deity-in-the-medium may write using blood from the tongue, if this had been cut with a sword as an act of ritualized violence. If no tongue cutting was done or if the blood has dried up, red ink is used instead. The devotees are given instructions by the deity about what to do with their charm papers. For example, some charm papers may have to be burned and their ashes mixed with water and then drunk. Others may have to be posted on the front and back doors of the house to keep out evil spirits. The deity-in-the-medium may also provide some treatment on the spot. For example, he or she may light some charm papers and wave them around the devotee. This is to give protection from evil spirits.

After the devotees have consulted the deity, they depart. At the end of the session, before the deity leaves the medium's body, the ritual assistants may have questions to ask. These may concern themselves or their collective worship. In the former case, the ritual assistants are just consulting as ordinary devotees. In the latter case, they are engaged in a collegial discussion about collective matters, such as ritual procedures for organizing a festival. When all questions have been addressed, the deity leaves the medium's body. This is manifested through shaking of the body and rotation of the head, culminating in sudden physical rigidity. Then the medium falls limp, either into the arms of the ritual assistants or onto the red chair. Medi-

ums then awake as themselves, claiming to have no memory of all that has happened. The ritual assistants have to tell them what happened.

The manifestation of spirit possession through ritualized violence and a divine tongue suggests a state of trance, meaning altered consciousness and loss of self-control (Strathern 1995). However, this is not seen as an end in itself, but as a means for achieving the this-worldly aims of the devotees.

While the belief structure of spirit mediumship in Singapore has persisted, its institutional practice has changed through time. To understand the continuities and changes to be found in spirit mediumship in Singapore today, compare the studies of Alan Elliot (1955), Vivienne Wee (1976, 1977), Ruth-Inge Heinze (1997) and Wee Thiam Lester Chua (2001).

Many spirit medium temples have been demolished in the massive re-urbanization of Singapore. In most cases, the medium, ritual assistants, and devotees still wish to continue practicing spirit mediumship as a collective activity. Thus, they need to find a new place of worship. However, because such mediumship groups usually did not register themselves as religious associations, they have difficulties in getting government permission to set up new spirit medium temples. As a result, they have to conduct their mediumship sessions in private homes—usually at the home of the medium. Despite this, mediumship groups still conduct lavish festivals at least once a year. Such festivals are held over several days in large tents on open grounds and involve processions, Chinese opera, feasts, and marathon mediumship sessions lasting days and nights.

Certain changes have occurred in mediumship practice in keeping with larger social changes in Singapore. In some mediumship groups, the manifestation of ritualized violence has decreased. Conversely, greater emphasis is placed on divine utterances. Some of these utterances have become so elaborate that they go on for hours, particularly during festivals. In one noteworthy case of ritual innovation, the possessing deity has dispensed with the divine tongue. Instead, as a manifestation of his power, this deity speaks in English, albeit with a singsong intonation. This has indeed enabled greater accessibility, particularly by younger, English-educated Singaporeans. In another noteworthy case, there is a significant degree of syncretization with Buddhism, such that Buddhist chants are played on a hi-fi set before and after the mediumship session. This helps devotees to feel that they are partaking of a ritual belonging to a world religion.

TAIWANESE SHAMANIC PERFORMANCE AND DANCE

The theatrical nature of contemporary Taiwanese shamanism, in the forms to be discussed in this entry of self-mortification and *lingji* performance, reflects the importance of drama and dance in early Chinese shamanic practice to end drought or floods, and to exorcise malevolent spirits. During the Great Exorcism *(Danuo)* rituals, twelve ritual functionaries played the roles of the twelve animals: "Rat, Ox, Tiger, Hare, Dragon, Snake, Horse, Sheep Monkey, Cock, Dog and Boar" (Loewe 1982, 54). Emphasizing the role of the shaman in dances, the Han dynasty lexicon *Shuowen jiezi* defined the shaman *(wu)* as a priest or invocator, who was female and who danced for rain. Among the early rituals performed by shamans, these rituals to summon rain were the most important and most coveted for proving a shaman's power.

Although present-day shamans continue to dance for rain in the rituals of the indigenous Taiwanese, one more commonly encounters the Taiwanese shaman called a *jitong* (or *tāng-ki*) as entranced dancer, exorcist, and theatrical performer in festivals, pilgrimages, and processions. Taiwanese shamans are spirit mediums, healers, diviners, changers of fate, exorcists, and counselors on issues ranging from fengshui to fertility. These contemporary Taiwanese shamans can be divided into two groups: those who perform spirit writing, who are associated with literature *(wenji),* and those who perform self-mortification, who are associated with martial gods *(wuji).* It is the second group of shamans who are the entranced dancers, exorcists, and theatrical performers in festivals, pilgrimages, and processions. These shamans are for the most part male, but women who have entered menopause can become self-mortifying shamans (Ahern 1975). Perceived as children of the demigods possessing them, self-mortifying shamans wear special costumes during performances in which they dance and strike their skin with sharp objects to cause themselves to bleed. Typically these costumes allow for the exposure of skin on the back. If they are male shamans, they appear bare-chested, wearing only an apron *(duer)* and pants, and no shoes. If they are female they wear special backless shirts, over which the apron is placed.

Donald Sutton explained the occasions that call for self-mortification in Taiwan:

> For Taiwan temples that have self-mortifiers, there are three kinds of occasions at which it is considered obligatory. The most important is in procession or pilgrimage to mark the encounter with another god's temple or his possessed medium. A second kind of occasion is a temple's events of transition at which chiefly temple members are present, for example at the dotting of the eyes (dianyan) of new images of gods, at the raising of the ridgepole in new construction, or at the initiation of a new medium. Thirdly, self-mortification is occasionally utilized on behalf of families of the temple community, to exorcise a dwelling at night, to expel evil airs (xieqi), or to exorcise objects such as unsanctified gods' statuettes that have brought bad luck. (Sutton 1990, 101–102)

Self-mortification requires the use of the five treasures *(wubao)*—the prick ball, axe, barbed stick, dagger, and double-bladed barbed stick. During performances involving self-mortification, shamans will strike their arms, back, face, and chest with each of the five treasures (and sometimes lit incense). Each blow to a shaman's body causes temporary cuts and demonstrates the power of the possessing deity. The blood from these temporary cuts is cleaned up with yellow paper called spirit money by those who accompany the medium through the procession. Unlike other forms of ritual performance in Taiwan, the dances and postures that make up the performances of self-mortifying shamans have a set structure and pattern.

During processions and festivals, the entranced mediums will chant and perform dances in which they dance, twirl, shadowbox, skip, and hop, for example, in order to scare away and battle with malevolent spirits. David Jordan explains: "Their performance consists of an athletic ballet, magnificently rehearsed and

Female jitong performing self-mortification. (Courtesy of Alison Marshall)

enthusiastically performed, in the pugnacious tradition of Chinese shadow boxing" (Jordan 1972, 48). Many of the other performers in processions and festivals also enter trance. These individuals are often boys from the village community who have begun their training with a local temple master. Some of them hold the sedan chair (carrying the image of the god) during processions and festivals and demonstrate their training in martial arts and in boxing "parading in strategic formations that repeat the cosmic diagrams: the Eight Trigrams, the Five Cardinal Points, the Dragon-and-Tiger" (Schipper 1993, 46). Others dance with the parasol, and the five flags, representing the five armies, and still others play musical instruments such as drums and gongs. For larger events, an electric flower truck *(dianzi huache)* is ordered, upon which attractive young women (often wearing very little) sing karaoke to entertain the gods.

Developing out of the performance tradition of shamans in Taiwanese festivals, processions, and pilgrimages is the new religious movement of the *lingji* (diviners of the spirit), sometimes called *lingxiu* (cultivators of the spirit), or *lingmei* (spirit mediums). Like the shamans who perform dances of self-mortification and exorcism while they are mediums of a god, lingji are mediums who perform dances when they are moved by a god *(lingdong)*. These performances take place both informally, in private and formally, in public, in both individual and group settings, and although they share performance elements with self-mortification (such as the use of costumes and flags in their dances), they are not linked to exorcism or the martial gods. During a performance a lingji may become moved by any one of the Taiwanese goddesses—Mazu, the Buddhist Guanyin, Jigong Bodhisattva—or even by Mao Zedong, God, or the Virgin Mary. Lingji may be either male or female, but many of those who dance and sing are female; they range in age from teens to eighty years old. The performances, unlike those of self-mortifying shamans, are not routinized and vary from individual to individual. Many of them use exercises from qigong or the martial art sometimes considered part of qigong, taiji (tai chi). There are those who twirl—some slowly like the parasol holders and mediums in festivals, pilgrimages, and processions, and some very quickly in the manner of dervishes. Many of the dances feature hand movements or mudras of Buddhist deities in which the index finger and thumb are joined, the middle finger and thumb are joined, or the ring finger and thumb are joined. Some dance on the balls of their feet, incorporating movements that appear to taken from western ballet. Others dance with flags.

Lingji practice and beliefs associated with it have much in common with qigong practice, which became popular in China during the 1950s. Lingji practice is a primarily spontaneous and rapidly growing religious phenomenon in which individuals cultivate increasingly intense states of ecstasy reflected in the way they shake, dance, and move with others (Ots 1994, 120–123).

Lingji practice has also been influenced by the practices of others called lingji who belong to and adhere to the standards set by the Republic of China Association of Mediums (Zhonghua Minguo lingji Xiehui). The association began in 1989 to establish standards for lingji practice. It offers lectures that instruct one in how to behave according to the institutionalized standards and also publishes a journal to help those belonging to the association understand what they should be doing. In one issue of the journal, Lai Zongxian explains the lingji, emphasizing the lingji's role as a medium:

> *Lingji* signifies someone whose body is available to the *ling* (spirit) realm to communicate to humans, which may be special messages, songs or poems to advise, wake up or save the world, or answers to questions asked by people. *Lingji* are selected by the spirits primarily from those who have inherited the ability through their family lineage or, secondarily, from those who in their previous life developed a relationship with spirits due to a number of reasons. One can recognize that one is potentially a *lingmei* if one begins to have visions with the eyes closed, if one has special dreams, if one hears voices, if one sees written characters while the eyes are open, if one begins to do automatic writing of literary Chinese (not having studied it) or if one spontaneously speaks or sings (Chinese) opera, etc. (Cited in Paper 1996, 110).

Unlike these lingji who belong to the association, the new religious movement of lingji

cultivation practice is not institutionalized, and emphasizes informal performances. When a lingji comes to the temple or gathers with friends to move the spirit in practice sessions, she puts on a special costume. Costumes vary from the favored loosely fitting long white top over white loose pants. Lingji also wear brightly colored embroidered satin tops and pants in green, yellow, and red. Still others combine aspects of the traditional and contemporary costumes, with white tops and yellow pants or yellow tops and white pants and yellow slippers.

The ever changing performance can be any combination of lingji meditating, burping, singing, or dancing and comes into being initially through the individual's discovery of her original spirit *(benling)* and original nature *(zixing).* The place for the performance can be anywhere, and the way in which the dance will unfold is never known before it is performed. As the dance emerges, so does the context. Although some of these performances might be appreciated for their aesthetic beauty like other forms of modern dance, their spiritual value lies in the way they reflect the moving of the spirit (Marshall 2002). Contemporary Taiwanese shamanistic practice continues to manifest the importance of dance, drama, and exorcism in formal and informal rituals.

Overview

SOUTH ASIA, THE HIMALAYAS, AND TIBET

The subcontinent of South Asia comprises the present-day states of India, Nepal, Bangladesh, Pakistan, Sri Lanka, Bhutan, and the Maldives; its influence over the adjacent countries of Tibet, Burma, and Afghanistan has been sufficiently strong that they too are often included as parts of the region. Among these countries, Nepal, Bhutan, Ladakh (part of India), and Tibet are located in the Himalayan region, the highest mountain range in the world. The economic, cultural, religious, and linguistic diversity of this region, which includes nearly 25 percent of the world's population, is staggering. India alone has recorded over 1,600 languages. Major religions originating in the region include Hinduism, Buddhism, Sikhism, and Jainism, while Zoroastrianism, Judaism, and Christianity have also existed for many centuries in well-established communities. The arrival of Islam in the twelfth century transformed the region, with Muslims forming nearly a quarter of the region's population and accounting for approximately a quarter of the world's Muslims.

South Asia has a complex prehistory, being considered, along with China and West Asia, as one of the three "cradles of civilization." Agricultural settlements in the Indus Valley cultivating barley and wheat date back at least 5,000 years, as does the domestication of sheep, goats, and cattle. Pottery also appeared by 5000 B.C.E. and came to be mass-produced with the introduction of the potter's wheel around 3500 B.C.E. Although the earliest written materials that have been preserved, the inscriptions of Emperor Ashoka, date back only to 240 B.C.E., the magnificent collection of hymns known as the Ṛg Veda has been preserved orally from the second millennium B.C.E., brought at that time to the subcontinent by Indo-Europeans, arriving in waves from the northwest to become the ruling power throughout much of the region. Prayer and sacrifices were the key characteristics of Vedic religion, which evolved to contribute to the complex practices, doctrines, and philosophies generally grouped together as "Hinduism."

Siddhartha Gautama, who became known as the Buddha, the Awakened One, was born in the region circa 563 B.C.E., his birthplace traditionally identified as Kapilavastu in the lowlands of Nepal. Buddhism spread from northern India throughout Asia, yet, except in Sri Lanka and the Himalayan regions, by the twelfth century C.E. it had nearly disappeared from the subcontinent, losing ground to a vigorous Hindu resurgence and the arrival of Islam from West Asia. Most of the region was colonized by the British during the eighteenth and nineteenth centuries, a legacy that has helped shape much of the region's current politics and economies, though the states involved gained their independence in the mid-twentieth century. South Asia has rich traditions of poetry, linguistics, science (having invented, most notably, decimal numerical notation), medicine, music, dance, architecture, and the decorative arts, but these all lie outside the scope of this present work.

Within a region so diverse and historically complex, the variety of divination, healing, possession, exorcism, and other ritual activities loosely identifiable as *shamanism* can only be sampled, yet indigenous shamanic expressions are well represented in the series of articles covering South Asia, the Himalayas, and Tibet. The historic depth of the phenomenon, with multiple expressions of

hypnotic trance, possession states, healing ceremonies, and prophecy, is demonstrated in the entry "Ancient South Indian Shamanism," which focuses on the Tamil-speaking region of South India, using the Sangam anthologies of poems that date back approximately two thousand years. These early Tamil poems describe various categories of ritual performers, several of whom appear to have had shamanic functions, including healing while in altered states of consciousness induced by drumming. A second entry, "South Asian Shamanism," reviews the earliest record of shamanic phenomena in South Asia, found in the classical texts of the Vedas, and also discusses some of the unique features of shamanic activity as it has evolved in South Asia.

The diversity of ritual activity found throughout India today is sketched in three other entries, covering Rajasthan, Manipur, and Ladakh, completing the four poles of India's compass. Although it focuses on India's western desert state, "Spirit Possession in Rajasthan" discusses many of the common themes regarding possession throughout India, particularly the tension between "popular" and "classical" modalities of Hinduism. That entry also emphasizes pragmatic aspects of spirit possession, which, like sorcery accusations, frequently has links to property disputes and social or familial tensions, aspects that deserve wider consideration throughout South Asia. Devotional and healing aspects of shamanic acculturation that draw on Rajasthani examples are also detailed in "South Asian Shamanism." In common with the ritual specialists of Manipur, most of those found in Rajasthan are more accurately termed spirit mediums rather than "shamans" in the strict sense, as they act as human vehicles for supernatural forces who overpower and occupy humans who have suspended their own consciousness. The situation in Manipur, as noted in the entry "Manipur Meitei Shamanism," is particularly noteworthy for the prominence of women as mediums there, including ritual specialists who function as midwives, responsible for cutting the umbilical cord of newborn infants and invoking their shadow souls to enter. Manipur mediums also have the social responsibility of pronouncing death. "Manipur Meitei Shamanism" also notes the opposition of written and oral traditions, another important axis of contrast when comparing indigenous healing practices throughout Asia.

Spirit mediums who incorporate many more characteristics of shamans than those of Rajasthan and Manipur are found in Tibet, most notably the State Oracle, best known of the high-ranking monastic oracles, a role also found in Ladakh, though in decline there. Other forms of oracular expression in Tibet and its adjacent areas occur among local curers, as noted in both "Tibetan Shamanism" and "Ladakhi Shamans and Oracles." The situation in Ladakh is particularly interesting, as it is characterized by growing popularity, with oracular possession gaining increasing centrality in local ritual practices, as what was formerly a hereditary calling has shifted toward becoming a vocational practice, a shift apparently not yet true in other Tibetan communities. Village oracles articulate concerns of the disempowered, sometimes so forthrightly that the authorities may seek to suppress them. "Tibetan Shamanism" adds detailed discussions of the spirit mediums' pantheon, examines their training, and describes their equipment and ritual practices. Of particular note are discussions in this entry of the very shamanic practice of calling back the soul, and the phenomenon possibly unique to Tibet of travelers to the realm beyond death, those who die "by mistake" and are sent back to the living with advice on how to avoid the hells where sinners are tormented.

Nepal provides more examples of the varieties of shamanic activity, as nearly every ethnic group in the country has its own forms of shamanic expression. These various forms are introduced in the entry on "Nepalese Shamans"; specifics on two ethnic traditions are found in the entries "Chepang Shamanism" and "Rai Shamanism." The entry "Nepalese Shamans" uses the common distinction between shamans and other forms of spirit possession and mediumship by the degree of control over the forces involved, a shaman having full control over the agents of possession rather than being simply a passive vehicle used by spirits to express themselves. That entry also reviews the complexity of shamanic etiology as well as the diversity of diagnostic, curing, initiation, and death rituals found among Nepalese shamans. The situation among the Chepang, a marginalized ethnic group of south central Nepal, is distinctive, in that shamans are the group's only religious specialists. Chepang shamans are responsible not only for conducting healing ceremonies that involve travels to the upper and lower worlds, but also for officiating at all life cycle rituals for

the community. Oral mythological traditions, a key aspect of shamanism, are discussed in the entry on "Rai Shamanism." Among Rai groups, the systems of ritual specialists differ considerably, with tribal priests existing alongside shamans in most groups. Thus this entry appropriately completes the sampling of South Asian diversity offered by these entries.

Gregory G. Maskarinec

ANCIENT SOUTH INDIAN SHAMANISM

Although shamanism per se is not a major force in the historical development of the Hindu tradition, there are subtraditions in South Asia in which certain figures appear to have shamanic functions. The existence of these figures historically indicates that the present-day subtraditions of the Hindu tradition in these areas may show an important influence from them. One of these areas is the Tamil-speaking region of South India, which coincides by and large with the present-day Indian state of Tamilnadu.

The primary sources of information and descriptions of the ancient culture and religion of South India are the large, well-developed, and beautifully crafted groupings of poems known as the Sangam anthologies. These poems were written approximately two millennia ago. The anthologies fall into the two categories of *akam,* "interior," poems focusing on love and personal relationships and *puṟam,* "exterior," poems focusing on war and political relationships. The poems themselves are classical in nature and show clear characteristics of being written compositions rather than oral compositions. George Hart, who has written extensively on the Sangam anthologies, has argued convincingly that numerous characteristics of these poems, especially their periodic use of enjambment, preclude the possibility that they are oral compositions. Figures referred to in the poems indicate, however, a preexisting tradition of oral poetry, powerfully religious in nature, which was the expression of a culture in which certain groups of sacred performers played roles that were important artistically and ritually—with no distinction being made between art and ritual. These performers appear to have produced a tradition of ritually powerful oral poetry, upon which the later written compositions of the classical Sangam anthologies were modeled.

Though these ritual performers may not precisely fit the standard definition of shamans, they appear to have had a shamanic function. If the distinctive and vital traditions of shamanism found throughout the world include ritually powerful healing figures who enter altered states of consciousness autohypnotically by means of various types of performance such as music, percussion, song, and sacred utterance in the form of oral poetry, then these ritual performers of ancient South India had a function in the society that crossed over into the shamanic. Moreover, considering the diversity found among shamans worldwide, it is important to explore cultures not traditionally or primarily associated with shamanism in order to find where on the scale of the shamanic to the non-shamanic these cultures fall. The culture and religion of ancient South India appear to be ripe for such exploration.

Early Tamil poetry describes and mentions several categories of ritual performers. The most important among them were the Pāṇar, Kūttar, Porunar, Viṟaliyar, and the Akavunar. The first of these, the Pāṇar, appears in numerous ritual contexts in the Sangam poems and is associated with drums and instruments that were ritually powerful. The performer could lend an aura of auspiciousness to a household that summoned him by performing songs and poems at various times of the day and during various types of activities. The Pāṇar played a lutelike instrument called the *yāḻ* that was believed to be filled with the sacred. The music he played on this lute was performed in sacred modes called *paṇ*s, from which his title Pāṇar is derived. Attesting to the ritual power of this music, these paṇs appear to be the basis from which the present-day traditions of South Indian classical ritual music called Saṅkītam are derived. The Pāṇar also played and was associated with ritually powerful drums and drumming. At times of harvest and during battle, they played a resounding drum called the *taṇṇumai.*

The Kūttar were ritual performers who danced as well as sang. They appear to have also been connected with ritual reenactments. Most probably the present-day *kūttu* tradition

of epic reenactment has its roots in these ancient performances. The Kūttar were associated with ritually powerful drums and with altered states of consciousness best described as sacred entrancement, or possession. There are clear references in the poems to such performers dancing ecstatically to the resounding, sacred drum called the *muḻavu.* The context of these dances of sacred entrancement/possession (called the *kaḷam*), was an area ritually initiated and bounded by the Kūttar. *Kaḷam* means "threshing floor," indicating an important connection between this area connected with grains and the harvest and the sacred entrancement ceremonies of the Kūttar.

The third category of ancient Tamil ritual performer mentioned above are the Porunar, who were singers and ritual poets. They also appear to have been associated with sacred drums and other instruments. Their ritual and artistic activities seem to have been connected with harvest festivals and with conferring blessings of prosperity, fertility, health, and success on communities and individuals. In the contexts of these groups of sacred performers and the importance of their experiencing sacred entrancement/possession or autohypnosis, the origin of the name *Porunar* is instructive. It is derived from the Tamil verbal root *poru,* which means "to join, to unite with, to be combined" (Winslow 1979, 822), indicating a theological concept of some type of fusion with the divine. It is important to note that in the devotional movements that developed centuries later in South India analogous concepts concerning sacred entrancement/possession played central roles. Still in the early twenty-first century in Tamilnadu, the experience of sacred entrancement/possession is vital to the religious movements and traditions that predominate in this region.

The Viṟaliyar were female ritual performers. The term is almost always glossed or explained by commentators as a word referring to the wives of the Pāṇar, Kūttar, and Porunar, indicating that they had achieved a status as sacred singers, dancers, and reenactors distinct from that of their spouses. The Viṟaliyar, as with the male groups of ritual performers, appear to be linked with sacred songs, sacred instruments such as the lute and various ritual drums, and ceremonies of blessing and ritual entrancement/possession.

The Akavunar appear to have been diviner-poets, both male and female. Their poetry, specifically linked to the sacred sounds of their words and music, has a particularly mantic quality. The term *Akavunar* is derived from the verb *akavu,* "to summon, to call," and is often linked to certain birds, carrying also the meaning of "to utter sound, as a peacock." This verbal root and its derivatives take on a particularly sacred sense in the ritual contexts of ancient Tamilnadu. The term *akaval* comes to refer to a meter for sacred poetry, particularly oracular poetry, and also takes on a primary meaning of prophetic utterance. The link with birds is also important in that certain birds were considered ominous. Of further significance is the association of the Akavunar with certain ritual instruments and implements. There appears to be a linkage with a drum called the *kiṇai,* which seems to have been used in ceremonies in which sacred figures were awakened or summoned. There is a more distinctive association of the Akavunar with a ritual rod or staff, probably made of bamboo. It is called the *piṟappuṇaṟttuṅkōl,* which, according to George Hart, is, "the staff that gives knowledge of the future" (Hart 1975, 145).

Several important characteristics emerge from a close study of the poems composing the Sangam anthologies that developed out of the traditions of sacred oral poetry associated with the ritual performers discussed above. One of these relates to the epithet *mutu vāy,* "ancient wisdom," which was frequently applied to them. This epithet was specifically linked with persons or creatures who possessed a knowledge of the past and future and who were associated with divination. Men and women from these groups of ritual performers received these powers of divination in the context of the rituals that characterized ancient Tamil culture and religion. These performers went into sacred hypnotic trance/possession, and their words were *mutu vāy,* "prophetic." The male diviner became a priest who was an exorcist, a dancer-priest in sacred trance/possession (Kailasapathy 1968, 64). In the early Sangam poems the male diviner was described as doing a sacred dance called *veṟi ayartal,* "to dance in frenzy/possession." These two vital ritual concepts, *mutu vāy* and *veṟi ayartal,* indicate that traditions of ecstatic prophecy and mantic poetry were central

to ancient Tamil culture and that the ritual performers discussed above were foci of these sacred traditions.

A poem from the Sangam anthologies that is an elegant and telling manifestation of the traditions and ritual performers of ancient Tamil society discussed above is *Akanāṇūṛu 98,* which has been translated into English:

> Women who utter ancient truths, skilled at lying,
> Spread out rice in a winnowing fan
> To discover the truth
> And say, "It is the presence of Murugan, hard to bear."
> Mother believes them,
> And in a house so well made it could be a picture,
> She prays:
> "May my daughter's loveliness,
> As lovely as a doll's, return."
> The sweet instruments are played together,
> The floor is prepared,
> A large pandal is decorated with ornaments for the dance,
> They put on Kaṭampu [sacred flowers] and white pieces of palmyra leaves,
> The sweet drone sounds behind a compelling beat,
> They cry out the great name of the god
> Throwing up their hands,
> And the priest makes the large floor resplendent
> With his frenzied dancing,
> Moving like a puppet
> Manipulated by a skillful puppeteer.
> (Hart 1975, 28)

The above typology of ritual performers from ancient Tamil society indicates that their sacred ceremonies and oral poetry were linked with hypnotic trance/possession, healing and blessing, and prophecy, each of these important aspects of traditions of shamanism worldwide. Studying these ancient Tamil traditions of sacred performance from a comparative perspective will enable those scholars specifically interested in more distinctly shamanistic traditions to place them on a spectrum from the shamanic to the non-shamanic and make important cross-cultural comparisons along this spectrum.

CHEPANG SHAMANISM (NEPAL)

Very little is known about Chepang Shamanism despite its extraordinary importance, and the Chepang, who at present reside in the central southern area of Nepal, in particular in the districts of Dhading, Makwanpur, Chitwan, and Gorkha, are one of the least studied ethnic groups in the country. The present geographical distribution of Chepang settlements is the result of a series of migrations that have, over the past fifty years, led them to abandon the lands originally inhabited by their forefathers, which was mainly in the district of Dhading, in search of arable land.

Up to a few decades ago, the Chepang were a nomadic population of hunters and gatherers, but a combination of violent deforestation and a ban on hunting activities in many parts of the country has brought sudden and violent change in the life patterns of the group. Most obviously, their subsistence economy had to change from one based on hunting and gathering to one based on agriculture. When the Chepang began their migration in search of land for cul-

tivation, the best land had already been occupied by other ethnic groups, which meant that the Chepang had to settle in areas that were particularly arid and often almost inaccessible. The Chepang are in fact one of the poorest ethnic groups in Nepal, where Hinduism prevails. The Chepang do not recognize the Hindu caste system, which is particularly rigid in Nepal. Though most profess to be Hindus to ensure a peaceful coexistence, their religion is clearly shamanistic and still closely linked to the world of the forest and hunting.

The relatively unsyncretic nature of their form of shamanism would also appear to be confirmed by the fact that their shamans, known as *pande,* are the only religious experts present in the group. Many other ethnic groups in the country have other figures functioning alongside the shaman, such as Buddhist or Hindu priests or other religious experts who conduct particular ceremonies such as funerals. The pande covers all functions and is the key figure in Chepang society. Apart from functioning as an intermediary between the world of humans and the divine, he or she also functions as a diviner, therapist, and psychopomp, whose presence is indispensable for all rituals connected to life cycles.

Though many inhabitants of Nepal consider the Chepang to be Untouchables, members of the lowest rank of the Hindu caste hierarchy, pande command great respect and are held to be the most powerful shamans in the country by other ethnic groups whose villages are located in the vicinity of Chepang settlements. The Chepang pande consider themselves to be *tunsuriban,* a term that denotes their ability to conduct cosmic journeys into both the Heavens and the Underworld. Shamans from other ethnic groups are classed as *urghsuriban,* as they are considered, though this is not strictly correct, only to be able to travel in the celestial regions. According to the Chepang and many other tribal groups in the country, the world is divided into three parts: nine celestial levels, an intermediate level, which corresponds to the human world, and seven levels of the Underworld. All three zones are inhabited by divinities, various types of supernatural beings, and demons.

The Chepang are undoubtedly closely linked to the Underworld, in which it is believed they have their origins and where the spirits of the most worthy ancestors are called upon to live alongside the divinities. Though accessing the Underworld is extremely dangerous, it is described by the pande as an idyllic place full of forests, rivers, and jungles in which the ancestors can hunt freely and where there is no reminder of anything negative, none of the hunger or illness that afflict the Chepang in the course of their sojourn in the human world. The Heavens, on the other hand, are conceived as a source of many problems and even death and destruction. The ninth and last celestial level is inhabited by the lord of death, known by the Hindu name Yama-raja. This lord is served by dangerous planets that inhabit the lower levels, in particular the Kal and Niu, which he sends to the human world to bring on illness and death.

The Kal and Niu, together with a host of supernatural beings and witches, for the main part human, are the greatest opponents of the Chepang pande during the frequent shamanic séances for almost all their nocturnal duration. The pande can only undertake cosmic journeys in the night, which journeys take place only during trances. These trances are sometimes so deep that they may, in particularly dramatic cases, lead to the pande falling into states of catalepsy. The séances held during the day are strictly diagnostic in nature, and pande never enter into the altered states of consciousness that allow them to conduct journeys into the celestial world or Underworld or to act as a host for spirits and divinities during the day.

No particular costume is worn during ceremonies, and a limited number of ritual objects are used, including two necklaces, one made out of black seeds and one of *rudraksha* (*Elaeocarpus ganitrus*), which are also common to other ethnic groups in Nepal and function as protection for the pande against attacks from evil spirits. The main instrument used is the single skin drum, termed *rin* or *ring* in the Chepang language, which has a diameter of forty to fifty centimeters. The ring has a cross-shaped grasp on the inside and various forms of iron chains and hangings dangle from the back of the drum. The role of the drum as it is used by the Chepang is particularly interesting. The drum is never associated with animal forms and never takes the form of a steed. Instead, it has its own personality and its own name, which is kept secret and is identified with the figure of a hunter who ac-

companies the pande on his or her cosmic journeys. The duties of the ring are to protect the pande and search for the causes of illnesses or calamities that may have befallen a certain individual or a whole village. The ring will chase wicked spirits and, especially during divinations, is also often associated with a mirror, which reflects the images of other cosmic zones.

Dreams play a particularly important role in Chepang Shamanism, especially during the initiatory call to the profession. The pande do not recognize any earthly instruction, and gurus can almost always be recognized in supernatural beings that appear in dreams to the initiates and provide instruction over the course of several dreams. Generally speaking, novice pande do not undergo any physical or other form of suffering in the course of initiation, as has been noted to be the case with many other Nepalese groups. The supernatural spirits involved in initiation vary from individual to individual though it is not uncommon for the guru to be the spirit of an ancestor, an ex-pande belonging to the same clan as the initiate, who undertakes the training of the future shaman. One of the most important figures that appears in many tales linked to the call to the profession is that of the spirit shaman of the forests known in Nepalese as the *ban-jhā̃kri.*

Those pande considered to be the most powerful generally tell of how they were kidnapped at a very young age or even when they were newborn babies by the ban-jhā̃kri. The ban-jhā̃kri is believed to take children he has chosen for initiation into the profession to his palace, where he lives with his terrible wife, the *ban-jhā̃krini,* who is an extremely dangerous witch, very fond of flesh and human blood. The ban-jhā̃kri has to protect the future pande from her. In the ban-jhā̃kri's palace candidates for initiation learn to play the ring, sing, and do everything else they need in order to practice the profession. Some, though not many, tell of experiencing cleansing and purification operations during which the ban-jhā̃kri opened their bodies to clean their internal organs. Once instruction has been completed, be it in the form of a dream or during a kidnapping, the pande must then be recognized as such by the community.

An important festival called the Chhonam Festival is held once a year, in the month of Bhado (August 15–September 15), to celebrate the new harvest. During Chhonam, harvest offerings are presented and offered by the pande to the divinities and ancestors. Many patients also appear at the dwellings of the pande where the ceremony is held, as this day is believed to be the most propitious for the curing of illnesses, especially for complicated cases or those cases that have not been resolved in earlier séances. Chhonam is the period during which novice pande are presented to the community to which they must prove their abilities and knowledge. These séances are usually watched over carefully by expert pande who help the novices and maintain control of the situation, especially during the phases in which the novice pande go into trance. These trances are considered to be dangerous since, if the novice has not yet acquired enough experience, he or she may well be possessed by evil spirits, which could endanger the lives of all present. The control exercised by the pande over the novices suggests that, though initiation apparently takes place in the course of a dream, the role played by those who are already pande is by no means secondary. Not all novice pande presented to the community in the course of the Chhonam are considered to be ready to practice the profession of the shaman, and those who are judged to be insufficiently prepared have to wait for the next year's Chhonam to be recognized as pande.

Apart from this important annual festival, the Chepang pande celebrate another in the course of the year, which is held in honor of the god of hunting, Namrung. As we have already said, Chepang shamanism and Chepang culture in general are closely linked to the world of hunting, and for this reason one of the main divinities of the pantheon is the god of hunting, who controls all wild animals and is believed to live in the dense forests. Namrung is one of the few divinities that appears to be common to all Chepang groups, whereas the names and characteristics of many other supernatural beings vary greatly from one area to another and even from one pande to another. This may also be because the pande receive the call to the profession and instruction in the course of dreams from different spirits and supernatural beings, which makes the personal element particularly strong in Chepang shamanism.

Shamanic séances are held fairly frequently and for different motives. People turn to the

pande in the case of illness or when they want to find the reason for which a person or an object has been lost. Funerals are extremely important, and the pande are called on to celebrate complicated and dangerous séances in the course of which they accompany the soul of the deceased to the world of the ancestors.

Therapeutic séances are still the most frequent, and are held according to a common pattern. The ceremony always begins with a request by the pande addressed to the friendly supernatural beings, some of which will accompany him or her on the cosmic journey in search of the soul of a patient that is believed to have been kidnapped by some angry divinity or malevolent spirit. Once the soul has been located, or in other cases once the cause of a patient's sufferings has been found, the pande attempts to negotiate with the supernatural spirits and often engages in real battles with the latter. Most of the time the pande succeeds in his or her task by promising the spirit some offering of blood. After the pande comes out of the trance in the course of which his or her soul has completed the cosmic journey, he or she communicates the requests of the divinities or spirits to the audience. This communication is often followed by a sacrifice of an animal, usually a chicken or in the most serious cases a goat, whose blood and head are offered up to the angry spirits.

The séance is concluded with the greeting of the friendly spirits, some of which possess the pande. In every way the pande function as intermediaries between the human world and the divine, and this role is of vital importance for the spiritual and physical well-being of the entire community.

HINDUISM AND ECSTATIC INDIAN RELIGIONS

Hinduism is not a unified, rigidly coherent religious system organized around a single revealed text or charismatic founder, but rather a congeries of beliefs, practices, and texts arising from different cultural and linguistic regions within India, all of which nonetheless are bound together by a history of mutual influence and share many cosmological features. Hinduism can be compared to a vast ocean into which streams of influence from many different regions have poured, and whose waters have, in turn, mixed thoroughly with those of the tributaries that feed it. Among those influences, ones flowing from what one could call shamanism have been particularly significant. Yet here too, terminological problems complicate the task of straightforward description. Scholars have described a variety of Indian ritual practices as *shamanism* and a variety of religious specialists as *shamans.* Indeed, the ecstatic states said to be characteristic of shamanism are a regular feature of Indian religiosity; meditation, devotional worship of deities, and spirit possession, for example, can all induce altered states of consciousness.

For the purposes of this article, the Indian religious specialists who will be identified as shamans are those who actively will supernatural beings to come to them, often using special drum rhythms or other techniques to induce in themselves the states of consciousness necessary for these beings to speak and act through their bodies. They do this not mainly for their own

spiritual benefit, but to assist people with difficulties, the causes of which may be moral, medical, or supernatural, or all three simultaneously. In general, Indian shamans usually do not describe their work as involving either journeying to another world or retrieving lost souls. Rather, an Indian shaman's performance usually entails the convincing bodily impersonation of a supernatural being.

Arguably the most prestigious and widely influential stream of texts, beliefs, and practices within Hinduism is that of Brahmanical Hinduism, which takes as its authoritative reference point a body of ancient inspired texts known as the Vedas. Devout Hindus would argue that the Vedas are eternal, heard rather than composed by human beings, but scholars estimate that they were composed in the north of India and compiled into a single collection around 1200–1000 B.C.E. The sages *(ṛṣi)* who first "heard" the Vedas have some of the characteristics commonly associated with shamans. Intoxicated by a drink prepared from the soma plant, rishis perceived the hidden webs of similarity that connect things that otherwise seem distinct, and they "trembled" *(vipati)* with the intensity of their visions. The religion described within the Vedas centers on the sacrifice *(yajña),* an elaborate ritual initially performed to nourish the deities, called *devas* (from the Sanskrit root √*div,* to "shine," to "be brilliant"), who create and sustain the universe. Later (around 900–600 B.C.E.), ritual commentaries elaborated on the inner meaning of sacrifice, revealing that the components of both the sacrificial altar and victim were identical with the constituents of the natural world and the social order. In the sacrifice, Brahman priests harnessed the power underlying these identities through the use of sacred syllables (mantras) and ritual action to provide their patrons with this-worldly benefits such as success in battle, wealth, long life, and sons.

Over time, the Vedic sacrifice lost its central place within Hinduism, but the authority of the priests continued. Brahman priests are still a significant component of Hinduism today. In their role as family priests *(purohits),* they preside over key life cycle rituals such as marriages, funerals, death anniversaries, and coming of age initiations, lending the authority of tradition to events through their recitation of Sanskrit texts and mantras. In addition, as experts in the science of astrology, Brahman *paṇḍits* (scholars) compete with shamans for clients seeking relief from problems with apparently supernatural causes.

In the seventh and sixth centuries B.C.E., a new style of religiosity emerged in the urban centers of northern India, crystallized in the figure of the *śramaṇa,* or "renouncer" (lit. "one who toils, who practices asceticism"). As a religious ideal first introduced in the Upaniṣads (Brahmanical philosophical texts), the renouncer rejected the this-worldly desires of the householder who patronized the Vedic sacrifice, abandoning spouse and family for a life of anonymous wandering or seclusion in the forest. Freed from social obligations, he devoted himself to ascetic and meditative practices that quelled egoistic desires and led to a revelatory understanding of the universe. A distinctive and influential cosmology developed from the renouncers' milieu, according to which no individual being comes into the world for one time only. Instead, beings move through an aeons-long cycle of birth, death, and rebirth (*saṃsāra*), in which the kinds of bodies individuals are born into are shaped by their actions in their previous lives (karma literally means "action" seen as bringing upon oneself inevitable results).

Within the Brahmanical orthodoxy, this cosmology reinforced the ideology of caste, according to which society was organized into an interdependent, hierarchical whole by the division of people into distinct social classes. Thus Brahmans and other elites deserved their high status and social privileges by virtue of their good deeds in previous lives, just as low castes deserved their low status and deprivation. Renouncers sought to escape this cycle of death and rebirth altogether by eliminating the karmic effects of action, which bound one to the world. The new Indian religions of Jainism and Buddhism took these ideas to their furthest realization, but they also deeply influenced Hinduism, as seen in the prevalence of *sādhus* (ascetics), yogis (spiritual adepts), and *sannyāsins* (mendicants) in present-day India.

Mircea Eliade, Sergei Shirokogoroff, and others have entertained the idea that the Sanskrit word *śramaṇa* is related to the Tungus word *shaman* (through a Pali cognate, *samaṇa*) (Eliade 1964, 495; Maskarinec 1995, 97). Although this etymological argument (and the argument about influence that it implies) is dis-

puted, one could argue that the meditative states of a sixth-century renouncer bear some similarity to the trance states of Central Asian shamans. A significant difference, however, is that the South Asian renouncer does not enter into trance states to act as a conduit for the divine for the sake of others, but rather to attain redemptive power and knowledge for him or herself. Buddhist monks and Hindu yogis *do* serve their communities—through preaching as well as through the exercise of the superhuman powers (*siddhi*s) they develop in the course of practicing meditation. In this way, like Brahman priests, they function as professional rivals to shamans. But the renouncer is ultimately engaged in a solitary journey, the goal of which is to transcend the cosmos altogether.

Renouncer ideals posed a challenge to the religious authority of Brahman priests, prompting a creative reconsolidation of Hinduism. Key for our purposes was the reemergence at this time of theism. The worship of divine beings had been an important component of Vedic religion, but with the elaboration of the technical aspects of sacrifice, the gods had taken a backseat to the awesome power of priests. Gods again resumed their central place with the rise of the Sanskrit mythological texts called Puranas (*Purāṇa*s) and epics such as the Rāmāyaṇa and the Mahābhārata. In the Bhagavad-Gītā (a section of the Mahābhārata composed between 100 B.C.E. and 100 C.E.), one learns of an alternative way to achieve salvation known as *bhakti.* Here, salvation comes not through the performance of Brahmanic rituals, or the meditative and ascetic rigors of the renouncer, but through absolute devotion to a god, who is generally understood as the Supreme Being. The word *bhakti* is derived from the Sanskrit verbal root, *√bhaj,* which means to "share" or to "participate in," and it refers to a style of devotional religiosity that stresses the intimate, embodied, and personal relationship of devotees to deities. Bhakti also gave rise to a new kind of ritual, *pūjā,* in which one offered pleasing substances to the deity. The characteristic bhakti theme of "sharing" is seen vividly in this ritual, in that after offering flowers, fruit, and other such things to the deity, worshippers distribute them among themselves. By consuming the leftovers that a deity has already sampled, devotees display both their intimacy with, and their subordination to, the divine.

The love of the divine celebrated in the path of devotion reached phenomenal heights in the regional forms of bhakti that arose first in seventh-century southern India and later throughout the subcontinent. Bhakti literature composed in regional languages such as Hindi, Marathi, Bengali, Kannada, and Tamil describes how groups of devotees sought to cultivate and intensify the experience of god-love through exercises involving visualization, energetic singing and dancing, and repetition of divine names. For example, when the "mad" Vaishnava saints of Bengal experienced the *bhāva* (the "mood," or "feeling") of Lord Vishnu they would cry, shout, writhe in the dust, babble and laugh incoherently, and engage in all manner of unorthodox behavior (McDaniel 1989).

Tantra is another theistic style of Hindu religiosity that emerged early in the Common Era. A mostly elite, conservative tradition within Hinduism, which is more extra-Vedic than anti-Vedic, tantra can be defined as a fast-track practical path to salvation aimed at the achievement of supernatural powers and salvation in this life through the practice of complex rituals that lead the adept to a reintegration with the original cosmic powers. Tantric cosmology does not stray far from established Hindu views in seeing the cosmos as saturated with the presence of a divine godhead, conceptualized as powerful, beguiling, and feminine. But while Hindu ascetics view the cosmos with its sensuous qualities as something to transcend, tantrics seek to achieve mastery over it by harnessing the feminine cosmic power and becoming fully, consciously integrated with it. In contrast to bhakti ritual, which encourages submission to the divine, the rituals of tantra enable the adept to *become* divine through visualization of the deity *(dhyāna),* recitation of mantras, and magical gestures *(mudras)* that "put" or "set" *(nyāsa)* the deity in the body of the practitioner. Having become divine, tantrics can command all the forces of the cosmos, including spirits, to achieve their own desires or the desires of others.

An argument that scholars often hint at, but rarely develop systematically, about both bhakti and tantra is that one sees in them ecstatic techniques found in indigenous shamanistic traditions channeled toward the worship of the gods of the Hindu pantheon. Given the difficulty of locating historical sources that repre-

sent indigenous regional traditions before contact with Hindu ideas, this theory will probably remain speculative. But the links between bhakti, tantra, and shamanism in India are undoubtedly very strong. Two theological assumptions are central to all three traditions in India: first, that the gods are physically close, easily accessible, and intimately concerned with human affairs, and secondly, that the gods are capable of both protecting and harming human individuals and communities.

One would be hard-pressed to find any community in present-day India that has not been influenced to some degree by the movements that have shaped Hinduism, as described above. However, at higher elevations and in more remote areas, the religions of the local people sometimes bear only a very slight resemblance to Hinduism. They may, for example, assign the names of Hindu gods to their own deities, while retaining religious practices and beliefs whose overall structure and tone are very different from Hinduism. The shamanistic elements in these religions are quite varied. This entry focuses on the shamanistic patterns that one sees in the religions of communities of the plains and riverine areas where Hinduism has had a deeper influence.

The type of religious specialist identified for the purposes of this article as *shaman* exists alongside many other specialists in India. The shamans do the work of diviners and astrologers when they offer diagnoses of present difficulties and make predictions about the future; but, like mediums and oracles, they do so by summoning deities who assume control of their body, speech, and mind. Like exorcists they can drive afflicting ghosts out of their clients, and like healers and curers they provide other kinds of diagnoses of and treatments for illness, but again they do so by channeling the power of a deity. Sometimes they function as priests for the gods who possess them, and sometimes they work in a complementary fashion with priests, prescribing the necessary sacrifices and rituals to propitiate a deity, which a priest must then conduct. The common thread connecting all of these functions is spirit possession, but of a particular kind.

Many Indian languages distinguish between two states that English conflates under the single word *possession:* an unwelcome, afflicting type of possession and a benevolent type that is actively sought out. In Tamil, for example, spirit possession is described and experienced as affliction when an unsatisfied ghost *(pēy)* or offended family deity *(kuladeyvam)* is said to have "caught" someone *(piṭikkiratu).* This sense of an entity that is hard to brush off, that is attached like a thorn or a burr, or a sticky stain, is also conveyed in the phrases used to describe unwelcome spirit possession in Rajasthan: *bhūt lagnā* or *bhooth laiyo* or *churail lagi,* which literally mean "a ghost lays hold of" or "gets stuck to" someone (Kothari 1982, 11). On the other hand, possession by a deity who is welcomed, sought out, and experienced as benevolent is described in Tamil as the god "coming to," or "descending upon" someone *(vakiratu, azhakiratu).* Similarly, the phrase *bhāv ānā* (literally the deity's "feeling" is "coming") in Rajasthan denotes the arrival of a welcomed and worshipped entity (Gold 1988, 38).

Consistent with Ioan M. Lewis's observations on the etiology of spirit possession (1986), there is a correlation between social status and possession. Women and young or low-caste men are generally more vulnerable to the negative type of spirit possession, while the benevolent type is experienced more often by men than by women, and more often by those with relatively more wealth, power, and status than their peers. In South India, for example, spirit mediums tend to be from the lower castes, but are often individuals with exceptional wealth or status.

This contrast between benevolent and malevolent possession depends in part on the hierarchical nature of the popular Hindu pantheon. A different set of specific deities presides over each region and village in India, but the underlying structures of each set exhibit considerable similarity. At the top is usually a local form of one of the great gods of the Brahmanical tradition, Śiva or Viṣṇu. These gods accept only vegetarian offerings from their devotees and are attended to by Brahman priests. At the next level down is usually a local goddess *(amma̱ṉ, śakti)* identified with the pan-Indian goddess. At this level and below, the deity usually accepts nonvegetarian offerings (e.g., goat and chicken sacrifices) and is attended to by non-Brahman priests *(pūjāris).* Next are the hero-deities, ancestors, local nature deities, apotheosized spirits of those who died violently or prematurely, and theriomorphic deities (e.g.,

the snakelike *nāgas*). Finally, at the bottom of the hierarchy one finds an assortment of largely malevolent supernatural beings, who may be recruited into the service of gods higher up in the pantheon but more often roam about spreading disorder: ghosts and demons *(pēy-picācu, bhūt, pretas, churail),* witches, the jinns of folk Islam, and so forth.

The notion that the divisions between types of beings, whether supernatural, human, or animal, are not absolute or fixed allows for considerable mobility between the levels. The spirits of men and women who died prematurely or with many unsatisfied longings may become afflicting ghosts who lurk in the branches of trees, in cremation grounds, and in lonely spots near rivers or crossroads. Even the most frightening ghost, however, may become a beneficent ancestor if worshipped properly. In time, a local godling with a large following may become identified as a local incarnation of or a guardian deity to one of the great gods of the Sanskritic tradition. Generally speaking, the deities invoked by Indian shamans are the minor gods and local hero-deities who partake of the ferocious power of the lowest beings, but who use it in the service of both humans and gods. In Tamil Nadu, the shamanistic ritual of exorcism vividly displays the hierarchy of gods, as the more powerful deity who speaks through the shaman dominates the afflicting ghost (speaking through the mouth of the possessed), berating it, beating it, and forcing it to disclose what it needs in order to go away.

Hindu shamans are almost always devotees, and often priests, of the gods who come to them. This is true for the *sāmiyāṭis* (lit. "God-dancers") and *kōṭāṅkis* (exorcists who use hourglass drums) of Tamil Nadu, the *gāḍigas* of Karnataka, the *bākīs* of the Pahari-speaking people of the Lower Himalayas, and the *bhopās* of Rajasthan. In addition, shamans tend to follow the purification conventions established by regular temple priests. Before conducting important rituals that require them to enter possession states they purify themselves by bathing and abstaining from sexual intercourse, eating meat, and drinking alcohol. When the deity comes to them, they become a kinetic icon of the deity and receive worship from others.

The line separating what one could call a *shaman* from people to whom a deity regularly or occasionally comes is fairly thin; in fact, crossing over that line is a regular element in the career of a shaman. Nevertheless, a distinctive professionalism characterizes those who can generate income and prestige by invoking the deity at will. A sign of such professionalism is often the use of special objects during their shamanistic performances. In Tamil Nadu, where the tradition of serving as the *sāmiyāṭi* for a particular deity is passed down by inheritance from one generation to the next, the office usually passes to an individual particularly adept at becoming possessed, along with the implements used to physically embody the divine (ceremonial staff, billhook, drum) or demonstrate that the possession-state is genuine (iron nail–embedded shoes, torch, hooks for piercing the skin, and the like).

The training of a shaman is often informal, based on a process of observation and imitation. As elsewhere, an effective shaman is sensitive to the cultural codes of a community, is aware of local gossip, and is a good judge of character; the shaman is also able to respond quickly and convincingly to minimal cues. This latter ability is especially important when clients come with the expectation that the deity will know without being told what problems or issues they wish to have addressed, as is common in Tamil Nadu and the Pahari-speaking areas of North India. Insofar as their performances consist of bodily impersonations of the gods, shamans must adhere to the conventions that shape the way audiences expect the gods to appear: The presence of Mariamman, a village goddess of South India, is physically signaled with wide-open, bulging eyes; Kaliamman sticks out her long tongue; and serpent deities cause the arms of their mediums to entwine above their heads in a sinuous, sometimes sensual manner. But successful shamans, those who attract many clients, are able to do this convincingly while adding their own distinctively personal touch.

Some scholars have maintained that shamanism in India displays a critical stance toward the established caste and gender hierarchies of Brahmanical Hinduism. Gerald Berreman noted in 1964 that low-caste Pahari shamans and their audiences seemed to derive considerable pleasure from the fact that higher-caste clients were compelled to do the shaman's bidding when he spoke in the voice of the god. Indeed, shamanism, like other deviations from

Brahmanical orthodoxy, denies the exclusive authority of Brahman priests, enables both men and women to assume prominent roles, values rather than denigrates the "natural" qualities of women and members of low castes, and encourages the expression of strong, one might say extreme, emotional and psychological states that may lead to the transgression of orthodox norms. To the extent that the authority of shamanism is based on a speaker's perceived ability to represent authentically the point of view of the divine, shamans can and do authorize departures from tradition. But on the same authoritative basis, they may just as easily support or reinforce prevailing norms.

Recently, scholars have questioned the extent to which shamanism necessarily sanctions resistance to the dominant social order, or whether it does so in a simple, straightforward manner (Hancock 1995; Kapadia 1995). For example, when the goddess "came" to the urban, middle-class Brahman mediums of the goddess Mariamman, as described by Mary Hancock, they were able to buck the social norms that compel a wife and mother to attend unquestioningly to the needs of her family, and they were also able to dictate unorthodox innovations, such as that women who are menstruating are not ritually impure (contrary to orthodox belief). But these moments of liberation were relatively fleeting and dependent on the cooperation of family members. One can also see a correlation between the caste identity of Indian shamans and the hierarchical position of the deities who regularly come to them. In general, higher-caste mediums serve as the vehicles for gods higher up in the pantheon, while lower-caste mediums serve gods lower in the pantheon. Moreover, higher-caste mediums, or those bent on upward mobility, often manifest spirit possession in a much more subdued manner than do mediums from lower-caste backgrounds; higher-caste mediums tend to "Sanskritize" the appearance of the deities they channel, even when these deities are from the lower echelons of the pantheon (Hancock 1995; Harper 1957). Such observations support I. M. Lewis's contention that where shamanism is marginal to a dominant religion it can offer opportunities to critique the prevailing social order, but when it is central, it tends to reinforce the dominant social hierarchies (Lewis 1986).

LADAKHI SHAMANS AND ORACLES (HIMALAYAS)

In Ladakh as elsewhere in Asia, shamanism is hardly a dead or desiccated issue as was once predicted (Geertz 1973). Once thought to be scholarly survivals, shamanism and spirit possession are part of a growing social phenomenon within that indeterminate and contested cultural realm known as the Himalayas. The growing popularity and centrality of oracular possession in local ritual practices is proof of its persistent ability to articulate an increasingly fragmented and contested social and cultural reality. The ability to resist the reductionism of rational or medical idioms is what allows possession to encompass the wider domains beyond the Cartesian mind and body, including family, kinship, society, and polity (Atkinson 1992; Boddy 1994). At the western end of the Indian Himalaya, the shamanic traditions of Ladakh both bridge and transcend a number of critical symbolic oppositions in local discourse—lay and monastic, male and female, purity and pollution, order and disorder, sickness and sanity.

Ladakhi shamans, or oracles (as they are known locally) both disrupt and consolidate key cultural norms through their flexible, pragmatic, and ad hoc approach to healing and divination. The oracles' paradoxical pronouncements both reinforce and resist the superiority of the monastic authorities who ultimately provide the authority for the oracles' ritual status. Yet even as oracles subtly submit to the monastic discourse of power and knowledge, they creatively adapt these discourses by enabling or empowering others to disrupt extant social hierarchies. In local discourse, oracles, or *lhapa (lha pa),* are one of a range of healers who engage in the strategic and professional transformation of personal and social suffering (Kleinman 1980). Other customary healers include monks *(dge slong),* reincarnate priests *(rin po che),* lay astrologers *(dbon po),* and practitioners of traditional Tibetan medicine *(am chi, lha rje).* Part doctor and part diviner, part psychiatrist and part lawyer, oracles not only diagnose and cure various illnesses and misfortunes, but also negotiate property disputes and divorces, counsel couples and families, and make predictions about individual, household, and community prosperity.

Ladakhi shamans are best understood as oracles or spirit mediums who are possessed by one or more named spirits of the local Buddhist pantheon. From a perspective outside of the culture, Ladakhi oracles are understood less as *journeying to* than *communicating with* a distant spirit world, as their bodies become vessels through which the divine can speak. Whereas Eliade was inclined to exclude spirit possession from his definition of shamanism, contemporary research on Himalayan shamanism and possession (Hitchcock and Jones 1976) regard both as variable aspects of a single phenomenon. Ladakhi oracles share an ability "to divine the future, diagnose disease and misfortune, and otherwise bring aid to . . . clients" with many other spirit mediums across the Buddhist Himalayas, including the Sherpa and Dolpo *lhapa,* the Tamang *bombo,* and the Tibetan or Bhutanese *dpa'-bo, dpa' mo,* and *lha pa* (Hitchcock and Jones 1976, xiii). Ladakhi shamanism is a historically and culturally mediated social practice with traditional links to the monastery as well as the state, the medical as much as the ritual realms. Although A. S. Anagnost (1987) has suggested that the rise of state and religious bureaucracies led to the replacement of charismatic male shamans by more peripheral female spirit mediums, the evidence from Ladakh suggests a more complex interpenetration of shamanism, monasticism, and the state. Rather than the replacement of male shamans by female mediums, the two roles coexist and complement each other in local discourse. In Ladakh, as in Tibet, the conversion to monastic Buddhism between the seventh and tenth cen-

turies never fully suppressed earlier shamanic traditions (Samuels 1993; Stein 1972; Tucci 1988). The synthesis between shamanic or ecstatic mediation and a more scholastic and institutionalized Buddhism is evident in the two types of oracular possession: a disruptive village level medium and a more official, formalized monastic medium.

The two major types of Ladakhi oracles—village/house mediums and monastic/state mediums—are both known as Lhapa (Brauen 1980, Day 1989). Whereas the village oracles have a more peripheral and ambiguous status as personal healers and diviners who are closely linked with the demonic and misfortune, the monastic oracles serve as official diviners who are closely affiliated with the monastery and the state. Village oracles diagnose and cure the body and spirit of their patients, the household, or the community. By contrast, monastic oracles simply divine but never cure the political fortunes of the state and its public servants. Village oracles are laypeople of either sex whose ability to enter into controlled trance is triggered by prior illness or a possession experience. In recent decades, village oracles have mostly been women. By contrast, monastic oracles are always men, either lay or monastic, who are chosen by lottery or election to be possessed by protector spirits *(chos skyong, srung ma).* Although their service to the kings ended with Ladakh's absorption into the Indian nation in 1947, monastic oracles still serve local bureaucrats and citizens who ask about politics and social welfare. While the popularity and prevalence of village oracles has grown steadily, the impact of monastic oracles remains small. By 1990 only two out of Ladakh's dozen monasteries, Matho and Stok, still maintained monastic oracles. By contrast, oracles (*lha mo*) are now found in many villages along most the heavily populated portion of Indus valley, half of whom were female by 1981 (Day 1989).

Ladakh lies in the Himalayan portion of Jammu and Kashmir, which borders the vast Tibetan plateau as well as Pakistan's Northern Area. With historic links to Central Asia, Tibet, and Kashmir, Ladakh has a mixed Buddhist and Muslim population. It is made up of two districts, Leh and Kargil, whose combined population is just under a quarter of a million people. Buddhists and Muslims each make up about 48 percent of the population; the rest of the population comprises Sikhs, Christians, and Hindus. There is also a small community of Tibetan refugees, who came across the border from Tibet after 1959. Ladakhi oracles are drawn from and cater to a predominantly Buddhist population that is concentrated in Leh district and the Zangskar region of Kargil district. Occasionally, clients and oracles are drawn from Muslim, Christian, and Hindu communities (Day 1989).

The rising prevalence of oracles in Ladakh is most related to changing work, marriage, and residence patterns. Older forms of status and rank cannot compete with new forms of wealth, status, and the growing spread of modern Indian cinematic and media culture. Despite rapid modernization, the household and its land remain the primary economic, legal, and social unit of Ladakhi society. Traditional practices of primogeniture, polyandry, in which many brothers marry the same wife, monastic celibacy, and the joint family system are on the decline, as younger sons commonly marry separately and divide the family estate or migrate to the city for work in the military, civil service, or tourist sectors. Most daughters move to their husband's natal household unless there are no sons, in which case a daughter inherits her natal household and brings in a husband from elsewhere. Although young wives are still subject to the authority of their in-laws, shifting careers have led some couples to set up house independently. The incomplete transition from primogeniture and the joint family to nuclear households and individual inheritance has left a growing percentage of the younger generation disenfranchised. Oracular possession is related to increasing conflict over collective identities framed around ethnicity, religion, or gender (Aggarwal 1994; Beek 1996; Gutschow 1998).

Local explanations for the recent rise in oracular possession point to politics, economics, and Buddhist cosmology. The rising number of oracles is said to be due to increased militarization and insecurity, state development initiatives, a growing cash economy, and increased external and internal migration (which causes ritual pollution, *grib*), along with the worsening state of the world, which forces deities into the human world or causes them to flee to Ladakh from elsewhere, such as Tibet (Day 1989). Within Ladakh, village oracles are con-

centrated most heavily in and around Leh, where the social fabric has been most dramatically altered by internal transience, population growth, militarism, and the influx of Kashmiri merchants, Indian soldiers, foreign tourists, and migrant workers from Bihar and Nepal. The slight increases in education and jobs have left a younger generation frustrated with limited social mobility, poor educational standards, and consistent discrimination against them as inferior subordinates who cannot compete at the state or national level. Extended stays by young people outside of Ladakh for higher education or employment, along with the influx of migrants, have led to heightened strain on cultural boundaries and local concepts of purity and pollution. Oracles mediate cultural and social boundaries as they attend to stresses such as finding a job, a wife, or a place in the education system. The anonymity and secularization of urbanization have led to increased incidences of depression, mental illness, suicide, and drug use. These have led to greater participation in the cult of village oracles, even as the monasticism oracles are in decline.

Village oracles are made, not born in Ladakh. What was formerly a hereditary calling has become a largely vocational practice. Although village oracles used to be drawn from households with a long tradition of oracular possession (Day 1989), village oracles currently come from a range of households, not necessarily associated with an oracular lineage. Oracles are drawn from both lower and middle classes, from wealthier and older households as well as more indigent newcomers, and from both commoner and outcaste strata, though rarely from aristocratic households. Despite varied social, economic, and personal backgrounds, all oracles undergo some form of an initiatory ordeal or illness. Although individual ailments may vary, a generic pattern can be tentatively identified. Before being formally inducted as oracles, most initiates experience a prolonged period of psychosomatic illness, often accompanied by involuntary possession attacks. During this prolonged attack by malevolent forces, which may last from several months to several years, initiates commonly face some form of social censure or ostracism. Although the initiates' unpredictable behavior—sudden fits of emotion, fainting spells, and inability to work—may be deemed evidence of divine election in the long run, they earn certain disapproval and loss of social status in the short run. The inexorable logic of karma may turn the victim into the accused, as present suffering is considered the well-deserved result of past misdemeanors.

Like psychoanalysts, village oracles must undergo a ritualized "cure" before they are trained to heal. Initiates become oracles by submitting to the same ad hoc treatments that they will recommend to their future patients. Most initiates seek out competing diagnoses and cures from a range of healers, including oracles, Tibetan doctors, monks, astrologers, and biomedical doctors (Day 1989, Gutschow 1997). With the exception of biomedicine, all of the traditional discourses—medical, monastic, oracular, and astrological—draw on shared idioms and compatible notions of causality. Although all of the discourses draw on the law of karma for ultimate or primary causality *(rgyu),* each recognizes a number of secondary or proximate causes *(rkyen).* The secondary causes of spirit possession include behavior, emotion, diet, season, astrological factors, mental illness (known in local idiom as wind disorder, *rlung gi nad pa*), demonic influences, witchcraft *(gong mo bzhug byes),* and ritual defilement *(grib).*

Ritual defilement in particular includes a range of transgressions from the ritual to the moral realm (Gutschow 1998). Defilement is caused by both accidental ritual oversights harming *(gnod)* unseen spirits and by improper behavior or emotions, such as theft, lying, violent activities, mixing with Muslims, obsessive thoughts, excessive anger, and violent jealousy. This emphasis on defilement defines possession as an attack by vulnerable spirits, who are in continual danger of being offended or wounded. In local idiom spirit possession is conceptualized as a transgression, excess, or imbalance of the spiritual, psychic, or moral order. Spirit possession reflects and refracts a broader Buddhist discourse about the disturbance of cosmic boundaries, natural balances, and bodily barriers. Oracles learn to repair that which has been transgressed as they begin to channel the spirits and their emotions in a more socially productive fashion. Whereas medical, ritual, and oracular discourses stress the physicality of the invasive demons or spirits, Buddhist philosophical discourses recognize demons as psychic projections or illusions, ultimately empty

of inherent and independent existence. All of the discourses, however, even the philosophical, accept the conventional validity of phenomenal reality and its spirits, even if they subordinate this reality to the Buddhist doctrines of karma, emptiness, and dependent origination.

Before becoming village oracles, initiates undergo extensive medical and ritual interventions. It is possible to make a tentative distinction between the medical approach, which focuses on the body, behavior, and emotion, and oracular, ritual, and astrological discourses, which focus more on morality and cosmic causality. In practice, the discourses are interdependent and inclusive rather than exclusive and separate. Most initiates who experience involuntary possession begin with medical treatments ranging from "gentle" herbal mixtures to "fierce" remedies such as acupuncture and moxibustion (use of the moxa plant, placed on the skin and used as a counterirritant. In Tibetan medical discourse spirit possession is grouped with other mental illnesses *(smyo ba)* caused by a profound imbalance of the body's three major humors, wind, bile, and phlegm (Epstein and Rabgyay 1982; Rabgyay 1985). If the medical treatments fail to assist the displacement of the body's central life wind *(srog rlung),* ritual intervention may be required to call back the soul or enhance the life force. The life force *(srog)* and soul *(bla)* are two of the five factors calculated in a Tibetan horoscope: The other three are body *(lus),* power (*dbang*), and luck *(klung).* Any number of personal or household rituals, including exorcisms *(brgya bzhi, lha gsol)* and enhancement rites such as putting up prayer flags *(rlung rta)* or calling the soul (*bla 'gugs*), may be performed to ransom the initiate's health, call back the soul, or enhance the initiate's luck and power in order to avert sickness and death. Initiates may be required to purify themselves by undergoing ritual performances, including ritual ablutions or fumigations *(khrus, bsang),* fasting, circumambulation, meditation, and pilgrimage, as well as other forms of gaining merit.

After completing ordinary rituals and taking standard ways of gaining merit, initiates may petition a high-ranking or reincarnate monk to use his tantric prowess to divine the god or demon that afflicts them and provide a ritual purification *(khrus),* blessing *(sbyin rlabs),* or sacred amulets *(srung ba)* to ward off further impurities or spiritual malaise. This monk may perform a standard tantric liturgy *(sadhana),* in which he generates and embodies his tutelary deity *(yi dam),* in order to dispel the demonic and bind the beneficial spirits plaguing the initiate. Only senior monks or reincarnates can confirm the presence of beneficial spirits and fully banish the demonic. The emphasis on tantric ritual and Buddhist merit making reinforces the primacy of Buddhism over the lesser spirits and folk beliefs with which it does continual battle. From an external viewpoint one could say that the monks use their monopoly of tantric practices to authorize the new oracles as ritual healers. Although oracles must submit to the monastic authorities for recognition, they may continue to challenge or resist the supremacy of the monks in their healing practice.

Village oracles can only be inducted as healers through explicit ritual recognition from a senior oracle and a senior monastic. During or after their ritual or medical interventions, initiates apprentice themselves to a senior oracle, from whom they learn to recognize and control the possessing spirits, as well as to perform basic healing practices. All village oracles undergo a lengthy tutelage under a senior oracle, a practice known as "submitting to the gods" *(lha 'bogs).* During this training period, initiates repeatedly enter trance in the presence of the senior oracle and a senior monk (Day 1989). The two ritual authorities interrogate the initiate in order to identify and authenticate any spirits that are present. These training sessions are used to confirm that all demonic influences have been banished and that the possessing spirits are dedicated to work only for the welfare of others, a standard Buddhist objective. The training and induction rites mirror the process by which Buddhism subdued *('dul ba)* the fiercely independent shamanism it encountered across the Tibetan plateau. The initiate, who is possessed by worldly spirits *('jig rten pa'i lha)* still trapped within the cycle of birth and rebirth *(srid pa'i 'khor lo),* submits to the monks, who draw on the power of higher tantric deities and transcendent gods, '*jig rten las 'das pa'i lha,* literally those who "have gone beyond" the world of suffering (Nebesky-Wojkowitz 1975).

In Tibetan Buddhism, tantric virtuosos are the most highly prized ritual experts because they can call on the widest range of forces in

their battle against demonic chaos. Tantric experts make use of Buddhas, celestial bodhisattvas, and tantric protectors, as well as more worldly gods, such as monastic protectors *(chos skyong),* household gods *(pha lha),* village gods *(yul lha),* and personal protectors *(dgra lha).* Oracles, by contrast, primarily access the worldly gods, such as protectors and more ambiguous sprites of the Underworld *(klu),* earth *(sa bdag),* and space *(gzhi bdag).* Such autochthonous worldly spirits are domesticated and absorbed within the Buddhist pantheon in order to secure the clerical sphere of authority and efficacy (Gutschow 1998; Samuels 1993).

The final induction into the status of full oracle involves a critical separation rite *(lha 'dre phye byes)* in which the senior oracle and an ordained monk determine that the initiate's spirits have come to work for Buddhist purposes (Day 1989). The senior oracle and the students will undergo trance simultaneously in order to separate and dispatch the negative demons and positive spirits accordingly. A variety of symbolic idioms are used to test the initiate's ability to distinguish the good spirits from the bad—arrows, stones, or a game of dice. The initiate may be required to break or discard the arrows or stones symbolizing demonic spirits and correctly identify those that signify certain Buddhist deities, such as the guardian deities *(chos skyong, dharmapala)* of the four directions. Alternatively, the initiate's fate may be decided by a ritualized game of dice, recalling the famous episodes from the Central Asian Gesar epic and the Indian Mahābhārata (in the latter the fate of the Pandava kingdom is decided by a game of dice) (Day 1989). In this ritualized competition, the senior oracle champions his or her protégé against a monastic adversary, whose victory spells defeat for the initiate. In the course of the separation rite, the monk discards a set of tantric offering cakes *(gtor ma)* signifying obstacles and performs a ritual ablution or fumigation to purify the space.

This final authorization of an oracle neatly illustrates how monks and oracles both complement and contest each other's ritual power. The induction process confirms monastic preeminence in dispelling impurity and danger, while restoring ritual order and purity.

After induction, village oracles begin practicing by performing healing séances in their own home or, if necessary, in the form of a house call. Most séances follow a typical pattern, as the oracle becomes temporarily possessed by one or more local guardian deities or more remote mountain deities from Tibet. Depending on the oracle's popularity, the séance may include anywhere from one to a hundred patients who have gathered at the appointed hour in the oracle's home. The oracle prefaces the rite by carefully washing of the hands and mouth, for most spirits are deemed to be particularly offended by human smells and other forms of defilement. While patients chat informally, the oracle prepares the standard set of offerings as invitations of hospitality *(gsol ba)* or requests for assistance from a range of Buddhist and local spirits (Ortner 1975). The oracle then dons her ritual costume after preparing the customary Buddhist altar of seven offerings, including water, flowers, incense, barley, a butter lamp, and offering cakes, as well as "golden drinks" *(gser khyem)* and juniper incense. In full view of the patients and audience, the oracle dresses herself with a ritual apron *(pang khebs),* cape *(stod le),* and five-pointed crown *(rigs lnga),* and ties a scarf over her mouth before picking up her major ritual implements—the bell, thunderbolt, and small hand drum, used in standard tantric practices.

The arrival of the god is signaled by hiccuping, sneezing, or other behavioral tics, often while putting on the crown or scarf. The oracle begins her séance with a lengthy chant, while spinning the hand drum, shaking the bell, and performing basic tantric gestures *(mudrās).* As the hypnotic combination of the bell, drum, and chant take effect, the oracle may address the god who has come to possess her, by offering the golden drinks.

The healing session begins when the oracle is fully in trance and turns toward the patients, who offer a blessing scarf and then present their ailments, predicaments, or queries. Most patients are treated either with an extraction or a divination. To extract noxious substances believed to be causing illness or misfortune, the oracle places a short copper tube upon the patient's body, vigorously sucks, and then spits the resulting substance into a bowl of water set aside for this purpose. The oracle may then divine the cause of illness by reading the offensive substances just removed from the body. She may also read the barley corns dancing across her drum or use her rosary beads to calculate

an answer. Patients may seek answers to any number of concerns, including marriage prospects, upcoming exams, jobs, and other mundane worries. The extraction of substances may offer only limited healing, yet the divination may specify the secondary causes of the ailment, including pollution, accidental transgression, or the attack of harmful spirits. Because accidental pollution is so common in a system where unseen spirits are offended by daily human activity, the question is not so much whether pollution is present but who has been offended. The oracle either identifies the wronged spirit and recommends ritual treatment or refers the patient to other healers for further diagnosis. After the tense acrobatics and power of the ritual, each patient contributes a small donation in cash or kind before leaving the oracle's house.

Oracular possession encourages multiple interpretations and a flexible, inclusive rather than exclusive approach to illness and treatment. Using Arthur Kleinman's terms for analyzing indigenous healing systems (1980), oracular possession uses informal institutional settings; a relatively intimate and yet authoritarian interaction between healer and patient; empathic and charismatic healers who accept limited payment for their services; and a ritualized rhetoric of diagnosis and healing using somatic, psychic, and moral idioms. The therapeutic stages of the healing process are open-ended and inclusive, as the diagnosis, treatment, and cure of the illness and final authorization as an oracle often require the wider involvement of the family, community, and religious establishment. Yet oracles do not supply seamless harmony at all costs. The village oracle may reject previous diagnoses, scold patients for seeking treatment elsewhere, and forcibly counter prior diagnoses offered up by supplicants.

Both village and monastic oracles may serve as a local voice of resistance, scolding villagers about the decline in morality, purity, and loyalty to tradition and custom. They may also go so far as to critique the establishment, by singling out lazy and lecherous monks, scheming astrologers, doctors, or merchants, and politicians with no sense of shame. In other words, the oracle voices truth to power, by articulating the concerns of the displaced or disempowered in a direct, shameless manner, openly disregarding customary norms of polite nonconfrontation. In the case of village oracles, such critique can earn both respect and disparagement, or even outright retribution from higher authorities such as monastics. It is not uncommon for village oracles to lose their abilities to enter into trance, unlike monastic oracles who are simply rotated out of their position. A village oracle may stop channeling spirits for a number of reasons, including personal health, concerns about the accuracy of her diagnoses or divinations, and monastic anxieties about the authenticity or benevolence of the spirits in question. Unlike monks, who draw on institutional backing even when rituals fail, village oracles renegotiate their healing authority every time they practice. Their ambiguous position outside of the institutional monasticism stands in sharp contrast with the second, much smaller group of spirit mediums in Ladakh: monastic oracles.

Monastic oracles have more legitimacy than most village oracles, although their practice is less frequent and more circumscribed. The two monastic oracles left in Ladakh are closely associated with royalty or aristocracy. In Stok village is the palace *(mkhar)* and estate granted to the last king of Ladakh in the nineteenth century; Matho housed a lesser aristocracy, which frequently intermarried with the kings and nobles of Ladakh, Zangskar, and Lahaul. Even after the fall of the Ladakhi monarchy to the neighboring Dogra rulers in the nineteenth century and up through Ladakh's incorporation into the Indian nation in 1947, monastic oracles were called upon to give advice to the kings and ministers who continued to adjudicate local affairs (Heber and Heber 1977). Because monastic oracles are chosen by rotation or by lottery, they bear little of the stigma associated with the prolonged ordeal of involuntary possession. At Stok, two village households each provide a man to serve as oracle every year, in turn, while the two Matho oracles are chosen by lottery from the monastic population, although they used to come from among the lay population. The laymen who serve as oracles are paid in grain for their performance, which is collected as a tax from every household in the village.

Before their ritual appearance during the two-day festival at Stok monastery, the two laymen chosen as oracles undergo fifteen days of ritual preparation, including daily ablutions *(khrus)* at the hands of the Vajra master (tantric master) *(rdo rje slob pdon)* of Stok monastery (Brauen

1980; Day 1989). The two oracles become possessed when the monks of Stok hold their annual sacred dances *('chams)* on the ninth and tenth of the first Tibetan month. While the monks present their spectacular dances of tantric deities and local protectors dressed in rich costumes of silk brocade topped with fierce masks, the oracles appear on the monastery roof, now running along the parapets, now slicing their tongues with heavy brass swords, now gesticulating wildly and making pronouncements or answering random questions that are warily tossed their way. Each oracle is possessed by one of the two manifestations of the local village protector *(yul lha),* Ser rang, one of which has a close relation to the palace and the other to the monastery. The oracles wear almost identical ritual dress. On the first day, they wear a red felt hat *(btsan zhva)* marked with three eyes linking them to the fierce Tsam spirits of the Middle World, a brocade coat, collar, and aprons, and on the second day they are dressed more plainly in light pants, aprons, and collars, as well as red and black wigs.

Matho used to have laymen serve as oracles until they complained of the strenuous nature of the possession; the Matho oracles are now chosen from the monastic assembly by lottery a year before the monastic dances *('chams)* take place on the fourteenth and fifteenth of the first Tibetan month. The two monks, who are selected from a group identified as fully purified, must spend a year in retreat, performing meditations, avoiding certain foods like garlic and onion, and receiving weekly ablutions from the monastery's Vajra master. During Matho's two-day dance festival, the oracles receive high-ranking visitors before they make a spectacle of themselves in the monastic courtyard by making ominous predictions and answering questions from the audience. The two oracles are possessed by either the wrathful or peaceful manifestation of the local village deity *(yul lha),* known as Rong btsan, who was brought from the Tibetan region of Kham by the Sakyapa monk who founded Matho in the fifteenth century, Drung pa Dorje. Each oracle wears a ritual costume over his monastic dress, including a red hat with three eyes, a brocade coat, and a large breastplate made of iron, and brandishes a spear and a sword as he runs along the monastic parapets, making pronouncements about the future of Ladakh to all and sundry.

Last but not least, the Shey oracle continues to serve as a state oracle, by making predictions about communal and agrarian welfare during the fall harvest festival *(shrub lha),* which marks the beginning of the scything period in the seventh Tibetan month. This oracle may date back to well before the seventeenth century, when Shey rather than Leh was the capital of Ladakh.

MANIPUR MEITEI SHAMANISM (NORTHEAST INDIA)

The shamanistic tradition in Manipur is part of the pre-Hindu religious tradition of the Meitei community who live in Northeastern India. There are both male and female shamans in this tradition, and their duties and practices are clearly designated and distinguished from one another.

Bordered on the east by Myanmar (Burma), the state of Manipur (total area: 8,456 square miles) in northeastern India consists geographically of an oval valley of about 700 square miles surrounded by densely forested mountain ranges. The members of the Meitei community are the principal residents of the valley, and the community has had a rich history. Their religious tradition combines pre-Hindu beliefs and Hindu Vaishnava practices. The pre-Hindu religion has a rich shamanistic tradition. There are both female and male shamans in the pre-Hindu tradition, and they are called *maibas* (male) and *maibis* (mostly female), respectively, in Meitei language. As female shamanism is such an uncommon feature in India, the maibis have received much more attention from scholars, and there are extensive accounts written about them. Less written material is found about the maibas.

Female Shamans

The priestesses, the maibis of the pre-Hindu religion are chosen by divine intervention. They may be chosen either in the Lai-haraoba ceremony during *Lai-nupi thiba* or at some other time. (The Lai-haraoba ceremony is a yearly public festival celebrated throughout Manipur. It is the principal religious festival of the pre-Hindu religious tradition.) If a woman falls ill and no other medical practitioner can cure her, the belief is that a god has chosen her to become a maibi. She is treated by a maiba, then sent as an apprentice to a senior maibi. She becomes a full-fledged maibi only after a long period of apprenticeship (Brara 1998, 136). It is considered normal for a woman to be a maibi and to also continue married life and have children. In some cases, however, maibis have to give up married life, since some families do not like their women to be traveling and performing in public. Socially the maibis perform several roles. They officiate as priestesses in the Lai-haraoba ceremony, leading the proceedings. They also sit in trance making divine predictions every morning during the Lai-haraoba ceremony. Many women consult them throughout the year when in any kind of uncertainty or trouble, and they make divine predictions about people's lives and futures. Apart

from some yearly rites such as the Sagei-apokpa khurumba (yearly functions for the progenitor of the clan), the main role of the maibis in the society is during Lai-haraoba.

After becoming a maibi, a woman has to follow certain food restrictions. She cannot take fire from a lit fireplace; instead, she has to light her own fire by friction. If a maibi deviates from the food restrictions, she tends to suffer from acute bodily pain and uneasiness, causing restlessness. Her hair becomes locked and matted (Chaki-Sirkar 1984, 168), and she develops some kind of lump in the abdomen, which surgeons are unable to find in order to remove. All these symptoms are thought to be curable through the *lairen puba* (purification process) of *laikhai-taba* (complete training) (Brara 1998, 137). Once she is possessed by the *lai* (god), she acquires incredible strength. (It is to be noted here that even though the word *lai* in the Meitei language is used to refer to both Hindu and pre-Hindu gods, in the context of the maibis it is used to refer to the pre-Hindu god, whom the maibi is propitiating.) When she is possessed, even a number of persons cannot control a single maibi.

The maibis belong to three *salais* (clans), Mangang, Luwang, and Khuman, and they are represented by their respective clan colors, *shanglen, nongmai,* and *phura*, respectively. These three groups have different languages. The deity of the shanglen group will only possess a maibi of its own group, and if a maibi of another group wants to talk to the deity of Shanglen, the deity will not listen to her. Hence the *lairon* (language) for all the three groups is different, so that each maibi can converse with only the deity of her own group. A Shanglen maibi will always look for an *Ima-guru* (mother-teacher) belonging to the Shanglen group; in fact, she will be automatically led to the Ima-guru of that particular group.

There is a hierarchy among these three groups, and they are trained differently, as they are headed by three different deities. If either of the other two groups performs the rituals and offers flowers to a deity from the third group in any of their own houses, that particular house is said to face chaos. These three groups stay in different places, are trained differently, and acquire different lairon. The maibi herself cannot change her group. She has to serve the deity who has chosen her.

Maibis are functionally divided into two categories: (Brara 1998, 138)

1. *Wangong shang da Angangbu Ngaibi* (who waits in the house for the child). This kind of maibi specializes as a midwife. She delivers the child, cuts its umbilical cord with a bamboo-knife, and while cutting it, requests the *limi* (shadow), or the soul, to enter the newborn.
2. *Khabi shingta chakpa larak phambi* (one who can stop the god). This kind of maibi has the ability to confront the god (or spirit). She is the kind of maibi who experiences possession. At the beginning of of her conversation with the god in lairon, she sits on a banana leaf, considered sacred and conforming to good etiquette, in order to reach the gods. It is also believed that the growth of banana trees is an indication of fertile ground. The banana leaf is a symbol of fertility, hence prosperity. She covers her head and face with a white cloth, holds a bell in one hand, and rings it near her body.

The dance of maibis and the ritual theater of the *lairoi numit* (meaning "the last day") (the last night of the Lai-haraoba ceremony) are the oldest examples of dance and traditional theater among the Meitei. The evening rituals of Lai-haraoba consist of Hoi-laoba (singing by the maibis), Thougal-jagoi (dancing by the maibis to invoke the deities), Laiching-jagoi (dancing by the maibis that involves a variety of expressive movements), and Laibou-chongba (the dance of creation, done by maibis). The sequence ends with Leiren mathek, in which a maiba leads a line of the participants in an imitation of the movement of a snake, a symbol of the snake-god Pakhangba), Wakol, during which all the cultic objects are put back in the temple, and a concluding song to put the deities to sleep. In the all-night function of lairoi numit, the mythological story of Tangkhul and Nurabi is enacted by the *Pena-khungba* (Pena [bow-stringed musical instrument] player) and the maibis. This enactment is highly ritual in nature and symbolizes the propagation of fertility in the Meitei society (Achoubisana 1989, 18).

The maibis can also be male. The male maibis dress up in women's clothes when they officiate at a function. In recent times, there has been an increase in the number of male maibis. One of the major maibis of Manipur today is a man. A member of the community told the author that, due to security problems in the state, organizers of Lai-haraoba prefer to have male maibis officiating at the festival, as they do not want to take responsibility for protecting women.

Male Shamans

The maibas, the male priests, are an important institutional presence in the Meitei society. Their services range from acting as medicine men to serving as counselors. They are experts in the indigenous medicine system of Meitei society. They are, however, not chosen by divine intervention as the maibis are. A man may choose to become a maiba if he wants to. He does *Ojha–Boriba* (a ceremony by which the teacher accepts the disciple) with a teacher and thus can become his disciple. The medical tradition of the Meitei community has been written down in the traditional text *Maibarol.* It is interesting to note here that even though socially both maibas and maibis are considered equally important, the male tradition of the maibas has a written tradition, but the female tradition does not.

The Meitei community has a long tradition of writing and literature, which is found in the ancient manuscripts of this community, popularly known as the *puyas* (Ray 2000). These manuscripts are handwritten in the archaic script on ancient paper derived from tree bark, and they are considered sacred by the community. They have been written from the fifteenth century up to the recent past. Many scholars are of the opinion that the writing of the puyas continued through the conversion into Hinduism. The royal authorities were hostile to the pre-Hindu puyas during the time of conversion, but later attempts were made to syncretize the two belief systems (Hindu and pre-Hindu), and writing and studying of puyas found royal patronage again. The subject matter of the puyas is varied. They encompass religion, philosophy, ethics, martial arts, dance, music, botany, zoology, mountaineering, anatomy, physiology, medicine, and so on. Very few of these puyas have been transcribed into the popularly used Bengali script and published. Most of them are still in handwritten form. Very recently under state initiative the puyas have been archived in the newly established Manipur State Archives.

From ancient times, the royal authority of Manipur has been the patron behind traditional scholarship. The shamanistic healing tradition was very much a part of this knowledge system. The royal administration was divided into eight departments, *loishangs,* and the foremost among them was the *pandit loishang,* the royal house of scholars. The palace of Manipur as it still stands today houses the adjoining royal temple of Govindji (a Hindu god). The temple along with the several royal departments includes the royal house of scholars. Even today the house of scholars stands in its place. There are three scholars in residence in the loishang, and the deputy head of the loishang has office hours there every day. The head of the loishang visits occasionally. The pandits (scholars) are allowed to choose their area of specialization, and many of the pandits also function as maibas or *amaibas.* Among the current residents of the loishang there are some prominent medicine men.

In the early part of the twentieth century there was a feud in the royal establishment. As the then Maharaja of Manipur, Maharaja Okendrajit, became a convert to a revivalist religion called Sanamahism, the royal temple separated from the palace and established a managing trust of its own. The royal departments, including the pandit loishang, came under the temple board. The head of the pandit loishang at that time was the renowned pandit M. Chandra Singh. In parallel to this establishment, a separate *maichou loishang* (department of scholars) was set up by the king, which was headed by a revivalist scholar, Nodiachand Amaiba. This system continues at the present time. The head of the pandit loishang adjoining Govindji's temple is Ngariyambam Kulachandra, and the head of the maichou loishang patronized by the present royal family is Ng. Kangjia, a well-known preacher of the Sanamahi religion.

As the pandit loishang and the maichou loishang belong to separate schools of thought, the difference in the religion has given rise to acute differences in the interpretation of the

puyas. But despite differences, there is a certain degree of standardization that is found in the shamanistic tradition of Manipur, as it is grounded in a textual tradition. The actual procedure of the healing can vary vastly. There is a medicinal tradition, in which herbal medicine is manufactured by the maiba and administered to the patient. There is also an indigenous science of studying the pulse beats of the patients. The ritual healing process is, however, completely different. It is a procedure of intense prayer on the part of the maiba, the details of which are usually unknown to the public.

In modern times, there are a number of doctors and nurses available in the state, and people usually do go to Western-trained doctors for treatment. In many cases, however, the ritual traditions of medicine as found in the traditional faith are considered important (Brara 1998, 144). Thus, in everyday life in Manipur no ceremony of birth is complete without the maibi ceremonially cutting the umbilical cord and invoking the *mi* (shadow), or the sixth soul, to enter the child. Even after a Western-trained doctor has written a death certificate, families wait for a maiba to come and declare the death ritually. The clientele of the maibas and maibis is thus varied. In villages in interior parts of the country, where people cannot afford to go to physicians, maibas are often contacted. There is no question of caste or creed among the clientele of the maibas and maibis. Their clientele may be composed of any resident of the state, including Brahmans, non-Brahmans, and even non-Manipuri residents of Manipur. In general people who are educated and Westernized do not openly admit that they believe in this indigenous system of healing. But when it comes to a crisis they usually resort to these indigenous healers. As uncertainty looms in the everyday life of the community, people depend more and more on the divine predictions of the maibas and the maibis of Manipur to make decisions about their future.

NEPALESE SHAMANS

To understand the diversity of shamanic expression found in Nepal, any discussion of Nepalese shamans must be first situated in the context of Nepal's history and cultural complexity.

The kingdom of Nepal, which for a brief time included most of the southern slopes of the Himalayas, began to emerge in the mid-eighteenth century, as the king of one of many petty hill states, Gorkhā, embarked on the conquest of his neighbors, successfully conquering in 1769 the sophisticated Newari cities of the Kathmandu Valley. That king, Prithvi Narayan Shah, described his kingdom as "a flower garden of four castes and thirty-six subcastes" (*cār varna chattis jātko phulbāri*). This remark, by recognizing the ethnic diversity found within

Nepal while simultaneously reframing those groups within a Hindu caste structure, may be regarded as the beginning of both Himalayan ethnography and Hindu hegemony. Prithvi Narayan's remark acknowledges the complex ethnic and linguistic heritage of Nepal, in whose small but geographically rugged area of 56,000 square miles 120 distinct languages have been recorded. Military interventions by the British in the early nineteenth century established the present borders of the kingdom but preserved Nepal's nominal independence, an independence that was strengthened by Nepal's strong support of the British during the Indian sepoy mutiny of 1857.

Never having been genuinely colonized and rigorously outlawing all missionary proselytizing, whether by Christians or Muslims, Nepal has preserved its diverse cultural traditions, which include many varieties of shamans, oracles, and spirit mediums, as well as Hindu priests, Buddhist lamas, Tantric practitioners, astrologers, fortune-tellers, wandering ascetics, Ayurvedic doctors (practitioners of the ancient Hindu science of health and medicine), and herbal healers. Within such diversity, it must be observed that there is no "Nepalese shamanism," not in the sense of a coherently integrated religious system practiced throughout the country, neither one paralleling those reportedly found among the Ural-Altaic peoples, as the term was originally applied by the ethnographers of Catherine the Great, nor as some systematic institution whose priestly specialists perform life-cycle rites or exclusive healing rituals for some society. Whatever their status elsewhere in the world, it is misleading to describe Nepal's shamans as forming a distinct religious practice, or to think of shamanism as constituting a "religion." Most groups of Nepalis have been sufficiently exposed to South Asian religious thinking during the past three millennia to think of what the West calls religion in terms of the concept *dharma* shared by both Hindus and Buddhists, and, except perhaps as part of the very recent emergence of increasingly militant ethnicity as a political force in Nepal and consequent efforts to define some ethnic practices in opposition to Hinduism, Nepalis do not regard shamans as part of their dharma. It is likewise untenable to see shamanism in Nepal as an atavistic survival of some earlier religious configuration, since there is little evidence to suggest what sort of practices may have preceded the emergence of the long-dominant Hindu and Buddhist life-cycle rites.

In Nepal, shamans may be most accurately characterized as intercessors who diagnose and treat afflictions that trouble their clients using ritual practices incorporating a mastery over spirits. To distinguish shamans clearly from other ritual specialists, such as the oracular mediums *(dhāmi)* of the Karnali Drainage area of western Nepal or Newari Tantric priests *(vajracarya)* of the Kathmandu Valley, this discussion follows Shirokogoroff's classic definition of shamans: persons of either sex who are masters of spirits, who can at will introduce these spirits into themselves, and who use this power over the spirits for their own purposes, particularly to help other people. Sergei Shirokogoroff listed five essential characteristics of a shaman: (1) The shaman is a master of spirits; (2) he has mastered a group of spirits; (3) there is a complex of methods and paraphernalia recognized and transmitted; (4) there is a theoretical justification of the practice; (5) the shaman assumes a special social position (Shirokogoroff 1935, 274). Additional characteristics that help distinguish shamans from other practitioners of spirit possession usually include a predilection for undertaking soul journeys to the underworlds and the heavens, trance states—sometimes described as "ecstasy"—that involve dramatically staged performances including specific initiation and death ceremonies, and an extensive repertoire of memorized oral texts.

Following Shirokogoroff's definition, there are shamans found in many different communities of Nepal. They are ritual intercessors. Their elaborate divination, exorcism, and healing practices incorporate command over extensive, well-defined groups of spirits; they use elaborate, traditionally affirmed paraphernalia; they often enter trance states to conduct ritual journeys; and their theoretical justification and major therapeutic tools can be found in their memorized oral texts, both long, publicly chanted recitals that preserve mythic stories and short, whispered, secretive incantations (mantras). As the article that first described Nepalese shamans observed, the shaman serves as "a privileged intermediary between spirits (who cause and cure illness) and men: between the past, present and future; between life and death, and most importantly between the indi-

vidual and a certain social mythology" (Macdonald 1962). Given the low caste of many of them and the accusations of sorcery with which they are sometimes faced, the special social position of these intercessors is ambivalent, but Shirokogoroff himself only meant by this that "a group distinguishes one of its members by bestowing on him their confidence" (274), something that the numerous clients of these intercessors do with each consultation.

Ritual specialists found in Nepal's different communities who meet most of the basic features of Shirokogoroff's definition (although each type of specialist has distinct characteristics, including different costumes, different rituals, and different oral texts) include Gurung *poju* and *hlewri* (Pignède 1966), Tamang *lambu* and *bonpo* (Höfer 1981, 1994, 1997; Holmberg 1989), Yolmo *bonpo* (Desjarlais 1992), Tharu *gurau* (Krauskopff 1988), Rai *bijuwā, padem,* and *lambu* (Allen 1976, Gaenszle 1991; Hardman 2000), Limbu *yeba* (Jones 1976), Sunuwar *puimbo* and *ngiami* (Fournier 1976), Chepang *pande* (Riboli 2000), and Sherpa *lhapa* and *mindung* (Paul 1982). However, the practitioners who most closely match the full set of conditions are the low-caste (Ḍum) *jhāngrī* (in central and eastern Nepal pronounced *jhākrī*) and Magar *rammā* of the western hill region, most significantly the *kāmī* (blacksmith) shamans who are found practicing throughout Brahman, Chetri, Magar, Gurung, and Tamang communities in western Nepal.

In an early article, John T. Hitchcock (1967) accurately noted the striking parallels between the symbols and practices of western Nepalese *jhākrī* and the shamans of Central Asia, clear parallels also visually demonstrated in a spectacular ethnographic film by Michael Oppitz (1980). Jhākrī still recognizable as closely related to those of Jājarkot, Rukum, and Baglung districts of western Nepal can also be found further to the east, at least as far as Parbat District, as the brief reports of Reinhard Greve (1982) and Wolf-Dieter Michl (1976) have shown. This distribution clearly results from the presence of blacksmiths found in the midst of other distinctive ethnic groups such as Chantals and Thakalis. How far to the east in Nepal this pattern holds true remains to be seen, since there have been no extensive studies of the lowest castes of Nepal, though they are often peripherally mentioned in ethnographies. Oral texts may demonstrate a much wider continuity, as fragments of text from a Lohorung Rai community of eastern Nepal (Hardman 2000, 65) and from among the Chepang of central Nepal (Riboli 2000, 134) show striking similarities with myths found among jhāngrī (Maskarinec 1998), though much more extensive documentation is required to establish how close the relationship is. As jhāngrī are the geographically most widely distributed and most numerous of the various types of intercessors found in Nepal, this article will concentrate on them, referring to them simply as Nepalese shamans.

Throughout Nepal, most shamans are male, although highly motivated women occasionally overcome the biases of patrilineality and gender discrimination and become shamans. Although many future shamans undergo disturbing possession crises as adolescents that prompt them to seek training, preparation of new shamans concentrates on their memorizing oral texts rather than on learning trance techniques such as drumming. Most important is to learn the secret mantras that control the many spirits that shamans must manipulate in their rituals. Unlike other circumstances that involve involuntary or spontaneous spirit possession, shamans thoroughly control the spirits that they summon to their ceremonies, ordering, flattering, bribing, cajoling, and threatening them to ensure that they obey the shaman's will. A line found in mantras used to summon dead souls and to dismiss the assembled spirits demonstrates most clearly the hierarchical relation between a shaman and his spirits: "Come when I say come, go when I say go" (Maskarinec 1998, 268, 391).

Spirits summoned by shamans belong to many distinct classes, including local gods and goddesses *(deutā, debī),* spirits of animals and inanimate forces *(bir),* souls of human suicides, particularly vengeance spirits—men or women who were unable to find justice in their life time and deliberately committed suicide in order to become such a spirit (male *barmā* and female *bājyu*), souls of other dead humans, especially those who died untimely deaths, whose funeral rites were improperly performed, or whose corpses suffered ritual pollution such as being touched by a dog *(masān, syāuryā),* familiars of living entities *(barāng),* familiars of dead entities *(māphī),* crossroads ghosts *(dhām,*

dhuwā), and the souls of other shamans *(gel).* Some of these groups are protective, solicitous, benign, and undemanding; others are malicious, oppressive, and threatening. Nearly all demand blood sacrifices, a key element of all major shamanic rituals. Communicating with these spirits allows shamans to diagnose problems, treat afflictions, and restore order and balance to the lives of their clients and their communities.

Shamans' diagnoses of their patients' afflictions commonly involve some combination of seven possible causes: (1) curses and spells, particularly those of witches and other shamans; (2) unlucky astrological configurations, foremost of which are dangerous planetary configurations called star obstructions; (3) the intrusion of alien substances into the body, whether by acts of sorcery, by violation of sacred space, or by violating rules of ritual purity, such as coming in contact with a woman's menstrual blood; (4) weakened life forces, including soul loss, lost wits, dullness, and several recognized forms of madness; (5) social disorder, especially disputes within families and communities; (6) fevers of autonomous origin; (7) the activities of spirits or ghosts, provoked by acts of neglect, pollution, or disrespect. When spirits are involved, the most common types are patrilineal family gods *(kul deutā, pitār)* or the numerous minor local spirits who inhabit particular hilltops, trees, waterfalls, and rivers. At other times, major local gods *(deutā),* particularly Masta; minor deities of nonhuman origin, such as the Barāh and the Mālā; quasi-spirits thought to have some degree of corporeality (Nāg, *moc*); the souls of recently deceased children *(rāh),* or even shaman helping or tutelary spirits may be diagnosed as causing affliction.

Witches figure prominently in the oral texts that shamans recite, where they are cast as traditional enemies, and treating cases of witchcraft is a special therapeutic domain of shamans. Nevertheless, Nepal's traditional legal codes set such strict criteria to ascertain bewitchment, as well as mandating severe punishments for unproved accusations, that cases specifically involving bewitchment are a small fraction of shaman consultations. These traditional sanctions remain well remembered. Nepal's first legal code, the *Muluki Ain* of 1853/1854, enforced for over a hundred years and still quoted in local discussions, stated that if a bewitchment accusation could not be proven, the person who made the accusation had to pay a fine, the amount of which could exceed local per capita annual income. Failure to pay this fine resulted in imprisonment. Strict criteria to demonstrate bewitchment included vicariously branding the witch by directly branding the patient, vicariously causing the witch's head to be shaved by shaving the head of the patient, or using a mantra to make the witch dance in public. Although cases documenting the successful use of all three proofs exist, most shamans now keep witch identifications vague, and prefer to diagnose astrological crises, soul loss, or the afflictions caused by spirits.

Even when the diagnosed cause of a problem is not witchcraft, however, every shaman performance acknowledges the close relation between shamans and witches, established when the first shaman allowed the youngest of the nine original witch sisters to survive, having negotiated a secure income by treating clients that she agreed to afflict. The story goes that the witch agreed, "I will cause illness, you will cure it," and she predicted: "You will eat land by deception, you will eat grain by deception" (Maskarinec 1998, 220). This is not just a guarantee of a profitable career for the shaman, however. As part of their treatment, shamans seek to replace the chaotic, unbalanced, inexpressible suffering of a patient with orderly, balanced, grammatical and eloquently expressed states. To do so, the healer has to take responsibility for the orderliness of affliction as well as for its cure, so that shamans must, ultimately, also take responsibility for the existence of witches as well as for the pervasiveness of suffering. This way of accounting for problems allows a patient to comprehend that their unfortunate situation is normal, that they are not singularly guilty, that they are not the cause of their own suffering, that suffering is an ordinary, even necessary, part of the everyday world, part of all human life.

Nepalese shamans perform diverse rituals, ceremonies that prominently incorporate throughout every stage of activity both long, publicly chanted recitals and short, whispered, secretive incantations. More accomplished shamans memorize between 10,000 and 12,000 lines of poetic oral texts, each line ordinarily a couplet of six or eight syllables in

length. It takes on average between seven and twelve years to memorize the complete repertoire, a pupil repeating each text line by line as a teacher performs them. These texts constitute the core of every Nepalese shaman's knowledge. In learning their texts, Nepalese shamans acquire the knowledge necessary for their profession and obtain a detailed view of the world and its participants. Most of the longer shaman recitals involve stories of origin, narrating the origin of the universe, this world and others, their inhabitants, and their afflictions. To cure acts of witchcraft, one retells the origins of witches; to repair a star obstruction, the story of the origins of the heavenly bodies is recounted; to counter acts of shamanic sorcery, the circumstances of the original curses are related. In each case, shamans seek to influence the history of the cosmos, to reestablish a natural order that has been disrupted, to produce a present time more favorable for their clients.

Different texts are used depending on whether the patient is male or female, adult or child, of high status or low. Nepalese shamans attempt to order the universe into patterns that more readily permit successful shamanic interventions, even seeking to rearrange inauspicious astrological configurations. As the texts recount actions by gods and by the original shaman to resuscitate the dead, the shaman mimics the same actions, waving yak tails at the patient's head, blowing into the ears, striking the back with an iron staff, tying strings around the limbs. Other public recitals conduct ritual journeys, search for lost souls or frayed wits, or dispel dangers. Other texts document the construction of the shaman's ritual equipment, most importantly, the construction of the drum, the brewing of beer, consumed as part of every ceremony, and the reconstitution organ by organ of the animal to be sacrificed, whether goat, sheep, or chicken.

Like the public recitals, the secret mantras portray an ideal world to which shamans seek to force this world to conform. Mantras suppress malign threats and encourage benevolent powers. Mantras are speech acts whose specific effective forces upon the listener differ, but whose primary goal or force is to exert compulsion. They compel spirits to be present. They constrain various items, quotidian and metaphysical, to stay in place, to be bound, to be distanced, delayed, or destroyed. They order dead spirits to stay dead, living villagers to stay alive. To accomplish these acts of compulsion, mantras incorporate aspects of any successful exorcism: They suppress, restrain, and eliminate. Mantras that open and close any ceremony protect by systematic prescription, ordering chaos into a comprehensively patterned taxonomy. At the beginning of a ceremony, the world receives shape and form, molded into a holding pattern of bound elements. The shaman's recitations and rituals then improve upon selected elements within that overall pattern. At the conclusion of rituals, the new system is fixed in place and held there with oaths, promises, and threats. "Seeds of truth" *(sat byu),* a mixture of raw grains, are scattered over patients, their families, their homes, animals, and property, to sprout into a reinvigorated life of reinvented meaningfulness.

Shaman repertoires clarify major concerns of traditional Nepalese society. They demonstrate the interrelatedness of illness, death, witchcraft, sorcery, land disputes, astrological impasses, political opportunism, childlessness, problems with in-laws, and accidents. In occasionally archaic but understandable language, the recitals clarify symptoms and provide explanations of the causes of problems, and they carefully describe the methods of intervention, detailing the proper ways to conduct rituals. Providing audiences with a perspective on their misfortunes that provides hope of possible relief, the results of public recitals parallel the ways that the whispered mantras seek to manipulate and change the world.

Many rituals illustrate in various ways the activities of repairing and postponing adverse fate and setting up barriers to protect the patient from its consequences. Two rituals incorporate explicit acts of raising the patient heavenward, where the crossed stars need repair, the closest that a Nepalese shaman comes to being a psychopomp (one who escorts souls to or from the world of the dead). In the first of these rituals, the shaman moves the patient's foot step by step up a small model of a pole ladder, in which he has cut nine notches. Upon return, the recital takes the form of a dialogue between the shaman and the patient, with the shaman speaking both parts: "Did you eat the green grass, the fresh water? Yes, did you see the nine suns, the nine moons? Yes, did you cross the seven star obstructions, the seven heavenly bar-

riers? Yes, if you ascend to the sky, I'll pull you pack by your feet. If you descend to hell, I'll pull you back by your top-knot" (Maskarinec 1995, 55). In the second lifting ritual, nine relatives and neighbors lift the patient as she crouches atop nine winnowing trays (Hitchcock 1974), ensuring both familial and neighborly solidarity in weaving the patient back into a normal life.

In other ceremonies, the shaman constructs a small barrier resembling a funeral pyre in front of the patient's house, helping to keep away the star obstructions, and to placate the Time of Death, Jama (Sanskrit: Yama) Kāl, and his ambassador, Jama Dut. Nepal's traditional legal codes forbade shamans to suck directly on their patients' bodies, but this is nevertheless still done to remove magical impurities that have become lodged in patients, sometimes with the drumstick as an intermediary tool. Shamans also employ diverse techniques as diagnostic or evaluative divinations. These are used at the beginning of treatment to identify the source of affliction, and afterward to determine if the ceremony has been efficacious. Once an animal has been sacrificed, the shaman carefully examines the liver of a goat or the gall bladder of a chicken to decide whether the patient will benefit from the offering. Some shamans also prepare amulets (Nepali: *jantar*) for their patients to wear to ward off negative influences.

Nepalese shamans perform their ceremonies at their patients' homes, not at shrines, after being personally invited by a member of the patient's family. The client arranges for an assistant, called a *curmi,* to carry the shaman's paraphernalia basket. The shaman never carries this basket himself, insisting on the minimal formal social recognition entailed by having a servant. For major ceremonies, shamans decorate their drums with simple line drawings of white clay. Crucial paraphernalia, besides the drum, include an elaborate costume whose elements deliberately suspend the shaman's identity between male and female, human and animal, living and dead, natural and cultural. The costume includes two kinds of women's outer wraps; men's pajamas; cinnamon, guava, oak, or chestnut leaves worn on their head along with pheasant feathers and porcupine quills, all secured by a turban; a vest made from the skins and cured leathers of several wild and domesticated animals, with bells and other iron objects such as miniature discs representing the sun and full moon attached; and necklaces of snake bones and *rudraksa* (Elaeocarpus) seeds. A piece of bitter turmeric root under the tongue and ashes on the forehead complete the shaman's adornment, all done as protection from witches, ghosts, gods, demons, and other shamans.

Ambiguous suspension of the shaman's personal identity is emphasized in initiations, which take place with the shaman suspended on a pole between heaven and earth, and in burial practices, when the shaman's corpse is seated in a mound half in the earth, half out of it, comparable to the tombs of Kānphaṭa yogis (religious ascetics that venerate the Hindu god Śiva). Shaman texts appear especially anxious to establish parallels with yogis, who are credited with miraculous abilities to intervene, and who also depend largely on a memorized repertoire to perform these interventions. Second only to shamans themselves and to witches, the descriptions of yogis found in shaman texts are elaborate and accurate, but the parallels are most pronounced in shaman death rites.

In the rites of initiation and their yearly reenactment, the shaman climbs a pine tree trunk erected in the center of the village whose "roots are in hell, whose branches are in heaven" (Maskarinec 1995, 217) to deliver prophecies while physically poised at the boundary of heaven and earth. In preparation, assistants have tied a living piglet toward the top of the tree. At the climax of the pole climb, the shaman drives his drumstick into the pig's neck and sucks out its blood. After drinking blood, he prophesies the future. He drums on the drum, which was first buried and then resurrected from the Underworld, and takes through his own mouth the blood drunk by the spirits who penetrate his body. The demands of those spirits become his demands, their appeasement his appeasement.

Nepalese shamans perform death ceremonies only for other shamans. They do not participate professionally in other funerals, nor do they guide souls to the Underworld. There is no evidence in their texts to suggest that they ever played a role in the funerals of ordinary individuals. Death ceremonies for a shaman have two parts. The first half of the ceremony is called "making a shaman disappear," while the second half is the "raising of the shaman." The first begins as biological signs of life fail. A

shaman is expected to predict his moment of death, so that it can take place at his home, with his pupils in attendance. Dressed in his costume, a shaman is expected to die sitting up, cross-legged. Relatives dig a shallow round grave not far from the shaman's home, at a spot chosen by him in advance. Pupils tie the corpse to a plow beam to support it and carry it outside in this posture, upright. They put a slice of bitter turmeric root under his tongue, a staff in his left hand, a drumstick in the right. They apply ashes treated with a mantra across his eyes, to protect him during his descent into the underworlds. Should a shaman have the misfortune to die away from home, his topknot is returned to his family, and the entire ceremony is performed with the topknot as a substitute for the corpse.

The tomb, built up into a cone, is sealed with a jug of alcohol inside and a pole planted either in the shaman's fontanel or between his legs, as though he were suspended on it. Above the tomb the pole pierces through the shaman's drum. On the ninth day, the shaman's pupils gather around the tomb and recite the stories of creation that shaped and animated the first man. The pole is expected to shake and the drum to sound, signaling that the time has come to open the tomb. The assembled shamans then drink the alcohol that was deposited inside. They become frantically possessed, and remove the shaman's topknot of hair, which becomes the foundation of his permanent monument in a prominent place elsewhere, such as a crossroads, confluence of streams, or on a ridge above the village. In at least one case personally documented by the author, the entire skull of the shaman was removed, hinting at a ritual dismemberment. The assembled shamans now claim the departed shaman as a participatory spirit in their future rituals, so that he remains committed to both the world of life and the world of death, detached from salvation, judgment, or cycles of rebirth.

PRIESTESSES (MEDIUMS) OF SRI LANKA

Shamanistic forms of religious practice coexist and intermingle with other forms of religion and magic in Sri Lanka, but it is the priestesses, or mediums, of Sri Lanka who come closest to the classic role of the shaman. Neither Buddhist *bhikkhu*s (monks), nor *dasa sīl mātā*s (ten precept–holding "nuns"), nor *kapurāla*s (shrine priests) usually function as intermediaries between the living and the dead. Although bhikkhus and dasa sīl mātās may serve as objects of merit-making practices (usually almsgiving) done by surviving kin for the benefit of their dead, and although some kapurālas who serve at *devālaya*s (shrines) dedicated to *baṇḍāra*-type (mid-level) deities may perform exorcisms or act as sorcerers, communications between the living and the dead are carried out almost exclusively by mediums who are not affiliated with royally established *vihāraya*s (temples) or devālayas. Almost all mediums within Sinhala religious culture and society are women, who respond to the needs of their clientele within the context of their own privately established devālayas. Nevertheless, the cultural and spiritual meaning of their work is thoroughly informed by the idioms of Theravāda Buddhist religious discourse. That is, their explanations for the manner in which the dead are perceived to persist, how their conditions may change in the future, and how they may interact with the living are predicated upon theoretical principles intrinsic to the moral economy of karma. Thus, the vocation of a priestess is driven not only by ecstatic experiences of the divine, but by the moral force of ethical precepts.

Since there is no formal community or guild, nor is the profession understood as hereditary, there are no regularized forms of initiatory rites for priestesses in Sri Lanka. In most cases, priestesses report a propensity or sensitivity, apparent already during a troubled childhood, for experiencing the presence of the divine or the supernatural. Ecstatic experiences of a significant deity (e.g., Viṣṇu, Pattinī, Skanda, Däḍimunda, etc.) are referred to in Sinhala as *diṣṭi* (derived from the Sanskrit root *dṛṣ* meaning "to see"), and function as a sine qua non for practicing priestesses, many of whom are raised in either impoverished socioeconomic urban conditions or in rural village contexts. In many cases, priestesses characterized their lives as children, youth, or young adults as very difficult. It is not uncommon to hear them speak about broken homes, sexual abuse, poverty, failed marriages, mental illness, and powerlessness (Holt 2004).

The ecstatic experience of diṣṭi signals the potential for acquiring supernatural knowledge and power. Some priestesses report that they re-

sisted these experiences at first and did not seek to use their supernatural encounters as the basis of a priestly career. They report that in Sinhala culture, a woman who is known to be frequently possessed might find that predilection a liability in hoping to secure a suitably arranged marriage. At the same time, many regard diṣṭis as a powerful and irresistible "calling" to do the bidding of the deity who has continued to encounter them. They believe that their own destinies as priestesses are somehow bound up with the power of a specific deity, a result of karmic retributions from the past. Some have come to regard the priestess vocation as kind of karmic debt that they are paying off, a way of making up for deleterious actions or mistakes that they may have committed in a past life (Holt 2004).

The supernatural knowledge and power priestesses acquire through diṣṭi is confirmed for them in the form of a *varama,* a "warrant" bestowed upon them by one of the higher or more powerful deities of the Sinhala pantheon, a deity who has decided to enlist them to work on the deity's behalf in response to devotees' entreaties. This pattern of understanding the priestess vocation means that the career of a priestess emulates the mythic careers of many of the lesser deities in Sri Lanka, whose own mythic charters in folkoric poetry and ballads usually contain stories about how their arrivals in Sri Lanka, and their divine provenance, were secured through the permission, bidding, and assistance of one of the higher guardian deities (e.g., Viṣṇu, Skanda, Pattinī). Varamas are thus given at important devālayas, such as Däḍimunda's chief shrine in upcountry Alutnuvara, and are usually symbolized by the purchase of ritual object; for example, a *halam̆ba,* "anklet."

The halam̆ba is a particularly potent and popular symbol of power for priestesses because it is associated with the cult of the goddess Pattinī, the most prominent female deity and one of the most active and powerful gods in the religious culture of Buddhist Sri Lanka. Often, a priestess will take the halam̆ba in hand while she chants her own especially designed mantra as a means of entering into an altered state of consciousness in order to perform her priestly functions. A priestess who claims a varama is indicating that she has passed a threshold: She is no longer only possessed by supernatural beings, but has now gained the ability to manipulate power in the supernatural world in the service of a deity's beneficent work. What separates the work of a priestess from that of a sorceress is that her power is derived from a morally sanctioned deity (as opposed to an ambiguous or demonic power), and therefore her intentions are wholly benevolent rather than malevolent. Insofar as most priestesses understand their work as assisting those in a state of existential distress, or suffering *(dukkha),* they understand their efforts to be fully aligned with the ethos of Buddhism.

Priestesses may communicate with or speak for the dead at any time, but they are usually "open to the public" on *kemmura* days, Wednesdays and Saturdays. These are the days in the astrologically configured calendar that are deemed intrinsically inauspicious, and therefore the days when devotees might be in greatest need and when the dead may be particularly active or attentive. In Sinhala culture, care and concern for the dead is an ancient legacy. While merit-making, almsgiving rituals involving Buddhist monks are performed for the benefit of the deceased on the seventh day after the third month after the death, and annually on the date of death for members of the immediate family, priestesses may communicate with the dead at any time, though sometimes they specify that departed kin must have been dead between three months and ten years if a successful connection is to be made. This specific time parameter reflects the belief that the period before three months is one of liminality (transition) for the departed and a time of pollution for surviving kin. After ten years, the soul of the dead is believed to be too far "gone" *(giya)* into the rebirth process to be reached.

A priestess's clientele is motivated to use her services for several reasons. They may simply want to inquire into the fate of the dead, a matter of compassionate curiosity. But often a priestess is sought to discover why inexplicable developments have occurred within the family since the death of a relative, especially if further tragedy or suffering has since occurred within the family. Often, troublesome departed kinfolk are envisaged as *preta*s (hungry ghosts) or *bhūta*s (malevolent supernatural beings) who are creating misfortune for survivors owing to some perceived motive of revenge. By inquiring

into the well-being of the deceased, clients often seek to know if a member of the surviving family has offended the dead, or if rituals performed on behalf of the dead have not been performed in an acceptable or efficacious manner. In addition to enjoining survivors to act ethically in relation to the memory of the deceased, priestesses often prescribe pilgrimages, donations, or almsgiving, with the idea of transferring the merit accrued from such actions to the deceased. The intended affect is to pacify a restless or unhappy preta or bhūta who may be wreaking havoc upon the living. Sometimes clients will ask the departed for specific advice about mundane family matters, including issues pertaining to arranged marriages, the selling of property, potential venues of education, and the like. On the whole, the vocation of the priestess is concerned primarily with those matters related to family affairs.

Successful priestesses attract a national clientele. As a result, some have risen out of poverty and have even entered the middle class. Others remain only locally known. In all cases, however, a priestess's varama is usually considered "valid" for only a prescribed period of time, usually for several years. Priestesses often claim that they can feel their powers ebb and flow, and that it is necessary to regularly recharge their powers by visits to important devālayas or pilgrimage sites. As a result of diṣṭis experienced at these sacred places, their powers are recharged and reaffirmed. Or, priestesses may learn that their efficacy is spent.

In Sri Lanka, many see the priestess vocation as a way of defending the psychic integrity of the family. Priestesses may see themselves as assistants to the great moral powers of the cosmos, antidemonic champions who defend the life, health, fertility, and the world of light against darkness, disease, sterility, disasters, and the world of darkness. They understand themselves as specialists in knowledge of death and the afterlife. It would not be wrong to see in the pattern of their experience a type of epic structure at work: They travel to the unknown realms of the supernatural world, acquire knowledge not known to normal mortals, and then return to this world armed with power to improve its plight. Priestesses in Sri Lanka are links to this Otherworld, and insofar as clients perceive them to exercise a beneficial influence on their lives, they represent the possibility that the laws of nature can be transcended in order to assuage the samsaric experience of suffering.

RAI SHAMANISM (NEPAL)

Rai shamanism comprises a plurality of shamanic traditions, varied but closely related, like the Rai groups themselves. The Rai in East Nepal consist of numerous subtribes, and even though they speak different languages and have their own distinct traditions, they all share a common linguistic and cultural heritage. Together with Limbu (the language of a related group residing farther to the east, also in Sikkim and Darjeeling), the Rai languages belong to the Kiranti family, which is a subgroup of Tibeto-Burman. Culturally the Rai have been influenced by both Hinduism and Tibetan Buddhism, but these influences have only marginally affected their ancestral traditions, in which shamanic features still figure prominently.

Oral Tradition

The religious tradition of the Rai is generally referred to by a single term in the various Kiranti languages. Among the Mewahang Rai, for example, it is known as *muddum,* among the Yakha Rai as *mintum,* among the Kulunge as *ridum,* among the Chamling Rai simply as *dum;* thus there is apparently a common root (**dum*), which points to a shared conceptual base. All these terms designate the essentially oral tradition of the group, including both the spoken "texts" as well as their ritual performances. This tradition may be seen as the means by which the Rai, with the help of their ritual specialists, that is, shamans and priests, maintain a link to the ancestors: remembering their deeds in mythological narratives, speaking to them in ritual invocations, and interacting with them in ritual exchanges.

The mythology of the Rai subgroups varies in details, but in the overall structure the narratives are quite similar. Creation stories recount the origin of the universe and nature, of man and culture (Gaenszle 2000). Often it is a snake, called *nāgi* and associated with the river source, that is seen as the cause of the beginning of all things: The first being originated from a clod of mud down in the plains "where all the waters dry up" after being swept down the river. In these times of origin, procreation continued through several generations of primeval mothers, all impregnated by the wind, until one daughter was told to look for a proper husband. She eventually found a husband up in the sky, but did not like him, and only through a trick did he manage to impregnate her. In due course this daughter gave birth to the whole variety of species. The duality of river source and plains, as well as that of the sky and the earth, in short the vertical dimension, is of crucial significance in the ancestral rituals: It provides the mythic pattern for the shamanic journey. The topic of movement along the up/down axis is prominent in other myths about the migration of the ancestors: The ancestors walked up along the rivers from the place of origin in the plains and separated by following different valleys. Similarly, both the shaman and the tribal priest travel along the riverside in their chants, thus replicating the mythic journeys (Gaenszle 1999).

Rituals among the Rai are focused very much on the spoken word. Many rituals consist of lengthy invocations and recitations, accompanied by only a minimum of ritual gestures and actions. What is unique about this form of speaking is that it requires the use of a special ritual language. This language is distinct from ordinary language. Though there is a certain continuity with everyday language, in particular on the level of grammar, the ritual code has a special lexical inventory, consisting largely of binomials (nouns consisting of two terms). Forms of parallelism are pervasive in all texts. Thus ritual speech has highly poetic qualities. It is seen as an ancient language inherited from the ancestors, and hence as the proper way of communicating with them.

Ritual Specialists

Although simpler rituals addressing ancestors can also be performed by lay persons, communication with the more powerful ancestral beings or deities requires special competence. Though the system of ritual specialists differs considerably between the Rai groups, it is striking that there is always a pronounced duality of ritual office. On the one hand, there is what is generally termed the *tribal priest* (e.g., *ngo:pa* in Mewahang Rai, *nokcho* in Kulung, *dewa nokcho* in Thulung Rai,); on the other hand there is the "shaman," taken in a narrower sense (e.g., *makpa* or *mangmani* in Mewahang, *sele mop* in Kulung, *seleme* among the Thulung Rai, who may be male or female). Shamans can be easily distinguished by their professional costume and paraphernalia: feathered headdress, white gown, harness of bells, and, most importantly, the handheld drum (*ḍhyāṅro*). In fact, this is the typical dress of the pan-Nepalese shaman, who is found among almost all ethnic groups and castes (including untouchables and Brahmans) and is generally known as *jhā̃kri* in Nepali. In certain contexts Rai shamans also use the big drum called *ḍhol.* The tribal priest usually does not have a special dress, except for the turban that some of them wear. He may use a metal plate to accompany his chanting, but he rarely uses a drum.

It is tempting to see a simple contrast between the tribal priest and the shaman: daytime ritual versus nighttime séance, sacrifice versus possession, ancestral spirits versus evil spirits, auspicious versus inauspicious, and so on. In fact, however, the situation is far from clearcut. In many of the groups, both may become

possessed, both may conduct sacrificial offerings, both may go on ritual journeys, and both may deal with dangerous spirits. Therefore there are good reasons to regard both ritual specialists as shamans, but in order to avoid confusion, the above terminology has become generally accepted (Allen 1976a). In spite of these ambiguities, however, one can say that the tribal priest is generally in charge of maintaining a good relationship with the ancestral beings (which involves regular blood sacrifice), whereas the shaman is responsible for warding off harmful influences and dangerous spirits (especially those associated with bad death). Moreover, the former often has the task and capability of dealing with the territorial spirits, whereas the latter also deals with many non-Kiranti spirits and deities (such as Śiva and Devi from the Hindu pantheon, as well as others). Whereas the tribal priest never uses the Nepali language, a good deal of the shaman's ritual chanting is done in an "archaic" version of the national idiom. This indicates that the duality of ritual office has also been subject to historical influences (Allen 1976b).

Initiation

Among all the Rai groups, members of both major classes of ritual experts have to undergo a period of initiation in order to be able to perform the respective rituals. Generally this kind of initiation cannot be chosen at will. Rather it is the divinity itself that selects its adept. At first the candidate has recurrent dreams that involve encounters with the tutelary deity and is shown certain paraphernalia that are needed for performance (e.g., the drum). The neophyte also dreams of travelling along ancestral routes, and in the case of the shaman embarks on real journeys through the forests. Eventually the candidate may become possessed by the divinity, in some cases suffering fits and illness, or even lengthy periods of confusion and "madness." But with the help of initiated ritual experts, the adept learns to control this contact with the divine forces and to communicate with them in a regular manner. However, such a calling is only possible if the adept has inherited some ancestral competence: Only if there is a forebear among the paternal or maternal ancestors who was a ritual specialist can the neophyte claim similar capabilities.

Performance

Rituals performed by both tribal priests and shamans are celebrated at regular intervals, as well as in times of special need. Both kinds of specialists are called for divination and healing, but the purpose of the performances is not only medical. They aim at achieving general prosperity, fertility, and well-being through reordering relationships with the ancestors. The performance of the tribal priest is somewhat less spectacular than that of the shaman. The main part of his performance consists of the verbal journey, which may last for several hours. For example, in the *nāgi* ritual the practitioner sits in front of his grain offerings and beer containers and recites the place names of his itinerary. When the deity's abode has been reached, divination takes place, during which the deity answers questions through "giving" mild possession. In some cases animals (goat, sheep, chicken) are sacrificed before the return journey begins.

The shamanic performance of the jhā̃kri (known as *cintā*), on the other hand, takes place at night and is full of symbolic action and dramatic events. The altar of the shaman is a composition of numerous paraphernalia that may be seen as helping to create a bridge to the other world: for example, horns of wild goats and deer, human bones, snake vertebrae, porcupine spines, the beak of the giant hornbill (a bird of mythic significance), quartz crystals, stones that have "fallen from the sky," and chestnuts. It also includes items of Hindu provenience, such as tridents, *mālā*s (necklaces), and conch shells. Further there are various leaves and offerings of rice, milk, coins, and incense.

During the first part of the séance the shaman dons the shamanic garment, as a warrior dons his armament, begins to drum (assisted by lay helpers), and invokes the tutelary deities (e.g., Aitabare, Mahadev, Shikari). Gradually these deities are brought into the shaman's body, and eventually they speak through the shaman's mouth. The congregation of the household and visitors now can ask about the state of affairs by directly addressing a divinity. After this crucial divination, a ritual journey in order to search for a soul or various kinds of offerings may follow (such as the presentation of flowers and burning wicks to Sansari Mai). The climax of the session occurs

at midnight, when the evil planetary constellation is "severed" *(graha kāṭnu).* The household members sitting on the verandah are connected by a cotton thread to a banana sapling placed in the courtyard. The shaman now moves the evil influences from the house through the thread to the banana, and with a powerful stroke accompanied by fierce drumming and yelling, the shaman eventually ends the connection by breaking the thread. The banana sapling is then discarded by kinfolk related through marriage.

After this the healing ceremonies proper *(jhārphuk)* may begin. Not only the household members but also neighbors may ask for treatment, so this part usually goes on for several hours, lasting until the early morning. Various techniques of diagnosis and treatment are employed, depending on the situation. For example, the shaman may ask a question and then count the beads of a section of the mālā, and depending on whether the number is even or uneven the answer is yes or no. Or the shaman may just look through a hollow bone and "see" the cause of the problem. In order to effect a cure, the shaman may suck some small substance out of the patient's body, chase away polluting witches with the help of green twigs of the chestnut tree, or use the technique of "inversion" *(ulṭo garne),* that is, feeding liquor to his patients and turning the cup upside down afterwards. After these healing rites, shaman and helpers dismantle the altar. Before parting in the morning a small "head-raising" ceremony is held. A cock and a chicken are offered by placing them on the heads of the household couple: through this their "head-soul" *(saya)* is "raised," which means that the vitality of the household is renewed, ensuring not only physical health but also more general prosperity (Gaenszle 1996; Hardman 2000). This, in fact, is the aim of most Rai rituals: Making offerings to the ancestors, thus keeping them happy and benevolent, maintains the balance of the social as well as the natural order.

SOUTH ASIAN SHAMANISM

South Asian shamanism replicates a sufficient number of features of shamanism found in Central and East Asia to conclude that it is part of a general cultural area of similarly constituted shamanism. South Asian shamanism does, however, exhibit unique features, for both Hinduism and other religious systems of the region, as well as the dominant South Asian social structure, lend it a wealth of unique details. Given Geoffrey Samuel's remark regarding "the multiple misunderstandings that seem inevitably caused by any use of the term 'shamanic' in scholarly discourse, however carefully defined" (2000, 663), along with earlier studies in which nearly everything dramatic from earliest recorded history to ethnographies of the first decades of the twentieth century was regarded as a manifestation of shamanism (e.g., Ruben 1940), the best course to adopt here will be close adherence to the most outstanding and least controversial features of South Asian shamanism.

In South Asia, as elsewhere in Asia, shamanism broadly indicates manipulation of spirits,

the usual process being the intentional, ritually induced, introduction of a spirit into the psychomental system (and presumably the body) of the shaman, which the shaman then employs in a deliberate manner, generally for the benefit of others, often for curative purposes. In South Asia this process usually takes the form of oracular possession. The practice of South Asian shamanism cannot be equated with that of Hindu or other higher profile priestly activity. Priests—which is to say Hindu, Jain, Sikh, Muslim, Christian, and Zoroastrian ritual officiants—perform rituals according to fixed injunctions and patterns. Although they undergo rigorous and specified training according to certain sectarian and lineage affiliations, shamans are self-selected and comparatively peripheral to their sectarian affiliations.

Priests are generally expected to be literate, whereas shamans are often uneducated or possess little formal education. Priests are usually linked with mainstream Hindu or Muslim textual traditions and as often as not perform rituals for individuals at close quarters. On the other hand, South Asian shamans are usually knowledgeable within public, even festival, ritual contexts that are often restricted to select communities. Priests follow tradition-based injunction, while shamans, ostensibly at least, act intuitively, though of course shamanic or ecstatic activity, even possession, is learned and cultivated. Priests in South Asia are preponderantly male, whereas a significant percentage of shamans are female. Most present-day South Asian shamanistic praxis is not linked with texts of any great antiquity; indeed it is not linked with texts at all. Rather, it is largely linked with the oral traditions of communities of lower social rank, though in recent decades newly emergent educated and literate people have been participating increasingly in shamanistic activity. Indeed, it may be argued that members of the upper classes, notably Brahmans, have always participated in such activity, beneath the radar screen of official Brahmanical orthodoxy.

Shamans often develop a practice, usually within their homes, as they become known for their healing or other oracular powers. The shaman's very presence is potent, empowering, and indicative of certain cultural and ritual subsystems. The potency or empowerment abides in the perception of the shaman's extraordinary gifts and is arguably the most essential component of the shamanistic process. It is this that sets in motion the performative processes and their eventual realization. Thus, in South Asia, the medium is the message.

Shamanism has a long history in South Asia. Certain inscriptions, masks, and other items of material culture from the Indus Valley civilization (ca. 3000–1700 B.C.E.) argue for the presence of shamanism, probably as a survival from earlier, more characteristically shamanistic hunter-gatherer cultures farther north (During Caspers 1992). The literary evidence, moreover, beginning with the earliest Sanskrit texts from the second millennium B.C.E. and continuing through ancient and classical Sanskrit and vernacular literatures, argues strongly for a shamanistic presence. The earliest text in Sanskrit, the Ṛg Veda, dating to the mid-second millennium B.C.E., describes a longhaired ecstatic sage of sweet disposition, who treads the aerial path of the *gandharva*s (celestial musicians) and the *apsaras*es (celestial dancers) (10.136). This is in general resonance with descriptions of shamanic journeying elsewhere. The most prominent ritual described in the Ṛg Veda is the soma ritual, in which a plant, thus far unidentified, is pressed, strained, and consumed. This soma plant is anthropomorphized as the god Soma, who bestows strength while leading the singer to the heavenly light. Soma enters into his friend, the singer or sage (*ṛṣi* or *vipra,* words that etymologically indicate a "quiverer," or ecstatic sage), bestowing prosperity and striking down demons and rivals. It is clear that the sage becomes possessed by Soma, experiences ecstatic trance-states (Ṛg Veda 5.44, 8.48, 10.119; cf. Thompson 2003), and is able to mediate between earthly and celestial realms.

Another early Indic example of shamanic possession appears in the Bṛhadāraṇyaka Upaniṣad (3.3.1), one of the best known religious texts of ancient India. Once upon a time, Bhujyu Lāhyāyani, a disciple of the celebrated teacher Yājñavalkya, sought the advice of Patañcala Kāpya. Upon entering his house, he discovered that the daughter of Patañcala Kāpya was possessed by a gandharva. Bhujyu asked the gandharva to reveal, speaking through the daughter, who he was. The gandharva replied that he was Sudhanvan of the family of Aṅgiras. Bhujyu asked him the

whereabouts of the descendants of Parikṣit. He then returned to Yājñavalkya and reported the conversation to him. Yājñavalkya accepted the possession without further question and confirmed the answer of the gandharva in the form of a riddle, "They went where the performers of the horse sacrifice go." The Upaniṣad explains that gandharvas pervade the sky and that the worlds of the gandharvas are pervaded by suns. Bhujyu's association with possession echoes another passage from the Ṛg Veda (1.116.3–5), in which Bhujyu is seemingly rescued or healed as a result of invoking a pair of Vedic healing deities called the Aśvins, after being abandoned in a deep sea or water cloud.

The same Upaniṣad further reports (3.7.1) that on another occasion Uddālaka went to the home of the same Brahman, Patañcala Kāpya, who was at that moment busy studying ritual. This time it was Patañcala's wife who was possessed by a gandharva. Through the wife, the gandharva identified himself to Uddālaka as Kabandha, the son of Atharvan. This gandharva also turned out to be quite learned, knowing both the sacrificial rituals and the inner self. In both stories, the gandharva announced his identity and communicated healing knowledge. Both possession and the gaining of healing knowledge from the possessing deity are well-attested features of shamanism.

These brief accounts from the Vedas satisfy Sergei Shirokogoroff's five characteristics of a shaman (at least among the Tungus of Siberia): (1) a shaman is a master of spirits, who has (2) mastered a group of spirits; (3) a shaman commands a recognized array of techniques and paraphernalia that have been transmitted from elders; (4) s/he possesses a theoretical justification for the shamanistic process; (5) the shaman occupies a special social position. Whether spirit or deity, these five are repeatedly borne out in studies of South Asian spirit mediumship or oracular possession (Shirokogoroff 1935, 274; cf. Maskarinec 1998, viii). This is not to argue that all possession in South Asia is shamanistic; indeed, it has been argued that much of the oracular possession in South India is not shamanistic, strictly speaking (Inglis 1985). It is simply to say that there are points of contact in phenomena that must be distinguished.

A little-known form of spirit mediumship that may be traced back perhaps two millennia and that unambiguously falls within the category of shamanism is what we may call *svasthāveśa,* based on several occurrences of this term in published Sanskrit texts and unpublished manuscripts ranging from Tamilnadu in South India to Kashmir in the extreme north, dating from the fifth century C.E. onwards. This term may be translated as "possession of one who is in a good state of (mental and physical) health." In svasthāveśa, a medium causes a spirit (usually ancestral) or deity to descend into any one of a number of reflective objects (e.g., a mirror, water, a sword blade, a shiny wall, an oiled thumb, and so on) or into the body of a young boy or girl, after which the medium or youth answers questions from a client relating to events of the past, present, or future. If a youth is employed, the shaman also serves as a mediator between the client and the youth. This form of shamanistic practice is also found in Tibet (Orofino 1994) and China (Davis 2001, 120ff.; Strickmann 2002, 194ff.), records of which read nearly word for word with the Indian texts, and are doubtless based on them, a diffusion northward and eastward through Buddhist Tantric texts and practice. The South Asian practice of svasthāveśa occurs as the central element in a fairly involved ritual (similarly in Tibet, though the ritual appears to be severely attenuated in the Chinese texts). If a child is employed, the ritual takes the following approximate form (the texts and manuscripts differ in details): A geometric representation of a deity *(yantra)* is inscribed on the ground, and a child (boy or girl) is made to sit on it. The ritualist then places powdered and scented ash from a ritual fire *(bhasma)* on the head of the youth and recites certain mantras specific to the deity invoked (Hanumān, Bhairava, Mahādeva or Śiva) at least a hundred times. Then the ritualist summons the deity, who then possesses the child. At that point the client asks questions, after which the child answers them directly or to the ritualist. The possession is then lifted with the application of ash twenty-one times, accompanied by another long mantra. Another form of this ritual attested in both Indian and Chinese texts has the child learning difficult philosophical or literary texts through this form of spirit communication.

Perhaps the most indisputable shamanistic characteristic in South Asia, arising from a widely distributed and more or less uniform de-

votional ethos, is that in oracular or any other divine possession the gods descend into humans as an act of grace. Though the shaman invites the deity, the prevailing indigenous view is that it is the deity who instigates the possession. Shamanic practice is, in short, a product of devotion (bhakti), an act of divine reciprocation. This attitude may be traced back to at least the first millennium B.C.E.

Despite the foregoing descriptions, shamanism in a strict, unembellished sense is difficult to locate in South Asia. There is no land of the dead into which local shamans accompany the deceased, and little magical shamanic flight. The negative evidence is strong, as the literature on locally constituted shamanism numbers in the hundreds of works. An example of this nonconformity with "standard" shamanism occurs in the central Indian state of Maharashtra, where possession among certain folk cultures may be understood as shamanic, at least in a broad sense, when it is mediumistic, involving exorcism or healing. Followers, often shepherds, of a well-known regional deity named Khaṇḍobā, experience the deity "coming" to them, then speaking through them. Though this occurs to relatively large numbers of devotees in certain festivals, for example when the new moon falls on a Monday, there are a few among them whose experience is qualitatively different, which is to say that their devotional commitment and intensity is deeper. Such a person is called *devṛṣī,* "divine sage." "By entering into the body of the *devṛṣī,* [the god] makes him into a 'temple' and enables him to diagnose others' diseases, adversities, and so on, in the form of *bhūta* [demonic entities], and to recommend methods for remedying them" (Sontheimer 1989, 145).

Many studies have been conducted of shamanistically influenced Buddhism in Ladakh (eastern Kashmir) and Nepal (e.g., , Mumford 1989; Reinhard 1976; Srinivas 1998). Buddhist (as well as Hindu) orthodoxy has historically envisioned itself as opposed to shamanism, which it positioned as impure, violent, disorganized, not bound by formal doctrine, and the property of people of lower social or educational rank (including women). Nevertheless, one of the strategies Buddhists of all sects have employed over the millennia in Buddhism's encounters with shamanism has been to co-opt or amalgamate those aspects of it that are least antagonistic to Buddhist doctrine. In practice this amounts to a great deal. Indeed, though the older shamanistic layer that exerts such a tremendous influence on popular religion in South Asia has continually been challenged by literate orthodoxies, most often the result has been a new configuration or balance between the two, not the eradication of one or the other. Often shamanistic practice and orthodoxy have been mediated by Tantric ritual, which is structured by a sense of inclusiveness. This may be found in the encounter between the Buddhism led by educated lamas of northwest Nepal and local Gurung shamanistic practice (Mumford 1989). In other parts of Nepal, shamanism is relatively untouched by Buddhism or philosophically oriented Hinduism. These are tribal areas in which the shaman becomes possessed in order to deal directly with the spirit world and perform divination and healing (Reinhard 1976). Such phenomena are also found among the Chepang of Nepal. This pattern of alternating orthodoxy, shamanistic practice, and amalgamation or Tantric mediation of the two, is repeated throughout the subcontinent.

A remarkable manifestation of "Hindu shamanism" (which has close Muslim cognates) may be found at the Hindu pilgrimage complex called Bālājī, in the small town of Mehndipur in the northwestern Indian state of Rajasthan, as well as at other pilgrimage centers, which double as spirit healing centers. In this practice, Hindu and Muslim religious imagery merges with a shamanic substrate (Dwyer 1998, 1999; Pakaslahti 1998).

Bālājī is the local name for Hanumān, the monkey god, whose devotion to Rāma is widely regarded in India as paradigmatic, and who has a major presence in shamanic ritual in India. At the Bālājī temple and in its immediate environs, dozens, sometimes upwards of a hundred, spirit healers set up small clinics. These healers are practically all from the lower social classes and have little formal education. These clinics are a last resort for people throughout much of north India whose physical debilities or mental dysfunction remain undiagnosed or are pronounced incurable through the more mainstream biomedical and indigenous health care delivery systems. These people, along with supporting family members, flock to Bālājī in search of a cure. Once there,

they encounter a healing system based on an extended image adopted from the British colonial legal system, which adopted the Persian-Urdu language of the Islamic legal system of the Mughals. These healers, who practice possession and exorcism rituals that are not standardized but bear the distinct imprimatur of each individual healer, situate their exorcisms in an imagined *adālat,* or Islamic court, drawing their inspiration from the concept utilized at the main temple. This envisioned court serves as a background metaphor employed for instituting their processes of possession, exorcism, and healing.

The primary deity, Hanumān as Bālājī, is the supreme magistrate. He is assisted by two subordinates, Bhairavjī (the local manifestation of the protector divinity Bhairava) and Pretrāj (King of the Spirits of the Dead), who are Bālājī's messengers *(dūt)*—as Hanumān is Rāma's messenger *(dūta).* Before visiting the office—usually a small rented shrine room—of one of the many clinicians in the town, Bālājī is first petitioned *(darkhvāst)* at the main temple. Whether pilgrim or afflicted petitioner, Bālājī is proffered sweets *(laddū),* parts of which are offered into a sacred fire *(havan),* while the remainder is returned to the client as blessed and potentiated *(prasād).* After this offering a larger petition *(arzi)* of sweets is served to Bhairavjī and Pretrāj in side annexes of the temple, where their shrines are located. By consuming the prasād, the clients are said to be infused with the power of the deities. One or two days later trance commences, usually during scheduled offerings *(ārati)* or devotional singing *(kīrtan),* which may occur either in the main temple or in the "office" of the exorcist. This kīrtan consists of deafeningly amplified recordings of Hindu devotional singing to the melodies of Hindi film songs. This engages the largely Hindu, but often multicultural, clientele of afflicted individuals and their families, who chant along with the music, "Jai Mā, Jai Mā" and so on, and clap rhythmically—some of the standard accoutrements of shamanic trance music.

The word used for this trance is the Urdu *peśī,* literally a "hearing" or "appearance in court." In it, the classic symptoms of possession occur, initially rhythmic swaying, but eventually violent whirling of the head and upper body, hectic chaotic movements such as somersaults, writhing and sobbing, and so on. Women's hair is always unbraided and left loose during the proceedings. During the peśī, the clinician or an assistant temporarily takes the offending spirit from the client, while simultaneously becoming possessed by Bhairavjī or Pretrāj. This double possession of the invasive spirit (bhūt) along with Bhairavjī or Pretrāj is understood as a battle between bhūt and dūt, negative and positive entities and polarities of personality. It is often cast as a literal battle; the dūt may be assisted by an army of positive spirits, with its own hierarchy, called *phauj* (Urdu for "army"; or *dūt saphāī,* "sepoy"), constituted of former bhūts that have been transformed into this lower grade of protective dūt by the exorcistic and analytical procedures of clinician-ritualists.

If the clinician or the assistant has taken on the bhūt, the battle transpires within her body, which has also become possessed by the dūt. She then acts out the violence of battle in chaotic movements, with eyes turned back, hair flying, mouth foaming, and other familiar effects of ecstatic possession. If the client has retained the bhūt (and often if not), one of the regular actions of the clinician is visibly forceful beating on the back (usually the lower part of the spine) of the victim with her fists, followed by wrenching upward movements of the fists, said to drive the spirit(s) up the spine and out the top of the head. This, according to the model of the adālat, is the punishment *(sazā, daṇḍ)* meted out to the bhūt by the dūt. It forces wildly uncontrollable shaking of the head and rocking of the upper body.

Often both the clinician and the afflicted person are in possession, writhing and wrestling, both sets of eyes locked or rolled back. But the clinician, with much more experience and comfort in the adālat and a seasoned eye for the dynamics of psychosocial issues, particularly the manner in which mental distress bears on social dysfunction, has more control of the situation. Therefore he is in a much better position to control the agendas and paths of rectification and healing. This process of administering psychological justice in the peśī usually must occur many times, not just once, before the healing is fully effected, which is to say before the bhūt is completely extricated. In this way the client becomes empowered or resocialized to the point of normal return to the flow of family life.

The penultimate step in this legal proceeding is the *bayan,* a confession or statement by the spirits, who identify themselves, announce their departure, their next destination, and perhaps other significant information, such as why they have taken up residence there. The confessions of the spirits are spoken out after the battle has been suspended due to exhaustion of either the client or the clinician or her ritual assistant who has borne them. In this way the battle lines are drawn between bhūt and dūt: Counterpossession of positive entities is required to combat possession by negative ones. Usually the bhūt reveals the required information upon questioning, often harshly worded, by the clinician or healer. This part of the adālat resembles a talking cure, a local variant of psychoanalysis that deals directly with the offending spirit, in which the clinician attempts to address the problems of the entity and elevate it into the ranks of the phauj, thus freeing the afflicted individual of his madness or dysfunctional condition. The final procedure in the adālat is the giving of *parhez,* home instructions, which often include dietary advice—usually the elimination of alcohol, meat, and garlic (because spirits are attracted by these), and their replacement with more salubrious foods such as barley—and the prescription of gifts of uneaten food offerings to cows and dogs.

It is apparent from this example that many classic aspects of shamanism have entered Hindu devotional and healing praxis, a shamanistic acculturation that has appeared throughout the Indian subcontinent in various forms for millennia.

SPIRIT POSSESSION IN RAJASTHAN (INDIA)

In Rajasthan, shamanism and spiritual possession are tightly intertwined. Shamans are most typically those who have been healed from experiences with possession. Based on these experiences and now controlling and accessing the power and knowledge of the pestering spirit that once afflicted them or the divinity that formerly overwhelmed their human capabilities, shamans find themselves able to heal others. Spiritual possession, then, begins as an affliction but can be transformed into a gift that plays an important role in a shaman's healing repertoire. This entry deals with the nature of sprit possession, which can be accessed by a shaman, healer, or anybody who has such ability for trance.

In Rajasthan, men and women serve as shamans. Still, men often monopolize these roles, as many consider it shameful for women to publicly experience the ecstatic states associated with spiritual possession that so often accompany shamanism. Shamans provide a wide range of services for their clients, from predicting the future, to healing, to petitioning for spiritual aid in matters of love and money. In all these contexts, shamans serve as intermediaries between humankind and supernatural entities and energies, communicating with and often channeling gods and spirits both malign and benevolent for the benefit of humanity. Shamanism is generally associated with village Rajasthan as well as with "folk" or "popular" Hinduism, thus distinguishing shamans from Brahmin priests and India's classical textual traditions. But, as we shall see below, the lines between shamanism and priesthood are blurred, as they are throughout India.

Working as a healer can bring honor and status to individuals and indeed can signal gratitude to the spirit or deity that allowed one to survive a difficult affliction. Serving as a shaman can also bring in new income, though most shamans retain their former employment.

Rajasthanis speak of spiritual possessions as *bhav a gaya,* literally meaning "a feeling has come." This phrase suggests that one feels an extraordinary emotion in one's body, but more specifically can imply, depending on the case and context, that one is simply overcome with emotion, that one is so overwhelmed by emotions as to seem crazy, that a person is pretending to be a particular spirit or god, that one evokes in an audience a supernatural being's feeling *(bhav)* or flavor *(rasa),* much as would a temple painting or a sacred song, that an individual emotionally identifies with a particular spiritual being and indeed thinks she is that being even though she is not, or, finally, that a person's demeanor and emotional state are so reminiscent of a particular spirit or divinity that she is probably being controlled by that entity.

In "true" possessions, the entities can be good and beneficial, as is usually the case with Hindu gods (*devis* and *devatas*), only a few of which in fact alight *(utarna)* on human mounts (*ghoralas,* related to the Hindi term for horse). Bhairuji, a lusty bachelor god of the Underworld, is said to grab human beings more than any other Rajasthani divinity (this god is a local equivalent of the pan-Indian Bhairava, "the Destroyer," also referred to as Bhutesvara, "Lord of Ghosts," both "fierce" or "terrible" forms of Siva spoken of in ancient Sanskrit scriptures) (Gold 1988a, 1988b; Harlan 1992, 66; Kothari 1982; Snodgrass 2002a, 39–42; Unnithan-Kumar 1997). Hanuman the monkey god, a popular Hindu

deity referred to as Balaji in Rajasthan, is also said to take over human bodies (Dwyer 1998, 1999; Seeberg 1995), as do various incarnations of the Mother Goddess collectively referred to as Mataji (Kothari 1982; Snodgrass 2002b; Unnithan-Kumar 1997), and other divinities such as Gailaji, a local god of madness (Gold 1988a, 177), Tejaji, a healing deity of snake bites (Gold 1988b), and Bhakar, a "tribal" god of the mountain (Unnithan-Kumar 1997, 217). Sagasji Baojis, the deceased spirits of murdered kings, also seize human beings (Snodgrass 2002a, 35–39), as do Muslim saints referred to as *pir babas* (Snodgrass 2002a, 42–45). *Kuldevis* (lineage goddesses), however, do not possess humans, instead communicating through visions and dreams (Harlan 1992, 66–68; for an exception see Snodgrass 2002b), nor do *satis* (women who immolate themselves on their husbands' funeral pyres) (Harlan 1992) or various "big" Sanskritic gods such as Brahma who, the author was told, possess such power *(shakti)* as to risk exploding earthly bodies.

Despite Rajasthan's many benevolent spiritual beings, possessing entities are more than often evil and malevolent. These include capricious ghosts trapped between the human world *(manushya-loka)* and the world of the ancestors *(pitri-loka),* ghosts that are referred to by Hindus as *bhut-prets* or *malris* and by Muslims as *jinds* (from the Arabic *djinn;* Muslims speak of possessing entities as a *hajris,* "presences"). Some spirits are said to linger as ghosts because of their immoral defiance of customs that keeps them bound to their earthly existences and enmeshed in the lives of their friends and family. Others are believed to have passed away before the time allotted to them by Yama the Hindu god of death and are referred to as *akal mots* (untimely deaths) reluctant to leave this world. The latter include murder victims, suicides (for example, young women who throw themselves in wells because of premarital pregnancies), accident victims (such as, the author was informed, a foreign tourist who drowned in one of Rajasthan's palace hotels), unmarried male children (who have no descendants to remember them), and stillborn babies. Other malicious spirits said to seize humans are dissatisfied ancestors *(purvajs, pitr-pitranis),* demons *(raksas),* witches (referred to as *dakan* if they are still living, *meli* if they are dead), deceased widows (considered sexually voracious or "hungry" entities who lust after the bodies of newlyweds), and still living men who send their own souls to torment and kill their enemies (Snodgrass 2002b, 45–49).

The distinctions between benevolent and malevolent spirits are not always clear, as even mischievous spirits can be used for good. Mediums who control their spirits—using spiritual energies to heal, locate jobs, fix marriages, predict the future (as oracles), find lost items, chastise the sinful, and reward the deserving—are referred to as *bhopas, ojhas,* and *bhagats,* which could be translated as "shamans," and who are akin to, in Komal Kothari's words, "human, or living shrines" (1982, 25). Controlling spiritual beings and being able to summon them at will—on auspicious days and at regular intervals—entails learning the songs, drumbeats, chants, smells, or images that please each entity. A shaman, when linked to a particular temple through the observance of that shrine-deity's *niyam* (regimen), can be referred to as a *cauki,* literally a "square stool"—in the sense of a judicial seat where legal court hearings *(peshi)* are held and justice is dispensed by divine powers (Gold 1988b, 38; Kothari 1982, 31; Seeberg 1995).

Spiritual beings, good and bad, possess humans for a variety of reasons. Hindu gods, it is said, want fame and feel that appearances in the world—the performance of miracles and communication of important messages—might boost their popularity rating. Ghosts, too, are said to want things. They "hunger" and feel that they can satisfy their desires—to play *(khelna),* eat sweet and sour things, devour meat and alcohol, smoke pipes, or engage in sexual activities—in human form. Because of their unclean desires, ghosts are drawn to dirty places such as toilets, cremation grounds, and burial sites, and toward beautiful things like perfumes and brightly colored clothing. This taste for dirt and beauty also draws spirits near women, as females are perceived to be ritually unclean *(ashudh)*—during menses for three or four days and after birth for twelve days (Dwyer 1998)—yet nonetheless alluring. Women are similarly perceived to have stronger fleshly appetites than men (for rich foods, money, and sex) and to be more vulnerable and fearful than men, thus further increasing their vulnerability to spiritual attack (Dwyer 1998).

Gods, ghosts, and ancestral spirits are also easily offended—from ritual neglect or simple human carelessness—which can draw them into the world in order to express their dissatisfaction and gain redress. The recently deceased, for example, sometimes feel that their families have not given the priests enough gifts, thus jeopardizing these spirits' safe passage to the realm of Yama (Seeberg 1995, 51). In other cases, sorcerers or conjurers, referred to as *jadugars* or *tantriks,* are contracted to place "dirty" *(gandi)* spirits in the bodies of their patrons' enemies. It is hoped that these summoned spirits, some who come voluntarily and others who are little more than slaves, will seize and consume their victims' souls (Freed and Freed 1990, 404). Spiritual hit men accomplish ghostly transfers in numerous ways, for example, by giving victims ensorcelled food disguised as a sacred offering termed *prasad,* that renders their marks more susceptible to supernatural attack (Seeberg 1995, 52). In addition to sorcery *(jadu-tona)* and poisoned gifts of food, witchcraft can also weaken a person enough to precipitate a spiritual attack. Shamans may even cause the possession of their former patients, if, say, they become angered because their patients turn to other healers. Finally, ghosts are closely associated with liminal places (crossroads, burial grounds) and times (dusk and dawn, noon and midnight). In traveling over these places or at these times, one may inadvertently bring pestering ghosts into one's body, although a host of auspiciousness (*shubh* and *ashubh*) beliefs concerning, for example, when to leave one's house and when not to, minimize such dangers (for ghosts' links to place, as opposed to sorcery's association with familial conflict, see Dwyer 1998).

Possessions by divinities, even angry ones, are boons. Having malicious spirits alight in one's person, however, is a curse, and Rajasthanis do everything possible to get rid of them. Spirits disrupt one's life—fouling up weddings, business ventures, and love lives—and generate a multitude of debilitating symptoms. Possessions begin with the afflicted swaying rhythmically, referred to as *jhumna,* literally, "to move as if one were intoxicated, as a drunkard" (as quoted in Dwyer 1999, 113). Some possessions never progress further than this, with mediums demonstrating a calm demeanor and no visible trance. In other cases, however, gentle swaying quickly turns violent, with victims entering altered states of consciousness.

Such states may involve voices other than the victims' own speaking through them; trembling and convulsions; moaning (spirits are said to howl in pain from the punishment, *dand,* they receive from exorcising shamans or justice-bringing gods); fevers; tearing at one's hair and body, interpreted as ghosts trying to kill their human hosts; rapid breathing; wailing for mercy, since when brought to hallowed ground, spirits are forced to appear and account for their sins, which can bring cries for leniency; cursing, threats, uncontrolled shouting, and other expressions of anger *(gussa)* directed at divine images *(murtis),* as spirits become enraged when forced to appear before divine judges (Dwyer 1999, 119). These states may also include gurgling, choking, and difficulty in breathing, which is "interpreted as a death rattle because a ghost is trying to take the victim's soul through its throat and mouth" (Freed and Freed 1990, 405); rolling on the ground in the muck (signifying degradation); complaints of numbness and coldness followed by uncontrolled shivering (perhaps showing mounts' nearness to death); feelings of being bound up (*bandha,* signaling the imprisonment of human souls by destructive spirits); and moans and movements reminiscent of sexual orgasm, in possessions by Bhairuji, for example, which are interpreted as sexual penetration, and thus especially undignified for men and high-caste women (Gold 1988, 257–258; Harlan 1992, 66), followed in most cases by weakness, lethargy, and amnesia, with the possessed claiming to remember nothing about their experiences.

Rajasthanis, spiritually tactical and medically polymorphous, practice a variety of measures to rid themselves of pestering spirits. Some try antibiotics and other allopathic remedies drawn from Western cosmopolitan biomedicine, while others turn to local systems of healing such as Ayurveda (a Hindu healing tradition described in ancient Sanskrit scriptures) or Unani prophetic medicine brought to India by Muslims, which has been described as a "combination of Greek humoral theory (four humors—blood, black bile, yellow bile and phlegm) and animistic beliefs introduced by the Prophet Muhammad" (Freed and Freed 1990, 404). These, in fact, represent first choices. Neverthe-

less, most Rajasthanis eventually turn to shamans.

Shamans, or "healed healers"—these persons were typically also once assailed by spirits—first engage ghosts in conversation, hoping to find out who the spirit is and what it wants. Having pinpointed ghostly identities and desires (though this is difficult, as ghosts are notorious liars and tricksters), shamans proffer deals to the spirits, offering gifts of sweets, coconuts, tamarind fruit, cloth, or money, thus hoping to entice or exorcise *(bhut-pret utarna)* spirits from the bodies of their hosts. These deals involve considerable pleading, cajoling, and complaining on the part of both healers and ghosts. Spirits are sometimes transferred to another person or thing—even, temporarily or permanently, into the shaman's own body. Alternately, shamans make offerings to sources of divine power, hoping that such powers will chase the spirit from their victims. Such fonts of spiritual vitality, be they gods, saints (in the Muslim tradition termed *pir babas*), or the shaman's own spiritual servants, are found near impromptu shrines erected in or near sacred spots (termed *sthans*), temples *(mandirs),* mosques *(masjids),* or saints' tombs *(pirs).*

If these steps do not work, spiritual specialists make ghosts as uncomfortable as possible, hoping to convince them to leave human hosts. Techniques include abusing and insulting ghosts, smoking spirits out with unpleasant fumes such as burning cow dung (Freed and Freed 1964, 168), beating or electrically shocking the bodies of the possessed (some locals say only villagers and saints, but not shamans, employ electrical shocks), transferring mounts and thus their ghostly parasites to holy ground, reciting sacred verses termed mantras that summon superior supernatural forces in order to discipline recalcitrant spirits (the term *mantra* is a condensation of *mananat trananat* meaning "thoughts that protect"; Seeberg 1995, 45), providing the possessed with consecrated amulets that offer protection from ghosts, and using bundles of peacock feathers or branches from the *neem* tree to "sweep" *(jhara, jharphuk)* disease-causing spirits out of the body (Lambert 1997, 259).

High-caste Rajasthanis link most forms of spiritual possession with the lower castes, the poor, "tribals," and women, the primary exception being possession by ancestors *(purvajs)*, a malady that commonly afflicts high-caste men (Harlan 1992, 66–67, n. 39; Snodgrass 2002a; for shamanism among "tribal" communities, see Unnithan-Kumar 1997, 229–234). Similarly, Rajasthanis, and especially urban educated men, associate beliefs in spirits with village contexts as well as with illiteracy and lack of education, referring to such traditions as mere foolish "superstitions" *(andvisvas)* (Dwyer 1998, 10). There has been little systematic study of the distribution of spiritual possession in Rajasthan across social caste, class, or gender, or according to whether victims dwell in rural or urban settings, making it difficult to verify locals' claims.

Graham Dwyer's study (1998) of 734 patients with "supernatural" maladies, along with their accompanying friends and family in the Balaji temple in Mehndipur village near Jaipur City, a popular exorcism site, is an exception (on this temple, which similarly features Bhairuji and Pretraj, "Lord of Ghost Souls," see also Kakar 1982 and Seeberg 1995). Among Dwyer's sample of the spiritually sick, 75 percent originated from towns and cities in northern India, 49 percent were men (though only 26 percent of men as opposed to 35 percent of women attributed their illnesses to spiritual possessions as opposed to other explanations like sorcery, demonstrating that men seem less susceptible to possession), and most were largely middle class and fairly well educated (10–12). This may reflect the fact that rural persons visit their own village shamans, not needing to venture to this popular temple on the outskirts of Rajasthan's capital, or perhaps that this shrine is particularly attractive to high-caste affluent persons. Nevertheless, these numbers do demonstrate that possession is not limited to villages and small towns, women, or low-caste uneducated persons.

Rajasthani spirit possession is associated with "folk" or "popular" Hinduism, given its link to illiteracy and oral traditions, to local incarnations of pan-Hindu deities, and to the countryside, low castes, and small dispersed shrines, and thus its opposition to "great" or "classical" Hinduism's ancient textual traditions, Sanskritic gods, urban centers of learning, established priesthoods and dominant classes, and wealthy temples (on the distinction between Hinduism's "great" and "little" traditions, see Marriott 1955). Moreover, the ecstatic, free-

wheeling and even bawdy behavior of spirits and shamans is opposed to the emphasis placed within orthodox Brahmanical Hinduism on composure, philosophical sophistication, sexual restraint, and bodily purity. High-caste persons may assert the religious centrality of established priesthoods and Sanskritic traditions, pushing folk beliefs in spirits to the superstitious social margins. Conversely, low-caste or rural persons might point to the way popular spirit beliefs infuse Hinduism with energy—folk traditions, then, give Hinduism its lively vitality, with priestly classes existing as mere money-hungry parasites.

In fact, neither of these positions is exactly correct. On the one hand, in orthodox Hinduism (*Sanatan* [eternal] *Dharma*), one finds the idea that the soul can become a ghost, usually just before passing into its next birth or merging in *moksha* (salvation) (or *mukti* [spiritual liberation]) with the Absolute; also, ancient Sanskrit texts, notably the Atharva Veda (the last of the four Vedas, the most sacred scriptures), the Mahābhārata (one of the two great Hindu epics), and the Puranas (tales reframing the moral lessons of the ancient Vedas), describe ghost illness, spirit possession, and the Brahman's power of exorcism (Freed and Freed 1990, 404); further, even Brahmans from high-caste communities, referred to as *pandits,* wield Sanskritic mantras to exorcise and slay spirits.

On the other hand, spirit possession's emphasis on embodied or revealed divinity, and thus on the immediacy of godhood, parallels and intersects with orthodox Hindu beliefs such as the belief in the possibility of *darsan,* "divine viewing" (possession provides a living glimpse of god); the belief in avatars, or divine incarnations (Rajasthani villagers say that possessions are less potent than full-blown divine incarnations, which were more common before the current decadent Kali Age; Gold 1988b, 41); the belief in shakti, or creative energy or essence (spirits are considered one form of such energy); the belief in making *puja,* "sacred offerings" to divine beings (gifts to possessed mounts allow exchange with the supernatural world); the belief in karma, the force generated by one's actions that shapes one's next life (sinful actions are said to bind souls to earth as ghosts); and bhakti, or devotional Hinduism (spirit possession reflects the direct experience of divinity and emotional intensity common to Hindu devotional traditions; Dwyer 1999, 132, n. 7; Seeberg 1995). Despite differences of emphasis—folk Hinduism's emphasis on the Mother Goddess, ghosts, practical problem-solving, and spirit possession, and orthodox Hinduism's emphasis on the next life, moksha, philosophy, purity and pollution, and Brahmanical morality—the two strands of Hinduism are intimately intertwined in Rajasthan (Lambert 1997).

Despite this interconnection, it would be possible to find support in Rajasthan for Ioan M. Lewis's "deprivation hypothesis"—the idea that possession allows women and other dominated classes to express dissatisfactions, thus providing not only emotional catharsis and social support but covert channels of protest that these persons would not otherwise have (1978)—for example, in the case of a low-caste Bhat woman whose possessing goddess rants at her husband's stinginess and antisocial nature, and in the fact that Rajasthani women suffer more from affliction possessions, while men are more likely to gain control of dangerous spirits and become shamans (Dwyer 1998, 12; Snodgrass 2002b). Still, the possessed offer statements *(bayan)* confessing their crimes, which seem like capitulations to dominant morals, ideologies, and hierarchies rather than contestations of them (Dwyer 1999; Seeberg 1995; Snodgrass 2002a, 2002b). Moreover, ethnographers of Rajasthan have asked whether seeming possession protests are actually experienced as such, or in fact more likely demonstrate, based on the stutters and gasps of the possessed, a failure to protest or even to speak at all (Snodgrass 2002b; see also discussion in Spirit Possession entry).

Dwyer, following Levi-Strauss (1979), saw Rajasthani possession and exorcism as therapy akin to psychoanalysis in the West, allowing ailing persons to de-identify with pathological states and negative emotions, thus reconstructing themselves in more positive images, and rediscovering what it means to give and receive emotional love and support (Dwyer 1999, 123). Dwyer, however, was less willing to enter into an explicit Western psychological language—where possession is conceptualized as, alternately, hysteria traceable to sexual disturbances and conflicts within the family (Freed and Freed 1964; Kakar 1982), dissociative and

somatoform conversion disorders (the latter term used if biological factors are involved) linked to the inability to transition to adulthood (Freed and Freed 1990, 405), or, more specifically, as a form of dissociation termed multiple personality disorder brought about by early childhood abuse (Castillo 1994) or by unresolved Oedipal conflicts (Obeyesekere 1981)—or even to speculate on the internal psychic states of the possessed. Instead, in an approach termed phenomenological, Dwyer explored the local conceptions of self and emotion that ground these spiritual experiences (1998). Helen Lambert, likewise, examined how local Rajasthani ideas concerning, for example, local medical systems, the body, and auspiciousness frame perceptions of illnesses such as spirit possession (1997).

Noting that possession is eminently theatrical, evoking humor and even applause, ethnographers have also used this form of sacred "play" *(khelna)* to explore the link between art and religion, drama and ritual, aesthetic pleasure and religious commitment. Ann Gold, for example, examined Rajasthani representations of true *(saco)* as opposed to false *(jhutyo)* possessions, the deep trancers as opposed to the clever con artists, thus exploring what might be meant by "belief" in spiritual beings, as well as the appropriateness of Western performance languages for analyzing local possessions (1988b). Likewise, the author, in examining the way untouchable bards referred to as *Bhats* conceptualize possessions as performances, examined how aesthetic imitation of threatening others—suicides, stillborn infants, widows—in allowing people to imagine their way out of unsatisfying identities, leads to healing (Snodgrass 2002a).

Other students of Rajasthani religion have used beliefs in spirits to tease out underlying cultural ideas regarding exchange and the economy, noting that, for example, spirit mediums quote the coming year's grain prices and are generally enmeshed in economic life (Gold 1988b, 40), that exchanges of money and evil spirits share an underlying logic of gifting and social relations (Seeberg 1995), that possessions, like sorcery accusations, are often tied to disputes over shared property such as land, homes, businesses, or grazing rights, bringing to the fore either intra- and interfamilial or caste tensions (Dwyer 1998; Snodgrass 2002a, 2002b), and that spirit possession provides an imaginative commentary, not at all unified and straightforward, on the modern capitalist economy (Snodgrass 2002b).

Possession, then, has been used as a mirror of Rajasthani society, as an institution in which key assumptions about the world are alternately celebrated and challenged, be these related to illness and health, self, emotion, and the body, gender dynamics within the family, social hierarchies of class and caste, local interpretations of the global economy, or other yet-to-be-explored dimensions of experience. For Rajasthanis, spiritual possessions hardly appear startling, much less supernatural. Nevertheless, the institution brings to the surface shocking emotions and extraordinary ways of being. And it is this tension between the expected and the unexpected, the quotidian and the remarkable, that allows spirit possession to so effectively reflect Rajasthani culture, displaying taken-for-granted assumptions about the world while adding unexpected intensity and mystery to Rajasthani self-perceptions.

TIBETAN SHAMANISM

Tibetan religion is, with some variations, practiced among peoples not only in Tibet, but also in parts of Nepal, Ladakh, and Sikkim. The religion is a particular form of Buddhism, in which a number of shamanistic elements and practices are to be found. Tibetan *lha-pas* and *dpa’-bos,* “spirit mediums,” who, when ritually possessed, will cure illness and tell the future, are especially relevant in this regard. The *‘das-logs,* the “travelers to the realm beyond death,” also clearly have shamanistic characteristics, but much less research has been done on them. Other specialists that have been seen by some authors as having shamanistic features, such as the *sgrung-pas,* the bards singing the epic of Gesar, or the *gter-stons,* the visionary treasure finders, will not be dealt with here.

Background

Tibetans, an ethnically relatively homogenous people, and populations closely related to the Tibetans, live today in the Tibetan Autonomous Region of China, as well as in other provinces of China, in Bhutan, in parts of India (Ladakh and Sikkim), and in parts of northern Nepal. Exiled Tibetans live in various countries, with substantial groups in India and Nepal.

Tibet traditionally was, and to some extent still is, an isolated country. Agriculture and animal husbandry form the basis of its economy, which is rather underdeveloped due to, among other things, the climate and the high altitude. The majority of the population belonged to the peasantry, but there was also a class of hereditary nobility, and the monastic institutions were powerful bodies in Central Tibet. Traditional Tibet ceased to exist in the mid-twentieth century with China’s incorporation of the country. The practice of religion has since been severely restricted. Thus, much of what is said here concerns traditional Tibet, or practices among exiled Tibetans outside of Tibet proper.

Ever since it arrived in Tibet in the seventh century, Buddhism has been the dominating religious force. Within Tibetan Buddhism many schools and monastic traditions have developed, and a vast religious literature exists. It is safe to say that Buddhism has entered every aspect of Tibetan religious life, its world of thought permeating every sector and its concepts and terminology articulating every religious experience. As an expanding and missionizing religion, Buddhism has often tended to be comparatively tolerant in matters of lay practice, which has led to a readiness to integrate local rituals and beliefs. Thus, shamanic elements have survived, after having been incorporated and often transformed. This process, difficult to follow historically in Tibet, has presumably been facilitated by shamanic features within the Buddhist tradition itself.

Spirit Mediums

The most obvious examples of shamanic features in Tibetan religion are the spirit mediums and the ritual possession they practice. Ritual possession may be found on different levels in Tibetan society, from the local curers in the villages to high-ranking monastic oracles, of whom the State Oracle of gNas-chung is the best known. In this article, lay mediums of the *lha-pa* and *dpa'-bo* will be described, as it is their practices and beliefs that are best known in the West. Although a few studies, films, and recordings have been made of the monastic oracles, much remains to be done in the field before a clear picture of their world will emerge. The main sources for the historical background discussed below are Nebesky-Wojkowitz 1975 and Samuel 1993. For contemporary practice, the sources are Nebesky-Wojkowitz 1975, Pommaret 1989 and the author's own work (Berglie 1976, 1983, and 1999).

There are male as well as female spirit mediums. It is possible that there are more males than females active today, but there seems to be no great difference in their status and activities. Further research is nevertheless needed with respect to the gender aspect.

Mythology and Pantheon

It is difficult to trace these practices back in Tibetan history. There are, however, occasional mentions of possession in early textual sources, and there is evidence of the existence of institutionalized mediumship from at least the sixteenth century onwards. History notwithstanding, the dpa'-bos have a foundation myth, according to which it was Padmasambhava (founder of the first Buddhist monastery in Tibet, placed by legend in the eighth century) who invited the first spirit mediums, whom their successors today still can name, to come to Tibet from four neighboring regions so that they could cure the illnesses afflicting the Tibetans at that time. Everything the spirit mediums do today is modeled on the actions of these four dpa'-bos. In the history of Tibet, Padmasambhava is clearly a figure often referred to in attempts to construct, or reconstruct, a religious heritage.

The pantheon of the spirit mediums is divided into three classes: the *lha* with 80 members, the *btsan* with 360 members, and the *klu* with several thousand members. The lhas are mild and well-disposed beings, clad in white and arriving at the séance from their home in the western snow-covered mountains riding on their white birds. The lha class is subdivided into smaller groups according to function and specialty, groups such as the astrologers, the fortune-tellers, the curers, and the soul lifters. The lhas are often called the "Indian gods" and are identified with the famous Tantric *siddhas* (those who have acquired miraculous powers through intense meditation and discipline) of the Indo-Tibetan traditions. Before they became Indian siddhas and Tibetan gods, they were the heroes of Gling, the epic warriors of King Gesar. They possess the spirit mediums very rarely. The btsans are wild and aggressive beings connected with mountains. They are red in color and arrive from their mountains riding on horses. The members of this class are grouped according to which mountain or mountain range they belong to. One group belongs to the Thang-lha mountains, and another important one is connected to Mount Targo in western Tibet. During their séances, the spirit mediums are most often possessed by members of the btsan class. The klu gods are connected with different lakes in Tibet. Often the mountain gods and the lake goddess are thought to be united in a divine polyandrous marriage. In addition to this hierarchical ordering of the pantheon, the gods are also distributed geo-

graphically from the west to the east. Thus the lhas belong to the high snow mountains in western Tibet and India, the btsans to the central provinces of dBus and gTsang, and the klus to Amdo and Khams in the east.

The pantheon of the spirit mediums is, however, not limited to anthropomorphic beings, but also includes a number of supernatural animals belonging to the gods. These wolves, dogs, wild yaks, and birds carry out important functions during curing séances, as it is they who actually remove the illness from the sick person's body.

According to the spirit mediums, *rtsa,* "channels," are to be found in the human body connecting different parts of the body in a complicated, esoteric, and systematic way. The three most important of these channels have their source in the heart and their opening at the crown of the head, and in the fourth finger of each hand, respectively. The gods enter the human body along these channels, after the spirit medium has sent his or her own consciousness, *rnam-shes,* out of the body through the opening at the top of the head. The rnam-shes then travels a short way up to the altar, where it will be protected by a guardian deity. The interval when the body is "empty" is considered potentially dangerous, as demons always threaten to enter the spirit medium. To prevent this, the spirit medium has to invite guarding deities and place them at the openings of the rtsa. They have the responsibility of seeing that nothing happens to the dpa'-bo then and during the rest of the séance. Further deities are placed at other parts of the body in the same function.

Vocation and Heredity

The hereditary transmission of the spirit mediumship seems to be very important, and it is obvious that a long line of spirit mediums in the family is considered a guarantee of the trustworthiness of a performing dpa'-bo.

Having the heritage of a spirit medium, however, is not enough. If a person is to become one, this vocation has to be confirmed by a call from the gods. The phenomenon of this divine election seems to be rather universal. The call usually comes when the boy is thirteen years old and consists of visionary encounters with the gods. The spirit medium-to-be sees strange but beautiful beings mounted on horses and feels an irresistible urge to follow them into the wilderness. This can go on for several years and be rather disturbing for the candidate and his family, as he often is irritated and angry, walks in his sleep, loses his appetite, and the like. Finally, a traditional authority such as a lama or an older spirit medium is consulted, and if he recognizes the supernatural beings as gods, and not demons, the boy may start his training as a dpa'-bo. The spirit medium will have an especially close relationship in the future to the gods he has met in this way in his youth. This is similar to classic shamanism in Siberia in its aspects of inheritance, vocation from the gods, visionary encounters, and attachment to the spirits encountered during this period.

Tests and Training

Tests of one kind or another are considered necessary by most spirit mediums. The tests all aim at safely identifying the supernatural beings met with in the visions. The identification might be carried out by someone who has a sufficient knowledge of pantheon and of the supernatural world of the spirit mediums. It is a rather complicated process, in which tests are followed by teaching. Thus it starts with describing and analyzing the visions and continues with the older spirit medium establishing contact with a wider range of gods. The teaching medium invites the gods with the candidate present and then asks the candidate to describe what he or she sees. Such séances may be held at irregular intervals for many years and indicate the kind of knowledge a spirit medium necessarily must have: The medium must know the names and appearances of a large number of gods. The possession of this knowledge is shown in the mastering of the invocation songs. If they are performed correctly, the gods are obliged to come to the séance where the spirit medium can identify and describe them.

A special relationship is established between the teacher and the candidate which is supposed to last for life. The older spirit medium is expected to help the younger in every aspect of medium activities, and even to "give" the latter gods for use at séances. During a sequence of séances, the teacher is able to check the ability of the student to clearly see the gods. This abil-

ity is thought to depend, on one hand, on the student's knowledge of the pantheon, and, on the other, on the "cleanness" of the channels in the student's body. Thus, a fortunate combination of intellect, memory, and morality is required.

To be able to recognize the members of the pantheon is, however, not enough to become a successful spirit medium. The most important task of a dpa'-bo is the curing of illness by sucking the object or substance causing the illness out of the patient's body. As this is carried out by one of the supernatural animals, the spirit medium must have a good knowledge of these animals, as well as of the technique of sucking out. This can only be learned from another spirit medium.

In traditional Tibet, a young dpa'-bo had to go on a pilgrimage to Mount Targo in the western part of the country. This mountain is the seat of a very important group of btsan gods, and there is also a cave in which Padmasambhava used to practice meditation. In this particular cave a spirit medium has to conduct a séance, in order to find out if he or she is good, mediocre, or bad. In this cave, three stones are said to be found: one for the spirit medium to sit on, one for incense, and one for the altar. According to one version of the initiation procedure, an incompetent dpa'-bo will die when invoking the gods here, whereas a good one not only can give an excellent performance, but also is sure to find some treasure, *gter,* when leaving the cave. According to another version, at Mount Targo the spirit medium has to climb a ladder in the cave; a good dpa'-bo flies up the ladder riding on a special bird, the mount of the lha gods. A bad dpa'-bo, on the contrary, will fail completely. When he or she tries to climb, the headdress and drum will become heavy as rocks and immobilize him or her on the ladder, in which position the dba'-po will die. In this version we find an interesting combination of the motifs of the legendary founding figure, Padmasambhava, the ritual climbing of a ladder, and the qualitative separation of the spirit mediums.

When a young spirit medium has had initial visionary experiences, has undergone the necessary tests, and has been taught by a teacher, the medium is supposed to seek the blessing of a lama, after which he or she can begin to help people on his own. By then the medium is also supposed to have command over meetings with the gods and many of his or her afflictions will cease.

If, for some reason, a dpa'-bo does not want to continue as a spirit medium, he or she has to perform the following ritual. Five small parcels made of leaves and containing tinder are put at five places on the body: the top of the head, the right and the left shoulder, the back, and the chest. Then an assistant has to set fire to these parcels and thus burn the body, making it disagreeable to the guardian gods who would otherwise stay there during the possession.

Ritual Equipment

All the spirit mediums use some kind of equipment in their séances. These ritual instruments may be obtained in various ways, for example, the spirit medium finds them as treasures, gter, or as a gift from his teacher, or inherits them from older dpa'-bos in his family line. The most important part of the equipment is the metal mirror placed on the altar, which a spirit medium arranges at the beginning of every séance. Without at least one mirror no séance can be held, because then the gods do not have anywhere to descend and to reside. Ideally, a spirit medium ought to have three mirrors, one for each of the three classes of gods. In the mirror the spirit medium can see the gods arrive on their mounts in good order and can see them dismount and place themselves in order of rank with their head god in the middle. Sometimes a knife can substitute for a mirror.

On the altar the spirit medium also places a few *gtor-mas,* cone-shaped sacrificial cakes, small paintings of high-ranking guardians, such as the Karmapa, the Dalai Lama, and mythic protectors of the religion.

Spirit mediums use musical instruments such as a drum, either a large one hit by a curved drumstick, or a smaller drum, shaped like an hourglass. Dpa'-bos also use a flat bell, a *gshang.* The sound of the drum is thought to reach the gods and make them come more willingly. Other instruments are occasionally used, such as a horn trumpet blown three times to greet the three classes of gods arriving.

The spirit medium ties a piece of red cloth around his or her head after the gods have arrived at the altar, prior to donning the headdress. The putting on of the headdress is an im-

A Tibetan shaman drives away evil spirits with a traditional drum and a female thigh bone, ca. 1980–1990, Manag, Nepal. (Earl & Nazima Kowall/Corbis)

portant moment during the séance, as it marks a change of status: The god has entered the body of the dpa'-bo, and from now on until the end it is the god who speaks and acts. The headdress is a five-lobed crown, a *rigs-lnga,* which is fastened to the head with strings. On the lobes paintings of the five cosmic Buddhas are to be found, namely, Vairocana, Akshobhya, Ratnasambhava, Amitabha, and Amoghasiddhi. In front of the outermost lobe at each side two "wings" are attached to the strings. The wings are fan-shaped and painted in the colors of the rainbow. In front of the wings, big bundles of multicolored ribbons hang down on each side. Such crowns, but without the wings and the bundles of ribbons, are also used by the monks in the highly esoteric Tantric rituals.

Among other ritual items a small figurine in the semblance of a human being may be used sometimes. It is made of leather with black stones as eyes and with bird-claws attached to its hands and feet. It is used at curing séances, when the patient is hit over the head with it as part of the exorcism. All the equipment is put away and kept near the ordinary house altar, when not used.

Functions

During the séance it is not the spirit medium who speaks and acts, but the god or goddess by which he is possessed. This is often said to be the sole source of the dpa'-bo's authority, and the only reason why people come to him for help. In theory, he has no responsibility for what happens during the possession, and he claims that he does not remember anything at all afterwards. In practice, however, he is responsible for the correctness of his invocations to the gods, and he is also supposed to see to it that no demons sneak into his mirrors or into his body. Thus it can be argued that an absolutely distinct line cannot be drawn in this respect between the nonpossessed and the possessed spirit medium.

The myth related above explaining the cause for the invitation to Tibet of the first four dpa'-bos also stresses their main activity, then and now—the curing of illness. This can be effected in many ways, but the method most often used is to suck out the illness or illness-causing substance or object from the body. When such a sucking out is carried out, the spirit mediums let themselves be possessed by a zoomorphic being, usually a wolf, a wild dog, or a bird. The medium then holds his or her drum, or some other item from the ritual equipment, against that part of the patient's body where the illness is thought to be located, sucks from the opposite part of the drum, and spits out the result in a small bowl of water. The patient, and everyone else present, can thus see for themselves if the cure really has been effected. The healing process is supervised and controlled by a group of gods belonging to the lha class called the three Indian doctors, while other gods guard the patient's body during the curing. Sometimes the spirit medium also hands out some herbal medicine in connection with the healing.

Spirit mediums can predict the future, and to do so they usually use a kind of drum divination called *rtsis.* This divination can be done in various ways. The spirit medium may put a drum in front of himself or herself and place a few grains of rice on the drum skin. Certain gods, who are present to check the procedure, are then asked to move the grains to show the answer to the question posed. If the rice moves toward the altar, or if it rotates clockwise, it is considered a positive answer; if, however, it moves in the opposite direction, the situation is serious. In another method of divination, the spirit medium drops the rice from his left hand onto the drum skin and reads the future from the pattern formed by the grains.

Exorcism forms a part of every curing séance, as it is opened with the dpa'-bo establishing an auspicious space for the coming events, a prerequisite being that no demons are around.

An interesting, but unfortunately only fragmentarily known, practice is that of the "calling back of the soul," *bla-'khug.* According to the spirit mediums, a person may lose his or her *bla,* "soul," for many reasons. Demons, for instance, may steal it and carry it away. They do not, however, keep it for very long but throw it away. The aim of the bla-'khug ritual is then to locate the lost bla and bring it back to its owner. The possessed dpa'-bo takes three objects, one turquoise, one coral, and one small shell, and puts them in a small ball of pap, *spags.* The ball is then thrown away with a sling. A bowl is filled with water mixed with milk, and a scarf, *kha btags,* is stretched over the bowl as a cover. The patient then has to put his or her hands into the bowl in order to find the thrown-away

objects. If the patient can find all of them, his or her bla will return, but if the patient can find only one or two of them, the spirit medium then is possessed by an extremely wrathful deity, who helps locate the missing object or objects. Here, the three objects are obviously thought to be identical with the bla. In this ritual members of the lha class are thought to be active, and even to possess the spirit medium, who then will speak in "Indian."

Finally, minor ritual practices, such as stopping escaping thieves at a distance by paralyzing them, or a thread-cutting ritual intended to cure human beings and animals suffering from difficulties in breathing, are also known.

The Séance

Spirit mediums usually perform in the evening and in the house of the people seeking help. All séances start with the arrangement of the altar. The invocations, mainly consisting of mentioning the names of many gods, are sung, during which the gods arrive and arrange themselves properly in the mirrors. This usually takes a little more than twenty minutes, after which there is a short break, during which the headdress is put on. The drumming and the singing become faster and faster, and the body of the dpa'-bo begins to rock to and fro. Suddenly the dpa'-bo leaps onto the floor and begins to dance. The god has entered his or her body, and the putting on of the headdress signals a change in ritual status. Just before the god enters, the spirit medium has to send away his or her own consciousness, the rnam-shes. It is thought that, for most mediums, their consciousness is protected by a special guardian deity during the possession. Other guardian deities also arrive to protect the spirit medium and the proceedings against the demons and their machinations.

When the god has entered and the excited spirit medium has calmed down, the god usually introduces himself in rather haughty and even insolent words and asks what he is supposed to do this time. The intermediary appointed for the evening then sets about the task without delay. Clients are not allowed to speak directly to the god who is possessing the dpa'-bo, and an intermediary, traditionally male, is therefore required.

Then follows the main part of the séance: the solving of the problem. When the help has been given, the god is duly thanked, and all the gods start to leave. Now begins the final part of the séance. This is the so-called *rigs-lnga* game, which may last for a few minutes or up to more than an hour. During this part the dpa'-bo swings and shakes his or her body violently. The singing has a more general content and is usually full of good advice, sometimes of an almost proverbial nature. All the séances finally end with the spirit medium leaning back in a sitting position, his or her head falling forward as the headdress slides off. As a rule it then takes only a few minutes for the dpa'-bo to recover and to start to collect and put away the equipment.

Spirit mediums find it hard to describe what they feel at the onset of the trance. Many of them have visions of light and color, and some also experience changes in the size of ritual objects, which seem to grow bigger and bigger. At the same time the people sitting around the dpa'-bo become smaller and smaller, while their eyes shine brightly and their voices become thinner and thinner. When the god enters, the body may feel big and as if filled with gas; then everything becomes black.

Under no circumstance may the dpa'-bo use any kind of drug or alcohol before and during the séance. It is considered wise and auspicious to abstain from alcohol and meat for some time before performing.

More people are usually present in the room than really belong to the house or the immediate neighborhood. The onlookers may drop in during the invocations and leave after the dpa'-bo has accomplished the task. There is always a relaxed atmosphere in the room, but if it is too relaxed and noisy, it provokes angry remarks from the deity.

The spirit mediums work in a society dominated by Buddhism, and the Buddhist monks are the religious specialists with the highest authority. The spirit mediums act with the blessing of the lamas, but there does not seem to be much cooperation. They seem to act in different sectors of the religious field.

The Travelers to the Other Worlds: The 'Das-Log

The travelers to the land of the dead clearly belong to the shamanic complex in the Tibetan religion, although much research on these phe-

nomena is still required, both with regard to its appearance in Tibetan texts and its living presence today. These soul travels are described in hagiographic texts (Epstein 1982; Pommaret 1989, 1996), as well as in the anthropological literature (Berglie 1999; Pommaret 1989).

The literary biographies of the soul-travelers, of whom the majority seem to be women, seem to be rather rigidly structured. In most cases, a conflict of a religious nature constitutes the starting point in the career of the ʻdas-log. Wishing to be a nun but forced to remain in a secular state, she suffers. She has visions of her future life, hears strange sounds, and feels soaked in a rain of blood and phlegm. She finally dies and sees her relatives gathered around her bed and realizes that she has, in fact, died. Then she travels in unknown and terrifying lands where she is approached by dead people, eager to tell their sad stories. In the different hells she then visits, she sees the pains and torments of the sinners. When it is time for the ʻdas-log to be put in front of the tribunal before which all the newly dead must appear, her case is investigated thoroughly. Since it is discovered that a mistake has been made, she is sent back to the living. Having returned to this world, she becomes a ʻdas-log and spends the rest of her life telling about her great experience and giving advice on how to avoid having to spend time in the hells.

Women seem to be in the majority also in the anthropological material. The overall structure of the career of the ʻdas-log is similar, the most obvious difference being the ability of the contemporary ones to die again and again. They may even travel to the nether regions several times a month, on fixed days in the Buddhist calendar, or whenever someone asks them to. Such a journey may last for a few hours, or even longer, and after having returned the ʻdas-log is able to deliver very precise messages as to what has to be done in this world to improve conditions for unfortunate relatives and friends in the Otherworld (Pommaret 1989).

Stories have been recorded of ʻdas-logs traveling in the heavens and in the hells for as long as seven days. And according to one informant, the ʻdas-log is herself able to save people from hell and bring them to a better world. After their return it is said that they weep for days, having seen so much suffering (Berglie 1999).

In the ʻdas-log, Buddhism and shamanism seem to have merged in a way that further studies may elucidate.

Overview

SOUTHEAST ASIA

The complexity of shamanism is Southeast Asia is in part a reflection of the geographical, linguistic, and ethnological complexity of the region. Southeast Asia consists of both a mainland area (which includes, most importantly, the modern countries of western, or peninsular, Malaysia, Vietnam, Cambodia, Thailand, and Burma, plus contiguous areas of southern China and eastern India) and an insular one (including, most importantly, east Malaysia, the Philippines, and Indonesia, excluding Irian Jaya, or western New Guinea). Except for remnant groups in a few areas, the indigenous peoples of the entire region share many physical features that link them to the inhabitants of the more northerly areas of East Asia. Most of the languages of mainland Southeast Asia belong to several large families or groupings, including Tibeto-Burmese, Mon-Khmer, Tai-Kadai, and Vietnamese-Muong. The languages of insular Southeast Asia (along with some of those of the mainland) all belong to the great Austronesian family, which, though spread throughout most of the Pacific Islands, is also of Asian origin. The indigenous peoples of Southeast Asia include very small and localized populations of nomadic hunter-gatherers or foragers, much larger and more widely spread groups of slash-and-burn horticulturalists, and vastly larger numbers of agriculturalists who practiced wet rice cultivation.

Shamanism in Southeast Asia also needs to be seen against a backdrop of religious development that includes a long and complicated history of involvement with other major zones of Asian civilization, especially (except in sinicized Vietnam) India, and of later Western colonial rule. Indic religious influences date to the beginning of the common era and were in full flower among lowland, rice-cultivating populations of the western Indonesian archipelago, the Malay Peninsula, and most of the mainland by 1,000 C.E. Beginning in the fourteenth and fifteenth centuries Islam began to spread, also mainly from India, along the routes of the spice trade, and it became dominant in the coastal areas of Sulawesi, Borneo, Sumatra, the Malay peninsula, the southern Philippines, and the northern littoral (and eventually all) of Java. At about the same time, Theravada Buddhism began to replace earlier forms of Hinduism and Buddhism throughout most of the lowland areas of the mainland. In all instances, however, elements of earlier indigenous and Indic beliefs and practices persisted, both among village cultivators and in the ruling court centers. Further, the later diffusion of Buddhism and Islam involved folk traditions of magic, animism, spirit possession, and the like, as well as scriptural or "orthodox" traditions. Finally, in the case of the numerous more autonomous tribal peoples of the upland and interior areas, the impact of outside influences was much more limited, and their classic religious traditions, including shamanism, much less affected.

It has been the introduction and spread of Christianity, along with other Westernizing and modernizing influences, by colonial and postcolonial regimes that have done the most to transform the religious traditions of the tribal peoples of Southeast Asia. Brought first by the Portuguese and then the Spanish, Roman Catholicism arrived almost as early as Islam. However, outside of the Philippines and a few other local areas, the wider spread of Christianity was linked to the expansion of Dutch, British, and French colonial control and began mainly in the latter part of the nine-

teenth century or in the early part of the twentieth. Such processes, which have made few inroads among Muslim or Buddhist populations, are ongoing, diverse, and far from complete.

Introduction to the Entries

The eleven entries that follow this overview include two general and comparative articles plus nine more specifically focused ones. "Southeast Asian Shamanism " provides a general introduction to Southeast Asia as a region, and to its types of societies, religious traditions, varieties of shamanism, and patterns of change. It makes a distinction between narrowly and broadly conceived forms of shamanism, one that is reflected in the more specifically focused entries. In addition to this introduction, "Indonesian Shamanism" also offers an overview of shamanism and related religious traditions in Indonesia, the largest and most ethnically diverse country in Southeast Asia. This entry takes a broad approach to shamanism and relates some of its general features to the different areas and religious traditions of the vast and varied Indonesian Archipelago.

The more specific entries are those that concern particular ethnic groups, including the Thai, Burmese, Malays, Javanese, Hmong, Taman, Murut, and Semai. These groups are of two types. The Thai, Burmese, Malays, and Javanese are large "national" (or transnational) ethnic communities that have long-established civilizations, literate cultures, state-level or centralized political traditions (courts, capitals, and kings), and adhere to either Buddhism (in the case of the Thai and Burmese) or Islam (in the case of the Malays and Javanese). Observers have sometimes used the term *shamanism* to describe the practices of trance and spirit mediumship and the notions of the soul and other spirit beliefs that have flourished, especially at the popular or village level of these societies, though more recently in increasing tension with religious orthodoxy. Such beliefs and practices fit better with a broad concept of shamanism than with a narrow one of the classical type first delineated regarding Siberia and central Asia.

Among these articles, the entry "Malay Shamans and Healers" follows a longstanding precedent in applying the term *shamanism* to Malay spirit medium and healing practices. In contrast the entry "Thai Spirit World and Spirit Mediums" uses the term *shaman* for the spirit medium, but not for the spirit priest, and brings out some shamanistic elements in those practices, at the same time noting the extent to which popular Thai animistic beliefs and practices actually derive from Buddhism. Among the Burmese the shamanistic overtones of popular animism, possession, and exorcism appear to be somewhat stronger, but the entry "Burmese Spirit Lords and Their Mediums" embodies a similar view and uses the term *shaman* simply as a different way of referring to a spirit medium. The entry "Javanese Shamanism" takes much the same approach, but notes more explicitly that neither the classical shaman nor a shamanistic worldview really exists in Java, though shamanistic practices persist. More specifically, the entry "Shadow Puppetry and Shamanism" briefly explores possible links between shamanism and the most important and popular form of traditional theater in Java, but finds few. The most notable connection is perhaps that the *dalang,* the puppet master, is believed to be "called," a common attribute of the true shaman as well.

The societies noted in the remaining entries, the Hmong, Semai, Taman, and Murut (along with similar groups mentioned in the two broader surveys, including the Iban and Ngaju of Borneo and the Wana of Sulawesi, to which many others could be readily added), are very different from the Burmese, Thais, Malays, and Javanese. The Hmong and the others of this second group are basically small-scale or tribal societies of the interior or upland areas of Southeast Asia. They have not been, at least until recently, adherents of any of the world religions, and although many of them have now converted, it has often been to Christianity rather than to Buddhism or Islam, thus contributing to their continued ethnic and religious separateness.

It is to the healing and religious practices and cosmologies of these societies that the label of shamanism has been most commonly applied by observers, and with the clearest comparative justification. Even so, it would be incorrect to suggest that all of the entries about these societies describe the same common form of true shamanism. Of these articles, "Taman Shamanism"—the Taman being a numerically small interior Bornean people of the upper Kapuas River in West Kalimantan, Indonesia—describes one of the most impressive examples of classic shamanism. Taman

shamans are always called to assume their position by willful spirits whose demands cannot be refused; once they are initiated, their souls can undertake journeys to other realms, and they cure by retrieving the souls of the afflicted and reinserting them back into their bodies.

As the entry "Hmong Shamanism" explicitly notes, the practices of the Hmong are also an instance of classic shamanism. Nonetheless, Hmong shamans are hardly carbon copies of Taman ones, one difference being that whereas the former are usually men, the latter are nearly always women. In contrast to the Hmong and Taman traditions, those of the Semai of the interior of the Malay Peninsula and the Murut of Sabah (far northern Borneo) fit the mold of classic shamanism less well. As described in "Semai Shamanism," the Semai have several types of practitioners of supernatural healing, of which *hala'* are the most shamanic. But although hala' do cure by rescuing and retrieving the absent souls of the afflicted, only some become hala' as a result of calls (that come in dreams) by spirits, others doing so only through apprenticeship and study. The Murut appear to be even more of a mixed case, one that combines elements of spirit mediumship with those of shamanism. The entry "Murut Shamanism" notes that though shamans acquire spirit guides, they do not become practitioners as an effort to gain relief from bouts of mental or physical illness attributed to the attention of spirits. Given the localized nature of such societies and the oral basis of their traditions, such diversity is hardly surprising, and it could be easily further documented by reference to many other instances.

Robert L. Winzeler

BURMESE SPIRIT LORDS AND THEIR MEDIUMS

The cult of *nats,* "spirit lords," is specific to Burmese cultural history. Negotiation with these "spirit lords" is undertaken by mediums, who in a shamanlike role go into a state of trance and thus become a conduit between the spirit and the client. Many aspects of shamanism can be perceived in these practices, including the location of the nats, who may reside in special features of the landscape or protect territories and kinship lineages. The cult of nats is encompassed conceptually by Theravada Buddhism and addresses specific practical and personal needs within that broader religious framework. Though the term *nat* is always translated "spirit lord," in fact nats may be female as well as male. The authority of nats derives from their association with past kings, one's kin group or ancestors, one's village or home region, or one's own personal affinity to them. Negotiating with spirit lords is a way of dealing with mundane social and personal concerns that require the practical authority derived from worldly power. The mythic origins of nats predate the reign of Anwartha (1044–1077 C.E.), the king who established the first Burmese empire in Pagan. He initiated religious reforms to strengthen Theravada Buddhism, but failed in his effort to purge the land of the veneration of nats. Several powerful spirit lords originated during his reign, and later kings confirmed annually the appointments of nats along with those for court nobility. Contemporary social forms of worshiping nats evoke a traditional past, its imagined authority and royal splendor. Burmese turn to these traditional sources of authority to gain control over uncertainty in everyday life and misfortune in times of personal crisis. Rosalind Morris (2000) has made similar observations in her work on spirits in northern Thailand.

The cult of nats offers psychological, cultural, and social venues for confronting risk and misfortune and allows for the integration of a variety of emotions into a broader social landscape. Normative Burmese Buddhist practice values generosity, restraint, equanimity, social harmony, detachment, mental discipline, and the good karma that results from such behaviors. The veneration of nats gives social reality to a host of emotions Buddhist practice discourages explicitly: hatred, greed, and desire; attachments, licentiousness, and jealousies; unhappiness over misfortune, illness, and the loss of social power more generally.

The nature of the annual ritual veneration paid to nats, especially the songs glorifying their lives, lore, and personal attributes of power, suggests that the Burmese cult of nats has been shaped by Hindu and Buddhist traditions as much as by local or animist practices. Similarities with Hinduism are evident in the deities involved, the notion of divine kingship, and the bhakti (devotion) seen in ritual veneration. Some nats are identified as Hindu gods, such as Indra, King of Gods, and Ganesh, the Remover of Obstacles, but they never appear involved when mediums experience possession. Other nats are of Muslim or Chinese origins, but most of them are of Shan, Mon, and Burmese descent. In principle, nats are an open-ended category of spirit beings, and new ones may reveal themselves at any time.

The Royal Cult of the Thirty-Seven Nats and Authority of Spirit Lords

The Thirty-Seven Royal Nats constitute a class of powerful protective spirits (see iconographic illustrations in Temple 1906 and Rodrigue 1992). The number of positions within the Royal Cult parallels the thirty-two realms in Theravada Buddhist cosmology, along with four Quarter Guardians and a center, usually represented by Mount Meru (Shorto 1967). The identities of the thirty-seven nats fluctuate, as Burmese often include different spirit lords among them. Many agree, however, on subsets among the thirty-seven. The Duttabaung Cycle includes seven nats linked to the Pyu period,

such as Thagya Min (Indra) and Mahagiri Min. They are thought to predate the formative period of Burmese political identity during the Pagan period. The nine lords of the Anawratha Cycle include the two Taungbyon Brothers, sons of Popa Maedaw (described below) and a minister at Anawratha's court. Others in the list of Thirty-Seven Royal Nats have less fixed dates of origin.

Local chronicles identify nats closely with Burmese history, social identity, and regional myths. The Glass Palace Chronicles, a nineteenth-century compilation of earlier histories, mention Popa Maedaw, the ferocious and fickle mother of the Taungbyon Brothers, who is an ogre nat who resides atop a volcanic mountain by the same name (Pe Maung Tin and Luce 1976). Other chronicles claim that King Mindon (r. 1857–1878), buried four men alive in order to turn them into guardian spirits at the four gates of his newly constructed palace in Mandalay. Countless local nats are said to reside in objects, such as cars and machinery, or reign over villages and features in the landscape, such as mountains or lakes. Still other nats protect specific territories and kin lineages (Nash 1966). All tend to be known for their mythic deeds, specific powers, personal attributes, and capriciousness. Even the most casual veneration of nats takes account of these personal quirks in negotiating exchanges and relations with spirit lords. Although Burmese recognize the power of nats in solving everyday problems, they also are aware of limitations on their powers. Nats are not omnipotent, universal deities. Instead, their personal traits, experiences, and connections to kings give them well-defined powers and attributes. Most nats are said to have met with an untimely, violent death, which according to Buddhist belief creates continued attachment to the people and contexts of one's previous life and a ghostlike existence that cannot be reborn (Spiro 1978).

Stuck in the cycle of rebirth, spirit lords nevertheless wield power and authority over specific regions. Prominent spirit lords continue to be worshiped at "palaces." Devotees travel there on pilgrimage to negotiate favors, gain promises of protection, and make good on obligations, repaying them during ritual audiences by a spirit lord. These regional palaces are the sites of annual festivals. Some Burmese claim to have an inherited obligation passed to them from their parents' generation through either or both of their kin lineages. Many deem it a part of this obligation to make annual pilgrimages to their nat's palace, attend the royal audience, and offer their tribute lest misfortune befall them and their kin. Others claim to come to these festivals mainly for popular entertainment, music, and fairs.

Thousands travel to Taungbyon, a small village near Mandalay, to participate in popular celebrations over three days. This nat festival is dedicated to the two Taungbyon Brothers, the sons of Popa Maedaw and a minister at the Anawratha's court. Their father became a nat when he was put to death by the king. The sons fell victim to palace intrigues and later also died at the hands of this king. Ritual activities at the annual palace festival proceed at multiple levels simultaneously. The gilded wooden statues of the nats are carried in procession through the palace grounds and down to the river in royal splendor. Meanwhile, at the palace, high-ranking spirit mediums make private offerings for them and organize large public rituals in which the brothers are ritually bathed and their status is reconfirmed.

Evenings are devoted to public audiences, where throngs of devotees crowd into the audience pavilion and offer Eugenia leaves, coconuts, bananas, shawls, and expensive fragrances to invoke the protection of the brothers. In return, they hope to receive tokens of blessing from them. These are times of intense public drama heightened by the hypnotic effects of the rhythmic, high-pitched music of a traditional Burmese orchestra. The air is heavy and drenched with the sweet smell of jasmine flowers and perfumes. Oxygen is thin, and the temperature rises as the sea of devotees inundates the small audience hall. Individuals are submerged in the shoving of crowds moving toward the images of the nats seated on thrones in the inner confines of the audience hall.

This emotionally charged, delirious atmosphere can create in some a cognitive and emotional dissociation from the ordinary social contexts of life. Spontaneous possessions occur when the spirit lords deign to show their affection to individual devotees. For many pilgrims, however, these rituals are not only contexts in which personal ailments and anxieties may be

resolved. A general lack of social restraint is permitted, if not expected, and many enjoy dancing, amusement, theatrics, drinking, and licentious sexual joking.

The most senior spirit mediums there carry the titles of queens and ministers of the Taungbyon Brothers. They are clad in traditional royal dress and begin to perform highly scripted and stylized dance performances. Public dances are the prerogatives of established mediums, who display in the dances their intimate knowledge of the spirits. The choreography narrates their mythic lives, trickery, and powerful feats, and displays their emblems of power and personal qualities. The personality of each nat becomes apparent through characteristic costumes, emblems, behaviors, songs, and their favorite food offerings, which are given to them during the performances. For instance, Kou Kyi Chaw enjoys drinking and gambling, the capricious little Ma Nge-le likes boiled eggs, and Popa Mae Daw devours fruit and flowers. The performances also incorporate ostentatious offerings, as mediums often accept large sums of money from clients in the audience. Similar rituals of veneration and solicitation are performed at housewarmings, in neighborhoods, or by professional associations. Some of them are especially dedicated to offerings made to the nine lords (Brac de La Perrière 1989).

Mediums and Clients

The shamanistic practices of Burmese spirit mediums are based on marriage to a spirit lord; they may include elements of alchemy, sorcery, healing, and divination. Mediums are known as *natkadaw;* literally, spouses who dance for spirit lords. Through trancelike possession, they become conduits for the spirit's communications with a client, offer private counsel, and guide those who are spontaneously possessed through the experience of altered states of consciousness.

Social marginality, unusual physical features, and the desire to transform difference into social validation and a steady source of income may be among the motivations for becoming a spirit medium. Recurrent spontaneous possession may signal that the spirit lord is courting a new spouse, and incurable illness may befall the bride until the spirit is placated. Many admit to initial embarrassment and apprehension, if not resistance, at being the object of love and desire for a spirit lord. The spirit lord is thought to become infatuated with the butterfly-like "souls" of a human being. During this at times traumatic trial period, the new recruit may simultaneously express resistance and receive instruction during an apprenticeship under a senior medium. Once conflicting desires and obligations to one's family, including perhaps marriage to a human spouse, are resolved, a mock wedding may be performed to indicate the rights and new status of the medium.

Sexual allusions and joking are commonplace in the cultural contexts of nats, in stark contrast to the usual restraint of Buddhist society. Although, in traditional Burmese society, men usually outrank women in social standing, this general social ranking of gender roles can be inverted in the marriage to a spirit lord. Regardless of the medium's gender, the status of the human spouse is always inferior to that of the spirit lord. Thus a female nat like Popa Mae Daw may be spoken of as choosing a male as a "bride." While most mediums are female, many are male. Some mediate for more than one spirit lord, and they may think of themselves as living in polygamous marriages. Others stress an asexual relationship to the nat. Still others are openly homosexual or dress as transvestites.

Clients who seek consultations with spirit mediums are motivated by personal or practical concerns, such as stress, anxieties, illness, or a family crisis that may be out of control. Others seek advice to ensure success in business or protection against potential risks or misfortunes. Soliciting the spirit's goodwill, clients may promise lavish offerings once their ventures are successfully completed. The tone in negotiating with nats ranges from fearful supplication to skillful currying of favors, boisterous barter, and boastful promises. Many cultivate personal relationships with the medium and the spirit lord. This familiarity gives social reality to a range of emotions that Buddhist practice explicitly seeks to ameliorate. Rumors of intrigue or misuse of power can, however, fuel allegations of sorcery, which constitutes an inversion of power structures in the practice of the Buddhist Lower Path. Natkadaws generally emphasize that their practice helps clients negotiate this-worldly concerns, and is encompassed by Buddhist ethics and cosmology.

Relations with nats entail an elaborate system of exchange. Spirit wives also frequently compete with each other for prestige, status, and recognition. As mediators, they receive money and other offerings intended for the spirit lord. The flow of offerings and other ritual expenditures constitutes a social exchange between nats, their mediums, clients, and a host of others, and may include the hire of beauticians and orchestras, or the upkeep of palaces. Living up to the demands of the spirit lords as well as to those of peers and clients can lead to significant expenditures for a natkadaw. Some nats have extravagant tastes for liquor, gambling, or lavish luxuries. In addition, a medium's conduct and reputation are important factors in the exchange between spirit lord and client and constitute symbolic capital in a profession that relies on divination, rumors, and trance to produce a steady income, if not considerable wealth and influence among an elite set of clients.

The shamanistic experience of mediums gives socially sanctioned expression to emotions and various mental states of dissociation. It can also create an experience of community often called *communitas*, to spontaneous trance, predictable seizures, and perhaps even the manifestation of multiple personalities. The exchange with spirit lords creates social identity empowered by imagined and traditional authority and ritual forms, including pilgrimage, royal audiences, and annual tribute. Communicating with spirit lords is a socially constitutive experience that may integrate experiences of misfortune or social marginality and helps construct personal identity, social memory, and cultural continuity.

HMONG SHAMANISM (THAILAND, LAOS)

Hmong shamanism, generally considered a "classic" form of Shamanism, very close to the Siberian forms to which it is probably related, provides a rich field of study, especially because it is still practiced among those of the Hmong who have settled in the United States.

Background

The Hmong are a large ethnolinguistic group originating in China, where the vast majority of approximately six million Hmong still reside. In China, the Hmong, known to the Chinese as the Miao, are among the fifty-six governmentally recognized *minzu,* "nationalities." This designation disguises a great deal of ethnolinguistic complexity, since there are thirty to forty distinct, mutually unintelligible Hmong languages in China (belonging to the Meo-Yao branch of the Austro-Thai linguistic family), and Hmong communities are widely scattered in the west and south, particularly in Guizhou, Sichuan, and Yunnan Provinces. Beginning in the early nineteenth century, Hmong groups have been migrating southward into Laos and Thailand, with smaller incursions into Vietnam and Myanmar, and since the Vietnam War,

Hmong from Laos and Vietnam have migrated even farther from their original source, to the United States, France, Australia, and other countries, even including Iceland. Because of the size and diversity of the Hmong (or Miao) in China, and the difficulty of access to Chinese groups from 1949 until recently, they are less well known to scholars than the Southeast Asian groups.

There are two main subgroups among the 140,000 Hmong in Thailand and 210,000 in Laos: the Hmong Njua (known as Blue Hmong in Southeast Asia but Green Hmong in the United States) and the Hmong Daw (White Hmong). The usual explanation for these terms of distinction refers to the dress of Hmong women, but there are also some linguistic distinctions, though the two dialects are mutually intelligible.

The Hmong have lived on the periphery of Chinese civilization for many thousands of years in relations of subordination and conflict. Early Chinese sources suggest their presence in the Yangzi River valley in 2000 B.C.E., with subsequent evidence of southward migration over centuries into present locations. The constant expansion of the Han and the growing power of the Han state kept the Hmong on the southern periphery from developing a competing state, and escape from Han dominance was always toward the south. As a result, the Hmong now inhabit the hilly areas in Southeast Asia, with an economy based on shifting rice cultivation; at preferred altitudes of 1,000 to 3,000 feet, they can supplement rice with opium as a preferred cash crop. They interact in Southeast Asia with the dominant lowland Thai and Lao, along with other hill tribe groups, mainly the Karen, Mien, Akha, Lahu, and Lisu.

Hmong Shamanism as "Classic Siberian Type"

Hmong shamanism is often said to be of the "classic Siberian type." All seven of the characteristics described by Robert Winzeler in his entry, "Southeast Asian Shamanism," in this encyclopedia, are true of Hmong shamanic practice and belief. Mircea Eliade's characterization of Siberian, or Inner Asian, shamanism included typical patterns of belief about the cosmos, the human soul, the calling and training of the shaman, the experiential state of the shaman while in contact with the spirits, and the techniques employed during shamanic events (Eliade 1964). Given the Hmong's probable origin in central or even northern China, partially evidenced by legends of having lived in a cold and snowy land, it seems likely that they once shared in the northern cultural area in which this kind of shamanism flourished.

The Cosmos

Spirits, domestic and wild, inhabit the hills, valleys, villages, and households of the Hmong world. Some are more powerful than others; some are dangerous, others are friendly or can be tamed. Humans cannot see them, but dogs always know when they are around. Most are unnamed, but there are three powerful spirits who live in the sky and have bureaucratic responsibilities similar to those assigned to the important deities of the Chinese Daoist cosmology. Yorso, said by some to be the chief of these deities, is heard to speak in thunder, to strike in lightning, and judge Hmong souls (Chindarsi 1976). Others say it is Yonglao, who is invited to celebrate the Hmong New Year festival, but generally sends one of his sons or daughters, who is the head of the deities. Yawang has the magisterial duties of interviewing the recently dead and determining whether reincarnation is possible immediately or must be delayed by a period of punishment; he grants licenses for rebirth in the human world for specified periods of time. On expiration, the license holder must die unless granted a renewal by Yawang.

Other named spirits hold up the cardinal directions: upland, lowland, sunrise, and sunset. Spirits with extraordinary powers also reside in unexpected places, such as those with elongated heads and red mouths that inhabit the ancient trees in Buddhist temples, where the karmic powers of the temple intensify the spirit's power. Most dangerous of all the "wild" spirits are those in the large termite mounds that are common in the hills of Southeast Asia; such mounds, it is thought, are built by insects over a decaying body, so a burial has been disturbed, and the spirit that has moved into the termite mound is hostile and looking for trouble. Moreover, snakes move into the twisting tunnels of termite mounds, and they often carry

evil spirits with them wherever they go. These spirits in termite mounds are so powerful that they usually cannot be evicted; they simply have to be appeased with sacrifice of pigs and burned paper money.

But the spirits that are most intimately connected with Hmong social life and shamanic practice are an assortment of spirits associated with the household, the village, and nearby mountains, forests, and streams. These spirits are hierarchized to a certain extent; the spirit of a mountain has power over those of forests and streams on its flanks, and for this reason will be invited to take up residence as the village protective spirit in a shrine called *tier ti tier seng* located in the shelter of a great tree in a grove high up the mountain. Similarly, there are various household spirits associated with the middle post, the door, and the two stoves, spirits that are served by the headman of the household. They protect both human and animal inhabitants of the household from attack by spirits of illness and the dead, keep souls from wandering away at night or during sickness, and prevent those who are not members of the clan from engaging in sexual activities in the household. The village shamans also contact and domesticate potentially dangerous spirits to serve as spirit guardians of the village.

The Soul

The Hmong soul, rather than a single fixed entity associated with a unique personality, is a loosely organized composite of seven entities associated with the six sense organs—two eyes, two ears, nose, and mouth—plus the heart. As the senses can function separately and break down separately, so can the various souls slip away during sleep or get lost during a serious illness or scatter like flies if frightened. Missing souls are generally imagined as wandering lost in the forest, and it is the task of the shaman to find them and lead them home, although it is also possible for the head of household to take steps to bring back the soul of a weak or sick family member. Nusit Chindarsi (1976) described a method, practiced by heads of households in Meto village, in which a bridge was constructed across a stream or track; the souls of the sick were lured from the forest to cross back into the security of the village. The spirits were then fed sacrificed chicken and given paper money, and the flighty soul was tied securely to the body with strings at the wrists, neck, and ankles. More generally, however, when a person falls ill, a family will call a shaman rather than treat the illness themselves.

The Shaman's Calling

The shaman is known as *txiv neeb,* the "father of the spirit," in reference to one or more familiar spirits, or "doctor spirits," under his control. It is essential for a village to have at least one resident shaman, although there are usually any number of them, since at least 25 percent of the men in a village have some shamanic powers. There are also women shamans, some with quite powerful reputations, but most are men (and so the male pronoun will be used in this entry). A shaman who has gained a reputation as being exceptionally effective at controlling particularly powerful spirits may be called to distant villages and paid relatively high fees in cash and kind, such as meat, live animals, firewood, or other practical gifts. It is ideal for the village headman to also be a shaman, but this is not always the case, since it is even more useful for a headman to have good political skills and linguistic abilities for dealing with government officials.

A shaman's career begins in sickness. If he suffers from an illness that is hard to cure, if he lingers in a sickly state for a lengthy period of time despite the ministrations of medicinal herbs and all shamanic efforts to dispel the hostile spirits and enlist the good ones on his behalf, someone will suggest that his only hope is to become a shaman himself. Certain diseases, such as epilepsy, are particularly portentous. Most typically the role is not sought, because Hmong fear the spirits and prefer to have no dealings with them. But once convinced, usually in his youth, that he has been called to the shamanic vocation, the initiate begins his training in an informal apprenticeship with an experienced shaman and goes on for several years. Unfortunately, there are no accounts, firsthand or otherwise, of the inner experience of the shaman in training, his acquiring of *neeb,* or *neng* (the familiar spirits), his visions while in entranced struggles with possessing spirits, or what he sees, hears, and feels while behind the mask and riding the "horse" into the invisible world that is interlocked with this one.

The Shaman's Practice

The Hmong shaman is a healer. Having survived his own illness, he has been to the liminal fringes of society, where death and danger reside, and come back again; he knows the way; he has been fortified by the experience; he can go there again on missions on behalf of other sick members of his society.

The Hmong shaman has a professional's tool kit of equipment to assist him, but his principal task, which may be accompanied by a great deal of dramatic elaboration that helps observers imagine what only he can see, is to cross a threshold from the visible world of human materiality into the immaterial and invisible sphere that shadows it. While never out of sight of anxiously watching family and neighbors, he shouts, wrestles, leaps, and even tumbles off his "horse" until he has finally won a victory on behalf of a feverish or injured or chronically ill patient.

His horse is the bench upon which he sits, or rather rides, positioned in front of the spirit altar that can be found in every Hmong household. The altar may be a low table or a box hanging from a wall, or something convenient like an old tin drum will be made to serve, but in any case it will be opposite the door, because spirits traverse a straight line between the altar and the door. It is covered with white paper or cloth and holds a container with incense sticks and a bowl of paddy (rice).

Much of a shaman's work is diagnostic. What is causing this youth's fever? Is it something that medicinal herbs will cure, or is an evil spirit involved? Why has the medicine from the lowland clinic not stopped this patient's epileptic seizures? What is causing this child's chronic nosebleeds? Why have several children in this household died in recent months? Why has this man become mentally disturbed? There is always a concrete presenting problem that requires the shaman's interpretive skills. There are several methods of divination to answer these questions.

The most common method of divination is to cast the split horns of a water buffalo. These horns are among the shaman's most important tools; they are the two tips of horn, 6 to 10 inches in length, that have been split lengthwise, producing a convex and a concave side. They are thrown in the manner of throwing dice, while the shaman specifies what it will mean if they land in particular positions. Since this method is considered rather a technology than a mystical state or communication with spirits, a shaman may be able to consult the horns without going into a trance.

However, the central task of the shaman's repertoire is passing through the permeable barriers separating the visible world of humans and the invisible world of the spirits. Only the shaman is equipped to do this, by the years of training following the brush with death and close encounter with spirits—good and evil—that singled him out for a lifetime of these engagements. However experienced he may be, it is an ordeal every time he approaches that invisible world. Covering his face with a black cloth to create a state of sensory deprivation, and accompanied by the hypnotic drumming of an assistant standing close behind him, the shaman sits on his "horse," clutching the sword with which he fights the demons on behalf of the sick. He rocks, chants, and drums the earth with his feet until, after two or three hours of uninterrupted labor the pounded earthen floor bears the marks of his effort. At some point the familiar spirits who aid his entrée beyond "bite" him, or so the achievement of what may be a trance state is described. From this point on, observation cannot follow; the Hmong in attendance watch the visible signs of the invisible struggle going on out of sight. The shaman may leap off the bench, sometimes assisted by the drummer, in order to enlist friendly household spirits cowering in the rafters in the struggle against the invader. If the fight gets very intense, the shaman may be pulled off his horse into the ashes of the firepit, breaking household furniture in the fall (Heinz 2000, 110–115). He leaps up, hurling his sword at the vanquished spirit, who retreats out the door.

Once the central drama of the fight is over, the patient, the family, and the house must be fortified against further onslaughts; for the offending spirit has not gone far. It may still be in the vicinity, looking for an opportunity to reinvade. Further chanting encourages the protecting household spirits to take courage, return to the beams, altar, and firepit where family life is lived, and reassert their protective functions. The patient must be fortified with strings at neck, wrist, and ankles that bind his soul to his body. The patient must be given a temporary disguise for protection from the vanquished

spirit, possibly an *X* in lampblack on his forehead. Offerings of chicken or pig are made to feed the household spirits newly restored to their posts; the family shares in this feast, eating the flesh as the spirits eat the spirit of the offered animal. The family then pays the shaman the price that was agreed to in advance.

The Hmong shaman may engage in other rituals on behalf of his family and community, either during crisis points such as illness or at annually marked points such as Hmong New Year. But most of these additional ceremonies are performed by Hmong heads of household and do not require the expert services of the shaman.

It is perhaps surprising that there is not more information about Hmong shamanism, given the prominence of Hmong in the United States since the Vietnam War and the well-known fact that they have brought shamanism with them. There are several excellent films and a scattering of descriptive accounts, but they leave some interesting questions unanswered. How much variation is there in Hmong shamanic practice among the scattered Miao groups of China, the Hmong groups in Laos, Thailand, and Vietnam? What relationships exist between Hmong and other shamanic traditions in China and Southeast Asia? What is the inner experience of the encounter with the spirit world for the shaman? What is the phenomenology of the shaman in training who warily approaches wild and dangerous spirits and seeks familiar spirits? These questions await further exploration.

INDONESIAN SHAMANISM

Indonesia comprises a vast archipelago inhabited by over 200 million people divided among several hundred ethnic groups speaking a simi-

larly large number of distinct languages and dialects. Most Indonesian languages belong to the Austronesian language family, as do those of the Philippines, Polynesia, Micronesia, and parts of mainland Southeast Asia. Related to this common linguistic heritage, one encounters general similarities of culture and local social organization, not just within Indonesia, but between Indonesia and neighboring regions. Indonesian societies are organized mostly on the basis of bilateral kinship, that is, a system that does not form clear-cut descent groups. However, communities with unilineal clans (patrilineal or matrilineal) are found in the Batak areas of north Sumatra, in west Sumatra (Minangkabau), and in various parts of eastern Indonesia (the Moluccas and Lesser Sunda Islands). Moreover, locality can play an important part in systems of exchange and alliance between specific social groups, even where communities comprise corporate clans; and the household is a major locus of sociopolitical, economic, and religious life in all parts of Indonesia. Particularly in eastern Indonesia, although also in northern Sumatra, households or other social units tend to be linked in enduring affinal alliances (relationships through marriage), predicated on a categorical contrast of wife-givers and wife-takers (those groups from which the bride comes and those who receive the bride) and involving a preference for marriage of a man with a woman related through his mother.

Owing to its size and diversity, it is difficult to generalize about shamanism in Indonesia. If one employs a broad definition of shamanism, forms of shamanic cosmology and practice can be found in most parts of the archipelago, where they figure as important components of local, indigenous religion. Shamans occur in both small and large cultural groups (for example, among both the Huaulu of Seram Island, who number less than a thousand, and the Javanese, with a population of about a hundred million), and among complexly organized cultivators as well as more simply organized food collectors. Western parts of Indonesia especially have been affected by the introduction of Hindu-Buddhist ideas and later by Islam. A variety of Hindu religion is still encountered on Bali, and Islam is now the majority religion in most of the other western parts of Indonesia. In eastern Indonesia, the majority religion is Catholic or Protestant Christianity, effectively introduced mostly during the last hundred years. All of these external religious influences have affected Indonesian shamanism, as have a variety of changing social, political, and economic developments. Nevertheless, adapting to these changes, shamanic practices continue as a component of local religious traditions, maintained even by people who have converted to Christianity or Islam.

Throughout Indonesia, shamanism is bound up with a belief in a human "soul" that is able to separate from the body. Thus, shamans are often represented as sending their own souls on a journey, on behalf of a client or the entire community. Typically, they do so as a means of dealing directly with harmful forces, including malevolent spirits. On the other hand, Indonesian shamans are regularly charged with retrieving other peoples' souls, which have wandered far from the body or become lost or captured by malevolent beings, resulting in illness or other misfortune.

The older literature gives the impression that spirit possession, mediumship (in the sense of channeling spirits through incorporation), and "trance" are general characteristics of shamanism in western Indonesia, while shamanic practices and ideology in eastern parts of the archipelago (and perhaps especially in the southeastern islands) are represented as incorporating different principles and procedures. This contrast, however, is by no means absolute. For example, among the linguistically western Iban (who reside both in Malaysian Sarawak and Indonesian Borneo, or Kalimantan), shamans are neither possessed by spirits nor do they serve as passive mediums. Also, while disassociation (or "fainting") figures in some shamanic rituals, it is not essential to Iban shamanism in general (Graham 1987, 2; Sather 2001, 11–12). Contrariwise, in eastern Indonesia, possession by spirits is part of shamanic representations among the Huaulu of the Moluccas (Valeri 2000, 29, 286), while dissociation, as a critical means of interacting with spirits of the dead, and even intervening on behalf of living persons who are near death, occurs in particular ritual contexts in both Sumba (Forth 1981) and Flores (Forth 1991).

If the idea of spirit possession accompanied by controlled dissociation (or trance) largely characterizes shamanism among the Javanese,

the Balinese, and the Malays of Sumatra and the Malay Peninsula, as Richard Winstedt suggested long ago (1947, 24–25), this may reflect the influence of Indian (Hindu-Buddhist) religion. At the same time, among the non-Hinduized Karo of northern Sumatra, one encounters female spirit mediums who are possessed by "wandering spirits" (Steedly 1989, 140–142); mediums practising possession are also reported for the neighboring Toba Batak (Vergouwen 1964, 70). Nevertheless, throughout Indonesia, more widespread than the notion of possession by spirits is the representation of voluntary and controlled soul travel, which may or may not be associated with trance or some other special mental state (such as sleep and dreaming). In accordance with the relative absence of possession as a dominant value, the notion of the shaman as someone plagued and made ill by spirits that he or she subsequently overcomes and masters in the service of the community appears not to be a common idea in Indonesia.

The status of shaman is generally not ascribed or hereditary, although in stratified communities the shamanic vocation may be associated with a particular social rank—typically not the highest. Among some groups, shamans are mostly or exclusively women (as for example among the Karo; see Steedly 1989), whereas in others they are predominantly men. As in Siberia, male shamans occasionally assume female gender attributes or roles, but transvestite shamans appear to be rare even in the societies where they are known (see Graham 1987, regarding the Iban *manang bali*).

Becoming a shaman is usually a matter of individual talent and inclination. In some societies, it is usual for an aspiring shaman to serve a period of apprenticeship with one or more established shamans, followed by a rite of initiation. All this typically occurs after the individual has entered into a relationship with a spirit; among the Iban such spirits serve as messengers, complementing the journeying of the shaman's own soul in dealings with the spirit world. Among the Nage of central Flores, such a spirit may approach a person, or the person may deliberately go in search of a spirit patron in order to gain special powers. After passing a series of tests and surviving frightening ordeals, the individual may then experience a period of derangement, emerging as a full-fledged mystical practitioner (*toa mali* or *ana mata da*). If such a power seeker fails the tests set by the spirit, he may instead be transformed into a witch. In this regard, it is noteworthy that detecting witches and countering their nefarious activities is probably the most important function of the traditional Nage shaman (see Forth 1991, 1998).

Among the Karo of Sumatra, where women become shamans following possession by a male spirit, this relationship may be formalized as a marriage, the familiar spirit then becoming the shaman's husband. Traditionally, Karo female shamans were subordinated to male priests who, unlike the former, gained control of spirits through a period of training and apprenticeship and took the lead in rites in which the female shamans became possessed (Steedly 1989, 140–142). In the Karo idiom of asymmetric marital alliance, male priests further established control over the spirit husbands of the women as higher-ranked wife-givers. Comparable distinctions involving gender are encountered in other Indonesian communities. For example, among the Nage of Flores, uncontrolled dissociation is a tendency of certain women who, while in this state, typically encounter the souls of people near death or recently deceased. In contrast, Nage male shamans do not engage in trance, but deal directly with spirits through soul travel effected by controlled dreaming. Similarly, among the Toraja of central Sulawesi, male priests, who do not themselves engage in trance, take the lead in "a ceremony of mass or community possession" in which all participants may fall into trance (Crystal and Yamashita 1987, 66).

The use of drugs to alter consciousness is not reported in Indonesia. Common shamanic techniques include dancing and chanting, sometimes to musical accompaniment, which may produce a special mental state in both practitioners and their audience. Especially in the practice of prophecy and clairvoyance, or as an aid to divination or diagnosis, Indonesian shamans may employ quartz crystals, stones, hens' eggs, and plant materials. At the same time, shamans may be credited with special powers of vision in their own right—as suggested by the Nage name *ana mata da,* "[people with] clear eyes." Particularly where a special poetic idiom is employed, the language of shamanic chanting—in which the shaman for example describes a journey undertaken into

the realm of spirits—can form an important part of shamanic ritual, as Clifford Sather has recently demonstrated in his study of the Iban (2001). In other societies as well, shamans employ special forms of speech when dealing with spirits, which may comprise elements of neighboring languages or what is represented as a special language, unintelligible to other people. In contrast, among the Nage of Flores, speaking of any sort does not play a significant role in shamanic ritual, although Nage female trancers, upon regaining consciousness, do report their experiences in the realm of the dead.

Indonesian shamans sometimes wear special clothing while engaged in ritual. This may include a special headcloth; also reported is the practice of painting the body with special designs. Among the Nage of Flores, where shamanism is a largely private and almost surreptitious practice, there is the idea that shamans can be identified by the possession of a long beard (Forth 1998, 284), yet this physical feature is not in any way crucial to the status. Indonesian shamans commonly operate at night; but whether their performances necessarily take place inside a special building, enclosure, or other location is variable.

Among the commonest functions of Indonesian shamans is diagnosing and curing illness and affliction. Curing is often effected by recovering lost souls, or by confronting malevolent spirits, even engaging them in combat and killing them. Also regularly included in the shaman's repertoire are divination through communication with dead relatives or other spirits, identifying witches, finding lost or stolen objects, prophecy, and guiding recently deceased souls to the land of the dead. Individuals or groups of shamans may also lead in major collective ceremonies, including agricultural rituals and other rites of a calendrical (as opposed to critical) nature. Although all these tasks can be carried out by a single kind of practitioner, sometimes shamanic functionaries subserve a single kind of function. For example, in eastern Sumba the *papanggangu,* hereditary retainers of a high-ranking noble person, characteristically fall into trance at their master's (or mistress's) funeral. Representing various aspects of the dead person's soul, the souls of the retainers are thought to travel with the soul of the deceased to the land of the dead (Forth 1981, 198–199). Among the eastern Sumbanese, this is the only instance of ritual activity that can clearly be identified as shamanic. Even so, the function of these mortuary trancers is identical to that of psychopomps, or what have been called soul guides, in other Indonesian societies.

When curing illness, Indonesian shamans may counter spiritual agents of illness by removing these from a patient's body. As in other parts of the world, shamans on the island of Flores are adept at manipulating material objects identified with these afflicting forces. The objects may take the form of pieces of stone or wood, sand, or small animals such as insects, worms, or snakes (Forth 1991, 8–9). Since illness may alternatively be diagnosed as deriving from a person's soul having wandered from the body, Flores shamans may on the other hand retrieve the soul, also in the form of a small animal, and by way of a manipulation appear to replace it inside in the body. (Among the Iban of Borneo, a seed is used to represent a returned soul.) In curing, shamans may additionally employ non-shamanic therapies such as massage and material medicines.

Shamans usually act on behalf of an individual, that is, a single patient. They may also perform rites for the benefit of a group or the entire community. Shamans often operate individually, but either a pair of shamans or a larger group may cooperate, especially in larger ritual undertakings. Indonesian shamans usually coexist with other religious specialists, including priests and magicians, as well as with lay healers employing purely medicinal or manipulative remedies. Also, a person may occupy these other statuses simultaneously with that of shaman. In fact, rather than viewing shamanism as a discrete set of practices exclusive to a particular sort of specialist, it is generally more useful to view shamanic activity and ideology as one component, albeit often a major component, of the total spiritual life and practice of a community. Some Indonesian societies, moreover, recognize more than one kind of shamanic practitioner. For example, in southern Borneo, the Luangan distinguish shamans as *balian* and *wara,* according to whether they are concerned with matters of life or death (Weinstock 1987). A single individual may function in both capacities, although at present women are forbidden from serving as *wara,* or "death shamans." (Luangan men also predominate among the

balian.) Conversely, among the Iban, shamans, who are normally men, are distinguished from "soul guides"—women who function solely in the context of funerals, when they guide deceased souls to the afterworld (Sather 2001, 8–9). Interestingly, whereas Iban shamans sometimes go into trance, there is no mention of this with regard to soul guides, whose souls, like those of shamans, are also thought to leave their bodies. This pattern, then, appears to reverse what is found among Nage male shamans and female trancers, who like Iban women can similarly serve as soul guides.

In parts of eastern Indonesia (notably the Lesser Sunda Islands), shaman practice is often peripheral to the religious and ritual life of the community, and shamans are generally subordinated to priests and other sorts of ritualists, as well as to political leaders. In contrast, in more westerly parts of Indonesia—at least where Islam or Otherworld religions do not predominate—shamans appear to be socially more central. Indeed, sometimes community leaders are themselves shamans. Describing the Meratus people of southeastern Kalimantan (Indonesian Borneo), Anna Tsing notes how many leaders are successful shamans, while those who are not "at least develop close working relationships with key local shamans" (1987, 204). In a similar vein, Jane Atkinson interprets shamanic ritual among the Wana of Sulawesi as informing and establishing political authority (1989). In fact, it may be in regard to the social location of shamanism, and the relation between spiritual and political power, that one encounters the most significant variations in shamanism among different Indonesian communities, rather than in regard to the occurrence of trance or beliefs in spirit possession.

JAVANESE SHAMANISM (INDONESIA)

The Javanese are the largest ethnic group in Indonesia. They inhabit the central and eastern parts of the island of Java (pop. 110 million), the western portion being the homeland of the culturally related Sundanese people. With its long history and diverse social structures, Java does not lend itself to generalization. Nevertheless, it would be fair to say that the figure of the shaman, in the classical sense of an embodier and master of spirits, a voyager on soul journeys, hardly exists in Java as a distinct social type. Curers, midwives, and magicians may call upon supernatural aid, but very few incarnate their spirit helpers. Nor, in the highly contested, pluralist arena of Javanese religion, is there a distinct shamanic worldview. Shamanic voices must compete with Islam, Sufi- and Indian-influenced mysticism, Indian mythological heroes, and village cults. Nevertheless, features associated with shamanism—spirit possession, mediumship, the ritual use of trance, curing based upon soul recovery, and not least the parade of spirits in dubious public entertainments—are widely found in rural and urban settings. Generals and presidents, merchants and peasants, all alike have occasional recourse to the spirit world through the services of a specialist.

Historical Background

The inconspicuous, residual role of the shaman in Javanese society needs to be seen against a complex cultural history. Little is known about popular belief in the Hindu-Buddhist period, though there are hints of shamanic practices in literary sources. The Islamization of Java, which began in the late fourteenth century, was gradual and uneven. The north coast has been, and remains, closer to Islamic orthodoxy; the inland agrarian states, officially Muslim from the sixteenth century, maintained a more syncretic form of Islam, tolerant of pre-Islamic beliefs. Away from the centers of orthodoxy, popular religion remained an unstable mix of Islamic, indigenous, and Indic elements. Religion in contemporary Java reflects this checkered past; and its diverse strands, competing and often politicized, have taken different views of local traditions. In areas where modernist Islam is strong, spirit cults, trance dances, and the like have been suppressed as polytheistic and un-Islamic; elsewhere such practices may persist, with the connivance of traditionally minded Muslims. Some pious Muslims themselves become magical specialists, though they emphasize the use of Arabic prayers over Javanese mantras.

Practitioners

The generic term for the ritual practitioner is *dukun.* Many dukuns specialize as midwives, numerologists, or diviners. But when a practitioner is described simply as a dukun, without further specification, he—most are male—can be assumed to possess a range of skills, including curing, divination, exorcism, love magic, and (counter)sorcery (Koentjaraningrat 1985: 410–426). One becomes a dukun through apprenticeship (often with a relative), study of esoteric manuals, ascetic retreats, and at the invitation of spirits. Such people may be important, respected members of the rural village community. Equivalent figures—often referred to as "wise persons"—can also be found in white-collar professions and government circles.

Dukuns diagnose illness through calendrical divination, dreams, meditation, and supernatural revelation. Their prescriptions range from herbal remedies, ritual baths, prayers, and ritual meals, to charms against sorcery. A standard treatment is to have the patient drink water over which mantras have been recited. A minority of general dukuns also possess the facility of contacting spirits while in trance. At some stage in their careers, they have been afflicted or possessed by a powerful spirit. Having recovered from this crisis, often by accepting their vocation, they are able to call upon the spirit or spirits to help them. The relation is one of collaboration rather than mastery.

Firsthand anthropological accounts being scarce, an example from the author's fieldwork in Banyuwangi, an area in East Java famous for its magic, may serve to illustrate the nature of

the dukun's practice. A séance was held one night in a shrine dedicated to a village guardian spirit—a legendary nobleman-exile from Central Java. The dukun, a shrine caretaker, announced his presence with the Islamic greeting, then entered and laid flowers on the stone altar, embracing in turn the stones of the spirit and his wife. He burned incense and then clapped the ground and began springing about, showing that he had been entered by the spirit *(kasusupan).* The supplicant, a young unmarried man, crouching in darkness, put his questions to the spirit. "Will my application to be a civil servant succeed, Sir?" In a hoarse voice the spirit admonished him to give up gambling, promising success would follow. The man asked why his other enterprises had failed and who was thwarting his efforts to woo a village girl. The spirit named his rival and told him to look for magical substances planted near his house, promising to provide a charm to protect the house from further mystical attack. Later the voice of the dukun changed in tone, signaling the arrival of another spirit—a relative of the first. Before departing, the spirit requested cigarettes and flowers, which were placed on the altar; then an assistant tapped the dukun three times on the fontanel (the soul's point of entry), and he came out of trance.

Aside from such semiprofessional dukuns, whose shamanship may be a minor sideline, from time to time lay persons receive the call. Such *dukun préwangan* or *dukun kamomong* (Weiss 1977, 353) are often female, usually lower-class and poorly educated. Unlike the classic Siberian shaman, they appear to be passive vehicles of the possessing spirits. If they are chosen it is because—like most other victims—they are "empty," lacking in wisdom and spiritual resistance. (A political reading would, of course, attribute agency to the medium rather than the spirit.) While the inspiration lasts they keep open house, seeing many clients in a day. The spirit familiar—sometimes a deceased relative—may be required to diagnose the cause of illness (e.g., sorcery or inadvertent disturbance of a spirit's home), the location of a stolen ring, or the cause of misfortune. The medium's spouse or assistant is on hand to feed the spirit incense and maintain trance, interpret the medium's cryptic speech, dole out medicines, and collect payment. Different again, a *dukun tiban,* rather than being possessed by a dead soul, receives power or illumination *(wahyu)* from the spirit world *(alam antara)* or God. Clifford Geertz gave a vivid picture of one such practitioner and of the frenetic, unpredictable style of her consultations with clients (1960, 101–102). He contrasted the unstable personality of the dukun tiban with the apparent "normality" of the ordinary dukun. Those who have made adopting a shamanic role a regular part of their lives, as in the Banyuwangi example, are in a sense in between: They carry on normal lives as farmers, artisans, and good villagers, but their shamanic performances lie outside normally acceptable behavior. The apparent loss of control, the consorting with rough spirits, and the taint of black magic offend Javanese values of social harmony, balance, and decorum. Consequently, their séances tend to be regarded with awe or disdain rather than approval.

As elsewhere in the world, belief in spirits and in the possibility of contact with them is tempered by skepticism about particular practitioners. The most powerful dukuns are in the next-but-one town or village (therefore their clients, especially in serious cases, are often strangers); one's own neighbor one knows to be an incorrigible fraud. Partly because of their ability to do harm as well as good, many dukuns have an ambiguous reputation. This does not, however, imply a negative evaluation of magical or spiritual efficacy in general. The rulers of the Central Javanese principalities, the acme of Javanese civilization, derive some of their prestige from an intimate relation with powerful spirits. The sultan's matrimonial alliance with the spirit queen of the Southern Ocean safeguards the prosperity of the realm (Jordaan 1984). Similarly, in a cult described by Woodward (1985), a respected healer acted as master of powerful spirits, operating through mediums rather than personally incarnating the spirits. The manner of contact and the eminence of the spirits involved evidently reflected upon the practitioner's status.

Elements of Shamanism

There is no distinctive shamanic cosmology or worldview; rather one can speak of a range of syncretic practices and beliefs that may gain shamanic formulation in ritual. Shamanic séances and healing sessions draw upon concepts and techniques with a wider currency in popular culture. Among these are the following:

1. Notions of divine power as a formless energy *(kasekten)* diffused in the world yet concentrated in certain places, persons, body parts, and objects such as heirlooms. Power can be accumulated through ascetic practices and manipulated in spells (Anderson 1990).
2. Belief in spiritual beings: ancestors, village founders, sprites and demons, place spirits (of fields, caves, graveyards). A person has four spiritual "siblings" *(dulur papat)* associated with the placenta, amniotic fluid, and other birth products. These personal guardians are propitiated in household rituals and are the focus of mystical attack or shamanic recovery.
3. Notions of spirit doubles, dual presence, and transformation into wild animals. As elsewhere in Southeast Asia (Wessing 1986), some practitioners claim to be, or are alleged to be, weretigers or to have tigers as their spirit familiars. In this form they can either abduct victims' souls or recover them from the forest/spirit world.
4. Belief in possession or affliction by spirits as a cause of illness and madness.
5. Techniques that facilitate contact with the spirit world: drumming, incense-burning, meditation, fasting and sleep deprivation, chanting of mantras, concentration on ritual objects.
6. Belief in the interpenetration of the visible and invisible worlds. The spirit world is not simply *other;* it underlies and mirrors the everyday world. Just so, a person has a visible material presence and a subtle self, which can be contacted through esoteric ritual, meditation, or trance. The spiritual and refined *(alus)* is the complement and counterpart of the worldly and coarse *(kasar).*

These concepts frame encounters with the spirit world, whether one is a healer, medium, mystic, or householder staging a ritual meal. One communicates with the spirits *(wong alus)* through the refined, powerful language of spells and Arabic prayers and by means of symbolic offerings of food whose essence is borne by incense. The symbolism gains its force from correspondences between material and spiritual realities.

Unmediated contact with the hidden sources of power can be dangerous. As dukuns are fond of relating, the uninitiated can become temporarily insane or may even be struck dead as a result of unwise dabbling or improper skepticism. Those who seek spiritual enlightenment or power must first undergo preparation in asceticism and meditation. Spells and ritual actions function both to conduct power and to protect the supplicant. And much ritual work goes into shielding the weak from hazardous contact. Sick people, young women, infants, and the very old—unless fortified by *èlmu,* Javanese science—are especially vulnerable to spirit intrusion.

Related Phenomena

If the classical shaman is a rare, secretive figure in Java, elements of the "shamanic complex" can be found in many public settings. In the sacred *seblang* dance of Olehsari, East Java, it is not the master of spirits who goes into trance but the dancer, a young girl, who is animated by a succession of local spirits. Similarly, at the climax of the *barong* show of the same area, the dukun entrances a masked man whose animating spirit is the weretiger village guardian (Beatty 1999). In neither case does the possessed person communicate verbally with the audience: The ambiguous meanings of the performance are evident in symbolism and narrative structure. Elsewhere in Java spirit possessions may form part of the annual village cleansing rites. There are also popular entertainments, such as hobbyhorse dances in which men fall into trance at the crack of a whip and prance about or chomp grass like horses.

Mysticism, widely practiced in rural and urban Java, has, in the past, incorporated magic as well as the quest for divine power. In certain respects spirit mediumship parallels mystical practices in which adepts "die in life" and transcend their worldly form in union with the godhead. They "return" from these altered states to report their experiences to fellow adepts. This is not to say that mystical ecstasy or gnosis is the same as shamanic trance: The one is inward-looking and calm, the other a violent encounter with the spirit world "outside."

MALAY SHAMANS AND HEALERS

Malays, practitioners of Hinduism for a thousand years before converting to Sunni Islam in the fifteenth century C.E., make up more than half the current population of Malaysia. They are speakers of Bahasa Malaysia (Malaysian Language, sometimes known as Bahasa Melayu, Language of the Malays), a Malayo-Polynesian dialect similar to Bahasa Indonesia. Although Malaysian cities have been growing at an increasing rate, Malays living in small villages *(kampung),* particularly on the east coast, still follow many traditional medical theories and practices. Malay healers are known, generally, as *bomoh,* but in the northeast states of Kelantan and Terengganu shamanistic specialists also treat "sickness of the soul" through ceremony, singing, dancing, and, in trance, becoming the voice of disembodied spirits.

Malay shamanism has attracted the attention of foreigners for more than a hundred years. The Malay spirit-raising séance first appeared in Western literature in the late nineteenth century as "demon worship" and "downright heathenism" (Maxwell 1881, 12; 1883, 222) and later, in 1925, as "gracious and beautiful" perhaps, but the product of "primitive minds" (Winstedt 1951, 14) lacking conceptions of unity and abstract thinking. By mid-century, Western opinion regarding Malay shamanism had evolved from considering it an example of the "black art" to examining psychotherapeutic elements in what was regarded as an essentially magical enterprise (Chen 1979). Although parallels were drawn between many cosmologies and psychoanalytic formulations, Western psychiatrists continued to believe that the work of the shaman could be compared to psychiatry only in the same way comparisons were made "between alchemy and chemistry, or between astrology and astronomy" (Prince 1980, 335). In recent years, Islamic leaders' religious objections to the shaman's practices have become increasingly strenuous. Contemporary Malay shamans, however, regard their work in quite a different manner. In fact, they claim it is the oldest kind of medicine, dating back to the time of Adam and Eve:

> In the days of the Prophet Adam (said one shaman), Eve was sick. Adam looked for medicine but he couldn't find any. Then he looked for a bomoh and he found one. Then he asked the bomoh, "Do you have medicine to treat Eve?" This is what the bomoh said, "I have medicine for everything!" He brought over a hand drum, he had a spike fiddle. Adam asked what those things were. "This is a bowl for medicine," he said, pointing to the drum. "This is a medicinal herb," he said, pointing to the fiddle. Then he treated his patient—he played. After he played Main 'teri, Eve was cured. When she was cured, then God said, "I can't afford to keep this bomoh around. It would be better if I send him to a cave. If I don't, no one will ever die, none of the followers of Muhammad." So he entered the cave and he is still living there. Its name is even older than that. When God made Adam he was just a lifeless image. God called Gabriel and breathed into his hands. He told Gabriel to fly over to Adam's image and put the breath up his nostrils. Adam sneezed, and the breath traveled all over his body. His body was too weak for the breath, and it broke into little pieces. God told Gabriel to weld *(pateri)*

> it back together, to make a whole. That's why it's called Main 'teri. When we do it, we weld people together, we make sick people well. (Laderman 1991a, 6)

Malay bomoh, most of whom never trance, treat many kinds of illnesses, using herbs, dietary changes, massages, and other, often humoral, treatments, as well as reciting spells. If a satisfactory response is not achieved, it may be necessary to hold a Main Peteri, a shamanistic healing ceremony that includes a *tok 'teri* (shaman) who achieves trance and speaks for the spirits, a *minduk,* who plays the spike fiddle, acts as interlocutor, and joins in singing with the shaman, and a player of floor gongs (often merely overturned pots); occasionally other instruments, such as the *serunai* (oboe) and hanging gongs, are added. This involves substantial expense, since a patient's family must provide a feast and pay a fee to each performer, as well as distributing refreshments at the close of the night's proceedings to an audience of friends, neighbors, and relatives who have come to offer moral support and be entertained.

Malay shamans differ from other bomoh in their breadth of knowledge and style of treatment. While many other healers insist on secrecy and rote recitations of incantations, shamans are concurrently or formerly performers in the shadow puppet play *(wayang kulit)* or Malay opera *(Mak Yong)*—or both. In their view, the power of words lies in their contextual meaning rather than in their inflexible recitation. What is essential to the shamanistic ceremony is that the shaman and minduk be in harmony with each other and with the patient. Students of shamanism are taught that what may appear to an outsider to be possession by and exorcism of external spiritual forces is not nearly as straightforward as it seems. The Main Peteri takes place within the Self. The minduk's invocation not only invites the spirits to the séance, but recounts the story of Creation—a double creation, of the universe and of humanity, the universe in microcosm. The mountaintop of which he or she sings is not merely the haunt of powerful genies; the healers, the patient, and the audience all know it refers as well to the human head. During this invocation the minduk recounts the role of the father in producing a child. The baby begins as a small entity in the brain of the father and lives there for forty days, absorbing human rationality and emotions, before being placed in the mother's womb.

Following the invocation, the shaman achieves trance, aided by the minduk's song, which raises the shaman's Inner Winds, the personification of his talent. While in trance, the shaman invokes forces within the human body and mobilizes them to help maintain and regain health—a kind of spiritual immune system. After the divination that follows, a series of spirits *(hantu)* appear, speaking through the shaman in a dialogue with the minduk, and occasionally with the patient and members of the audience. These spirits are believed to be external to humanity; their attacks are ineffectual unless the victim's own vital forces have been depleted by illness, overwork, shock, or fright. During the Main Peteri, the patient as well as the shaman may achieve trance. This is not a form of possession by external spirits; it is an outward expression of the inner workings of the personality, a sign that the Inner Winds have begun to blow freely within the patient's bosom.

The shaman does a divination, using the flame of a beeswax candle, or a handful of popped rice counted out as earth, air, fire, and water. A divination that points to any combination of earth, fire, or water may point to hantu (disembodied spirits) or genies as causal factors. They may have been sent by an enemy of the patient, or they may have come of their own volition, angered perhaps by the trampling of their invisible homes, or a shower of urine on their invisible heads. Although they are our older siblings, God didn't grant them the power of reason that makes us truly human. They are like children, easily flattered, cowed by threats, and caught in their lies by clever bomoh, whose insulting remarks make the human audience roar with laughter but elude the spirits' understanding. If an illness shows signs of spirit-connected etiology, the suspected spirits must be brought to the séance by the officiating shaman's own familiar spirits. The victim's humoral balance has been put awry by the spirits' airy heat. The minduk exhorts them to return to their origins and restore the balance within the patient and within the universe, whose integrity is threatened by their encroaching on humanity.

Complications can arise when the patient's birth sibling, as it is called, joins the hantu's attack. The afterbirth that accompanies the birth of each human child is the mirror image of the hantu. Both are incomplete: The spirits lack the earthy and watery elements of which our body is made, while the birth sibling never receives the airy and fiery breath of life that animates its human sibling when the baby takes its first breath.

A divination that includes air *(angin)* points to problems concerning the patient's inner winds. The inner winds, as understood by Malays, are close to European concepts of temperament, both in the medieval sense of the four temperaments, and as artistic temperament. Everyone is born with angin, the traits, talents, and desires inherited from ancestors, but some have more, or stronger, angin than the common run. If they are able to express their angin, they can lead untroubled and productive lives and, in fact, will often be respected for their strong and gifted characters. If they cannot, their angin may be trapped inside of them, where it accumulates and produces sickness due to blockage of the inner winds. Healers of all types must possess the wind specific to their calling, and they suffer when their talents are ignored. The meaning of inner winds extends as well to the basic personality. The majority of conditions treated by Main Peteri are *sakit berangin* (wind sickness), and the most prevalent are due to the thwarting of the personality type known as the Wind of the Young Demigod, Angin Dewa Muda, whose archetype is the hero of a story from the Malay opera. Those who have inherited this wind crave life's luxuries, both material and psychic, needing love and admiration as much as dainty foods and handsome clothes. Heirs to another wind, the Wind of the Weretiger, are quick to anger and heedless of its consequences, unable or unwilling to control their anger and hostility.

People with gentle winds run little risk of wind sickness. Strong winds will not harm their possessors if they can be expressed in ways that satisfy the individual and enrich the community. If they cannot, their angin is trapped inside them where it accumulates, unbalancing the humors and causing disharmony within the person. The symptoms of wind sickness include backaches, headaches, digestive problems, dizziness, asthma, depression, and anxiety; in short, a wide range of what we call psychosomatic and affective disorders. Asthma in particular represents a graphic example of repressed angin—wind locked within, choking its possessor.

The inner winds of a patient in the Main Peteri who has been diagnosed as suffering from sakit berangin must be allowed to express themselves, to be released from the confines of their corporeal prison, enabling the sufferer's mind and body to return to a healthy balance. After the hantu have been brought to the séance and exorcised, the patient afflicted with wind sickness is put into trance by means of appropriate music and the story of the angin's archetype, recited by the shaman. When the correct musical or literary cue is reached, the patient achieves trance, aided, as well, by the percussive sounds of the musicians and the rhythmic beating of the shaman's hands on the floor near the patient's body.

In shamanistic ceremonies whose primary aim is to remove demonic influence from human sufferers, the patient's trance is the peak moment at which the object of the demonic enters into direct communion with the entity that is possessing the patient (Kapferer 1983). For the Malay patient, trance doesn't occur during the exorcistic parts of the Main Peteri. The communication achieved by trancing patients is not with the demonic but with their own inner nature. While in trance, patients are encouraged to act out the repressed portions of their personalities until they feel refreshed and content. Entranced patients may sing and dance, perform the stylized moves and stances of *silat* (the Malay art of self-defense), or roar and pounce like a tiger. The relaxation experienced by patients after coming out of trance is profound. Headaches and backaches have disappeared, and asthma sufferers find they can once more breathe freely.

Patients in trance feel the inner winds as experiential reality rather than merely metaphor. At the height of trance, a person with powerful winds can feel them blowing inside the chest with the force of a hurricane. Trance, for a Malay, is never achieved by the use of drugs, either by the shaman or by the patient. It accompanies the music, singing, and dance of the practitioners, and, for the patient, the recitation of the story of the patient's own archetype.

Shamans have been said to provide remission without insight, or symptomatic relief rather

than a cure, in contrast to psychiatrists, who help patients form a better self-image, allowing them to cope with the world. Shamans' theories are conventionally thought to blame outsiders, whether spirits or humans. Malays, however, don't conceive of the séance as a cure, since inner winds are inherited and inborn, and, unless life circumstances of patients change, those with strong angin will always be at risk of accumulating too much unexpressed wind. The portion of the Main Peteri that attempts to heal the wounds of body and soul caused by thwarted inner winds is the sole method of nonprojective psychotherapy (that is, psychotherapy that does not involve projection of the difficulty onto an entity outside the patient) reported to exist within the context of a shamanistic séance. Perhaps a fresh look at shamanistic rituals in other cultures might reveal comparable constructs not yet fathomed, based on traditional knowledge of the human psyche.

Not all Malay healers are shamans. Other bomoh heal patients with medical treatments and incantations. Rather than dividing the causes of illness into natural and supernatural categories, they speak of usual and unusual sicknesses, a distinction based more on incidence than etiology. Usual health problems may be attributed to a number of causes: poor hygiene, bad diet, many intestinal worms (a small number is considered normal), overwork, worry, and changes in the weather that may upset the body's humoral balance. Belief in intrinsic heating and cooling elements (humors) of the microcosm, the human body, and the macrocosm, the universe, is a pervasive part of traditional Malay medicine. Humoral qualities of foods and diseases are not related merely to temperature; boiling squash is considered very cold, and alcohol, even if iced, is extremely hot.

Although villagers must travel for miles to see a physician, traditional healers are often readily available. The *mudin* treats broken bones and sprains. Obstetric and perinatal problems are the province of the *bidan* (midwife). Masseurs are in demand for muscular aches. Other usual problems are treated by patients and their families, often with the aid of a bomoh whose services are sought for both usual and unusual conditions. Bomoh are often experts in herbal medicine, as well as adepts of the spirit world.

Usual illnesses are often considered to be caused by humoral imbalance. They are treated through dietary changes that increase or decrease the heating or cooling elements, by ingestion or topical application of medicines, massage (thought to break up the lumps of cold phlegm that cause pain and keep the hot blood from flowing properly), and thermal treatments such as steam inhalation and cold compresses.

Illness are classified as hot or cold, using criteria that interpret symptoms through empirical evidence in the light of humoral reasoning:

1. External heat, such as fever or boils, hot to the touch.
2. Internal heat: illnesses that make the patient experience burning sensations, such as sore throat or heartburn.
3. Visible signs: hemorrhages demonstrate that the hot element, blood, has boiled over.
4. Deficiency or excess of a humor deduced from internal evidence: that is, anemia (not enough blood), or hypertension (blood rising to the head, overheating it).
5. Pulse reading: fast denotes heat, slow denotes cold.
6. Some forms of madness due to overheating of the brain.
7. Response to treatments classified as hot or cold, indicating illnesses have the opposite humoral quality. (Laderman 1983, 50–51)

Illnesses that do not respond to typical treatments are often blamed on incursions from the spirit world and must be treated by other means. Malays believe in a four-fold universe composed of the elements of earth, air, fire, and water. Spirits, lacking the earthy and watery components of fleshly bodies, consist only of superheated air. They were created, bomoh say, owing to the curiosity of the archangel Gabriel. God blew the breath of life into Gabriel's hands and ordered him to place it near Adam's nostrils so that his lifeless body, made of earth and water, might be animated. Gabriel, wanting to see what the breath looked like, opened his hands as he flew toward Adam, and the breath escaped. Having no body to receive it, the breath became *hantu,* the disembodied siblings of humankind. Like all siblings, hantu are sometimes beset with feelings of envy toward their broth-

ers, and like human siblings, they occasionally find ways to even the score. By blowing their hot breath on a victim's back, they upset his humoral balance.

Treatment involves increasing the cool and moist elements and ridding the body of excess heat and air. Bomoh employ "neutralizing rice paste," made of earthy and watery elements, recite spells *(jampi),* blowing their magically cooled breath on their patients' backs, and bathe them in cooling water. Healing, for Malays, concerns treating not only a body that is born and dies, but also a soul *(roh)* that lives on in heaven or in hell. The Malay person consists, too, of the breath of life *(nyawa),* which animates all God's creatures, the spirit of life *(semangat),* which pervades the universe, dwelling within fire and rock as well as plants and animals, and the inner winds (*angin*), which determine the individual personality, drives, and talents already present at birth. The presence of these winds can be deduced from the behavior of their possessor, but they are palpable neither to observers nor to their owner, except during trance, when they are felt as actual presences: high winds blowing within their possessor's breast. A whole, healthy person normally has little to fear from hantu, but, should an imbalance of component parts occur, whether due to depletion of semangat or accumulation of angin, the integrity of the person is breached, his "gates" no longer protect the "fortress within" but have opened to allow the incursion of disembodied spirits. The bomoh aims to return the patient to a state of balanced wholeness.

One bomoh's performance of healing began with an examination (Laderman 1991a, 44–48). He felt the pulse at his patient's fingers, wrists, inside the elbow, at the shoulders, ears and toes, to ascertain the source of a persistent fever. He then asked his assistant to chew a betel quid and spit into a cup. The saliva, red and frothy, formed patterns in the cup, which the bomoh divined as pointing to a path his patient had traveled, into a kampung (village) recently claimed from the jungle. The patient had neglected to ask permission from the hantu before intruding on their land. The bomoh cut the saliva with a knife, destroying the picture within. He dipped a leaf into the liquid and painted two crossed lines on the patient's forehead, red circles around the ears, the shoulders, elbows, wrists, knees, and ankles, causing the hantu's heat to descend, exiting by way of the toes. Seated behind the patient, he recited a jampi, blowing his supernaturally cooled breath on the patient's back to counteract the hantu's hot breath. Then he prescribed two kinds of cooling herbal mixtures, which he compared to vitamin pills, valuable for renewing the patient's strength and appetite. Before he left, the bomoh filled a pail with water to which he added lime juice, reciting an incantation, and recommended his patient bathe in the treated water. His treatment was complete; both the symptoms and their underlying cause had been dealt with.

During pregnancy, through childbirth, and until the end of the forty-day postpartum period, Malays rely on the midwife (bidan). Each kampung has its appointed trained government midwife and several traditional midwives. Although the latter are termed *untrained* due to their lack of formal education, they have been apprenticed since childhood to older midwives: mothers, aunts, grandmothers. Women suspect pregnancy when their breasts ache, their faces turn pale, they crave sour foods, and their periods cease. But before conception takes place in the mother's womb, the father has been pregnant for forty days. Men remember craving foods shortly before their wives began to exhibit signs of pregnancy. The baby begins life not as a creation in the mother's womb, but as an essence, not merely an idea, in the father's brain. Humanity is formed of the four elements and partakes of animal nature, but human beings also possess rationality, which makes humans higher than angels. Although both men and women have both rationality and animal nature, developed states of self-control are associated with men, while the body's emotions and hungers are associated with women. What better source is there for a baby to develop its distinctively human characteristics than in its father's brain?

Although a bidan may be informed of a suspected pregnancy, she cannot feel the presence of a fetus until the third month. She can relieve stomachache, backache, and aching legs by massaging the mother and adjusting the position of the fetus. If a mother-to-be has fallen or been beaten, she may come to the village bidan to be reassured that the baby inside is still healthy. In the seventh month of pregnancy,

the mother and her family will present the bidan of their choice with several dollars and a betel quid for her to chew, which is meant to reserve the bidan's assistance during childbirth. For a first pregnancy, special rites are performed to ensure ease of labor and safety of delivery. Many clients today request that Islamic prayers and ablutions be substituted for traditional forms; in the 1970s and 1980s, however, it was still possible to witness a full-scale *lenggang perut,* a rocking of the pregnant abdomen (Laderman 1983).

Seven cloths of different colors were placed on a mat, and the mother-to-be, after removing all clothing except for her sarong, lay down atop the cloths. After the bidan examined her abdomen to determine whether the baby was positioned properly, head down and body vertical, she and the pregnant woman's mother, sitting on either side, tied each cloth in turn loosely over the woman's belly, rocked her gently, untied the cloth, and pulled it out from under her. Each release of a cloth signified the release of the mother from spiritual danger. Then, one after the other, the bidan rolled three plants across the pregnant belly: palas leaves, used to tie rice seedlings; leaves of the areca palm employed to brush noxious spiritual influences away; and a joint of bamboo, one end open and the other closed, a duplicate of the womb's anatomy. After rolling a coconut three times around the woman's body, the bidan placed it on her abdomen and pretended to cleave it with a machete. The symbolic release of its contents was meant to encourage the successful release of the contents of the womb. After bathing in cooling water, the pregnant woman was daubed with neutralizing rice paste (the elements of earth and water opposing the disembodied spirits' fire and air) and gently touched with a knife or razor blade, to harden her semangat (spirit of life).

Childbirth, for Malays, is not merely a physiological event necessitating medical care, but is also a stage in a rite of passage requiring spiritual prophylaxis and ritual expertise. A competent midwife provides practical obstetrical and nursing care and knows how to ease a baby's way into the world and protect a vulnerable mother from attacks by envious spirits. Traditional Malay midwives employ a directional system whereby the laboring woman faces in the proper direction for the day of the week, humorally speaking. North and east are avoided; north because corpses are buried facing this direction, and east since it is the opposite of the direction toward Mecca. The midwife doesn't claim her methods are indispensable; they only encourage the baby to arrive with less difficulty than would otherwise be the case.

During labor, the mother-to-be lies upon a mat on the floor of her bedroom, her head and shoulders on her mother's lap. The midwife gently massages her abdomen, inserting a finger up her vagina at intervals to determine the descent of the fetus. Coffee and snacks are available to the mother and occasionally are requested. Female friends and relatives are present during labor, and children roam in and out of the room. The husband may enter the room briefly, but men usually stay in an adjoining room. The star of the drama is neither the husband nor the midwife; it is the mother. Although it is considered wise to follow the bidan's recommendations, rural Malays view childbirth as a normal event in every woman's life that should not be allowed to erode the mother's autonomy. In the event of a difficult or perilous labor, a bomoh may be called upon to recite an incantation beyond the knowledge of the midwife. But whatever the outcome, the birth is followed by a burial: the disposal of the baby's birth sibling, the placenta and umbilical cord, composed of earth and water and lacking the fire and air its human sibling receives with the breath of life. The midwife carefully washes it, wraps it in white cloth, and places it in a half-coconut coffin. Death follows birth, and birth includes death, in the Malay vision of the cosmos.

MURUT SHAMANISM (BORNEO)

Murut shamanism is context-specific and therefore unique to Sabah, a state formerly known as British North Borneo. The *Muruts*, a term that literally means "Hill People," are the third largest indigenous groups in Sabah, after the Kadazandusuns and the Bajaus. The Muruts are by no means a homogenous group. They are subdivided into dialect groups such as the Baukau, Gana, Kalabakan, Okolod, Paluan, Selungai, Serundung, Tagal, Timugon, and the Beaufort and Keningau Muruts. The 1991 census has indicated that there are 54,037 Muruts in Sabah, with about 90 percent of them geographically concentrated in the southwestern part of Sabah (Pensiangan, Keningau, and Tenom).

Traditional Beliefs

The cosmos of the Muruts consists of seven levels above the earth and seven levels below the earth (Harris 1995, 70). Muruts believe that there is a "Creator God, known to them as *Aki Kaulung*" (Fung 1998, 69), whom some regard as a higher and unknown power (*kuasa* in Malay). Aki Kaulaung is the creator of heaven and earth and lives in the uppermost level above the earth (Harris 1995, 70) As creator, Aki Kaulung penalizes human beings for any disrespect and mockery of the animals. Furthermore, they believe in *aru* (spirits), whom they call by various names (Harris 1995, 72–75). The *kamanggas* lives in rocks and trees. This spirit travels to different areas and may even reside in objects kept in the house. Whoever accidentally disturbs a kamanggas living in objects in the house will be shot at with a blowgun and then will fall sick or die. The *angungkung* is a lion that has become an evil spirit that flies around and preys on victims' souls when they laugh as they walk in the jungle. The *tambailung* is a spirit that takes the form of an animal such as a deer and feeds on its victims. The *lalandou* takes on the form of a tall person and also kills its victims. Muruts believe in other jungle spirits that kill their victims in specific ways. The *amamalir* deceives its victims, especially children, and makes them wander lost in the jungle. The *tampuyung* leads people who sleep a lot to places of danger, such as a high place or the branch of a tall tree, so that when they awaken, they fall to their death.

Muruts believe in different kinds of water spirits (Harris 1995, 73). The *bandak* resembles water buffalo with long teeth; the *panandom* looks like a human being. The deep parts of a large river are believed to be the abodes of the panandom, and this spirit drowns its victims. The *lompor* is a snake that becomes an evil

spirit that sleeps in a hole in the river or jungle. The *baasan* does not kill but scares people. The *omolopot* is a water spirit that drowns a victim who is bathing in a river by catching its victim in a net in the river. Other spirits attack vulnerable persons such as children, pregnant women, and older people. The *amaratan* causes children and the aged to fall sick. The *baai* cries like a child, but it disturbs children, causing them to have bad dreams, cry, and fall sick. Pregnant women are prone to be attacked by *lalabi',* which causes the baby to die. To avoid the attack, a pregnant woman must light a lamp and stay awake. Akin to the lalabi' is the *pontianak,* which cries like a child and eats up the fetus in the womb.

Moreover, Muruts believe in a personal spirit known as *taniou,* residing in a rock, a piece of wood or some other object, which attaches itself to an owner (Harris 1995, 73–74). Taniou relates to people through dreams in which it communicates its location. When an individual obeys the dream and obtains the object, that person becomes a *lumahon,* the Murut word for a shaman. The taniou affords the shaman supernatural power for purposes of healing or inflicting harm, sickness, and death on others. In healing, the taniou assists the shaman in diagnosing the illness and finding the method of curing the sick. In addition, Maruts believe that the spirits of the dead, known as *alinguh* and *andauu,* linger on (Harris 1995, 74–75). The former returns just after death to bring spouse and children to accompany it in death. The latter is the spirit of one who died a violent death, which specifically preys on children left unattended by their parents.

Educated Muruts consider that belief in the ordinary spirits of trees or rocks is not inconsistent with belief in God. The presence of aru enables Muruts to live the moral imperative that nature and animals must be respected. To ridicule and disrespect them will incur punishment, whereas to honor and respect them will bring blessings and rewards. When Muruts sail past or underneath some boulders along the river, they observe a custom known as *amupuk* (Fung 1998, 70). Water from the river is sprinkled on the heads of those who are making their first trip to sacred sites, particularly young children as they sail upstream. It is a sign of respect paid to the aru. At the same time, when they pass these boulders, it is customary to utter a few words, asking to be excused or offering an apology for the use of the passage. During such times, no one is allowed to shout, bang the boat, or swim around in the river, out of deference for the aru of the boulders.

Muruts relate to the spirit world through taboo, divination, ritual, and magic. Taboos governing their everyday life, communicated to them via dreams, omens, and divinations, enable them to avoid coming into conflict with the supernatural spirits. They also placate the spirits through individual and group rituals.

Characteristics of Shamanic Rituals and Shamans

The two shamanic practices known to most Muruts are *sasampui* and *lumaagon.* The first ritual literally means "to blow accompanied by the uttering of spells." These shamanic rituals are normally intended for benevolent as well as malevolent purposes. For instance, Muruts resort to *babas tangou* to reverse the curse that causes someone to turn yellow (Harris 1995, 82). *Umparan* is a form of curse that is used with chants to inflict harm. On the other hand, *Babas rambuyun* cures those people who have gone insane and walk around talking to themselves. *Babas umparan* has the ability to heal someone who has been cursed. In another form of sasampui, small needles are used, together with a piece of paper with Malay words written on it, which cause the needles to fly into the heart of an enemy, resulting in a heart attack and death.

In general, shamanic rituals are rarely communal celebrations. They are conducted in response to personal requests, often by the family of the sick. The sick person is either brought to the shaman's house, or, the shaman makes a trip to the home of the sick person.

In both kinds of shamanic ritual, chants or spells embodying supernatural power are involved. Shamans obtain the chants through dreams or direct personal communication, or even as a result of a monetary transaction. Chants mediate the shamanic power of the spirit guides, known to the some Muruts as *jinx.* These spirit guides of nature assume different forms, such as birds or fireflies, or even human forms. They reside in the shamans, and their power can be extended also to objects that they use. Moreover, the spirit guides give a kind

of magical power known to Muruts as *amol* that makes them invincible to any bodily harm, even to bullets. Shamans are able to transform themselves into animals and are able to revert back to their human forms when they deem fit.

Murut shamans have experienced "privileged moments of election" when the spirit guides "visit" them, usually through dreams or when they engage in a *batapa,* a "quest" (Harris 1995, 82) in locations that are abundant in spirits, such as a graveyard or on top of a tall hill. Once shamans have been elected, the spirit guides act as their personal tutors. Unlike shamans of other regions, they do not become shamans as a consequence of an illness or a period of mental derangement (Winzeler 1993; Appell and Appell 1993). There is also a period of initial apprenticeship for those interested and initiated directly by the spirit guide or by a skilled shaman. After this period, the newly initiated are encouraged to memorize the chants. The well-intentioned shaman usually sternly forewarns them only to call upon the spirit guides for a well-founded reason, never to disclose the chants to anyone, not even their spouses, or to exhibit their latent power, lest these actions cause the spirit guides great displeasure, resulting in withdrawal of their power.

Shamans are not regarded with awe and do not live far from people (Winzeler 1993, xxvi), unless they are persons of ill repute because they resort to *ilmu hitam,* a Malay term that literally means "black knowledge." In such cases, they are feared and shunned. Murut shamans live in the midst of the villages and conduct their ordinary chores, such as collecting firewood, fishing, and mending their nets, like any other villager. Among the Semai, however, they live away from the village, usually at the fringe of the forest (Fung 2000, 191–192).

Murut shamans are by no means only men. Living in a village called Scalaban is a woman known as Inang Urik. She is a shaman who uses a rock called *babas* (Harris 1995, 81) with a hole in the center to bring about healing of the sick or reverse a spell and inflict sickness on the originator. The stone is said to whistle, and the tune is only audible to persons who are destined to hear it.

Garing bin Muntalan, a legendary living shaman, receives the spirit guide of water. The spirit guide came to him through his dreams when he was fourteen. At one point in his life, he devoted himself to ten days of solitary living for further initiation by the spirit in a cave. Chants were communicated to him through personal interaction with the spirit guides. Each one of his spirit guides has a name, and the name is disclosed upon his request. They belong to a cohort, akin to a large family of elders and siblings. They live in a nearby cave with a stream flowing by. They can be seen on moonlit night as illuminated translucent beings in human forms. Yet their movement resembles that of the flight of spirits, and they can move to a destined place in a split second. During his interaction with them, he is privileged to see and hear them as friends to a friend. They will come to him in his room in the night. At other times, he meets and talks to them in the open field, at the entrance of the cave, even at certain spots somewhere downstream, at a short distance from the cave where they reside.

Subversive Shamanic Power

Two well-known deceased shamans and heroes in the collective memory of the Muruts are Ontoros and Korom. The Muruts address them as *guru na amul,* teachers of amul (Harris 1995, 83). Ontoros's spirit guide resided in his *tung,* a Murut term for a tobacco pipe. Korom was believed to be guided by the spirit of a plant. When he slept under a solitary bamboo tree, his spirit guide came to him in a dream in the form of a woman. She requested him to marry her as a prerequisite to initiating him in the art and knowledge of shamanism. Shamanic power has been deployed by Murut shamans for protecting themselves or their comrades in subversive activities, as shown in many narratives associated with Ontoros, Korom, and Garing, the legendary living shaman.

Korom may serve as an example of the kind of feats that made these men into heroes. He was a rebel who fought against the Japanese during World War II. He was born blind, and that earned him his name, which means in Murut "his eyes were closed." When he was young, a cobra, intended to suck his blood, turned away from him. He drank poison and broken glass, but he did not die. If he hit anyone with his hands, the person died immediately. In a boxing match, when he hit his opponent in the jawbone, it was severely damaged. If he put his hand to the earth in a sand hole, he would be

able to hear the sound of the wild boar. His shamanic power extended to his *parang* (a Malay term meaning "knife"). When it remained in the scabbard, it was short. But each time he drew out his parang to use it, it lengthened. During the Japanese occupation, he used it to kill three or four Japanese soldiers. When he was in prison, he could break out. When the Japanese captured him, he was chopped up and burned alive, but he turned into a log that was seen to be burning in the flame. During the British rule, he was put to the test. He was tied up in a sack and thrown into the middle of the sea. But to the utter amazement of witnesses, he was found later to be drinking in a coffee shop (Fung 2000, 188–190).

SEMAI SHAMANISM (BORNEO)

A shamanistic belief system with many of the traits of classic shamanism, particularly noticeable in the form of rituals, still exists among the Semai and the Temiar, a people closely related to the Semai. The Semai are one of the eighteen subgroups of indigenous peoples in Peninsular Malaysia, frequently referred to by the Malaysian public as Orang Asli (Original Peoples). The Semai, also referred to as Seng-oi (Juli 1998, 2), constitute an Orang Asli ethnic subgroup, and they are part of the total population of 106,131 Orang Asli (Nicholas 2001, 3), spread out among eleven of the thirteen states in Peninsular Malaysia.

The Semai and the Temiar belong to the Senoi category, which represents one of the three main groups (the other being Semang Negrito and Aboriginal Malay) of indigenous peoples in Peninsular Malaysia. The Senoi are a Mongoloid people who are the direct descendants of the Hoabinhians (ca. 9000 B.C.E., an inland group of hunter-gatherers in the Red River delta of Vietnam (Higham 1989, 35) and the Neolithic cultivators. They migrated to Peninsular Malaysia around 2,000 B.C.E., presumably from present-day Cambodia or Vietnam.

The Semai live an essentially sedentary life in various locations on both sides of the main mountain range in Perak, Kelantan, and Pahang (Nicholas 2001, 4). Traditionally, they were swidden agriculturalists. Besides their main occupation, consisting of the cultivation of rice, they further engage in supplementary activities such as hunting and fishing (Juli 1998, 10). Some of them continue to cultivate the pieces of paddy land known as *selai* that they inherited from their ancestors. Traditionally, their land use has been dictated by a rotating cycle of "use and fallow," an agricultural method that is environmentally sustainable. When the soil of the selai was no longer fertile, they moved on to the adjacent plot in groups known as *gu,* each of which is made up of one or two extended families (Dentan 1968), only to return to the same plot years later. In the late nineteenth and early twentieth centuries, these gu referred to the land for their permanent settlements, with the land around them, as *dengri* or *lengri* (Gomes 1990). In their contacts with outsiders, they have been known to be less shy than the Negritos. But as a people, they prefer to avoid conflict, as they prize nonviolence in their way of life. Faced with any threat, they withdraw deeper into the jungles. However, with the change of the times, some groups of Semai have been found to be fairly adaptable to

new experiences and challenges. It is not surprising that today they have taken to permanent agricultural settlements; some even manage their own rubber, oil palm, and cocoa estates, while others are employed on an unskilled, skilled, and even professional basis.

The Semai believe that the universe is divided into the real world and the spiritual world (Dentan 1968; Juli 1998, 67). Living in the spiritual world are supernatural beings. *Nyenang*, or *Jenang*, is the name used for the highest supernatural being, a term that means "elder," "owner," or "master." Names such as *Tuhard*, *Uyaang*, or *Muyaang*, and even Malay names such as *Tuhan* (God), are used to refer to Nyenang as well. As an ultimate power, Nyenang created the universe, and even became a human being with a *ruwai* (spirit, or head-soul). Nyenang sends plants to the earth, which possess ruwai as human beings do.

Since Nyenang does not deal directly with human beings, the *malikat* (angels, supernatural beings) become Nyenang's intermediaries with humankind. Jaja' Bidat, Malikat Maut, and Pangkal Tiik (Juli 1998, 69) are the only three types of malikat that assist human beings, while the other malikat remain in heaven. Of the three, Malikat Maut is the most feared. Nyenang sends Sabit to earth to bring about death, and Maut is responsible for extracting life, *nyawa',* from the dying body. Sometimes malikat are known as Mungkar and Nangkir or Sabit and Maut. They are given the task of returning the souls *(kloog)* of the dead to heaven. As the "root of the earth," Pangkal Tiik, otherwise known as Pasak Tiik, Mai Dengri', or simply Penyakit, is a guardian responsible for looking after the agricultural land of the seven main river tributaries where the Semai live. In the rituals, Pangkal Tiik is addressed as Datuk Keramat, or *mai engra' de be jaga' dengri adeh,* "elders who look after this plot of land," otherwise known in Semai as *dengri'.*

As a third category, the *keramat* are not believed to come from heaven, though they are supernatural beings (Juli 1998, 70–71). Human beings can become keramat too. A keramat has a human spirit, which takes on diverse forms of animals and plants, such as elephants, tigers, crocodiles, turtles, or snakes, especially pythons and dragons, and even fallen trees. Keramat live as a cohort in a small area, such as a river, a swamp, or a cave.

The supernatural beings in the final category are known as *penyakit* (Juli 1998, 72), with Ngkuu' and Naga' as two of the most well known among the Semai. They were both human beings who became bored with their existence. Upon their request, Nyenang transformed them into supernatural beings who watch over human behavior. Ngkuu' looks like a gibbon, while Naga' assumes the shape of a dragon snake with its scales shinning most of the time. When pets and disabled persons are being ridiculed, Ngkuu's anger transforms its voice into *terlaij* (thunder) and its shining tooth into lightning. Naga brings about flood. Penyakit are deemed bad when they set themselves up as opponents of the *hala',* a class of shamans, and enemies of the ruwai of human beings, which they devour as *menghar* (meat).

Among the Semai, there are several kinds of shaman, known as *pawang, hala', malip,* and *bidat* (Juli 1998, 62). Pawang are the highest-ranking shamans, for several reasons: Nyenang has given them *betuah* (extraordinary characteristics), they perform the Ngenggulang ritual, and they have a special relationship to the guardian spirits of the land. Pawang are given their kloog (souls) by the first shaman, known as Hala' Asal (Original Shaman), now living in a section of the heaven only inhabited by the souls of the hala'. Besides, pawang must possess a cool ruwai (head-soul) and a cool *broog* (body) in order to have the power to deal with supernatural beings such as Pangkal Tiik, Pawang Tiik, or Mai Dengri'. Pawang must be able to harness the supernatural power of the *gunig-gunig* (spirits) as guides and helpers and work the different kinds of spells known as *jenampi* and *chenagoh.* In the performance of rituals, pawang must take care not to commit errors that annoy the Pangkal Tiik, whose flaring anger may bring an epidemic upon the villagers or death to the pawang. For this and other related reasons, pawang are few, limited to one in each village, with one or two would-be successors. The pressing demands on the pawang and their ability to manipulate supernatural power and shamanic knowledge for healing purposes make them revered persons in the community. When they no longer fulfill their duties as pawang, they will choose their successors, who are known as *ie panku'* or *ie penangku'.* The chosen successors are required to undergo a rigorous process of apprenticeship. They will also undergo ritual

baths called *muh bunga* (flowery bath) to cool down their ruwai and broog in order to approach the Pangkal Tiik.

Hala' are ordinary persons who possess *gunig* (spirit guides) and knowledge of the spells known as jenampi and chenagoh for healing purposes (Juli 1998, 64). They only gain extraordinary characteristics when they become ie panku under a pawang. They become shamans in two ways: by apprenticeship under a skilled hala' and by election through a dream, in which a gunig abandoned by a living hala', or one who has died, comes to choose a person to be a hala'. The person is advised not to ignore the dream, for to do so will bring about illness. With the help of a skilled hala', the chosen one establishes a relationship with the gunig through a singing ritual known as *kebut,* or *lamur.* During the healing rituals, the hala' seeks the help of the gunig-gunig to find, and even rescue the lost ruwai of those people who are ill from the captivity of the bad penyakit, and bring the ruwai back to them. In some communities, hala' have a considerable standing. In others, hala' choose to be rather inconspicuous in the village.

Malip are shamans who have only mastered jenampi and chenagoh but do not have the gunig (Juli 1998, 66). A strong ability to memorize and remember hundreds of jenampi and chenagoh is a prerequisite for becoming a malip. The malip obtain the knowledge of jenampi and chenagoh through a tedious learning process or through their dreams. The malip recite the jenampi over objects such as water and ointment, which are rubbed into the body or drunk by the sick for healing. Sometimes, the jenampi is recited over the affected parts of the body. The same jenampi is used for personal gain and to bring about harmonious or intimate relationship, the jenampi is recited over fragrant oil, which is then known as *cenuai* (love potion). A desperate man may use cenuai to entice a woman, and a politician, to regain his declining popularity. It is also used to rebuild a harmonious relation between husband and wife, or even the relationships within a whole family. On the other hand, chenagoh is used to seek help or protection from a supernatural guardian and to expel bad supernatural beings.

Bidat (midwives) are exclusively women shamans (Juli 1998, 66–67). Bidat receive their skill from Jajag Bidat, believed to be the first midwife on earth. Her kloog is said to be residing in that part of the heaven only inhabited by children since it is her duty to oversee them. She too assists all the bidat on earth. Upon the requests of the midwives, Bidat comes to earth frequently to look after the ruwai of children. Bidat are given the task of looking after pregnant women, delivering their babies, and looking after the health of the children of her community. Among the Semai's kindred Senoi group, the Temiar, bidat are considered clever, brave, and filled with knowledge and steeped in experience; they are on a restricted diet all their lives (Jennings 1995, 140–141).

Sewang gelap, a Malay term, is a shamanic ritual, literally a "ritual in the dark." This ritual is often held some distance away from the village, but it is rarely held now. On the other hand, the Temiar have a number shamanic rituals, which have continued (Jennings 1995, 152–155). Play-dance is the simplest ritual, celebrated without any elaborate decoration, without even the intention of calling upon the spirit guides. Play-séance takes place with some measure of decoration and is accompanied by singing, dancing, and vigorous and less vigorous trancing. The shamans and trainees administer healing to the sick. As Sue Jennings put it, séance or trance-dance performance is "complete with decoration, ritual objects and healing elements" (Jennings 1995, 153). It is held either in the main house of the village for the sick who can attend or in the house of the sick person. The shamans in trance perform individual healing, with the patient lying or seated in the middle of the room, witnessed by all present.

A ceremony known as "the bursting of the mourning" is a ritual held among the Temiar to conclude the mourning period. It lasts three nights. There is a big celebration in the village before the ritual. Gifts are presented to the visitors. On the first night, the music is played in a minor key, participants put on old clothes, and no makeup is allowed. The most solemn and significant ritual is known as the tiger-séance, which is held in darkness. A special shelter is made within a house, without any decoration at all. Its purpose is to contain the shaman, who becomes a tiger. The ritual is conducted to "heal sick persons but also to improve an ailing community" (Jennings 1995, 153).

The better-known shamanic ritual among the Semai is known as *sewang terang.* The term

in Malay literally means a "ritual in the bright," so called because it is conducted with lights on even though it is nighttime. Usually it lasts for five days, during which the sick people of the village are "doctored." Participants who attend the shamanic ritual known as sewang terang are requested to strictly observe the rule that no question must be asked during the ritual. The account that follows is based on the author's observation of several such rituals.

Before the actual night of sewang terang, the living room where the ritual is to be held will be decorated with different items such as the *jari lipan, ketupat, kemenyan, berteh,* and *mangkuk putih* for the healing ritual. The jari lipan is a plaited string made from coconut palms. The Semai believe it acts as a channel for the descent movements of the gunig. The ketupat is a place for putting food for the gunig while they play and communicate with the shaman. The kemenyan is a kind of incense that is burned during the ritual. Its aim is to alert the gunig that the shamans intend to contact them for the healing ritual. The berteh is a kind of flower; these flowers are strung together into a chain around the stems of the leaves of red cassava. Finally, the mangkuk putih is a white bowl with water. Some women will already be in the kitchen, preparing different kinds of food for the night gathering.

By about ten on the first night, some of the villagers are seated in the living room, with their backs leaning against the wall of the house. The hala' also takes his seat among the crowd. When the time comes to begin the ritual, the young Semai women and men dance to the drumbeat made by beating a local instrument known as a *gendang.* They move counterclockwise in a circle in the living room, close behind each other. After about fifteen minutes the dance stops. The hala' gets up from where he is seated and begins the prayerful chant. Normally assistants, consisting of a woman and a man, help the hala'.

The language of the chant consists of ancient Semai phrases, which are occasionally interspersed with some Malay words. The two assistants join the hala' in the chant. The hala' begins the sewang terang with a prayer (*bercagoh* in Semai). The chant is offered to the gunig-gunig of the trees, animals, hills, flowers, and so on. Through the prayer, the hala' informs the gunig-gunig that a healing ritual is about to begin. As a hala', he is seeking their guidance in curing the sick. At the same time, he petitions them to be present at the ceremony. At other points in the ritual, the hala' alerts the spirit guides to the completion of the period of medication. The same prayer of the hala' is also directed to the *roh nenek-moyang* (spirit of the ancestors), *malikat* (the angels from the four corners of the earth), and to the Nyenang (God).

In the course of the ceremony, certain participants enter into a trance, and the others gather around to support the person in trance until the trance state is over. Sometimes, when the person in trance appears to run amok, a few strong young men wrestle with him and pin him down to the floor. They stay with him until he comes out of his trance.

As the ceremony continues, the hala' waves a leafy bundle made from the leaves of a plant known locally as *cenau.* When the bundle gets worn out, he takes a fresh one from the rack on which are placed other leafy bundles prepared earlier in the day.

During the shamanic ritual, normally the hala' and the assistants are in a state of trance, but they are still in control of themselves. As the hala' chants, he "sees" the gunig-gunig descending from "above." Occasionally, he makes "catching" gestures, which are intended to capture the gunig-gunig coming to his aid in the healing ceremony. The catching takes place at a time when he seeks the spirits' guidance to diagnose the kind of sickness. The assistants have to wave incense around the hala' and sprinkle him with water in order to cool down the gunig-gunig. The patients are requested to come to the center of the gathering. The hala' noisily sucks through a clenched fist to bring out the sickness. Then he releases the gunig into the sick persons by touching the leafy brush to their backs. Sometimes, the hala' blows the gunig through a clenched fist into the affected part of a patient.

On the second day, the ritual continues with greater intensity. On the third day, the hala' reminds the gunig-gunig to bring the necessary antidote for the cure of the sick. The hala' also alerts them to gather the dew of the earth for the last day. The dew is used to bless the villagers and cool down the life in the village.

On the final day of the ritual, the room and all the utensils (such as earthenware, pails, and glasses) to be used for the healing ritual are decorated with strings of plaited coconut leaves. From the ceiling, in the middle of the living room, a *balai* (shelter) hangs down. It is made of wood and decorated with lovely fresh coconut braids. The outside is painted black and red. Glutinous rice and fried cakes, made from flour and wheat, are placed inside the balai. This food offering does not include the orange juice, glutinous rice, beef curry, eggs, and red flour that are offered on this final day to the gunig-gunig. Candles are lit inside the balai, offering light to the gunig-gunig.

A second balai well decorated with coconut braids serves as a location for all the different *buyung* (metal jars). The mixture poured into one of the jars consists of rice flour *(tepung beras)* fried with lemon, a spice known locally as *serai guntung,* and leaves of an aromatic plant known locally as *perawas.* A special metal jar is filled with a type of scented wood known locally as *lengak,* or *stow.* This jar is offered by the sick to thank the gunig-gunig, and it serves as a place for the "pleasure and play" of the gunig-gunig. The rest of the jars are used for storage of the medicine brought by the gunig-gunig. These jars are filled with water, and the water serves as medicine for the sick and the general health of the villagers.

A little boat is made by the menfolk from a stemless palm with edible fruits, called *kelubi* or *ngentig* in Semai. In it are seated the wax figures of two centipedes, two snakes, and two scorpions. Into these items, the hala' discharges the misfortune of the sick from the village. Then the hala' and his assistants remove and dispose of them in the nearby stream. As they leave, the participants in the healing ritual are prohibited from looking at them, or else the misfortune will return to the patients. On this final day, the hala' dons a *sawit* (catlike attire made from berteh and the stems of cassava), *songkok* (headdress), and *pedang* (sword).

Since the fourth day is the climax of the healing ritual, it lasts until early morning. The solemnity of the final night enjoins that the participants refrain from any form of jesting and laughter, lest this unruly behavior offend the gunig-gunig. At the ceremony, the hala' prays with great earnestness to the gunig-gunig to bring the necessary medicine for the cure of the sick. At the close of this final day of the ritual, the patients bathe themselves with the water from the jars. Even the villagers are requested to drink the water from the jars, while those who have finished taking their medication wash their faces with the water from the jars. The patients are obliged to refrain from any activity for a day because the gunig is no longer with them to accord them protection. Those under medication must rest themselves too so as not to alarm the gunig within them. They too must observe the necessary food taboos also; hot spicy food is forbidden. In addition, they are not allowed to be wet by the rain. This ritual, clearly shamanic in nature, still plays an important role in the lives of the Semai.

Javanese shadow puppet. (Shelley Gazin/Corbis)

SHADOW PUPPETRY AND SHAMANISM (JAVA)

Javanese shadow puppetry (in Javanese *wayang kulit,* "leather shadows") is arguably the most elaborate form of shadow puppetry found anywhere in the world. Stories are drawn from the ancient Sanskrit epics the Rāmāyana and the Mahābhārata and from the myths of native Javanese animism (Van Ness and Prawirohardjo 1982). A close look at this art as practiced in Java reveals shamanistic elements.

A full performance takes around nine hours, from sunset until dawn. Musical accompaniment is provided by a *gamelan*, an orchestra that may consist of anywhere from ten to forty musicians, but the burden of performance rests on the puppeteer (in Javanese, *dhalang,* in Indonesian, *dalang*). The dhalang manipulates the puppets, provides them with voices, sings mood-setting songs, and directs the musicians. Working without a script, he must construct a nine-hour narrative according to a set pattern of scenes.

Though most dhalangs drink sweet tea and smoke during the performance, the dhalang is not permitted to eat during the performance. The position in which the dhalang needs to sit—cross-legged, with the right leg cocked over the left to allow signals to the accompanying gamelan to be rapped out on the side of the puppet chest with a small mallet held between

the toes of the right foot—is extremely uncomfortable.

Men who can do this (there are a few women dhalangs, but the overwhelming majority are male) are accordingly granted a special level of respect in Javanese society. The demands on stamina and memory alone are phenomenal, as is the range of skills and fields of knowledge a dhalang must master: puppet manipulation, gamelan music, singing, a firm grasp of the complex system of court linguistic etiquette, in-depth knowledge of the characters and plot lines of the stories of the repertoire, and the ability to vocalize dozens of characters.

The origins of wayang are now lost, but are certainly very ancient indeed—a Javanese chronicle of around 1000 C.E. contains the first written mention of a performance (Zoetmulder 1974, 208–211). Javanese religion at this period appears to have been a blend of Hinduism and native animism, and the wayang probably represented a form of communion with ancestors.

Although schools for training dhalangs do exist, these are a recent innovation, and very few (if any) successful dhalangs owe their skills solely to formal training. By tradition, dhalangs come from dhalang families. The craft is passed on from father to son, and dhalangs tend to marry the daughters of other dhalangs, women who are skilled in playing the *gender*—a gamelan instrument crucial in the accompaniment of song during the performance.

Most great dhalangs are said to be possessed by their art. Some speak of their training as starting before birth: "I began my profession as a dalang before I was born. I say that because I am a possessed dalang. My grandfather and my father were dalangs. I only continue the culture that was passed down to me. I never went to a dalang school but obtained my skill, in playing the shadow puppets, from my elders" (cited in Williams 1991, 117)

Becoming a dhalang involves many ritual or spiritual aspects besides learning the practicalities of the art of puppetry (in Javanese, *pedhalangan*). Many of these relate to the practice—widespread in Java—of asceticism to build up spiritual strength. It is a traditional belief that certain practices or exercises increase one's store of spiritual energy (in Javanese, *batin*), while other practices (which include performing wayang) drain or put a strain on batin. These ascetic practices include fasting (normally carried out on Mondays or Thursdays, or both), abstinence from sex, going without sleep, and performing meditation in particular places, including the mountains and the seashore, as well as while immersed in water up to the neck, this last practice being known as *kunkum.*

That these practices are also followed by student *dukun* (*dukun* is a term that embraces witch doctors, faith healers, and practitioners of Javanese ritual magic) is no coincidence. Dhalangs were formerly seen as somewhere between magicians and priests in their communities. Since the coming of Islam to Java in the fourteenth century, much of the overtly theological element has disappeared from wayang performances. Nowadays, Javanese interpretations are more likely to focus on the ethical and moral aspects of the stories, with the characters of Hindu heroes and demigods being seen as archetypes, and their moral dilemmas as metaphors for the travails of everyday life. In this interpretation, the battles fought by heroes and demons represent the inner battles waged by the individual in the course of progress toward spiritual maturity.

Traditionally, wayang performances are sponsored to mark notable events—the rice harvest, marriage, circumcision, and so forth. Although wayang performances to mark family events survive, many of the older traditional occasions for wayang performance have largely disappeared. These occasions were for the most part associated with a type of ritual known as *ruwatan* (from the Javanese verb *ngruwat,* "to release someone or something from a curse or evil spell"). Traditionally, misfortunes requiring a ruwatan could include breaking a grindstone or overturning a rice pot. Ruwatan might also be performed to release an individual from illness or misfortune caused (it was thought) by inauspicious circumstances surrounding their birth, or from having been given a name too "heavy" for the soul to bear. Such names commonly included those of major wayang heroes.

In these cases, only the performance of the appropriate wayang story could release them. Such performances, though rarer now than in the past, are still carried out in Java today. The story in question is called Lakon Murwakala, and deals with the ogre Betara Kala (Yousouf 1994, 135).

The story relates that Betara Kala, son of Betara Guru (the Javanese name for the Hindu god Śiva), was born out of a flame that could not be extinguished until Betara Guru acknowledged paternity. This done, Betara Kala was married to Betari Durga, and given the right to prey upon man, subject to a complex and extensive list of prohibited victims. Those who do not appear on the list are the potential victims who can be protected from Betara Kala's attentions by the performance of Lakon Murwakala.

Two versions of Lakon Murwakala exist in the Javanese wayang repertory. In the first, any wayang story can be used in a normal all-night version, concluding before dawn. On the conclusion of this performance, the dhalang introduces the Betara Kala puppet and tricks it into eating rice in the belief that the rice is his intended victim (i.e., the boy for whom the ruwatan is being performed). Thus duped, Betara Kala will be unable to persecute the victim again. At the end of this performance, the dhalang and most of the principal guests drop offerings of money into a bowl of water scented with flowers.

The second version of Lakon Murwakala is, unusually, staged during the daytime, beginning at around eight in the morning and concluding around one in the afternoon. In this version, the entire performance stages the Murwakala story instead of elements from it being added to the end of another story, as in the first version.

One further shamanistic element still sometimes appears at ordinary wayang performances—the introduction of a single three-dimensional rod puppet *(wayang golek)* at the end of a performance, to symbolize the return to reality from the two-dimensional world of the wayang kulit.

SOUTHEAST ASIAN SHAMANISM

Southeast Asia is one of the core areas of Old World shamanism. Indeed, given the absence of any evidence to the contrary, it seems likely that shamanism in Southeast Asia is as old as that of any other region of Asia. The fact that the term *shaman* derives from northern Asia does not mean that the practice or complex itself does. The occurrence of shamanism throughout this vast and complex region is broad but discontinuous, especially if shamanism is identified in terms of the "classic" features found among Siberian and Inner Asian peoples. Still, shamanism appears in both the mainland and insular areas and among all of the major language groups of Southeast Asia, has many of the same characteristics that it does in other regions of the world, and poses similar issues of definition and explanation. More specifically, much of what is known of classical shamanism concerns (1) the Hmong and other hill peoples of northern mainland Southeast Asia; (2) the Orang Asli, "original people" of the mountainous central region of the Malay peninsula; and (3) the interior and upland Austronesian groups of the insular regions, especially Sumatra, Sulawesi, and Borneo. Shamanism among these peoples is undergoing the same processes of decline or transformation that are occurring elsewhere, as the populations among which it occurs are brought under increasing control by postcolonial states and become subordinate and generally marginalized ethnic minority groups. Such peoples are now being attracted or pressured to convert to one of the world religions (Buddhism, Islam, or Christianity, depending in part on the country or region in question) and drawn into modern national and global processes of change.

Origins and Prehistory

Archaeologically recovered and analyzed materials (including grave goods and Dong-Son-style bronze drums) have sometimes been taken to indicate shamanism in the past, a conclusion arrived at by reference to more recent ethnological information. Ethnological accounts, moreover, involving the Orang Asli of the Malay Peninsula mention that shamans are sometimes buried differently from others (Endicott 1979, 137–138). The use of historical linguistic analysis to reconstruct early terms for shamans and shamanistic practices (in Borneo including *balian* and *dayung* for example) would probably also yield interesting results, but these would likely be limited at most to particular areas or language families, and even then would be unlikely to differentiate shamans from other sorts of ritual practitioners. The origins of shamanism throughout Southeast Asia are probably ancient and beyond recovery through any of the techniques used by anthropologists and others to learn about the past.

The evident origins of both present-day Southeast Asian populations and many Southeast Asian languages from more northern areas of Asia has given rise to the notion that shamanism in Southeast Asia is also derived from north, but this is a complicated matter. It can probably be said that the forms of shamanism practiced in the far northern areas of Southeast Asia are most directly and immediately connected to those of Inner Asian peoples. The Hmong and other hill peoples of this region trace their origins to Inner Asia, from which they have been moving southward for many centuries, until today they are spread over Yunan in China as well as the northern parts of the Southeast Asian countries. Much farther to the south the Mon-Khmer and other non-Austronesian languages spoken by many of the Orang Asli groups in the interior of the Malay Peninsula also link them to more northern populations, but the ties in this case are presumed to be much too ancient to suppose that their forms of shamanism also are linked to the north. The Austronesian versions of shamanism of Sumatra, Borneo, Sulawesi, and elsewhere probably do also have northern origins, in that the Austronesian peoples themselves are known to derive from the north, although the migrations concerned extend back over five thousand years or more (Bellwood 1979, 112–113). Although they probably brought their own version of shamanism with them, they could have adopted or borrowed parts of it from the modern humans who had already been living in Borneo and probably other areas of insular Southeast Asia for thirty or forty thousand years.

Shamanism as Narrowly and Broadly Conceived

Observers do not always clearly distinguish shamans from other types of ritual practitioners, including priests (specialists who perform various rituals, often involving sacrifice, based on the routine learning of standardized knowledge and procedures) and especially spirit mediums (specialists through whom the spirits speak and who cure or solve other personal problems through exorcism); observers may not necessarily even think that such a distinction should be made. In reading accounts, therefore, it is necessary to not only note the use of the terms *shaman* and *shamanism* or their absence, but also to consider the descriptions of various kinds of ritual specialists and their activities.

Scholars in general tend to take either a narrow or a broad view of shamanism, though in either case such views are often implied rather than stated explicitly. Those who take a narrow view tend to follow the lead of Mircea Eliade and see the phenomenon primarily in terms of its Siberian or Inner Asian features.

Although such scholars do not produce identical lists of essential characteristics, they tend to stress the following: (1) the belief in a cosmos with many spiritual beings that can help or harm human beings, some of whom can be controlled or influenced by shamans, that is humans who have been chosen, initiated, and trained; (2) the belief that the cosmos itself consists of distinct levels that include, broadly, a spiritual Upper World, a Middle World that is experienced through the natural senses, and a spiritual Underworld that is also the realm of the dead; (3) the belief that humans have souls that leave the body during illness and dreams and permanently at death, but that can sometimes be overtaken and returned by the shaman with the assistance of spirit helpers; (4) the belief that even though shamanism may be hereditary, shamans do not seek their vocation and often resist it, but are called by the spirits who

Southeast Asian shamanism as broadly conceived: A Malay spirit medium performing at a séance in a coastal fishing village (in Bachok, Kelantan, northwestern Malayan Peninsula, 1966), to secure the good-will of the spirits of the sea. (Courtesy of Robert Winzeler)

wish to form a relationship with them, one that is sometimes thought to be sexual or marital in nature, this call involving either dreams or bouts of physical or mental illness that recur and resist other attempts to cure them, phenomena that are interpreted by trained shamans as a summons that must be accepted, refusal meaning death or permanent insanity; (5) the practice of initiation, during which shaman candidates undergo training by other shamans and participate in ceremonies through which they gain control over their familiar spirits; (6) the understanding that, although the shaman deals in ecstasy and trance and may be a medium, most importantly the shaman goes on spiritual journeys to recover lost souls, or in some instances to guide souls of the truly dead to the afterworld, or is able to send familiar spirits to do these things; 7) the acquirement by the shaman of various paraphernalia that are used in ritual activities, usually items of dress or adornment and other objects. (Shamanism has also often been linked with transvestism or androgyny.)

Not every one of these characteristics alone would serve to differentiate shamans from other sorts of ritual specialists, but two in particular can be stressed. These are the beliefs that the shaman is chosen and called by the spirits and that once initiated the shaman has the ability to travel to other worlds, or at least to be able to send spirits to do so. Such basic features of course presuppose some of the other, less distinctly shamanistic ones, including the belief in spirits and in spiritual worlds. There are also mixed or marginal cases—ones in which one of these features is present but not the other.

In Southeast Asia, shamanism defined along narrow lines occurs mainly among "tribal" societies—those that until recently were at or beyond the margins of state control or of adherence to any of the world religions (mainly Islam or Buddhism, or, more recently, Christianity) and for whom, therefore, shamanism is much more than a mode of curing or a peripheral cult for troubled or subordinate persons, but in fact a large part of the religion they practice. Such tribal peoples traditionally have much in common throughout Southeast Asia. A few of them live or previously lived by hunting and gathering and are nomadic, but most practice swidden cultivation and live in more permanent villages, often in longhouses in the past (and still in some places today); many were headhunters. All of these practices set the tribal peoples apart from the lowland, or coastal, wet rice cultivating, single house dwelling, and permanently settled populations that have state political organization and adhere to one of the world religions.

Shamanism more broadly conceived includes other practices involving ecstasy, trance, or altered states of consciousness. In particular, practices of spirit mediumship are regarded by some scholars as shamanism, especially when some of the spirits involved are believed to have been summoned by the medium and are under the medium's control. Shamanism among Chinese, Koreans, and Japanese in East Asia, for example, is primarily interpreted in this way.

In Southeast Asia, shamanism approached in broader terms occurs not only among the tribal peoples but also the lowland, state-controlled societies adhering to one or another world religions. Although the term *shaman* itself has not been widely used in regard to the latter groups, two well-known examples in which it has been used are the Buddhist Burmese and the Muslim Malays. In his study of Burmese village religion, Melford Spiro devotes a chapter to the *nat kadaw* (literally "nat's wife"; sometimes spelled *natkadaw* and translated, "spouse who dances for a spirit lord) whom he labels a shaman (Spiro 1967, 205). But he explains that he does so simply "for want of a better term," and goes on to say that the nat wife is not a shaman of the classical Siberian sort, since she does not ascend to the spirit world or perform other kinds of shamanistic supernatural feats or even cure illness.

Another instance is that of Malay shamanism. As originally formulated by the British colonial scholar R. O. Winstedt in his book *The Malay Magician,* the interpretation is that Malay shamanism, usually involving spirit mediumship, séances, trance, and exorcism, has existed along with, but subordinate to, orthodox Islam over a long period of time in various forms throughout the states of the Malay peninsula. The argument is that shamanism as practiced by the modern Malay *bomoh* (magician) was originally brought by Malays long ago in their southward movement from China, and then overlaid first with Hindu Saivism (the worship of Śiva) and then Islamic Sufism. Whatever its possible origins, Malay trance performances

Southeast Asian shamanism as narrowly conceived: A Selako Dayak shaman in a curing seance in Lundu, western Sarawak, Borneo, 1989. (Courtesy of Robert Winzeler)

and spirit mediumship have continued to be reported as shamanism in more recent accounts (Endicott 1979; Laderman 1991).

No absolute answer can be given to the question of why narrowly conceived shamanism is mainly lacking among Southeast Asian peoples with world religions and state organization. Probably, however, the combination of the cosmology of shamanism and the spiritual powers claimed by or attributed to shamans make them unacceptable to both the world religions and to the traditional rulers of the Southeast Asian states who also claim spiritual powers. The world religions of Southeast Asia are famous for their traditional tendency to absorb earlier beliefs and practices and to be tolerant of heterodox forms of religious expression. Supernatural curing, spirit beliefs, agricultural magic, exorcism, and the like were all widely tolerated and flourished within the boundaries of acceptability, at least until recently, so long as their practitioners also affirmed their loyalty to Islam, Buddhism, or Christianity, depending on the country in question. Shamanism in its classic form, however, was probably too much to digest until it was tamed or transformed into forms of magic and spirituality familiar and acceptable to the practitioners of the world religions and to the kings, princes, and chiefs who ruled in the name of these religions, and who often sought to monopolize or control spiritual powers, if never with complete success.

Characteristics of Southeast Asian Shamanism, with Special Reference to Borneo

The cosmologies associated with Southeast Asia shamanism are broadly similar to those found elsewhere—a universe of three levels, and often many sublevels—but there are many local variations. In Borneo there is a widespread view that the Upper World is a male realm associated with life and birds, the most important of which is the hornbill, and is reached by traveling upriver, while the Lower World is a female realm associated with death, fish, and reptiles and presided over by the dragon, and is reached by traveling downriver. Travel to the spiritual realms, both by shamans and by the souls of the dead, is often by boat.

As elsewhere, the idea of crossing boundaries between worlds is probably linked to the association of shamanism with transvestism or intermediate sexuality that occurs in some instances. Among the Iban of Borneo the highest grade of shaman is the *manang bali*—the transformed shaman, one who has sought to change his identity from male to female, donning women's dress and doing female things thereafter. Transvestite shamans have also been noted in Sulawesi (Eliade 1989). In general, however, shamans in Borneo and elsewhere in Southeast Asia are neither of transformed or intermediate gender nor sexually deviant in other ways.

In most instances, therefore, shamans are either men or women, although this does not mean that they are equally likely to be one or the other in particular societies. The common pattern seems to be rather that they are predominantly men or women in each instance. Why this should be so is not so easily answered in a general way. In Borneo, for example, there are exclusively female versions of shamanism or spirit mediumship, but most societies with shamanism in Southeast Asia appear to have no formal cultural rules that specify gender. Instead, it is usually more a matter of tendencies or preferences and of offering practical reasons for why men or women are or are not apt to become shamans. Jane Atkinson thus reported being told by the Wana of Sulawesi in Indonesia that women were not prohibited from becoming shamans, but they were discouraged from doing so, since the practice involves extensive travel (Atkinson 1989, 280–282). Much the same thing might be expected in the case of the Iban of Borneo, among whom shamans are also mainly men. Here shamanism is similarly a traveling activity, renowned shamans often being called from long distances. This means also that among the Iban shamanism is one of several activities—others being headhunting in the past and trade and wage labor in distant places today—that are sources of male prestige because they involve travel.

In contrast to priestly sorts of activities, which are more highly localized, shamanism itself seems to travel readily between ethnic groups as well as within them. Probably all over Southeast Asia members of one ethnic community regard the shamans of other groups as being especially effective for one reason or another. In both the Malay Peninsula and in Borneo, nomadic hunting and gathering groups are believed by others to have particu-

larly powerful shamans. In Borneo, shamans from Punan nomadic groups are sought out by the settled peoples because of their reputed efficacy—because the Punan are considered by their neighbors to be intermediate between humans and animals—even though their shamanistic practices are but rudimentary versions of those of the surrounding settled groups (Sellato 1994, 161, 205).

Obviously, such observations about shamanism and travel do not explain the opposite pattern of female shamanism that prevails (in Borneo at least) in some places, the Taman of the interior of West Kalimantan as recently described in detail by Jay Bernstein (1997 and in the current volume) being a good example. Nor are the consequences or corollaries of female shamanism always clear in general terms. In some instances female versions of shamanism or spirit mediumship are prestigious roles for women, but in others they are not. The latter include several instances from Borneo, including the Baluy Kayan (Rousseau 1998, 119–140) and the Ngaju, in which there are two kinds of shamans: one kind mainly female with lower status and limited to curing activities, one mainly male with higher status and political influence, which involves priestly as well as curing activities. It is also possible—and in the case of the Ngaju is in fact known to be so—that such a development is the result of change (Jay 1993).

Shamanism and Change

In Southeast Asia the establishment of colonial rule brought the beginning of changes that have often altered, marginalized, or eliminated shamanism. Colonial authorities seldom objected to shamanists or shamanism in the same way they did to indigenous practices of warfare, headhunting, or in Borneo occasional human sacrifice. Insofar as they were aware of it, they generally held shamanism to belong to the realm of local culture or lifeways that should not be disturbed, but if anything studied and written about as a contribution to ethnological knowledge. The missionaries who came with colonial rule generally took a different view. It is true that some of them also produced excellent and sympathetic scholarly accounts of indigenous shamanism as practiced by the peoples among whom they lived, but many or most regarded it as devil worship, or at least as a form of paganism that would have to be eliminated.

Postcolonial governments have often been much less reticent than colonial ones about interfering directly with the religious practices and traditions of indigenous peoples. Such governments are usually dominated by the lowland ethnic groups adhering to world religions that formed the traditional states: the Javanese, Malays, Thai, Khmer, Lao, Vietnamese, and Burmese. Such groups tend to regard the tribal peoples of the hills and interior areas as primitive and marginal, sometimes as disloyal or as outsiders altogether. In seeking to modernize and incorporate the tribal peoples, the modern governments of Southeast Asia have not focused on shamanism per se, about which they may have little knowledge, but rather religion and culture in general.

For their part, the tribal minorities in predominantly Buddhist or Muslim countries in Southeast Asia often convert to Christianity, partly because of Christian missionary efforts among these groups, going back to the colonial period in many instances, and partly because Christianity enables them to be modern but separate from the dominant central, coastal, or lowland groups. In any case, the result is often the alteration or eventual elimination of shamanism, along with other religious practices that are held to be in conflict with Christian practice. Not everyone converts, or stays converted, but even where some do not, shamans tend to be marginalized as backward and traditional. Even in places where Christianity has been propagated for long periods without much success, or where large segments of a population continued to adhere to their own religious practices, it may have an effect on shamanism.

In recent decades at least, those who have converted to Islam have probably been under the greatest pressure to abandon shamanistic practices and to separate themselves from those who still adhere to them. Even here, however, the policies and practices of the Southeast Asian governments of countries with dominant Muslim populations (Malaysia, Brunei, and Indonesia) vary in their inclination or ability to effect religious change among tribal or ethnic minorities. Like the government of Brunei, the Malaysian government has sought to promote the Islamicization of indigenous minorities, al-

though this effort has generally been resisted by the Orang Asli in the Malay Peninsular and by the various Dayak and other indigenous non-Muslim groups in Malaysian Borneo. However, the Orang Asli have been more vulnerable to government pressure to become Muslim and to assimilate to Malay Muslim society than have the Borneo groups, who are much more numerous, powerful, and independent. The shamanism and other religious practices of the Borneo groups are also protected by the legal guarantees accorded to *adat,* "customary practices." At the same time, they have, throughout Malaysian Borneo, widely converted to Christianity, and although shamans—including ones who themselves have converted—may perhaps occasionally still practice in Christian villages, the likelihood that they will continue to do so and to pass their knowledge and practices on to new recruits does not seem great.

The situation in Indonesia, including Kalimantan or Indonesian Borneo, has been different, although here also shamanistic practices as such have not been singled out or even identified, but rather affected by broader government attitudes and policies regarding the religion and cultural ways of the interior minority peoples. Although the Indonesian constitution guarantees religious freedom, this in effect refers to the practice of one or another of the world religions, including Hinduism as well as Buddhism, Islam, and Christianity. All of these religions are officially defined as being based on a "belief in one god," adherence to which is the first of the five basic principles of the Indonesian state (Kip and Rodgers 1987, 17). Shamanism and other indigenous beliefs and rituals that are not based on monotheism are therefore "not yet religion" and not covered by guarantees of religious freedom. Such beliefs are not considered to be proper beliefs and practices for citizens of a modern Indonesia. Moreover, such definitions and requirements are not simply bureaucratic abstractions that have little effect on real religious practices. Religious identity is, among other things, indicated on the identity card that is required for many purposes and is a fundamental part of social identity.

The effect of Indonesian government policies on shamanism has varied, however. In many or most regions of the interior, former tribal groups have by now formally converted to Christianity, or, much less frequently, to Islam, with resulting differences. Among the Ngaju peoples of Central Kalimantan in the far south of Borneo, those who have become Muslims have withdrawn from any involvement with shamanistic ceremonies, including the great death rituals associated with secondary funeral practices (those held months or years after the initial funeral, which provide for and celebrate the final journey of the soul to the land of the afterlife). Some Ngaju Christian converts on the other hand, especially first-generation ones who live in villages and households in which some members have not converted, continue to participate in the shamanistic festivals (Jay 1993, 154).

At the same time, such Ngaju shamanistic practices have themselves been transformed and gained official approval as a legitimately monotheistic religion. Faced with government pressure to adopt one or another form of monotheism, some Ngaju Dayak succeeded in having their own traditional religious beliefs, practices, and ritual specialists recognized as a form of Hinduism, similar to that practiced by the Balinese. Ngaju shamanism has thus been transformed, just as the religion itself has been, to better fit the model of monotheism (Schiller 1997). In the past Ngaju shamans were of two types, both of whom were essential participants in religious ceremonies: the female *balian,* who was a slave prostitute, both within and outside of ceremonial contexts, and the male *basir,* who was a transvestite or a hermaphrodite (Schärer 1963, 53–59). With the transformation of the "old religion" into Hindu-Kaharingan, the priestly role of female shamans was eliminated from the great life-and-death ceremonies and restricted to curing and to dealings with the downriver, Underworld spirits. The role of *basir* was retained and enhanced, but males who came to assume it are no longer sexually transformed or of intermediate gender but normal men, who assume the role by studying with established priests or by going to a school for priests (Jay 1993).

TAMAN SHAMANISM (BORNEO)

Among the Taman of Indonesia, a form of healing is still widely practiced that manifests some aspects of classic shamanism. Those who practice healing rely completely on their relationship with the spirits.

Background

The Taman are a Dayak (non-Muslim Borneo indigene) ethnic group of 5,000 inhabiting ten small villages along the Kapuas, Mendalam, and Sibau Rivers upstream of Putussibau, the largest town in the Kapuas Hulu regency in West Kalimantan, Indonesia. The remoteness of the area contributes to the persistence of traditional ways of life, but its isolation has been

alleviated somewhat by the advent of a small airport in the 1970s and a paved road to Pontianak in the 1990s. With the Embaloh and Kalis peoples, the Taman form a larger ethnolinguistic entity called Maloh by outsiders, although some local scholars have recently recommended the appellation Banuaka as a preferable substitute. The Taman are believed to have lived in the Upper Kapuas at least since the seventeenth century; intriguing evidence from legends and research in the statistical study of their vocabulary suggests a much earlier link to Sulawesi, and specifically Bugis. Today, the Taman frequently interact with Chinese, Malay (Muslims, often Dayak converts to Islam), Iban, Kantu', and Bukat people.

The Taman economy is based on shifting rice cultivation, supplemented by the sale of produce and forest products in Putussibau's morning bazaar, rubber tapping, and timber cutting. Fishing, hunting, and gardening also contribute to their subsistence.

Christianity was introduced by Catholic Dutch pastors during the colonial period, and more recently through Protestant churches, notably the Evangelical Church. Mass conversions were carried out in the 1970s, and most Taman are Catholic, except in the villages on the Sibau River, which have a Protestant majority. Many Taman have converted to Islam, but with few exceptions they cease to identify themselves as Taman once they are Muslims. Relations are amicable between persons of all faiths.

The Centrality of Shamanism in Treating and Explaining Illness

Despite its heterodoxy and unflattering association with idolatry, shamanism is extremely important for the Taman, since it is the remedy both of first resort, and in some cases, last resort in treating illness. Taman shamanic curing uses no medicine—its purpose is to treat illnesses (or those aspects thereof) for which there is no medicine. More precisely, it treats illnesses resulting from the attack of a *sai* (spirit) on a person's *sumangat.* The latter term refers to a person's image, as in what one sees in a mirror, or something containing a person's identity or essence. Unlike the English word *soul,* which will henceforth be used as a gloss for sumangat, it does not refer to psychological processes or personality structures. A person's sumangat has the same experiences as the person, but it can separate itself from the person's body, travel, and materialize.

An individual has eight sumangat. All but one "original" sumangat may leave the body, especially during sleep, as proved in dreams. The seven souls that can wander are not further individualized as to name, function, personality, or location in the body. The majority of dreams are considered harmless and normal, although all dreams are believed to contain important meanings, perhaps as omens or warnings, and are taken to emerge from actual journeys of the soul. Some dreams, however, signify special danger, such as interference with the recently deceased, and may require ritual actions or proscriptions. The further a sumangat wanders, and the longer it is absent, the more perilous the outcome.

A sai is any animal or other nonhuman spirit unattached to a body. Sai are believed to live an unseen world and to be found outside the village: in the forest, in certain trees, especially banyans (*Ficus*), localities in a river, grottos, and the like. Sai are considered typically amoral, petulant, and vicious. They act impulsively as well as intentionally and out of revenge. They can cause illness by shooting an unseen object into a person's soul. They may attack a soul by punching, spearing, biting, or clawing it. They can also cause illness by lodging themselves in a person's soul. Most simple or body part illnesses are attributed to cuts inflicted on a soul. Infections and other more serious internal illnesses are attributed to a soul being stabbed or burned by a sai while outside a person's body. These serious illnesses are believed to be caused out of vengeance on the part of a sai for some behavior attributed to a particular person. The victim of spirit attack may not have knowingly committed any action harmful or insulting to a sai but may innocently share the name of the offended sai.

Treatment by Shamans

Taman shamans (called *balien*) are able to cure illnesses caused by sai in part because they are the only persons who can not only see them but have ongoing relationships with them. Few non-baliens report ever having seen a sai.

The first stage of balien treatment is to rub certain stones over body parts, including but

not limited to the parts about which a complaint is made. The treatment is called *bubut,* which derives from a Malay word meaning "pluck" or "extract." Bubut is conducted to treat simple illnesses caused by the attack of a sai, but is also the first and last step of all other balien cures. Certain highly polished stones, kept in a small kit woven from thatch, called a *baranai,* are used. The stones used in bubut are not ordinary stones but are thought to be solidified spirits that represent the souls of the persons in the balien's household. Most are black, polished, and roundish (female spirits) or long and round (male spirits), in a size that fits easily in the hand. Some are oddly shaped but smooth.

Before being rubbed on the person the stone is dipped into a decoction of a crushed, freshly cut ginger plant, usually the ground rhizome of *tantamu (Curcuma xanthorrhiza),* though *saur (Kaempferia galanga)* leaves may also be used, and are preferred in treating children. The balien not only strokes the wet stone over the skin but deeply squeezes and sometimes blows on the patient's flesh. The cure is revealed in the removal of a small object, usually a tiny pebble, from under the stone (and purportedly the patient's flesh), which drops audibly into a bowl held by the balien. This object must be "fed" to the bubut stones to prevent the extracted disease from flying into the balien's body. The normal payment is a cup of uncooked rice.

The next ceremony, *mangait,* involves calling back the patient's absent soul. A balien is brought to the patient's house in the evening, bringing not only bubut stones but a much larger basket, called a *taiengen,* containing stones called *batu kait.* Also used is a wooden pole fitted with a hooked metal tip, called a *pangait.* (The word *kait,* from which the words *pangait* and *mangait* derive, means "'hook"). This pole is planted in or put next to the taiengen and is tied at the top to a house post facing eastward (the direction of the rising sun, symbolizing the living). The balien wears bracelets, called *tauning,* that are covered with cast iron bells that jingle when the balien pulls down on the pangait.

In preparation for the ceremony the balien rubs her face and hands with a magical oil called *polek mo,* drinks a cup of palm wine that is offered to her, covers herself with a blanket or a cloth called a *kain burih* (see illustration in Bernstein 1997, 122), and crouches while grasping the pangait. (The feminine pronoun is used in reference to baliens because about 90 percent of them are women.) As the balien chants, her soul is carried by the batu kait on a trip in a canoe manned by the batu bubut. She visits various spirit houses, searching for the patient's missing soul. She may find that the soul is being held by a sai and may plead with it to return the soul in exchange for a small figurine called a *sulekale,* which is carved into a human shape (further illuminating the Taman soul concept). She then must make her way back, sometimes bringing the soul with her. The entire journey is narrated, usually in an archaic dialect little understood by those who are not baliens.

After emerging from under the cloth, the balien advises the patient's family as to the cause of the illness and may instruct a family member to present a second sulekale at a specified location to assure the release of sick person's soul.

The next level of therapy often involves two baliens working together. It begins early in the morning and is not finished until late in the afternoon. Besides baliens and family members, many guests will attend the ceremony and must be treated with hospitality. This ceremony, called a *malai* or a *maniang,* is similar to a mangait, but differs in that it requires the baliens after locating the missing soul to travel with a number of the patient's kinsmen and supporters to the spot where the spirit has taken it. To catch the soul, they use their equipment as they did at the patient's home, but for a different purpose. In a mangait they use the pangait and stones to enable their own souls to travel, but here they summon the spirits, bringing them near so they can snatch the patient's soul from the spirit who holds it, capturing it in a vase, bringing it back, and reinserting it into the body of the patient, who has been home the whole time.

An even more advanced technique, a *menindoani,* is a further elaboration of a mangait, in which the balien works at the patient's house to locate his soul. It is the step taken after a malai, performed only when the patient's soul is thought to be in great jeopardy, whether from illness or an inauspicious dream or death. A menindoani is the only ceremony a balien may

perform for a reason other than the treatment of illness or to initiate a neophyte balien.

Whereas the previous two ceremonies involve travel on an earthly plane, a menindoani requires the further step to heavenly flight. A menindoani uses a specific chant, *timang manik* ("rising up" chant) and a specific stone, a *batu bau* (eagle stone), not used in previous ceremonies. The chant may last over two hours, as compared with twenty to forty minutes for a mangait. The balien performing a mangait induces through isolation under a cloth or blanket a "shamanic state of consciousness" (Harner 1990, 21–39), but in performing a menindoani the balien conforms to the defining criterion of a shaman as a person who employs "a trance state in which his soul is believed to leave his body and ascend to the sky or descend to the underworld" (Eliade 1964, 5).

In another ceremony, *tabak buse,* the balien chants the timang manik but does not use a pangait, effecting soul travel instead through the beating of a drum on two consecutive nights. No firsthand, observational accounts of this ceremony exist. Tom Harrisson, whose report was based on the testimonies of three nonbaliens he interviewed in 1962, described a ceremony called *belian maniang buluh ayu sera* that corresponds with tabak buse, except that it was said to last for six nights (Harrisson 1965, 262–263). The name derives from the decorated bamboo poles used. Harrisson also mentioned a ceremony, no longer practiced by the 1980s, in which the provisions were doubled and two decorated bamboo poles were used instead of one.

The next ceremony, *mengadengi,* is performed when an illness that may not be severe is thought to be the result of spirit victimization and may indicate that the person treated will have to become a balien. It involves two or more baliens and requires food offerings contained either in a tray placed on the floor or a platform made from wooden boards and suspended from a ceiling rafter draped with a cloth, functioning as an offering structure. Also used is an unripe areca palm blossom *(mayang pinang)* to determine whether the person will need to become a balien. Chants are made to invite spirits from the surrounding area. The baliens, wearing special blouses and other finery, dance around the offering structure, accompanied by percussion rhythms made on bowls, gongs, and drums. The person being treated may join the dancing if he or she wishes. While dancing, each balien carries a bundle of leaves including one from the cordyline plant, or palm-lily *(suri),* in one hand and a bowl in the other hand. The baliens see the spirits as they descend and tap them with their leaves, at which time stones drop as if by magic into their bowls. These bowls are displayed, collected, and later given to the patient. At the end of the night the blossom is stroked with tantamu and is cracked open and examined (see Bernstein 1993, 196–197 for illustrations). If the tips are seen to be hook-shaped, it is a sign that the person must become a balien.

The Basis of Taman Shamanism

The balien does not consciously choose her profession but is selected through a process of illness, treatment, and ceremonial induction. The process begins with an indistinct illness that could affect any person, and may include such symptoms as gastrointestinal disorders or an illness that seems to 'travel' from one part of the body to another. Over time, and as treatment continues, men and young people of both sexes usually select themselves out or get selected out of the process. Those who become baliens are mainly mature, often elderly women.

Becoming a balien is considered a fate determined by sai. Balien status is not only not sought voluntarily but is avoided. In fact, anyone who wanted to be a balien would be consider inauthentic. (It is possible that some people desire to become baliens but do not admit it precisely for this reason.) Baliens' intimate and familiar relationship with the spirit domain begins with illnesses and other experiences that are interpreted over time as disturbance from a spirit. Like ordinary illnesses, the balien's predisposing condition is believed to have been sent by some spirit purposely, but not in order to harm them in the more ordinary sense, even though the target may suffer and may even die if not healed by becoming a balien.

Instead, the spirit has selected the person for victimization out of a romantic preoccupation. Signs of these illnesses are recurring sexual dreams that continue to disturb and preoccupy the victim. The victim may long for the dreamed-of person or constantly see the imagi-

Baliens and candidate gathered for a group portrait during a menyarung ceremony, Sibau Hulu, August 1986. All women wear a baju kalawat, a blouse worn only by them. No such garment is worn by male baliens. (Courtesy of Jay H. Bernstein)

nary person in waking life, following it with no awareness of having wandered off. The victim may frequently faint, cry, or feel sad for no apparent reason.

The balien's initiation is an elaborate and expensive ceremony called *menyarung.* Because of the high cost of holding this ceremony, years may elapse between the mengadengi that indicated the candidate was to become a balien and the full initiation to finally resolve the condition. In the interim, the candidate cannot use the stones, though they may reveal their identities to the person through dreams.

Up to ten baliens participate (see photo) in a menyarung, at least one of whom must be a man. It lasts for three days and nights, followed by a day and night of rest and a final night and day. The ceremony involves dancing and stone-catching as in the previous mengadengi ceremony, but is far more elaborate in its provisioning. It is a public event, attended by as many as one hundred guests at some times. The candidate must participate in some dancing and must catch a stone on the last night of the ceremony. All the stones collected become the property of the neophyte, for whom they become occult instruments for treating patients. The candidate is further initiated through the (symbolic) piercing of the fingertips with fishing hooks *(rabe),* which are then embedded in the flesh to enable the novice to feel and remove sai, and similar piercing (though not embedding) of the outer eye tissue, to "clean" the eyes and enable the person to see sai.

After the ceremony is complete, the person is formally authorized to be employed as a balien, though in practical terms she learns the various techniques one by one through apprenticeship, starting with the simplest, bubut. Practicing healing activities enables baliens over time to resolve their own difficulties.

Since much of the balien's work, including all of that performed by less experienced persons, involves no soul flight but only extractive magic, the balien does not fit the classic, primal model of the shaman embodied in Siberian, Inuit, and Central Asian practitioners. Indeed, only the most experienced baliens are able to execute the menindoani ceremony, which best satisfies the prototypical criteria of shamanism. The existence in many societies of healing regimes that include both shamanic and nonshamanic techniques led Michael Winkelman to introduce the term *shaman/healer* (Winkelman 2000, 73), which succinctly characterizes the balien.

Baliens work together in certain ceremonies and are associated loosely through their traditions, but they have no other common interests binding them together. The origin of the whole balien tradition is attributed to Piang (Grandmother) Siunsun Amas, an ancestral goddess who had the power to revive a person who had died, and who guides souls to the land of the dead. She was the first balien and is said to have dictated the rules, methods, and customs followed by baliens to the present day.

The domination of shamanic healing work among the Taman by women is intriguing to anthropologists, since it is not a peripheral cult of rebellion organized by a subaltern category of people, which is the usual explanation of such phenomena. It is possible that the key lies (at least in part) in the experiences of the sexual longing and sense of victimization often described as harbingers of their destiny by those who subsequently become baliens. It would be worthwhile to explore more deeply and compare mythologies about the origins of healing traditions among the Taman and other peoples to determine whether this female domination is part of a larger pattern.

THAI SPIRIT WORLD AND SPIRIT MEDIUMS

Thailand is a Buddhist country. The people of Thailand, like other Southeast Asian peoples, also practice an additional religion or ritual system that is centered around spirits. These spirits can be powerful protectors, and people go to them for protection from danger and help with worldly matters with which Buddhism does not much concern itself.

This ritual system has its roots in indigenous religions predating Buddhism in Southeast Asia. Having their roots in different societies, these religions were not identical to shamanism of the classic type found in Siberia. Nevertheless, in their dealings with the spirit world, Thai spirit mediums employ methods similar to those of the Siberian shaman, such as inviting the approach of the spirits and altered states of consciousness.

Spirits *(phi)* are often the ghosts of dead humans, but they can also be the spirits of natural phenomena, such as trees and streams. Important spirits are usually the ghosts of known people, either historical or mythological, and stories are told about their histories. Indeed, the more important spirits can legitimately be called divinities. Sometimes the Vedic gods of India, such as Indra and Brahma, who are important in Buddhism, are installed as protective spirits. The Erawan Shrine (more properly the Brahma shrine) in Bangkok is a well-known example. The four-faced Vedic god Brahma is installed there as the protective divinity for the site of the Erawan Hotel and has become very popular with the public as a divine patron who can grant wishes.

The spirit world is, from an orthodox Buddhist point of view, an ambiguous and potentially dangerous thing. The Thai have historically defined themselves as a Buddhist people, and Buddhism defines the spirit religion as morally troublesome, for it involves the killing of animals and is addressed to amoral supernatural forces. For instance, it is explicitly and strictly prohibited to make sacrifices to spirits during Buddhist Lent. The spirits of socially acceptable cults are thus generally said to be Buddhists or protectors of Buddhism. These spirits observe the Buddhist sabbath, defer to monks, and cannot receive sacrifices during Buddhist Lent. Furthermore, many of the important tutelary spirits of the traditional Thai state were said to be the spirits of deceased princes, whose political legitimacy rests in part on their personal religiosity.

The Thai spirit hierarchy structurally parallels the traditional social hierarchy. Under the traditional system there was a global integration of state, territorial, and domestic cults within a single ritual-*cum*-political framework.

Spirits can be classified by the type of thing they protect or rule. A preliminary classifica-

tion would distinguish three kinds: (1) spirits that protect physical spaces (territories, structures, and waters); (2) spirits that protect persons (kinship groups and individuals); and (3) spirits that are either malevolent (such as witchcraft spirits) or indifferent to humans (such as nature spirits), but capable of becoming dangerous if annoyed. This classification distinguishes spirits by their functions, but it is entirely possible for any given spirit to be both a protector of places and a protector of persons, in the sense that a territorial spirit may sometimes be adopted as a kinship spirit. Similarly, personal protective spirits are spirits who have established a reputation for effectiveness and are adopted by people seeking special protection, such as soldiers or workers going overseas.

Territorial Spirits

Territorial spirits can be ranked according to the territory they protect, in a hierarchy that closely parallels the traditional political hierarchy. At the top are spirits that protect whole principalities. Below them are spirits that protect capital cities, such as those associated with city pillars. (City pillars are large free-standing pillars enshrined at the center of a walled city.) These first two are often the same. Then there are spirits that protect smaller towns and districts, down to village-protecting spirits. Below these spirits are the spirits of neighborhoods and individual house sites. A hierarchy of structure-protecting spirits parallels that of the territorial spirits, and the two hierarchies partially overlap. Essentially three types of structures are protected: (1) public works (such as palaces, city walls, and irrigation structures), (2) Buddhist temples, and (3) houses. At the top are spirits that protect royal palaces, city walls and gates, and the like. These spirits were sometimes made to order by the colorful custom of killing and burying people under the foundations of new structures.

At an equal level of prestige, although outside the political hierarchy as such, are the spirits of the royal temples and great reliquaries, also sometimes made to order. For example, the chronicle of Wat Lampang Luang in northern Thailand recounts that four prisoners were beheaded and buried under the foundations of the reliquary with their heads facing in the four directions. At a lower level are the spirits of ordinary houses (as opposed to house sites), which live in the master bedroom. The house itself is fairly crowded with spirits. In addition to the spirit of the whole house, there are spirits for the staircase, the threshold, the kitchen, and the rice pot, among others. At all levels these spirits, and the territorial spirits as well, serve to mark centers and boundaries. They are meant to protect and keep in what is wanted in a place and keep out what is not wanted, such as robbers, disease, and evil spirits. If the bedroom and kitchen are each in their own way the center of the home, then the front staircase and threshold are the boundary. If the city pillar and palace are each a center of the capital town, then the city walls are its boundaries. Territorial spirits of the political system are likewise found not only in capitals, but also high in the mountains at the frontiers, along the routes by which enemies invade.

Individuals and communities interact with the spirits for various purposes on many occasions. Spirits that protect communities receive collective offerings. Individuals usually interact with spirits to ask their help with problems and challenges in life. Spirit priests and mediums, of course, interact with spirits as part of their duties. Spirits that protect communities receive offerings on a scale commensurate with the spirits' status in the social and territorial hierarchy. When made collectively, these offerings are given to the spirit by a man known as a spirit priest, sometimes in cooperation with a spirit medium or shaman. Priests are men who have been trained in the proper rituals and means of addressing both their specific spirit and spirits in general. In villages, such priests are usually ordinary farmers. In large cities they are sometimes professionals who also act as healers and diviners. Local spirits receive frequent regular offerings that can be given by a priest acting alone, or by whole communities in large sacrificial rituals. These sacrifices are given in regular cycles of years. Some villages seal off their territory with sacred thread during their sacrifices, clearly protecting boundaries and defining the community.

Individual houses have protective spirits in little shrines (spirit houses) on their sites. These spirits usually receive daily food offerings, given

by a woman of the household. The same spirits that receive collective offerings can also receive private offerings, and frequently do. An individual who needs help with some problem can make an offering to the spirit and ask for its help. It is common, for instance, at examination time to see the spirit shrine of a university covered with flowers offered by students asking for a little extra help in passing their exams. In the case of more serious problems, individuals will often approach a spirit through its priest or a medium, or both. This is especially true for spiritual healing, because illness can sometimes be a sign that a spirit has called someone to be his or her (usually his; most spirits are male) medium. The only way to avoid chronic illness, madness, or death is accept the spirit's call. It is not at all clear, however, that the initial illness or the initial possession state is in any way related to any modern medical (particularly psychiatric) disorder.

Spirit Mediums

Spirit mediums, practitioners who exhibit many shamanistic features, have a personal relationship with a specific spirit. They are usually women, and their spirits are almost always male. They are usually from peasant, working-class, or lower-middle-class backgrounds. The medium acts as the spirit's "riding horse" or "seat," and is a kind of servant to the spirit. On the other hand, spirits will come at their mediums' call. This gives mediums the possibility of acting as professionals. Professional mediums are popular at all levels of society and are consulted by many people seeking medical treatment, advice, and the location of lost objects, or wishing to confer with deceased family members. Mediums who serve as the seats of protective spirits play an important role in maintaining social solidarity and transmitting cultural knowledge.

The social status of mediums varies, depending on the social status of the observer and the origins and role of the medium herself. In general terms, the lower one is in the social hierarchy, the higher the status of a medium appears to be. The higher the status of a medium's spirit and the more prestigious a medium's clientele, the higher the status of the medium. Other considerations include the religiosity and modernity of an observer's orientation. Buddhism regards spirit mediumship as a bad thing in and of itself. Pious people are therefore likely to regard mediums as people of bad character—not so much low in status as morally deficient. A person of consciously modern orientation is likely to regard mediumship as superstitious claptrap. On the other hand, many modernists—like many Buddhists—regard the whole spirit religion not as false, but as a waste of time.

Spirit-possession rituals vary, but they all have certain basic features in common, which are similar aspects of shamanistic ritual. Namely, the medium enters a receptive state, invites the spirits, and has initial possession. Then the spirits interact with the people present. When the session involves a private audience of people seeking advice, the session is usually fairly calm and quiet. In the case of large-scale sacrifices, the rituals can be quite dramatic. The mediums dress in their spirits' attire, which is that of traditional noblemen, in preparation for possession. Once they have entered their mediums, the spirits receive large, bloody offerings of sacrificed animals, such as buffaloes, pigs, and chickens. Activities are accompanied by traditional musical groups playing spirited music. Spirits (embodied in their mediums) can become very aggressive during a sacrifice, swaggering about with swords, threatening people present, and eating the raw meat of the sacrifice in bold displays of machismo, authority, and wildness.

Spirits as Guardians of Morality

In addition to serving as protectors and benefactors, spirits can also be guardians of morality. As such, they punish people who engage in certain kinds of immoral conduct by making them sick or killing them. Household spirits are particularly concerned with sexual morality. If a member of the household engages in extramarital sex, the spirit will afflict him or her. This function is tied to the household spirits' role as protectors of the family. Spirits of the fields and forest are usually not so particular about these things. The chronicles do tell, however, of a king who had an affair with a friend's wife while visiting his court. To punish him, the forest spirits caused him to be drowned in a

stream as he returned home. Since he was the ruler, the king's misconduct would upset the moral balance of his kingdom. What stands out in both these cases is firstly, that the spirits concern themselves with people at the spirits' own level (household spirits oversee household members, territorial spirits govern territorial rulers), and secondly, that the spirits' actions are aimed at maintaining social harmony by punishing those who violate the norms of social relationships.

Spirits of the Natural World

Spirits of the natural world are another important type of spirit. Spirits inhabit the world of nature in great profusion. Most of them are unknown to humans, who rarely come into contact with them. Each intrusion into the world of nature, however, carries with it the risk of encountering and angering one of these spirits. Thus people do not like to go into wild forests, and when they do enter a forest, they take care not to engage in activities that might offend the spirits, such as urinating on them. An offended spirit will make its displeasure known by striking down the offender through illness or accident. Every human-inhabited space, however, was once a wild place, and as populations move and grow they intrude into new wild spaces, requiring the domestication of the spirits there. Thus, whenever a piece of woodland is cleared for cultivation or habitation, the person who clears it must make an offering to the spirits there and entreat them not to harm him. He then must beg them to stay on as protective spirits and erect a small shrine to them.

Malevolent Spirits

Witchcraft spirits are found in areas that have ancestral spirits. They are a type of descent spirit gone bad. It is said that they are ancestral spirits that became malevolent because of the neglect of their lineages, who did not perform the necessary sacrifices to them. These spirits may go out and attack other people, eating their livers until they die. The matrilineal descent groups of people who have these spirits are sometimes ostracized from villages and live in separate communities. Witchcraft accusations historically served as a mechanism of social control, often of a political nature. There are also some other extremely unpleasant spirits, such as the spirits of people who have died violent deaths.

Overview

AUSTRALASIA AND OCEANIA

This regional section includes entries for shamanistic beliefs and practices of the people who speak mainly Austronesian (Malayo-Polynesian), Papuan, and Australian Aboriginal languages. Geographically it refers to the peoples who live in Micronesia, Melanesia, Polynesia, and Australia, as well as to Austronesian speakers in Taiwan. It covers numerous islands over a vast area in the Pacific and the Australian continent in the south.

Geography and Language

Micronesia covers the Federated States of Micronesia, Guam, the Marshall Islands, and other island nations in the Pacific; Melanesia includes Fiji, New Caledonia, the Solomon Islands, Papua New Guinea, Papua and Vanuatu. Polynesia consists of New Zealand, the Cook Islands, Easter Island, French Polynesia, Samoa, Tonga, Hawaii, and other islands. Located in the northern tip of this Oceanic region, the indigenous peoples of Taiwan such as Puyuma and other ethnic minorities are also included in this section, as they speak Austronesian tongues related to other Oceanic languages.

Except for the languages of various peoples in New Guinea, Australia, and other nearby regions, the peoples of this vast Pacific region have a common Austronesian linguistic origin, although the variants number over a thousand. Australasia and Oceanic lands are covered by variety of terrain, such as tropical rain forests, deserts, delta plains, flat grasslands, and mangrove swamps. High humidity, hot temperatures, and severe weather are characteristics of this region. Moreover, malaria and land erosion are two major concerns of the people of some of these islands. Some members of these Pacific peoples are wage laborers in an urban environment, but the principal economic activities are subsistence farming and fishing. Many of them are good gardeners and grow breadfruit, taro, coconuts, bananas, yams, sweet potatoes, and other crops as the main staples, in addition to raising pigs for ceremonial reasons. Some ethnic groups are hunters and gatherers in remote regions. Their societies vary from small-scale bands and tribal groups of egalitarian social structure to chiefdoms, all existing today within various nation states.

History

Based on the study of their languages and cultures, and material traces of their past, it is generally accepted that Australasian and Oceanic peoples originated from Southeast Asia, although there are still disputes about the origins of these people. People have been in Australia and New Guinea for at least 60,000 years, but spread to other parts of Oceania much more recently. Numerous tides of migrations by sea took place from prehistoric times on, and the various peoples developed languages and cultural characteristics over millennia as they lived in isolation on different islands. Since the sixteenth century, various European nations such as the Spanish, Portuguese, and Dutch

dominated the region. The Australian continent was claimed for the United Kingdom in 1770 and first colonized in 1788. In the nineteenth and twentieth centuries, colonial powers such as the United Kingdom, France, Germany, and the United States dominated the South Pacific, and later the Japanese joined in the colonial game. This colonial encounter eventually led to the Pacific war, or World War II, in which the Japanese and the United States confronted each other in the Pacific. The United States gained many islands in Micronesia after the Japanese lost the war, and many of them are still U.S. territories. Since the 1970s, if not before, many island nations have achieved independence, although these nations are still dependent to a large extent on former colonial powers for economic and military aid.

Religions

During these centuries of European and American colonial encounter, most of the people adopted English or French as their national tongue and Christianity as their religion. As noted in the entry "Oceania: Rituals and Practitioners," Islam is also present in Papua (western New Guinea) due to the immigration of Muslims from Java. As the British brought many South Asians to Fiji to work in the sugar industry, Hinduism also exists in the region. Moreover, the Japanese also brought Buddhism and Shinto to Micronesia during the Japanese occupation from 1920 to the 1940s. Nevertheless, none of these major religions, with the exception of Christianity, has managed to convert large numbers of indigenous people.

Christian missionaries have been extremely active in providing material assistance; the price of this assistance, however, has often been discarding or at least drastically changing indigenous beliefs and practices. Most of the Christian denominations (including the Roman Catholic Church, the Church of England, the Mormons, and the Methodists) have taken root in Australasia and Oceania. Christianity has introduced new symbols, which have had a profound effect on indigenous religious beliefs and practices, yet elements of traditional religion have blended with the new beliefs and still coexist with Christianity in religious practice.

Despite these changes, indigenous religions have in various ways and to various extents survived to this day, and shamanistic elements can be detected in the myth, beliefs, and rituals of these peoples, as these entries demonstrate. As for the indigenous peoples in Taiwan, the conflict and coexistence between their traditional shamanistic beliefs and Buddhism were and still are apparent. Like the conversion to Christianity among the Australasians and Oceanic peoples in other regions, many Atayal and the Puyama in Taiwan had to adopt Buddhism, the religion of the colonizing Chinese, due to socioeconomic reasons as well as a part of the colonial assimilation policies. Yet Buddhism is an eclectic religion and these indigenous people managed to keep their spirit worship and other practices even after they became Buddhist.

New religious movements in these regions have involved syncretism between indigenous religions and Christianity, which also have brought both spiritual and material culture from the West. For example, cargo cults, which embody a kind of millennialism, spread in Melanesia after contact with the colonial powers, as mentioned in the entry "Oceania: Rituals and Practitioners." These movements, less influential today, seek to reconcile local egalitarian values of sharing and European inequality and capitalism through spiritual means. This kind of syncretism still continues, manifesting in various movements.

Shamanistic Practitioners

Many Pacific societies have shamanistic figures, whether they are called healers, priests, witches, sorcerers, diviners, or mediums. These religious specialists either have positive functions in the community or cause harm to the people through the control of supernatural powers. Some religious specialists use soul journeys and communicate with spirits in dreams, as described in the entry "Dreams and Shamanism (Papua New Guinea)." Shamans among Australian Aboriginals are called "men of high degree," "medicine men," and "clever men" (or clever people, since women do play this role to some extent), as described in the entry "Australian Aboriginal Shamanism." They

can commune with the dead, see spirits, fly through the air, and heal or harm, thus resembling in many ways shamans in other parts of the world. The *tohunga* (priest) among the Maori of New Zealand could be a specialist in magic, knowledge, or healing; in their functions as shamans they spoke as mediums, having received communications from the gods. In Oceania various practitioners such as healers, priests, mediums, and prophets have shamanistic functions. Spirit mediums in Tikopia in Polynesia enter into trance and serve as mouthpieces of gods or spirits of the dead, as noted in the entry "Oceania: Rituals and Practitioners." Puyuma shamans in Taiwan, discussed in the entry "Puyuma Shamanism," also function as therapists, exorcists, and sometimes soothsayers through their communication with the spirits.

Thus the shaman figures of these societies in Australasia and Oceania utilize their supernatural powers and control spirits embedded in indigenous beliefs and practices. There are thousands of ethnic groups in the regions covered, and easy generalization would be misleading. Nevertheless, the shamanistic elements in their practices are strong enough that it makes sense to see these shaman figures as at least comparable to shamans in other parts of the world.

Mariko Namba Walter

Introduction to the Entries

In the entry on "Dreams and Shamanism (Papua New Guinea)," the major feature emphasized is the importance of dreams as sources of spiritual information and hence as an integral part of the shaman's practice, from the initial vocational calling to analyzing the dreams of others to dream travel in search of information from ancestors. The author notes that for the people of Papua New Guinea, success in hunting, war, and gardening depends on good relationships with supernatural beings, and therefore "shamans," those specialists who use dream work as a type of soul journey, are important for their ability to facilitate these relationships. It is also noted that there is a wide variation in religious belief systems among the many different peoples of Papua New Guinea, but that ancestors, ghosts, and other spirits who resemble human beings generally play a role, as do spirits associated with specific places; the belief in witches and sorcerers is a common theme, and in some areas totems and deities are accepted. The shaman is thus one of a number of religious specialists who may be called upon for good or for evil. Dreams are understood to be omens of the future, but they serve diagnostic as well as prophetic purposes; people believe in some areas that spirits of nature—trees, stones, and water—can cause illness and that the dream of a shaman can reveal which spirit has caused an illness and what the appropriate ceremony would be. As Christianity has spread throughout Papua New Guinea, it has been combined in various ways with local shamanic practices and beliefs. Among the Asabano, for example, there are now "Spirit women" who are in essence Christian shamans and whose practice includes various Christian artifacts and prayers; moreover, it is now the Holy Spirit who is the bestower of game and who appears in hunters' dreams.

The entry "Oceania: Rituals and Practitioners" includes a widespread area: Micronesia, Melanesia, and Polynesia. Despite the great diversity of languages and cultures in this area, the entry brings out that there are certain religious themes in common. Primary among these is the relationship of the Oceania people to their land, attested to in myths and reinforced in ritual. As noted above in the entry on Papua New Guinea, relationships to spiritual beings, including ancestors, is important for fertility in gardening and other economic subsistence enterprises. Ritual specialists are necessary to ensure or to restore the health and well being of the land and the people. The author notes that throughout Oceania people have traditionally identified with a particular locale, and this relationship has been reflected in myths and rituals and ideas concerning gods and spirits. The importance of the relationship to the land has led to the maintenance of life-giving relationships and motivated participation in the rituals of traditional religion and Christianity, and more recently has led to the emergence of new religious movements.

In Oceania there are a variety of rituals for crops, gardens, hunting, fishing, and healing, for which different types of practitioners are employed, such as healers and mediums. The healer is always a diviner who uses ritual, often including dreams and trance, to diagnose and treat illness.

Mediums, sometimes called shamans in the ethnographic literature, communicate with spirits and are able to enter into an altered state of consciousness. Moreover, their work, like that of many shamans in other cultures, is directed toward improving the well-being of the community as well as that of the individual.

The entry "Australian Aboriginal Shamanism" continues some of the same themes noted in the previous entry. The term *shaman* is rarely used by those who study this area; rather the author describes a "clever" person who has shaman-like knowledge and special powers but does not go into trance nor have political power. "Clever" men (and sometimes women, though most of the literature up to this point has focused on men) have advanced psychic abilities, and only they can intervene between ordinary people and dangers of a supernatural kind. The clever person is described as "one who sees" and has a special relationship to the Rainbow Serpent, a prominent mythological figure in Aboriginal cosmology. Such a person therefore has special powers that the ordinary person does not have: They may hold off floodwaters, change shape, revive a corpse, send storms and floods, and the like. They have a training that is similar to shamans in Eurasia: Their special powers are noticed in childhood, and in their initiations they encounter a spirit or have special dreams and visions. They undergo a ritual "disembowelment" and have their insides replaced by magic substances, such as quartz crystals. After this death and disembowelment, the initiate will spend time alone in a deserted place, meditating.

Elements in making a clever person in southeastern Australia include going into a cave and meeting supernatural beings, the growth of feathers, a sky flight, quartz crystals rubbed or inserted into the body, and a magic rope used to climb into the sky. (In Eurasia, a classic concept of shamanism is the cosmic tree, connecting the three worlds, used for the ascent of the shaman, particularly during initiation).

There is some question in the literature whether the clever person is also a sorcerer, or whether they are separate specialists. Among some Aboriginal peoples a clear distinction is made, and one way of making a clear distinction is that, though clever people may sometimes do harm, their main function is to heal. Substance insertion and substance extraction are major practices of these healers; they can retrieve lost souls with the aid of spirit helpers, they see with the inner eye, they go on journeys while asleep, and they can even travel on a spider's web. Clever people thus exhibit many of the properties of "shamans," including the practices of initiation, soul journeying, divination, clairvoyance, seeing diseases in the body, and healing. However, they do not go into altered states of consciousness, though some do use dreams (as in Papua New Guinea) to follow a sick person's spirit, catch it, and return it to the body.

The New Zealand Maori, covered in the entry "Maori Religion," were a Polynesian people who began to arrive in New Zealand, about a thousand years ago according to myth and legends. Yet it wasn't until around the middle of the fourteenth century that fleets of Maori arrived and settled. They based their social organization on the belief that they descended from those who came in a "great fleet," which arrived at that time. The deities worshipped by the Maori are found among other Polynesian tribal groups, and in contrast to Australian Aboriginals, their traditional religion was polytheistic, not totemic. Membership in the Maori tribe is by tradition based on common ancestry, and this basis is reflected in the Maori worldview, which connects everything through ancestors.

Traditionally, the concept of *tapu* (holy) has permeated their religious life; objects (and people) could become tapu once in contact with supernatural beings or aspects of the supernatural. For this reason priests have had very strong tapu, which also gave them mana, the power over fate as mana is a concept where power is combined with sacredness. Mythology and stories about cultural heroes kept these concepts alive. The ‘*tohunga,* "priest," was a specialist in art, knowledge, magic, and healing. The tohunga were able to diagnose the sources of adverse events often due to witchcraft or the breaking of a tapu. In their capacity as healers, they were mediums of their own local gods *(atua),* and in a shamanistic manner they relayed messages from these deities, who communicated by whistling. As elsewhere, Christianity made inroads into Maori religious life, and several syncretic religious developments have resulted. Nevertheless, kinship and the concept of tapu are still important parts of Maori religious life.

The Puyuma are an aboriginal group living in the southeast area of the island of Taiwan. They speak an Austronesian language and are divided into two groups; the village of Puyuma, where the group lives called "born of a bamboo," is described in the entry "Puyuma Shamanism." In the entry, a distinction is made between "religious practitioners," who are bound up with mythical founding ancestors and attached to their territory and who perform those rituals that recur every year, and "shamans." Shamans, who currently are always women, play the role of therapists, exorcists, and sometimes soothsayers. There are three categories of *birua* (spirits): the *kaqisatan* (On High), the *kaqaulasan* (the Aulas), and the "homeless." Only the shamans have access to the *kaqaulasan,* allowing them to invoke the spirits of their ancestors and of dead shamans, as well as their elector spirits. The shaman candidate undergoes the usual initiatory process: visions, dreams, illness. Her investiture is a kind of death and rebirth. A shrine is built by the men of the shaman's household; it holds among other cult objects a special bag with a rattle that is used to communicate with the birua and to recall a soul. There is no formal training, since it is said that invocations come to the initiate while she sleeps, but there is a period of apprenticeship.

At the end of the nineteenth century, hunting was the major occupation of men, and shamanism was built around this activity, with men as shamans, providing spiritual support for this activity. With the change from hunting to agriculture and the influences of Japanese colonization, men now do the community rites, whereas women are the shaman healers. Today, the author notes, the shamanistic practices of the Puyuma can be seen as falling somewhere in the middle between classic shamanism and a possession cult. When Puyuma shamanism was shaped by hunting, it shared features with Siberian shamanism as observed in the nineteenth century; the current form is closer to the possession cult that characterizes Korean shamanism.

The entry "Atayal Shamanism" discusses another one of the Taiwan aboriginal tribes who focus their religious practice on ancestor worship, with the ancestors as a source of moral authority, propitiated with prayers and sacrifices. Again there are two types of religious specialists involved: the *gaga* chief, male, who acts as a priest, responsible for rituals, and the "shaman," female, who performs exorcisms, makes rituals for weather-related problems, and most importantly diagnoses and treats illnesses. The healing functions of the shaman, including the recovery of lost souls and exorcism of evil spirits who are creating illness, are made possible by the shaman's ability to communicate with ancestor spirits. Head-hunting is also an important part of Atayal ancestor worship because it is believed that head-hunting adds to the soul substance of the village, increasing its fertility and viability for the future. If a member of the head-hunting expedition party is killed, it is believed that the enemy now controls his spirit, and hence it is a source of danger; the local shaman is called upon to perform an exorcism to prevent his spirit from entering the village. Although shamans are not as powerful as gaga priests, these practitioners contribute to the health and safety of their community.

Eva Jane N. Fridman

ATAYAL SHAMANISM (TAIWAN)

The Taiwan (Formosan) aborigines, an indigenous people who number around 400,000 people (less than 2 percent of the entire population), inhabit the Central Mountains, the Eastern Coastal Region, and Botel Tobago Island (Government Information Office 2001). These tribal groups are the Atayal, Saisiyat, Sedeq, Ami, Bunun, Tsou, Kanakanabu, Saaroa, Rukai, Puyuma, Paiwan, and Yami (Mabuchi 1953). They were called Takasago People by the Japanese (Takasago is an old Japanese name for Taiwan), Mountain People by the Nationalists, and simply "nonsinicized people" by the Manchu of the Ching dynasty (1644–1911 C.E.). Physically, they are considered to be of Southern Mongoloid stock. Their language belongs to the family of Austronesian languages, but culturally they are Indonesian. Their primary subsistence pattern is slash-and-burn agriculture, based principally on the cultivation of cereals and root crops. Hunting and fishing are supplemental activities.

In this entry, the Atayal are discussed as representative of these aboriginal groups in their head-hunting and shamanistic practices, which are major aspects of their religious belief system (Ho 1956). The source of the account of shamanic rituals is an interview by the author in March 2003 with a seventy-four-year-old Presbyterian minister named Watan-Tanga who lived in Taoyen Hsien, Fushin Hsiang, Tsojin Tsun.

Shamanism

In the religious beliefs of the Atayal, the ancestral spirits are the most important group of deities. They are the objects of prayer and sacrifice. In community-based rituals, such as head-hunting and agricultural rites, the *gaga* chief, the leader of ritual groups, acts as a priest. He is in charge of most of the rites. Shamans *(phgup),* on the other hand, are involved in exorcisms for a victim's family and handle weather-related disasters. Shamans are very active in the diagnosis of causes of illness, treatment of illness, recovering of lost souls, and exorcism of evil spirits associated with family or individual affairs. The gaga priests are men only, whereas the shamans are women. The gaga priests' function is on a permanent basis and consists of regular ritual activity. The shaman's performance is only temporary and for specific reasons.

It is moderately difficult to become a shaman. A woman must take lessons from a master. The student pays the master a tuition fee, in the form of strings of shell beads. After the training, if she passes the examination, she will become a shaman. Therefore the social status of shamans is not as high as that of gaga priests. The shamans treat any kind of sickness, such as headache, stomach problems, or even toothache. There is no trance, nor helping spirits; only ancestor spirits are involved. The shamans do receive payment for their work. The form of the payment is a string of shell beads, sometimes a "bundle" (ten strings of shell beads), sometimes a skirt (five bundles, or fifty strings), depending on how long and how hard the work is.

Shamans are like doctors in that their main function is to cure sickness. They communicate with the ancestor spirits, using prayers and divination to ask whether a sickness can be cured, the cause of the sickness, and the nature of the sickness. The ancestor spirit answers only yes or no. The shaman has a device made of a piece of bamboo stick and a wooden board, to which a glass ball *(ureyanan)* is attached. When the ball falls it means "no"; when the ball stays on the joining point of the bamboo and the wooden board, it means "yes." For healing sickness, shamans use a variety of natural items such as the gall of a bear, leaves of a peach tree, the tender branches of a vine, mugwort or artemisia leaves, and calamus roots.

Shamans have special power in dealing with other sicknesses. For example, in the case of a very sick person, who is about to die, they tie a string between the sick person's hand and the foot of a chicken. They kill the chicken by beating it to death. It is said that the life of the chicken will go into the body of the sick person, who will then survive.

Head-hunting trophies were permanently preserved in the public head shelf of the Ulai village, a Saqoleq subgroup of the Atayal. (The Album of the Customs of the Taiwan Aborigines, vol. 1, plate 50, Ushinosuke Mori)

If a farmer finds that someone is stealing his crops, he asks a shaman to come and say a special prayer. After the prayer, the thief's hands and feet will become numb and not able to move, and therefore he will no longer be able to come to the farmer's field to steal. The same method is used to prevent birds or beasts from eating the crops. Shamans are also called upon in weather-related emergencies; when a drought happens, they butcher a pig, letting its blood flow into the river. People then jump into the river and splash the water with their hands, symbolizing raining.

Head-Hunting

As noted, the most important spirits for the Atayal are the ancestral spirits, ancestor worship being the core of the Atayal religion. The ancestor spirits are the sources of moral authority and the object of prayers and sacrifices. The Atayal called head-hunting *megaga,* which means "to follow the rules and demands of the ancestral spirits." Hence, head-hunting by the Atayal people was motivated by their belief in the soul and the spirit world. Early research records mentioned that in some subgroups of the Ataya, human heads were needed at sowing, harvesting, and thanksgiving rituals—demanded as a sacrifice to promote the fertility of crops and the prosperity of the human population (Kojima 1915, 61).

Head-hunting also added to the soul substance of the village, as newly acquired heads were believed to increase the power of resistance to disease and encourage the fertility of the villagers as well as agricultural fertility. Moreover, it was believed that the soul of the head one has taken will serve the hunter in the next world as a slave. A case is known in which

a person who wanted to die went head-hunting before his suicide so that he would have a slave in the next life.

When the need for head-hunting arose, it was customary to organize a head-hunting party, usually consisting of a dozen men. A man of experience was chosen as a party leader for the expedition. He would visit the village chief to get permission for an expedition and borrow a village-owned good luck amulet *(tsinetto).* This amulet was a bag made of leather containing the enemy's hair, fire-making tools, and a water container made from a gourd to use for headhunting rituals.

After permission was granted, the men discussed their head-hunting strategy and performed a ritual to form a party. Then the participants prepared the hunting weapon, head-carrying sack, and other items, and returned to base camp. That night they would consult an oracle through a dream *(mita-supi).* The dream was regarded as a revelation from the ancestors. When the men dreamed of receiving gifts from others, young girls coming to visit, or drinking wine, these were considered good omens. On the other hand, giving gifts to others, breaking things, or teeth falling out were seen as bad omens. A person who received a bad omen might drop out of the expedition.

Next morning, all the men who had received good omens performed a purification rite. In front of the shed, the leader faced the person holding a water container in the left hand, and a camphor branch in the right hand. He prayed to the spirits of ancestor, "Please let us have a good bird omen." On the way to the destination, the bird omen *(mita-sileq)* was consulted for the expedition. The Atayal regarded the bird called the *sileq* bird as a divine messenger who could foretell good and bad luck. It was a good omen when a sileq bird flew in front of the expedition, keeping a certain distance, and called out with a smooth cry. On the other hand, if the bird was flying on one side alone, calling with a harsh cry, or cut across the march of the expedition, these were bad omens.

When they arrived near their destination, all members faced in the direction of home in order to pray to the spirits of the ancestors, "Blessing us return in triumph." After the attack and gaining a head from a nearby settlement, they quickly went home. The head-hunting feast followed with songs and dance, encircling the head itself as if they were welcoming a new spirit. After one or two days of celebration, the head would be moved to the public head shelf. A village-wide memorial service would be held there. Every family brought their best offering to the spirits of the victims, and the village chief addressed the spirits of the victims saying, "Please stay here. We will treat you the best. Tell your relatives and friends this is a wonderful place to stay. Ask them to join you." After the ritual was completed, members of the head-hunting party would perform the last head-hunting dance to end the celebration. Next day, the headhunters and all the villagers would go together to hunt. When they catch game, part of the game would be offered to the spirits of the heads on the public shelf. After this hunt, the head-hunting expedition was officially completed, and people would return to their normal life.

When a member of the head-hunting party was killed during the raid, the head of the victim had to be cut off and discarded at the outskirts of the village in the dark. The villagers had to destroy the house and belongings of their slain comrade, because the enemy, who inevitably will do evil things to the villagers, controlled his spirit. At this point the village shaman was invited to perform an exorcism. Both the gaga priests and the shamans exhausted every means to stop a killed person coming back into the community.

Presently in Taiwan, the practice of head-hunting is completely outlawed. Instead of human head-hunting, youth hunt animals in "games" to exhibit their skill and bravery. These Australasian people maintain their communities and live among themselves in special regions or on tribal reservations in Taiwan. These reservations were strictly maintained for the tribal peoples before 1945 by the Japanese administration but are now open to other people. They maintain their tribal identity—in practices such as costume—only in festivals or special occasions, such as the New Year celebration. These people, especially those who are over fifty years old, still speak their own language as well as Chinese (Mandarin). The majority has converted to Presbyterianism but a small portion of the population, especially the old, still keep their religious identities. Only a very small percentage of the population believes in Buddhism or Daoism. There is no signifi-

cant revival of traditional, tribal beliefs and ritual except for songs and dances.

AUSTRALIAN ABORIGINAL SHAMANISM

Many of the techniques that a person acquires in order to become a recognized shaman are similar cross-culturally: the ability to enter an altered state of consciousness, to act as intermediary between the seen and the unseen worlds, to be a "supernatural specialist," to wield power, and to bring back knowledge from other realms. Both healing and harming are qualities attributed to the shaman, making the shaman a person of high degree in a special sense.

With regard to Aboriginal Australia, there is some debate about whether the term *shaman* should be employed, and in fact the term is rarely used. A. P. Elkin (1977) called them "men of high degree" and used "medicine man," "doctor man," and "clever man" interchangeably with "man of high degree." He wrote, however, that the man of high degree is not peculiar to Australia, and likened him to the Amerindian "man of power." Other Australian aboriginalists have stated adamantly that "clever" men are not shamans. The reasons they give mainly center on the definition of shamanism as incorporating ecstatic possession, the role of the shaman as specialist, the shaman's connection with political power, and the perception that shamans are in some way abnormal. The Australian clever person possesses a high degree of normality according to the mores of the group, does not become ecstatically possessed, and has no political power. Although he must undergo a life of self-discipline, training, and social responsibility, he enjoys no extra privileges and, apart from his special powers, leads a life like anyone else in his group. Also, "clever" powers are possessed to some degree by many people and are sometimes spotted in children as inherently present. Some actions, such as pulling certain plants out of the ground, or killing a living creature such as a bat, can create heavy winds and rain without the intervention of a clever person. A more recent objection to the term is that shamanism is linked with the New Age, and any such association may pave the way for possible trivialization of Aboriginal culture and the subsequent neglect of important contemporary social and political issues concerning indigenous rights.

Nevertheless, most agree that clever people display shaman-like knowledge, skills, and qualities. They can commune with the dead, see spirits, bilocate, shape-shift, fly through the air, and learn what is happening at a faraway location, and they have the ability to heal and to harm. A person is clever and of high degree because he has been admitted to secrets not disclosed to the ordinary person. In some places, clever people are called upon to interpret dreams, recover missing objects, predict future events, explain unusual phenomena, and protect people from psychic attack. This type of access to information is not considered extraordinary, but only clever people are considered experts on such subjects. Where clever men differ from others is in their more advanced psychic abilities and their heightened perception and awareness of the world around them.

Uluru, formerly Ayers Rock, Australia. (Corel Corporation)

Although the literature emphasizes *men* of high degree, and thus the pronoun *he* has been used so far, this may be a narrow and restricted view of clever people. Women can also be clever (Bell 1998; Payne 1993; Reid 1983). Indeed, women possess curative knowledge for the benefit of both males and females and have other abilities similar to those of men, a fact that eluded earlier studies conducted by male researchers. In the areas of Australia where there are reports of clever women or doctor women, women's expertise is thought to be principally concerned with women's business, midwifery and menstruation, though also with the practice of healing and love magic.

Although most Aboriginal people are conversant with various bush medicines, and women have the most consistent responsibility for their preparation and application, only a clever person can intervene between ordinary people and dangers of a supernatural kind. A powerful person, operating primarily at a spiritual and social level, is usually only called upon to treat illnesses that do not respond to the bush medications. The ability of powerful people to cure comes from the possession of spiritual powers or from powerful objects given to them by spirit beings, as well as from their astute knowledge of events and relationships within the community.

Regional names for clever people vary according to linguistic groupings (Hume 2002). In the Western district of New South Wales they are called *karajji,* in central western New South Wales, *wireenan* or *walamira;* in Queensland, *wingirin;* in Victoria, south of the Murray, they are known as *kuldukke.* In the Kimberley area of northwestern Australia they are known as *banman* or *barnmarn,* in the Western Desert as *mabarn,* in northeastern Arnhem Land as *marrngitj,* and in western Arnhem land as *margidjbu.* In southeastern Australia, the Dieri call them *kunki,* and the Wiimbaio call them *mekigar* (from *meki,* "eye," "to see"—"one who sees'). The Wiradjeri refer to such a man as *wiringan* (powerful man), or *buginja*

(spirit, or spirit of the whirlwind), or *walamira* (clever person). He is clever in the sense that he has intellect and shrewdness, but he also has the ability to receive help via spirit and psychic agencies. The clever man also has a special relationship with the Rainbow Serpent (a prominent mythological figure in Aboriginal cosmology) and its powers.

Whenever clever people appear in myth they have power beyond that of most other figures mentioned. These powers include keeping floodwaters at bay temporarily, changing shape more rapidly than any other characters in the story, reviving corpses, knowing what is happening at a distance, sending storms and floods to punish people, and summoning their personal magic snake to either protect themselves or to harm others.

Becoming "Clever"

The training of clever people varies from one region to another. One can become clever in several ways: by inheriting powers (although individuals still have to prove themselves equal to the task), being "made" by another clever person, by a personal quest, a psychic experience, or being "called" by the spirits of the dead. Whatever the way, however, a reputation for special powers is essential.

The making of a clever person can be a long and complex process. Other clever people might keep their eyes on a promising young candidate who has psychic abilities or experiences, or on a child with a reflective nature and a more than passing interest in tribal lore. By the age of ten or twelve years, someone who shows promise might be taken to an isolated spot and have his assistant totem or spirit companion "sung" into him and be taught how to use it. But it is more common for a young man with power to be required to pass through some of the stages of initiation before another clever man assists him to release his power. This, again, may vary from one region to another. A potential clever man might have his vocation confirmed by significant dreams or visions, or by encountering a spirit. Such experiences might be further encouraged by sleeping in isolated places or near the grave of a deceased clever man.

The procedure for the making of a clever man mirrors shamanic procedures in other cultures. Typically, he is taken by a spirit into another realm where he undergoes disembowelment and his insides are replaced, usually by substances such as quartz crystals (Elkin 1977). Alternatively, objects may be magically "hammered into his body" by a group of older medicine men. Thus transformed, he has the ability to use the power in these new innards to do his magical work. Quartz crystals and other magical substances such as a magical cord are usually put inside a medicine man during his "making," sometimes physically and sometimes metaphysically.

In eastern Australia, it was reported that magical substances such as quartz, pearl shell (both closely associated with the Rainbow Serpent), and special stones were inserted into a novice through an abdominal incision or a hole made in his head, or were rubbed or pressed and sung into his body and limbs.

Among the Gunwinggu of western Arnhem Land, a clever man obtains his power mainly from spirits of the dead. A deceased relative inserts into his head a small thin rod, like a bamboo spear, and breathes power into all his body apertures, telling him to use this for healing purposes. Only a man thus transformed by the spirits could survive such insertions. When the clever man "sends" these things to others, they become very ill and die, unless countermagic is used. Generally, except in the case of clever men, insertion leads to illness, and extraction leads to cure.

After a ritual disembowelment and "death" at the hands of the spirits, the clever man might spend lengthy sojourns in the desert or the bush in order to meditate alone and develop his psychic powers. He may acquire a spirit familiar or a spirit assistant. Djiburu, an Arnhem Land clever man, said that his powers came from spirits called *gulun,* who stupefied him for five days and operated on him while he was asleep, inserting a kangaroo fibula into his thigh, then rubbing away the wound with water. When he awoke, he recognized that he had been "made" because of his ability to see through objects. The clever man's knowledge and powers would become more fully developed over many years, during which time he was given instruction by others in the art of bone-pointing, sorcery, diagnostic techniques, the cure of illness, and psychic healing, as well as how to use his quartz crystals most effectively.

In other places the postulant is sometimes swallowed by a water snake and spat out, or by the Rainbow Snake and vomited out. In the North Kimberley region of western Australia, Ungur, another local name for the Rainbow Serpent, is believed to live in a pool. On top of the pool floats scum that is said to be Ungur's spittle. When a boy is selected for training, his induction includes the magical insertion of a ball of the pool scum into his navel. The ball is Ungur's egg, which hatches in the boy's belly. While it grows, the boy neither drinks nor eats anything hot, for fear of disturbing it. Once the boy is "made," Ungur endows him with special powers that enable him to summon the snake to do his bidding. In northwestern Arnhem Land, the Rainbow Serpent is known as Ngalyod and is the bringer of life and the creative expression of continuing life. Some clever people are said to possess a *ngalyod* (a private rainbow serpent usually located in the stomach region), and its power is very potent for those clever enough to harness or control it. It can also be sent out of the body to penetrate other people.

Essential elements in the making of clever men in the southeastern part of Australia involve going down into a bright cave and meeting supernatural beings, the growth of feathers, a flight into the sky or among the stars, quartz crystals being inserted into or rubbed against the body, and possession of a magic rope by which the person is able to climb upward to the sky. A fully qualified clever person can travel through the air or under the ground, cure illness, see with a "strong eye," and even transmogrify (Berndt and Berndt 1977).

Characteristically, an Aboriginal clever man has his own spirit familiars, or personal totems that act as his assistants. A Walbiri (central Australia) clever man has an assistant called a *mabanba,* a small being the size of a thumbnail that lives in his body. In this area, being a clever man is dependent on the possession of a mabanba, and it is usually inherited from the father. The mabanba is said to be transparent as glass and soft as rubber, and although it is invisible to the uninitiated, it appears to the medicine man as clear or white—the color of quartz crystals. The mabanba makes a ticking sound that anyone may be able to hear, but only the clever man understands its message. It can choose to leave the man's body and travel about freely at great speeds, either through the air or under the ground, and its resting-place is in the man's belly, arms, chest, or head. The mabanba can be "pulled out" of the physical body to be sent on diagnostic errands or used for healing purposes. Clever men may apply their mabanba directly by rubbing or inserting it into a patient's body (Cawte 1974).

Overcoming fear is a necessary prerequisite in achieving mastery of the power, and not everyone is even a candidate for being clever. To be able to gain knowledge, transfer thought, see visions, and send out power to bring life and death, one must face terrors and dangers of a psychic nature. Becoming clever requires much practice, courage, and perseverance.

Healing and Harming

There is some ambivalence in the literature about whether or not a clever person is also a sorcerer. Some say that the function of the clever man or woman is to heal rather than harm, and to withdraw evil magic rather than promote it. But there is evidence to suggest that the clever man has the power to perform acts that both heal and harm. In some places, different names are conferred upon the two, helping to delineate their separate roles. For example, in eastern Arnhem Land, a medicine man is called *marrngitj,* and a sorcerer is known as *kalka.* The main role of the *kalka* is to injure or bring about the death of a person. The role of the *marrngitj* on the other hand, is to attempt to diagnose and cure illness, which often has been caused by a sorcerer (Berndt and Berndt 1977).

Substance insertion and substance extraction play a large part in both magical healing and sorcery, and are mentioned repeatedly in the literature as being powerful tools of the clever person. Sometimes a magical object is extracted from a clever man's own body and used on the patient as part of a cure. Or patients may have an object extracted from their bodies that has been sent by a sorcerer.

Traditional curing techniques also include sucking (the most common healing method in many areas), biting, massaging (or rubbing), squeezing, pinching, and pressing various parts of the body, as well as the magical extraction of objects such as bone, stone, or charcoal. Sometimes the patient may be smoked, or objects

such as quartz, pearl shell, and stones may be placed on the affected part. Other cures might necessitate retrieving lost souls with the aid of spirit helpers. The clever man might go into a trance and send out his spirit familiars to locate and return an object that has been removed from the patient's body. Singing or chanting accompanies most methods. Sometimes evil magic can be sucked out as a mouthful of wind and blown away, or a medicine man might pass his own power to that of the sick person, then suck the affected part and draw out his own power along with the patient's pain. Massaging a patient with bare hands or a rag (or kangaroo skin pads) smeared with fat or oil is believed to be efficacious in some areas, as is brushing an affected part with feathers. Another method employed to alleviate pain is to place hands on the affected part of the body. Sometimes several methods are used on the same patient.

The work is said to require much energy and concentration, and a man may say at times that his power is light, or weak. Some clever men have more power than others; a man "heavy with power" can follow a sick person's spirit in a dream, catch it, and return it to his body. Although sucking and massaging are common procedures for getting rid of illness, sometimes a clever man's powers are believed to have become so strong in his later life that he might dispense with techniques such as sucking.

Clever people throughout Australia consistently use human body fat, especially gall or kidney fat, to magically harm a person. A bunch of emu feathers soaked in a dead person's fat could make a person unconscious if waved over him by a sorcerer. Fat was considered lucky, and the eater of human fat gained strength through its consumption. Smearing a spear with a dead person's fat was considered to give it a magical quality. Other bodily excretions—feces, urine, phlegm, or spittle—were used in sorcery. Urine sorcery created bladder troubles; phlegm or saliva sorcery caused severe colds or chest pains.

Seeing with the Inner Eye, Spirit Flight, and Other Powers

One attribute of clever people is the ability to "see with the inner eye," or "strong eye," and locate the site of an illness. Aboriginals compare the strong eye to an X-ray machine; the person possessing such sight can see parts of the body such as the liver and the intestines and establish whether or not they are diseased. R. M. Berndt and C. H. Berndt (1977) wrote that a clever man was noticeably different from others because of the light radiating from his eyes. He could also see through trees and other objects, and was able to detect a psychic light moving about a dead man's grave for up to three days after death.

Clever people can go on journeys while their physical bodies are asleep. The person's spirit might exit through the navel and fly away. During these journeys a person might find himself at a ceremony where he is both a witness to and a participant in events and learns important songs and other information. In 1937, Norman Tindale noted that a man could "travel as a whirlwind," leave the supine body, and fly on a spider web. A hair cord is reported in some areas as the means by which one might fly into the sky world. In the Northern Territory, clever men might fly through the air astride the rainbow. This is achieved by a self-induced trance and is called traveling in a clever way.

The abilities of clever people also include: divining, clairvoyance, thought-reading and thought-transference, seeing what is happening at a distance, seeing visions of the past, present, and future, making themselves invisible (or transforming themselves into other shapes), fast traveling, communicating with spirits, control over the weather (especially rainmaking), and the conquest of space and time. All these powers can be lost if clever people fail to maintain strict self-discipline such as adhering to food restrictions or, more recently, avoiding excessive alcohol consumption. Illness and age can weaken their powers as well, either temporarily or permanently. Clever people are not all-powerful, especially when it comes to combating sorcery, and some have more power than others. A person of high degree has great power, but others are credited with only a little power.

Nowadays, Aboriginal people use the facilities of Western medical health clinics and Western medicine, but they do not abandon bush medicines and the assistance of clever men if they are available. Indeed, some Western medical practitioners recognize the importance of traditional healers and allow them to work with their patients. In the mid-1970s an elderly Aboriginal nursing aide who was also a medicine man was

employed by the Yuendumu (central Australia) Hospital and encouraged to use techniques such as massaging, sucking, and withdrawing substances alongside Western methods of health care. Not all clever people respond to requests for their services, and some are called upon more frequently than others. Increasing urbanization and less interest shown in traditional culture by Aboriginal youth has resulted in a diminishing number of clever people.

DREAMS AND SHAMANISM (PAPUA NEW GUINEA)

Introduction

Papua New Guinea (PNG), a Melanesian country north of Australia in the Western Pacific, is home to hundreds of distinct peoples, many of whom see dreams as a source of spiritual information and a venue for shamanic action. In this tropical land of vast forests, rugged mountains, impenetrable swamps, and scattered islands, people experience dreams as nightly soul-travels in which people can see their own and others' hidden intentions and actions. As most societies in Papua New Guinea emphasize human equality, anyone can exploit dreams to discern causes of misfortune, produce magical effects, and communicate with supernatural beings. Nevertheless, some individuals specialize in these and other shamanic endeavors.

Papua New Guinea's Cultural Diversity

Comprising the eastern half of New Guinea and surrounding islands, Papua New Guinea is one of the most culturally diverse regions on Earth, with approximately 760 language groups. Even the homogenizing effects of outside political, economic, and religious contacts do not override Papua New Guinea's human diversity. Sustained interactions with outsiders began at different points in the nineteenth and twentieth centuries, under the aegis of German, British, Australian, and since 1975, independent Papua New Guinea administrations. The hundreds of indigenous religious traditions have been combined with numerous mission-introduced Christian sects. These influences add new cultural variation to the mix, so that generalizing about Papua New Guinea is even more perilous.

Papua New Guinea's indigenous peoples remain the vast majority and control their own land. Ethnic groups have from tens to thousands of members, with traditional economies

based on gardening, pig raising, foraging, and fishing. Social structures include egalitarian bands, tribes led by "big men," and chiefdoms. Villages typically number in the tens or hundreds of residents, and in some places men and women reside separately. In the twentieth century, colonial powers established cities and governments associated with states and world system economics. These now coexist with traditional villages and social institutions.

Religious belief systems vary widely as well, though they usually concern ancestors, ghosts, human-like sprites, place spirits, witches and sorcerers, and in some places, totems and deities. Some religious traditions emphasize secrecy and initiations, often with men being privy to special foods and maintaining sacred houses off limits to women and children.

Many societies have "shamans"—healers who use soul journeys in dreams and trance to counteract supernatural causes of illness. However, anthropologists use various labels to describe practitioners of shamanic arts in Papua New Guinea, such as "sorcerer," "witch," "diviner," and "medium." Which term is used depends on what activities practitioners undertake in the various societies. "Shamans" not only heal, but can also attack people as "sorcerers" or "witches." Sorcerers purposely manipulate supernatural powers to harm or kill, and occupy a socially accepted role. Witches are unable to control their powers and destroy their own people, resulting in social disapproval. Of course, whether an action is for good or ill depends on perspective. In most Papua New Guinea societies, illness and death are understood to ultimately result from sorcery, witchcraft, or the action of spirits rather than simple physical causes. Therefore, to heal one person is to thwart another. Depending on the society, any of these roles can be occupied by either men or women or both.

Numerous references attest to shamans using dreams as a source of information for healing and other pragmatic concerns in both traditional religions and in localized forms of Christianity. For Papua New Guinea peoples, success in gardening, war, and hunting, like health, depends on robust relationships with supernatural beings. Shamanic practices that heavily emphasize dream work serve these relationships because of the widespread belief that dream experiences are not mere fantasy, but soul journeying.

Shamanic Uses of Dreams

Dreams aid every stage in the shaman's career, from the initial vocational calling, to analyzing the dreams of others, to dream-travels in search of information from the dead and other supernatural beings. Shamans use dreams of patients, interested others, or themselves to divine disease causes, intervene with spirits, or determine actions for waking life. For example, M. J. Meggitt observed among the highland Mae Enga that "diviners" and "mediums" see and communicate with ghosts in dreams (1965, 110).

Many Papua New Guinea peoples recognize an affinity between dreaming and death, as among the Gimi of the highlands, who experience dreams as a kind of reversible demise, in which the person's life departs from the body (Gillison 1994). Not only is one's own death-existence envisioned in dreams, but one may also encounter those already deceased and learn from them, as among the highland Melpa (Strathern 1989). Here, seeing the dead in a dream can portend one's own death because one is in effect reestablishing a close relationship with them—risky, because they can pull one to the other side. However, it can also be an opportunity to seek assistance, for the dead are regarded as having an understanding of hidden actions and intentions that the living lack. The shaman can thus temporarily die and acquire the insight of the ancestors.

Among most Papua New Guinea peoples, there is a strong sense that neither illness, death, nor success are accidental, but rather flow from the hidden intentions of human or humanlike beings who can be witnessed in dreams and trance. For example, the Mekeo of southern coastal New Guinea see dreams as a realm in which sorcerers' hidden selves operate to both kill and heal. People can also become ill or die when they dream of spirits whose interest in them causes distress or physical maladies. For example, Michele Stephen described a Mekeo woman who suffered back pain after recurrent dreams in which a water spirit in the form of a European man took her dream self as a lover. In her subsequent dreams, other water spirits prescribed certain medicines. Upon applying these in waking life, her pain dissolved (1996, 476–479).

Among the highland Sambia, dreams are frequently understood to be omens, and shamans share their own dreams and later reinterpret

them in line with events to give the impression of prophecy (Herdt 1987, 65). In one fascinatingly convoluted case, Gilbert Herdt reported that a shaman dreamed he hit his wife. When his stepmother subsequently fell ill, he feared that his dream actions had caused her condition. A second shaman's trance quest produced a reinterpretation, changing the identities of the characters in the dream: The first shaman's dream-self had not in fact hit his wife's dream-self; rather, his familiar had attacked his stepmother's spirit. Accepting this interpretation, the first shaman performed a cure that involved tethering his familiar to prevent further attacks (1989, 99–101). These Sambia shamans saw dreams as venues in which people cause, diagnose, and heal illness. Illnesses could also be treated through reentering dreamlike awareness in trance.

Maurice Godelier reported that the Baruya of the highlands consider shamans distinctive from ordinary people based on the actions of their spirits during sleep. Instead of merely wandering at random, like most dreamer's spirits, male shamans' spirits transform into birds, and female shamans' spirits change into frogs. They assemble nightly at the boundaries of the group's territory to stand sentry, protecting Baruya spirits who may be led astray by malevolent beings. In healing rituals, following a diagnostic visit to the patient, shamans seek a course of action in their own dreams based on the cause of the sickness that has been revealed. To allow greater control than is possible while dreaming, shamans undertake the actual cure while in a tobacco-enhanced trance, rescuing the patient's spirit from its captor and restoring it to the body. Shamans then seek and appear to remove an illness-causing object from the body, hurling it toward the enemy territory to project its harmful effects there. Godelier pointed out that here we have a link between shamanism and warfare, which illustrates that the shaman's role as healer includes the ability, or even the necessity, to harm as well (1986, 115–117).

Asabano people don traditional finery for a celebratory dance, 1994. The woman in the foreground is a spirit woman named Maka, who described her own shamanic dreaming as follows: "I don't see traditional spirits. I see only the good Spirit of the Lord. I do spirit work and the Lord shows me indications that people from far away will come, and tells me to get food to offer at church. I just see this in dreams and the Lord tells me to do no wrong. The Lord gives me [prophetic hunting] dreams and then my husband takes a gun and kills animals. [When I get sick,] I pray and sleep, and then I dream and get better. I saw a dream in which the Lord told me where to make a garden and showed me that plenty of food would grow. I planted there and harvested plenty of food. I just hear talking in dreams; I don't see a face. I see dreams and think they are true [prophetic] dreams that the Lord gives me." (Courtesy of Roger Lohmann)

Dream Shamanism and Religious Change: The Asabano Case

Missionary work has resulted in spiraling cultural change—most of Papua New Guinea is now Christian. Typically, Christianity has simply been superimposed upon indigenous beliefs, so that local spirits find themselves demoted to created beings, likened at best to angels, and at worst to demons. Nevertheless, shamanic dreaming remains vital, though transformed in many areas.

Roger Lohmann (2000b) described a case in which shamanic dreams of God, Jesus, the Holy Spirit, and angels compelled the Asabano of the highlands fringe to convert to Christianity. The Asabano discontinued their traditional initiations for men and women and abandoned the traditional food taboos that had maintained the religious order. Further dreams clarified and established the supernatural authority of the Bible and writing, transforming the social structure (Lohmann 2001).

Traditionally, Asabano shamans, who were usually male, used tobacco trance and dream encounters with spirits to diagnose illness and prescribe cures. The people believed (and still believe) that tree, stone, and water spirits cause some illnesses by holding onto the souls of passers-by. Dreams indicated which spirits had caused a particular illness and made possible an appropriate offering and curing ceremony to retrieve the soul. Asabano say that witches also cause sickness by mystically cannibalizing their victims. Dreams, together with other indicators, revealed the identities and actions of "witches," who were then executed. Asabano hunters also used dreams to communicate with benevolent forest sprites believed to control access to wild game.

Conversion saw the advent of Christian shamans, called Spirit women because they are usually female. Spirit women say they communicate with the Holy Spirit in dreams and during prayer-induced trance to discover the spirits and witches responsible for illnesses. Rather than executing or making offerings to the revealed culprits as in former times, Spirit women prescribe various prayers to God, including the new practice of planting a wooden cross bearing a Bible verse in the path supposed to have been taken by the culprit. This practice itself originated in a Spirit woman's shamanic contact with the Holy Spirit (Lohmann 2000a, 264). The Holy Spirit now appears in hunters' dreams as well, having replaced forest sprites as the bestower of wild animals.

Even peoples like the Asabano who depict Christianity as the antithesis of traditional religion retain the widespread notion that in dreams one's soul may encounter and influence supernatural beings. Dream travels by people adept at communing with the new god provide a cure for the uncertainty and unease that comes with the overthrow of familiar beliefs and the adoption of foreign ones. This, too, is a kind of dream shamanism, to heal whole societies as they move from one set of religious assumptions to another.

MAORI RELIGION

The Maori, a people of Polynesian descent who inhabit New Zealand, maintain a worldview of the cosmos and a religious outlook that goes back to the earliest development of their culture. Shamanism, which involves a close association with the natural landscape, such as mountains, rivers, and ocean, and the maintenance of sacred sites and sacred areas within each tribe’s stewardship, has continued as a vital aspect of Maori culture to this day. Previously under the care of the *tohunga* (a shaman-like priest), currently the concern of elders or specialists, the recovery and maintenance of land is a major component of any discussion of Maori identity and religion.

Background

Drawing on myth and legend, together with other evidence, Western historians have assigned a date of around 1350 C.E. when the first peoples migrated from an island known as Hawaiki lying in a northerly direction from New Zealand (Shortland 1856, 1–30). It is thought that a civil war had broken out on the island, and therefore they embarked for the coast of New Zealand in seven large seagoing canoes, the most famous of which were named *Tainui* and *Te Arawa:* They came to land in Waitemata harbor (Simmons 1976, 103–108). Significantly, a sperm whale *(paraoa)* was discovered beached at that location, and hence the harbor was called Wanga-paraoa, “Whale-port” (Shortland 1856, 2). The memory and significance of this early voyage remained central to Maori traditions, and the sperm whale continued to be an important source of food, while its bones were used for weapons, and the teeth of the whale valued as neck pendants. There is a legend concerning the god of fishes and whales, Tinirau, who sent the tohunga (priest) Kae home on the back of his pet whale, Tutunui, after he had baptized Tinirau’s son (Reed 1966, 183). For the Maori, the mythological past is peopled with deities; it is brought to mind through religious ceremonies and practices, enabling them to trace their descent from the ancestors who arrived by canoes and holding a sacred relationship to their land and ocean.

Once settled in New Zealand, the Maori organized into descent groups of tribes, subtribes, and families, each tribe occupying a large area; and the various subtribes and families cooperated in warfare and ceremonial gatherings. Men usually emphasized their descent from their paternal ancestor, although they occasionally gave allegiance to their matrilineal line of descent (Salmond 1976, 12). The descent continuity of a group, the role of chief, and the respect and awe due to ancestors were, particularly in the past, important components of Maori culture.

Cosmology and World Order

Maori history is considered to begin in the time before even the birth of the land of Hawaiki, both a real and an imagined, mythological place. This place, distant ancestrally, is linked with the spirit world and hence is part of the Maori concept of the cosmos. Once Hawaiki (the spiritual cosmic place) came into being, the gods, Rangi the Sky Father and Papa-tua-nuku, the Earth Mother, were created. From their embrace, many children were created, who then populated the sea, winds, woods, and other plants, and who were also progenitors of human beings. According to this version of the creation myth, the children, living in darkness with their parents, decided to separate themselves and create a world of light. One of the children, Tane, the spirit of the forest, separated Sky Father from Earth Mother, and hence the (earthly) New World *(Te whenua Hawaiki)* arose (Henare 2001, 202). Joseph Campbell (1949, 283n) recounted this narrative, quoting from George Grey’s 1855 *Polynesian Mythology and Ancient Traditional History of the New Zealand Race, as Furnished by their Priests and Chiefs.*

According to Grey’s version of the story, Tane rejected the suggestion of one of the other children to kill their parents: “Then spake Tane-mahuta, the father of the forests and of all things that inhabit them, or that are constructed from trees, ‘Nay, not so. It is better to rend them apart, and to let the heaven stand far

above us, and the earth lie under our feet. Let the sky become a stranger to us, but the earth remain close to us as our nursing mother'" (Campbell 1949, 282). This was the beginning of life in the world—birds, animals, and fish, including humans. A contemporary Maori scholar, looking at the creation myth from a philosophical point of view, wrote that the cosmos was thought to have started with a burst of primal energy (Henare 2001, 202–203).

Oral historical sources recounted the crossing of the Ocean of Kiwa by the partly human, partly spirit hero Maui, who was said to have tamed the sun, captured fire, and tried to conquer death. His great achievement, however, was to bring up from the ocean depth, using his grandmother's jawbone, the Great Fish of Maui *(Te-Ika-a-Maui),* now the North Island of Aotearoa (the Maori name for New Zealand). The Polynesian explorer Kupe sighted the land, which looked like a long white cloud, and named it Aotearoa—Land of the Long White Cloud (Henare 2001, 203).

It is important to note that the fundamental religious and philosophical concepts of the Maori did not originate in Aotearoa, but such concepts as *tapu,* mana, and other aspects of their religious thinking were brought to Aotearoa from the original Polynesian homeland. One of these concepts, which was found in Polynesia and had its later echoes in Aotearoa, was the idea of the creation of the universe, seen as an egg that contained Te Tumu and Te Papa; after the egg burst they remained on the lowest of three levels and created humans, animals, and plants. The first two men were incomplete, but after the creation of Hoatea (Sky-space) and Hoatu (Earth fruitfulness), the human race descended from them. This concept of the creation of the universe and the human race as deriving from a cosmic egg, known to many mythologies worldwide, emphasizes "the fertile seed-power within [that] typifies the inexhaustible life dynamism of nature" (Campbell 1949, 277)—a concept fundamental to Maori religion. The Maori myth has the narrative of the egg dropped into the sea by a bird; when it burst, a man, woman, boy, girl, pig, dog, and canoe came out. They all got into the canoe, arriving in New Zealand (Campbell 1949, 274–275, 292).

Nature and Deities

The children of Sky and Earth were the gods *(atua),* who were closely connected to various aspects of nature. Tane, the god of the forest, created all vegetation, and the trees of his forests reach toward the sky, making that spiritual connection between the levels of sky and earth. Rongo was the god of peace and agriculture; Tangaroa was the god of the ocean. Rain bound earth and sky together again, in their sorrow over their separation. The elements of nature thus, like the human beings, were linked in kinship; the Maori world order was seen as genealogically connected (Parrinder 1967, 50). Respect for and love of the land are still part of the spiritual outlook of the Maori. The land is conceived of as a sacred gift passed on from the ancestors to the present generation, a gift that needs to be cared for. The memory of the mythic history of the people links the Maori to the environment, and to the deities associated with it.

Other important atua are the house-dwelling gods *(atua noho-whare),* the spirits of the seeds of the unborn infants; their importance clearly relates to the respect paid to the line of ancestry and descent, past and future (Shortland 1882, 35). Edward Shortland noted that the Maori addressed *karakia* (invocations) to the Powers or Deities of Nature, considered as their own original ancestors. Moreover, they had forms of invocation *(karakia)* addressed to the spirits of their dead ancestors (Shortland 1882, 10, 11). This offering of incantations to deities of nature as well as to ancestral spirits shows great similarity to shamanic forms of invocation and worship in Eurasia, specifically in Siberia and Mongolia. This is not to suggest that there is any connection or diffusion between shamanic cosmology and forms of religious invocations between Siberia and the Maori, but simply to note that very similar outlooks and forms of worship prevailed.

Mauri, Tapu, Mana, Hau, Wairua

Tapu is defined as the cosmic power with which all things—persons, places, objects—were imbued at the time of creation; hence all are in a sacred state. The power or potency within a thing or person is defined as mana. In the concept of mana, the idea of power is combined

with a sense of sacredness that leads to awe and respect, and the separation of the sacred from daily life. Hence the idea of tapu as a system of prohibitions, but its real meaning is related to the concept of sacredness, which may be applied to children, houses, gardens, rivers, lakes, and often whole ecosystems. Balance and harmony is brought about by respect, whereas abuse leads to disharmony and imbalance. *Mauri* is defined as the vital spark, or life force, once possessed by Io, the Supreme Cosmic Being. Since mauri may be abused by improper usage or lack of respect, the proper rituals, prayer forms and incantations need to be offered to reestablish the balance of life again. *Wairua* is the spirit within the body that is implanted in the embryo and needs to remain in the body for its continued existence. The wairua can move away from the body but must return to it for life to continue. The *hau,* on the other hand, a cosmic power that is embedded in the embryo and is often called the breath of life, or the wind, "is called up by the priestly leader at birth and bound in humans" (Henare 2001, 210). Together with the tapu and mana of the child's ancestors, which are present at conception, these life forces are vital essences for the human being (Henare 2001, 207–210).

Karakia and Makutu Ceremonies

Religious rituals play an important role in reestablishing and protecting the hau of the natural world, feeding it by making offerings to the waters and the forest. Religious rites of the Maori are essentially oriented toward correcting breaches of the laws of tapu. According to Shortland, the sacred essence of an atua could be communicated to objects that he touched; this sacred essence could then be transmitted to something else, and hence it was necessary to make the object containing the sacred essence of the atua tapu to protect it from pollution. To this purpose, various *karakia* would be chanted. A karakia was a prayer, an invocation of ancestral spirits in genealogical order, or a combination of prayer and invocation (Shortland 1882, 25, 28). Karakia were chanted at a variety of situations and life stages. Karakia were recited for childbirth, for grown men going into battle, for eels, for birds, and for *makutu* (sorcery). A special karakia was recited at the birth of a child; Shortland noted that, among the Arawa tribe, in the case of a difficult birth, this karakia was used (Shortland 1882, 30). Moreover, in such cases it was assumed that the mother had committed a breach of tapu, which had to be discovered by the *matakite,* "seer." The father of the child had to plunge into the river while the karakia was recited; during this time the child would be born. Once the child was born, if the mother had difficulty nursing, the tohunga was called; he brought the mother and child to the water, sprinkling the mother and dipping the child in the water. The tohunga then repeated a powerful karakia, which brought the power of the water to the breast of the mother and caused her milk to flow.

Disease was considered to be caused by a spirit having taken possession of the body of the ill person. Any neglect or violation of the laws of tapu could bring about the anger of the family atua, who then would send an infant spirit to feed on some part of the patient's body. Infant spirits were used because of their short time on earth; they would have lesser attachment to their relatives and be less inclined to show mercy in their feeding on the bodies of the guilty. Sick people needed to consult the matakite and a tohunga in order to understand what offense they had committed and what ceremonies were necessary to appease the atua and restore health. In addition, there was a dark science called *makutu* that could make a person violate tapu and offend the atua without the person being aware of it. The person wishing to use makutu just had to obtain some of the person's spit or some part of the person's food, in order to change it so as to anger the family atua and bring about illness (Shortland 1882, 31).

There was a very strong belief in the power of makutu among the Maori. Even in instances of petty theft, the power of makutu in the words of the tohunga was used to bring about the image of the thief and curse him with death threats. As among other peoples with shamanic practitioners, forms and curses of makutu were used to counteract the makutu of a more powerful tohunga, someone whose mana came from a more powerful atua (Shortland 1882, 34–35).

The Tohunga

Tohunga in Maori language means "expert." Various kinds of experts in the Maori community were known as *tohunga: tohunga-whakairo* (expert in carving), *tohunga-moko* (expert in tattooing), and *tohunga-karakia* (expert in charms and incantations). It was the tohunga-karakia who had many of the duties of a priest and was, in many respects, a shamanic person (Andersen 1948, 1), and to whom this entry refers simply as a tohunga. The tohunga was able to make the body of a dead warrior move as though it were alive, as an omen of future victory for the tribe (Andersen 1948, 38–39). Original notes taken by S. Percy Smith, published in 1899 in the *Transactions of the New Zealand Institute,* are the basis of description of the tohunga by Johannes Andersen (1948). S. Percy Smith had noted that ancient traditions of this priesthood were recounted among the Polynesians in the Rarotonga traditions. These priests were active in the selection of ruling chiefs and performed many other magical and astrological functions. They were seers, poets, historians, and most importantly, navigators with knowledge of astronomy. As a historian, the tohunga performed a most important function, knowledgeable in tribal history orally handed down from father to son. Their knowledge extended to ancient songs and karakia, which had to be performed correctly.

Expeditions of war were a part of Maori life; the tohunga could lead an expedition, or function as a *matakite* (seer) to foretell the outcome. Since everything connected with war was tapu, the tohunga, considered the representative of the deity Tu-matauenga, god of war, needed to be engaged in every aspect of warfare, from the preparations of war to the return of the warriors after blood had been shed, since shedding blood was a violation of tapu. The tohunga was involved in all ceremonies of Maori life and life-stages: naming of the newborn child, sicknesses, handling the infringement of laws of tapu, and counteracting makutu thrown by an enemy. Marriage and death were ceremonies at which karakias intoned by the tohunga were necessary, and indeed, it is noted that more karakias connected with death have been preserved than any other type (Andersen 1948, 18–20).

The powers of the tohunga were transmitted from father to son, across many generations. The father or grandfather would teach the son; occasionally, the young acolyte went to a tohunga in another family or tribe. However, some knowledge and certain karakias were the property of a particular family or tribe. Young boys, starting at age twelve, were taught in the *whare-maire,* the special building with carvings of ancestors and ancestral lore. They were taught by recitation the origins and the history of the tribe, the entire genealogy of the ancestors, and other tribal lore. Initiation ceremonies with special karakias were used, and care was taken not to mention the name of the Supreme Deity, Io, as well as other sacred karakias, taught only to prospective tohungas. Karakias were supposed to be learned perfectly after one session; a single mistake could ruin the efficacy of the incantation and even cause the death of the tohunga (Andersen 1948, 21–25). There were various tests and ordeals to which the young initiate had to submit. The Arawa tribe had the pupil brought by the tohunga to the altar *(tuahu),* a tall upright stone, which he was supposed to hit with a small flat pebble. If he succeeded in not breaking the small stone, then he was further tested, using a karakia called a *hoa* (an exertion of willpower), to break the stone into fragments without damaging his hand. A further test was to try these powers on an animate object, such as a flying bird, causing its instant death. A final test is noted, whereby the *tauira* (pupil) showed his powers by willing the death of a near relative (not a child or parent), to demonstrate that the powers of the tohunga were greater than all other emotion and needs (Andersen 1948, 26–28).

The tohunga were used as mediums in all situations where communication between humans and deities was necessary. It was thought that the called-upon deity entered the body of the tohunga, who then uttered oracular words intended for the guidance of the people. Often the tohunga would be in a state of trance, *urua,* and in this state he was described as "like a furious raging madman, his body and limbs convulsed, his eyes protruded, foaming at the mouth, giving utterance to strange tongues; sometimes rolling on the ground, at others rushing hither and thither with furious grimaces and frantic cries. These fits gradually died away, and were succeeded by a long period of prostration" (Andersen 1948, 34). This description is like that of the classic shaman of

Siberia, and although the term *shaman* is not used in accounts of Maori religion, it is quite clear that the tohunga can be thought of as such a personage, starting with the ancestral line, the passing through various ordeals and tests, his functions, and indeed, his ability to go into trance (altered state of consciousness) while communicating with the atua of the world above.

Current Adaptations

Though *tohunga* was the name historically given to the person who acted as a shaman for his tribal group, currently the term *tohunga* is not used for such a personage. In accounts of the important nineteenth-century and early twentieth-century Maori leaders Te Kooti, founder of the Ringatu faith, and his successor, Rua Kenana, the term is not used, though both were heirs of famous tohungas. One can see, however, despite the predominance of Christianity in their teachings, the continuing importance of land and landownership as an intrinsic aspect of these religious leaders' messages and activities (Binney 1997; Binney, Chaplin, and Wallace 1990). Although Rua cast aside all traditional Maori practices in favor of new forms associated with Christianity and spoke of himself as the promised messiah, he was greatly concerned with more modernized systems of landownership and land usage, organized on a strong communal basis but at the same time emphasizing family ownership of land (Binney, Chaplin, and Wallace 1990, 9). In his focus on land, despite the Christian framework of his religious ideology, older, more traditional forms of shamanic thinking still prevailed.

Present-day shamanistic practices connect very strongly to land and its stewardship. A major focus of current practitioners, who are called specialists, is the guardianship and care of sacred sites. They look after land, mountains, and rivers. Each subtribe has a symbol that represents a mountain, river, lake, harbor, or ocean. When the subtribe moves within or outside its own territory, it takes on the mountains or rivers of these new lands and those associated deities. Specialists are asked to go to sacred areas that have been disturbed and deal with the problems that have arisen. This could be an ordinary person from the family, or, if it is a serious tapu, people will ask someone who has special powers to take away the difficulty on the land. In present-day situations and since the nineteenth century, many issues have arisen relative to resource management, treaty claims, and land usage—issues that are of vital importance to the identity and continuity of Maori life. In this context, these spiritual specialists have great importance, and it is in fact thought that prophets and spiritual leaders receive much of their power from these sacred sites.

The specialists, who may be either male or female, have inherited their gifts from their ancestors and can see the future as well as the past. The task of the specialist varies from tribe to tribe. Trance, which used to happen, no longer does; it is considered that specialists have access to spiritual powers by virtue of their ability and hence do not need trance for access. The old term *matakite,* "seer," is used for those among these specialists who are known to see things, to foresee and foretell; they may occur within a family. There are usually a range of people who can do things within the tribal group. These specialists are called upon to heal those illnesses known as Maori sicknesses, or "things of the Maori world," such as witchcraft. For Western-type illnesses people seek out Western medicine and doctors. Faith healers, as noted above in the historical account, do karakia rituals in order to heal; it is not usual for them to fall into an altered state of consciousness. People in urban areas who are less connected to the land still use traditional healers and may need the attention of a specialist; they will go to an elder who has practice dealing with these issues. Despite the strong influence of missionizing Christianity and the modernization of life in the twentieth century, Maori traditions have continued, at least within some families.

OCEANIA: RITUALS AND PRACTITIONERS

In the widest sense Oceania embraces the region between Asia and the Americas, but this article is concerned only with the religious traditions of Micronesia, Melanesia, and Polynesia. The shamanistic traditions of Australia and New Zealand are discussed in other articles. Micronesia in the northwest, Melanesia in the south, and Polynesia in the east are distinguished from each other partly on geographic and partly on cultural grounds. Inhabitants of Polynesia are thought to derive from a historically interrelated group of communities. Micronesia is more a geographic than a cultural notion and, moreover, has relationships with Asian neighbors. The region named Melanesia, with more than a thousand distinct languages, is even more culturally diverse and ecologically varied.

Despite the great linguistic and cultural variation in these island regions of Oceania, there are common religious themes. Throughout Oceania, people's relationship to the land, attested to in myths and reinforced in rituals, is basic to subsistence and to religious practice. Myth and ritual support social structures that vary considerably—in some cases employing matrilineage and in others patrilineage, in some cases designating castes and hereditary chiefs and in others advocating egalitarian forms of organization. Relationships with numinous beings, including ancestors, are cultivated in order to achieve fruitful outcomes and to avoid possible afflictions. A concern with fertility pervades ritual "work" for gardens and for other economic enterprises. Ritual specialists are engaged to ensure, or to restore, the health and well-being of land and people. Today the large majority of the peoples of Oceania are Christian, and indigenous traditions and Christianity coexist in religious practice. Islam is present in Irian Jaya as a result of the immigration of Muslims from other parts of Indonesia, and Hinduism is represented in Fiji as a result of nineteenth-century British-sponsored immigration of Indians to work in the sugar industry. However, only a small number of the indigenous peoples of Oceania have joined these religions; most have become Christians.

Throughout traditional Oceania people identified with a particular habitat. Even today the relationship to a particular location is strong, although in some places, such as New Caledonia and Irian Jaya, large amounts of land were removed from traditional tenure and assigned to colonists or migrants. The relationship to a particular landscape is reflected in myths and rituals and in ideas concerning gods and spirits. Although some of the peoples of Oceania are today urban dwellers dependent on wage labor and a cash economy, most remain subsistence horticulturalists, supplementing a diet of tubers and green vegetables with game or fish. A minority engage primarily in hunting and gathering. Many raise pigs for ceremonial purposes. Most participate to some extent in the monetary economy through production of cash crops or occasional wage labor.

A concern with the maintenance of life-giving relationships pervades the manner in which people interact with other people, with numinous beings, and with the environment. The desire to ensure health and wealth and good relationships motivates participation in both the rituals of traditional religion and the practices of Christianity. In the contexts of colonialism and modernity, this desire has led to the emergence of new religious movements.

The terms *religion* and *shamanism* are outsider's categories that do not closely match areas of Oceanian life. One definition of religion that would accommodate the cosmologies and rituals of Oceania suggests that religion is the nonempirical part of the total cosmic order (Lawrence and Meggitt 1965, 7). This non-Oceanian working definition is only partly satisfactory and illustrates a common problem in religious studies. It does not say what counts as empirical, and it does not leave room for taking the insider's claims seriously. To the traditionalist Pacific Islander, as to many an adherent of world religions, visions and ghosts, for example, are a real part of human experience. Shamanism, in the sense of a religious tradition centered on practitioners who enter into trances and go on soul journeys in which contact is made with spirits, is not dominant in Oceania. Nevertheless, the region is home to a variety of ritual practitioners who seek to empower life, and some of whom, like classic shamans, enter into trances and communicate with spirits.

Cosmology

Oceanian societies have conceived of the world as consisting of communities of human beings, numinous beings, and animal and plant beings, each community inhabiting its own place but with beings from one community traveling from time to time to the locations of another. In parts of the highlands of Papua New Guinea, for instance, the cosmos includes a distant world of sky people, forests inhabited by various kinds of spirits, settlements where the ghosts of the dead carry on a life similar in many ways to that of the living, and the hamlet or village of the living community. In contrast, in parts of Micronesia the sky world is home not only to celestial beings but also to the spirits of the dead. Like human beings, animal, bird, and fish populations may be described as carrying on their community life in a particular habitat. Each person negotiates relationships with the beings who dwell in the realms into which he or she must venture as a matter of daily life, and ritual specialists interact with the beings who may visit the living, or be visited by them, on ritual occasions.

Writing of numinous beings in traditional Tikopia, a Polynesian society, Raymond Firth noted, "Alongside the highly formal worship of gods and ancestors through the agency of lineage heads as hereditary priests was the operation of a spirit medium cult, with practitioners primarily self-selected for their capacity to enter into trance and serve as mouthpieces of gods or spirits of the dead" (Firth 1996, 157). The variously conceptualized gods and spirits of Oceanian societies are upholders of a morality that is based in relationships to kin, community, and land. Culture heroes and gods are responsible for the creation and regulation of the world. They are said to have given rise to the physical and social world of today, having shaped mountains and planted trees and instituted marriage and exchange relationships. Some gods and heroes are more significant in mythology than in ritual practice. Brother heroes, such as Kilibob and Manup in the myths of the Madang area of New Guinea (Lawrence 1964), typically portray contrasting ways of life and behavior. Land spirits inhabit forests, grasslands, mountains, and swamps. These spirits may be simply imagined as the inhabitants of particular trees or caves, or they may be construed as tricksters, monsters, or ogres, at least capricious and potentially malevolent. People usually perform rituals or observe taboos, or both, when venturing into dangerous and isolated places where spirits are said to shoot arrows of affliction into trespassers and to trip up those who disturb them. Before making a change to their environment, such as felling a tree, people will placate spirits with gifts and politely entreat them to move to another place.

It is considered that the dead dwell in settlements separate from those of the living—under the ground, in the sea, in the sky—to which they travel after death and from which they may from time to time return to visit the settlements of their living relatives. At death, rituals mark the transition from life in the domain of the living to life in the domain of the ghosts.

Traditional mortuary customs vary considerably, from burial in the family house to exposure on platforms in the forest or burial at sea. They are more elaborate for people of high rank, as in traditional Hawaii, where chiefs were considered to become gods after death. Today bodies of the dead are usually buried in cemeteries or at individual burial sites. Further rituals periodically sustain and nourish the relationship between living human beings and the dead. Some rituals are for individual ghosts and others are for the ghosts collectively. These rituals usually involve the killing of animals, most often pigs, and the sharing of food between living and dead. They also include speeches, singing, and dancing. The presence of ghosts invited to festivals is signified by the use of masks, costumes, drums, and flutes. People appeal to dead relatives for assistance in times of need. When ancestors as a group are invited to participate in ceremonies, carved figures and masks may be produced to represent them. In some places temples or cult houses are, or were in the past, built as places in which to entertain gods or ancestors.

Often mentioned in studies of Polynesian religion are the related concepts of mana (power), *tabu* (taboo), and *atua* (god). Analogous notions are also to be found in Melanesia and Micronesia. In fact the first sustained treatment of mana in written accounts came from the work of the Anglican missionary Robert H. Codrington in eastern Melanesia. Mana is understood as the power to effect results in the various enterprises of life and may be acquired through contact with the atua. In the cultures of Polynesia and eastern Melanesia, the chief is considered to possess mana by virtue of his relationship to the atua. Although notions about gods and spirits vary across Oceania, the practice of cultivating relationships with them is universal. Such cultivation includes not only engaging the spirits and gods in pursuit of human ends but also showing due respect for them. Thus each person employs a repertoire of taboos or avoidance behaviors with regard to spirits, just as he or she also exercises taboos in relationships with the living. Oral traditions—in the form of songs, spells, and narratives—tell of the relationship of a community to a particular habitat. Stories narrate the exploits of historical people, of mythic ancestors, and of gods and culture heroes. Traditional narratives of events that took place in particular places serve to transmit a system of land tenure, and they designate places of power where people should perform rituals.

Rituals

Oceanians employ ritual action and spoken words to sustain a fruitful interaction of people with land and with ancestors. The practical work of gardening, hunting, fishing, and animal husbandry is accompanied by ritual work that enacts desired abundant outcomes. There are rituals for weather, gardening, child raising, attracting members of the opposite sex, hunting, fishing, tool manufacture, pig husbandry, trade, warfare, and healing. Most societies do not have full-time ritual officiants but employ a variety of healers, mediums, and other practitioners who devote part of their time to ritual practice. Everyone knows some rituals, such as for gardening and healing, but the specialist has a greater repertoire. Ritual is not a substitute for work but is a kind of work. Gardeners with a good knowledge of plants and soils and seasons are still dependent on the weather and are at the mercy of insect pests. Aware of the precariousness of the human hold on life, they express their desires for their gardens and their commitment to the work of gardening in ritual. Garden spells invite the sun and rain to visit the garden and direct insects and disease to depart. Some communities prohibit sex during a crop's growing period; others expect a couple to have sexual relations in their new garden. Thus, practices of ritual and spoken language magic connect the fertility of the couple with the fertility of the garden.

Rituals are employed to encourage the health and well-being of humans and to send away the forces that inhibit a good life. If a person is sick, a ghost, a land spirit, or a sorcerer or witch is blamed. Healers frequently combine the works of healing and sorcery. They are engaged to divine the causes of illness, to prescribe remedies, which may be herbal or ritual or some combination of the two, and to carry out sorcery and countersorcery. They seek to promote the life of their community and to destroy the forces that threaten it. Some ritual practitioners, who are occasionally described in English as shamans, enter into trances and consult spirits for assistance in divining the cause

Baining Mask, East New Britain, Papua New Guinea, 1994. (Chris Rainier/Corbis)

of illness and in recovering souls that have left their bodies and not found the way back.

Ritual renews and reinforces social structures. For example, in areas with hereditary chiefs, firstfruits ceremonies celebrate the people's relationship to a particular crop such as yams and also summarize the structure of the society. In several societies yams are eaten in turn by priest, chief, men, women, and children, and exchanges of yams take place between individuals and lineages. The pattern of eating and exchanges mirrors the pattern of the society. Similarly, in the highlands of New Guinea, where leadership is not hereditary and is periodically changed, ritual exchange in events such as the large-scale killing of pigs and transactions of pork and shells provides opportunity for renewal of community and cosmos. Rituals mark transitions in the lives of both individuals and communities.

Practitioners

While everyone carries out some rituals, so that we could say that every person is a magician or a ritual practitioner, there are a variety of spe-

cialists who preside over seasonal rituals or are called upon in times of need. Their titles have been represented in English by terms such as *healer, sorcerer, witch, magician, diviner, priest, prophet, cult leader, medium,* and *shaman*. In many cases the roles of specialists overlap, and an individual practitioner may carry out the functions of two or more practitioner types.

Healers, priests, mediums, and prophets are significant types of ritual practitioner in Oceania. Today these traditional practitioners are supplemented, and sometimes usurped, by a variety of Christian officiants, such as pastors, prayer leaders, and catechists, and by modern medical practitioners. The traditional roles are not constrained by tight job descriptions but are responsive to the needs of local communities. Healers who employ a variety of pharmacological, surgical, and ritual cures are found in all Oceanian societies. Most are men, but there are a significant number of women healers. The healer is nearly always a diviner who uses ritual—including in some cases dream and trance—to determine the cause of illness, and also a sorcerer who uses ritual processes not only to heal patients but also to harm enemies. In many cases of illness it is considered that someone—a living person or a ghost—is afflicting the sick person, and through the sick person, punishing the group. Victims' relatives consult a healer-diviner to find out who is responsible for afflictions that have befallen them. The specialist's role is to determine who is causing the illness and to propose a course of action that will cause the person to desist. Such a course of action could, for instance, involve making overdue marriage payments or offering food to an aggrieved ghost. In general traditional healers are not opposed to modern medicine, but they see it as treating the symptoms rather than the causes of illness.

Whereas healers are to be found everywhere in Oceania, the priest is more prominent in hierarchically organized societies. As in Tikopia, the priest may be a lineage head or may be in the service of a chief. Presiding over an established ritual system that emphasizes the continuity of the chiefly families and the prosperity of land and community, he tends to support the political status quo. Hereditary priests receive training, which is usually imparted in stages. The leaders of local cults in societies where leadership is ascribed rather than inherited are akin to priests, in that they preside over established rites directed to the welfare of the community. In the ethnographic literature, specialists who communicate with spirits are usually called mediums and are sometimes referred to as shamans. However, given the large corpus of Oceanian ethnography, the term *shaman* is not common and when used is employed in a broad sense. Mediums who conduct séances facilitate interactions with the spirit inhabitants of Oceania. They may be possessed by spirits or dramatically enact conversations with spirits, obtaining information about what enemies have done, seeking advice on actions clients ought take, and finding and retrieving lost souls. They employ fasting, ingestion of hallucinogenic substances, chanting, drumming, and shaking of rattles to induce trance. Their work is directed to enhancing the situation of individuals and of the local community and is responsive to changing social situations.

Like mediums, prophets are bearers of messages. There may well have been practitioners of the prophet type in traditional Oceania; in modern Oceania prophets have emerged as leaders of the so-called cargo cults and other renewal movements. Modern prophets such as the Solomon Islander Silas Eto, a traditional chief and Methodist pastor who founded the Christian Fellowship Church, and Yali, leader of a movement in the Southern Madang area (Lawrence 1964), have sought to address changing social and religious circumstances and to institute rituals for new communities. Oceanian healers and mediums, to a greater extent, and Oceanian priests and prophets, to a lesser extent, share some of the characteristics of shamans, particularly the shamanic responsiveness to the needs of a local community.

Religious Change

In Oceania both Christianity and indigenous traditions are part of contemporary religious practice. Moreover, religion is constantly changing. It is likely that even prior to colonial and missionary contact considerable change occurred in indigenous religions. Oral traditions from Melanesia tell of cults imported from one area to another, and it is likely that events such as the arrival of pigs from Asia some 5,000 to 6,000 years ago and the introduction of the sweet potato several hundred years ago affected

people's ways of relating to their environment and of conceptualizing the numinous. Similarly, one may speculate that Micronesian and Polynesian migrants who left behind the sacred places of their families adjusted ritually as well as economically to their new habitats.

In the colonial period, Pacific Islanders were recruited for labor in mines, plantations, offices, and factories, and workers from diverse cultures came in contact with traditions that differed from their own. During this period, Christianity in a variety of denominations began to be introduced to the region, beginning in the Marianas in 1668, in Tahiti in 1797, and in Hawaii in 1820, and reaching New Guinea in the late nineteenth century. The colonial powers in the region were Christian nations, which saw missions as their allies in the spread of civilization. Both Protestant and Catholic missions in Oceania became involved in the work of health and education. Studies of Christian conversion indicate that those to whom the first missionaries preached assumed that biblical stories and Christian rituals worked in ways similar to indigenous myth and ritual.

Religious movements drawing on both indigenous traditions and Christianity have developed in the Pacific. In Melanesia, movements in which participants await the arrival of an abundance of goods or anticipate a social utopia, were reported following colonial contact; from the mid-1940s they came to be known as cargo cults. The cults need to be understood in relation to wealth rituals and exchange activities that were part of precolonial Melanesia. These movements, which take elements from both indigenous religions and Christianity, seek to attain a lifestyle characterized by wealth and good relationships. Classic cargo cults, which have generally been understood as a response to colonialism and capitalism, have waned in Melanesia. However, a plethora of religious movements and new churches continue to respond to changing circumstances. Today most Pacific Islanders are Christians, and the style of Christianity varies from place to place depending on the nature of local traditions and the denomination that sent missionaries to the particular area. Indeed, in Oceania the relationship of Christianity and indigenous traditions is a matter of ongoing conversation.

PUYUMA SHAMANISM (TAIWAN)

In Taiwan, shamanism still flourishes among the Austronesian people known as the Puyuma. The author's work among this people provides an interesting picture of a shamanistic tradition that has been transformed by outside influences but has managed to adapt and thrive.

Background

The Puyuma inhabit the Taitung plain in the southeast of the island of Taiwan. They speak an Austronesian language and are divided into two dialectal groups: the group "born of a stone," and the one "born of a bamboo." The first comprises seven villages, the second the single village of Puyuma (Nanwang village). The Nanwang Puyama, the focus of this article, occupies an area five kilometers from the town of Taitung.

Society in Puyuma has undergone violent upheavals, caused first by Japanese colonization in 1895, then by the new Chinese government set up in 1950. Until the Japanese arrived on the island, the Puyuma's lives were entirely directed toward the northern mountains, and the group existed by horticulture, hunting, and gathering. But with the prohibition of hunting, farming became more important for the economy. Men had to take part in the agricultural work, which up till then had been done by women. The foreign administration also made schooling in Japanese compulsory, introduced fatigue duties, harassed female shamans, and forbade hunting, including head-hunting rites.

From 1950 onwards, Chang Kai-shek's government continued the destruction initiated by the Japanese administration. In the 1960s, the Puyuma began to sell their lands in order to acquire consumer goods. Today, there are only a few peasant families left, and young people leave the village to work in the island's big cities. Nevertheless, the old structures have not entirely disappeared. The population of the village is divided into two moities for purposes of ceremony, known as the upper moiety and the lower moiety. Opposition exists between na-

tives and nonnatives, and between religious power and political power. Until the 1930s, each moiety of the village contained three households stocked with provisions, and three men's houses, the latter being attached to three hunting grounds. Each moiety also had an adolescents' house. Today, the village has only one men's house and one adolescents' house.

Social organization is based on residential units resulting from the division of the six founding households. At the beginning of the twentieth century, residence was predominantly with the wife's family, but since the 1930s, the trend has been toward living with the husband's family. The children are attached to the household where the parents resided at the time of their birth. Village endogamy was formerly strictly applied; that is, young people were required to marry within the village.

Puyuma society is characterized by an age system. During their lives, males pass through four well-defined stages: "children," "adolescents awaiting initiation," "virile warriors," and "elders."

Ritual functions are assumed by soothsayers, religious practitioners, and shamans. Soothsayers (all men) consult bamboo splinters. Male religious practitioners are in charge of the sociocosmic unity of the entire society, performing the regular cyclical rites concerning the life of the group. Through their relationship with the mythical founding ancestors of the group, religious practitioners are attached to their territory. In December the practitioners perform all the rites of the yearly ceremonial cycle, *mangayaw,* which ensures the restoration of harmony. The entire society is involved. Shamans (currently all women) intervene on a day-to-day basis. They are concerned with immediate social relations between people, and they play the role of therapist, exorcist, and sometimes soothsayer. Shamanistic ritual is performed according to the needs of the moment, and so an altar is set up at each intervention.

Religion is the key element of Puyuma identity. No Puyuma is insensitive to the manifestations of *birua* (spirits), which are classified in three categories according to the spaces they inhabit: the *kaqisatan,* literally, "On High"; the *kaqaulasan,* literally "the Aulas" (world of the spirits); and the third category, which seems to be "homeless" (Cauquelin 1995, 190). The men and women in charge of religious activities play an important role in the whole of Puyuma society. Shamans, some of whom do not even speak the national language, can be seen getting into planes with their ustensils and their long miscanthus stems, to perform rituals at the homes of Puyuma living in a block of flats in Taipei or Kaoshiung.

All men and shamans, but not ordinary women, can intervene with "homeless" spirits, and the innumerable beings from "On High," but only shamans have access to the kaqaulasan. In the kaqaulasan, another imprecise but completely different place, shamans invoke the hosts of their ancestors, all the dead shamans, and their elector spirits (the spirits who have chosen individual shamans). All these ancestors are the shamans' auxiliary spirits.

Becoming a Shaman

It is impossible for a woman to become a shaman unless she has shaman ancestors, one of whom becomes the elector spirit, the principal birua who will help her in her work. The elected one cannot refuse, but it is she who chooses to reveal the call of the birua that she has experienced. Her charisma is based solely on her heredity and this election. The shaman has no choice, the people say. She cannot avoid being chosen; some try to gain time by making offerings, but the elector spirit never gives up. Her situation is irreversible; she is no freer to abandon the call than she was to choose it. The belief that the shaman must answer the call is deeply rooted in the belief system. Transmission is on the father's or the mother's side, sometimes skipping a generation, but sometimes occurring in two siblings.

As part of her initiation, the candidate undergoes some kind of uncommon experience: visions, dreams, profound and painful internal disorders, accidents, fertility problems (perhaps the death of a child in the womb or of a very young child). There is no average age of investiture, but it tends to happen at two different periods, either around the age of thirty or between forty and fifty.

Investiture introduces the novice into the shaman community. The ceremony lasts five days. On the first day, the soul leaves the body: "The elector spirit has come for me," says the shaman, so it is a kind of death. On the second day the soothsayer designates the place where the

Male practitioners in the house of the founding ancestors. (Courtesy of Josiane Cauquelin)

shaman's shrine will be built; on the third day the shrine is erected. At dawn on the fourth day, the shaman places the protective spirit in the shrine. In the evening the entire shaman community prepares the novice's ritual objects (bag, bell, and the rest), and the same evening the novice's instructor places the bag on the new recruit's left shoulder; the soul which left on the first evening is recalled, and reinstated in the top of the head (this is perceived as a rebirth). The ceremony ends on the fifth day with the ritual of the novice's admission into the group.

The shrine is built by men from the newly elected shaman's household, her father, brothers, and husband; her husband moves into the new building. The bag and all the other accessories are made by the other shamans, so two social categories are concerned: her household and her new colleagues. The shrine is a holy place, not in the sense that it is forbidden but because it is the place where the shaman lives in perfect harmony with her auxiliary spirits and where she keeps her cult objects. The walls are covered with knick-knacks.

The bag "makes" the shaman. The rattle is kept in the bag and enables communication with the birua in the kaqaulasan to take place. This Pierrot-headed object (a white-faced clown) is only taken out of the bag for important ceremonies such as the voyage to the Aulas, or the recall of a soul. It cannot be bought in a shop; it belonged to the electing ancestor, and it is acquired for a considerable sum from his or her descendants. Among the accessories, there is rope braided from banyan root, and a little calabash bottle containing lime for binding restless birua. The young novice becomes a shaman at the precise moment when the instructor places the bag on her left shoulder during the investiture ceremony.

When she leaves her house to perform a rite at a patient's home, the shaman ties the strings of her little apron behind her back, and places a crown of flowers on her head, nothing more.

There is no formal training. The new recruit receives no verbal instruction. Training is of a practical kind: The shaman assists her instructor and imitates her. But she denies this, since

it is held that invocations "fall into the novice's head while she is asleep." The mistress of ceremonies, the shaman who was her instructor during the ceremony, sleeps in the novice's bed for a month after the investiture ceremony. This woman has, for many years, been surrounded by shaman ancestors, and she shows them the way to the new shrine. The new shaman must be gifted and able to memorize and improvise. Learning how to perform rites, and know the arrangement of a ritual, naturally makes it necessary to follow another shaman, to take notes and make sketches.

Changes in Shamanism

Religious practices in Puyuma have been undergoing a dynamic recomposition process for many years. The study of ritual in Puyuma, that is, the study of the distribution of activities, and the analysis of myths, shows an initial change, which took place at about the time when hunting was abandoned for rice-growing, around the end of the nineteenth century, when men left shamanistic practices to women, but continued to perform community rites. Puyuma society was probably once a shamanistic hunting society, whose religious practitioners were men, before becoming a shamanistic society whose religious practitioners are women.

The Puyuma used to hunt any game provided by the mountain. All aspects of hunting were important, and society was of a communal type. The game captured was eaten by all the men in the men's house, and shared among their households. In hunting societies, the primary function of the male shaman is the transaction with the spirit (or spirits) known as the "master of the hunt" in order to obtain luck in hunting during the year (Hamayon 1990a and 1990b). Each year, the men of the upper moiety in Puyuma performed the ritual of "feeding the mountain," also known as the "Takio ritual," to thank the masters of the hunt in hope of obtaining their favors once more. Among the many legends, one tells of the rice cake thief, Takio, who crossed a bridge of creepers to reach an island and hunt game, but who returned empty-handed mounted on an aquatic creature. Takio, a shaman, tried to make the rice cakes vanish, since they would deprive him of his function, which, in a hunting society, is the capture of game. Another legend tells the story of the hunter, a father, who killed his daughter's lover, who, in the form of a stag, was guarding the crops in the field. The transition from one type of society to another, marked during the transition period by an attempt to unite farming and hunting, can only be completed through death—the death of the useless old stag is brought about by the girl's father, a useless old hunter who kills the object of his envy. Takio is the worthless shaman, whose role of empty-handed hunter throws scorn on the shaman's very function. Both the stag and the hunter are useless participants in a farming society.

A second change in practices took place at the time of Japanese colonization. The legend of Samguan, in addition to showing modifications in ritual practices and speeches among the shamans themselves, proves that a change took place as the result of an upheaval, caused by the prohibition of religious practices imposed by the colonial administration. In the legend, Samguan, an effeminate man, is described as the first shaman, whereas in the final chant of the shamanistic journey (*yaulas,* literally "being in the *aulas* world") a woman appears—Udekaw with her favorite son, Tuben—and she is there described as the first "true" shaman. The story of the election of Samguan, aged about twenty-five when the Japanese arrived, tells us that he was working in the fields when the "spirits who loved him" invested him and dropped at his feet a bag full of attributes. This story implies that, after a complete interruption, shamanistic practices resumed in secret, but in a different form. Samguan is supposed to have restored these practices and simultaneously renovated them. He converted the first, uncontrolled appearance of the spirits into ritualized manifestations. The bag used by shamans today is made exactly the same as the bag that fell from the sky at Samguan's feet when his election took place in the fields. Today, shamanistic practices are situated within a shaman–possession cult continuum. Integration into the colonial state set shamanism back. The institutional link between the organization of the household and shamanism was broken and traits considered characteristic of possession cults were acquired.

Overview

AFRICA

Africa is indeed a big continent, populated by 800 million people—comprising thousands of ethnic and linguistic groups—and second only to Asia in terms of total area. The ecology and geography of Africa vary a great deal. Stretching from the Atlantic in the west to the Red Sea in the east, the Sahara divides Mediterranean North Africa and sub-Saharan Africa, which consists of West, East, Central, and southern Africa. In addition to the deserts, rain forests, and grassland savannas for which Africa is known, mountainous regions can be found to the north and east of the continent, as well as in the interior of the Sahara.

Most of the current geopolitical boundaries of African nation-states were either the creation of European powers dominant in Africa in the late nineteenth to mid-twentieth century or, alternatively, the result of the decolonization process. Thus the outlines of many African nations do not reflect actual and continued cultural, religious, or historical regions. Historically, migration, circulation, trade, warfare, and social stratification have contributed to the ongoing redefinitions of ethnic groups and what constitutes them.

Africa exhibits markedly differing types of societies, both in terms of scale and organization. Social organizations ranging from large regional empires based on trade, to pastoral nomads, to hunter-gatherer groups living in the forests or deserts can all be found in Africa. Political organization varies as well. Despite overt and increasing attempts on the part of many nations to extend the reach of centralized governmental authority, kinship and religion are still influential idioms. Many of the newer political developments, in fact, are couched in religious, not wholly secular, terms.

Interaction and Systems of Belief in Africa

Africa has been home to a rich variety of indigenous belief systems from before ancient Egypt to the present. Ancient Egyptian religious practices were extremely complicated systems of belief, incorporating animal symbolism, various sorts of ritual specialists, elaborate funerary practices, and above all multiple deities. In most instances at the present time, the systems of beliefs coexist or articulate with scriptural religions, the most widespread of which are Christianity and Islam. Religious pluralism on the African continent is not, however, a new phenomenon. Whereas the spread of Christianity to most parts of Africa is embedded in the colonial project, either as a direct intent or in some cases as an unanticipated end, Christianity existed in North Africa early in the first millennium and spread to Ethiopia soon thereafter.

Islam first moved to North Africa in the seventh century. From this point onward, trade networks spread Islam to interior areas, most notably perhaps West Africa, where towns like Tombouctou became centers of learning in the early middle ages. Mercantile activities along the eastern coast of Africa also played an important role in bringing Islam in from the coastal towns.

Yet Islam did not enter the tropical forests and the East and Central African interiors until recent times.

The increased spread and ensuing influences of Islam and Christianity did not eradicate indigenous religions; rather it brought about changes within them or opened up possibilities of religious conflict. The incorporation of Christian or Islamic symbolic content at times augmented religious life, introducing new syncretic tendencies.

The slave trade represents another significant development in the historiography of African systems of belief. The movements of great numbers of Africans to North America brought African religious practice to the Caribbean and the American South (as well as to northern states) and prompted the creation of new sorts of spiritual practices, as demonstrated in the entry on Voudou in New Orleans, in the North America section. Such syntheses are also seen in Brazil, as seen in the entry "Afro-Brazilian Shamanism," in the Central and South America section.

A common view at present is that indigenous beliefs are represented and defined within "traditional" structures of social organization in Africa. Yet the issue is more complex; the areas where African systems of belief are made manifest at present are not simply rural areas or "traditional" enclaves; rather, ritual practice can be seen in urban areas as well (see entry "Zarma Spirit Mediums" for example) and alongside scriptural religion. Syncretic tendencies—the adoption and incorporation of new religious practices—have been apparent for some time and are becoming more so in various parts of Africa, especially those that are religiously plural (see entries on "Swahili Healers and Spirit Cult" and "Zulu Shamanism").

Noah Butler

African Shamanism

Mircea Eliade defined a shaman strictly as an ecstatic whose soul leaves his body and ascends to the sky or descends to the Underworld. If this trait were not present, said Eliade, the person was not a shaman but a healer or magician (Eliade 1989, 5, 507). This definition excluded African spirit practitioners from the category of shamans and had a delaying effect on the exploration of the spirituality of African healing and ritual. Eliade's criterion was firmly linked to that of a belief of the people in a Supreme Being (507), and he maintained that spirit possession in healing—common in Africa—was developed later in history. However, since the time of his book, *Shamanism: Archaic Techniques of Ecstasy,* first published (in French) in 1951, new studies of what is clearly shamanic work in Africa, documented in detail and often reported by experiencers, have been added to the literature, and have even outpaced the ethnography of shamanism in Eurasia. African indigenous prophets and prophetesses have indeed been in touch with a Supreme Being. Scholars' understanding of the level of consciousness that gives East African initiates their sense of equiprimordiality—oneness—is developing, as described, for instance, by Stephen Friedson (1996) and Roy Willis et al. (1999) in their studies of African spirit ritual. The sense of oneness is very close to the sense of God.

The question arises frequently in African ethnography. For instance, where were the souls of the Mbuti pygmies as they sang their "making good" songs in the Ituri forest of Congo? The anthropologist Colin Turnbull *knew*, but could not fully put the matter into words. "The bodies [of the singers] were empty"—they were gone (Turnbull 1990, 56). Turnbull said that the Mbuti's songs and their sense of the forest very definitely included whatever is implied by God and Spirit. Furthermore, in a study of the healing dances of the !Kung bushmen of the Kalahari, Richard Katz quoted the words of the healer Kinachau: "During the death of full *kia* [an altered state of consciousness] the soul leaves the healers' body through their head. The soul goes to encounter god and the spirits of the dead ancestors. It pleads for protection for the !Kung back at the dance" (Katz 1982, 100). Back at the dance the singers call out for the soul to return. They too know it has gone. Other examples exist. For many reasons it is time to establish the inclusion of African and African American spirit practitioners in the category of shamans, indeed, that of mystics.

General Characteristics of Shamanism in Africa

From the following overview of the shamanic craft of Africa, something of the richness and deep spirituality of the shamans' work will be recognized. In the understanding of most Africans, God created the world and then gave the most active part of the work of the world to spirits. The spirits are the beings who are most frequently responsive and efficacious. Ancestor spirits are constantly present among the living and are deeply concerned in their doings. At death, a person journeys to the land of the ancestors, and also, after death, the soul may be reborn in a new child. This metempsychosis, the soul's power to migrate, can occur when a tribal king sits on the throne of the ancestor whose death occasioned his succession. He then becomes that ancestor.

For most Africans, illness is caused not only by infections and other medical conditions but by spiritual trouble, brought about by the dissatisfaction of the ancestors (still spiritually alive and active) with the ways of the living, especially when hatreds tear a family, or when the spirits see disrespect in the attitude of the living toward those who have gone before and who gave them life. The other major cause of illness is the action of jealous or inimical persons, witches or sorcerers, who perform occult acts to harm their enemies, "eating" their vitality.

Village Africans frequently hold rituals of healing to counteract these dangers. The rituals draw together descent groups or wider village attendance to carry out the rites, which are led by a spirit doctor, or shaman. The ritual consists of song, drumming, clapping, dance, the use of medicines, and a variety of performances to bring the spirit strongly into the midst of the people so that it is able to help, not harm. These acts insure the necessary connection with the spirit world. The entities, having begun by afflicting a person, when recognized for what they are and are respected, will give good health, good fortune, and, for some individuals, a call to the life of a shaman.

The person destined to be a shaman is sometimes a person with an unusual birth, such as being born a twin, or born in a caul. The first sign of a vocation in the young person may be in the form of a dream about the person's own dead ancestors, often a parent. Thus it is an ancestor or power spirit that takes the initiative in leading a shaman to his or her career. It guides the budding shaman into the spiritual way of life, teaches him or her through dreams, and when the person is initiated gives powers of healing and also of knowing which herbs to gather and how to treat the sick. It enables the shaman to communicate with others from afar, to meet the ancestors through dreams and visions, to tell the future, find lost objects, and help hunters to find animals.

During the first intimations of change the incipient shaman is at first in two worlds, that of the spirits and that of village life. He or she often suffers confusion at this point, runs wild, and may fall in trance. A rite of sacrifice may occur at the height of the initiation when the new shaman is shaken by the intense drumming and laid low by the spirit. The killing of an animal in sacrifice sends a message of power to the spirit—death being the membrane between mortals and spirituality. The blood, the result of the penetration of that membrane, will cool and quiet the perturbation of the novice. This may become the moment of breakthrough when the gift arrives. The spirit is taking control; then, with the aid of full initiation by older practitioners along with music and community help, the shamanic gift is accepted, confirmed, and becomes of use to humans. The shaman's initiation may include a test of his new divinatory powers, sometimes in the form of finding hidden objects. Such a test is a common feature of African shaman initiation. A new shaman sometimes says that the experience was life changing.

A shaman has wisdom, and is able to "tune in" and intuit the nature of an illness and the state of the sick person. The shaman has modesty and does not claim responsibility for cures, but ascribes them to the spirits concerned. Shamans are commonly marginal people in some way in the village. They are rarely headmen or kings.

A shaman often keeps a container in some sacred place—a bag, a basket, a jar, or even a "doctor's black bag"—holding divining objects, various objects of power, medicines possessing homeopathic, contagious, or sympathetic virtue, or maybe a conch shell to serve as a spiritual telephone. The medicines and rituals used by shamans have been shown to them by their spirits. Part of the power of the herbal substances derives from their spiritual quality and part from what the West may recognize as their medicinal value. The two values are blended in one. As for the divining objects, shaman-diviners, who are often specialists, make use of a variety of objects or even random

marks of nature that hook their attention. The objects may be collections of bones, figurines, or palm nuts, the naturally formed footprints of wild animals, or the appearance of the internal organs of a hunter's newly caught quarry. The random pushing of a pole along the ground may also be a divining test. These objects or circumstances tell the diviner the nature of the trouble the sick person is suffering, whether it is from ancestor affliction or from witchcraft, what steps the relatives should take, or whether they should undertake a ritual appealing to the ancestor spirits or an antiwitchcraft ritual or herbal treatment.

In divination, the practitioner feels a shaking or burning, a great sensitiveness to disturbance, and a sense of his or her tutelary spirit taking over. In a state of heightened awareness, the practitioner will put pertinent questions about the trouble in question. The diviner in the sacred state is able to reverse a downward trend in a person's life. In some cases the diviner (or oracle) may not remember anything about the séance afterwards.

The diviners, therefore, are shamans; they perform extractions of harmful intrusions, reconcile a person's ancestor spirit to make him or her a guardian and protector, and may heal with herbs or physical treatments. Above all they have knowledge. As for whether African shamans make spirit journeys, examples of these have been briefly mentioned. Full descriptions are only just becoming available.

Introduction to the Entries

In the entry "Ancient Egyptian Shamanism," many shamanic features are noted, for instance, the spirit qualities of bulls and jackals, the part-human, part-animal nature of gods, and the dismemberment and rebirth theme of the god Osiris. There existed knowledge of multiple souls, along with the practice of trance by priests, which brought them gifts like those of shamans. The spirit journey was well attested. The entry "Igbo Shamanism" notes how the primary spirit entity, Agwü, empowers the "man of knowledge" (*dibïa*) in his craft, and how a deceased dibïa grandfather will teach a new dibïa in his dreams. At present the dibïas (now frequently women) do not treat disease so much as disorders due to lifestyle, corruption, dishonesty, and abuse. "Hausa Shamanistic Practices" describes how Bori spirit doctors in Nigeria owe the efficacy of their healing and wisdom to the spirits. Among the Hausa, Muslim and non-Muslim practices sometimes intermingle and are sometimes in opposition. In the Gungawa section of the Hausa region, shamanic mediums, often benign or trickster figures, are held in high repute, while at the same time displays of power by any of them are frowned on.

The entry "Ndembu Shamanism" points out that the shaman-diviner attains all the typical powers of universal shamanism: healing, interacting with the dead and other spirits, finding lost objects, bringing animals to the hunter, changing the weather, and speaking from insight and foreknowledge. The author of "Ancestor Worship in Africa" notes that African piety toward ancestors was respected by the Greeks of the classical era as a good example to be followed. For the Akan in Ghana, humans are descended from spirits who are descended from God. The priest-mediums of the ancestor cults are called to their work by supernatural agents. In their initiation there occurs a temporary paralysis, like trance. These attributes are noted in the entry "Asante Shamanism"; the *okomfo* or priest is possessed by spirits of nature who impart the knowledge for the okomfo to cure illnesses and assist people in other ways. Similarly, in the entry "Cape Nguni Shamanism," the healer-diviners are described as called to their professions by the ancestors. More women than men become mediums in this region of Africa. Another entry, on the West African shamanism known as the "Mami Wata Religion" (mother of water), focuses on a deity who inhabits bodies of water and is revered, along with water spirits, in the West African coastal area. Initiates are called to the priesthood through signs of being drawn to water. They then set up unique individualistic shrines to Mami Wata, incorporating non-African images and objects that were brought into West Africa by European and Indian trade and cultural contact since the fifteenth century. The entry "Swahili Healers and Spirit Cult" shows the intermingling of Islamic and pre-Islamic ways of understanding healing at all levels of the craft: contacting and treating spirits, divination, astrology, geomancy, and magic. For healing, Qur'anic passages are written on a cup or plate, washed with wa-

ter, and the water given to the patient to drink. Possessing spirits will use humans as their "chair"; the spirits are ambitious and desire fine things.

The entry "Yaka Shamanistic Divination" describes a religious view based on an awareness of the world in which everything is alive and an ecstatic communion can take place between humans, spirits, and the life world. Yaka diviners often operate within the framework of a healing church. In "Zarma Spirit Mediums," the *zima* is described as a holy man who variously combines spirit possession, healing, and magic through ritual in an effort to manipulate spirits. In "Marabouts and Magic," it is noted that the marabout variously combines divination, magic, healing, spirit manipulation, and ecstatic prayer. The entry on "Cape Nguni Shamanism" emphasizes the role of the diviner, who interprets the messages of ancestors in order to heal the patient. Herbalists also have knowledge of magic, but do not possess the occult powers of the diviner. The author notes that certain aspects of Xhosa ecstatic divination may be derived from the cosmology and shamanic practices of the !Kung—such as the ecstatic healing dance. The entry "!Kung Healing, Ritual, and Possession" describes this cosmology as a universe defined in terms of creation and destruction, with important animal and ancestor spirits. Shamans are spiritual specialists—healers who protect people from evil spirits by entering into trance. A major feature of !Kung shamanic practices is the ritual trance dance, also practiced by the Xhosa, a ceremony entered into in order to placate malevolent deities; music is a key factor in the !Kung trance dances.

In the entry "African Traditional Medicine," reference is made to the development of healers' associations such as the Zimbabwe National Traditional Healers' Association, formed to support traditional medical culture. The differences between African healing skills and those of modern medicine are outlined. The entry "Twin Cult of the Akan" gives the sacred cosmology of this Ghanaian people and includes the ritual to draw the deity into twins, showing how the twins are tested, fall into trance, and are finally purified. "Witchcraft in Africa" discusses anthropological theories of witchcraft, including Max Marwick's theory that "witchcraft is a conservative force" (Marwick 1967), meaning that both the complexities of witchcraft and the defenses against it have the function of giving support to the existing social system. Many details of intentional witchcraft and also evils done without the witch's intention are included here.

!KUNG HEALING, RITUAL, AND POSSESSION

The phenomenon that might be described as shamanism among the !Kung involves healers who, during rituals, enter a trance state and transmit power from the spirits. Despite recent changes in !Kung life, these people still play a central role

Background

Residing along the intersections of the borders of Namibia, Botswana, Zimbabwe, Zambia and Angola, !Kung have lived historically as hunter-gatherers. For many, the terms *!Kung* and *Bushmen* are synonymous. Indeed, various bodies of literature have used them interchangeably, with *Bushmen*—an Anglicization of the Dutch *bosjesmans* (Lee 2003, 9)—employed as a generic descriptive term for various southern African hunter-gatherer groups.

Use of the term *Bushmen* has been abandoned altogether by the social sciences, as it is vague and obviously outdated, if not blatantly derogatory. Anthropologists, for instance, prefer calling these groups what they call themselves. But sometimes this is no less problematic. The term *San* (viz. !Kung San) frequently used in place of *Bushmen* comes from the Nama word *saan* (plural) or *saa* (singular), which has the same meaning of "bush dweller(s)." *Ju/'hoansi* (pronounced zhut-wasi) is the term by which most !Kung refer to themselves (Lee 2003, x); nonetheless, Ju/'hoansi is seen but rarely in the literature.

One of the most common remarks about the !Kung is that an ethos of egalitarianism pervades most facets of their social life. This is not to say that a division of labor does not exist; quite the contrary; men hunt, and women gather. The products of their efforts, however, are distributed with attention to sharing.

Estimates of the number of !Kung vary from 35,000 to 100,000, depending on whether settled people or only hunter-gatherers are counted. Consisting of thirty or so related individuals, a band is the predominant unit of !Kung hunter-gatherer social organization (Lee 2003, 59ff.). !Kung migrate with the seasons. In the dry season when water is at a premium, larger camps with more substantial shelter spring up around established water holes. During the rainy season, !Kung tend to circulate much more freely since they have no need to stay settled near durable water holes because the rains give birth to numerous new ones (Lee 2003, 33ff.).

Yet not all !Kung live nomadic lives. Indeed, many are settled. In part due to the introduction of reservations in the 1970s, in addition to restrictive policies of land tenure by some nations, !Kung lifestyle, modes of subsistence, and social organization have changed drastically. Sedentary life introduced new sets of concerns, not the least of which was a money economy. Many !Kung, especially men, turned to wage labor, working for their neighbors (the Herero, Tswana, and others) as herders or farmhands. Still other !Kung, men and women alike, migrated to less rural areas, taking various sorts of jobs there.

Adaptations to changing ecology and political economy are not new phenomena to !Kung. Initially, the twelfth-century migration into the area of Bantu-speaking pastoralists and horticulturalists and then the movement of Europeans since the seventeenth century drastically altered !Kung life. Initial efforts to control !Kung territory, compounded with later political maneuvers to limit their access to it, have made it difficult for !Kung to continue hunting and gathering with the same alacrity as in the past (Lee 2003, 168ff.).

!Kung Belief Systems

In contrast to the egalitarian ethic of !Kung social life, !Kung cosmology is hierarchical. !Kung believe that a grand deity created the universe. What they call this deity varies, although coincidentally a good many !Kung call their creator !Kung as well. There were two separate phases of creation. First, the universe was brought into existence. In the beginning, there were no distinctions between animals and people; both were human (cf. Lee 2003, 128–129). During

this stretch of time, the basic structures of !Kung society were established. A second stage of creation differentiated people from animals, leaving them to live together in the same world but as different sorts of beings. The second moment of creation, therefore, established the current natural and social order of things.

!Kung people maintain that presently their creator resides in the eastern sky and has power over another lesser deity, Gauwa the trickster, or death-giver, who lives in the western sky. Thus !Kung cosmology recognizes the nature of the universe in terms of creation and destruction, made manifest by competing deities of life (!Kung) and death (Gauwa). The contrast between life and death, creation and destruction, is hinted at further by the cardinal points: !Kung the creator lives with the rising sun, whereas Gauwa the death-giver resides where the sun sets. !Kung the creator has power not only over Gauwa but also over other malevolent forces aligned with this death-giver.

Animal and ancestral spirits occupy a central place in !Kung cosmology as well. Although they are not nearly so powerful as the !Kung deities, these spirits affect individuals and the community directly. Ancestral spirits may be indifferent, benevolent, or malevolent; in particular they are respected because of their ability to inform human affairs positively or negatively (Lee 2003, 125ff.). While the nature of the afterlife is not clear, it is the ancestors who serve to enforce basic principles of !Kung belief and behavior, since they may cause illness as retribution for violating community norms. Moreover, the fact that ancestors can cause illness suggests that the !Kung believe in the survival of the soul, or spirit.

Healers

Shamans are defined as part-time spiritual specialists; the !Kung refer to such people as healers (*n/um k"ausi,* literally "medicine owners") (Lee 2003, 120). !Kung ritual life is centered on the efficacy of these healers, who enter into trance to heal people and protect them from malevolent spirits responsible for causing illness and misfortune. Additionally, healers have a supernatural potency *(n/um)* within them that enables them to see the future, control the weather, and perform a whole host of other services, including ensuring good hunting and generally looking after the well-being of their group (Lee 2003, 125–140). Among the !Kung, nearly half the men and one-third of the women have acted as healers in trance dances at one time or another (Lee 2003, 13, 82–83).

Ritual and (Trance) Dance

One of the central functions of healers is to organize and participate in trance dances. Such dances may be performed at any time, although they are most commonly staged during the dry season, for several reasons. First, during the dry season the community is most likely to be threatened with food shortage; hence ritual ceremonies are one way of placating malevolent forces and beseeching the spirits for assistance in times of scarcity. Second, because camps are larger in the dry season, since people must move to established water holes and stay there until the rains come, more people are able to participate in the trance dances. Some communities hold trance dances upwards of two or three times a week, while others stage but a few in the course of a season.

Dances begin in the evening and last through the night. There is a clear division of labor in dance. Women sit around a fire at the center of the dance area singing, shaking rattles, and playing other instruments, while men dance (Lee 2003, 132–132). But not all dances incorporate both sexes. Depending on the function of the dance, there may be men's and women's variants. Alternately, some dances invert roles: Men provide the music while women dance to enter trance. Apparently these dances are a newer innovation (Lee 2003, 135–137).

Music is perhaps the most significant factor in all !Kung trance dances. Despite the fact that modern instruments are readily available, !Kung prefer to use traditional instruments such as the thumb piano, mono-chord violin, harp, bow, and rattle to provide rich and complex accompaniments. !Kung weave four or more background melodies together, over which vocals are laid. Songs take various forms: At times singers use wordless streams of vowels in a fashion akin to jazz scat singers; at other times they may imitate animals or each other in song, while the dancers mimic the subject's gait; and, of course, there are songs with established lyrics in addition to ones where the lyrics are created ad hoc.

Possession and Its Functions

Possession and spirit mediumship—qualities made manifest and manipulated through trance—are central concerns of healers. While in a trance (altered state of consciousness), the healer may address a variety of issues affecting either individuals or the community as a whole. Trance dance, then, serves multiple functions, some of the most common of which are (1) healing, (2) choosing future healers, (3) contacting the ancestors, and (4) ensuring subsistence.

Healing

Trance activates healing n/um (medicine). !Kung believe that trance results when a person pleases a spirit or deity and is subsequently (and temporarily) absorbed into that spirit or deity. When people attain spiritual connection in this way, their personal healing n/um can be used to heal others (Lee 2003, 125–130). It is at this point that the actual healing ritual begins. Physical contact between healer and patient enables the healer to feel the sickness. Once a healer has located the problem, he figures out its cause. After discerning the location and nature of the problem, the healer uses ritual paraphernalia (e.g., tortoise-shell rattles, herb bundles, charms, beads, various tradegoods) to fight the illness. Ultimately, by laying hands on the patient, the healer is able to "pull" sickness out (Lee 2003, 96), taking it into his own body and then expelling it (cf. Katz 1982, 1993). If, however, someone in a state of trance fails to find someone to heal, then the would-be healer falls into a swoon.

In trance dances, healers transmit energy to each other (a phenomenon Richard Katz, in his 1982 book, *Boiling Energy,* called *boiling;* see also Katz 1993; Lee 1984; Marshall 1969; 1999). N/um is not confined to men, nor to dancers; women's singing and music may activate their own personal healing energy, setting off screams in lieu of vocals. Their screams are a sign for male healers to begin going around the circle touching the sick people brought to the dance for their attention (Lee 2003, 131). The male healers draw power from the women's songs, relying on hyperventilation and intense concentration as well as the rhythm of dance to enter a state of trance. Therefore, women play an essential role in their efforts to bring on a healer's trance. Even the rhythmic shaking of rattles that accompanies the dancers' steps is said to be a hypnotic action.

Choosing Future Healers

In addition to healing ailing community members, healers also use the trance dance to identify future healers. They look for young people with particular qualities: namely, reliability, responsibility, and an ability and desire to aid the community. Once healers have identified these qualities in young people, they begin to provide them with n/um at trance dances. This transference of power leads to a training period, in which healers train youth in songs and dances appropriate to trance ceremonies. They provide supplementary n/um to them as appropriate to their stage of development in becoming healers. Healers also counsel all youth in appropriate behavior in the community, reminding them (and adults as well!) to remember the ancestors, honor them, and attend to community expectations. In so doing, senior healers teach novices how to tell what is wrong in the community in general, and with certain individuals in particular, and to provide solutions for those wrongs.

Contacting the Ancestors

The ancestors are believed to play a dominant role when it comes to enforcing community ideology and moral standards. They reiterate the importance of !Kung ethics of sharing and modesty by causing sickness in the selfish. For example, if a person kills more than his share of game and distributes it wastefully or avariciously, the ancestors will bring about illness. The healer ought to know the reason for the illness and, furthermore, to make this fact known to the community. After curing the patient, the healer will warn the community that the ancestors are angry and that they have punished the patient because the patient or a relative has killed more animals than the community actually needs. Literally, the healer makes the ancestors' wishes known. Thus, in a sense, healers act as conduits through whom the ancestors communicate.

Subsistence Rituals

Because they are hunter-gatherers, !Kung subsistence is unpredictable. Since they must

demonstrate acute awareness of their means of subsistence, healers are in a prime position to advise people on their interaction with the environment. Although periods of serious scarcity are infrequent, temporary food shortages are a painful reality. Healers are charged with preventing such shortages. Trance dances summon animal spirits so that they may be communicated with and convinced to follow certain courses of action. Acting here as spirit mediums, healers beseech the animal spirits to make the actual animals come closer to the camp. While entranced, the healer undergoes a personal transformation in which he forges spiritual bonds of understanding between himself as hunter qua healer and the types of game that sustain the community. Thus in addition to the latent function of ensuring food stuffs, there are more manifest reasons for holding a trance dance: namely, curing people, rainmaking, controlling and finding animals for the hunt—all of which contribute to !Kung subsistence, some more directly than others.

Change and Continuity

By nature of their geographic location, !Kung are in a somewhat precarious position, compounded further by the nature of the history of their territory. As mentioned above, !Kung reside at the intersections of five different national borders. Predictably, political policies and land access regulations differ between these nations, and by extension, so do lifeways differ between people of the same ethnic group once united by a shared lifestyle and some common sets of ethics. Indeed, for a variety of reasons, many !Kung no longer continue living as hunter-gatherers.

Trance dances are currently used as a means of cultural revitalization in some !Kung communities. They are reminders of the past and the means of reasserting !Kung cultural identity and promoting group solidarity. New dances have emerged in the face of new problems and new ways of living. With their emergence, new practices are performed by new healers aware of the new concerns of their communities and cognizant of some of the pressures generated by the uncertainties in social life. In some communities, healing has emerged as a profession, as a service that is now paid for in cash or kind (cf. Lee 2003, 139–140). Healing has become a livelihood in and of itself; a means to live outside of the requirements of cooperation. Not all healers charge for their services, but some are now profiting as individuals from what was once a distinct community practice.

AFRICAN TRADITIONAL MEDICINE

This entry is compiled from the work of Gloria M. Waite on African traditional medicine, a subject about which she wrote extensively, and which she strongly felt deserves the kind of recognition hitherto reserved for Chinese and Indian traditional medicine. Although she did not specifically discuss the shamanistic elements in this medicine, the reader will find some shamanistic elements, as in most traditional religions. Most obviously, there is the belief in spirit possession and in the power of spirit mediums to heal problems caused by spirits. There are, moreover, other sources that deal with this material; citations of them will be found in Waite's writings listed in the references.

African traditional medical systems, in common with medical systems throughout the world, comprise several interrelated components. These include specialists, techniques for diagnosis and treatment, classification of illness types, and theories that make the system intelligible and weld its component parts together. Unlike modern medicine, traditional medical systems take a holistic approach to health, based as they are on a unity of social and biological forces.

According to many African traditional beliefs, anything that makes a person or community dysfunctional or weak places that individual or community at risk. For example, puberty is likened to physical illness, in that uncircumcised youth represents a weakness or dangerous state in the community. The community is strengthened when young people are circumcised and admitted to adulthood. Menstruation, too, is often regarded as an illness because it is a time during which a woman is not supposed to perform some of her normal activities, such as salting the soup. Her routine has been disrupted, placing her in a socially dysfunctional state: Her condition is believed to make certain other people susceptible to illness. Newborn babies are also believed to be in a state of danger. They, however, are not the ones who cause the danger; rather, they are vulnerable to illness on account of their parents' negligence. People considered at risk are often protected by taboos (Waite 1992).

In the traditional belief system, chronic illness, sudden malaise, and misfortune are often attributed to malevolent forces, which are usually called witchcraft or sorcery. The activities of sorcerers are of medical concern because they are deemed to threaten the health of individuals and, ultimately, entire communities. Moreover, sorcery is detected and eliminated through medical techniques (Waite 1992).

Diseases of metaphysical or social origins are not, of course, the only ones known to African traditional medical systems. But since modern medicine recognizes only biological causation, Westerners (Europeans and North Americans) often exaggerate the metaphysical aspects of African medicine. Yet African medical systems link numerous diseases to biological processes, and historically Africans have recognized a biological basis for any number of maladies, such as sleeping sickness, smallpox, leprosy, and numerous others.

Still, the belief that nonbiological forces are a basis of disease causality is an important difference between traditional medicines, including African traditional medicine, and modern medicine. Modern medicine focuses primarily on microbes to explain illness, giving little or no attention to the social milieu. Yet like their modern medical counterparts, African traditional doctors are not at the mercy of personal forces, any more than modern doctors are at the mercy of impersonal ones. Both groups of practitioners try to control, or at least influence, the course of disease and illness.

African traditional health-care systems, unlike those in the modern Western world, are not monopolized by a professional class. Rather, treatment may be provided by specialists or laypersons. The traditional systems, to be sure, require a limited number of specialists; but these individuals supplement rather than provide all the health care. The choice of whether to rely on a layperson or consult a practitioner depends on the nature of the malaise and how serious it is. Traditionally, most adult villagers knew a good deal about their environment and what plants to use for common ailments and conditions, and many still do (Waite 1992).

Under traditional systems of medicine, most individual health problems were taken care of within the household. In many parts of Africa, however, some medical conditions were considered public and therefore required state intervention or that of ruling elites.

Queen Ntuli, A Zulu sangoma, or traditional healer, points with her divining stick at the shells and bones that she has thrown for a client, April 2000, Durban, South Africa. She is active among traditional healers helping to educate them about HIV and AIDS and believes that they cannot cure AIDS, but can help with many of the symptoms of the disease. She believes that traditional healers are very influential within their communities and need to be taken more seriously by the medical establishment as key people in the fight against the disease. (Gideon Mendel/Corbis)

Such a public sphere of medicine existed in east-central Africa, among other parts of the continent. The societies of east-central Africa—a region that encompasses all or parts of the modern countries of Tanzania, Congo, Zambia, Malawi, Mozambique, and Zimbabwe—share a common set of medical traditions, so much so that they may be said to constitute a single medical system. This is especially true of the region's Bantu-speaking people, whose ancestors began settling there some 2,000 years ago. (Bantu refers to a family of languages; most of the languages spoken in the southern third of Africa are Bantu languages.) In the traditional medical history of east-central Africa, there were two medical conditions that required the intervention of ruling elites: those caused by spirits and those caused by sorcery (Waite 1987).

Spirit causation is a significant part of most traditional medical systems. In the traditional system, spirits are believed to bring certain kinds of illnesses and other afflictions to individuals, families, and entire communities. When an illness is of unknown origin or a calamity strikes a whole community, people consult doctors who divine the cause of the problem, using either their own spirits for inspiration or mechanical devices. If the doctor diagnoses the problem as being caused by neglect of ancestral spirits, then people generally undertake propitiation of those spirits by visiting specially selected sites and making gifts of food or goods to the spirits, who are called upon to hear the complaint and minister to the need (Waite 1987).

Sorcery, which involves antisocial, nefarious acts, was the second medical condition that re-

quired the intervention of the state or ruling elites. Generally, sorcery was suspected when people died suddenly or had an illness that was unexplainable or progressed rapidly. Sorcery was not a family or private matter. From the outset, sorcery accusations were usually made in public. Historically, ruling elites, whether priestly or chiefly, intervened and "medicized" conflicts involving sorcery. "Medicized" is an appropriate description because the techniques used to identify sorcerers—such as inspiration from the spirits or poison ordeal—along with the medicines used to counter sorcery, were deployed in strictly medical contexts (Waite 1987).

The authorities who controlled traditional public health institutions were priestly, chiefly, and kingly figures, or they combined both chiefly and priestly roles. These authorities, like the spirits they evoked, were guardians of the land and all that dwelt therein. They derived their power and authority from their ancestral spirits and from their knowledge of medicines. In some instances, there would be competition or even conflict between priests and kings, since both groups claimed the same power and authority. Nevertheless, the control exercised by elites—whether priestly or chiefly—over health-care institutions set them apart, as a group, from the rest of the population (Waite 1987).

Whether in the public sphere or in the more private domain of the family or household, practitioners and consumers of African traditional medicine had access to a vast pharmacopoeia—drugs derived from barks, leaves, roots, mineral springs, and other natural products. Historically, plant knowledge was passed from one generation to another, from older to younger people. (This did not, of course, preclude acquisition of such knowledge from nonfamilial sources.) Some traditional doctors claimed to receive knowledge of plant application through inspiration while sleeping. Most plant knowledge, however, was acquired through apprenticeship, usually to an older family member.

The therapeutic value of a plant is determined in part by the active principle(s) it contains. Principles are compounds that form in a plant that, when used in medicines, act upon the body's structure or functions. New principles are constantly being discovered. There are still thousands of plant species about which little or nothing is known.

Though perhaps unfamiliar with modern scientific terms like "principles," traditional doctors used plants and herbs in ways that indicate considerable knowledge of their pharmacological actions. Through selection, traditional doctors also took their medicines through what is known in modern medicine as clinical trials. Consider the genus called *Albizia,* which is widely used throughout east-central Africa. Scientific studies indicate that it contains a saponin called musennin. Saponins have an expectorant quality, for they cause increased secretion in respiratory passages and loosen mucus. It is no doubt for this action that the species has long been used as a remedy for cough in the region (Waite 1988).

There is also the species *crossopteryx,* which derives its name from an early association with antifever activity. Though its efficacy against fever is disputed, the plant is used as an abortifacient in parts of east-central Africa. Research shows that it contains alkaloids, though the particular kind is debated. Alkaloids, by their nature, promote menstrual discharge. There is thus scientific evidence to confirm, if only tentatively, the value of *crossopteryx* as an abortifacient (Waite 1988).

In sum, medicines played a prominent role in African traditional health care. They were used to restore and disrupt health, to protect households from sorcerers, to safeguard gardens from thieves, and to shield people in their enterprises and help them succeed. Medicines could be taken internally, rubbed into specially made cuts in specific parts of the body, rubbed unto the body itself, inhaled through steam, planted in the garden, or worn around the body. The action required by the medicine determined the method of application.

European colonialism had a marked impact on African traditional medicine. In most of Africa, the colonial powers—Britain, France, Belgium, Germany, Portugal, Italy, Spain—imposed their authority in the later nineteenth century through a series of conquests. Colonialism brought new institutions and cultural formations to Africa, including new technologies and new forms of economic, political, and social organization, along with new social relations and ideologies. The colonialists also introduced new health personnel and trained a small number of the colonized people in the new science of biotechnology.

Colonial health policies and programs reflected the economic and political demands of colonialism. The European conquest led to population dislocation and disequilibrium in the disease environment between people and animals. Accordingly, some of the first public health measures put in place by the Europeans were aimed at controlling the epidemics brought on by the conquests.

Colonial health policies and programs were aimed, first and foremost, at increasing worker productivity. The result was the emergence of public health programs to control vector-borne diseases (such as sleeping sickness and malaria), and to provide maternal and infant care, urban sanitation, and public education. It bears emphasizing, however, that these programs were not altogether successful, or even widespread. Indeed, health—like education and social welfare generally—received only small portions of the colonial budgets. The exceptions were those colonies (like South Africa and Zimbabwe) in which Europeans settled in relatively large numbers, in which case the great bulk of the expenditures on items like health were earmarked for the welfare of the settlers rather than that of the colonized Africans.

As the colonialists introduced new medical institutions, they also attempted to suppress the existing ones. The colonialists denounced African medical systems as quackery and superstition, and, in many instances, set out to destroy them. In Zimbabwe, for instance, the colonial authorities sought to suppress sorcery. The Witchcraft Suppression Act of 1899 made it a crime even to accuse someone of practicing sorcery, while "witch-finding" was proscribed. Public control of sorcery thus came to an end, or at least decreased significantly, though popular belief in its existence remained widespread (Waite 2000).

In certain African countries, independence, an end to European colonialism, brought with it a reassessment of traditional medicine. Some independent African governments attempted to revive institutions and traditions that had been suppressed or debased by the colonialists. However, since the African elites who assumed power at independence generally were deeply attached to the European way of doing things, they were uncertain as to what aspects of tradition, including traditional medicine, to revive.

Zimbabwe—which became independent in 1980, some two decades after most African colonies had emerged from under the colonial yoke—went further than most African governments in engaging traditional medicine. Indeed, the connection between anticolonial agitation and traditional medicine was especially close in Zimbabwe. At the dawn of colonial rule in the 1890s, Africans in Zimbabwe (then called Southern Rhodesia) went into revolt against foreign domination, an event in which the spirit mediums played a central role. Some seventy years later, when Zimbabweans again resorted to armed struggle in their fight against colonialism, the spirit mediums once more became involved. Consequently, the independence festivities in 1980 included celebrations of some of the major "spirits of the nation." One particular medium, Mbuya Nehanda, was lauded as "the grandmother of all ancestors." Nehanda had been hanged by the colonialists for her role in the uprising of the 1890s, though not before prophesying that she would return to help drive the Europeans out. The advent of independence was seen by some as fulfillment of that promise (Waite 2000).

There was thus strong symbolic support for traditional medical culture in the new Zimbabwe. Initially, it appeared as if this symbolism would translate into substance. When, three months after independence, 1,500 traditional healers rallied in the capital, they were greeted by the minister of health, Herbert Ushewokunze, who lauded their contribution to the liberation struggle. Within days, the Zimbabwe National Traditional Healers' Association (ZINATHA) was founded at a meeting organized and attended by Ushewokunze.

The founding of ZINATHA was no small matter. The medical establishment, then still dominated by members of the country's small white minority, expressed alarm, as did some Christian churches, especially the Catholic hierarchy. Even the government-run media, now controlled by the triumphant African nationalists, showed far less enthusiasm for traditional medicine than did the minister of health (Waite 2000).

A major issue faced by ZINATHA soon after its founding was that of continuous access to traditional medicines. Already, some practitioners were beginning to travel outside the country in search of medicines, while others were be-

lieved to be hoarding medicines made from species that had become extinct. To address these concerns, ZINATHA instituted a program to grow herbs and trees on a plot at a research center it had established.

ZINATHA and its members also faced financial challenges. Many traditional doctors, for instance, complained that they needed help to build larger facilities for their growing practices. One particular category of practitioners, traditional midwives, wanted the same treatment as that accorded midwives in modern, Western-style clinics, namely government compensation for their services. In support of these demands, ZINATHA pointed to the large number of people—estimated at 80 to 90 percent of the population—who continued to consult traditional practitioners and use traditional medicines. This argument, however, increasingly came to fall on deaf ears, as ZINATHA and traditional medicine more generally lost support within the counsels of government. The most dramatic sign of this diminishing influence was the removal of Ushewokunze from his position as minister of health just over a year after he took office, partly on account of the fallout from his advocacy of traditional medicine (Waite 2000).

Still, others sought to continue the work begun by Ushewokunze and ZINATHA. In Bulawayo, Zimbabwe's second city, a new phenomenon emerged. A traditional practitioner established several clinics that attempted to combine the best of both traditional and Western medicines, not to integrate them, but rather to let them complement each other. Even without official support, and often in the face of indifference or even outright hostility in high places, traditional medicine continues to thrive, often in new ways. In the past decade, as ordinary Zimbabweans have been driven into greater poverty, and in the face of the AIDS pandemic that has ravished their country, they have increasingly turned to traditional medicine and its practitioners, not least because of the lower costs in relation to modern medicine. Affordability and accessibility, if nothing else, will likely ensure the continued success and vitality of traditional medicine in Zimbabwe and much of the rest of Africa for a long time to come.

ANCESTOR WORSHIP IN AFRICA

Modern Ghana is located on the West African coast. It comprises the Akan kingdoms, including the Asante, and has become well known for its royal stools and other regalia and objects of power. Funerary caskets and statuary were important objects, linking people to their ancestors in the afterlife.

Ancestor worship in Ghana is based on the belief that the human being is a spiritual entity originating in the ancestral world (called *Samanadzi, Asamando,* or *Nsamankyir,* according to the Akan of Ghana), born into the ordinary human world to be morally and ethically concerned with existential and metaphysical issues, and destined to return to the ancestral world after death as an ancestor. Teleologically, therefore, the religion of ancestor worship is concerned with universal salvation for adherents, who must follow culturally defined ritual processes to ensure its efficacy.

Ancestor worship seeks to commemorate the birth, life, death, resurrection, and vindication in the ancestral realm of a remote ancestor by

living descendants, through festivals, sacrifices, rites, and use of symbols and images. These activities are consistent with ancient African religious practices; according to the Greeks not only were Africans "the first of all men," but that they "were the first to be taught to honor the gods and to hold sacrifices and processions and festivals and other rites by which men honor the deity, . . . and it is generally held that the sacrifices practiced among the Ethiopians . . . are those which are the most pleasing to heaven" (Davidson 1991, 61–62). Following their forebears, contemporary Africans still cherish the memories of their loved ones long after their deaths. But, as rightly noted by the ancient authorities, the gods or deities are indispensable to ancestor worship.

The Deities *(Abosom)*

A deity, or what the Akan of Ghana call an *obosom* (singular of *abosom*) is an invisible spiritual agent, power, or force with strange features, endowed with phenomenal capabilities, a force that, when invoked under certain psychological conditions, can take possession of a medium. Ontologically, the deities (abosom) are thought of as the first offspring of God, created in God's own image and endowed with ethereal attributes comparable to God, although they are not God. These attributes enable them to assume human properties during divination rites. Furthermore, their strangely powerful features cause any human who might see them in their natural forms to die immediately, for no human gazes upon the face of a deity and lives to tell it (Rattray 1927, 46). From the spiritual standpoint, therefore, the meaningful way to experience a deity is through the process of divination, when the divine manifests itself in a human subject and brings him or her under its dictates.

The deities were the first to occupy the earth and subsequently controlled the universe and everything in it, including humans. They did so by competing for the best suitable spots—rocks, seas, mountains, rivers, and trees. Aware that nature is imbued with spiritual powers, the Africans developed a special sacred rapport with nature, knowing full well that the environment must be treated reverently in order to win the benevolence of the deities. More is involved than just a symbiotic relationship with nature; humans are indeed the offspring of the deities acting in the ordinary world through human fathers (Ephirim-Donkor 1997, 49–53). Consequently, many African parents seek out the spiritual progenitors of their children in order to bring the children under their aegis.

Obviously, then, ancestor worship is more than a simple commemoration of defunct relatives by the living: It entails the recognition of the hierarchical structure inherent in the religion. That is, God is at the apex, and under him are the deities, then the ancestors, and then the living elders. Moreover, ancestor worship is based on the concept of mediation: The elders intercede with the ancestors on behalf of their posterity, and the ancestors intercede with the deities on behalf of their descendents. As God is not directly involved in the affairs of the world, temporal and metaphysical matters are in the hands of the elders, and through them of the ancestors and deities. Deities may be owned exclusively by lineages or clans, but the same could not be said about God; God is a universal entity claimed collectively, hence the irrelevance of temples or priests in African religious practices. The ancestors and deities do have shrines, priests, and devotees, which often leads to the mistaken assumption that the objects in which the ancestors and deities are manifested are in themselves the focus of worship (Sarpong 1974, 14). On the contrary, worshipers clearly understand the difference between those inanimate objects and mediums who are possessed during divination.

The Ruler

On earth the king is the eldest among elders, a member of a royal family who has been duly nominated and elected to the highest sociopolitical and spiritual office. The queen mother was the symbolic mother and sister of the king and the primary kingmaker. She could become ruler-in-residence upon the absence of the king. The ruler's authority and sanctity is invested in him by installation rites, culminating in the act of seating the ruler on the throne of the ancestors (Ephirim-Donkor 2000). Transformed thus, the ruler embodies his predecessors, entrusted with sacred traditions, which he must preserve and protect for posterity. As the personification of the ancestral rulers, the king

is a living ancestor, on the threshold between the world of the ancestors and the world of the living, and therefore accorded the same praise and worship as his predecessors.

Deriving his divine and temporal authority from a long continuum of rulers, the king exercises religiopolitical and psychological control over his people, his pronouncements having powerful effect on them. Accordingly he addresses his subjects indirectly through mediators, and he observes many taboos and prohibitions, which he must follow in order to preserve his divinity. The mediators mitigate the potency of the king's pronouncements, and they also attest to the veracity of words emanating from him, verifying that the king never errs.

Cross-culturally, this royal discourse has been contextualized in the Black diaspora, taking on a unique life of its own in the form of call and response during Black religious ceremonies. In the absence of the king in the diaspora, the clergy usurped the role of the divine king and continued the call and response mediation, when an address or sermon is authenticated through a rhythmic congregational response. Paradigmatically, the Black diaspora perceives their clergy as "kings" and above reproach. Yet another vivid diasporic manifestation of ancestor religion is found in the *Candomblé* and Voudou practices of South and Central America. During these religious expressions, the diaspora is clearly linked up with the African religious rapture displayed in the original practices.

Cosmically, ancestor worship has the greatest effect when the king leads the community periodically in sacrifices designed to propitiate the ancestors and deities and to insure existential and metaphysical balance. Either walking or carried in a palanquin in a procession of his people, the king dances to martial or royal music during festivities marking the founding of the state by his ancestors. Summoned home, the ancestors and deities partake of the ambrosia of fruits and vegetables, meals, wine, and animal sacrifices offered to them by their representative on earth, the king. Socially, the festivities serve a didactic function when the history and heroism of the ancestors are dramatically recalled. In their exuberance, the people affirm their faith in the ancestors and gain greater hope for the future, believing that the nation has been purified and brought into the right homeostatic relationship with the ancestors.

The Medium *(Okomfo)*

Assisting the king ritually are members of the clergy—priests, doctors, and prophets—in their role as mediums. They perform purification rites, sacrifices, and preparation of sacred meals *(to),* which are scattered at sacred sites on behalf of the king. But most importantly, the mediums are possessed by the spirits of ancestors, dead kings, and deities, who through them commend the ruler, or even admonish the ruler or the community for not properly carrying out a ritual process. Among the Akan, the *akomfo* (prophets) in particular feature prominently during these periodic celebrations because they receive specialized training as mediums. These prophets are tied to the kingship, in that every ruler has his own group of prophets, who, as instruments of the ancestors *(nsamanfo;* also *asamanfo)* and deities, make known divine pronouncements to the king.

To be a medium one must be a twin or be born into a family of priests, both of which are felt to convey unique, even divine, status. The process begins with a call, which James Christensen (1959) describes as the "supreme religious experience," when an individual is periodically visited by a supernatural agent of some sort, who alters the psychological profile of the individual in order to bring the subject under its influence. An interview is subsequently sought with an adept to ascertain the authenticity of the phenomenon and, most importantly, the name of the deity seeking a medium (Rattray 1927, 40–41). The next step is becoming a novice *(okomfoba)* for a number of years, during which time the novice is clad in red cloth, with hair in locks, and walks barefooted.

The novice is taught many esoterica, including how to perceive his or her deity and the ancestors, study of archaic languages and songs, public dancing, breathing techniques when possessed, herbal discernment and application, diagnostic and healing techniques, and above all, divination rites *(ebisadzi).* Often the difficult period of training is compensated for by the graduation. The ceremonies commence at night, when all members of the clergy converge for the final sacred rites for admission into this ancient clerical vocation. Now clad in white

Ancestor wood fetish from Mossi Tribe. (Burstein Collection/Corbis)

clothes or raffia skirt the medium-to-be is led into the forest for the final rites pertaining to the order. Finally the medium-to-be jumps three times over a huge bonfire, each time being caught on the other end by a family member to prevent falling. The rest of the night is devoted to drumming and dancing by the new medium and the assembled clergy to celebrate one of their own.

At about midmorning the new medium is escorted to his or her community to put on a public display of spiritual prowess. From a king's perspective a medium is an indispensable part of the kingship as s/he is the direct line of communications between the ruler and his predecessors and deities. In the wider social context, however, anyone may engage the services of a medium.

Although many symbols are used as objects in which the sacred is manifested, water is the most common element used, collected in a specially made earthen pot, calabash, or small brass tray for hierophany. R. S. Rattray described the process in 1927 as follows: after water was drawn from a river, the pot was placed on special vines, and prayers were offered as some form of alcoholic beverage was poured into the "energized" water. Then the medium began to ring a bell or bring into play some other communicative symbol recognized by the ancestors (the bell serving as a telepathic line to the ancestors). The most anxious and certainly the most spectacular moment during rites of divination was when an ancestor or deity was making its entry into the medium. As it approached, the ringing of the bell became faster and louder, and suddenly the medium was possessed. Every hierophany is unique and may engender a momentary disorientation for the medium.

Invariably the first words spoken by a deity or ancestor are "My peace to you," followed by "How are you." Following the greetings, the cause of the summons is then ascertained. Some ancestors not summoned may intermittently intervene to deliver messages to their loved ones, while others may appear in the water for the chance to speak to the living. There are those deities who merely pass on messages to their loved ones without actually possessing the medium. To receive these messages, a medium continues to ring the bell intermittently. But unlike the faces of the deities, the faces of ancestors in the water can be looked at by the medium without incurring any adverse effects. While all these communications may take place in private, occasionally a medium may be possessed at a public forum in order to convey a message to the public. Often a medium will dance until s/he enters into a trance and becomes possessed.

Equally dramatic is the departure of the ancestors and deities. After bidding farewell to a seeker they leave suddenly, and there is a sense of the seeker traveling into deep space with the ancestors or deities until the echo disappears after them. Free of possession, the medium drops the bell, unless another ancestor or deity possesses the medium again. The phenomenon is very exhausting, as the medium literally carries each ancestor or deity during the entire period of divination, causing the medium momentary loss of consciousness. After regaining consciousness mediums ascertain from a seeker what messages were communicated. Based on that information they are able to determine if follow-up rites are necessary.

Non–Medium-Assisted Worship

Ancestor worship does not always involve mediums; members of a lineage or a clan meeting as a group or kings and their councils of elders invoke the ancestors whenever they convene meetings. An individual or a family may offer prayers and offerings of money, cola nuts, and eggs to the ancestors anywhere. Furthermore, anyone may put food to be eaten on the ground or in a plate and set it aside in a house for an ancestor. The practice may also be repeated outside a home for both benign and malign ancestors (or spirits).

Among the Effutu, a Guan subgroup in Ghana, memorial services for the dead are held annually during the harvest festival in August. At dawn women in the female households wail and sing dirges and then proceed to their respective *pramma,* the agnatic and spiritual households of the various lineages, to awaken their male counterparts. Thus awakened, the elders offer libations with wine brought along for that purpose, imploring the dead to return home and feast. In the afternoon the women return again with sumptuous meals, which, once they have been offered to the dead, are feasted upon by the residents.

The most common expression of ancestor worship among the Akan is the practice of pouring a drink of wine on the ground and then inviting the ancestors to share in it. Customarily, after arriving from a journey a visitor is first offered cola nut fruit or water to drink, but not before the visitor has poured some libation to the ground for the ancestors who accompanied the visitor safely on the journey.

When elders formally convene a meeting, invariably prayers are said before proceedings begin. These prayers are in acknowledgment of God, the deities, and the ancestors. The hierarchy of God's creativity and sovereignty are acknowledged by simply raising the cup of wine toward the sky. Moreover, priests may sometimes throw a remainder of the wine into the sky after prayers. Then local deities are acknowledged by name. Finally the elders invoke the ancestors—some by name—imploring them to take their honored place among the living. Symbolically, when two or more elders are brought together, the ancestors are thought to be in their midst, authorizing the elders to proceed with their earthly jurisprudence.

To show utmost reverence before the ancestors an intercessor lowers his cloth to the shoulder or waist level with either both or one sandal removed. Accompanying the intercessor is an assistant who attests to the truthfulness of the prayers. Before commencing, however, the intercessor seeks permission from the elders to invoke the ancestors, to which they respond in the affirmative if there are no dissenting voices. Attention is thus drawn to the prayers about to be offered.

The assistant opens a bottle of wine and pours three drops of the wine to the ground. Or he may gently touch the tip of the intercessor's cup with the bottle of wine three times, pour some into the cup and drink it first, then refill the cup partially and hand it over to the intercessor. The assistant then fills the cup to the brim. At this juncture the intercessor may again call for order by saying "Agoo!" Usually the response to this expression is "Amen," but since at this point it is directed toward the ancestors, silence follows.

The intercessor pours an equal amount of wine into an earthen pot or tray containing medicated water or directly on the ground as s/he prays to the ancestors. In a style reminiscent of a king and his orator, whenever the intercessor utters a word, the assistant responds affirmatively by saying "Yes, true, let it flow, go on," while still holding on to the bottle of wine for intermittent refills. The intercessor first implores the ancestors for their continued blessings and protection of the community. Then the reason for their invocation is offered, fol-

lowed by prayers for the success and well-being of the elders and their endeavors, and finally the agenda to be adjudicated or deliberated upon is summarized for them.

Immediately after prayers, the intercessor is congratulated by the elders, after which the assistant fills a cup with wine, drinks from it, and pours the rest on the ground for the ancestors. The assistant then proceeds to share the wine with all present, and even if one does not wish to drink, one must taste it or pour it on the ground. In this way, all the elders partake of the same wine as the ancestors. The exceptions, however, are rulers, whose wine is poured in front of their feet because they do not drink in public, and, moreover, are living ancestors. Finally, the remainder of the wine is set down for those who may arrive later and for closure. The ancestors at this point are believed to have emerged from the ground, figuratively speaking, to dwell among the living.

When finally the meeting is over, the remainder of the wine from the opening of adjudication is now used in closure. First, the ancestors are dismissed in the same way as they were invoked by offering them another libation. Next, if there were rulers among the elders, then they rise first before the assistant adjourns the meeting.

The symbolic participation of the ancestors reinforces a sense of social responsibility and accountability in the elders about the decisions they render. Collectively the elders do not err, since they derive their mandate from the ancestors to adjudicate and preserve their memory. Consequently, what is legal on earth is also binding in the ancestral world, because the ancestors took part in the affairs of their posterity.

The Ancestors

Theoretically, a king never dies, according to African socioreligious and political thought, because he is a living ancestor. But the existential reality is that all living things die, and when a king finally dies, the corpse is given the same ritual preparation as his predecessors, aimed at transforming the defunct ruler into an ultimate ancestor and deity.

An ancestor must have first been an elder, led an ideal existence, mastered the art of living, and bequeathed to succeeding generations wisdom about life's vicissitudes; after death, that elder becomes one of the eternal saints.

After the corpse is ritually bathed, it is adorned in the most expensive and finest apparel and jewelry and then laid in state for viewing. Traditionally, the final ritual preparation is interpreted as the ultimate homecoming, the homecoming to the ancestral world, therefore the deceased must put on the opulence of that world. In the same way as a baby is given a shower after it is born, among the Akan and their kindred peoples, the children and daughters-in-law of the deceased give a shower *(eguradzi)* for the deceased. Gifts given at the shower may include the most expensive apparel and cosmetics used to adorn the corpse.

The most important element in the deceased's ostentatious journey to the ancestral world is the coffin. Among the Akan, the question often asked is how aesthetically beautiful, expensive, and unusual or unique the coffin was. These qualities are meant to convey to the larger community the dead person's sociopolitical, religious, or economic standing in society. The irony is that many old people die from neglect and poverty, and even ignominiously, in spite of their accomplishments in life. The point, however, is not necessarily how one died, but what one bequeaths to his or her lineage, including, of course, children. In the coffin is put evidence of the dead person's earthly possessions: various gifts of money, clothing, and items of sentimental value.

Wailing and dirges are an integral part of ancestor worship, especially during funerals. On such an important journey society offers its final farewell address through dirges and gesticulations, occasionally hiring professional mourners to dramatize the poignancy of social grief. First, mourners express their repugnance toward death by directing their dirge to the corpse and demanding answers about the enigma of death. Next, they show their deep sense of communal loss by affirming death's inevitability. And finally, after the initial shock and denial of death and then acceptance of death as an existential reality, a central component of the obsequies commences. Waves of dirges known as *nkra* (message/s) are recited to the corpse. As God bestows *nkrabea* (destiny) on every soul before it embarks on its mundane existence, so too the deceased is about to embark upon the final idealized existence and is therefore given messages by the living about its

destiny as an ancestor. These messages tell of God's accompaniment of the spiritual personality *(osaman)* on its journey, of perpetual bliss and peace, omniscience and ubiquity, and the ability to bestow blessings on the living from the panoramic vantage point of the ancestral world.

After burial the spiritual personality lingers in the earthly world for a transitional period of up to forty days, during which time apparitions are believed to be common. On the fortieth day the deceased is again mourned and remembered, thus setting the stage for the spiritual personality to depart from this human plane, taking along personalized nkra from the living. Just as no human being can alter an individual's destiny (nkrabea), so the spiritual personality cannot alter the messages that it carries into the world of the ancestors. And, in the same way as the soul is the bearer of destiny from God, the spiritual personality is the bearer of earthly messages that shape its destiny in the world of the ancestors.

The journey to the ancestral world is an arduous one. The spiritual personality must cross a huge river by paying the ferryman some of the money in its possession. Next, the spiritual personality climbs a ladder. The traffic on this ladder is so voluminous that it gives rise to the saying among the Akan that the ladder of death is ascended by many. When the spiritual personality finally reaches the ancestral world it is welcomed in accordance with tradition.

Where then is the ideal world of the ancestors? In the first place, the ancestral world is thought of as beneath and below, for the simple reason that the dead are buried in the ground. Consequently, the ground becomes the focal point during libations or prayers, which are aimed at offering sacrifices and drinks to the ancestors.

Secondly, the ancestral world is above and beyond, because everything tangible is below and beneath, while intangibles are above and beyond human perception, and now that the ancestors are believed to be spirits, they are thought to reside in a world above and beyond the temporal. The Akan names for the ancestral world, Samanadzi, Nsamankyir, and Asamando, clearly point to a definite place, kingdom, sky, or heaven that is above and beyond and different from the tangible world. But far from being different, it is the same as the tangible world except that in the ancestral world the impermanence of the human plane is nonexistent, and it is where all spiritual personalities ultimately return. From this place, the ancestors watch over their descendants, and what better place to have a panoramic view than from above.

Finally, the ancestral world is both within and without. It is an inner phenomenon that exists wherever an individual is found. In other words, people carry their worldviews along with them wherever they reside. In the same way, when an individual offers a libation or prays, the efficacy of the ritual is immutable regardless of where it is performed. At the same time, it is never simply inner; rather the ancestral world is a shared belief and conveys clearly defined meaning for those who share ancestor worship.

Distinguished in jurisprudence as elders, the ancestors are sages, intercessors, mediators, and ultimately judges, as they judge all spiritual personalities upon their arrival in the ancestral world. However, these attributes undergo an etherealization that is consistent with their new idealized existence. Having lived, died, and been resurrected and vindicated in the ancestral world, the ancestors have achieved something that no human being has—immortality. At the same time, they continue to influence affairs of the world because they have achieved immortal existence after first achieving perfection as elders, but they now constitute a pristine community of eternal saints whose lives are commemorated periodically. Yet immortality should not be construed as final or as a state of stagnation; rather, the ancestors serve to replenish the human plane through the phenomenon of reincarnation.

ANCIENT EGYPTIAN SHAMANISM

Ancient Egyptian mythology, concepts of multiple souls, and some functions of the various priests and healers show clear shamanistic elements. Spirit possession, ritual dance performance, some healing practices, and initiation ceremonies all provide additional evidence of these elements.

Ancient Egypt refers here to the dynastic era from the time of the first king, Narmer (Menes) (ca. 3000 B.C.E.) to the conquest of Alexander the Great in 332 B.C.E. However, even before the dynastic era, indeed as early as 4000 B.C.E., early animal worship can be traced in the burials of bulls, jackals, and other animals. Egyptian religion existed for several millennia; the last temple of the Goddess Auset (Isis) was closed on the island of Philae in the mid-sixth century C.E. Most of the evidence for the shamanistic beliefs and practices of the ancient Egyptians derives from various texts and inscriptions found in the tombs and temples, and is thus funerary in character. The oldest of such texts are the Pyramid Texts, which were hieroglyphic writings dealing with the king's afterlife. Egyptian theology, rituals, and mythology can be deduced from such texts. The earliest examples are the inscribed texts on the interior walls of King Wenis's pyramid at Saqqara, dated 2350 B.C.E. The Coffin Texts, found in tombs, were written on sarcophagi and rolls of papyrus and date roughly from the Middle Kingdom (2050–1786 B.C.E.). *The Book of the Dead,* written on papyrus with color illustrations, tells of both royal and nonroyal religion. Temple inscriptions, many of which were inscribed on stelae, contain hymns to the gods and mythological tales of the later period.

Egyptian Religion

Each region of Egypt had its own god(s), manifested in the form of particular animals. These totemic animal figures symbolized particular tribal groups, and members of the ruling elite tended to pay special homage to them. In addition to zoomorphic deities, cosmic elements such as the moon, storm, wind, and, especially, the sun were later included in the Egyptian pantheon. During the dynastic periods, animal gods began to have more anthropomorphic forms, such as ram-headed Amun, lion-headed Sakhment, and Hathor (cow goddess). In the myths of that time, these gods had human emotions and lived and died like human beings.

A creation myth recorded in a text found in Heliopolis explains how the creator god Atum separated air (Shu), the sky (Nut), and the earth (Geb) from the darkness of the primordial chaos of waters. From the union of the sky and the earth four children were born: Osiris (Ausares), Auset (Isis), Seth, and Nephtys. Of them, Osiris and Auset became the central figures of the Osiris worship that spread all over the Egyptian kingdom in the late Old Kingdom in relation to funerary mythology and rituals.

The myth of Osiris includes shamanic transformations of both Osiris and Auset. According to the myth, Osiris was a living king of Egypt killed by his brother, Seth, who was jealous of his power. Seth cut Osiris's body into pieces

and scattered them throughout Egypt. Auset transformed herself to a bird and collected the pieces of Osiris's body, which she revived by magic spells. This motif of death and resurrection resembles elements of shamanic initiation in North Asia and elsewhere: ritual dismemberment of the initiate's body and subsequent rebirth as a fully initiated shaman. Osiris eventually became a ruler over the dead, and the dead pharaoh was always identified with Osiris.

Wallis Budge argued that the ancient Egyptians had both polytheistic and monotheistic tendencies coexisting from the Archaic period (Budge 1969, 1: 353). *Kheper tchesef* (self-produced being) is equivalent to the Judeo-Christian concept of God, the Creator of all beings. Nevertheless, multiple gods of all functions and shapes called *neteru* were the more prominent in Egyptian religion. Neteru could appear on earth as men, women, animals, birds, reptiles, trees, plants, and the like. They were more powerful and more intelligent than men but had emotions and suffered like common mortals, often marrying and having offspring.

The Egyptian Concept of Multiple Souls

Ancient Egyptians developed complicated ideas of multiple souls and spirits, identifying three kinds of souls relating to the body of each person: a *Ka,* "double," *Sāḥu,* "spirit body," and *Khaibit,* "shadow." Every normal Egyptian was born with a Ka, which dwelt in the figure of the dead person after death. The Ka might go wherever it wished but preferred to enter the figure and reside there (Budge 1911, 2: 118). The Ka required food offerings from family members to survive. Through repeated ceremonies and offerings the Ka could be elevated into the Sāḥu, which was held to be incorruptible and everlasting. This spirit body could also travel everywhere in heaven or on earth. When the Sāḥu was ready for resurrection, the body needed the shadow, the Khaibit, which functioned like a soul, in that it could harm other fellow shadows and go anywhere it wished.

In addition to these body-related souls, there were at least two more spirit-oriented souls. They were the *Ba,* the spirit soul, and the *Khu,* which can be translated simply as "spirit." The Ba, whose hieroglyphic character represents a bird with a bearded human head, is close to "soul" in the modern Western sense. The Ba could take any form and was also free to travel throughout heaven and socialize with other Ba there. Due to the influence of evil spirits, a Ba might be prevented from rejoining its Ka and physical body. The Ba and Ka were to be rejoined in Heliopolis, where the soul of Osiris rejoined itself to the body of the god. King Unȧs ruled all Khu, spirits of both humans and gods in heaven. The Khu lived somewhere in the body, but its nature was unchangeable, incorruptible, and immortal (Budge 1911, 1: 134). As part of funerary rituals, priests uttered spells so that the Khu could rise and reside in the elevated spirit body, which could then ascend to heaven to live with Osiris.

Various texts and inscriptions indicate different ideas about where the dead go. According to some texts, spirits of the dead went to live in the bodies of animals and birds. Other texts indicate that they entered the stars or lived in the Boat of the Sun (Budge 1911, 1: 155). The more common Egyptian belief about the afterlife was that the dead went to the land of Ṭuat, which is almost a duplicate of Egypt in its geographical features, but without the sun. People could reach this spirit world by climbing to the top of high mountains or using ladders.

Dance and Music

Budge provides some evidence that spiritual dance was performed in front of a god, possibly Osiris, as an act of worship. An ebony plaque in the British Museum depicts King Semti (Ḥesepti), a king of the first dynasty, dancing before a god (Budge 1911, 1: 232). The king wore the Crown of the South and North and held a whip in his right hand and a paddle in his left—items that might relate to certain ceremonial functions. Pygmy dancers from Punt and other regions, "the Lands of the Spirits," were particularly welcomed by these kings, according to the text in the Pyramid of Pepi I, which mentions the pygmy dancers of the god who "rejoice the heart of the god before the god's great throne" (cited in Budge 1911, 1: 233). Another text extract shows that a king should dance in front of Osiris in the other world like a pygmy to cheer and strengthen the deity. Many illustrations of kings dancing in front of Osiris and other gods are found in the Egyptian bas-reliefs of all periods. It would

therefore appear that the ancient Egyptians incorporated the "spirit dance" of other parts of Africa into Osiris worship.

Both men and women could participate in ceremonies as singers of sacred music at the temples. The singers' roles became more and more important with time, and they maintained high status as religious officials. Women entered the temple as singers and eventually managed to become priestesses from the time of the Old Kingdom. The rank of priesthood was sometimes passed down from father to daughter (Sauneron 1960, 67).

The Priests and Trance

The priests, *Kher ḥeb* or *Kheru hebet,* were called servants of the god. According to Nunn, Kher ḥeb means literally those in charge of the festival rolls and is usually translated as "lector priests," low-ranking priests (1996, 98). At first they were appointed by the king, but in the New Kingdom, a priestly caste based on hereditary succession became the dominant office. There were many subdivisions according to function, but in general they performed rituals for the kings and the welfare of the people. Ancient Egyptian hieroglyphic writings show a wide range of shamanistic functions of the Kher ḥeb as the official director of religious and magic ceremonies. The Kher ḥeb knew how and when to recite spells, were able to draft incantations and magical formulae, could foretell the future, interpret dreams, reveal the causes of illnesses, and declare the name of the spirit of the dead who caused an illness (Budge 1911, 2: 170). These priestly figures had knowledge of the secret names of the gods and so knew how to cause death and to bring the dead to life. They could also dispense powerful medicines and transform themselves into animal shapes. Most priests wore linen clothes, but specialized priests and the high priests wore a panther skin (Sauneron 1960, 40), a practice like that of some shamans in other parts of Africa and South Asia who wear the hide of a wildcat.

On some ritual occasions the Kher ḥeb used possession to deliver the god's divine words. In such a ritual, the spirits of the gods resided in the priest's body temporarily, and all that the priest said on such occasions was inspired by divine beings and had divine authority (Budge 1911, 2: 171). Some examples of the spells to deliver the gods' divine words according to *The Book of the Dead,* as quoted by Budge (1911, 2: 171–174).

"My mouth hath power over the *ḥeka* (magic power)" (Chapter XXXI).

"I am Osiris, I am Horus, I am Ȧnpu. I am the priest in heaven" (Chapter XXXI).

"I command the spirits . . . I recite his commands and announce his words" (Chapter XXXVIII).

"My tongue is the tongue of *ptaḥ* [the creator god of Memphis]" (Chapter LXXXII).

"I am the chosen one of millions of years, who cometh out of the Ṭuat, whose name is unknown" (In magical papyrus—British Museum No. 10042) (Budge 1911, 2: 171–174).

The words of spells were particularly important for the Egyptian priests. To make spells and magic rituals effective, the Kher ḥeb had to be ritually pure: They had to wash and refrain from sex and eating meat or fish. Using the power of the words, the priests held various ceremonies to make the soul of the dead (the spirit soul) ascend into heaven in the form of Osiris or Rā and to resurrect the spirit body. The Kher ḥeb used his powers to effect the preservation of bodies and souls and united the spirit soul with the spirit body (Ka). Accordingly, the Kher ḥeb, like a shaman, mediated between the spirits of the gods and the living.

According to a report by the Roman monk Apulin (Sauneron 1960, 50), inducing trance was an important element in the initiation of young Egyptian monks. During the initiation ceremony, the monk Lucius was purified in a nearby pond after ten days of fasting. He was led to the most secluded part of the sanctuary and received revelations while in a trancelike state. Lucius was "carried beyond all the elements" and saw "the sun shine with a brilliant light in the middle of the night" after he "approached the limits of the dead." Apulin explained that Lucius "approached the gods from below and from high and saw them face to face." Lucius's revelation showed his ritual death in this world and subsequent rebirth as a priest through mystical experience under trance.

Serge Sauneron also described the use of trance by ascetic monks who had long hair and were half-naked, clothed in rags and chains. Due to their rigorous abstinence and practices of spiritual perfection, their bodies were emaci-

ated, and they pronounced oracles to visitors and pilgrims at sacred sites in a state of "divine madness" (Sauneron 1960, 75).

Egyptians could also use magical power to harm people by bringing sickness or misfortune. For this purpose, a wax figure was created to harm the enemy of the sorcerer's client. Some Greek writers of the Greco-Roman period reported that Egyptian sorcerers could send terrifying dreams to people to cause illicit love affairs, sickness, and death. These sorcerers could transform themselves into animals, birds, reptiles, and other beings, and control the powers of heaven and earth.

Healing in Egyptian Medicine

There are various extant medical texts available to illuminate Egyptian healing practices. These medical papyrus texts include both magical cures and the "conventional medicine" of the day—that is, treatment without religious associations. John Nunn (1996, 25) listed a dozen such texts, including the Edwin Smith Papyri, the Ebers Papyri, and the Kahan Papyri. These were mostly written in hieratic (a cursive hieroglyphic writing system) and date from 1550 B.C.E. to 250 C.E. The content of these papyri books includes general medicine, gynecology, pediatrics, ophthalmology, and the treatment of rectal diseases and snakebite.

According to these texts and other evidence, there were at least five different healing professions in ancient Egypt. There were doctors (*swnw,* pronounced *sewnew*), magicians (*sau*), lector priests (Kher ḥeb), the priests of Serqet, and the *wab* priests of Sekhmet, the lion-headed goddess. Swnw were to some extent like Western allopathic physicians. They examined patients, diagnosed sickness, prepared a sacred herbal remedy, and performed surgery when necessary. Some doctors, however, carried priestly titles, or double titles as both doctor and magician. For example, Hery-shef-nakht of the Middle Kingdom was both a swnw and a wab priest of Sekhmet, and he was also an overseer of magicians. The title of the doctor was usually passed down from father to son; the son learned medicine from his father using these medical texts, which were transmitted through the family and were buried with the doctor when he died. These medical texts included many magical incantations, as doctors regularly practiced magic together with conventional medicine.

Magicians (sau) practiced medicine independently of conventional medicine (Nunn 1996, 99). In the Middle Kingdom, the word *hekay* (from Heka, the god of magic) was also used for magicians. The lector priests were also known for using magic for healing. According to the Ebers Papyri (855u), lector priests could use their magic in malignant ways to cause evil actions such as a failing heart. The priests of Serqet were also magicians and healers who prevented and treated attacks by poisonous snakes and scorpions, and wab priests of Sekhmet had roles as veterinary surgeons.

Treatment and Incantations

Sickness was considered by the ancient Egyptians to be caused by demonic forces that entered the body from the outside. These sickness demons, *wekhedu,* were to be driven out by various remedies prescribed in the medical papyri (Nunn 1996, 104). As the medical texts indicate, the great varieties of incantations used for healing involved gods, disease demons, and drugs. The following is an example of an incantation against wekhedu.

> An incantation [against] wekhedu: . . . I trample Busiris; I throw down Mendes; I ascend to the sky to see what is done therein. Nothing will be done in Abydos until the driving out of the [evil] influence of a god, a goddess, male wekhedu, female wekhedut, and so on, and the influence and all evil things that are in this my body, in this my flesh and in these my limbs. . . . Words to be said four times and spat out over the site of the disease. Really effective: a million times. (cited in Nunn 1996, 105)

The Metternich stela also provides an example of a spell to be used when a deity is to be invoked for the treatment of snakebite: "Flow out, poison. Come forth. Go forth on to the ground. Horus will exorcise you. He will punish you. He will spit you out" (cited in Nunn 1996, 105). In addition to Horus, benevolent gods and goddesses such as Osiris, Nekhet, Auset (Isis), and Nephtys were to be addressed in the incantation. According to the spells, these deities would protect the patient. These

incantations were given at the time of drinking a remedy to reinforce its effects. *The Book of the Dead* also includes many incantations to avoid dangerous creatures in the other world such as crocodiles.

The interpretation of dreams was also performed by priests as therapy. A patient slept in a temple or sacred dormitory and upon awakening next morning was asked to describe the dream to the priests. Amulets were also a popular means to protect a person in life and after death. These amulets were usually small figures depicting parts of the human body, deities, or animals that one desired to avoid.

ASANTE SHAMANISM (GHANA)

Although shamanism in the classic sense is not practiced among the Asante, what is practiced is close enough that it should be considered essentially the same phenomenon. Moreover, it has much in common with the practices of other indigenous religions in Africa as a whole.

The Asante are part of the Akan people, the dominant ethnic group in Ghana. The word *Akan* is both a linguistic and cultural description of a group of people speaking distinct dialects of the same language and bound together by the same social structure. The unity of the group is manifested in similar clan names, in similar religious beliefs and practices, in matrilineal social organization *(ebusua)* that reckons descent and succession along female lines, and in political organization based on kinship. Other Akan people include the Fante, Akyem, Akuapem, Kwahu, Bono-Ahafo, Agona, Wassa, Sewfi (in southern Ghana), and Baule and Anyi (in the southeast corner of the Ivory Coast).

The Akan migrated from the northern part of present-day Ghana, settling first in Takyiman in the Brong-Ahafo region, from where parts of the larger Akan people broke away to found new communities further south. The Asante settled in the forest belt, where they founded the town of Kumasi, their capital, in 1665 (Busia 1954). Occupationally, the Asante are generally farmers, producing the bulk of the cocoa that is Ghana's main export commodity. They are also weavers, potters, and gold- and blacksmiths. They are famous for their Kente (woven) and Adinkra (stamped) cloths.

The essential unifying factor among the Asante is the Golden Stool *(Sikadwa),* which is believed to have descended from heaven through the agency of the royal priest or shaman, called Okomfo Anokye. The Golden Stool contains the souls of all living Asante.

Akom, or Shamanism: Belief System and Practices

Asante religion is based on belief in a spiritual world and a material world that are distinct yet constantly interacting. The interpenetration of these two worlds is understood as a venture in which the efforts of human beings and God are joined in a common enterprise (Rigby 1981, 106). Briefly, the Asante believe in a Supreme God called Onyame, or Onyankopon, creator and sustainer of all creation. They believe in a multitude of male and female spirits called *abosom* (singular, *obosom*), "deities"; in ever-vigilant ancestor spirits; and in good and evil spirits that can be exploited by human beings.

Shamanic duties in Asante religion are embodied in the office and functions of the priesthood, *akom,* which is associated with the abosom and the ancestors. The abosom are localized in natural phenomena such as trees, rocks, stones, hills, rivers, the sea, and some animals. The very essence and power of the deities originate from God. "They come from him and are part of him" (Busia 1954, 193). The mythological sources tell that God, or Onyankopon, whose abode is the sky, used to live closer to human beings. The sky was so close to earth then that whenever Aberewa, an old woman, pounded *fufu* (a staple meal of yam, cassava, or plantain) with mortar and pestle, the pestle hit God. After several unheeded complaints to the woman, God withdrew, with the sky, farther and farther upwards to the sky's present position. When human attempts to reach God by piling all the mortars at their disposal failed, God sent his children, the abosom, to attend to human needs. Thus, most acts of religious devotion revolve around the abosom, who are also custodians of the moral order, rewarding good conduct and punishing wrong behavior. Among the most important deities in Asante are the spirits of the rivers Tano and Bea, and the spirit of Lake Bosomtwe.

The abosom are approached by priests and priestesses called *akomfo* (singular, *okomfo*). The okomfo is outwardly distinguished from other people not only by name but also by official attire. Professed priests and priestesses wear white clothes on ritual days, and smear their bodies with white clay. On ceremonial occasions they may wear skirts made of raffia or cotton material and carry a short broom (Brookman-Amissah 1975, 5). Priests are also adorned with special black and white beads as insignia of their office and to distinguish them from ordinary people.

Functions of Akomfo as Shamans

The akomfo are primarily intermediaries between divinity and human beings, transmitting divine revelations on to human beings and submitting human supplications to the deity (Sackey 1989, 19). The obosom possesses the okomfo, bringing him or her into the spirit world and imparting to her or him knowledge to cure a disease, find solutions to pressing human problems, restructure broken human relationships, recover lost articles, and interpret dreams. The okomfo also consults the dead on behalf of family members, intercedes on behalf of humans in times of calamity or danger such as famine, drought, epidemics, and presides over festivals for the deities and ancestors. Among the Asante and Akan, when a person becomes ill his *okra* (soul) is said to have run away, as reflected in the saying *ne kra eguane* (his soul has run away). The object of healing by the okomfo, therefore, is to find and restore the fugitive soul. Kofi Appiah-Kubi described the okomfo as "at once a friend, priestess, doctor, social worker, advisory bureau, psychologist, psychiatrist, and philanthropist" (1981, 30)

Eliade described shamanism as "preeminently a religious phenomenon of Siberia and Inner Asia," a restrictive application of the term based on an emphasis on ecstatic soul travel to the world of spirits (1987, 991). According to this definition, the shaman is distinguished by being able to control his helping spirits; he does not become their instrument, in contrast to mediums, who obtain access to the spirit world through possession. Although the modus operandi in some respects differs, there are more similarities than differences between the duties, call, and status of akomfo in Asante and those of shamans in Alaska, Siberia, and Asia. Even among these northern shamanistic societies there are differences; and the religious phenomenon occurs in different cultural matrixes so that terminologies vary. What is most important in both shamanism and akom is the goal of the shaman or okomfo—which is to solicit spiritual help to solve human problems in the physical world—rather than the mode of transmission to the spirit world, or the kind of agency.

The Call to Shamanism (Akom)

As in shamanism, the ascension to the office of priesthood in Asante may be hereditary or by means of a calling, or vocation. In the case of the private hereditary office, there appears to be no specific "call," and the most suitable member of the family succeeds the family okomfo who has died. The selection is made during the funeral of the deceased okomfo, whose spirit indicates which family member is most suitable to succeed him or her. A call into public service may be manifested by possession. A possessed

candidate goes through a series of mental and physical crises expressed apparently in paranoid behavior and sudden illness, which for a time may defy therapeutic treatment. In other words, the person behaves strangely, but this strangeness is regarded as normal because its symptoms are evidence of the call (Brookman-Amissah 1975, 7; Sackey 1989, 19). Sometimes a person may go to the forest and discover a flaming stone charged with power, the temporary dwelling place of a spirit. The discoverer becomes the priest of the deity that has thus revealed itself. He remains in the forest for several days, and when found, behaves strangely. Other symptoms of a call include intermittent fits, seizures, and convulsions similar to epilepsy. When a person is under such attack, he may tear off his clothes and cast them off, roll on the ground, groan, and moan. These symptoms may persist until the person consults a senior priest, who may interpret this condition as a sign that a deity would like to "marry" the person.

Even though the call to the Asante priesthood is a divine obligation, some people reject it. For example, the parents and relatives of the possessed person may plead with the deity through the senior okomfo for her release. The deity may accept the plea, having been pacified by sacrifices from the supplicants. On the other hand, the deity may reject the plea, and then the person has no choice but to comply or face repercussions from the deity, which may include afflictions such as sterility, infertility, mental diseases, successive and inexplicable deaths in the person's family, and even the person's own death. Sometimes, a deity may not kill but will "spoil" the person; that is, from time to time the person may go into fits and experience some form of dementia (Sackey 2000).

Whether selected by succession or a call, the candidate must undergo three years of training under stern discipline, observing certain taboos. According to Robert Rattray (1927, 40), the novitiate and training undergone by an Asante priest is a long, trying, and very serious business, and even when a person is fully qualified, the profession of priesthood is no sinecure.

Initiation

The initiation into priesthood as a rite of passage has three distinct phases: separation, transition, and reincorporation. The separation phase involves initiates leaving their homes and going to reside with their instructors. If an initiate is married, he or she must leave his or her spouse, with whom he or she may no longer cohabit until the three years' training has ended; if an initiate is unmarried, he or she must stay chaste for the three years. If the initiate is already married and his or her spouse does not wish to wait for three years, the initiate may obtain a divorce. An unmarried person may enter into marriage after the training. Virtues such as obedience and reliability are the hallmark of the initiate. The initiate is ritually cleansed and given a special hairstyle (braids, which are not shaved during the whole period of training). Clad in a red piece of cloth, the initiate is confined in a room for eight days. The training or transitional period begins after the eighth day.

The first year of training of the new priests consists of ceremonial ablutions, or "bathing with medicine," intended to strengthen them in akom techniques. Most importantly, some of the herbal medicines are meant to introduce the initiates to the spiritual world. The instructing priest will collect leaves from plants growing over some grave in the *samanpow* (thicket of the ghosts) and bring them to the shrine, where they are placed in a pot. Eggs and a fowl are then sacrificed upon them, and the pot is placed upon the grave from which the leaves were taken. The initiate is then ordered to go alone, in the middle of the night, to the thicket of the ghosts and bathe with the medicine for three successive nights, amidst beatings and harassment from the ghosts. The medicine in the pot on the grave is changed, and the initiate must wash with it for seven successive weeks (Rattray 1927, 41).

In the second year the laws and taboos of the deity and social conduct are stressed. Some of the taboos, apart from celibacy, forbid drinking alcohol, eating sweet things or pork, and putting on footwear. The initiate must refrain from quarreling or any disgraceful acts. Initiates are taught drumming, singing, dancing, offering libation, and the like.

During the third and final year, the initiate is taught water-gazing, healing, divination, necromancy, and witchcraft detection. The initiate learns how to impregnate charms *(asuman)* with various spirits, how to hear the voices of the trees, the streams, and other forest spirits,

and how to identify and know the secrets of herbs. The initiate studies psychology, theology, and dedication to service to the spirits and human worlds (Damuah n.d., 39–40, Appiah-Kubi 1981, 37–39).

Graduation

The training ends with a private and public graduation in which the initiate is tested for proficiency. On the eve of the public ceremony, he or she is taken to a thick forest and left alone to undergo a spiritual test of endurance necessary to face the challenges of the spiritual world, which is part of the initiate's *akom* duties. In a case study, an initiate reported that she encountered many deities, including the one that possessed her, spirits of some of the ancestors, and other ghosts. For the public graduation ceremony, she was shaved and dressed in a white cloth, besmeared with white clay, adorned with beads and charms, and seated before the *akor,* a pot containing water for the purposes of water-gazing, to test all she had learnt. As she gazed into the water, she could recognize all the spirits she had encountered the previous night.

The final rite involved "fire dancing." A bonfire was set up, and she danced through the fire without getting hurt. Only candidates who had broken some taboos during their training, especially sexual taboos, would get burnt. Going through the fire three times marked the end of her initiation, after which she was reincorporated into her family, not only as mother and wife but also as a full-fledged priestess in her community. Some of the cases she had treated include healing sick adults and children, curing infertility problems, restoring lost items, and training priestesses into the priesthood. She had trained over seventy priestesses. Later, she was elevated to become the chief priestess in her hometown. At the time of this writing, she is retired, and though she does not work she is possessed from time to time (Sackey 2000).

Coexistence with Other Religious Specialists and Religious Traditions

In Asante, medical practitioners include the okomfo, the *edurnsifo* (herbalist), and the *sumankwafo* (expert in the production and control of protective charms). Unlike the okomfo, the last two practitioners are always men. The work of the okomfo includes that of the other two; that is, he or she is at the same time herbalist and expert in charms, while the work of the edurnsifo and sumankwafo is limited to a specific expertise.

Like all other people in Ghana, the Asante have been affected by social, political, economic, and religious changes. In the religious realm, the modern Asante state exhibits a religious pluralism, within which their ethnic-based indigenous religion exists in relative harmony with other religious traditions, including Islam, Christianity, and variants of new African religious movements such as African Independent Churches, Spiritual, Pentecostal, and Charismatic churches (Sackey 2001). Despite a relatively peaceful coexistence among the religions in Asante and Ghana generally, the concept of deities and akom, or shamanic, functions have always been a paramount cause of conflict between Christianity and indigenous African religions. Whereas Christianity sees worship of many deities as a violation of the first two of the Ten Commandments, indigenous religions regard the deities as an integral part of their religious system, without which the religions would be incomplete and meaningless (Sackey 1998). These differences notwithstanding, Christians generally seek the help of the akomfo when the afflictions of life, especially health, social, and financial problems, become insurmountable.

CAPE NGUNI SHAMANISM (SOUTH AFRICA)

The role of the diviner-healer among the Cape Nguni of South Africa is still a central one. It is filled by both women and men, though women are definitely in the majority.

Background

The Xhosa-speaking peoples of the Eastern Cape of South Africa, together with the Zulu, make up the ethnic group commonly known as the Nguni. Oral evidence suggests that they were originally one people, at some period before they settled on the eastern seaboard of the southern part of Africa, the Zulu occupying that part of the continent between the Drakensberg Mountains and the Indian Ocean, while the Xhosa settled further south. In the course of time, the Xhosa people came to dominate and incorporate the Mpondo, the Mpondomise, and the Bharca as well as the Hlubi, Zizi, Tolo, and Bhele peoples who migrated into the area in the nineteenth century. The latter immigrants subsequently became known as the Mfengu (Hirst 1990, 12). Collectively, the Xhosa-speaking peoples are known as the Cape Nguni. The Xhosa-speaking peoples, as a result of incorporation, are the dominant ethnic group in South Africa.

Cape Nguni Healer-Diviners

The figure of the shaman is roughly equivalent to what is known among the Cape Nguni as the *amagqira* (a healer-diviner), or, to a lesser extent, the *amaxhwele* (essentially an herbalist). Although the generic terms *igqirha* and *amaxhwele* are the most commonly employed by the Cape Nguni, the media in South Africa typically use the Zulu designation *izangoma* to refer to both diviners and herbalists. The fully qualified diviner (amagqira) and the initiate *(twasa)* who is being trained to become an amagqira are distinct from the herbalist, the amaxhwele.

The Cape Nguni herbalist shares with other herbalists worldwide a comprehensive knowledge of local plants and their properties, which can be learned by anyone who is interested. The herbalists are ordinary people who have acquired extensive knowledge of magical techniques, ritual artifacts, and botanical preparations, and who do not typically possess occult powers (Hammond-Tooke 1989). Nevertheless, their instruction and training, like that of the diviner, begins with a call from the ancestral spirits to undergo the necessary rites of passage under a practicing herbalist. Another kind of practitioner is the *nolugxana,* "the doctor of the medicine digging-stick"; these practitioners are uninitiated novice diviners *(abakhwetha)* who employ their acquired skills and knowledge as healers (Hirst 1990, 24).

Cape Nguni specialist diviners include the *izanuse* (omniscient diviners), *awemilozi* (ventriloquists), *ambululayo* (revealers), *awomhlahlo* (appeal diviners), *awamathambo* (bone diviners), *aqubulayo* (extractors), and *awezipili* (mirror diviners) who exist for a variety of ailments and predicaments. Finally, witch finders, or witch smellers *(igqirha elinukayo)* specialize in scrutinizing a client's social, business, or neighborhood associates for malign intent. The

awemvula, or *igqirha levula,* are rainmakers, and the *amatola* (or *itola*), war diviners. The itola were active during the Frontier Wars of 1846–1878, in which the English Empire and its colonial administration opposed the Xhosa peoples.

Within these various forms of healing, then, methods, materials, and ritual are so interrelated that disputes in regards to clientele occasionally arise among practitioners. The development of charismatic Christianity among the Cape Nguni has also given rise to Zionist prophets *(amaprofeti),* "women of prayer" *(abathandazeli),* and ministers *(abafundisi)* of the established Christian churches in the predominantly Black townships. Though the healer-diviners of these newer groups owe their primary allegiance to the Christian churches, most also observe and accommodate reverential and placatory rituals directed to the shades of the ancestors and employ dreams, trance, and ecstatic healing methods.

The Cape Nguni Worldview

Traditionally, the Cape Nguni worship a supreme being known as uThixo, Qamata, or uDali, who is seen as remote from the world of everyday life; thus they turn to the ancestral shades to intercede for them. These shades are known among the Xhosa proper as *iminyanya,* and as *amathongo* among the Mpondo and the Xesibe. The shades pervade almost every aspect of traditional Cape Nguni life and social space, supplying prosperity and protection, and withholding their blessings when angered. Occasionally, they afflict the disobedient with illnesses and other misfortunes (Kuckertz 1990), the most significant being pain, infertility, loss of property, and death (Lawuyi n.d.). Through dreams and omens, they communicate with and influence the lives of their descendants. Transitional life phases and instances of prosperity or crisis see the shades invoked and appeased as necessary.

The Cape Nguni consider the dead *(elemimoya)* as spirit beings in the process of becoming spirit ancestors (*moya:* wind). The dead are buried in their own cattle byre, cattle being considered a vital medium of spiritual communication. (Not all ancestors, however, are equally revered.) The typical room is built to face the east, a tradition probably related to the San belief that the power of good derives from the east. Rivers are also considered dwelling places of the ancestor spirits and sources of divine inspiration. Rivers are seen as possessing the potential for renewal and destruction (Lawuyi n.d., 8); thus their connection with the communal ancestor spirits called "*abantu bomlambo*" (People of the River).

Pollution beliefs among the Cape Nguni attest to the existence of mystical forces that create conditions inimical to life. These forces emanate not from the ancestors or society, but from an individual's "own contaminated position" resulting from "ritual impurity" (De Wet 1998, 92). In the more traditional areas, one finds a belief in the existence of witches *(ubugqwirha),* who use their innate psychic power for antisocial ends. Witches are considered to interact with familiars, variously symbolized in peculiar creatures. Lastly, there is a belief in bogeymen *(ubuthakatha),* who employ their unusual psychic power to create free-floating fear in the minds of others (Hirst 1990, 237).

The Cape Nguni do recognize disease and illness due to "natural biological causes" and those that result from "natural degradation of bodily systems or environmental or genetic predisposition" (Hammond-Tooke 1989, 56–57). But their notion of illness and disease also incorporates whatever brings misfortune, creates imbalance in society, or poses an environmental threat (Hammond-Tooke 1989). The intermediaries between the spirit ancestors (or the supernatural realm) and the living are the healer-diviners, who are seen as having moral authority in the world of the shades, and thus the competence to initiate the restoration of order.

The Role of Cape Nguni Healer-Diviners in Society

Cape Nguni diviners focus on diagnosing the inexplicable in society, which for the most part has to do with illness, misfortune, and social, physical, or spiritual imbalance. As servants of the ancestors, they analyze, through divination, the causes or origins of specific events and interpret their messages. Though their function is chiefly that of divination, they also provide medication for many of the problems they diagnose.

The clients who consult healer-diviners come from socially diverse backgrounds; they include

educated Christians, elite professionals, and minimally educated traditionalists. Most nonliterate folk typically depend on the advice of diviners. Manton Hirst noted that white clients coming from diverse social, economic, and religious backgrounds occasionally consult healer-diviners (Hirst 1990, 70). Practitioners do not seem to exclude clients on the basis of social and racial background, nor do the religious beliefs of most clients interfere with their seeking a suitable and effective therapy for their ills from one of the many kinds of practitioners.

The problems for which most clients would consult the range of herbalists, diviners, and faith healers, are often psychic, psychosomatic, or psychosocial. Conditions for which Western biomedical treatment offers no treatment, such as witchcraft, spirit possession, lineage sorcery, pollution, madness, hysteria, and fainting fits are susceptible to intervention by the healer-diviner. Reproductive dysfunctions such as impotence and sterility are quite commonly brought to the healer-diviner, as well as problems of uncertainty, fear of misfortune, addictive smoking, alcoholism, and unrestrained promiscuity. Through their practices, healer-diviners help in reintegrating families or social relations with the use of ritual, and in so doing, they resolve social conflicts and promote group cohesion and a sense of community. In this way, they bolster not only the client's physical health, but also the psychological and social health of the patient. It is their aim to heal the broader kinship and community networks by means of their rituals and practices.

Besides these intangible ills, some Cape Nguni healer-diviners treat a wide range of common physical illnesses and diseases, including for example colds, pneumonia, asthma, bronchitis, sprains, rheumatism, premenstrual pains, sexually transmitted diseases, blood poisoning, anemia, migraines, epilepsy, parasitic infections, skin problems, angina, and high blood pressure. Some also claim to treat tuberculosis, miners' lung diseases, and AIDS.

Herbalists and diviners also offer magical medicines, potions, or charms to clients, who desire them for various purposes: charms to traders to attract customers in a competitive trade; medicines to promote wealth, to ensure easy success in an election, or to win in commercial contests; charms or love portions; concoctions to help a criminal escape a policeman, or to cause a magistrate to become confused in court; medicines to avert the need to pay bills, to render an enemy powerless, to make a person lose prestige, or to enhance the client's social standing; magical medicines to ensure the faithfulness of a partner, to enable the unemployed to find employment, to protect oneself against witchcraft, to make oneself immaterial or invisible, and to enable urbanites to maintain contact with their lineage ancestors.

The Healer-Diviner's Ritual Paraphernalia

The contents of the healer-diviner's medicinal bags vary from one region to another, as South Africa is made up of varying ecological areas supporting different kinds of plant and animal life. Typically, however, a Cape Nguni diviner's paraphernalia consists of ritual goatskin bags containing herbs, barks, roots, leafy fronds, powders, horns, ivory tusks, teeth, claws, quills, and wild animal skins. Healing is effected through the use of otter and mongoose skins; hippo-hide switches, and preserved body parts of wild animals, all of which are imbued with medicinal or magical potency. Masilo Lamla (n.d.) observed healers making use of a number of plants: *talinum caffrum (impunyu), alepidea amatymbica (amaqwili), crimum bulbispermum (inqwebeba), acokanthera,* or cape aloes *(isihlungu senamba), aconkanthera venenata (intlungunyembe), artemisia (um-honganye), obliquus (umuthunga), helichrysum appendiculatum (indlebe yemvu), bowiea volubilis (isicwe ugqogqa),* and *knowltonia cordata (isichwe),* among others. Also available to healers and diviners are asbestos flint, washing soda, cloudy ammonium, permanganate of potash, and powdered cape aloes. Psychoactive plant substances contribute to healing rituals; sorghum beer, the foam *(ubalawu)* of which produces plentiful dreams (Hirst 1990, 64–66), constitutes perhaps the most common agent diviners use to alter consciousness.

Herbalists and diviners often collect their medicinal products themselves; otherwise, they procure items from hunters or rely on one another to supplement their stores or replenish finished stocks. Those in the large urban centers obtain their products from the rural areas and the open countryside.

In addition to their goatskin bags, the apparel of healer-diviners makes their vocation

visible to the community. This consists of a white headdress *(umyekho)* that falls to the shoulder blades. Besides this, the male healer-diviner typically wears a headdress made of white bird plumage. White beads symbolic of clarity decorate the diviner's hair, which neither male nor female healer-diviners are allowed to cut. Beads also ring both hands just above and below the wrists. Goatskin shoulder bands *(iminqwamba)* and wristlets, as well as the diviner's fly whisk *(ishoba),* said to be under the influence of ancestral spirits, complete the garb. Female novice diviners commonly walk the streets of the urban areas bare-footed, faces striped with white clay, adorned with beads, and dressed in white skirts.

"Go-Twasa": The Initiation of a Xhosa Diviner

The initiation of a Cape Nguni diviner (as reported in Hirst 1990) begins with *intwaso,* a state akin to spirit possession. The individual is afflicted by personal problems or troubles *(inkatazo)* or somatic emotional states, such as various aches and pains, a sinking sensation in the solar plexus, palpitation of the heart, and fainting fits. The patient is overwhelmed by dreams *(amathonga, amaphupha)* and visions *(imibono)* featuring wild animals. He then develops healing powers *(ubugqirha),* occasionally deserts the homestead for the bush, and feels an impulse to physically immerse himself in a river or pool. Healer-diviners interpret these symptoms as the individual being "called under the river" by the ancestors.

Go-twasa, the process of initiation, calls for the intervention of a diviner, who examines the patient, probes the patient's life history and social situation, and scrutinizes the symptoms and recurrent nature of the patient's troubles *(inkatazo)* in an attempt to determine his or her vocation. Many patients are known to have a history of intwaso from childhood (O'Connel n.d., 17), the symptoms often becoming more severe after puberty. Some psychiatrists have suggested that foreign spirit possession is involved, but research has now made it clear that the Nguni differentiate spirit possession from *ukutwasa* (ancestral dream communication). Refusal to accept the call often results in madness.

Social maturity is a necessary condition for becoming a novice diviner. The male initiate, twasa, must have undergone the *ukwaluka* circumcision rites, and the female, the *intonjane* puberty rites (Hirst 1990, 92). Ultimately, for an individual to enter a diviner's school, the spirit ancestors must commit to resolving that person's difficulties, and the individual must be willing to accept the "calling." In the diviner's school *(umgongo),* the initiate is given a new name and dance wands and is taught the practice and discipline of silence and how to hold the body (Fossback 1996, 48–51). The initiate is trained to search out the truth by questions (O'Connel n.d., 29–30), much as Western medical doctors interview patients to discover an array of symptoms pointing to an appropriate diagnosis.

Initiates abstain from certain foods or drinks, sexual intercourse, and oversocialization with the rest of the community. They fraternize with one another and with other schools or networks. Learning to dream as well as to understand and interpret dreams (Fossback 1996, 82–90) is crucial to their development. Visionary dreaming is preceded by drinking vision-inducing "entheogens" (psychotropic or psychoactive substances), which help the initiates to dream lucidly and to recollect their dreams in detail. They develop a repertoire of dreams and dream interpretation skills.

Novice diviners accompany the tutelary diviner on trips, during which the tutelary diviner imparts to them practical knowledge of divination, healing, and training in herbal treatment. Central to their training is the observation of an official ecstatic ritual song and dance (the *intlombe*), which invokes the presence of the spirit ancestors, a sense of community, and thus healing therapy (Fossback 1996; Hirst 1990, 143, 148). To accommodate a patient (or initiate's) troubling spirit, they dance in a hut until a trancelike state is reached (Hammond-Tooke 1998). Dancers go round the hearth *(iziko)* at the hut's center, accompanied by hand clapping, during which the patient confesses.

The induction of the twasa calls for the instructing diviner to officiate over the initiation ritual, which includes the mobilization of the candidate's social network, offerings to the People of the River, and an announcement of the candidate's readiness. The initiate is immersed in a river, physically or symbolically, followed by the diviner priest narrating to the

initiate in his divination hut the "timeless river's myth" (Hirst 1990). Where the myth is not narrated to the initiate, it is implicit in the rite of immersion.

The success of the initiation rite (known through propitious omens) breaks the general fasting that commenced before the rite. A white goat is ritually slaughtered and a thong *(imtambo)*—a symbol of restraint and sacrifice—is made for the fasting novice. The now purged novice shares in eating the meat. An intlombe dance ensues, during which the candidate narrates his or her troubles. This completes the rite. At the end, the ritual "takes home" the candidate diviner, while an ox or a bull is immolated. In the "feast of the multitudes," the candidate "walks out" from the "neophyte" state, dressed in full diviner's regalia of wild animal skins, with goatskin shoulder bands and wristlets, and armed with a hippohide switch, a black rod, and a spear. He or she performs a dance *umhlahlo* (associated in the past with witch finding) to the clapping of family, kinsmen, and friends assembled at the person's own homestead (Hirst 1990, 150). All these rituals entreat and encourage the spirit ancestors to abide with the candidate, while drawing on the candidate's network to make durable her newfound strength.

The Zionist prophets and women of prayer also experience, through mystical dreams, a call to heal and to prophesy. Though their calls are said to come directly from God, they necessarily involve the shades. The calls often come with an illness, for which competent diviner-herbalists are consulted. However, only another prophet can successfully treat the illness (Hirst 1990, 24) and officially baptize those that are called in a river.

Gender and Healing

The balance is in favor of women in recruitment to healing and divination in Southern Africa, a development that for theoretical and practical purposes is worth investigating. In the 1930s, Monica Hunter pointed out the dominance of female diviners by a three to one ratio among the amaMpondo (Hunter 1979, 320). In the 1970s, David Hammond-Tooke noted that among the Bharca "it is almost invariably the maternal ancestors who summon the novice" (Hammond-Tooke 1974, 335). He later observed male initiates among the Xhosa who adopted female dress and sometimes spoke in high-pitched voices (31). Hirst also reported that among the Xhosa diviners of Grahamstown the ratio of women to men was two to one (Hirst 1990, 26).

Although this transvestite phenomena is mostly reported among amaZulu practitioners, more women appear to be recruited into both traditional and charismatic Christian healing in South Africa. As social phenomena occurring in societies that for the most part have male-dominated institutions, these gender (and cross-gender) dynamics are signifying processes that shape contemporary consciousness through illness interpretation and knowledge production. The voices of these female healer-diviners therefore merit close study.

Contemporary Shamans

The amagqira shamans enjoyed much power in the past for their ability to communicate with and interpret the will of the ancestors. They were very relevant to their communities, where the bonds of kinship were still strong and the influence of Western urban cultures not yet dominant. With the recent waves of massive urban migration, population explosion, and socioeconomic change, the status of the Cape Nguni healer-diviner has also shifted to accommodate new social contentions and economic patterns. Competition between healer-diviners can be fierce. More healer-diviners have moved to urban areas and attend to the health of the displaced urban populations. Globalization and the growing interest in ethnic or indigenous cultures, along with the end of apartheid, have led to a boom in popular interest in healing traditions. Because foreign tourists are interested in experiencing the magical aspects of traditional healing which many consider exotic, a number of township healer-diviners have turned to tourist visits for an income. Accordingly one finds divination chambers in the townships that have also become traditional museums, where tourists flock to have a feel of the healer-diviner's ritual paraphernalia or to experience divination. Some argue that this development has rendered the practice voyeuristic.

Healing and divination thrives in both the traditionally rural and urban areas of Southern Africa. As prophets and spirit healers, the Zion-

ist ministers and women of prayer perform a much needed role in healing, as well as reinforcing positive and healthy social relations among their populations. The increase in living costs resulting in social tensions, the rise of new diseases both of a psychosomatic and biomedical order—coupled with the limitations of the modern medical service—mean that the populations that require alternative and traditional forms of therapy can only increase.

The drawbacks to divination and healing have to do with the want of proper regulation and control that would hold healers and diviners legally accountable for malpractice and would draw a line between trained healers and diviners on one side versus quacks and charlatans on the other. The impact has been evident in the past few years, with the rise in South African HIV/AIDS statistics. The highly reported cases of rape of female infants by HIV/AIDS patients, purportedly as a diagnostic treatment suggested by some healer-diviners, is a worrying development. A case can be made that the sources of this occurrence lie in the many false healers and diviners who have swelled the numbers in the profession. There has also been criticism of the stripping of the natural habitat of medicinal herbs and visionary plants on an extensive scale for the huge urban markets. The provincial authorities for nature and conservation, as well as the press, are quick to blame the "witch doctors"; healers and diviners place the responsibility on unscrupulous traders. Certainly, the multiplicity of modern health problems and social conflict calling for inexpensive holistic knowledge from healers and diviners, the want of recognition for their medical and therapeutic efforts, and the drive for money and profit on the part of opportunists are all factors likely to complicate the growth and legitimization of these endeavors.

San Influences On Cape Nguni Divination

Taken as a complex group of practitioners, Nguni healer-diviners constitute an important class of alternative medical and spirit practitioners in today's South Africa. Many aspects of Cape Nguni practice have been traced to the much earlier San (/Xam) language and culture. The cosmology and some practices of healing and divination are shared, according to Hammond-Tooke and other scholars. The Xhosa language contains words, such as the term for the healer, *gi:xa* (medicine man, or holder of power) borrowed from the San (!Kung) language. The healing dance, the intlombe, which is a crucial element in the training of Nguni neophyte diviners, is thought to have originated with the San and has been incorporated into Nguni shamanistic practice. Finally, the association of wild animals with altered states of consciousness in Cape Nguni divination is an aspect central to the San (!Kung) (as it is, of course, to other hunter-gatherer spirit practices). Mircea Elaide's definition of a "shaman" in the strict sense of the word excluded African spirit practitioners with the exception of the !Kung. However, it is now possible to find a connection between certain aspects of Xhosa ecstatic divination and San (!Kung) cosmology and shamanic practice. It is probable that the Xhosa not only borrowed the clicks of the San language (through contact) but also the ecstatic healing dance, the intlombe, which is part of the healing and initaitory ritual of Xhosa diviners. Another aspect the Xhosa incorporated into their cosmology is the linking of wild animals with altered states of consciousness. Hammond-Tooke (1999) recalls that shamanism is essentially the religion of hunter-gatherer societies, and the Xhosa's relations with the San explain the strong differences between the Xhosa and other Southern Bantu divination systems. These differences illustrate Cape Nguni healing and divination as a complex amalgam of hunter-gatherer and traditionalist pastoral worldviews. It is also likely that the /Xam (San) term for shaman, *gi:xa,* was borrowed by the Xhosa to designate their diviners, igqirha.

HAUSA SHAMANISTIC PRACTICES (NIGERIA AND NIGER)

There are about fifty million Hausa speakers in West Africa, primarily in northern Nigeria and southern Niger. Despite tribal variations within the Hausa, the present-day Hausa share a common culture and language; Hausa is a branch of the Chad group of the Afro-Asiatic language family, and it serves as a lingua franca in West Africa. Originally, the name Hausa referred only to the language of the Habe people of northern Nigeria. In the early nineteenth century, various Habe tribal states were conquered by the Fulani, who established the Islamic Sokoto Caliphate. The Fulani, a pastoral people, were eventually "Hausaized" and became sedentary. Islam has been part of Hausa life since the sixteenth century, but the Fulani jihad gave it predominance in Hausa life. Thus Islam permeates the Hausa culture at every level, but there is a group of non-Muslim Hausa, the Maguzawa, who have retained the pre-Islamic religions of the indigenous people. These early religions include belief in spirits, or *bori,* and shamanic Bori doctors and diviners. The Maguzawa continue to follow traditional Hausa religious practices, oriented around a variety of good and bad spirits and involving sacrificial offerings to the spirits and spirit possession. These Bori cults are centered on the family rituals and healing practices, in which women and members of the lower strata of marginalized people participate. Muslim Hausa also take part in spirit possession cults, which though not identical seem to be related.

The Socioeconomic Background of the Hausa

Muslim Hausa raise livestock, including horses, donkeys, goats, sheep, and poultry, but farming is not their main means of subsistence. Non-Muslim Hausa, the Maguzawa, however, are full-time farmers, who grow millet, maize, Guinea corn, and rice during the May-October rainy season. The contrast between Muslim Hausa and the Maguzawa is apparent in many ways, such as social organization, marriage, and kin relations. Muslim Hausa society is based on a stratified social network of tight hierarchical relationships, dependent on occupation, wealth, birth, and patron-client ties. The Maguzawa are less stratified; they reside in small villages, comprised of exogamous patrilineal kin. As among the Muslims, each Maguzawa male may have four wives and as many concubines as he can support. The Maguzawa also prefer cousin marriage, on both the father's side and the mother's side.

The Interplay of Traditional Beliefs and Islam

Faulkingham (1975) noted that the Muslim and "pagan" Hausa in the southern Niger village he studied believed in the same spirits. Both be-

lieved in the same origin myth for these spirits as well. According to the myth, Allah called Adama, "the woman," and Adamu, "the man," to Him and bade them to bring all their children. They hid some of their children. Allah asked them where their children were. They said that they had brought all their children to Him. He then told them that the hidden children would belong to the spirit world. Faulkingham stated that these spirits explain everything; the primary efficacy belongs to spirits. What Faulkingham noted for the Hausa in southern Niger and Murray Last (1991) for the Maguzawa is true of many other ethnic groups who live in what is now termed Hausa territory.

The Hausa, therefore, share in the common Nigerian practice of maintaining systems of belief with ancient roots in the area alongside the universal religions of Islam or Christianity. These beliefs combine family spirits with relations to the primordial spirits of a particular site, providing supernatural sanction to claims on resources. Indigenous theology link dead ancestors to the spirits of place in a union that protects claims and relationships to the land. Spirits of place include trees, rock outcroppings, a river, snakes, and other animals and objects. Rituals celebrated for and prayers to the spirits of family and place reinforce loyalty to communal virtues and the authority of the elders in defending ancient beliefs and practices. In return for these prayers and rituals, the spirits offer their adherents protection from misfortune, adjudication, and divination through seers, or shamans. Evil is appropriately punished. Shamans, or diviners, work with the spirits to ensure good and counteract evil.

Among the Hausa, individual participation in Islam varies according to a number of variables, including wealth and power. The more wealth and power one has, the stricter the adherence to Islam. The majority of Muslim Hausa who participate in the spirit possession cult, or Bori cult, are women and members of the lower classes.

Guy Nicolas (1966) stated that most members of the spirit possession cult are women and prostitutes. In other words, they are socially marginal people. Michael Onwuejeogwu (1969) argued that Bori cults have homogeneity of organization and meaning throughout Hausaland. Moreover, they are, in his opinion, vestiges of Habe religion. Faulkingham (1975) disagreed with these findings, noting that there is more diversity in Hausaland than Nicolas and Onwuejeogwu grant. Muslims and *arna* (pagans) believe in the same spirits, but Muslims claim that they do not need to perform rituals to these spirits. In fact, many do perform them, depending on the occasion, and consult the Bori doctor for aid.

Faulkingham has given a list of the spirits in hierarchical order (1975, 13), from which the following is adapted:

1. Allah
2. Mala'iku, angels
3. Annabawa, prophets
4. Rafani, the bookkeepers
5. Aljanu, close spirits
6. Directional spirits
7. Specifically evil spirits
   a. Local
   b. Elsewhere
8. Mushe spirits, soldiers
9. Bori, inheritable spirits

It should be said that the participation of women in the Bori cult among the Muslim Hausa is not necessarily a sign of their lack of power. Zainab Sa'id Kabir (n.d.) stated that the status of women in early Hausa society was rather high. In his words, they were "not confined." They interacted freely with men, marrying at a later age than is now common among the Muslim Hausa. They were able to own their own farms. They were also important members of the Bori cult. Furthermore, they had a significant role in domestic and clan religious rituals. Interestingly, some Hausa groups had matrilineal inheritance, and it was not uncommon for elite women to be queens or titleholders. The famous warrior queen Amina was but one of many famous Hausa queens. The Hausa even had a title for women in charge of the Bori, *Bori Magadjiya.*

The Bori Doctor among the Gungawa

Just as Faulkingham and Last shed light on the Hausa expression of the Bori cult through examining its practice in related groups with ties to earlier pre-Islamic Hausa religion, so too the author wishes to shed light on Hausa practice by examining a shaman among the Gungawa, a people who have traditionally been seen as hav-

ing "become Hausa" over time (Salamone 1975). The uneasy relationship between the Bori doctor of the Gungawa and the official Islamic power structure, including those *mallams* (Hausa religious practitioners) who practice medicine and also deal with spirits, finds echoes in the writings of others who have studied the Bori cult. Some hint of the "original" Bori can be found among these minority people among the Hausa, as well as insight into the process of adaptation that marks Bori among the Hausa.

Among the Gungawa, real power is masked in modesty, for the naked display of power is culturally condemned. Those people who possess power among the Gungawa are those who least appear to do so. Moreover, they must deny their influence. The truly powerful tend to make the least display of their power, dressing more simply than other Gungawa and living more modestly than those who seem to have power do. There is, additionally, a gentleness and benign humor among the truly powerful. This gentle quality is true of religious as well as political leaders.

Medicine and those who practice it are held in high repute among Gungawa. Indeed, people from other ethnic groups come great distances to receive care from Gungawa doctors. The Gungawa are also noted for the skill of their Bori practitioners. Just as people confuse the Bori of the Maguzawa and rural Hausa who may be non-Muslims with the Hausa spirit possession cult, so, too, do people confuse the Bori of the Gungawa with that of surrounding Hausa. Interestingly, many, if not most, of the surrounding "Hausa" have Gungawa and other "pagan" ancestors.

Gungawa doctors do not cause any spirits to possess people. They do, however, talk to the spirits on behalf of their clients and convey their responses. It is also important to note that spirits do not possess them and that the spirits do not speak through them. The client can hear the spirits just as the Bori shaman can, although perhaps more faintly. The spirits do tend to speak in an oracular fashion, demanding interpretation.

The Gungawa Bori doctor is a benign trickster. Jugun Hella, whom the author knew well, was a man who emphasized his large belly, making it appear larger to draw laughs. Jugun Hella enjoyed making people laugh and wore his green robe, a sign of office, loosely draped and purposely "sloppy." At the same time he displayed his wrestling scars, a reminder of his early athletic prowess. Jugun Hella sought to draw people to him, cloaking his religious potency behind a shield of humor. He perceived his role as drawing all people to him, not simply Gungawa, but also Christians, Muslims, and people of all ethnic groups.

There is deep significance in Jugun Hella's statement that he never talked to Allah because Allah was too far away. He said he believed in him, but that Allah was too far away for the everyday problems of people. Belief in a god who has no effect on everyday life is naturally relatively emotionless, bloodless, and abstract. The spirit intermediaries, on the other hand, are seen as playful creatures who aid people in their approach to the sacred or whose bedevilment of people through adversity causes them to seek refuge in the sacred.

Jugun Hella was open to all religions and quite knowledgeable about them. However, he was a threat to the Muslim power in the area. The mallams, who saw him as a competitor, were delighted when someone poisoned him in a fashion reserved for witches. At the time, people were reluctant to discuss his death. However, the finger of suspicion pointed to the ruling powers as being behind his murder. It is a situation that underscores the tension between Bori practitioners of any kind and the mallam healers (see Abdalla 1991.)

Careful study of current Hausa Islamic practice and of Bori priests reveals significant insights into earlier Hausa religion and spirit possession practices. Certainly, earlier practices were more inclusive of women than current ones. They were also more community oriented, specific to what was happening locally. Families, as units, were more involved in the practice of religion. As the Hausa people became Muslims they had to accommodate traditional religious practices to a universal religion. Much that was particular to local customs and specific situations had to be given up or played down in light of the fervor of Muslim reformers. This provides but one example of what happens when local religions come into contact with the religion of fervent conquerors.

Other Aspects of Shamanism in Hausaland

Diviners, functioning as shamans like other Bori practitioners, foretell the future and deal with personal problems. They fit into the scheme of religious specialists, a scheme that includes priests and magicians. The boundary among the categories is a shifting one at best. Diviners continue to play an important part in determining the causes of luck, in the shape of both good and bad fortune, including the nature and cause of disease. Among the Hausa it is necessary to point out that many of the Muslim holy men are themselves diviners of a sort; they make amulets, which include decoctions of the ink in which pious texts have been written. They also manipulate sand patterns or use the stars to tell the future.

Some scholars have discussed the widespread perception that males who attend Bori rituals tend to be homosexuals. The Bori rituals among the Hausa appear to be rituals of inversion, and among the Hausa homosexuality is considered an inversion of appropriate male heterosexuality. The Bori cult is widely understood as being a refuge from the strongly patriarchal ideal of Hausa Islam. Thus it seems natural that both women and effeminate males would find some respite there.

It is important to remember that although the Bori cult may be a "survival" from pre-Islamic Hausa religion, it differs among the Muslim Hausa from that which is practiced among related peoples, such as the Gungawa, or among non-Muslim Hausa, such as the Maguzawa. It has a different meaning for these Hausa. Thus, Fremont Besmer's point that the spirit rides the possessed and that this is somehow a symbol of homosexuality (1983) does not necessarily apply to the Maguzawa, Gungawa, or other non-Muslim groups who have the Bori cult. Among the Muslim Hausa, homosexual transvestites, or *Yan Dauda,* play a prominent role. *Dauda,* a praise name for any *Galadima,* or person of rank, here specifically refers to the Prince, a Bori who is a handsome young man.

These Yan Dauda sell various foods at ceremonies, mainly luxury foods such as fried chicken, and serve as pimps for prostitutes. Women who attend Hausa Bori rituals are deemed to be prostitutes. Renee Pittin (1979) listed three activities for Yan Dauda: procuring, cooking, and prostitution. She argued that there was a close tie between prostitutes and Yan Dauda. Moreover, the Yan Dauda in combining male and female roles mediate between men and women, occupying an ambiguous category. Living among the prostitutes further provides a disguise for men seeking homosexual activity. Protection and discretion are provided through this arrangement.

Certainly, the Bori cult provides a niche open to marginal people of all kinds, not simply women or homosexuals. Butchers, nightsoil workers, musicians, and poor farmers are welcome there. Mentally disturbed people of all classes similarly seek refuge among the Bori devotees.

Murray Last (1991) noted that among the group of rural Hausa non-Muslims, whom he studied, there was an inherited obligation to appease particular spirits. For some, this obligation was to become a member of what is called the Yan Bori. Certain physical ailments may plague the chosen person. A headache is a common ailment. The diviner whose aid the beleaguered individual seeks will interpret the sign as a call to the Yan Bori. This group is headed by a shaman who is invested in that position by the younger sister of the *sarki* (emir).

There is a great deal of continuity between traditional Habe religion and "folk" religion among the Muslim Hausa. In many ways, the mallams and the various Bori leaders are in a kind of complementary opposition. Although the mallams see "pagan" Bori doctors and Bori cult leaders, male and female, as threats to their position, they also appear generally powerless to stop them and profess belief in the same spirits as those honored by Bori devotees. Their interpretation, certainly, is at least subtly different but the mallams know that many Muslim Hausa consult these shamanic healers when their own magical practices fail.

Jugun Hella, the Bori doctor whom the author knew best, stated that he was more powerful than all the other healers in Nigeria, for their people came to him to consult his spirits. He was ecumenical in his practice, turning no one in need away and asking no money in return for the use of his gift. Today, when the Bori has often become cheap TV entertainment, as Faulkingham indicated (1975), there is still behind all the versions of the Bori this

simple humanistic boast and ethos of Jugun Hella. The power to heal is given by a higher power and is sacred in itself.

No matter how much current Bori practice has changed to survive in an increasingly fundamentalist Muslim Hausa world, it still provides glimpses into the powerful source from which it came. It is a link with other forms of Bori, which I. M. Lewis and his colleagues have shown stretch throughout a wide swath of Africa and the New World, and now even into Arabia, with the ease of travel for the pilgrimage to Mecca. The pull of old spirits whose existence is rooted in the nature of the people themselves is compelling, and it is a pull people often find irresistible.

IGBO SHAMANISM (NIGERIA)

The Igbo people are well known to scholars of African ritual and religion because of their spectacular masquerade performances and their religious and philosophical traditions, made famous by Chinua Achebe and other Igbo writers. Over 20 million Nigerians share Igbo culture and language (sometimes spelled Ibo in older literature). Igbo is classified as one of the eight major languages in the Benue-Congo group (Echeruo 1998, ix). The homeland of the Igbo people is in the tropical rainforests of southeastern Nigeria, where they farm using traditional techniques of shifting agriculture. Igbo social organization is characterized by politically autonomous village groups made up of many patrilineal descent groups. The practice of the Igbo shaman, or *dibïa,* is an occupational specialty inherited through certain of these patrilineal groups. Therefore, although there are exceptions, dibïa are born to the profession and learn the practice through apprenticeship with their father or some other patrilineal relative. Traditionally dibïa have been predominantly male, but female dibïa are becoming increasingly common. Historically, Igbo people played a role in the transatlantic slave trade, both as traders and as slaves. For this reason, practices similar to those of Igbo dibïa can be found among peoples of African descent living in the Caribbean.

A dibïa ceremony called Ikoro Agwu, 1989. This festival celebrates the practical attainments of the celebrant, recognizing him as a seasoned professional. The dibïa in the photograph is wearing a knit cap adorned with clusters of cowry shells. This is typical attire for the Igbo dibïa. (Courtesy of John McCall)

In general, scholars do not use the term *shaman* to refer to indigenous healers or ritual specialists in African societies; indigenous African medicine and divination rituals are often quite distinct from the complex of practices found in Central Asia and the Americas. Eliade's (1989) discussion of the "techniques of ecstasy" central to his classic definition of shamanism suggests that those techniques have little in common with the practices of Igbo dibïa. The fundamental characteristics identified by Eliade, such as initiation by spirits through sickness and dreams (110) and the centrality of trance or possession states in the healing process, are not typical of dibïa practice. Igbo dibïa inherit their profession and utilize mechanical divinatory devices for communication with the spirit world rather than trance. For the sake of consistency with the literature on Igbo culture and West Africa in general, this entry uses the term *dibïa* rather than *shaman* to refer to Igbo practitioners.

The term *dibïa* has no English equivalent. Attempts to gloss it as "herbalist" or "diviner" fail to do it justice (Umeh 1997, 76). A literal translation might be "master of knowledge." In spite of their distinctive character, however, dibïa practices fall within the broader definition of shamanism employed for the purposes of this encyclopedia. For example, although the dibïa profession is inherited, and specialized knowledge of herbs and divination techniques are held within particular family lines, family members who choose not to practice sometimes fall ill or experience misfortune. Upon consulting a dibïa, they may learn that their misfortune can only be remedied by initiation

into their father's profession. Such a call to vocation through illness is characteristic of shamanic practices worldwide.

Any discussion of dibïa must begin with Agwü, the spiritual entity that empowers dibïa to see the spirit world, perform divination, conduct effective sacrifice, and make productive use of herbal knowledge. Communication with Agwü is established through initiation and maintained through divination and sacrifice. Many of the items in a dibïa's toolkit can be understood to function in one manner or another as a means of interacting with Agwü or the dibïa's ancestors. Because the profession is inherited, ancestors in the paternal line are important allies to the dibïa. These dibïa grandfathers continue to provide teaching long after their death by visiting their descendants in dreams. Every dibïa maintains a shrine to Agwü. The dibïa's Agwü shrine is understood as a construction of human artifice that establishes a visible face for Agwü in the world of the living. Although every dibïa maintains an Agwü shrine somewhere in the paternal compound, dibïa descent groups also maintain shared shrines located outside residential space in the bush. These are used during important ceremonial events such as initiation ceremonies.

Children in dibïa families who exhibit an interest in dibïa work are often initiated at an early age so that they can begin apprenticeship as a helper to the dibïa who will train them. Others are called later in life, alerted by misfortune or illness that Agwü desires their service. The initiation ceremony varies from region to region, but most last several days, culminating in the sacrifice of a dog, and a test to confirm divinatory ability. The initiation of a dibïa is said to open the initiate's eyes, meaning that the process enables the dibïa to see things noninitiates cannot see. The author witnessed such a ceremony in the village of Akanu, Ohafia. When the dog had been killed, its eyes were removed and taken into the quarters where the initiate was sequestered. After a short time he was carried out, apparently unconscious, with blood-soaked leaves covering his face. It was explained that his eyes had been replaced by those of the dog so that "he will be able to see spirits just as dogs are able to see spirits." The young initiate eventually ran back into the compound pursued by his initiators. After calming him, they tested the boy by requiring him to guess the contents of a bundle of leaves. When he succeeded, the ritual was declared a success, and the feasting began (McCall 1993, 58–59).

Initiation is only the beginning of a long period of apprenticeship, most often with the father or an uncle in the paternal line. Every dibïa family holds certain specialized knowledge that is passed on within the family, though such training can sometimes be acquired by dibïa from other families for a fee. When apprentices demonstrate adequate mastery of these specialized practices and knowledge they are allowed to practice independently. These novice practitioners are required, or at least strongly encouraged, to leave their natal villages and take their skills to other regions. At present, they often travel from the rural areas of their birth to any of various urban centers.

A consultation with a dibïa is likely to begin with *ïgba aja* (divination). Most dibïa are skilled in several different methods of divination. Most methods involve specific divinatory devices such as chains of seed shells *(afa)* or divination tokens *(okwe Agwu)* (Cole and Aniakor 1984, 73). Though divination involves communication with the spirit world, trance or possession is not typically part of the procedure. Instead, the dibïa interrogates the divinatory device to discover the nature of the problem in question and, ultimately, its cause. Possible etiologies of maladies and misfortune might include the failure of the questioner to recognize and pursue his or her destiny, the maleficent machinations of another, or a fate negotiated prior to birth in the spirit world. Each of these would suggest different courses of action (McCall 2000, 145–147). Dreams are also considered important diagnostic tools. Some dibïa specialize in the interpretation of the dreams of patients and utilize a codified system of symbolic interpretation. Whether they are dream specialists or not, however, nearly all dibïa interpret some of their own dreams as communications from the spirit world and use them to make decisions in their own practice.

Sacrifice *(ïcü aja)* is a fundamental practice in Igbo spiritual life, not only in the rites of dibïa but also those of shrine priests, lineage heads, and other ritual functionaries. Goats, roosters, chicks, yams, eggs, palm wine, and kola nuts are among the many things ritually

offered in various contexts. Offerings of kola nuts and palm wine to ancestors are everyday occurrences, always accompanied by requests for good fortune. But more precious sacrifices are required for the powerful spiritual entities interacted with by dibïa. Victor Uchendu noted that sacrifice must follow from any revelation of the divine will through divination (1965, 102). Thus, part of the diviner's task is to identify the appropriate sacrifice. This frequently involves not only an offering by the questioner but mobilization of whole households or descent groups to rectify matters as instructed by the dibïa.

A key component of dibïa practice is the manufacture and use of *ögwü.* Although ögwü can mean herbal medicine, the actual significance is broader. A literal translation might be "means to an end." The dibïa's production and use of ögwü is integrated within an esoteric technology that also involves indigenous psychology, social manipulations, and cosmological negotiation through sacrificial ritual and other means. The process operates on several fronts simultaneously to harmonize the physiological, psychological, social, and cosmological dimensions of the lifeworld of the person being treated.

Some observers predicted that the spread of Christianity in Igboland, coupled with the ready availability of Western biomedicine, would lead to the extinction of dibïa practices. This has not been the case. The Igbo attitude toward change has traditionally been one of embrace rather than resistance. They have embraced change, however, by appropriating and adapting foreign influences. This led Simon Ottenberg to observe that of all Nigerian people the Igbo "have probably changed the least while changing the most" (1959, 142). Igbo dibïa have always maintained an open system of knowledge, and the acquisition of new and exotic practices increases the stature of a practitioner.

Dibïa are flourishing in the social environment of modern Nigeria. Most are officially registered with the Nigerian government, and they maintain a national professional organization and various regional ones. Dibïa have largely abandoned treatment of infectious and parasitic diseases, which they readily acknowledge are more effectively treated by biomedical methods. Most now focus almost exclusively on what the author has called "existential disorders" (McCall 2000, 152)—conditions such as excessive consumerism, corruption and dishonesty, substance abuse, neglect of family, and various forms of "madness"—serious problems that medical doctors cannot address. Healers argue that these disorders result primarily from the weakening of family and community structures under the economic and social pressures that constrain the lives of modern Nigerians.

Like most Africans, Igbo people find themselves torn between the strictures of their cultural heritage and the pressures of an increasingly globalized culture and economy. In this environment, dibïa position themselves as mediators of modernity. They confront the pressures of consumerism, changing sexual mores, shifting paradigms of family and gender roles, and widespread corruption. Through the transformative power of ritual they reframe these potentially destabilizing forces in ways that make them intelligible in terms of a distinctly Igbo ethical view. A new generation of Igbo dibïa is now taking on leadership roles in the profession. These young practitioners are more cosmopolitan than their predecessors were. Their practices borrow from a global repertoire of shamanic and occult traditions. But close analysis reveals that they walk solidly in the footsteps of the forebears, addressing the needs of their communities by drawing on a rich cultural inheritance.

ISLAM AND SHAMANISM

See South Asian Shamanism; Tajik Shamanism; Zarma Spirit Mediums

MAMI WATA RELIGION (WEST AFRICA)

Mami Wata, a pidgin English term meaning "Mother of Water," refers to a popular West African deity who inhabits local lakes, streams, and rivers, as well as the sea. Mami Wata is also sometimes used as a generic term to describe a host of beliefs and practices associated with water spirits. The Mami Wata shaman, or priest(ess), can be found all along the West African coast from Senegal to Zaire, particularly among groups whose cosmologies emphasize the centrality of water spirits and their ability to influence people's everyday lives. These specialists are consulted by both men and women in the hopes that Mami Wata will bring them wealth, success, and children.

Although Mami Wata practitioners can inherit their specialized knowledge from priests and priestesses who may or may not be family members, all have been "called," or chosen by Mami Wata. This calling usually manifests itself in the form of an illness or affliction. A number of signs begin to emerge during a person's childhood indicating affinity with Mami Wata. The most common of these signs include being drawn to areas of water and swimming in one's dreams. If an individual grows to adulthood without recognizing this calling, he or she may experience a number of misfortunes, including serious illness, infertility, the loss of a child, marital problems, and financial hardship. It is usually a diviner or Mami Wata specialist who determines whether a person has been chosen to serve the deity.

Upon diagnosis the individual is instructed to make sacrifices to Mami Wata and to set up a personal shrine. This often requires an elaborate ceremony involving several days of sacrifices accompanied by ritual and musical performance and feasting. Depending on the region and ethnic group, the animals commonly used for sacrifice include horses, bulls, goats and chickens. The initiate, dressed in white, is escorted to a local river, stream, or the ocean carrying these sacrifices, along with food and other items, on his or her head. Upon reaching the waterside, the items are thrown directly into the water as offerings to the spirit. Once the ceremony is complete, the individual is said to be "married" to Mami Wata and must therefore continue to make periodic sacrifices and uphold certain vows to maintain a harmonious and reciprocal relationship with the spirit. Although Mami Wata can be very demanding, requiring her "spouses" to be celibate certain days of the week, along with various other rules and taboos, she also brings her devotees wealth, fertility, and overall success.

Mami Wata shrine sculptures, pictures, and signboard paintings commonly depict her as an Indian snake charmer, a woman with long flowing hair and a large python coiled around her waist and neck. On other occasions she appears as a fair-skinned mermaid or as a Hindu deity. The predominance of non-African images in Mami Wata religious practices reflects the long history of cultural contact between West Africans and foreign explorers, traders, and missionaries beginning in the fifteenth century. These images, along with the variety of Western goods used in Mami Wata rituals, led Henry Drewal (1988) to argue that Mami Wata is a foreign deity who arose out of the need for West Africans to both mediate and represent their relationships with foreigners. Because Europeans and Indians brought wealth

from overseas, some Africans perceived them as belonging to the realm of water spirits and their riches. Yet, though it is true that images of mermaids and snake charmers have traditionally been associated with foreign wealth and power, they also resonated well with indigenous beliefs and practices surrounding water spirits. In many areas of the Niger Delta, for example, pythons and certain types of fish were once thought to be physical manifestations of water spirits and were therefore not killed.

Mami Wata shrines are as unique as the individuals who create them. Some are located outside in close proximity to bodies of water; others are set up in a room within an individual's compound. Many contain a table covered with white cloth and a host of items that are thought to attract Mami Wata. These include candles, incense, talcum powder, perfumes or fragrant oils, white chalk, bells, cowry shells, coins, mirrors, wooden and plastic dolls, eggs and foods considered to be sweet like biscuits, groundnuts, and bananas. Many of the items were introduced to West Africa by means of trade with Westerners. Cowry shells were brought from the Indian coast by the Portuguese in the fifteenth century and were used as a local form of currency in many parts of West Africa. In Nigeria, plastic dolls, mirrors, and perfumes were among the many trade goods introduced by British merchants and colonial officers in the nineteenth and twentieth centuries.

It is also not uncommon for shrines to contain Christian iconography, including the crucifix and pictures of Jesus and Mary. In southern Togo and the Niger Delta region of Nigeria, shrines may also include clay mounds with a small hole on the top that serves as the "mouth" of the spirit, into which libations are poured. The pouring of libations and animal sacrifice are crucial in keeping the shrine active. Libations usually consist of locally distilled gin and Coke or orange Fanta, all of which are considered to be Mami Wata's favorite drinks. A white chicken is usually the animal of preference for sacrificing to one's shrine. White is an important color in Mami Wata worship. It symbolizes the coolness of the water and the delicate boundary between the world of humans and the world of spirits. It is commonly juxtaposed with red, the color of blood, which is used to signify life force and virility (Jell-Bahlsen 1997, 113). Strips of red and white cloth are often tied to the top of wooden poles, which are set up just outside the shrine area to publicize Mami Wata's presence (Jenkins 1984, 75).

Whereas some Mami Wata devotees are content with simply maintaining their own shrines, others may choose to carry their worship a step further by becoming priests or priestesses. Initiation into priesthood is a long process; it begins with apprenticeship, usually to the very priest or priestess who first detected Mami Wata's influence over the person. During this time, the initiate learns the techniques and practices associated with spirit mediumship, divination, and healing. Upon completion of the training, the initiate will have the ability to communicate with the spirit directly through dreams, visions, and possession trance. It is through these mediums that Mami Wata provides the priest(ess) with healing knowledge, which is then used in curing patients. After consulting Mami Wata, the healer may receive dreams or visions of certain herbs and roots, which are then collected and administered according to the instructions given. In other cases, Mami Wata may aid the healer in divining the cause of a particular patient's illness. Mirrors are sometimes used during the divination process to help the healer see into the spirit world. Communication with Mami Wata through dreams and visions and occasionally during trance entails a journey to the spirit world, which is characteristic of all shamanic practices.

Although many Mami Wata healers work independently as diviners and herbalists, others are members of local healing societies, which often meet once a week to collect membership dues and to honor Mami Wata through ritual, song, and dance. These groups are common in the riverine areas of southeastern Nigeria, particularly among women. Among the Cross River Igbo, for instance, women have their own Mami Wata healing society, known as Owummiri. This group is made up of priestesses and other initiates, all of whom were called and cured by Mami Wata. Although Owummiri priestesses treat and cure a variety of afflictions, they specialize in the treatment of sexually transmitted diseases, infertility, and a condition known as *ogbanje. Ogbanje* is an Igbo term meaning "one who comes and goes." It is used to describe a group of children who choose to die at an early age and re-

turn to the spirit world, where they are continuously reincarnated into the wombs of mothers. Ogbanje is a spiritual affliction that can be caused and cured by Mami Wata.

During Owummiri meetings, the members dance to tranquilizing drum rhythms and perform motions of paddling and swimming. These movements help to invoke the spirit of Mami Wata by creating an aquatic atmosphere. In Igbo cosmology, the spirit world and the physical world are separated by a large body of water. Thus, this collective ritual is meant to evoke a journey to the spirit world, and possession trance is a common feature during these performances. When a member becomes possessed, her body stiffens, and she extends her arms forward, closes her eyes, and begins to flail about with little or no control. She is restrained and attended to by one of the priestesses, who proceeds to rub chalk on her face, sprinkle powder on her feet, and throw eggs on the ground in order to calm the spirit. Mami Wata healing societies such as Owummiri are centered around fertility and the protection and maintenance of human life. For this reason, they serve an important function, both for the individual and the community.

In those areas of West Africa where Christianity is well established, Mami Wata healers have increasingly become the targets of negative representations and witchcraft accusations. The demonization of Mami Wata practices by Pentecostal churches, in particular, has had a profound impact on the way they are perceived in the Christian community. Rather than denying the existence and influence of Mami Wata, these churches have instead relegated her to the realm of evil spirits and use deliverance ceremonies to exorcise her from the host's body. Other religions, however, have tended to be more accommodative. Among the Ewe and other groups of southern Togo and southeast Ghana, for instance, Mami Wata practices have been firmly integrated into the earlier traditions of *Vodu* in Africa (from which have come the various forms of "Voodoo," especially Haitian Vodou and the Voudou of French Louisiana) (Kramer 1993, 235). And in Islam, Mami Wata has been incorporated into the category of jinn, a host of spirits created to serve Allah. It is perhaps the flexibility and adaptability of Mami Wata religious practices that has contributed to their growth and spread beyond West Africa. Indeed, through the processes of transmigration, Mami Wata religion is becoming increasingly popular in other parts of the world, including the United States.

MARABOUTS AND MAGIC (WEST AFRICA)

Marabouts are virtually an institution in Islamic West Africa. *Marabout*—a French rendering of the Arabic *murabit,* from the root *rabat* (to tie) (Geertz 1968, 43)—is a broad, inclusive term referring to Islamic holy men (and women) who specialize variously in teaching, counseling, scholarship and Qur'anic exegesis, jurisprudence, manipulation of spirits (*djinn*), healing,

ritual, divination, and magic. Of course not all marabouts combine all these practices, and some in fact are quite hostile to anything other than teaching, counseling, and scholarship. Muslims in West Africa tend to use specific Arabic terms to describe someone who does what shamans do: Such a person is termed a scholar, magician, mystic, ascetic, healer, and so forth. There is no broad term in Arabic (such as the word *shaman*) for someone who combines all these attributes. Yet the word *marabout* does refer to people who, like shamans, incorporate overlapping sets of practices.

A majority of Muslims in West Africa are members of various Sufi "orders" (*turoq,* plural; *tariqa,* singular), among which the Tijaniyya, Qadiriyya, and Mouridyya are the most prevalent (see Trimingham 1959 for an overview). And all marabouts are Sufis. At a colloquial level, however, and especially recently, the term *marabout* has been increasingly popularized to refer to any person of learning (not always even Muslim). What follows focuses exclusively on Islamic magic and the means by which those marabouts who are specialists in Islamic magic ply their trade.

Published accounts of marabouts in West Africa date to fifteenth-century European travel literature. For the most part these early works contained only obvious descriptions; remarks tended to be sketchy, superficial, or sensationalized, depicting marabouts as no more than magicians (cf. O'Brien 1971, 24). Portuguese explorer Diego Gomes's summary of his voyage up the Gambia river, published in 1456, mentioned *marabutu,* and in so doing was perhaps the earliest European reference to marabouts (Monteil 1964, 122–125). Jobson's 1623 account of his travels in West Africa was one of the first English sources that described the magical occupations of marabouts. He noted the importance of the talismans called "Gregories" (a certain derivation of *gris-gris,* "talismans"), which "Mary-buckes" manufacture. As he pointed out, the wearers believed that no harm could befall them as long as they wore one (as cited in Sanneh 1989, 208).

Baraka: Grace, Force, Power, Charisma, and Divine Blessing

One of the reasons marabouts are esteemed is that they are believed to embody *baraka.* The term *baraka* is commonly (and narrowly) defined as divine blessing (cf. Geertz 1968, 44). Muslims, however, use the term much more broadly to refer to qualities of spiritual grace, personal force, unique power, charisma, luck and success, all of which are subsumed within divine blessing. In many instances, magical ability is a sign of the possession of baraka; and conversely, those thought to have much baraka are expected to have at least some rudimentary supernatural abilities.

Ironically, even denials of possession of baraka may be considered evidence that one does indeed have it, precisely because baraka is unintentional and not self-ascribed. That is, baraka is not a virtue to be refined or a habit to be practiced; rather it is attributed to a marabout by those around him, and that attribution is not necessarily permanent. Only actions and the effectiveness of these actions convince others that a marabout has baraka; possession of baraka must be demonstrated continually. Thus baraka is thought of as a supernatural power that must be practiced in the natural world.

Marabouts

Because Islam lacks a central corporate body like the various Christian churches, marabouts are religious figures neither dependent on nor orchestrated into any type of clerical order. Practically, though, marabouts are viewed as closer to God (especially in tight situations) than ordinary human beings, due to their position in the community. Quite simply, marabouts are distinguishable from and appreciated by the populace due to their body of (esoteric) knowledge, and more importantly their uses of it.

Like shamans, most marabouts are not full-time practitioners of magic. Rather, they divide their time between work and religious specialization. Not all marabouts work, but this does not mean that they devote all their time to spiritual matters either. Students work for marabouts in exchange for schooling. Thus marabouts of particular renown with quite a few students have large labor forces at their disposal (cf. O'Brien 1971 Coulon 1981; Sanneh 1997).

Particular esoteric abilities of marabouts include spirit manipulation, dream interpreta-

tion, clairvoyance, divination, and meditation. In parts of West Africa, the marabouts with the strongest reputations as practitioners of magic are those who control spirits (djinn). Since such an ability is thought to be rare, difficult, and dangerous, the capacity to safely control djinn demonstrates the baraka of the marabouts.

In Islamic West Africa, dream interpretation is an ordinary task, especially in societies where dreams are believed to be portents of the future or channels of communication with ancestors. The interpretive process is a simple one: People describe their dreams, and marabouts interpret them, sometimes using various paraphernalia (e.g., tablets, texts, numerology charts, and especially the Qur'an). Clairvoyance and divination follow similar procedures, and marabouts employ the same types of paraphernalia. One of the most common ways to predict the future is by the esoteric interpretation of verses from the Qur'an. Because of their esoteric knowledge, marabouts are believed to be able to uncover the true meanings behind words and verses as they apply to a specific person's life and future.

Meditation *(khalwa)* is another maraboutic practice. Meditation takes place in solitude and serves one of two purposes. First, it leads to spiritual enlightenment and an increased connection with one's own spiritual nature and, by extension, God. Thus meditation leads to the personal spiritual growth that marks one as a reputable marabout. Alternatively, marabouts may meditate on behalf of someone. That is, a client may make a request for a magic talisman, and meditation is often one of the steps in performing this task for the client. As with shamanic trance, it is through meditation that marabouts summon spirits (djinn), and this is the reason that meditation may serve magical ends.

Marabouts assume leadership roles as well, directing members of Sufi *turoq* (brotherhood) in group recitation *(dhikr).* Dhikr is staged for various reasons, including religious holidays and to combat natural disasters (e.g., drought, flood, poor harvest) or social troubles (moral crisis, political instability, economic calamity). The marabout provides the litany *(wird)* in cases when it is not commonly known or when a special wird is called for (Monteil 1964, 138), and then supervises the dhikr. The participants sit in a circle, with the litany vocalized or silent. In some areas, the vocalization of the wird takes the form of a chant accompanied by loud rhythmic drumming. In these situations, ecstatic trances may result, thus, say some Sufis, bringing one into closer union with God.

Magic, Talismans, and the Power of Words

Talismans are one of the predominant forms of magic common throughout the world, and in Islamic West Africa their manufacture is sometimes the major occupation of a marabout. The general forms vary little; most are encased in leather, fabric, or metal. The interior contains texts (usually verses from the Qur'an), numbers considered significant in numerology, or a combination of the two. Texts tend to be handwritten, but increasingly printed versions are used when the rendition is an exceedingly complex one. Because Muslims believe that Arabic is the language spoken in heaven by Allah and the angels, Arabic words are thought to have unique and divine power in and of themselves. Marabouts, by way of their esoteric knowledge, manipulate words to release their inherent power, then direct the power toward certain ends. Usually this involves transcribing words into numbers or vice versa; and there are, as may be imagined, extremely intricate systems whereby the magical power of words is activated.

The way people carry talismans on their persons varies, and there is no one rule whether they should be seen or unseen. Some are displayed around the neck or worn as bracelets or anklets. Others are kept secret, worn about the waist or strung diagonally across the chest hidden beneath clothes. The location of a talisman may also indicate a particular belief about secrecy: It may indicate that the wearer believes that talismans are things that ought to be displayed in public, revealing that one visits marabouts for magical purposes, or it may indicate the wearer's belief that one's relationship with marabouts and the services they provide is ultimately a personal matter that ought not to be made apparent in public at all. Both beliefs about objects are present throughout Africa and the world. Even though shamans assume public roles and personas, many of their dealings are conducted in private, cloaked in secrecy.

Occasionally talismans incorporate decidedly non-Islamic local traditions. Natural ingredi-

ents, some marabouts explain, are needed in conjunction with the power of Arabic as a holy script in order to activate the words in the text. In addition, some talismans are constructed around natural things and as such look very different from the standard leather-bound varieties. Animal skulls, heads, horns, and other durable parts are stuffed with texts, sometimes partially wrapped in leather, sometimes left completely open. Such types of talismans, due to their ungainliness, are not mobile; they are not worn and tend to be used for the protection of things. (Generally, not even all ordinary talismans are worn; many protect one's possessions, not one's person.) The use of supplementary ingredients is not widely accepted; it is frequently contested on the grounds that the practice is not entirely Islamic and that words have power enough by themselves.

Prohibitions about the use of talismans are strict. Marabouts explain that talismans must be removed in various situations, for example during bathing, premarital sex, and sometimes prayer. Failure to follow the prohibitions "dirties" a talisman and drastically reduces its power, if it does not destroy its capacity to function altogether. Because various prohibitions go along with talismans, some people prefer more durable, less maintenance-intensive forms of magic. Ingesting magical formulas, for example, is a permanent way to keep magic in one's body. Marabouts write formulas on wooden tablets with vegetable-based ink; they then wash off the ink into a bowl and add various flavorings (e.g., honey, rose water, herbs), at which point, after a brief invocation, clients drink the water, washing their faces with the leftovers. Formulas written on chalkboards are popular for this as well, though people will wash their faces with this water rather than drink it.

Magical formulas can also be incorporated into food in any number of ways. During the preparation of the meal, water from washed tablets may be used as an ingredient. More commonly, though, ashes of formulas that have been written on paper and then burned are added. Meat and poultry dishes are common, because the animal can be ritually killed—the same is not true of vegetables.

Lastly, ordinary and inconspicuous material objects may be imbued with power by the marabout. Although this method is not nearly as widespread as the others, some marabouts will bless jewelry, clothes, and other things with which the person is in constant contact. Ordinary by-products of marabouts such as spit, sweat, previously worn clothing, and the like are venerated by followers (in the Mouride order in Senegal, for instance), who consider these things holy due to the baraka inherent in them since they came from the marabout (cf. O'Brien 1971). These practices are at once unusual and happen when the marabouts are perceived as exceptionally holy.

The Present: Competition and Contest

At the initial stages of the spread of Islam in parts of West Africa, it seems obvious that marabouts were esteemed due to their grasp of a new technology—writing. Indeed, where literacy is not the norm, to be literate is to be esteemed, powerful, or at least different. The fact that writing simplified and codified communication introduced pivotal considerations, not the least of which was that it represented a new, superior medium of magic (see Launay 1992; Sanneh 1997).

At present, however, marabouts have increasingly come under fire by various anti-Sufi movements for acting as practitioners of magic. In West Africa, so-called Wahhabis—members of a reformist movement known as the Wahhabiyya that originated in Arabia and gained popularity in sub-Saharan Africa after World War II—are the most vocal critics of marabouts and their practices. Sufis and Wahhabis differ not only in terms of theology but also in terms of their conceptions of religious hierarchy. One of the ways these disagreements play out is around marabouts and their practices. Wahhabis argue that the only one capable of the miraculous is Allah, and accordingly marabouts' claims to have supernatural abilities are a form of polytheism. Further, they contend that marabouts' manipulation of the Arabic script is a sacrilege because the script itself is sacred. Wahhabis use terms such as *sorcery* and *witchcraft* to imply that maraboutic practice is non-Islamic and moreover that it is a residue of local "animist" systems of belief. The beliefs and practices that Wahhabis label "animist" are ostensibly related to African shamanism, which is extenively discussed in other entries within this regional section.

Of course, behind Wahhabi dissatisfaction with maraboutism lies extensive ideological problems with Sufism in general. Indeed, in the West African context, the intra-Islamic disagreement apparent between Wahhabis and Sufis involves larger and more pronounced doctrinal and exegetical differences; magic is by no means the central locus of debate. But the fact remains that whether their services are contested or lauded, whether they are criticized or frequented, marabouts are still an integral part of life for Muslims in West Africa.

NDEMBU SHAMANISM (ZAMBIA)

The Ndembu people inhabit the western portion of Mwinilunga District in the northwestern province of Zambia, eleven degrees south of the equator. The name *Ndembu* refers to the people of the Kanongesha chiefdom within a much larger group, the Lunda. The Ndembu are sometimes called the Lunda-Ndembu. The Ndembu speak Lunda, which belongs to the Bantu language group. In the 1950s the Lunda-Ndembu group numbered 17,000. By 1985 the figure had nearly tripled.

The Ndembu originated in the southern Congo; they were part of the Lunda peoples there. In the mid-seventeenth century, led by the chief who inherited the title "Kanongesha," they migrated further south and settled in lands that are today divided by the international frontiers of Angola, Zambia, and the Congo. In the process they lost some of the centralized character of their political system and became a people of small villages, each with barely a dozen huts, surrounded by gardens producing cassava, the staple crop, a diet that was supplemented by bush meat. Strings of these villages and smallholdings are now dotted over areas of the Zambian bush, connected by trails and dirt roads. Women are the main food providers; accordingly the descent system has tended to be matrilineal, changing somewhat to patrilineal descent in the modern era. The area has suffered from Zambia's economic troubles, which followed the large increase of population after independence in 1964.

The religion has partly shifted in the direction of Christianity. By the 1950s 5 percent of the Ndembu were Christians, and in 1985 the figure was 40 percent (Turner 1992, 210). However, the shamanic nature of the prevailing types of divination and ritual has remained the same as in the Congo days. The people have a sense of an inactive creator god, Nzambe. The main feature of their religion is a close relationship with ancestor spirits, who call upon them to perform complex rituals in which the people approach the spirits and are able to engage their help. Altered states of consciousness are a familiar phenomenon, and it is possible that in earlier times reality was not seen as dualistic; rather, everything was imbued with spirit.

Up to the present, scholars have rarely if ever used the term *shaman* for African medicine per-

A witch doctor from the Tonga, Zambia, sits in his grass hut, ca. 1950–1980. Various gourds, boxes, and other items are spread before him. (Paul Almasy/Corbis)

sons, but in fact the term is appropriate for those who do much the same work and have the same powers as the shamans where the term originated, among the Tungus of Siberia. Shamans' powers consist of (1) healing, (2) interacting with the dead and other spirits, (3) finding lost objects and people, (4) bringing animals to the hunter, (5) changing the weather, (6) insight and foreknowledge, and (7) a sense of joy. Among the Ndembu in the 1950s there existed healers with shamanic characteristics called *ayimbuki* (doctors), and diviners with their own shamanic powers who were called *tutepa* or *mahong'u.* The diviners were specialized for insight, prediction, or "reading" or "seeing" the right path to take. They were in touch with a personal spirit who enabled these powers to develop. Healers, under the direction of the diviners, would put the diviners' message into action and engage with the spirits of the sick to heal or set to rights the troubles of afflicted people. Among the Ndembu three

decades later the roles of diviner and healer had roughly become one: It was the healer's own tutelary spirit who both divined and healed. That situation has continued into the early twenty-first century.

Ndembu medicine people in the 1950s tended to be marginal persons. Not being central members of any particular group, their loyalties were not narrowly partisan; their sympathies were broader, and their experience was richer and more varied than that of most Ndembu. In professional action they were likely to be aware, agile, and full of prescience and élan, with needle-sharp minds, sometimes with a smile of unusual sweetness and charm, sometimes with a streak of buffoonery, or with an outstanding gift of extrasensory perception (here was the power of insight and foreknowledge, the sixth power of the shaman).

The compassionate side of medicine people was shown by the respect they gave to the luckless spirits whom Ndembu called *ayikodjikodji,* "mischief-makers." These spirits were not neglected but were offered libations of food and beer like other spirits.

The vocation of diviners began by their being afflicted by a spirit in what might be called "the mode of Kayong'u." *Kayong'u* was the name of the illness peculiar to the shamanic gift, the name of the spirit that afflicts the aspirant, and the name of the curing ritual. The spirit was that of a person who had been a medicine person in this life. The Kayong'u spirit took the initiative and chose a person to be an African doctor. Women suffering from a sickness at the beginning of their divining careers might either be treated in the mode of Kayong'u, or in that of a similar ritual, Tukuka, in which the spirit involved might be an ancestor, a white person, or a bird such as an osprey.

The initiatory ritual had two purposes: one to cure the illness and the other to prepare the patient to be a diviner. The initial affliction was painful, involving a heavy sickness in the body; persons chosen by the spirit found it hard to breathe. They described it as like being pricked by needles in the chest, and sometimes a person's chest felt as though it has been blown up by a bicycle pump (Turner 1967, 142). The person could only mutter the exclamation "Boyi, boyi." The ears of incipient diviners might be completely blocked up. They were like drunken people and might slip to the ground in a fit (as in the break-up of the personality, *sparagmos,* in classic shamanism). They might be afflicted by a whole battery of spirits—not merely a single ancestor—singling them out for this arduous and dangerous profession. The experience would change a person's life, and the process was remarkably similar to that of incipient shamans worldwide.

The initiation when it occurred was complex. The afflicted person received treatment all night, sitting beside a ritual fire of green wood outside the huts with drumming in progress, while being attended by a Kayong'u member who washed the patient with medicine and administered herbal drinks. The medicine had a faint mind-altering power, but its focused spiritual power, which was strong and not well understood, predominated over any drug effect. The patient shuddered convulsively to the drum rhythm, now being open to the spirits. At the first faint light, the senior officiant, a hunter-diviner, brought a red rooster to the sacred site and held it up before the patient by its beak and legs. Kayong'u, like the hunting cults, was a "red" ritual, with the power of witchcraft in it. The initiate in a sudden spasm leaped on the rooster and bit through its neck, severing the head. Blood spouted out, and the initiate beat the bloody head on the heart to quiet the mind. This was done because a rooster awoke people from sleep. The Kayong'u spirit too awakened people it had caught. It made them emit a hoarse breathing, like a rooster or a goat. This also happened when an initiated diviner was about to shake the basket full of divining objects: The person's voice changed and the person no longer used the Lunda language but spoke hoarsely in another tongue. Diviners might also make a deep wheezing noise in the course of ordinary conversation. This was the voice of the Kayong'u spirit inside them.

When the Kayong'u spirit made a person kill a rooster by biting it, it made that person a little mad. When the initiate shuddered, it was like being drunk or epileptic, struck suddenly in the liver as if by lightning, as if beaten by a hoe-handle, stopped up. But all was opened when the rooster was killed. From the killed animal the diviner obtained wakefulness and heightened sensitivity, necessary for one who would seek out hidden things.

At sunrise, the doctor took a hoe, a cupful of goat's blood, the heart of the rooster, and vari-

ous sharp objects, and led a procession of the doctors from the village into the bush. They went to a fork in the path and kept straight on instead of following either path. They found the principal medicine tree of the ritual, a *kapwipu* tree, which stood in this context for initial misfortune followed by success. They prayed to the afflicting spirits and then heaped up a mound of earth at the foot of the tree roughly in the shape of a crocodile, with legs and tail. Next they concealed the various small objects, such as a knife, a razor, needles, a bracelet, and a string of beads, under the mound, at the head, tail, and sides. Before concealing the razor and needle, the big doctor pricked the rooster's heart with them. When the new diviner started to divine, the sense of that pricking would return. It was the thing that told the diviner how to see—in the objects tossed in a basket—the cause of the client's illness or bad luck, or how someone's death was brought about by a witch or sorcerer. The diviner had to be sharp like the needle, cutting like the knife or like sharp teeth. The diviner went straight to the point in hidden matters. It was said that sharpness and the divining objects helped one another.

Then the participants brought the drums and beat out the Kayong'u rhythm. The initiate was led out of the village to the crocodile image and seated upon it. The initiate had to divine where each of the objects had been concealed. The spirit guided the hand, and the initiate was completely successful, seeming to know just where everything was hidden. The new diviner now had this power to use whenever necessary. (Here the third shamanic power was shown, that of finding lost objects.) Meanwhile the accompanying adepts trilled their praises aloud, and the new diviner became extraordinarily happy. Everyone danced home. (This was the seventh attribute, the sense of joy.) Furthermore the new shaman had been cured of the malady, which had immediately disappeared. The spirits that once caused affliction henceforth helped the new diviner and gave protection from evil (the second shamanic power, communication with the spirits). Shortly after the performance, the initiate was apprenticed to an experienced diviner and learned the difficult manipulative and interpretive techniques of that profession.

As for medicine people, usually male, they were the ones called on to conduct a drum ritual for the healing of a sick village member (the first shamanic power, that of healing). The ritual required the help of neighbors to sing, clap their hands rhythmically, play instruments such as drums, rattles, rasps, and ax irons, sometimes go into trance with the patient, and come to a unity through the music. Under these circumstances the spirit effected the cure.

To begin the ritual the doctor's first act was to take a small party into the bush to collect herbal medicines. These plant objects were more than simple ingested remedies, for the first herb-bearing tree, one that was called the mother tree, was itself a shrine through which the doctor could communicate with his tutelary spirit and bring it to his aid. Thenceforth, during the ritual the doctor, though not in trance, was directed by the tutelary spirit as to his course of action. It had given him secret knowledge. It was said that just as hunters seek out hidden animals in the bush, the same insight and sensitivity were needed for both communicating with spirits and for the healing itself.

For instance, in the highly shamanic curing ritual of Ihamba, the aim was to make the patient shake and fall in trance, thereby releasing the afflicting spirit, which would then become an ally. The medicine person was a willing catalyst in such a ritual. The Ndembu medicine man moved and acted under the instruction of his tutelary spirit during the ritual, sometimes verbally communicating with the spirit afflicting the patient, though he was not prone on the ground as was the patient at the climax. The medicine man became a kind of conduit or catalyst in the village to transmute dire effects into good fortune. Social matters were also resolved, for until they were, the harmful intrusion that had been the cause of the trouble could not be removed, and no cure can be effected. The people had the sense of an intervention of caring spirits, which required the cooperation of the villagers, the frankness and sincerity of the participants, and good neighborliness and peaceful relations. The resolution of conflict and the cure of poor morale were necessities in order to bring about the much desired physical healing and improved relations with the spirit concerned. The result of such village rituals was that morale and happiness vastly improved.

A further notable shamanic feature of Ndembu life concerned hunters and was seen

in the hunter's relationship to spirits. As in Kayong'u, the hunter was first afflicted before gaining help. In this case the trouble was lack of game. The hunter dreamed of a bush spirit called Mukaala, a hunter figure, spotted in appearance, with ridged fur. The afflicted one could also hear Mukaala in the bush, whistling and driving away the game. To win the spirit to his side the hunter purified a site in the village, then planted in the ground a forked stake with a stone at its foot, which was his shrine to Mukaala. He marked the stone, the ground, and himself with white clay, thus becoming connected with the spirit. He called on the spirit, asking for the gift of invisibility so that he might catch animals. He whistled, marking his identification with Mukaala, then went to the bush to hunt. On catching an animal he marked his shrine and the stone with the blood of the animal, and placed the animal's head on the point of the forked stake (this was the fourth shamanic power, the power of catching animals). Thus in this type of shamanism the hunter did not have communication with the animal but with the animal-like human-helping spirit, which brought him good hunting.

Invasive spirits, harmful intrusions, or witchcraft entities and poisons were dealt with by shamanistic medicine men in a ritual called Kaneng'a. The medicine man had to obtain from the graveyard the powerful substances needed to combat the entity, such as a spirit snake, created by a sorcerer. This entity could eat the life-substance of a villager. If the medicine man used the tibia of a dead person as a gun, he could shoot the spirit snake and restore the sufferer to health. The journey down to the graveyard and the land of spirits was a terrible thing that only a Kaneng'a doctor could do.

A final capacity, which used to be exercised by Ndembu chiefs, was rainmaking (the fifth shaman power, changing the weather). This ritual, which the chief himself had to perform in time of drought, was called Musolu, and consisted of closing the two shells of a fruit amid appeals to the demigod Mweni.

SWAHILI HEALERS AND SPIRIT CULT (EAST AFRICA)

The Swahili have their own distinctive form of healing, in which some of the healers function in a way that could be described as shamanistic. Their tradition draws on various sources, Islamic and non-Islamic, and is still very much alive despite recent changes in their society.

Background

The term *Swahili* comes from the Arabic word *sawahil,* "coasts." It refers to the narrow East African coastal strip from southern Somalia to northern Mozambique, where a distinctive language and culture developed as a dynamic synthesis of indigenous African and foreign elements. This synthesis resulted from a long history of maritime trade and urban settlement in prolonged contact with the wider world of the Indian Ocean, especially the Persian Gulf and later the southern Arabian Peninsula (Nurse and Spear 1985). Whereas some scholars restrict the term *Swahili* to the geographic area and language, it is also used for the distinctive coastal Islamic culture of the indigenous Swahili-speaking peoples. Although there has been much debate about whether the coastal

people themselves should be called Swahili, and if so how they should be defined, the Swahili people are best described as the various groups from the East African coast and nearby islands who speak Swahili as a first language and share the distinctive Muslim syncretic culture of the area (Eastman 1971).

Today Swahili are mostly found in the nation-states of Kenya and Tanzania, where they are minorities. They are Sunni Muslims and live in rural villages as well as towns and cities of the coast, interspersed with other ethnic groups and religions. Neighboring African groups have often been heavily influenced by the Swahili, and many of their members have been incorporated into Swahili society through marriage and cultural assimilation.

Supernatural Beliefs and Ritual Specialists

As in many Muslim African societies, the sources of Swahili beliefs about the supernatural include Islamic sources as well as pre-Islamic and non-Islamic sources in both the Middle East and Africa. These components are intertwined, and often not clearly distinguished. Middle Eastern practices of healing, contacting and treating spirits, divination, astrology, geomancy, and magic are found together with, and sometimes merged with, indigenous African practices (Pouwels 1987, 73–92 and 120–123)

There are several different kinds of Swahili ritual specialists. Some are Islamic *walimu* (sing, *mwalimu*), literally "teachers," although perhaps a better translation is "scholars," that is, those who have knowledge of written Arabic texts on the mystical arts. Walimu often use prayers and Islamic texts, including passages from the Qur'an, in either spoken or written form. The latter includes the use of *kombe* (Qur'anic passages written on a plate or cup and then washed off and given the patient to drink or bathe with) and amulets. Amulets are also written using cabalistic formulas consisting of Arabic letters or numerals. In addition, walimu also use rosewater and incense and other fumigations, as well as other store-bought medicines. They frequently instruct clients to make *sadaka,* "offerings," which help to purify them and obtain blessings (cf. Middleton 1992, 179–181).

Other ritual specialists are known as *waganga* (sing, *mganga*), traditional healers/diviners. Waganga themselves are divided into several basic types: *waganga wa kitabu* ("waganga of the book"); *waganga wa pepo* or *shetani* ("waganga of the spirits"), also known as *waganga wa kichwa* ("waganga of the head"—referring to the bodily location of possessive spirits); and *waganga wa miti shamba,* who use wild plants as medicines. Waganga wa kitabu are very similar to and often the same as walimu, since "the book" refers to the Qur'an and other Arabic texts. Waganga wa pepo call up, bargain with, and utilize spirits, often through *ngoma*—dancing, music, and drumming appropriate to particular spirit types. All three kinds of waganga, however, frequently overlap. Waganga wa pepo are generally also waganga wa miti shamba, and many waganga wa kitabu use wild medicinal plants in addition to their store-bought medicines. Waganga wa kitabu and waganga wa pepo also share many other similar practices, and some waganga practice as both. All three types of waganga can also be *wachawi,* "witches" or "sorcerers," for if one has special powers, they can be used to harm as well as help, or for selfish as well as altruistic reasons. All waganga thus are potential wachawi (cf. Lienhardt 1968).

Spirit Beliefs and Practices

Swahili beliefs about spirits are complex and sometimes contradictory. Islamic interpretations and Middle Eastern concepts have been adopted to varying degrees by local Swahili, depending on their literacy, Islamic training, or religious tolerance of the spirit world. Although orthodox Islam is extremely monotheistic, emphasizing the worship of one God (Allah), it does recognize the existence of spirits, known as jinn. Orthodox Islam condemns establishing relationships with spirits as *shiriki,* the grave sin of associating other beings with Allah. However, the presence of spirits who follow the Islamic religion, some of which are closely connected to Allah, makes the issue less clear-cut. Moreover, there is no consensus among the Swahili as to the approved methods of dealing with the various types of spirits (cf. Caplan 1975, 100).

The Swahili commonly call spirits by several different terms—*jini* or *shetani,* both derived from Arabic, or they may use *pepo,* a Bantu word for "spirit" or "wind." There is great variation in how these terms are used, and many Swahili use

them interchangeably. Moreover, they are used both as general terms and as specific types. The term *shetani* is especially misleading. Whereas the Arabic word *shaitan* means a demon, the Swahili often use it in a more neutral fashion (cf. Middleton 1992, 170–174, where a more rigid classification is attempted).

Regardless of the terminology used, the key distinctions in spirit typology are whether the spirit is Muslim or pagan, and whether it is from the coast or the East African interior. Whereas all inland spirits are described as pagan and uncivilized, coastal spirits may be Muslim, pagan, or of a mixed character (cf. Caplan 1975, 100–101). Within these broad groups, spirits are further differentiated into more specific categories that are often the focus of particular spirit possession cults. Many possessive spirit categories correspond to various human ethnic groups, including Arabs, Masai, Mijikenda, Pemban (Swahili from the island of Pemba), Malagasy, and so on (cf. Topan 1971, 57–58).

Although some spirits are always harmful, most are more ambiguous. Whether they are helpful or harmful depends on the relationship one has with them. Whereas some are used specifically for private gain or even sent to trouble other people, many can also be used for the benefit of the community, for healing, divination, protection, and the like. Moreover, some spirits are pious Muslims, and they demand that their human associates also observe Islamic practice and morality.

Relationships with spirits can take several different forms. Some are possessive, whereas others are merely associations. Although the initial relationship is often started by the spirit, in some cases it is initiated by humans, generally using special ritual procedures. There are certain types of jini, in fact, that are purposefully kept and bred like domestic animals, because of the wealth and good fortune that they can bring.

Most Swahili acquire spirits unintentionally, through inheritance, through the spirit's attraction to, or anger with, them, or by having someone purposefully send the spirit to them for good or for ill. The spirit may manifest itself directly by possession, making the patient's body its vehicle and sometimes speaking through the patient. In Swahili terminology, the spirit is said to "mount" or "climb" the person (a conception common in many African and Caribbean areas) and come into the head. Usually, however, the spirit first manifests itself through illness, bad luck, barrenness, and other misfortunes.

Diagnosis is generally made by a spirit medium or diviner, who may be a mwalimu, mganga wa kitabu, or mganga wa pepo. Once the spirit has been diagnosed, the diviner will send the patient to a mganga who can treat spirit cases (this may be the original diviner in some cases). Sometimes the spirit is exorcised, especially if Islamic methods are used, if the spirit is sent by witchcraft, or if it is deemed by its nature to be evil or useless. If it is a spirit that can enter into a useful relationship, however, it is often appeased. Such spirits may or may not be of the type that establishes long-term possessive relationships. If it is, the human may agree to become the regular mount of the spirit, that is, the "chair," in Swahili terminology. In either case, the spirit may be enticed to possess the patient, or sometimes the ritual specialist, and explain why it has come and what it wants. Most often it will want an offering plate (of food and incense, and the like), an animal sacrifice, a certain type of cloth or ring to wear, or a special ceremony in its honor. If it is decided that the spirit will enter into a permanent relationship with the patient, certain offerings and ceremonies must be continued periodically in order to keep the relationship positive. Often such spirits are possessive, and they usually ask that the patient be initiated into a cult group *(chama* or *kilinge).*

Initiation involves an elaborate and expensive ceremony, generally lasting from several days up to a week, depending on the type of spirit and local practice. At the conclusion, the spirit should possess the patient and start a cooperative relationship with the patient as its "chair," including ceremonial possession during cult ceremonies. The spirit may want the initiate to advance to higher ranks within the cult, obtained through payment of fees, sponsoring the necessary ceremonies, and demonstrating greater competence in healing and other spirit matters (often through instruction). The highest rank is that of a mganga. Waganga of this kind have their own medicine bag, enabling them to possess the full range of spiritual skills, including divination and healing. They thus can attract their own clients and perhaps become the head of their own cult group (Giles 1987, 240–241; cf. Topan 1971).

Not all waganga wa pepo are associated with spirit possession cults. Some in fact might not have possessive relations with spirits, but other forms of association, including inheriting spirit abodes that give them access to the spirits living there. Spirits may merely help such waganga in their work, or they may actually communicate with them without possessing them, through dreams, telepathy, divination, or other signs. The title of mganga in such cases may be more descriptive than an official title. There are also people who act more as intermediaries with spirits or custodians of their abodes, without claiming any spiritual power themselves. These people are often not called waganga, but by other terms that vary according to locality, for example, *ratibu,* or *wavyale.* This position is often inherited. (On *wavyale,* see Gray 1966 and Trimingham 1964, 116–117.)

Differences and Similarities between Types of Spirit Specialists

Walimu and waganga wa kitabu are usually viewed as fundamentally different from waganga wa pepo and similar types of spirit specialists. Whereas the former use Islamic means to try and exorcise spirits, the latter use more pagan means to placate and cultivate them. Waganga wa kitabu, as their name implies, acquire their skills from written texts (often in Arabic) and personal instruction. The primary means of acquiring skills and knowledge for waganga wa pepo and related spirit practitioners is through personal relationships with spirits, although considerable training may also be involved. These fundamental differences also relate to another distinction—whereas walimu and waganga wa kitabu are almost always male, waganga wa pepo and other spirit specialists can be either male or female (cf. Middleton 1992, 179–180).

The opposition between these two basic types of ritual specialists, however, is not as pronounced as it first appears. In actual practice, their methods are often similar. Although their ceremonies are viewed mainly as exorcisms, waganga wa kitabu use many of the same procedures to attract and interact with spirits as waganga wa pepo, including covering the patient with an appropriately colored cloth, burning incense, and making offerings. Often they also call the spirit to possess the patient and state what it wants in order to stop troubling the patient. Moreover, waganga wa kitabu often have spirit helpers that they call on for assistance. They may have sought these out, inherited them, been chosen by them, or even been possessed by them.

Often these spirits are Middle Eastern jini, or more specifically *ruhani,* which are a special category of very powerful spirits that are highly Muslim in character and demand that their human partners lead an exemplary Muslim life. These jini, however, are otherwise much like other types of spirits. They cause illness or misfortune and demand offerings, cloths, and often sacrificial animals. They also require ritual celebrations in their honor, but these are the same ceremonies that would be used in other Islamic contexts, *dhikri* (repetitive chanting of words and formulas in praise of God with rhythmic breathing and body movements, often leading to trance) or *maulidi* (recitations and songs associated with the birth of the prophet Mohammed). If the relationship is a possessive one, it is often the reason why the person became a mganga wa kitabu in the first place, to please the spirit. Moreover, the spirit may also have required him to be initiated into a spirit cult. Some waganga wa kitabu also have relationships with non-Muslim spirits, although in this case they may resist initiation because the ceremony would be non-Islamic.

On the other hand, waganga wa pepo use many of the same Islamic methods as waganga wa kitabu to deal with Islamic spirits. They utilize many of the same incenses and medicines, and ask Islamic specialists to come and read Qur'anic passages and perform dhikri or maulidi when calling such spirits. Also, waganga wa pepo and spirit cult members are usually themselves possessed by ruhani and other Islamic spirits in addition to non-Islamic ones. Hence regular cult ceremonies honoring members' possessive spirits include Islamic ceremonies as well as ngoma, which are non-Islamic forms of dancing and music (Giles 1987, 246–247).

Changes in Spirit Practices

At present, only a minority of the Swahili population is involved in spirit cults, whereas evidence from cult traditions and written accounts portray spirit cult activity as fairly common in the past. Increasing Westernization, orthodox

Islamic opposition, governmental interference, and worsening socioeconomic conditions (making ceremonies less affordable)—all these are factors. Also, the amount of male participation in spirit cults seems to have declined. Currently, the majority of clients and cult members are female (cf. Middleton 1992, 176–178).

On the other hand, spirit cults still remain viable. They have adapted well to modern urban conditions. Members can be drawn from all segments of society, including some well-educated and Westernized individuals. Even those who have strong objections to spirit ceremonies or cult membership will participate if they believe it is necessary in order to get well. Furthermore, most Swahili, whether or not they participate in spirit activities, share the belief system, including belief in the possibility of possession. Many people visit spirit cult mediums when they need assistance, for divination, medicines, or spiritual intervention. Even more use the services of waganga wa kitabu.

Much more decline is evident in the role of spirits and their various intermediaries in everyday activities, especially communal activities. In the recent past, spirit propitiation by individual hunters, fishermen, and cultivators was common, as well as communal spirit rituals associated with the monsoons, various stages in the agricultural cycle, and especially the Swahili New Year (Trimingham 1964, 117). Certain spirits also acted as general guardians of the community, with special huts erected for them and ceremonies dedicated to them several times a year. All of these rites were carried out by special spirit intermediaries such as the wavyale or ratibu. Remnants of these communal practices can still be found in the more isolated villages of the Tanzanian coast and Pemba, but elsewhere they have become the domain of the spirit cults and individual spirit practitioners (Giles 1995, 90–96).

TWIN CULT OF THE AKAN (GHANA)

One aspect of the religious practice of the Akan is a special cult that centers on those who are born as twins. It is of particular interest in an encyclopedia like this one because it centers on

Okomfo Essoun completed her akom (priestess-medium) training in another town, and accompanied by a group of clergy (Akomfo) she was brought to Winneba and introduced to her people for the first time. Here, she is brought through town in a procession in a state of trance. Winneba, Ghana, 1998. (Courtesy of Anthony Ephirim-Donkor)

spirit possession, so often a central feature in shamanism.

Background

The Akan are found in the modern nations of Ghana and the Ivory Coast. In Ghana they constitute about 50 percent of the population; the major groups that make up the Akan are the Asante, the Fante, the Akuapim, the Akyem, the Akwamu, the Khwahu, the Nzema, the Ahanta, the Wassa, the Bono, and the Safwi as the major groups. All the Akan share a common language, religion, and political ethos (Ephirim-Donkor 1997, 3).

The Akan believe in a monotheistic creator God called Odomankoma Nyame. They adhere to a system of succession that operates within the *ebusua,* a uterine, blood-linear group of kin who congregate in order to bury their dead and share the funeral expenses, set the date for the final funeral rites, appoint a successor for the deceased, and remember the dead periodically (Ephirim-Donkor 1997, 33). These beliefs have their origin in the Akan cosmogony, according to which the previously perfect coexistence between God and the primordial old woman, Aberewa, and her children was severed over arguments about food *(fufu)* preparation. The separation of heaven from earth created a void, which was filled by the *abosom,* "deities," spiritual offspring of God who remained on earth, though capable of moving between the two worlds (Ephirim-Donkor 1994, 44–45). Naturally, the Akan began to worship the abosom (plural) and in the process developed elaborate rites, shrines, and codes governing existence *(abra bo).* Not everyone could approach the abosom; consequently a special class of clergy believed to be the children of the abosom themselves was born and taught the esoterica of the deities (Christensen 1959, 257–267).

An *obosom ba,* "child of a deity," is a person whose mother, after experiencing difficulties

conceiving, asks for a deity's intervention and pledges to consecrate the child (or children) born in consequence of that intervention to the deity, together with certain prescribed rites of thanksgiving. A deity may *will* as many as five children; as an indication of their sacred nature, the hair of such children is kept uncut and unkempt, with strings of bead, cowry, or coin tied to the hair. The *abosom'ba* and their descendants, together with twins and those born under special conditions, are the only ones considered called into the clerical profession.

There are three categories of clergy among the Akan, the priest, *osofo,* the prophet-medium, *okomfo,* and the doctor, *oninsinye* or *obosomfo.* Even though their roles overlap, each kind is unique in that each receives a specialized training. To be a member of the clergy one must be born into or must have descended from a priestly ancestry. That is, the original ancestor must have been an obosom ba, the offspring of a deity (Ephirim-Donkor 1994, 56).

The process begins with a call by a deity and not by God, because God is worshipped through the deities. The call is critically examined by an experienced member of the clergy in order to authenticate the veracity of the phenomenon. Then the subject undergoes training for at least one year, during which time she or he learns about the secrets of the clerical vocation and of the deity that called her or him. Upon graduation as an okomfo, the new medium demonstrates her spiritual prowess in public by dancing herself into a trance and being taken over by a deity. Since God is not worshipped or approached directly, societal and individual problems are addressed to the deities via a medium in a trance; the deities in turn take the problems to God.

Twins and Possession

The focus of this article is another special class of people among the Akan, twins—who, together with the abosom'ba, are considered to be divine, having a religion of their own. Twin religion (Nnta Abam) manifests itself as spirit possession when the special deity of twins, Abam Kofi, possesses twins *(nntafo)* during festivities honoring the deity.

Twins are considered unique and therefore enjoy special recognition in Akan sociocultural and religious practices. Their uniqueness is based on the oddity of their birth, which is interpreted as divine. The Akan believe, quite dogmatically, that twins are gifts from a deity who shows favor to some women, so that "mothers of twins or triplets are held in especial esteem . . . not only in life, but after death" (Rattray 1927, 66–67).

Although the Akan are aware of the role heredity plays in twin births, they also believe in the arbitrariness of their births. Many, indeed, believe that twins are born to those who may not necessarily need them, i. e. the poor. Existentially, having twins is thought to be a test; the challenge lies in a couple's ability to properly nurture them into adulthood before obtaining Abam Kofi's beneficence.

Traditionally, a set of twins, like a set of *abosom'ba,* comprises five children. The twins proper, *Panyin* and *Kakara;* then the first child born after the twins, *Tawuah* or *Tawiah;* the second, who also happens to share the same name as the deity, *Abam;* and finally, the third child born, *Nyankomangor.* Upon parturition the mother and neonates are sequestered for a culturally defined period of at least eight days before they are formally introduced to the extended family, culminating in a naming ceremony. On this day, special rites are also performed in honor of the twin deity, at which time a raffia twig is shaped into a doll.

To invoke Abam Kofi to enter the doll, libations are offered, after which a chicken is slaughtered and its blood is poured on or around the doll. Then boiled eggs and two sacred meals called *oto*—one red and the other white—are placed on or around the doll to signify Abam Kofi's acceptance of the ambrosia. Concealed under a white piece of cloth, the doll is then hung permanently on a wall.

During the naming ceremony, the neonates also receive raffia-strung beads of white and black colors tied around their wrists to signify the fact that they too have been hung on a wall, figuratively. Sometimes a piece of gold is strung together with the black, but regardless of the addition, the rest of the beads on both sides must be white. Henceforth the twins wear the raffia-strung beads throughout their existence, unless they want themselves taken down from the wall where they have been figuratively hung.

Situational rites are performed for twins who display neurotic tendencies in order to restore

Okomfo Essoun, Winneba, Ghana, 1998. (Courtesy of Anthony Ephirim-Donkor)

psychosomatic equilibrium. Otherwise, twins wait until the annual festival, which is held to coincide with the harvesting of crops when Abam Kofi is fed, who in turn possesses his offspring—the set of twins.

The festivities begin early in the morning at participating twins' households (Ephirim-Donkor 1994, 54). Ceremoniously, Abam Kofi is taken down and laid on specially prepared bedding. Meanwhile, food items, including yams, plantains, eggs, and a chicken or sheep are readied for a sumptuous meal. Then trays containing diluted seawater, in which are placed special vines believed to empower the seawater, are readied. Afterwards a chicken or sheep is slaughtered, and some of the blood poured into the water and onto Abam Kofi. Next, boiled eggs and morsels of the sacred oto meal are offered to Abam Kofi. The twins then congregate around the oto and eggs in a white tray to partake also of the same sacred meal as Abam Kofi.

The preparation of the main meal is completed by early afternoon, and the actual feasting begins, after selected portions of the meat have been set aside for Abam Kofi. Twins, however, eat apart from everyone else. When the feasting is over, the kitchen is swept and the trash added to the sacred seawater and readied for the most festive part of the ceremony, which is the journey to dispose of the trash.

Bathed and clothed in white outfits, each twin is then smeared with white myrrh and marked with a double insignia of red (or white and red) myrrh on every joint, the forehead, and the temples (Ephirim-Donkor 1994). A priestess proceeds to offer libations in front of each tray and takes some of the water and gently rubs each twin, while exhorting them about the impending ordeal. Beginning with the eldest twin, the priestess lifts up each tray and taps it three times on each twin's head, and on the third count the twin holds the tray in place. Lined up behind the eldest, the priestess again offers libations, but this time into the trays now being carried by the twins. Finally, they are ready to proceed.

The eventual destination is the community's kitchen midden or disposal into the sea. Ac-

companied by members of the household and joined by spectators singing praise songs of the deity, the twins slowly make their way to the beach to dispose of the contents of the trays. The journey, however, is a struggle; Abam Kofi and other deities descend, literally, into the sacred water, thereby possessing the twins. That is, a twin may experience a gradual increase in the weight of the tray, which becomes heavier and heavier until the twin is virtually unable to move. In a state of trance, a twin is completely under the control and sway of the deity.

Thus possessed, twins react naturally by attempting to throw the trays away entirely—quite an impossible task because the hands appear to be glued to the tray. They turn their heads back and forth and from side to side, stand still momentarily, then sway from side to side erratically, raise and tap the trays on their heads, rub the base of the trays around their heads, and run helter-skelter. In the process the water and most of the contents are wasted, while some spectators are even injured as they attempt to avoid the encounter. There are some twins who are never possessed during the entire journey. Remarkably very few twins, if any, of those that are possessed are actually injured.

Once the procession reaches the dumping site, the contents are thrown into the sea, and each twin is dipped into the sea three times. The ritual bathing effectively ends spirit possession. Upon their return home, more libations are offered, and Abam Kofi is returned to his hanging posture to await yet another annual festival.

WITCHCRAFT IN AFRICA

In many African cultures, particularly those south of the Sahara, witchcraft is an idiom used to explain misfortune within a community. This misfortune may be physical or social in nature; it is usually thought to emanate from the ill will of someone within the community. Among the Shona-speaking peoples of Zimbabwe, for example, if a person falls ill with malaria or if a person loses a job, witchcraft is often understood as the reason why, and it is assumed that someone within the community (often a relative) used witchcraft out of spite, jealousy, or the desire for revenge. In most African contexts, then, the idiom of witchcraft is commonly used to explain *why* something unfortunate happens to a particular person, often with the implicit understanding that someone else "bewitched" the person in question because of a strain in their relationship.

Unfortunately, not much is known about witchcraft practices in Africa before the era of European colonial expansion, which did not reach its height until after the 1890s. Of the few exceptions to this rule, research on the eighteenth-century kingdom of Kongo is notable. According to historian John Thornton, in Kongo there was a class of people called *ndokis,* whom the Capuchin priests working in the Kongolese royal courts called *fattucieri,* the Italian word for "witches" (Thornton 1998, 71). Thornton says the Italian translation does not adequately capture its meaning in the KiKongo language, but he does describe ndokis as "selfish and greedy people who will stop at nothing to get what they want. They enlist Otherworldly power that has been garnered by like-minded people and 'eat' their victims either literally or symbolically" (Thornton 1998, 42). This description is similar to the way witches are described in numerous contemporary African contexts.

The earliest work on witchcraft was in anthropology, and with few exceptions (see Ashforth 2000), it is still a topic that draws the most attention from that discipline. In 1937, Edward E. Evans-Pritchard, a British anthropologist who taught for many years at the University of Oxford, published *Witchcraft, Oracles, and Magic among the Azande,* a monograph that in many ways sets the standard for the topic. This work was published in an abridged version in 1976 and is still widely read. The Azande live in what is today western Sudan, the Central African Republic, and the Democratic Republic of Congo. At the time Evans-Pritchard conducted his research, in the late 1920s, the Azande had been under British indirect rule for several decades. They were settled in homesteads over a wide swathe of savanna land, grew crops (corn, ground nuts), and kept some domestic animals (primarily fowls). There was a defined class distinction between nobles and commoners (Gilles 1976, vii-xxix). One of Evans-Pritchard's main goals in this monograph was to refute the notion that belief in witchcraft is irrational. "Witchcraft has its own logic," he wrote, "its own rules of thought . . . and these do not exclude natural causation. Belief in witchcraft is quite consistent with human responsibility and a rational appreciation of nature" (Evans-Pritchard 1976, 30). Taken on its own terms, appealing to witchcraft in Zandeland was a perfectly reasonable way for an Azande person to explain misfortune.

Evans-Pritchard related a number of interesting ethnographic details about Azande witchcraft. According to him, witchcraft among the Azande was inherited. It was believed to be a substance found in a person's small intestines. It does not correspond easily to the Western notion of something supernatural. Both men and women could be witches. Often a person would never know whether he or she were a witch, because witchcraft substance usually remained "cool" (that is, not active). Witchcraft substance became "hot" when a person became jealous or sought retribution for someone else's misdeeds. Even so, often a witch would not knowingly "bewitch" someone else. Witchcraft was believed to work at night, under the cover of the shadows, and to travel through a homestead to its intended victim.

The Azande were not interested in witches, per se, but rather in acts of witchcraft. In any discussion of African witchcraft, in fact, it is important to distinguish between "witchcraft" and "witches." In many—although not all—African cultures, the latter are rarely discussed. People express interest in and concern over acts of witchcraft, but not necessarily the existence of witches. For Evans-Pritchard, this point was critical to his general argument that witchcraft was primarily an idiom the Azande used to explain why misfortunes happen.

In many African societies, ritual specialists are employed to protect people from witchcraft. (Bettmann/Corbis)

There is a famous example in *Witchcraft, Oracles, and Magic* that lays out this emphasis on witchcraft as an idiom for explaining why

something unfortunate occurs. The Azande stored their crops in granaries, which were suspended above the ground by wooden stilts to keep out rodents. Because of the hot weather, and a preponderance of termites in the area, the supports on these granaries occasionally rotted through and collapsed. During his time in Zandeland, Evans-Pritchard noticed that people often sought refuge from the heat by sitting in the shade of their granaries in the middle of the day. On rare occasions, a granary would collapse when people were sitting under it, sometimes causing serious injury. Although the Azande knew that the humidity and the termites weakened the supports, they were also suspicious as to why a granary would collapse at the precise moment people were sitting under it. The answer they gave, according to Evans-Pritchard, was witchcraft. "If there had been no witchcraft people would not have been sitting under the granary and it would not have fallen on them. . . . Witchcraft explains the coincidence of these two happenings" (Evans-Pritchard 1976, 22). To further elucidate this claim, Evans-Pritchard appealed to the cross-cultural example of luck. "When, in spite of human knowledge, forethought, and technical efficiency, a man suffers a mishap, we [in the West] say that it is his bad luck, whereas Azande say that he has been bewitched" (Evans-Pritchard 1976, 65).

Azande tried to control threats of witchcraft through the use of oracles. Oracles were consulted before any major event (such as a lengthy trip), at key moments in the life cycle (such as a wedding), or when a person was suffering serious misfortunes. The most powerful oracle was the poison oracle (Evans-Pritchard 1976, 121). A substance called *benge* (similar to strychnine) was given to a domestic fowl; whether the bird lived or died after ingesting the benge helped the Azande determine the answer to a particular question posed. Other common oracles included the rubbing-board oracle (the most common) and the termite oracle. The rubbing-board oracle worked by rubbing the lid of a rubbing board against the board itself, after it was lubricated with a special treatment of fruit juices and tree bark. Whether the lid stuck to the board or not helped the Azande answer a particular question. For the termite oracle, a Zande person would break off branches from two different kinds of trees, stick the branches in a termite mound, and address the termites through a question, the answer to which was determined by what the termites ate—one or the other of the branches, both of the branches, or neither. Oracles played a central role in the idiom of witchcraft for the Azande. They were part of what Evans-Pritchard saw as a rational system of investigation and explanation. As he argued, "[Azande] mystical notions are eminently coherent, being interrelated by a network of logical ties" (Evans-Pritchard 1976, 150).

A generation after Evans-Pritchard's pioneering work, another British anthropologist, Max Marwick, conducted a study among the Cewa peoples, in what is now Zambia, that further enriched our understanding of African witchcraft. Actually, Marwick studied sorcery, but in many African contexts (although by no means all) *sorcery* and *witchcraft* are synonymous terms (cf. West, 2001). Sorcerers, or *nfiti* in the Cewa language, are, like witches in Zandeland, motivated by ill will, jealousy, and greed. Unlike Azande witches, however, Cewa sorcerers are primarily male. According to Marwick, sorcerers rely on a number of techniques to carry out their nefarious activities, including poisoning a victim's food with magical substances, giving a victim ulcers, and using their familiars—often hyenas and owls—to cause trouble (1967, 107). Sorcerers can also fly around in the winnowing baskets used to clean and store certain crops. This reliance on familiars, particularly nocturnal animals, is common in other contexts of African witchcraft and sorcery.

Marwick trained at the Victoria University of Manchester under the noted anthropologist Max Gluckman, who relied heavily on Karl Marx's idea that conflict helps structure society. Among the Cewa, who are matrilineal, Marwick found that 55 percent of all misfortunes in the community were attributed to the actions of sorcerers (1967, 105). Like Evans-Pritchard, he was interested in sorcery as an idiom used to explain misfortune. But Marwick, perhaps because of the particular dynamics of Cewa sorcery as opposed to Azande witchcraft, presented a more persuasive and vivid argument for the role of occult idioms in the articulation of personal tensions. "First and foremost, beliefs in sorcery are a means of formulating tense relationships" (Marwick 1967, 125). In this way, Marwick worked out an important

understanding of the connections between kinship, politics, and witchcraft.

Kinship is a key axis for Marwick. Indeed, as other researchers have shown from case studies in Cameroon (Geschiere 1997) and South Africa (Ashforth 2000), tense kinship relations often lie at the heart of witchcraft activity. Among the Cewa, this tension is often expressed in social situations involving political succession. Since the Cewa are a matrilineal society, political authority is determined through a man's relationship with the women in his family. During his fieldwork in the 1950s, Marwick observed a number of cases in which a man's seniority in the matriline was contested, often on the grounds that this man—or his potential rival—had used sorcery to disrupt the normal course of succession. As Marwick observed, "matrilineal relatives are especially prone to practice sorcery against each other because . . . they develop smoldering hatreds that flare up in attacks by sorcery" (1967, 108–109). Kinship and politics, then, are framed by the idiom of sorcery. The idiom of sorcery is "catalytic to the normal process of matrilineage segmentation," in other words, brings about divisions of people within a matrilineage (Marwick 1967, 113).

Evans-Pritchard's argument that witchcraft in Africa is not based on irrational or superstitious thought has been invaluable in defining the academic study of occult practices. He helped pave the way for future generations of scholars to treat witchcraft as a serious academic pursuit. Recent critics of Evans-Pritchard's work, however, have contended that Evans-Pritchard's analysis was too functional (Comaroff and Comaroff 1993; Geschiere 1997; West 2001). By this they meant that Evans-Pritchard described witchcraft as a mechanism that regulated social relations without disrupting the social status quo. In other words, Evans-Pritchard did not take into account the dynamics of social change, and in particular the impact of colonialism on African systems of thought. Throughout *Witchcraft, Oracles, and Magic,* Evans-Pritchard gave readers the impression that witchcraft is a "traditional" practice. Marwick, too, argued that sorcery is "a conservative moral force" (1967, 109). He also predicted that as African societies modernized, and as Western ideas of individualism took a firm hold, witchcraft would disappear. Other anthropologists, however, have pointed out that the influence of witchcraft as an idiom has grown as Africa becomes more "modern." With the development of market economies, the integration of cultural and economic networks into the international arena, and the increasing influence of Western-style education, the role of witches and witchcraft in Africa has flourished, not languished. As Jean and John Comaroff put it, "Witchcraft is a finely calibrated gauge of the impact of global cultural and economic forces on local relations. . . . Witches are modernity's prototypical malcontents" (1993, xxviii-xxix).

This sense of witchcraft as an index of social disruption was developed largely in the 1990s, after a fairly long period in which little new work was produced (perhaps twenty years). It is difficult to say why there was such a lull in witchcraft studies, whether it was due to a decline in witchcraft accusations and activity, or whether it was due to the proclivities of researchers in choosing their research subjects. Suffice it to say, by the late 1980s and early 1990s, anthropologists began to study witchcraft with renewed vigor, and, indeed, contrary to what Evans-Pritchard and Marwick predicted, the importance of witchcraft in Africa has grown dramatically.

In her work with Igbo communities in Nigeria, Misty Bastian gave a clear sense of witchcraft as a modern practice. "Witchcraft," she argued, "is not seen in Nigeria as the sole province of the 'traditional'" (Bastian 1993, 133). She described a case from 1987, in which a columnist for one of the country's most popular newspapers wrote an editorial about the prevalence of witchcraft in modern Nigerian life. The columnist equated modern day politicians with witches, a situation he blamed in part on the growing divide between people who live in urban centers and rural areas. As with witches, "greed is [the] hallmark [of politicians; they have] an abiding zest for destroying the successful, the healthy, and the 'lucky' in the community" (cited in Bastian 1993, 129). Rather than abandoning the language and ideas of witchcraft, this columnist translated the ideas into a contemporary context. The editorial was "a contemporary form of witchcraft accusation" (Bastian 1993, 133), revealing how the idiom of witchcraft is still relevant to the lives of Nigerians.

In Mozambique, the connection between witchcraft and contemporary politics is also evident. Harry West, an anthropologist who works among Mueda speakers in the northern parts of the country, has collected a significant amount of data on sorcery, called *uwavi* in the local language (West 1997; 2001). Muedans believe that sorcerers—who may have both good and bad intentions—can transform themselves into lions. Harmful sorcerers, motivated by jealousy and greed, can exact revenge, steal from, or disrupt the success of others in the community. As in Nigeria, in Mozambique these understandings of sorcery and witchcraft have been translated into the language of national politics. People in Mozambique—a country that was torn apart by civil war through much of the 1980s—understand the power of their politicians to come from sorcery. "In a changing world," West argued, "Muedans both made sense of and gave shape to power relations through their continued reference to sorcery" (2001, 122). Just as once a local headman might have been understood as a possible "people-lion" (as sorcerers are called), this is now considered a possibility for national-level leaders, as well.

Western scholars, of course, are not the only people writing about witchcraft in Africa. A number of prominent African novelists have discussed the influence of witchcraft in their novels, including the Zimbabwean Chenjerai Hove (1995) and the Kenyan Ngugi wa Thiong'o (1965). In Ngugi's *The River Between,* a young Kikuyu man with political aspirations, called Waiyaki, falls victim to what is recognizable as the ravages of witchcraft. Not long before Waiyaki's demise, Ngugi writes: "He pleased many. But not everybody. At such moments jealousy and ill-will are bound to work" (Ngugi 1965, 92).

For all of its diverse manifestations, witchcraft in Africa speaks to the heart of people's concerns with the well-being of society. When that well-being is threatened (on the local, regional, or national level), the "idiom of witchcraft," as Evans-Pritchard so well put it, is often invoked. Perhaps the most important aspect of witchcraft in Africa, then, is its profound role in shaping the sense of why things happen, whether in a "traditional" Azande village, through the use of oracular consultations, or in "modern" Nigeria, through a popular daily newspaper.

YAKA SHAMANISTIC DIVINATION (SOUTHWESTERN CONGO)

Shamanistic divination, practiced by diviners both male and female, is one of the most influential practices in Yaka society, one that manifests the Yaka worldview. It is practiced both in the rural homeland of the Yaka and in the capital city of Kinshasa. Among the Yaka shamanistic divination is a highly sensory practice, one that focuses on the awakening of a power from within and on soliciting communal adherence to that power. The practice of Yaka divination requires one to become awakened to an entire world that is alive, interacting, open-ended, and self-regulating to a large extent, and infused with life-giving or death-giving power. Yaka divination also entails a belief that a kind of ecstatic communication or exchange is possible between humans, spirits, and the animated life world, an exchange that reenacts and reinforces the profound interconnectedness of the otherworldly and the this-worldly.

Yaka People: Geographic and Ethnographic Data

The Yaka, a Bantu ethnocultural group, live in the southwestern part of the Democratic Republic of Congo (formerly Zaire). They are an influential culture in the province of Bandundu, sharing borderlands with many other cultural groups, such as the Lunda, Suku, and Pelende. Up to 400,000 Yaka dwell in the woodlands and tree-covered savanna near the Kwango and Wamba rivers. It is mainly Yaka women who grow the crops for their community's subsistence and take care of the domestic tasks, whereas men are involved in hunting, trading, and the construction and maintenance of the thatched houses.

A good number of Yaka have now migrated into Kinshasa in search of paid work, trade opportunities, schools, and biomedical care. The sad irony, though, is that the city has staggeringly failed them in a number of ways. Since the 1990s, a spate of riots and economic and political upheavals have continued to disrupt urban life. This crisis notwithstanding, the sociocultural institutions of the perhaps half million Yaka in suburban Kinshasa have held firm. In the rural southwest Bandundu region, a hierarchical and centralized mode of political organization, which Lunda rulers imposed on the rural Yaka three centuries ago, still characterizes the political superstructure.

The Yaka divinatory practices and their therapeutic knowledge have been well documented, especially in the rural milieu of southwest Congo bordering Angola. Based on research conducted in this area between 1972 and 1974, and again in 1991, and recently with the more urban Yaka of Kinshasa, the author has documented some 250 oracles narrated by eighteen diviner-shamans, some of which were recorded at the scene of divinatory consultation; the author also witnessed two full initiation cycles of diviner-shaman novices. A film (Dumon and Devisch 1991) documents some phases of the initiations and oracular consultations. This work confirms reported records that Léon de Beir (1975) and Arthur Bourgeois (1983) collected in the 1940s and 1970s respectively.

The Foundations of Yaka Divination

The shamanistic beliefs of urban and rural Yaka trace their origins to the institution known as *Ngoombwa weefwa,* which is derived from one of the major cults of spirit possession and healing responsible for the Yaka mediumistic style of divination. In rural areas, there is one mediumistic diviner *(ngaanga ngoombu)* for some two thousand people. In urban areas it is difficult to assess the ratio, but there is no doubt that the Yaka living in Kinshasa have continued to consult a diviner for critical matters such as abnormally long unemployment, marriage breakdown, life-threatening misfortune, or the aggravation of some other states of affliction, such as love affairs and business failures. By any standard, Yaka diviners in the city enjoy nearly the same level of authority as in the rural areas.

The Yaka diviner functions as a visionary type of medium involved with ancestral spirits. As an interregional cult, Ngoombu is spread across the Congo-Lunda belt of southwest Congo, southeast Angola, and northwest Zambia (De Boeck and Devisch 1994; Janzen 1992). It is one of the fifteen major possession and healing cults practiced today among the Yaka (Devisch 1993, chap. 4). The Ngoomba diviners initiate visionary contact with the spirits through a self-induced altered state of consciousness, by means of which the spirits in their bodies express themselves as the diviners recount their visionary journeys. Divination has ongoing relevance to the lives of contemporary Yaka, telling individuals whom to consult when faced with certain afflictions (De Boeck and Devisch 1994; Devisch 1985; 1991; 1993; Devisch and Brodeur 1999, chap. 2).

Diviner-shamans in urban areas are more likely to be consulted by single individuals, rather than family groups as is the case in the rural area. In the city, though, the institution of divination is met with the challenges of born-again church congregations, who also minister to the afflicted members of the society. A few Yaka diviners have been converted by members of these churches and have shifted to addressing cases of affliction in the name of the Holy Spirit. These healing churches have evolved to overcome the inefficiencies of traditional churches (Western Catholicism and Protestantism) and the inability of both church and state to satisfy people's basic needs and expectations in contemporary society.

Techniques of Yaka Divination

Yaka divination involves communication and mediation between worlds, namely between spirits and the living. It is no wonder then that diviner-shamans are very much agents of spiritual forces, endowed with charismatic personalities. As mediators connecting the present world (the this-worldly) and the world of spirits (the otherworldly) they assist clients by transmitting messages and channeling forces across from spirits, relying on oracular divination. Divinatory materials are kept at a shrine, in a basket, bag, cup, or the like, in order to obtain from them either forces or messages bearing on the misfortune. Apart from these objects, the Yaka also have divinatory media consisting of anomalous, marginal, or ambiguous entities and objects, such as a dog, spider, crab, tortoise shell, or seeds excreted by an elephant. Other divination items include those derived from animals renowned for their strength, keen sense of smell, ability to hunt at night, or ability to live in more than one habitat (for example, in both water and air) Divination items may consist of the remains of animals, birds, or insects (such as shells, bones, fur, hair, teeth, nails, or hoofs). Imported items that have been manufactured and are used in daily life or that have symbolic importance are also used.

The Process of Becoming a Diviner

The process of becoming a diviner begins with a chronic illness or affliction that reveals the innate gift *(yibutukulu)* of clear-sightedness (a sign of a calling to the vocation) in the afflicted person. Clear-sightedness presents itself as a call. In the case of Ngoombu, which is a name for cult spirits who are not ancestral as well as a type of divination, the candidate is afflicted with a matrilineally transmitted hereditary illness that causes him to enter into an altered state of consciousness.

Accounts by diviners disclose that the sight of fire or a reference to sorcery (perhaps a spoken reference while in an altered state of consciousness) can induce in them an irrepressible need to break out of themselves or cause some force to surge within them. At this stage candidates tend to fidget or throw themselves into a fire or flee the village. In an altered state of consciousness, the diviner candidate climbs to the top of a palm tree or jumps onto the roof of a nearby house. There she stands astride the ridgepole and begins to tear away the thatch, expressing in a secret language that the uterine divine spirit has possessed him or her. Such behavior is described by the terms *kaluka,* "to release or deliver oneself," and *vuula,* "to slip away." Once the candidate has calmed down again, the medium has only the faintest recollection of trying to run away. Sometimes she may recall the identity of the ancestor who has appeared in her altered state of consciousness. In other cases, candidates remember thinking they were wounded and bleeding profusely. If the candidate is able to demonstrate the ability to divine in the wake of this crisis, then she is pronounced ready for initiation.

The skills characterizing a worthy candidate for initiation, as opposed to the ordinary person, include an unconventionally lively personality and an unbridled imagination. Once these candidates recover from their inward state of possession, they resume speaking normally. However, following such episodes novices tend to feel insecure, edgy, and even timid, to the point of avoiding boisterous companionship. There is a partial explanation for this: Were their pronouncements proven false, they would be threatened with death. Hence, the appearances and mannerisms of a diviner-shaman changes when he consults an oracle: He becomes irritable and withdrawn, his voice becomes shrill, and his gaze appears to be turned inward and focused on his inner visions.

The initiation proper entails a nearly nine-month seclusion period under the supervision of an experienced master-diviner, called the "mother-demiurge." A small seclusion hut is constructed on the outskirts of the village. There the initiate is instructed to "sleep on the bed" during the initiation period, while she undergoes some initiatory mutations. Seclusion is understood as a time when the aspirant focuses on trying to be able to perceive and scrutinize the otherworldly domain of the spirits. Each day the master brings the initiate bouquets of fresh fragrant plants from the savanna and woodland regions. These are used in the preparation of decoctions that the novice will take in the form of enemas. This process can be interpreted as a transformation of the initiate's lower torso into a channel of communication of the physical and sensory body with cosmic bodies.

The Divinatory Séance and Techniques of Interpretation

Representatives of the various family groups related to the person who has been afflicted with an illness and who is the subject of a divinatory séance, validate the divinatory message and thus lend credence to its divinatory or paranormal nature. But at the séance itself, the person who is actually ill is not present. Even in cases where there is a corpse of the recently deceased, the body is not present at the divinatory séance. Two stages of consultation are worthy of note here. The first begins shortly after the arrival of consultants. The diviner-shaman reveals the essential elements of the case without any help from consultants. From time to time, he sniffs at, and looks in, a small mirror where ritual medicines (or ritual power objects) have been attached. Diviner-shamans report that their principal source of information resides in their powers of clairvoyance.

When the diviner-shaman is ready to initiate a consultation, he enters into an altered state of consciousness. Speaking in a rhythmical and melodious fashion, he uses a secret language to pose a series of fixed yes-or-no questions (Beir 1975, 124–125). These questions help him to develop a body of knowledge that can then be used to determine the precise nature of the present misfortune or poor social relationship experienced by the afflicted, such as a theft, an act of sorcery, or a violation of matrimonial and uterine rights. The diviner's success at this phase of the consultation is determined solely by his clairvoyant talents, in principle without the aid of any significant external information. The diviner-shaman must identify the main factors in the consultation, learn the client's identity and trace the relationships between the individuals concerned, describe the place where the events occurred, and, indeed, determine whether the case concerns death, illness, difficulty in some important enterprise, or an act of sorcery. If they are satisfied with the diviner's description of the problem, the consultants may furnish additional details before making installments on the agreed payment.

The second phase of the consultation is strictly concerned with finding the causes of the trouble. It does not take place until the following morning because the diviner-shaman must be allowed to consult his dreams in order to corroborate his clairvoyance and allude to precise events in the evolution of the illness and the family history. More importantly, dreams constitute a focal point of the forces that affect the eruption of the affliction in the individual and in family life. Among the dreamlike images that come to the diviner-shaman's mind are actions blamed on uncles, sorcery, ritual treatments received by the ill person, initiations, or a curse. Then, on the basis of facts gleaned through clairvoyance, the diviner-shaman applies a kind of causal grid (Devisch 1991; 1993, 169–178) to the situation at hand. In so doing, the diviner-shaman directs the blame for the affair affecting the patient toward various family members involved.

Social Contexts

It will be plain that divination seeks to answer social needs. Here, it is critical to distinguish between the oracle proper and its social use, namely the strategies guiding the consultants in their subsequent reinterpretation, of the divinatory assertions in a family council. Diviner-shamans are expected not only to justify their claims to their audience by offering criteria substantiating their skills and source of their knowledge, but also to demonstrate some degree of impartiality. Divination entails the basic assumption that human relations may be the cause of affliction. Divinatory etiologies subject disorder and misfortune to basic social rules of exchange in the agnatic, uterine, and matrimonial circuits of social reciprocity, and reintroduce clients into a more orderly level of discourse that carries with it authority in the society.

Matters of divination are thus constituted by the intertwining of anomaly and norm, of deficient and normal, or of social, cosmological, and bodily domains. The problem situation is expressed nonverbally through the diviner's body. Although the divination described here pertains solely to the Yaka, it is clear that their neighbors have also widely resorted to the same practice. What is peculiar to the Yaka, however, is the fact that the institution has survived and continued to express the deep-seated belief that only people with special powers can command forces and bring them to bear on individuals and the society as a whole.

ZARMA SPIRIT MEDIUMS (NIGER)

People who might be called shamans elsewhere are called *zimas* by the Zarma. Zimas are ritual and spiritual specialists who work variously as healers, clairvoyants, spirit mediums, possession and trance experts, and sorcerers. They may be men or women of any social group (Stoller 1989, 37). They still play an important role in their society, in spite of increasing disapproval from orthodox Muslims.

Background

The Zarma (Djerma, Djarma) are an ethnic group living predominantly in the areas surrounding riverine Niger, working historically as farmers and fishermen. Through the latter eighteenth century, the Zarma were concentrated mainly in territories in southern and southwestern Niger (de Sardan 1984, 21). Yet with the onset of the French colonial epoch at the turn of the twentieth century and the changes in political economy that ensued,

many Zarma spread north and east from these areas. Zarma speak a dialect of the Songhay language, and maintain that they are "cousins" to the Songhay (Songai, Sonraï), a large ethnic group occupying stretches of southern and southeastern Mali. Frequently the term *Songhay* is used in place of *Zarma,* or the two are hyphenated as Zarma-Songhay. Most Zarma in Niger, however, differentiate themselves from the Songhay, explaining that, though cousins, the Songhay are a distinct ethnic group living to the west near the border with Mali.

Zarma social structure recognizes distinctions between people, differentiating between noble and nonnoble free persons *(bourcin)* and the descendants of slaves *(banniya)* or captives *(tam)* (Marty 1931, 30ff., 190ff.; de Sardan 1984, 91; Stoller 1989, 17–18). These social distinctions, however, are not analogous to castes, since they are neither exclusively drawn in terms of occupational group, nor do they correspond with concrete expectations of conduct (de Sardan 1984, 27, 56). Even before the French abolished slavery in their West African colonies in 1898, Zarma slaves could buy their freedom; although free, however, they could never be noble. The children of slaves, at least initially, had limited options. Most became farmers, artisans, musicians, or griots; alternatively, they remained slaves in the service of the patron to whom, or in whose lineage to which, their parents were indentured (Stoller 1981, 767). At present, although hierarchical social distinctions continue to be recognized and to constitute a significant part of social life, such distinctions are of less importance than they were in the past.

Cosmology and Systems of Belief

Dualism is a fundamental and recurrent theme in Zarma cosmology. The earth is suspended between heaven *(béné iyé)* and hell *(ganda iyé),* each comprising seven spheres (Hama 1967, 11). Irkoy (from *iri,* "our," and *koy,* "master") is the supreme deity and resides in the seventh and highest sphere of heaven (Hama 1967, 11; de Sardan 1982, 221), with spirits called *holle* occupying the six spheres below. The seven spheres of heaven are organized in such a way that the most mundane spirits occupy the lower spheres and hence are closer to humans, while the more powerful are in the upper spheres and closer to Irkoy. Although Irkoy constantly shapes the fate of the people and that of the world, the people have no direct recourse to him. Spirits in the sixth tier of heaven act as messengers *(n'debbi)* between humans and Irkoy (Stoller 1989, 25). Thus Zarma conceptualize their cosmology as a chain of influence between Irkoy, holle spirits, and humans.

The Zarma pantheon is multi-ethnic (with Zarma, Hausa, Fulani, and Tuareg holle, among others) and populated by distinct lineages of holle. The most predominant are *tooru* (nobles, deities of nature), *genji kwaare* (white spirits; that is, Muslims), *genji bi* (black spirits; earth or hell deities, sometimes evil), *hargay* (deities associated with cold, death, infertility), *genji Hausa* (Hausa spirits; associated with trade, sickness, death) (Stoller 1989, xx-xxii, 25; cf. Hama 1967, 24ff.; 1968, 40ff.; de Sardan 1982, 209ff.). There are, of course, alternate and additional holle lineages, which differ by locality within the Zarma areas of Niger.

The Zarma notion of dualism extends to morality as well. To them, the world consists of a constant flux between good and bad. Likewise, each individual embodies good and bad forces *(fundi).* Good comes from the father, inherited through blood; bad comes from the mother via mother's milk (Hama 1967, 10–12). The Zarma, then, hold that they live on an earth suspended between heaven and hell and that their own bodies contain positive and negative moral powers inherited patrilineally and matrilineally, respectively. Further, the theme of duality continues in terms of personhood. The individual *(boro)* has a body *(gaa)* and a double *(bia),* sometimes described as a soul (de Sardan 1982, 209). The Zarma believe that most things in the world, animate and inanimate, have doubles. More importantly, the Zarma believe that the double of a zima is able to receive holle, as well as other doubles, and then act as their medium (Hama 1967, 18).

Zimas

Like shamans, many zimas are part-time ritual specialists, in that they ply other trades as well. Generally, the right to be a zima descends through the paternal line, yet not all who could theoretically become zimas do so. Connections with specific holle are inherited, but more importantly, so is the ability to control them

(Hama 1967, 11–12; de Sardan 1982, 209). In some areas, however, the capacity to become a zima is not inherited through the father at all, but rather demonstrated through works or desire. Potential zimas are formally initiated after a training period marked by servitude and apprenticeship to another zima (Hama 1967, 18). Afterwards, they maintain their position through a record of results, as well as through demonstrated knowledge of the orchestration of various rituals, rites, and ceremonies (Stoller 1989, 35).

Zimas are not the only spirit mediums in Zarma culture, but they are considered the most knowledgeable ones. As such, they have as a primary duty the organization of possession rituals wherein holle communicate to the community and specific people through spirit mediums, the majority of whom are women. By and large, possession ceremonies take the form of ritual dances. In this context, the zima's duties include preparation of the staging area, making the necessary sacrifices beforehand, and overseeing dancers, musicians, spirit mediums, and other members of the cast.

Possession Ceremonies

The general purpose of a dance is to induce spirit possession. Because specific holle bring about particular illnesses, communicating with them through spirit mediums may bring to light means to cure the ills that they are causing, either by following their instructions or by forcing them to leave the affected individual (de Sardan 1982, 211). Thus possession is a means to identify a personal problem so that it may be fixed. During the ceremony, the zima supervises the spirit mediums and interprets the messages they deliver. The possession ceremony begins with the zima reciting his genealogy, thus reiterating his ancestral ties. He beseeches the ancestors individually and then together as a representation of the overall spiritual force of the lineage (Hama 1967, 11). Music commences next, common instruments being the monochord violin, various drums, and (always) calabashes. Dancers dance in a circle, moving gently to a slow tempo. As the tempo increases, the dancers form a line, dancing and stomping about faster than before. Finally, the music reaches a furious crescendo coinciding with a fevered pace of dance and the onset of spirit possession. Once possession occurs, the music slows (Stoller 1989, 2–19). At this point, the zima interacts with the possessed spirit mediums, listening to and questioning them. Throughout the dancing, and especially in the latter stages, dancers are tipped by the audience. And at times even the zima will dance, sometimes (though infrequently) even to the point of possession.

During spirit possession, the spirit displaces the medium's body double (i.e., soul) (Stoller 1989, 31). Certain holle regularly possess certain people. Nevertheless, the same spirit may enter several people at different times (de Sardan 1982, 419–20). Spirits signal their desire to enter a new medium by causing pain in the person. A zima diagnoses the malady and rectifies it either by helping rid the person of the spirit and hence the pain or helping the person to become possessed in order to interrogate the holle (de Sardan 1982, 209). Once mediums are possessed, they are given a standardized costume to wear associated with the particular type of holle believed to possess them. During the dance, holle speak through their mediums, offering commentary about the community at large and providing instructions to specific people about what to do in order to complete a variety of successful undertakings. The zima then supervise people's actions afterwards and use their expertise to make sure the prescriptions are carried out attentively. In so doing, zimas often provide magical charms *(kotte),* which allow holle to appear in secret, often under cover of darkness, exclusively to the people wearing the charms (Stoller 1989, 6, 12ff.). As with the dance, yet now on a one-to-one basis, the holle provide people with instructions to do certain things, the accomplishment of which proves beneficial (de Sardan 1982, 419–420).

Dynamism Past and Present

Both Zarma cosmology and religious practice are dynamic rather than static. In the course of the last several decades, new lineages of holle have emerged; with these new spirits, zimas too have adopted new means of ritually engaging them. Thus inasmuch as the Zarma conceive of their universe, their world, and the people in it as comprising fundamental and important dualities constantly in articulation, so too do these themes appear in venues of ritual practice such as possession ceremonies.

Indeed, Zarma spiritual practices are embedded in histories of change. During the initial phases of the Islamization of Niger, public possession ceremonies became more visible—either because they were increasingly staged or simply because people came to define them in newer terms or in comparison to Islam. Interestingly, this has led some to speculate that such practices, since they were a shift from domestic (viz. family) practice to community practice, served to rearticulate community identity in the face of changes in the role of religion in daily life; that is, things came to be done not only in common but on behalf of the community as a whole (Stoller 1989, 19ff.). Nevertheless, there is a decided individualism underlying many of the motivations for frequenting a zima. And the long-term changes in the religious demography of Niger have seen Zarma conversion to Islam en masse. Possession rituals and zimas as their practitioners have come to be contested by Zarma Muslims and other Muslims. Due to such pressure, many rituals are now performed in private, usually domestic, spaces, or even in hiding at times.

For their part, zimas maintain that they are neither intolerant of Islam as a religion nor Muslims as people. In fact one zima in Niger took upon himself the healing of an ailing marabout (Muslim holy man)—though of course the marabout did not ask for the favor (Stoller 1989, xii). On the other hand, marabouts tend to be rather intolerant of zimas. Some avoid zimas at all costs, while others confront them openly and in Islamic terms. In a country where an overwhelming majority of the populace (circa 98 percent) claims to be Muslim, the fact that zimas and those who frequent them are a marked minority cannot be ignored.

ZULU SHAMANISM (SOUTH AFRICA)

The word *shamanism* is not typically used in South Africa, but Zulu-speaking peoples have long-standing practices of traditional healing, divination, and spirit mediation. Traditional healers have maintained these practices, constantly adjusting them to new sociopolitical and economic circumstances. The last two centuries have also seen the creation of African religious practices that draw on the teachings of mission Christianity while retaining aspects of traditional spiritual belief. The Zulu religious outlook is both diverse and flexible. Traditional healers may be partially Christianized and engaged with the modern economy. Zulu people may lead relatively Western or Christian lives while retaining a belief in traditional religious practices.

Traditional Spiritual Beliefs

Within the traditional Zulu belief system in its contemporary form, there are two "high gods," or primal deities. Umvelinqangi is the first being, the creator, and uNomkuhbulwane, or

Zulu medicine man wearing beaded necklaces and a fur headband, ca. 1995, Shakaland, Zululand, South Africa. (Nik Wheeler/Corbis)

Inkosazane yezulu, is the princess of the sky, or heaven, responsible for the weather and the success of harvests, but otherwise not commonly referred to in day-to-day life. The spirits of the unborn, the recently deceased, and the ancestors *(abaphansi)* live among the people and play active roles in the decisions and fortunes of the living. It is with these spirits that diviners communicate on behalf of their customers.

The Diviner

Diviners in Zulu society are individuals with exceptional awareness of the spiritual realm. They act as mediators between the ancestral spirits and the living. Diviners spend a portion of their day in prayer and constantly make sacrifices to the spirits in order to keep their visions clear. If a diviner loses her power to communicate with the spirits, the surrounding community will recognize this and go elsewhere for advice. The diviner's livelihood depends on the satisfaction of her customers. Divination is a principally female realm, although men do also practice.

The diviner, traditional healer, *inyanga,* or *isangoma*, acts as healer, spirit medium, social counselor, and decision maker. Most misfortunes in Zulu society are believed to result from some displeasure or unrest among the ancestral spirits. These misfortunes can normally be overcome by pacifying the ancestors through specific ritual practices. Called upon in times of illness, misfortune, and social imbalance, the diviner is asked to ascertain the source of the problem and to reestablish a sense of social, physical, and spiritual equilibrium. A diviner should not be confused with a medicine man. The latter has expertise in herbs and medicines, but no particular connection with the spirits. The two work in cooperation by referring customers to one another for further treatment.

Divination is not hereditary, nor does one make a conscious choice to become a diviner. Instead, someone destined to be a diviner will experience a period of severe illness. Typical symptoms include constant dreaming of wild animals and snakes, pains in the body (particularly the shoulders, where the spirits are believed to rest), failing to wash, repeatedly sneezing and yawning, hearing voices, convulsions, weeping, singing out at night, and a fondness for snuff. A woman may become sterile, a man a hunchback. This can go on for months or more and normally ends when the family takes the sick person to consult with a diviner. Once the sufferer has been diagnosed, training can begin. If the family desperately wants to avoid the person becoming a diviner, then the spirit, who is causing the symptoms in order to call the person to the role of a diviner, can be "barred" through powerful divination processes. This is rare, and the person will remain weak for the rest of her life. Otherwise, a novice is trained by another diviner who is often chosen by the spirit itself. A process of sacrifices establishes which ancestral spirit is trying to occupy the initiate. Thereafter the initiate will learn about medicines and cleanse the body of imperfections that may inhibit possession. Possession, or full contact with the spirit, will be facilitated through the Nqwambisa ceremony, when medicine is taken and a goat is slaughtered and spread across the initiate's body. Training is completed, and the

diviner receives final public recognition with a feast welcoming the initiate to her new status as a diviner.

There are several kinds of diviners. A thumb diviner, *izinyanga Zesithupa,* diagnoses and suggests a solution for problems with the cooperation and assistance of the client. As the diviner offers interpretative suggestions, the client expresses agreement by banging sticks against the ground, or by saying *ngiyavuma* (I agree) with varying levels of enthusiasm. A stick diviner, *amabukuluzinti*, uses three or four foot-long sticks. Their movement in response to a question helps to diagnose the problem and indicate the correct path of action. In the province of KwaZulu-Natal, a bone diviner, *amathambo,* uses the most common divining method. A collection of thirty to forty animal bones, cowry shells, claws, and roots will be thrown and their positions "read" for messages. Each object has one or more symbolic meanings and is read in relationship to the other objects to expose truths or to get advice. The bones can simply be collected, or acquired mysteriously. Whistling diviners, *abalozi,* are the most powerful and directly connected to the ancestral spirits, so the biggest problems are referred to them. Spirits speak directly to the client in a whistling voice, often coming from the roof of the diviner's hut. The diviner interprets the voice when the client cannot understand. The spirits may ask for food; in return medicines will fall from the roof.

The Heaven Doctor

A heaven doctor takes his power from heaven rather than the ancestors. Any man can take this position (often prompted by encountering heavenly good fortune) and can be trained, briefly, by another heaven doctor. He will lead a life of restrictions and fasting in order to maintain his power. It is his role to ward off lightning, thunder, and hail (some of the few misfortunes believed to originate from heaven rather than ancestral displeasure). The heaven doctor will "proof" a village against lightning strikes and go out during storms to pacify the elements.

Spirit Possession

There are two main types of spirit possession: *indiki* and *ufufunyane.* Indiki possession occurs when the spirit of a recently deceased person fails to become integrated with the ancestral spirits and takes possession of a random living body. Someone possessed in this way becomes ill or deranged until a diviner exorcises the spirit by integrating it into the spirit world. The person's openness to spirit possession may also indicate potential as a diviner, and training will ensue. Ufufunyane possession is a result of sorcery (see below), and will cause sickness and madness.

Sorcery

Sorcery, *abathakathi,* is the use of medicines and magic to bring evil and misfortune. Sorcerers work at night with wild cats, snakes, owls, wolves, or baboons as helpers. *Night sorcerers* are born evil and harm people for no reason. Always men, they are believed to dig up corpses to transform them into dwarfs and use them as night-time laborers to get ahead of their neighbors. They spread medicines along pathways and in the homes of their victims. Medicines can be targeted to an individual by adding that individual's "body dirt" (urine, feces, hair, nails). Night sorcerers are rarely openly identified within a community, but selfish, antisocial individuals with disproportionate wealth or good fortune are often suspected. *Day sorcerers* orchestrate misfortune by administering bad medicines or interfering with sacrificial rites. Day sorcery is directed toward specific people due to personal animosity and can be practiced by both men and women. *Lineage sorcerers* are male, and work together within their family unit. Not all descendants within a lineage are sorcerers, but those who are work together to create misfortune and unrest. Often different branches of the family use sorcery against one another to claim the maximum ancestral power.

New Forms of Divination and Healing

In 1892, Wesleyan minister Mangena M. Mokone broke away from mission authority to form the first independent black church. Since then, numerous denominations have proliferated. Many have maintained close adherence to missionary forms of worship, but others have combined Christian teachings with traditional modes of thinking. Two of the religious follow-

ings with the strongest shamanistic inflections are the Zionist and Nazarite groups.

Zionism

Around 1900, a small group of Protestants in South Africa began to connect together through the name "Zion." Numerous churches now fall under the umbrella term of Zionism, but all identify with faith healing, baptism, the Pentecostal gift of speaking in tongues, and taboos against the consumption of pork, beer, tobacco, and blood. Zionism resonated powerfully with African traditional beliefs—most notably through the centrality of dreams, healing, and the spirit *(umoya.)* Paradoxically, Zionists condemn many traditional practices and consider them to be the work of demons.

Zionists will receive dreams and visions in which the spirit (umoya) protects them, gives them advice, and prophesies through the voice of angels. These visions may come during the night or in the daytime; they help to reinforce the faith of believers, or to convert nonbelievers. Zionism recognizes two form of possession: by demons through sorcery and by umoya (the spirit). Both forms of possession can provoke thinness, nervousness, and fanatic behavior. Possession by umoya can be permanent, but is most often expressed through speaking in tongues (unknown languages) during emotional points in a religious service. Zionists reject Western medicine's ability to cure sickness, believing it to facilitate possession by demons. They see the traditional healer or diviner as possessed by demons and encouraging possession in others. Sickness is another form of demonic possession. Healing and cleansing are therefore critical. These are achieved through baptism and healing ceremonies. As in thumb divining, the healer offers a prophetic diagnosis of the illness, and the sick person responds with varying degrees of enthusiasm, depending on the accuracy of the diagnosis. The demons are commanded to leave the body while the congregation looks on and sings in a heightened state of religious emotion, or Christianized possession.

The Nazarites

Ibandla lamaNazaretha was founded by Isaiah Shembe in the early twentieth century in KwaZulu-Natal. Initially an itinerant preacher and healer, Isaiah quickly gathered a following, mostly of widows, orphans, and victims of state legislation that drove black South Africans off the land. Isaiah Shembe died in 1935 and has been succeeded by his brothers and sons. The name Shembe may refer to any of the successive Nazarite leaders, but also refers to the cosmological lineage, and like the name Jesus for Western Christians, is believed by Nazarite members to be imbued with power. The Nazarite belief in Shembe as part God/part prophet/part healer is fostered through the expressive domains of song, dance, dreams, and miracles of healing. These domains reflect the combined influences of traditional Nguni ritual, mission Christianity, and contemporary Zulu social life.

The Nazarites place dreams and visions at the center of their religious epistemology, regarding them as communications from and with the heavenly realm. These dreams often document the prophet Shembe healing, sheltering, counseling, or rescuing his followers in miraculous circumstances. Others feature ancestors, Jesus, or traditional Nguni gods. The public sharing of these narratives strengthens the spiritual wealth and power of the entire community. Shembe composed his own hymns after visitation from messengers of heaven, often in the form of young girls. Isaiah and Galilee, two of Shambe's successors, received many songs in this way. Their ability to receive these heavenly messages contributed greatly to the credentials of the Shembe lineage as spiritual leaders. In fact Isaiah Shembe's initial legitimacy as a leader is established in the Nazarite myth that describes him being called by God in a dream to minister to the Nguni traditionalists of KwaZulu-Natal.

Isaiah was endowed with a remarkable power to heal. His troubled early life, which included a severe illness, points to patterns similar to those that are evidenced in the calling of a traditional healer. The power to communicate with ancestral spirits is pivotal to Shembe's role as spiritual medium. After receiving a monetary gift, Shembe, as the personification of the ancestors, acts as intercessor for the living. In return, the ancestors provide protection from misfortune. Should misfortune occur, the ancestors speak through Shembe to explain the causes and prescribe remedies. The spiritual force of the heavens and the ancestors in the

lives of Nazarite followers is evidence of the power of Shembe to work the miraculous in their lives.

ABOUT THE EDITORS

Mariko Namba Walter is a visiting professor and teaches Shamanism and Asian Religions at Bucknell University, Lewisburg, PA. Her publications include *Tokharian Buddhism in Kucha: Buddhism of Indo-European Centum Speakers in Chinese Turkestan before the Tenth Century* and she is the primary editor for the forthcoming *Death Rituals and the Afterlife in Japanese Buddhism: A Historical Perspective* by University of Hawaii Press.

Eva Jane Neumann Fridman, author of *Sacred Geography: Shamanism in the Buddhist Republics of Russia* and numerous articles on Shamanism, is a practicing psychotherapist and anthropologist. She has been a senior fellow at Harvard University, Center for the Study of World Religions, and taught courses on Shamanism at Brown University.
