FOREWORD

When Mircea Eliade wrote his major work on shamanism in 1951, he set himself the goal of reading every existing publication on the subject. He compiled a list of some six hundred items, the largest part consisting of articles in Russian. By the time Eliade recounted this memory in 1985, he reckoned that more than 2,000 book-length studies of shamanism had appeared in the intervening thirty-four years as well as countless scholarly articles in many languages—more than an individual can cover. Eliade's *Shamanism,* still in print today, intensified enthusiasm for the subject by challenging the prevalent view that shamanism was a mental illness. Instead, he interpreted the dramatic trances, ecstatic visions, and extravagant behaviors as signs of a life-transforming spiritual experience with a wide range of profound consequences beneficial to self and society.

Far from sating the appetite for shamanism, the amazing surge of interest in shamanism among pundits and in pop culture over the past two decades has generated greater interest still—a curious fate for a religious expression once deemed archaic, pathological, and approaching oblivion. No longer can one person fully absorb the explosion of ideas about shamanism coming from such distinct fields as, for example, neurobiology, pharmacology, and gender studies.

Shamanism serves, in this respect, as a parable for religious life more broadly in our day. Even as the death knell of religions sounded in the halls of the academy and in other strongholds of secular policy throughout the twentieth century—based on psychological, economic, or sociological theories—religious fervor continued in circles disvalued by scholars or, more remarkably, renewed itself in the face of prevailing efforts at secularization. As with so many aspects of religious life, a mix of intellectual curiosity and spiritual seeking has churned up a sea of information about shamanism and produced a flood of interpretations regarding its practices, experiences, and overall meaning. The study of religion and shamanism has grown apace with the awareness of the vitality of religious life. The subject of shamanism has long called for an encyclopedic treatment, but the subject has proven increasingly daunting due as much to the breadth of its manifestations as to the difficulty of specifying its precise nature.

The great accomplishment of Mariko Walter and Eva Fridman is twofold. They first of all embrace the rich and fascinating complexity of shamanism, assembling in one place the evidence from cultures throughout the world and presenting this rich diversity in arrangements accessible to scholars and general readers alike. In the second place, they include the full range of important perspectives on the topic, inviting the best ethnographic specialists to describe what they know about shamanism from firsthand field studies, as well as asking philosophical writers and religious thinkers to reflect more broadly on the meaning of such behaviors and beliefs. Ingeniously, they have also commissioned creative commentaries on the relationship of shamanic experience to such distinct domains as dreams and drama, art and music, clothing and governance. In this landmark new work, Walter and Fridman take care to address the broad cultural interest in shamanism and,

especially, its connection to healing and the extraordinary spiritual adventures that enlarge the sense of oneself and the world.

Both Walter and Fridman specialize in the study of Central Asia, which holds a special place for the understanding of shamanism. And yet their collaboration for this project began on the other side of the globe, at Harvard University, where both scholars served as fellows at the Harvard University Center for the Study of World Religions. As director of the Harvard Center from 1990 to 2003, I saw their first outline for the project and have followed their developing plans. I remain impressed by their open-architecture approach to the subject, an openness that allows them to begin with broad working definitions so as to include within the encyclopedia the full press of conflicting opinions about the nature and significance of shamanism. And I remain impressed as well with their thorough knowledge of the subject, beginning with their linguistic abilities, which lets them work not only in Western European and Central Asian languages but in Russian, Chinese, and Japanese as well. Their complete familiarity with shamanism extends from their own field work to their control of the historical and anthropological literature on the subject. Their unusual capacities and dedication have produced a wonderful work well suited to the new realizations about shamanism. No doubt this encyclopedia will benefit all interested readers and serve as a spark for further exploration of one of humankind's richest spiritual heritages.

PREFACE

Shamanism is a living, vital phenomenon, one that interests a wide range of people. Today it is clear that shamanism, as an area of academic study, is a rich and rapidly evolving field. This encyclopedia represents a wide range of perspectives and approaches of over 180 contributors according to their academic specialties. Thus it is not the intent of this encyclopedia to present a homogenized picture, either of the phenomenon of shamanism or of the present state of shamanism as a field of study. The reader will find the story of the development of the field and some of the most pertinent theoretical and historical issues addressed in the Introduction, as well as in related entries.

Shamans are globally distributed and shamanism is an ancient spiritual practice. Thus this encyclopedia covers this most human spiritual endeavor in its worldwide manifestations, with the goal of developing an inclusive and multidimensional picture of shamanism as currently and historically encountered throughout the world. The scope of the entries in these two volumes is broad: the reader will find considerations of the earliest indications of shamanism in rock art, of early historical writings that portray various aspects of shamanistic worship and practice, of later manifestations attested to by European and Russian ethnographers, and of current research in the field all over the world. The reader will be able to see how shamanism has developed and changed over the centuries, allowing shamanic practices to remain significant in present-day cultures. Some of the entries focus on universal aspects of shamanism, but of course shamanism is not one uniform phenomenon over a wide range of time and space; each culture lays its own imprint on the belief system, practices, and outward appearances of its shamanic practitioners. For this reason, in the majority of the entries the focus is on the way shamanism is practiced within a particular culture, and to provide an understanding of the cultural specifics of this phenomenon.

Most basically, shamanism can be defined as a religious belief system in which the shaman is the specialist in knowledge. The shaman knows the spirit world and human soul through "ecstasy," the power of an altered state of consciousness, or trance, which is used to make a connection to the world of the spirits in order to bring about benefits to the community. Mircea Eliade, in his book *Shamanism: Archaic Techniques of Ecstasy,* saw the essence of shamanism in the techniques by which the shaman is able to travel into the supernatural world in a state of ecstasy induced by drumming or other means. The broader definition of shamanism adopted for the purposes of this encyclopedia includes not only the kind of ecstatic relationship to the spiritual world involved in such journeys—the kind in which the shaman deliberately goes to meet the spirits and is in control of them or "masters" them—but also the phenomenon of possession, in which the spirits take the initiative, and the shaman is "possessed" by the spirits who then speak through the shaman as a vessel.

The hallmarks of shamanism as a religious phenomenon are most clearly seen, historically and currently, in Siberia, Mongolia, and the Inner Asian geographical area, an area often referred to as Eurasia. As noted by a number of scholars in the field, shamanism as a phenomenon or system of

religious belief is most closely allied with hunting and gathering societies. The human need to exert some control or influence over the natural world on which subsistence depended provided the impulse for the development of the concepts and practices of shamanism. The cosmology of hunters and gatherers included deities who could influence weather and the harvesting of flora and particularly fauna; the shaman was a member of the community who had special abilities to influence the deities responsible for the well-being of the group. Only the shaman, in a state of trance, was able to offer the appropriate prayers and entreaties to the deities, so that the deity, as master of the animals, would feel honored and let more animals be caught, or, in later pastoral societies, so that the deities in control of the weather would make it auspicious for the growth of grain or grass in order to feed the flocks. In other words, in a society in which human beings were dependent on natural forces for their sustenance, it was important to continually interact with the natural world, a world seen as driven by spiritual forces, so that these forces would act in a benevolent manner toward human beings.

Thus shamanism in what is generally considered its most classical form was based on a particular cosmology and belief system, one in which the community depended on the shaman, a person with exceptional powers and abilities, to communicate while in trance with spirits and deities for the benefit of the community. Even in Siberia and Inner Asia, this classical form did not last; hunters and gatherers became pastoral nomads or, due to political pressures, settled in villages and towns. In Russia, for example, the emphasis in the previous century and currently is on the shaman as healer of the soul and body of individuals, as well as healer of the community at large in the performance of rituals for the general well-being.

Although many scholars believe that shamanism is an ancient and universal belief system held by hunting and gathering peoples, there is only limited evidence of its most ancient aspects. This encyclopedia includes several entries on those ancient practices of shamanism based on evidence from archaeology and historical documentation. Most of the historical information on shamanism dates back to practices and practitioners who were observed and studied in the nineteenth century as missionaries, explorers, and finally anthropologists began to take note of religious practices of indigenous peoples, practices that up to that time had received scant Western attention. Therefore, many of the entries reflect shamanism as it was practiced at the beginning of the twentieth century; contributors often also describe the current state of shamanism in these cultural groups. A number of essays (included under "General Themes in World Shamanism") deal with new constructions of shamanism.

The organizational principles of the encyclopedia are covered in more detail in the last section of the Introduction, but some preliminary account may be given here. Because one important purpose of this work is to provide a cross-cultural view of shamanism in its universal as well as its particular and local aspects, the encyclopedia has two parts. The general entries, found under the title "General Themes in World Shamanism" in volume 1, offer information on broader aspects of shamanism; the rest of the encyclopedia consists of regional entries, which examine shamanism within a particular cultural group or region, providing an in-depth understanding of the particular and local manifestations of shamanism. The criteria for selection of topics were developed in consultation with scholars of shamanism from all over the world.

The regional entries are grouped into ten sections on a geographical basis: North America; Central and South America; Europe; Eurasia; Korea and Japan; China and Sino-Asia; South Asia, the Himalayas, and Tibet; Southeast Asia; Australasia and Oceania; and Africa. Within each of these regions, there are certain cultural commonalities in the concepts and practices of shamanism. Consequently, this geographical approach provides a broader and more comprehensive view of these particular shamanic complexes, reflected in the regional overview with which each section begins. The relation of shamanic belief systems and practices to their particular geographic and cultural locales can be seen in the specific rituals and prayers used, and in the way shamans interact with their communities. Since shamanism is community-based, shamans receive their sanction, and any temporal powers they may possess, from their communities. Shamans are therefore closely interwoven in community life, even though they also stand outside it as spiritual specialists. In the

entries in the regional section, the specific beliefs and practices of the shamans treated have accordingly been discussed within their geographical, historical, and cultural context.

The reader will notice that there has been no attempt to provide the same number of entries in each region. Thus, for example, the region of Eurasia has the largest number of entries; as the area generally considered the core of shamanism, it has received the most attention from scholars in the field. These entries offer a detailed view of classical aspects of shamanism, as well as current adaptations in the post-Soviet world. Even in Eurasia, however, there are many cultural groups that are not represented. Considerations of inclusion were based not only on size constraints and the need for some degree of balance with all other regions, but also on the principle of selecting the most representative and important shamanic complexes. Some were excluded simply because they were so similar to others that were included, and hence it was thought that the material would be too repetitive. At the same time, in some cultures such interesting work has been done on specific aspects of shamanism, such as masks or music, that separate entries have been included on those aspects. In the other regions, such as Europe, shamanic complexes are far more limited and scarce, and hence fewer entries are included.

The largest number of entries fall under the title "General Themes in World Shamanism." This large grouping includes many important aspects of shamanism that can usefully be studied across cultures, not only as part of a specific cultural complex. For instance, there are entries such as "Bioenergetic Healing," "Divination," "Healing and Shamanism," "Soul Retrieval," and "Transformation," to name a few examples. Thus "General Themes in World Shamanism" provides a more inclusive, less regional view of shamanism, not only to allow the reader to look at the phenomena cross-culturally, but also to make possible an understanding of the more universal nature of certain practices and beliefs. The general entries may also fill in gaps with respect to particular cultural aspects that may not have been discussed in some of the culture-specific entries. Where subtopics such as costume, music, literature, dance, or specific types of healers have not been treated for some cultures, some of these absences may be compensated for, when scholarly research is available, in the "General Themes in World Shamanism" section.

We have made every effort to be as inclusive, complete, and up-to-date as possible within the confines of a two-volume encyclopedia. Shamanism is, however, an evolving and rapidly changing phenomenon, most obviously in areas where religion was repressed in recent historical memory, though not only there. At the same time that new forms of shamanism have emerged, new research on historical complexes has become possible, as documentation becomes accessible in less repressive times, and so understanding of earlier and contemporary forms of shamanism has increased. There are many new scholars working in all areas. This encyclopedia provides an introduction to a dynamic field, in which relevant new material allows constant revision of our present knowledge.

This encyclopedia is intended for the general reader as well as for the scholarly community. It is intended to be useful for a range of readers, from the high school student who has an interest in exploring these questions, to college and graduate school students and scholars in other fields who want to understand and explore this topic. Bibliographic references at the end of each entry are designed to lead the reader into further research, and cross references to other relevant subjects accompany each entry. An alphabetical list of entries, found on page xxix, will assist the reader in locating cross-referenced topics.

Eva Jane Neumann Fridman

INTRODUCTION

The richness of the field of study called *shamanism* is obvious in many ways. Researchers in the field come from areas as diverse as history, anthropology, psychology, religious studies, sociology, medicine, and art. The phenomena studied are equally diverse. The use of the term *shamanism* might give the false impression that the phenomenon so labeled is a single fixed religious system, which exists in various societies in the world. In reality the term *shamanism* covers a number of beliefs and rituals, which are continuously changing and evolving as new historical and religious situations arise in different societies. It can be argued that it would be more appropriate to speak of *shamanisms,* related dynamic religious processes, but at least the term is usually written with a small initial *s,* rather than a capital *S,* as would be the case if it were the name of a specific religion.

In the Preface, a broad working definition of shamanism is given; it is defined as a religious belief system in which the shaman is a specialist in the knowledge required to make a connection to the world of the spirits in order to bring about benefits for the other members of the community. Later in this Introduction, the controversies associated with the definition of shamanism will be handled in more detail, but those controversies will be more meaningful in the context of a historical perspective on the way the West has come to know shamanism.

A Historical Perspective

Ancient Societies and Shamanism

Many scholars have seen evidences of shamanistic elements in prehistoric and ancient societies; among the societies covered in this encyclopedia are ancient Egypt, Iran, North Asia, and South India, as well as the Celtic world and pagan Europe as a whole. Any discussion of shamanism in prehistoric and ancient societies must rely to a great extent on archaeology, and here as in so many areas of study related to shamanism there is great controversy. David Whitley's entry on "Archaeology and Shamanism" introduces the work that has been done in this controversial area, stimulated by the idea that shamanism may well be the oldest religion of hunter-gatherers. He discusses the three types of evidence used by those who work in the field, namely data on hallucinogenic plants in the archaeological record, evidence derived from a study of the iconography and symbolism of ancient rock art, and evidence based on other types of ritual or ceremonial remains.

The work done on the symbolism associated with rock art in Eurasia, the Americas, and southern Africa has certainly created heated debate between the archeologists who promote the idea that Paleolithic rock art provides the first evidence of shamanism in art and those who oppose such a notion. J. David Lewis-Williams and Tomas Dowson (1988), as well as others, see in this ancient art what they call "entoptic images" (on which Lewis-Williams has written an entry for this encyclopedia), which are derived from the human nervous system, as it functions during certain altered

states of consciousness. This neuropsychological model has been applied to various imagery, ranging from northwest European tomb art to Australian rock art.

On the other side, scholars such as Alice Kehoe (2000), Roberte Hamayon (2001), and Paul Bahn (2001) have criticized such approaches as unsatisfactory for understanding prehistoric rock art. As for the field as a whole, Whitley admits that archaeological studies of religion in general are relatively new and that this is still a somewhat underdeveloped field. Esther Jacobson's entry, "Ancient North Asian Shamanism," is also written from a critical point of view; she objects to any free subjective interpretation of rock art images such as great moose, elk, or so-called "bird-women" as shamanistic. She believes those images refer to cults of fertility and rebirth earlier than and unrelated to shamanism.

Other attempts to show shamanistic features of early religions extend to pagan Europe. Michael Strmiska's entry, "Paganism in Europe," discusses the efforts scholars have made to reconstruct the pagan religions of pre-Christian Europe, which display shamanistic elements of great interest. One specific area that has gotten a good bit of scholarly attention has been the Celtic world, discussed by Tina Fields in the entry "'Celtic Shamanism': Pagan Celtic Spirituality." Fields finds in Greco-Roman sources and early Celtic literature (folk songs, fairy tales, and the like) ample evidence of shamanistic elements in Celtic religion; there are descriptions of practitioners and patterns of magical initiation, as well as of experiences of deep mystical inspiration and understanding.

Thus, archaeologists and religious historians as well as folklorists have used the available data to reconstruct early religions and to find shamanistic elements in ancient societies. Such reconstructions inevitably depend to a great extent on each scholar's interpretations, an approach apt to trigger the criticism of some anthropologists and others who would like to stick to a "scientific" approach to the study of shamanism, or to adhere only to culture-specific evidence that can be supported by ethnographic research.

The First Encounter: Reports of the Sixteenth to the Eighteenth Century

In looking at shamanism from a historical perspective, we have first considered the evidence that can be gleaned of shamanistic elements in ancient and prehistoric cultures. Yet the more direct accounts of contact with shamans in "primitive" cultures can be found in the reports of Europeans who actually traveled to the remote regions for their own personal reasons. Jeremy Narby and Francis Huxley (2001) have compiled these Western accounts, the earliest of which date from the sixteenth century, in their recent book, *Shamans through Time: 500 Years on the Path to Knowledge.* According to them, the first such reports is given in the accounts of the Spanish navigator-historian, Gonzalo Fernández de Oviedo, published in 1535. He observed that some old men among the inhabitants of Hispaniola (the island currently comprising Haiti and the Dominican Republic) used tobacco in order to communicate with spirits and worship the Devil (Narby and Huxley 2001, 11–12). The French priest André Thévet similarly reported in 1557 that the natives in Brazil invoked the evil spirit in certain ceremonies. Yet Thévet's report was not completely negative; according to him, these shamans also provided answers to community problems and learned "the most secrete things of nature" (15).

In the seventeenth century, when Russians started colonizing Siberia, the Russian priest Avvakum Petrovich became one of the first observers to use the word *shaman* in print, in his autobiography published in 1672. He told of finding Siberian shamans who claimed to communicate with spirits and who put on trickster performances such as pretending to stab themselves with knives. He called the shaman "villain of a magician" (18). Denis Diderot (1765), a French writer-philosopher who was one of the editors of that great work of the Enlightenment, the *Encyclopédie,* defined Siberian shamans as "imposters," who function as priests, jugglers, sorcerers, and doctors who claim to have an influence on the devil. According to Diderot, shamans "perform tricks that seem supernatural to an ignorant and superstitious people" (32). He described them in their role as jugglers as making "a pact with the genies" while drumming, screaming, yelling, singing, and smoking. These shaman figures "persuade the majority of people that they have ecstatic transports," but these transports are really trickery (34).

A French Jesuit missionary, Joseph Lafitau (1724), reported two types of shamans among the Iroquois and Hurons in Canada: Evil shamans who consorted with the devil to harm people, and "jugglers," or "diviners," who communicated with the spirits for the good of the community. He acknowledged that shamans were not just preoccupied with magic and trickery, but also explained dreams and exposed "the secret desire of the soul" (24). Thus he can be seen, as Narby and Huxley noted, as an authentically enlightened precursor of modern anthropology because he admitted that there was something more to shamans' practices than just trickery.

According to Gloria Flaherty, in her *Shamanism and the Eighteenth Century,* the shaman during this early period was being described with the word *giocolare* in Italian, *jongleur* in French, *Gaukler* in German, and *wizard* in English (Flaherty 1992, 6). Before the end of the eighteenth century, however, the Siberian Tungus word *shaman* became the common term in the West (7).

The intellectuals of the eighteenth-century Enlightenment held to a scientific methodology based on objectivity and rationality, yet, as Flaherty noted, an interest in irrationalism, supernaturalism, and romanticism coexisted with the prevalent humanism and scientific determinism. The second half of the eighteenth century was marked by academic expeditions, undertaken in the attempt to understand shamanism through scientific observation in the field and the collection of native drugs for the analysis of data (67).

Among the scholars and explorers who led expeditions to Siberia were several notable European scholars. One of these scholars was Daniel Gottlieb Messerschmidt (1685–1735), commissioned by Peter the Great, who learned about indigenous illnesses, especially epidemics. Like many other Western observers, he regarded shamanism as "nothing but lies and trickery and saw no scientific value in it whatsoever," and his report clearly indicated his position as a Eurocentric European scientist (Flaherty 1992, 48). Similarly the Russian botanist Stepan Krasheninnikov, who obtained and analyzed the substances various shamans used to induce ecstasy in Kamchatka, in a report published in 1755 called shamans "absurd" and "ridiculous" (Narby and Huxley 2001, 36).

Some later Enlightenment scholars showed more understanding of shamanism. The German critic, theologian, and philosopher Johann Gottfried von Herder, in a work published in 1785, made clear that he regarded shamans as imposters, but he also stressed that imaginary representations among tribal people, who were misunderstood in the past, should be considered valuable. He explained that an understanding of the nature of imagination is important for understanding shamanism, since this phenomenon involves myriad relationships between mind and body, which depend on the workings of the brain and nerves, as human illnesses demonstrate (Narby and Huxley 2001, 37).

Scholars of many different disciplines in the eighteenth century were fascinated by shamanism. Whether they were philosophers, missionaries, writers, archaeologists, physicians, botanists or ethnographers, these observers from different backgrounds in the West reported their perceptions of shamanism, despite their limited understandings of the religion and culture of the peoples they observed. This trend toward broad interest in shamanism continued into the nineteenth and twentieth century, and the framework for discussion about shamanism widened as shifts in methodology occurred. One of the major shifts was that both anthropologists and psychologists in Europe and America entered with full force into the study of shamanism.

Pioneers of Cultural Ethnography

In the early twentieth century, Franz Boas (1858–1942), often described as the father of American anthropology, created the foundation for a holistic approach to the studies of different cultures based on ethnographic documentation. In his approach to anthropology, he stressed the need for understanding a particular culture through many disciplines, such as archaeology, psychology, geography, biology, linguistics, and mythology. He believed that an ethnography that made use of all these perspectives would provide a more objective and comprehensive understanding of shamanism, since shamanism, like any cultural phenomenon, is the product of a cultural system as an integrated whole.

Boas studied the indigenous peoples of the Canadian and American northwest coast, such as the Alaskan Inuit and Siberian ethnic groups. In his expedition to the North Pacific (1897–1902), Waldemar Bogoras and Waldemar Jochelson accompanied Boas and reported on the shamanic practices of Arctic peoples. Their findings indicated that these shamans were of the "psychopathic" type, who performed a specialized function in tribal society (Grim 1983, 17). They also observed that this Arctic shamanism was based on archaic religious experience, the practice of which had indeed originated in North Asia. In other words, Boas and his students took a diffusionist view of cultural phenomena: Shamanism passes from one culture to another and changes its forms, functions, and meanings. In other research on Native American societies in the first half of the twentieth century, Robert Lowie in his study of the Crow Indians advanced the theory that shamanism is one of the significant facets of "primordial" religion, and Paul Radin described the "psychopathic" condition of the shamans of the eastern Woodland tribes, especially Siouan Winnebago (Grim 1983, 18).

Whatever the limitations of their approach, the significant point is that these early twentieth-century researchers were the first anthropologists who seriously studied the religious phenomena of tribal societies in North America, despite the inappropriateness of the terminology they used (such as "primordial," "primitive," or "psychopathic"). Following Boas's example, Knud Rasmussen also studied shamans and shamanic rituals among the Inuit of Greenland and Alaska in the 1920s and 1940s, and his work provides useful historical data for Inuit shamans at that time. Following the American anthropological tradition initiated by Boas, most of the entries in this encyclopedia are written based on ethnographic studies from the authors' own fieldwork and other relevant empirical materials, which have been analyzed and interpreted from the perspectives of the respective cultural traditions.

Russian Studies of Shamanism

The development of Russian studies of shamanism followed quite different paths from the work in America, although both considered ethnographic and empirical data as centrally important. As Siberia started to be intensively colonized by the Russians, starting in the seventeenth century, shamanism in the region was suppressed by the Christian missionaries as part of the process of colonial Russification. During the Soviet era (at least from the 1920s to the 1970s), shamans were severely persecuted directly by the government, through social isolation, purges, and extermination policies. This persecution was based on the cultural evolutionary theories of Marx and Engels, who viewed shamanism, like any forms of religion, as superstition and destined to end in alienation from the common good. Being treated as class enemies, thousands of shamans were arrested and deported from their homes, often dying in gulags, with a subsequent loss in the rich oral tradition of Siberian shamanism (Glavatskaya 2001, 245).

In such a political climate, Soviet scholars of shamanism described shamans in rather negative terms, as hypnotizers of susceptible believers, for example, or malicious deceivers, or rich exploiters of their people (Balzer 1997, xiv). In Soviet museums, Marjorie Balzer, an American scholar, noted that shaman figures with insane and frightening appearances had been made and displayed in public as evil religious figures. Another limitation of Soviet scholarship, noted by Åke Hultkrantz, was that their studies contained very few references to sources published outside the former Soviet Union (probably due to lack of access to this research); hence much Russian scholarly work gives the impression that shamanism only existed in the Soviet area, with some extension to Lapland and northern Alaska and Canada (Hultkrantz 1993, 4). Nevertheless, Soviet researchers did record and gather ethnographic materials as historical data or for the purpose of comparative cultural studies. These numerous data were catalogued and kept in the Leningrad (now St. Petersburg) Museum and other museums, though without much analysis. Yet Vilmos Diószegi, a notable Hungarian scholar on Siberian Tungus shamanism, realized the urgency of keeping the records of disappearing religions and used the vital data for his interpretive studies for shamanism in North Asia (Grim 1983, 22).

In this encyclopedia, many entries have benefited from extensive Russian ethnographic records for their analysis of shamanistic practices in North Asia. Elena Boikova's entry, for example, "Funeral Rites in Eurasian Shamanism," is largely based on Russian archives of the nineteenth century.

By the end of the twentieth century, Russian scholars were taking shamanic practice seriously, and many indigenous scholars had also started to study their own traditions in order to seek their own shamanic heritage. This drastic change in attitudes toward shamans and shamanism in Siberia and Central Asia was, as Balzer has explained, the result of wider societal changes that made all religious faith valid again after many years of repression (Balzer 1997, xiv). Especially in the past couple of decades, as in the West, multiple approaches to shamanism have been welcomed; linguists, ethnographers, folklorists, and historians have all contributed to the study of shamanism in Russia and the independent nations of the former Soviet Union. This trend is evident in the many entries under Eurasia in this encyclopedia. These entries make clear that Eurasian shamans in the past provided healing, psychotherapy, and socioreligious leadership for their communities, as well as entertaining ritual performances.

Eliade and Phenomenological Approaches to Shamanism

Mircea Eliade is one of the most influential figures in academic studies of shamanism. The extent of his influence can be seen simply in the number of contributors to this encyclopedia who have included his prominent work, *Shamanism: Archaic Techniques of Ecstasy,* in the references for their entries. Yet Eliade was not an anthropologist and did not base his research on his own fieldwork; rather, as a historian of religion, he was concerned with comprehending the religious meaning of shamanism. Using his language skills, he was able to utilize a variety of sources from many different European languages regarding shamanism that were available as of 1951 (the year of the first publication of his classic work in French). Eliade's contribution was to provide insight into shamanism as an ecstatic technique used to contact the world of spirits.

His methodology is a hermeneutical study of religious phenomena based on an interpretation of the data in a larger cultural context. Following Rudolf Otto, the renowned scholar of phenomenology of religion, Eliade related the religious experience to the divine, or the sacred, which has a profound effect on life. For Eliade, ethnography is the interpretation of cultures, but not a system of scientific laws to be discovered. The sacred is accessible only through an interpretative, or hermeneutical, technique, which involves the discernment of meanings.

This hermeneutic approach to shamanism or any religion is something that Alice Kehoe, to take one example of an anthropologist committed to fieldwork, considers too romantic and confusing. Kehoe has criticized Eliade for "collecting second-hand data to picture and project ancient religion" and for undermining "the dirty fieldwork of more menial producers of data" (Kehoe 2000, 1). Contesting such criticism, Hultkrantz has argued that anthropology might not provide an appropriate tool for theorizing shamanism, since the goals of anthropology are to understand historically situated and culturally mediated social practice (Hultkrantz 1993, 309). Hultkrantz argued that a phenomenological approach is more appropriate to shamanism, given its articulation of the human experience of the supernatural world and its power.

The academic debate between the anthropologists who emphasize empirical data and the religious scholars of phenomenology still goes on. In practice, most of the entries here are based on interpretative analysis of available empirical data or ethnographies and do not present any serious theoretical dilemma explicitly, but an awareness of the variety of theoretical assumptions in the field should help the reader see each entry in context. Whatever shortcomings Eliade's book on shamanism has in terms of the use of particular data, grouping criteria, and the evaluation of sources, Eliade has inspired numerous anthropologists and religious writers, including many of the editors who worked on the various regions and the writers of the entries, and it remains as one of the most pivotal books on shamanism from a hermeneutical perspective.

Other Theoretical Issues

Perhaps the main issue shared by almost all the authors of entries in this encyclopedia focuses on the definition of the term *shamanism,* although many of the entries do not explicitly mention this issue. How to define shamanism has been one of the main problems for researchers in the field from the very beginning of the study of shamanism in association with the study of magic, animism, and "primitive" religion. The first and arguably most basic question was whether shamanism was simply a form of magic or whether it could be considered a religion. This theoretical question is addressed here as a background for the complex definition issues regarding shamanism.

Is Shamanism a Religion? The Magic vs. Religion Debate

Already in the nineteenth century, scholars of shamanism were concerned with the question of whether shamanism is magic or a religion. As discussed earlier, some researchers consider ancient shamanism as the original form of human religion, or at least an early form of religion. Anthropologists and sociologists looked at small-scale societies to understand the evolutionary development of religious phenomena. For example, Edward Tylor (1871) regarded shamanism (which he called animism) as the earliest form of religion, since it involves a belief that inanimate objects have souls (Langdon 1989, 54). For some, shamanism is the substratum beneath all the world's religions, and "shamanism is understood not only in its culture-specific manifestations but also cross-culturally, comparatively, as a near-universal phenomenon" (Furst 1994, 4). Peter Furst also made the point that shamanism and shamans coexist with other forms of religious belief, rituals, and professional priests.

The German anthropologist Wilhelm Schmidt (1931), holding an evolutionary view of religion, considered that shamanism was a primitive religion that (at least in "advanced" civilizations) eventually evolved to a higher monotheistic religion. Similarly James Frazer (1854–1941) believed that shamanistic magic was an early and false form of science and had to be replaced by a "higher" science. Social functionalists Emile Durkheim (1858–1917) and Marcel Mauss (1872–1950) saw magic as immoral and antisocial, in contrast with religion, which creates social cohesiveness and solidarity within a community. These functionalists considered the magic practiced in shamanism a private act for mainly evil individual goals, and ignored the significant positive role of the shamans in contributing good will and spiritual strength to their communities.

Such views on magic and religion are generally considered as biased, reflecting a narrow Judeo-Christian perspective. Other scholars writing in the early twentieth century, such as Bronislaw Malinowski, Alfred Radcliffe-Brown, and Evans Pritchard, presented a more positive side of magic. For example, Radcliffe-Brown observed that African witchcraft actually enforced socially accepted behavior and concluded that magic aimed at social control and maintenance of social values. Pritchard stressed that magic is a part of religion, as magic is involved with highly cognitive aspects of human consideration. In early studies shamanism was often equated with magic in a pejorative sense, but these twentieth-century anthropologists preferred to see almost no gap between magic and religion in social as well as cognitive (psychological) functions. R. R. Marett summarized this position and concluded that any distinction between religion and magic is an illusion due to ethnocentric projection and historical distortion (Versnel 1990, 180).

Hultkrantz saw the issue slightly differently, calling shamanism a religio-magical cultural complex: that is, magic with an ingredient of established religion, though without a priesthood. He considered shamanism as a "religious configuration (a mythico-ritual)" instead of a genuine religion (Bäckman and Hultkrantz 1978, 10–11). He stressed that the key word is "supernatural," which defines any religious phenomenon, including shamanism, referring as it does to "extraordinary," "other transcendental reality" or as Durkheim put it, "the world of the mysteries" (Hultkrantz 1983, 237). Thus Hultkrantz investigated the more religious components of shamanism, stressing the shaman's ability to perform magic and to communicate with the supernatural world of spirits while in a state of trance or altered consciousness.

The Problem of the Definition of Shamanism

After several centuries of debate, Western anthropologists, sociologists, and religious scholars have generally agreed that shamanism is in some sense a religious phenomenon. Yet it is not at all clear exactly what kind of religious phenomenon shamanism is. Some claim that the term *shamanism* has been used so indiscriminately that it has lost its meaning. Certainly the use of the term raises questions. Are all magicians, or all medicine men, for example, shamans? What quality makes some religious practitioners shamans? Surely some kind of precise definition is needed as a basis in order to treat shamanism in academic discourse. On the other hand, a strong case has been made by contemporary thinkers that there is no such thing as a perfect or complete definition of the term. In fact, Versnel claims that any definition is provisional or experiential and it needs continuous readjustment and reworking (Versnel 1990, 186). From this point of view, a good definition is an open definition, without absolute or exclusive implications. The term *shamanism* is only a convenient label, which helps us, as Evans-Pritchard said, to "sort out facts which are different or in some respect different. If the labels do not prove helpful we can discard them" (Evans-Pritchard 1937, 11).

Nevertheless, it is natural to ask whether the origin of this particular label can shed any light on its meaning. The term *shaman* was used by Dutch diplomats E. Ysbrant Ides and Adam Brand, who accompanied a Russian embassy sent by Peter the Great to China during 1692–1695, as explained in the entry "History of the Study of Shamanism" in this encyclopedia. Ysbrant Ide's published accounts of the Tungus shamans, followed by several European writers, used the word *shaman.* In 1875, the word *shaman* was included in an article for the Encyclopedia Britannica by A. H. Sayce (Grim 1983, 15). The origin of the word has been debated by philologists and ethnolinguists; the current scholarly consensus seems to be that the word is of Tungus origin, though its root meaning in that language is still debated. Some have argued that the ultimate derivation is from the Sanskrit or Pali word for a Buddhist monk, and since Buddhist monks were often considered to have magical powers, this Indian origin of the word is a possibility. Whatever the origin of the word *shaman*, however, it seems clear that there is no single indigenous term that covers all the various magico-religious activities that Westerners have called *shamanism.* A reasonable conclusion is that *shamanism* has been created and developed as a heuristic term in the West, which helps researchers to identify phenomena that are linked by a complicated network of similarities and common qualities.

Not all researchers accept this perspective, of course. There are at least two major trends among the researchers on shamanism. Those who define the term *shamanism* very broadly, as referring to many different phenomena related to ecstatic behavior, are the first category. These researchers are likely to accept shamanism as both an ancient and a universal phenomenon. For example, Ioan Lewis belongs to the first category, since he includes spirit possession, witchcraft, and cannibalism under shamanism. According to Lewis, "a shaman is an inspired prophet and healer, a charismatic religious figure, with the power to control the spirits, usually by incarnating them. If spirits speak through him, he is also likely to have the capacity to engage in mystical flight and other 'out-of-body experiences'" (Lewis 1984, 9). Lawrence Krader saw shamanistic elements in all religions, such as the role of ecstatic charismatic leaders in Buddhism and Judaism, and in various cults and sects (Krader 1956, 282–292). Joan Halifax narrowed the definition somewhat by including in her definition of shamanism various features such as an initiatory crisis; a vision quest, an ordeal, or an experience of dismemberment and regeneration; the sacred tree or *axis mundi* and the spirit flight associated with it; and the role of the shaman as a healer, in addition to the ability to enter shamanic trance (Halifax 1991; Bowie 2000, 193). Geographically, Halifax included under shamanism practices in the Arctic regions, as well as Australia, Africa, Borneo, and South America and Mesoamerica.

Piers Vitebsky also belongs to the above category of the broad definer; he stressed that "shamanic motifs, themes and character appear throughout human history, religion and psychology" (Vitebsky 1995, 6). According to him, though shamanism is not a single, unified religion, it is "a cross-cultural form of religious sensibility and practice." He has argued that shamanism is not

limited to northern Eurasia and the Americas, but can be found in Africa, New Guinea, and pre-Christian Europe (Vitebsky 1995, 50–51).

Other researchers prefer a more narrow and restricted definition of shamanism, and they are critical of the broad approach. They tend to confine the term to the specific cultural features and worldview characteristic of the Siberian-Arctic complex (Bowie 2000, 194). Alice Kehoe in her recent book, *Shamans and Religion,* took on the holders of the broad view, stating that "The time is ripe for a sensible, serious overview of anthropological uses of the term and concept 'shaman'." She claimed that Eliade, in initiating such a loose use of the term *shaman,* placed shamanism within the broad range of "initiatory rites and mystical experiences of certain primitive and oriental peoples" (Eliade 1981, 116–117; Kehoe 2000, 1). She also rejected the idea of ancient contact between Siberia and Northwestern America, and argued that similarities between American Indian religious practices and Siberian practices were due to the mixing of peoples in the late eighteenth and nineteenth century brought about by the Russian fur trade (Kehoe 2000, 48). She also rejected the notion that shamans' rituals and beliefs are remnants of a primordial Paleolithic religion. Accordingly, she warned that applying the generic word *shaman* is an oversimplification, arguing that "It is confusing and misleading to use a simple blanket word, lifted from an unfamiliar Asian language, for a variety of culturally recognized distinct practices and practitioners" (Kehoe 2000, 53). Thus Kehoe criticized Eliade's approach from the perspective of the anthropological tradition created by Boas and others who stress the necessity of specific ethnographical data as empirical evidence for academic analysis and interpretation.

Many writers have not accepted Eliade's definition of shamanism as "an archaic technique of ecstasy" uncritically. Some have seen it as too simplistic and restrictive; for one thing, his "ecstasy" does not include broader possessive trance and mastery of spirits, as Lewis and others pointed out. Even in an early work on Tungus shamanism, Sergei Shirokogoroff (1935) stressed that the shaman is a master of spirits and has a group of spirits varied in their interests and powers, whom the shaman controls, using a complex of special methods. According to Hultkrantz, the two most important components of shamanism are the ability of shamans to be in contact with the supernatural world and their ability to act on behalf of their communities in a way based on their extraordinary ecstatic experience, achieved with the aid of their helping spirits (Bäckman and Hultkrantz 1978, 11). Thus Hultkrantz treats ecstasy as just one element of the complex behavior of the shaman, extending Eliade's definition with his emphasis on the spiritual worlds with which the shaman is deeply involved.

Joan Townsend has provided a working definition that summarizes the work of Hultkrantz and others:

> A shaman is one who has direct communication with spirits, is in control of spirits and altered states of consciousness, undertakes some (magical) flights to the spirit world, and has a this-material-world focus rather than a goal of personal enlightenment. Spirits may be allowed to enter the shaman's body and speak through him. And he can call spirits to be present at a ceremony. He/she usually remembers at least some part of a soul journey and normally is a healer. (Townsend 1997a; 2001, 1)

The definition of shamanism that guided the making of this encyclopedia, as a religious belief system in which the shaman is a specialist in the knowledge required to make a connection to the world of the spirits in order to bring about benefits for the other members of the community, is obviously a broad definition, designed to allow this work to be as inclusive as possible. Nevertheless, most of the entries were written based on ethnographical data, as Kehoe and others emphatically stress. As this encyclopedia includes not only entries based on anthropological materials but also those on historical, religious, and psychological aspects of shamanism in many different cultural contexts, it is important to have a broad definition of shamanism, as noted in the preface, to cover the wide range of cultural phenomena related to shamanism.

Psychological Perspectives and Altered States of Consciousness

Another theoretical issue in the field centers on the psychological state of shamans. It is a crucial issue, as shamans in North Asia and the Americas were often characterized as mentally deranged, neurotic, schizoid, or psychotic, largely due to their behavior during trance. This kind of stigmatizing of a shaman as a mentally sick person was created by Western researchers based on Western cultural standards of madness and sanity. The shamans in their own cultures, however, carried out their positive roles as religious specialists and healers without such negative stigma. Obviously the abnormality or normality of a shaman or indeed any person should be defined according to the standard of that person's culture. Nevertheless, as recently as 1967 Julian Silverman, the American psychiatrist, wrote that the psychological state of the shaman is a form of acute schizophrenia characterized by "grossly non-reality oriented ideation, abnormal perceptual experiences, profound emotional upheavals and bizarre mannerisms" (Silverman 1967, 22; Krippner 2002, 965).

In order to test the alleged abnormality of shamans, Western psychologists have carried out various studies. Stanley Krippner, in his article on "Conflicting Perspectives on Shamans and Shamanism," published in 2002, as well as in his entry in this encyclopedia, "Psychology and Shamanism," has provided several examples of such tests. For example, the Rorschach ink-blot test was given to twelve male Apache shamans, fifty-two non-shamans, and seven self-nominated shamans (Boyer et al., 1964, 179). The results indicated that the shamans were less hysterical and healthier than the ordinary people, and no trace of neurotic or psychotic personality was found. Similarly an epidemiological survey of psychiatric disorder among Bhutanese refugees, including forty-two shamans, in Nepal, which was conducted through structured diagnostic interviews, showed that fewer general anxiety disorders were detected among the shamans (Van Ommeren et al. 2002; Krippner 2002, 966). These psychological studies showed that shamans were not mentally deficient or psychotic, but highly imaginative and talented individuals with higher than average awareness of the environment, concentration, and control of mental imagery. Along the same lines, Morris Berman has described the shaman's ability to go into trance as an ability to achieve "heightened awareness," a state of consciousness used in a healing modality somewhat similar to psychotherapy (Berman 2000, 30). Krippner concluded that the psychological study of shamanism could offer something to cognitive neuroscientists, social psychologists, psychological therapists, and ecological psychologists (Krippner 2002, 970).

Hamayon, Kehoe, and other anthropologists are rather critical about these psychological studies and the whole tendency to focus on altered states of consciousness as a characteristic of shamanism. The reader will find in Hamayon's entry, "History of the Study of Shamanism," a warning that the definition of shamanism in terms of states of consciousness is misleading, since it assumes that shamanism is a universal phenomenon that can be found everywhere and at all times, from prehistorical times to the present. Nevertheless, it can be argued that multidisciplinary approaches that include psychology can enrich the study of shamanism; in any case, as with other debates, both sides of the argument are presented in this encyclopedia.

One interesting result of the focus on altered states of consciousness has been the creation of modern mystical movements, discussed by Joan Townsend in her entry "Core Shamanism and Neo-Shamanism." Inspired by traditional shamanism, Michael Harner and Carlos Castaneda have been two major figures in these newer Western spiritual movements. Their movements encourage individuals to have direct contact with the spiritual world, or to "journey" into alternate reality, through drumming (emphasized in Harner's Core Shamanism) or in some cases through the use of hallucinogens (in some forms of Neo-Shamanism) in order to discover their own paths. The entries "Neo-Shamanism in Germany" and "Russian Shamanism Today" also focus on the continuing evolution of shamanic practices in a modern, urban setting.

The Organization of the Encyclopedia

A basic account of the organization of this encyclopedia is given in the Preface; more details are added here to help the reader understand the encyclopedia's framework. According to Hultkranz,

for example, ecstatic healers and diviners of the Arctic and circumpolar regions, northern Asia, North and South America, Southeast Asia, and the Pacific Islands are all shamans according to the criteria used by many writers (Hultkrantz 1993, 7). East Asia and Africa are relatively latecomers to studies of shamanism, but from the point of view of those, like Ioan Lewis (1971, 1984), who see possession as the core of shamanic ecstasy, it makes sense to include these areas. Australasia and Oceania are based on Andreas Lommel's observation of shaman-like figures in Australia (1989), which seems to agree with that of the various authors of the entries in that region.

The encyclopedia is divided into two major categories, the general entries at the beginning of volume 1 and the regional entries in the rest of volume 1 and in volume 2. The general entries contain much that will have particular interest for the general reader, as well as for the specialist who is interested in a broader viewpoint of shamanism in general. For example, there are entries that explore the relationship of shamanism to the world religions Buddhism, Christianity, and Islam (in the entry "Sufism and Shamanism" and related entries), as well as entries that focus on such areas as art, costume, ecology, gender, healing, psychology, and witchcraft. Initially we hoped to include many other general topics, but in the end the actual volume of the regional entries exceeded by far that of the general entries. This is due to the fact that some general entries require a degree of generalization of religious phenomena of many different cultures, a generalization that is regarded as problematic for anthropologists, who have usually specialized in a particular culture and who, moreover, avoid broad generalizations that can lead to innacurate and misleading interpretations.

Some of the topics, such as Animal Symbolism, Dramatic Performance, Buddhism, and Tantrism, can be classified in either general or regional entries, since many of the general entries can be geographically bound and include evidence derived from at least one or two particular cultures according to the author's expertise. Thus general and regional classifications overlap each other to some extent. These classifications were created for the convenience of users of the encyclopedia and are not to be considered as absolute categories.

The ten sections of regional entries take their names from the ten major regions of the world covered: North America; Central and South America; Europe; Eurasia; Korea and Japan; China and Sino-Asia; South Asia, the Himalayas, and Tibet; Southeast Asia; Australasia and Oceania; and Africa. The overview that introduces each regional section was written by the regional editor in charge of that section or by a representative, and it plays a crucial role in providing the reader with a larger context for the individual entries. The overview introduces the region, starting with a brief account of its geography, history, and general cultural characteristics, followed by the general characteristics of shamanism in the region. A very brief introduction to each entry is also included. Here again, no attempt has been made to impose one approach to the study of shamanism on the scholars who have written the overviews; rather the overviews reflect the rich diversity of the field, embodying the distinctive points of view and disciplinary approaches of their authors.

The reason for choosing to place some of the entries in the sections in which they are found needs some explanation. For example, the Atayul people in Taiwan are geographically in the area covered under the title "China and Sino-Asia," but the entry has been placed in the "Australasia and Oceania" section, since the Atayul are an Australasian people. The guiding principle is that peoples of the same ethnic group are, as much as possible, placed in the same section, in order to highlight the common features these peoples share, even when they have become widely separated, due to migration and other reasons. Thus readers are advised to use both the index and the cross-references, as well as the table of contents, to locate the various indigenous peoples who are covered. A few words on each section here may also be helpful in orienting the reader.

The entries in the regional section "North America" represent only a small selection from the thousands of cultures that existed before the arrival of Europeans, but these entries provide in-depth accounts of major North American and Circumpolar Arctic groups. Michael Winkelman, in his overview, has presented the story of the migration of these peoples from North Asia and the changes in their shamanistic practices over the centuries, both before and after contact with Western Europeans. As he notes, North American shamanistic practitioners interact with the spirit

world and induce trance through the use of drumming or chanting. Another scholar in the field, Jordan Paper, has made the point that shamanism in North America (south of the Inuit) tended to be more "democratized" than that of North Eurasian shamanism. He noted that the Siberian shaman in North Asia was a specialist with specific societal roles, whereas the spirit world and the trance experience were available to all members of the community in the Americas before Euro-American cultural domination. Through trance and visionary experience, a personal relationship with these spirits was vital for the benefit of individuals and the community (Paper 1990, 90).

The entries in the "Central and South America" section also cover vast cultural regions, where "the most ancient, enduring and spectacular examples of shamanistic practices [are] documented," as Glenn Shepard explains in the overview. He believes Central and South American shamanism developed independently from the Arctic practices in response to heterogeneous ecological, sociocultural, and historical conditions.

The section on European shamanism highlights shamanistic interpretation of the ancient, medieval, and modern religious phenomena called variously paganism, witchcraft, mysticism, magic, and Neo-Shamanism. The sources used include myths, folklore, and fairy tales. These entries present the shamanistic practices of Celtic, English, Roman, Germanic, Finno-Ugric, Russian, and other European peoples. Carl Ruck's overview makes the case that European pagan practices have never completely died out, and the entries themselves contain suggestions of an interesting continuity between the ancient practices among such peoples as the Celts and Romans and the practices of the modern spiritual movements of Neo-Shamanism.

Still, the number of entries in the European section is relatively small, whereas "Eurasia" includes the largest number of entries: Eurasia, as the center of Siberian and Arctic shamanism, seen by many as the most authentic form of shamanism, has been historically the most well-studied region. In most Eurasian societies, traditional forms of shamanism have disappeared, but shamanistic beliefs and rituals survived in many cultural systems, specifically in the idea of spirits, certain rituals, and the worldviews of the people. The entries, some contributed by indigenous scholars, are based on firsthand field experience of their own cultures.

East Asian entries are divided into two sections: Chinese cultural domains ("China and Sino-Asia") and the Altaic speakers' region ("Korea and Japan"). China has many different minority groups. The Turko-Mongol peoples and Manchus in the north are included in "Eurasia," due to their ethnic and cultural affinity with the Eurasian peoples; the Yi and Miao, in the south; the Tibetans in the southwest are discussed in an entry in the "South Asia, the Himalayas, and Tibet" section. The shamanistic practices of Hong Kong, Singapore, and the Chinese population of Taiwan are also included.

Korea has perhaps its own pivotal tradition of shamanism in East Asia, one which is very different from Chinese shamanistic practices. For one thing, Chinese shamanism includes a much broader range of practices, due to ethnic and cultural variations in China. Japanese shamanism is seen as closer to Korean than to Chinese shamanism, due to possible ancient linguistic and cultural ties with the Altaic peoples originating in Eurasia, although present forms of Korean shamanism seem to be more performance-oriented than Japanese forms.

The region covered in the section "South Asia, the Himalayas, and Tibet" includes both Hindu and Buddhist countries, all considered more or less under the Indian cultural domain. The Tibetans and related peoples in Nepal have clearer forms of shamanism than the forms found in India, where the practice of spirit possession, divination, healing, and exorcism are the main features of shamanistic practice. In India, spirit possession can be practiced by any individual inclined to such capacity, not just religious specialists.

Southeast Asia, which also provides a variety of shamanistic beliefs and practices, is one of the core areas of Old World shamanism, according to Robert Winzeler's entry, "Southeast Asian Shamanism" (which supplements the overview with which he introduces the section). A belief in spirits seems to be the common denominator of shamanism in Southeast Asia, but the various forms of shamanism in this region are not necessarily related. Migrations of Southeast Asian peoples by land and sea further complicate the religious map of the region.

Possibly originating from Southeast Asia, the shamanistic practices of Australasian and Oceanic peoples in Micronesia, Melanesia, and Polynesia are also included in this encyclopedia. Shamans in this region are called various names such as healers, priests, and diviners, like shamans of many other regions. There are strong shamanistic elements in the practices of these peoples, such as the importance of trance and dream, although some writers in this field are reluctant to call them "shamans."

Africa has a rich variety of indigenous religious traditions, many stemming from ancient times. Edith Turner's overview points out that the narrowness of Eliade's definition of shamanism has done a disservice to the study of African religious practices. She adopts broader definitions of shamanism, which include African spirit possession in healing and divination. The study of shamanism in Africa has grown enormously, and the opportunities for fieldwork among peoples whose practices still have many shamanistic elements have made valuable work possible. The entries of the Africa section reflect such new perspectives on shamanism in Africa.

The inclusion of the perspectives of almost two hundred contributors writing about such a wide range of cultures will allow the reader to consider the controversial issues already discussed, as well as other fascinating questions in the field, questions such as, What kind of society or culture tends to support shamanic or shamanistic beliefs and rituals? Under what circumstances do people tend to turn to shamans as their helpers and healers? Scholars such as Jane Atkinson have pointed out that shamanism never occurs in isolation, but is always embedded in wider systems of thought and practice (Atkinson 1992, 315). Our hope is that this encyclopedia will provide the foundations of a study not only of shamanism itself but also of the wider societal and cultural basis of which each form of shamanism is a part.

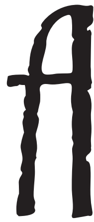
GENERAL THEMES IN WORLD SHAMANISM



ANIMAL SYMBOLISM (AFRICA)

Across Africa, one of the primary duties of traditional healers is the manipulation of symbolic paraphernalia, especially in ritual contexts. Many of the important symbols in ritual life relate to animals, yet any attempt to systematize animal symbolism as it relates to indigenous beliefs in the whole of Africa cannot but be general. Indeed, Africa embodies greatly diverse cultural traditions on both the regional and the local level. What follows focuses on the various means ritual specialists use to manipulate animal symbols. It draws on a number of African cultures, in the expectation that such particular remarks will elicit more general themes prevalent in shamanistic practice throughout Africa.

Animal Symbolism and Cultural Values

Animal symbolism plays a huge role in social life in Africa: Animals and their behaviors frequently represent the unwritten rules of a society. It is ritual specialists and mediums who bring these rules to light and reiterate their importance to the community. Thus, animal symbolism, through the mediation of ritual specialists, serves as a means to instill values within the varied cultural contexts in which it is used. This can be seen in several ways: most notably perhaps in terms of aspects of social organization, cosmology, and personal power.

Social Organization

Many African societies view the animal kingdom as a reflection of their own human society. Indeed, such considerations are made particularly explicit in ritual life when symbols are manipulated and used to facilitate entering into various states of ecstatic trance or spirit mediumship. The organization of the animal kingdom is often considered as mirroring the hierarchical structure of many African societies. Thus, in most of West Africa, at the acme of the hierarchy is the lion. One of the greatest compliments is to be compared to a lion; indeed, in a great number of rituals the lion is an especially popular symbol of strength and power. In many senses, lions are seen to have taught human beings how to live, hunt, and behave nobly. Thus animals and their actions bespeak values inherent in humans, so that symbols fuse perceptions of the animal kingdom and actual social life. In relationship to human society, mediums' interactions with animals suggest a didactic relationship: Animals teach and instill knowledge that, often transmitted through the religious specialist, is related back to the community and elucidates appropriate modes of conduct.

Cosmology

Animals relate to spirits or supernatural worlds as well. Sometimes animals are held to have direct recourse to the spiritual pantheon, especially when they symbolize lineage or represent ancestral sprits. In a great variety of cases, animals are thought to embody human spirits; this holds for actual living animals, as well as for the spirits of animals. In either case, whether through interpreting their movements or acting as a spirit medium, the medium interacts with human spirits in animal form. Alternatively, various responsibilities are attributed to animal spirits, and it is the job of the medium to know, if not to manipulate, these influences. Animals, then, consistently symbolize recurrent themes inherent in social and psychological life. Accordingly, the use of animal symbols, both in shamanistic ritual and ordinary life, is a conspicuous element of social life in Africa.

Personal Power

Most importantly, the religious specialists are charged with placating the malevolent forces that are often believed to be harming the community. In so doing, they engage with various sorts of animal symbols, the meanings of which are culturally specific and sometimes far from obvious. Indeed, notable differences between animal symbolism and human qualities can be drawn. For example, small and weak creatures commonly symbolize positive qualities such as survival and determination rather than negative ones such as vulnerability and feebleness. Despite the fact that animals such as hares are prey in the wild, easily and commonly slain by larger more powerful animals, in the social world they represent decidedly favorable characteristics. So, inasmuch as symbols of power speak to recurrent themes in African social life, symbols of resilience and persistence suggest that the sometimes difficult quest for survival is held to be valuable.

Healing

The most widespread occurrences of animal symbolism in shamanistic practice in Africa have to do with healing. Indeed, myriad cultures incorporate animals into healing rituals. The Lebu healers, known especially for their expertise in the Ndeup ceremony, are called *ndeupkaat* in the Lebu version of the Wolof language. In rituals among the Lebu of Senegal, shaman-healers dress as hyenas and are confronted and scared off by the more powerful and noble lion. The hyena represents immorality and human weakness. The hyena is thus seen as symbolizing all that is negative about humans, which perhaps explains why it is so frequently referred to in modern West African culture (see Mambéty 1992). Lebu shaman-healers generally contribute to strengthening community morality by demanding that women take part in the Ndeup ceremony, which serves to ward off evil spirits from the community, as well as satisfying the needs of other spirits who demand sacrifices.

In order to identify the evil spirits who may have contaminated a human body, causing depression, Lebu ritual specialists tie up the sick person next to a tied goat or bull (such animals are common in ritual sacrifice throughout Africa and are used similarly by the Bamiléké in Cameroon). The shaman-healer then anoints the ill person with the blood of chickens and the horns of a bull, seeking the name of the contaminating spirit. Women are then ordered to chant as the shaman-healer consults these spirits. Their rhythmic chants, in fact, enable the shaman-healer to enter into the ecstatic state necessary to communicate with the spirits causing the illness. Eventually the ill person feels reborn and is ordered to jump over the animal seven times. Then he sits on the animal's side and whispers all his desires into the creature's ear before it is sacrificed. From here, many people accompany the ill person to a specific location, where many of them fall into trances induced and supervised by the shaman-healer. Afterwards, the ill person is declared healed, his troubles having been transferred to the animal before it was sacrificed. Thus through ritual, the shaman-healer instills morality back into a member of the community and reasserts his authority as guide.

The importance of lion symbols in Lebu ritual practices reflects the recurrence of this creature as a symbol of power throughout West Africa. Another example from Ghana underscores the importance of the lion to voodoo healers. Lions, in addition to hyenas and hares, serve as central symbols in rituals of curing. In order to reach spirit worlds in the relatively recent Dhani voodoo form, these healers use actual parts of a lion's body as ingredients in concoctions present during these rituals. The lion is equally important in East Africa as well. Amongst the East African Nuer peoples, a healer is seen to be an expert in the "science" of the lion, which underlines the importance of the creature as a link between seer and spirits in shamanistic ceremony. By contrast, in other parts of East Africa, the lion symbolizes laziness, and hence is a negative, if not insulting, symbol. As such, it is either not used in ritual, or used in a negative way.

Trance, Dream-States, and Spirit Mediumship

Many African tribal traditions show that humans are mistaken in believing they are separate and different from the animals. For example, animals gave the gift of enlightenment to humankind, and this gift is given again through shamanistic dreams and altered states

of consciousness. Normally, shamanic ecstatic trance or dream-states, in which animals often appear to the seer as humans, make it clear that humankind's acquisition of hunting knowledge represents an endowment of gifts and wisdom from predators to humankind. The relationships and sets of interaction between healers and animals can be broken down into four distinct types: tutelage, personification, communication, and protection.

Tutelage

The idea of an intimate relationship of tutelage between humans and animals has continued over time. Such motifs have sometimes, for example, been grafted onto the story of Njajaan Njaay, the hero of the Wolof people and founder of the thirteenth-century Waalo kingdom. Njaay was reputed to be a diplomat and fair dispenser of justice, who could unite peoples behind him as if by magic. Although stories of his miraculous return after many lost years abound, some stories (see Diouf 2001) now portray him as having been brought up by lions and then returning part-man/part-lion to unite the people of the Waalo kingdom, due to the wisdom and powers acquired from his experience with lions.

Moreover, healers often state that it is thanks to the various sorts of tutelage that animal spirits offer them that they are able to ply their trade. In some instances, this tutelage comes to nonreligious specialists, and it is in this way that they are started on the path to becoming healers endowed with special abilities and powers. This is one way among many others that such healers are selected in varied cultures across Africa.

Personification

Spirit mediums commonly assume animal personae in rituals. In so doing, they reaffirm the importance of animals in daily life and, by extension, the efficacy of animal symbolism in ritual. For instance, in shamanistic practices among Senufo societies in Côte d'Ivoire and Mali, the practitioners use bull, ram, or antelope horns to symbolize masculinity in the masks they create for their rituals. Using such paraphernalia, the healer strives to be able to relate to such animal spirits and in so doing to placate the malevolent forces inherent in them and stress their benevolent qualities.

Communication

In southern Africa, one of the central functions of !Kung shamanic trance is to communicate with or act as a spirit medium for animal spirits, because animals are seen as messengers between worlds. In order to communicate with them and coax them into certain locations so that they may be more easily hunted, mediums are reputed to leave their own bodies and enter those of the animals, at which point they can communicate with and persuade them. Alternatively, when animal spirits represent malevolent forces, !Kung shaman-healers may serve as spirit mediums for the animals' spirits in order to allow the animals to communicate to the community as a whole.

Among the !Kung, music is a central means of bringing about trance. Songs tend to be of two sorts. They either tell about animals and their relation to social or spiritual life, or they mimic the sounds of animals, using either voice or instrument (or both). In either case, the relationship between animals and trance should be clear: Songs, an essential means for entering an ecstatic state, focus on animals, and the trance itself allows communication with animal spirits. The !Kung, as a historical hunter-gather nomadic group, place an extreme emphasis on community relations with animals, and this is indeed made manifest through ritual and in particular through the conduct of the !Kung shaman-healer.

Protection

On the other hand, and unlike !Kung society, in which trance permits animals' spirits to enter humans and vice versa, in parts of West Africa some animals are seen as containing the spirits of angry humans. Such animals often come to haunt people who have unjustly preyed upon fellow humans or creatures. Shaman-healers are believed to have the abilities needed to cure individuals of the illnesses brought about by unwanted spirit possession, and even more importantly, to protect the whole community. The shaman-healer's role as protector is made clear in a Lebu myth that tells how a man, wronged and killed by his friend after the friend had

murdered the man's powerful father, returned in the form of a shark, which also carried the spirit of his father, and haunted the murderer, eventually killing him (see Ngom 1982; Wade 2002). Although the murderer had mended his ways and assumed the power of the lion in a shamanistic ritual, such a transformation did not kill his guilty conscience, which the shark may be taken to symbolize. This myth and the shamanistic uses of animal symbolism depicted in it give evidence of perception of the sometimes negative influence of animal spirits in daily life. The shaman-healer is responsible for preventing these negative influences from coming to fruition.

Some Changes

Ritual ceremonies and animal symbolism in Africa is changing. Whereas lion symbolism once formed the basis of many forms of African culture, and ritual sacrifices of bulls and goats lay solely within the domain of shamanistic practice, the lion has more recently emerged as a symbol for specific nations rather than for the whole of mankind, and the sacrifice of bulls and goats has been incorporated into Islamic rituals.

Although the types of rituals supervised by mediums and the types of animal symbols they use are shifting, the need for religious specialists to interact with the spirit world and their ability to do so remain omnipresent. Among the !Kung, for instance, new trance dances have appeared within the last decade, and with them come new roles for animal spirits and new ways in which to ritually engage them. Yet shamanistic practice is controversial, especially due to the ubiquitous influence of scriptural religions in so many parts of Africa. Moreover, in many parts of the continent shamanistic practices are hotly contested as outdated and out of step with the modern world.

In turn, the manipulation of animal symbols is no longer exclusively the property of shaman-healers and ritual specialists. On the contrary, new generations of Africans are attentive to means whereby they can combine old symbols with new representations. Indeed, the increase in outlets of expression such as films and texts has meant new ways of showing the importance of animal symbolism in most of social life. In addition, the meaning of symbols is changing significantly. Even though most of these animals have maintained their symbolic roles over centuries, it is to be expected that some creatures may change their roles and that new animal symbols will continue to emerge.

ANIMAL SYMBOLISM (AMERICAS)

For the indigenous peoples of the Americas, the symbolism associated with animals helps form and configure indispensable links between human, natural, and spiritual realms. Expressive of these vital relationships, animals are often referred to and categorized as Animal People, or some variation on that theme. Although there are of course regional and tribal variations, in general the resulting mediations help communicate the knowledge and teachings, as well as the transformative potency, to successfully orchestrate a rite of passage, a healing ceremony, a hunting ritual, or the renewal of the world itself. Partnership with the Animal People was established in the creation time, and is revealed and celebrated through the telling of the oral traditions. A particular partnership may also be personally acquired through a visionary experience, or perhaps inherited, and expressed in the images used to adorn a costume, heard in the words of a song, and observed in the movements of a dancer as he is transfigured into an eagle, jaguar, or wolf. And it is a partnership that allows a shaman to journey as easily to the creation time as to the bottom of the sea, transcending temporal and spatial dimensions. An appreciation of the relational roles and meanings of the Animal People, richly embedded in narrative and ritual symbolism, is thus an essential component of an understanding of the structures and dynamics of American Indian shamanism. Some of the traditions that nurtured the links between humans and the Animal People are still alive, others are not; but for the sake of simplicity, all will be described in the present tense in what follows, except where clearly linked to a world that no longer exists.

The significance and relationship animals have with humans were set forth during the primordial time of creation, as witnessed in the actions and deeds of such mythic animal beings as Coyote, Salmon, Raven, or Spider, and as discovered and celebrated in the retelling of the oral traditions. The mythic Animal People are beings with volition, thought, and speech, exhibiting human desires and frailties, often with animal names and characteristics, and typically with great transformative powers. In the beginning they confronted and destroyed monsters of all sorts, and prepared the world for the coming of humans.

In one Crow Indian oral tradition (of the North American northern Great Plains), it was

Isáahkawuattee, Old Man Coyote, with the help of four ducks, who brought dry land to a watery world. Then with his younger brother, Little Fox, Old Man Coyote traveled the land, transforming it into mountains and valleys, creating the game animals and fish, and finally humans themselves. Old Man Coyote subsequently established the kinship rules, hunting practices, and religious ceremonies necessary for humans to prosper. Although a culture hero and benefactor for humans, Coyote was also endowed with self-serving, trickster qualities. As Coyote was given his particular disposition, so too were the other animals. In the instance of the Nez Perce (of the North American Plateau area), it was Hanwayáat, the Creator, who named all the animals and gave them their specific abilities. These "assigned" qualities helped determine the unique character of each animal species, whether exhibited in their behavior as game animals or in their potency and prerogatives as guardian spirits.

In preparing the world for humans, the Animal People also brought forth the essential teachings that further patterned the nature of animal-human relations. Continually emphasized in the oral traditions of the Plateau peoples of North America is the importance of not hunting too many animals, of sharing all that is acquired, and of not boasting of one's success in the hunt. In a creation story told by the Desana of the Colombian Amazon, humans arrived on earth in a great Snake-Canoe, the anaconda, who also acts as a watchdog for Vaí-mahsë, the Master of all the Animals. The success of the hunter as well as the *payé* (shaman) depends on their ability to enter into certain symbolic sexual relations with Vaí-mahsë. The intimate association between human and animal was further strengthened by the nature of the first couple, which consisted of a human Desana and an *aracú* fish. All later Desana would trace their ancestral kinship to this union, and a significant part of their diet consists of this important fish.

Shamanic success, be it in healing the sick, hunting an animal, or renewal of the world, can depend on the ability of shamans to travel the landscape of the primordial era and renew their kinship with the Animal People, dissolving temporal and spatial boundaries. It is an act accomplished only after carefully listening to and interpreting the teachings, symbolically represented in the oral traditions and in the shaman's own visionary experiences. As an Iglulik *angákut* (of the Canadian Arctic) applies with great skill the "magic words," utterances once spoken by the animals and handed down from the beginning of time, shamans throughout the Americas learn and use the esoteric languages of the Animal People. Adept at singing their own medicine songs, shamans must be just as much at ease deciphering the rich symbolism of dreams, visions, and oral traditions, all of which have emanated from the voices of the Animal People.

In various rites of passage, especially those associated with vision questing and shamanic initiation, the importance of establishing kinship with the Animal People is particularly paramount. During an initiatory vision, it would likely be an animal spirit, either in animal or human form, that communicates with the seeker. Serving as a guide, the animal spirit would escort the neophyte in a journey of spiritual discovery into the landscape of the primordial time. Such a journey is rich in imagery, and it may only be a shaman, wise in years, who can interpret the significance of the dream gift. Among the Plains and Plateau peoples of North America the eagle or hawk could symbolize flight, while the salmon or buffalo could refer to sustenance, or bounty.

The culmination of the Desana shaman's initiation occurs when the novice takes *vihó* snuff. If the vihó accepts the novice, the novice is turned into an animal shape, perhaps into the *yé'e,* "jaguar," and roams the forest indistinguishable from its other inhabitants. For the Desana another term for payé (shaman) is yé'e. As an intermediary between society and nature, the payé is able to change himself into the jaguar and travel the spiritual terrain of the forests. The jaguar is to nature as the payé is to humans; each must be a great hunter if survival is to be assured. Following initiation, the payé (who is always male) can turn into the jaguar at will. The association is so complete that the payé speaks with the voice and sees with the eyes of the jaguar; he devours raw meat and sleeps on the ground. Created by the Sun Creator to be his main intermediary on earth, the jaguar has great powers of fertility, is associated with fire, and is heard by its roar, the thunder. So powerful, the yé'e is the only animal not under the control of the Vaí-mahsë, the Master of the Animals.

Having demonstrated their tremendous transformative powers in the preparation of the world for humans, the Animal People can be viewed as archetypal of the original shamans. As the shaman is able to identify and establish a personal kinship bond with a particular Animal Being, perhaps replicating its character, the transformative potency of the Animal People is brought to bear for the shaman to affect the lives of others. Among the Crow, an *akbaalía,* "one who doctors," has an adoptive relationship with his "medicine father," perhaps an elk, eagle, or buffalo, acquired during a vision quest. In addition, the personality qualities of the akbaalía himself often parallel the primary transformer in Crow tradition, Coyote. Although typically self-effacing, a benefactor and a healer of the sick, the akbaalía can just as easily assume the role of a trickster, deceptive and self-serving, especially in the face of a rival. Among the Coeur d'Alene (of the North American Plateau), an individual's *suumesh* (spiritual power) is expressed in the song acquired in a vision from a guardian spirit and renewed each winter in the Jump Dance. During the dance, when an individual properly sings his suumesh song, he becomes his animal spirit, speaking its voice and dancing its mannerisms, perhaps that of a wolf or an elk. If the song is not properly sung, ill fortune and spirit sickness will likely ensue. If the song is properly sung by, for example, a salmon shaman, then the spirit of the salmon will provide the insights and power for the salmon shaman to successfully coordinate salmon fishing.

The nature of a shaman's particular spiritual power is often framed in how his animal guardian spirit is categorized within the larger worldview of his society. In many hunting-oriented societies, for example, a hunter will seek out a predatory animal as his spirit guide. For the Iglulik, the fox, owl, bear, and shark, all great hunters themselves, are considered among the most powerful helping spirits for a human hunter. As noted, hunting success for the Desana payé revolves around an intimate relationship with the animal hunter par excellence, the jaguar. Among the Crow, there is a close association between what are considered the natural attributes of an animal and the particular spiritual powers of a *baaxpée* (medicine). As the squirrel spends its time gathering and storing nuts and berries for the coming winter, possessing squirrel medicine helps assure food for one's family. As the eagle's keen sight and physical prowess are unsurpassed, eagle baaxpée is highly sought. This categorical relationship is not unlike that expressed in the use of an "Indian name." Often ritually bestowed on a child by an elder, the name itself would refer to a particular animal and perhaps some special action of that animal—Swift Hawk or Hidden Badger. If cared for properly, the animal name would help protect the child and nurture in the child abilities of the kind expressed in the name.

With newly acquired kinship with the Animal People, the initiated shaman is ready to apply the transformative powers of the primordial realm to the welfare of the human realm. As shamanic societies are often dependent on game animals, birds, and fish for subsistence, one primary focus of ritual effort is in the perpetuation of animal species. These efforts might take the form of individual hunting rituals, specific to a hunter and his game, as well as more communal ceremonials, seeking renewal in the vitality of the entire animal world.

The game animals are themselves often characterized as possessing humanlike qualities and referred to as kinsmen. For the Desana, the deer is the most human animal of the forests, able to laugh and dance, with its own language, and prone to suffer from illnesses. As a principal game animal, the deer represents the female principle and symbolizes cleanliness. Similarly the deer for the Coeur d'Alene is Amotqn's, the Creator's, favorite pet. It knows the thoughts of the hunters, and enjoys playing games of hide and seek with them. As with the buffalo on the Plains and salmon in the Plateau of North America, the deer is often addressed as a "brother." With its intelligence and close physical resemblance to humans, the bear for the Naskapi of the interior Labrador of North America is one of the most powerful of all animals, having influence over the other animals and knowing the inner desires of hunters. Tremendous ritual observances are thus paid to the bear, from communicating with it through dreams, to showing care in how it is consumed and its bones are disposed.

There is a widespread respect shown to the bones of game animals. Often symbolizing the souls of animals, the bones of animals are to be respected and returned to the place of their origins. In so doing, hunters facilitate the rebirth

of the animals. Among the Iglulik, dogs are not allowed to chew on the bones during the butchering of an animal, lest the soul of the animal be offended. Among the Naskapi, the bones of the beaver are ritually deposited back in the river from which the beaver came, to please the "giant beaver," Master of the Beaver, so he might look favorably on the hunter and allow the spirit of the animal to return to life. The bones of other game animals are ritually collected and placed in trees near where the animals were hunted or eaten, to honor the animals. Among the Plateau peoples, the bones of salmon are returned to rivers to be reborn. As a link to the soul, the bones can also be used in divination. Among the Naskapi, a hunter attempts to induce a dream, *pwamu',* to communicate with the animal's spirit. If the soul of the animal, such as a caribou or beaver, comes to the hunter, the dream can be clarified by charring the shoulder blade of the animal. When reading the resulting marks on the burnt bone is accompanied by singing and drumming, the marks reveal the language of the animal's soul, guiding the hunter to where the animal can be located.

As in any kinship-based relationship, reciprocity is needed if the animal-human relationship is to continue. If an animal "brother" is to offer its flesh to a hunter, a gift must be given in exchange. If the salmon spirit is to assist a shaman in the salmon harvest, the shaman must give respect to his suumesh (the spiritual power of the salmon). These exchanges can involve a wide variety of symbolic gifts, such as the souls of an enemy, as among the Desana, or adherence to an elaborate set of respect rules and taboos, as exemplified by the Iglulik. When the balance is maintained, the animal populations are replenished and maintained, and the hunters are offered the flesh of their animal kinsmen. By entering into a relationship with the Animal Peoples, power is then applied back to perpetuating animal, as well as human, kinsmen.

The various exchanges seek not only to maintain the assistance of a guardian animal spirit and garner the favor of the game animal itself, but also to secure the goodwill of a prominent Animal Person or Master of Animals who oversees the game animals. When an imbalance in the gift exchanges occurs, as when a hunter kills too many animals or the dogs chew on the bones, the animal flesh is withheld from the hunter, and the human populations suffer. It would then be the responsibility of the shaman to help restore the balance by traveling to the place of the Master of the Animals and appeasing it.

Among the Desana there are two Vaí-mahsë, Masters of the Animals, one for the animals of the forests, a masculine being, and the other for the fish of the rivers, a feminine being. Their periodic sexual visits with each other assure animal and fish offspring. Vaí-mahsë can appear as a dwarf painted red, or as a small lizard. In a hallucinated state the payé travels to the Milky Way and with the help of Vihó-mahsë, the Master of the *vihó* snuff, negotiates an exchange. For the souls of humans from a neighboring tribe the hunters will receive game animals; by the death of humans the loss of animals is replenished. If a hunter kills the wrong animals, for whom an exchange was not negotiated, Vaí-mahsë may send sickness or dangerous animals, and famine may result.

An Iglulik angákut seeks to keep the right balance between humans and the domain of animals, presided over by Takánakapsâluk, Mother of the Sea Animals. When too many animals are taken, or when taboos are broken, the angákut must restore the imbalance by "fall[ing] down in order to bring to light the animals hunted," that is, by journeying to the dangerous bottom of the sea and the abode of Takánakapsâluk. There he must win her favor.

In the Mandan Okipa ceremony (of the Great Plains of North America), the assistance of the Animal People was called upon to perpetuate the buffalo herds and a good hunt. Dancers became key primordial beings, such as Lone Man (Buffalo Spirit), Hoita (Speckled Eagle), and, dressed in a coyote hide, First Creator. The Buffalo dancers had blackened bodies with white and red strips on their legs and arms, and wore a buffalo head, buffalo hair anklets, breechcloth, and tails on their backs. The ritual drama of the ceremony sought to replicate the creation time, dramatizing a period of struggle and famine, when the buffalo were eventfully released from their captivity in Dog Den Butte. If the dancers were successful, the transformative power of the Mythic Animal People was brought to bear, renewing and perpetuating the world of animals and humans alike.

ANIMAL SYMBOLISM (ASIA)

Animals and plants are intimately related to aboriginal religions and to shamanism and its practices in particular. In this respect, European, Central Asian, and North African shamanism probably have the longest history of evidence of this association: many petroglyphs, dating from the Upper Paleolithic to the premodern period, arguably depict shamans, who are always surrounded by animals. The relation between shamans or other practitioners of aboriginal traditions and animals and plants is extremely multifaceted and complex. Animals and plants and animal-anthropomorphic figures, mythic or real, sacred or profane, have played very diverse roles within and across Asian cultures. Unfortunately, Eurasian shamanism, much of the territory of the practice of which falls within China, Mongolia, and the former USSR, has not been studied in all its diversity due to the severe ideological restrictions in the above-mentioned countries (Hutton 2001). One of the most regrettable results of this is that very rich data on the traditional myths and folklore, collected by the folklorists in the twentieth century, was called secular folklore and was almost never linked to the shamanic and other aboriginal religious practices of which it has been a natural part. Fortunately, it is still not too late to make such a connection, using the unpublished archival materials and field research. It is this material that makes it possible to discuss the categorization of the different roles and functions that animals play in the myth and practice of Eurasian shamanism.

Animals in the Creation Myths

Most of the creation myths of the aboriginal nations of Asia do not involve an animal as the Creator. Usually, the Creator is vaguely anthropomorphic or uniconic (shapeless). The exception to this general rule in Eurasia is found among Paleoasian groups (Mongoloid peoples of northeastern Asia—the Chukchee, Itel'men, and others), who consider the Raven (Kutkh) to be the Trickster-Creator (and the shamanic prototype). This fact and the proximity of the above-mentioned groups to North America (Paleoasians live in the far northeast of Siberia, mostly along the northern Pacific coast) sug-

gests the shared roots with a number of the West Coast Native groups of North America (e.g., Tlingit, Haida) whose mythology has striking similarities to the Paleoasians'.

Although the Creator in the myths of most aboriginal cultures of Eurasia cannot be easily connected with any animal figure, however, he (or sometimes she, or it, or they) always has animal helpers, who are created prior to humans and function as demiurges (supernatural beings imagined as creating or fashioning the world in subordination to the Supreme Being). The list of such animals varies from culture to culture (sometimes, animals work as teams during the creation process, performing different functions) and is very extensive: For example, among Finno-Ugrians (Saami, Khanty, et al.) a very important spirit-animal demiurge is a duck, or a loon; among the Ainu of Hokkaidō, Japan, it is a type of magpie, and so on. However, almost all of the animals that a given culture lives among have certain roles in the Creation process and Mythic Time, and thus are marked with specific sacred properties.

In some cultures, myths tell about a first attempt at mankind, or an alternative mankind, or even several alternatives, each a different species. The leading (but not unique) candidate for the role of an alternative mankind throughout boreal and circumpolar Eurasia is the bear. Thus, animals are considered the older siblings of humans, and their treatment in the religious context reflects the family hierarchy of the group in question, where younger and older siblings have their specific roles, rights, and responsibilities. Being the "first ones," animals are considered to have a more immediate connection to the Spirit World, and often function as its emanations and messengers. In these roles they are employed by shamans.

Moreover, many stories of the Mythic Time tell of animals interbreeding with humans. It is very important to notice that in most totemic beliefs that involve the descent of a lineage from an animal, the animal is not the only ancestor of a given lineage, but is one of the proto-parents (the other one is usually either a human, or a mythic being, as illustrated by the myth of the origin of Tibetans, according to which they originated from an ape and an ogress). The totemic ancestors are not necessarily the important animals of the Creation myths. However, as in the case of the Bulagat and Ekhirit clans of Buryats (Lake Baikal area, Russia) whose totems are, respectively, Blue Bull *(Bukha-Noyon)* and a Dogfish, the totems are not the ancestors, but rather the patrons of the clans from among the animals of the creation team. Shamans usually employ as their spirit helpers not the totemic animals, but rather the animals who are/were important in the Creation myths—due to the specific powers they have, which made them so important during the Creation process.

Three Spheres and Varieties of Animal Roles

Shamans, and the practices of traditional religions in general, function as a support of the balance, or homeostasis (Hamayon 1994, 109–125) of three closely connected and interpenetrating, but nonetheless differentiated spheres of the aboriginal universe: the human sphere, the spirit sphere, and the natural sphere. The communication/negotiation may be happening in any direction between any of the two spheres to affect the third one. In the hunting ceremonies, spirits (the Masters of the Animals, who are not the animals themselves) are asked to intercede on behalf of humans to bring the game. In shamanic ceremonies, animal spirits are the helpers or vehicles who carry the shaman (or that being into whom the shaman transforms) to the non-animal spirits and gods. In many cases, a shaman has to contact the non-animal spirits to mend an offense committed against an animal by a human. Finally, in many cultures, animals are treated as the messengers or, sometimes, manifestations of the spirits (a very developed view of this type is found among the Ainu of Hokkaidō [Spevakovsky 1994 and Yamada 1994]). In particular, this view is reflected in the practice of the interpretation of the omens (often, but not exclusively, conducted by shamans) and in the sending off of the spirit of the hunted game (Watanabe 1994, 55–56). More combinations of this type may be mentioned, but they all have the three realities—the human, natural, and spirit worlds—as their variables. And in all, the shaman is a representative of the human sphere on behalf of the community.

The following are the main roles that animals play in traditional religions and shamanic practice:

1. Protector and guide
2. Totem
3. Object of shaman's (or hunter's) partial or complete identification
4. Commodity offered to the spirit(s) in the form of sacrifice
5. Messenger, sometimes a malignant spirit in the disguise of an animal, often sent by another human
6. *Nagual* (spirit-animal, protector)
7. A shaman's vehicle (to the spirit-world), such as a horse or elk

In addition, in some cultures there are a number of entirely mythic animals (e.g., Altai *kerdyutpa,* the fish-like monsters of the Underworld) whom shamans have to confront and appease during their journeys. Also, there are a number of animal-astral characters who do not play an active role in shamanizing but are nonetheless addressed and reflected in myths (e.g., Altai "Three Elk Does"—Orion constellation). There has been an ongoing speculation, that the Asian (Chinese, Tibetan, et al.) animal cycle calendar is intimately connected with early shamanistic beliefs of the inhabitants of Central Asia and China. This list is by no means exhaustive, and also each of the mentioned categories can be divided into subcategories.

Protector-Guide Animals

In some groups of Eurasia, shamanic spirit-protectors are only animals, in others they may be animals, various mythological personae, and ancestors-humans, and in others only the human ancestors play this role. However, even in the latter category (Altai shamans), animals or their spirits, although not part of the core guardian spirit retinue of a shaman, are still employed as protector-sprits and are called during the ceremonies. In Tuvan shamanism, the term *eeren,* or *ongut,* denotes the category of spirits, protectors, and guides, but not necessarily the core protectors. It has extremely complicated semantics. An eeren may be an animal spirit, or an object that is endowed with power (but not quite personified) and is used as a sacred tool. An eeren may be an animal, a mythic monster, or such a thing as a *khomu* (musical instrument), *solongo* (rainbow, or its representation), or *kuzungu* (mirror) (Diakonova 1981, 145–148).

Birds are usually related to the Upper World, deer, wolf, and elk, to the Middle World, and bear, badger, wolverine, and, especially, the snake, to the Lower World. Some animal spirits are especially valued for being representatives of the several worlds; thus, as noted, the duck or loon, representing air, water, and under-water (earth), is a shamanic guide par excellence among Finno-Ugrians (Komi, Saami, Khanty and others), Samoedians (Nentsy), and other groups.

Most (but not all) of the spirit-animals depicted on the shamanic costumes, drums, and other accessories belong to this category.

Totems

As mentioned above, totemism in Asian traditions takes many diverse forms. Usually, shamans are not involved with the totemic animals, but there are exceptions. Thus, the bear among the Khanty may be a totem and, at the same time a spirit helper of a particular shaman. Also, a vague mixture of a totemic animal, a shamanic protector-animal, and even a god, who sometimes takes on a human form, sometimes an animal form (specifically a tiger), is known in Korean Shamanism (Lee 1981, 19). In general, in the cultures that have been exposed for a long time to the great world religious traditions such as Buddhism (Tibet, Ladakh, China) the categories of animals and nonanimal spirits employed by shamans tend to merge and become vague.

Objects of Shaman's Identification

Among the Eurasian aboriginal groups, the term *soul* cannot be used as it is in Western tradition, because they typically believe in multiple "souls," or rather aspects of a human (or animal, or spirit) being. The shaman's identification with an animal is usually an identification with that animal's image, which carries a particular ability, be it sight, stamina, or ability to fly. Thus some aspect of an animal, usually not the animal in totality, but rather disparate parts such as feathers and limbs, is depicted on the shamanic costume and other accessories. Interestingly, Finno-Ugrian groups, as well as the nations of the Caucasus that have some rudiments of shamanic beliefs, believe in the "vere-animal" phenomenon (that is, the physical transforma-

tion of a human into an animal), whereas this belief apparently has not been documented for the trans-Uralic (Asian), or non-Finno-Ugric groups.

Commodities

This category is almost entirely confined to groups in which hunting-gathering patterns were firmly replaced by herding long ago. Examples of such groups are Buryats, Mongolians, Altai-Sayan Turkic groups (Altai, Khakass, Tuvan), Sakha (Yakuts), various ethnic groups of Northern China, and Koreans. The shamanic pattern among such groups is strikingly different from the shamanism of the hunter-gatherers. One of the important differences between the hunter-gatherers and the herders is their respective attitudes to what is commonly called a sacrifice. Whereas for the hunter-gatherers it always has an element of sending off the animal (who is a spiritual sibling), and the carcass of an animal is treated with utmost respect, among herders the sacrifice of a reindeer, a horse, or a sheep is, first and foremost, an *offering of valuable property* to the spirit in question. The offered animal does not have value in itself, but is treated as a commodity that the spirit would enjoy. Missionary-ethnographer Verbitsky, who worked among the Altaians in the late nineteenth century, erroneously saw the sacrifice of damaged horses to Erlik, the god of the Underworld, as the sign of people's dislike of an "evil god" (Verbitsky 1893, 62). Apparently, he did not know that, according to Altai belief, in the Underworld objects behaved in the opposite fashion, compared to the objects of the Middle World: Only things that were broken or damaged in the Middle World were whole and functional in the Underworld.

Messenger

Animals (sometimes all, sometimes just certain species) are often seen as messengers of the spirits (good or bad). Among the peoples of the lower Amur River in Northeast Asia (the Ul'chi, the Nivkh, and the Evenki), such a messenger is the Siberian tiger. His name, *amba,* means "master." His appearance may mean many things, but it is always seen as an awesome omen. Prophetically, the Russian settlers of the area use amba as a slang term for death. Even the game animal, which has been sent to be hunted, is seen as a messenger. Therefore, it is sent off in a ceremony after having been consumed (or killed). The malignant messengers, which are seen as evil spirits disguised as animals, often insects, are usually sent by an enemy shaman or a warlock. Sometimes, such animals are warlocks themselves (or one of their aspects, or "souls," is). Across the Eurasian boreal area, a bear, woken up in winter and wandering, is commonly seen as one of these spirits. For the above-mentioned people of lower Amur as well as for the Manchus, a tiger may sometimes be seen as a malignant messenger.

Nagual

This term, used by the Mazatecan in Oaxaca, Mexico, denotes a spirit-animal that is a protector of a person (whether shaman or not). The difference from other spirit-protectors lies in the fact that this type of protector is embodied in an individual animal whose life is intimately connected with the life of the protected person. The research on nagualism in Asia has been very limited, but it is possible to say confidently that such a phenomenon exists in one or another form in many of the Asian groups. For example, among the Altai, an animal and a plant (both a species and a certain specimen) are called *bayana* (or *payana*) and occupy a position somewhere between a totem and a nagual. According to the author's field data, mending damage done to one's bayana, or healing the harm done by its destruction, is one of the goals of shamanic sessions.

Shamanic Vehicle

A peculiar variation of the idea, close to nagualism, can be found in the Siberian notion, among the Altaians, Tuvans, and Evenki, of the spiritual value of the shamanic drum. Whereas in some cultures the drum is simply a tool and can be replaced by another drum, for the Altaians it is an animal, which is strongly connected to the drum's owner. The skin of the drum is usually taken from an elk, killed in a very particular manner, and the "soul" of the elk, its *pura,* or *bura,* is placed into the drum through a fairly sophisticated ceremony. The drum (or rather, its bura) is an object of suppli-

cation and sacrifice, performed by the shaman at every session. Thus, the drum (or its bura) becomes a vehicle and, simultaneously, an assistant to the shaman. Each shaman can have only a limited amount of drums during his or her lifetime. After a drum is damaged, its skin is broken to release the bura. After the last drum destined for a given shaman cannot serve anymore, the shaman is expected to die, and the skin of the drum is broken at the funeral. Despite the fact that the skin of an Altai drum is always made out of elk hide, it is often called a horse, or even a camel. The bura, in the form of an animal, is usually depicted on the surface of the drum. In both Chinese folk cults and Daoism, the notion of an animal as the vehicle for a mystic is quite prominent: This might indicate that there is a relationship between Daoism and shamanism.

Finally, in many Asian cultures, a number of entirely mythic animal figures are present in traditional religions, especially in shamanism. Although some of these human-animal hybrids, which often serve as shamans' spirits, are apparently indigenous to the culture in question, other beings are evidently imported from elsewhere. This kind of foreign origin is especially characteristic of the Inner Asian Turkic ethnic groups. Thus, for example, the Altai fish-like monster *ker-dyutpa* (depicted on the shamanic costume and confronted by shamans during their journeys to the Underworld) was borrowed from Tibetan mythology (Sagalaev 1984, 72). Most such borrowings can be traced to China, Tibet, India, or Iran. Although tracing the origins of various mythological personae imported into Asian shamanism is a fascinating topic, very little work has been done in this direction.

The theme of animals in Asian shamanism and other traditional beliefs and practices still needs much research. There are two directions for cross-cultural research in this area. The first involves research along the line of cultures' common origin. Many of the cultures of Asia are genetically related and share common mythologies, which are reflected in their practices. The second involves research in areas that share the same ecology (Irimoto and Yamada 1994). Although cultures that occupy the same or similar ecological zones (e.g., groups of the Pacific East and West Coasts) do not show any signs of being genetically related, their beliefs, especially with respect to animals, are strikingly similar. When both kinds of cross-cultural research are done, it may shed light on the often raised question: What is more likely to make the beliefs and practices of two cultures resemble each other, shared habitat or common origin?

ARCHAEOLOGY OF SHAMANISM

Shamanism is widely distributed and commonly (even if not universally) associated with hunter-gatherers. These facts have led various researchers to propose that it is not simply an ancient religious system, but also the original system of belief brought into the Americas, if not perhaps even the first religion of humankind (e.g., Furst 1977; LaBarre 1980). Research on the archaeology of shamanism has been stimulated by these hypotheses as well as by interest in prehistoric religion more generally.

Archaeologists typically investigate prehistoric shamanism using three types of evidence: (1) paleoethnobotanical data on hallucinogenic plants in the archaeological record; (2) iconography and symbolism; and (3) less commonly, other types of ritual or ceremonial remains. The first two evidential concerns are predicated on the importance of altered states of consciousness in shamanistic practice; the third is often tied to some type of ethnographic analogy (i.e., comparisons with ethnographically described rituals and beliefs of a later date). The best studies combine different types of evidence and approaches, but all confront the problem of coming up with a definition for shamanism that can be recognized archaeologically. That is, although cross-cultural studies have identified characteristics of "classic" shamanism in order to distinguish it from other magico-religious practices and practitioners (e.g., Winkelman 1992), isolating the evidence upon which such distinctions can be made in the archaeological record is a difficult task.

Paleolithic and Neolithic Eurasia

Archaeological investigations of shamanism have concentrated on Eurasia and the Americas, with an important but smaller body of work in southern Africa. In greater Eurasia they have emphasized three general topics: (a) the time-depth of Siberian and central Asian shamanism; (b) Paleolithic rock art of western Europe; and, recently, (c) western European Neolithic passage tombs. The antiquity of Siberian shamanism is important, inasmuch as Siberia is often described as the cradle of shamanism. In particular, the first inhabitants of the Americas migrated into the hemisphere from eastern Siberia, suggesting that this region may be the source for the New World shamanistic complex and, if so, that shamanism must be Paleolithic in age (over 10,000 years old) in its putative northeastern Asiatic homeland. Debate still surrounds this question, partly because the archaeological record in Siberia is little studied.

With respect to antiquity, Ekaterina Devlet (2001) cited continuities in the form of iconography on historical shamanic costumes and ritual objects (especially drums) with certain unusual burials and the iconography of Siberian rock art. The similarities she identifies suggest that shamanism dates from at least the Bronze Age (approximately 3,000 years ago) in this region. Similarly, Andrzej Rozwadowski (2001), concluded that Bronze Age (and perhaps late Neolithic) rock art in Central Asia is shamanistic. Both cases are supported by evidence for the ritual use of the narcotic cannabis, found in Bronze Age Siberian tombs dating from 500–300 B.C.E. (Rudenko 1970). But in none of these examples, nor in any others, do archaeologists propose the kind of Paleolithic age required to support arguments for a Siberian origin for New World shamanism. Whether this lack of evidence is due to the limited archaeological work in Siberia and Central Asia or, alternatively, is the case because the Asiatic-origin hypothesis is simply wrong, remains unresolved.

Two circumstances make it seem more likely that the Asiatic-origin hypothesis is wrong. For one thing, cross-cultural ethnographic and neuropsychological studies suggest that the widespread distribution of shamanism is not solely due to diffusion but instead is partly a result of independent invention based on innate human capacities (Winkelman 1992); shamanism, in other words, may not have originated only in a single region. The related circumstance involves the second major topic in the archaeology of Eurasian shamanism: the origin and meaning of western European rock art, especially the Paleolithic cave art of France and Spain. This art is exclusively associated with anatomically modern humans (i.e., *Homo sapiens,* not Neanderthal). Recent research at Chauvet Cave in the Ardèche region of southeastern France demonstrates that it was created as early as 33,000 years ago; work at other caves shows that it continued to be made until about 10,000 years ago (Lewis-Williams 2002a). Yet no evidence beyond potential cross-cultural universals suggests any direct linkage between this art and Siberian shamanistic beliefs and practices, and these cross-cultural universals may be neurobiologically rather than culturally based (Winkelman 2002).

Compelling evidence has been presented supporting the interpretation that some if not much European Paleolithic art is shamanistic in origin, and that it depicts visionary imagery (Lewis-Williams and Dowson 1988; Lewis-Williams 2002a). Foretelling detailed arguments made recently by J. David Lewis-Williams, Weston LaBarre described the art at two important French caves thus: "The dancing-shaman [at Les Trois Frères] is [not a 'god' but] a shamanic trickster-transformer; the cave artist at Lascaux perceives an unevenness in the rock wall and on this he paints the animal into existence deep in the womb of the earth. He literally only creates what he 'conceives'—out of a half-reality he has perceived" (1980, 53–54).

Important here is the context of the sites: Art in the deep recesses of the caves occurs in locations where sensory deprivation is likely, and this can easily result in an altered state of consciousness; humans are then predisposed to enter trance at the sites. More directly, the art itself is supportive of such an interpretation, inasmuch as it includes kinds, mixtures, and characteristics of motifs that, based on clinical neuropsychological studies, are known to be generated as mental images and somatic hallucinations in trance (Lewis-Williams and Dowson 1988).

Lewis-Williams's (2002a) detailed analysis of the caves suggested that they served as entries into the supernatural; and that shaman-artists engraved and painted the spirits they perceived on the cave wall or ceiling, during their visionary experiences, on that rock surface—which served as a kind of veil between the mundane and the sacred. To Lewis-Williams, the appearance of European Paleolithic rock art signals not only the first evidence of shamanism and art, but also the development of a fully modern human consciousness; one that was neurally capable of achieving trance but, perhaps more importantly, was mentally able to invest that brain-mind state with the greatest emotional and intellectual significance.

Interpretation of the subsequent Neolithic passage tombs of western Europe as shamanistic was first stimulated by the discovery of opium residues and ceramic braziers at sites dating to approximately 6,000 years ago. These finds caused Andrew Sherrat (1991) to hypothesize the existence of a cult that spread from south to north, with the inhalation of narcotics related to "mortuary rituals and communication with the ancestors" (Sherrat 1995, 28). Richard Bradley (1989) noted that the engravings on curbstones at some of these sites, such as Newgrange and Knowth, Ireland, resembled the geometric designs that Lewis-Williams and Thomas Dowson (1988) had identified in rock art as exemplary of the mental imagery of trance. Bradley noted further parallels between the mental images of trance and the designs on Grooved Ware ceramics, dating from about 4400 to 5000 years ago in southern England and found in ritual contexts. Jeremy Dronfield (e.g., 1996) reported the recovery of seeds and pollen of imported psychoactive henbane found in Grooved Ware at a megalithic ceremonial complex at Balfarg, Scotland. Based on neuropsychological analysis, he further concluded that various trance-induction techniques were employed at these sites.

In comparing the evidence for Paleolithic versus Neolithic shamanism in western Europe, Lewis-Williams and Dowson (1993) suggested a shift in the Neolithic to more politically controlled access to altered states of consciousness, toward the use of shamanistic techniques to ac-

cess spirits of ancestors associated with these grave sites. Neolithic passage tombs, then, may not have been shamanistic in the narrower classic meanings of this term, but instead may have been associated with magico-religious practices, including trance induction techniques, more similar to mediumistic and spirit possession cults (cf. Winkelman 1992).

The Americas

The prevalence of shamanism in Native American cultures and their direct ties to the archaeological record have contributed to considerable research on prehistoric shamanism in the New World. This research has emphasized two general concerns: the evidence for and the implications of shamanism among North American hunter-gatherer cultures, and the interpretation of shamanistic elements in the art and iconography of the large-scale cultures of Mesoamerica and South America.

The mescal, or red, bean *(Sophora secundiflora),* for example, was used historically by shamans in various hunter-gatherer cultures for vision questing on the southern Great Plains of North America (Howard 1957). In the Trans-Pecos region of Texas, paleoethnobotanical evidence of this plant has been found in archaeological contexts extending back to Paleo-Indian times, more than 10,000 years ago; the Texas buckeye *(Ugnadia speciosa),* whose seeds are a particularly potent hallucinogen, has been found in association with the mescal bean in a 9,000-year-old deposit; peyote *(Lophophora williamsi)* has been identified archaeologically as early as 7,000 years ago; and jimsonweed (*Datura stramonium*) about 5,000 years ago (Campbell 1958; Boyd 1998). These discoveries suggest a hallucinogenic tradition of great antiquity. This tradition has been linked to the rock paintings of the lower Pecos River region for the period of about 3,000 to 4,000 ago, as these paintings are, for numerous reasons, widely recognized as shamanistic in origin (Boyd 1998).

Further study of the antiquity of North American shamanism has occurred in the Mojave Desert, California. Four lines of evidence provide support for Paleo-Indian origins for a central component of this religious system: the vision quest (Whitley et al. 1999). The evidence includes more than 10,000 years of continuity in the creation of rock engravings (made historically to portray trance imagery experienced during the shamans' vision quests); the continuity is evident in the general rock art motifs created (including imagery linked to altered states of consciousness), as well as in four specific iconographic aspects of the dominant iconic motif; in site use; and in the use of quartz hammerstones to make the engravings.

In the last case, use of quartz hammerstones is linked to the ethnographic practice of breaking quartz during vision quests to release the supernatural power said to be present in this common mineral. This belief is itself tied to physical properties of quartz: When quartz is struck, triboluminescence (a change at the atomic level in the mineral) causes it to glow, thereby providing a physical manifestation of the rock's putative supernatural power. The almost universal association between shamans and quartz is then explained by the natural logic resulting from this physical property of the mineral, a conclusion further supported by the fact that archaeologically recovered quartz specimens commonly display evidence of battering or rubbing.

As the Pecos and Mojave examples imply, archaeological studies of North American shamanism are frequently tied to rock art research, with much if not most hunter-gatherer rock art on the continent now recognized as shamanistic in origin. Although this fact might be taken to suggest a monolithic and timeless interpretation of this art, exactly the opposite is the case. The 3,000- to 4,000-year-old lower Pecos rock art, for example, includes detailed paintings of apparent peyote rituals that are unlike rock art elsewhere and derive from ritual practice otherwise not known archaeologically or ethnographically in the Trans-Pecos region (Boyd 1998). Similarly, although the shamanistic basis for Mojave Desert rock art has been shown to extend back to Paleo-Indian times (Whitley et al. 1999), this by no means suggests that the social place of the art and the shamanism that it implies was in any way static and unchanging. In fact, the ideological role of this art and the sociopolitical position of its shaman-creators apparently changed significantly between 1,000 and 2,000 years ago, during a period of climate change and adaptive shifts, reflecting changing gender relations in societies and the emergence of bands with shaman-head-

men (Whitley 1994a). Among prehistoric North American hunter-gatherer cultures, at least, shamanism served as a unifying but not unitary symbolic and religious system.

The diversity in the expression of shamanism in prehistoric America is best seen by comparison with the large-scale cultures of Mesoamerica and Andean South America. Although the religious systems of these civilizations were not shamanistic in the classic sense, the importance of shamanistic iconography in their art and the centrality of shamanistic techniques in their ritual practices is nonetheless inescapable. With about 130 of the 150 plant hallucinogens identified worldwide found in the Americas, LaBarre (1980) has hypothesized the existence of a "New World narcotic complex." This does not appear to have resulted from unusual botanical circumstances in the Americas but instead from a very intensive and long-lasting interest in psychotropic plants taken by Native Americans, including those living in complex chiefdom- and state-level societies.

Evidence for the ritual use of hallucinogens then is present essentially from the Formative Period beginnings of these New World civilizations, starting about 3,000 years ago, and continues into the historical period, as was well-documented by the Spanish (Furst 1976). This use included a wide range of hallucinogenic plants, such as peyote, jimsonweed, native tobacco (*Nicotiana* spp.), *ayahuasca (Banisteriopsis caapi)* vine, *teonanacatl* mushroom *(Psilocybe mexicana),* morning glory *(Turbina corymbosa),* and the San Juan cactus *(Trichocereus pachanoi),* among others. Evidence also exists of other practices intended to induce altered states of consciousness, including bloodletting and the possible ingestion of psychoactive secretions from the giant toad, *Bufo marinus,* which contains bufotenine and buftalin. The various substances were smoked, snuffed, eaten, drunken, taken as enemas, administered topically to the skin and eyes, and, in certain cases, carefully mixed using specific recipes in order to achieve particular hallucinogenic effects.

The importance of these hallucinogens and the altered states of consciousness that they were used to induce is shown dramatically in art and iconography, both by identifiable depictions of the hallucinogens themselves and through representations of their effects. Mushroom stone effigies are common at sites in the highlands and Pacific slope of Guatemala prior to about 200 C.E., for example, as are stone "altars" made in the form of the *Bufo marinus.* In West Mexico, at about this same time, ceramic human and animal figurines are shown holding or eating peyote as well as taking snuff. Similarly, the San Juan cactus is shown in Peruvian sculpture, textiles, and ceramics, including examples from Chavin de Huantar, the first great Formative civilization in the Andean region, and other examples can be found in later cultures, especially the Moche, dating from the first millennium of the common era.

Equally importantly, a shamanic repertoire of symbolic themes such as mystical flight, death/rebirth, aggression, and bodily transformation is widely represented. All of these symbols are well known cross-culturally and can be linked to the somatic and emotional effects of altered states of consciousness; they were used as embodied metaphors for otherwise ineffable experiences (Whitley 1994b, 1998). Figurines and sculptures of "jaguar-priests" characteristic of the first major civilization of Mesoamerica, the Olmec of southern Mexico, for example, can be understood as conflations of humans and the predatory feline, which, throughout the lowland tropical Americas, is strongly associated with shamanic power. Humans in flight, which is to say having an out-of-body experience, are also present in Olmec iconography. Similarly, an early sculpture at Chavin de Huantar not only depicts the hallucinatory San Juan cactus, but also a standing human with serpentine hair, bird claws, and feline fangs.

Combinations of bird, reptile, and feline characteristics, sometimes also melded with human, are in fact a hallmark of shamanistic imagery for the civilizations of Mesoamerica and South America, speaking to the importance of transformation in the belief systems and ritual practices of these cultures (Furst 1976): that is, the transformation of ritual practitioners, during trance, into their supernatural alter egos. But perhaps the best expression of the shamanistic aspects of New World civilizations is provided by the Classic Maya, who occupied eastern Mexico, Guatemala and Honduras from about 200 to 1000 C.E.:

> The act of communication between the human world and the Otherworld was represented by the most profound symbols of Maya

> kingship: the Vision Serpent and the Double-headed Serpent Bar. In the rapture of bloodletting rituals, the king brought the great World Tree [axis mundi] into existence through the middle of the temple and opened the awesome doorway in the Otherworld. During both public and private bloodletting rituals, the Vision Serpent, which symbolized the path of communication between the two worlds, was seen rising in a cloud of incense and smoke above the temples housing the sculptured sanctums. (Schele and Friedel 1990, 68–69)

Shamanistic techniques and the art and imagery that resulted were not only part of the religious systems of New World civilizations, but were central to these systems, so central that they served as symbols of rulership. These systems appear to have involved a kind of institutionalized shamanism, or at least an institutionalized use of shamanistic techniques. In Mesoamerica, at least, this use involved rituals and public spectacles that implied a supernatural sanctification of rulership, pointing to the fact that, although the prehistoric connection between shamanistic power and political power may have not been complete, they were nonetheless joined at the hip; rarely did one exist without the other completely in step with it.

Southern Africa

Archaeological evidence for shamanism has been identified in many other cases in additional regions of the world, but one of the strongest bodies of evidence, and richest interpretive frameworks, has been developed for the southern San (or Bushmen) rock art of southern Africa (e.g., Lewis-Williams 2002b). Painted on rock shelters in open locations that (unlike European Paleolithic cave art) were adjacent to living areas, or engraved on open boulders in regions lacking shelters, this art provides a particularly detailed record of the San perception of the spirit world. Unlike the New World case, this supernatural realm appears to have been accessed largely through what is known as the communal Trance Dance, which was open to a large proportion of adult society. Again, due to the cross-cultural universals commonly cited in shamanistic practice and symbolism, the San art has many parallels with the shamanistic rock art of Paleolithic Europe and North America, including depictions of motifs known to be generated as the mental imagery of trance, and the use of shamanic metaphors like death and flying for ineffable altered states of consciousness.

The southern African shamanistic tradition appears to be of great antiquity, rivaling the European Upper Paleolithic: At Apollo 11 Cave, Namibia, a painted plaquette was recovered from a stratigraphic layer dated to about 27,000 years ago. The plaquette portrays a feline with plantigrade rear feet, suggesting that it is a conflation of a human and an animal; this bodily transformation indicates continuity in belief throughout the Late Stone Age in this part of the world (Lewis-Williams 1984).

Archaeological research has traditionally emphasized material culture and material aspects of prehistory. The archaeology of religion, regardless of type, is in fact a relatively new and still somewhat undeveloped concern. As the above examples illustrate, however, substantial work has already occurred, contributing to some understanding of the prehistory of shamanism.

ART AND SHAMANISM

The meaning of the terms *shamanism* and *art* has been much debated; to consider both together, then, is a challenging task. Shamanism is an academic construct: Those from the West who encountered Siberian shamans in the eighteenth century (see, e.g., Hutton 2002), and thereafter compared them with similar ecstatic priests and mediums (see, e.g., Narby and Huxley 2001), created *shaman-ism* as a generic term ascribed to a wide diversity of socioreligious practices worldwide (see, e.g., Eliade 1989). The use of such a generalizing term contributed to a tendency to ignore the diversity of practitioners,

and now, in a neoshamanic era, shamanisms are further decontextualised, universalized, and romanticized (and in some instances honored) by Westerners wanting to be shamans (Wallis 2003). The term *art* has endured a similar process of homogenization, having also emerged as a concept in the West in the eighteenth century, defined according to Kantian and Hegelian aesthetics and notions of genius, connoisseurship, and taste; in the early twenty-first century, almost any form of visual (and material) culture can be incorporated into the art dealer-critic system. Thus one can make a good case that shamanism and art have been constructed historically by the West. When these terms are applied to non-Western communities, then, as in the study of shamanic art, the approach must be self-consciously critical and sensitive to diversity among indigenous and prehistoric communities. Recent work in the field has tried to take this imperative into account.

The Problem of Defining the Terms

Scholars have yet to agree on a discrete definition of shamanism (Harvey 2002), but Thomas Dowson (1999) argued that rather than pin shamans down by going through a checklist of features, specific religious phenomena, or restrictive definitions, it might be best to look for three elements that embrace intercultural similarity and community specificity: (1) Agents consistently alter consciousness; (2) these altered states are accepted as important ritual practices by the agent's community; and (3) knowledge concerning altered consciousness is controlled as a way of seeing to it that certain socially sanctioned practices are carried out. Such nuanced consideration is also essential when considering art. Recognizing *art* as a concept created during the eighteenth-century Enlightenment, Mary Staniszewski (1995) argued the term should not be applied before this period, to such imagery as Paleolithic "Venus" figurines and Michelangelo's frescoes in the Sistine Chapel. Janet Wolff (1981) had already suggested that the production and consumption of specific visual cultures can only be understood when examined in their social contexts. Drawing on both approaches, it seems reasonable to retain the term *art* when examining non-Western visual imagery, since like the generic *shaman* it has currency, so long as (1) it is clear that it is not a fixed, nonnegotiable, value-free term, (2) indigenous art is not directly compared with Western art, and (3) the "art" in question is examined in its specific social context.

With the terms *shamanism* and *art* recognized as problematic and approaches to them developed, it becomes reasonable to consider the four principle disciplines that have proposed links between shamanism and art: anthropology, archaeology, art history, and psychology. In brief, then: Anthropologists in general have debated the value of applying the Western concept of art cross-culturally to shamanic visual culture and have developed methodologies for exploring local indigenous aesthetics. Archaeologists have proposed sophisticated methodologies that suggest that certain elements of rock art imagery (e.g., some European Paleolithic cave art, some Southern African rock engravings and paintings) and other material culture derive from the altered states of consciousness entered into by shamans. A variety of artists in the twentieth and early twenty-first centuries have called themselves shamans, or their work has been interpreted by scholars as "shamanic." Linking the interests of these three groups, via the perceived commonality of the human central nervous system and/or psychological interpretations of "mind," psychologists have referred to the art of mentally ill patients as shamanic. Clearly shamanic art has a wide variety of meanings to different people, so wide perhaps that the value of the term could be questioned. Nevertheless, it seems worthwhile to provide more detailed accounts of how these four disciplines have approached shamans and art, with reference to specific examples of perceived shamanic arts, in order to bring out the value of each approach to an understanding of both shamans and art.

Anthropology

Anthropologists have pointed out that the application of the terms *art* and *aesthetics* is problematic outside the occident (e.g., Gell 1998). In elucidating the meanings of imagery to the specific communities that produce and consume it, anthropologists often have the advantage of being able to ask the people themselves. In the context of shamanic art, ethnographic records suggest that the visual imagery is often a direct depiction of shamanic experiences. For

the Huichol (who call themselves Wixárika) in Mexico, for example, yarn paintings produced by applying brightly colored woolen threads to beeswax "canvases" portray the intense visions of the Mara'akáme (Schaeffer and Furst 1996). According to the elements common to various shamanisms defined above, the Mara'akáme are shamans: (1) they induce altered consciousness by ingesting the cactus peyote; (2) such ritual practices are supported by the community—the role of the Mara'akáme is central to community life; and (3) the Mara'akáme engage with the spirit world in order to perform essential community-related tasks; in particular the peyote enables them to "see with their hearts," promoting social well-being and cohesion.

The bright colors and kaleidoscopic shapes in the yarn paintings are a reflection of their origins in altered consciousness. Based on their formal properties alone—the tools of the traditional art historian—the meaning of Huichol yarn painting imagery is elusive. Only awareness of Huichol cosmology makes it possible to understand why Huichol artists might portray, for example, two hunters shooting a cactus. On the sacred thousand-mile pilgrimage to the land of Wirikúta (in the north-central desert of Mexico) where the Mara'akáme harvest peyote, all social conventions are reversed: Men become women, for example, the young become old, and the peyote cactus becomes a deer. When collecting the cactus, the Mara'akáme "hunt" the deer, firing "prayer arrows" into the plant. It is now clear why some yarn paintings portray the hunters and cactus as they do: The art is a literal depiction of the Mara'akáme "hunting" the deer/peyote in Wirikúta. Where the traditional methods of art history might examine formal properties and aesthetics alone at the expense of indigenous understandings, approaching Huichol yarn paintings as shamanic art in a specific socioreligious context makes it possible to understand the complex meaning of the imagery.

Embroidered artwork of the Huichol Indians, bright with colors and symbols. January 1982. (Morton Beebe/Corbis)

Since Huichol art works so well as an example with which to argue against the institutionalized concept of art, it is ironic that Huichol art has entered the Western-motivated dealer-critic system: Yarn paintings by famous Huichol artists fetch high prices on the unfortunately named "primitive" art market. In fact, anthropology itself has turned to this arena, the "traffic in [visual] culture" (Marcus and Myers 1995), as a fertile area for research, not only for understanding how the Huichol and other indigenous communities in similar situations (indigenous art is hot property across the world) are adapting actively to these circumstances, but also for better understanding the ways (post)modern Westerners are implicated in processes of neocolonialism (see, e.g., papers in MacClancy 1997). Contemporary art historians are also interested in how the dealer-critic coterie reifies canonical approaches to art (selling indigenous art as "Art," for instance), since it has developed a more self-reflective understanding of art, one that takes into account postmodern theory (e.g., Hides 1996). Although the anthropological example of the Huichol demonstrates that approaching some indigenous art as shamanic is valid, applying the terms *shamanism* and *art* to archaeological data is more controversial.

Archaeology

Use of the term *shamanism* in discussions of archaeological art is not new: The stereotypical shaman Other, whose practices are perceived as

the origins of religion, is singled out as the "artist" of that classic Other archaeological art perceived as the origins of "art"—Cave Art. Cursory references to shamanism are all too frequent in archaeological literature: In G. Speake's analysis of raptors in Anglo-Saxon "animal art," for instance, he observed that "the interpretation must be that the birds represent the mind of Odin as seer or shaman" (Speake 1980, 82). This liberal, off-the-cuff use of the term *shaman* strips shamans, art, and the material culture in question of context. To provide more than cursory comments, one must embed shamanistic interpretations of archaeological art in specific, local, community contexts. (The term "shamanistic," used here in connection with archaeological findings, indicates that our interpretation of such art can be even more tentative than more recent—and verifiable—examples of "shamanic" art.) Such an approach, aided by ethnographic analogy and neuropsychological research, has produced sophisticated interpretations of rock art.

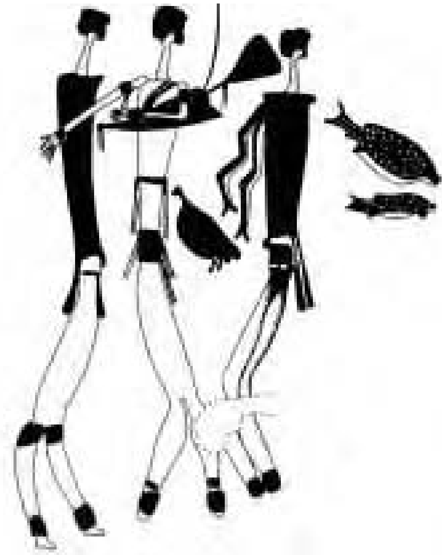
San (Bushman) rock painting, Southern Africa, interpreted as a depiction of trance dancing. (Courtesy of Thomas Dowson)

Interpretations of rock art traditions worldwide have been diverse: Rock art has been understood as art for art's sake, as information storage, and as hunting magic. Contemporary researchers tend to agree that many of these interpretations have been Western constructions and problematized insufficiently to be of value. Over the last fifteen years, however, theorizing of the approach that sees rock art as shamanistic has made an important contribution to rock art research. Southern African rock art researchers (e.g., Lewis-Williams and Dowson 1999), have reexamined rock art imagery in the region in light of ethnographic documents from the nineteenth century and anthropological records since the 1950s, both of which record the lifeways of the San (Bushmen). Central to the community life of the contemporary San and likely also to the life of their ancestors who produced the rock art is the trance, or healing dance, in which shamans alter consciousness by means of dancing, hyperventilation, and the auditory driving of monotonous clapping and singing (e.g., Katz, Biesele, and St. Denis 1997).

The altered consciousness San shamans induce is felt as a painful boiling energy called *n|om* (or *n|um*) at the base of the spine; it is considered a supernatural potency, and it rises up the spine as it increases in intensity until shamans collapse in a trance, called *!aia* (or *!kia*). To the Western observer, the shaman appears unconscious, often sweating profusely and bleeding from the nose, such is the intensity of the experience. Other shamans revive trancing shamans by rubbing them vigorously with their own sweat (said to contain n|om), and sweat is used similarly to heal the sick—sickness that, from the anthropologist's point of view, may be physical or social. Hence the trance dance facilitates community healing and is central to community life. After the dance, shamans have described how !aia was rather different from unconsciousness: Out-of-body experiences in the spirit world have been reported, during which shamans may journey over the veldt in search of game, remove arrows of sickness from the sick, and encounter spirit helpers in the form of birds and animals. It is precisely these shamanistic aspects of San lifeways that are depicted in some Southern African rock art.

One painting, for example, is most likely a literal depiction of a trance dance: A number of human figures are dancing around two central figures, leaving a circular furrow in the desert sand. Some of the dancing figures have their arms raised upwards or are bent over in postures like the trance postures San shamans adopt in the Kalahari today. At the center of the group appears to be a shaman laying his or her hands on a prone patient. A single arrow is

juxtaposed with these figures and the arrows on the outside of the group: There is little in this imagery to suggest we are dealing with real arrows or hunting magic here; rather, the arrows are likely arrows of sickness—perhaps one of these has been removed from the prone figure and expelled by the shaman. But the meaning of arrows is not exhausted by a single interpretation: San shamans describe somatic trance experiences, such as the sensation of prickly skin, as being pierced by arrows. Other shamanic experiences of San shamans are depicted in a painting showing a figure with arms that are depicted as two wavy lines and that end in fish tails, enigmatic features that may be explained by the juxtaposition of the figure with fish. Entering the spirit world is described by the San as a death, and, in one account, as a drowning (Old K'xau, reported in Halifax 1979, 55–56). Perhaps the fish here, then, and the wavy arms terminating in fish tails, are a metaphorical reference to the feeling of submerging into the spirit world, being underwater, or even drowning. Shamans also describe experiences of floating, flight, and out-of-body travel while in the spirit world, so the image of a bird may also be a metaphor for these experiences. Alternatively, the birds and fish depicted here may be examples of the spirit helpers San shamans encounter while in the spirit world.



San (Bushman) rock painting, Southern Africa: the human figure with arms that end in fishtails may depict a shaman expressing the "underwater metaphor" for altered conscious experiences. (Courtesy of Thomas Dowson)

With a strong case for shamanistic interpretations of Southern African rock art, David Lewis-Williams and Thomas Dowson (1988), noting like many before them the similarities between San rock art and the polychrome cave paintings of Upper Paleolithic Europe, propose a neuropsychological model for interpreting cave art. These authors suggest that specific (though not all) geometric shapes found in some rock art may be derived from the entoptic (within the eye) phenomena reported by indigenous shamans and Western subjects of neuropsychological experiments on altered consciousness. They argue that the commonality of the human central nervous system and entoptics derived therefrom might account for similar trance-induced images being depicted in a variety of shamanic arts worldwide; hence the similarities between them. These suggestions have been much contested, all the more so since a number of rock art scholars have gotten on the entoptics bandwagon and interpreted rock art traditions they are studying as shamanic just because of the presence of geometric, entoptic-like images. Proponents of the shamanistic approach (i.e., those scholars who find these shamanic interpretations not sufficiently verifiable) have argued against such laissez-faire applications of the neuropsychological model, pointing out that only specific geometric forms should be recognized as entoptics and that the identification of entoptics is only one part of the model—those searching for entoptics alone have neglected to apply the neuropsychological model in its entirety, thus overlooking the diversity of rock art and shamans. (For a critical review of the debate, see Wallis 2002.) With these concerns addressed, the shamanistic (that is, the more conservative) approach has been refined and developed into a sophisticated methodology for examining shamanistic art, and scholars are acknowledging its value for understanding some rock art traditions, as well as other aspects of visual culture.

Modern Art

As discussed above, the eighteenth century was formative in the development of the terms

shamanism and *art,* and perceived links between the two derive from this time. The concept of the artist as a divinely inspired but penniless genius subsisting on the fringes of society is not a world away from the concept of the shaman as a social misfit, an inspired or mad (or both) ecstatic priest plagued by "artistic" visions. Even though both concepts are misleading fabrications, and neither applies consistently across cultures, the stereotypes have endured. The link between shamans and art intensifies and is solidified in the context of modern art in the twentieth century. The poet Jerome Rothenberg has claimed that various romantic and visionary poets, including Rainer Maria Rilke, Arthur Rimbaud, and the Dadaists, all represented "Neo-Shamanisms" (cited in Wallis 2003, 26). Certainly, modern artists have drawn on the Western magical tradition (if not shamanism) to inspire their art, with works by Marc Chagall (1887–1985) and Vasily Kandinsky (1866–1944), for example, influenced by occultism, mysticism, and folklore. Kandinsky himself regarded the artist as a shaman, as, more recently, did Joseph Beuys (1921–1986).

The tribute to Beuys in the Tate Modern Art Gallery (South Bank, London) states he "was no ordinary sculptor. He was also a shaman" ("Bits and Pieces" collection display in the Landscape/Matter/Environment gallery, 2002). Beuys himself claimed that everybody is an artist, a concept that Beuys's biographer, Caroline Tisdall, in a conversation with the author of this entry, agreed may also imply that everybody is a shaman. Beuys has been termed a shaman for a number of reasons. He claimed that after the Stuka plane in which he was radio operator crashed in the inhospitable conditions of the Crimea during World War II, he was rescued by Tartars who revived him, badly burnt and freezing, with fat and felt insulation. These substances became a primary inspiration for his work: wrapping himself in felt for hours at a time, for instance, and wearing a felt trilby hat, which he always termed shamanic, during the performance of *Coyote.* He viewed felt and fat as alchemical substances, felt being both an insulator and a filter, and fat being an insulator with a unique state that fluctuates between solid and liquid.

Beuys regarded the plane crash as an initiatory experience, likening it to a death and rebirth, and he also endured a long-lasting breakdown, which he viewed as a rite of passage essential to being an artist. Beuys's words, "Show your wound," espoused the view that vulnerability is the secret of being an artist, the term "wound" here perhaps alluding to the indigenous shaman as a "wounded healer." Many of Beuys's paintings are entitled *Shaman,* and the techniques he employed to produce the drawings entitled *Coyote,* as well as the performance of *Coyote* itself (New York 1974), were certainly mimetic of shamanic consciousness-altering practices: Sometimes wrapped in an enormous piece of felt, wearing the trilby and an old pair of boots (later renamed "sulphur [another alchemical substance] boots"), and wielding a cane walking stick, which he perceived as a conductor of energy, Beuys spent three days in a room caged with a live coyote, accompanied by a tape recording of chaotic turbine sounds.

To apply Dowson's elements of shamanisms to Beuys and other modern artists to elucidate whether or not they were or are shamans is to miss the point. Not only is applying a term suited to indigenous contexts to modern Westerners anachronistic, it is more significant to consider the sociopolitical implications of the artists themselves using the term (as in the case of Beuys) or art historians and others applying the term to them (as in the case of Chagall). In both cases the use of the term associates certain "mystical" meanings or abilities with the individual concerned; connections made between artists and shamans imply that they have in common a "divine madness." In both cases, the process of comparison is part of a wider historic trend: As had happened in previous centuries, the shaman in the twentieth century was relegated to the realm of the bohemian artist.

This is not to say that appropriations of shamanisms by artists and art historians and critics are without value entirely. Beuys used art and his understanding of shamans to challenge the art world's elitist dealer-critic system: In Beuys's worldview, archaeology, the everyday (in a similar vein as Duchamp's readymades), and shamanism (particularly healing of nature, individual, society, and planet) are embraced by the term *art.* Beuys's use of shamanism in his art was self-empowering on the one hand, and a potent postmodern critique of modernity on the other. To avoid anachronism then, rather than call Beuys a shaman, one might more accurately term him a neo-Shaman.

A number of other modern artists may also be approached as neo-Shamans, as they utilize shaman-like techniques in the production of their work. Austin Osman Spare's (1887–1956) idiosyncratic system of atavistic resurgence incorporated sexual excitation and orgasm combined with will and image in a technique of ecstasy. He encountered spirit familiars (well known to shamans); he made automatic, or trance, drawings of them; and the Native American spirit "Black Eagle" was a major source of Spare's ecstatic inspiration. Similar shamanic other-than-human-helpers are evident in the artwork of Australian witch Rosaleen Norton (1917–1979). To term these artists neo-Shamans is not to construct a generalizing metanarrative across cultures, which neglects diversity and difference (whether differences between different artists, shamans, or human beings); it is rather to suggest that our understanding of these artists and their work is advanced by seeing them in relation to Neo-Shamanism.

Artists such as Beuys, Spare, and Norton differ significantly from indigenous shamans, particularly in terms of sociocultural context, but the boundary between shaman and neo-Shaman is more permeable in other instances. Some Western practitioners involve themselves in the revival of shamanisms in indigenous contexts, for example, as Michael Harner has done in his Foundation for Shamanic Studies in Siberia (Wallis 2003). Some indigenous shamans adapt their practices to the global village, as Peruvian shamans have done in adopting Catholic saints as spirit helpers. And some Sakha artists in Siberia have, in this post-Soviet era, reconceptualized shamans in their art as positive, though they were once perceived negatively. In these instances, any rigid boundaries between shamans and neo-Shamans perceived by academics are disrupted.

Psychology

The perceived divine madness link between artists and shamans was intensified in the twentieth century with the emergence and popular consumption of psychology, which has played a significant role in the discernment of relationships between altered consciousness, shamans, art, and mental illness. In the first half of the twentieth century, shamans were defined as psychotics (e.g., Kroeber 1940), a perception that was revised from the 1960s toward the opposite extreme of seeing shamans as adept psychiatrists (Groesbeck 1989). In either case, the debate concerns concepts of mind, madness, and consciousness, as well as the question of whether the similarity of the imagery some artists, mentally ill patients, and shamans produce is due to the fact that all possess a human central nervous system or to Jung's "collective unconscious." The images produced by patients undergoing art therapy, particularly the images created by schizophrenics, have been likened to the "hallucinatory" imagery of art produced by indigenous shamans, as well as to images produced by artists such as Kandinsky, founder of "pure" abstract art and the German expressionist movement.

Since Mircea Eliade and other scholars of shamanism decontextualised and universalized shamans, and where traditional art historians have promoted a similar transcendental and homogenous approach to "art" across cultures, in order to do justice to shamans, artists, and shaman or neo-Shaman artists, it is now vital to examine them as individuals, case by case, to tease out diversity and nuance. Thus psychological approaches to shamans, artists, and the mentally ill that foreground similarity at the expense of difference are problematic. It may be argued that the human central nervous system is a biological given, whereas the existence of Jung's collective unconscious is debatable, but the real question is how much these psychological approaches contribute positively to our understanding of shamanic art. The notion of entoptic imagery derived from neuropsychological research and applied in the shamanic interpretation of rock art is controversial, yet proponents of the research have developed an approach that acknowledges similarity (i.e., the commonality of the human central nervous system, altered consciousness, and entoptics derived therefrom) but foregrounds diversity (i.e., ways in which these visual percepts are interpreted in rock art imagery according to cultural differences). Jungian analysis of indigenous, prehistoric, schizophrenic, and modern art, however, tends to explain similarity in a sweeping metanarrative (e.g., Tucker 1992), precisely the kind of approach anthropologists, archaeologists, and others in cultural studies have deconstructed,

accusing it of being peculiarly Western in its simplicity and insensitivity.

The essential point is that, whether researchers explore "shamanic art" in indigenous and prehistoric contexts or in the modern West, it is vital to be sensitive to social specificity and diversity. In the modern West, it would be well to approach shaman-artists as neo-Shamans, so as to be sensitive to indigenous shamans past and present and to recognize the sociopolitical contexts and implications of calling oneself a shaman in the West. With such precautions, which involve using the terms *shamanism* and *art* critically and sensitively, the notion of "shamanic art" can be useful.

BIOENERGETIC HEALING

In New Age parlance, bioenergetics refers to certain forms of therapy, including the therapy specifically called bioenergetics; Reiki; and chakra, distance, and aura healing. These therapies deal with natural but invisible energies flowing around the human body through numerous channels, or meridians (e.g., Nudel and Nudel 2000; Oschman and Pert 2000). Complementary therapies such as acupuncture and reflexology, which also explain their healing effects by energy channels, are comparable, although "bio-energy healing" deals more specifically with noncontact techniques. The term bio-energy is used in both instances to lend an air of scientific authenticity to complementary healing techniques that are not based on Western medical science. Much jargon-laden literature exists on the subject, fusing the language of the New Age, quantum physics, and Eastern mysticism, but that does not necessarily mean that the techniques do not have healing effects. Bio-energy healers claim that the physical bodies of humans, animals, and plants contain and are surrounded by electromagnetic, or bioenergetic, fields. These energies are polarized into positive and negative bio-energies and when flowing harmonically through the body, both positive and negative forces are balanced—the body is in good health. These energy fields are in constant communication with one another through the body's network of energy channels, known variously as meridians, power centers, energetic transformers, or chakras (a frequently used term from Hindu philosophy). At times of physical or mental stress and illness, one or more of the channels may become blocked, and the bio-energy there stagnates.

It is the task of the bio-energy healer to unblock these areas, free the flow of bio-energy, and restore the body to a state of balance. Bio-energy healers also attempt to maintain the harmonic flow of bio-energy in healthy bodies, so as to prevent and avoid imbalance. Bio-energy healers suggest that all humans have an intuitive ability to sense and affect the bio-energy field with their hands and mind, but certain gifted individuals stand out as exceptionally able. Both practitioners and patients make big claims for the power of bio-energy healing, which is said to be able to relieve such conditions as asthma, prostate cancer, multiple sclerosis, and even infertility. It is not necessary for the healer to be present in order to effect a healing, since energy healing from a distance and healing using a photograph are also possible.

Practitioners of bioenergetics may claim their techniques, as a form of holistic natural healing, are ancient and traditional, but there is no evidence to link bioenergetics to indigenous shamanistic techniques. Although the engagement of shamans and neo-Shamans in postmodernity has led to certain New Age techniques (as in, e.g., Michael Harner's Core Shamanism) passing into indigenous shamanic knowledge systems, the manipulation of hidden or invisible energies of the body without contact with the body is not a significant feature of traditional shamanisms.

Indigenous shamans consistently use the spirit journey to seek out sources of illness and may battle with evil spirits, and sometimes remove spirits from a patient's body, in order to effect a cure. This approach to healing is particularly prevalent in Siberia, where the term shaman originates (e.g., Hutton 2001), but it is also found in such geographically distant areas as the Arctic and South America, where shamans may extract the spirit causing the illness by, for example, sucking through a tube placed on the skin (e.g., Harner 1990). In both of these instances, the shaman considers the

spirit-illness to be a foreign body in the patient, not a blockage of natural energies, as is the case with bioenergetics. A closer analogy to bioenergetics in an indigenous context might be San (Bushman) shamanism in southern Africa. San shamans sweat profusely while performing a trance dance, and this sweat is perceived to contain supernatural potency, so shamans rub the sweat vigorously onto their patients in order to effect healing (e.g., Katz 1982). Even in this instance, however, San shamans believe they are introducing healing substances from outside, rather than balancing naturally occurring energies within the patient.

BUDDHISM AND SHAMANISM

It is easier to explicate why shamanism is a widespread practice in Buddhist societies if common misconceptions about the Buddhist tradition are dispelled. Although Buddhism is often called an atheistic religion, it is atheistic only in the sense that it is not based on belief in an omniscient and omnipotent God; in fact, as a look at the "wheel of life" showing the different domains of rebirth will easily demonstrate, Buddhists believe that gods, demons, ghosts, and many other spirits exist, that they reside in heavens and purgatories, and that most supernatural beings can inhabit the human realm, affecting individuals. Further, although Buddhist texts counsel elite monks and nuns to ignore all of these beings, since they are irrelevant to the search for nirvana, it is important to understand that the great majority of Buddhists in every Asian community have been householders (secular people) who have not pursued nirvana, but whose main interests have been acquiring merit for a better rebirth, and using the resources of Buddhism and other cultural traditions to secure health, success, and prosperity. Though the canonical texts were written by monks and definitely focused predominantly on the monastic minority, there are canonical passages that make this division of spiritual concerns clear. The Pali Canon of Theravada Buddhism conveys this division clearly, when the Buddha instructs the good Buddhist householder to seek "The Four Conditions":

> Housefather, there are these four conditions which are desirable, dear, delightful, hard to win in the world. Which four? . . .
>
> [1] Wealth being gotten by lawful means . . .
> [2] Good report gotten by me along with my kinsmen and teacher
> [3] Long life and attain a great age . . .
> [4] When the body breaks up, on the other side of death may I attain happy birth, the heaven world!

The text then proceeds to specify how the moral and wealthy Buddhist householder should attain these goals by doing the "The Four Good Deeds":

> Now, housefather, that same Aryan disciple, with the wealth acquired by energetic striving . . ., is the doer of four deeds. What are the four?
> [1] [He] makes himself happy and cheerful, he is a contriver of perfect happiness; he makes his mother and father, his children and wife, his servants and workmen, his friends and comrades cheerful and happy. This . . . is the first opportunity seized by him, turned to merit and fittingly made use of.

> [2] Then again, the . . . disciple . . . with that wealth makes himself secure against all misfortunes whatsoever, such as may happen by way of fire, water, the king, a robber, an ill-disposed person . . . He takes steps for his defense and makes himself secure . . .
>
> [3] Then again . . . the disciple . . . is a maker of the five-fold offering (bali), namely: to relatives, to guests, to departed hungry ghosts, to the king, and to the gods (devatā) . . .
>
> [4] Then again, the . . . disciple . . . offers gifts to all such recluses and brahmins . . . who tame the one self, . . . to such he offers a gift which has the highest result . . . resulting in happiness and leading to heaven.
>
> (*Anguttara Nikaya* IV, VII, 61; Hare 1992, 75–76)

Thus, the good Buddhist householder is instructed to foster family ties, engage in "energetic striving" after economic success, and worship hungry ghosts and local gods, seeking justly earned worldly happiness and security (Powers 1995).

The pragmatic conception of the Buddha's teachings (the dharma), however nuanced in every local community, shaped the domestication of Buddhism from Sri Lanka to the Himalayas, from Central Asia to Japan. To focus only on texts designated to guide the rare meditation master or philosopher is to miss the center of Buddhism in society and the rationale for Buddhists enthusiastically supporting shamans.

The canonical texts clearly indicate that Buddhists should understand not only that gods, ghosts, and demons exist, but that they should also be taken seriously, as they can cause suffering through their powers to influence the natural world, spread disease, and foment misfortune. Thus, the understandings of the power of the gods and spirits from early South Asia were extended to other parts of Asia, though the spirits themselves often differed. In many localities where Buddhism flourished, the monastic leaders had no basis for objecting to indigenous shamanic traditions whose aim was to contact the great gods, local deities, or ancestral spirits. The only basis for conflict was the practice of animal sacrifice associated with such cults, an issue that will be discussed below.

The most dangerous spirits have been thought capable of possessing individuals, causing the body's essential elements to become unbalanced or the individual's consciousness to become deranged, even to leave the body. In addition to indigenous curative practices, the first Buddhist rituals were designed to protect individuals and communities from these and other dangers, primarily through the repetition of special words (called *mantras, paritta,* or *raksha*) bestowed by the Buddha for this purpose.

Since there was no universally acknowledged institutional locus of orthodoxy or orthopraxy in the history of Buddhism, and since adapting to local societies and cultures was encouraged from the very beginnings of this missionary faith, Buddhists creatively melded their traditions with local practices. Monastic leaders across Asia skillfully balanced their general doctrinal norms with a great variety of cultural understandings about deities, illness, and methods of healing. Acceptance of and support for shamanistic practices by Buddhist householders should therefore not be surprising.

Whatever the accommodations, however, there was no compromising with the universal Buddhist notion that the Buddha is the greatest being in the cosmos, that all deities are subject to karmic law and hence are inferior to the Buddha and Buddhist saints, and that Buddhist moral law must take precedence over local ritual practices, especially in the realm of animal sacrifices. Thus, shamanic traditions have existed—and in places thrived—where Buddhism has been the dominant culture, though their ritual practices have commonly been adapted to respect Buddhist ethics.

As for Buddhist monks, the two branches of Buddhism, Theravāda and Mahāyāna, differ significantly in distancing the monastery and monastic practice from shamanic practices. In the South and Southeast Asian culture regions, there have been a number of studies of Theravada tradition and the wider religious contexts in which it has existed that have included a study of shamanic elements. Shamanism in Sri Lanka illustrates the "southern school's" pattern of accommodation: A host of dancing and drumming exorcisms are still conducted by troupes *(kattiya)* of typically low-caste exorcism specialists *(adura),* who remove the influences

of hostile ghosts or demons from sick Buddhist patients. Thought to act capriciously and often without warning, specific demons are believed to cause specific illnesses, some potentially fatal. The five greatest exorcistic rites are similar in many respects: The chief exorcist goes into trance to divine the cause of illness; for the ritual, he (and others in the troupe) wear the demon-specific masks or makeup, enter the trance state to channel the demon's presence, then confront the patient, eliciting the family's and community's protective response; finally, the shaman plays out having the demon's malevolent presence removed by invoking the law of the Buddha. These nightlong rituals "define the character of demonic attack, and fill out and outwardly objectify the nature of the patient's subjective experience as this is culturally constructed. The movement of a patient from a condition of demonic control to a condition freed from the power of demons is presented and validated in the order of the performance" (Kapferer 1983, 60).

Buddhist monks have no involvement in these shamanic events, and in the strict interpretation of the monastic code should not even witness them. However, it is the Buddha's law, the dharma—through both its supernatural spoken power and its definition of cosmic order—that is ultimately invoked to establish the final triumph of humanity over demonic control. As illustrated in the climax of the *Sanni Yakuma,* an exorcism rite ridding a patient of the eighteen illness demons, the chief of these evil forces, the frightening Kola Suniya, is made to depart, forced to read the long-accepted *varan* (warrant) of the Buddha: "The Great Lord, Our Buddha says, according to this letter of authority . . . [to] give this mean ancestral spirit, this mean one, seven bags of rice and seven bags of food, burn him with the rays of the Buddha, chase him beyond the seven villages, beyond the seven boundaries. All the misfortunes, upset humors are over" (Obeyesekere 1969, 196).

Quite different were the Indo-Tibetan *vajrayāna* traditions of Mahāyāna Buddhism. Here, spiritual masters of tantra (called *siddha*s or *vajrācārya*s) adopted spiritual practices that incorporated shamanic elements while retaining the ancient Buddhist purpose of reaching enlightenment. The tantric meditative practice of *sādhana* involves practitioners "seizing the divine ego"; through mantra incantations, mudra hand gestures, drumming, and visualization, this sādhana practice invites the enlightened divinity to merge with the siddha and so impart both enlightenment and blessings to the practitioner.

Masters of the tantric spiritual tradition are expected to serve as bodhisattvas, dedicating their accomplished practice of channeling the divine Buddhist presence to serve others. The substances offered in carefully choreographed tantric rituals are imbued with the enlightened being's power and grace; gathered at the end, this *prasād* is a vessel of blessings that is consumed by the master's community of disciples. All schools of Tibetan Buddhism, Newar Buddhist vajrācāryas in Nepal, as well as the priests of the Shingon school of Japan, all adopted these spiritual practices and rituals that applied the master's powers to compassionately serve others.

Tantric ritualism also was integral to Chinese Mahāyāna Buddhism. Monks applied this ritual technology and control over the enlightened divinities to perform rites to satisfy the departed ancestors who were thought possibly to be reborn as *preta*s (hungry ghosts). In China, these hungry ghosts were regarded as more dangerous than in India, where the early conception was that pretas were too consumed with their own suffering to harm others. But in China, as a marker of filial piety to the departed ancestors, monks perform tantric rituals to make merit for themselves and the dead, while seeking to insure the best possible afterlife destiny for their relatives. In the five-hour evening rite called the *fang yen-k'ou* (release of the burning mouths), monk ritualists seek to draw upon the powers of the Buddha, the dharma, and the *sangha* to break through the gates of purgatory, open the throats of the suffering pretas, and feed them mantra-imbued water, making rebirth as a human being or in a paradise inevitable (Welch 1973, 186–187).

There were also tantric practitioners across the Mahāyāna culture area who were famous for their ability to exorcise spirits from the afflicted using tantric amulets, prasād, and ritual implements that are placed in contact with the body. Buddhist monastic healers were sought based upon their individual charisma and the record of their cures. These practices were regarded as praiseworthy, since healing is a direct

act of compassion and consistent with the bodhisattva monk's vow to help others while pursuing enlightenment. Although it is difficult to ascertain whether the Indic origins of these tantric practices were Buddhist or non-Buddhist, there is no doubt that later Buddhists in the Mahāyāna communities pursued them, in part, to offer a Buddhist healing practice, one that in places had to compete with indigenous shamanic curing traditions.

Such rivalry between Buddhist monks and shamans has been especially highlighted by recent studies of religion in the Himalayan region. Stan Mumford (1989) studied refugee Tibetan Buddhists of the Nyingma-pa school and the shamanic traditions among the Gurungs, a Tibeto-Burman ethnic group of the central Himalayas that had also adopted Buddhist traditions from the north several centuries ago. He shows how the traditions of Buddhism and shamanism overlap in many respects (exorcism, healing, worshipping the local deities), at times competing for support by the local merchants and farmers. In an ongoing cultural dialogue—one that likely was entered into by many who converted to Buddhism across Asia over the millennia—the Gurungs straddled these traditions, adopting to some extent Buddhist beliefs in consciousness and rebirth, yet unwilling to abandon their ancestral practice of having shamans perform "guiding the soul" rites after death and worshipping the local deities with an annual animal sacrifice. It is not the shamanic practice per se that caused conflict between these specialists, but the shaman-led annual sacrifice of a captured deer to the local deities. From the Buddhist perspective, killing an animal is like killing one's parents; from the shamanic perspective widely accepted by the villagers, if the mountain guardian deities do not receive their annual "red offering" indicating the villagers' gratitude, the rains will not fall and their life will become impossible.

Geoffrey Samuel (1993) has provided an interpretation of tantric Buddhism that helps to explain the distinctive features of the Tibetan tradition, distinguishing clerical monastic Buddhism from what he terms Shamanic Buddhism: "Vajrayana Buddhism as practiced in Tibet may be described as shamanic, in that it is centered around communication with an alternative mode of reality via the alternative states of consciousness of Tantric Yoga" (Samuel 1993, 8). In effect, the tantric monks of Tibet function as shamans, utilizing the practices and techniques of tantric Buddhism: A few utilize these methods for pursuing enlightenment; most do so to serve the pragmatic needs of the householder majority. In Tibetan Buddhism, then, both the shamanic-tantric approach (visionary, involving oral instructions from teacher) and the clerical monastic approach (discipline-bound, textually derived meditation) have been woven closely into the fabric of religious life, with the scholastic monastics such as the Gelug-pa Tsongk'apa (1357–1419) developing theories to reconcile the clerical and shamanic modalities.

CHRISTIANITY AND SHAMANISM

The concept of shamanism was borrowed from its original central Asian context by historian of religions Mircea Eliade. His intent was to define the notion of shamanism with greater precision, so that it would no longer be arbitrarily equated with magic and wizardry (Eliade 1989, 13). Eliade identified as shamanic phenomena certain basic characteristics that can occur in all religions and cultures.

Christian theological studies, on the other hand, seldom use the concept of shamanism and rarely discuss it as a component of Christian texts and tradition. For many years, shamanic activities were usually regarded as standing in opposition to Christian religious practices. The reason for this avoidance of the concept derives, at least in part, from the history of the dissemination of Christianity and is related to Christianity's rejection of magic and wizardry. There were, however, syncretistic phases in Christian religious and missionary history during which pagan influences were integrated. One such phase, for example, occurred in the sixth century C.E. when Pope Gregory the Great ordered a halt to the practice of destroying pre-Christian cult sites. But ever since the High Middle Ages and continuing into the early modern era, bloody missionary activities in Europe, the Americas, Africa, and Asia set Christianity ever further apart from the religious rites of indigenous peoples. Christian dogma became progressively less willing to accept other peoples' faiths as genuine religions on a par with Christianity.

This hierarchical attitude, along with the definition of the concept of magic, had already become firmly established in ancient times. Under the influence of the Greek enlightenment that started in the sixth century B.C.E., magic was deprecated, whether as part of religion or medicine; philosophy and the enlightened sciences rejected magic and distanced themselves from it. The so-called evolutionary view, which began during the epoch of the ancient city cultures, regarded magic as a relic of an earlier and more primitive agrarian way of thinking that had served its purpose and become obsolete (Graf 1996, 18). This rejection of magic became particularly obvious after Emperor Constantine recognized Christianity as the official state religion and ordered decapitation as a punishment for practicing magic or fortune-telling in 357 C.E. (Kieckhefer 1992, 54). Nonetheless, the relationship between magic and religion continued to be an ambivalent one for many centuries, into the middle of the medieval period. "Monks in the monasteries employed magical healing methods with which they had become familiar partly from folk medicine of the native culture and partly from ancient medicine, both of which included magical elements" (Kieckhefer 1992, 72).

Beginning in the thirteenth century, moral and theological condemnation of magic increased steadily, sometimes going as far as juridical indictment and prosecution. The Latin word for superstition *(superstitio)* carries the connotation of "a remnant of paganism." The accusation, which claimed that adherents of superstition had misunderstood certain passages in the Bible, supported a division of piety into a lower religion in opposition to a higher religion (Kieckhefer 1992, 212–213).

This division into low cultures as opposed to more highly valued cultures became still further reinforced during the Reformation of the sixteenth century and the Enlightenment of the seventeenth and eighteenth centuries and survived into the twentieth century. The history of research into the concept of shamanism reveals the influence of this tendency, with much of

the work obviously judgmental in the words it uses as it attempts to deal with shamanic phenomena. Any discussion of shamanism or magic therefore requires "critical reflection about the conditional nature of the sources as well as the scientific, metalinguistic concepts and statements" (Motzki 1977, 16).

This religious and cultural history of Christianity has interposed itself and distorted the view on testimony contained in the Bible and on the dissemination of the Christian faith during the first three centuries C.E. Closer scrutiny shows that Biblical texts are by no means unanimous in their rejection of shamanic practice. Ever since the Christian faith was first committed to writing, opinions have differed, for example, about the way the work and person of Jesus as a healer ought to be judged and about the significance of ecstasy among the prophets and early Christian congregations.

A Shamanic Reading of Biblical Texts

The breadth of variation in the texts of the Christian tradition yields no unified picture. These texts indicate above all that shamanic activities were not fundamentally rejected, as they came to be in later apologetical discussion. On the contrary, elements of shamanic practice, such as the act of healing in Christ's name or on his behalf and the ability to experience ecstasy, characterized the social work, welfare-related, and missionary activities of the early Christians during the first three centuries C.E.

In addition to orienting itself according to Eliade's criteria and viewing the testimony from a phenomenological standpoint, this understanding of shamanic practice also relies on a functional definition of shamanism. Through the special way in which shamans practice ecstasy, they also have social significance, serving the community, for example, as intermediaries between the divine and the people or as healers of the sick (Motzki 1977, 48–49).

Mircea Eliade identified as specifically shamanic characteristics the technique of ecstasy and the shamanic flight as an ascent into heaven or a descent into the Underworld. In a wider spectrum, he particularly cited the special initiations that shamans undergo, the instruction they receive in the proper ways to conduct healing ceremonies, and necromancy. Eliade also described important shamanic symbols such as the shaman's costume and drum, and the special significance accorded to the numbers 7 and 9, the world tree, and the cosmic mountain (Eliade 1989, 148–268).

In this context, it is essential to realize that the aforementioned basic forms and functions of shamanism, as well as its characteristic symbols, can all be found in the Bible with varying frequency and in different combinations (Wilhelmi 2000, 11–17). Many of these forms and functions are or were components of Jewish and Christian religion, at least during a particular span of time.

Ecstasy

Ecstasy was fundamentally affirmed in a story about Moses and Joshua (Numbers 11:16), where the spirit of the Lord came upon seventy elders of the people, who thereupon experienced a seizure of prophetic ecstasy. In response to Joshua's criticism, Moses exclaimed, "Would God that all the Lord's people were prophets, and that the Lord would put his spirit upon them!" (Numbers 11:29). Moses, who was also shown in Exodus 7 as one who magically competed with Egyptian sorcerers and who, especially in later Jewish tradition, was regarded together with Solomon as the guarantor of spiritual and magical knowledge, was shown here as a prophet who approved of ecstasy for his entire people.

The First Book of Samuel described companies of ecstatic prophets. Seized by the spirit of Yahweh, these groups of people played rapturous music upon instruments and fell into an ecstatic state of consciousness (1 Sam. 19: 20–24). The prophet Samuel described such a group to Saul and told him he would meet them prophesying and be changed himself: "The Spirit of the Lord will come mightily upon thee, and thou shalt prophesy with them, and shalt be turned into another man" (1 Sam. 10:5–6). The spirit was described as an irresistible power that transformed, overwhelmed human volition, and led to a state of prophetic ecstasy. Ecstatic experiences were also mentioned as occurring among prophets of the sixth century B.C.E., for example, Isaiah and Ezekiel.

In the New Testament, ecstatic gestures among the early Christian communities were welcomed by Paul as evidence of charisma. He described them as "speaking in tongues" (glos-

solalia) and said, "He that speaketh in an unknown tongue speaketh unto God" (1 Cor. 14:2). Glossolalia was experienced in a communal setting, but not all people were capable of doing it. The story of Paul's calling as told in the Acts of the Apostles is clearly related to shamanic ecstasy (Acts 9:1–19). Paul saw "a light from heaven," heard a voice, and was stricken blind for three days, during which time he neither ate nor drank. Guided and treated by a spiritual helper, he emerged from the ordeal healed and transformed, and afterwards bore a different name. Paul explicitly mentioned his special ecstatic gift in his First Epistle to the Corinthians: "I thank my God, I speak with tongues more than ye all" (1 Cor. 14:18). The Pentecostal story told in the second chapter of Acts likewise contains ecstatic elements.

The Shamanic Flight: Ascent and Descent in the Bible

The prophet Ezekiel deserves particular mention with regard to the second shamanic criterion, namely, the shamanic flight. Several passages in the Bible recounted how Ezekiel was lifted up into the air by the spirit and borne upon wings (Ezekiel 3:12, 3:14, 8:3, 11:1). The similarity to shamanic ascents is evident in the change of states of consciousness, the description of the visions, and the intervention of a spiritual helper in male or female guise.

Another impressive vision of an ascent with shamanic overtones can be found in the Old Testament (Money 2001, 19). Jacob's dream at Bethel, in which he saw a ladder that stretched from earth to heaven (Genesis 28:10–22) suggests the possibility of shamanic ascent, especially when it is considered in the overall context of the story of Jacob, who is sometimes described as a "trickster," and even clad in animal's pelts, albeit to fool his father into thinking he is Esau.

The New Testament mentioned an ascent into heaven by Jesus himself (Mark 16:19 and Luke 24:51, Acts 1:9–11). Perhaps intended primarily to lend credence to Jesus' divine nature, this story may have little in common with shamanic journeys. Nonetheless, the depiction of his death, its interpretation as offering salvation to souls because he has thereby carried away the sins of humankind, and his resurrection after three days all contain elements that bear strong similarity to Underworld journeys of the sort that can occur in the shamanic context.

Jesus as Shaman

The theologian Morton Smith discussed the evangelists' texts primarily against the background of shamanic criteria (Smith 1978). In particular, he also included in his research certain statements that are recorded as having been uttered by opponents of Jesus and Christianity. Smith interpreted as characteristic of a shaman Jesus' withdrawal into the desert, driven into the wilderness by the spirit of God for a lengthy period of time. Smith also called particular attention to Jesus' communication with "wild beasts and angels" during this time (Mark 1:12–13). Other passages in the Gospel according to Mark likewise indicate that the evangelist unquestioningly viewed Jesus as having powers that can be considered shamanic, as also can be noted in parallel passages in the Gospels according to Matthew and Luke, where they discuss this story (Matthew 4:1–11, Luke 4:1–13).

In these Gospels, too, the tale of Jesus in the wilderness formed the beginning of the story of his works. This episode, however, was depicted here in a far more finely differentiated manner than in Mark. Matthew and Luke likewise mentioned the spirit who led Jesus into the wilderness, but communication with wild beasts and angels went unmentioned. While Jesus was fasting in the wilderness, the devil appeared and tempted him to embark on a shamanic flight, but Jesus resisted and refused to cast himself from "a pinnacle of the temple." Jesus also denied the devil's request to change stones into bread. Thus Matthew and Luke seem to distance themselves from the shamanic practices of flight and transubstantiation. On the other hand, the evangelists either approved of similar practices or emphasized descriptions of them. Dreams and visions, for example, are given particular significance in the Gospel according to Matthew.

Supernatural miracles such as the tale of the calming of the storm (Mark 4:35–41) likewise alluded to the shamanic motif of being able to exert a direct influence on natural forces (Kollmann 1996, 272). Jesus' rebuke and pacifica-

Sculpture relief depicting Christ healing the blind man. (Araldo de Luca/Corbis)

tion of the sea and wind seem to stand squarely in the context of ecstasy and the shamanic journey (Kollmann 1996, 275).

The gospels ascribed many shamanic roles to Jesus. Especially with regard to the functional definition of the shaman as one who practices shamanic techniques, it seems reasonable to speak of Jesus and his disciples as people who practiced techniques similar to those engaged in by shamans. Several different shamanic roles can be distinguished: (1) spiritual leader and guide (i.e., guardian of the consciousness of a people or group), (2) leader of ceremonies, (3) psychopomp (i.e., companion of souls), (4) bringer of good fortune, (5) healer and helper, (6) poet, singer, performer of shamanic acts (Hoppál 2000, 100).

The texts of the Biblical evangelists ascribed many of these shamanic roles to Jesus. The very name Jesus (deliverer) expressed his role as a healer. In addition, he was also assigned the roles of savior and spiritual guide. It seems most important in this context to call attention to his unconditional sacrifice for humankind and to his social and helping acts. Healing, in the classical definition, is foremost among a shaman's various tasks (Eliade 1989, 208).

Another typically shamanic motif can be seen in Jesus' repeatedly asking people to tell him who and what they believed him to be. Shamans do not call themselves shamans (Smith 1978, 43–44). Jesus only described his acts, and he mentioned as first among them, "I cast out devils, and I do cures" (Luke 13:32). Healing the sick and casting out evil spirits numbered among the principal tasks engaged in by those who felt that they belonged with Jesus. The dualistic notion of evil and good spir-

its, a dualism that is familiar in shamanic contexts, is also present here.

Although the healing tradition of ancient Greece had long since established itself in the Palestinian world, there also existed a vital tradition of ancient Jewish magical spells and rites designed to heal and help. There even seems to have been a comprehensive collected wisdom, attributed to King Solomon, about pharmacological medications and incantations (Kollmann 1996, 137).

Some stories in the New Testament are nearly impossible to interpret unless they are considered from the point of view of religious and cultural history, in the light of magical papyri and traditions handed down from Joseph and preserved by rabbinical Judaism (Blau 1898). As an example of this, consider the passage where Jesus says, “Whosoever shall give you a cup of water to drink in my name, because ye belong to Christ, verily I say unto you, he shall not lose his reward” (Mark 9:41). The meaning of this passage is difficult to understand unless one knows that a spilled cup of water was regarded as a sign that an evil spirit had departed (Merkelbach 1996, 6).

From this perspective, it seems reasonable to reconsider and reevaluate many other passages in the Gospels. Although some passages urge that the person of Jesus not be reduced to his thaumaturgical abilities (Kollmann 1996, 379), passages about those miracle-working abilities are more numerous and more comprehensive than are passages that deal with other contents (Mark 2:17ff).

Healing Rituals in Early Christian Communities

During the first three centuries after Jesus, his adherents and opponents alike testified to the importance that healings and psychopomp work played in the missionary dissemination of Christianity (Brown 1999, 41). As early as the Acts of the Apostles, explicit descriptions were given of several cures performed by Jesus' disciples. Peter, for example, healed by means of *talitha kumi,* an ancient Aramaic phrase that means “arise” (Acts 9:34 and 9:40). Jesus too uses this spell. The healing of possessed and ailing people subsequently became a matter of course within the everyday life of early Christian communities, where such practices were regulated through the offices of the presbyters, “the elders of the church” (James 5:14–15).

Justin and Tertullian continued the tradition of these successful early Christian healings into the Roman Empire, whenever pagan conjurers, magicians, and pharmacologists failed or were too expensive (Kollmann 1996, 373). For Tertullian, it was important in whose name the possessing spirits were expelled. Tertullian reports on specific individual cases and, like Origen and others, he did not preach against the belief in spirits or psychopomp practice per se (Kollmann 1996, 374), as long as the spirit invoked by the healer is the spirit of God.

A turning point seems to have occurred during the fourth century C.E. In the context of confrontations with pagans and in the wake of Christianity's recognition as the official state religion, thaumaturgic practice declined among Christians and ceased to be a basic aspect of the Christian mission (Barb 1961). Although Christian enthusiastic and spiritual groups (e.g., Pentecostal and revivalist congregations) have arisen repeatedly throughout subsequent centuries, it was the *word* of God that came to occupy the central position in Protestant theology. Thought and thinking have continued to occupy the foreground since the Reformation and Enlightenment. Attempts were made to offer rational explanations for miracles, which were generally dismissed as more or less marginal events in the actual history of Jesus and his works. Only the general theology of the Resurrection and Epiphany remained untouched by this rationalist tendency to minimize the importance of wonder-working (Kollmann 1996, 379).

Liaisons with Foreign Religions: Motifs and Symbols

On the liturgical level of religion, motifs of the Christian faith entered into liaisons with similar motifs in foreign religions and often developed into new religions or cults. One example of this evolution is the contemporary appearance of the peyote cult. The central element of this cult is a sort of sacrament, a holy repast (Hultkrantz 1992, 270). The background of this sacramental banquet is a ritual practiced by Mexican Indians in which peyote is eaten in order to come into contact with supernatural beings. As time went on, this cult evolved into

an independent religion containing certain Catholic contents.

When symbols that have been isolated from their cultural and historical surroundings are carefully reviewed, numerous relationships can be discovered between shamanic notions and corresponding Christian or Biblical ideas. In addition to the cosmic mountain, which plays a central role as Horeb in the Old Testament and as the "high mountain" where Jesus undergoes transfiguration in the Gospels, it is above all the symbol of the Crucifix that deserves particular emphasis. Within the context of Christian religious history, the meaning of the Cross soon became divorced from its historical form as an instrument of torture. The cruciform symbol came to express the relationship between the world and the heavens as an orderly connection between God and man. The Crucifix is thus quite similar to the shaman's drum in this sense. Furthermore, many men and women shamans have had and continue to have spiritual relationships with the person of Jesus Christ and can justifiably describe themselves—often in an ecstatic state—as having "Christ consciousness."

A New Approach

A new approach to the relationship between Christianity and shamanism has evolved during the past several decades. Christian missionary theology is giving a new impulse to intercultural dialogue through the reawakened self-awareness of formerly missionized peoples of Asia, Africa, and Central and South America.

Whereas in the past the declaration of faith in Christ meant a break with tradition, the encounter with indigenous religions is now being described anew, and the one-sided, exclusively Western pattern of interpretation is no longer being continued. The situation in contemporary Korea deserves explicit mention here within the context of Protestant theology. On the one hand, evangelistic denominations have the largest number of adherents in Korea, and at the same time, shamanism thrives as a substantial feature of Korean culture. Korean theologians are formulating Korean Christianity's encounter with the country's native religions in a new way and do not necessarily regard the encounter as inherently confrontational or contradictory (Choi 1999). This view has consequences for the future evolution of Christian theology in general. In the long ignored areas of creation theology and the awareness of nature, it can offer new impulses for a more holistically oriented view of the world and humankind.

Another example of new impulses for intercultural dialogue about healing and ecclesiastical practice comes from missionary stations in Africa. After a long period of time during which a generally demystified understanding of the New Testament's text had predominated, the African cultural context led to a rediscovery of the Christian healing tradition in accord with the continent's own understanding of the nature of reality (Kahl 2001, 118). This new access also led to changes in conventional Christian theology, so that religious services conducted with the intent to heal or rituals performed with the intent of bestowing blessings are again the subject of more intensive discussion.

The history of the relationship between Christianity and shamanism has alternated between intimacy and aloofness. Throughout many centuries and even into recent times, the interpretation and exegesis of Christian texts has been characterized by an effort to distance Christianity from shamanism. Of late, however, a rapprochement has become evident, catalyzed in part by the current renewal of shamanic and indigenous traditions among various groups.

The practice of Christian counseling too is being stimulated and revivified in the context of the New Spirituality and through a return to its own early Christian roots. Renewed attention to features that are shared by both early Christianity and shamanism alike is helping to catalyze a reconciliation in the intercultural and interreligious context.

COLONIALISM AND SHAMANISM

According to the classic definition proposed by Åke Hultkrantz, a shaman is "a social functionary who, with the help of guardian spirits, attains ecstasy to create a rapport with the supernatural world on behalf of his [or her] group members" (Hultkrantz 1973). As a social functionary, the shaman is defined not merely by extraordinary personal abilities to achieve ecstasy, communicate with spirits, or affect the healing of individuals, but also by a public capacity to mediate between a transcendent reality and a particular social group. In many instances, the relevant social group for a shaman is constituted by kinship, since shamans often serve as hereditary ritual specialists for their clans. But the constitution of a community might also be determined by broader social relations within a territory. Operating as an inspirational mediator on behalf of a community, the shaman necessarily performs a range of political, social, and economic roles. Under colonial conditions, those roles are inevitably altered.

In simple terms, colonialism is the use of military and political power to create and maintain a situation in which colonizers gain economic benefits from the raw materials and cheap labor of the colonized (Chidester 2000a). Generally, colonizers come from outside of a territory, arriving as alien intruders to dominate an indigenous people, although situations of internal colonialism have also involved similar relations of domination.

Not only a system of military, political, and economic power, colonialism is also a cultural project, advancing a cultural agenda, but also entailing intercultural contacts, relations, and exchanges. Often legitimated by explicit appeals to religion, colonialism inevitably affects indigenous religious life. Following the colonial disruption, dispossession, and displacement of an indigenous community, everything changes, including the religious roles of shamans. Characteristically, in response to colonizing forces, shamans are faced with the options of extinction, assimilation, or resistance. However, more complex, creative responses have also been evident in new strategies for weaving together alien and indigenous religious resources. Although colonization has always been destructive of indigenous religion, shamans have often

played new, innovative roles as mediators, now not only between the supernatural and human beings but also between the religious worlds of the colonizers and the colonized.

Mobility, Geography, and Resources

Since they provided the original source of the term *shaman,* Siberian shamans have often been regarded as the classic type of indigenous religious specialist. However, subject as it has been to two empires, Chinese and Russian, Siberian shamanism has been shaped by a long history of colonization. That history has witnessed both political fluctuations and religious changes in the mobility, spiritual geography, and spiritual resources of shamanism.

Buryat shamanism, which was subjected to colonization by both Chinese and Russian empires, illustrates religious persistence and change, surviving persecution, but also adopting a new mobility under colonial conditions. In Buryat shamanism, ritual specialists mediated between humans and the supernatural in two ways, developing a hunter's shamanism, which negotiated access to game animals, and a cattle-breeder's shamanism, which negotiated relations between the living and the dead, the ancestral masters of the mountains. Chinese imperial states, such as the Manchu Qing dynasty (1644–1911), that supported Buddhism tended to force shamanism into a marginal position by asserting a centralized claim over material and spiritual resources. When those states collapsed, Buddhism retreated, and shamanism resurged in Inner Asian states. In these imperial religious politics, the vitality of shamanism was clearly affected by the fate of empires.

Many indigenous people living in tribal arrangements during the nineteenth century, however, recalled an earlier history of imperial power, a time in which their shamans were at the center of political power. In relation to the Chinese empire, competing religious interests could operate in the same political economy of the sacred. Although the political status of shamanism depended on the historical rise and fall of empires, shamans, Buddhist clergy, and officials of imperial ancestor veneration operated in the same field of religious references, making competing claims on access to the sky, for example, which represented the supreme symbol of political authority from all religious perspectives encompassed within the Chinese empire (Humphrey 1994, 196). Accordingly, shamanic ascent, which represented the hallmark of a shaman's spiritual capacity, also registered as an explicitly political claim.

When subjected to the force of a dominant, colonizing Chinese empire, however, shamanism was usually cut off from establishing access to centralized political power. Beginning in the nineteenth century, Buryat shamanism survived Buddhist persecutions by working out a kind of division of spiritual labor between shamans and lamas. Making no explicitly political claims, shamans assumed responsibility for healing. As the case of Buryat shamanism shows, shamans have generally been vulnerable to centralizing religious power. Although shamanism can adapt, what often survives are the most portable aspects of shamanic practice, such as techniques of healing which are not necessarily anchored in the political economy of a community, but are services that can be made available to clients wherever they might be. In colonial situations all over the world, this new mobility of shamanism has been made necessary not only by the expansion of imperial power but also by the disruption of local communities. In the process, religious mobility has become a new requirement of indigenous survival.

Although marginalized under the centralized, hierarchical power of Chinese empires, Buryat shamans nevertheless survived, even if their sphere of political, social, and economic influence was circumscribed. For Buryat shamans enclosed during the seventeenth century within the Russian protectorate, Russian colonization allowed much less room to maneuver. Although shamans were active in anti-Russian revolts, they were forced to retreat in the face of overwhelming military power. Legitimated by Orthodox Christianity, Russian colonization entailed a more pervasive project of converting indigenous people, land, and wealth to Russian ends.

As the Russian empire advanced, shamanism was systematically persecuted. In response to the colonization of their religious life, indigenous people displayed a range of strategic positions, rejecting, accepting, or selectively appropriating the Christian mission that accompanied Russian colonization. For example, in nineteenth-century Siberia and Alaska, the Chukchee disregarded the missionary mes-

sage; the Dena'ina embraced Christianity; and the Altaians engaged in selective borrowing of Christian symbols (Znamenski 1999). Although different indigenous responses were possible, Russian colonialism inevitably altered the religious position of shamans. In addition to adopting a new colonial mobility, often demonstrated by fleeing to remote places, shamans developed new spiritual geographies and new spiritual resources for negotiating with the spiritual world on behalf of their fractured communities.

Among the Khanty and the Mansi in northwestern Siberia, an indigenous political system of chiefdoms was destroyed by Russian colonization during the sixteenth century. Beginning in the eighteenth century, these Ob-Ugrian people were subjected to forced conversion to Christianity. Since they were closer to the imperial center of Russia, the Khanty and Mansi were exposed to the full range of colonizing measures developed by European states—alienation of land ownership, multiple forms of taxation, exactions by professional civil servants, and legal prohibitions on indigenous religion. Instead of adapting to these measures or inspiring revolts against Russian colonization, shamans retreated to the forests. Surviving in exile, they developed a new spiritual geography.

Like many indigenous people displaced by colonial incursions, these shamans found that the meaning of their territory, including their spiritual territory, had been fundamentally altered. In earlier practice, a shaman might have been adept at spiritual travel, but shamanic voyages generally moved on a horizontal plane from the ordinary world of the community to the places of extraordinary power associated with the forest or the sea. Under colonial conditions, horizontal movement within this spiritual geography of the world tended to be replaced by a vertical axis along which shamans ascended to the sky or descended to the Underworld. Living in exile in the forest, shamans no longer traveled to the spiritual forest, but instead they journeyed into heavenly realms and subterranean regions that were beyond the geography of this world. Since this world had come under the control of an alien colonizing power, shamans had to work out an alternative spiritual geography that transcended colonial conditions (Hamayon 1995).

New maps for the spiritual world, therefore, could be developed in colonial situations. Subjected to foreign domination, shamans all over the world found that they were suddenly in a world turned upside down, a world in which alien intruders from foreign places had become central and indigenous people were alienated from their own land. In the case of many Siberian communities, shamans assumed the responsibility for remapping the contours of a spiritual geography in such a distorted world. No longer able to draw upon spiritual meaning and power within the world, they looked to other worlds. Although the vertical axis of ascending and descending into spiritual worlds has often been regarded as a constant, universal feature of shamanism, in many cases this verticality, replacing earlier attention to the spiritual contours of a territory, might instead represent an innovative religious response to the crisis of colonial domination.

While developing new spiritual geographies, shamans under colonial conditions also appropriated new religious resources of spiritual power from the Christian mission. In northern Siberia, Yakut shamanism, which had been subjugated by Russian colonization from the beginning of the seventeenth century, displayed this indigenous appropriation of alien sacred symbols. Although the Yakut people converted to Christianity for a variety of material reasons, such as avoiding persecution or gaining tax relief, the majority had been baptized by the end of the eighteenth century. Preserving the indigenous traditions of shamanism, Yakut ritual specialists modified those traditions by introducing aspects of Russian Orthodox Christianity, including God, the Virgin Mary, guardian angels, and the promise of spiritual rewards in a heavenly afterlife. By integrating these Christian features, Yakut shamans were not merely developing a syncretism of foreign Christianity and indigenous religion. They were drawing in new, transcendent, and powerful negotiating partners in their ongoing spiritual work of securing health, prosperity, and survival for their community.

Shamanism is not merely mediation but also negotiation with supernatural forces on behalf of a community. In the case of indigenous Yakut religion, with its basis in hunting, shamans were particularly adept at negotiating with the masters of animals for the souls of

wild game. Not only expert in techniques of ecstasy, they were skilled in negotiating techniques, supplicating and imploring, but also bartering, trading, and exchanging with the spiritual world. In rituals of healing, for example, shamans could negotiate with spirits by trading a sacrificial animal for the soul of a sick person. Such negotiations with spirits were central to shamanic sessions. Aided by a principal spirit, usually an ancestral spirit, Yakut shamans conducted ongoing negotiations with the forces of the spiritual world on behalf of their clan or community.

Under colonialism, however, indigenous ritual specialists experienced a breakdown in negotiations, a shift from earlier relations of reciprocal exchange to new colonial relations based on the invasive, coercive, one-way flow of value from the colonized, who were dispossessed of their resources, displaced from their territory, and exploited for their labor, to the colonizers. By introducing new negotiating partners into the spiritual world, spiritual negotiating partners associated with the religion of the colonizers, shamans struggled to change the very terms of negotiation in ways that might restore reciprocity between indigenous people and the spiritual world.

As specialists in ritual techniques of trance, healing, and spiritual power, shamans continued to play a significant role in Siberian and Alaskan religious life, even when subject to Russian domination and Christian conversion. Sent to Alaska in the 1820s, the Russian Orthodox missionary Ioann Veniaminov (later Bishop Innocent; 1797–1879) found a Christian shaman among the Aleuts, an elderly man by the name of Ivan Smirennikov, who had been baptized into the Russian Orthodox Church, but was regarded by the local Aleutian people as a shaman because of his familiarity with spirits that enabled him to see the future, heal individuals, and locate food for the community.

Based on his investigations, Veniaminov found that Ivan Smirennikov was a "shaman, not an ordinary person." During his interview with the shaman, Veniaminov learned that shortly after his baptism in 1795 Ivan Smirennikov had been visited by two spirits who said that they had been sent by God to instruct him in Christian teachings. Over the next thirty years, the spirits appeared to him almost daily, providing Christian instruction, but warning him not to listen to the Russians or to confess his sins to their priests. Instead, he was to rely directly on the spirits, and they would grant his requests and the requests made by others through him. To Veniaminov's surprise, he found that Smirennikov had become not only a noted shaman but also an informed Christian through the mysterious intervention of the two spirits. Although Veniaminov worried that these spirits were demons, he became convinced that the Aleut shaman's spirits provided confirmation rather than competition for his Christian gospel. The two spirits, according to Smirennikov, were even prepared to reveal themselves to the Russian priest, although they chastised him for his curiosity: "What does he want? Does he consider us demons?" Accepting the orthodoxy of Ivan Smirennikov, the Russian priest nevertheless insisted that he should not be regarded among the local people as a shaman. "I told the other Aleuts who were present not to call him a Shaman," Veniaminov reported, "not to ask him for favours, but to ask God." Apparently, the shaman agreed with this resolution, since he was also convinced that his spiritual negotiating partners were not demons but emissaries of the one true God of heaven and earth (Chidester 2000b, 382–388).

Memory, Concealment, and Noise

In Christian representations of indigenous religion, we find a long history of demonizing local forms of religious life, from the expansion of Roman Catholic Christianity into Europe to the explorations and conquests of the New World. The earliest appearances of the term *shaman* in travelers' reports tended to demonize indigenous religious specialists. Having served at the court of Peter the Great and journeyed through imperial Russia, Nicolas Witsen (1640–1717) reported in his travel account, *Noord en Oost Tartaryen,* that a "Schaman" was nothing more nor less than a priest of the devil (Flaherty 1992, 23). While allegedly serving the devil and his demons, shamans were also represented as fakes, frauds, or imposters, thus combining genuine evil with deception. This mixture of authenticity and fakery made the shaman a strange contradiction—full of real demonic power, but empty of legitimate religious power—in colonial representations of indigenous religions.

Certainly, these accounts recycled classic features of superstition, which could be rendered as beliefs and practices based on ignorance, fear, and fraud, as the defining antithesis of authentic religion. Nevertheless, the depiction of shamans as authentic frauds represented a strange crisis for the ideology of Christian colonization well into the nineteenth century. Working in southern Africa during the 1830s, the missionary Robert Moffat dismissed the local ritual specialists, the Tswana *ngaka,* as nothing more than imposters, but at the same time demonized them, along with all other indigenous religious specialists, whether the "angekoks" of Greenland, the "pawpaws" of North America, or the "greegrees" of West Africa, by identifying them as the "pillars of Satan's kingdom" (Moffat 1842, 305; Chidester 1996, 192). In this formula, shamans, who supposedly were empty of any real power, were paradoxically also full of demonic power as the primary obstacles to the advance of a colonizing Christian empire.

Suggesting more than merely an alien incomprehension of indigenous religious specialists, this colonial representation of shamans as demonic obstacles, simultaneously immaterial and material, underwrote specific colonial policies of religious destruction. In the Americas, the extirpation of idolatry entailed both physical and spiritual warfare against shamans. According to Bishop Peña Montenegro in 1668, Indian shamans, who "since time immemorial had been worshiping the devil," formed "the principal obstacle to the spread of the Gospel." These sorcerers and magicians, charlatans and imposters, he argued, "resist with diabolical fervor," in order to avoid being exposed as frauds, "so that the light of truth shall not discredit their fabulous arts." To overcome these diabolical obstacles, Bishop Peña Montenegro advocated a campaign against what he regarded as fake material objects and real immaterial demons. Military action had to be taken to "destroy their drums, deerheads, and feathers," the bishop urged, "because these are the instruments of their evil and bring on the memory of paganism" (Taussig 1987, 143, 376). Destroying sacred objects, therefore, was part of a campaign against real spiritual forces of memory—the memory of ritual, the memory of ancestors, the memory of the land, or the memory of an indigenous way of life—identified by the alien logic of colonialism as an integral part of the evil, diabolical work of shamans.

In northern Siberia, shamanism was also reconfigured under colonial conditions as a work of memory. As reported by Martin Sauer, secretary to the expedition of Joseph Billings (ca. 1758–1806), which had been commissioned by Catherine the Great, the advance of colonization and Christianization had undermined the authority of once almost-omnipotent shamans. Like the Roman Catholic extirpation of idolatry in the Americas, the Russian Orthodox campaign against indigenous religion attacked the material signs of shamanism, the masks, musical instruments, and other material objects of spiritual practice. In the process, Sauer observed that their old customs were abolished (1802, 308), but the shaman was recast as the guardian of indigenous memory. Weaving together threads of indigenous continuity that had been broken by colonization, the shaman assumed a new role, which could be acquired through extraordinary acts of resistance or recalled in ordinary, everyday nostalgia for a lost heritage. Among the Yakuts, as Sauer reported, a man by the name of Aley had shown remarkable skill in avoiding the Russian conquerors and leading people to safety. By demonstrating this extraordinary power against the overwhelming power of the colonizers, Aley came to be regarded as a shaman and began to practice traditional divination (Sauer 1802, 110). As this case suggests, colonial situations could redefine the role of the shaman as defender of tribal survival, thereby creating new ways of becoming a shaman.

Under the weight of colonial oppression, however, many indigenous people could only recall the power of shamans as a lost legacy, a memory preserved but also distorted under colonial conditions. According to one of Sauer's Yakut informants who had been forcibly converted to Christianity, shamans represented traces of a lost world that only survived in memory, even if the indigenous terms of memory had been Christianized. Indigenous shamans, Sauer's informant recalled, "were observers of omens, and warned us of approaching dangers, to avert which sacrifices were made to the demons" (1802, 308). Betraying the influence of a pervasive Christian demonology, this Yakut account nevertheless located the shaman not as an obstacle to over-

The taking of Kumassi, Ashanti Expedition; the submission of King Prempeh. Gold Coast, West Africa. (Hulton-Deutsch Collection/Corbis)

come but as the dividing line between current misery and a precolonial world in which the Yakuts had been "wealthy, contented, and free." Under colonial conditions, that lost world could only be recreated in memory, a memory so fragile, however, that Sauer's Yakut informant concluded that "our former religion was sort of a dream" (Sauer 1802, 308).

In this new work of memory under colonial conditions, shamans concealed ritual objects from alien colonizers, adding another layer to the practice of concealment that was already part of the shaman's ritual repertoire. As the traveler Giuseppi Acerbi reported, Siberian shamans hid their ritual drums from Christian missionaries, in the process concealing their true religious identities from outsiders (Acerbi 1802, 2:294). Accused in colonial accounts of being diabolic deceivers, shamans actually were forced to engage in deception to preserve themselves, their practices, and their ritual objects from destruction. Secrecy, therefore, assumed new meaning under colonial conditions.

Although shamanic practices were concealed from the colonial gaze, they often registered in colonial ears as incomprehensible noise. From a colonial perspective, the sound of the shaman's drum produced meaningless noise rather than coherent music. Songs, chants, and ritual performances were often described in colonial accounts as dissonant noise. As Acerbi reported, the song of the Siberian shaman, performed in secret in the mountains, was "the most hideous kind of yelling that can be conceived" (Acerbi 1802, 2:311). Likewise, in early reports from the Americas, shamans were said to produce the "most hideous Yellings and Shrieks" (cited in Flaherty 1992, 26), while accounts from southern Africa claimed that indigenous ritual experts "sang only ha, ho, HO, HO, until one

almost lost hearing and sight because of the terrible noise" (cited in Chidester 1996, 40–41).

For colonial regimes relying upon visual surveillance, verbal command, and embodied discipline, the practices of shamans represented a kind of sensory disorganization. Inherently threatening to colonial rule, this alternative ordering of the senses was sometimes intentionally deployed by indigenous ritual specialists in opposition to a colonial domination. In the Eastern Cape of southern Africa during the late 1830s and early 1840s, a Xhosa diviner by the name of Mngqatsi conducted regular rituals outside the British colonial settlement of Grahamstown, frightening the settlers with loud drumming and chanting. Often performed on Sundays, these rituals sought to disrupt the religious order of colonialism (Chidester 1992, 43). During the 1920s in central and southern Africa, anticolonial noise was transposed into a Christian idiom, under the influence of Pentecostal missions, in the practice of *chongo,* all-night sessions of loud drumming, singing, shouting, and speaking in strange tongues. Although chongo was nothing more than "gibbering, shivering, and generally mad fits," according to colonial administrator Charles Draper, his attempt to suppress this religious activity suggests that the sounds of shamanic ecstasy could be perceived as threatening colonial authority and control (Fields 1985, 156). Occasionally, shamans were involved in explicitly anticolonial movements and revolts (Capeci and Knight 1990). Their mere existence, however, represented a wild space beyond colonial control.

Wildness

In colonial situations, shamanism can be located in struggles over the meaning and power of wildness. Drawing on a long history of literary and pictorial representations of the "wild man," European colonizers generally saw shamans as the wildest among wild people. As a hunting religion, requiring familiarity with wild animal spirits, shamanism has been perceived as essentially wild, but only from the perspective of a social order based on animal husbandry and settled agriculture. For colonizers based in metropolitan centers of empire, shamanism represented the wild, dangerous, and disruptive antithesis of urban order.

As the opposite of domestication, wildness has often appeared as an indigenous category. Throughout southern Africa, for example, indigenous African religious life was organized by a structured opposition between the domestic space of the home, which was sanctified through relations with ancestors, and the wild space of the forest, bush, or desert, which harbored wild, dangerous, and evil forces. Operating between the domestic space and the wild space, African ritual specialists invoked ancestral spirits to protect the home against evil forces of the wild. Often, those evil forces were identified with witches, those antisocial agents who drew upon the dangerous power of the wild space. When colonial governments intervened to stop the detection and exposure of these agents of evil, indigenous ritual specialists could only conclude that the colonists were in league with the witches, colluding with these wild forces to disrupt the stable order of the ancestral home (Chidester 1992, 4–5).

In precolonial Andean religion, shamans also moved between domesticated order and the wild forces associated with the forests. Under the Inca empire, the shamans of the highland, who assumed religious responsibility for maintaining social order, stood in contrast to the lowland shamans of the forest, the wild, dangerous, and sometimes rebellious specialists in techniques of ecstasy (Taussig 1987, 99, 236–37). In the highlands, *kubu* shamans tended to comprise a small elite, the "owners of the chants," skilled in the regular rituals of the life cycle, social relations, and political stability. In the lowlands, *payés* (or *piais*) shamans formed a more egalitarian, decentralized network of religious practitioners, gaining extraordinary power through rituals of trance and spirit possession, aided by hallucinogens, power that could be used in healing, hunting, or warfare. The lowland shamans were conversant with *auca,* "the wild." Challenging the centralized political power of the highlands during the era of Inca sovereignty, these wild shamans of the forest were also at the forefront of religiously inspired rebellions against Spanish colonial authority. During the nineteenth century, shaman-prophets, identifying themselves with Christ as the "*payés* of the Cross," organized messianic movements in opposition to both foreign domination and indigenous shamans of the highlands (Hugh-Jones 1994, 47–49). As

these religious rebellions suggest, anticolonial resistance can also address indigenous tensions between religiously sanctioned social order and the religious power of the wild.

In colonial engagements with wildness, indigenous and alien categories generated hybrid productions of meaning and power. Although wildness defied colonial control, many colonizers, following the novelist Joseph Conrad into the "heart of darkness," were both repelled and attracted by the "mysterious life of the wilderness that stirs in the forest, in the jungles, in the hearts of wild men" (Conrad 1973, 9). As the wildest of the wild, the shaman was a focal point of colonial fear and fascination. Despite colonial policies of opposition, European settlers on colonial frontiers were known to consult indigenous shamans for healing or divination, although these intercultural exchanges have been largely neglected in the history of shamanism.

Today, they still consult. For many scholars in the academic study of religion, following Mircea Eliade's classic text, *Shamanism,* the shaman exemplifies premodern religious experience, cultivated by "archaic techniques of ecstasy," a spirituality however that has been irrecoverably lost in modernity (Eliade 1989). For enthusiasts of New Age spirituality, including self-proclaimed "white shamans" in the United States, the shaman exemplifies postmodern religious experience, available to anyone, anywhere (Noel 1997). By signing up for guided shamanic tours, which take spiritual tourists to meet with shamans in Siberia, Africa, or the Amazon, anyone can be initiated into the wild spirituality of the shaman. Between the premodern and the postmodern, the realities of colonialism anchored the religious practices of shamans within specific relations of meaning and power. Acting on behalf of a community, even when that community was displaced and dispossessed, shamans developed new religious strategies, not only for preserving archaic techniques of ecstasy, but also for exercising new capacities for memory, concealment, performance, translation, and transformation in negotiating indigenous religious survival under difficult colonial conditions.

CORE SHAMANISM AND NEO-SHAMANISM

For centuries, both in Europe and North America, people have been on spiritual quests for meaning, transcendence, and healing. This search has become more intensive at various times in history, and the modern mystical movement (Townsend 1988) of the late twentieth and early twenty-first centuries is one of the most recent examples.

Within the mystical movement there are two forms. In group movements people are subject to that group's doctrine; individualist movements are structured as fluid networks—individuals create their own meanings based on a variety of sources (Townsend 1999a, 224). Modern individualist movements include the following broad categories:

1. New Age, which emphasizes such things as trance channeling, tarot, reincarnation beliefs, and astrology
2. Neopaganism, positive witchcraft, Wicca, Goddess religion, and groups that focus on the earth as a living organism
3. Modern shamanic spirituality, consisting of Core Shamanism and Neo-Shamanism

Those who practice Core and Neo-Shamanism object strongly to being included within a generic New Age category. Although some practitioners, especially of Neo-Shamanism, do overlap with Neo-paganism and occasionally with New Age, to include them as merely one subset of a larger category seriously obscures the uniqueness of these explorations.

Core and Neo-Shamanism are especially appealing for people on quests for transcendence and healing because they offer the potential for direct contact with the spirit world. At least part of their inspiration is drawn from "traditional shamanism," a term used here to designate shamanism practiced in a society over a long period of time and considered a continuous cultural presence (Hoppál 2000, 89). Traditional shamanism can be observed among some indigenous societies in various areas of the world, particularly the Arctic and Subarctic, North America, and Asia; it occurs within a variety of cultures and belief systems. (For a detailed discussion of traditional shamanism see Townsend 1997a). Consequently adaptation of aspects of shamanism into Core or Neo-Shamanism by people within modern Western belief systems is a comparatively simple matter (Brunton 1999, 233; Harner 1980; Townsend 1988).

Belief System

The belief systems of Core Shamanism and parts of Neo-Shamanism are similar. Their paradigms maintain that sentience and interconnectedness permeate the universe. Like traditional shamans, Core and Neo-Shamans believe that there are two realities: the ordinary material reality of conscious, waking life and alternate (nonordinary, or spiritual) reality, which is peopled by spirits, souls of the dead, deities, transcendent powers, and other entities. Usually alternate reality is conceived of as having three layers: the Lower World, the Middle World (which occupies the same space as ordinary reality), and the Upper World. By entering an altered state of consciousness one can travel in alternate reality to various levels of the spirit world to gain knowledge and help and healing for people in the material world. Further, what

happens in alternate reality can affect material reality (Townsend 1988; 1997a, 437).

Very important in addressing Core and Neo-Shamanism is the fundamental epistemological quandary dealing with questions of the source of misfortune (and evil, if such exists), death and the afterlife (if there is one), and the nature of reality: whether there are deities and spirits separate from the individual, or whether the individual is part of an undifferentiated oneness. These crucial questions underlie many of the beliefs and actions within the movement.

Traditional shamanism is clearly dualistic, though it has animistic elements, as well a belief in interconnectedness at some level. Humans, deities, and spirits are independent entities, and their relationships with each other often reflect worldly social interactions. Those relationships can sometimes be seen as a cosmic battle with evil in the form of dangerous spirits and witches. Core Shamanism, which is also dualistic in the sense that spirit and matter are distinct, does not stress the good/evil dichotomy of traditional shamanism, although that dichotomy is present. The emphasis in Core Shamanism is on helping and protecting one's self and others. One of the prime rules is *not* to use shamanic knowledge to attack or harm others; that is sorcery and is forbidden. In advanced Core Shamanism, ways to guard against intentionally or unintentionally caused dangers are addressed.

This dualistic perspective contrasts with much of Neo-Shamanism, Neopaganism, and New Age, all of which have monistic or pantheistic approaches to reality. The universe is usually conceived of as friendly or benign; there is no dichotomy between good and evil. Another aspect of the contrast of traditional shamanism and Core Shamanism with Neo-Shamanism, Neo-Paganism, and New Age is epistemological. It concerns the source of authority. For traditional shamanism and Core Shamanism, knowledge and direction come from spirits. For the others, knowledge and direction come from "within," from one's higher self, inner voice, or inner wisdom. It should be noted, however, that within Neo-Shamanism, Neopaganism, and New Age there is a range of beliefs on these matters. In keeping with the individualistic stance, one's personal epistemology may vary to some extent from generally held positions.

History

The two primary catalysts for modern shamanic spirituality are Carlos Castaneda and Michael Harner. Beginning in 1968, Castaneda wrote a series of books describing the beliefs and the magical practices of Don Juan, supposedly a Yaqui (of northern Mexico) *brujo* (sorcerer or witch). Particularly fascinating to readers were Don Juan's journeys into alternate reality. Although the validity and authenticity of Don Juan and his adventures have come under severe questioning, and most knowledgeable people feel that Don Juan was a figment of Castaneda's creative imagination, his works still make an impact on the Neo-Shamanism segment of modern shamanic spirituality.

Michael Harner is a professional anthropologist who conducted extensive research in shamanism and other aspects of the Conibo and Shuar (Jívaro) cultures of Amazonia in the late 1950s and 1960s and undertook further research among other societies that had shamans. He began to give workshops in Core Shamanism in the mid-1970s and published his definitive *Way of the Shaman* in 1980.

It was not long before a range of so-called teachers, medicine men, ersatz shamans, and others who supposedly had esoteric shamanic knowledge began to offer their versions of the new shamanism. Still, Core and Neo-Shamanism are the main forms of modern shamanic spirituality.

Both forms are leaderless, in the sense that there is no ongoing controlling presence of an individual; no one is a "guru" who dictates what one can or cannot do or believe. There are a few minor organizational structures around an individual who has created a specific method or ritual system (for example, Brant Secunda's Dance of the Deer Foundation and Michael Harner's Foundation for Shamanic Studies, mentioned below), but they are very limited in their controlling ability. Leaders in this movement are for the most part simply knowledgeable people who organize and teach workshops, lead pilgrimages, and help perpetuate the broad general character of the version of the movement they support.

Core Shamanism is a conservative, purist approach to shamanism. Neo-Shamanism uses metaphorical images and idealized concepts of shamanism, which are often joined with beliefs and diverse rituals that have little to do with tra-

ditional shamanism. There are some areas of overlap between the two forms, but their foci are distinct. The leaders of Core and Neo-Shamanism work within their own system. Seekers are often more versatile (Townsend ms).

Core Shamanism

Michael Harner is the creator and remains the prime mover of Core Shamanism. It is an experiential method based on his ethnographic research, a method that distills the core elements that have real time depth and are found in traditional shamanism cross-culturally. It creates no additional mythology or theology, nor does it incorporate specific beliefs, ceremonials, or other aspects of any indigenous people's culture, although specific ethnographic examples may be referred to as illustrations in teaching (Conton 2000; Harner 1980; Townsend 1999a, 1999b, ms). Consequently, it should not be accused of stealing the spiritual traditions of indigenous peoples. The method is taught in workshops given by Harner or those certified by him; the workshops teach both introductory and advanced methods.

The basis of Core Shamanism is the journey into alternate reality, through the stimulus of drumming. Drum beats vary between about 205 and 220 beats per minute according to the needs of the journeyer (Harner 1980). Hallucinogens are never used, and it is this drug-free aspect of attaining an altered state of consciousness that has made the method especially appealing. In alternate reality journeyers can contact their helping spirits as well as other spirits and the dead, explore the reaches of alternate reality, gain knowledge, and heal others with the assistance of spirits. Traditional shamans' power, and the power of shamans trained in this method, lies in the ability to contact spirits and enlist those spirits to help them accomplish their goals (Townsend 1999b, 115).

Harner eschews becoming an authoritative guru and encourages seekers to discover their own paths through journeying and to learn what lies in alternate reality from the spirits (Townsend 1999b). The real teachers are those in alternate reality; he provides only a method of contacting them. For the conscientious Core Shamanism student, this approach provides a freedom to learn directly from spirits. At the same time, it opens up a freedom to diverge from the pure Core Shamanism method and incorporate unrelated systems.

The journey differs from other methods of altering one's state of consciousness. Loud rhythmic drumming strongly contrasts with quiet meditation, guided imagery, or chanting. Both Core Shamanism and traditional shamanism stress the *reality* of alternate reality and *seeing* in that reality. Meditation and other methods usually consider visions as some form of illusion or as originating in the mind of the seeker rather than actually existing in any alternate reality. There is considerably more interaction with spirits in Core and traditional shamanism. In meditative systems, if spirit illusions are dealt with at all they are considered unimportant or a nuisance (Townsend ms). Leilani Lewis (1991, 3; also Grimaldi 1997, 4–9) observes that the journeyer sets the objective of the journey; the journeyer is not guided or "pre-programmed" by an instructor. The teachers one meets in alternate reality are actual spirits, not one's "inner self."

As in traditional shamanism, the belief is that illness is caused by the loss of a spirit helper (such a helper being essential if one is to survive), by soul loss, or by spirit intrusion. It is the healer's job to travel to alternate reality to retrieve the patient's spirit helper or lost soul and return it. If the problem is intrusion, the healer must go into alternate reality in order to determine the cause and then remove it, usually by the traditional shamanic method of sucking out the object and disposing of it. Core Shamanism and traditional healing techniques require considerable effort and focus (Harner 1973, 1980; Grimaldi 1997; Townsend 1997a).

In 1985 Harner established a nonprofit educational Foundation for Shamanic Studies. With proceeds from workshops and memberships, the foundation sponsors basic and applied shamanic research in areas where traditional shamanism is threatened. The goals are to salvage shamanic knowledge before it disappears, and where possible assist existing shamans in the preservation of their traditions. With regard to the latter, some shamans in Siberian, Native American, Inuit, Saami (Lapps), Nepalese and other societies have petitioned the foundation to help them to regain and perpetuate their systems. While it is unlikely that lost or fading traditions can be regained in their entirety, reviving and develop-

ing what remains can also contribute to a resurgence of ethnic pride and meaning (Townsend 1999a, ms).

While active face-to-face "groups" are not a formal part of Core Shamanism, small drumming circles do exist almost anywhere Core Shamanism is taught. These groups are autonomous, and although they are sanctioned and encouraged by Harner and his foundation, the foundation does not control them. People who have taken at least the introductory course may meet weekly or once or twice a month for journeying using drums and for healing. Some have considerable time depth, having been active for a decade. In 2000, foundation-recognized drumming circles existed in thirty states in the United States, with the east and west coasts having the largest number. Drumming circles also existed in six Canadian provinces, Argentina, Belgium, Denmark, England, Finland, France, Netherlands, Scotland, Sweden, Japan, Australia, and New Zealand (Conton 2000; *Shamanism* 2000: 94–96). In the Germanic countries in 2001 there were fifteen to twenty drumming circles in Austria, ten in Germany, and fifteen in Switzerland (Harner, personal communication, August 2, 2001).

Some people take Core Shamanism workshops and remain completely within that system. Others also become involved in diverse activities and move toward some version of Neo-Shamanism or Neopaganism. In that case the Core Shamanism method then becomes merely one of many elements employed (Townsend 1999a, 225).

Neo-Shamanism

The amorphous, eclectic nature of Neo-Shamanism makes it difficult to characterize. In contrast with Core Shamanism, there is more emphasis on rituals, other often nonshamanic activities, and a tendency to incorporate aspects of Neo-paganism and aspects of New Age. Authoritative sources are diffuse. Castaneda never taught, except to a small group near the end of his life, but many have been influenced by his books. Other sources of inspiration are workshops, the Internet, and a plethora of literature. Although Neo-Shamanism draws from some traditional shamanism, it emphasizes Western idealized and metaphorical images of the shaman as an all-wise hierophant, a mystic, a guardian of the earth. The shaman exists within a broader idealized unchanging "primitive" or "native" ethos. These important symbols, "nature," the "native," and the "primitive," exist within the old ideology of romanticism, which encourages searching for spiritual guidelines among indigenous peoples, especially Native North Americans (Townsend 1999a, 228; ms). In contrast to practitioners of Core Shamanism, Neo-Shamans tend to rely on calling spirits to them rather than undertaking journeys to spirits in the spirit world. This approach reflects Neo-Shamanism's greater involvement with real or assumed Native American cultural systems. Healing of one's self or others may be undertaken. Healers may use rituals or other techniques in addition to or instead of traveling into alternate reality.

A variety of pseudoindigenous "shamans," "medicine men," and others claiming access to esoteric knowledge have become more active recently, conducting workshops or giving talks. Another recent prominent feature is the pilgrimage in which a group of seekers is led to "points of power" or native villages. There they perform "shamanic" rituals, hoping to gain more spiritual empowerment and perhaps get in touch with their "heart's spirit." Some of these activities take on an element of New Age practice. Pilgrimage destinations include Mount Shasta in California, the southwest United States, Mexico, Hawaii, China, Tibet, Nepal, Alaska, and southern France.

Related to the pilgrimage is the use of psychoactive compounds to induce altered states. Recently some Neo-Shamans have begun to travel to the Amazonian area, either on their own or as part of a pilgrimage led by someone claiming to be a shaman. There they experiment with various hallucinogens, including ayahuasca (*yajé*), amanita muscaria mushrooms, and San Pedro cactus. Concerns have been expressed regarding the dangers of the uninformed use of such drugs, particularly in the hands of ersatz shamans (Townsend 1999a, 228–229; see the journal called *Shaman's Drum* for papers addressing the phenomenon).

Modern Shamanic Spirituality

Modern shamanic spirituality as a whole is a democratic movement; authority is vested in each individual because sacred knowledge is

held to be experiential, not doctrinal. Individuals can create personal belief systems based on information gained from spirits during journeys and from workshops, literature, and other sources. In a movement such as modern shamanic spirituality, it would be almost impossible to limit access to sacred knowledge because of the variety of media and network information systems available, the individualistic nature of the movement, and the fluid relationships between leaders and seekers (Townsend 1999b, 117).

There is a continuum in modern shamanic spirituality from the deeply sincere to the dabbler who searches for the newest esoteric fad. "Traditionalists" adhere to Core Shamanism with minimal additions. "Modernists" blend Core and Neo-Shamanism, some elements of traditional shamanism, and additions from other healing and spiritual practitioners. Rather than trying to follow traditional shamanic systems closely, modernists focus on applying an idealized, often invented, form of shamanism to daily life and to psychotherapy. At the far end of the continuum, "Eclectics," the more extreme segment of Neo-Shamanism, glorify the idealized "native" and "shaman" and integrate a range of unrelated, often invented rituals and beliefs not related to shamanism such as chakras, astrology, and crystal healing. Some eclectics consider themselves to be shamans; some, such as artists or other "creative" individuals, suddenly realize they are shamans, although they were not previously aware of it. Included in the eclectics are the "wanna-bes"—those who "want to be" Indian—who try to involve themselves in indigenous cultures, enjoy dressing up like idealized Indians, and take on pseudo-Indian names such as Running Fawn or Brave Wolf. These practices raise the ire of the native people. These last two types may also include aspects of Neopaganism in their world view (Townsend 1999a, 225; ms).

Nonviolent nativistic, eschatological, apocalyptic, and millennial themes (Townsend 1984) appear in modern shamanic spirituality, as they do in Neopaganism. Humans and the earth are in grave danger. This is partly due to the West's loss of transcendent awareness and loss of connection with nature and the spirit world. These crises must be dealt with quickly, or there will be a catastrophe. "Shamanic cultures" have retained this connection and are the keepers of the mystical knowledge that will prevent catastrophe and create a saner world. Part of the mission of modern shamanic spirituality is to prevent the world's destruction by rekindling the lost spiritual awareness. This mission entails learning from indigenous people and carrying on activities in the spirit world that will save our material world (Townsend 1999b, 116–117; ms). The current global warming fears and other environmental problems have added fuel to this concern.

Spread of Core and Neo-Shamanism

In the past people who held beliefs that deviated from the accepted norm gave up their beliefs, kept quiet, or were ostracized. They might retain their beliefs if they found others nearby who shared them. Today there is more openness to deviant beliefs, and face-to-face verification of beliefs is not necessary. Modern shamanic spirituality is a fluid network. One can gain access to new beliefs, to a virtual community, and to belief verification through a plethora of books, magazines, specialty bookstores, radio and television programs, workshops, pilgrimages, and most recently and importantly, the Internet. Web sites provide information, chat groups, e-mail, and lists to which one subscribes in order to discuss relevant issues, rather than simply being on the receiving end. Strong cyber-friendships are sometimes formed. The Internet reaches throughout the world, and so supports the globalization of the movement, which appears to be expanding exponentially (Townsend 1997b). Although the development of both Core and Neo-Shamanism seems to have initially stemmed from North America, as a result of all these factors they have rapidly spread through much of the First World.

In Europe, especially in Germany, a form of "Scientific Neopaganism" and Nordic pagan revivalism has been evident since at least the 1920s (Poewe 1999). In the last thirty years, partly from a desire to find a spiritual heritage in one's own culture and partly because of indigenous people's anger at real or assumed usurping of their traditions, there has been a rise in the search for European shamanic traditions, notably Nordic and, most recently, Celtic.

Harner began his European teaching of Core Shamanism in Germany in 1978 and continued his personal activities there until 1985. Core Shamanism actively continues in the Germanic countries today (Harner, personal communication, August 2, 2001).

During the middle 1980s some people claiming to be North American Native shamans or medicine men of various kinds traveled in Europe professing to teach "Native American wisdom." The alleged medicine man, Rolling Thunder, who claimed to be Shoshone or Cherokee, held a seminar there. Another ersatz spiritual leader, Harley SwiftDeer (supposedly of Cherokee and Irish heritage) who came to Europe about 1984, seems to have developed a particularly large following, which has continued through 1997 (Kehoe 1990, 201; Lindquist 1997, 25–48). These people purveyed pseudo-Native American rituals such as sweet grass, the Sun Dance, and other conglomerations of pieces of Native American rituals and newly invented ones.

In Scandinavia, especially Sweden, the desire to integrate Nordic shamanism with Core and Neo-Shamanism has been especially strong. The Swedish Association for Nordic Shamanism—Yggdrasil (world tree)—was created in the mid-1970s and has published its magazine *Gimle* since 1976. The first issue briefly commented on a Nordic kind of shamanism and gave a complete list of Castaneda's books. Early issues also included information on non-shamanic traditions, including Druidism, the Arthurian legend, Hinduism, Yoga, and Tantra. In 1982 Yggdrasil became more directly associated with Nordic shamanism, especially the Nordic *seid,* or *sejd,* a séance used for divination and problem solving. No journeys to alternate reality were undertaken until Michael Harner visited in 1983 (Lindquist 1997, 23, 29–31, 131–174). In 1986 his representative in Denmark, Jonathan Horwitz, began teaching and has been particularly influential. In 1993 Horwitz's association with Harner was severed, and he has continued to teach on his own (Lindquist 1997; Harner personal communication, August 2, 2001). Presumably he still adheres to much of Core Shamanism.

Core and Neo-Shamanism manifest differently in Europe than in North America. Boundaries between the two seem blurred in Europe. Some take Core Shamanism workshops and continue within that movement, but it appears that there is a greater tendency in Europe to combine Neo-Shamanic systems, Nordic or Celtic "shamanism," and Neopaganism. Then the blend is lumped under the rubric of Neo-Shamanism. Of course, there is a strong feeling among the North American Core-shaman participants (and especially Michael Harner) that there are major distinctions to be drawn; Core shamans do not want to be classed with the larger, more amorphous Neo-Shaman movement or other spiritual forms in North America or in Europe.

One of the distinctions between North American and European, particularly Swedish, activities is the greater degree of face-to-face interaction in the latter. In North America, Core shamans tend to work independently or to participate in small drumming circles, usually of about eight or ten, discussed above. In Sweden, however, there seems to be a tendency to form some more formal groups.

For most Swedes, Core Shamanism, particularly the journey, is one of the tools used; then rituals are added, including annual Nordic celebrations and practices presumed to be Native North American, such as sweat lodges, sun dances, vision quests, and so on. The practitioners join with others to create local communities and establish sacred localities within a local shamanic cultural milieu (Lindquist 1997; Harner personal communication, May 17, 2001). Harner agrees that it is likely that the Scandinavian version of shamanism is not pure Core Shamanism as he teaches it but is a merging of Nordic mythology and rituals with some input from the itinerant alleged Native North American medicine men who traveled in Europe (Harner personal communication, August 2, 2001).

Unfortunately the ersatz teachers of "authentic" Native American shamanism and their ritual and belief systems have made a major impression on not only Europeans but also North Americans. This influence has created tremendous anger among many Native Americans. Further, some of these inventions have found their way back to Native people, who at times take them to be "real," "traditional" Native spirituality with considerable time depth. There is a danger that these inventions may become fixed in the literature as valid ancient traditional Native spirituality rather than recent

inventions, a few of which may hold some value for the Native people (Townsend 1999a).

Globalization

U.S. citizens still make up the majority of practitioners of shamanic spirituality, although precise numbers are almost impossible to obtain. Membership lists of the Foundation for Shamanic Studies may give some idea of the numbers of those in various geographical areas who are deeply involved. Of a total of 1,696 individuals who volunteered to allow their names to be listed on the 1994 membership list, 86 percent were Americans and 13 percent were from the rest of the world (Canada, Mexico and Central America, South America, Europe, Middle East, Asia, Australia, and New Zealand). A tentative estimate based on a small sample from one shamanism Internet list, which draws from Neoshamans as well as Core shamans, indicates that non-Americans represent about 25–28 percent of the active list participants. The total number of subscribers to the Internet list (both participants and lurkers) is difficult to ascertain. Those who actively participate are probably only a fraction of those who subscribe to the list. Where nationality could be determined, countries represented on the list were the United States, Canada, Norway, Denmark, Finland, Britain, Russia, Portugal, Australia, South Africa, Brazil, and Argentina. There are many other lists, chat rooms, and Internet sites, so these figures are only a very gross approximation (Townsend 1997b). Lindquist's (1997, 288) guess is that there are perhaps between 200 and 300 people in Sweden with some involvement in what she calls Neo-Shamanism.

The globalization of shamanic spirituality is limited primarily to middle-class people of First World countries. Those who are not financially well-off, wherever they are, have little or no access to individualist or group new religious movements. Several factors restrict the involvement. Workshops do cost money, and English is the main language for written materials and the Internet. The Internet is expensive and not always available to people in Third and Fourth World countries. Globalization of belief systems is still a phenomenon of the economically well-off and residents of the First World (Townsend 1997b).

The Future of Core and Neo-Shamanism

There are threats to the survival of both Core and Neo-Shamanism. As more and more people become involved throughout the world there is the danger that there will be more grafting of beliefs and rituals that are borrowed from other systems or invented outright. Another threat to the movement is the propensity of some practitioners of Neo-Shamanism to put forth as authentic ancient traditional beliefs and rituals of Native Americans and other indigenous people that are in fact recently invented and miscellaneous fragments of systems; this deception is practiced for notoriety and profit by a few ersatz spiritual leaders. When seekers begin to realize the shallowness of some of these leaders and their practices, it may jeopardize the movement as a whole.

Modern individualist movements have been heavily criticized by both laymen and academics as examples of the shallowness and superficiality of today's supermarket society, which expects instant answers for profound epistemological questions and practices that require little effort. Although this assessment may be true in some cases, for the most part it is an unfair evaluation. Those who are involved in the individualist movements as a whole, especially shamanic spirituality and Neopaganism, are mature, middle-class, well-educated people, who may have families, and often are in positions of influence or power in society. These are the people who have the potential to bring about social change as well as changes in belief systems. There is a strong possibility that the leaderless individualist movement will persist and spread, at least in Western society, and become a catalyst for social and religious change much more powerful than any organized new religious movement can be. This development was predicted at the turn of the twentieth century by Ernst Troeltsch (1931). That it is becoming a global phenomenon among First World countries is already clear (Townsend 1988, 73, 81; 1997b; 1999b, 117–118).

Importantly, Core and Neo-Shamanism provide the potential for transcendent experiences. The experiential element can have a much more profound effect—a true *knowing*—on those seeking answers than detached intellectualizing or hearing about the experiences of others (Townsend 1988, 82). Finally, shamanic spirituality may represent a practical or folk re-

ligion that focuses on producing important and desired transformations in people's lives. The consequence for people involved is the critical element, rather than what the belief system asserts (Buchdahl 1977; Carter 1996; Townsend 1999a, 226).

COSTUME, SHAMAN

Shamans in many cultures do not wear specific costumes as part of their ceremonial attire, although they may wear traditional tribal regalia, westernized dress, individual symbolic items such as masks, headdresses, rattles, or necklaces, or any combination of the above. However, highly specialized complete costumes for shamans exist in many of the parts of East Asia, where traditional shamanic practitioners have long used complete costumes as an important part of assisting, controlling, and expressing the ecstatic journey. Shamanic costumes in these instances are more than mere regalia to indicate tribal affiliation or office, and more than religious vestments that subsume the identity of the wearer into a mere representative of a religion. They are actively powerful magical tools in their own right, capable of assisting the shaman to complete a total internal and external transformation. The relationship between the shaman and these specialized garments is closest to that which an actor in performance has with the expressive and transforming dress of theatrical costume, where the performer assumes another personality or acquires other personal attributes by the process of donning the costume and expressing the character of the being the costume represents.

In the practice still current today, a female Korean shaman (known as a *mansin,* or *mudang*) will, when conducting a *kut* (séance), don a series of robes, hats, and vests that are representative of the spirits of the ancestors she is possessed by in turn. All these spirit clothes are worn over the mansin's main clothing, usually male in style, excepting in the rare case of a male shaman *(paksu),* who wears female base clothing (Covel 1983, 97). In both cases the base dress assists the shaman to subsume the identities of both sexes into one, encouraging spirits of both genders to possess the medium while in the ecstatic state.

As each spirit speaks, dances, or acts out through the mansin, she switches garments, since the spirits are thought to inhabit the robes. Certain outfits are associated with particular types of ancestor spirits, and the mansin's voice, demeanor, and attitude change to reflect these spirit's characters as she dons their dress. Spirits of great kings, generals, magistrates, mountain gods, and other regal spirits wear wide-sleeved red robes and tall hats (Kendall 1985, 6). A blue vest and broad-brimmed black hat will indicate a greedy government official, who is comically greedy even in the afterlife (Kendall 1985, 8). A yellow robe may be for a demanding spirit grandmother, while a yellow blouse and red skirt belong to a princess or maiden who is angry because she died before marriage or before having a child. Children who died before they became adults cry and demand sweets, and are indicated by tying a child's robes to the belt of the medium. Many other sorts of spirits are also indicated by traditional garments appropriate to their status during life. These spirit robes and headdresses are stored in the mansin's shrine, and a mansin's patrons who wish a particular spirit's protection for their family will bring offerings of food, cloth, or money to the shrine as offerings to the spirits. A woman wishing particular attention for her family from a spirit may even give the spirit a new or a finer robe on which she em-

broiders her name, or a spirit during the performance of the kut may demand such a robe in order to agree to intercede in human affairs (Kendall 1985, 134–135).

Siberian shaman costumes are quite different from this, and most typically consist of a single highly embellished outfit that has many magical attributes that assist the shaman to contact helpful spirits, ward away evil ones, and safely make journeys to and from other worlds. Much has been written of Siberian shaman costumes since they first caught the imagination of Russian and European observers in the eighteenth century, and many examples of nineteenth- and twentieth-century costumes survive in museum collections around the world, but what is perhaps most notable about them is that no two are ever closely alike, as each was the creation of the individual shaman who wore it (Hutton 2001, 80–81). This was true when Johann-Gottlieb Georgi first tried to draw the dress of the inhabitants of Russia in 1776, and found that he had to illustrate eight completely different styles of shaman's costumes to show what he had seen in just a few regions (Flaherty 1992, 75). As in Korea, shaman clothing among the Siberian groups of Yukagir, Koryak, Itelmen, and Evenk had attributes of the clothing of the opposite sex (Serov 1988, 248–249), but unlike in Korea this was not a hard and fast rule, but a matter of local custom and individual inspiration. Higher-level shamans in the Nganasan and Karagas Regions sometimes had multiple costumes dedicated to various types of rituals, with more dangerous rituals requiring more elaborate costumes for protection, but again, the dress required for each level was not standardized in any way.

Certain symbols and attachments, such as fringes, mirrors, bells and other metal ornaments, skeletal markings, and others, reoccur on many different costumes from a broad range of locations, but the meanings and powers ascribed to them vary considerably, not only from location to location, but from shaman to shaman. The probable reason for this is that

while making the costume is part of the shaman's apprenticeship, it is also a continuing work throughout the shaman's life. If the shaman has a mentor, or an ancestor who was a shaman, the mentor may give direction to the student on how to begin making the costume, or the ancestor may have bequeathed metal ornaments to the family (Dolgikh 1978, 70, 73). These influences help to continue traditions that often make costumes produced in certain areas have many similar features. However, the shamans also seek for ideas directly from the spirits who help them, and many costume features are intended to physically represent attributes of animals that the shaman has been allowed by his animal spirits to acquire for use in the other worlds. Shamans in these cultures are said to gain power through the process of making and wearing the costume, and the reverse is also true: There is a recorded incident in the eighteenth century of a Tungus shaman who lost all his powers after a group of professors from the West stole his costume (Flaherty 1992, 73).

Typical metal attachments may include iron "antlers" affixed to the body of the garment, or, more usually, to the headdress. In images from the eighteenth century, these sometimes appear to have been made from actual antlers. Other headdresses have stylized hornlike decorations of stuffed leather, feathers and fur, which appear to echo the antler motif; still others omit the horns entirely. Yenissei shamans explained that the antlers on their costumes signify a relation to a deer spirit who helps one run swiftly in the Underworld (Lommel 1967, 108); others equated the deer imagery with an ability to insure good deer hunting. Metal disk "mirrors" are another common feature found on a majority of Siberian, as well as Mongolian and Northern Chinese, shaman costumes. The number of these disks varies considerably, their placement also varies, and their composition may be either brass or iron. Nganasan shamans when interviewed have described them as variously being there "to break the ice" when going to the Lower World of the dead (Dolgikh 1978, 70), or more simply being there "for beauty" (Graceva 1978, 82). In the Goldi culture of the Amur River the mirror is used to see wandering spirits and to hold helpful spirits (Vasttokas 1977, 98). In other regions they are thought to drive off evil spirits who fear their own reflection, or are used like armor to protect the navel or heart from attack by hostile spirits.

Most, though not all, costumes are also embellished with many iron amulets that make noise; they may be in abstract shapes or stylized forms representing boats, faces, fish, animals, snakes, breasts, six-fingered hands, or humans. The earliest Western account of a Siberian shaman's headdress in 1557 described the face as covered by a piece of a shirt of mail, with fish and animal teeth and small bones hanging on it (Hutton 2001, 30). Occasionally metal "found objects" were also included, as is the case with some garments now in the Kunstkamera Museum of Anthropology and Ethnography in St. Petersburg, which have old horse brasses, or, in another case, an old brass Soviet army button, added to the mix of metal amulets. Homemade metal noisemaking cones are also common, while further south old trade bells are often also used. Iron amulets are thought to repel hostile spirits, due to the noise created by the blacksmith during their manufacture (Lommel 1967, 125), as well as the noise they make while dancing. Bells are equated with living beings who call good spirits with their ringing (Lommel 1967, 125). Metal plates are also often attached in a pattern resembling a skeletal structure, while other garments trace similar patterns using couched, sacred white throat fur from the skin of a wild reindeer. Further south, these patterns are often repeated in stitched-on patches of fabric. Some have equated the metal "bones" with the bones of the shaman's spirit animal (Lommel 1967, 125), others with the shaman's own bones (Vasttokas 1977, 98), while others have identified it as armor against evil (Halifax 1982).

Siberian shamans also have many soft attachments to their garments, the most common being fringes made of fur, leather, fabric or even beads. Fringe, though it is the broad term most used to describe these dangling pieces, conveys an overly generalized meaning; in fact they are usually individually sewn on strings, or tassels, or bundles of strings. Very often these fringes are attached to the headpiece and used to cover the face, which for the protection of the shaman must be concealed in the world of the dead (Lommel 1967, 110). If a fringe does not cover the face, the face may be painted black, covered in a limited-vision

A tribesman from Northern Siberia, a Tungus Shaman, holding his drum and wearing traditional costume, ca. 1890. (Bettmann/Corbis)

mask, or simply covered with a handkerchief or scrap of cloth to afford the same protection. Fringes are also frequently attached to the body garment in great profusion, especially in the case of shamans whose main animal spirit is a bird; the fringes on the arms of the garment allow the wearer to fly to the other world with the aid of the animal spirit. Fringe strings of leather or fabric are also used to represent helper snake spirits, especially by the Tuvan shamans, and may include tiny carefully sewn bead eyes on each individual snake of the fringe (Djakonova 1978, 160–161, 164).

Another typical feature in areas where hallucinogenic mushrooms are used during trance is a strong back strap, which is sometimes tied to a tree, or held by an assistant, to symbolically hold the shaman so that he can be pulled back to the world of the living, and, on a more practical level, to hold him up from falling over and being injured while in the trance state. Whole pelts of small animals may also be attached, or bundles of fur from larger animals, as a way of sympathetically assisting in the hunting of those animals (Dolgikh 1978, 69, 74), or symbolizing individual animal helper spirits. Patches of fur or fabric are also sometimes attached in the shape of people, or crosses indicating bird spirits (Serov 1988, 241). The earliest complete Siberian shaman's outfit still surviving is from the 1780s Tungus people and is now housed in the Göttingen University Museum (Flaherty 1992, 170, 171). It has many small stuffed human dolls with brass face masks attached, as well as a variety of other amulets and stuffed objects. Shamans' garments also may simply have painted or line-drawn figures and images: A Goldi shaman dress from the Amur River region of southern Siberia in 1900 is entirely covered with elaborately drawn images of the tree of life, humans, animals, plants, and abstract images, with only a cone bell belt and a single breast mirror as dimensional accessories (Vasttokas 1977, 98–104).

Further south, where shamanism has been incorporated into Mongolian, Chinese, Nepalese, Tibetan and other Buddhist traditions, shaman costumes sometimes blend the vestments of Buddhist priests with some of the elements seen in Siberian practice, or use these elements over items of their modern or traditional national dress. Like all religious practice in the region, the Chinese Communist government has tried repressing shamanism, but unlike the Soviets, there was no great push to record and document the practice before attempting to wipe it out. The result is that in these areas little has been written on the subject, so most conclusions must be drawn from limited photographic evidence. Nepalese shamans working now wear multiple belts, necklaces, and baldrics of assorted bells and cowry shells over the traditional dress of the region, as well as a special headdress of bundled tail feathers of mountain pheasants (Hitchcock 1977, 42–48). Lama-shamans of Tibet and China, where shamanism has long been incorporated into the Buddhist religion, wore especially elaborately decorated priestly vestments, and items like protective face-covering fringes or flaps, breast mirror disks, and bell belts. Many of these ensembles also had an unexplained feature borrowed from Chinese theater: a series of flags strapped to the back of the garment, which on

stage signify a legendary general and his army, with each flag representing a troop of soldiers at his command. Like the bundled snake spirits of the Tuvans, these flags may have represented armies of good spirits, or like the mansin's red robes in Korea, may have been a way for the shaman to channel a heroic general of the past to rout out evil spirits in the afterlife, as he routed out enemy soldiers in life.

CROSS-CULTURAL PERSPECTIVES ON SHAMANS

The concept of the shaman has been problematic. Central topics of contention are whether shamanism is specific to particular cultures (e.g., Paleosiberian), a human universal, or a widely distributed cross-cultural phenomenon. Underlying issues are whether the concept of the shaman is strictly emic (related to specific cultures), or whether shamanism constitutes an etic (transculturally valid) construct. Cross-cultural investigations establish the etic nature of shamanism and empirically establish characteristics of shamans. These studies differentiate shamans from other shamanistic healers, practitioners who use altered states of consciousness (ASC) in community rituals involving interaction with spirits. The relationship of different types of shamanistic healers to subsistence patterns and social and political characteristics provides evidence of the evolutionary transformation of a hunter-gatherer shamanism into other types of healing practitioners.

Definitional vs. Cross-Cultural Approaches

Specification of the nature of shamanism has been problematic because of the lack of systematic cross-cultural investigations of shamans and their characteristics. The term *shaman* has been used to refer to a wide range of magico-religious practitioners, often with the implicit presumption of shared characteristics. Although some researchers have specified what they viewed as the characteristics of shamans (e.g., Eliade 1989; Hultkrantz 1973; Halifax 1979; Townsend 1997), many use the term without explicating the commonalities or universals of shamanism. Purported universals of shamanism are generally based upon a haphazard synthesis of data from select cultures. Others have employed a subjective definitional approach, specifying the particular characteristics they consider to define the shaman (e.g., see Townsend 1997). These arbitrary definitional approaches cannot establish the characteristics of a shaman nor address cross-cultural variation in shamanistic practices. A cross-cultural or holocultural method is necessary to answer these questions regarding the universality of shamans and their characteristics.

A Cross-Cultural Study of Shamanism

An empirical determination of the etic status of shamans and their characteristics is provided by a cross-cultural research project on magico-religious practitioners (Winkelman 1986a, 1992; see Winkelman and White 1987 for data). This study was based on a forty-seven-society subset of the Standard Cross-Cultural Sample, which is representative of the geographic, social, and cultural regions of the world, and a time span of approximately 4,000 years. This study individually assessed each of the culturally recognized magico-religious roles, coding data on 117 different practitioner types. Those culturally recognized positions involving interaction with supernatural entities or supernatural power were assessed in terms of several hundred descriptive variables developed from an emic perspective, as described in the ethnographic literature. These covered a wide range of characteristics, including selection and training procedures, procedures for inducing altered states of consciousness and characteristics of those states, sources of power, relationships to spirits, the social context of and motives for professional activities, economic and sociopolitical powers, and various aspects of their healing, divination, malevolent acts, propitiation, and other ritual activities.

Statistical analysis of these cross-cultural data permitted empirical determination of the similarities in practitioners from diverse societies. These empirical similarities provided a basis for forming groups representing *types* of practitioners that have cross-cultural validity. A central question was the existence across societies of practitioners associated with the classic characteristics of shamanism. Quantitative assessment of shared characteristics provided the basis for answering this question, and determining different etic types of practitioners based upon their similarities (for methods and analysis, see Winkelman 1986a, 1992). The practitioner types derived from cluster analyses were subjected to independent validation that revealed interrelated and distinct types of practitioners. These empirically derived groups have been labeled with commonly used terms: shaman, shaman/healer, healer, medium, priest, and sorcerer/witch.

These cross-cultural findings establish the etic status of shamans and other types of magico-religious practitioners. Practitioners from different societies and different regions of the world who belong to the same type are more similar to each other than they are to geographically more proximate practitioners, including other practitioners in the same culture and region. These findings include an empirically derived type of magico-religious healers that possesses the classic characteristics of the shaman. Some magico-religious practitioners labeled shamans by ethnographers have characteristics significantly different from those associated with the empirically derived type labeled shamans.

A differentiation of shamanistic practices was also proposed by Siikala (1978), who characterized Siberian shamanism as including four types: small-group shamans, independent professional shamans, clan shamans, and territorial professional shamans. She postulated the prevalence of small-group shamans in highly nomadic groups and independent professional shamans in societies without hierarchical control. Clan and territorial professional shamans

she saw as occurring in more complex groups. Winkelman's cross-cultural study included the Kazak, a group found in the region where Sikala pointed to the predominance of what she called territorial professional shamanism. The practitioner from the Kazak (the *baqca*) was not empirically classified as a shaman, but rather as another type of shamanistic healer, a medium.

Healing practitioners found in Eurasia, the Americas, and Africa are more similar to one another than they are to other magico-religious practitioners in the same regions. This similarity is more relevant than geographical location or definitions, and indicates that the term *shaman* should be used on the basis of empirically shared characteristics. Winkelman's cross-cultural findings suggest restricting the use of the term *shaman* to refer to healers of hunter-gatherer and other simple societies who are trained through altered states of consciousness for healing and divination, as well as sharing other characteristics discussed below. These shamans are distinguished from other types of shamanistic healers (mediums, healers, and shaman/healers) in more complex societies who also use altered states of consciousness for healing, but have different characteristics.

Shamans

Empirical research found the group called shamans were found in societies around the world, with the exception of the region around the Mediterranean; this absence reflects the lack of hunter-gatherer societies from this region in the sample. Shamans were found throughout the world, but survive in only a few places in modern societies. For example, in the formal cross-cultural analyses, shamans found in the modern world included the !Kung *n/um kxoa-si,* the Chukchee *ene nilit,* and the Jivaro *wishinyu.* Societies with shamans are predicted by nomadic residence patterns and political integration limited to local community, but not by diffusion, indicating the role of shaman had an independent origin in each society. The healing practitioners empirically clustered in the group labeled shaman have characteristics emphasized by Eliade—using ecstasy to interact with the spirit world on behalf of the community. These shamans are charismatic political leaders in hunter-gatherer and simple pastoral or agricultural societies, where political integration is limited to the local community. Shamans' ecstasy, or altered state of consciousness, is central to their professional training and activities of divination, prophecy, diagnosis, and healing. Shamans also led raiding parties, organized communal hunts, and decided group movement. Shamans engage in activities on behalf of a client, but generally with the entire local community (the band) participating. Shamans also may engage in malevolent magical acts designed to harm others. They may attack enemies of the group, and they are sometimes suspected of killing patients who died.

Shamans are often from families with a long history of shamanic practice. In most cultures, shamans are predominantly males; however, most cultures also allow females to become shamans, but typically limit their practice to before or after childbearing years (Winkelman 1992). The selection of a shaman might result from the desires of a deceased shamanic relative who provides spirit allies, but anyone could become a shaman who is selected by the spirits, undergoes training, and is successful in practice. Shamans are selected through a variety of procedures, including involuntary visions, receiving signs from spirits, and serious illness. These spontaneous experiences are followed by deliberately induced altered states of consciousness, during which shamans acquire spirit allies, particularly animal spirits. Animals are central to shamans' powers; shamans are believed to transform themselves into animals and have them carry out activities.

Shamanic training involves induction of altered states of consciousness and seeking contact with the spirits, often an extension of vision quest experiences undertaken by the entire population (or all males) as a part of adult development. Shamans' altered states of consciousness are induced through a variety of procedures: auditory driving (e.g., drumming and chanting); fasting and water deprivation; exposure to painful austerities and temperature extremes; extensive exertion from drumming and dancing; hallucinogens and other drugs; and sleep, social, and sensory deprivation. Shamans' altered states of consciousness are generally labeled as involving soul flight and journeys to the spirit worlds, and they are usually not possessed by spirits. A characteristic feature of shamans' altered states of consciousness is a vi-

sionary experience during which they contact the spirit world.

The shamanic ritual was typically an all-night activity in which the entire community participated. The shamans' chanting, singing, dancing, and enactments brought the community into a dramatic encounter with the spirit world. Central to shamanic therapy is soul recovery, which involves soul journeys to do battle with terrifying spirits to rescue the patient's soul. Soul loss has been characterized as the loss of, or injury to, personal essence, manifested in disharmony in life and feelings of disconnectedness with others (Achterberg 1985). Soul recovery restores a sense of identity and emotional well-being, balancing and transforming self. Therapeutic processes involve community participation, healing through enhancing social bonding processes, as well as other symbolic processes characteristic of the shamanistic healers (see below). Other aspects of shamanic therapeutics involve removal of afflicting spirits or objects. A variety of physical healing techniques are also used: herbs, massage, and cleansings (Winkelman and Winkelman 1991).

Initiatory Crises, Death-and-Rebirth, and Psychological Status

Adoption of the shamanic role is often motivated by a psychological crisis, an initiatory period characterized by illness or insanity provoked by the afflictions of spirits. This crisis generally leads to a death-and-rebirth experience involving the dismemberment and reconstruction of the initiate's body that imbues them with powers. It might occur spontaneously, during an initiatory crisis, or during an active engagement in a vision quest. The death-and-rebirth experience begins with attacks by spirits, which cause death; this is generally followed by descent to the Lower World, where spirits may destroy the victim's body, typified by total dismemberment. The initiate's body is then reconstructed with the addition of spirit allies, which provide power, and the individual is reborn.

These initiatory experiences and other shamanic altered states of consciousness have been characterized as pathological, as manifestations of neurosis, psychosis, hysteria, and epilepsy. These attributions largely reflect misunderstandings, although some cultures have considered these experiences as illness. The difference is that in the shamanic context, the expectation is that these experiences are to be resolved as a part of professional development. The shaman's initiatory crises and death-and-rebirth experiences are not schizophrenia or other pathologies (Noll 1983), but a temporary period of emotional turmoil and psychological distress.

The shamanic crisis is a period of psychological deconstruction manifested in natural symbolic forms of self-reference. The death-and-rebirth experiences reflect processes of self-transformation that occur under conditions of overwhelming stress, resulting in the fragmentation of the conscious ego from the consequences of psychological conflict. Dismemberment experiences are autosymbolic images of the disintegration of one's own psychological structures; the inability of the psyche to maintain its integrity is experienced symbolically as death. The rebirth cycle reflects the reformation of ego and self, a psychological reorganization guided by innate drives toward holism and integration (Laughlin, McManus, and d'Aquili 1992). Shamanic development involves the ritual and symbolic manipulation of self and neurological structures to restructure the ego, attachments, affect, and other psychodynamic processes, providing the basis for individuation and self-actualization. These changes produce a new level of identity and consciousness, a self-transformation at the basis of the exceptional health of shamans.

Although the shamanic initiatory crises may involve pathological conditions, the claim that altered states of consciousness of shamans are inherently similar to pathological states is not justified. Shamanic altered states of consciousness have significant differences in their voluntary nature and the deliberate actions taken to induce them, conditions distinct from the involuntary conditions experienced by persons suffering from psychopathology. Noll's (1983) analysis of shamanic states and schizophrenia reject arguments that shamans manifest pathogenic personality traits of acute schizophrenia. Shamanic altered states of consciousness differ from schizophrenia in that shamans enter altered states of consciousness deliberately; they do not lose their social interaction and communication skills; and they are able to discriminate between shamanic experiences and experiences of every-

day life. The experiential qualities of shamanic altered states of consciousness also differ sharply from those of schizophrenia, with shamanic hallucinatory experiences characterized by visual phenomena and positive affective experiences and intensification of emotion, directly contrasting with the schizophrenic's emotional flattening and auditory hallucinations. Shamans are healthy rather than psychopathological, though mediums (see below) may manifest symptoms indicative of organic abnormalities.

Shamanistic Healers

The hunter-gatherer shamans' utilization of altered states of consciousness to communicate with the spirit world on behalf of the community and for divination and healing is found in all societies; however, these activities are associated with different types of practitioners in more complex societies. The general term *shamanistic healer* has been proposed for these universally distributed practitioners, who use altered states of consciousness for training, healing, and divination (Winkelman 1990). Different types of shamanistic healers share characteristics, including aspects of healing involving use of altered states of consciousness, use of rituals and invocations, and removal of detrimental effects of spirits and human agents (e.g., sorcerers) (Winkelman and Winkelman 1991). Shamanistic healing processes share commonalties in addressing emotional distress. Shamanistic healers provide assurance, counteracting anxiety and its physiological effects. Their symbolic manipulations can intervene in stress mechanisms through changing emotional responses and the balance in the autonomic nervous system. These symbolic manipulations also elicit emotions, linking body and mind through effects on the limbic system.

Shamanistic healing processes elicit community support, meeting needs for belonging, comfort, and bonding with others. Shamanistic healing practices can also heal emotional problems by eliciting repressed memories and restructuring them, providing opportunities for social confession and forgiveness, resolving intrapsychic and social conflicts, and providing processes for expression of unconscious concerns. Emotions and unconscious dynamics are typically manipulated by attributing these processes to external forces (spirits). Shamanistic healing practices utilize universal aspects of symbolic healing (Dow 1986). This kind of healing involves placing the patient's circumstances within the broader context of cultural mythology and ritually manipulating these relationships to emotionally transform the patient's self and emotions. Ritual manipulations of unconscious psychological and physiological structures enable shamanistic healers to evoke cognitive and emotional responses that cause physiological changes. These are achieved by the manipulation of cultural symbols associated with autonomic responses and through activities that cause physiological changes (e.g., drumming, fasting).

There are differences in the emotional psychodynamics of shamans and the other groups included under the general term shamanistic healers, and psychodynamic differences in soul journey, possession, and meditation (Winkelman 1999). Shamanistic healers also differ with respect to a variety of other characteristics, including their ideologies of illness, the processes involved in training and healing, the nature and source of their powers, and their relationships to social institutions. These differences in shamanistic healers are illustrated in the following discussion of shaman/healers, mediums, and healers.

Shaman/Healers

Practitioners in the formal cross-cultural study who were classified as shaman/healers included the Nama Hottentot seer, the Roman sorcerer, the Kurd dervish, the Japanese ascetic, the Hidatsa "bundle holder," and the Bribri *jawa.* The shaman/healers are associated with sedentary agricultural societies, and are found at all levels of social stratification and political integration. This suggests that the adoption of agriculture and its associated consequences were fundamental causes of the transformations of shamans into shaman/healers. The fundamental role of agriculture in the transformation of shamans into other types of shamanistic healers is further supported by the significant association of agricultural societies with the presence of another form of magico-religious practitioner, the priest (Winkelman 1992). Shaman/healers are similar to shamans, engaging in healing and divination for the community, but they differ from shamans on a number of key

features. Shaman/healers are not the highest status individuals in their societies, being eclipsed by the priests. Shaman/healers also engage in agricultural rituals. Their training involves a professional group that provides instruction, ceremonial recognition of formal status, and organization of professional activities (Winkelman 1992). Shaman/healers have specialization in their roles. Different practitioners focused on different types of activities; for example, some might carry out diagnosis or agricultural rituals, but not healing, or only healing specific kinds of illness. Shaman/healers enter altered states of consciousness and interact with the spirit world, but these generally do not involve either soul journey or possession. Shaman/healers' altered states of consciousness are similar to those experienced during meditation, and are induced by fasting, auditory driving, social isolation, sleep deprivation, and other austerities (Winkelman 1986b, 1992, 2000). The sources of their powers include both spirits and impersonal sources, as well as rituals and techniques learned from other professionals.

Mediums

Mediums are healers and mediators of relations with the supernatural. Some of the practitioners in the cross-cultural study who were empirically classified as mediums include the Amhara *zar;* the Wolof *M'Deup,* or *lefohar;* the Kazak *baqca;* and the Japanese *miko,* or *kyoso.* The work of Lewis (1989) and Goodman (1988) typifies modern descriptions of characteristics of mediums.

Although the practitioners classified as mediums are frequently called shamans by investigators, they have profiles distinct from the empirically derived characteristics of shamans. For one thing, they are still quite common. Mediums are found primarily in agricultural societies with political integration beyond the local community. Mediums are predominantly women and are generally of low social and economic status. Mediums are not believed to engage in malevolent acts; rather they act against the influences of sorcerers, witches and evil spirits. They engage in worship and propitiation of their possessing spirits and make sacrifices to them.

Mediums also use altered states of consciousness, which begin as spontaneous possessions that occur in late adolescence or early adulthood. Mediums' initial episodes of altered states of consciousness are generally spontaneous and outside of personal control; these constitute both an illness and a call to the profession. These episodes are interpreted as the personality and volition of the individual being taken over by a spirit entity (Bourguignon 1976). The altered states of consciousness of mediums are characterized by central nervous system symptoms such as compulsive motor behavior, tremors, convulsions, seizures, and amnesia. These characteristics of temporal lobe discharges are not associated with the altered states of consciousness of shamans or other types of shamanistic healers (Winkelman 1992).

The training of mediums involves deliberate induction of altered states of consciousness, which enables them to gain control over possession episodes. Their professional episodes of altered states of consciousness are also characterized as involving spirit possession. These altered state of consciousness generally involve subsequent amnesia, which may also result from temporal lobe disturbances; it also reflects the belief that the medium's body is controlled by the spirits. These spirits communicate with the clients directly through the medium's speech, rather than through an account of visionary experiences of the kind given by a shaman.

To summarize, the most significant contrast between mediums and shamans, apart from the features of their respective societies, involve mediums' lower social and economic status; control by the spirits; affliction and training occurring later in life (early adulthood); altered states of consciousness characterized by possession, amnesia, and convulsions; and agricultural rituals and propitiation.

Mediums (like healers) specialize in treatment of possession illness. The concept of possession involves forces outside one's self that act upon the patient's body and consciousness. The psychodynamic of possession provides symbolic mechanisms for externalization of the control of emotions and attachments. The altered states of consciousness associated with possession involve dramatic changes in emotions and self, with the possessing spirits providing opportunities to engage in alternate selves that express socially prohibited roles and emotions. Possession manipulates self, emotions, and relations to

others (Boddy 1994). Possession allows the responsibility for feelings and behaviors to be displaced from the patient, and instead attributed to a spirit entity that controls the body and mind. Possession may shift responsibility for illness and deviance from self to other, implicating social relations as causes of disturbance. Possession consequently allows for indirect influences and subtly alters power relations, enabling transformation of self and others. Possession affects emotional dynamics by expanding self-expression and reconstructing identity, channeling expression of emotions of anxiety, fear, and desire. Possession changes relations between individuals and groups through the incorporation of spiritual "others" into self.

Healers

Healers are still found around the world in agricultural societies with political integration beyond the level of the local community. Practitioners in the cross-cultural study empirically classified as healers include the Vietnamese *thay,* the Igbo oracle, the Kavak *iman,* or *molah;* the Amhara *debtera,* and the Fur Islamic *puggee.* The study shows that healers are generally males; have high social and economic status; exercise political, legislative, and judicial powers; and officiate at group ceremonial activities. Their professional organizations, which provide costly training and certified initiates, also wield considerable power, enabling healers to be full-time specialists. Healers also engage in specialized diagnosis and healing, but many seem to altogether lack the activities associated with altered states of consciousness characteristic of shamans. Altered states of consciousness may nonetheless be part of the clients' experience in their interaction with the healers, with the structuring of interactions with healers having profound effects upon the clients' consciousness. Their divination procedures use material systems, which they interpret within standard frameworks to make diagnoses (e.g., the I Ching and Tarot). Healers' treatments emphasize rituals, spells, incantations, formulas, and sacrifices. Exorcism was a significant activity; they also frequently use herbal medicines. Healers engage in life cycle activities—naming ceremonies, marriage rituals, and funerals. Healers also have the power to determine who is a sorcerer or witch, and take actions against those individuals. Healers are found in societies with priests, and generally work in collaboration with them in exercising political and legislative power.

Healers differ from shamans in their lack of altered states of consciousness and direct communication with spirits; in their powerful professional organizations and formal political power; in their relations with superior group spirits and gods; in their use of material and mechanical systems for divination; and in their learning of spells, formulas, and ritual enactments for healing.

The Socioeconomic Transformation of Shamans and Shamanistic Healers

Shamans formed the original basis for spiritual healing practices in hunting and gathering societies. These practices were transformed as a consequence of social evolution. The emergence of sedentary agricultural societies, political integration, and class structures had significant effects upon the psychobiological foundations of shamanism, but their origin in innate brain structures and functions of consciousness assured the persistence of healing practices based on altered states of consciousness in more complex societies. The persistence of shamanic potentials can be seen in the shamanistic healers (mediums, healers, and shaman/healers), who reflect universal manifestations of the core characteristics of shamanism postulated by Eliade (1989): the use of altered states of consciousness in training, healing, and divination activities; their enactment in a community context; and their relations with the spirit world. Differences among shamanistic healers reflect the adaptation of the psychobiological potentials of altered states of consciousness to different subsistence practices and social and political conditions. These different social conditions transformed the manifestation of shamanic potentials, including types of altered states of consciousness and spirit relations, selection and training practices, the sources and nature of their power, their socioeconomic and political status, illness ideologies, and the nature of their treatments and professional practices (Winkelman 1990, 1992; Winkelman and Winkelman 1991).

Siikala proposed the differentiation of shamanic types as reflecting the effects of the

Societal Practitioner Configurations

BIOSOCIAL FOUNDATIONS

breakdown of the clan structure and increasing community stratification. Winkelman's (1986a, 1990, 1992) research implicates different conditions as transforming the original basis of shamanism. Analysis of cross-cultural data illustrates this evolution of the shamanic potentials in the systematic relationships of different types of shamanistic healers and other magico-religious practitioners (sorcerers/witches and priests) to socioeconomic conditions. The transformation of shamanic practices into other types of shamanistic healers and magico-religious practitioners can then be seen as a function of (1) agriculture replacing hunting and gathering; (2) transformation of nomadic lifestyle to fixed residence patterns; (3) political integration of local communities into hierarchical societies; and (4) social stratification, the creation of classes and castes, and hereditary slavery (Winkelman 1986a, 1990, 1992). These relationships of practitioner types to socioeconomic conditions are illustrated in the table (adapted from Winkelman 1992).

The chart also illustrates the way these practitioner-societal configurations correspond to relationships between practitioner selection procedures and their professional functions (Winkelman 1992), providing the basis for a model of the evolution of magico-religious functions. These social functions involve three major dimensions: (1) the psychobiological basis in altered states of consciousness (characteristic of all shamanistic healers); (2) the role of social-political and religious leadership (assumed by priests); and (3) the conflict of shamanistic healers and priests, manifested in the sorcerer/witch. Shamans were the original source of traditions involving altered states of consciousness, and provided the social leadership potentials at the basis of priesthoods. Shamanistic practitioners were eventually persecuted by the expansion of hierarchical priestly religious structures, giving rise to the phenomenon recognized as witchcraft.

Contemporary Shamanisms and Neo-Shamanisms

Modern European societies did not have shamanism, which had disappeared in processes of sociocultural evolution and the brutal oppression of remaining shamanistic practices by religions and state political systems as witchcraft (Harner 1973, Winkelman 1992). Consequently, the concept of shamanism reentered modern consciousness through colonial contacts with other cultures. Ethnographic studies of healing practices around the world contributed to an awareness of cross-cultural similarity in these healing practices. An-

thropological and interdisciplinary studies contributed to an emulation of these practices in modern societies, an expansion of Western spiritualities in the late twentieth century, and their application to contemporary healing (Krippner and Welch 1992). Some of these modern borrowings have attempted to maintain a focus upon the classic aspects of shamanic practice; these aspects are emphasized in the concept of Core Shamanism developed by Michael Harner (1990) and in the activities of the Foundation for Shamanic Studies (see www.shamanism.org). Many other modern adaptations, however, were not based upon the primordial hunter-gatherer patterns of shamanism, resulting in the extension of the term *shaman* to a bewildering variety of practitioners, some of which have little relationship to original forms of shamanism.

This overextension of the term *shaman* can be remedied by restricting its use to the practitioners who share the empirically derived characteristics described above. Terms such as *medium, healer,* and *priest* can be applied to other types of healing practitioners. All those practitioners who, like shamans, use altered states of consciousness in training and healing, can be associated with their ancient shamanic roots through the term *shamanistic healer.*

DAOISM AND SHAMANISM

To understand the connection between Daoism and Shamanism it is necessary to examine the shamanic nature of early Chinese religion. Shamanism in China is said to extend back to the mythical past when rulers relied on special powers to end drought, solicit rain, and improve the harvest. Shaman kings with the surname Wu reigned during the Shang dynasty (1600–1027 B.C.E.), using divination and sacrificial rituals to connect with the spirit world, as suggested in oracle bone inscriptions and animal-like designs in art (in bronze, jade, lacquer, and wood) (Chen 1937; Chang 1983). But in recent years some scholars have voiced concerns about the use of the term *shamanism* to describe early Chinese kingship. The chief complaint has been that there is no evidence providing specific details about the nature of the shaman king's experience, such as whether the king took spirit journeys, became possessed, or spoke the words of the deity (Keightley 1983). Others, such as Edward Davis, are concerned about the proliferation of works that describe shamanism as the substrate of Chinese religion (2001, 2).

Those who subscribe to the view that rulers of the Shang dynasty were shaman kings note that following the Shang dynasty, when the dynasty was overthrown by the Zhou, shamans suffered a decline in social status. The *Rites of Zhou* (*Zhouli*), a Chinese ritual classic, tells how the *wu* (a term referring to both male and female mediums or shamans) became part of an idealized feudal bureaucracy that may have existed in the late Zhou dynasty (1027–256 B.C.E.). During this period, shamans belonged to the Ministry of Rites, presiding over funerals, performing exorcisms and rain dances, and sometimes becoming possessed during trance. Only those who did not enter trance enjoyed the rank of ministry official. These ranked male shamans were charged with the training of the other shamans in the rain dances. In addition to the male and female shamans, there were also shamans charged with caring for horses.

Among all of the early rituals that shamans performed, rituals to summon rain were the most important and most coveted for proving a shaman's power. The Han dynasty lexicon, *Shuowen jiezi,* defines the shaman (wu) as a priest or invoker, who is female, and also dances for rain with two sleeves raised in dance posture. Explanations about the importance of rain dances and flood control in Chinese shamanism often include a reference to the myth of Yu, the flood controller and sage king, and King Tang. After five years of flooding and severe famine, Yu exhausted himself while he was trying to stop a raging flood. An illness following his successful efforts crippled him, and for the rest of his life Yu walked with a limp that history records as the gait of *yu,* or the shaman's gait. The shaman's gait became the name of a dance performed by Daoist adepts in later Daoist religion.

The story of the sage King Tang also illustrates the combined role of king as political ruler and shaman, and the precedent for later shamans to perform rain prayers and dances. After several years of drought, King Tang assembled a funeral pyre in the mythical Fusang grove, and prayed to *di,* the ghosts and the spirits. He was on the verge of searing his flesh when it began to rain. Miraculously, the downpour extinguished the flames and saved King Tang from sacrificing himself.

Reflecting the importance of self-sacrifice in securing rain, early Chinese rain rituals involved the rain (yu) sacrifice, in which the female shaman (wu) and the cripple called the *wang,* as well as sick children, were burned ei-

ther by fire or by the heat of the sun (Schafer 1951). Later rain rituals in the Han dynasty introduced different elements believed to improve the chance of rain during times of drought, such as the substitution of dragon effigies for the sacrifice of a human being (Loewe 1987).

Daoism

Early Daoism is usually defined by two texts: *The Way and Its Virtue* (*Daodejing*) and the *Zhuangzi.* The *Zhuangzi* is attributed to Zhuang Zhou, who lived in the district of Meng within the State of Song near the border of Chu during the reigns of King Liang and Qi. In the *Zhuangzi*, shamans named wu are not depicted favorably, and are instead portrayed as charlatans who fool people into believing they can divine the future, and as outdated practitioners of cruel sacrificial rituals. These individuals have many of the traits of shamans: They are able to fly and ride on the clouds and mist, they enter trances, and they are masters of fire and the other natural elements. They are recognizable by their names (the true man, the daemonic man, the perfect man, the sage, the nameless man) and by their unusual appearances (hunched backs and skinny necks). These individuals become shaman-like individuals through experiences such as the one had by Ziqi of the south wall: His breathing changed, his body seemed like a tree that had withered, and his mind seemed like ashes. Master Yu is an example of an ideal human being who acquired his unusual appearance—becoming a hunchback—during illness.

In addition to the *Zhuangzi*, early texts often associated with Daoism include the *Elegies of Chu* (*Chuci*), and the *Classic of Mountains and Waters* (*Shanhaijing*). Wang Yi (d. 158 C.E.), an imperial librarian who wrote the earliest commentary on the *Elegies of Chu*, attributes the text to Qu Yuan (fourth century B.C.E.), a loyal official betrayed by his ruler and banished to the south of China. Although Wang Yi's commentary downplays the shamanic origins of the songs, contemporary commentaries and scholarship have mined the work for its detailed information about shamanism in southern China before the second century C.E. (Waley 1955; Hawkes 1959; Sukhu 1999). One of the best examples of shamanism is found in the section called the Nine Songs. In the first song of this work, "Great One, Lord of the East," a *ling,* "shaman," performs a ritual dance to Taiyi, the great sun god. The shaman's dance to a cacophony of drum beats, pipes, zithers, and the jingling of the jade pendants on her waistband sends her into a trancelike state that enables the deity to descend and possess her. In other songs, a ling takes spirit journeys, riding in chariots pulled by dragons. Another section of the *Elegies of Chu*, Zhaohun (The Summons of the Soul), tells about a shaman named Wu Yang (wu being the name of the traditional shaman in China), who summons the soul of a sick or dying person to return, warning the soul of the terrifying things that await it if it continues to wander, and tempting the soul with the celebration that awaits its return (Hawkes 1959).

The authorship and dating of the *Classic of Mountains and Waters* (*Shanhaijing*) is shrouded in debate, with some saying the text is a traveler's guide or geographical gazetteer of the ancient Chinese terrain and others saying that the text is the work of shamans (Yuan Ke 1982, preface, 1). Shamans called wu are healers, and bring the dead back to life. There is also the suggestion that their practices are related to the snake cult and the cult of the Queen Mother of the West, who is later associated with immortality. The shamans of the *Classic of Mountains and Waters* also search for medicinal herbs believed to extend one's life, and transform one into an immortal, like the *fangshi,* "magicians," who are known to have traveled in search of immortality elixirs for the first emperor of China (259–210 B.C.E.) and Emperor Wu of the Han (141–87 B.C.E.).

Later Daoism

Daoist religion is traditionally seen as having developed out of these Daoist texts and the pursuit of immortality, as well as shamanic exorcism, healing, and spirit possession, during the latter part of the Han dynasty. For most of the Han dynasty, shamans performed rain dances and exorcisms and acted as spirit mediums in court circles, but unlike the shamans of the Shang and Zhou dynasties, shamans during the Han dynasty seldom held official positions (Lin Fushi 1988).

Shamans and ecstatic practices, such as the use of talismans, exorcism, and spirit possession, played key roles in gaining popular support for new Daoist movements. In 142 C.E. Zhang Daoling had a shamanistic vision of Laozi, in which Laozi appeared to him in person, transforming him into the first Celestial Master and founder of the Celestial Masters Movement (*Tianshi*), which began in the west. In 184 C.E., another Daoist movement was underway in the east, called the Yellow Turban Movement (also known as the Great Peace Movement), led by Zhang Jue, a man with shamanistic healing powers. Part of the Yellow Turban Movement's appeal was in their use of talismans, which were burned and mixed with water and offered up as cures to patients (Harper 1998).

Daoist schools were influenced by the rituals of the Celestial Masters as well as Buddhist texts and practices, and by shamans, who were seen as competitors by the early schools of Daoist religion. Like the Daoist movements before them, the new texts and practices of the Highest Clarity (Shangqing) and Numinous Treasures (Lingbao) Daoist schools incorporated shamanistic techniques such as spirit possession and spirit journeys, rain dancing, healing, exorcism, and talisman writing. Between 367 and 370 C.E., the scriptures of the Highest Clarity school of Daoism were revealed to Yang Xi during visions of Lady Wei, an immortal. This new school of Daoism also absorbed many shamanistic aspects into its practice, such as the use of talismans, the pursuit of longevity and immortality through inner cultivation, and meditative techniques. Daoist adepts took spirit journeys to the stars, and while they were there performed the dance of yu, or the shaman's gait. In this dance, the adept would drag one foot behind him, mimicking the way in which Yu walked after he stopped the flood (Robinet 1993, 200–226).

The Numinous Treasures (Lingbao) school of Daoism became a unified school during the middle of the fifth century. The term Numinous Treasures refers to the one who "summoned and controlled the numinous souls of the dead" (Yamada 2000, 226). The term *lingbao* came to represent those who became guardians of the spirits during rites of spirit possession and may have originated in the song "Lord of the East" in the Nine Songs, where the lingbao is a type of shaman who communicates with the spirit world (Hawkes 1959). Numinous Treasures scriptures emphasized liturgy and developed out of the scriptures of the Highest Clarity school and southern traditions (such as those discussed in the *Elegies of Chu* and the *Classic of Mountains and Waters*), as well as Pure Land Buddhism (Bokenkamp 1983).

Daoism Today

Daoism today combines rituals, divinations, beliefs, and practices from the many schools of Daoism (Celestial Masters, Highest Clarity, Numinous Treasures, Quanzhen [lit., "whole truth"]) and shamanism. Formally, Daoist rituals and practices are divided into two groups, but in practice there are variations in southern China and on Taiwan. There are the Daoist priests *(daoshi)* and the Daoist ritual masters *(fashi),* who are distinguished by the color of their hats and the kind of rituals they perform. Daoist priests belong to the literati class and inherit their positions. They wear black hats and use classical Chinese during communal rituals in which trance and exorcism do not play a part, and they do not serve a local community. Daoist ritual masters, in contrast, do not belong to the literati class and do not inherit their positions. They wear red hats and use vernacular Chinese during rituals for the local communities they serve.

The Daoist ritual master provides a link between the formal aspects of Daoist religion and the local traditions, often taking on the role of the shaman who is a spirit medium and performing exorcisms (Davis 2001, 11). Shamans, often associated with Daoist practice, have many names and can be found in southern China and on Taiwan. Some have names like the wu of Chinese antiquity, such as the *wupo,* "granny shaman," the *wushi,* "shaman teacher," and the *shenwu,* "daemonic shaman." Others have names that imply childlike qualities such as the *tongzi,* "youths who are mediums," the *jitong,* "divining youths," and the *matong,* "horse youths." There are other male and female shamans called *lingji,* "diviners of the spirit," and shamans who are female called the *hongyi.* Contemporary shamans perform many functions, sometimes alone and sometimes with the help of the Daoist ritual master. He or she is a

spirit medium, exorcist, diviner of fortunes and dreams, spirit writer, healer, and ritual dancer. During important festivals and on pilgrimages, male and female shamans who are in ritual trances and possessed by deities sometimes perform self-mortification, using sharp objects such as swords to cut their backs and foreheads.

DEMONIC POSSESSION AND EXORCISM

Possession by demons, that is, evil spirits, and the resulting need to free the person who is experiencing this type of change through shamanistic healing, is reported from many parts of the world. While the concept of possession is often attributed to shamans, core shamans and the shamans of hunter-gatherer societies generally do not experience possession (Winkelman 1992). Possession experiences are associated with societies where the people's livelihood is predominantly agricultural, and with cultures characterized by social stratification and jurisdiction hierarchy (Bourguignon and Evascu 1977). Possession is, however, significantly and independently predicted by political integration (Winkelman 1992).

The phenomenon of possession is widespread, but the type of invading entity varies according to the cultural circumstances in which it arises. It is not always negative. Sometimes a possessing entity is helpful, having been called by a ritual to enter a body and then leaving at the conclusion of that ritual. In some cultures, spirits are useful if one is careful not to offend them. The therapeutic resolution of possession experiences is traditionally achieved through the ritual of exorcism. In other cultures, invading entities are considered inherently dangerous. This article focuses upon neg-

ative possession experiences and their therapeutic resolution.

Possession is conceptualized as involving an alien entity or consciousness that enters into a person's body, influencing the person and acting through and controlling the person's body. Possession generally occurs spontaneously, and then may be deliberately induced in healing sessions through drumming, dancing, and drugs that induce an altered state of consciousness. The altered state of consciousness typically produces an alteration in EEG, resulting in a profile where theta waves are dominant and blood pressure drops to low levels, while at the same time the pulse rate increases (Goodman 1972 377–379; cf. Winkelman 2000 on the physiology of altered states of consciousness).

In cases of demonic possession, a possessing spirit is essentially evil, an invader whose goal is to do harm and who will leave only after a sometimes very difficult exorcism has been performed. Though demons are occasionally considered useful for the information they can give, they always attempt to do harm to their victims and the people around them. Someone possessed by a demon does not desire this experience; rather, the demon is asked to enter by someone else through a curse or a similarly harmful ritual. If such a spirit has entered, then the victim or the victim's family must find someone who can perform the appropriate exorcism. Otherwise, the possession is likely to end in the victim's eventual death.

Demonic possession can cause various types of illness; it falls loosely into two distinguishable categories based on the cultural expectations of the people involved, although these categories do not exhaust all cases of negative possession. Possessions originating within the large agricultural societies of sub-Saharan Africa differ from those originating within the agricultural societies of Eurasia. The exorcism rituals for each are different. The African type typically involves rough handling within a death and rebirth ritual. The entity expelled is conceived of as a ghost, that is, a spirit of a once living person. The Eurasian type involves communicating directly with the demon and demanding from it its name, purpose for entering, and the conditions on which it will leave. The entity here is usually an inherently evil spirit with no past as a human.

Many of the agricultural societies of Africa have developed rich cultural systems around positive possession. Possession is used for healing and divining, as well as to meet other diverse social needs. The spirits involved are considered helpful and benevolent. The spirits themselves are viewed as benefiting from the exchange—people keep them alive by offering them sacrifices and allow them to participate in the social process by lending the spirits their bodies. Such beings enter only when invited and leave at the ritually appropriate time.

Some entities are used in negative ways. In most negative African possessions, the invading demon is a ghost, that is, a spirit of a dead person. In 1969 Elizabeth Colson wrote about Tonga ghosts of Zambia: "Ghost possession [is] wholly undesirable. Victim and helpers seek only to expel a ghost and prevent its re-entry. The ghost has no message to give, either public or private; it has no desire to be appeased. Ghosts have no mediums, only victims, and these must be short-term ones; either a ghost is expelled or the victim dies."

This description applies to most other African ghost possessions. The Voudou practices of Haiti, known popularly in the United States as voodoo, provide another good example. Voudou is a contemporary descendant of native African religious practices brought to Haiti when members of different African groups were transported there as slaves. Cases have been described where an otherwise healthy person becomes suddenly sick and unable to eat. When other cures are unsuccessful, the person may be brought to a *mambo,* or priestess, for an exorcism. The illness is thought to be the result of a curse from someone who wished the victim harm. A person wishing to make such a curse must first invoke the deity Saint Expédit and the Master of the Dead, Baron-Samedi, and then make an offering at a graveyard, and take handfuls of grave dirt and put them in a place where the victim regularly passes. To rid someone of a ghost possession, the mambo must perform an elaborate exorcism, which may involve spitting rum in the face of the patient and killing a hen by burying it alive at the roots of a banana tree. Shortly after the conclusion of an exorcism ceremony, the victim should regain health and be able to return to regular daily life.

In exorcism rituals of the African type, the patient is handled roughly and made to go through much physical discomfort. At the close

of the ritual, the patient is cleaned and given fresh clothes and food or milk to consume. The ritual as a whole can be seen as representing a death and rebirth, endured so that the victim can be reborn without the encumbering spirits.

In demonic possessions of the African type, the invading beings are usually undifferentiated ghosts without individual personalities. In possessions of the Eurasian type, on the other hand, the invaders are generally creatures of evil with individual characteristics and even names. They may claim to be dammed people, fallen angels, or simply evil spirits. As in the African type, Eurasian demons may enter a victim through a curse or an act of witchcraft. Demons are also thought to enter when the person breaks a significant taboo or commits a serious crime.

Typically, a person experiencing an African demonic possession will not have direct communication with the possessing being, nor will it usually take control of the body. In the usual cases of Eurasian demonic possession, on the other hand, the invading demon may cause the victim to act in unusual ways, hurting others or causing self-injury, or the demon may speak through the victim's mouth, announcing its presence.

Eurasian possessions usually include periods of depression and frightening visions, interspersed with sudden episodes in which a demon appears to take complete control of the victim's body. These attacks have a clear onset, where the victim exhibits all the signs of entering into a religious altered state of consciousness. Eurasian demonic possessions also have their own particular set of symptoms (although they are not necessarily all present in any given case) including insomnia, aimless wandering, compulsively eating strange or repulsive substances (or else refusing to eat at all), a repulsive stench, rigid muscles, unusual strength, fits of screaming or weeping, a significant change in facial features as a result of muscle contractions, and violent aggression against oneself, nearby people, or objects.

When the demon takes control, it will speak through the person's mouth but with a deeper, harsher voice. This may be because in this altered state the person's true vocal cords are not used, but rather the ventricular folds (the superior or false vocal cords). Also, the speech of the demon has been found to have a characteristic intonation pattern. Each phrase has an early peak followed by descending intonation. In this state the demon yells invectives and obscenities, and, if in a Christian context, it speaks of damnation and insults religious figures. The demon may also make predictions relating to the Church.

A person possessed must seek an exorcism; otherwise the possession will end in death from wasting away or from the demon forcing the victim to commit suicide. Different cultures have different qualifications for someone performing an exorcism. An experienced sorcerer, shaman, or priest may be necessary. For a Catholic priest to perform an exorcism, he must first get permission from a bishop, rarely given today. The Roman Catholic exorcism ritual was last committed to writing in the seventeenth century in the *Rituale Romanum.* It is a rite and not a sacrament, which means that the acting priest has considerable freedom in varying the details.

The Eurasian exorcist's ritual involves little physical handling; the only physical contact between the exorcist and patient is the laying on of hands. The possessed person may also be made to touch sacred objects. In such a ritual there are a few standard steps. The exorcist appeals to the relevant benevolent entities of the alternate reality. The demon will be pushed into revealing its name and its reason for entering into the patient. It is finally asked for the conditions upon which it will leave and when it will depart.

In some cultures it is common for a demon to request that the family give a large feast or that a ritual drama be performed in its honor. Commonly the demon will name a specific time in the future, at which point it will leave. The contract of a demon is always maintained, but when a demon does go that does not always end the victim's troubles. In some cases multiple demons will claim to inhabit a body. When one is driven out, another may come forward, with a new name, personality, and new conditions for going.

Most demons will resist strongly the attempt to exorcise them. It may not be until after many sessions of exorcism (in which the presence of holy objects or the reading of holy texts has tortured the demons) that they announce their time or conditions for leaving.

Accounts of these possessions and exorcisms are widespread and ancient. In the Christian

New Testament, the Book of Mark tells of a successful exorcism preformed by Jesus. Jesus encounters a possessed man who lives in tombs and who cries and cuts himself with stones. Jesus asks the demon its name, to which it replies "My name is Legion: for we are many" (Mark 3:7–9). The demons beg to stay, then finally ask to enter a large herd of swine. Jesus allows it, and the demons possess the swine, sending them over a cliff and into the sea to drown, at which point the man is cured. In a work of third-century C.E. Greek writer Flavius Philostratus, a magician named Apollonios of Tyana is reported to have cured a young possessed boy. In this story, however, Apollonios writes a letter, and the exorcism is achieved by having the boy's mother read the letter out loud to the demon.

Exorcisms seem to have been occurring for thousands of years all over the world and continue today. For example, in the 1970s a well-publicized case occurred in Germany. A twenty-three-year-old woman named Anneliese Michel experienced a severe demonic possession. She went first to the medical establishment, but they were little help. She eventually found a priest who would perform an exorcism, and he did so regularly for almost a year. During this time the demons claimed to be the spirits of Cain; Judas; Nero; Adolf Hitler; an obscure, but documented, Pastor Fleischmann; and even Lucifer. They claimed to have entered her as a result of a curse that was put on her before she was born. The exorcism was unfortunately unsuccessful, and Anneliese died in July 1976.

Most exorcisms, however, are successful. Anneliese might have died because of the interference of the psychoactive medication that medical professionals gave her over the same period, which gradually made it impossible for her to enter the trance state necessary for the exorcism to be performed properly.

Much has been written attempting to explain possession phenomena scientifically. The illnesses of possessions of the African type may have physical origins. The exorcism is then seen as a psychosomatic cure. The possessions associated with an altered state of consciousness have interesting parallels to various behaviors diagnosed as psychological disorders. Demonic possession is an illness, not a normal or desired condition. Demon possession has particular signs and symptoms that do not exactly correspond with the symptoms of any psychological ailment. Possession cannot simply be reduced to psychological disorders. Furthermore, exorcism usually provides a successful cure in cases of negative possession, one that would be difficult to achieve through medical or psychiatric processes. Whatever the explanation, such exorcisms are important to people who need them and to those interested in the range of human experience. They should not be disregarded by modern research.

DIVINATION

Divination is concerned with the acquisition of information. The derivation of divination from *divine* makes explicit the customary assumption about divination—that the information comes from a spiritual source. Cultures have many different forms of divination processes; those associated with shamanism are some of the most widespread divinatory forms. Divination is inherent to essential aspects of shamanism, reflected in classic conceptualizations of shamans as someone who enters ecstasy to interact with the spirit world on behalf of the community. This interaction with the spirit world had as a primary function the acquisition of information relevant to group or individual concerns. Use of divination in shamanic practice mirrors the functions of shamanism: diagnosis of causes of disease; prognosis regarding the patient's recovery; determination of the interests and intents of spiritual forces; location of animals for hunting; learning about the condition of separated family members; planning the future movement of the group or its enemies; determination of the intentions and whereabouts of others; and prophecy.

Social Explanations of Divination

Divination's etymological origin in *divine* reveals its roots in relationships to spirits and the information available from the spirits. The dominant theories addressing divination fail to respect this indigenous perspective of interaction with spirits as a means of obtaining access to real knowledge and valid information. Although anthropology has viewed divination as a form of communication, "scientific" approaches have generally rejected the perspective that divination procedures involve communication with spirits. Rejecting the explicit claims of spiritual communication and influence made by those who use divination procedures and the presumed empirical legitimacy of those procedures, those who accept the scientific perspective have instead offered explanations of the basis of divination that emphasize latent social functions and psychosocial processes. Divination persists, according to this dominant perspective, because it contributes to societal stability.

This dominant approach reflects George Park's (1963) functionalist perspective that divination procedures produce socially useful results, eliminating disorder in social relations through facilitating decision-making processes. Park considered the consequent reduction of anxiety as secondary to the social implications. Park pointed out that divination is generally with respect to some plan of action about which decision-making is difficult—life crises such as illness and potential death, conflicts, and economic or political calamity. But the legitimizing function of divination lies in its ability to provide a social validation for actions that would be difficult to justify on an individual basis, depersonalizing specific decisions and actions. Divinatory consultation takes the direct decision away from the individual, bringing in other considerations. Divination procedures distance the decisions from the individual, engaging a consultation process in which many opinions and points of view are considered and a consensus derived. It is this consensus accepted by the group that is viewed as the "function" of the divination, giving decisions a stamp of legitimacy in a dramatic social ceremony that invokes divine approval.

The traditional characterization of divination procedures as conservative devices points to what is in some respects an inevitable aspect of divination, since established cultural frameworks are used to define conditions and treatments, channeling opinion and producing social consensus. Divination inevitably operates

as a form of social representation, classification, and control, orienting people to traditional cultural norms and authority. But many lines of evidence call into question simple social control functions of divination procedures. If divination procedures apply the legitimacy of authority and tradition to determine behavior, why not seek out the wisdom and advice of high-status elder authorities?

An alternative view of divination as a randomizing device was postulated by Omar Moore (1957) in his assessment of the practices of scapulimancy. Scapulimancy uses an animal scapula, or shoulder blade, which is prepared and placed upon the coals of the fire; the ensuing burns and cracks are interpreted to determine the direction for hunters to take. Moore characterized this as a method to weaken habitual decision-making processes that could produce nonproductive outcomes. Instead of relying upon experience from past hunts, which may be nonadaptive because of reactions by surviving animals, Moore postulated that scapulimancy provides a randomizing or chance mechanism that produces advantages over habitual behaviors in hunting outcomes. Lothar Vollweiler and Alison Sanchez (1983) rejected Moore's postulations on the basis of a careful analysis of divination practices, hunting patterns, and behavior of hunted animals. They instead viewed scapulimancy as a practice used by hunters during ecological crises to reestablish their relations with spirit powers that control game animals. They rejected theories of the material adaptiveness of such practices, instead pointing to well-recognized sociopsychological consequences motivating continued effort in the face of uncertainty.

Divination is a context in which a socially acceptable outcome is negotiated, but one that is subjected to the development of consensus among many points of view. Rather than a blind acceptance of tradition, these processes involve a selective interpretation of tradition and the application of some traditional models but not others. Social control views of divination's social functions may be legitimate interpretations of some practices. But the success of new approaches in medical anthropology suggests the need for new perspectives in this area. Medical anthropologists have been able to establish the therapeutic effectiveness of traditional healing processes, and so it no longer seems appropriate to dismiss the possibility that the divinatory and diagnostic practices involved in those processes may have empirical validity.

Philip Peek (1991) characterized divination systems as an epistemology, constituting a people's system of assumptions about the nature of knowledge. Although academics may not be willing to embrace the "spirit hypothesis" of external autonomous entities, they should attempt to understand what spirit experiences mean for those who engage them. In particular, they should ask questions about the nature of the information provided by these spirit encounters. One approach involves "naturalizing" the spirit encounter by considering people's experiences to be real, but analyzing these experiences in terms of social and brain processes. These perspectives were voiced in Peek's views of divination procedures as engaging nonrational processes and non-normal modes of cognition. The willingness to submit important questions to the outcomes of oracular processes reveals a willingness to take information from sources beyond the direct control of one's rational processes. Peek points to altered states of consciousness and spirit possession associated with divination as principal manifestations of non-normal cognition. Altered states of consciousness have specific neurological properties that engage nonordinary modes of cognition, providing important sources of information not directly available to the conscious mind (Winkelman 1997, 2000).

Divination procedures also apparently access nonverbal information channels of the limbic brain and lower brain centers. In addition to the symbolic communication forms of language, humans use other forms of visual, behavioral, nonverbal, emotional, and somatic communication (see Hunt [1995] for a discussion of presentational symbolism and Winkelman [2000] for a discussion of other forms of thought from the ancient levels of the brain). Many of these processes are symbolic, but are experienced in systems that function without the mediation of language. Peek reminds us that divination systems combine this intuitive-synthetical mode of thinking with logical-analytical thought, making the diviner someone who is effective in communicating between modes of thought.

Shamanic Healing and Divination

The use of shamanic divination in healing was concerned with both the immediate cause of illness and the more distal and perhaps ultimate causes of a condition.

Divination was generally part of the shaman's activities as a prelude to healing. Divination of the patient's circumstances and likelihood of cure was often a preliminary step, but in some cases shamans would receive information about patients and their likely prognosis before the patients' arrival. In some cases divination specialists were distinct from those doing the healing. Some divinatory specialists did not heal, but referred their clients to others for healing of the conditions they diagnosed. Other diagnostic specialists also cured, but were called upon for diagnoses in cases where other shamans had failed to effectively heal the patient. These specialists are associated with more complex societies and belong to the category Michael Winkelman (1992) classified as *shaman/healers.*

Information Channels in Shamanic Divination

Shamanic divination engages in a number of different information channels, including experiences interpreted as spirit communication, which may be viewed as involving fundamental structures and processes of consciousness; altered states of consciousness and their visual experiences, a presentational symbolic system induced through deliberate vision questing and dreams; body-based sensations derived in particular from the hands; and experiences induced by the focus of attention on material objects, particularly those with reflective surfaces.

Spirits in Divination

The shaman's ability to divine, regardless of the method used, was generally seen as based on information provided by the spirits. The necessary engagement with the spirit might be as simple as turning attention inward and asking the spirit present within one's body. In other cases it required a much more elaborate engagement with the spirit, singing, talking, and making offerings to the spirit before it would take up abode within the shaman and be available for divinatory consultation. The information coming from the spirit could be manifested in a variety of ways. These included visions and voices that appeared to the shaman and their effects upon divinatory objects (e.g., statues, beads, parts of the body).

Dominant anthropological perspectives have considered spirit beliefs to be reflections of societal structures and concerns. While at first glance this view might be seen as simply reflecting the social control hypothesis, viewing the spirit world and associated divination-interpretation systems as an indigenous psychology provides additional perspectives. Spirits reflect both innate brain structures and cultural-psychological structures internalized in the processes of socialization (Winkelman 2000). The importance of culturally construed spirits and traditional interpretative frameworks in divination lies in their ability to place the individual's circumstances within the cultural cosmological framework that informs experience and situation of self. These frameworks are not generally explicit conceptualizations, but part of an implicit way of viewing and understanding the world. The nature of the experiences of the spirit world provides perspectives for characterizing this spirit-borne information. These spirit world interactions are typically accessed via an altered state of consciousness that is viewed as the means by which relations with spirits are activated and brought to bear upon the current situation; spirit information may also be manifested in bodily sensations.

Altered States of Consciousness in Divination

Altered states of consciousness are central aspects of shamanic divination, although not necessary in all cases. The engagement with the spirits in an altered state of consciousness may involve dramatic changes in behavior and appearance, or a subtle internal personal shift in consciousness apparent only to the trained observer. Whether or not the altered state of consciousness is apparent, engaging with nonordinary modes of cognition and consciousness that enhanced spiritual awareness and intuition is typically part of shamanic divination. Altered states of consciousness that provide access to the spirit world are induced through a variety of methods, including voluntary withdrawal and internal focus of atten-

tion; prayers; drumming, chanting, and singing; and smoking tobacco or taking other psychoactive plants. In general, the spirits are seen as speaking to the shaman, rather than speaking through the shaman as in possession. The spirits are often reported as speaking inside the shaman's head, telling the shaman who is coming, their condition, and whether or not they can be cured.

One divinatory aspect of shamanic altered states of consciousness involves visionary experiences that reveal the nature and cause of the patient's condition. Shamanic divination also often engages the visionary capacity, where the shaman "sees" the information desired. This includes in some cases a type of x-ray vision, in which the shaman sees within the person's body to determine the location of the cause of illness. Others see the illness appearing on a screen inside their head, providing details of cause and treatments. Dreams are one aspect of the visionary capacity often used for divination processes. Shamans may also deliberately engage in dream periods over the days prior to or during a healing ceremony to obtain dream guidance on the case.

Body Perceptions

Shamanic divination of illness also employs the shaman's hands in both physical and psychic modalities. The hands may be merely placed upon the body to gather sensations, or systematically moved over the body. Physically touching the body, massaging and kneading specific areas, and observing the patient's response to this touching are also used to determine some ailments. The shaman's hands may also be used as diagnostic instruments without touching the patient's body. Often the hands are rubbed together, warmed near a fire, or cleansed with ash before extending them toward the patient to feel the condition (Lyon 1996). In some cases, the patients' own somatic responses to the repertoire of songs the shaman sings may be taken as an indication of their condition. The renowned Navajo hand trembler exemplifies the use of the diagnostic shaman's own body in receiving information about the nature of a patient's condition. Peek (1991) points to the prevalent use of the otherwise tabooed left hand in African shamanistic divination, a behavior that would facilitate access to right-hemisphere intuitive, holistic, and analogic modes of cognition.

Divinatory Objects and Systems

Diagnostic skills, including the visionary capacity, may also be engaged through the use of physical objects. Some of the most important are mirrors, shiny reflective objects of stone or metal, bowls of water, bones, rocks, and crystals. Quartz crystals are frequently used as instrument for divining. Crystals may be used in diagnosis as a "lens" for observing the patient's body, with the cause of disease being manifested within the crystal. Crystals may also be seen as the abode of spirits that could speak to the shaman and provide a diagnosis or other information. Other material systems are observed for their reactions to drumming, dancing, or other natural processes. A variety of objects may be used to engage the psychic sight of the shaman, including both personal objects of the patient and ritual substances selected for their ability to elicit psychic sight on their reflective surfaces (e.g., bowls of water, mica sheets), where the visionary experiences are projected. Shamanistic systems have also used the appearance of animals and natural phenomena as signs relevant to divinatory outcomes. Many divinatory systems also use complex material systems with relatively standardized interpretations (as in the I Ching and Tarot), but these systems are not shamanistic in their basis.

Divination: Rational or Not?

Although divination has often been seen, like other religious behavior, as something irrational, the behavior of those who seek the counsel of diviners rejects the characterizations of irrationality. The use of multiple verification processes in divination procedures attest to petitioners' efforts to ascertain an empirical and veridical characterization of the situation they confront. Evans-Pritchard's (1937) classic assessment of divination among the Azande also emphasized its rational character, pointing out how the consultants searched for multiple forms of verification that allowed them to reject inconsistent answers. Those present at the divination often sought diviners far from their villages and maintained their anonymity to avoid revealing information to the diviner. In many

cases clients might not sit down with the diviner until significant information about the case had been revealed, and might take back their consultation fee and leave if significant errors occurred in the divinatory revelations. Diviners might be asked questions designed to test their power. Revelations that were accepted were often subjected to further verification and corroboration, several diviners often being consulted and their revelations compared before their divinatory revelations were applied to make decisions. Concern with the accuracy of divinatory revelations was reflected in practices of having the diviner reveal information that was verifiable by previous experience.

It seems, then, that the use of divinatory processes in shamanism and other magico-religious practices engages a number of different modalities of information acquisition and communication. Science may eventually explain many of these processes and illustrate their empirical and rational basis. But for shamanic traditions, divination remains preeminently a mode of communication with the divine in an effort to reach a real truth. For the scientist, divination must remain an effort to incorporate the extraordinary, unknown sources of knowledge beyond our immediate access within the social context of the interpersonal dynamics, conflicts, and psychodynamic constellations of the participants.

DRAMATIC PERFORMANCE IN SHAMANISM

An elderly Korean shaman was once asked about a shaman's powers as she sees them. She said that a shaman is, on the one hand, a person through whom the gods and ancestral spirits truly speak and, on the other, a good actor. "It's like a stage," she said. These two aspects of a shaman's powers seem contradictory, but they are not. Shamanist ritual is inherently dramatic. It aims at a direct manifestation of a supernatural presence (Kirby 1975, 2). Its mimetic activity, feats of wonder, music, and dance make the gods directly present before our eyes. It brings to the stage the inherently dramatic encounter between human beings and the gods and spirits that constitutes the core belief of a shamanist community.

A study of shamanist ritual as dramatic performance does not imply denigration of whatever extraordinary psychic or spiritual powers shamans may have, nor does it suggest that the spirits they invoke are mere figments of the dramatic imagination. Such a study highlights the fact that whatever powers shamans have to manipulate spirits are complemented by an artist's skill in manipulating the imagination of persons in attendance (Lommel 1967, 8). It calls attention to the fact that whatever extraordinary powers of healing they may have, they commonly achieve their effect with the aid of the ordinary powers of an accomplished stage artist.

It stresses that whatever private visions shamans have in a state of trance attain significance for the community when given concrete expression in public performance. Such a study approaches ritual in the way a dramatic critic analyzes any dramatic performance. It investigates how mimetic and symbolic activity, music and dance, physical setting, the structure and emotional atmosphere of the rite, and tensions between various elements and parts create the significance of what is taking place and heighten the effect the rite has on those present.

In the still alive and flourishing shamanism of the Korean peninsula, a ritual may be a simple, private affair of a lone worshipper chanting in the night on a mountain by a candle burning before an unusual rock outcropping, a spring, or a gnarled old tree. Often, however, it is a highly theatrical event consisting of a series of episodes that lasts hours or days, takes account of the natural setting and social context, employs colorful costumes, props, and numerous shamans and musicians, and includes the whole neighborhood for an audience. A Korean shaman ushers in a segment of a rite to deal with family problems in the metropolis of Seoul with a dance, first slow then fast, that creates a sacred atmosphere and may induce a trancelike state. Most commonly a woman, she summons the spirits and is believed to serve as their medium in interaction with the family. With an old-style military uniform, weapons, and a fierce demeanor, she exhibits the authority of the General Spirit. With a whining voice and peevish gestures, she gives theatrical life to the spirit of an ancestor who died as a young girl. In the role of the Mountain Spirit in a shaman's initiation rite, she may shed tears of sympathy for the hard life the new shaman is entering. As the soul of a deceased father in a rite for the dead, she may give the son a big hug and then comically upbraid him and his wife for not yet giving him a grandson.

In northern China, a Manchu Han Army clan rite may dramatize the opening of the gates of the other world, in a midnight episode in which a male shaman raises two large sword blades in the air and hammers them together. The next day, the clan gods appear. With silver hairpins stuck in his cheeks to suggest a boar's tusks, a shaman thought to be possessed by the Wild Boar God shakes and gets stiff. As the God of the Underworld, he appears with a mourning cloth hung around his neck. Taking the role of a Tang dynasty emperor, he reenacts the sorrow that the emperor felt when his general fell in battle. As the Hawk God, he waves his arms and jumps about lightly. As the Tiger God seeking his prey, he prowls around on the ground (Guo and Honggang 2001, 85–89).

To say, "It's a stage," sounds like saying, "It's all just playacting," and for many young Manchu, it is said to be just that. In Korea, however, the playacting reinforces what participants take as quite real—the presence of the spirits and their desire to be of help in time of need.

Nonetheless, neither the shaman nor others present take the performance as real in the way a child would. They seem well aware of the element of theatrical play. Like the private hallucinations that an initiate may have in the process of becoming a shaman, the public drama of a ritual performance reinforces a sense of the reality of the spirit world. Now, however, the shaman does not hallucinate. Her dramatic gifts are conscious and controlled. She may say in a rite, "I am the General Spirit" or "I am the Mountain Spirit"; but she does not suffer from dissociative illusions like a schizophrenic who thinks he is Jesus Christ.

The dynamics of shamanist ritual are said to be rooted in a shaman's trance possession by a god (Kirby 1975, 2); but, as has been pointed out with regard to Korean rites (Choi 1987, 35–36), it seems truer to say that these dynamics are rooted in the shaman's performance and in the faith and expectations of the worshipping community. Scholars debate at length about the state of a shaman's consciousness during a rite, but participants in a Korean family rite manifest little concern about the state of the shaman. They could care less about distinctions between possessed mediumship and simple role-playing. They simply seek a vivid dramatization of the ancestors' presence. In the Chinese tradition of shamanist masked drama called *Luoxi,* the key factor in making a god present is said to be simply the putting on of the god's mask (Xue 1996, 2). Indeed, to the mythic mind, role-playing in any such drama never has a "merely representative" significance. Possessed or not, in a trance or not, the performer "does not merely imitate the god"; he is "transformed into him and fuses with him" (Cassirer 1955, 238).

In any case, in evoking the presence and power of the gods, a shaman shows his ability as a performer, not only in vivid mimetic role-playing, but also in dazzling feats of wonder (Eliade 1989, 551). Korean shamans balance a pig's carcass on a huge trident, do a lightning-swift knife dance, or dance barefoot on high-placed chopper blades. Manchu shamans and clan representatives run over burning coals. Taiwanese shamanist mediums dance barefoot over fire fed by paper "spirit money" and beat themselves to the point of drawing blood.

Of course, spectacular feats in themselves do not constitute a sign of the gods' presence. The acrobats of Beijing Opera and the trapeze artists of the Moscow Circus perform more astounding feats without any pretension to divine power. A shaman's feats may arouse wonder in anyone; but they constitute a sacred sign only for a community of believers who expect such a sign (Wilson 1980, 29). Belief in the spirits empowers a rite, and the rites achieve their prime purpose in fostering this belief. Among the Yi people of southwest China, a family sometimes has a shamanist figure perform a rite to seek the protection of the ancestral spirits for one of the family who goes away to school. A Yi student has said that what distinguishes him from other Chinese university students is that he has an abiding sense of this protection.

The Yi pride themselves on their indigenous writing system, and their rites are said to center on the poetic, perhaps magical, force of the dialogical texts chanted in the rites. But in the main, a shamanist culture is not a verbal culture. It is the "culture of gestures" that the twentieth-century French drama critic Antonin Artaud saw as providing the life force of any powerful theatrical experience (1958, 108). The spirits' words constitute the core of a rite, but theatrical gestures empower these words.

Healing Rituals

Some shamanist performances use the language of gesture to dramatize, not the presence of the gods or spirits, but the shaman's act of healing. A Manchu Han Army healing ritual can become a playful game. Wearing grotesque paper masks and clothed in sheepskin, persons taking the part of ghosts grab about fiercely at participants while spectators watch in glee. The shaman, or perhaps a god possessing the shaman, fights off the ghosts. Then he enacts an attack of stomach pains, grabbing at his stomach; and the ghosts pull out of his stomach something shaped like the large intestine. Finally, the shaman chases them away, thrashing at them with bunches of straw (Guo and Honggang 2001, 90–91).

A shaman from the central Siberian Republic of Tuva has said that in his tradition, shamans may speak with a family's ancestral spirits, but that they dread the possibility of actual possession by such spirits. Nonetheless, the healing rite of a shaman from Tuva or neighboring Khakassia can also become an eye-catching dramatic performance. The shaman appears to draw out evil pestilence from a patient's body with his fingers or suck it out with his mouth and spit it out.

Korean shamans sometimes perform acts of ritual magic in a more symbolic kind of theater. They symbolize release from the knotted pains and frustrations of a person's past in simple but evocative dancelike gestures, as they release large loop-knots tied in a long white cloth. Sometimes they dramatize the cure of someone suffering from anxiety, or "soul loss," by spraying a mouthful of water over the patient or using knives to press the seventh vertebrae, where the "lost soul" is thought to return. The effectiveness of such rites in no way depends on spectacular activity performed in an altered state of consciousness. It depends on simple symbolic gestures and the prayers and support of those present, all of which reinforce the patient's world of trusted, harmonious relationships—human and divine.

In other Korean rites, theater and worship become one in a much more lively form of dramatic psychotherapy. Speaking the words of the spirits and vividly dramatizing their presence, the shaman brings a family's troubles and grief out in the open, provides objectifying perspectives on their problems, and encourages release from pent-up frustrations in tears and laughter.

One such rite was offered for the recently deceased mother of six married children. In life, the relations between the mother and one of the daughter-in-laws had been strained. In the course of the rite, the mother's spirit was thought to speak through the mediumship of the daughter-in-law as she held a branch of oak that symbolized the deceased. The branch began to shake, and the daughter-in-law shrieked

Shamaness performing rite, ca. 1980s–1990s. Mount Samak, Seoul, South Korea. (Earl & Nazima Kowall/Corbis)

and went into a trance, speaking sometimes in the mother's voice, sometimes in her own. At one point, the daughter-in-law said she was sorry, and the mother promised to give assistance from the grave. Finally, the daughter-in-law came out of her trance. The whole experience was traumatic for her and frightening for all present, but it gave her a unique opportunity to seek her mother-in-law's forgiveness and personal healing.

In a similar rite offered by a widow one summer for her deceased husband, the proceedings took a humorous turn when the husband asked for his old watch, hat, and clothes and then became irritated when the clothes given him were heavy winter clothes. He cried out, "Where can I go on this sultry summer day with these cotton clothes on?" Later, he asked for medicine for stomach pains, to which his wife replied, "You've already died. Isn't that enough? Why do you, a dead person, want some medicine?" (Yi 1988, 167–168).

Whatever extraordinary powers the shaman offering such rites has, the performance itself goes a long way to achieve cathartic healing, family harmony and well-being, and a sense of the continued presence of the deceased. Belief in this presence plays an essential role in the healing process, but techniques of participative drama, the public use of the stage comedian's humor, and theatrical play provide liberating, objectifying perspectives on the family's situation that modern psychotherapists might very well learn from.

Communal Preventive Rituals

East Coast Korean village celebrations seeking village harmony, health, and abundance in fishing and farming constitute a kind of communal preventive medicine. In the key symbolic event, villagers and a family troupe of what are termed hereditary shamans and musicians gather at the village shrine by the sea or in a grove of trees to summon the village ancestral god. The god is believed to show his or her presence in the shaking, sometimes quite violently, of a tall bamboo "spirit pole" held by a villager, who may go into a trance. The shaman asks the advice of the god regarding the well-being of the village and interprets responses manifested in the shaking pole.

For the preservation of the people's belief, it is important that the pole shake or that the one holding it go strangely into trance. But the effect of the rite does not depend only on this miraculous feat, and its significance cannot be reduced to the degree of altered state of consciousness of the person holding the pole. As participants join in a buoyant round dance, the clear April sky, the towering mountains, and the picturesque shrine on a knoll above the sea crystallize around the spirit pole, its white flag fluttering toward the sky. The result is an evocative "poetry in space," such as Artaud proposes as the ideal of any vital theatrical performance (1958, 38). Everything works together to create a sense of harmonious union among villagers, their gods, and the natural surroundings. Performed by skilled musicians, the subtle rhythmic interplay of drum, shrill pipe, clamorous gong, and chant draws worshipers musically, moreover, into a heightened, Dionysian

sense of the celebration of life in harmony with the gods. This communal heightened state of consciousness is of much greater significance than the momentary state of trance of the one person holding the spirit pole.

So is the harmonious play that unfolds throughout the days of the celebration. While some shamans perform individual divination rites for families on the side, the shaman troupe as a whole engages the villagers and their gods in playful entertainment in the form of moving folktales, lively song and dance, eating and drinking. The genius of the Korean shamanist imagination as manifested in the rite as a whole has little to do with trance or ecstatic vision, but much to do with harmonizing play. It has the boldness to envision contact with divinity in terms of lively Korean banter, shared laughter, and playful entertainment that bring the gods down to the level of neighborly camaraderie and raise the everyday toil of fishing and farming into the realm of sacred play.

Throughout man's history, religious worship has been a vehicle for play (Norbeck 1976, 98). Korean shamanist rites commonly begin, not with "Let us pray," but with "Let's play." A Mongolian rite may honor the god by incorporating a wrestling match and the eagle dance of the wrestlers. The Chinese Luoxi draws upon the rich heritage of the mask carver's art to enhance the sense of the presence of the gods while entertaining both the gods and human beings (Xue 1996, 28).

At the same time, both Luoxi and the farcical skits that may end a Korean village rite exemplify the evolution of pure theatrical entertainment out of religious worship. In a mode of drama that stands poles apart from the symbolic event of the greeting of the god in the spirit pole in the Korean rite, the lone male shaman performing these comic skits portrays not the gods, but the down-to-earth adventures of figures from village life—schoolmaster, fisherman, a blind man, a woman giving birth. In the skit portraying a fisherman, his boat gets caught in a storm. In one version, he calls to the gods for help and is saved. In a darker version that seems at odds with the trust in the gods that the village rite as a whole seeks to foster, he calls for help, but the gods do not hear. As is often the case in the risky business of fishing even today, he drowns. In the episode portraying childbirth, a woman about to give birth calls in her pain to the Grandmother Spirit of Childbirth. The baby, in the form of an orange plastic water dipper, is a cute baby boy. The shaman evokes a burst of laughter from spectators when he claims the baby was fathered by one of the respected village officials. He then chants a poetic lullaby asking the baby, "Where have you come from? Did you fall from heaven? Have you come wrapped in the summer clouds that hide the steep peaks?" (Ch'oe and So 1982, 350). In one version, the skits end here; but in the darker version, the help of the gods is again of no avail. The mother prays for the child's health, but the boy takes sick and suddenly dies.

Shamanic Performance as a Unified Rite

A study of shamanist ritual as dramatic performance considers not just isolated segments of a rite. Like the study of any dramatic work, it considers the interrelationship of parts as they form a coherent, well-unified movement; and it sees how ambivalent tensions and seeming contradictions between parts add to the rite's power and meaning. In themselves, the skits discussed here constitute examples of theatrical entertainment evolving out of religious ritual; but they have an integral role in the religious thrust of the celebration as a whole. They bring the everyday realities of the villagers' lives into the ambiance of the gods' blessing and protection, as symbolized in the encounter with the god in the spirit pole. The dark versions of the final skits stand in marked tension with the buoyant atmosphere surrounding that encounter; but they ensure that villagers celebrate their belief in the presence of the gods with a mature, realistic awareness that the gods' help does not always insure a happy ending.

A midsummer night's rite performed by a band of shamans and religious practitioners from the central Siberian Republic of Khakassia provides a simpler example of how various segments of a rite form a unified thrust. In the evening, on the hills above the clear-flowing Abakan River, the shamans performed a traditional purifying ritual that brought a disparate group of local inhabitants and foreign participants into harmony with one another and nature around a fire. The fire and the simple, unsophisticated drumming of the shamans provided the focus of attention, while a sheep

was slain off to the side. After midnight, all went down by the river for the second stage of the rite. A fire was lit on a small raft and sent floating down the river as a sacrificial gift to the Master of the Waters in thanksgiving for a spring free from flooding. Each participant was urged to make a prayer, and the fire, floating away into the star-filled night, seemed to carry the prayers into the darkness and bring all present into harmony with the cosmos. All then spent the night sharing the meat of the slain sheep as they waited to greet the dawn in the final rite. This rite was said to be traditional, but it could also well be a New Age shamanic ritual. All joined once more in a circle. Then, recalling their prayers of the night before, they followed a shaman ringing a small bell up a small hill to greet the sunrise and offer these prayers in the presence of the new sun. Except for one woman who at times seemed in a trance, the whole constituted a consciously organized, well-integrated symbolic event.

Of course, careful organization and a coherent integration of disparate parts are not the prime criteria for a successful shamanist performance. In June 1996, a group of Buryat shamans in Eastern Siberia performed a daylong sheep sacrifice on the shores of Lake Baikal to seek communal blessing and prosperity. As a dramatic performance, the rite was diffuse and lacked the clear, coherent organization of the Khakassian rite just described. Nonetheless, after many years of not being able to perform the rite under Communist rule, the belief and prayers of the local participants were probably more sincere than that of the disparate participants in the Khakassian rite. In the sublime setting of Lake Baikal, huge like the sea in the midst of pristine stretches of birch and pine forest, the simple gesture of raising arms toward the Master of the Lake became itself a moving dramatic performance. Such a simple ritual action suffices to create a sense of the cosmic drama underlying all shamanist rites, that of the movement of human beings to divinity and, it is believed, divinity to human beings.

After a program of Communist education in the middle of the twentieth century, the shamans of the Oroqen (Orochun) People, a small nation of hunters at the northern tip of China, decided to send their gods away forever. They did so in a grand rite of several days of dancing and drumming; and since then, they say, they have never celebrated a full ritual. But the simple act of carving the face of the Mountain God on a tree and doing homage to him as it is still performed before and after a hunt likewise constitutes a dramatic action fraught with meaning. This miniature dramatic performance preserves a belief system and worldview in which human beings are at one with nature and the gods, and seeking one's livelihood by hunting is itself a form of prayer.

Rites for the Dead

A Korean shaman from the southern port city of Pusan once inveighed against the elaborate performances of Seoul shamans in the north as nothing but empty theater; and some rites performed in modern Seoul theaters probably justify such criticism. But rites for the dead exemplify the fusion of worship with drama of a shamanist performance at its best. (The discussion that follows draws on Kister 1997.)

Korean rites for the dead seek both to send the deceased to the "good place" in the other world and provide a measure of peace for the bereaved family. As a well-integrated dramatic unity, they project the sense of inevitable forward movement toward a destined end that is said to be the mark of a fully developed dramatic work (Langer 1953, 307). From the very beginning, props in the background point toward the destiny of the deceased. In a Seoul rite, there is a flower-covered "gate of thorns" to the other world; in an east coast rite, a colorful paper-craft boat and white cloth symbolize the watery path or bridge to the "other shore." All the mimetic, psychodramatic, and symbolic activity of the rite moves steadfastly toward the climax, in which the deceased is sent to his or her destined end in the "good place."

A Seoul-area rite regularly includes a playful cathartic episode in which the Messenger Spirit from the World of Darkness comes to snatch away the deceased to judgment for sin. As portrayed by the shaman, the wildly flailing Messenger Spirit sometimes evokes the terror of death in a way that threatens all present. On other occasions, his presence evokes billows of healing laughter that dissipate some of death's terror and pain. Mouth stuffed with rice cake, he charges forth to lasso the soul of the deceased, symbolized by white papers attached to

paper-craft flowers on the altar. The family of the deceased gleefully tries to fend him off in playful battle.

At the end of the rite, humor gives way to sorrow; psychodrama gives way to symbols; and play yields to spatial poetry. In a Seoul rite, the shaman chants the tale of the Abandoned Princess Spirit, the god who leads persons through death. Dressed in a princess' elegant robes, she or he then escorts the deceased, symbolized by white funeral clothes carried by a family member, to the destined end. The shaman does so in a graceful, slow-paced dance around tables of offerings before the flower-covered gate of thorns to the stately music of the drum, cymbals, and pipe. She makes three rounds as a butterfly, three displaying long flowing sleeves in a gesture of leading, three displaying a fan to sweep away evil, and three rounds wielding a knife to cut away obstacles. The "poetry in space" that results transforms the sorrow of separation into an event of beauty and peace. The deceased then takes final leave of the family through the mouth of the shaman, who ends the rite by splitting a long white cloth held out by assistants. Running wildly through the tough cloth, she splits it with her body, demonstrating her spirit-given powers and dramatizing the rupture of death.

A shaman also ends an east coast rite for the dead by splitting a long white cloth. In this case, however, the cloth symbolizes the path to the other world; and she or he splits the cloth with a staff tipped with paper flowers that represents the deceased. The shaman stretches out the cloth and sadly tells the deceased, "Now we must load the boat and you must go." As an assistant takes down paper flowers and lanterns from the altar, she does a slow-motion dance, imaginatively loading them onto the paper-craft boat. She holds the flower-covered staff near the deceased's family and speaks words of farewell for the deceased. Then with calm, dignified grace, she uses the staff slowly, but firmly, to split the cloth.

This final gesture is basically the same as that which ends a Seoul rite, but it constitutes an evocative spatial poetry that conveys a quite different feeling and has richer significance. It fuses the searing pain of final separation with an image of the flowering of existence. Composed equally of splitting and blossoming, it evokes both a cruel fear that life is ultimately parting and a soothing hope that death brings fulfillment. Fashioned though it is from the simplest of materials, this ambivalent symbolic gesture speaks an eloquent theatrical language that can move believers and nonbelievers alike. Whatever effect it may be believed to have for the deceased, its impact on those still alive depends just as much on the artistry of the dramatic performance as on faith in the world of the spirits.

Whether complex or simple, well ordered or diffuse, shamanist rituals speak the spatial language of dramatic performance, and any study of these rituals bears its best fruit when it is rooted in this language. As with any drama, the language of the performance itself has an intrinsic significance regardless of the intent or interpretation of any particular shaman, actor, participant, or scholar. As a language of dramatic gesture, it often has its richest meaning and cathartic power when it is multileveled, ambivalent, and, as in this east coast rite, even self-contradictory.

DREAMS AND VISIONS

Dreams and visions constitute a large part of shamans' accounts of their experiences, whether the dreams and visions are at the initial stages of their careers, when the shamans are elected, or during the later period of their lives when the shamans have become firmly established in the community and periodically communicate with the supernatural to heal their patients and to provide messages to their communities. In spite of the widespread presence of dream accounts in shamanic cultures, there is not a unifying concept across cultures, primarily because each shamanic society is subject to its own cultural notions about dreams and shamanic traditions. Cultural and religious theories of knowledge expressed in ideas about dreams are analytically distinct from what today we might or might not be able to know of the actual content of the experience. For example, the Western classificatory system separates dreams from visions, whereas in many other societies this classification is blurred, or there is no linguistic or conceptual distinction between them. The language of the Mapuche of Chile, for example, does not distinguish linguistically between dreams and visions (Nakashima Degarrod 1989). On the other hand, many cultures do separate the two and differentiate them linguistically. In some societies, visions occur in full waking consciousness and are thought to be quite different from sleeping dreams. Both dreams and visions can be deliberately sought, so the distinction cannot be a matter of voluntary inducement. It seems clear that dreams and visions, whatever their final definitions, are inextricably linked and that their prevalence in the shamanic discourse matters. Douglass Price-Williams has suggested that what scholars of shamanism have coded variously as dreams or visions can be part of a continuum from a waking to a sleeping state (Price-Williams 1992).

Shamanic visionary experiences are also narratives that are orally communicated by shamans to their communities through a variety of means, such as songs, speeches, diagnoses of illness, storytelling, and informal conversations. Johannes Fabian has observed the communicative value of sharing dreams in a religious context in communities (Fabian 1966). As narratives, shamanic dreams and visions have a communicative value; narrators can send messages by narrating or refraining from narrating dreams and by interpreting dreams with a group with whom there is a shared knowledge of interpretative meanings. Narrators can indicate different meanings by selecting different audiences and contexts of narrations (Herdt 1992). Shamanic discourses about dreams and visions in many societies are valued not only for their different healing, religious, or political meanings but also for their aesthetic value, as these narratives are not transmitted only by the shamans themselves but also by other narrators.

Dreams and the Selection and Initiation of Shamans

Dreams play an important role in the selection and initiation of shamans. Shamans are commonly selected to take on their profession by inheritance from deceased shamans. For example, shamans from the Paviotso of Nevada were reported to inherit their spirit powers from a deceased shaman relative who urged the dreamer to accept the shamanic calling and power (Park 1934). In other societies, shamans are selected when they exhibit unusual physical characteristics, or they are selected from spontaneous vocation. Whatever the means of shamanic selection, it is primarily through dreams that shamans learn about their calling. Most shamanic societies believe that the refusal of the individuals selected to be shamans will result in future misfortunes to those called into the profession (Krippner 1989).

The ability to dream frequently or to have prophetic dreams are some of the unusual individual characteristics that signal future shamans in many societies. Among the Harney Valley Paiute in North America, the ability to dream is encouraged with the purpose of creating shamans. Parents instill in their sons the desire to become shamans and persuade them to dream. Sons are told what kind of dreams to expect to have in order to become shamans. They warn them also to adhere to the instructions in the dreams carefully. Otherwise the spirits will become angry and punish them by making them ill (Whiting 1950).

Shamanic vocation can be caused by spontaneous dreams or visions. This was the case with Henry Rupert, a Washo shaman who lived at the end of the nineteenth century (Handelman 1967). During his early years he had a series of dreams, which in retrospect marked him off as one who would become a shaman. He would dream specifically of a bear who stared at him. When he looked back at the bear, it would vanish, and then Henry would fly up into the sky to the moon. But it was at the age of seventeen that Henry had his power dream, which signified that he was to become a shaman. In the dream he saw a horned buck, which looked toward the east. A voice told Henry not to kill babies anymore. Henry woke up with a nosebleed while it rained outside. He interpreted this dream in the following way: The conjunction of buck and rain suggested that he could control rain, as the buck was recognized as "boss of the rain." The cardinal directions in the dream were important symbols. For the Washo there is the belief that the souls of people who have just died travel south, but the path of evil souls is toward the east. Henry interpreted the buck's action of looking toward the east as meaning that he was being warned against developing potentialities that could become evil. The voice in the dream was recognized as being the voice of a snake. Here the warning was against the indiscriminate taking of life. The rain that he heard on awakening signified to him that water would be his major spirit power. And the nosebleed meant that his dream intended him to have power, as it was the kind of physical reaction associated with the gaining of power. Later, when Henry became a practicing shaman, dreams guided him.

Henry Rupert's use of a symbolic metaphoric system of dream interpretation to decode his vocational dream exemplifies one of the two major types of interpretation used by shamans in the exercise of their profession, the other being the literal interpretation of dreams, in which dreams are taken at their face value as opposed to the symbolic system in which dreams are interpreted according to a specific system that translates different images as symbols for specific meanings. Douglass Price-Williams and Lydia Nakashima Degarrod found in their cross-cultural study of the use of dreams in forty Amerindian societies that shamans make use of both systems of interpretation, with the exception of the Raramuri, who only make use of the literal system of dream interpretation (Price-Williams and Nakashima Degarrod 1989).

Shamans undergo physical and emotional transformations in their dreams of initiation. Lydia Nakashima Degarrod found that in the autobiographical narratives of shamanic initiation among the Mapuche of Chile, shamans narrate dreams in which the shamans describe their physical and spiritual transformations after a period of intense emotional and physical suffering (Nakashima Degarrod 1989, 1996, 1998). Shamans not only go through the physical pain and the anguish caused by inexplicable illnesses, but commonly lack emotional or material support from their families, either because they are orphans or simply because their families do not believe in their calling. In this

context, shamans can have two types of dreams: dreams of an explanatory character, in which supernatural beings explain to the novices the reasons for their inexplicable illness and announce their shamanic calling, which tend to occur during the worst part of the physical and emotional suffering; and dreams of a rewarding nature, in which gods or other supernatural beings provide the novices with their shamanic training and grant them power occurring at the end of the initiatory period.

In these autobiographical narratives Nakashima Degarrod found that these dreams become the sites in which the final transformation of the novices occur—they not only become shamans with all the necessary knowledge and power, but they also overcome all the negative physical and intellectual traits described at the beginning of the autobiographical accounts. Shamans who, prior to the dreams, described themselves as being weak, ugly, or viewed as stupid proclaimed their strength, beauty, and intelligence after the dreams. This explanatory and rewarding nature characterizes most of the dreams that shamans narrate during the course of their profession. In the exercise of their profession shamans use their dreams to receive information and power to fight the agents of evil *(wekufe)* and they receive explanations for their own personal suffering and the suffering of the community at times of natural or political crisis.

Dreams of initiation may be thematically patterned. Common themes widely reported are dismemberment, death, and rebirth. These themes have been described in the initiatory dreams of Siberian, Eskimo, Australian Aborigines, and South American shamans (Eliade 1989). In these dreams, shamans undergo different forms of death, which may include the extraction of their viscera and contemplation of their own skeleton and their actual rebirth. For example, an Eskimo man selected to become a shaman reported a dream in which he was devoured by a bear, chewed up, and then finally spat out (Roheim 1952).

The Vision Quest and Shamanic Initiation

The term vision quest refers both to the experiences of a young person being initiated into adult society and to the shamanic initiation. It is frequently associated with the Guardian Spirit complex of Native American societies (Benedict 1923). Hardship is a necessary preparation for both initiation visions and shamanic experiences. All societies that involve the vision quest have the corollary belief that certain kinds of experiences will facilitate significant dreams and visions. It is generally believed, for example, that the quest necessitates a period of social isolation, coupled with increased vigilance and alertness. Lonely vigils on mountaintops or in forests or desolate places are advocated. Repetitive singing or praying is encouraged. Even the playing of repetitive games is sometimes undertaken in order to promote monotony.

In contrast to this passive approach of meditation and isolation, there is an opposite group of methods that encourages hyperactivity. Excitation, stress, and fatigue are the factors involved. A particular Salish group in the Pacific Northwest coastal area encourages bodily exercises and general exaltation of the senses. There are reports from the Southern Coast Salish of children being sent out on their vision quests in stormy weather and in thunderstorms, or being encouraged to dive into shark-infested waters (Jilek 1974). It is worth mentioning that hallucinogens are not used in these cultures of the Pacific Northwest. All methods of facilitating vision inducement involve harsh physical methods. Sleep deprivation is common. So are methods of dehydration or fasting. Sometimes vomiting is encouraged through the use of purgative plants to cleanse the system. Hyperventilation is sometimes promoted through the use of continual diving or other means of inducing exhaustion. The methods sometimes extend to exposing oneself to extreme temperatures, and even to self-inflicted pain. All these methods tend to create vivid mental imagery.

Charles Wagley (1977) described the novice shamans of Tapirapé of Brazil as seeking out dreams as part of their shamanic training. Annually during the late dry season all the young aspiring shamans gathered each evening in the central plaza of the village and discussed their dreams. A novice would sit near a fully-fledged shaman who was his mentor and be given smoke from his mentor's pipe until he vomited. The practice of "eating smoke," as it was called, persisted until the novice fell into a trance and became ill from the tobacco. During this trance the novice might dream. The practice was con-

tinued over a period of two to three hours. When the novice returned to his hammock, he would be expected to dream during the night. It was a difficult time for these novices. They had to refrain from bathing during this period. They could not eat certain animals, as they might be expected to encounter them during their dreams. There was also sexual abstinence. Frequently Tapirapé shamans would have dangerous dreams, at which stage they would become uncontrollable, running wildly through the village in a trance breaking things and perhaps killing animals.

Dream Helpers

The notion of the dream helper is widespread among Native American groups, though it has been best described in south-central California (Applegate 1967). Essentially the idea is that a supernatural being appears to the dreamer or visionary as a spirit offering power and protection. A song or a talisman is given to the dreamer, with advice on how to use the gift. Direct warnings may also be given. A shaman may further be given skills and knowledge on how to deal with witchcraft. A lay person may be given skills for hunting or even gambling.

The dream helper may manifest itself in dreams in different guises. It is usually in the form of an animal. It is thought of as the archetypal spirit of the animal species, rather than as a specific individual. An animal helper is actually the spirit of one of the First People, as they are called, who at the end of mythic times turned into the animals as we know them today. Owl, for example, is embodied in each individual member of the owl species, but Owl himself still lives in mythic times. Although they mostly appear in the form of animals, the dream helper can also appear as a ghost, a dwarf, or a water monster, or it may be a natural force personified.

There are basically two ways for an individual to acquire a dream helper, through drugs or through fasting and night bathing. The dream helper may be directly sought, as in the vision quest, but it can also appear spontaneously and unbidden.

There is another kind of dream helper, found among the Yurok in northern California. Here the shamans base their power on objects that reside in their own bodies (Kroeber 1925). Theses are objects that would prove fatal in the body of a non-shaman. The acquisition of these magical objects is due to a dream in which a spirit either gives the object to the shaman or places it directly into the shaman's body. The object causes pains to the shaman, whose task is to be able to maintain the lethal object. The fulfillment of that task is the achievement which marks a shaman.

Dreams and Healing

Dreams are a frequent means of diagnosing what it is that is ailing a sick person. If the source is a malevolent being, or a human person wishing the victim ill (as in sorcery), then the dream can reveal the identity of such a being or person. Furthermore, the dream can be used to identify the nature of the medicines to be employed with the sick person. These medicines are usually plants. The kind of plant, its location, and time to be picked can be provided to a shaman or healer by dreams.

Illness can also be induced in dreams in several ways. One of these is through a supernatural force that creates illness directly. Contact with dead people in dreams can also induce illness, not necessarily because of any malicious intention by the dead person. And sometimes just a bad dream has been sufficient to create illness. The activity of dreaming, therefore, is sometimes associated with danger, as a person can become ill through it.

Shamans largely cure through the art of dreaming. They do this often with the help of a dream helper or spirit with whom they enjoy a symbiotic relationship. Frequently the spirit specifies actions to be undertaken by the shaman subsequent to the dream that will facilitate the healing. Such actions sometimes are elaborated into full-scale rituals.

A frequent motif in the teaching of healers through dreams is the giving of instructions for the dreamer to carry out an action while awake. Usually a spirit or an ancestor or sometimes an animal declares in the dream that the dreamer should do something. A Blackfoot shaman learned in a dream how to cure different illnesses (Wissler 1912). A man appeared in his dream and told him that he would give him his body. The dreamer was told that he must carve the man's image in wood and carry it with him. Whenever anyone had a hemorrhage, the im-

age of this spirit-man from the dream must be put on the hemorrhaging person's body, and the hemorrhage would stop. The Blackfoot man said that this dream had given him the power to cure wounds, to heal disorders of the bowels, and to stop hemorrhaging. Another example comes from a Kwakiutl shaman during a great influenza epidemic (Boas 1921). The shaman himself was ill from this sickness when he had a dream of a wolf helping him. In the dream the wolf came into his house and told the shaman he should get into the river both morning and evening. He had to sit in the river and pour water from a bucket over both sides of his neck. More precisely he had to pour two buckets of water on the right side of his neck, then two buckets on the left side of the neck. He should do this for four days. This was to cure him of the influenza. Then he was told to do the same for others who were sick.

Many other groups practice various kinds of incubation rituals in order to have dreams for healing. Kwakiutl shamans were known to induce dreams before going to sleep by concentrating on an article belonging to a sick person as a means of diagnosing an illness (Boas 1921). Chippewa shamans went to a shake lodge in order to get dreams to diagnose illnesses (Levi 1956).

The shamans of the Sharanahua Indians of eastern Peru enter the dream world of their patients in order to heal them (Siskind 1973). They are aided by taking the hallucinogenic drug, *ayahuasca.* Their treatment is effected through curing songs. The choice of songs is dictated by the dreams of the patients and their type of symptoms. The patient reports dream images that coincide with the songs that the shaman knows. The shaman asks the patient about his dreams and also about his symptoms. A hallucinogenic brew is then cooked in the evening. When it is cooled and ready, the shaman and other men drink it. The men chant and the shaman sings a curing song. A vision then appears to the shaman of the image from the dream of the sick man. As he experiences the vision, the shaman openly speaks of it to the others.

There is a malevolent side of dreaming too. Tapirapé shamans have the power of doing damage to the vulnerable souls of people while they sleep. A shaman called Panteri was reported to engage in a dream battle with another shaman. In his dream he would travel in his canoe to the top of a high mountain. From this vista he would look around until he could see the soul of his shaman enemy, whom Panteri suspected of sorcery. Panteri would then throw his headdress, which would wrap itself around the soul of his enemy, carrying him off into the sky (Wagley 1977).

Psychological Healing

The Ute of Colorado and Utah and the seventeenth-century Iroquois are known for their use of dreams, which have been considered in contemporary times to approximate modern psychoanalytic practices (Price-Williams and Nakashima Degarrod 1989; Opler 1959; Wallace 1958). It has been considered that the Ute perceived dreaming as "emotionalized striving." The Ute shaman would dissect a dream in terms of the wishes, attitudes, and motivations of the dreamer. When living relatives appeared in a dream, the shaman would analyze the relationship with the dreamer for rivalries and resentments. Ute shamans and sick people confided that dreaming often reflected life problems in a distorted or delusional way. Dreams were thought by the Ute to show evidence of dominant drives and motivations. Marvin Opler, who studied the Ute fifty years ago, considered the Ute's own idea of dreams was that in the dream world the individual mind was free to roam or imagine, and its fantasies revealed tendencies toward the disguised expression of unconscious wishes. This is almost identical to psychoanalytical theory, and it is difficult to know whether this interpretation represents Opler's own summarizing of Ute ideas or whether this was independently the Ute position. Dreams of deceased relatives, labeled by the Ute as Ghost Dreams, also were regarded in a psychological light. The ghost was blamed for returning and troubling the dreamer, and the latter was advised by the shaman to cease worrying about the dead relative and to focus on the tasks of the living.

Shamanic Political Discourse

Dream and vision reports can transmit political messages and provide aid to a community undergoing communal crises. Lydia Nakashima Degarrod has found that the Mapuche shamans

of Chile narrate their dreams to their communities to provide messages from their gods and ancestors at times of natural disasters and political chaos. She observed that from 1985 to 1987, the last years of the dictatorship of Augusto Pinochet, was a period of strong political repression when large public gatherings were often prohibited, and a new law had been passed that promoted individual ownership of land and that threatened to break the Mapuche communal land holdings (Nakashima Degarrod 1996, 1998). During this period the shamans of several communities defied authorities by calling for the performance of community rituals that brought together hundreds of people. They were able to ask for the performance of these traditional rituals by narrating dreams in which their gods and ancestors explained the miseries that the Mapuche people were experiencing as a result of the people's deviation from the traditional norms.

The shamans in their roles as *peumafe,* "special dreamers," receive in their dreams explanations for catastrophes from their gods and ancestors and tend to view any form of catastrophe being caused by nature or society as a punishment for the Mapuche's deviation from the traditional behavior. The shamans receive specific instructions about the management and performance of rituals to appease the anger of the gods and ancestors. Because the Mapuche live in an area known for intense seismic activity and other natural disasters, the shamans' activity in their role as special dreamers is rather often called for. Although Mapuche shamans do not have a permanent position in the political organization of their communities, their participation at times of stress is important because through their dreams they provide the divine rules according to which the leaders keep the tribal law functioning—rules that define traditional and ideal behavior.

DRUMMING IN SHAMANISTIC RITUALS

The drum is used in a variety of ways in shamanist rituals; it may serve as (1) a rhythm instrument, (2) a divination table, (3) a "speaker" for communicating with the spirits, (4) a spirit-catcher, (5) a spirit boat, (6) a purifying device, (7) the shaman's mount.

To illustrate these functions of the shaman's drum, it will be relevant to summarize three representative shamanist rituals for distinctive purposes as practiced by different peoples of Siberia and Japan: The first of these accounts describes the descent of the Tungus shaman into the Underworld; the second, the ascent of the Altai Turk shaman into the world above; and the third, a healing ceremony performed by an Ainu shaman of Japan. Other uses of the drum from other cultures will also be mentioned.

The Descent of the Tungus Shaman into the Underworld

A historical account by Shirokogoroff (1935) describes the traditional preparation for the Tungus shaman's descent into the world of the dead. This consisted of setting up the following pieces of paraphernalia: (1) an idol; (2) a pair of wooden staffs representing two legs of a reindeer the shaman will ride when traveling over land; (3) a raft, consisting of four planks, which the shaman will use to cross the "sea" (Lake Baikal); and (4) two purifying implements, each made of four or eight narrow pieces of wood set up to form a gate through which the participants pass at one point in the ritual.

The first part began with the shaman drumming and concluded with an act of divination using the drumstick; the shaman throws it into the air, and if it falls down with the back side up, the indication is positive; but if it lands with the bowl or concave side up, the indication is negative. After the divination a reindeer is sacrificed.

Shirokogoroff observed that at the beginning of the second part of the ritual the shaman himself drummed; he rose up, then handing the drum to his assistant, took up the two staffs representing the reindeer's legs and started singing and dancing, from time to time taking short leaps. During the course of his song the

participants joined in by repeating the last words the shaman had uttered or a set refrain. The tempo and volume increased; the shaman took a large cup of vodka, smoked several pipes of tobacco, and, singing and jumping with even greater excitement, he entered a state of ecstasy and dropped down onto the raft motionless. The drumming slowed down, and the singing stopped. In time the shaman came out of his trance and began to reply in a weak voice to questions put to him by the participants.

The ceremony ended with purification (the participants passing through the wooden gate) after which the shaman sang for a long time, then jumped onto the skin of the slaughtered reindeer. The drumming became faster and the singing louder while the shaman remained there motionless. Finally the drumming and singing subsided, and the people began to call the shaman back. (Shirokogoroff 1935).

What is notable about this ritual is that the shaman himself used the drum only at the beginning; the rest of the time the drumming was performed by the assistant. Obviously the shaman could not continue drumming while in a state of trance, whether genuine or simulated, and so entrusted the assistant with the task of maintaining the rhythm. It is doubtful that the vodka and tobacco consumed by the Tungus shaman during the first part of the ritual was powerful enough to induce a state of trance. Among the ancient Indo-Iranians a substance, called in Sanskrit *soma* and in Avestan *haoma,* was prepared and offered by the priests in a special ceremony. This was obtained from a plant, identified as a variety of ephedra that, when crushed, yielded a powerful substance that was mixed with water or milk to make a drink with hallucinatory properties.

Although Henrik S. Nyberg's interpretation of ancient Iranian religious practices and those in Zoroastrianism as decidedly shamanic in nature (1938) was attacked by most scholars of Iranian studies, Mircea Eliade (1989) agreed that the ancient Iranians were familiar with many elements of shamanism, including ecstasy induced by intoxication, which he attributes to the use of hemp *(Cannabis sativa),* or *bangha,* an Iranian word that was disseminated among the Ugrians to refer to the mushroom *(Agaricus muscarius)* consumed by the shaman. The use of ephedra may have been yet another, perhaps earlier, borrowing from the nomadic Iranians, at least among the more southerly peoples of Inner Asia, for *Ephedra monostachya* is native both to the steppes and to Mongolia and Siberia.

The Ostyak shaman of the Irtysh region consumed narcotic mushrooms on the first day of a ritual and while in a state of intoxication communicates what the spirits have revealed to him, but he subsequently falls into a deep sleep and does not continue until the next day (Karjalainen 1921–1927).

René de Nebesky-Wojkowitz (1975) pointed out the close parallels between the Siberian shaman and the Tibetan Lamaist oracle-priest; the oracle-priest, unlike the Bon shaman of Tibet, does not himself make use of a drum, but during the divination ceremony the assembled monks sing an invocation to the accompaniment of a drum and a bone trumpet; the god invoked takes possession of the oracle-priest, or medium, and he enters into a state of what by all reports is a genuine trance. The tendency to enter such a state under the influence of the music and without the use of a stimulant or narcotic appears to have been the original situation.

Examples of the "refrains" sung by the participants during the Tungus shaman's ritual descent into the Underworld may be observed in a manuscript of the Sibe Manchus entitled *Saman jarin.* This text is divided into two parts, and in each part there are two repeated phrases, each consisting of two or three words, which alternate at the end of each line of a couplet; the last word (or two) of each alternating phrase is the same and the remaining word is similar (Stary 1992), so that the constant repetition in conjunction with an increase in volume would have had a hypnotic effect.

As for using the drumstick for divination, this appears to have been an incidental intrusion into the original ceremony, but it is now customary during the shamanist rituals of certain areas as, for instance, among the Nganasan (Dolgikh 1978). Though seventeenth-century visitors to the Lapps reported that the shaman entered a state of genuine cataleptic trance (Ohlmarks 1939), the present-day Lappish shamanist ceremony is devoted entirely to divination. The head of the drum is painted all over with figures; the drum is held horizontally, a group of brass rings is placed on the drum-

head, and, in response to an inquiry the shaman beats the drum so that the rings move around over the surface of the drum. The shaman answers according to where the rings come to rest (Sommarström 1989).

The Ascent of the Altai Turk Shaman

In an account of the ritual of ascent into the Upper World from a nineteenth-century source, the Altai Turk shaman, unlike the Tungus shaman in the ritual of descent, retained possession of the drum the whole time, even though, due to required actions at certain junctures, the drumming had to stop. The Altai Turk shaman did have an assistant, called the head-holder, who helped him even before the ritual began by holding the head of the horse that had been chosen for sacrifice during the ceremony, as the shaman waved a birch rod over it and forced its spirit to leave its body. The spirit of the head-holder left his body at the same time and made its way immediately toward the Upper World (whereas the spirit of the horse continued to hover somewhere in the vicinity), and the head-holder did not reappear physically until the very end.

The shaman began the first part of the ritual by sitting in front of the fire, where he conjured the spirits by calling to them one by one through the drum; as they answered, the shaman then used the drum to catch the spirit, waved the drum, and tilted it toward the assembled participants to show that the spirit thus invoked had indeed been trapped. He continued to do this until he had enough spirits to help him. Next he went out after the spirit of the horse and caught it in the drum, and several people attending the event helped him slaughter the horse.

The second part of the ritual took place the following evening. It started with the offering of horse meat to the Masters of the Drum. The shaman then fumigated his drum and once again invoked a multitude of spirits to assist him; his drum grew heavy with them. The shaman then commenced drumming and with his drum purified all the participants; by the end of the long and complex procedure he was ostensibly in a state of ecstasy.

In the middle of the yurt there was a young birch (representing the Cosmic Tree), stripped of all its bark, with nine notches for steps carved in its trunk. In his altered state the shaman climbed this tree, passing through heaven after heaven until he had reached the ninth heaven, sometimes even the twelfth, all the time recounting to the people below what he saw. On the way the shaman encountered the spirit of the head-holder and encouraged him to continue up into the next heaven. The account did not mention what had happened to the flock of spirits that the shaman gathered in his drum to help him, nor whether the shaman was still carrying the spirit of the sacrificial horse in the drum, but he must have had it with him, for when he reached the uppermost heaven he was able to offer it to Bai Ülgen, the king of heaven, in the event the sacrifice had been accepted. Upon his return to earth, the shaman appeared to awaken from a deep sleep, addressed the participants, and the head-holder stepped forward to take the drum and drumstick from him (Radlov 1885).

It was noted by Shirokogoroff (1935) that the Tungus also had a ritual of ascent into the Upper World, though it was much less frequent than that of the descent into the Underworld; this ritual was performed for healing purposes, but only if the person involved was a sick child. In this case, as in that of the Altai Turk ritual, an animal was sacrificed, though it was either a sheep or young deer, and it is clearer in these accounts that the purpose of the shaman's ascent is to take the spirit of the animal to the Upper World. Unlike the instance of the Altai Turk shaman, however, the Tungus shaman in this ceremony also had an assistant who took over the drumming once the shaman was ready for his journey, the first part of which was mimed by dancing and jumping (Shirokogoroff 1935).

In a healing ceremony of the Yakut of Siberia, described in an account from the early twentieth century, the shaman also escorted the spirit of a sacrificed animal to the Upper World; this happened only after he had captured the illness from the patient's body. Presumably he accomplished both of these tasks using his drum as a medium (whereas in healing rituals of certain other peoples the shaman sucks the illness out, but he may then spit it into his drum), for, though the ritual started in complete silence, by the time the shaman was ready to effect the cure, he was drumming, singing, and dancing, and continued drum-

Manchu shaman with drum. (Adapted from Alessandra Pozzi, 1992, *Manchu-shamanica illustrata* [Wiesbaden, O Harrassowitz])

ming throughout, the last part of his dance imitating the flight of a bird (Sieroszewski 1902).

Unfortunately there is no detailed information about the Bon shaman and his rituals at the time Buddhism first began to spread throughout Tibet; he is credited, though, with the power to perform various feats of magic and sleight-of-hand, such as making a deer walk floating above the earth, but his best-known feat is the flight through the air on his drum (Stein 1981), a shamanic accomplishment implicit in any instance of celestial travel.

The idea of the shaman's drum as mount is common to most societies where shamanism is practiced. The drumhead is made from the skin of a reindeer, roebuck, elk, deer, antelope, or horse, and the shaman rides whatever animal whose skin was used for his drum; in cultures where the drumhead is decorated this mount is one of the figures on the drumhead. At points in the ritual where the drum has been passed over to the assistant, the shaman may have to substitute some other prop for the drum, such as the two staffs representing a reindeer's legs in the Tungus ritual outlined above. And though the shaman rides through the sky on his drum, this does not mean that he conceives of the drum at that moment as a bird; it means rather that his mount is not earthbound.

On the other hand, where a journey to the Underworld through water is involved, the drum may be designated as something more appropriate to the task; according to an early twentieth century account, the Chukchee of northeastern Siberia, for example, referred to the shaman's drum as a canoe (Bogoras 1904–1909), and the Yukagir of Siberia called the shaman's drum *yalgil,* which also means "sea" or "lake" (a related word *yalgide,* "to ring [a bell]," may reveal that the resemblance between the words for drum and sea is coincidental, or it may simply recall the fact that there are small jingles hung inside the drum), and the shaman on his journey says he "travels through his drum as through a lake" (Jochelson 1924–1926). The reason for this association is that the shaman's descent into the Underworld in maritime societies was in fact an underwater venture. This did not inevitably have the same result, however, in all maritime societies, for neither Yupik *cauyaq* "drum" nor Inuit *qilaun* (from a root *qela,* "to invoke spirits, shamanize") has any connection with water.

The shaman's assistant is an individual who has exhibited some potential for becoming a shaman (through calling by a spirit or spontaneous states of ecstasy), and has set out to be the disciple of an established shaman. In many, perhaps even most cases, the candidate is not permitted by the master even to touch the drum until he reaches a certain stage in his initiation, so that he must be satisfied with some substitute such as a drumstick without the drum. The differences between the role of assistant in the descent to the Underworld ritual and the Altai Turk ritual as they were reported may be simply that the Altai Turk shaman's assistant was a novice, whereas the Tungus shaman's assistant had reached a more advanced level.

Normally we would expect a fully qualified initiate either to take over his master's duties entirely or move on to a new territory, but there do exist examples where shamans of the same rank perform side by side. In Korea the ceremony of exorcism is as a rule performed by the *phansu* (a male shaman either blind at birth or blinded voluntarily), rather than by the *mudang,* the female shaman. Typically the phansu

performs this ceremony in threes, one of them intoning the text while the second plays a drum and the third a brass bell (Lee 1981). In the east Canadian Inuit autumn ritual pertaining to the tradition of Sedna, supreme Being and mistress of the Underworld, the most powerful shaman, or *angatkuq* (compare Mongolian *ongun,* pl. *ongut,* the spirit of a shaman inhabiting some material object, generally an idol made of hide and/or felt, which is hung in the yurt) leads the action, but he is assisted by three other shamans (Boas 1964).

The Inuit ceremonies Franz Boas described, which were held in the summer, took place out of doors, but those held in the winter were performed in a structure called a *gaggi,* "singing house," specially erected for the purpose (1964). In Yupik this is *qasgiq* or *qaygiq,* "men's community house; steambath house"; this house was also regularly used for dances and feasts.

The first part of the Sedna festival as described by Boas was a ritual conducted in "a large hut" and the masked pantomime that is part of the same festival may be identified with one that among the Yupik of Alaska occurred in late October.

Boas did not mention the use of the drum by the shaman in other rituals he reported, but the opening of the ceremony held in the singing house as the Sedna festival began was signaled by the appearance of the shaman, who took up his drum and danced and sang to the rhythm of the drum. It is not specifically stated that the drummer was a shaman, but Boas did say that subsequently shamans were heard singing and praying in house after house, conjuring familiar spirits to help fight off the evil spirits aroused by the onset of winter and now active. Certainly these shamans were involved throughout this feast, culminating in the appearance of two "gigantic figures" wearing masks; Boas did not indicate that these figures were shamans either, but one of the sources he quotes did (Kumlien 1879; Boas 1964).

Healing Ceremony by an Ainu Shaman

In his account of shamanism among the Sakhalin Ainu of Japan, Bronislav Pilsudski (1909, 72–78) described two rituals, the first for divination, the second for healing a sick child. In the first ritual the shaman, or *tusukuru* (from *tusu,* "to prophesy," and *kuru,* "person") was bound hand and foot facing the participants, and his drum was hung up some distance from him. Then all the lights were turned out "to encourage the approach of the spirits." Presently the sound of the drum was heard, a signal that the spirit had arrived. This spirit had a rod and approached the row of participants; whomever he touched with the rod might ask a question. A positive answer was indicated by hitting the inquirer on the foot or the ground in front of his foot in a vertical direction; hitting in a horizontal direction indicated a negative answer.

The healing ceremony opened with the shaman warming his drum over the fire, but even before he started drumming, strange half-hissing, half-piping sounds emanated from his breast. He then beat the drum, first light and fast, then slower and louder. At this point he uttered a long series of inhuman sounds, including the baying of a dog, barking of a fox, howling of a wolf, growling of a bear, sounds of ducks and other birds, and creaking of trees in a storm.

The helping spirits arrived and circled the fire; the shaman screamed at the approach of the evil spirits, and he took a whisk (*takusa,* made from the stems of mugwort and wild strawberry) and chased after them. He prayed to the helping spirits to cure the sick child, and every strophe of the prayer was followed by an interval of solo drumming, the sound of which altered from time to time.

Often the shaman held the drum in front of his face, and the sound he made reverberated like an echo. He appeared now to be in a state of trance and ran here and there throughout the hut, his cries growing stronger. The climax came when the spirits spoke through him concerning the condition of the sick child; the participants heard strangled words, which the shaman repeated, instructions for what had to be done to cure the child. At the conclusion of the ritual he swung the whisk around his head to clear out the helping spirits, who were no longer needed, and fastened the whisk to the underside of his drum in preparation for the next ritual.

During the Yukagir healing ceremony the shaman also uttered a series of animal noises, in a manner similar to that of the Sakhalin Ainu shaman, including the sounds of a hare,

cuckoo, stork, owl, diver, wolf, bear, and dog, all of which were his helping spirits.

The Ainu divination ritual as reported appears to be independent of the healing ritual, but it may also have served as a prelude to the healing ceremony, as in the case of the Barguzin Tungus healing ceremony (Shirokogoroff 1935). The binding of the Ainu shaman recalls that of the Inuit shaman in the ritual ascent to the Upper World, when his hands were fastened behind his back and his neck was tied to his knees; the veil of secrecy provided by extinguishing the lamps in the Ainu ritual is paralleled by the use of a curtain to hide the Inuit shaman from the spectators in both the ritual just mentioned and in the ritual of descent into the Underworld (Rasmussen 1929).

John Batchelor, in his 1902 study of the Ainu of Hokkaidō, reported that the shaman lost consciousness and was possessed by the spirits so that he became capable of divination or prophecy; when this happened he appeared to be in a state of trance, a condition marked by tremors, heavy breathing, perspiring, and sightless though open eyes. All these symptoms were apparently self-induced without the stimulus of drumming.

The principal function of the shaman, or *angakuq,* among the eastern Canadian Inuit was to find out the reason of sickness and death or of any other misfortune visiting the natives, which he did by consulting his *tornaq* (Inuit *tarniq,* Yupik *tarneq,* "soul," "spirit")—a familiar most commonly in the form of a great bear—in the case of illness presumably to cure the patient. Boas (1964) made brief reference to the flight of the shaman with his tornaq to propitiate a hostile tornaq and to visit Sedna, mistress of the Underworld (or rather one of three underworlds), the abode of the dead, though he made no mention of escorting the spirits of the dead there. According to several sources that he quoted, however, it would seem that another function of the Eskimo angakuq in general was to visit Sedna, who was, in addition to her chthonic role (mistress of sea animals) to persuade her to release some of them in times when game was scarce. This appears to belong to a hunting magic tradition that may predate the other functions of the shaman.

In most reports on the customs and beliefs of the Eskimos dating from the early 1900s (among which were those of Rasmussen), no mention was made of the use of a drum by the shaman, which led Eliade to conclude that "the Eskimo shaman lacks . . . the drum" (1989, 289) According to certain earlier accounts, however, dating from the 1800s, the Eskimo shaman did make use of a drum during the rituals (Mousalimas 1989). This instance and that of the differences between the practices of the Ainu shaman in Sakhalin and those in Hokkaidō suggest a gradual loss of tradition.

Conclusion: Drumming and Trance

The question arises, then, whether it is possible for the shaman to enter a state of trance without the aid of drumming. Instances reviewed where genuine trance was attested all involved music: drumming, drumming and singing or, in the absence of a drum, at least rhythmic choral singing. In a work devoted specifically to the relationship between music and trance, Gilbert Rouget (1985) reviewed the theory that drumming has a neurological effect that may induce a state of trance and concluded that though the reaction is by no means spontaneous or inevitable, it could occur if the subject expected such a stimulus to trigger this response. In cases where the shaman found this stimulus did not have the expected result he might have recourse to some narcotic or intoxicant to bring on the trance; but this would happen only if a state of trance was the sole credible way to achieve the objective of the ritual as, for instance, when the shaman is required to cross into the Underworld.

Otherwise the shaman might either feign a state of trance or eliminate that particular ritual from his repertoire.

DRUMS, SHAMANIC: FORM AND STRUCTURE

Introduction: Historical Origin of the Frame Drum

The frame drum historically has been found in widely separated areas of the world. Sumerian statuettes portraying women playing frame drums date from about 2000 B.C.E., and Egyptian frame drums that have survived date from 700 B.C.E. The Egyptian frame drums were of two types: round and square. The round one was called *sar,* and the square one was called *tab.* Some of these frame drums, like some shaman's drums, were very large. A round frame drum from a relief of the Twenty-Second Dynasty (950–730 B.C.E.) measures over a meter in diameter (Farmer 1997). Varieties of frame drums may also be seen on large stone slabs in Hittite temples or friezes. For example, frieze no. 1 in the Ethnological Museum, Ankara, shows a pair of *kudum,* a kind of frame drum, and frieze no. 10 shows a frame drum with jingles inside at the top (tambourine). In the orthostat frieze from the palace of King Barrekup (late Hittite, eighth century B.C.E.), now in the Archaeological Museum, Istanbul, there are two musicians playing frame drums.

The first representations of frame drums in India occur in the sculptures of Bharhut

(second century B.C.E.), Sanchi (first–second centuries B.C.E.) (Deva 1978), and Amaravati (first century B.C.E.–second century C.E.) (Hariharan and Kuppuswamy 1985). The Vedas, the most ancient and revered scriptures in India, held by most Western scholars to date from towards the beginning of the first millennium B.C.E., mention several drums. Beside the *bhumi dundubhi* ("pit drum" or "pot drum") and *dundubhi* (a bowl-shaped drum, or kettledrum) occur the names *dambara* and *lambara.* These drums are unknown, and there is no description of them in the text (Deva 1978), but from the names it is possible to connect these drums with the Sumerian *dapa,* Egyptian *tab,* and, in the Semitic languages, Akkadian *atapu,* Hebrew *tof,* and Arabic *daff,* most of which have been identified as frame drums.

The single-headed frame drum had its origin in Siberia and was probably from the first a shaman's ritual object or instrument. Its size would have been determined by the materials from which it was constructed, the earliest form consisting simply of the skin of a deer or elk or a similar animal stretched over a frame of green sapling bent into a hoop. Primitive drums of this type are still extant among certain Indian tribes of western North America.

Unfortunately there are no surviving examples of such frame drums in Siberia dating from an early period. Although petroglyphs discovered in Mongolia depict a number of cultural items such as weaponry and carts, there are no representations of drums or other musical instruments or even figures that may be identified as shamans, as in the case of the famed Paleolithic wall painting of a shaman found at Lascaux in France.

Early Sumerian Frame Drums

The earliest representations we have of the frame drum, then, are those from Sumer. The Sumerians may have brought the frame drum out of central Asia with them. It was at one time thought that they were the original inhabitants of lower Mesopotamia, but research in the study of proper names shows that many place names in Sumer are not Sumerian words but belong to an earlier people (called Proto-Euphrateans) of unknown origin and linguistic affiliation. It is now believed that the Sumerians migrated into Mesopotamia in the second half of the fourth millennium B.C.E. from somewhere in the region of the Caspian Sea, possibly from a city-state named Aratta. Hence, it is thought that the Sumerians belong to that broad cultural continuum that extended from the Caucasus area eastward through Central Asia into Siberia.

As early as the third millennium B.C.E., Egypt and Ethiopia, known as Magan and Meluhha respectively, were mentioned in Sumerian texts. By the time of Sargon the Great, the founder of the powerful dynasty of Akkad, the influence of Sumer was felt from India to Egypt, and Sargon may even have sent his armies into Egypt, Ethiopia, and India. So far, Semitic equivalents for the Egyptian name for one kind of frame drum, tab, have been attested to only in Akkadian, Hebrew, and Arabic, and the Akkadian appears to be a borrowing from Sumerian. If a common Semitic or Afro-Asiatic root cannot be recovered, then it is likely that the frame drum, along with the Sumerian name for it, came into Egypt as one of the culture items borrowed from Sumer.

It is not clear from the Sumerian representations of the frame drum whether it had any function other than that of a rhythm instrument. It is not possible to say if it was by origin a shaman's drum because no evidence exists of shamanic elements in the Sumerian religion. However, there is a legend that King Etano of Kish, the first ruler of Sumer whose deeds are recorded, ascended into heaven with the aid of an eagle to obtain the "gland of birth," a legend that has a strong shamanistic air. Magical practices as outlined in Sumerian texts have been compared to the healing and exorcist rituals of the Altaic and Uralic shaman (Lenormant 1877). The descent of Lemminkainen into Death's Domain (Lönnot 1967), obviously the account of the familiar shamanist journey into the Underworld, has its parallel in the Sumerian accounts of the descent of the goddess Inanna into the Underworld realm ruled by her sister Ereshkigal and in the Gilgamesh Epic account of the descent of Enkidu to retrieve the *pukku* (drum) and *mikku* (drumstick) fashioned by Inanna from the wood of the *huluppu* tree (perhaps a willow) she planted, which had fallen into that same death's domain (Kramer 1963).

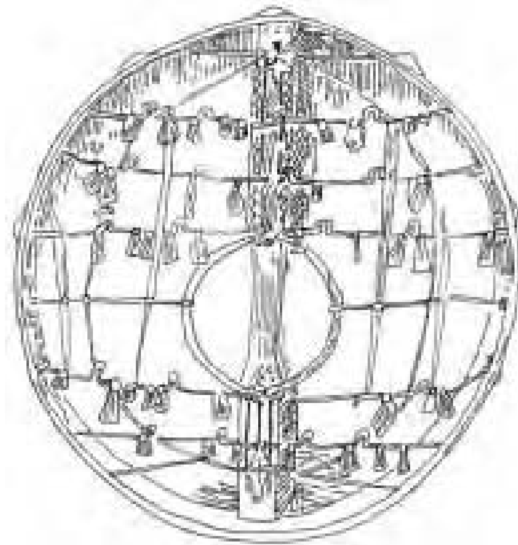
In any case, if the Sumerians brought a shaman's drum with them, they brought a form with jingles on it, for it is in this same general

area that the tambourine spread, in the hands of dancers, westward into Europe and through North Africa and eastward into India.

Early Frame Drums in the Americas

From south India the frame drum was carried to the east coast of southern Africa. The frame drum spread at a very early date from Siberia and then in successive waves into North America; it can be noted that innovations that arose in Siberia later are found on the other side of the Bering Strait closer and closer to Siberia in order of appearance, with the earliest ones being found closest to Siberia.

South America presents a special case, for the sound-producing adjuncts appear to have preceded the drum itself or to have completely superseded it; the typical rhythm instrument which was as a rule used by the shaman was the gourd rattle. At a later period, when the frame drum made an appearance in South America, transmitted there probably by a more direct sea route, a second face was added to the frame drum in Peru so that the drum could contain pebbles or other sound-producing material, thus turning the drum into a kind of rattle. In Chile, a native kettledrum was so modified in form that it came to resemble the broad but shallow drum of Siberia that was its model.



Yenisei Ostyak shaman's drum, back side. (Adapted from Georg Nioradze, 1925, Der Schamanismus bei den sibirischen Völkern [Stuttgart: Strecker & Schröder])

Functions of the Shaman's Drum

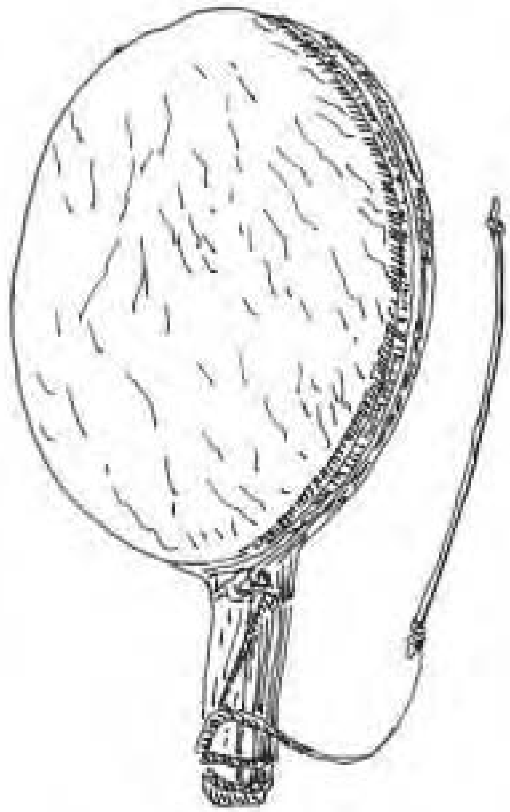
The shaman's drum is still used currently; it has many functions. It serves as the shamans' "mount," on which they ride to the Upper World or the realm of spirits, the hole through which they descend into the Netherworld, or a net in which they catch spirits. The principal function of the drum is through the repeated sound of its rhythm to produce in the shamans a heightened state of consciousness, or a state of ecstasy (Rouget 1985). As a rule, the shamans themselves play the drum and use it to measure the pace of their singing or dancing. But there are also cultures in which the shaman's disciples or assistants may either accompany the shaman on other instruments or may take over the drumming on another drum if the shaman stops playing. This generally happens when the shaman falls into a trance or a trancelike state.

The instruments used by the assistants vary from culture to culture. It hardly matters what these instruments are, for they have no significance for the shamanic ritual other than their sound-producing capacity. But we find in some cases that the shamans themselves do not use a drum but some other instrument, such as the *qopuz,* a stringed instrument of the lute type. What has undoubtedly happened in such cases is that the shamans have taken over an instrument originally used by their assistants. Possibly the drums fell into disuse because the role of music maker was taken over by the assistants, and then the shamans came to use the secondary instruments themselves whenever the assistants were not present or when they had no assistant. This would happen where shamanism suffered a decline.

In cases where the substitute instrument is not a drum, it is easy to recognize that the instrument is a substitute for the shaman's drum, but when it is another type of drum, not a frame drum, the substitute drum may come to be regarded as a variety of, or development of, an earlier shaman's drum, even in cases where it is not.

Korean Shamanism

Particular problems exist with respect to the shaman's drum in Korean shamanism because in



Chukchee shaman's drum. (Adapted from Georg Nioradze, 1925, Der Schamanismus bei den sibirischen Völkern [Stuttgart: Strecker & Schröder])

Korea the female shaman, the *mudang,* far outnumbers and occupies a far more important place in the practice of shamanism at the present time than the *paksu,* or male shaman. Drumming has been relegated to the *kitae,* a musical specialist female shaman who assists the mudang, thus leaving her freedom in her dance. The *changgu,* the principal drum, is a large hour-glass shaped drum; the ends are sixty to ninety centimeters in diameter and are covered with hide (Huhn 1980, 26; Lee 1981, 88). Among the traditional Chinese drums, there are drums of this size, but they are barrel drums, not hourglass drums; there are hourglass drums among the traditional Japanese drums, but they are all small drums. The Korean changgu is a stationary drum, unlike the usual shaman's drum, and the kitae sits to play it. Its origin is the *damaru* of India, Tibet, and ancient Chinese Turkestan. The Korean changgu is thus not derived from the familiar shaman's drum of Siberia but is a substitute for it.

During the ceremony to honor the dead ancestors, the female shaman shakes a set of jingles called *ulsae.* This instrument consists of a metal grip with several metal mirrors, each about ten to thirtheen centimeters in diameter, suspended from each end. Jingles are a frequent adjunct to the shaman's drum in Siberia, but they are used apart from the drum. A small double-headed drum, called *puk,* consisting of a wooden frame with cow skin stretched over it, is used primarily by the male shaman while chanting. A round or oval wicker basket, *tongkoli,* is sounded when the female shaman calls out the spirits of the dead (Lee 1981, 32, 88, 91, 104). Either of these may be derived from the original shaman's drum in Korea. Finally, there is a small round drum with handle, called *soku* (small drum) or *suku* (hand drum), similar to the Japanese *uchiwa-daiko,* with a drumhead made of cowhide or sheepskin, used in instrumental groups and by dancers; it is not mentioned in the sources whether or not this drum is also a shaman's drum.

According to Mircea Eliade, the Lamaist drum of Tibet influenced the shape not only of the Siberian shaman's drum but also that of the Eskimo and Chukchee shaman's drums. The latter, however, are single-headed drums with a handle, and they resemble the *phyed rnga,* "half drum," of the "black Bon" shaman of Tibet, rather than the double-headed drum of the Buddhist lama. Furthermore, such drums have been attested to in use in the Arctic and North America, in Java, Yugoslavia, and India, and hence are not so limited in distribution that they may be traced to a single source.

There is a great difference between a single-headed drum such as the Siberian shaman's drum, which may be held easily in one hand by a dancer, even without a grip in back, and one with a handle, whether single-headed or double-headed, which may be held just as easily. The Tibetan religious dances, like the dance of the Korean female shaman, are performed to the accompaniment of an orchestra consisting of various instruments. There is a formal division of function between a dancer or group of dancers and a musician or group of musicians; thus it is less likely that the Lamaist drum represents an original shaman's drum or is derived

from it than that it originates from some independent source.

In conclusion, the frame drum has an ancient origin and is found worldwide. The single-headed frame drum originated in Siberia and was most likely associated with shamanic activity. However, the earliest representations of frame drums are from Sumer, where the association with shamanism is unclear, with the exception of some legends. The spread of the Siberian single-headed frame drum can be shown by its diffusion into North and possibly South America.

The shaman's drum functions principally to help the shaman achieve an altered state of consciousness where he can have contact with spirits. Often other instruments may be used in a shamanic ceremony, usually by the shaman's assistant. Changes have been noted in the use of the drum by the shaman, either due to a different origin or a different cultural construction placed upon it, as is the case in Korea. However, in general, the single-headed frame drum, with variations, has been associated worldwide with the practice of shamanism.

E

ECOLOGY AND SHAMANISM

Throughout the varied forms of shamanism in diverse cultures worldwide, both male and female shamans cultivate intense, intimate, and transforming relationships with local lands, animals, and life forms, and it is these relationships that are referred to when ecology and shamanism are discussed. We need to note that shamanism is not a distinctive religion that unites strikingly different shaman-healers across cultures, but rather that the term *shamanism* suggests shared patterns of expression evident in the relationships of these ecstatic practitioners with self, society, and environment. These shared expressions can be seen as simply resulting, at least in some cases, from the intimacy of interaction of small-scale societies with their environments. Similarly, a basic impulse, which might be called an ecological imagination in the human family, may cause individuals to relate to local environments in innovative and creative ways.

The forces associated with a shaman's turning into an animal, linking community identity to sacred sites, and calling together the spiritual beings that dwell in the surrounding territory mark activities strongly related to ecology. Whereas aspects of a shaman's traditional environmental knowledge such as plant, animal, and weather knowledge correspond to the empirical knowledge of scientific ecology, these activities more clearly manifest culturally constructed religious ecologies. Religious ecologies involve seeing the environment as animistic, interdependent, and formative of personal and community identities. Found within many small-scale, indigenous communities, the healing and divining arts of shamans present a range of unique individual expressions of culturally specific religious ecologies, the understanding of which demands a reexamination of animism.

As Nurit Bird-David suggested (1999), the concept of animism needs to be revisited for what it has to tell of the strikingly relational character of environmental knowledge evident in shamanism. Knowing spirit presences in the local environment, for example, is not simply a subjective experience that draws shamans away, or alienates them, from their community. Rather, power presences within the environment are understood as persons with whom one establishes relationships entailing privileges and obligations similar to personhood within the human community. As spirit persons, these presences take form in imaginative performances, express desires, undertake willful actions, and are capable of communication. Shamanic rituals are distinctive occasions in which communities talk with the more-than-human persons in the cosmos. Moreover, a shaman's ecstatic performance brings to life his or her knowledge of the world in which a logic of interactive need and relatedness draws together these communities of beings. A shaman's rituals often interrelate the powerful persons of the bush with the village community in order to transform situations of need such as illness, loss, and anxiety.

Shamans also function within the social and psychological boundaries of their societies. This is evident, for example, in their use of kinship terms to describe their relationships with spirits in all the cosmological realms. They develop symbolic expressions of their visionary encounters within the context of culturally constructed cosmologies, cosmologies that interrelate local bioregions with the shamans' inner psychological experiences of spirit persons. This mutually reflexive and creative flow between shamans, their communities, and the powerful persons of the cosmos, then, activates an animistic epistemology, a relational knowing as if between dis-

tinct persons, and a religious ecology that stresses the interrelationship of community, local environment, and the larger cosmos.

This investigation of shamanism and ecology focuses on the ways in which shamans function in terms of three aspects of life: the external environment, for example, of mountains, rivers, and biodiversity; an inner experiential landscape that resonates with the animate world surrounding the human community; and a realized, or functional, cosmology that weaves together the outer environment of other-than-human persons and the shaman's inner psychic world. As will be evident in the examples below, the external environment, the inner psychic world of the shaman, and the generative significance of a people's cosmology cannot be neatly separated out from one another for analysis. Rather, they mutually inform and implicate one another in the holistic lifeways of shamanic cultures, even though they can be identified as distinct dimensions of shamanism (Grim 2001, xxxiii-xxxix).

In his now classic study of the fishing and reindeer-herding Evenki peoples of the Central Siberian Plateau, Arkadii Anisimov (1963) described the shaman's tent and ritual as a "fencing" of Evenki country, so as to protect it from the harmful spirit attacks of Underworld beings and of neighboring shamans. In effect, the ritual configures zones of symbolic activities that manifest the Evenki cosmology of a tripartite world. The shaman's tent is in the middle region, the earth, environment of humans, with an eastern gallery as the celestial realm and a western gallery as the Underworld. The cosmological symbolism of the realms is evident to the Evenki. Thus, the eastern gallery has living green-leafed larch trees that are turned upside down with their roots on top as if anchored in the celestial world. Wooden plaques present spirit images of reindeer and pike symbolically swimming in the Milky Way as river, plaques that are planted in the ground as guardians of this celestial region. Dead larch trees in the western gallery have their roots pointing down to the netherworld with wooden images of spirit birds and ancestral figures that guard the path to the departed. This western gallery, moreover, has multiple wooden board images of eelpouts, elk, stags, salmon trout, and larch trees with birds on top, all arranged in the form of a fish weir to capture any dangerous wolf spirits sent by neighboring shamans to attack the Evenki during the shaman's ritual.

The shaman's tent set on the human earth level has a central larch tree, a fire at its base, and a raft-seat for the shaman with wooden-plaque images of salmon flanked by attending representations of knives, spears, and fish other than pike. In this setting of the external earth environment, the shaman invokes personal forces associated with becoming an animal and undertakes therapeutic journeys to heal members of the community who are ill. Along with healing symbolism, the shaman marshals considerable military might in the form of spirit-animal legions to oppose dangerous intruders into the external environment of the Evenki.

The shaman may symbolically move through all three realms during his ritual performance while he sits on the raft drumming and invoking his spirits. As these animal spirits appear, the shaman ritually places them in the wooden images, thus empowering them to guard the land and the people. When his major animal spirit, or *khargi,* appears, the shaman increasingly identifies with this powerful and intimate spirit presence. Traveling to the celestial regions and the Underworld as his khargi, the shaman repeatedly returns to the local region with healing for the patient. In the same way, he returns with stories of his encounters with spirits and deities of the other regions. His stories and ritual performances evoke even more bird, mammal, and fish spirit-watchmen, who increasingly form a stockade, or fencing, that reaches through the air and across mountains and ridges on behalf of the people and land. These guardian spirits reside in rivers and local bodies of water to guard the people. As long as the shaman lives, these spirit forces stand guard over the land and the people. Should the shaman die, a cultural anxiety arises until a new shaman can reestablish this protective spiritual fencing. The animistic knowledge of the Evenki shaman, therefore, draws on a complex religious ecology that connects animal symbolism, military guardedness, and healing journeys so as to protect the people in their earth environment.

Understanding the ways in which shamans place spirit beings in the environment in conjunction with their personal inner, psychic visions and journeys has opened remarkable new insights into shamanism and ecology. Helpful

in this effort has been the work of Juha Pentikäinen in describing the cognitive mapping of the cosmos within, as is accomplished by mature shamans. Typically this inner topography of mental states corresponds to the external environment. This correspondence is often made manifest in shamans' rituals using layered symbolisms drawing associations between their initiating call experiences, local landforms, and body parts of assisting animals. The topographic sophistication and beauty of these inner mappings are often embodied in shamanic rituals. These ritual enactments of interior states are often the means for dialogue with the powerful beings of the land. One classic expression of this mapping of the inner landscape, with the external environment into a shaman's ritual, can be found in the narratives of the Lakota *wicasa wakan,* or shaman, Nicholas Black Elk.

Black Elk's great vision at the age of nine was told to John Neihardt in 1931, when Black Elk was sixty-eight. The clarity of his narration of the sequence of visionary events suggests the indelible nature of the vision. Black Elk's acute mapping of his inner, visionary topography connects directly to the local geography of the Black Hills, which are sacred to the Lakota. In one section of his vision Black Elk described receiving a daybreak star herb. He recalled the two male spirits who came to him, saying:

> "Behold the center of the earth for we are taking you there." As I looked I could see great mountains with rocks and forests on them. I could see all colors of light flashing out of the mountains toward the four quarters. Then they took me on top of a high mountain where I could see all over the earth. Then they told me to take courage for they were taking me to the center of the earth. . . .
>
> Two men came and stood right in front of us and the west black spirit said: "Behold them, for you shall depend upon them." Then as we stood there the daybreak star stood between the two men from the east. . . . They had an herb in their hands and they gave it to me saying: "Behold this; with this on earth you shall undertake anything and accomplish it." As they presented the herb to me they told me to drop it on earth and when it hit the earth it took root and grew and flowered. You could see a ray of light coming from the flower, reaching the heavens, and all the creatures of the universe saw this light. (DeMallie 1984, 134)

Black Elk eventually narrated his experiences to a shaman, Black Road, who assisted him in reenacting his vision for his people. As Black Elk further pondered his visionary experiences, he undertook a traditional Lakota vision quest, during which he received a vision from the Thunderers causing him to join with other *heyoka,* sacred clown, visionaries. Having expanded his spiritual knowledge, Black Elk was culturally and spiritually equipped to begin mapping his experience of being at the center of the world, and to understand the placement of the daybreak star herb in both his inner visionary world and the local Lakota lands.

Finding the daybreak star herb entailed more than Black Elk's simply searching for the place where he had dropped the herb from his vision into the northern plains of the Missouri River. Rather, locating the herb meant aligning his own visionary experiences of personal centering with the Lakota spiritual world of wakan beings, or power persons. Cognitive awareness of his vision, its purpose, and the Great Plains location of the actual herb joined with a deeply affective, felt understanding of the interrelation of these components as a relational epistemology. Black Elk described it in these words:

> One day I invited One Side to come over and eat with me. I told him I had seen an herb in my dream and we should go out and look for it. . . . That morning we got on our horses and went out in search of this herb. We got on top of a big hill and saw a place and knew this was in the vicinity of the place that I had seen in my vision. We sat down and began to sing the song I had sung in the first vision: "In a sacred manner they are sending voices to you," etc. When we finished singing this song, down toward the west I could see magpies, crows, chicken hawks and eagles swarming around a certain place. I looked over to One Side and said: "Friend, right there is the herb." (DeMallie 1984, 235)

The affirmation by the creatures circling around the herb linked place, plant, and Black Elk's vision experiences. The birds signaled both this cognitive awareness and deeply affec-

tive knowledge by which Black Elk had mapped his vision onto the land. These modes of sensual and intellectual knowing enabled Black Elk to connect his inner visionary landscape with his Lakota people's land as well as with the invisible and powerful wakan realm, so as to be able to respond to the human world of need. This mapping of the visionary daybreak star herb with the actual plant was the final preparation for Black Elk to begin his work as a healer and adviser to his people.

These examples manifest a realized, or functional, cosmology in which the story, or understanding transmitted in oral narratives of the all-pervasive powers of the cosmos, is woven both into the local environment and into the daily activities and material culture of the community. Shamans exemplify, but are not necessarily the sole religious figures associated with, the realization of cosmological power. The sophistication and skill with which shamans activate these therapeutic and inspirational relationships with more-than-human forces is amplified and expanded throughout the diverse ethnography on shamanism. A prominent characteristic in many cultural settings is the manner in which shamans become cosmic persons aligned with the powerful persons of their visions and dreams. In these roles shamans are believed capable of traveling in cosmic realms, of sustaining social order and environmental balance, and of penetrating into hidden personal, social and cosmic realms.

In her studies of the Wana people of Central Sulawesi, Indonesia, Jane Atkinson focused on the shamanic drumming ceremony called *mabolong,* at which the shaman calls an extraordinary crowd of spirit presences. Conversing with these powerful persons, the shaman speaks in esoteric and ordinary language styles that both conceal secrets of these presences and subtly reveal relationships that empower the shaman. Atkinson describes the profound interrelationship of person, environment, and cosmos according to Wana shamanship:

> The person, like the cosmos, possesses hidden as well as accessible dimensions. What is more, the hidden aspects of the person interact with the hidden aspects of the world beyond the person. Shamans alone can mediate that interaction. Because the well-being of a person is dependent on the behavior of others, both spirits and humans through their actions can intentionally or unintentionally disrupt one's state of health. A person's well-being rests on a fragile assemblage of hidden elements: when these elements are concentrated in their proper places, the person thrives; when they are dispersed, the person grows weak and sick. In this sense the person and the polity are homologous. Like a person, the Wana homeland prospered when "knowledge," "power," and "wealth" were concentrated at their source, but when these elements departed for the "end of the earth," this prosperity declined. Only when these elements are reassembled at their origin will the homeland recover, like a patient whose soul parts have been restored. (Atkinson 1989, 119)

Thus, Wana shamans model a remarkable cosmological gaze in their sensitivity to the local environment. Their thaumaturgical display of cosmological power evokes the collective spirit elements from the "ends of the earth" in order to restore individual, community, and environmental harmony. This activation of cosmological forces is also evident in healing by Temiar spirit mediums of Central Malaysia.

In her work, Marina Roseman (1991) described the ways in which the soul of a flower, bird, animal, or mountain in the rainforest detaches from its outward form and appears to the roaming head-soul of a dreaming Temiar spirit medium. Gifting the human dreamer with a song, the spirit guide sets in motion the potential for the healer to identify illness agents that also come to individuals from the rainforest environment as detached, disorderly spiritual elements. It is the healer's task to move the cosmos back into harmony by performing dream-songs that transmit the cool, spiritual liquid called *kahyek,* which combines the inner force of foliage, rivers, rain, and dew. For the Temiar, singing embodies this transformative process, clearly demonstrating how healers align themselves with culturally determined cosmological forces to respond to individual, community, and environmental needs.

Describing a similar act of alignment, within a totally different cultural setting, Johannes Wilbert (1993) wrote of the *wishiratu,* Warao shamans of the Orinoco River delta in Guiana. These shamans work with fire, tobacco, magnificently crafted rattles, and quartz crystals

maintaining the light, *mehokohi,* in the chests of the living by traveling the spiritual roads of Warao cosmology to negotiate with the powerful spirits. The Warao sense of a "participatory universe" provides the context in which their shamans weave their own inner revelatory experiences with the warp and weft of cultural lifeway and local environment.

ENTHEOGENS (PSYCHEDELIC DRUGS) AND SHAMANISM

The term *entheogen* was initially proposed to free the study of shamanism and comparative religion from the pejorative connotations associated with terms like *hallucinogen* and *psychedelic.* Introduced in 1979, it is now widely accepted, both within professional disciplines and in common usage, as a more appropriate term than those words that imply that the visionary religious experience that results from the ingestion of the substance is illusory or otherwise inauthentic (Ott 1993, 104). Entheogens are "vision-producing drugs that figure in shamanic or religious rites" (Ruck et al. 1979, 146). Combining the ancient Greek adjective *entheos* (inspired, animate with deity) and the verbal root in *genesis* (becoming), it signifies "something that causes the divine to reside within one." The ingestion of entheogens makes the celebrant consubstantial with the deity, providing a communion and shared existence mediating between the human and the Divine. The word's strong spiritual implications make it a useful and accurate term for describing the historical-cultural role of such sacred foods in the study of religions. *Entheobotany* investigates a culture's use of psychoactive plants within a sacred context. It relies upon aspects of anthropology, ethnology, psychology, philosophy, folklore and mythology studies, theology, and interdisciplinary methodologies.

An entheogen is any substance that, when ingested, catalyzes or generates an altered state

of consciousness deemed to have spiritual significance. Like shamanism itself, entheogenic spirituality is dependent upon, and defined by, this induction of altered states of consciousness. Altered states of consciousness are often considered indispensable to such typical shamanic practices as diagnosis, curing, soul retrieval, and communication with ancestor and nature spirits (Winkelman 2000). In myth, they are an integral element in the basic story of the hero or heroine who founds the pathways of communication between the human and the divine, and they are viewed as validating the community's spiritual life (Schultes and Hofmann 1979).

Richard Rudgley and others have noted that, to the degree that present cultures do not value altered states of consciousness, they are aberrations, "out of step with the entire record of human experience" (Rudgley 1993, 172). As a product of just such an aberrant culture, modern scholarship has largely ignored the significance of altered states of consciousness and the means by which they are accessed, often dismissing them instead as the result of primitive spiritual instincts or mental illness (Harner 1973).

Although the present sociopolitical environment has marginalized the central role of entheogenic substances in the study of religion and culture, this situation has begun to change. Much of the shift in attitude can be traced, ironically, to the same popular "psychedelic" movement, beginning in the 1950s, which fed a prejudice *against* these substances in academic and medical research. It has been pointed out, however, that members of the first generation of academics to take serious account of the role of entheogens were taking their university training during the 1960s (Devereux 1997).

The academic study of the entheogens is a comparatively recent phenomenon, as is recognition of them as a basic formative influence in the shaping of cultures (Schultes and Hofmann 1979). It is now widely accepted that entheogens represent one of the most direct, powerful, reliable, and ancient means of inducing "authentic" shamanic altered states of consciousness. Entheogens may, in fact, be the only reliable way of inducing the often extreme alteration of consciousness commonly associated with ecstatic shamanic states.

When the entheogenic sacrament is taken, mythopoetic traditions are relived and reinfused with profound immediacy and power. The entire congregation becomes sacralized, making its members worthy to be in the presence of Divinity, and of the subsequent gnostic vision that validates the culture's theology.

Entheogenic epiphany is commonly described as a state where all distinctions and boundaries between the individual and the metaphysical realm dissolve into a mystical and consubstantial communion with the Divine. Thus, this ecstatic experience is interpreted as a pure and primal Consciousness, which brings the individual into direct contact with the root of being. Shamanic practices ascribe highest importance to the regular access to such transcendental states; this point of contact with divine influence ensures the undisturbed continuation of natural cycles and protects against the potential dangers of unappeased or neglected gods or spirits. The entheogenic experience, though inexplicable in mundane language, is often considered more real and vibrant than ordinary consciousness (Schultes and Hofmann 1979).

Since shaman, entheogen, and deity come to share a common identity, all three become consubstantial, with both the human and the god or gods acquiring attributes of the ingested botanical agent that brought them together. (Ruck and Staples 1995). Weston La Barre (1972) concluded that the ecstasy-driven shamanic Ur-religion followed a cultural programming that inclined it to pursue the entheogenic effects of plants. Eliade's early opinion, retracted shortly before his death, that these plants represented a late and decadent form of shamanism was a profound error (Ott 1993), contributing to decades of academic marginalization.

The Entheogenic Roots of Religion

With the emergence of Neanderthal culture about 60,000 years ago, we find evidence of the specialized knowledge of medicinal plants linked to the burial of an apparent shaman figure at the Shanidar cave in Iraq. It seems clear that our rapidly evolving ancestors, at the very origin of the species, developed shamanic religious and ritual structures around chemically altered states of consciousness. The very impetus for human religiosity may well have originated in the awe felt by these earliest humans

after initial "accidental" ingestion of entheogenic foodstuffs (Wasson et al. 1986; La Barre 1972; Schultes and Hofmann 1979; McKenna 1992; Winkelman 1996). The fact that cross-culturally the use of entheogens declines as social and political complexity increases (Dobkin de Rios 1984; Winkelman 1996) supports the hypothesis that entheogens were an important, and perhaps even necessary, primal fundament for the development of shamanism.

Recognition of the powerful spiritual forces that seemed to reside within these special plants would inevitably have become fundamental knowledge for the group. The gifted visionaries most adept at eliciting and enduring the experience would be enlisted as what we now call the shamans, and entrusted with establishing and managing the pathways of communication, appeasing and attempting to control the spiritual forces through ritual enactments and proscriptions. Experiences of contact gave rise to various myths, and further experimentation produced a sophisticated tradition of entheobotanical lore. Such a scenario would have been repeated innumerable times, with traditions sometimes diffusing rapidly, while elsewhere remaining isolated.

Archaeological evidence suggests that entheogenic plants have been employed by humans since the most remote antiquity. All around the globe, evidence of prehistoric and shamanic use of entheogenic plants has been uncovered, from the 4,000-year-old mescal beans *(Sophora segundiflora)* found along the Rio Grande river basin and the cache of ancient peyote cacti *(Lophophora williamsii)* found in Texas to the mushroom stones (and related ceramics) of Mesoamerica, China, and Paleolithic Old Europe and the so-called mead-drinking Venus of Laussel, dating from the Upper Paleolithic.

Some of the earliest and most striking indications of the shamanic use of entheogens comes from the petroglyphs of the Tassili plateau in the southern Algerian desert, dating from between about 20,000 to 7,000 years ago. One is explicitly a shamanic figure with the face of a bee and mushrooms sprouting all over his body, indicating his consubstantiality with the spirit of the fungal entheogen. Another portrays individuals running with mushrooms in their hands.

A shamanic figure with the face of a bee and mushrooms sprouting all over his body. Tassili Plateau, Algeria. (Courtesy of Kathleen Harrison)

Still other examples of rock art identifying the painter with the entheogen occur in the Americas, such as the Panther Cave site in Texas, where the humanoid figures are clearly botanical, each having a cactus body with a foliaged arm, bearing thorn apple (*Datura*) fruits. In Siberia, where *Amanita muscaria* is still known and shamanically used in the twenty-first century, Bronze Age petroglyphs depict mushrooms and mushroom-spirits. Similarly archaic figures have been found elsewhere in Siberia, Scandinavia, Denmark, and around the world (Devereux 1997). Linguistic evidence for Siberian mushroom inebriation goes back at least 7,000 years (Wasson et al. 1986). In addition to the common "mushroom-stones" of pre-Hispanic Mesoamerica, figurines of shamans occur portrayed beneath the canopy of their fungal entheogen. Cross-culturally the artistic expression of shamanic visionary experience associated with entheogens is common.

Male Figure with Dog, 200 B.C.E.–500 C.E. Mexico, Nayarit. (Los Angeles County Museum of Art, The Proctor Stafford Collection)

Although this evidence is geographically scattered, there is a growing body of compelling data indicating that entheogens were an integral aspect of ancient rituals of shamanism, as they are in many primal cultures today. The cultural and ritual forms observed today probably resemble closely those of tens of thousands of years ago, and it is likely these entheogenic ritual forms have persisted in some places into the present without significant interruption. On the basis of Wasson's findings, La Barre concluded that the entheogenic mushroom cults of the proto-Indo-European, Uralic, and Paleo-Siberian peoples were of sufficient antiquity to make Old and New World traditions ethnographically related. Hence he argued for the "very great antiquity of man's ritual utilization of plants with psychotomimetic properties" (La Barre 1972, 270).

Though the importance of foods and dietary changes is widely accepted in contemporary evolutionary theory, the specific biochemical mechanisms of genetic mutation remain unknown, as does the evolutionary role of psychoactive substances. These unique plants, in fact, may have played a significant role in human evolution, both physically, in offering selective advantages such as strength, endurance, and improved visual acuity, and due to their marked effects on cognition, which probably lent important stimulus to the emergence of the human capacity for abstract reasoning, symbolic thought, and language, as well as stimulating the religious capacities that distinguish our species (Dobkin de Rios 1984; Devereux 1997; McKenna 1992).

Anthropologically, humans are "tricksters." That is, we are the animal characterized by the "tricks" it plays, with minor technological advances leading to major selective advantages. These technological tricks are a product of what is called abstraction reasoning, and our success as a species has resulted from accumulating and improving these tricks. It has been suggested that the intentional, continuing, and long-term use of these plant teachers is precisely the kind of trick that might account for the scientifically baffling sudden evolution of the protohuman neocortex between about one and two million years ago (McKenna 1992).

It is possible, too, that the human capacity for ecstatic integrative experience may have evolved in furtherance of the procreative sex drive. The mystical trance is often experienced as an orgasmic union with the cosmos, and it is important to note that psychoactive plants are commonly considered effective aphrodisiacs and are often used as such. If the transcendent emotions evolved to augment such a fundamental and primal instinct, the close similarity of sexual and entheogenic states suggests an extremely archaic cooperation of plants and humans in coevolution. Such speculation is supported by the fact that humans are capable of endogenously producing entheogenic compounds such as DMT (dimethyltryptamine) and have evolved very specific receptor sites, which enable plant-based neurotransmitters to induce liminal states.

Speculation and unanswered questions aside, it is clear that entheogens have played a far more significant role in the evolution of human cultures than has been generally recognized (Schultes and Hofmann 1979).

From a scientific perspective, it is important to consider that although there are comparatively few species of entheogenic plants, they manufacture a host of rare and unique chemicals, which, in turn, have profound effects on the human nervous system and neurochemistry. The effects that occur are remarkably universal, regardless of cultural conditioning. For instance, without knowledge of its effects on indigenous peoples, urban subjects under the influence of entheogens often report experiences that closely parallel well-known themes of shamanic experience. The cross-cultural similarity of experiences, as well as the interpretations of entheogenic states, reflects a commonality of underlying biological mechanisms (Winkelman 1996).

The Sociocultural Role of Entheogens

Erika Bourguignon performed a cross-cultural study of altered states in 1973, and from a sample of 488, found that altered states of consciousness were institutionalized within a spiritual framework in 90 percent of these societies (Bourguignon 1973). Anthropologist Marlene Dobkin de Rios discussed the shamanic use of "hallucinogens" in eleven different cultures and found that similar traits emerged. She found that psychoactive substances were typically used in the following ways: magico-religiously, within a ceremonial context, to contact and celebrate spiritual forces, to diagnose or treat an illness, for divination, and to promote social solidarity (Dobkin de Rios 1984).

Some of the shamanic cultures that have placed a central emphasis on entheogens, even into modern times, include Siberian and Central Asian tribes, such as the Koryak, Chukchi, Ostyak, and Kamchadal; the Huichol of central Mexico; the cultures of Lower Mexico, Amazonia, and Peru; the ancestral Bwiti cult of west-central Africa; and the Native cultures of North America.

Many other examples of intact entheobotanical traditions exist, while many more have been lost to the passage of time, or obscured due to the effects of heightened social and political organization as well as ongoing persecution. Also, it is common for cultures to adopt surrogates (such as alcoholic "spirits") in the traditional role of the entheogen, the sacrament then becoming known to only a small minority, or lost completely. In such cases, artistic or mythological elements often preserve some distinguishable traces of the plant god. Even where ritual inebriation is generally shunned, as among certain Pueblo Indians, the shamans still exhibit a close spiritual tie with the plant that is used in their sacrament; a case in point is the relationship of Zuni rain priests with *Datura stramonium* (La Barre 1972).

Because hunter-gatherers tend not to ritualize or socialize the use of entheogens to the same degree observed in agricultural societies, some investigators have argued that psychoactive plants emerge into culture along with an agricultural economy. However, the fact that shamanic religion is more developed among hunter-gatherers supports the conclusion that such plants have always been used to broker personal relationships with spirits, even though agriculturalists attach a greater ritual and social significance to the entheogenic experience. Hence, the "great period of ritual entheogens" is the Neolithic, which corresponds with the beginning of agriculture (Wilson 1999, 9–10). The rituals temporarily recreate a more primal connection with nature in its chthonic and chaotic fullness, a connection that is needed in the new situation. With agriculture both a literal and psychical chasm opens between "culture" and "chaos," and this dichotomy becomes the primary existential anxiety demanding the full attention of the community's religious impulses. As the vitality of the chthonic lapses from consciousness, the loss continues to be felt, and it is expressed to some degree in all great and small "redemptive" religions that evolved in settled agricultural cultures (Wilson 1999). The entheogenic origins of these religions may be considered in terms of an impulse to revisit the more balanced spiritual consciousness of a preagricultural "golden age," and specifically the need to reconnect with the primal root of all creation. Thus entheogenic experience becomes the personal touchstone of contact with natural forces (La Barre 1972).

The shift of the focus of anxiety from that present in a hunting ecology, dependent as it is on the fortunes of the hunt, to that found in a settled agricultural life, dependent on the vagaries of weather, started in the Neolithic; this shift resulted in a concomitant change from a more archaic form of shamanism to religions with defined priestly roles. It is this change that can help account for the later accretions that

have obscured most of the archaic, shamanic elements of what became the advanced agricultural civilizations (La Barre 1972).

The earliest and most historically significant mythological and religious traditions prominently feature magical foods such as the Mesopotamian "herb of immortality," the Vedic soma (and Avestan *haoma*), as well as the Chinese *ling chih,* "fungus of immortality," the nectar and ambrosia that fed the gods of ancient Greece, and the eye-opening Judeo-Christian "forbidden fruit" of the Garden of Eden.

Just as the entheogen figures mythopoetically as the object of the hero's quest, which as a recurrent theme is itself derived from the tales about the culture's founding shamans (Ruck and Staples 1995), it functions as well as the agent in initiation, where the role of the hero and "primordial shaman" is reenacted on a personal level: The individual achieves full membership in the sacred community by partaking of the entheogenic sacrament (La Barre 1972). Self-sacrifice, in the form of preparatory ordeals such as periods of prolonged fasting, special diets, difficult pilgrimages, sexual abstention, exposure to extremes of heat or cold, sleep deprivation, and flagellation, is often ritualized as the prerequisite or circumstance for the ingestion of the sacred food. Generally such sacrifice is considered the means for attaining the ritual purity necessary to elicit the desired experience from the plant spirit.

Such trials are especially common in the context of initiations or prolonged vision quests, where the subject may experience an ecstatic death and rebirth (often described in terms of dismemberment and reintegration). The ecstatic death can be understood as an extension and result of approaching literal death through starvation, dehydration, exhaustion, or the like. Although entheogens are often taken as "medicine" to relieve pain and confer uncommon strength and stamina, they are also used (and in heroic doses) as the catalyst of a culminating trial in the candidate's initiation or petition. Indeed, the entheogen may be required to make the supreme ordeal physically bearable. Among both the earlier hunter-gatherers and the subsequent agricultural peoples, entheogenic plants have always been revered and feared. Such respect is demonstrated by their exalted status in mythology and by the secrecy and taboos that often surround their use. Thus, the seriousness and danger attributed to these plants have always been a defining characteristic. They have a frightening and uncanny aura, which contributes to their powerful potential as catalysts of personal and communal integration (Schultes and Hofmann 1979).

Perhaps most often the entheogen assumes the role of a "plant teacher," revealing previously unknown or inaccessible information and offering a reliable means of inducing trance states for common shamanic tasks such as healing, resolving conflict, finding lost objects, and otherwise accessing information by nonordinary (i.e., "psychic" or telepathic) means. Lacking organic, pathological models for understanding disease, the shaman uses entheogens as the ultimate medicine, and although other remedies may be known and employed, these "plants of the gods" are ascribed a superior sacred status as panaceas.

Often confronted with difficult hermeneutic dilemmas, students of shamanism have long recognized that entheogenic and other altered states of consciousness—being inherently "mystical" experiences—are not easily described by means of common language. Many reports support the assertion that entheogenic altered states of consciousness and peak religious experiences are identical. Thus, "being intoxicated with God" is indeed a very accurate description not only of entheogenic states, but also of mystical experience, as well as shamanic ecstasy.

ENTOPTIC IMAGES

Entoptic images are luminous, scintillating, geometric visual percepts that are perceived in an early, or "light," stage of altered consciousness. They are also known, somewhat confusingly, as phosphenes and form constants. Some writers prefer to reserve the term *phosphenes* for comparable percepts that are generated within the eye itself, as, for example, by pressure on the eyeball. By contrast, *entoptic* means "within the optic system" and may thus include phosphenes and geometric percepts that are wired into the optic nerve or the visual cortex. *Form constant* refers to the cross-cultural nature of the geometric percepts: Their forms are universally constant.

Entoptic forms are perceived independently of an external light source. They include bright dots that may appear as clouds or as chains, zigzags, nested catenary curves, grid patterns, jagged sun-burst forms, and sets of parallel lines. All the forms are visible with the eyes open or closed; when the eyes are open the forms are projected onto veridical percepts, partially obliterating them. They also flicker, change from one form to another, and expand through the field of vision until they pass beyond the periphery. Initially, subjects find the array of entoptic images bewildering, but practice makes it possible to discern the individual forms.

Although the existence of entoptic images was known in the nineteenth century, some of the best work on them was done in the 1920s by Heinrich Klüver (1966). He and other researchers found that the percepts could be induced by a wide range of stimulants, including ingestion of psychotropic substances, electrical stimulation of the brain, pathological conditions, including migraine (the so-called fortification illusion is well known to migraine sufferers), sensory deprivation, pain, and aural and physical rhythmic driving. The means of induction is related to emotional circumstances: Entoptic percepts induced by psychotropes are far more emotionally charged that those produced by, say, clinical electrical stimulation.

As subjects move into deeper, more autistic altered states of consciousness, they try to make sense of their entoptic percepts. They interpret them as images of emotionally charged objects or items prominent in their mythical system. This stage has been designated stage two and called construal. In stage three, deep altered states, entoptic images become peripheral in the visionary field, or integrated with true hallucinations of animals, monsters, therianthropic fig-

ures, and so forth. Such iconic hallucinations are not in themselves entoptic, though they may have entoptic elements within them; they do not derive from the actual wiring of the brain. At this stage, emotions may be ecstatic or charged with fear (whence good or bad "trips").

Later, a number of researchers discerned formal parallels between entoptic percepts and images that were believed to be shamanistic in origin. Among these writers were Max Knoll, Joseph Eichmeier, and Oskar Höfer. It was, however, Gerardo Reichel-Dolmatoff who first explored, rather than simply noting, a possible association between the images of stage one and shamanistic visions. Working with the Tukano and other shamanistic people of South America, he found that they painted on their bodies, bark-cloth, ceramics, and houses formalized patterns that they themselves said they saw in *yajé*-induced altered states of consciousness. Set side by side, the patterns painted by the Tukano were clearly homologous with the entoptic forms that Knoll and others had identified. Reichel-Dolmatoff concluded that the Tukano were painting entoptic images. He also found that the Tukano ascribed meanings to the forms: For instance, parallel chains of small dots were said to be the Milky Way, the destination of shamanistic flight, while wavy parallel lines were said to be the "thoughts of the Sun-Father" (1978, 88). A spiral was said to symbolize incest and the threat of pollution. The Tukano told Reichel-Dolmatoff that this design element derived from the imprint left in the sand by the lower end of a ritual trumpet, an instrument of great importance in Tukano religion, involved in the maintenance of exogamic rules and male supremacy. It was this formal similarity that led them to identify their entoptic percept.

These few instances exemplify two key points. All shamans who enter altered states of consciousness have the potential to see the same geometric entoptic images because they are "wired into" the human nervous system. Communities tend to focus on certain forms and to ignore others. The meanings that they ascribe to each of the selected forms are also culturally specific; it would not, for example, be possible for an outsider to guess the meaning that the Tukano ascribed to the spiral, one of the most common entoptic forms, the one that leads into the deepest levels of altered states. The forms are universal, but the meanings are contingent. The Tukano serve as a useful example, but clearly other shamanistic communities could readily be cited.

The insights of Knoll, Reichel-Dolmatoff, and others were taken up by rock art researchers with mixed results. Critics of the rock art work have pointed out that the presence of a single spiral does not necessarily mean a shamanistic art. The researchers have rightly responded that no one proposes such a simplistic inference. To clarify the debate, they have distinguished between two kinds of context: those rock arts for which there is some ethnographic suggestion that the people who made the images were shamanistic, and those for which there is no ethnography. Often, as in the case of southern African San rock art, associated images of ethnographically well-documented San shamanistic trance dancers suggest that the geometrics (usually somewhat rare) incorporated into true hallucinations of the spirit realm were probably entoptic. Where there is no ethnography at all, researchers should be circumspect. They need to find out how many design elements parallel entoptic forms; one or two elements will not be persuasive, but a wide range could be more significant. Even then, researchers should examine other images to see if any are comparable with stage three hallucinations before suggesting a shamanistic context. Some of the most successful research on entoptic elements in rock art has been conducted in southern Africa and North America, where there is abundant ethnography to suggest that the arts are shamanistic.

ETHNOCENTRISM AND SHAMANISM

Ethnocentrism refers to the tendency to see, interpret, and, especially, judge other cultures in terms of one's own culture and cultural suppositions. In its most commonly applied understanding, it refers to the belief that one's own culture is superior to other cultures, leading to grotesque misunderstandings of the behaviors of others, intellectual distortions of what they believe, and even violent persecutions of others for their beliefs and practices. Ethnocentrism in all its forms has influenced the various ways outsiders have viewed and reacted to shamanism.

As described originally in what has been considered its classic form, in Siberia and Central Asia, shamanism refers to a complex of beliefs and practices revolving around an ecstatic magico-religious specialist, or shaman, in a small, close-knit community (prototypically though not exclusively a community that lives by hunting and gathering), of the kind found among the Tungus (Evenki), Chuckchi, Buryat, Yakut (Sakha), and other Siberian tribes (Shirokogoroff 1982; Vitebsky 2001). The shamanic candidate suffers a profound personal crisis (the calling); after recovering, the candidate is considered a shaman and performs dramatic rituals for the community. These rituals may include mystifying feats and the shaman's entering trance, sometimes by ingesting hallucinogenic plants, and always associated with drumming. In trance, the shaman's soul travels to upper and lower worlds and battles spirits and retrieves lost souls in order to heal individuals or ensure the community's well-being (e.g., by enabling successful hunting). The shaman may also summon spirits to help in the spiritual quest. Other magico-religious complexes that resemble Siberian shamanism to varying degrees have been identified throughout the Americas, South and Southeast Asia, and other areas (Townsend 1999, 429–433; Vitebsky 2001, 26–51). All of these forms of shamanism have provoked ethnocentric reactions, but two kinds of reaction stand out in the literature: the various reactions of the state (notably the Soviet and Western colonial governments, with their respective ideological and religious foundations) and the reactions of scholars (especially those scholars shaped by western European and American culture).

Ethnocentric States, Their Ideologies or Religions, and Shamanism

Most of the areas of classical Siberian and Asian shamanism came under Soviet Communist rule in 1917, and by the late 1920s the regime had instigated a widespread campaign to eliminate shamanism from that huge region. According to the Soviets' Marxist-based ideology, all religions promoted backwardness and a "false ideology," a cover or facade for some form of domination over the people, and thus constituted a major obstacle to the Soviet's socialist agenda. Since shamanism did not have any churches or temples that the Soviet state could destroy, shamans themselves became the focus of the persecution. Moreover, since shamans were so essential to their tribal communities and their people believed that they held spiritual powers, the Soviets considered them particularly threatening and branded them "exploiters" and "enemies of the people." Typically, the shamans' ritual paraphernalia were destroyed, and they were exiled to labor camps, tortured, or killed, as in one dramatic account of shamans being dropped from helicopters and told to fly (Vitebsky 2001, 136). As part of

the campaign, local representatives of the League of Militant Godless gathered information on shamans, spread anti-shaman propaganda, and tried to replace shamanism with the Lenin-Stalin Cult, in which Lenin and Stalin were portrayed as all-powerful solar deities who could defeat all evils (Bodley 1982, 116).

Earlier in North America after the American Civil War (1861–1865), the U.S. government launched a similarly ethnocentric campaign of cultural genocide against the Indians and their shamanic beliefs and practices. Initially aiming to "pacify" and to "civilize the savage," so the argument went, the government confined Indians to reservations en masse and pressured them to practice Euro-American customs, including Christianity, in place of their shamanic religions. Because the Euro-Americans in the big cities at the time continued to view the Indians as savages, lesser beings on an evolutionary scale who could not know what was good and right, they came to believe that the Indians had to be forced to learn. By 1889, President Harrison declared an urgent policy of forced acculturation (forced adoption of American culture). Indians were to be rigorously forced to abandon their own beliefs and practices, and completely reeducated, which, it was declared, would ensure a better life for them and for the many pioneers who wanted their land (Kehoe 1989, 14–15, 28–30). Indian children were removed from their homes, put up for adoption by Euro-American families, or placed in brutal boarding schools, often run by the U.S. Army and especially designed to change the culture of the children (see photos). Laws forbade "pagan" Indian ceremonies, as the Indian Bureau feared they would inhibit the spread of Christian beliefs and values. Among the Washo Indians, for instance, shamanism was practically eradicated by the 1890s during the forced acculturation of American Indian children (Bodley 1982, 117; Handelman 1967, 447–448).

Earlier still, in Central and South America, zealous sixteenth century Catholic missionaries tied to the Spanish colonial invasion viewed and judged shamanism from their own European cultural framework, which was founded on Catholic cosmology, notions of good and evil spirits, and prominent beliefs at the time in Europe about "witches," "witchcraft," and making pacts with the Devil. Consequently, when they encountered Indian shamans who spoke of spells and spirits and used hallucinogens in their rituals to see and communicate with these spirits, the missionaries concluded that the whole practice was a manifestation of the Devil—their Christian Devil, that is! But the Indians claimed that many of the beings they contacted were "helper spirits," who had helped them in their own personal spiritual transformations and given them the ability to heal. Nevertheless, the missionaries could neither understand nor accept the Indians' own and very different interpretations of their shamanic practices. In the missionaries' ethnocentric view, the communication with spirits through shamanic trance and soul voyages could only refer to "talking with the devil" (Vitebsky 2001, 130–131).

Supported by the missionaries' perspective, the Spanish crown sought to manage the diverse indigenous populations by unifying them around the Catholic worldview and faith (Quezada 1991, 38). But this was a difficult task. By the mid-seventeenth century, for instance, the Franciscan bishop of Quito, Ecuador, Peña Montenegro, was writing in his instruction manual for missionaries that the major obstacle to the spread of the gospels was still those Indian sorcerers and magicians (i.e., shamans): "They resist with diabolical fervor so that the light of truth shall not discredit their fabulous acts" (cited in Taussig 1984, 96–97). Yet, he added, their beliefs and actions were understandable: "Utilizing his malign astuteness, it was easy for the devil to set up his tyrannical empire amongst them, for they are people, brutish and ignorant, whom it is easy to deceive" (cited in Taussig 1984, 97).

Not surprisingly, the Tribunal of the Holy Office of the Inquisition prescribed the kinds of beliefs and practices that must be punished, such as the following recorded for New Spain (Mexico) during the seventeenth and eighteenth centuries: healing the sick through contact with supernatural beings; using hallucinogens to achieve a magical trance and intentionally contacting supernatural beings; using prayers and idolatrous imagery in curing ceremonies; and using magical divinations for the diagnosis and prognosis of illnesses (Quezada 1991, 52). All of these were fundamental to shamanic Indian *curanderos* (healers) in the region.

Ethnocentric reactions to shamanism were hardly limited to Christian missionaries and

Having just arrived at the Carlisle Indian School in Pennsylvania, Chiricahua Apache children pose for a photo in 1886 (above). The institution attempted to eliminate traditional Native American culture, as demonstrated in the picture below, taken four months later, of the same group of children. (John N. Choate/Corbis)

the Soviet, American, and Western European states. Representatives of Buddhist, Hindu, Confucianist, Daoist, and Shinto traditions all encountered shamanic communities in the areas into which they spread and also persecuted them, or else strongly pressured them to assimilate or syncretize (merge elements) with their religions. One result was the development of hybrid forms of shamanism throughout South and Southeast Asia, some more Buddhist in character, as in Nepal and among Tibet's *Bonpo* shamans, some more Hindu, as among the Sora, nestled in Hindu-dominated areas of India. In Mongolia, Lamaist Buddhist missionaries from the Tibetan area declared firmly that shamanism was the old, wrong way of seeing things and attacked the shamans and their practices. In Indonesia and Malaysia, shamanism was viewed as an abnormal religion, not only by Christian missionaries allied to the colonial European states but also by Islamic leaders among the merchant class (Vitebsky 2001, 38–41, 135).

Ethnocentric Scholars and Shamanism

Scholars have also drawn on fundamental assumptions from their own cultures and scientific paradigms to analyze shamans and interpret shamanic phenomena. In the nineteenth and early twentieth centuries, for instance, theories of cultural evolution characterized culture and religion as evolving from the most primitive forms to the most advanced forms, the culture and religion of the theorist always being considered the most advanced. Such theories dominated European and American thought, and many scholars at the time imposed such models of cultural evolution onto their studies, like a template. In this way, for example, several scholars "found" *animism* (a belief in souls in all things, including inanimate objects), which they formulated as a characteristic of the most primitive forms of religion, in the shamanism they studied, when in fact it was not there. Note, for example, Shirokogoroff (1982, 53–54, 393) on I. A. Lopatin's imposed evolutionist rendering of Goldi shamanism and Siikala (1978, 20) on J. Stadling's interpretation of animism as evidence of the "most primitive religious thinking" of humanity in shamanism. Ethnocentric analyses of shamanism by Robert R. Marrett, James Frazer, Marcel Mauss, and other evolutionists "found" magic, and the "primitive mentality" they associated with it, in shamanic beliefs and rituals (e.g., Langdon 1992, 7–9).

In a similar vein, scholars have been seen as imposing their own cultural frameworks when they have characterized the shaman's trance and visionary experiences as psychopathological. Russian ethnographer Waldemar Bogoraz, for instance, called the Siberian Chuckchi shamans he studied mentally deranged or crazy, as did psychoanalytically trained American anthropologists such as Alfred Kroeber, Ralph Linton, George Devereux, and Anthony F. C. Wallace (Townsend 1999, 454–455). Silverman's (1967) diagnosis of shamans as schizophrenic was particularly influential and echoed Kroeber's earlier argument that shamanic societies simply reward their neurotics and psychotics with a socially sanctioned role of healer or ritual specialist that relies on their shifting states of consciousness.

However, psychologist Richard Noll (1989) challenged Silverman's schizophrenia model of shamanism and a similar one by Soviet scholars, arguing that ethnocentrism was behind them. When Noll (1983) actually compared the records of shamans from forty-two cultures with the diagnostic criteria for schizophrenia in the standard diagnostic manual of mental disorders (DSM-III, *The Diagnostic and Statistic Manual of Mental Disorders*-III), he found glaring phenomenological differences, which Silverman and the Soviets had bypassed in their analyses. Simply, unlike schizophrenics and other psychotics, who are helpless victims of their states and visions, the shamans *control* their states, entering and leaving at will; *control* the spirits that appear to them; and do it all for a social function, which is hardly true of schizophrenics (450–454). What must really be behind their "false and misleading" use of the term schizophrenia, Noll argued, is their psychoanalytic or Marxist-Leninist devaluation of religion and religious experience. Thus, Noll concluded, their schizophrenia model "is in reality a Western (and Soviet) ethnocentric distortion based on the misapplication of psychiatric/medical schemata to experiences encountered in ASC [altered states of consciousness]" (48).

Noll emphasized that the shaman's psyche must be seen as stable because the shaman is in

control. But perhaps a more fundamental consideration is whether the culture has, in a sense, "told" the shaman how to act, how to experience and recount the experiences. That is, are the forms of shamanic behaviors and experiences modeled by the shaman's culture (in which case they function as symbols) or do they depend on the mental state of the individual shaman (in which case they can be seen as symptoms)? If there are cultural beliefs about how the shamanic experience should be, the shaman would have been imbued with these beliefs long before having any shamanic experiences, and thus the shaman's experience would potentially have been shaped by them (Langdon 1992, 6). The case of the Guajiro Indians of Venezuela and Colombia is particularly revealing. The Guajiro have specific cultural beliefs about the traits of the ideal shaman, and these traits coincide, generally, with the Western cultural representation of hysteria. Consequently, Westerners readily misjudge the Guajiro shaman's behaviors as reflecting hysteria instead of Guajiro culture (Perrin 1992).

A third area easily subject to ethnocentric evaluation is the shaman's use of what appear to be simply conjurers' tricks during séances, and particularly during healing. For instance, Siberian shamans have been observed cutting off their own heads, opening and closing their own or their patients' bodies, mysteriously creating complex soundscapes of animal spirit calls everywhere and seemingly out of the blue, and, as most often reported the world over, sucking out disease-causing objects from their patients, after having secretly inserted them in their mouths before the "magical surgery" (Siikala 1978, 113–114, 135–136; Taussig 1998, 227–228). Such tricks of the trade suggest to many scholars that shamans are simply exploitative charlatans. But at the same time, ethnographers have frequently reported that the same shamans really did believe in the healing, and that they sought other shamans when ill and claimed they were healed, despite knowing full well that tricks were involved (e.g., Taussig 1998, 225, 228).

Don Handelman actually asked a Washo Indian shaman of western Nevada about the healing tricks he had observed in the shaman's work, and the shaman explained that the tricks were like the other paraphernalia and really beside the point: "I use them only to gain attention of the sick person, nothing more" (Handelman 1967, 457). This is akin to Sergei Shirokogoroff's argument that the tricks he and others observed among Siberian shamans served to establish a necessary kind of hypnotic rapport that engendered the healing results (1982, 330–334). But perhaps more directly to the point is the case of the Kwakiutl Indians of British Colombia and the healing tricks of their shamans. According to the Kwakiutl, the "tricks" are actually techniques for directing the spirits, who, they believe, mimic the shaman's moves. When the shaman is sucking on a patient, the spirits are also sucking, and when he removes the disease-causing object (which he has palmed), the spirits remove the *real* cause of the disease. That's why, amongst the Kwakiutl, a shaman would consult another shaman when ill. He believes the techniques, if precisely executed, ensure the spirits' proper curative actions. Thus, in the context of a shaman's own system, the "tricks" may well be part of the shaman's healing techniques and integral to beliefs about inducing spirits to heal, and not at all manifestations of charlatanism, as those who look at the phenomena from an ethnocentric perspective assume (Taussig 1998, 235–236).

EXORCISM

See Demonic Possession and Exorcism; Extraction

EXTRACTION

Extraction is the practice of removing a spiritual intrusion from a person and neutralizing it. The basic idea behind this practice is that the intrusion causes psychological or physical illness, and removing the intrusion effects a cure in the patient.

Extraction is a very old practice and, though not limited to cultures in which shamanism plays a strong role, is frequently found in shamanic practices worldwide. The idea that evil spirits are the source of personal or communal disease predates the germ theory by several millennia. Given primitive cultures' animistic worldview, which sees every object, animal, and person as possessing an animating spirit, removing intruding powers is a logical means of effecting healing. The theory of possession by evil spirits or demons, and the possibility of exorcising them, is a direct descendant of these earlier concepts of disease-causing, intruding spirits.

The presence of malevolent spirits in itself is not enough to account for illness; conditions must be conducive to the evil gaining enough strength to cause harm. Many folk practices and rituals attempt to preserve the strength of individuals and communities. Rites of propitiation have the dual purpose of appeasing a deity and maintaining the ritual benefactors' vigorous immunity to disease and disaster. Charms and rituals are deemed a success as long as the warder remains well. Lack of success is attributed to not performing the ritual properly, the presence of exceptionally strong evil spirits or demons, or just plain bad luck. Vulnerability to illness may also result from failure to observe taboos, being targeted by a practitioner of black magic, or physical changes such as childbirth, menses, battle wounds, or overexposure to the elements. Anything that contributes to physical or spiritual weakness makes holes in a person's spirit, and harmful intruding powers take residence in these holes.

Regardless of the cause, when a normally healthy person takes ill, the shaman or local

wise one steps forward to effect a cure. The cure involves removing the spirit causing the disease, neutralizing or destroying it so that it cannot infect anyone else, and perhaps carrying out a practice to restore the affected individual to health.

The form of the extraction itself varies. All or part of the community might be involved, or only the shaman and his or her apprentice. The extraction might be removed by sucking it out, pulling it out with the hand or with a sacred object, or scaring it away with noise, threats, and smoke. Other means of removing an extraction have been practiced, but these are the most common.

Before attempting removal of the evil spirit, the shaman prepares by calling on guardian and helping spirits to assist in diagnosing the cause of the affected person's disease. The shaman's spirit helpers allow the shaman to locate the intrusion and remove it. Extracting intrusive powers is considered to be very dangerous, as the intrusion can enter the shaman's body and cause sickness. Extractions are usually not attempted unless the shaman is feeling very powerful.

Once the intrusion is identified and localized to a part of the body, the ritual of extraction begins. Using drums, rattles, or other percussive instruments to enter the shamanic trance state, the shaman focuses on the intrusion and grabs it. Once removed, the invading evil spirit may be burned, hurled into water, put into a piece of raw meat, or otherwise transferred to a neutralizing medium. The medium containing the intrusion is typically destroyed. If the intrusion is thrown into a fire or body of water, however, it is considered to be neutralized. Again, specifics of the practice vary; those listed are the most common.

After removal of the intrusion, the affected person may need to undergo some rite or complete an activity to restore his or her strength. The shaman then gives the patient a prescription for recovery, perhaps eating special foods, drinking herbal beverages, ritual cleansings, or some other practice specified by the shaman's helping spirits. Frequently a power animal or soul retrieval will be performed to fill the spiritual gap created when the intrusion has been removed.

Note that extraction is practiced today by contemporary urban shamans as well as by traditional folk healers around the world. Modern shamans understand that there is both a physical reason for the malady as well as a spiritual one and recommend treating the illness conventionally as well as shamanically. Because Western scientists proved a link between psychological imbalances and susceptibility to disease, the concept that a ritual aimed at restoring health will strengthen the body's ability to heal is gaining wider acceptance in the medical community.

F

FIRE AND HEARTH

Heat and fire are magical attributes in both primitive and more advanced societies. Pyrolatreia, or fire worship, is common in many cultures throughout the world. Shamanic concepts of fire are related to mythological and religious perceptions of fire as a worldwide symbol of the invisible life force that strives to return to heaven by consuming earthly substance. Fire is constantly in motion, moves like a living being, "eats" through the process of combustion, and throws off light and heat, which are necessary for human survival. Associations of fire with the sun and sun worship are common. Ritual use of fire as a focal point, for purification and meditation, and as a symbol of deity is still practiced today.

The shamanic concept of fire sees energy, a force of transformation, and the power to cleanse. Many shamans work exclusively during the night, so fire is a practical part of the ceremony, providing light, heat, and a focus for group work. Fire is a source of shamanic power and mystic force.

Magico-religious power is conceived of as hot or burning in many cultures. Australian sorcerers and sorceresses have so much inner fire that they are not allowed to burn anything. Hindus describe powerful divinities as "possessing fire," "burning," or "very hot." In the Solomon Islands, someone with a great deal of personal power (mana) is considered to be burning.

Heat and fire may be seen as internal powers that a shaman must cultivate to remain strong. On the Dobu Island of New Guinea, magic is associated with heat and fire; sorcerers keep their body "dry" and "burning" by eating spicy foods and drinking salt water. The Dobu also believe that fire originated from an old woman's vagina, and magical techniques are divided between the sexes. In India, yogic practice includes the concept of *tapas,* inner heat, which is cultivated through ascetic practices or magic. Tapas is a creative force, one a shaman would conceive of as power. South American shamans use fire and heat as a means to access ecstatic states.

The power to handle fire is considered proof of individual shamanic and personal power. The Chukchee shamans would drum to "heat" their bodies, that is, to build magical power, and then cut themselves open, swallow coals, or touch hot iron during competitive demonstrations of their powers. Many shamans practice fire tricks, such as handling hot coals, as a means of proving the depth of their trance state and to indicate their power through mastery of fire. Being burned or demonstrating insensitivity to fire by handling it may be initiations in themselves or proof that an initiatory test has been passed.

The Ojibwa shamans are fire handlers who are unhurt by touching burning coals. Zuni shamans specialize in fire tricks, including swallowing coals, fire walking, touching heated metal without being burned, and most dramatically, burning a man to ashes, minutes before he is resurrected and appears at another ceremony far away. Fijian shamans are able to walk over burning coals and white-hot stones. The Fijian shaman can give this power over fire to the whole tribe. Siberian shamans are believed to swallow burning coals.

Fire and smoke are a means to transport the spirit to other worlds. The Buryat, Chukchee, and Koryak of North Asia believed that burning the body allowed the spirit to rise skyward, carried by the smoke. The spirits of people struck by lightening, as well as those who died a heroic death, were also believed to pass into the sky realm. Burning the body to liberate the

A shaman leaps onto a pile of burning twigs, ca. 1901–1933. (Hulton-Deutsch Collection/Corbis)

soul and transform the deceased into spirit is a common funerary practice throughout the world. Burnt offerings of various kinds also reflect beliefs about the ability of fire, and its resultant smoke, to carry prayers to heaven.

A shaman seeking access to the spirit world may ride a column of smoke or fire while in a trance state. Use of fire or smoke as a means of ascent can be found in Eskimo, Melanesian, and ancient Iranian cultures. In Melanesia, flames that leap into the sky are but one of many paths for accessing the Upper World. Urban shamanic practitioners may use fire or smoke as a "road" to the Upper World.

The Maori art of *poi,* twirling balls on the ends of strings, has evolved into fire twirling, an activity that appears in contemporary urban rave subcultures. Some modern fire twirlers acknowledge the shamanic origins of fire handling and describe the state of mind achieved through fire twirling as ecstatic. Fire twirling and other techno-shamanic practices are areas ripe for study.

GENDER IN SHAMANISM

Gender is a set of cultural meanings pertaining to the differences and similarities between women and men as they are lived and interpreted within specific historical and geographical contexts. The social construction of gender combines an understanding of what is possible, proper, or perverse in gender-linked behavior with a set of values. It is taught, performed, and deeply enmeshed in power relations (Butler 1990).

In North America gender is primarily determined by the physical characteristics of the external genitalia. Whenever a hermaphroditic or intersexed baby is born in a hospital, physicians automatically perform surgery in order to correct the infant's sexual ambiguity. As a result of such medical interventions, many people understand sex as signifying gender, and anatomical sex is used as a metaphor for the construction of sexual and gender identities. In this way gender identity is assumed to be biologically based and somehow "natural." That is, someone can "feel like a woman," or "feel like a man" (Bolin 1996).

Hupa female shaman, ca. 1923. (Library of Congress)

Societies that exist outside of, or on the edges of, Western biomedical systems and monotheistic religions hold quite different views. They construct multiple nonstigmatized gender statuses for individuals by separating gender tasks and social roles from sexual morphology. Many Amerindian cultures, for example, traditionally recognized, and in some cases still recognize, four genders: woman, man, woman-man, and man-woman (Roscoe 1998). As a result, what many regard as quintessential insignias of sex in Western society have little stability either historically or comparatively when considered through the lens of gender.

Shamanism is a fluid gendered practice, a reflexive and highly contextualized discourse about femininity and masculinity, as well as a mutually constituting dialogue between women and men. For the Kulina of Brazil, while it is not necessary to become a shaman in order to be an adult man, only shamans—in their practice as masters of game animals as well as village protectors and leaders—achieve the full potential of maleness (Pollock 1993). Similarly, among the Yurok of northern California, while it is not necessary to become a shaman in order to be an adult woman, only shamans—in their practice as sucking doctors, midwives, and vil-

lage protectors—achieve the full potential of femaleness (Buckley 1992).

Shamans within the Mazatec tradition of Mexico practice within a domestic context in the areas of human reproduction and agricultural production (Munn 1973). They search, question, untie, and disentangle all of the internal origins of human misfortune. Depending upon their training and sexual orientation, they have distinctive healing behaviors and chants. Those traveling a strongly masculine path battle with external political and social causes of illness; their words flash forth with the terrible force of thunderbolts. Shamans following a more feminine path center their practice on searching for the internal psychological causes of illness and releasing them. These gender differences have emerged in the context of family shamanism. Here spouses commonly shamanize together as a team within a family setting. Over the years children learn how to experience and talk about healing by picking up a combination of same-gender and opposite-gender symbols, rituals, and bodily responses. Although this choice is wide open, only a few boys actually end up following a purely feminine healing path and only a few girls end up following a purely masculine path. While some women work with masculine spiritual energies, or powers, most embody feminine sources of energy. Likewise males can work with either feminine or masculine powers. But the most powerful shamans of all combine parts of each of these gendered traditions.

A relationship of dominance and subordination between nation-states and the indigenous people living within these states has been symbolically constructed and analytically described along the sexual divide. Relations between men and women are often used to express power relationships. Worldwide, an educated elite consisting of either males or male-identified women rules the hegemonic state (Scott 1999). In this environment indigenous peoples and most especially their religious leaders and healers, shamans, are seen as uncivilized outsiders who might threaten the state's authority. To control them, they are gendered "feminine" and incorporated as subordinates.

Many shamans directly confront this attempt at subordinating them. Instead of accepting a purely feminine role, they describe human beings as containing a combination of masculine and feminine energies and aspects including possession of a female and a male soul, as well as membership in both a matriclan and a patriclan. They often work with both masculine and feminine forms of energy, sometimes even shape-shifting into beings of the opposite gender. The gender crossing, bending, and blending of these ritual specialists during shamanic séances and other community-wide rituals enables them to manipulate potent masculine and feminine cosmic powers. Though women shamans are nurturing, they can also be brave and powerful when they help with a difficult birth or take on the warrior's role in healing.

This flexibility of gender among shamans has important implications for understanding how gender-variant identities are contextually situated within a broader system of meanings associated with femaleness and maleness worldwide. Femininity and masculinity are not necessarily opposite ends of a single sex or gender spectrum, with women on one side, men on the other, and shamans in between. Rather femininity and masculinity are terms of an unstable difference/similarity, interlocking, though contradictory, aspects or modalities of personhood. People following shamanic paths in many societies include feminine and masculine characteristics within their performances. When individuals are initiated into these traditions, they are trained to avoid choosing, negating, or destroying either of the binary pairs. Instead, they are encouraged in an ironic manipulation of both sides of the polarity during which the contradictions rarely resolve, even dialectally, into larger wholes. Where this kind of interplay occurs, the genders are viewed as complementary rather than hierarchical.

Shamanism offers a context in which the outlines of self and other, female and male, define one another through interaction. Social identity becomes multiple, shifting, constantly being created, erased, and re-created in interaction between self and other. One can view oneself, or can oneself be viewed, as bounded and essential, boundless and contextual, or in fluid transition between these poles. And shamanic performance itself can be viewed as a type of serious play involving the tension of holding incompatible things together because they are both necessary and in some sense both true.

In Chile most Mapuche shamans are biologically female. As midwives and mothers, they

are conceived as "givers of life," who obtain powers from the moon in order to bring fertility to land, animals, and people. Even though they identify themselves as women, they, unlike most local women, are household heads whose families perform domestic chores for them. These women shamans make their own decisions independently from their men, traveling as they please and influencing community decisions. During public rituals they use feminine integrative symbols and actions as well as masculine exorcising or warring symbols and actions. Female symbols, like women, are called on to nurture, heal the body, and integrate the self. Male symbols, like men, are called on to exorcise, defeat, and kill the outside other. Shamans in this tradition dramatically weave together these seemingly incommensurable nurturing and warrior themes, and in so doing embody multiple genders during their performance of healing (Bacigalupo 1998).

Because of this dramatic gendering, radically shifting during public performances, it has been suggested that the figure of the shaman is neither masculine nor feminine but rather a mediator between the sexes, or a "third gender" (Saladin d'Anglure 1992). Although this idea is intriguing, at least at first, it represents a static structuralist description of what is in fact an extremely fluid situation. The concept of third-gender persons was created to describe people with distinct gender identities separate from women and men. They are labeled cross-gendered because their gender and sex do not match up with the Euro-American woman/man binary system.

It is not membership within any one gender category per se but rather the transformation of gender, or frequent gender switching, bending, blending, or reversing that is directly linked with the process of coming closer to the sacred. The theme of gender reversals and mediation frequently occurs in mythology and rituals, but the significance attached to it varies greatly, depending on the form of the reversal, the context, and the specific gender culture. Some of the most diverse variations on the theme of gender flexibility are reflected in beliefs about shamans, animal spirits, and the manipulation of their sexual organs and energies.

Messages about gender within shamanic rituals range from the enforcement of difference to the encouragement of ambiguity and the acceptance of partial or total transformation. One code through which these messages are made manifest is transvestitism, or cross-dressing. In Siberia, during the early years of the twentieth century, shamans often wore women's clothing during their séances, whether or not they were transgendered or what were called locally "soft men" in their everyday lives. Some male Chukchi shamans in northeastern Siberia identified with their female spirits so strongly that they dressed all of the time as women, did women's work, and used the special language spoken only by women. Others combined male with female features or acted out a female role without cross-dressing (Bogoras 1904–1909).

Across the Bering Strait in Alaska, an Eskimo shaman by the name of Asatchq performed a birthing ritual. While someone drummed, he rubbed his belly until it swelled then, removing his pants, he knelt in the traditional birthing position and pulled blood from between his legs, followed by his shamanic icon. In Siberia Sakha shamans of both sexes are also said to have been able to give birth. Beginning at puberty, a shaman's training entailed birthing a raven or loon, which instantly flew away. In the second year the shaman birthed a pike that swam away. And in the third and final year of training, a truly great shaman gave birth to a bear or a wolf (Balzer 1996).

Birth together with death provides key actions, symbols, and metaphors within shamanic systems, traditions, and cultures. In many societies shamans are said "to be born" or "to die" into the profession and in their subsequent practices they may assist at actual births and actual deaths. Mircea Eliade (1989) and other scholars following him have focused on illness, death, dismemberment, and skeletalization leading to rebirth as a shaman. Since men cannot physically give birth, this shamanic path, emphasizing death and culminating in rebirth, is masculine in both symbolism and practice. Among the Tukano of the Amazon basin, for example, the journey of initiation into shamanism centers on the penetration of the cosmic uterus that ends in orgasm, followed by the woman-free birth of a neophyte masculine shaman (Reichel-Dolmatoff 1971). Other indigenous societies that exist outside of, or on the edges of, Western biomedical and religious cultures create multiple non-stigmatized gender statuses for individuals who do not behave ac-

cording to the biological sex ascribed to them at birth. In a number of these traditions, gender is united at the highest cosmic level with the image of a dual or a co-gendered creator deity or culture hero who combines the perspective, occupation, and outward appearances of both a male and a female being.

Dual Deities and Co-Gendering

In a large number of societies the highest-ranking deities consist of a feminine-masculine pair. This singular but nevertheless bipolar dual deity is manifested as a fluid shifting cosmic ordering force permeating all areas of the universe. Among the Mixtecs of Oaxaca, Mexico, for example, there are two sets of divine couples: a creator pair as well as a younger pair, both named One Deer after their day of birth. These younger gods are an unfolding of the initial aged gods who went on to produce numerous progeny. Likewise, in ancient Nahua (Aztec) mythology the creator deity Ometeotl is not singular but dual. This deity consists of a female-male who resided at the Place of Duality (Ometeotl), located in the twelfth and thirteenth levels of the sky. They fought, breaking their dishes, and from each and every shard a new dual divinity sprang up. Another dual deity, Oxomoco and Cipatonal, created two calendars: one of 260 days that is linked to the feminine gestation cycle and a masculine agricultural calendar of 360 days with five extra days added to adjust it to the astronomical calendar. These deities and their calendars are complementary rather than hierarchical (Marcos 2000, 95–96).

In K'iche' Mayan culture past and present, the primordial couple, Xpiyacoc and Xmucane, are believed to have performed a divinatory sortilege at the time of human creation. The two were described in the Popol Vuh, commonly considered the Mayan Bible, as a midwife and a matchmaker. In this shamanic tradition, as it is still practiced today in highland Guatemala, husbands and wives are trained together as shamans by a shaman couple. Among the central lessons they are taught is how to recognize both cosmic co-gendering and their own co-gendered nature. In other words, they learn how to properly balance the feminine and masculine dimensions both within their own bodies and in the cosmos. For example, the left side of everyone's body is female, and the right side is male. During their training and initiation, shamans are encouraged to behave in both feminine and masculine ways, and from time to time to take on the social role of the opposite sex. After their first initiation they might also then undergo more specialized training and initiation separately in what are considered gender-exclusive healing specialties: women as midwives and men as bonesetters (Tedlock 1992).

Warao women, living in the Orinoco Delta of Venezuela, specialize in treating the nicotine seizures of their husbands and other male relatives who use large doses of tobacco as a hallucinogen (Wilbert 1972). As a result of this role they are considered to be important shamans. They cure the convulsions their male relatives suffer during shamanic séances by asking the tobacco spirits that reside in men's chests to release them. Their healing role is modeled on the behavior of the original shamans, a married couple who on the death of the man's parents began to fast and after eight days of smoking strong tobacco ascended together to the zenith. There they went into the House of Tobacco Smoke, where the man began to transform himself into his guardian spirit, the swallow-tailed kite. While he was shape-shifting, however, he suffered a nicotine seizure and nearly died. His wife instantly transformed herself into a frigate bird; rustling her wings and blowing over his rigid body, she soothed and healed him. The tobacco spirit then gave her the job of healing seizures and initiated her as a shaman. From then on she filled the role of a shape- and gender-shifting shaman.

Here, as in many other Amazonian societies, healing is performed in terms of gender complementarities. Women specialize in treating illnesses brought on by odoriferous contagion, while men specialize in treating illnesses caused by spirit aggression and object intrusion. Once the contagions or foreign objects invade the body they expand, creating fetid gas and producing clinical symptoms affecting both the physical organs and the soul of the particular region of the body.

In the Kodi district of Suba, Indonesia, there are also many double-gendered shamanic deities. The distant, rather otiose Creator figure is referred to as the Mother Binder of the Forelock, Father Smelter of the Crown. The house-

pillar deity, who controls human childbearing and health, is called Great Mother, Great Father. The clan deity who lives in the large banyan tree growing in the center of each village is Elder Mother, Ancient Father. Shamans who often cross gender boundaries during their performances address this co-gendered deity, who presides over ceremonial feasts and enforces ancestral law. Although Kodi has no permanent or semipermanent liminal figures, such as the transvestite shamans of Siberia, their healers may assume a gender-ambiguous role for a short period when it is necessary to concentrate power (Hoskins 1990).

H

HEALING AND SHAMANISM

The question of whether shamans can heal their clients can be answered satisfactorily only if one looks carefully at the meaning of healing, and then uses the insights of postmodern philosophy to shed light on the nature of what shamans do. If healing is recognized as bounded within an experiential domain of suffering, then shamans are capable of healing their clients, providing relief from the chaos caused by illness, repairing personhood, and offering new models of meaningful identity. Shamans do not cure disease; they seek to construct a life world in which disease has lost its meaning.

Health and Healing

To heal is to restore health. If, following the 1948 charter of the World Health Organization, "health" is taken in its widest sense to mean "complete physical, mental, and social well-being and not merely the absence of disease or infirmity," then healing is rarely accomplished, no matter what type of practitioner seeks to achieve it. Shamans are no more likely than are specialists of any other medical or religious system to effect physiological, psychological, and social changes so comprehensive that any patient could ever be considered completely healed. Chronic poverty, a major cause of ill health throughout much of the world, remains untouched by most forms of medical intervention, and it is also left unaddressed by shamans. In the industrial West, death rates from all infectious diseases fell throughout the last century with no obvious contribution from medical science. As Richard Lewontin noted, "complex social changes, resulting in increases in the real earning of the great mass of people, reflected in part in their far better nutrition, . . . really lie at the basis of our increased longevity and our decreased death rate from infectious disease" (1991, 41). Many forms of ill health are masked by the medicalization of their origins, which often lie not only in poverty, but also in its closely associated conditions of malnutrition, overpopulation, ecological degradation, unfair land tenure systems, institutionalized gender disparities, racism, exploitive wage labor, political oppression, and corruption. Likewise, the medicalization of symptoms may lead to situations where, for example, chronic hunger is treated with tranquilizers or vitamin injections, whose magical status lends them power no more likely to cure underlying causes than would a shaman's intervention.

If, however, healing is taken less comprehensively, in subjective terms of whether a person, a family, or a community feels better after some specific activity or intervention is performed, then there is a circumscribed area in which the outcomes of shamanic healing can be identified. To explore this domain, it is useful to recall the distinction commonly drawn in medical anthropology between disease and illness, with its corollary distinction between curing and healing. The biomedical locus of disease as an explanatory concept is the human body, delimited by anatomy that focuses on pathology (Foucault 1994). As defined by Arthur Kleinman, disease refers to biological or psychological malfunctioning, while illness refers to the patient's experiences and perceptions, including social responses to disease. Illness "is created by personal, social, and cultural reactions to disease," and so has a biographical significance as well as a physiological significance (1980, 72). In this model, curing is primarily a process of clinical intervention in the pathophysiological realm applied most successfully to acute conditions such as infectious disease, and healing fo-

cuses on less precise states of illness, including a wide range of psychosomatic complaints, social problems expressed in the soma, emotional problems, and undiagnosed or undifferentiated disorders. Conditions medically diagnosed as congenital, degenerative, or terminal may fail to be either cured or healed.

This model recognizes that one can have a disease without having an accompanying illness, and can also be cured of a disease without being healed of it. Although healing is often seen as secondary to curing, a more radical application of the distinction between the two suggests that a patient could be healed of an affliction without being cured: In such a case, the integrity of a patient as a social person would be restored, even if a pathological state might remain untreated in the patient's body. It is precisely in this sense that shamans, and other religious specialists, as well as practitioners of "traditional" or "alternative" medicines, may be capable of treating diverse conditions that more rigorously scientific types of medicine do not cure. A tacit recognition of this premise underlies much popular usage of the concept *healing,* as the term frequently implies spiritual, miraculous, or psychic means, and may be seen as involving occult or divine forces at work, although such transcendental speculations lie beyond the scope of this essay.

Scientific Approaches to Healing

At the other end of the spectrum from supernatural explanations lie attempts to study healing scientifically. Many of these attempts focus on the placebo effect, whose precise mechanisms remain difficult to document. Placebos—substances or procedures without specific activity for the condition being evaluated—have been found effective in producing relief from cough, headache, anxiety, hypertension, pain, and depression, among other conditions, and have also been documented to produce toxic side effects, all of which results can also, by extension, be attributed to shaman rituals. Some of these results may, however, be attributable to a reporting bias, and a recent meta-analysis (Hrobjartsson and Gotzsche 2001) has shown that in studies in which treatments are compared not just with placebos but also with no treatment at all, participants given no treatment improve at about the same rate as participants given placebos.

Nevertheless, the work that has been done to explain the success of the placebo effect may have value in promoting an understanding of the effect of shamanic healing. Howard Brody suggested a model of conditions that may be most conducive to the success of the placebo effect: (1) the patient is provided with an explanation of her illness that is consistent with her preexisting view of the world; (2) a group of individuals assuming socially sanctioned roles is available to provide emotional support for the patient; and (3) the healing intervention leads to the patient's acquiring a sense of mastery and control over the illness (1977, 122). These three conditions are met by many forms of shamanic healing, particularly in those traditional societies that have long had well-defined roles for shamans.

Other, more biologically reductionist approaches to shamanic healing seek explanation in various neuroendocrine mechanisms. Much of this approach is based on the stimulation of pain-controlling endogenous opiates by various quasi-shamanic practices such as self-inflicted wounds or the use of psychotropic drugs. Such studies have ordinarily examined practitioners rather than patients, and most often have been based on neopractitioners, that is, practitioners who are devoid of traditional cultural contexts. In the absence of rigorous, double-blinded case-controlled trials, these hypotheses remain on or beyond the periphery of science.

Shamanic Healing

Throughout much of the world, the capacity to heal was traditionally seen as resulting either from power of office, as by priests or kings, or by a sacred commission or special gift. Both of these traditions were combined in the role of shaman, whose position within the social system of most cultures was well defined, a result of apprenticeship and rigorous training, but who nevertheless frequently claimed a special calling to the profession, often with a privileged relation to particular spirits. This relation was often manifested by suffering illnesses attributed to those spirits before agreeing to become a shaman. Anne Fadiman (1997, 21), for example, reported that Hmong epileptics often became shamans, since their seizures offered evidence of their power to perceive things other people could not see and were a means for fa-

cilitating their entry into trance. Crucially, as Joan Halifax put it, "that they have been ill themselves gives them an intuitive sympathy for the suffering of others and lends them emotional credibility as healers" (1982). She explored this phenomenon in depth, drawing on the myth of the centaur Chiron, who, although greatest of healers and teacher of Aesculepius (who became the god of medicine and healing), was unable to heal himself of the wound given by Hercules's poisoned arrow.

Shaman healing rituals traditionally rely on oral texts, chants or songs telling stories of the creation and of the relations between humans and spirits. Shamans recite myths of the origins of worldly disorder and histories of malevolent forces, stories that explain why people suffer, grow old, and die. They tell of extraordinary events and exceptional healers, list symptoms attributable to different agents of affliction, identify where those agents may be found, and explain how they may be placated. The relationship of these myths to healing was first examined by Claude Lévi-Strauss in his 1949 article "The Effectiveness of Symbols," (Lévi-Strauss, 1963), in which he drew specific parallels with the process of abreaction in Freudian psychoanalysis. Lévi-Strauss concluded that by a shaman's recital, "conflicts and resistances are resolved . . . because this knowledge makes possible a specific experience, in the course of which conflicts materialize in an order and on a level permitting their free development and leading to their resolution" (198). This helps to explain why so many healing rituals of shamans involve symbolic activities, such as gestures of binding, burying, sucking, or blowing.

Healing rituals personally observed by the author in Nepal (Maskarinec 1995) often illustrated the activities of repairing or postponing fate and setting up barriers to protect the patient. Two of these rituals incorporated explicit acts of raising the patient heavenward, in cases in which astrological difficulties needed repair. In one, the shaman moved the patient's foot step by step up a small model of a pole ladder. In the second, relatives and neighbors lifted the patient as she crouched atop winnowing trays. To reinforce the sense that the patient was being conveyed into the heavens, the shaman might suspend models of the sun and moon from the roof beam, along with a plant shoot. The patient was lifted up to them. Once elevated, the patient bit the plant shoot. The recital took the form of a dialogue between the shaman and the patient, with the shaman speaking both parts:

> "Did you eat the green fodder, the cold water?"
> "Ate it!"
> "Did you see the nine suns, the nine moons?"
> "Saw them!"
> "Did you cross the seven difficult passes, the seven crevasses?"
> "Crossed them!"
> "If you go to the sky, I'll pull you back by your feet!
> "If you go to deep earth, I'll pull you back by your top-knot!" (Maskarinec)

Moving the patient physically is paralleled symbolically by soul retrieval rituals, common in many shamanic practices. When a patient's vital forces have been fragmented, they may need to be recalled, or, if they are recalcitrant, shamans may need to search for them. Retrieving lost souls is the symbolic converse of healing by extraction, in which shamans "remove" quasi-physical objects from their patients, things that have been inserted by witches or other malevolent forces. Shamans may also work as exorcists, casting out spirits that adversely affect their clients, including, on occasion, ones that they have themselves dispatched, as shamans recognize that if they can heal, they can also cause illness. For example, Nepali shamans may dispatch the souls of the dead to drum up business:

> Wake up, dead souls, those who died at the right time, wake up!
> Those who died at the wrong time, deceased dead souls, wake up!
> Wake up, dead souls, wake up!
> Go to the east, go to the west!
> Go to the north, go to the south!
> You, go in the middle of the night,
> entering towns, whoever you fancy, strike!
> Go, dead souls, go! (Maskarinec 1998, 349)

Shamanic healing often acknowledges the claims of the person who is seen as causing the illness, illness becoming an index of social relationships. Some sources, such as dead ancestors, may need to be placated and bribed; still

others, such as witches or other shamans, must be threatened and punished. Negotiating on a patient's behalf with dead relatives who remain troubled by unresolved family issues and social dilemmas is another form of shamanic intervention (Vitebsky 1993), one in which the social aspects of shamanic healing are made clear, particularly its useful contribution toward healing grieving.

Discourse and Language

As Lévi-Strauss also observed, "physical integrity cannot withstand the dissolution of the social personality," opening an additional explanation for shamanic healing; it can be seen as a form of logotherapy, a therapy that works by restoring meaning, originally developed by Viktor Frankl. It uses cosmogony to recreate a meaningful world, reintegrating the patient with her society. Creation myths frequently play significant roles in shaman healing rituals, the words not only giving shape and purpose to the rituals, but fundamentally establishing new orders in the world. Reversing a psychoanalytic observation of Julia Kristeva (1989, 11), one can say that the discourse itself forms and transforms the subject. The discourse of cosmological knowledge is communicated to the shaman through his spiritual connections when he is in trance, as though he were truly an "other," thus converting him into a specialist who can actively intervene in the world by taking responsibility for it. A shaman affirms by his recitations not only his mastery of esoteric material but also of the topics—the spirits and their properties as healing or harming agents—that it contains. This cosmological and theoretical knowledge is shared with the audience, giving them hope of possible relief from misfortune.

Through a dialectic of unity and difference, of fragmentation and integration, shamans reconstruct an orderly world, connecting cosmology with healthy social relations and personal well-being. Shamans replace the chaotic, unbalanced, inexpressible suffering of a patient with orderly, balanced, grammatical, and eloquently expressible states. Reading the *Golden Bough,* Wittgenstein noted, "In magical healing one *indicates* to an illness that it should leave the patient." (1979, 6e; italics in original) A shaman does more. With her words, which are her power and her tools, she creates both the illness and the disease, creates the body of the patient, and creates the world in which her patient experiences relief. A shaman's language does not attempt to describe how things are. It determines how the world will be. Words shape and give substance to the accidents of the external world. The right words create the world anew, curing the victims of a stale, deteriorated world; healing is thus an aesthetic endeavor. A shaman, to heal, battles entropy, resisting the inevitable accelerating descent of the world into chaos.

Ritual language, with its powerful figures of speech, creates maps for transforming reality; Ruth Murray Underhill noted for the Papagos, "The describing of a desired event in the magic of beautiful speech was to them the means by which to make that event take place" (1938, 6). Gary Witherspoon noted the same for Navajo theories of language: "The symbol was not created as a means of representing reality; on the contrary, reality was created or transformed as a manifestation of symbolic form. In the Navajo view of the world, language is not a mirror of reality; reality is a mirror of language" (1977, 34). Shaman texts are structured presentations of life, not representations of life or references to it; their recitations are ideal dramas that open for intervention the shapes and boundaries of the human condition. A shaman healing text, like a musical composition, cannot represent anything other than itself, and nothing can improve on the power of the words themselves. Concentrated at the shape-giving boundaries of action, healing texts embrace an aesthetic of completion, integration, purity, and balance, reshaping the imbalances and fragmentation that characterize illness (Desjarlais 1992).

Hegel may have been talking about the same phenomenon when he said "sound releases the Ideal from its entanglement in matter" (Hegel 1975, 88). The metaphysical understanding behind Hegel's words, however, is very different from the shamanic worldview. If one were to accept, as Hegel plainly did, Plato's metaphysical premise that language represents things in a primary world, the world of the Ideal, and that tropes—a further remove from that reality—are just "figures of speech," then shamanic healing is an irrelevancy. Shamans implicitly deny this fundamental principle of Western metaphysics, rejecting Plato's transcendental signi-

fied beneath the world of daily life. Shamans use language to constitute reality, not to denote or to imitate it. Shamanic language is not a mirror of the world, not even of an ideal world, but a set of technical devices to give form to a new world, an experiential life world in which the words of a correctly recited formula will alleviate corporal suffering, because they give form to pain, to the sufferer, to the cause of the pain, to the entire world in which the sufferer experiences pain. Instead of a denotative theory of language in which words signify the world, shamanic speech presupposes a generative theory of words creating the world, and therefore posits that healing is not just a possibility, but a necessity in order to create a world.

The Sacrifice

Every shamanic healing ritual concludes with either a sacrifice, usually a blood offering, demanded by the familiar spirits with which shamans work, or minimally a temporary substitute postponing that offering. Acknowledging the violence of illness as a disruption of order, the new reality constructed by the shaman must be cemented by a parallel act of violence, perhaps reflecting an intuition similar to that of Jacques Lacan, that violence "is situated at the root of formalization" (Nakazawa 1986, 122; Lacan 1968). These words conclude one shaman healing text:

> For my patient, I have provided complete protection,
> I have provided safety, I have provided protection,
> I've distanced the crises, distanced the obstructions,
> life joined to life, breath joined to breath,
> blood joined to blood, flesh joined to flesh,
> body joined to body, breath joined to breath.
> (Maskarinec, forthcoming)

The sacrifice completes the negotiations with those unseen forces who have been blamed for the illness, whether witches, dead humans, or spirits of various types. It compels those forces to acknowledge the shaman's power over life and death. Therapeutically, the sacrificed animal's flesh and blood not only provide a substitute for those of the patient, they concretely bridge the space opened between myth and reality, reuniting the unseen with the present and offering tangible social evidence that shamans continue to have meaningful power over this world of suffering.

HISTORY OF THE STUDY OF SHAMANISM

Studies on shamanism as a scholarly concept date back to the late nineteenth century, when this neologism came into current use. The word *shaman,* used for a type of religious specialist first encountered among the Tungus of Siberia, had been progressively extended to similar specialists all over the world, starting in the mid-nineteenth century (Mikhailowski 1894).

However, sources on Tungus and other Siberian forms of shamanism go back to long before that time: to the account of his exile in Siberia by the Russian archbishop Avvakum (1672–1675) (Narby and Huxley 2001, 18–20). Travel accounts written by western Europeans in the eighteenth century introduced this word to literature, but the understanding of the word *shaman* remained confined to intellectual circles in Europe and Siberian specialists. The first two accounts were written in German (Isbrants Ides, ambassador of Russia to China, 1692–1695, translated into French in 1699, and English in 1706), and in Dutch (Nicolas Witsen, 1692). Their choice of the term *shaman* from among other Siberian terms for this figure resulted in making the term standard and Tungus shamanism paradigmatic. Its extension and recognition by early ethnographers as a legitimate term—more than one century later—to define similar ritualists encountered in other parts of the world was mainly due to its being a native term from the language of a shamanic society.

The term *shaman* came to be used liberally in literature to replace a series of European terms deemed unsatisfactory (sorcerer, diviner, healer, magician, juggler, and the like). It was used with no reference to a well-established definition and rather served as a term that could be all-encompassing: A shaman could be both sorcerer and healer, with no contradiction

between these two activities. Similarly, the term *shamanism* came into use without being delineated as a particular scholarly concept nor associated with definite methods. It was designed to support the term *shaman* as a general scholarly concept and enjoyed the same extension. Nowadays both terms are used to refer retrospectively to a still wider range of cases, which were given other names before.

Throughout the three-century-long history of scholarship in the area, shamanism has been approached by academic disciplines as different as the history of religion, psychology, medicine, art, and, more recently, anthropology. It has also been the topic of many kinds of more or less extrascientific approaches, for it is a matter where subjective considerations are apt to interfere. The very fact that it has become an object of popular interest in the framework of Western countercultural movements since the 1960s has entailed a large variety of uses of the word far beyond the boundaries of usual applications and specialized studies. On the whole, shamanism has given rise to an enormous amount of writing.

Several trends can be distinguished, at some risk of simplification. Debates have focused mainly on the extent to which shamanism should be seen as a religion (and thus a sociocultural institution) and the extent to which it should be understood as an inherent human property, to be understood in terms of the field of psychology. These two approaches appear to be derived from Western ideological positions, which have led to a full range of divergent valuations in the course of time. In what follows, names and dates are given for the most significant contributions, whether or not those works have been listed in the already lengthy References.

A Cultural Phenomenon: Devilish, Backward, Romantic

The first trend is the one taken up by missionaries and a majority of early travelers who all, as Western people, looked at shamans with Christian eyes. They acknowledged the shaman as a religious character, but in the devil's service and not in God's. As evidence for this conclusion they brought forward the "wild and extravagant", animal-like attire and behavior of shamans during their rituals and their claims to foretell and influence the future—an offense to God's will. Such arguments were used late into the nineteenth century to convert shamanistic peoples to Christianity, in order to further the process of their integration into the Russian Empire.

Another view emerged in the eighteenth century under the influence of Enlightenment ideas: Far from coming within the realm of religion, shamans were seen as quacks who make use of their fellows' gullibility. While competing as an interpretation with the religious one, this view led to similar conclusions. In their comments from a distance, rationalist philosophers argued that shamanism was to be eradicated, if not in the name of monotheist transcendence against the devil, then in the name of reason against obscurantism, of culture against nature. In all respects shamanism was seen as potentially subversive and a hindrance to the progress of humankind. On one hand, this trend encouraged explorers to stay in the field for long periods of time and to carry out the most accurate and wide-ranging observations possible, which produced a large set of excellent descriptions (such as those of D. G. Messerschmidt, describing his travels 1720–1727; J. G. Gmelin, travels 1733–1744, published 1751–1752; John Bell 1763; S. Krasheninnikov 1764; J. G. Georgi 1776–1780; Pallas 1776). On the other hand, it led some of them (especially Gmelin) to focus on unmasking the shamans' presumably misleading tricks—which, of course, made both shamans and their audiences suspicious of foreigners and led to many shamans choosing to practice in secret.

Then, in the context of the romantic reaction against the Enlightenment, other philosophers (mainly the German Johann Gottfried Herder) praised shamans as "noble savages," and exalted their magic art. Gloria Flaherty (1992) brought this trend to light by gathering favorable comments on shamanism (mostly called by other names) from writings by the French philosopher Denis Diderot, Herder, the German poet Johann Wolfgang von Goethe, and others. At that time, their ideas remained confined to urban intellectual circles and were rarely featured in firsthand descriptions. Only a few Russian fieldworkers, belonging to the group of Siberian regionalists under the leadership of G. N. Potanin, expressed romantic views in their records. (See Narby and Huxley

2001 for documents from many of these observers and philosophers.)

A Psychological Phenomenon

A majority of field observers—mainly scientists and administrators following the colonization process—were rather inclined to reflect realities in their records. These testified to changes in shamanic practice under the impact of and as a reaction to colonization: Nervous and mental troubles increased, and so did rites to heal them. In addition to their usual healing function, healing rites also developed as a means of symbolic protection of traditional life at both individual and collective levels: They were better tolerated than all other traditional rituals by colonial authorities who were eager to spread their own law and faith. As a consequence, more and more individuals resorted to "shamanizing" for themselves. Be that as it may, this context gave rise to a full range of psychological approaches to shamanism.

Thus, the study of shamans and shamanism passed from the realm of religion to that of psychology as it was becoming widely used in the late nineteenth century. One reason was that sociology did not characterize shamanism as a religion, since it is marked by a highly personalized practice with neither clergy nor doctrine: What exists is only "a certain kind of people filling religious and social functions" (Van Gennep 1903, 51). In addition, shamanism is often found mixed with popular practices attached to world religions (Aigle, Brac de la Perrière, and Chaumeil 2000), so that such questions arose as, "Does shamanism fit any type of belief or is it independent of any belief?" The other reason lay in the fact that this failure of sociology to classify shamanism as a religion fitted in with field observers' statements about the therapeutic function of shamanism on the one hand and with the growing influence of psychoanalysis on the other hand. Under the influence of the latter, debates about "the certain kind of people," as Van Gennep described them, calmed down: Far from being heroic or charismatic, shamanizing was declared psychopathological. The healing power of shamanic rites was therefore seen as intended for the shamans themselves as well as for the audience.

This interpretation predominated throughout the first half of the twentieth century, in the field and elsewhere. The work of Waldemar Bogoras (1904–1910), popularized by Marie Antoinette Czaplicka (1914), established a connection between shamanism and "arctic hysteria" on the basis of external similarities—a trend that culminated with Åke Ohlmarks (1939), who classified types of shamanism according to the degree of shamans' psychopathology. A majority of scholars then adopted a similar position, whatever the cultural area concerned (Ackerknecht 1943), with a few of them retracting afterwards, while still focusing on the shaman's personality as the source for shamanic behavior (Kroeber 1940). The most extreme position was that put forward by George Devereux (1961), who branded the shaman "a severe neurotic or psychotic," who is never cured but whose contact with the supernatural world provides him with continual self-therapy. Discussions about the shaman's personality and mental state during ritual continued far into the 1970s and 1980s, mainly in the United States (Silverman 1967; Bourguignon 1973; Hippler 1976; Noll 1983)—without mainstream psychology ever taking them up. As early as 1935, however, Sergei Shirokogoroff had emphasized in his famous *Psychomental Complex of the Tungus* that shamans must be physically and mentally strong to cope with their duties, although there were also weak personalities among those he met.

It is worth stressing that, in the middle of the twentieth century and later, anthropologists deserted the debate on the shamans' psychology. A majority of them pursued monographic field studies more or less based on the idea that shamanism is an all-inclusive system in each society (Lewis 2003). But others declared the concept of shamanism irrelevant and useless (Geertz 1966; Taussig 1987).

Idealization and Universalization

At the same time, however, shamanism started to become popular with the general public. It was still assigned to the sphere of psychology and seen as a matter of individual subjectivity, but approaches took a new turn in the frame of a complex trend that emerged from the counterculture movement born in the early 1960s in California. This trend eventually came to idealize shamanism and in fact recreate it. Several

factors played a role in this reversal of values. In the first place, two writers, whose work intellectual and artistic circles extolled, had an important influence. In works of ethnographic fiction, Carlos Castaneda exalted the use of hallucinogens by sorcerers as a source for enriching spiritual life, which contributed to interesting members of the drug culture in shamanism (Furst 1972; Harner 1973).

Then, the English translation of the most famous book ever written on shamanism, *Shamanism: Archaic Techniques of Ecstasy* (1964), published by Mircea Eliade in French in 1951, enhanced interest in the use of shamanism as part of personal spirituality by offering a "purer" model of shamanism, free from any psychotropic conditioning, primary in all respects. This book attempted to reconcile religious and psychological views of shamanism: It was the shaman's success at curing himself that enabled him to heal other people, and his "ecstasy" (understood as a kind of journey to heaven) is the religious experience par excellence. The word "ecstasy"—perceived as direct contact with the Divine—made the idea attractive to those Christians who were contesting what they saw as a too strict clerical hierarchy at that time.

Eliade's book was also a mystical essay, in which shamanism was understood as potentially universal (in the line of Jung and Campbell) and in fact elitist. Eliade saw the shaman, in addition to being a rebel against all kinds of established powers, as a forerunner of a full range of creative or innovative specialties—a return to romanticist views. Alice Kehoe (1996) criticized, under the ascription of "primitivism," such an idealization of shamanism by Eliade and one of his best-known followers, Åke Hultkrantz. Be that as it may, the view ascribing "the beginnings of art" to shamanism, first expressed by Andreas Lommel (1967), valid for all kinds of art (for theater, according to Schechner 1976), has been widespread up to the present in general public and artistic circles. It is worth emphasizing that it has been the popular success of Eliade's book that has gradually imposed it as a reference on anyone who writes on shamanism. It is seen both as an impressive scholarly work and as one contested because of its weak scientific value (distortion of data, comparison between elements taken out of context and not based on actual fieldwork by the author, and the like). It is translated into many non-European languages and popular in formerly shamanistic societies.

Interest in shamanism has developed in several directions, marked by postmodernist thinking and the New Age trend. It has given rise to Western forms of Neo-Shamanism, the most influential of which was founded in 1985 by Michael Harner in California: the Center, then Foundation, for Shamanic Studies. It is meant to spread Core Shamanism, a creation of Harner from common elements of various shamanic traditions, therefore supposed to be universal and accessible to Westerners. The message is intended for everybody: There is a spirit world or "nonordinary" reality that can be accessed through the "shamanic state of consciousness"—Harner's designation of what others call an "altered," "alternate," or "modified" state of consciousness, which corresponds to Eliade's "ecstasy" or "trance." Core shamanism proclaims itself as leaderless. It has been introduced in the form of fee-paying courses in urban areas, in Europe and in the United States, as well as in formerly shamanist societies in the Americas, Asia, and Russia (Funk and Kharitonova 1999; Townsend 2001; a depiction of the training by a trainee is given in Jakobsen 1999). The definition of shamanism in terms of a state of consciousness encourages the idea that shamanism is universal, ahistoric, and culture-free. To supporters of this view, shamanism may be found everywhere and at all times, in modern cities as well as in prehistoric rock art (Clottes and Lewis-Williams 1998; comments in Francfort and Hamayon 2002) or in Celtic culture (Noel 1997; Jones 1998). It epitomizes primordial spirituality, including in the first place that of the West.

References to shamanism have diversified in the last two decades of the twentieth century, more often in the shape of limited individual initiatives than in an organized framework, and are marked by the disappearance of the shaman's figure as a common feature. Initially focused on therapy, practices may evolve towards performing arts, expected to put body and soul in harmony (Kim and Hoppál 1995). Ideas may evolve towards "deep" or "spiritual ecology," based on the sense of nature and the general "interconnectedness" inherent in shamanism (Stuckrad 2002). Other purposes emerge: musical innovation (Howard 2002);

"mystic or ecstatic tourism," based on the notion of "experiential" shamanism (advertising abounds in the journal *Shaman's Drum*); acquisition of "powers" or tools of "conscious business," "leadership coaching," and so on. As to financial objectives, although they are now widespread in Asiatic neoshamanic practices, they seem to have only recently emerged in the West, as suggested by Merete Demant Jakobsen, quoting from a leaflet: "Shamanic Finance is: Integrating Money with Spirit" (1999, 203).

Most of the approaches born during the last three decades have the effect of making practice interfere with scholarly study and abolishes the distance of the researcher from the object of research required by classical scientific approaches. Moreover, the present disparity of understandings deters any attempt at a general theory of shamanism.

HORSES

Horses are used in shamanism as totems, spirit guides, and medicine. The power of the horse is its tireless ability to cover long distances, a trait that was probably envied by our prehistoric ancestors, who also had to journey for miles in order to survive. Horses were also a source of meat, and there is a tendency among primordial people to view animals that provide essential protein with reverence. Cave paintings of primitive horses certainly depict the fatness of horses as a quality worth recording for posterity.

In prehistoric times, shamans probably practiced propitiation rituals designed to appease the spirits of animals needed for survival. Horses were originally game animals, whose spirits had to return in the form of new horses to continue being available for hunting and eating. As the human relationship to the horse changed, the symbolic meanings ascribed to the horse changed as well.

Horses are domesticated animals and have been helpers to humankind for millennia, par-

ticularly as a means of transportation. As a result, the concept of travel, especially for preindustrial societies, is strongly associated with horses. This association with travel is reflected in the symbolic horse in cultures that practice shamanism. Because the shaman enters into a trance state and is believed to travel to other worlds, an ally that can assist in these often perilous journeys is valued.

Horses have figured prominently in many cultures' mythologies. The sun god's chariot in Hindu and Greek mythology is pulled across the sky by teams of fiery horses. Pegasus of the Greeks, Sleipnir of ancient Nordic culture, Mohammed's horse Alborak, and many others reflect the mystical connotations associated with horses. The winged horse symbolized the ability to fly into heaven, or to the Underworld, and horses with multiple sets of legs mirrored the number of pallbearers' legs as they carried the coffin to the grave. Shamanic concepts of the horse reflected these cultural beliefs.

Horses carry connotations of freedom and independence, as well as devotion. Not only is the domesticated horse used to preserve the integrity of the family farm and take the traveler safely on long journeys, the horse is also capable of surviving alone in the wild. Because a horse can live without the support of human beings, the fact that horses allow themselves to be used as beasts of burden is often seen as an act of loyalty. Small wonder that many nomadic Arabic cultures kept their horses in the tent with the rest of the family.

Sacrifice of a horse is an enormous offering due to its value. Horses were sacrificed both literally and symbolically in association with many shamanic rituals. The Buryat consecrated the horse stick used in shamanic ceremonies with the blood of sacrificed animals during shamanic initiations. This practice was believed to make the horse stick "real." The Buryats also sacrificed horses themselves, placing the horse skin and skull on a tall pole as an offering of propitiation to the deities. Other Siberian groups, such as the Yakut, had similar practices. The Altaian shaman both sacrificed the horse and conducted the slain animal's soul to God. Horse sacrifice was practiced in Vedic India to enable the shaman to achieve direct contact with Bai Ulgan or another god.

The association of horses with flight relates to the concept of shamanic journeying, initiatory experiences, and movement through ecstatic states of consciousness. This makes the horse the perfect companion for shamanic work. Many of the objects and symbols used in shamanic practices are referred to as the shaman's "horse." The rune Eh in Sami culture, which resembles the letter M in the English alphabet, is called the shaman's horse because the shaman can "ride" it into the other worlds. Drums, or the beat of drums, are described as the shaman's horse as well for the same reason—the beat conveys the shaman safely through the Otherworld. The Buryat horse stick becomes a real horse in nonordinary reality that is ridden as part of the shaman's ecstatic journey.

Mongolian shamans conceive of personal psychic energy as a windhorse, and this aspect of self is developed through balanced living and religious practices. Destructive actions and bad thoughts deplete windhorse, making the concept similar to Tibetan Buddhists' idea of karma. The Buryat also believe that reincarnating *ami* souls (body souls) are sent out on spirit horses to inhabit the newborn by the goddess Umai.

The result of humanity's long time admiration of horses and dependence on them for work, transportation, and artistic inspiration is the horse's appearance as both symbol and magical agent in shamanic practices throughout the world.

HYPNOSIS AND SHAMANISM

Hypnosis and hypnotic phenomena are integral aspects of certain shamanic practices. The use of hypnotic methods can be identified in ancient shamanistic traditions from around the world, long before hypnosis was formally introduced into modern Western society (e.g., Teitelbaum 1978; Bowers 1976). This close relationship between shamanism and hypnosis can be clearly observed in at least two areas of the shamanic complex. First, both shamanism in its healing rituals and hypnosis in its therapeutic encounter rely essentially on the skillful manipulation of the patient's imagination in order to achieve the desired therapeutic benefits. Accordingly, shamanic healing and clinical hypnosis can be jointly defined as the "masterful presentation of ideas [by the hypnotist or shaman] in order to manipulate images in the subject or client, all for the purpose of causing deliberate physiological and/or psychological responses to take place" (Overton 1998, 167). The second aspect shared by both shamanism and hypnosis is the representative use of the same dissociative state of consciousness, which in shamanism is referred to as the shamanic journey, or ecstatic flight, and in hypnosis is called the hypnotic trance, or simply trance. Neurophysiological and empirical evidence support the view that the shamanic journey achieved without the use of hallucinogenic substances, that is, with the aid of musical instrumentation, chanting, and similar phenomena, elicits the same electroencephalographic profile as the hypnotic trance state. In addition, experiential phenomena characteristic of the shaman's ecstatic flight, such as shapeshifting, contact with imaginal agents, and the like, can likewise be achieved in hypnotic trance (see Overton 1998, 2000).

The role of trance and imagination in hypnosis is not always self-evident from the definitions of hypnosis that have been given, which vary greatly. Hypnosis has been defined as "any effective communication" (Grinder and Bandler 1981, 2), "a state of mind in which suggestions are acted upon much more powerfully than is possible under normal circumstances" (Alman and Lambrou 1990, 7), and "ideas evoking responses" (Bierman 1995, 65). Each of these definitions illustrates differing views on the relationship between hypnosis and trance, an association that is often not clearly understood, although the latter is frequently implicitly viewed as equivalent to the former. However, although the use of trance with patients is central to the manner in which hypnotherapy is currently practiced, this was not always the case, nor do all practitioners understand it to be an essential element.

From its initial stages to its present-day usage, hypnosis in the West has undergone a series of identifiable transformations in its development. These transformations reveal the relationship between hypnosis and trance, the role that imagination plays in the therapeutic process, and some key intrinsic aspects of hypnosis that pertain to its relationship with shamanism. In the West, hypnosis, or mesmerism, as it was once called, can be directly traced to Anton Mesmer, who in 1776 promoted the idea that a general magnetic fluid pervaded all of nature, including living organisms, and that disease resulted when this magnetic fluid was unevenly distributed within the body. The proximity of a magnetized substance was employed to reestablish the flow of magnetic fluid in the body and therefore restore the organism to health. Although the hypnotic procedure took place without a formal trance induction process, healing was accomplished by the successful manipulation of the patient's expectation of the effects of imagined magnetic forces. So powerful were the images of the effects of these illusory forces, that these therapeutic interventions were often accompanied by violent convulsions on the part of the patient.

The second phase in the development of hypnosis centered on the techniques promoted by a disciple of Mesmer, the Marquis de Puysegur. Puysegur insisted that the healing power to realign the magnetic fluids in the patient's body resided not in the magnets themselves, but rather in the magnetizer, who by mere willpower redirected the magnetic flow and promoted healing. Puysegur was the first hypnotist known to induce a trance in his patients, a state that he referred to as somnambulism. Thus, this phase in the development of hypnosis is distinguished by the use of (still imaginary) directed forces, combined with the introduction of the somnambulist, or the patient in a trance state. Puysegur's techniques inspired several healing methods involving

hand passes (so-called laying on of the hands) and light touching in key areas of the body.

The next stage in the evolution of hypnosis began in 1819 with Abbé Faria, who developed the fixed-gaze method, in which he required subjects to fix their attention on an object in order to induce trance, after which he would offer healing suggestions to complete the intervention. Faria believed that the capacity for healing resided, not in the magnetizer's powers, but rather in the patient's trance state. Despite the publication of his results, his discoveries sparked little attention and remained unknown for some time.

In 1849, several decades later, and independently of Faria's findings, Dr. James Braid also discovered that when patients experienced a period of focused attention on a light, they became more suggestible. He coined the term *hypnosis* to refer to the sleeplike state patients entered when they stared at the light for extended periods. As with Abbé Faria, Braid's discovery that patients became more susceptible to the images elicited by his suggestions when in hypnosis than otherwise led him to conclude that the therapeutic process depended, not on the effect of any magnetic substance, but rather on the hypnotic state of the patient. Furthermore, Braid concluded that patients' suggestibility was measured by their capacity to enter the hypnotic state. With the advances of both Abbé Faria and James Braid, hypnosis passed into what has been called the trance stage, during which trance alone, without the manipulation of imagined magnetic forces, became understood as the basis for the healing intervention.

By the end of the nineteenth century, Hippolyte Bernheim and Auguste-Ambroise Liebault in France had fully determined that hypnosis is the result of psychological forces within the subject and not physical or any other kind of forces existing outside the subject. In 1958, after a two-year study, the American Medical Association accepted hypnosis as a viable clinical procedure. Currently, the term *hypnosis* has become exceedingly controversial, difficult to define and therefore to delimit. It is still often applied indiscriminately to the method of intervention called hypnotherapy, the hypnotic trance state, and the psychological and cognitive phenomena commonly elicited during trance, as well as to the means of inducing the trance state itself.

What is important to note about hypnosis and can clearly be seen in its history is the central role that the individual's imagination, in the form of beliefs, suggested images, and expectations, plays in the hypnotic encounter, with or without the use of trance. In 1784, for example, at the request of the king of France, Benjamin Franklin led a commission to investigate the scientific validity of Mesmer's magnetic claims. The result of the royal commission's findings were that "imagination without magnetism produces convulsions, and that magnetism without imagination produces nothing" (cited in Bowers 1976, 8). Nevertheless, trance currently plays a central role in hypnotherapy, as in this state the suggestions of the hypnotist are thought to have magnified effects compared to those that similar manipulations would accomplish in a "normal," or "waking," state of consciousness. In any case, the patient's expectation, which is a cognitive-affective state resulting from the combination of the imagined outcome of an event or procedure together with anticipation associated with that imagining, is at work not only within the hypnotic trance, but also in each aspect of any given therapeutic encounter. This is the case even prior to the formal intervention procedure. The psychophysiological effect of the impact of imagination plus anticipation is an ordinary occurrence in the history of medicine and is commonly reflected in the phenomenon often derisively referred to as the placebo effect (e.g., Bierman 1995; Overton 1998). The placebo effect can be defined as the beneficial physiological or psychological response that occurs as a result of the patient's expectation alone, despite the ingestion of an inert substance or the use of an intervention that could be expected to have no effect. The placebo effect is the bane of the pharmacological industry, its power being so pervasive that every new drug or treatment must demonstrate that its efficacy is greater than that of a placebo (Harrington 1997). Furthermore, "its effectiveness has been attested to, without exception, for more than two millennia" (Shapiro and Shapiro 1997, 1). Hypnosis exemplifies the psychophysiological power of the human imagination, arguably the same power also at work during the placebo effect. Indeed, for Steve Bierman, the placebo effect is "the cardinal fact" of hypnosis (Bierman 1995, 67). The relationship between the placebo ef-

fect and hypnosis is most evident during the earliest stages of the history of hypnosis, when it relied exclusively on the magnetizer's manipulation of the patient's expectation.

The counterpart of a placebo is often referred to as a *nocebo,* that is, an inert substance or otherwise nonfunctional intervention that produces negative physiological responses based on the patient's fatalistic expectations. "Voodoo death," in which the witch doctor or other shamanistic figure's curse leads to the demise of the victim, is often presented as the classic example of the nocebo effect. The first scientific investigation of Voodoo death was undertaken by the physiologist Walter Cannon (1942), who described this shamanistic phenomenon as the "fatal power of the imagination working through unmitigated terror" (cited in Benson 1996, 41). Thus, the relationship between Voodoo death and hypnosis is easy to discern: "Voodoo death is hypnodeath" (Overton 1998, 159). Whether positive (placebo) or negative (nocebo), the imagined outcome of the patient's expectation can often be so compelling to the individual's physiology that the resulting imagining becomes, to a lesser or greater extent, enacted in the form of healing or ailment.

From the perspective of clinical hypnosis Bierman emphasized that placebo, that is, hypnosis without trance, and trancework indeed represent opposite ends of the "technique spectrum" (Bierman 1995, 67). It is also here where we can clearly find one of the common denominators between shamanic healing and hypnosis. In the shamanic healing encounter, the patient's imagination is excited and exercised while observing the actions, in the form of physical behaviors and verbal descriptions of the shaman who, in trance, is mentally traveling in the supernatural realm. The reason for the "shamanic journey" or "ecstatic flight" in shamanic traditions lies in the etiology of disease in the shamanic paradigm, according to which pathology is often attributed to supernatural causes in the form of illicit interference, such as soul loss, witchcraft, or sorcery. Thus, the shaman must ecstatically, that is, in the form of an out-of-the-body experience, enter the supernatural realm to either obtain the knowledge to heal or to intervene in that dimension on behalf on the patient.

The role reversal between hypnosis and shamanism in the use of trance is an interesting one. For the hypnotherapist, the patient's trance magnifies the therapeutic effect of the mental images elicited by the hypnotherapist's words. For the shaman, the vividness of the experiences he describes when journeying plays powerfully on the patient's imagination, heavily conditioned by culturally acquired expectations. In hypnotherapy, following the development of the Western model, the ability of the healer to heal resides in the mind of the patient, because disease is understood to originate within an individual. For this reason, it is there, in the patient's mental realm, that the healer must endeavor to find a solution to the malady. Ultimately, both shamanic healing and hypnotherapy rely on the power of the human imagination to both create vivid and dynamic images, and to respond to such imagery, psychologically and physiologically, often in dramatic and enduring ways (Overton 1998).

Aside from the essential role that imagination plays in both shamanism and hypnosis, another area in which they are similar is in the nature of the trance experience itself. From a neurophysiological standpoint, the pattern of brain wave activity created during a hypnotic trance experience is practically identical to that created during a similar recording of shamanic journeys. In addition, the phenomenology of the shamanic journey can readily be replicated in any suggestible subject during hypnotic trance (Overton 1998, 2000). Consequently, it is reasonable to assume that both the shamanic journey and the hypnotic trance correspond to the same state of the mind-brain and are simply social and cultural adaptations of the same psychobiological phenomena. As the author concluded, where shamanic healing and clinical hypnotherapy principally differ "is in the fact that they are each cultural adaptations fundamentally rooted in opposing epistemological polarities" (Overton 1998, 167). In other words, for "the Westerner, knowledge resides in this reality, thus so should the clinician's consciousness"; on the other hand, "for a member of a shamanic culture, knowledge resides in non-ordinary reality, and so should the shaman's spirit" (Overton 1998, 167). Inherent to both healing methodologies is the fundamental use of the patient's imagination in order to achieve the desired responses, be they psychological, or physiological, or both.

INITIATION

The process of becoming a shaman combines an initial ecstatic or revelatory experience with a lengthy period of training to gain command of "techniques of ecstasy" (Eliade 1989, 13–14). The initial blow—sickness, dreams, fainting fits, fright, or lightning strike—constitutes a physical and psychological ordeal that sends the soul of the candidate on a journey. Recurrently, this spiritual crisis portends a drama of death and dismemberment of the physical body before renewal of the vital organs and rebirth. "A man must die before he becomes a shaman," said the Akawaio of Amazonia (Wavell, Butt, and Epton 1966, 49; see also Eliade 1989, 83). The new shaman's power to heal is proved by "successful mastery of the grounds of affliction" (Lewis 1989, 70). Initiation, the long process of acquiring that mastery, is paradigmatic, often reenacting the mythical exploits of the first shaman (Sullivan 1988, 390, 395). The new shaman's primary ecstatic experiences recall a primordial time of unity before communication between heaven and earth was severed; the initiate is the privileged individual who renews that link as his soul travels to the Otherworld in the service of the community (Eliade 1989, 144).

In his classic comparative study, Mircea Eliade regarded the typical death and resurrection sequence as similar in morphology to other rites of passage, whether tribal or secret society initiations (1989, 64–65). Such rituals were lacking in Siberia and Central Asia, the preeminent centers of shamanic practice in the strict sense. But across North America rites for admission to secret societies could be difficult to distinguish from shamanic initiation. In Australia, although medicine men had a separate class of rites from the general tribal initiations, they dealt in secret knowledge of the cosmology in which the wider initiation was embedded, particularly with respect to the Rainbow Snake (Elkin 1977, 22–24). Numerous accounts from South America explicitly compare the treatment of novice shamans to that of menstruating girls at initiation (see, for example, Sullivan 1988, 824, note 37). Among the Ju/'hoansi (pronounce Zhun-twasi), who provide perhaps the most convincing African case of strict shamanic practice, Richard Katz reported in 1982 that half of all men and a third of women might learn techniques of ecstasy. Here, training for getting and controlling *n/om* (pronounced *n-ts-om,* roughly) potency to achieve !*aia* (pronounced *kia*), the healing trance, was scarcely formalized. Yet Katz remarked that the ceremonial preparation of girls for getting n/om was the same as for menarche or marriage—all were dangerous, transitional forms of n/om initiation (1982, 171). In other Bushman groups, the trickster-creator god governed both puberty initiation and trance activity (Guenther 1999, 112).

Death and Dismemberment

Danger and power threaten to engulf the candidate in the first uncontrolled encounter with the spirits. The cosmos is thrown into reverse. Animals hunt and eat man—such as the bear or walrus who tore and devoured the Inuit apprentice *angakkoq* (singular; plural, *angakkut*); people run wild—such as the prospective Tungus clan shamans who fed on "animals . . . caught directly with their teeth" (Shirokogoroff 1982, 350). The Buryat initiate's body would lie lifeless and untouched seven days and nights while ancestral spirits carried off his soul and cut up and cooked his flesh "to teach him the art of shamanizing" (Ksenofontov, cited by Eliade 1989, 43–44). All over Siberia, as the candidate lay sick or "dead," the soul witnessed limbs disjointed on iron hooks, blood drunk by

the spirits (souls of dead shamans), eyes torn from their sockets, flesh cut and pierced with arrows. Similarly savage accounts of the experience of shamanic dismemberment recur worldwide. In Australia, Adolphus Elkin reported the Mandjindja initiate being killed by "two totemic heroes," cut open from neck to groin, his organs removed (1977, 21); an Unmatjera medicine man had tiny crystal *atnongara* stones thrown at him with a spear-thrower, right through his chest and head, and his insides were then cut out (Spencer and Gillen 1904, 480–481). Whereas Siberian and Australian novices saw their bodies dismantled by shaman ancestors, an Inuit apprentice had his soul extracted from his eyes, brains, and intestines by an old angakkoq. After arduous preparation, he performed a mental exercise of contemplation of his own skeleton; this reduction to the bones freed him from "the perishable and transient flesh and blood" (Rasmussen 1929, 114). Gerardo Reichel-Dolmatoff told of the "skeletonization" of South American Desana initiates, before they could be reborn from the bones (1997, 123, 147). Elsewhere in the Americas, initiates watched, in ecstasy, their own destruction, and then reconstitution, their worlds, like their bodies, being "reordered and refashioned" (Sullivan 1988, 400).

Renewal and replacement of body parts by magical substances or the organs of the spirits themselves is a persistent motif. In the Arctic, candidates might be reforged with metal, while the eviscerated Australian medicine men were packed with rock crystals, or "snakes," the crystals being given the same name as the Rainbow Serpent (Eliade 1989, 132; Elkin 1977, 21–22, 33, 93). Crystals also feature typically in South American initiation, whether introduced into the body, or being carried as "*organs removed* to the outside" (Baer and Snell 1974, 69; cited by Sullivan 1988, 418). In this new condition of heightened sensory perception, the shaman's body, like the world itself, is turned inside out, newly revealed.

In the first experience of n/om, the Ju/'hoansi novice is shot by the teacher with arrows of n/om, pricking the neck, belly, and spine (Katz 1982, 46, 168). Like long thorns, these arrows stick out of the *gebesi*—the pit of the stomach, liver, and spleen—so that the abdomen is transfixed with arrows in all directions, according to old healer Kxao ≠Oah (pronounced Kau Dwa) (Katz 1982, 214). The shamanic rock art that alone remains to us of the lost Bushman cultures of southern Africa depicts such prostrate arrow-pierced figures of trancers (Garlake 1995, 130, 143–144). The same images of humans stuck with arrows are seen in cave art of the Franco-Cantabrian Upper Paleolithic, attesting to the antiquity of such experience. Among the Ju/'hoansi, the dance to powerful singing and rhythmic clapping activates the spiritual energy of n/om. The healers have said that it "heats up" with their movements, describing the searing pain as n/om boils in the gebesi, vaporizes, and rises up the spine. The first extraordinary pain of "drinking" n/om brings intense fear, the fear of death. For the heart to be open to boiling n/om, to enter into the trance state of !aia, one must be willing to die (Katz 1982, 45). Another old healer, /Ui, spoke of death: "Your heart stops. You're dead. Your thoughts are nothing. You breathe with difficulty. You see things, num things, you see spirits killing people. You smell burning, rotten flesh. Then you heal, you pull sickness out. You heal, heal, heal. Then you live. Your eyeballs clear and you see people clearly" (Katz 1982, 45).

New Powers of Vision

To "see" the spirits, to have contact with the dead, as Eliade said, means *being dead oneself* (1989, 84). To attain their dreams and visions of the spirit world, initiates undergo a terrifying metaphysical journey. Again, narratives from all continents bear marked similarities. The narratives tell of souls from Siberia to South America carried off by great birds of prey—eagles, vultures or mythical bird-spirits. Their magical flight lands on a giant tree where souls may nest and ripen—such as the great fir tree of the Yakut—or undergo ordeals, as with the Tree of Trials of the Mataco. Other modes of travel on a vertical axis encompass lightning, rainbows, ladders and ropes to the sky, or descent through graves or cave passages to the Underworld. The drum was the vehicle in Siberia, described by the Yukaghir as the "lake" into which the shaman dove to descend to the kingdom of the shades, described by the Yakut and Mongols as the shaman's "horse" ascending to spirits in the sky (Jochelson 1908, 59).

Such explorations map a mythical geography of the primordial cosmos at the time of creation (Sullivan 1988, 410–412). In the texts of Amazonian Desana initiation collected by Reichel-Dolmatoff, the initiate's journey is symbolized on a vertical dimension by ecstatic birdlike flight into the clouds, likened to the soaring of the harpy eagle, and on a horizontal dimension by travel between the mouth and headwaters of rivers (1997, 123–124). In mythic time, rivers were the outstretched bodies of anacondas who originally carried people to settle on the banks. In several parts of Australia, medicine men received their power from the Rainbow Serpent or a water snake, which could also be seen in the sky. In a Forest River region initiation, an old doctor took the candidate, reduced to the size of a baby in a bag, mounting to the sky by climbing the Rainbow Serpent as if a rope, throwing the initiate into the sky and "killing" him (Elkin 1977, 22). Alternatively, initiates from South Australia might be put into a waterhole, to be swallowed whole and regurgitated by the mythical snake living there (1977, 20). Bushman cultures likewise have described the soul's travel in trance as climbing to the sky, God's place, by threads or ropes, or else as immersion underwater. The ancient rock paintings of the Matopos in Zimbabwe show ladders to the sky in the form of giant snakes (Garlake 1995, 131). In South Africa, snakes or "rain animals" are frequently found in depictions of trance states. In 1873, one of the last Maluti Bushmen was asked to interpret such paintings from the Drakensberg. He spoke of the trancers as men who lived un-

derwater, taming elands and snakes. They were people "spoilt" by the dance. Their noses bled, they would fall down and die, but Cagn, the Mantis-Trickster, gave "charms" to raise them again, in which there was burnt snake powder.

Traversing these new domains, the initiate gains a mystical ability to "see," where "seeing" is a total experience involving all senses (Sullivan 1988, 423). *Qaumaneq,* the mystical enlightenment of the Inuit angakkoq, was described to Rasmussen as a mysterious light in the shaman's body, inside his head, "a luminous fire which enables him to . . . see through darkness and perceive things and coming events which are hidden from others; thus they look into the future and into the secrets of others" (1929, 112). This sense came upon the candidate after days spent in solitude, invoking the spirits. The hut he was in suddenly rises; he saw far ahead of him, through mountains, as if the earth were a flat plain, to the end of the earth: "Nothing is hidden from him any longer; not only can he see things far, far away, but he can also discover souls, stolen souls" (1929, 113). When he first went to the master for instruction, an Iglulik Inuit novice said that he desired to see. Ju/'hoansi healers have spoken of "seeing properly" when in trance, allowing them to locate and "pull out" sickness (Katz 1982, 105). Though totally blind, Kxao ≠Oah could see in !aia. God kept his eyeballs in a little cloth bag, and brought them down from heaven when he danced: "as the singing gets strong, he puts the eyeballs into my sockets, and they stay there and I heal. And when the women stop singing and separate out, he removes the eyeballs, puts them back in the cloth bag, and takes them up to heaven" (Katz 1982, 216).

Relations with Spirits

Critical to learning how to work with the comings and goings of souls is some dialogue with the spirits. In the guise of shaman ancestors, animals, plants, or magical substances, these beings may appear at first to molest and attack, but ultimately, with the initiate's spiritual progress, they become helpers and guides. For the Chukchee, communication with the spirits was through beating the drum and singing. An extra whalebone drumstick was provided for the use of the spirits who approached. Hours of drumming and singing to attain the necessary endurance for performance was a large part of the novice's training. Sustained by the spirits, he should show no signs of fatigue (Bogoras 1904–1909, 424–425). Among the Bushmen, Katz reported that relations with the spirits remained confrontational. Once a Ju/'hoansi novice has become an owner of n/om, able to see and travel in !aia, healing becomes possible. The process is one of seeing which spirit is troubling a person, and negotiating with that spirit to leave. Experienced healers engage in struggle as equals with the gods or spirits of the dead; they can "bargain with them, insult them, even battle with them" (Katz 1982, 112). Friendly overtures and appeals turn to an interchange of screamed profanities and menacing gestures. Those at the dance hear the healer's side of the dialogue in response to the spiritual opponent (Katz 1982, 113).

Such dramatic, even histrionic conversations, reproduced in chanting, form part of the repertoire of shamanic curing all over the world. By contrast with the Ju/'hoansi, however, in many communities the messages relayed through the shaman request propitiation for offenses against the spirit world. The primary role of an Inuit angakkoq was to police the taboos that preserved the community from fear of revenge by souls of the animals they had killed. As the Iglulik told Rasmussen, "The greatest peril of life lies in the fact that human food consists entirely of souls" (1929, 56). An Iglulik séance took the form of a public confessional, as the angakkoq asked his helping spirits to divulge to him what taboos had been violated, until the patient owned up to specific breaches and could be purged of transgressions (1929, 133–134).

The mythic and dream narratives of initiation direct the candidates in the proper relations with the spirits who are to be their teachers, and whom they will be able to summon. A future Samoyed shaman fell ill with smallpox; carried into the middle of a sea, he was addressed by his own Sickness, telling him that the Lords of the Water would give him the gift of shamanizing. Guided to the Underworld by an ermine and a mouse, he was shown seven torn tents. In one, he found the inhabitants of the Underworld, men of the Great Sickness (syphilis), who tore out his heart and threw it into a pot. In other tents were the Lord of Madness, the Lords of all the nervous disorders,

and evil shamans. Thus he learned the various diseases tormenting mankind (Eliade 1989, 39). In Yakut narratives, once the candidate's soul had matured, parts of the body were shared out to the evil spirits of disease, one piece to each of the diseases the new shaman would be able to cure (Eliade 1989, 36, 38). The East Greenlander Sanimuinak told how he summoned his first spirit, or *tartok.* He went to a mountain facing the sunrise, with two great stones laid over a deep cleft. Rubbing the upper stone against the lower, he heard a voice out of the cleft and recoiled in terror. The next day, grinding the stones, he was seized with horrible pains at the sound of the voice, but on the next, he overcame his terror to command the spirit to come up. The stones lifted and a "sea monster armed with claw-like shears emerged, looking toward the sunrise" (Holm 1914, 298ff.; cited by Jakobsen 1999, 53).

In all these accounts, fasting and solitude aided the capacity to contact the spirits. The secluded Akawaio novice imbibed a special tree-bark infusion and vomited it out, so that the Spirit of the Bark entered the body. This enabled the shaman to rise into the sky, by a ladder or a tree. Along that same ladder other helper-spirits descended into the shaman's body. The novice learned to ascend a mountain where tobacco grows on a tree that propagates all fruit and vegetables. A spirit gave tobacco to the shaman. Then the tobacco spirit made the novice's own spirit small enough to fly out through the cracks in the house to the spirit realms. Tobacco spirit also brought down spirits of mountain birds to help the shaman. In particular, *kumalak*-bird spirits assisted the tobacco spirit in lifting the shaman's soul with their songs (Butt Colson 1977, 51–52). At each stage, a spirit helped the shaman to rise and gain more spiritual help at the next stage.

In the initiate's state of extreme vulnerability during the initial trauma and subsequent training period, strict taboos on food intake and sexual contact can be seen as protective precautions. An experienced shaman may be on hand to supervise such practical aspects of routine. However, often the master is a shaman who has died, or, if living, may be spiritually, not physically present. The master's prime role is to act as a spiritual guide "through unfamiliar supernatural terrain" (Sullivan 1988, 398). In Desana traditions, an apprentice shaman spends months or even years in building knowledge of plants and animals, cosmology, myths, and genealogies, as well as ritual procedures. He is also introduced to the hallucinogens that will carry him to the Otherworld. Once he has demonstrated his commitment to observing the rules of abstinence required of shamans, his master will take him, with perhaps two or three other experienced shamans, to a remote part of the forest. There, for months in isolation, the small group live on nothing but a little manioc, ingesting large quantities of drugs, spending "most of the time in their hammocks, their prostrate emaciated bodies convulsed, their faces contorted, their hoarse voices chanting endlessly to the rhythm of their gourd rattles" (Reichel-Dolmatoff 1997, 123). In this skeletal condition, the initiate falls into deep trance under the influence of a narcotic cocktail. The master-shaman "systematically administers a sequence of specifically prepared drugs," modifying dosage and admixture. The initiate's work in trance is to become aware of his own reactions to these psychotropics (Reichel-Dolmatoff 1997, 147).

Contemporary master shamans may assist initiates in their dealings with helper-spirits ultimately by establishing a lineage of communication with the original and most powerful mythical shaman (Sullivan 1988, 399). In Martin Gusinde's remarkable account of the initiation of a Yamana *yékamuš* (shaman), hallucinatory contact with the spirits of dead yékamuš came through severe physical deprivation. Painted each day with a white mash, the initiate had to sit in a conical hut in a prescribed position, unable to move or touch the walls, completely silent, barely eating, drinking, or sleeping. Once bonds were established with ancient shamans as spiritual helpers, the novice was instructed by living experienced shamans and the ancient ones. His progress was seen as every day he rubbed his cheeks with white clay and wood-shavings. As he grew wiser, the rubbing revealed a softer, finer skin, visible only to yékamuš. The rubbing continued until, exquisitely painful to touch, a third layer of skin—shiny, tender, and beautiful—was exposed (Gusinde 1936, 1307–1310; cited by Sullivan 1988, 393–395).

By contrast with these South American accounts of severe and closely supervised ordeals, the Ju/'hoansi do not draw on spiritual assis-

tance in learning to drink n/om. Help and support from teachers, family, and friends is practical in the here and now. In Bushman culture, learning to heal is "a normal aspect of socialization" (Katz 1982, 44). Teachers carefully regulate the numbers of "arrows" and intensity of n/om they shoot into students; if fear escalates at the approach of !aia, the teacher may make the student stop dancing to "cool down" boiling n/om. Physical contact between the students and those supporting them at the dance is extensive. They are "carried," physically, emotionally, and psychologically (Katz 1982, 46–47). Teachers may supervise dietary taboos for novices, while women students take care not to activate n/om during pregnancy (1982, 171–172).

Metaphors of Sexual and Reproductive Potencies: Gender Ambiguity

Of the variety of imagery symbolizing the metamorphosis of the new shaman from one state into another, pregnancy and fetal development are central motifs. Desana metaphysics utilizes a complex chain of interlinked models, including insemination and growth in the womb, the growth of plants, and transformative processes of cooking and pottery firing. These are accompanied by the changing neurophysiological sensations of the advancing narcotic trance (Reichel-Dolmatoff 1997, 147). Sexual metaphors permeate the manipulation of substances and props used in Desana initiation. The initial snuff-taking, using the phallic harpy eagle bone, has a connotation of insemination (1997, 128). The gourd rattles, which are viewed as wombs, contain tiny sharp quartz particles seen as semen, and they generate smoke or sparks when shaken for hours, this being an act of uterine creation (1997, 129). The types of firewood that effect transformation through heat include the "shrimp" tree, whitish with red veins, of phallic association, and the "bat" tree, referring to blood-sucking bats, which exudes red latex. Together, they mix semen and female blood. Added to these principles is the *puikerogë* tree whose bark, used in making straps of women's food baskets, has a "peculiar, pungent odour which men compare with menstrual or estrous smells" (1997, 135). Drug-induced optical and physiological sensations are described in terms of the erotic effects of a beautiful woman, a passion that has to be controlled (1997, 135–136, 140). Two metaphors represent the shamanic rebirth, one as penetrative passage through a hexagonal door of the river headwaters (1997, 144), the other conflating imagery of a fired pot and food cooked in a vessel. The pot is decorated with a zigzag motif seen around the waists of Desana women, their wombs identified as vessels for "cooking" the child within. The name of the design refers to the clitoris, that most gender-ambivalent sexual organ (1997, 146).

Mastery of combined female and male potencies, as seen in the Desana sequence repeatedly balancing "male" and "female" principles, underlies shamanic transformation. This is evident in overtly sexual unions with spirit teachers who grant powers to new shamans of the opposite sex. In Siberia, the *ayami* (tutelary spirit who chooses the shaman) of a Goldi shaman was a beautiful woman who had taught his ancestors to be shamans, and would teach him. He was to become her husband, or else she threatened to kill him. "When the *ayami* is within me, it is she who speaks through my mouth" said the shaman, " . . .When I am . . . drinking pig's blood [forbidden to all but the shaman], it is not I . . ., it is my *ayami* alone" (Sternberg 1925, cited by Eliade 1989, 73). Similar accounts of celestial "marriages" come from the Yakut, Buryat, and Teleut (Eliade 1989, 74–5). The ascent of the Teleut shaman was portrayed as a struggle with his new wife, who tried to detain him to make love in "seventh heaven" (Eliade 1989, 76). Among the Akawaio, the *kumalak* bird, whose *malik* spirit songs are the wings on which the shaman rises, becomes his wife during the séance, and is called "clairvoyant woman." She can make a child with him, who grows up to help the shaman in his work (Wavell, Butt and Epton 1966, 55–56). Other more awesome female spirits governed shamanic powers: The Mother of the Sea, keeper of all sea creatures, was the terrible adversary of the Greenland angakkoq (Jakobsen 1999, 70); while the Mother of the Caribou was the source of qaumaneq, "enlightenment," for the Iglulik (Rasmussen 1929, 113). In the Samoyed narrative of the journey to the Underworld, the shaman encountered two naked women covered in reindeer hair. Each was pregnant, one with the sacrificial

reindeer, the other with those that would aid and feed humans. Both gave him hairs to assist his shamanizing (Eliade 1989, 41).

Sexual contact with spirits is one way of expressing the shaman's non-availability, at least periodically, for terrestrial sex (Lewis 1989, 61, 63). Another way is to place the shaman into a state of taboo equivalent to that of a menstruating woman, a feature of South American initiation. A Trio shaman described his position to Peter Rivière as "like a menstruating woman, an apt simile which stresses the state of betwixt and between in which they both exist" (1969, 268). When Baniwa shamans inhale snuff to open the Sky Door, it is said to be the menstrual blood of the male culture hero Kuai (Sullivan 1988, 410). As Sullivan argued, menstruation is the "best statement of the periodic nature of incarnate human life" (1988, 266). Since this periodic flow is manifest in both men and women, both sexes "menstruate." For the Barasana, menstruation is a change of skin that makes regeneration possible. To give birth to a new generation of initiate boys in the *He* House ceremonial, men "must first be opened up and made to menstruate" (Hugh-Jones 1979, 132). The boys themselves are treated as menstruating women in seclusion (1979, 87). Not only women and initiate boys menstruate, but the sky itself undergoes a cosmic skin-change during rainy season, the "menstrual period of the sky," Romi Kumu, Woman Shaman, from whom all life and shamanic power flows (1979, 179).

Across Australia, the Rainbow Serpent, which governs both shamanic initiation and the elaborate male menstruation rites of male initiation, expresses the same principle of cyclicity and cosmic renewal (Knight 1988). In Bushman rock art from Zimbabwe and South Africa, images of trance potency and menstrual potency are conflated as means of movement to the Otherworld. Figures transformed in trance climb to the sky by the snakelike periodic flow of giant female beings (Garlake 1995, 87). The power of fusing aspects of both sexes within a single gender is characteristic of shamans worldwide. Recounting several examples of transvestitism and taboos observed by both women and shamans in Siberia, Jochelson asked, "Why is a shaman believed to become more powerful when he is changed into a woman?" (1908, 52–53). Most feared by the Chukchee was a shaman who changed sex, a "soft man" (Bogoras 1904–1909, 451–452).

Initiation might culminate in a final consecration, a public display of the new shaman's ability to deal with the spirit world, and of his or her effective healing power. This display might involve formal examination by master shamans of the candidate's knowledge of songs, myths, spirit genealogies and secret language as techniques of accessing the world beyond. The sequences of death and resurrection and the soul's journey are recapitulated. A Manchurian Tungus initiate had to tell the history of the spirits sent to him by the master; each night after the performance he climbed a specially built structure of trees and beams (Shirokogoroff 1935, 352). In an elaborate replay of his ascent, the Buryat initiate climbed a tree set into the center of a yurt (Eliade 1989, 119). Much was made of sacrifice in the Buryat ceremonies, and purification with water and blood, which should recur each new moon (1989, 116–117). Yakut and Goldi shamans were likewise consecrated with the blood of sacrificed animals (1989, 114–115). Such ritual tree-climbing coupled with anointing with blood and sacrifice also marked the Araucanian shaman's accession. The candidate appeared in company with the old women *machi,* who drummed ecstatically for her to dance. One of the older women, blindfold, cut the candidate with white quartz, and cut herself, mixing her blood with the candidate's. The new *machi* mounted the special tree-trunk structure, called the *rewe.* The older machi, climbing after, stripped from her the bloodstained fleece of a sacrificed sheep. Time alone would destroy this sacred object, hung out beside the rewe, the machi's ladder to the sky (Eliade 1989, 123–124).

"MAGIC," POWER, AND RITUAL IN SHAMANISM

Shamanism involves a religious complex characterized by trance, curing, and a belief in the possibility of cosmic flight, centering on an individual (the shaman) believed to possess superhuman powers. In shamanic ritual, there is articulation of power at several levels—psychological, social, and religious (Saladin d'Anglure 1994). The shaman appears, from this perspective, as a mediator who transcends these levels in a complex and dynamic fusion. The shaman is often able to overcome the contradictions between binary oppositions (man/woman, human/animal, human/spirit, living/dead), through playing with ambiguity, paradox, and transgression, in order to manage illness, misfortune, and other crises.

Theories of Magic and their Implications in Understanding Shamanism

Shamanic rituals have long intrigued outsider observers because they appear to use "magical" powers. The terms *magic* and *magical* have been used loosely with a variety of meanings, such as illusion or sleight of hand; the ability to change form, visibility or location, or to create something from nothing; spirit invocation and command; and inspiring awe. Nineteenth-century evolutionists such as Edward B. Tylor and James George Frazer focused on comparisons that allowed them to make what they saw as ranked distinctions in the context of a linear progression of human cognition and cosmology from "magic" to "religion" to "science."

Later, by the 1960s, anthropologists came to recognize that so-called magical power really involves processes that activate or express connections; magical power activates connections among things and projects specific forces among them. In these processes, symbols play a crucial role. In cultural context, objects and behaviors can become symbolic and have extraordinary magical power. Some symbols transcend cultural boundaries and may be universal key symbols evoking such themes as life and death (Turner 1967); for example, the color red is worn by a Korean shaman called a *mansin* in her rituals to treat unfulfilled desires for marriage and children (Kendall 1989).

Most symbols can be understood only within a specific cultural context, as recognized in magical or religious ritual. A symbol can be arbitrary, carrying a specific meaning assigned to it by its user and given to it by speech or even only through thoughts. In Niger, West Africa, for example, some Tuareg diviners wear blue, a color associated with spirits (Rasmussen 2001). Symbols can also be transformed from one ritual context to another. This is illustrated in Mayan shamanic rituals when an ordinary table is converted into "sacred" ritual space by arranging candles in proper symbolic directions for purposes of healing (Fabrega and Silver 1973). Objects used in shamanic rituals addressing deities can be used in magical ways, their power intended to motivate the natural forces, or as a defense against malignant spirits or against forces directed at a person by the malign magic of another. For example, Claude Lévi-Strauss argued that the symbols in a myth recited by a Cuna shaman are effective in their metaphoric power in facilitating a difficult birth (1963). Among the Inupiat of northern Alaska, a coil of leather ribbon about a half an inch wide with a large dull red bead bound to the end and having knots at the top and bottom, was traditionally shamanic: It was worn around the forehead when hunting, an allusion to the creator wearing a raven's beak set in the middle of the forehead (Turner 1996). Recall-

ing Frazer's classic theory of sympathetic magic, many symbols used in magical practices assert power either metaphorically, through similarity, or metonymically, through contact.

The resemblance between the thing and the cultural symbol of it may or may not be obvious, however. Thus the principles of what is called magic involve the manipulation of natural forces along a network of natural interconnections by symbolic projections of power. People can affect forces through manipulation of symbols in diverse ways according to context; for example, the use of amulets involves human efforts to increase the efficacy of natural forces along lines they would or might move on anyway, as in farming, gambling, or love magic. Among the Tuareg, a seminomadic, socially stratified Muslim people in Niger, West Africa, many Islamic scholars have shamanic mediumistic healing powers. They manipulate Qur'anic and non-Qur'anic symbols into their amulet charms according to traditional and changing social contexts. For example, one traditional amulet consists of an envelope, or "locket," filled with papers on which Qur'anic verses are written; its cover is made of metals with special powers derived from pre-Islamic beliefs: Silver symbolizes happiness; copper coagulates blood; and copper protects like a shield. A more modern amulet reflects the political violence of the recent armed separatist conflict between the Tuareg and the central government: One child was seen wearing a bullet as an amulet, made for the purpose of protecting him from his father's tragic fate of being shot to death (Rasmussen 2001).

Some scholars, such as Keith Thomas (1971), have assumed, following the earlier unilineal evolutionary views of Frazer and Tylor, that magic declines with advances in modern science. However, like science, magic uses logical principles. Magical thinking is found in all times and places (Malinowski 1948). Its powers address human questions that science cannot always explain. More recently, many scholars have recognized that magic will accommodate science, even stand as part of it (Horton 1982).

Other theories of magic take into account their possible empirical validity based upon laboratory research in parapsychology: This research has produced empirical support for some phenomena claimed by magical traditions. Studies have indicated, for example, that humans can exercise psychokinetic influence on radioactive decay, on computerized number generators, on growth rates of plants, fungi, and bacteria, and on healing in animals. Most recently, some scholars have critically deconstructed and recast magic, religion, and science as culture-bound distinctions and Western classifications, and have questioned efforts to make any system conform neatly to one or another of these categories (Jackson 1989; Tambiah 1990). Inspired in some cases by the works of Carlos Castaneda emphasizing the "separate reality" known to Yaqui Native Americans of the Mexican Highlands, they have considered magical phenomena as objectively real, whether or not they are inexplicable in terms of Western scientific knowledge (Stoller and Olkes 1987; Jackson 1989). Calling magic irrational or rational according to Western cultural formulations therefore poses complex epistemological problems that affect the understanding of shamanic ritual powers.

Shamanic Ritual and Power

Scholars of shamanism have long recognized the importance of the performance aspect of shamanic ritual powers (Bogoras 1904–1909; Rasmussen 1929). The core of shamanism, the shamanic "séance," has been variously portrayed, depending on the cultural context and perspectives of observers and participants. The term *séance,* however, reveals religious bias and problems of translation of cultures: Many early observers saw Siberian séances through Russian Orthodox eyes as the most fearsome examples of "wild frenzied truck with the devil." More recent analysts, for example the Tuvan insider-ethnographer Mongush Borakhovich Kenin-Lopsan (1987), in contrast have stressed the compelling poetry of shamanic chanting. Spirit-invoking songs help shamans enter trance, and key mythic metaphors depicting shamans as dancing, riding, and flying on drum-boats or drum-steeds to the supernatural world are taken literally, not merely as poetic images.

In her study of the *tende n goumaten* spirit possession exorcism rituals among the Tuareg of Niger, the author has drawn attention to the importance of the aesthetics of the sung poetic verses in the therapy of exorcism: Local partici-

pants stated that these songs "soothe illnesses of the heart and soul" and "distract" the possessed from their troubles (Rasmussen 1995, 130). Among the Tuareg, there are also shaman-like herbalists with special mediumistic powers called medicine women (Rasmussen 1998, 147–171), who in their healing rituals use natural and cultural substances both literally and metaphorically to refer to, but also negotiate among, sometimes opposed spheres in local ideology (Rasmussen 1998, 151). They translate and negotiate men's and women's interests in fertility, descent, and property, bridging and reconciling conflicts. Many patients, for example, come for attention and resolution of personal difficulties, or to seek medicines to become fatter or to conceive a child. In their managing of female biological fertility and the cultural and legal descent interests of men and women, and in their cooperation with Islamic scholars, medicine women comment on and reinterpret important issues in Tuareg society: matrilineal and patrilineal property institutions and pre-Islamic and official Islamic worldviews (Rasmussen 1998, 151). These worldviews become intertwined and sometimes reversed in herbalists' and diviners' ritual healing.

In their ritual uses of substances and spaces, Tuareg herbal medicine women work with the earth, ground, and clay rather than iron or other metals worked by smiths. During treatment, the Tuareg herbalist uses massage and touch, contacting not only the woman patient's stomach but also the ground in order to take the disease out of both patient and healer. The herbalist has to throw the disease away, allowing it to be absorbed by the ground, because she is heavy from the patient's illness and needs to have the ground take it off or away. The ground, which opens up during childbirth, is associated with the Old Woman of the Earth, who threatens a woman giving birth. To counteract this danger, babies should be born inside the mother's tent, on clean sand. Possessed persons are cured of spirits when they fall exhausted to the ground. Herbalists also work with trees and wood, leaves and bark; rocks and stone; and millet and other nonmeat foods (rather than animals, which are more often offered by Islamic scholars and male diviners). Mountains, rocks and stone, metal and wood, all are richly resonant with symbolism in Tuareg cosmology, mythology, and ritual. Mountains are described in myth as related to one another in kinship, like people.

Herbalist diviners transform substances and bridge domains. They combine, but also reinterpret, natural and cultural substances and spaces. They convert some natural materials into cultural materials: for example, those medicines they cook over the fire. They combine pre-Islamic and Islamic substances, actions, and spaces. They work both in the home space of villages and camps, where they heal, and in the wild, in the dried riverbeds, mountains, and deserts where they gather. The latter are all distant from homes and opposed to maternal tent, mosque, and houses. Herbalists alternate between the wild and these points of habitation. They cure in domestic spaces, but gather medicines in the wild, near stone ruins of ancestral spirits. Before they leave to gather medicines, they circle millet and sugar three times over the heads of maternal nieces and nephews. They pray before pulling leaves or bark off each tree and bush; for each tree, one offers a different prayer, because some trees produce big, important medicines and others are less important (Rasmussen 1998, 163). In local cosmology and ritual, these trees are associated with matrilineal spirits.

Herbalists carry Islamic prayer beads along on gathering expeditions; they pronounce "Bissmillah" (in the name of God), an Islamic benediction, before some trees; touch the ground three times and perform Islamic ablution motions and recite full Islamic prayers; and also write Qur'anic verses in the sand. Herbalist diviners are accompanied by young, preadolescent maternal nephews, never mature men, on their gathering expeditions. They spit *al baraka* (Islamic blessing) power on some leaves and bark before placing them in their medicine bags. They are obliged to remove bark from trees with a rock or stone, but not an ax or any tool made of metal, particularly iron; iron is believed to make medicine ineffective because iron repels spirits, and in this context medicine women seek to attract rather than repel spirits (Rasmussen 1995, 1998). Yet herbalist diviners also display devotion to Islam. Thus they stand on a boundary. They appeal to locally recognized symbols, making sometimes conflicting power sources more compatible. They evoke and commemorate, comment upon and redirect these

forces, facilitating their reinterpretation according to context.

The substances and spaces with which many shamanic ritual specialists work are associated with unpredictable and potentially destructive powers, but also with their conversion and regeneration into positive forces by the mediation of these specialists, who are able to successfully navigate opposed and dangerous social and ritual territories. Their roles take on multiple nuances and illustrate refinements that mediating roles can exhibit in cultural systems.

In the Mayan Mexican community of Zinacantan, Mexico, studied by Horacio Fabrega and Daniel Silver (1973), mediumistic healers called *h'iloletik,* usually male, received their powers through divine revelation, and practiced by combined physical and spiritual efforts, and thus could be called shamans. A new *h'ilol* usually went through a period of ambivalent status and furtive activity, during which he engaged circumspectly in curing activities but attempted to avoid public recognition of his role, which would entail onerous public duties. It is only when he had been discovered and forced to take part in public ceremonies performed by the h'iloletik that the public could be sure of his identity. Notions of cause, disease, and illness, logically separated in the Western biomedical system, were fused and condensed in shamanic rituals in Zinacantan: A patient's symptoms were seen as objectifications of spiritual and malevolent powers. Local residents said the disease traveled and entered "like smoke or wind spreads and diffuses in and around an object," in concepts analogous to force, damage, injury, and evil (Fabrega and Silver 1973, 93).

In Zinacantan, a h'ilol's specialized knowledge of bodily mechanisms or manifestations of illness is less important than his ownership of the spiritualistic power that confirms his actions in the medico-ritual sphere. He wrestles with superhuman, malevolent, and potentially life-destructive cosmic forces. It is in performing public and private ceremonies connected with the social and interpersonal affairs of patients that a h'ilol displays his powers. His mediatory ritualistic acts are designed to bind earthly humans in the everyday social world to the deliberations of ancestral and other superhuman beings, and his acts display a h'ilol's supporting and unifying functions in the culture (Fabrega and Silver 1973, 217). Rum, for example, helps the curer see: Intoxication aids his divinatory powers. Rum consumed by participants in a curing ceremony is simultaneously received by the deities, to whom it is served as a sign of respect and propitiation. Foods of ritual importance include chicken, coffee, sweet corn gruel, and Ladino bread, a round bread enjoyed in North Africa and surrounding regions. In rituals, social behavioral sequences are common and are replicated on different levels of activity throughout the system: The sequences involve formal courtesy elements such as the drinking rituals, ritual meals, feeling the pulse, fetching the curer, and the curer's gift. Proper use of ritual objects converts them into offerings to the gods: Flowers, candles, food, rum, and gifts are all received by the gods only after they are transformed by prescribed uses in rituals. Thus the ritual is a transaction in which participants offer the gods not only ritual sacrifices themselves, but also the ceremonial labor needed to convert them to divine use (Fabrega and Silver 1973, 268).

Gods were believed to be present at various stages of the ritual, summoned by the shaman's prayers and by ritual placement of rum on the table and the hearth, and before crosses. Rum was an outstanding avenue of communication and ritual power between individuals, other persons, and the gods. Ritual drinking also symbolized respect, and reflected the existing seniority relationships of participants. The patient tended to move to a position of seniority in a curing ceremony, drinking right after the h'ilol and marching directly in front of him, whatever his social standing. This may express the extraordinary position in which illness temporarily placed the patient, as the center of supportive activities from all the participants.

Among the Inupiat of northern Alaska studied by Edith Turner (1996), during traditional shamanic treatment a shaman sang to whale meat in a patient's stomach, telling it to bring the bad thing up and out, and then called and waited. The bad thing came up and up, by the power of the whale meat the patient ate, up into the skin of the abdomen, and out. The shaman had hands cupped on the patient's stomach; took it along carefully and blew it out up the smoke hole, and the patient slept for a whole day afterward, awakening hungry (Turner 1996, 174).

Turner also related stories of Inupiat doing "shaman's tricks" in the modern era, for example, doubling, such as spirit presence and actual presence (the shaman in two places at once), and other tricks hard to explain in scientific terms (Turner 1996, 132). Turner described the way an Inupiat woman named Claire, at different stages in her life, experienced episodes that psychologists in our culture might term "fugue states" or even "psychosis," yet these episodes did not derive from psychosis. They appeared to be classic eruptions of shamanic experience, just as the ancient Inupiat knew them, lasting four days (Turner 1996, 205–208). In early times, these were characterized by meeting with something fearful, a spirit of a dead person or of an animal, one that first afflicted the incipient shaman, then changed and became a helper. This woman saw a devil continually in her peripheral vision, and uttered nonsense words, upsetting her relatives. But at the end of the four-day episode, she was able to pray to Jesus again, and afterward her healing power was stronger. She appealed to Jesus to be her helper, seeing him as the opposite of Satan, and thus her change was parallel to the traditional shift in the spirit from being dangerous to helpful. Her appeal was to Jesus, yet the basic experience was quite close to that of shamans in pre-Christian days. Thus shamanic rituals are often resilient: Shamanic and "official" religious rituals cannot be easily separated, and one does not necessarily replace the other, despite pressures exerted by missionaries and other outside influences.

Cosmology, Belief Systems, Myths, and Practices in Shamanic Power

The shaman medium is perceived to be a mediator between spiritual and human worlds. This mediation is often painful, for the mystical forces shamans describe themselves as negotiating in ritual are fraught with danger and easily misused. The process requires moral, psychological, and physical strength, as well as exquisite knowledge and dramatization of diverse cultural symbols and histories of one's people.

The shamanic worldview often presupposes a multileveled cosmos, with the heavens, and often an Underworld, complementing the mundane world of everyday existence. Shamans move between these worlds in the exercise of their calling. Mystical flight is integrally connected in most versions of shamanism with two other themes: curing soul loss and interaction with spirit beings. It is the task of a shaman to travel to one or another cosmic realm to retrieve the soul of the sick person and thus to restore the sick person to health. These powers that shamans exercise are attributed to mastery over various spirits, both those who act as familiars, and those malignant spirits whose powers shamans must overcome. Siberian Evenki shamans invoked cacophonous spirits who raced inside séance tents so exuberantly that tents and participants alike trembled. These séances often produced cathartic confessions of taboo-breaking. Knud Rasmussen (1929), for example, noted that in one Iglulik (Inuit) session, there was confession of violating menstrual taboos, used to explain miscarriage.

Among the Inupiat in northern Alaska, traditionally the spirits and ancestors worked through shamans in healing, changing the weather, finding lost people and objects, and communicating with the dead (Turner 1996, xvii). These sessions took place in the neighborhood underground meeting house. If a shaman wished to make a journey to cure a sick person, drummers and singers would assemble and sing the songs the shaman had taught them, who in turn had been taught them by his or her helping spirit. The shaman, in dancing the part of his or her spirit animal, would eventually fall, and the shaman's spirit would depart, leaving the body behind. He or she would take a trip under the water or ice, or underground, or above the tundra, and would visit the home of the animals, asking them to restore the sick person's health. In some cases, a shaman might extract small spirit spear points from the patient's body by means of sucking where the trouble was perceived to be.

Healing is inseparable from mediumistic actions among many peoples. For example, Inupiat shamans conducted dancing and drumming to bring caribou, verbally giving the young their oral traditions at the same time. One oral tradition tells that a shaman went under the water in his ball of fire in order to help a sick young man. The shaman arrived at the animals' house under the water. The animals' parkas were hanging on the wall. Inside the animals' house the sick young man was lying down. The shaman asked a favor of animal people, "Let our relative come

back and not die. We need him to hunt for us, he is young." So they let him go. At that moment, back in his village, the young man lying on his bed began to get better, and he recovered (Turner 1996, 50–51).

In this classic Native American shamanic soul retrieval, the shaman learned to address the animals properly and respectfully, talking to them, developing a relationship of respect with animals. Thus human beings, by living well with animals, learned the Inupiat art of drumming, imitating in their drumming the rhythm of the heartbeat of the mother animal; they learned dog sledding, and after that, trading. According to Turner, this type of spirit cosmology and mythology contrasts with that of Christianity, Judaism, and Islam; in the latter, peoples are embedded in a hierarchy. God is usually envisaged at the apex of the hierarchy, like a king; humans come next, animals at the bottom. The idea in Inupiat cosmology is a continuous cycling of all existing things; here, it is often animals who are masters and teachers, not human beings, who are weaker and need their help (Turner 1996, 86).

Among some other peoples, by contrast, shamanic powers derive from an interweaving of hierarchical official and nonhierarchical unofficial religious cosmologies. Among the Tuareg of Niger, the Islamic and pre-Islamic spirit pantheons are both powerful in mediumship and healing. Different persons may inherit or cultivate a pact with different spirits, bringing them under their control through offerings and ritual restrictions and acquiring mediumistic divining and healing powers. The Qur'an mentions jinn, "spirits," and these are appealed to by Islamic scholars in their Qur'anic verse healing and divination, but there are also non-Qur'anic, matrilineal ancestral spirits appealed to by some herbalist medicine women who are gifted with special mediumistic powers. Other non-Qur'anic spirits are called *Kel Essuf*, People of Solitude. These spirits are the focus of non-Qur'anic diviners called *bokaye* (singular *boka*), and are also addressed in the public ritual exorcism of the tende n goumaten possession ritual.

Power in the Use of Altered States, Rituals, and Artifacts

Shamanic power generally occurs through trance. As a concept, however, *trance* constitutes a naturalistic gloss, a cover-term describing a range of altered states of consciousness. The focus here is how shamans, and sometimes also their followers and patients, attain trance, and how this process is related to the magic power of shamans.

The widespread cultural association of shamanic/mediumship/possession rituals with the experience of struggle and control, yet also creativity, is related both to the phenomenology of these experiences and to the distribution of power in society. As Ivan Karp pointed out, power in Max Weber's sense of material access and secular control does not adequately account for the power of possession or mediumship trance in its diverse cultural formulations (Karp 1989, 96–97). In cultures where the cosmos is seen as constituted of transactions, flows, and interactions between various orders and levels, and boundaries are fluid, the person is seen as porous and open to diverse outside influences, yet above all power resides in access to semantic creativity, to meaning making.

The way this kind of power works is shown in the shamanic healing powers recognized in Jamaican peasant culture, which distinguishes between sacred and profane, referred to locally as spiritual and temporal (Wedenoja 1989, 79). Balm healing is often called a spiritual science, because it deals with spirits, treats spiritual afflictions, and relies on trance states. Although God is held to be the ultimate source of healing power, power is delivered to healers through angels by means of the Holy Spirit. The balm healer, a woman, is essentially a shaman, a person who has received—generally during a severe illness—a spiritual calling to heal the nation and the spiritual gifts of divination and healing. The balmist's power to heal is based on spirit mediumship: She works with angel familiars who advise her in diagnosis and treatment. Balm-yards can be identified by banners (flags) flying from poles, often next to a small structure. Generally, they are enclosed by fences and have an arched gateway guarded by a follower. In addition, one or more offering tables are on the ground: poles, about five feet high, with a glass of water and fruit set on top to attract and feed angels.

In a similar fashion, in Tuareg culture, many diviners act as mouthpieces for spirits, who speak through the diviners in invasions and

cures. In Tuareg *bokaye* divination, the senses, particularly those affected by the use of nonvisual media such as aroma, are powerful means of communicating with spirits within the ritual trance context and outside it more generally: The *boka,* a male diviner, is obliged to constantly maintain and reinforce relations with his spirits by keeping perfumes at home in order to attract them. He is, moreover, obliged to wear perfume, as well as distinctive clothing of a deep blue hue; blue is a color associated with spirits tamed for constructive purposes, as opposed to black spirits, which are more ambiguous (Rasmussen 1995; 2001, 117). He is also obliged to carry ritual paraphernalia: a small mirror; a small copper ring; and a non-Islamic amulet. The mirror symbolizes iconically the process of divination, and is believed to repel evil eye–like powers of jealousy and coveting. Copper is believed to heal wounds. The diviner needs to wear the ring and the non-Islamic amulet exactly at the moments he throws the cowry shells as dice. He is supposed to refrain from sexual relations with unmarried women or prostitutes, to apply henna to his palms, fingernails, and toenails, and the soles of his feet, and must give alms to the poor. The diviner asks trees' spirits in Hausa regions of Niger and Nigeria about illnesses, and these spirits instruct him on how to treat certain types of psychological afflictions with specific roots he must gather on certain days only, at dawn.

While most Siberian and Central Asian studies have supported the idea that autosuggestion rather than narcotic or alcohol-induced ecstasy is typical of the induction of trance in classic shamanism, evidence in the Americas describes the use of trance-producing drugs, from peyote, datura, and psilocybin to morning glory and tobacco (Furst 1972). A reexamination of Asian data has led to greater acceptance of the possible antiquity of use of the Vedic soma (often identified as the mushroom *amanita muscaria*) and hemp seed (cannabis).

Witnesses have claimed that shamans, while in trance, have produced spirit voices in odd places, walked on hot coals or water, withstood cold, stabbed themselves without leaving scars, disappeared and reappeared, escaped the bonds of ropes, found lost objects and people, and even induced or controlled floods, winds, and storms. Some of these talents, celebrated in Siberian and Central Asian lore, may have involved sleight of hand tricks, ventriloquism, and hypnosis. Some Siberian shamans admit to using tricks, but claim their feats would not work if spirits were not helping them. Other behavior, including actual cures, is less easily explained with Western biomedical models of scientific knowledge. One medical explanation is that natural morphines called endorphins are stimulated in the brain. Thus reports of various parapsychological phenomena occurring in shamanic performances have come to be given more serious attention by anthropologists. Religious healing, shamanic curing, and Western psychotherapy should be investigated as equally clinically efficacious, though not necessarily exactly equivalent phenomena.

Michael Taussig (1987, 460–461) in his study of Putumayan shamanism has argued, alternatively, that the ritual power of shamanism lies not with the shaman at all, but rather with the coming together of shaman and patient, constituting imagery essential to the articulation of what he calls implicit social knowledge. Power comes from a joint construction of the healer and the sick person in the colonialist context (Taussig 1987, 460). This is a privileged moment in the casting of the reality of the world, in its making and its remaking. Taussig cautioned against projecting the concept of magic held by Western academia or science onto shamanic trance séances (Taussig 1987, 460–463).

Thus in shamanic altered states, there are many performative features of magical or ritual symbolic actions that are understood only when extracted from the context of exclusive belief in positivistic causality. The shamans' magical powers cannot be rigidly separated into technical and expressive aspects.

MESSIANISM AND SHAMANISM

Strictly speaking, the term *messianism,* or *messiah-ism,* refers to belief in a coming redeemer, or "messiah." In its broader, more anthropological usage, messianism refers to new and often radical religious cults and movements that emerge suddenly and revolve around a central (and living) charismatic figure. Messianic movements frequently occur at times of very severe deprivation or community-wide trauma, trauma caused by such factors as foreign conquest and oppression. This connection has suggested to many scholars that such movements constitute a religious and prepolitical response to the oppression and resultant upheaval (e.g., Lanternari 1963; Worsley 1957). Indeed, messianic figures bear prophetic visions of how to free their people from their strife-ridden social and cultural order and replace it with a new one of universal harmony and bliss. They are thus believed to be saviors or liberators with special access to the supernatural. In most cases, the messianic prophet's vision is also apocalyptic: The world will end in some cataclysm, but those who heed the prophet-messiah's instructions (e.g., obey certain new social rules and perform the right rituals) will be saved and enter a promised land on earth, a terrestrial paradise (Wallis 1943). Messianic movements guided by such a message are often referred to as millenarian, or millennial, deriving from the Christian idea of a messiah (Christ) ushering in a new "millennium" (thousand years) of peace, goodness, and perfect happiness. Messianic and millenarian cults and movements have occurred and continue to occur in all forms of societies, from ancient times to the present. They have frequently appeared in non-Western indigenous societies in which shamanism is or was prominent (La Barre 1971; 1990b; Wallis 1943).

Like messianism, the term *shamanism,* or *shaman-ism* refers to a magico-religious cult that revolves around a charismatic figure—the shaman. And like the messianic prophet, the shaman is believed to be a kind of liberator, though in the role of healer. As such, the shaman frees or protects the individual or community from disease-causing spirit attacks, but not, typically, from actual foreign aggression, oppression, or the ensuing misery of societal collapse, as would the prophet. The shaman is also believed to have special access to the supernatural, and like a prophet, may have visions or significant dreams; but unlike a prophet, the shaman is defined, prototypically, in terms of mastery of ecstatic trances induced by drumming or the rhythmic shaking of a rattle, and in many cases, by hallucinogenic herbs. While in trance, the shaman's soul journeys to "upper" and "lower" worlds to battle spirits attacking the community or to retrieve a patient's stolen soul. Spirits might also possess and speak through an entranced shaman, at the shaman's call. In either case, shamans solicit the support of helper spirits, nature gods, and their ancestors in their battles, offering these beings animal sacrifices and other valuables to ensure their support (Vitebsky 2001).

Thus, whereas shamans are concerned with maintaining the health and stability of their societies and not with changing them, prophets are directly concerned with changing things as they are and offer a vision of a new and different world with a new religious program for getting there. Yet, in shamanic societies undergoing severe social and cultural upheaval, it is often the shaman who becomes a prophet, a "shaman-prophet," or "shaman-messiah," and creates a new religious form or movement, even if that "new" form entails a revival of older or even lost traditions. Anthropologist Weston La Barre (1990b) went so far as to argue that shamanism may well have emerged originally in prehistoric hunting and gathering societies as a kind of messianic cult in which shaman-prophets offered both healing and new cultural models to cope with ongoing crises over food and deadly aggression by competing groups.

In historic times, messianic and millennial forms of shamanism have been reported from

Siberia to the Americas, where the number and quality of cases is richest, and in Southeast Asia and elsewhere as well. Some are more explicitly political and military in character and may even lead to actual armed rebellion against a foreign power; others are more exclusively religious and expressive, aiming to achieve liberation through magical and spiritual means alone. Still others fall in between. At either extreme, the actual messianic beliefs and practices may tend to be more acculturative (emphasizing foreign religious elements and de-emphasizing the indigenous) or more nativistic (emphasizing indigenous religion and rejecting foreign beliefs and practices) (cf. Fernández 1964). Although many anthropologists attribute the cause of such sudden new religious forms to exogenous, or external, factors, such as severe natural disasters, the clash of cultures, and social, economic, and political oppression (e.g., Aberle 1970; La Barre 1971; Lanternari 1963; Wallace 1956a), others point to endogenous, or internal, factors, such as a society's own sociopolitical conflicts and traditional millenarian or messianic ideas and myths (Brown 1991; Clastres 1995; Espíndola 1961; Spier 1935).

Messianic Shamanism in Siberia

Marjorie Balzer (1999, 75–98) described two nineteenth-century cases of messianic shamanism in Northwest Siberia that appear to have been responses to oppressive external conditions, though one was more military in character and the other was more expressive, or religious. They both emerged after 1820 among the indigenous Nentsy (Samoyed, Yurak) and Khanty (Ostiak, Ugra) peoples. It was a time of increasing Russian contact and colonization in their area, with stiffer taxation by the czarist government and mounting pressure by the Russian Orthodox Church to Christianize. At the same time, ecological disasters, such as widespread forest fires that devastated the tundra, and a burgeoning poverty further contributed to the breakdown of these tribal peoples' traditional and relatively free nomadic and egalitarian way of life based on herding and breeding reindeer. As a result, they became increasingly more dependent on Russian grains and products. But during several famines, the grains were withheld, fueling their growing desperation.

Then, in 1825, a very talented, charismatic, and well-known Nentsy shaman, Vavlyo Neniang, began preaching about a prophetic vision he had had. He saw his people return to a traditional way of life, and he saw the usually opposing Nentsy and Khanty tribes united in a combined religious, political, and military response to their mutual plight. Within a short time, large numbers of Nentsy and Khanty gathered around Vavlyo, forming a messianic community of more than 400 tents. Vavlyo led his followers in shamanic ritual dances, chanting, and nighttime sacrificial offerings of reindeer to placate local spirits and, plausibly, to liberate them from their condition. He preached that his followers should reclaim their nomadic lives and religion and denounce the life of hired laborers and fishers. They should also withhold payment of taxes and join him in Robin Hood–like raids on the reindeer herds of the wealthy, who were allied to the Russians, to redistribute the herds to their poor and starving people.

In 1839, after many such raids, Vavlyo was imprisoned and exiled. However, after a stunning escape, which followers attributed to his shamanic powers, Vavlyo returned and marched toward the provincial center of Obdorsk with 400–600 armed followers. His plan was to force merchants of the regional market there to lower the prices of Russian goods, increase the value of Native furs, force Taishin, a puppet Khanty "prince" of the Russian government, to distribute the government supplies of grains that had been withheld, and replace Taishin with a Khanty elder of Vavlyo's choosing to serve as cultural broker with the Russians. Though Vavlyo was captured and imprisoned en route, a Khanty cohort, the shaman Pani Khodin, continued the movement and its religious and military activities in a much smaller band for another fifteen years (until 1856).

By 1896, Russian colonization and influence had spread to the Vakh river region to the south and was strongly undermining the fundamental values of very poor Khanty peoples, who had been forced into the area and who were surviving on hunting, fishing, and the trade of squirrel skins. Many squandered their meager earnings on alcohol and tobacco, vices tied directly to the Russians. Even very young girls were seen drunk in the villages, and, among adults, smoking and drinking were be-

coming common at traditional religious ceremonies held at sacred grove sites. Sexual relations with the Russians were also increasing, leading to the breakdown of traditional kin relations and constituting a major breach of Khanty moral codes. Many believed that such breaches would affect the health of the people as a whole, and indeed, various sicknesses, notably smallpox, were appearing in neighboring regions.

In that year, one of several types of Khanty shamans, a female dream-seer, *ulam-verta-ni,* had a powerful dream predicting a terrible sickness among her people. She preached that to prevent this cataclysmic epidemic people would have to give up tobacco and alcohol, renew the Khanty moral code regarding sexual relations, and perform ongoing and intensive ceremonies before ancestor shrines at a large number of sacred groves. In each ceremony, they were to execute the most rigorous and most costly form of ritual sacrifice, that of horses (instead of the more common and less valued reindeer). The sacrificed horses were to be offered to obtain the protection of diverse ancestor spirits and celestial gods and to placate disease-causing entities, the Christian devil, and other evil spirits. The shamanic dream-seer soon attracted a large Khanty following from as far away as 100 kilometers. This following included other types of shamans, such as the *ëlta-ku,* who directly battled disease-causing spirits in trance, sacrifice specialists, various kinds of healers, and the elders of many Vakh river settlements. All participated in elaborate shamanic séances and sacrificial rites at the numerous ancestor grove sites. The shamans danced, chanted, sacrificed seven horses in each ceremony, and escorted the horses' souls to the gods and spirits they were offered to. But due to sickness, despair, and the apparently irreversible impact of Russian culture, the movement dwindled in less than a year. (For cases of shaman-prophets and shamanic revivals in post-Soviet Siberia, see Balzer 2002; Fridman 2004.)

Messianic Shamanism in the Americas

In North America, external factors also appeared to be responsible for the development of indigenous messianic movements during and after European and Euro-American colonization, which devastated Native American lands, forced Indians into reservations, eliminated the huge roaming herds of bison upon which many groups depended, and led to both widespread malnutrition and a series of terrible typhoid and other epidemics. Many Indians died. At the same time, the Indians also lost their political autonomy and suffered from the U.S. government's campaign to eradicate their languages, customs, and beliefs (Kehoe 1989, 13–40).

In 1870, during the development of these extreme deprivations, the North Paiute Indian shaman, Wodizob, of Nevada, famous for his soul-fetching trance journeys to heal the ill, had a prophetic vision in which he saw the souls of the dead. He said that if the people performed a sacred round dance for their ancestors, a "Ghost Dance," there would be a great cataclysm in which the white people would vanish, the Great Spirit would return their loved ones who had died, and all would live happily in a paradisiacal land of plenty. Though the movement ended after four years of intensive trance dancing without effect, the Ghost Dance spread throughout California and Oregon (Du Bois 1939).

Then in 1888, Wovoka ("Jack Wilson"), a Northern Paiute "weather doctor" and healer, who had been raised in part by whites and exposed to Christian beliefs, suffered a serious sickness during which he lost consciousness. At the height of his delirium, there occurred earth tremors and a dramatic total eclipse of the sun. The terrified Paiute believed that the world was ending. When it did not and Wovoka regained consciousness, he talked of meeting God in a spiritual journey. God told him that his people must lead a clean, honest life (no fights, no war against whites, no lying, stealing, drinking) and carry out a sacred Ghost Dance. If they obeyed, they would be reunited with their deceased loved ones in a new world, but with no more sickness, old age, or death, and with plenty of game. The whites would be carried away or become one with the Indians. Wovoka's Ghost Dance spread to some thirty-five tribes throughout the West. Some variants developed more intensely religious forms, as among the Northern Paiute and Arapaho. Others became more political and potentially military, as among the Sioux, who devised "bulletproof" shirts in preparation for war. The Sioux Ghost Dance ended in the tragic slaughter of Ghost Dancers at Wounded Knee. Most other

Ghost Dances disappeared in time, but some continued into the 1960s (Kehoe 1989; La Barre 1990a).

Though many scholars attribute the emergence of the Ghost Dance movements to external factors, namely Euro-American oppression, others point to internal sources. For instance, according to Leslie Spier (1935), pre-European beliefs among Indians of the Northwest and the Northern Paiute region strongly resembled those of the Ghost Dance. They believed, for instance, in an impending destruction of the world, its renewal, and the "happy day" when the dead would return—all invoked by a round dance led by an inspired leader (Spier 1935, 5). This "Prophet Dance," as Spier called it, was observed and recorded among various groups, such as the Pacific Coast Salish Indians, as early as 1820, long before the Ghost Dances of 1870 and 1890 and many years before the first trading posts and missionaries in that region (Suttles 1957, 353–358, 382–383). Plausibly, then, the later Ghost Dance prophets drew from these traditional Indian beliefs and practices in their region, and thus their messianic shamanism was not, or not primarily, a creative response to Euro-American colonization.

In regard to the earlier Prophet Dances, some anthropologists, like Spier, have emphasized endogenous causes. They have argued, for instance, that in the politically precarious Indian societies of that area, the Prophet Dance was a kind of cultural mechanism through which needed political leaders could arise, offering new models of how things should be (Suttles 1957, 393). Indeed, although many Prophet Dance leaders were shamans, others were inspired chiefs. Other anthropologists, however, have argued that Western trade and colonizers' diseases had actually strongly impacted the Indians in those societies before any direct contact with whites. The diseases and the effects of trade had spread into these Indians' areas and caused crises in their societies, and they responded with the Prophet Dances—pointing back again to external causes (Aberle 1959; Walker 1969).

This debate over internal versus external causes figures prominently in the literature on messianic shamanism in South America. Often cited in the controversy are the astounding messianic movements of the closely related Tupí and Guaraní tribes. During European colonization in the sixteenth century, the Tupí-Guaraní populated coastal Brazil, the northwest Amazon region, Paraguay, and nearby areas. Their movements were led by the most revered form of Tupí-Guaraní shaman, a male shaman-prophet called the *karai (caraí, caraïbe).* Between 1539 and 1549, for instance, ten to twelve thousand Tupí (Tupinamba) of coastal Brazil suddenly left their otherwise sedentary agricultural communities, presumably under the direction and visions of a karai. They traveled westward en masse across the entire continent to the Andes of Peru in search of a terrestrial paradise they called *kandire,* "the Land-Without-Evil." Spanish settlers in the Peruvian Andes in 1549 recorded the arrival of some 300 survivors of this extraordinary messianic trek and the Indians' account of it.

In 1562, the Jesuits stopped a similar messianic exodus of 3,000 Tupí from Bahia on the northeast Brazilian coast, led by two karais in pursuit of the Land-Without-Evil. But in 1609, another karai successfully led an estimated 40,000 to 60,000 Tupí (Potiquara) for more than a thousand miles, from Pernambuco, a state just north of Bahia, to Maranhão in the far north, again following their karai's visions of the end of the world and a promised land of plenty and immortality. Jesuits, adventurers, and army captains met the massive migration at different points along the way and recorded details of the karai's vision, message, rules, and rituals. There were many more such migratory forms of messianic shamanism in Brazil, but an even greater number appeared among Guaraní groups from Paraguay and nearby areas. All of them headed east to the Brazilian coast in search of the Land-Without-Evil. Such messianic migrations continued through the nineteenth century and into the beginning of the twentieth century (Clastres 1995, 49–57; Métraux 1941).

What evil were they all fleeing—an evil from without or from within? Dramatic developments in the colonization of the Brazilian coast in the 1530s (just preceding the first recorded migration in 1539–1549) suggest external causes, an evil from without. At that time, sugar mills were founded along the coast, leading to the extensive enslavement of Indians for labor and for widespread sexual

exploitation. At the same time, to boost the Portuguese presence on the coast, King João III emptied his jails of murderers and other hardened criminals and sent them to Brazil, where they committed terrible atrocities, particularly against the Indians (Hemming 1978, 35–44).

Plausibly, such external conditions were behind the messianic migrations. But if the Tupí were simply escaping the evil Portuguese and servitude, why would they cross the entire continent to escape them? They could have stopped long before then. According to Hélène Clastres and other anthropologists, the movements were rather motivated by religious and political concerns within Tupí-Guaraní society. In their model, fundamental Tupí-Guaraní beliefs and myths together with the stresses within their power structure (tensions between chiefs and karais) periodically drove karais to draw from their myths and form messianic movements in order to escape internal conflicts—thus pointing to internal causes, an evil within. The Tupí and Guaraní believed in a central high god, Tupä, who was actually a god of destruction (not of creation) and intimately tied to their ostensibly pre-European apocalyptic myths about the world's future destruction and the quest for the Land-Without-Evil. These beliefs would explain their major preoccupation with these themes and why so many disparate Tupí and Guaraní tribes from northeast Brazil to the northwest region of the Amazon and Paraguay held virtually the same myths and exhibited the same kinds of messianic migrations periodically, as noted by chroniclers early in the colonial period (Clastres 1995; cf. Thomas 1988). (For other cases in North America, see Wallace 1956a; Thornton 1993; and for South America, see Brown 1991; Hugh-Jones 1997; Wright and Hill 1992.)

MUSEUM COLLECTIONS

The material history of shamanism today exists primarily in the museums of the world's developed nations. The oldest collections exist in the Ethnographic Museum of the Americas in Madrid, the Russian Museum of Ethnography and the Kunstkammer Museum in Saint Petersburg, Russia, and the British Museum in London. The largest African collections are held in the Royal Museum for Central Africa in Belgium and the Ethnologisches Museum in Berlin.

Collections consisting of objects relating to shamanism, ritual, divination, and healing were established during a colonial era extending from the fifteenth through the twentieth centuries. These objects were obtained as curiosities, booty, and ethnographic specimens and subsequently gathered as collections in faraway cities like Oslo, New York, Chicago, Paris, Seattle, and Ottawa. Many museum collections, such as those of the American Museum of Natural History in New York and the Field Museum in Chicago, were developed by private or museum sponsorship, motivated by civic boosters eager to establish collections of ethnographic importance. As a result, many objects, some still integral to cultural practice and heritage, were acquired by ethically questionable means. Other museums, most notably the Royal Museum for Central Africa in Turvuren, Belgium, developed their massive collections forcibly, often at the expense of cultures and lives.

Though many museums were complicit in the weakening of shamanism and indigenous cultures, paradoxically their collections now exist as testaments to the widespread and multifaceted heritage of shamanism. To be thankful yet regretful is the part of the complicated colonial legacy that all Westerners share today. Mindful of their colonial legacy, many museums have subsequently developed an awareness of context, meaning, and sacredness for objects within their collections. Similarly, the rise in cultural awareness and political empowerment of many indigenous cultures has spurred the development of regional museums in places like Ulan Ude in Siberia and Pusan in Korea. These museums, operated and curated by indigenous people and dedicated to a local culture, are part of a broader movement of cultural reclamation, whereby cultures are recovering and reimagin-

ing their heritage. Central to cultural recovery efforts has been the reexamination of spiritual and shamanistic traditions.

In turn, many museums have aspired to more accurately identify objects, their context, and use. However, due to incomplete or vague collection data, the identification of many shamanistic, ritual, or cultural objects remains imprecise. A recent exhibit at the Royal Ontario Museum in Ottawa, for instance, identified an ancient Chinese figure simply as a "figure" rather than as an image of Nuogong, the father of Nuo—a complex shamanistic spiritual system based on Daoism—who traditionally had to be present to oversee each shamanistic ceremony. Similarly, many of the ritual objects, regalia, masks, talismans, and figurines located in the world's museums have been vaguely identified by their collectors and often ascribed, wittingly and unwittingly, with misleading information because of the association of an object with "pagan" or "heathen" significance or ceremonies. As a consequence many objects remain incorrectly identified or generally described as "ritual" rather than "shamanistic." A visitor or researcher should be mindful of less than obvious shamanistic connections; in fact, most ritual objects should be viewed as being associated with shamanistic practice, even though not specifically identified as such.

It is impossible to note all museums containing objects relating to the world's diverse shamanistic heritage. Instead, this entry will cite major and unique collections, which will hopefully serve as guideposts for the reader's further investigations.

The Russian Museum of Ethnography and the Kunstkammer Museum, both of which are located in Saint Petersburg, contain the world's largest and most comprehensive collections of Siberian and Far Eastern shamanistic objects. The second floor of the Russian Museum of Ethnography holds several thousand ritual objects relating to the wide variety of ethnic groups contained within Russia, a nation that accounts for one-fifth of the earth's land surface. Under the sponsorship of Czar Alexander III, the museum collected objects from more than 150 ethnic groups to proclaim the breadth and depth of Russian culture; under the Soviets, ethnic diversity was used to demonstrate the triumph of Communist ideology. The main part of this ethnographic collection was obtained in the latter part of the nineteenth and early twentieth centuries. Anthropomorphic images, shaman's coats, ritual costumes, drums, and masks from Russia's vast cultural landscape are represented. Objects from the Baltic States, the Volga, Caucasus, Alvic, Byelorussia, Amur, Ukrainian Crimea, Daghestan, Ural, and the Kazakstan regions are included. The museum also has a valuable photo collection and an extraordinary representation of ritual regalia from Siberia, Central Asia, and the Far East, which includes the Yakut, Buryat, Khakass, Tungus, and Tuva people.

Nanai shaman (Siberia). Russian Ethnographic Museum, St. Petersburg, Russia. (Courtesy of Eva Jane Neumann Fridman)

The Kunstkammer Museum was founded in 1704 by Peter the Great and is the oldest state museum in Russia. Like the Russian Museum of Ethnography, this museum holds several excellent examples relating to Siberian shamanism. Because of its early founding, it also holds several objects connected with pre-Christian

shamanistic and spiritual practices in Russia. Animist and pre-Christian Slavic and European traditions are also represented with such objects as birch-bark masks representing tree spirits. Because Peter the Great was intent on establishing a museum of international repute, the museum also has several ritual objects from East Asia and Southeast Asia, Africa, the Americas, Australia, and Oceania.

Established in 1857, The Ethnographic Museum of Norway occupies the top three floors of the University Museum of Cultural Heritage, University of Oslo at Tullinløkka, in the center of Oslo. The Ethnographic Museum collection numbers more than 45,000 objects and has permanent exhibitions from a number of regions of the world: the Arctic, North and South America, South and East Asia, and Africa.

Norway's historical and political interests in the circumpolar north motivated its extensive Arctic and Subarctic collection during the early part of the twentieth century. Museum-sponsored ethnographers and explorers came into early contact with several cultural groups in northern Canada and Siberia; Roland Amundsen gathered the world's largest collection of objects from the Netsilik and Chuckchee people. The Netsilik collection, with over 900 items, is the museum's largest from a single culture, and includes many shamanistic and ritual objects. Ørjan Olsen collected extensively from the Tuvan people, reindeer herders from southern Siberia and Mongolia, who have a long and developed history of shamanism. Several rare objects, such as shaman headpieces with reindeer antlers, are included in the collection, as are ritual items that reveal the unique blending of animist and Buddhist influences. Gustav Holm's collection from East Greenland includes several spirit carvings used by shaman as mnemonics and for divination. The Adolf Dattan collection of the Orochi and Nanai people of the Amur River region offers remarkable examples of artifacts connected with shamanistic practice from people living along the southern Pacific coast of Siberia. The shamanistic artifacts in this collection illustrate the confluence of Siberian, Chinese, and Tungus-Manchu cultures. The variety and depth of the museum's vast collections offer an opportunity to compare the highly developed shamanistic traditions of Siberia and the Russian Far East.

The Ethnographic Museum of the Americas in Madrid holds the largest and finest collection of shaman- and ritual-related objects from the Caribbean and Central and South America. The museum also includes objects gathered from the Tlingit, Alutiiq, and Yupik of Alaska. The museum holds thousands of objects, gathered primarily in the sixteenth, seventeenth, eighteenth' and nineteenth centuries; many objects also were collected during the era of Columbus, constituting one of the earliest collections of ethnographic and shamanistic artifacts in the world. Early, often pre-Columbian objects offer unique insights into the world that existed before contact with Europeans, a world organized by indigenous spiritual belief systems, ritual cycles, and shamanistic practice. The collection is extensive, if not overwhelming, in its variety, wealth, and detail. The early acquisition date of some of the objects has, however, also made them difficult to identify and classify.

The collection includes objects from the Plains Indians of the American Southwest and Colorado River areas. Hopi Kachina dolls, representing ancestral spirits and ritual objects from the Maya of Chiapas and Guatemala are prominent in the collection. The Huichol of northern Mexico are also well represented; the spiritual perspective that still makes them a nation of shamans permeates all objects with ritual, making the collection of special interest. Other objects in the collection are the only material testaments of several now-extinct indigenous groups.

Because of the wide and early sphere of influence of the Spanish, the collection also includes a diversity of items—headpieces, masks, ritual drums, implements, and shrunken heads—from the Caribbean, Peru, and Amazonia, dating from the early part of the eighteenth century. Ritual and spiritual objects from the Araucanian culture in Chile can be compared to masks and regalia worn by the healers from a variety of Andean indigenous groups. The collection also includes a surprising number of objects from Melanesia, Micronesia, Malaysia, Hawaii, the Philippines, and even Africa and China. Of particular note are the spirit figures of the dead from the Ifugao people of the northern Philippine island of Luzon. The Ifugao people have a pantheon of gods and believe the universe consists of five regions, which their shamans call

upon: earth, sky world, Underworld, downstream region, and upstream region.

The Royal Museum for Central Africa was organized in 1897 in order to arouse public support for the Congo Free State, then the private domain of the notorious and despotic colonizer, King Leopold II of Belgium. The exhibition was a success and the Musée du Congo Belge was built in Tervuren, outside Brussels, in 1910. In 1960, after the Congo (later known as Zaire; currently the Democratic Republic of the Congo) gained independence, the museum adopted its present name. The museum entranceway includes allegorical or "ethnographic" sculptures representing the philosophy and perspective in vogue during the colonial era. Maps and miscellaneous documents and objects that belonged to Henry Morton Stanley and other explorers help visitors to follow the development of European knowledge about Africa. A number of displays also reveal how Africans perceived the "white man" who settled on their land. Today, the museum is known for its proactive stance, encouraging intercultural dialogue and development by undertaking cooperation with African partner institutions.

The museum collection of ethnographic objects from central Africa is unsurpassed. In many instances Belgium's initial forays into the vast and largely inaccessible central African region represented initial contact with indigenous groups. As a consequence, like the Madrid collection, Tervuren contains many excellent examples of precontact, pre-missionary existence. The collection of artistic, spiritual, and material objects from central Africa is grouped together by cultural, ethnic or geographical zone. These zones are generally located in the territory that now forms the Democratic Republic of the Congo (DRC), the Republic of Congo, Northern Angola, Rwanda, and Burundi. The Ethnography Section has a collection of around 180,000 objects, most of which were collected on site by colonial administrators, missionaries, and scientists after 1885 and subsequently supplemented by donations. The collection includes possibly the world's most extensive collection of African masks and statues, many of which were used in the ritual practice that was central to everyday African life. Some of the collection's most famous objects relate directly to healing rituals, divination, and shamanistic practice. Since 1961 the museum has extended its field of study to include West Africa, North Africa, East Africa, and southern Africa. The most recent East Africa and southern Africa collections already feature more than 14,000 objects. The museum also includes several thousand objects from the Americas and Oceania and a photographic library of almost 13,000 archive photographs preserved on glass plates; the collection has a supplement of 40,000 field photographs, including many relevant to ritual, divination, and healing practices.

The two largest collections of objects related to shamans, spirit, and ritual in the United States reside at the American Museum of Natural History (AMNH) in New York City and at the Smithsonian Institute's National Museum of the American Indian (NMAI). The NMAI is located at the George Gustav Heye Center in New York City and has a Cultural Resource Center in Maryland; a major new facility, located on the national mall in Washington, D.C., is scheduled for completion in 2004. The collections of both museums were founded on numerous sponsored ethnographic, archaeological, and anthropological expeditions, and they include material objects and extensive written and photographic documentation. The NMAI and the AMNH both have extensive collections of objects relating to shamanistic practice in North, Central, and South America. In addition to its impressive Americas collection, the AMNH also has holdings from Africa, Asia, and the North Pacific region.

The British Museum in London has possibly the best representation of ritual and shaman objects from the ancient worlds of Egypt, Greece, Mesopotamia, India, and China. The former colonial reach of Britain, combined with its long history of scholarly inquiry, has shaped the British Museum's broad-ranging collections of shaman-related objects, making it ideal for comparative and historical insights. The collection holdings include ancient Egyptian amulets, ritual mirrors from Tibet, fetish figures from the Congo, and Siberian shamans' drums and aprons.

Among large museum collections of shaman-related objects, a few others are especially worthy of note: Chicago's Field Museum has an exceptional and detailed Tlingit and American Northwest coast collection; the Samchuk City Museum in Pusan, South Korea, offers a com-

prehensive display of items relating to Korean shamanism; and the Ethnologisches Museum in Berlin has a broad range of pre-Columbian objects from Central and South America, and strong Africa, Asia, and Oceania collections.

Smaller, but no less notable collections of shaman-related objects can be found at a variety of museums around the world, including the National Museum of Denmark, the University of British Columbia Museum of Anthropology, the Canadian Museum of Civilization in Ottawa, the Thomas Burke Memorial Washington State Museum at the University of Washington, the University of Alaska Museum in Fairbanks, the University Museum of Anthropology in Philadelphia, the Whitney Museum in Valdez, Alaska, the Sakhalin Regional Museum in Russia, the Peabody Museum of Archaeology and Ethnology at Harvard, and the Royal Ontario Museum. Museums sponsored by the recently independent autonomous republics of Buryat and Sakha, located in Ulan Ude and Yakutsk respectively, offer fine examples of shamanistic representation from an indigenous perspective. The State Museum of the Buryat People includes an impressive open-air display—authentically re-created under the supervision of Evenki shamans—of a traditional shaman's camp, with hundreds of spirit carvings symbolically diagramming their cosmology. An excellent collection of old Evenki shaman costumes and artifacts can also be seen in the ethnological museum in Irkutsk, Buryat Republic.

Innovative projects relating to shamanism, such as those sponsored by Cambridge University Museum of Archaeology and Anthropology (CUMAA), are greatly adding to our knowledge of shamanistic practice. Recognizing the limits of collecting sacred objects out of context, the museum sponsored a practicing Pachyu shaman from Nepal to conduct research and collect sacred materials for a museum exposition. The understanding and documentation of objects in context, how they interrelate and are part of a ritual complex, is an important advancement in the relationship between shamanism and museums. Issues such as storage, respect for secrecy, display, handling, preservation of sacredness, and an appreciation of multiple levels of meanings and function of the objects, mark a significant development in shamanistic studies. The CUMAA exposition of Pachyu spiritual material also included a public event to raise a greater awareness of social, political, and environmental issues surrounding and challenging traditional shamanistic practice today. Similar initiatives have been undertaken by other museums as correctives to historical inaccuracies and exploitation. These efforts to foster understanding of shamanism from an indigenous perspective and these examples of proactive participation in its preservation are encouraging and suggest that the museums of the world are evolving to give shamanism the informed and respected place it deserves.

MUSIC IN WORLD SHAMANISM

Music is one of the core features that cohere and identify the practice of shamanism worldwide. From its incipient forms in prehistoric times to contemporary freelance simulations in popular culture, shamanism has almost always relied on creative manipulations and extensions of sound. In most cases, sound and sound objects constitute the essential implements and channels of the shaman's multifaceted spiritual journey. Musical instruments can also, for example, be temporarily transformed into a shaman's divination mirror, through which the shaman has vivid visual encounters and communicates with disembodied forces. Through ingenious and creative performance techniques, sound and movement patterns become potent forces capable of generating multiple and shifting sites of meaning, affect, and symbolic association. The shaman's assistants and audiences are usually indispensable in achieving the desired musical momentum, as well as the mental and physical settings necessary for a successful staging of shamanism.

The particulars of local culture, ecology, history, and belief system are also influential in determining the categories and varieties of sound and sound objects that are preferred and assigned meaning. The similarities and divergences in general performance practice, types of musical instruments, sounds, and powers associated with these in the contexts of world shamanism are thus predicated, in part, on extramusical factors, and in part on common tendencies in local musical traditions and frames of interpretation. Certain names or terms associated with a shaman are sometimes good indicators of the centrality of music both in the shaman's life and in his or her ritual performances. Consider, for example problems—and hence multiple roles—associated with defining the Turkmen *bakhshy* (poet-musician-shaman), or consider the designation "NEEB" in Miao (Yunnan) shamanism, which refers both to the shamans' tools or objects and to the range of musical instruments employed.

Shamans creatively explore extant and innovative instruments and sounds to enhance theatrical display and serve clinical goals (Charles 1953, 95–122). The preferred instruments are usually an integral part of the shaman's tools, armory, or costume.

The aesthetic, strategic, and spiritual import of music in shamanism from ancient times to now is underscored also by the shaman's symbolic and metamusical commentaries, as indicated in the following excerpt from the shaman's song no. 1 of the "Nine Songs" of Ancient China:

> *Now the sticks are raised, the drums are struck,*
> *To beats distanced and slow the chanters gently sing*
> *Then to the ranks of reed-organ and zither make loud reply.*
> *The Spirit [shaman] moves proudly in his splendid gear.*
> (Waley 1973, 23)

General Stylistic Features

There is a predilection for hybrid sources of sound, including the familiar and unusual, in almost all reported cases of shamanism. While the preferred corpus of music and sound instruments derives mainly from existing or local inventory of sound, a wide range of highly artificial sounds and unusual performance practices are employed. For example: falsetto, whistling, ventriloquism, nasal sound, the cry of a baby, and imitation of nature or animal sounds; unpitched sound types such as the plosive sounds that accompany the ritual expelling of a liquid from the mouth; and a range of other "noise" types. The literature pertaining to music in shamanism, therefore, often employs the terms "noise," "timbre," "acoustic effects," and "soundscape" as a statement on the complex and yet innovative musical features associated with shamanism, as seen in the following report:

> The spiritual function of Tuvan music is especially clear in relation to shamanism. The shaman sets up a soundscape using the natu-

> ral setting: bird calls, rustling breezes, voices of domestic animals, and various other sounds which, though deliberately produced, can hardly be called musical. Most of these come from the costume. On top of this soundscape comes the rhythm of the drum and the melody of the *algysh,* or poetic chant. (Van Deusen 1996, 3–4, quoted in Hoppál 1997, 123–136)

The importance of timbral and acoustic variety is corroborated in examples from the Malay Peninsula:

> A prerequisite for instrumental invocation and intreaty of these spiritual substances among some Orang Asli groups is the perceived existence of living tonalities, with an array of distinct timbral consistencies: the souls of each wild animal, plant, rock, or the earth contain a sound characterized by distinct timbres, tonal rows, melodic contours, vocal ornamentations, rhythms, and other formal musical parameters. . . . Players can reach the appropriate experiential realm through performances on musical instruments alone, including the mouth organ, the nose flute, the transverse flute, or the tube zither. They blow or pluck their instruments, improvising upon predetermined parameters and tempering their sound with thickly timbred interludes. (Roseman 1998, 560–589)

There are, however, moments or practices in which silence is prescribed (Charles 1953, 95–122).

In addition, these sounds are often closely identified with particular spirits (or a class of spirits, which include ancestral, nature, and other disembodied spirits). Due to this close association, the sounds usually take on various symbolic and extramusical associations, often resulting in special affect and emotional encounters. For example, a nasal or falsetto may be employed to attract, acknowledge, and represent the "physical"—even virtual—or dreadful presence of the spirit of an ancestral spirit. A particular song, chant, or rhythmic formula may thus invite or indicate the presence of a particular spirit. Musical instruments such as varieties of bells (clapper-bells, as in Anlo-Ewe exorcism [Avorgbedor 2000, 9–24], or seven small bells known as *baul,* as practiced in *hanyang kut* ritual music of shamans in Korea) are "believed to bring the attention of the spirits" (Lee 1981, 88–91).

Repetition of a line, word, verse or short rhythmic pattern (in lead voice or accompaniment) is a common feature in shamanistic séances. According to Aaron Watson, "In some cases such states might be induced by repetitive drumbeats, but it is also likely that the *nature* of some sounds, especially those with low frequencies, might influence transcendental experience" (Watson 2001, 178–192 [speaking of "sound and trance"]). Although many research reports in psychology and religious studies tend to label extreme repetition as among the shaman's resources for facilitating trance states, there is no firm evidence on the precise relationship between repetition and the inducement of trance in shamanism. (See also Rouget 1985 for detailed discussions of shifting relationships between music and trance.) As indicated in the following example, some of the musical traits often identified with music in shamanistic ritual can sometimes be underused, reversed, or absent: "the voice of the shamaness had not become louder, she did not raise it at all, her recitation did not even become faster. And, in spite of that, the atmosphere was filled with tension" (Kenin-Lopsan 1997, 126).

Creating Musical Coherence/Meaning through the Agency of the Supernatural

An ability to weave or demonstrate supernatural and learned musical skills and talent is another universal characteristic, as confirmed also among the Temiar of Malay: "A spirit gives a set melody in her dream, along with some central images, vocabulary, and lyrics. But the singer extemporaneously expands upon the text in performance" (Roseman 2001, 109–129). The centrality of music in mediumship or shamanism is stressed further in examples where the spirits actually "correct mistakes" in the music, thus performing the role of a music and dance teacher, temporarily. There are many legends worldwide that are associated with the "correct" and "exact" performance or repetition of music in specific rituals or shamanistic sessions, and mistakes often bear grave consequences, both for the performer and for the ritual as a whole: "In certain ceremonial songs it is required that a song be repeated if there is the

slightest mistake in its rendition" (Eagle 1997, 108). Local notions or beliefs associated with aspects of music in shamanism thus include prescriptions and proscriptions, which are designed to cohere musical performance and to ensure ritual integrity and efficacy. During her research on shamanism and music among the Kutenai, Norma McLeod was advised by her informant "not to play them [recordings] indiscriminately, as someone might disappear" (McLeod 1971, 83–101, note 16). The common and supernatural powers associated with music and musical instruments are thus best illustrated in contexts of shamanism.

Depending on the level of the shaman's competence, the specific context, and the nature of spirits involved in a shamanistic session with active music making, a session could last throughout a whole night, a day, or several days. The quantity and duration of musical activities engaged could be considerable. For example, "The shamans, as told me months later, hit the drum until four o'clock in the morning before *chini* began to shout out the names of her gods" (Kendall 1995, 17–58). The extended performance of music is also seen in epic genres that either accompany or have their roots in shamanism, as employed in Asian, North American, Pacific and Oceanian societies. In sub-Saharan African societies the epic is less prominent in shamanistic sessions, but extended music making or "all-night" music and dance sessions are often the norm (Beattie and Middleton 1969; Friedson 1996; Ijzermans 1995, 245–274).

The general importance of music in the efficacy and efficient structuring of shamanistic sessions is summed up in examples from the Lower Kutenai Indians of Northern Idaho, who employ particular songs to put the shaman into trance and particular songs to bring him out of it (McLeod 1971, 83–101). Similarly, in a necromancy ritual known as *kuchiyose* performed by blind female spirit mediums in the Aomori Province of Honshu Island of Japan the accompanying music includes *yobikotoba,* the lyrical incantation to call the spirits of the dead, and *okurikotoba,* the incantation that sends the spirits back into the afterworld (Mamiya 1987, 45–51; see also Lee 1981, 127–128 for similar descriptions for Korean shamanistic rituals for the dead).

Special circumstances could, however, redefine or limit the type, quality, and quantity of music privileged. For example, there was a near-total absence of music in shamanism in Vietnam due to proscriptions by the Vietnamese Communist Party from the 1950s to the 1960s, although "some vocal forms were still used secretly" (Norton 2000, 75–97). Even our modern sprawling and easily congested urban spaces bear important implications for continuity, change, and adaptation in the forms, meaning, and quality of music in contemporary shamanism: "Formerly loud percussion music was a common and frequent feature of shamans' houses, now they reside in highrise apartments and practice in other locations" (Seo 2000, 175–617). The shifting of type and quantity of music in shamanism is also indicated in the following observations: "When *mansubaji* is sung for *chôngshin* (invited spirits), the principal *kangshinmu* plays the bell tree. But when *mansubaji* is sung for miscellaneous spirits during *twitchôn kôri* at the end of the ritual, the *pangul* (bell tree) is not used" (Seo 2001, 113–114).

Role of Movement, Audience, and Accessories

Although shamans are musical and dance experts in many ways, they are also aided by assistants, who may also serve as apprentices. General audiences, when present, are usually allowed some form of musical participation, depending on the local practice and norms governing shamanism and the music involved. Music in world shamanism cuts across several performance genres, including song, chant, verbal formulae or incantation, and instrumental accompaniment. The shaman-dancer-musician can be either male or female, and the focus on a particular gender may shift over time. (Among the Tlingit and Warao, shamans are mostly men; they are mostly women among the Mapuche.)

The overall importance of music, dance, costume, and special ritual objects in world shamanism is also well captured in studies that focus on iconographies, especially rock art, as illustrated in, for example, *The Archaeology of Shamanism* (Price 2001).Walter Andritzky's study on shamanism in Peru (Andritzky 1989) and Sung Lee's Korean examples (Lee 1981) include, among other iconographic details, the importance of dance and musical instruments.

Musical Training

Since shamanism often subsumes other forms of spiritism and ritualistic practices, the variety or quantity of music involved in shamanism varies also according to the interests, training, and musical demands of the ancillary practices. Training and apprenticeship are related common features of shamanism; in most cases they are critical to the successful establishment of clientele and expertise. Although detailed accounts of the level and intensity of musical training vary, the general competence of the shaman seems to be closely linked with the special or acquired musical skills. There are three main sources of such skills: exposure to musical practice in the general local culture, skills and repertoire acquired during novicehood or apprenticeship, and a body of skills and repertoire (and even musical instruments) that are attributed to supernatural sources (i.e., received and taught by spirits through dreams, visions, and magical or ritual transference of such skills and repertoire from an adept or a spirit being). Training in music includes learning the "proper" techniques and manners of recitation, chanting, singing, performing on musical instruments (rhythm and tone production), ability to accompany oneself, ability to memorize extended song texts and related incantations, and ability to dance, which is complementary to the musical skills. Occasionally, a shaman may not have a good voice, or impressive musical and dramaturgical skills may be lacking. For example, among the Anlo-Ewe, the author observed that shamans do not usually engage in elaborate music making, in contradistinction to other ritual and religious activities in which music and dance play a significant role. In such contexts, the shaman is careful to minimize the incidence of music and related arts in subtle ways without damaging the overall efficacy of shamanistic rituals and personal reputation. In general the success of a séance is, therefore, predicated partly on appropriate skills and proper enactment of musical moments and movement patterns, and partly on the overall dramaturgical skills and ritual expertise of the shaman.

One of the most elaborate discussions of the structure, content, and overall significance of music in shamanism is presented by Maria Kongju Seo in her doctoral dissertation, "Ritual Music of Hanyang Kut by Spirit-Possessed Shamans in Korea" (2000). The importance of music in the training and practices of the Korean shaman (*kangshinmu*) is summarized by Seo as follows:

> In Korea, the first moment of *kangshin* (spirit possession) marks the beginning of the musical training required of a neophyte *kangshinmu* (spirit-possessed shaman) to become a ritual specialist. They learn songs from the vast repertoires of *mugyông* (incantations) and *muga* (ritual songs), which may last several hours each. Musical competence determines what type of *kangshinmu* one will become. . . . Musicianship divides Seoul area shamans into two large groups: *Chônnae* and *ch'ôngsūng mudang*. *Chônnae* are those who devote themselves to divination and small-scale rituals where no songs and dances are required, while *ch'ôngsūng mudang* are musically talented performers who officiate at large-scale rituals by singing and dancing. . . . Musically talented *kangshinmu* are in great demand. . . . *Kangshinmu* must learn to play percussion instruments such as the ching (gong) or *chekūm* (cymbals). (Seo 2000, 93–94)

Some amount of self-training is also possible, as indicated in the case of shamans who purchase and learn from published song texts or audio and audiovisual recordings, and in many cases there seem to be no particular prescriptions for order and rules for learning music. According to an 1840 report, "a shaman who wished to summon the spirits was obliged to practice alone for many months in the wilderness, rehearsing his songs and dances and specific drum rhythms to perfection" (Veniaminof 1840, 41; quoted in Johnston 1992).

Shamans often undergo an informal apprenticeship, living in the house of a master shaman. Contemporary cultural trends and government policies have, however, encouraged the institutionalization of shamanistic traditions, as well as the professionalization and formal training of shamans, as exemplified in Korea's Musok Pojonhoe Preservation Association, which was established in 1988.

Musical Instruments and Symbolism in Shamanism

The natural resources, traditions, individual creativity, beliefs, and demands of specific rituals influence the selection and use of specific instruments in shamanism. The notion of a "musical instrument" is therefore constrained, in part, by these sources of influence and, in part, by the observer's (or analyst's) categories or preconceived notions about what constitutes a musical instrument. First, the wide range of musical instruments encountered in world shamanism falls generally under the traditional main categories proposed by Hornbostel and Sachs: aerophones (winds), chordophones (strings), membranophones (drums, skinned), idiophones (percussion varieties), etc. (Hornbostel and Sachs 1961, 3–29). Most of the sound objects employed in world shamanism, however, support the findings of recent studies that highlight difficulties in identifying and hence classifying a musical instrument; they also emphasize the importance of cultural and contextual data that would challenge and open up the Hornbostel-Sachs system of classification. As shown in the examples cited in this essay, a comprehensive inventory of sound instruments employed in world shamanism certainly presents additional challenges to organologists (i.e., those involved in the scientific study and classification of musical instruments).

The importance of bells, drums (of various shapes and sizes, including water drums), and meshed or enmeshed shakers motivate almost all the authors on the subject of music and shamanism to conclude that percussion instruments are prominent. For example, a case study from contemporary Japan observes:

> During the *kamitsuke* ritual, sutras and ritual formulae are intoned against the background of a boisterous din produced from a variety of percussion instruments, transforming the ritual site into a sacred space. The traditional "seven instruments" include catalpa bows, priests' staves (*shakujô*), large and small gongs, large and small bells, and drums. Together, these percussion instruments and chanting voices transform the ritual site into a sacred space of sound. (Kawamura 1994)

Despite the emphasis on percussion, archaeological evidence (Basilov 1992, 77–100) and contemporary practices of shamanism show a wide variety of instruments (including stringed, wind, etc.) as regular members of the shaman's "orchestra," depending on local practices.

Musical instruments are commonly employed to heighten the mystical and symbolic associations often desired in shamanism. The instruments are as varied as the fascinating array of sounds that are found in world shamanism. Various categories of instruments have been represented, even in a single context:

> Many theatrical properties are used for sound effects, like rattles, trumpets, and drums. A sort of crude violin is played by the Kazak shaman. Mongol trumpets are made from thigh bones of maidens, and drums from girls' and boys' skulls. The drums are painted green and decorated with bright ribbons embroidered with the eight emblems of lamassery sacrifice. The Yakut drum is oval, with various protuberances that act as resonators and symbolize ears, chin, and horns. Among the Tungus, the drum may be thought of as the shaman's reindeer. (Charles 1953, 95–122)

One of the best examples showing the symbolic representation and interpretation of a shaman's drum is the one reported among the Magar shamans of Nepal, in regard to the construction and use of the double-headed frame drum; the following is a thirteen-point English summary:

1. Three-stage construction process: selection of wood, construction of frame, membrane attachment and consecration of the drum (consummated in specific temporal spaces)
2. Prayers, offerings (blood of poussin poured on drum in final rite), chants, and trance accompany the searching and discovery of appropriate construction materials
3. Chants or epic narratives that correspond with or accompany specific stages and type of construction materials
4. Construction and founding of a new frame drum usually is linked with the initiation of a novice shaman

5. Discarded skin fragments are buried, and the raw hide of a wild dog is regarded as impure cadaver whose spirit must be tempered
6. Symbolic paintings and fingerprints in white, astrological images, geometrical images of animals and fishes, and abstract images are integral to the design and construction
7. Procedures for repairing the drum follow those observed during a new construction
8. During the construction process, the drum traverses both human and spiritual worlds
9. Shaman looks into the drum like a mirror
10. The drum is silenced and hung up for nine days
11. Irregular beats on the drum imitate sounds of animals and are used in trances
12. Noise is produced on the drum to scare malevolent spirits
13. The frame drum is one of the shaman's protective instruments or armor; it also serves as a vehicle for transporting the dead into the underworld (Oppitz 1990, 79–95; condensed from the French)

In shamanistic and other ritual performances worldwide the symbolic, abstract, and decorative are often fused in the design, construction, and performance of musical instruments, as indicated in two separate volumes of essays devoted to musical instruments and symbolism. Such multiple features or conceptions speak multivocally of power, prestige, skill, competence, and ritual efficacy, which are important concerns in shamanism. The symbolic and cosmological orientations of the shaman's drum are further explained in the practice of tracing the musical skills of shamans (i.e., as drummer and singer) to divine origins. In special states or dreams, Shamans frequently receive not only their musical instruments but also special songs and necessary musical skills. For example, among the Mapuche, "each *machi* [shaman] receives her drum in her dreams from supernatural beings, who also teach her how to play it and paint its membrane" (Grebe 1978, 84–106).

Symbolism and musical details are usually a unified consideration in shamanism, as stated earlier. The spirits are usually assigned or identified by their favorite pieces and melodic or rhythmic patterns, in addition to those highly artificial sounds discussed earlier. A one-, two-, or three-stringed instrument, for example, could indicate the presence of a particular spirit, as in the case of the Korean two-stringed *haegūm.* In Hausa *bori* cult séances a particular song is played on the one-stringed *goge* to welcome a particular spirit; as practiced in the Malay Peninsula, a three-stringed *rebab* is played by the Temiar shaman's ritual pair, *minduk,* during a séance:

> While the vocal music shows the relationship between people (or between people and spirits), the instrumental interludes function as transitions into altered states. . . . Then the oscillating two-note figure played by the fiddle in the lowest part of the ensemble's tonal range accelerates and comes to a crescendo, and the shift to a new persona is complete. (Laderman 1995, 115–142)

Or, a musical bow (another stringed instrument) is transformed into a divination implement in the hands of the shaman, as practiced among the Khakass, Kuznetsk, and Sayan Turks (Sheykin 1980, 26).

In conclusion, the above descriptions are examples of the symbolic representation and transformation of personalities and images, as facilitated by sounds and their sources. The general function of a piece of music or sound in shamanism fluctuates between serving as an aesthetic object and as a symbolic formulation. The shaman is foremost highly creative, a quality often identified with accomplished performing artists and musicians. Music and musical instruments are integral parts of world shamanism, irrespective of local constraints on the type, quantity, and quality of music involved. Shamans and their musical tools of the trade adapt well to our contemporary times of increased urbanization, modernization, and national or local politics of culture.

NEO-SHAMANISM

See Core Shamanism and Neo-Shamanism

NEUROPSYCHOLOGY OF SHAMANISM

Analyzing the universal characteristics of shamanism in terms of modern neuropsychology provides an understanding of those universals as rooted in the normal functioning of the human mind and body. More importantly, it provides a basis for understanding why these characteristics have functioned effectively in the past and why they still have an important contribution to make to the healing of individuals and society.

The assumption of shamanic universals is inherent in most conceptualizations of shamanism. The central aspects of the shaman emphasized by Mircea Eliade (1989)—someone who enters ecstasy to interact with the spirit world on behalf of the community—have been extended in recognition of other universal characteristics associated with shamanism (see, e.g., Harner 1990; Winkelman 1992 for review). The concept of shamanism as a cross-cultural or universal practice implies a foundation for the systematic similarities. These similarities derive from adaptations to the psychobiology of altered states of consciousness and innate brain modules that provide the basis for a variety of shamanic practices, experiences, and representations (Winkelman 2000). This entry outlines a neurological model of shamanism, organized around the core concepts of altered states of consciousness, spirit, and community, and addressing shamanic universals: the soul journey, death and rebirth, drumming, music, dancing, animism, animal spirits, and therapeutic processes.

The neurological basis of shamanism involves what Charles Laughlin, John McManus, and Eugene d'Aquili (1992) referred to as neurognostic structures. The term *neurognostic* refers to the biological structures underlying gnosis (or knowing) and experience. Shamanism uses a number of neurognostic structures, which provide the basis for the universality of shamanic practices and their adaptive advantages. Shamanism was the original neurotheology, ritual practices that activated brain structures and processes in ways that produce psychological integration and a sense of the transcendent and spiritual. Human evolution involved acquisition of a specialized innate modular brain structure with specific functions (see, e.g., Mithen 1996). These innate modules were adaptations for addressing particular kinds of tasks, and provided capabilities in language, music, mimesis (imitation), animal species classification, self-recognition, inference of other's mental states (mind reading), and tool use. Many universals of shamanism involve the use of these innate modules (Winkelman 2000).

Universals of Shamans

A cross-cultural study (Winkelman 1990, 1992) has empirically established shamanic universals, showing similar characteristics associated with the healing practitioners of hunter-gatherer societies around the world. These universal features include characteristics emphasized by Eliade—ecstasy (an altered state of consciousness), spirit world interaction, and community service—as well as other characteristics:

- an experience in an altered state of consciousness known as soul journey or soul flight
- training through deliberately induced altered states of consciousness, particularly vision quests
- an initiatory experience involving death and rebirth
- the use of chanting, music, drumming, and dancing
- the ritual involvement of the entire community
- therapeutic processes focused on soul loss and recovery
- the belief that disease is caused by attacks by spirits and sorcerers, and the intrusion of foreign entities
- abilities of divination, diagnosis, and prophecy
- charismatic leadership
- malevolent acts, or sorcery
- various relationships to animals, including control of animals, transformation into animals, and hunting magic

Many of these universal features of shamanism are directly related to (1) the physiological dynamics of altered states of consciousness; (2) the metaphoric integrations of innate representational modules; and (3) the psychophysiological effects of the ritual healing activities.

Ecstasy, or Altered States of Consciousness

The ecstasy, or altered state of consciousness, recognized as a universal of shamanism is central to the selection, training, and professional practice of shamans. Shamanic altered states of consciousness are induced by a variety of procedures (e.g., drumming, clapping, singing, and chanting; fasting and water restrictions; prolonged periods of sleeplessness, or deliberate periods of sleep for dream incubation; austerities such as temperature extremes and painful exposures or mutilations of the body; and hallucinogens and other plant medicines). The shamanic altered state of consciousness is most typically engaged through drumming, chanting, and dancing to the point of collapse (or deliberate repose). However, the diversity of practices for inducing altered states of consciousness has an underlying set of commonalities in overall physiological effects upon brain processes and functions (Mandell 1980; Winkelman 1992, 1996, 1997, 2000). The overall physiological dynamics involve an activation of the autonomic nervous system until exhaustion from sympathetic exertion leads to collapse and a parasympathetic dominant phase; this phase in which the parasympathetic nervous system is dominant may also be entered directly through withdrawal, relaxation, and internal focus of attention. This activation until collapse induces the body's relaxation response, a part of the cycle of homeostatic balance in the nervous system that provides natural recuperation and healing.

The Integrative Mode of Consciousness

The shamanic altered state of consciousness is one of several states of consciousness that occur in the *integrative mode of consciousness* (Winkelman 2000). The presence in all cultures of procedures for altering consciousness reflects its role in the normal functions of the brain. The integrative mode of consciousness reflects a normal brain's response, manifested in synchronized brain wave patterns in the theta and alpha range (3–6 and 6–8 cycles per second). These brain wave patterns are produced by serotonin-mediated limbic system activity that establishes linkages with lower brain structures. This activity produces strong, coherent, and synchronized theta wave patterns that send ascending discharges or impulses up the neuraxis of the brain (a central nerve bundle integrating information from the nervous system). These synchronous discharges are driven up into the frontal cortex, where they replace the normal fast and desynchronized brain wave activity with coherent slow wave discharges (Mandell 1980; Winkelman 1992, 2000). The overall effect of the integrative mode of consciousness is to integrate information from the whole organism, particularly stimulating or moving emotions and memory, creating ascending brain waves that propagate into the frontal cortex. In other words, this integrates nonverbal information from the emotional and behavioral brain structures into the personal and cultural systems mediated by language and the frontal cortex.

Soul Journey: Self in Presentational Symbolism

The principal form of an altered state of consciousness experienced by the shaman is characterized as a "soul journey" or "soul flight"; although possession is often attributed to practitioners called shamans, possession is not normally associated with shamans of hunter-gatherer societies. Shamanic soul flight is a universally distributed phenomenon, reflective of bases in neurognostic structures. The basic structure of soul flights is reported cross-culturally in astral projection, out-of-body-experiences, and near-death experiences. This experience of shamanic flight reflects activities associated with innate psychophysiological structures and psychosocial capacities of the human nervous system. Harry Hunt (1995) proposed that the experience of soul flight involves the capacity for self-representation from the point of view of the "other." The soul flight is "of" one's self, but one can see one's self from a detached third-person perspective. One sees one's self traveling and doing things, allowing one to reflect upon their significance from another perspective. These perceptions of self found in soul journey involve representations in the visual spatial modality that Hunt referred to as a presentational symbolism; it is the same symbolic system that presents the experiences of dreams. Charles Laughlin (1997) characterized shamanism as a body-based cosmology. These symbolic systems predate language, providing mediums for externalizing self-representations, visual presentations of one's self and significant phenomena. These "presentations" are information that create new forms of self-awareness that permit transcendence of ordinary awareness and identity.

Shamanic development focuses on "mental imagery cultivation" (Noll 1985), utilizing internal visions that result from release of suppression of the visual cortex. These internal images involve brain structures for processing of perceptual information. Imagery involves psychobiological communication processes that mediate metaphoric relations between different domains of experience and levels of information processing; images evoke complex physiological and psychological reactions. Images integrate unconscious and psychophysiological information with affective or cognitive levels, where a "vision" of a threatening object emerges into consciousness, propelled by subconscious processes that have integrated information revealing the threatening situation (Winkelman 2000). Images constitute a preverbal symbol system that activates muscles to achieve goals, often acting outside of consciousness, as when a plastic snake makes us jump away without thinking. Shamanic visions provide adaptive advantages in analysis, analogic synthesis, diagnosis, and planning, integrating diverse information sources into a concise plan of action—the "vision."

Shamanic Induction of Altered States of Consciousness: Chanting, Drumming, and Dance

The induction of shamanic altered states of consciousness is primarily based upon the use of chanting, drumming, and dancing. The use of these practices reflects their ability to induce theta and alpha wave patterns (Winkelman 1997, 2000); they are also based in innate brain modules associated with the call and expressive systems of other animals and a uniquely human mimetic controller. Musical skills are a uniquely human capability having deep evolutionary roots in capacities that humans share with other primates (see Wallin, Merker, and Brown 2000). Calls, hoots, and group enactments are an expressive system that communicates emotional states, attracts attention, and motivates responses. These expressions play a role in managing social contact, interpersonal spacing, mate attraction, pair bonding, and enhancing group cohesion. This expressive system based in rhythm and affective dynamics evolved for communication of internal states and enhancing group dynamics (Wallin, Merker, and Brown 2000). Music's adaptive roles include promotion of group cohesion and coordination, enhancing synchrony and cooperation among group members. Music strengthens group dynamics through cognitive and emotional expression and coordinating the behavior of different individuals into synchronized performances.

Mimesis. Music, chanting, singing, poetry, dancing, and play share origins in mimetic modules that provide rhythm, affective, seman-

tics, and melody. The effects of music include a compulsion to move with the rhythm, including shaking, clapping, stomping and dancing, which reflect operations of this innate mimetic controller. This mimetic capacity, manifested in music and dance, evolved to enhance social bonding and communication of internal states; this capacity also provided mechanisms for inducing altered states of consciousness and breaking down existing habits and thought patterns. These provide processes for establishing group behavioral and mental coordination through body-based systems of "rhythmo-affective semantics," the use of the body and imitation to mime in ways that express fundamental emotions and a mythic worldview. Mimesis involves the unique human ability to entrain the body to external rhythms, including imitation, clapping, stomping, and dancing. The first of human mimetic activities involved ritual dances and imitation of animals, using body movement and gestures and facial expressions as symbolic mechanisms through mimesis. The shamanic practices of drumming, dancing, and ritual imitation are based in operations of this innate mimetic controller. Group ritual dances provide mechanisms for maintaining coordination among a group. These mimetic expressive capacities still provide mechanisms for learning social roles and manual skills, expressing interpersonal dynamics, and communicating preverbal levels of experience.

Innate Modules and Shamanic Thought

Central aspects of shamanism involve the cross-modal integration of the innate processing modules for recognition of animal species (natural-history intelligence), self-conceptualization, and mental attributions regarding social others (mind reading). This shamanic role in managing the integration of different modules is exemplified in shaman's skills in these areas: in natural history, being the master of the game animals; in self-conceptualization, exemplified in shifts in identity developed through animal familiars and guardian spirits; and in social intelligence, being the leader of the group and mediator of intergroup relations. The innate modules for recognition of self and other and animal classification provided the basis for shamanic universals of animism, animal spirits, guardian spirits, and totemism. Animism, or belief in the spirit world, involves the projection of innate representation modules for understanding self and social others onto the unknown and natural phenomena. Animal allies, guardian spirits, and totemism involve the use of the natural-history intelligence, employing capacities for representing animal species and their characteristics to form personal and social identities.

Animism as a Natural and Social Epistemology

Shamanism is based in animism, the belief in spirit entities. Animism involves attributing human mental, personal, and social qualities to the unknown and natural phenomena. Anthropomorphism is one example of animism, since it involves attributing characteristics of the human mind to spirits and nonhuman entities (Guthrie 1993). Shamanism emphasizes the attribution of human qualities to animals. This projection of cognitive similarity, the use of the self as a model of the unknown other, is a normal manifestation of symbolic capabilities in relationship to the environment (Hunt 1995). Environmental and personhood theory suggests animism is a relational epistemology that is universal because perception requires that humans be related to (situated in) their world and environment. Spirits involve "super persons" capable of entering into relationships, processes basic to the shamanic process of forming personal and group identity. The belief in spirits reflects a natural social and relational epistemology derived from the social intelligence ability to infer the mental states of others. This ability enables prediction of others' behavior through an intuitive psychology, a "theory of mind," involving attribution of mental states to others. This "mind reading" involves the organism's use of its own mental states, feelings, and behaviors in similar contexts to gain insight into the mental states and likely behavior of others.

Animals in Shamanic Thought: Totemism and the Guardian Spirit Complex

Shamanism engages forms of self-development by integrating representations from the natural history module, specialized capacities for organizing knowledge about animals and species,

within the representations of the self and social domains. Animals are central in shamanic practices and beliefs. Animals are the basic allies and spirit helpers of shamans, who are generally considered to be "masters of the animals" or to have special relationships to the deities and natural forces that control animals. Shamans are typically called upon to assist in hunting, and are generally believed to be able to transform themselves into animals. These universals of shamanism involving animals reflect the use of the innate module that Steven Mithen (1996) referred to as the natural history or intuitive biology module. This module involves specialized innate capacities for organizing knowledge about animals and recognizing "species essence," manifested in the human universal of taxonomical classification schemata for the natural world. This ability to produce natural taxonomical classification schemata provides a universal analogical system for creation and extension of meaning. The use of animals in social and cognitive modeling is one of the most fundamental aspects of metaphoric and analogical thought (Friedrich 1991), a universal human system for expression of meaning and creation of social and personal identity.

Totemism. The use of animal species for social representations and self-representations is manifested in the phenomena of spirit allies and totemism. Claude Lévi-Strauss (1962) characterized totemism as involving the establishment of metaphoric relationships between the domains of animals and social groups, conceptualizing humans through models provided by the animal world. Totemic thought works analogically, applying the analogy of differences among species to understand differences among human groups. The differences among animal species are used to represent the differences among human groups. In totemism, human groups are distinguished by attributing to them the characteristics derived from the animal world, and the identity of social groups is conceptualized in terms of the models provided by animal species.

The Guardian Spirit Complex. Shamanism also uses the natural history module to incorporate animal spirits as a part of personal identity and powers, as manifested in the practices of the guardian spirit complex. Guardian spirits have psychosocial functions, guiding the individual in personal and social choices (Swanson 1973). The animals with whom shamans have personal relationship have psychosocial functions: The animals empower the shamans and provide them with a representational system for self-development and self-differentiation. This was illustrated in the widespread North American guardian spirit complex focused on development during the transition to adulthood (Swanson 1973). Animals as aspects of self-representation involve "sacred others," the intersection of the spiritual and social worlds in cultural processes that provide aspects of personal identity (Pandian 1997). The intersection of the animal spirit with personal identity involves cultural processes for producing symbolic models for the self. The animal spirits provide projective systems for psychosocial relations and ideals that structure individual psychodynamics and social behavior. Spirit representations produce a symbolic self and provide for resolution of social contradictions in the development of the self. Spirit beliefs are projective systems, exemplifying norms for self and psychosocial relations, and structuring individual psychodynamics and social behavior. The "shamanistic sacred self" (Pandian 1997) provides protection from stress and anxiety through management of emotions and attachments.

Animal powers and guardians are natural modules that provide alternate forms of self-representation that facilitate social adaptations. The alternate senses of self that animal allies provide are mechanisms for problem solving and mediation of personal and social conflict. Spirit concepts of self serve as variable command-control agents for mediating conflict between the different selves and instinctive agents, enabling the operation of the social organism with respect to a hierarchy of goals, and orienting problem-solving modules to nonroutine tasks and problems (Winkelman 2000). Spirit concepts as self-representations help mediate a hierarchy of personal and social goals. Shamanism developed these associative processes, constructing and manipulating a variety of selves for psychological and social integration. Animism, totemism, and guardian spirits, like soul flight and death-and-rebirth experiences, are natural symbolic systems for self-representation within which the self is internally differentiated and manipulated in relationships to others.

Shamanic Therapeutics

Shamanic practices use a number of therapeutic procedures based in physiological processes and their manipulation through psychological and social dynamics. Central aspects of shamanic therapies involve the physiological dynamics of altered states of consciousness, the psychobiosocial effects of community bonding, and the psychophysiological consequences of symbolic healing and ritual.

The Bases of Shamanistic Therapy in Altered States of Consciousness

Altered states of consciousness have therapeutic effects through a number of processes. Procedures that induce parasympathetic dominant states and limbic-frontal integration and synchronization provide a number of healing mechanisms (Winkelman 1992, 1996, 1997, 2000): reduction in stress, anxiety, and psychosomatic reactions; regulation of psychophysiological processes underlying emotions, social attachments and bonding; providing access to sub- and unconscious information; and integration of behavioral, emotional, and cognitive processes. Parasympathetic dominant states can produce therapeutic effects through lowering autonomic arousal. Rapid induction of parasympathetic dominance causes erasure of conditioned responses and increases suggestibility and placebo effects. The neuroendocrine mechanisms of meditation indicate that stress reduction also occurs through enhancement of serotonin functioning (Walton and Levitzky 1994). Increase of serotonin reduces cortisol levels, and consequently the anger and fear reactions. Activation of preconscious brain processes facilitates their integration into consciousness and the resolution of repressed conflicts that affect emotions and physiological responses. Stimulation of limbic system functions and associated processes involved in the feelings and in the formation of individual and social identity contribute to healing through producing an integration of emotional information into consciousness, an enhanced integration of cognitive and emotional processes. The systemic integration across the different functional systems of the brain enhances learning, attention, memory, and adaptation to novel situations (Mandell 1980).

Community Relations as a Psychobiological Therapy

The role of community emphasized by Eliade in characterizing shamanism reflects its psychosocial influences (community cohesion, positive expectation, and social support) and psychobiological effects (attachment and opioid mechanisms). Communal activities meet and reinforce attachment needs of the mammalian biosocial system and elicit psychosociophysiological mechanisms that release endogenous opiates (Frecska and Kulcsar 1989). Shamanic practices elicit the mammalian attachment and affectional bonding system, providing for feelings of security and eliciting opioid responses. Shamanic rituals elicit psychobiologically mediated attachment processes that are based in the body's opioid mechanisms (Frecska and Kulcsar). Shamanic rituals cross-condition cultural symbols with patterns of attachment and their physiological and emotional responses. Emotionally charged symbols provide a basis for elicitation of the opioid system and ritual manipulation of physiological responses.

A variety of shamanic activities also evoke production and release of endogenous opioids (see, e.g., Prince 1982; Winkelman 1997). Shamanic activities that stimulate the opioid system include exhausting rhythmic physical activities (e.g., dancing and clapping); temperature extremes (e.g., cold or sweat lodges); austerities (e.g., water and food deprivation, and self-inflicted wounds); emotional manipulations (e.g., fear and positive expectations); and nighttime activities (when endogenous opioids are naturally highest). The release of natural opioids stimulates the immune system and produces a sense of euphoria, certainty, and belonging. Endogenous opioids enhance coping skills, maintenance of bodily homeostasis, pain reduction, stress tolerance, environmental adaptation, and group psychobiological synchronization.

Spirit Relations and Role Taking: Incorporating the "Other"

Humans have an innate capacity to take the perspective of others. Humans understand other's mental states by using their own minds to infer the cognitions and motivations of

others. This capability enables humans to incorporate others into self-identity, to use the models of others to augment and model the self. Shamanism uses this capability in soul flight and to provide therapeutic processes through role taking (Peters and Price-Williams 1981; Winkelman 2000). The processes of role taking are exemplified in the shaman's spirit world interaction, during which shamans enact the personalities of the spirits. The interactions with the spirit world provide representations of personal and social psychodynamics, including emotions, attachments, social influences, and behaviors. Spirit beliefs also reflect social structures of the group and the dynamics of social and interpersonal relations. Spirit concepts are symbolic systems representing the intrapsychic dynamics of the self and psychosocial relations with others. Consequently, spirits integrate cultural and natural symbolic systems, manipulating unconscious aspects of personal and communal identity, and affecting psychosocial relations with others. Spirits involve symbolic systems that represent complexes, that is, organized perceptual, behavioral, and personality dynamics that operate independent of, or dissociated from, ordinary awareness and social identity. The psychosocial content of spirit representations allow shamanic rituals to affect the psychodynamics of the patient.

Shamanistic healing practices address dissociated personality complexes by eliciting the holistic imperative, a drive toward integration across levels of consciousness (Laughlin, McManus, and d'Aquili 1992). These complexes, representing unintegrated aspects of self, are manipulated in shamanic rituals to produce healing by restructuring and integrating the unconscious dynamics. Shamanic healing integrates the self, utilizing visual and corporeal processes to unite unconscious information with the conscious mind. Shamanic manipulation of spirit constructs provides therapeutic change because the spirits represent fundamental aspects of the self. The shaman's dramatic enactment of interactions with spirits provides models for self-development and resocialization. The innate capability to incorporate the other enables the spirit systems to contribute to identity modification through the internalization of spirit behaviors and animal allies and powers.

Death and Rebirth. Shamanic constructions of identity are also illustrated in a universal feature of shamanic development, the death-and-rebirth experience. Shamanic development includes a crisis involving attacks by spirits that lead to the experience of death and dismemberment, followed by a reconstruction of the victim's body with the addition of spirit allies and powers. The universality of the death-and-rebirth experience reflects neurognostic processes of self-transformation, a natural response to overwhelming stress and intrapsychic conflicts (Walsh 1990). This breakdown of ego structures is experienced in visual symbols, images of bodily destruction, which activate innate drives toward psychological integration (Laughlin et al. 1992). Shamanic healing restructures ego and identity, using ritual to activate holistic imperatives to produce a new self identity at higher levels of psychological integration.

Biosocialization and Symbolic Healing Processes

A preeminent function of shamanic healing is the use of symbols to manipulate physiological processes. Symbolic capacities emerged during phylogenetic evolution as a part of the neural processing of experience and are fundamental to development of neural organization (Laughlin, McManus, and d'Aquili 1992). Human cognitive modeling of the environment occurs through processes of socialization that canalize physiological responses to symbols, training specific patterns of response in the operation of organic systems. Symbolic and affective associations enable neural symbols to evoke physiological processes and brain structures. This link of symbols to perceptions, cognition, and affect is grounded in common foundations of neuropsychological and symbolic processes. The association among social, symbolic, and physiological systems enables "symbolic penetration," symbolic effects on physiological processes and latent psychological structures. Shamanic healing evokes latent structures, archetypal and preverbal processes of the preegoic levels of the limbic brain, and integrates them into conscious processes to produce healing (whole-ing, making whole).

Shamanism developed as a human institution to manipulate the relationships between symbols and brain processes to produce healing

through psychophysiological integration at preverbal mythic levels through metaphoric processes. These ritual processes help overcome cultural conditioning and psychosomatic dynamics. Shamanism heals through processes of psychophysiological integration, projection of advanced developmental models for transference, and engaging neurocognitive structures to produce therapeutic changes (Laughlin et al. 1992). These enhanced interactions between conscious and unconscious processes establish links of preverbal mythic levels with cultural and egoic structures, creating psychosocial and psychophsyiological integration. Shamanistic healers' symbolic manipulations provide a form of assurance that can counteract the physiological effects of stress and anxiety. Ritual symbolic manipulations can intervene in stress mechanisms through changing emotional dynamics, and consequently altering the balance in the autonomic nervous system and endocrine responses. Symbolic manipulations also elicit emotions, linking body and mind through effects on the limbic system.

Contemporary Manifestations of Shamanic Neurognostic Structures

The neurological foundations of shamanic features persist in contemporary society, reflected in contemporary spontaneous religious experiences (Stark 1997) and diagnostic categories of spiritual emergencies (Walsh 1990). These include a variety of relations between self and spirit others (Stark 1997; Winkelman 2000), as well as spontaneous shamanic journeys, the death-and-rebirth experience, mystical experiences with psychotic features, and expressions of psychic abilities (Walsh 1990). The shamanic paradigm is a more useful framework than the pathological attributions of psychiatry for addressing spiritual emergencies as natural manifestations of human consciousness and as developmental opportunities (Krippner and Welch 1992). The neurognostic framework explains why these shamanic phenomena are spontaneously manifested and why a spiritual healing approach is more successful in addressing these conditions. The shamanic paradigm provides a framework for reinterpreting what psychiatry considers acute psychosis and emotional disturbance. The psychobiological basis of the shamanic paradigm allows for these shamanic experiences to be interpreted as natural brain processes and as opportunities for personal development, providing a context for developing control over these experiences. The shamanic approach treats death and rebirth, soul loss, out-of-body experiences, power loss, animal familiars, and spirits as natural manifestations of consciousness, and provides the opportunity to engage in the classic shamanic approach of self-empowerment to address these experiences.

The shamanic paradigm and its neurognostic frameworks make it possible to treat the modern resurgence of this ancient human healing tradition as a normal part of healing processes rather than as a return to superstition or a psychopathology. The neurognostic framework provides an understanding of these phenomena as natural phenomena of consciousness. Their continued manifestations make the shamanic traditions of altering consciousness, ritually manipulating identity, and changing psychosocial dynamics through adopting animal and spirit world identities still relevant. Consequently shamanic healing practices may not only be good complementary therapies, but may also provide important alternatives to biomedicine by addressing the biopsychosocial and spiritual dynamics of health and illness. Shamanic healing can open new avenues for all healers by ritually addressing the innate brain processing modules for knowledge about mind, self, others, and nature and manipulating these natural models of self for personal healing and development.

OFFERINGS AND SACRIFICE IN SHAMANISM

As conduits to supernatural beings, shamans are often courts of first and last appeal for community members who seek to recover good health, ensure a plentiful harvest, appease harmful spirits, and more. Shamanic techniques vary cross-culturally in their details. However, preparing offerings to spirits is an element of shamanic performance routinely considered central to its efficacy. The substance of these offerings varies among societies. Some shamans use seeds and abalone shells (Handelmann 1967). Others use beads and tobacco (Dixon 1908). There are those who offer ceremonial silk clothing to the spirits, thus creating an interface between natural and supernatural realms "charged with significance" (Humphrey 1996, 282). In certain instances the shaman's craft may also require animal sacrifice. Spirit mediums among the Philippines' Buid, for example, sacrifice pigs or chickens as food for malicious spirits that are said to cause illness by "biting" their human victims. Conversely, provisioning good spirits with sacrificial pigs is a way to invite them to share a closer relationship with humans (Gibson 1986). As Henri Hubert and Marcel Mauss noted at the end of the nineteenth century, the category of sacrifice includes "any oblation, even of vegetable matter, whenever the offering or part of it is destroyed" (Hubert and Mauss 1964, 12). In that sense, many shamanic offerings may be considered sacrifices, regardless of whether blood is drawn.

Offerings in Ngaju Shamanism, Indonesia

The question of what constitutes an appropriate offering or sacrifice is often a paramount concern of shamans and their audiences. Regarding the séances of the Oya Melanau shamans of Malaysia, H. S. Morris noted that their spirit familiars enjoy good food and sweet scents. "[A shaman] must provide a suitable reception. . . . [For this reason] shamanistic curing ceremonies are regarded as a series of entertainments," akin to hosting friends (Morris 1993, 112). Among the Ngaju Dayaks of Central Kalimantan, Indonesia, shamans known as *tukang sangiang* are likewise often called upon to conduct healing ceremonies. One part of a Ngaju shaman's work involves mixing antidotes and salves from roots, tree bark, and flowers. Another calls for the shaman to "smoke" patients, building smoldering fires of carefully chosen woods that chase disease away.

Ngaju shamans are solicited for their ability to enter trance and become possessed by spirits known as *sangiang.* They flatter, cajole, or bribe spirits into identifying the cause of illness and suggesting courses of treatment. Rarely are the sangiang themselves blamed for sickness, but the extent to which a sangiang is able to effect a cure may hinge upon whether the supernatural being is satisfied with the offerings given to it (Schiller 1997). Thus bargaining with spirits is an important aspect of the work of some shamans. At first glance the ability of shamans to negotiate with the supernatural world may seem surprising. In many cultures, however, the shaman is thought of as the equal of the supernatural beings with whom the shaman comes into contact, or even as enjoying mastery over those beings. Thus shamans, as has been noted regarding the Kalahari Bushmen, rather than "plead," "throw themselves into combat with the gods" (Marshall 1962).

Indu Onot, the Transvestite Shaman

An example of how offerings may be used by shamans is provided by the aforementioned Ngaju Dayaks, as observed by the author. In

preparation for a session, Ngaju shamans set out offerings for the spirits to attract them to the ceremony site. Throughout their performance they add offerings, usually in response to spirits' specific requests. An example of this shamanic technique is provided by Indu Onot, whose clientele includes villagers from throughout the middle and upper Katingan River region. Indu Onot received her calling as a child, when a female spirit approached in her dreams. The spirit explained that in return for shamanic abilities, the youngster would have to honor her throughout the years by bringing offerings of food, clothes, and perfumes to a special shrine. The spirit also added a singular request—that the child would dress in a manner that indicated their close relationship. Two decades later, Indu Onot continues to uphold her end of the bargain, making offerings of food to her spirit patron whenever she takes a meal and setting out offerings of rice, tobacco, coconut oil, and perfume whenever she invokes her. She also observes the spirit's special request, and, although she is anatomically male, Indu Onot dresses as a woman. She wears a colorful wrapper tightly wound around her body, and modestly covers her shoulders with a lacy blouse secured by a brooch. Her gold bracelets, purchased with money she has collected from her patients, sparkle on her wrists. Her three children address her as "mother," just as they do Indu Onot's wife, who is their biological mother.

When asked to perform a divination or healing, Indu Onot sends her assistant ahead to ready the site, including arranging offerings for the yet unknown spirits who will possess her body during her shamanic trance. Raw rice, tobacco, coconut oil, betel nut, and lime are set out in a brass bowl in front of a chair on which the shaman will be seated. A small pot of smoldering resin is lit—this, too, is considered an offering. Sometimes a chicken is killed; its blood is used to "feed" the animate essence of the shaman's ritual paraphernalia, and its cooked flesh is set out on a plate where spirits may feast. After making an obeisance to her tutelary spirit, Indu Onot begins to rock to and fro, clutching in her hands strips of cloth or palm fronds suspended from the ceiling. She mumbles an invitation to the spirits to descend into her body. She places the brass bowl on her head and begins to dance, her hands darting and weaving above her like birds searching for a resting place amid the jungle canopy. Suddenly she stamps her foot and speaks in a voice that is not her own. One after another, spirits pass through her, each requesting something. Normally they ask for specific foods, which the audience members rush to procure and place in front of Indu Onot. Not all requests are for things to eat, however. During one performance, a spirit asked for the loan of a pair of soccer shoes. A teenage observer removed the pair he had on, and Indu Onot wore them until the next sangiang arrived. Sometime spirits request cigarettes, which Indu Onot immediately smokes. Such offerings of tobacco, or the use of tobacco in shamanic performance, are common throughout the world.

Wana Shamans

The interactions that take place among Indu Onot, the spirits who have possessed her, and the onlookers who have assembled for the session are not unique. Similarly "spirited" exchanges between shamans and audiences who are anxious to respond to the demands of supernatural beings for offerings appear elsewhere in anthropological literature. Jane Atkinson, for example, refers to the "dramatic conundrum" faced by Wana shamans in Sulawesi, Indonesia. On the one hand, members of Wana society depend upon shamans and their supernatural allies for continued well-being. On the other, shamans are "dependent upon audience members to acknowledge their shamanic claims" (Atkinson 1987, 346). By enlisting audience members in efforts to respond to the requests that spirits are making through particular shamans, the shaman gives the audience a chance to demonstrate its "great feelings" for the shaman's condition (349) and to endorse the shaman's claim to possessing special powers. Thus, although the patient's illness is the catalyst for the performance, it is the shaman's immediate needs rather than the patient's that the audience must address. In this way, the shaman's standing in the community is acknowledged and strengthened.

Animal Sacrifice

Neither Ngaju nor Wana shamans emphasize animal sacrifice in their healing performances.

However, among some peoples who attribute illness to soul loss, blood sacrifices performed by shamans are said to substitute for human souls. An example comes from the Rungus of Sabah, Malaysia. Rungus shamans turn to their spirit familiars for assistance in determining what type of *rogon* or *rusod,* spirit of the natural or social world, is causing a patient's illness and what sacrifice that spirit requires in exchange for a soul's return. When a rogon demands a sacrifice that is beyond a patient's family's means, the shaman may try to negotiate on the family's behalf: "Some *rogon* receive large pigs, others small ones and some rogon want red chickens and others white. At this time [the shaman] is able to ask for mercy and bargain for a smaller sacrifice" (Appell and Appell 1993, 28). In some cases, as in that of a major or lingering illness, only a large sacrifice will do. In those cases, a bargain is struck with a rusod to hold a ceremony at a future point "when the family has been able to raise a pig of sufficient size. . . . At the time of making this bargain, a piglet is designated to be raised for this ceremony" (29).

Whether shamans offer pigs, plants, palm wine, or even a young man's soccer shoes to the spirits that assist them, useful information about social, political, and economic conditions in contexts where shamanism is practiced may be gleaned by considering the nature of the offerings presented. Writing about Korean shamanism, Kwang-Ok Kim has argued that "shamanism provides the people with a profound symbolic language" (1994, 218). Although analyses of this symbolism have traditionally focused on elements of costume, dance, or percussive accompaniment, the type, number, and arrangement of shamanic offerings also offer insight into local knowledge systems, including how they have been affected by social change. Among the Karo of Sumatra, Indonesia, for example, shamanic healers have organized financial savings clubs to offset the expenses of holding ceremonies and entertaining spirits. Such voluntary associations have become necessary as relatives and neighbors who have converted to Christianity or Islam now refuse to provide economic support for ceremonies that they consider "heathen" (Steedly 1993, 6). Thus, offerings and sacrifices should clearly not be considered dimensions of shamanic performance of a low order of importance. For social scientists, a shaman's offerings may hold clues to a deeper understanding of the complex relations between spirit beliefs and other dimensions of social and cultural orders. For shamans, offerings and sacrifices may be seen as crucial to the efficacy or failure of their efforts, with lives and livelihoods hanging in the balance.

PERFORMANCE

See Dramatic Performance in Shamanism

PILGRIMAGE AND SHAMANISM

Pilgrimage normally involves travel to and from a sacred place, and parallels shamanism in its emphasis on the role of the journey in religious experience. Pilgrims, like shamans, move toward an otherworldly realm in order to engage with spiritual forces, and often have a specific aim in mind, such as healing of the self or others. Many shamans seek a temporary release from ordinary consciousness through trance, while many pilgrims aspire to achieve temporary release from the concerns of their daily lives through physical travel. In both cases, the trip away from ordinary reality may be fraught with austerities and dangers, resulting in death or harm to the practitioner, but if successful it has the potential to bring prestige and renown.

Some writers argue that the tripartite structure of a rite of passage is central to both pilgrimage and shamanism. The person leaves the mundane world (in body or in soul), spends some time in a "liminal" (in-between) zone where normal rules of human behavior are suspended or reversed, and then returns to society, possibly with a changed identity. Shamans themselves may be ambiguous figures in their communities, feared as much as revered for their powers, just as pilgrims are sometimes mistrusted by the local inhabitants of places through which they travel as strangers.

At times, pilgrimage is clearly an integral part of shamanism. In her account of forms of sacred journeying carried out by the Huichol Indians of Mexico, Barbara Myerhoff (1974) argued that the male shaman-priest, or *mara'akame,* gains some of his extraordinary powers and authority specifically through pilgrimage. Ramón, her chief informant, claimed to make magical flights to the land of the gods and to be able to follow the souls of the dead to the Underworld, while using these skills on behalf of patients in curing ceremonies. His initial training period involved the leading of five, physically very demanding, trips to the sacred land of Wirikuta in an annual hunt for the peyote cactus, used to promote visionary experiences.

Similarly, Carmen Blacker (1975, 100) wrote of how Japanese shamans, whose practices combined Buddhist influences with other, possibly older religious forms, acquired powers to heal and to banish malevolent spirits through a number of ascetic practices, such as fasting, seclusion, standing under waterfalls, and scaling mountains. She quoted the example of a tenth-century female ascetic who complained that no sooner did the word go round that someone had climbed a mountain, than he or she was besieged by people wanting a cure. Such traveling to holy mountains may not merely parallel, but may even replace, shamanic flights of the soul through the cosmos, particularly among contemporary practitioners.

In the Japanese case, religiously inspired movement complemented the stillness involved in self-imposed seclusion; in common with other examples of pilgrimage and shamanism, this example reveals how traversing space may involve not only a testing of the person, but also a search for the otherness of the spirit realm (Vitebsky 2001, 15). Geographically and cosmologically defined landscapes are central to both pilgrimage and shamanism. Donald Joralemon and Douglas Sharon (1993) followed the shamanic career of Rodrigo López, a Peruvian *curandero* (healer). As part of López's train-

ing, he made various pilgrimages to sacred highland lagoons in the company of expert practitioners, but once initiated he felt no need to return to such power spots, since he regarded himself as able to tap the power of the lagoons in spirit. Artifacts collected by curanderos on their trips can also be used to evoke the power of sacred landscapes and can become permanent features of a curer's practice, paralleling the pilgrimage practice of bringing home souvenirs as a means of recalling but also appropriating the powers of a place.

Shamanism is often seen as involving exchange between humans and spirits or animals. Kaj Århem (1998, 104) noted that, among the Makuna Indians of the Colombian Amazon, shamans travel in the mind to spirit owners and guardians of animals, asking them to deliver the hunter's prey and the fisherman's catch, and offering coca and tobacco in return. The dealings between Makuna shamans and the spirit owners are likened to marriage negotiations, and a successful hunt is compared to a completed marriage—an exchange of women between groups. Pilgrimage can also illustrate the connections between travel and exchange, with material or spiritual offerings to the gods cementing requests for help or providing thanks for a boon provided. The pilgrim, like the shaman, may make a journey on behalf of another person, seeking for divine aid. In both cases, transactions are mediated through an economy of human-divine relations, and in some instances the transacting pilgrim is also a shaman. Among the Mixe of the Oaxacan highlands of southern Mexico, shamans travel to mountain tops or sacred caves and sacrifice fowls in order to alter the fate of a child born on a negative calendar day (Lipp 1991, 88–90).

Scholars have debated the political significance of shamanism and pilgrimage, and in particular their respective connections with centralized forms of authority. The fact that both shamans and pilgrims journey to, and sometimes beyond, the known world and the social order sometimes makes them appear peripheral in relation to mainstream hierarchies. They may even be seen as a threat to such hierarchies if they appear to be able to cultivate alternative sources of power and authority. Shamans in Siberia and Mongolia were mistrusted and killed by Communist governments, just as mass movements of pilgrims in medieval Europe were sometimes feared as potential embodiments of the uncontrolled crowd. However, it would be misleading to see either shamanism or pilgrimage as inherently resistant to centers of political power or always in conflict with the state. Using the example of twelfth and thirteenth century Mongols, Caroline Humphrey noted that such inspirational practices were profoundly implicated in the formation of Inner Asian States. She added that, in China and among the people of the hinterland, the sky was seen as the all-encompassing principle of cosmic order and human destiny, with the ruler on earth governing his people by virtue of the destiny accorded by heaven. In such a context, the assertion of a shamanic ability to ascend to the sky could be seen as a politically highly significant claim (Humphrey 1994, 193–197). Similarly, numerous pilgrimage sites have acquired political importance: Walsingham in England became a favorite venue for medieval English royalty to display their piety, while the Golden Temple in Amritsar has famously become not only a place of pilgrimage but also a key focal point for the assertion of Sikh identity.

Nevertheless, the apparently close parallels that have been revealed between shamanism and pilgrimage should also be treated with caution. As a result of the approach adopted by Mircea Eliade (1989), there has been a tendency to regard shamanism as ideally capable of existing in a "pure," transhistorical form, involving mastery of spirits and magical flight as part of generic and archaic "techniques of ecstasy." Similarly, pilgrimage is sometimes perceived too crudely as a firmly identifiable and homogeneous phenomenon, the manifestation of an allegedly universal human need to engage in a quest for the sacred. In reality, the religious complexes termed *shamanism* and *pilgrimage* contain very many varieties of ritualized action and religious meaning, which can only fully be understood by examining the cultural context in which any given activity takes place. Alice Kehoe pointed out that Siberians themselves distinguish between several types of practitioners and adepts, who are too loosely labeled shamanic by outsiders (Kehoe 2000, 4). Within the same religion, or even within the same traveling group, pilgrims can also have very different motivations, behaviors, and roles.

There are some obvious differences between conventional depictions of shamanism and of pilgrimage, despite the fact that the two can coexist in the same society and sometimes help to constitute each other. Shamans tend to venture out alone (or perhaps with familiars) in their soul flights, although drumming and dancing may accompany the passage of the practitioner's soul as it seeks the company of spirits. Pilgrims much more frequently engage in actual physical travel, and often undertake their journeys in groups to enjoy the good company of others or—as often in the past—for safety's sake while encountering unknown lands. The shaman's role often requires specific skills as part of a specialized calling, possibly including the regularized cultivation of trance states (in Central and South America, drugs that can promote altered states of consciousness play a key role in shamanic traditions). Pilgrims are less likely to be religious virtuosi or leaders within their communities, and while they sometimes experience religious ecstasy, they do not usually expect to achieve changes in states of consciousness unless they are mystics. The cultural locations of the two religious complexes also exhibit some differences. Many examples of shamanism come from within the hunting societies of Europe and Asia (for instance, Scandinavia, Siberia, and Greenland), while pilgrimage has become most fully developed within the world religions, which have encouraged believers temporarily to leave their local communities in order to seek out distant but concretely attainable goals (Mecca within Islam, the Holy Land for Christians, and so on).

In recent decades, shamanism and pilgrimage have experienced an upsurge of interest in scholarly circles, and in both cases there has been a growth in studies highlighting the cultural and historical particularities of specific historical and cultural contexts. Both institutions have also been influenced by a rising interest in popular spirituality in the West, which has frequently involved the appropriation and transformation of non-Western cultural forms. So-called Neo-Shamanism avoids the austerities of shamanic initiation described above, and—displaying its connections with New Age spiritualities—tends to be oriented toward individual quests for self-realization rather than community welfare. The selling of "shamanic journeys" (Kehoe 2000, 81) through weekend workshops has become common, and new techniques draw disparate ethnographic traditions together in syntheses that are designed for ease of assimilation by clients. Galina Lindquist noted that attention to the imagery of the mind (whether manifested in journeys, dreams, or daydreams) seems to be the principal feature that distinguishes a member of the neo-shamanic movement from a "mainstream" person (Lindquist 1997, 89–90). The non-Western "other" is depicted in these terms as a source of power and self-renewal, but the ambiguity and danger frequently associated with the shamanic role is played down in favor of a more benign view of nature, the environment, and the spiritual world.

Similarly, contemporary pilgrimage often (though by no means always) avoids the dangers and privations of the past, not least because travel is nowadays much easier than before, and in the West is also influenced by current tendencies to mix and match cultural forms. For instance, some contemporary travelers on the *camino,* the network of pilgrimage routes that reach across Europe and lead to Santiago de Compostela, are ostensibly following an ancient tradition, but in fact exhibit individualized attempts to achieve spiritual renewal that are characteristic of New Age thought. Thus both pilgrimage and shamanism provide metaphors of journeying and self-discovery that can readily be adapted to certain aspects of contemporary Western sensibility, whether participants see themselves as being overtly "religious" or not.

Observing such developments in the West should not lead us to assume that supposedly pristine, ancient, and static forms of pilgrimage or shamanism will necessarily die out and be replaced by their New Age counterparts. Such a view would ignore the fact that all religious traditions have constantly changed and adapted throughout history. More generally, we can be confident of the continued salience of both pilgrimage and shamanism—sometimes closely combined, sometimes more clearly separated—in the near future.

PSYCHOLOGY OF SHAMANISM

The psychology of shamanism has been ignored for many decades because psychologists did not value the shamanic tradition, and because earlier models of science could not do justice to its complexity. Developments in psychological phenomenology, cognitive neuroscience, and qualitative research, however, provide both the perspective and the tools to bring rigor and imagination to an investigation of shamanic experience that will give understanding of its contents and its structure (Krippner 2002). For example, Roger Walsh has provided an analysis of shamanic phenomenology, concluding that it is "clearly distinct from schizophrenic, Buddhist, and yogic states," especially on such important dimensions as awareness of the environment, concentration, control, sense of identity, arousal, affect, and mental imagery (Walsh 2001, 34).

From a psychological perspective, shamans can be described as community-sanctioned spiritual practitioners who claim to deliberately modify their attention in an attempt to access information not ordinarily available to members of their social group. (The use of the term *attention* instead of the more usual *state of consciousness* is discussed later in the article.) Shamans use this information in their attempts to ameliorate the physiological, psychological, and spiritual problems faced by the group members who gave them shamanic status. Shamans appear to have been humankind's first psychotherapists, first physicians, first magicians, first performing artists, first storytellers, and first weather forecasters (Eliade 1989). They were originally active in hunting and gathering tribes and fishing tribes and still exist there in their most unadulterated form; however, shamanic and shamanistic practitioners also exist in nomadic pastoral societies, and in horticultural, agricultural, and even urban societies today.

Shamanic Roles

Michael Winkelman's (1992) seminal cross-cultural study of forty-seven societies focused upon *magical-religious practitioners,* that is, those individuals who occupy a socially recognized role that has as its basis an interaction with the nonordinary, nonconsensual dimensions of existence. This interaction involves special knowledge of purported spirit entities and how to relate to them, as well as special powers that allow these practitioners to influ-

ence the course of nature or human affairs in ways not ordinarily possible. Winkelman coded each type of practitioner separately on such characteristics as the type of magical or religious activities performed, the techniques employed, the procedures used to alter consciousness, the practitioner's mythological worldview, and the practitioner's psychological characteristics, perceived power, socioeconomic status, and political role. Statistical analysis provided a division into four groups: (1) members of the shaman complex (shamans, shaman-healers, and healers); (2) priests and priestesses; (3) diviners, seers, and mediums; (4) malevolent practitioners (witches and sorcerers).

It turned out that the shaman was most often present in hunting and gathering societies and fishing societies. However, the introduction of horticulture and agriculture coincided with the rise of priests and priestesses, and of organized religions. Shamans lost much of their power to priests, but retained their healing abilities. Shamanic oral traditions differ from the body of sacred scripture as maintained by an organized priesthood, remaining flexible and adaptive, each situation being unique.

Political differentiation of the society led to a further division of labor into that of healers, mediums, and malevolent practitioners. Any given society may have one or more magical-religious practitioner. Among the !Kung of southwest Africa, for example, the majority of males are magical-religious practitioners, as well as a sizable minority of females (Katz 1981).

Using Winkelman's terminology, the shaman-healer specializes in healing practices, while the healer typically works without the dramatic alterations of consciousness that characterize the shaman and, to a lesser extent, the shaman-healer. Diviners (as well as seers and mediums) act on a client's request to heal or to make prophecies after they have "incorporated" spirits. These practitioners typically report that they are conduits for the spirits' power, and claim not to exercise personal volition once they "incorporate" (or are "possessed by") the spirits. Shamans, on the other hand, frequently interact with the spirits and sometimes "incorporate" them, but remain in control of the process, only suspending volition temporarily.

For example, volition is surrendered during some Native American ritual dances when there is an intense "flooding." Nevertheless, the shamans purportedly know how to enter and exit this type of intense experience (Winkelman 2000). Malevolent practitioners are thought to have control over some of the "lower" spirits as well as access to power through rituals. Typically, they do not see their mission as empowering a community as a whole (as do the shamans). Rather, sorcerers are employed by individual members of their community to bring harm to enemies (inside or outside the community) or to seek favor from spirit entities for specific individuals through sorcery, witchcraft, hexes, and spells.

The more complex a society, the more likely it is to have representatives of each type of practitioner, except for the prototypical shaman. It should be kept in mind, of course, that categories are never absolute; some practitioners are difficult to classify and others switch roles according to the occasion (Heinze 1991). Many writers reserve the word "shamanic" to refer to practitioners and practices that clearly fall within the domain of the shaman or the shaman-healer. The same writers use the word "shamanistic" to refer to practitioners and practices that are related to the shamanic realm, but which are basically adaptations of it because one (or more) of the critical criteria, such as community sanction and voluntary control of shifts in attention, is absent.

Shamanic Selection and Training

Shamans enter their profession in a number of ways, depending on the traditions of their community. Some shamans inherit the role. Others may display distinctive bodily signs (e.g., an extra digit, albinism, an unusual birthmark), behaviors (e.g., bodily fits and seizures, behavior patterns culturally associated with the opposite gender), or experiences (e.g., vivid dream recall, professed out-of-body activity). Depending on the potential shaman's culture, any of these might constitute a *call to shamanize.* In addition, future shamans might survive a near fatal disease and interpret this phenomenon as a call. Spirit entities might call them in dreams or in daytime reveries (Heinze 1991, 146–156). These calls may come at any age, depending on a society's tradition; in some cases, the call arrives late in life, giving meritorious individuals opportunities to continue their service to the community in ways that utilize their life experi-

ences. On the other hand, the strange and erratic behaviors of some tribal members may be interpreted by the community as a call, thereby canalizing potentially disruptive actions into behavior patterns that are perceived to be beneficial (Katz 1981).

In some societies, there is no formal training program, while in others the training process may last for several years. The mentors may be older shamans or even spirit entities (e.g., one's ancestors, power animals, nature spirits) who are said to give instructions in the neophyte's dreams. The skills to be learned vary from society to society, but usually include diagnosis and treatment of illness, contacting spirit entities from nonordinary dimensions, supervising sacred rituals, interpreting dreams, predicting the weather, herbal knowledge, prophecy, and mastering the self-regulation of bodily functions and attentional states.

So-called spirit entities need to be contacted for different purposes. If they are dissatisfied they have to be propitiated; if a person dies without leaving a will, the deceased person's spirit needs to be contacted to determine property disposition; if a deceased person's spirit is causing trouble, the spirit needs to be appeased. Magical performance of one sort or another is learned, whether it be sleight of hand, taking advantage of synchronous events, or the purported utilization of what Westerners would call parapsychological phenomena (e.g., extrasensory perception, psychokinesis). In most shamanic societies, a variety of chants, dances, songs, epic poems, stories, and symbols must be learned and used when appropriate. Some tribes arrange a special feast when the initiate passes a phase of training.

In many instances, a society has recognized several types of shamans. Among the Gold Eskimos, only the *siurku* shaman knows how to heal, the *nyemanti* shaman performs special rituals over a deceased person's soul, and the *kasati* shaman conveys the soul of the deceased to the spirit world (Kalweit 1988, 139). Among the Cuna Indians of Panama, the *abisua* shaman heals by singing, the *inaduledi* specializes in herbal cures, and the *nele* focuses on diagnosis (Krippner 1993).

It would be erroneous to assume that shamans represent a single constellation of traits, or that there is a "shamanic personality." It may be that some shamans have been "psychotic" but nonetheless have been honored by the community as long as they served social needs. More often, shamans undoubtedly have been men and women of great talent, mastering a complex vocabulary and a treasury of knowledge concerning herbs, rituals, healing procedures, and the purported spirit world.

Shamanic Personality Traits

Some social scientists have observed the links between shamanism and changed states of consciousness, concluding that these states are symptomatic of "schizophrenia." Julian Silverman postulated that shamanism is a form of acute schizophrenia because the two conditions have in common "grossly non-reality-oriented ideation, abnormal perceptual experiences, profound emotional upheavals, and bizarre mannerisms" (Silverman 1967, 22). According to Silverman, the only difference between shamanic states and contemporary schizophrenia in Western industrialized societies is "the degree of cultural acceptance of the individual's psychological resolution of a life crisis" (23). Silverman claimed that the social supports available to the shaman are "often completely unavailable to the schizophrenic in our culture" (29). George Devereux (1961), among others, conceptualized shamans as neurotics, epileptics, or hysterics.

L. B. Boyer, B. Klopfer, F. B. Brawer, and H. Kawai (1964) attempted to gather data regarding this controversy by administering Rorschach inkblots to seventy-one Apache men, twelve shamans, fifty-two non-shamans, and seven "pseudoshamans" who claimed to possess special powers but who had not been accorded shamanic status by members of their community. Rorschach analysis demonstrated that the shamans showed as high a degree of reality testing potential as did members of the non-shamanic group. Pseudoshamans were more variable on this dimension and demonstrated "impoverished personalities"' (179). The shamanic group was as able to approach ambiguous stimuli as were the non-shamans, but showed a higher degree of ability to "regress in the service of the ego," a keener awareness of peculiarities, more theoretical interests, and more "hysterical" tendencies. These tendencies were in evidence when the team examined the high frequency of anatomical and sexual responses to the Rorschach inkblots, as well as the frequent use of

color. Even so, the authors stated, "In their mental approach, the shamans appear less hysterical than the other groups" (176). The study concluded that the shamans were "healthier than their societal co-members. . . . This finding argues against [the] stand that the shaman is severely neurotic or psychotic, at least insofar as the Apaches are concerned" (179).

Richard Noll (1985) compared verbal reports regarding the phenomenology of their unusual experiences from both schizophrenics and shamans to criteria in the third edition of the *Diagnostic and Statistical Manual of Mental Disorders.* He reported that important phenomenological differences exist between the two groups and that taking what he called the "schizophrenic metaphor" seriously, by asserting that shamans are schizophrenic, is untenable (455). Indeed, some social scientists (e.g., Peters and Price-Williams 1980) claim that such altered states as spirit possession and out-of-body experience can be therapeutic in nature.

Sheryl Wilson and Theodore Barber (1981) have identified fantasy-prone personalities among their hypnotic subjects. This group is highly imaginative but, for the most part, neither neurotic nor psychotic. It is likely that many shamans would fall within this category, as the shaman's visions and fantasies are thought to represent activities in the spirit world. Also, the shaman typically exhibits considerable charisma as what Jungians refer to as a *psychopomp,* a culturally validated figure who mediates between realities. Among the psychopomp's duties are transporting souls of the dead to the spirit world, as well as traveling to the spirit world to receive instructions or to petition favor from the deities.

Cross-gender behavior has been reported to characterize shamans in many societies. Walter Williams (1986) reviewed the way in which Native American cultures dealt with sexual diversity, finding that most tribes believed that someone who is unusual could be easily accommodated without being regarded as abnormal. Many tribes directed what Westerners would refer to as effeminate males and masculine females into shamanic roles, recognizing their sensitivity, androgyny, and capacity for empathy.

Many Siberian tribes often select "soft men" as shamans, and Siberian shamans in general frequently cross-dress during their rituals in order to partake of the opposite gender's power. These practices are also common in Polynesia and Korea, where androgynous males who serve as shamans are highly regarded for their healing abilities, as well as for their purported knowledge of future events.

Altered States

Some Russian anthropologists claim that the first shamans were nature healers, but during a later feudal phase of social evolution, they invented spirits, necessitating the cultivation of altered states of consciousness to contact them and communicate with them (Hoppál 1984). Morris Berman suggested that "heightened awareness" may be a more accurate description than "altered states," because shamans describe their intense experience of the natural world in such terms as "things often seem to blaze" (Berman 2000, 30). Most other scholars, however, have favored the idea that altered states of consciousness are basic to shamanism, especially spirit "incorporation" and out-of-body experience or "journeying." Erika Bourguignon surveyed 488 societies (57 percent of those represented in an ethnographic atlas) and discovered that 437, or 89 percent, were reported to have one or more institutionalized, culturally patterned altered states of consciousness (Bourguignon 1974, 11). She concluded that the capacity to experience altered states of consciousness was a basic psychobiological capacity of human beings, a conclusion supported by Winkelman's (2000) review of pertinent psychoneurological data. Steven Mithen's (1996) vivid portrayal of the mind's "prehistory" describes the emergence of what he calls the *cognitive fluidity* that caused the cultural explosion of the Middle and Upper Paleolithic Ages, and it is likely that shamans and their altered states of consciousness were manifestations of this fluidity.

Larry Peters and Douglass Price-Williams (1980) compared forty-two societies from four different cultural areas to determine commonalties among shamanic altered states of consciousness. They identified three common elements: voluntary control of entrance into and duration of the altered state of consciousness; memory of the experience after the altered state of consciousness; and ability to communicate with others during the altered state of con-

sciousness. Ruth-Inge Heinze has pointed out that the basic difference between shamans and mediums appears to be that "shamans are capable of going on a magical flight and remain the actors during their performances. On the other hand, mediums become possessed by spirits who use human bodies through which they are able to act" (Heinze 1991, 15). In addition, shamans characteristically travel into the spirit world more often than other practitioners do. They may journey from "middle earth" to the "Upper World" to visit ancestral spirits and to the "Lower World" to visit power animals, and journey to the past, the future, and remote areas of the globe (Krippner 2000). The spirits encountered in each of these realms will differ from society to society, but shamanic journeying is typically linked to the ability to enter altered states of consciousness.

Incorporation is a term often used to denote the voluntary nature of spirit embodiment; it may or may not be accompanied by amnesia after the experience, depending on the practitioner, the practitioner's training, and the practitioner's cultural tradition. In possession, however, the individual generally embodies the spirit in an involuntary or unpredictable manner; there is usually amnesia after the experience. In obsession, the spirit works from the outside, purportedly influencing the individual's behavior, characteristically in a maladaptive way. Exorcism is often necessary to treat involuntary possession and obsession if a malevolent spirit is involved. Sometimes the troublesome spirit is not wicked but simply "ignorant" or "underdeveloped." The exorcist, who might be a shaman, priest, priestess, or medium, often attempts to "send" the offending spirit "into the light," because the spirit needs to progress in its evolution and spiritual development.

The notion of spirit possession poses problems for psychologists because it is an implicit explanation as well as a description. Vincente Crapanzano defined it as "any altered state of consciousness indigenously interpreted in terms of the influence of an alien spirit" (Crapanzano 1977, 7). Others have defined possession more behaviorally, noting that the possessed person appears to be invaded by a different personality who manifests through changes in that person's physiognomy, personality, voice, and motor function. A differentiation can also be made between forms of voluntary possession, or incorporation (as experienced by, e.g., shamans and mediums) and involuntary possession (as experienced by, e.g., victims of hexes or malevolent spirits).

Bourguignon (1974) distinguished between *trance* (i.e., an altered state of consciousness not linked to cultural concepts of possession but in which spirit messages can be delivered and spirits contacted) *possession trance* (i.e., an altered state of consciousness in which there is radical dissociation without subsequent recall accompanied by spirit-manifested speech and other spirit-directed behavior), and *possession* (i.e., behaviors associated with spirit invasion that do not directly involve altered states of consciousness, such as spirit-induced illness).

Peters and Price-Williams reported that shamans in eighteen out of the forty-two societies they surveyed engaged in spirit "incorporation," ten in out-of-body experiences, eleven in both, and three in some different kind of altered state of consciousness (Peters and Price-Williams 1980, 397–415). Peters and Price-Williams have also compared the experience of these altered states of consciousness to a rite of passage in which an episode of panic or fear yields to insight; a new integration of various elements of one's personality results from this process.

Winkelman's cross-cultural survey of forty-seven societies yielded data demonstrating that at least one practitioner in each populace demonstrated the induction of an altered state of consciousness associated with role training. The specific induction procedures included mind-altering substances (e.g., alcohol, opiates, psychedelics, stimulants, tobacco), auditory stimulation (through drumming and the like), exposure to extreme temperatures, sexual abstinence, social isolation, sleep induction, sleep deprivation, food restrictions, induced convulsions, excessive motor behavior, and extreme relaxation. Winkelman's analysis indicated some distinct patterns regarding incorporation and magical flight. However, Winkelman found cases of profound altered states of consciousness that involved neither incorporation nor magical flight. He presented a unifying psychophysiological model of these altered states of consciousness: "a parasympathetic dominant state characterized by the dominance of the frontal cortex by slow wave discharges

emanating from the limbic system" (Winkelman 1992, 198), interacting with various social variables.

Michael Harner (1980) and others have cited additional ways in which shamans alter consciousness, for example, jumping (e.g., the 16–24-hour *ut* ceremonies of Korean shamans), mental imagery (e.g., the visualization practices of the Tamang shamans of Nepal who "see" their tutelary spirits prior to incorporating them), and chanting (e.g., the repetition of monotonous incantations by Taiwanese shamans). Often, shamans use two or more procedures simultaneously to alter consciousness. Korean shamans combine jumping with drumming, and the Arapaho Indians smoke a ceremonial pipe and rub their bodies with sage in addition to using drums. Andrew Neher (1961) has demonstrated that drumming can produce brain activation by coinciding with the theta EEG frequency (about 4 to 8 cycles per second) through auditory driving. Others have built on and extended Neher's work, finding that theta brain waves were synchronized with monotonous drumbeats of 3–6 cycles per second, a rhythm associated with many shamanic ritual themes. Others have found trends toward enhanced positive mood states and an increase in positive immune response as measured by a concentration of salivary immunoglobulin A (S-IgA) during shamanic drumming, and another team has reported that rhythmic drumming had a salubrious effect upon group members' immune systems, as measured by increased natural killer cell activity (see Krippner 2002 for references).

Shamans also use naturally occurring altered states of consciousness, dreams being the primary example. Some shamanic traditions deny that they alter consciousness; Navaho shamans exhibit prodigious feats of memory in recounting cultural myths, and use sand paintings, drums, and dances, but they downplay the effect these procedures have in bringing about a shift in their states of consciousness. Several similar examples may make it more appropriate to speak of shamanic "shifts of attention" rather than shamanic "states of consciousness" as a universal hallmark of the practice. Paradoxically, shamans are characterized both by an acute perception of their environment and by imaginative fantasy. These traits include the ability to construct categories, the potential for pretending and role-playing, and the capacity to experience the natural world vividly. During times of social stress, these traits may have given prehistoric shamans an edge over peers who had simply embraced life as it presented itself, without the filters of myth or ritual (Berman 2000, 81).

Putative "parapsychological phenomena" are frequently said to accompany shamanic practices, and a few investigators have used psychological methods to study these claims. For example, Patric Giesler conducted several studies with members of what he termed "Afro-Brazilian shamanic cults." Both "shamans" and "initiates" attempted *remote viewing* to locate hidden objects as well as a task involving distant influence on ritual objects. He concluded that "cultists did not demonstrate [anomalous effects] on the laboratory tasks" (Giesler 1986, 123). Indeed, members of control groups obtained the only significant results. Nevertheless, this is a provocative area of shamanic lore that deserves additional investigation.

Shamanic Healing

The shaman's healing function is a primary focus of his or her repertoire and skills. Body and mind once were seen as a unity, and so there was no sharp division between physical and mental illness. Pain and other symptoms were viewed as sources of information that could be used in diagnosis, as were the client's dreams, "aura," or "energy field," and unusual life events.

Shamans seem to know how to mobilize the expectancy of their clients. This is one of the components of effective healing described by E. Fuller Torrey (1986), the others being a shared worldview, the appropriate personal qualities in the practitioner, and procedures that empower the client. Jerome Frank and Julia Frank (1991) added that all effective healing practitioners resemble shamans in that they bolster their clients' sense of mastery and self-efficacy by providing them with a "myth" or conceptual scheme that explains symptoms and supplies a "ritual" or procedure for overcoming them.

Procedures used by shamanic healers vary, but they may include diet, exercise, herbs, relaxation, mental imagery, surgery, prayers, purifications, and various rituals. Specific treatment procedures depend upon the diagnosis

and the cultural traditions. If a community member appears to be suffering from soul loss, a shaman needs to search for that client's soul, restoring it before the client succumbs to a terminal condition. Diagnosis will determine whether the soul has been stolen, has been spooked away from the body, or has simply strayed during some other activity. Treatment will aim to recover the soul through "soul catching" or similar procedures.

Each shamanic society has its own diagnostic classification of diseases and their causes. Some causal agents that result in sickness are the breach of a taboo, karma for past actions (including those from a past life), the intrusion of a foreign object into the body (usually by sorcery), and a jealous neighbor casting the evil eye. In recent years, many shamans have added the germ theory of disease to their etiological schema and may refer some clients to allopathic physicians if such physicians exist in the neighborhood. Shamanism is basically an open-ended system; it can be modified, altered, revised, or changed due to the demands of historical circumstances and community requirements.

Symbolic manipulation plays a major role in shamanic healing. The drum may serve as the vehicle with which the shaman rides into the spirit world during altered states of consciousness. The blowing of smoke toward the four directions may represent an appeal to the guardians of the universe's four quarters. For shamans and their communities, any product of human imagination represents a form of reality. As a result, mental imagery and imagination play an important role in shamanic healing (Noll 1985).

Shamanic healing usually involves the client's family and community. Richard Katz (1981) proposed that rituals of transformation are the essential link in introducing a *synergistic healing community.* He noted that by providing experiences of *transpersonal bonding,* these rituals enable individuals to realize their communal responsibilities and sense their deep interconnectedness. Even when a client must be isolated as part of the healing process, this drastic procedure serves to impress the community with the gravity of the ailment.

There are shamanic methods of healing that closely parallel contemporary behavior therapy, hypnosis, family therapy, milieu therapy, psychodrama, and dream interpretation. Torrey (1986) concluded that shamans and psychotherapists demonstrate more similarities than differences in regard to their healing practices.

The State of the Field

The psychology of shamanism is a growing field, as evidenced by the acceptance of symposia on the topic at several annual conventions of the American Psychological Association, the creation of the Society for the Anthropology of Consciousness (a division of the American Anthropological Association), and the publication of the popular magazine *Shaman's Drum.* Articles on shamanism sometimes appear in such scholarly journals as the *American Ethnologist, Current Anthropology, Anthropology of Consciousness,* and *Ethos.* Since 1984, the Independent Scholars of Asia have sponsored annual international conferences on the study of shamanism. There is an International Society for Shamanistic Research, a group that has sponsored several international conferences.

The impact of shamanism is reflected in the call for preserving the Earth's ecology, as well as in the practice of evoking positive imagery in the treatment of personal and social distress and attending to people's spiritual emergencies and crises. Many people see the quest for healing the planet as basically a shamanic journey, requiring of all human beings a development of their shamanic capacity for sensing the connection of all living beings.

PSYCHOPATHOLOGY AND SHAMANISM

Since the inception of academic interest in shamanism during the second half of the nineteenth century, there has been a long-standing anthropological and psychological debate over the status of a shaman's psychological well-being. Essentially, this debate pits those individuals who argue that the behavior and psychologi-

cal states associated with shamanic practices are the result of diagnosable mental pathologies against those scholars who assert, to the contrary, that shamans are psychologically well-adjusted individuals who have honed culturally valued, therapeutic skills. Indeed, the positions in this debate range from the view that shamans are nothing other than culturally sanctioned schizophrenics or neurotics who display dissociation, sexual or behavioral deviance (or both), and often paranoid thoughts of persecution, to the view that shamans are some of the most intelligent, well-adjusted, creative, and insightful members of their communities.

This pervasive interest in psychopathology in the context of shamanic studies is grounded in what are easily two of the most dominant perspectives found in multidisciplinary work on shamanism: investigations into the psychological state of the shaman and the therapeutic efficacy of shamanic healing (Atkinson 1992). In the first of these perspectives, the shaman is viewed as suffering from numerous forms of psychopathology and mental illness, in the second, as a healer. In recent years, however, discussions of shamanism have largely shifted away from exploring shamanic practices primarily in terms of psychopathology and abnormal psychology, and have instead focused attention on what a growing number of scholars hold to be universal psychobiological structures underlying shamanic practices cross-culturally (Atkinson 1992, 310).

Early Assessments

The link between shamanism and psychopathology has its roots in early anthropological publications that attempted to draw links between shamanic practices and what was deemed at the time to be a psychotically based behavior known as "Arctic hysteria" *(piboktoq)* (e.g., Bogoras 1907). By the midpoint of the century, with psychoanalytic theory broadly influencing social scientific theorizing and research, much of the discourse on the shaman's mental state shifted to interpretations characterized by the work of such anthropologists as Ralph Linton (1956), who believed that shamans were less psychotic than neurotic. That is, shamans were seen as individuals suffering from psychological conditions not unlike those evidenced by individuals diagnosed with clinical hysteria. This view of the shaman as neurotic, however, was also challenged during this same period by authorities like Erwin Heinz Ackerknecht (1943), who argued that it is more often than not cultural practices rather than clinical syndromes that dictate the experience and behavior of shamans cross-culturally.

One of the most polemical positions on shamanism and psychopathology to arise during this time was found in the work of George Devereux (1956, 1961; see also Spiro 2001). Throughout his career, Devereux decidedly rejected the notion that the cultural values and norms that shaped shamanic behavior and allowed shamans to function well and serve their communities made it impossible to see their practices and states of consciousness as evidence of psychopathology. According to Devereux, shamans suffer from a definite psychological illness—comparable to schizophrenia—that, while perhaps able to enter remission through wider social acceptance, is never completely cured. At best, Devereux argued that shamans should be understood as neurotics who are able to partially mask their symptoms by utilizing socially sanctioned defense mechanisms. Ultimately, however, Devereux asserted that despite the fact that the shaman's role is often to some degree culturally sanctioned, the behavioral and cognitive concomitants of shamanic practices are "ego dystonic"—that is, discordant with the maintenance of a healthy ego boundary—and "quite obviously culture dystonic"—that is, in strict opposition to those norms and values deemed necessary for the transmission and perpetuation of a given culture through time (1956, 29).

During this same period, the basis for a less exclusively pathological rendering of the shaman's psychological state and therapeutic practice was advanced by the famous French anthropologist Claude Lévi-Strauss (1963). Lévi-Strauss argued that the therapeutic efficacy of shamanic practice is embedded in a "shamanic complex" that integrates a threefold experience: that of the shaman's specific psychosomatic states, that of the suffering patient who undergoes a tangible bodily experience ensuring psycho-biological transformation, and the audience or public, who also participate through their social influence in effecting a cure (179). Drawing from psychoanalytic theory, Lévi-

Strauss then outlined an argument that was based on the assumption that, although the shaman is potentially a neurotic (182), in his performance as healer, he serves as a "professional abreactor," aiding the patient to intensely relive the initial situation or event that is held to be the etiological basis for the patient's current condition (181).

Lévi-Strauss further suggested that even though the shaman may display pathological thinking, based in subjective experiences that do not correspond to an objective reality, the shaman should still be viewed as an astute healer who is comparable to a modern psychoanalyst, in as much as he is able to provide a sufferer "with a *language* by means of which unexpressed, and otherwise inexpressible, psychic states can be immediately expressed" (198). This more positive orientation toward both shamanic states of consciousness and the therapeutic efficacy of shamanic practices through an explicit connection to psychoanalytic theory was of course also pursued by Carl Jung (see Dourley 1996).

A less pathological rendering of shamanic states of consciousness was also put forth by Mircea Eliade (1989 [1964]). Eliade saw shamans as individuals who, having undergone an initiatory crisis involving a period of illness or psychosis, filled a culturally valued role by interacting with the spirit world on behalf of their community. Anthony F. C. Wallace (1966) took a more or less complementary stance when he argued that although shamanism may have its roots in psychopathology, the cultural and social value associated with the shaman's abilities to enter into trance states and effect cures for those in the community suffering from various forms of illness also had potentially positive effects for the shaman's psychological well-being. According to Wallace, shamans are individuals who have suffered from multiple psychological and physiological disorders, and who without the community's acceptance, garnered through their role as a recognized and valued healer, would certainly have developed more debilitating psychological imbalances such as those associated with schizophrenia.

Another key article supporting a more moderate viewpoint is found in Julian Silverman's (1967) discussion of some similarities between shamanic states of consciousness and reactive forms of schizophrenia. For instance, according to Silverman, the types of cognition and behavior associated with each results from a discernible patterning of psychological states (e.g., feelings of fear, guilt, impotence, and failure, leading to isolation and estrangement, leading to the narrowing of attention and sensory deprivation, leading to fusing of higher and lower referential processes, and resulting in an ensuing cognitive reorganization) (23). That said, Silverman further argued that the extent to which each form of cognition and behavior is variously interpreted as pathological or curative depends specifically on the cultural context in which it occurs.

One of the most telling arguments against a pathological view of shamanism to arise during this period is found in the context of Horacio Fabrega and Daniel Silver's (1970) work with Zinacanteco shamans in Mexico. According to Fabrega and Silver, most of the research that links shamans with psychopathology has been grounded in unsystematic and impressionistic observations (471). In their study, which compared shamans and non-shamans in a single community along a number of differing social and psychological parameters, Fabrega and Silver found that in light of rigorous statistical data there is little evidence that shamans and non-shamans in Zinacanteco communities differ from each other substantially in terms of psychological criteria. Moreover, noting the great variation in the psychological characteristics of Zinacanteco shamans, Fabrega and Silver importantly suggested that this evidence for variability within the group should serve as a caution to those researchers who make assertions regarding the psychological homogeneity of such cultural subgroups as shamans.

From Diagnosing Pathology to Descriptive Phenomenology, and Beyond

With the cultural and social changes that occurred during the 1960s and early 1970s (e.g., interest in Eastern philosophy and meditation, and the pervasive use of psychotropic drugs), there occurred an important shift in both academic and popular understandings of consciousness that significantly affected the way that shamanism was viewed by scholars interested in better understanding the states of consciousness characteristic of shamanic practices

(Atkinson 1992, 310). This resulted in what can be viewed as a general movement toward a more descriptive and less evaluative and diagnostic approach. The new approach sought to clarify the phenomenological properties of what Eliade had earlier termed shamanic ecstasy (1989). A number of works sought to sharply distinguish shamanic states of consciousness from those states of consciousness classified as pathological within the interpretive framework of Western psychology and psychiatry. These works also sought to discern the phenomenological specificity of the various forms of trance states that could be associated with shamanic practices cross-culturally (see Atkinson 1992, 310; Walsh 1997; Winkelman 2000).

In these more recent works, a key difference between shamanic and pathological states of consciousness was held to lie in the fact that shamans tend to have control of altered states of consciousness, entering and leaving them voluntarily. In these more recent works, individuals such as Ioan Lewis (1971), who compared shamanic trance to involuntary possession states, are criticized for failing to recognize the distinctive intentional nature of shamanic states of consciousness. Indeed, it is held that shamanic states of consciousness differ from psychopathological states precisely because of the fact that shamans voluntarily enter into these states of consciousness, creating a sharp contrast with the involuntary nature of those states of consciousness associated with individuals suffering from various forms of psychopathology (see Winkelman 2000, 79; Mitrani 1992; Walsh 1995, 1997)

A more descriptive and less evaluative assessment of shamanic states of consciousness is also found in the work of scholars like Richard Noll (1983) who have sought to do systematic comparisons of the phenomenological properties of those states of consciousness associated with shamanic practice and schizophrenia as described in the *Diagnostic and Statistical Manual of Mental Disorders* (DSM). According to these thinkers, there are distinct differences between shamanic and schizophrenic states of consciousness, not only in terms of the intentional and voluntary nature of these states, but also in terms of the affective, perceptual, and cognitive entailments associated with each. One such phenomenological distinction includes the fact that shamans are able to discriminate between experiences had in alternative states of consciousness and those had in everyday life, a capacity that is not readily evident in schizophrenics (see also Winkelman 2000). Moreover, in contrast to schizophrenics, whose hallucinatory experiences are largely auditory, shamans tend to have experiences that are primarily visual in nature. When shamans do have auditory experiences, they are often of "a helpful and healing nature rather than the accusatory, intrusive, and paranoia inducing auditory experiences that are characteristic of schizophrenia" (Winkelman 2000, 80). In the same way, the emotions associated with shamanic practice are in general far more positive than those associated with schizophrenia. Schizophrenics tend to experience hallucinations as confusing and totally real, as well as frightening.

In response to accusations that shamans are individuals suffering from various dissociative disorders, including hysteria and hysterical neurosis, many of these more recent works draw a clear distinction. They point out that there is no evidence of amnesia, but rather a persistent self-awareness reported by shamans who enter into these states of consciousness, making shamanic states of consciousness radically different from experiences associated with hysterical and dissociative disorders. In those disorders, defense mechanisms are understood to block an individual's awareness of psychologically disturbing conflicts (Winkelman 2000).

These same scholars also answer the often cited accusation that shamans are epileptics by pointing out that those behaviors comparable to epileptic seizure displayed by some shamans (shaking, tremors, apparent involuntary motions) occur primarily during voluntarily induced alternative states of consciousness. Moreover, they point out that problems associated with diagnosing shamans as epileptics also stem from the fact that this claim is most often based on shamans' recollections of undergoing "fits" during their "initiation crises" (Walsh 1997). The difficulty with basing any diagnosis on recollection lies in the fact that in clinical situations the recollection of past illnesses has proven to be notoriously inaccurate, and therefore a shaman's memory of undergoing "fits" cannot be used as a reliable basis for a clinical diagnosis of epilepsy (Walsh 1997, 105). In addition, many of these same thinkers suggest if these "shamanic fits"

were indeed generalized or grand-mal seizures, clinical data suggests that there would be no conscious memory of the epileptic attack for the shaman to recall at a later date. Finally, whereas organic epilepsy is usually a chronic condition, "shamanic fits" are reported to occur only at the specific occasion of the initiation crisis, following which they spontaneously disappear (Walsh 1997, 106–107).

Some scholars have also questioned the long held assumption that all shamans share distinctive personality types and psychological characteristics (Atkinson 1992, 309)—a perspective that is still evident in the work of a number of scholars who discuss in some detail the "nervous" and "hysterical" tendencies that are deemed to be characteristic psychological traits of practicing shamans. These scholars have failed to closely examine the phenomenological properties of specific individuals' experiences while practicing shamanism, leaving their psychopathological interpretations of shamanic practices open to criticism for all too often conflating the shaman's role with the shaman's psychology (Mitrani 1992). Also, they have not taken into account that "it is very likely that there are as many different kinds of shamans as there are different kinds of personalities within the group in which they live" (Mitrani 1992, 160).

Cultural Neurophysiological Perspectives

During the late seventies and early eighties, a nonpathological rendering of shamanic states of consciousness was also established through a number of insights into the neurophysiology of ritually induced trance states (d'Aquili and Laughlin 1979; Lex 1979; Prince 1982; Winkelman 2000). The work of Barbara Lex (1979) and Eugene d'Aquili and Charles Laughlin (1979) explored the relationship between ritually induced trance states and alterations in the functioning of the autonomic nervous system. For instance, they suggested that participation in ritual activities often serves to affect the balance and functioning of participants' autonomic nervous systems, which in turn may engender healing. Coining the phrase "symbolic penetration," Laughlin and his colleagues (1990) have also extended this model to account for the often powerful psychophysiological effects of symbols in the context of ritual forms of healing cross-culturally. According to these scholars, the symbolic imagery utilized by such religious practitioners as shamans works to directly affect alterations in the connectivity of neuronal pathways in the brain, which may in turn affect both the individual's psycho-physiological response to illness and organization of lived experience.

Further insights into the neurophysiological effects of shamanic practices have been reviewed in a special edition of the journal *Ethos* (Prince 1982; see also Atkinson 1992 and Winkelman 2000), which importantly sets out to demonstrate how shamanic states of consciousness may be intimately associated with the release of endorphins, our brain's endogenous opioid compounds, which produce euphoric, immune-enhancing, and analgesic effects. More recently, Michael Winkelman (2000) has provided an extensive review of the positive neurophysiological and psychoneuroimmunological effects of shamanic practice, ritual, and concomitant nonordinary states of consciousness. According to Winkelman, the positive and health-inducing properties of shamanic states of consciousness are tied to interhemispheric synchronization and coherence, limbic-cortical integration, and integration across the neuraxis that is effectively induced in conjunction with these alterations in conscious modalities.

Conclusion

There has been a long history of trying to understand the relationship between psychopathology and religious experience more generally—see for instance William James's (1991) early writings on the "sick soul." The literature on this subject includes debates over the merits of psychopathologically based explanations of religious and mystical behavior, explanations that range from multiple personality disorder (Bourguignon 1989) to obsessive-compulsive disorder (Dulaney and Fiske 1994) to anorexia (Banks 1996). The ultimate question raised by this literature is whether or not there exists a continuum of psychological propensities that various cultures parse in differing ways, such that individuals can be viewed as "pathological" or "normal" depending on the cultural context in which their propensities are nurtured.

As for shamanism, the weight of evidence seems to suggest that the cultures in which

shamanism is practiced do not often classify these individuals as mentally ill. Moreover, even if only Western criteria are used, according to phenomenological and neurophysiological assessments shamanic states of consciousness differ significantly from psychopathological states. Finally, there is abundant evidence for a strong "monophasic bias" (see Laughlin et al. 1990) in Western thought: nonordinary states of consciousness have been seen in negative terms, and normalcy tends to be defined in "reference to the rationality of ordinary [waking] consciousness" (Winkelman 2000, 78; see also Walsh 1997, 104). At the very least, then, it seems that those who want to see a relationship between shamanic experience and psychopathology must be especially careful to give a close, scientifically based look at the phenomenological, cultural, social, and neurophysiological underpinnings of shamanic states of consciousness.

PSYCHOPOMP

A psychopomp is a conductor or guide of the dead, someone who escorts the spirits of the dead to the place where they will spend their afterlife. Cultural myths concerning psychopomps are found throughout the world.

The shaman's role as psychopomp is a direct extension of the shaman's power to walk between the worlds. Both personal experience and training impact the shaman's ability to conduct the soul to an appropriate afterlife when a person dies. Many shamanic initiations mimic the dying experience, and it is not unusual for a person who has a close brush with physical death at an early age to be chosen to become a shaman.

The souls of dead shamans may contact a person chosen to become a shaman in order to impart knowledge, power, and guidance. In Siberia, a new shaman becomes initiated through contact with the spirits of dead shamans and their spirit helpers (Eliade 1989, 34). Initiation by dead shamans has been known to be common in South America also. Mircea Eliade noted that among the Bororo, a spirit chose the person who would become a shaman by making that person a receptacle for the spirit (1989, 92). Apinaye shamans were chosen by the spirits of relatives, who then put them in touch with other spirits (Eliade 1989, 83). Once a person had direct access to spirits, he or she became capable of doing a shaman's work.

The shaman escorts the souls of the dead to protect the living as well as to aid the deceased. Due to the common belief that newly dead souls can haunt the living and cause all manner of trouble, the shaman's ability to safely remove the departed person's spirit to the afterlife is essential to societal welfare. In some cultures, professional mourners assist in placating the soul of the recently dead, and other people may play important roles in funeral ceremonies. But it is always a shaman who enters trance, leaves his or her body, and conducts the soul to its last home.

In the Tibetan region, the Na-khi and the Moso believed that the soul should rise to heaven, but that there were demons that would try to force the soul into hell. The mythical founder of Na-khi shamanism, Dto-mba Shi-lo, received the power to conquer demons and send souls to the realm of the gods. Dto-mba Shi-lo is the archetype of a psychopomp in this culture and is imitated by those who followed him. Na-khi shamans invoked Dto-mba Shi-lo before conducting souls through the nine infernal regions that must be crossed to have any chance of getting into heaven. Na-khi shamans left the soul in the ninth region; from there the soul ascended seven golden mountains and received the fruit of immortality from a sacred tree before entering heaven (Eliade 1989, 444–445).

Culturally held myths and cosmology are reflected in the shaman's journeys while performing as a psychopomp. For example, if a people believe that the road of the dead scales a mountain and crosses a river, then the shaman must journey up the mountain and over the river to escort the dead on their way. The Bakairi of South America believed the shaman is the person able to safely do this because the shaman already knows the way (Eliade 1989, 326). Among the Manacica of South America, the shaman is reported to have undertaken the journey after the funeral ceremony. This jour-

ney was considered to be very dangerous, fraught with difficulties and challenges that would be impossible for the unaccompanied soul, hence the role of the shaman was altruistic in that the shaman took a risk to benefit the deceased (Eliade 1989, 326).

Different props and procedures may be involved in the shaman's psychopomp work. Indonesian shamans may use a boat in the ecstatic journey that transports the deceased to the afterlife. Among the Lolo of Yunan Province, China, the shaman priest read prayers describing the beauty of heaven at the deathbed. During the funeral rite, the shaman opened the way to heaven by removing beams from the house roof and exposing the sky (Eliade 1989, 355, 441).

Mongolian shamans, historically and currently, work with the dead in several ways. In addition to sending souls to the Lower World in the role of psychopomp, Mongolian shamans also work with the souls of the dead that are still in this world. Shamans still travel to the Lower World to commune with the dead, as well as to find and return the soul of someone who died to this world (Shirokogoroff 1935, 142; Sarangarel 2000, 53). Part of the variety of work with dead souls in Mongolia and Siberia may be related to the belief that people have three separate souls—the *suld* soul, the *suns* soul, and the *ami* soul. (Sarangerel 2000, 50–54). All work with the spirits of the dead is considered extremely dangerous, but it can be undertaken by shamans because of their spirit helpers and allies.

Shamans are considered to be dwellers in two realities, that of the visible world and the invisible. Their ability to peer into the invisible world and take action there gives them the power to be psychopomps.

RITUAL

See “Magic,” Power, and Ritual in Shamanism

ROCK ART AND SHAMANISM

Rock art consists of motifs painted (pictographs) or engraved (petroglyphs) on natural landscape surfaces, such as cave walls and ceilings, open cliff faces or boulders. Rock art is nearly ubiquitous among hunter-gatherer groups living in regions containing natural rock outcrops. Because shamanism is also commonly associated with hunter-gatherer cultures, it has long been assumed that rock art too might be shamanistic in origin. Ethnological and ethnographic studies, along with archaeological analyses (based in part on neuropsychology), support this hypothesis, although shamanistic rock art is more prevalent on some continents and in some regions than others.

Ethnological studies and ethnographic syntheses of hunter-gatherer rock art have been completed primarily in the Americas, Australia, and southern Africa, which is to say those regions where significant hunter-gatherer groups existed at the time of recent European contact. Robert Layton (2001) has usefully distinguished between totemic and shamanistic rock art traditions in these regions. Totemic traditions include those where the creation and use of conventionalized rock art images is tied to some type of group membership, such as a totem, moiety, or clan; often totemic rock art is created as part of increase rituals. Shamanistic traditions, in contrast, are associated with shamanistic belief systems, which themselves typically involve direct individual interaction with the supernatural world through an altered state of conscious or trance. Shamanistic traditions commonly include or emphasize the depiction of hallucinatory imagery resulting from experiences of altered states of consciousness.

Although Australian aboriginal cultures had ritual practitioners who used shamanistic techniques—“men of high degree” (Elkin 1945)—much aboriginal religion was totemic rather than shamanistic. The majority of recent Australian aboriginal rock art, as a result, is interpreted as totemic in nature (Layton 1992), although it has been argued that one tradition of purely prehistoric Australian rock art, discussed below, is shamanistic in origin.

African Rock Art

Synthesis of the ethnographic record for the San (or Bushmen) of southern Africa has demonstrated the fundamentally shamanistic nature of the rock art produced by these hunting and gathering peoples (Lewis-Williams 1981, 2002a). San shamanism emphasized the communal trance dance where, through repetitive clapping, singing and dancing, and hyperventilation, numerous individuals in the group fell into an altered state of consciousness in order to perform cures and other supernatural tasks. Although the Kalahari San still practice these rituals, the Kalahari itself is effectively devoid of rocks, and its residents do not make rock art. San rock art is thus found in other portions of southern Africa where, during the last 2,000 years, the San were isolated in marginal mountainous and desert environments by Bantu-speaking pastoralists.

The Drakensberg Mountains of southern Africa contain a particularly rich and detailed corpus of finely painted rock art, found on the walls of large, open rock shelters that also served as habitation sites. These pictographs are linked to the trance dance and the supernatural experiences that resulted from it, with shamans

responsible for painting the designs. For paint the shamans used, in part, the blood of the bull eland in their pigment, reflecting the centrality of this large antelope to their symbolism, including its dominance as a motif in the rock art and this animal's role as an alter ego of their trickster creator deity, /Kaggen, thereby suggesting that it was extraordinarily potent. Use of this blood infused the painted images with the antelope's supernatural potency, or *n/um,* allowing the paintings to serve as a kind of storehouse of this power. During the trance dance, shaman dancers would turn to face the painted images, heightening their own n/um as the power in the eland's blood flowed from the images to the shamans themselves (Lewis-Williams and Dowson 1989).

San rock art, as a result, is dominated by depictions of the eland; human figures shown with ritual accouterments; ritual scenes, especially of the trance dance and rainmaking; and therianthropes—conflations of different animal species into supernatural beings. Included are "flying-bucks," combinations of birds and antelopes, and, especially, combinations of humans and antelopes. Among these are examples showing the hooves, forelegs, and faces of antelope combined with human rear legs and torso, posed in the bent-over and arms-back posture characteristic of San shamans going into a trance, and bleeding profusely from the nostrils, another common occurrence during the trance dance (Lewis-Williams and Dowson 1989). The quantity and detail of San rock art in fact is much greater than the sometimes fragmentary evidence provided by the ethnographic record. The art in such cases has provided a kind of graphic ethnography that has greatly amplified our understanding of shamanism among these now largely extinct indigenous groups.

North American Rock Art

Much of the hunter-gatherer rock art in North America is shamanistic in origin, with the ethnographic record on shamanistic rock art particularly rich in the Far West (Whitley 2000). This includes the Californian, Great Basin, and Columbia Plateau culture areas, each of which was occupied by hunter-gatherer cultures into the late nineteenth century. The ethnography in the Far West illustrates the potential diversity in origins and meanings of shamanistic rock art, in part reflecting differences in the social position of the shaman in various societies more generally. This diversity refutes any argument that shamanism necessarily implies a monolithic or unitary rock art interpretation. Throughout this broad area, for example, rock art was made by shamans at the conclusions of their vision quests to portray their experiences during altered states of consciousness. Yet these vision quests themselves could vary in nature and intent. Commonly, and probably initially, they were undertaken to obtain supernatural power, which was usually manifest in an animal spirit helper. Regionally important animal species, accordingly, are common components of the art and typically these portray the spirit helpers. Stylized human figures, sometimes in dancing postures or with elaborate ritual gear, are also common, illustrating the shaman. But vision quests might also be undertaken to make rain, find lost objects, cure the sick, control game, and, especially, to bewitch an enemy. Each of these may be illustrated in the art in its own way.

In the Great Basin, for example, the bighorn sheep was the special spirit helper of the rain shaman. Because the shaman and the shaman's helper were considered indistinguishable, and because entry into a trance to make rain was considered as a metaphoric "death," "killed" bighorn sheep motifs served as indications of a shaman's ritual self-sacrifice, through trance, intended to make rain. Rainmaking is understandably emphasized in the Great Basin, especially in the dry Coso Range region of eastern California (adjacent to Death Valley), which contains perhaps 100,000 petroglyphs, the majority of which are bighorn sheep. Ethnographic accounts indicate that shamans traveled from great distances to the Cosos, apparently to obtain this special power and to make rain. The very large Coso sites were thus communally used, even if for private rituals undertaken at great distances from an individual's home territory. In the nearby southern Sierra Nevada to the west, in contrast, shamans painted the spirits and events they experienced during their altered states of consciousness at small sites that they owned, which sometimes were handed down patrilineally when shamanism ran in a family line (as commonly occurred). These small sites were often adjacent

to or within a village, even though as potentially dangerous places of power they were avoided by the village's inhabitants (Whitley 2000).

In both cases the supernatural world was considered distinct from the mythic past, and little or no connection existed between mythology and rock art sites, visionary experiences and shamans. More specifically, the art does not portray mythic actors or events. Among Yuman speakers along the Colorado River Valley, however, the supernatural world of the shaman was intimately tied to the mythic past, with the shaman acquiring supernatural power by reexperiencing the creation of the world by the culture hero Mastamho during a vision. Rather than spirit helpers, Yuman-speaking shamans' power was embodied in a vision of the "essence" or "pattern" of the creation, and the acquisition of a song recounting this etiological event. The primary vision quest site for Yuman-speaking shamans, accordingly, was at the foot of Avikwa'ame, "Spirit Mountain," Newberry Peak in southern Nevada. This is the home of Mastamho and the spot where creation took place, and it is the biggest rock art site in this region. But note that (for reasons discussed below) the images created by shamans to portray their visions of creation do not represent identifiable actors or composed events, but instead are intricate geometric patterns, just as their origin songs are made up mostly of nonsense syllables rather than a narrative account of events.

Rock art was also created during shamanistic puberty initiations in southwestern California, along the Colorado River, and on the Columbia Plateau. In southwestern California these initiations involved formal group rituals for cohorts of either boys or girls. These ceremonies concluded by ritual races to a special rock where the spirit helpers, received in their visionary experiences during the initiation, were painted. Along the Colorado River, boys took long ritual runs across the desert, during which their nasal septa were pierced, they had a visionary experience, and they created rock art at designated locations.

On the Columbia Plateau, in contrast, vision questing was both very important and common for all members of society, but was undertaken as a solitary event. Individual boys or girls, usually under the direction of their parents, would go on a vision quest to prescribed, isolated locations. The quest would commonly occur over a period of days, sometimes involving trips to high locations (such as Mount Hood, Oregon), where rock cairns and alignments were built as part of the physical exertion required of the supplicants. The culmination would occur with the painting or engraving of rock art, often at a relatively low spot on the landscape, intended to portray the spirit helper the seeker had received. Non-shaman adults would also conduct vision quests during life crises, such as the birth of a child, in order to reinvigorate their potency. Shamans of course also vision quested in solitary rites, although shamans' assistants were in some areas responsible for repainting the shamans' motifs when these became faint. Columbia Plateau rock art sites were sometimes associated with cemeteries and sometimes with locations of mythic events. But the supernatural world visited by individual supplicants does not appear to have related to mythology or ancestors, and there does not seem to have been any necessary distinction between those sites used by shamans and those used by others (Whitley 2000).

Despite these regional, social and functional variations, some characteristics appear to have been shared by the various rock art traditions in the Far West of North America. Included is the fact that, everywhere, rock art sites were considered to be portals into the supernatural realm. Similarly, the motifs resulting from shamanistic traditions are almost invariably representations of visionary imagery, which of course can be strongly influenced by cultural and personal expectations and training.

The importance of visionary imagery in shamanistic rock art has particularly important implications for the study of prehistoric rock art—that is, bodies of art that have no link to the ethnographic record, such as the Paleolithic cave art of western Europe, dating from about 33,000 to 10,000 years before the present. Likewise, research on visionary imagery has assisted in the identification of the time depth of shamanistic traditions in those regions, such as far western North America and southern Africa, where the recent art is ethnographically known to be shamanistic. Use of neuropsychological information on trance has provided the key to this research (Lewis-Williams 2001).

Rock Art and Altered States of Consciousness

For over fifty years, neuropsychologists had observed regularities in the forms of the mental images experienced by individuals during altered states of consciousness. In the late 1970s, archaeologists began to notice correlations between characteristics of hallucinations, as described by clinicians, and rock art motifs. These clinical reports, along with cross-cultural observations, were synthesized by David Lewis-Williams and Thomas Dowson (1988) into a neuropsychological model (called the N-P Model) of the mental imagery of altered states of consciousness. This model is applicable cross-culturally because all humans share the same neurological and neurochemical systems.

The N-P Model describes the form—but not personal or cultural meaning—of the images resulting from trance and provides a predicted range of image types and characteristics that can be used to test if graphic art in fact portrays visionary experiences. The model has three components: (1) seven common entoptic forms, (2) seven principles of perception during altered states of consciousness, and (3) three progressive stages of trance. The entoptic images (which include phosphenes or form constants) are geometric light patterns that are generated in an individual's neural and optical systems. They include grids, dot patterns, parallel lines, zigzags, filigrees, nested curves, and concentric circles. The seven principles of perception are based on the fact that the mental images of an altered state of consciousness are not normal vision of exterior events but instead are at least partly images in the mind that are unconstrained by real world physics. The images, hence, may be depicted in standard fashion, or they may reduplicate, rotate, fragment, integrate with, superimpose on, or juxtapose against other images. Experiences of altered states of consciousness also commonly progress through three stages: Initially the entoptics are perceived alone; next they are construed or interpreted as culturally or personally meaningful iconic images; finally, full-blown iconic imagery is seen. The principles of perception apply during each of these three stages.

Initially Lewis-Williams and Dowson (1988) used the N-P Model to test whether European Upper Paleolithic rock art was shamanistic in origin. They concluded that at least some of it was. This conclusion has been supported by subsequent analyses (Clottes and Lewis-Williams 1998; Layton 2000; Lewis-Williams 2002b). The N-P Model has also been applied to the European Neolithic (Bradley 1989; Dronfield 1996), leading to the inference that the imagery on passage tombs was inspired by altered states of consciousness.

The somatic and emotional effects of trance have also been examined, allowing for the identification of a set of common metaphors for an otherwise ineffable altered state of consciousness (Whitley 1994, 1998). These metaphors correspond to the widely identified shamanic themes of death and rebirth, aggression, flight, sexual arousal, and bodily transformation. In this case, however, they are linked to a predictable range of embodied experiences that occur during trance, rather than to some nebulous and archaic symbolic substrate. In combination with the expectations of the N-P Model, the identification of these metaphors has helped establish the time depth of shamanistic rock art in those areas where its presence is known ethnographically. Notable in this regard is far western North America, where neuropsychological, iconographic, and archaeological evidence have been combined to suggest that shamanistic rock art was created for at least 10,000 years (Whitley et al. 1999). In southern Africa, similar evidence suggests that shamanistic rock art was made for 27,000 years (Lewis-Williams 1984). And rock art analysis in northern Australia, based partly on the N-P Model and the somatic effects of altered states of consciousness, indicates that the so-called Dynamic figures, dating to approximately 10,000 years before the present, are shamanistic in origin (Chippindale, Smith, and Taçon 2000), despite the fact that later art in this same region is apparently totemic.

As this last circumstance suggests, not all rock art worldwide is shamanistic, nor is all hunter-gatherer rock art necessarily shamanistic. Indeed, some hunter-gatherer groups made and used shamanistic as well as non-shamanistic rock art, more or less simultaneously. Yuman-speaking tribes along the Colorado River in California, for example, created petroglyphs in two shamanistic contexts, shamans' vision quests and puberty initiations, both of which display the kinds of imagery expected in trance-

derived art. But these tribes also made large earth-figures, or geoglyphs, that portrayed and commemorated myths. These were used in group ritual pilgrimages that traced the paths of mythic actors across the landscape and, given their narrative nature and function, they understandably lack the kinds of graphic features predicted by the N-P Model. Still, in regions where hunter-gatherer religions were entirely or predominantly shamanistic, shamanistic rock art is the norm. Moreover it is clear that in western Europe, southern Africa, and the Americas, the earliest rock art is shamanistic, signaling the importance of shamanism in the earliest religious beliefs and ritual practices of anatomically modern humans.

SORCERY

See Witchcraft and Sorcery in Shamanism

SOUL RETRIEVAL

Soul retrieval is the practice of recovering and restoring lost soul parts to the person who lost them. The practice is related to the belief that through trauma, abuse, voluntary surrender, soul theft, or black magic, pieces of a person's spirit may be lost. The idea of soul loss is accepted by some modern psychologists as well as by traditional tribal shamans.

The essence of soul retrieval is the shaman's use of the altered state of consciousness referred to as journeying. The shaman, who can be male or female, journeys into nonordinary reality to find the missing parts, heal them if necessary, persuade them to return, and bring the parts back to be restored to the client experiencing soul loss. Restoring the lost soul to the client is believed to increase that person's level of energy, to cure disease, and to recover memories associated with the lost soul part.

Both traditional shamans and modern urban practitioners believe disease results from soul loss. Traditional shamans believe soul loss creates a hole in the person's spirit, and that a psychic intrusion can invade the weakened spirit, leading to physical disease. For this reason, an extraction is often performed before the soul retrieval. Traditional shamans also recognize that apathy, depression, amnesia, and other psychological illnesses can result from soul loss.

Traditional shamans who have practiced soul retrieval techniques include Native Americans, notably the Coast Salish, Tlingit, and other Puget Sound tribes, as well as the Crow and other Plains Indian people. The concepts of soul loss and soul retrieval are also widespread throughout Siberia and South America, particularly in the Amazon and Andean regions. Some traditional shamans distinguish between a "free soul," which is capable of taking flight away from the body, and the "life soul," which sustains physical life (Hultkrantz 1992, 66, 67). If a person is in a coma, for example, the traditional shaman will assume that the free soul is wandering loose or held captive by a practitioner of black magic.

Mircea Eliade noted that some shamans, such as the Buryat, attempt to call the soul back before going out to look for it. If the soul does not come back of its own volition, the shaman will descend to the land of the dead, recapture the soul, and bring it back (Eliade 1989). Calling lost souls is not confined to human sickness alone. The Karen of Burma use the technique of imploring the soul to return to a crop of rice to treat crop failure (Eliade 1989).

Traditional shamans will go into trance to diagnose the problem affecting a client. If the shaman discovers that soul loss is at the root of the client's problem, she will perform a soul retrieval. The shaman journeys to the Underworld to recover the lost part, always with the help of power animals, spirit helpers, or other guides. Once located, the lost soul parts may require persuasion or outright trickery to return with the shaman. The shaman may cajole or offer gifts to the soul part in exchange for its cooperation. The shaman may capture the soul parts in a spirit catcher or with her hands, or the soul part may return with the shaman voluntarily.

On returning to her body, the shaman takes the recaptured soul parts and blows them into the client, typically into the crown of the head, the heart, or the abdominal area. A ceremony

A woman who has become possessed after hypnotic chants and drumming, Haiti, ca. 1950. The men on either side are assistants to the high priest, or houngan, and help to guide the woman through the unseen world. Voudou spirits are usually good. (Bradley Smith/Corbis)

to ensure that the lost parts don't take flight again is often performed. The client who receives the shaman's services may also be required to perform a task, complete a ritual, or tender an offering in thanks for the return of the lost soul parts.

Some traditional cultures believe that soul parts can be stolen, usually as a result of sorcery or black magic. If untreated, the person weakened by the act of soul theft may become ill and die. The shaman called upon to rescue soul parts taken by force may find himself wrestling with the thief during the journey. The shaman calls on the power of his spirit helpers to assist him in defeating the soul thief, rescuing the lost soul parts, and returning the parts to the victim. If the shaman is not strong enough to accomplish this task, he may die during the journey or soon after. The belief that soul theft is possible is not common to all cultures practicing shamanism and is rejected outright by most urban shamanic practitioners.

Modern urban shamans usually subscribe to the traditional shaman's beliefs that soul loss can cause disease. However, contemporary psychological theories, particularly the concepts of self-integration and individuation, often have a greater impact on the urban shaman's practice of soul retrieval. There are classically trained, licensed counselors who use soul retrieval as an adjunct to conventional psychotherapeutic techniques. There are also both licensed and unlicensed shamanic counselors who practice healing techniques that involve trance states as the core of their work.

Carl Jung's concept of the unconscious opened the door for modern psychotherapists to examine less orthodox curative techniques. As psychologists began to understand the link between the conscious, subconscious, and unconscious aspects of the mind, the use of altered states of consciousness as a means of accessing wisdom and memories became more commonly practiced in the psychotherapeutic community. Some psychologists and anthropologists theorize that the shaman enters the collective unconscious while in the altered state of consciousness known as shamanic journeying. The shaman, as well as the psychologist's client, may access race wisdom and experience instinctual drives directly while in trance.

The use of altered states of consciousness has emerged as a significant adjunct to more conventional talking therapies. Hypnosis, neurolinguistic programming, guided meditations, and now shamanic journeying are becoming accepted methods of assisting clients in making changes in their lives. Soul retrieval is a practice that makes use of the altered state of consciousness and the nurturing of the counseling relationship.

One influential proponent of soul retrieval in psychotherapy is Sandra Ingerman, a leading teacher and practitioner of soul retrieval in psychotherapeutic counseling. Her book *Soul Retrieval* is an anecdotal work that describes the practice of soul retrieval in detail and includes many stories of clients who experienced psychological healing after participating in soul retrieval. Ingerman pointed out that for the psychologist, the soul parts are lost in the undifferentiated region called the unconscious, from which the client recovers disassociated contents. (Ingerman 1991, 20). Ingerman's book helped further the examination of shamanic healing techniques within the conventional world of psychotherapy.

A more recent examination of shamanic healing appears in Jeanette Gagan's work. Gagan outlined the wounding of the infant psyche and concludes that parts of the psyche are sequestered from conscious recall as a result of early wounding. In order to complete the developmental task linked to these early childhood traumas, Gagan teaches her clients to do shamanic journeying. Gagan proposed a new branch of modern psychotherapy, which she calls shamanic psychotherapeutics (Gagan 1998, 93).

Gagan's practice involves teaching clients how to engage in shamanic journeying. The journey is recorded and analyzed by both client and practitioner in the context of the client's healing process. Gagan noted that this practice generally leads to faster insight into psychological issues confronting the client. The expression of instinctual drives and repressed emotional states in the safe context of journeying allows clients to release emotional patterns that interfere with developmental processes. Destructive emotional states find expression in and are contained by the boundaries of the journeying experience. Power animals and other internal allies found during the journey can take the place of external nurturing sources that failed to meet needs for bonding in earlier life.

The practice of soul retrieval gives the client the impetus to move forward. The soul retrieval itself demonstrates to the client that he is worthy of effort and attention. The shaman takes personal risks on the client's behalf, facing frightening phenomena in nonordinary reality in order to find, heal, and return lost soul parts. The ritual practice of soul retrieval fills the client's need to be the center of attention, cared for, and nurtured. When returned soul parts symbolize repressed aspects of the psyche, the client is given permission to allow those aspects of self to manifest in his personality. This process furthers self-integration and individualization.

Contemporary traditional shamans still practice soul retrieval with the same beneficial effects that urban shamans provide for their clients. Soul retrieval continues to gain acceptance as part of the repertoire of trance-based practices used by modern psychotherapists. New studies of the way the brain processes ex-

perience, patterns of activity during altered states of consciousness, and the long-term effects of using soul retrieval and trance to heal psychological dysfunction demonstrate the viability of shamanic practices in the modern world.

SPIRIT POSSESSION

Spirit possession, the intrusion or influence of an external spirit, is closely related to shamanism, but the nature of this relationship is debated. Some scholars believe that spirit possession is a type or attribute of shamanism, whereas others believe that spirit possession and shamanism are essentially different though related phenomena. The degree of their relationship depends to a large degree on how each is defined. Spirit possession, like shamanism, is used to describe a wide range of ethnographic phenomena, and the term is often used in imprecise ways. Erika Bourguignon (1973 and 1976) and others have pointed out that spirit possession cannot be defined in terms of certain behaviors, states, and personal experiences in themselves, but rather in terms of the cultural interpretations of those behaviors, states, and experiences. These cultural interpretations vary from culture to culture, and often within a particular culture as well. Modern Western society is often uncomfortable with the concept of possession and tends to reduce it to other types of explanations: medical, psychological, sociological, and the like. Nonetheless, the concept of spirit possession is widely found throughout the world, both in the past and the present. Moreover, contrary to Western scientific expectation, belief in it seems to be increasing rather than decreasing (Behrend and Luig 1999).

It is not easy to provide a definition of spirit possession that will apply in all cultural contexts. The most general definition speaks of the concept of spirit possession as a cultural explanation for perceived changes in a human being in terms of the intrusion of an external spirit. Changes in other animate or inanimate beings or things may also be explained in this manner—thus perceived changes in an animal or even a plant or object such as a stone may be explained in terms of spirit intrusion. Most studies of spirit possession, however, focus on possession experienced by human beings. Similarly, whereas an alien spirit may possess a dead human body, most studies are interested in the possession of a living person.

The form and degree of spirit intrusion may vary greatly. The intrusion may be viewed as the spirit's inhabiting the human body and even taking it over completely, so that the actions and speech of the possessed human is that of the spirit rather than that of the human being. However, possession can also be viewed simply as the spirit's exerting control or influence over a person, which leads to states, abilities, or actions that the person would not otherwise exhibit. Bourguignon observed that possession can involve "alterations in consciousness or in capacity" (1973, 15). Hence possession is often used as an explanation for illness, fortune or misfortune, and the like, as well as for altered forms of consciousness. Many scholars of possession use the term trance to refer to altered consciousness, but as Vincent Crapanzano pointed out, trance is merely the

most common form of altered consciousness associated with spirit possession, not the only form (1977, 7–8).

Altered states of consciousness, including trance, however, are not always explained as possession. Scholars have noted that there are mystical, supernatural, or religious explanations as well as nonmystical, naturalistic, nonreligious explanations, and that both can coexist in the same culture. Nonmystical explanations include modern Western psychiatric and psychological or physiological explanations, but nonmystical interpretations can also be found in indigenous non-Western cultures. For instance, Ioan Lewis pointed out that the East African Samburu interpret certain trance states exhibited by young warriors as an emotional expression of assertive masculinity (as do other related groups such as the Masai) (Lewis 1989, 35–36).

Many scholars have observed that the most common type of mystical explanation besides spirit possession is that of the absence or journey of the affected individual's soul, an aspect of it, or (in cases in which humans are believed to possess multiple souls) one of the individual's souls. This explanation is often connected with shamanism. Lewis pointed out that the explanations of possession and soul loss can both exist in the same culture, and that in some cases at least some degree of soul loss may be seen as necessary for possession to take place. In the case of Haitian Voudou, for example, a possessing spirit is believed to displace one aspect of the human soul known as the *gros bon ange* (big good angel). Lewis disagreed, however, with Luc de Heusch's suggestion that soul loss, or a depossession of the self, is always a precondition for possession (Lewis 1989, 40).

Spirits that engage in possession include a wide range of spirit types and characters. They include the souls or ghosts of once living people, both ancestors and unrelated persons from both inside and outside the society. Some are supernatural entities that have never been human beings. These spirits may be conceived as benevolent or malevolent (such as angels or demons), though many are more ambiguous in character, being harmful in some circumstances and helpful in others. Many can bring their human associates supernatural gifts of healing, divination, and ability to communicate and interact with the spiritual realm and to manipulate fortune and misfortune to achieve their desires for themselves and others.

There are also various ways that societies view and deal with spirit possession, often depending on the character of the spirit involved. In some cases, possession is sought or encouraged as part of the group's essential public religious practices. This is often the case where the spirit is seen as benevolent, as with possession by the Holy Spirit in some Christian Protestant denominations (e.g., the Pentecostals), though in some cases possession by demons is also desirable in certain ritual contexts (e.g., Balinese religion). Spirit possession may also be sought if the possessed acts as a spirit medium who can communicate messages to and from the spiritual world. If a spirit comes uninvited, however, especially to private individuals in nonritual contexts, the response may vary considerably. If the spirit is seen as malevolent or otherwise undesirable, it is often exorcised (forced to leave the person). On the other hand, if the spirit can be useful, a relationship may be cultivated with the spirit. In many cases the spirit may be initially harmful to the human victim, but the nature of the relationship can be changed. Hence the spirit is often kept but tamed or domesticated so that it can be used for beneficial purposes, or at least no longer harms its human associate. The latter is also trained how to be the host of the spirit and often learns how to be a spirit medium.

Gilbert Rouget (1985) has mapped out a series of useful contrasts that Mircea Eliade, Raymond Firth, and other scholars have made between what they call true shamanism and spirit possession: (1) Whereas in shamanism the human soul journeys to visit the realm of the spirits, in spirit possession the spirits come to visit humans. (2) Whereas the shaman is a master of the spirits and controls those embodied within her, the spirits control the one who is possessed by them. (3) Whereas the shaman's interaction with the spirits is voluntary, this interaction is involuntary on the part of someone who is possessed. Rouget admitted that there are intermediate cases where the spiritual encounter involves elements of both shamanism and possession, as well as cases where the same individual may experience both shamanistic and possessive episodes, but he maintained that the difference between them is still fundamental. Many other scholars, however, believe that the

distinction is too rigid to describe what individuals actually experience (e.g., Crapanzano 1977, 10). Ioan M. Lewis (1989) pointed out that a spirit medium with possessive spirits is essentially a shaman, and a shaman is initially a possessed patient. What Rouget outlined as distinctive contrasts Lewis saw merely as different stages in an individual's spiritual career. Individuals start out as involuntary patients who do not control the spirits that afflict them, and gradually learn to domesticate the spirits so that they can control them and interact with them voluntarily as healers.

The frequency of spirit possession beliefs among the world's many cultures has been examined by a group of scholars from Ohio State University, directed by Erika Bourguignon. Using a sample of 488 societies from all areas of the world drawn from George Peter Murdock's *Ethnographic Atlas,* they found that 74 percent had possession beliefs. In terms of geographic regions, the most possession beliefs occurred among the cultures of the Insular Pacific area and East Eurasia and the least among the indigenous cultures of North America (although the latter figure was still considerable, at 52 percent). The Ohio State group also examined the distribution of trance states and found that trance interpreted as possession was most prevalent in sub-Saharan Africa and the circum-Mediterranean area (Bourguignon 1973, 17, 19).

Possession is important, not only in many indigenous religions, but also in many syncretic religions that have developed from the interaction of world religions with indigenous religious concepts. Among these are a number of syncretic possession cults that have developed from the interaction of Christianity and Islam with indigenous African spirit beliefs and practices. In Latin America and the Caribbean, new Afro-American religions of great creativity and vitality have resulted from the combination of African, and some Native American, religious traits with Catholicism. Among the best known are Voudou (often referred to as voodoo) in Haiti, Santería in Cuba, and a number of Afro-Brazilian religions such as Candomblé, Xangô, and Umbanda. The importance of these religions, (sometimes considered cults) is often underestimated. They play a major role in Latin American and Caribbean society. For example, almost all of the Haitian population practices Voudou, and in 1977 O'Gorman estimated that one third of the Brazilian population practiced some form of Afro-Brazilian religion (O'Gorman 1977, 25). In addition, many of these neo-African religions have taken root in New York City, Miami, and some other cities in the United States.

Syncretic African spirit cults have also developed in Islamic contexts, including sub-Saharan Africa, North Africa, and to some extent in the Middle East, where they have been carried by African slaves or immigrants. Examples include the *bori* cult among the Hausa in Nigeria and Niger, the *zar* cult in Somalia, Sudan, Ethiopia, and Egypt, the *holle* cult of the Songhay/Zarma in Niger, the *sheitani* or *pepo* cult among the Swahili of the East African coast, and certain Islamic brotherhoods *(tariqa)* like the Hamadsha in Morocco. Often these cults do not have distinct boundaries but merge with one another. They are not mere pre-Islamic survivals but represent a creative synthesis with Islamic and Middle Eastern concepts concerning spirits, saints, and religious ritual, as well as with the trance practices of the Islamic Sufi brotherhoods. Orthodox Islam is often hostile to spirit cults. Muslim authorities usually believe that spirits exist (since they are mentioned in the Qur'an) and that they can possess people, but maintain that these spirits must be exorcised rather than bargained with or cultivated. Hence, unlike the situation in the Caribbean or Latin America, only a minority of the people, or certain segments of the population, belong to such cults, although many others make use of the services of practitioners as mediums and healers.

There are a number of common elements that can be found in these African-inspired possession cults. Spirits are called by drumming, dancing, special songs, and sometimes certain incenses or libations. Each type of spirit has its own distinctive rhythm and dance style. Often it also has distinctive colors, attire, and other insignia. Spirits require offerings of their appropriate foods and beverages as well as the blood of animal sacrifice. In the Americas, African gods or spirits are often integrated with Catholic saints; for example, the Haitian Voudou god Ogun is also seen as Saint Peter. In North Africa, possessive spirit cults are sometimes integrated with Islamic saint cults. Whereas this is not often true in other Islamic

African areas, certain types of possessive spirits are equated with Islamic spirit categories and viewed as devout Muslims. Another characteristic of possessive spirits in both Africa and the New World is that they often represent certain ethnic groups or cultural areas that have played a role in the history of the society, both internally and externally. In Haitian Voudou, spirits belong to different nations that reflect ethnic groups or regional areas in Africa, for example, Igbo, Kongo, Wangol (Angola); in Brazilian Candomblé there are spirit groups that are Old Indians and Black Slaves; and in Africa there are often various spirits of foreign ethnicity, including Europeans.

Personal case histories and treatments also follow common patterns. Generally a person can acquire a possessive spirit in a number of ways. It may be inherited from ancestors, or it may simply like the person. Frequently spirits can also be sent by witchcraft. On the other hand a spirit sometimes attacks indiscriminately if someone passes the place where it resides. A spirit may immediately take over the person's body as its own vehicle of expression. During these possessive episodes, the spirit is often said to "climb," "ride," or "sit" on the person. Thus in Haitian Voudou the possessed are called "horses of the gods," whereas in the Swahili pepo cult and the northeast African zar, the possessed is referred to as the "chair" of the spirit. It is more usual, however, for the first signs of possession to be physical or mental illness, barrenness, bad luck, or other misfortunes. Hence these types of spirit complexes are often called "cults of affliction."

The patient is usually sent to a medium or diviner for diagnosis. If spirit possession is diagnosed, the patient is sent to a specialist for treatment, who may recommend exorcism or appeasement. These two opposite types of treatment, however, are sometimes accomplished in very similar ways, with the spirit being enticed to speak through the patient or the attending spirit medium and say what it wants in terms of an offering of food, drink, and other desired items (e.g., flowers, incense), sacrifice, dress, or ceremonial or musical performance. If a permanent relationship is envisioned, these desires should continue to be met periodically. In such cases, the relationship between the spirit and its human associate is basically contractual and is often envisioned as a marriage. If such a spirit is one that normally interacts with its human associates through possession trance, it will also usually ask for initiation into an organized spirit cult group, generally requiring an elaborate and expensive ceremony that lasts at least several days and sometimes much longer. Often possessed people are reluctant to do this because of the cost of such a ceremony as well as the ritual obligations it will bring, but will concede to the spirit's demands once they are reminded through additional illness or other troubles that initiation is necessary for their well-being. After initiation, the spirit may want further rank within the cult, which entails the payment of fees, special ceremonies, and demonstration of competency in healing and divining. Cult members may eventually reach the stage where they head their own cult groups.

Non-African spirit possession may show both similarities and differences from these patterns. One Pacific island culture that is well known for its spirit possession practices is Bali, a small island in the Indonesian archipelago. Bali practices its own version of syncretic Hinduism. Possessive trances are very common in Balinese society and integral to its religion. Jane Belo (1969) reported that spirit trances take a wide variety of forms. There are cases like those described above where possession is signaled by physical illness, strange behavioral episodes, or altered consciousness, which, after diagnosis, lead to careers as healers and mediums. Belo listed two types of spirit mediums that follow this pattern. One type consists of shaman-like healers and diviners who use possessive trance to contact the deceased ancestors of their clients. The second type are institutionalized trance mediums for their possessive gods during temple ceremonies. As in many African-inspired spirit cults, these mediums undergo an initiation that is spoken of as marriage to the god. The gods are also called to possess them in similar ways through music, incense, and offerings; once possession occurs they are dressed in their god's preferred attire.

In contrast to these two types of mediums, there are people who regularly undergo ceremonial possessive trance without experiencing a prior diagnostic illness or altered state. These include (1) dancers who fall into a wild possessive state because of wearing the masks of the Barong dragon and the Witch Rangda during public ritual performances; (2) followers of the

Barong dragon who also go into a wild but very prescribed trance, first attacking the witch, then falling unconscious to the ground, then being revived by the Barong and stabbing themselves in the chest with their daggers, before being carried off and revived in the temple; 3) people who occasionally go into possessive trances at temple festivals; and 4) young girls who are chosen by their villages, because of their ability to go into trance, to become possessed by the gods and dance during village rituals. Thus in Bali there is unsolicited possession that is transformed into controlled mediumship; solicited possession that is expressed as dance; and possession that, although culturally encouraged in ritual contexts, remains violent and uncontrolled, even though it follows a prescribed pattern.

Although most members of modern Western societies view spirit possession as exotic and unusual, spirit possession was not all that uncommon in the past. Possession beliefs were found in ancient Greece, the best known cases being the possession trance of the Delphic oracle at the temple of the god Apollo and the wild ecstatic behavior of the devotees of the god Dionysus. Many of the ancient peoples of the Middle East, including the Jews and early Christians, believed in possessive demons. In the New Testament, one finds both negative and positive possession, the former as illness-causing demons that Jesus cast out, and the latter in the possession of the disciples by the Holy Spirit, which resulted in their speaking in unknown tongues. Exorcism of demons, or the Devil, continued in Christianity, especially within the Catholic tradition, where it still occasionally takes place. Possession by the Holy Spirit has often received less emphasis due to its revolutionary potential, but it has been common during certain revival periods, including the transatlantic Protestant revival of the early eighteenth century, the formation of independent Pentecostal and Holiness churches in the early twentieth century, and the more recent Pentecostal and charismatic movements. Mediumistic possession by spirits of the dead also appears in the Spiritualist tradition, which gained a large following for a period of time in nineteenth-century United States and Europe. In France a unique form of spiritualism known as Kardecism also developed during the nineteenth century. Both the Pentecostal movement and Kardecism have considerable influence in current Latin American religious practice (Bourguignon 1976; Taves 1999).

Western conceptions of spirit possession have often caused misunderstanding of spirit possession in other societies. The Christian emphasis on the exorcism of demons has made it difficult to understand that in many non-Western traditions possessive spirits are often not viewed as demonic and that treatment often involves appeasement or negotiation rather than exorcism. Similarly, Christians often fail to see the similarities between Christian possession by the Holy Spirit and spirit possession in other contexts, especially because it is often not the Supreme Deity who possesses but other, often intermediary, spirits. One of the most misunderstood religions in this regard is Haitian Voudou, perhaps because of its obvious syncretism with Christian Catholicism.

Nonmystical explanations of possession in Western society have also led to questionable interpretations. Possession has often been explained as psychological pathology. Possessed people were described as "mad" or "crazy," and as the fields of psychology and psychiatry developed, those who were possessed were described as suffering from weak nervous integration, or mental problems of neurosis (quite often hysteria) or psychosis (e.g., paranoia, schizophrenia, or multiple personality disorder). Many more recent psychologists and anthropologists suggest that instead of being pathological, possession beliefs and practices may be psychotherapeutic. Moreover, many have pointed out that in cultures where possession is seen as a normal and expected occurrence, it should not be viewed as abnormal (e.g., Bourguignon 1973; Crapanzano 1977. See Lewis 1989, chapter 7, for a useful discussion of possession and psychiatry.)

Psychological interpretations have often been combined with sociological observations about the role that possession plays in various societies and the social positions of those who usually undergo possession. Bourguignon and the Ohio State group observed from their statistical studies that possession trance was correlated with large complex societies with a high degree of social stratification and rigid social roles (Bourguignon 1973). Many others have focused on internal social correlations, pointing out that many possession cults are primarily associated with women and secondarily with

lower-class members of highly stratified societies. The explanatory theories offered for these latter associations tend to focus on one central argument: that such cults act as therapeutic outlets for psychological frustrations and socioreligious exclusion suffered by marginal members of the society (e.g., Kennedy 1967; Crapanzano 1973).

One of the most influential elaborations of this argument is Ioan M. Lewis's theory of peripheral possession, expressed in his *Ecstatic Religions,* originally published in 1971, which proposes that persons in "peripheral situations" (women in male-dominated societies and other subordinate groups) are afflicted by "peripheral spirits," which are not central to the maintenance of the society's morality system and are, in fact, often of extraneous origin. Lewis suggested that such spirits are used as "oblique strategies of attack" in order to command attention, redress grievances and exact concessions from superiors (Lewis 1989, 26–27 and 105). In contrast to peripheral possession, Lewis posited "central possession religions" where "men of substance compete for positions of power and authority in society at large" through possession by spirits which directly sustain public morality (28). Lewis pointed out that, like peripheral possession, central possession arises in response to acute societal pressures, but that here such pressures affect the society at large in the form of harsh environmental or external political constraints (30).

Many subsequent studies of possession have continued to rely on Lewis's model, but others have challenged his characterization of peripheral possession cults by arguing that they involve more intrasexual than intersexual competition, provide a legitimate avenue of power and authority, are not vindictive weapons against the more powerful, and are not amoral or even peripheral (e.g., Wilson 1967; Bourguignon 1976; Crapanzano 1977).

More recently, scholars have pointed out that although possession may serve the functions that Lewis and others have noted for certain individuals or subgroups in certain circumstances, possession cannot be explained adequately in functional analyses that do not also address spirit possession as a symbolic system that conveys meaning. A number of scholars have stressed possessive events as communicative texts and applied various techniques of textual and semiotic analysis. Many have also stressed that the idiom of these texts, possession, is culturally constructed, and adopts the model elaborated by Clifford Geertz (1972) of the cultural text, as stories that the society tells itself about itself.

Since the language of possession is highly symbolic, it can convey many different levels of meaning and personal interpretation. Moreover, it can reflect unavowed aspects of society that could not be expressed through other means, and expresses them in powerful metaphorical dramas, enacted in human form but attributed to the spirits. Some scholars have noted that those possessed often occupy a position in society that makes them culturally appropriate to play this role, to become mediums for the expression of the unexpressed. Hence spirit possession can be seen as a positive social role rather than an indication of social deprivation, and possession itself can be seen as "an integral part of the whole culture" (Lambek 1981, 83).

Various studies have proposed certain core messages that are expressed through possession in specific societies, often pertaining to societal, cultural, or cosmic contradictions. Others see the messages as more diverse, expressing many different aspects of cultural identity as well as historical consciousness, where different spirits represent the various internal and foreign influences that have impacted the society and the wider world connected with it (see, e.g., Giles 1999). Some recent scholars have thus viewed possession as "a form of knowledge" as well as "a way of knowing" through embodiment (Boddy 1994, 424). The possessed person not only knows the spirit world, but also the knowledge encoded through it, by embodying spirits.

A number of studies have examined how possession relates to modernity and the new global society. Far from disappearing, possession seems to be increasing, serving as a means of interpreting and sometimes contesting sociocultural change and globalization (Behrend and Luig 1999). Another recent line of inquiry concerns how the self is perceived, how it is viewed as an agent of action, and once again, how this relates to the body. In possession, neither the body nor the self are self-contained, and the self as acting subject (possessing spirit) is also divorced from the self as object (person possessed), hence pre-

senting a very different model from that usually found in modern Western culture.

SPIRITS AND SOULS

The ethnographic literature on shamanism is predominantly written by individuals who were socialized in a Judeo-Christian cultural context. From the time of the sixteenth-century French Jesuit priests taking Roman Catholicism to South and North America and the Russian Orthodox explorers of Siberia in the seventeenth century, the tribal epistemologies of indigenous shamans have been filtered through Judeo-Christian cognitive categories for supernatural concepts. Thus, the literature on shamanism is unfortunately filled with accounts of "spirits" and "souls" as supernatural agents interacting with shamans. How much understanding is lost in the translation of indigenous concepts of the supernatural into Judeo-Christian ones is incalculable. However, the literature on shamanism generally makes the following distinction: Spirits are entities or energies that act as agents of both ill and good on the person of the individual shaman and on the community. Spirits are originally external to the individual identity, physical body, and essence of the shaman, though they can merge with it. This can happen through possession of the shaman by spirits or through the possession of spirits by the shaman, thus enabling the shaman to draw upon an external power source to assist in healing and divination. Souls, on the other hand, are inextricably bound to a physical body. In the Judeo-Christian tradition, one human body hosts one immortal soul. However, in European pagan antiquity as well as in many shamanic societies, an individual body can have two or more souls. One of the shaman's souls can leave the body and then return to it, a phenomenon called magical flight. After the death of the physical body, souls can then become spirits (for example, ancestor spirits).

Spirits

There is no single satisfactory definition of the term *spirit* that can be universally applied to all shamanic cosmologies. Mircea Eliade put it best: "Several volumes would be needed for an adequate study of all the problems that arise in connection with the mere idea of 'spirits' and of their possible relations with human beings; for a 'spirit' can equally well be the souls of a dead person, a 'nature spirit,' a mythical animal, and so on" (Eliade 1989, 5–6). Eliade therefore focused on the relationship between shamans and spirits. Shamans may be possessed by spirits either voluntarily or not, they may control spirits (spirit mastery) to the point that spirits become the instruments or slaves of the shaman, they can summon the spirits to be present during a ritual, or they can serve as mediums for communicating with the spirits and receiving vital information from them. Many shamans have reported over the centuries that some spirits even act as teachers during the long and difficult period of training to become a shaman. For example, Waldemar Jochelson reported meeting two Koryak shamans in Siberia who claimed that, while in solitude, "the spirits appear to them in visible form, endow them with power, and instruct them" (Jochelson 1905, 47).

The sheer magnitude of trying to comprehend the spirit world of even a single indigenous form of shamanism is illustrated in the massive volume *The Psychomental Complex of the Tungus* by Sergei Mikhailovich Shirokogoroff. In his classic 1935 study of the forms of shamanism among the Tungus "ethnical units" of Siberia, Manchuria, and Inner Mongolia, Shirokogoroff included an "Index of Spirits" that contains no less than 514 spirits—and this does not include a list of hundreds of other Manchu spirits printed elsewhere in the book. Furthermore, it must be remembered that the spirits at work in a given tribe or geographical region are in constant flux, endlessly coagulating and dissolving. Shirokogoroff compiled these lists in the five years prior to 1917, the date of his last fieldwork among the Tungus, and he admitted that by the time of the writing of his book in the early 1930s, some of these spirits might have disappeared from the lives of the Tungus and other new and unclassified spirits might have introduced themselves. Although change has certainly occurred since that time, prior to the Russian Revolution, there is still a strong belief in spirits and souls in Siberia at the beginning of the twenty-first century.

One of the most glaring examples of cognitive bias generated by the Judeo-Christian worldview of interpreters of shamanism is the tendency to label indigenous spirits as either "good" and "beneficial" or "bad" and "harmful." As is the case with current Western folk psychology about the influence of "good" and "bad" genes on a person's life and fate—analog-

ical constructs that essentially function as "spirits" do in indigenous societies—to label spirits good or bad is to bring in moral absolutes where they have no place. Again Shirokogoroff's classic ethnographic work, which contains the most comprehensive material on the natures and roles of spirits and souls in a specific ethnic complex of shamanism, is useful:

> In fact, the Tungus spirits cannot be classified according to the schemes of evil and good, malevolent and benevolent spirits, as is often done by authors adapting the spirits of other ethnical groups to that of their own or to that with which they are most familiar. The Tungus actually do not distinguish such two extremities—any spirit may be malevolent, benevolent or neutral, which depends chiefly on the human attitude and human art of managing the spirits. Perhaps some of the spirits are particularly malevolent or benevolent or neutral, but in the Tungus mind there is no such a grouping as "evil" and "good" and the most benevolent spirits may become malevolent, and the most malevolent spirits may become neutral and even benevolent. The Tungus distinguish spirits according to their power. (Shirokogoroff 1982, 121–122)

Spirits *are* power.

Spirit Mastery

Definitions of what constitutes a shaman generally cast spirit mastery in a central role (Shirokogoroff 1982, 271; Ohlmarks 1939, 353; Eliade 1989, 93; Firth 1967, 296; Lewis 2003, 51; Landy 1977, 417; Siikala 1978, 334; Harner 1980, 20; Noll 1985, 448; Vitebsky 1995, 10–11, 22). Shirokogoroff's definition of a Siberian (specifically, Tungus) shaman is often applied cross-culturally in the literature on shamanism: "persons of both sexes who have mastered spirits, who at will can introduce these spirits into themselves and use their power over the spirits in their own interests, particularly helping other people, who suffer from the spirits; in such a capacity they may possess a complex of special methods for dealing with the spirits" (Shirokogoroff 1982, 269). Only certain spirits in a given culture can be mastered by shamans, for others may be higher up the ladder in a hierarchy of spiritual powers. For example, among the Tungus the Supreme Being and certain master spirits may be propitiated and appealed to by shamans for their assistance—usually in calling the animals for a hunt or mastering lesser but still powerful spirits—but they cannot be enslaved by shamans for their ritual activities.

Some spirits are energy sources embedded in sacred environments (certain groves or forests) or geological structures (such as mountains, caves, or quartz crystals) and can be propitiated but not directly mastered by shamans. Some animal spirits (e.g., bear), some nature spirits, and even dead ancestors—particularly if they were shamans—can be mastered. Many spirits are vain and must be praised by shamans even though the praise is a sham, and many are greedy, especially for food, and must be left delicious treats. *Tutelary spirits, helping spirits,* or *assisting spirits* are the terms for the mastered spirits, and the more spirits a shaman masters the more powerful that shaman is judged to be. Among the Tungus, a master shaman may have more than 100 spirits under his relative control, assuming he treats them individually with the proper respect by offering appropriate sacrifices and by singing their songs to summon them. If a shaman forgets a spirit song or makes mistakes in singing it, the spirits will be offended and will not appear. But spirit mastery is a highly precarious activity. The shaman attempts to control powers that often resist him, and often these spirits are at war with one another and can cause great calamity, which can result in the failure of a healing or divination ritual. Additionally, the shaman risks madness, physical disease, or even death if he cannot control the spirits.

Spirit Possession

Few issues concerning shamanism have generated such disagreement among scholars as the notion of spirit possession. Do shamans master, or possess, their spirits, or are they possessed by them during their rituals? There is evidence for both in the literature, and it is not always an easy distinction to make in practice. Spirit possession is a universal theory of mental distress and disease, and shamans do report becoming possessed during their initiatory illnesses, and sometimes even later in their lives, if they lose power or are weakened by sorcery or other mis-

fortunes. Among the Tungus, as with many other groups around the world, people can only practice healing as shamans after first being healed. For shamans, recovering from the initial sickness means they can now master the spirits that caused the illness. Shamans routinely administer exorcisms to their clients as the recognized treatment for healing diseases caused by spirit possession. After the paradigmatic 1968 study of Erika Bourguignon of Ohio State University, which found that possession trance was correlated with societies of a higher complexity than the hunting-gathering-fishing ones associated with shamanism, the literature on shamanism has tended to downplay spirit possession as a core constituent of shamanism. However, there are magico-religious practitioners, still commonly referred to as shamans, who are essentially spirit mediums who experience possession and who may not even engage in magical flight to other worlds (e.g., Korean shamans).

Souls

The Judeo-Christian worldview allows for only one immortal soul per human body. In centuries past there was much discussion of a more trinitarian concept of human nature—that of body, soul and spirit (mind)—but dualism now reigns in the folk psychology of Christianity. In the earliest European pagan antiquity, the mind-body problem was a trinity. Besides the physical body, there was the seat of personal identity, personal memories, and personal consciousness, called the *thymos* (Greek) or *animus* (Roman), which resided in the chest cavity and which died when the physical body died. Localized in the head was the *psuche* (Greek) or *anima* or *genius* (both Roman), the life force, which was immortal and survived death but which did not carry one's personal identity or memories but instead entered Hades as a simulacrum of the living person, a shadow or shade. Thus, about two thousand years ago, the folk psychological theory of the common person in Europe was that each human body housed two souls.

Åke Hultkrantz of the University of Stockholm, Sweden, has argued that soul dualism is a core belief of most shamanic societies worldwide (1984). The shaman's "body-soul," which can leave his or her body only at death (with some exceptions in some cultures), is associated with the waking, conscious identity of the shaman, and is the seat of his or her personal memories. The "separable soul" or "free soul" is the one that leaves the body during altered states of consciousness (sleep, trance, coma, trauma-induced shock). The shaman learns to bring the separable soul under voluntary control and make it leave his or her body, travel to other sacred realms via magical flight to engage or do battle with spirits, or to retrieve the lost soul of a sick client. Since soul loss is one of the most common theories behind many physical diseases and mental distresses, retrieving lost souls is one of the primary healing techniques of shamans worldwide.

Shirokogoroff admitted that there are multiple concepts among the Tungus (the Manchu, the Reindeer Tungus, etc.) that may be interpreted as multiple souls, but he personally was skeptical of this notion: "I believe that in some instances of very multiple souls . . . we have the ethnographer's complex, his creation and not that which exist in [the indigenous population's] mind" (1982, 54). He therefore wrote of the unitary soul of the shaman, which leaves the body during trance. For the Tungus, shamanism is not only about the relation of the shaman to spirits, but also to souls: "The aim of shamanizing may be: (1) a sacrifice to the souls of dead people, personally and known by their names, and to ancestors in general; (2) the bringing back of the soul captured by spirits, but which can be brought back; (3) the transfer to the Lower World of souls which do not leave this world, without the shaman's interference" (Shirokogoroff 1982, 307). This latter ritual, in which the shaman plays the role of psychopomp (one who escorts souls to or from the world of the dead), is an important one in all shamanic cultures: Souls are considered pathogens that cause disease or death if they do not leave the human world and complete their passage to the other world where the dead reside, hunt, squabble, and long for the company of the souls of the living.

STUDY OF SHAMANISM

See History of the Study of Shamanism

SUFISM AND SHAMANISM

The historical interaction between Sufism and shamanism has been studied by anthropologists rather than by specialists in Islamic studies. At present there exists no study that takes the relationship between Sufism and shamanism as its main focus. One of the reasons for this lack is the controversy about the extent to which Sufism can be considered a genuine Islamic phenomenon. This controversy is closely connected to the question of how Sufism has been influenced by external factors (such as Judaism, Christianity, Buddhism, shamanism, and animism) throughout its emergence and development all over the Islamic world, where it came into intensive contact with non-Islamic and pre-Islamic belief systems.

The mutual contact and influence between Sufism and shamanism became particularly intensive on the geographical and political peripheries of the Islamic world (Central/Inner Asia, the Caucasus, Anatolia, India, and Indonesia). This may be explained by the fact that, compared to the center, Islam was introduced into these regions later (tenth to twelfth century), and it spread primarily in its mystical form. It was the Sufis who transformed the nominal affiliation of the local populations to Islam into active participation. In this form of Islamization it was not so much the contents of beliefs and practices as religious identity that underwent changes. What before had been practiced in the name of an earlier form of be-

lief system came to be practiced in the name of Islam. A similar development may also be observed in West Africa, in the relationship between mystical Islam and animistic practices (the marabout as Muslim mystic, saint, and animist healer).

First of all, the strong syncretism characteristic of Sufism has resulted in its accommodation of numerous pre-Islamic customs, traditions, and belief systems, including shamanism in the above-mentioned regions. This process was not limited to the integration of earlier religious beliefs but also involved the acceptance of popular cult places, such as sacred tombs, springs, and trees, many of which had belonged to shamanism. Secondly, Sufi religious propaganda proved to be influential on account of its simplicity. This simplicity has contributed to the fact that large segments of the population, who insisted on their shamanic beliefs after the victory of Islam, could be won over for Sufism. So, for example, many Turkic speaking tribes of Inner Asia and Anatolia accepted Islam in its mystical form, because it had integrated many shamanic elements successfully.

At the same time, it is also possible to speak of the Islamization of shamanism. Shamanism could survive only in an Islamized form. Since it was incompatible with Orthodox Islam, shamanism had to change as it developed within the diverse forms of Sufism. As a result, shamanism has lost many features and rites that stood in obvious contrast to Islamic religious teachings. Shamanism continued to be practiced by both men and women. In Sufi practice, it has been possible for women to be Sufis. They could meet separately or together with men. In this way, Sufism and shamanism shared a community. The social and ritual functions of the shaman became considerably more limited. The shaman's ritual costume had largely disappeared by the twelfth century. The latest form of that costume appears, however, to have survived (according to some scholars, e.g., Sukhareva 1960; Basilov 1992) in the clothing of the Sufi dervishes (mystical mendicants). The shamanic cosmology with its tripartite division of the universe has been forgotten and taken over by Islamic cosmology.

The interaction and mutual influence between shamanism and Sufism can be demonstrated particularly well in five areas: the cult of saints, healing rituals, ecstasy, ritual clothing, and the preparation of charms. This interaction should not be understood as meaning that Sufism developed directly out of shamanism. In the historical development of religious ideas, shamanism and Sufism are divided by a long period of time. At the same time, there has never been an obvious break in the contact between shamanism and the later forms of Sufism. Although, for example, the shamanic ritual meal, during which the shaman's protective spirits were nourished, is absent from Sufism, some specialists in Islamic studies assume that the ritual consumption of wine in Sufism constitutes a parallel to this (Sukhareva 1960). (The communal eating in some Sufi brotherhoods of Inner Asia did not form part of the ritual, but took place after the ritual.)

Muslim saints have typically replaced shamanic protective spirits. A shaman might have a vision of the Prophet Khydr who came to give a blessing to the shaman. Many shamans imagined their protector spirits in the shape of Sufi leaders *(ishan)* or religious practitioners *(mollah).* In some parts of Inner Asia many people believed that there existed Islamic saints who were the patrons of the shamanic profession as well as of music and singing. Those who were convinced that they were destined to become shamans would go to certain saintly tombs and spend some time there. Legends from Inner Asia, the Caucasus, and Anatolia concerning outstanding Sufi saints who could bring the dead back to life, an ability that Orthodox Islam ascribes to God (Allah) only, emerged from ideas about the power of "big" shamans in Siberia. In Inner Asia, the Caucasus, and Anatolia, as well as in parts of India that had been conquered by Turkic-speaking nomadic groups, the cult of saints became integrated into shamanic ritual practice. Shamans prescribed to their clients that they should spend the night at an Islamic holy place in order to become healed from their illnesses, since it was assumed that the Sufi saint would either heal the patient during his or her sleep or advise the patient what to do in order to regain health. According to the shamanic diagnosis, one cause of the illness could be the displeasure of a Sufi saint. In such cases the shaman assumed the role of a mediator and helped to reconcile the Sufi saint. In Central Asia, traditions of shamanism and the practice of male and female shamans in Uzbekistan, Kazakstan, and

A group of Muslim dervishes, who are devotees of sufism, perform a vigorous twirling dance to render themselves into a state of near trance, mid-twentieth century, Syria. (Paul Almayy/Hulton-Deutsch Collection/Corbis)

Tadjikstan have been preserved and continue (Basilov 1997, 44–46).

The Sufis took over the shamanic healing and its rituals, as well as some functions of the shamans. This is well demonstrated by the role of the dervishes known as *baba*s (men who are sheiks, leaders of a group of sufis) in some Anatolian villages. The similarities between their rituals and shamanic performances were so striking that one could mistake them for old Central Asian Turkic shamans, who had simply assumed an Islamic appearance. They interpreted dreams, acted as rainmakers, healed illnesses, and controlled fertility. In Inner Asia, for example, Sufis were assumed to possess helping spirits who aided them in working miracles, in fortune telling, in healing, and in conducting other shamanic rituals. Sufis accommodated shamanic practices to the extent that it is difficult to tell the difference between a mystic and a shaman. Often the separation of the two is rendered impossible, because one and the same person could simultaneously pose both as a mystic and as a shamanic healer. This became obvious, for example, in the shamanic ritual known in Central and Inner Asia as *kamlanye* (a Russified word from the stem *Kam*).

For some Central Asian and Anatolian groups the concepts of shamanizing and conducting a Sufi *dhikr* ceremony are practically synonymous. In both regions the Sufi dhikr (the central ceremony of Sufi rituals, whose literal meaning is “remembrance of God”) was integrated into the shamanic ritual. It was possible for a shaman to recommend that a patient attend a dhikr ceremony. In spite of the external similarities of some practices applied to induce ecstasy (dance, music, drugs, and the like), there was a great ideological difference between the assumptions surrounding the ecstatic state of the Sufi and the shaman. One of the important characteristics of the mystical state of ecstasy has been recognized and discussed by Islamic scholars. According to them,

the Sufi, whose purpose is to unite with God *(fanā),* does not try to get beside or outside himself. The Sufi stays in himself, sunk in the "sea of the soul," and for this reason it has been suggested that the Sufi ecstasy should more appropriately be called an "in-stasy" (Schimmel 1995, 253). In contrast, during an ecstatic state the shaman's soul is stolen and taken temporarily away by the protector spirits. Even when a shaman is powerful enough to summon his helping spirits, his soul must leave his body in order to enter into contact with the summoned spirits. The shaman's soul tries to establish personal contact with the supernatural world outside his own body. This difference is often ignored, and the two types of ecstasy are regarded as identical, but in actuality one can only talk about similarities in the techniques, not in the contents of the ecstasy.

This technical similarity certainly greatly contributed to the mutual interaction and influence between shamanism and Sufism. Especially in Central Asia, the Caucasus, and Anatolia, the mystical ecstasy was understood in the spirit of the shamanic tradition. The relationship between Sufism and shamanism was often not understood by the practicing Sufis themselves, but it was recognized by some medieval scholars. For example, Navoi (d. 1501), himself a Naqshbandi mystic and a Chaghatay poet from Herat, North Afghanistan, recognized the sexual background and connectedness to shamanic practices of some of the dhikr ceremonies that also characterized shamanism (Sukhareva 1960, 49).

There are numerous cases when the dhikr ceremony was used by shamans as a healing ritual. At the same time, the Central Asian shamanic ritual (kamlanye) also adopted many elements of the dhikr ceremony. Either the shamans invited the Sufis to perform the loud dhikr *(jahr),* or they performed it themselves. In many areas the dhikr became the central element of the shamanic ritual (Khorezm). During the kamlanye the participants used the same magical formulas employed during a dhikr (consisting of different names of God), and the shaman could summon both shamanic protector spirits and God and the Sufi saints to help (Sukhareva 1960).

Since dance and spinning around are among the most ancient religious techniques, it is impossible to tell from which source Sufism took over these techniques. The *samā*ʿ (from the Arabic word for "hear") or ritual dancing and singing were techniques used by many Sufi brotherhoods, the best known being the Mevlevis in Turkey (the "whirling dervishes," the order associated with the great mystic and poet of the thirteenth century Mevlana Jalal-ud-din Rumi).

Some of the external characteristics of the Central Asian mendicant dervishes *(qalandār)* are reminders of shamanism. Dervishes who let their hair grow were well known everywhere, a practice reminiscent of some Siberian shamans, who never cut their hair. That could of course be coincidence, but some cases of shamanic influence are much harder to deny. A particularly good example is the remarkable attire of the Central Asian *divana* (mystics possessed by spirits). They wore a hat made of swan feathers and carried a stuff decorated with jingling objects, as well as the jaws of an animal decorated with iron rings (Basilov 1992). The shaman's ritual clothes made out of animal hide or bird feathers, as well as the stuff, are well known in Siberian shamanism. Of course, many other features, such as the contempt for Muslim behavioral norms (for example at the Malamatiya brotherhood) may not have had any direct connection to shamanism.

In addition, mention must also be made of the making of charms, which served the purpose of protecting the wearer from various diseases, the evil eye, jinns, malevolent spirits, and misfortune. Such charms prepared with various magic formulas and Qur'anic verses could be made by shamans as well as Sufis. In shamanic rituals, prayer rugs, rosaries, and Islamic books also played an important role (Basilov 1997, 40).

The interaction between shamanism and Sufism described above cannot be regarded only as a phenomenon of the past. It can still be observed in Central Asia, Anatolia, Pakistan, and other regions of the Islamic world.

T

TANTRISM AND SHAMANISM

It is possible that Tantrism, since it is so widely accepted, may originate in a shamanic past and that it may have the ability to incorporate and to influence shamanistic beliefs and practices. Similarities between Tantrism and shamanism can be found in the areas of possession, ritual performance, and the local and secret nature of the transmission.

Tantrism is a stage in the history of all the great Indian religions, Hinduism, Buddhism, and Jainism. The oldest texts in which Tantrism is reflected may be dated to the seventh century, but it certainly extends its roots further back, into an obscure past. This obscurity and the complex character of its beliefs and practices still make Tantrism controversial in the scholarly world. Few of the basic and central Tantric texts are available in critical editions, and even fewer can be read in acceptable Western translations. The interest in Tantric research is, however, growing, and contemporary scholarship has produced important results in the fields of, for instance, Tibetan and Kashmiri Tantrism. Some of these results reveal that Tantrism is an even more diversified tradition than had been thought, but on the other hand they also establish a chronology according to which the Buddhist Tantras, as the texts and rituals are called, are seen as later than and dependent on the Hindu Tantras.

Origin, Beliefs, and Practices

The features of magic, sexual practices, the eating of repulsive or otherwise forbidden substances, and ecstasy, to mention a few of the elements in mature Tantrism, seemed to earlier researchers difficult to connect to earlier phases of Hinduism. Thus, Tantrism's origin in tribal cultures within or outside Hindu India was brought up for discussion. The Himalayan area, especially the lands of Tibet, and even China, was considered a possible place of origin of Tantric practices. Later research, however, has often stressed the possible root of Tantrism in ancient ascetic practices hinted at in Hindu and Buddhist texts. These practices, however obscure, probably began to a great extent in local cults, without a common ideology or terminology (but all probably to some extent shamanistic) and were normalized at a later stage, "Sanskritized," and finally made parts of a greater tradition and provided with texts.

The development is thus from local ascetic and folk traditions of various kinds to a textual subsystem in the great tradition of Hinduism. Due to the lack of evidence, this process cannot be traced in detail, but it seems that possession cults of a shamanistic nature, involving the ritual identification in one way or the other of the practitioner with a divinity, were important elements. This identification, ritual or psychological, was evidently seen as a prerequisite for the acquisition of the power to carry out, among other things, divination, curing, and exorcism; at a later stage, this identification was seen as a prerequisite for attaining supreme union with the divinity. In the latter development, these sophisticated and advanced trends culminate in the eleventh century Kashmiri Saiva, Tantrism's radical monist speculation and extremely rich symbolism using the human body, the nature of language and words, and the ritual process of recreating oneself and attaining the absolute reality, Śiva.

There is now convincing evidence of the primacy of Hindu Tantrism, from which much of Buddhist Tantrism can be derived. There is thus much in common between the two traditions. In brief, Tantrism can be regarded as an aesthetic form of religion, one in which the

A seer from the tantric sect of Hinduism holding a skull, 150 km (95 miles) south of the eastern Indian city of Calcutta on 14 January 2001. An estimated 300,000 people are expected to take a holy dip at the confluence of the river and the Bay of Bengal for the "Makar Sankranti," a festival marking an auspicious day in the Hindu calendar. (Jayanta Shaw/Reuters/Corbis)

participants use a symbolically rich dress, ritual instruments such as yantras and mandalas, geometric patterns or schematic pictures of the palaces of gods and Buddhas, powerful words, mantras, and the like. Using ritual, a master directs the adept through a series of initiations and empowerments, from a state of ignorance to ever deeper knowledge, understanding, and realization. Central are visualization exercises during which deities are made present. In the process the body of the adept loses its human nature and becomes subtle and deified. Every stage in the ritual process leading up to the identification with the deity is symbolically emphasized in various ways. There is in the beginning of the process a stage usually called "the entrance into the mandala," discussed further below, which seems to involve a kind of possession experience during which the adept loses individual human consciousness. This fits into the Tantric basic ideology, with its focus on striving after divine identity.

In addition to this often complicated ritualism and sophisticated psychology, other points of interest may be found. The Tantric traditions incorporate vast mythologies as well as extensive hagiographic literatures. Here a rich corpus of legends and folklore is woven around famous Tantric masters and illustrates the ritual process and its parallel activities in the human mind. In these hagiographies, Buddhist and Hindu, the masters, accomplished magicians and perfected ones, *nāths* and *siddhas,* demonstrate many abilities that may be called shamanic, such as the ability to fly, to become invisible, and to contact supernatural beings, often female, in order to gain knowledge and receive initiations. These powers are often said to be gained after considerable difficulties, pain, and suffering. Scholars interested in comparative mythological or folkloristic motive studies will find here a rich field of research.

Hindu Tantrism and Shamanism

What has been mentioned above in a general description of the basic elements of Tantrism is of course true for Hindu Tantrism. In the ritual process, attention has been drawn especially to one moment, the so-called *āveśa,* the "entering," or "entrance into the mandala," also evident in the Buddhist Tantras; what happens during this stage can be compared with shamanistic possession. The term *āveśa,* variously prefixed, is found carrying different meanings in Hindu texts from the Upaniṣads and onwards. It also occurs in Kashmiri Saiva texts, such as the *Mālinivijayottara Tantra* and the monumental exegetical commentary *Tantrāloka* by the eleventh-century sage Abhinavagupta. As has been seen, one of the basic purposes of Tantrism is the ritual and psychological transformation of the performer into the

deity, and the term *āveśa* denotes this very process. Thus it can point to the deity's subtle penetration of the ritualist, as well as to the taking of possession of the ritualist at the initiatory entrance into the mandala. As with shamanistic trance, the description of this experience in the texts makes it possible to interpret it as possession in the psychological sense, as the adept is said to tremble, shake, and lose consciousness.

The texts do not offer many explicit details, but it seems evident that what is found here is ritual possession, also found in other stages of the ritual, where the identification with the deity, leading to the acquisition of the divine power and ability, is emphasized.

Buddhist Tantrism and Shamanism

Buddhist Tantrism is based on the same concepts and practices as Hindu Tantrism, and seems in fact to be derived from it. To ritually transform oneself by creating a subtle body, to visualize the deity, and then to become one with it is also here the central process. The āveśa ritual is found also in Buddhist texts, among which the *Kālacakra Tantra* commentaries, the *Subāhuparipṛccha Tantra,* and a few accounts of Tantric activities in Tang, China, may be mentioned.

In one of the subcommentaries in the *Kālacakra* corpus of texts, the *Sekoddeśaṭīkā,* we are offered a few details. The passage in question concerns the initiation or consecration, *abhiṣeka.* The initiation is carried out in the mandala, which is purified and protected from the demons. The purification also includes the candidate and all the other participants, as well as the ritual instruments. After the purification, the deities are invoked, and contact with them is established, just as a shaman enters trance, having been possessed by a local spirit. As the candidate is about to enter the mandala, the moment of *krodhāveśa,* "the entrance of the Wrathful One" has occurred. A later Tibetan commentator explained this stage by saying that the candidate has to generate a *krodha,* a wrathful god, and get hold of its identity. The text then says that the candidate will threaten the demons and evil forces with his body, dance even if he never has been able to do that before, and sing with sounds incomprehensible to men and other beings. He has acquired all the qualities of the god and has lost all sense of modesty and shame. Thus, the candidate behaves as he does because the deity has entered his body and is in control of his body and mind. Other texts mention that this possession is established for the purpose of prognostication. If the state of possession ceases by itself, the ritual goes on with further purifications, after which the candidate finally is led into the mandala. If the possession does not cease by itself, the master responsible for it stops it with the appropriate mantras. Thus the significance of possession in Tantric rituals seems to be parallel with that of shamanism.

Interestingly enough, a ritual very similar to the one just described is carried out by contemporary Newar Buddhists in Nepal. As David Gellner (1992) reported, the participants, especially the women, are apt to tremble and shake, that is, show signs of possession, when about to enter the mandala. This can be compared with other shamanistic performance practices of other Nepalese peoples.

Further details of the āveśa ritual are given in some texts found in the Chinese Buddhist canon. A few of these texts are associated with the Indian Tantric masters Vajrabodhi and his disciple Amoghasiddhi, both active during the Tang dynasty. In the biography of Vajrabodhi, for instance, it is said that a princess was dying and lying unconscious. The Tantric master chose two young girls, wrapped their faces with red silk, and had them laid out on the ground. Vajrabodhi then entered into *samādhi* (a state of concentration attained through meditation) and sent the two girls to Yama, the lord of the Land of the Dead, who allowed the princess's spirit to return for a short while; thus Vajrabodhi used his power to accomplish something similar to what a Siberian shaman accomplished by his own descent to the Underworld. In other episodes, the Tantric master used children in a similar way. They had to be young, preferably seven or eight years old, without any marks on their face, perfect physically and mentally. After fasting, the child was placed on a platform, and its eyes were covered while mantras were recited. Then the child started to shake, which is the sign of possession, and those present could start to ask the deity questions concerning the future and otherwise hidden things.

In the process described above, it seems that the Tantric master first identified himself with

the deity, thus acquiring the power to invoke other gods and make them take possession of the children, in order to answer questions. This model, a master controlling his spirit mediums, has molded segments of Chinese shamanistic folk religions and Daoism.

In the article on Tibetan shamanism in this encyclopedia, the beliefs and rituals of the *dpa'-bos* are described. It is evident that a number of features mentioned there are derived from Tantric Buddhism. It suffices here to mention the beliefs of the spirit mediums that the human body contains "channels" along which the consciousness can leave the body and gods enter and take possession, that the spirit mediums carry a crown almost exactly like the one used by the Tantric practitioners, and that the mediums, just like the Tantrics, have a close relationship with female supernatural beings, who protect then during their séances, and who teach them and inspire them. Similarities also exist between the Tantric visualizations of the deities and the spirit mediums' visions of their gods.

Final Remarks

Possession involving exorcism and divinations are features of Tantrism. The term for possession, *āveśa,* covers a range of meanings, from possession in the psychological sense to the subtle and mystic union or merging with the supreme reality. There are scholars who see the Tantric identification with the god as having its root in older possession cults, while others see Tantrism as a sort of hiding place for heterodoxy and alien practices entering at later stages. Thus Buddhism, which otherwise stresses meditation and the calming of the mind, is according to this view still able to offer shelter to possession and similar phenomena. According to a third view, the meeting of Indian Buddhism with Tibetan and Chinese culture led to syncretism and the absorption of local ritual practices, sometimes of a shamanic nature. No final answer can be given here, and it seems probable that what has happened has been a combination of all these processes.

TRANCE DANCE

Dance is central to much of the ritual in which direct contact with the spirit world is sought by means of altered states of consciousness, or trance. Dance is involved in the induction of trance, the central events of the ritual, and often the termination of trance as well. Such rituals may be shamanistic in the narrow sense; for example, among the Paiute Indians of the American Southwest, a shaman/healer goes into trance to fetch the patient's abducted soul. The spirit journey is acted out in dance. Such a shaman receives his ritual dances in dreams. By contrast, in sub-Saharan Africa and the African diaspora, spirits may be invited to possess the bodies of their faithful. The purpose of these rituals may be healing, divination, exorcism, veneration, or some combination thereof.

Historically, there has been a movement from trance rituals to "attenuated" ritual, as in Japan, where the trancing is mimed, to outright theatrical performances, nowadays often to entertain tourists, whether in Brazil or in Bali.

Though dance is virtually universal in human societies, its definition is strikingly complex. Some students of the subject (e.g., Kaeppler 1996) prefer to speak of "structured movement systems," noting that not all such systems may correspond to a local concept of dance. In Western societies, marching is such a system, but one distinct from dance. Some societies may not have a concept of dance at all. For J. L. Hanna, "dance is human behavior [that is composed of] purposeful, intentionally rhythmical and culturally patterned sequences of nonverbal body movements . . . [having] aesthetic value" (1979, 5). G. P. Kurath wrote: "Out of ordinary motor activities, dance selects, heightens or subdues, juggles gestures and steps to achieve a pattern, and does this with a purpose of transcending utility" (1960, 234).

Among the common features mentioned are patterned body movements, rhythmic behavior, symbolic meaning of specific steps, movements and gestures, and aesthetic criteria, which permit one to judge the competence of the dancer. Consequently, dance has local and traditional meanings that may not be evident to outsiders. Music is intimately linked to dance; whether vocal or instrumental, it may even be supplied by the dancers themselves, as among the !Kung. In its absence, dance is unlikely.

Rather than dealing with religious dance in general, this discussion focuses on ritual dance in relation to trance. Trance, here used in the sense of an experience of an altered state of consciousness, is a psychophysiological state other than that of the ordinary wakefulness of workaday life. When integrated into a system of religious rituals, its cultural meanings vary, but they fall into two broad groups: visionary experiences, which are remembered, as in the case of the shaman, and possession experiences, which are generally followed by amnesia. In the former, trancers encounter one or more spirits in their visionary experiences, in the latter the spirits are temporarily embodied in humans, who enact the presence of spirits to an audience. In spite of their diversity, altered states of consciousness share a number of features, such as modifications of perception of time, space, and self, and of sensory modalities, including the perception of pain. They also involve changes in memory, suggestibility and learning and are often followed by euphoria and heightened levels of energy.

Altered states of consciousness are induced in numerous ways, among which various combinations of dance, music, chanting, incantations, and other ritual activities are most frequent. Other induction techniques are austerities, such as isolation, fasting, and mortifications, meditation, and the use of plant sub-

stances, notably hallucinogens. These techniques rarely involve danced rituals.

Dance is used primarily where altered states of consciousness are induced intentionally. Ritual altered states of consciousness are best understood in terms of dissociation, a psychological phenomenon involving a temporary narrowing of the focus of attention, where one part of the personality takes over the whole field of awareness and behavior. Dissociation may also occur spontaneously in response to stress. Other spontaneous, involuntary altered states of consciousness also occur, such as seizures, fever states, and so-called mass hysterias. Such negative trances, whether explained as possession or in some other way, for example as attack by witches or hostile spirits, require curing, either by accommodation with the spirits or by exorcisms.

So-called dancing manias, as in the European Late Middle Ages (Hecker 1970), are rare. Here, as in certain neurological illnesses, such as the so-called Saint Vitus' dance (Sydenham's chorea), the term "dance" is applied to disordered involuntary movements. C. Casey (1999) reported an instance of contagious compulsive dancing among Hausa school girls in Nigeria, in which this behavior followed the watching of Indian movies. Locally, this was interpreted by some as due to spirit possession, by others as resulting from witchcraft.

Where trance is desired, dance may be used as one element in its induction and also to act out the interaction with the spirit. Among the Hunza of Northern Pakistan (Sidky 1994) a shaman *(bitan)* acts as a diviner and healer. He puts himself into trance during a public ritual by inhaling the smoke of burning juniper branches. Dancing as musicians play, he invites the mountain spirits to come. When they come, his movements are said to be no longer voluntary but to be controlled by them. He listens to the voices of the spirits as they emerge from the drums. A sacrifice is performed and the bitan, in trance, drinks the blood, which is believed to be passed through him to the spirits. He then conveys their messages to the audience. This sequence is repeated several times. The last phase of the ritual is a rapid circling dance, ending in the collapse of the bitan.

Rapid circling, whirling, twirling are frequently noted both in the induction and the termination of trance. Trancers speak of dizziness as a sign of the oncoming trance or of disturbances of equilibrium as a way of (temporarily) separating the soul from the body. Where possession is considered desirable, trance is taken to be evidence of the genuineness of the possession. Its suspected imitation may then cause questioning of the ritual's efficacy, or invite punishment by the spirits.

Dance may be used to induce trance, and it may also be expressive of it, and vice versa: The dance that expresses the interaction with spirits is also used to bring on the trance. J. G. Moore (1982) described a pattern in Jamaican revival services where people are possessed by the Holy Spirit. In what is called trumping and laboring, the dancers imitate the movements and breathing patterns characteristic of trance. This imitation is used to induce the trance state. Here, trancing clearly is learned behavior.

Perhaps the most famous example of dance as a means of entering into a state of religious transcendence as well as of experiencing it is that of the Mevlevi dervishes of Konya (Turkey). The ritual performances of these "whirling" dervishes, an order founded in the thirteenth century by Rumi, the great Sufi teacher and poet, can now be seen on their international tours. The ritual, called the Sema, begins with a eulogy of the prophet Mohammed and ends with a reading of the Qur'an. The dance is repeated four times, each section having its own mystical theme; the music, movements, and clothing all have symbolic meanings. Beginning with arms crossed, then stretched out, one hand pointing downward and the other up, the men dance with eyes closed. They circle about the dance space while rotating, keeping a fixed distance from each other. Their faces remain calm and there is no evidence of a loss of balance, even when the music changes and a period of walking ensues. The trance state they are said to experience is a subjective, interior one, for which there is no public evidence.

Possession trance occurs in all parts of the world, but it is most widespread in Africa and the African diaspora and in South and Southeast Asia. There are certain commonalities in each region, but also significant differences. The rituals range from very simple to highly complex, depending partly on the community's resources.

In West Africa (e.g., among the Yoruba of Nigeria and the Fon of Benin) and in Afro-

America (e.g., Cuba, Haiti, Brazil), the spirits, often ancestors, are venerated and invited to participate in rituals. They may be questioned as to their wishes, feasted, asked for advice. Each spirit, or kind of spirit, has a choreographic signature and personal identity. It is this identity that the trancer assumes. This transformation into someone else is a key element in the experience and in the religious and social significance of the ritual. The personalities of the spirits are acted out. They have their own tastes and preferences, dance steps, colors, clothing, speech patterns, preferred food and drink, and so on. Only rarely are masks used, and then only by men. The majority of trance dancers are likely to be women, and they take on the characteristic of male as well as female spirits.

Among the Tuareg of Niger, possession is considered an illness. Most possessed individuals are women. During exorcism, a public occasion, the patient is put into trance while lying on her back. She then dances in a seated position, swaying with loosened hair until she falls back exhausted. The dance is that of the spirit; the collapse signifies the spirit's departure. Here, spirits communicate only by gestures and do not have individual characteristics (Rasmussen 1995).

In the *zar* cult, a spirit religion found in a broad region of Eastern Africa, from Somalia to Egypt, spirits are also said to cause illnesses. The healing rituals consist of induction of possession trance so that the spirit can be identified and questioned. However, healing does not require exorcism. Rather, a permanent relationship is established with the spirit, who is transformed into a helper. The patient becomes a member of the zar group. Spirits have individual characteristics, often, in these days of wide-ranging cultural contacts, those of foreigners (Boddy 1989).

In the Americas, the most elaborate traditions are linked to Catholicism, and African and local spirits are identified with Catholic saints. There are, however, other traditions as well. J. D. Dobbins (1986) described the Jombee Dance of Montserrat as he observed it in the 1970s. By the 1980s this ritual was dying out. Jombees are the spirits of the dead, and the dances were held to question them about illnesses and other life crises. In addition to music, there was food and drink. The musicians played concertinas, drums, and triangles, and also sang. Dancing started with a waltz and four quadrilles, followed by a polka. This sequence would be repeated with increased tempo until someone began to "turn," that is, entered into trance, as shown by disordered, darting movements. Revealed information made the presence of a jombee credible. In the 1990s, the island and its culture were virtually destroyed by a series of volcanic eruptions.

Cuban Santería, Haitian Voudou, and a number of Brazilian religions such as Candomblé, Umbanda, and Macumba are also examples of the Afro-American traditions. These religions are now also found in many cities in the United States and Europe. There are both similarities and differences among them. Many of their rituals are public or semi-public performances in which the spirits are feasted and behave in their characteristic ways. In Haiti, as in Montserrat, European formal dances may start the proceedings. Trance typically starts with the disordered movements of a dancer, who then starts to dance in a manner appropriate to that person's particular spirit with the help of music. There are many spirits: Gran Ezili (grandmother Ezili) is understood to be a powerful old woman. Her dance is called *dos bas* (low back): she is old and bent, dancing in an almost crouching position. Other manifestations of Ezili may be flirtatious and vain. The male spirit Ogou is a powerful angry warrior and behaves accordingly.

Perhaps the greatest elaboration of the South Asian ritual tradition is found in Bali, with its profusion of possession trance rituals and performances, ranging from seated spirit mediums, mostly women, to presentations of masked classical dramas in which female roles are enacted by men (here the spirits are said to reside in the masks, not in the masked dancers).There are male hobbyhorse dancers, male and female kris dancers, and most spectacularly, little girl trance dancers. They are put into trance through the rotational motions of objects, so that they perform like puppets on a string. They embody the visiting village goddess. Their acrobatic dances, performed on the shoulders of men, are not taught.

In the Judeo-Christian tradition, beliefs in possession by harmful spirits have long existed in various forms, and they have made a comeback, particularly in the United States, since the

1970s. Such spirits require exorcism, which includes trancing on the part of the patient so that the spirit can be questioned, identified, and dispatched. Rarely is dance involved. A notable exception was *tarantism,* an affliction whose healing ritual gave its name to a famous dance, the tarantella. Tarantism still existed in Apulia, in Southern Italy, in the 1950s. E. De Martino (1966) reported on the illness, which affected mostly young women. It was thought to be caused by the bite of a tarantula, leading to possession by it. Although the illness was manifested largely by depressive states, it was believed that the tarantula's bite could cause the patient to dance wildly. The therapeutic ritual, repeated annually, had the patient dance to exhaustion. With musicians playing, the patient first lay on her back, then slid about in a circle on hands and knees, beating her head on the floor. Rising, she circled the dance area, holding a colored scarf. She moved about briskly until she collapsed into the arms of family members. This sequence was repeated several times. At the end she felt healed. This outcome was held to be a miracle, credited to Saint Paul. The next day the patient and others like her performed a shorter version of this dance at the church of Saint Paul. Tarantism, both the possession illness and its therapeutic ritual, was once widespread throughout the Mediterranean region.

TRANCE, SHAMANIC

The term trance derives from the Latin verb *transire,* "to cross over," and generally indicates a state in which the subject is sensorially detached from the world and from the surrounding reality. This condition may be either induced or spontaneous, and in many cases, when the subject in question is believed to come into contact with the nonhuman world in the course of the trance, also involves extrasensory abilities.

The trance is an important part of shamanism, since the shaman functions as an intermediary between the world of humans and that of the supernatural. In general, altered states of

consciousness allow communication with the other, nonhuman world. The authors of past anthropological studies have engaged in an ongoing debate on the phenomena of the trance and altered states of consciousness, particularly in the seventies and early eighties (Bourguignon 1973, 1976; De Heusch 1971; Lewis 2003; Rouget 1980).

As part of the debate, some scholars made a differentiation between the trance of possession and shamanic trance, based mainly on the point that shamanic trance entails some form of travel on the part of supernatural beings toward the human sphere, whereas in the trance of possession it is the human or shaman who travels to the supernatural sphere. In shamanic trances the shaman has the ability to dominate the spirit that has possessed him or her, whereas this ability is absent in trances of possession. Finally, the shamanic trance is a voluntary trance, while that experienced by the possessed is not (see Rouget 1980, 73ff.). In fact, it is not always possible to define the boundaries between the trance of possession and shamanic trance clearly. In any case, these and other studies on the subject have formed the basis for an initial attempt at classification and ordering of the so-called ecstatic religions, a category that groups together religions very different from each other, such as shamanism and African Voudou (Voodoo) with its various descendants throughout the American continent and in the Caribbean.

Most of Mircea Eliade's famous work (Eliade 1989) concerned journeys engaged in during the course of trances, focusing mainly on those carried out toward the realm of the heavens by shamans from various parts of the world. It must be noted that though the aspect of travel for the soul of shamans in the course of a trance is one of the main features of shamanism, this is not universally present, nor is it, in fact, the only point at which shamans experience and use altered states of consciousness. The trance is present in the lives of shamans from the moment when they are called to the profession by the spirits, through initiation and for the rest of their lives, manifesting itself in particular during the séances they are called upon to perform. It was most likely these exterior, more theatrical and dramatic manifestations of the trance that for many years prompted various studies to conclude that there must be some link between shamanism and hysteria or other conditions of a psychopathological nature. Fortunately, this interpretation has now for the most part been dismissed, though there are still certain tendencies that continue to persist in applying terminology and interpretations clearly associated with the world of psychiatry and psychoanalysis to shamanism and the shamanic trance in particular.

Generally speaking, shamans are perfectly normal men and women with abilities of concentration, sensitivity, and mental control in most cases clearly superior to those of the average person. Shamans the world over are usually in complete control of their own trances, which they elect to enter into and come out of at will. They dictate the duration of the trance and often decide which supernatural beings they will allow themselves to be possessed by and to which zone they will send their souls.

Shamans may facilitate access to states of trance with the use of psychotropic substances, in particular by using plants with hallucinogenic properties, such as the peyote and ayahuasca (*Banisteriopsis caapi*), widely used in Central and South America, or *Amanita muscaria,* a mushroom used mainly in Siberia. They also enter into trance by using techniques involving deep concentration, in which the marked rhythm of percussion instruments such as drums probably plays an important role. This aspect has been examined in studies on the effects that certain types of intermittent sonorous stimulation produced by the sounding of a drum can have on the brain (Neher 1962), though it must be noted that there is still no convincing proof that the rhythmic sounding of a drum can produce neurophysical effects.

Furthermore, it must also be noted that, in many parts of the world, drums or other types of percussion instruments do not make up part of shamanic paraphernalia. Korean shamans use a fan, whereas in the shamanism practiced in India, particularly in Orissa, shamans from different ethnic groups enter into altered states of consciousness by merely rotating their heads or rhythmically moving a branch with leaves. A chain of thirty-one amino acids called beta-endorphins, produced directly by the human body in particular conditions, was located in the seventies, and it was discovered that these

Bodka, Mongolian shaman, singing in trance to the spirit of her mother. Tsaagan Nuur, Hövsgöl province, Mongolia, 2000. (Courtesy of Eva Jane Neumann Fridman)

had similar effects to those induced by morphine and opium. This discovery was very quickly applied to shamanism, as, apart from their analgesic effects, endorphins can also induce states of euphoria and altered states of consciousness (Prince 1982). These studies recognized that shamanic trances did not consist of a pathological condition linked to upsets in equilibrium and disturbances of a psychiatric nature, but consisted of a state dictated by physical conditions alone, which therefore could, in theory, be experienced by anyone.

On the other hand, it is certain that none of these theories allow a full comprehension of the significance of the shamanic trance, which cannot be understood apart from the cultural context in which it functions. More recently, Roberte Hamayon has discussed the question of whether concepts such as shamanic trance and ecstasy are in fact of any use in understanding the significance of Siberian shamanism (Hamayon 1995). Hamayon saw the application of these terms as masking the tendency, in some way, to demonize shamanism, first on the part of missionaries. Later the more important religions and the excessive medicalization of terms contributed to this tendency. There are, in fact, no words in any of the Siberian languages to describe what we define as trance (see Hamayon 1990, 33). The term *trance* is extremely generic and is used to define manifestations and states with completely different meanings, whose only common features are the physical and exterior aspects (Riboli 2002).

The main function of trances and altered states of consciousness is to allow the shaman to come into contact with the supernatural world, which explains why such states are manifested from the beginning of shamanic activity. In the first phase, that in which the neophyte is called to the profession by the spirits, both the neophyte and community to which he or she belongs believe it is actually the supernatural beings, divinities, spirits, or souls of the ancestors that send and provoke the altered states of consciousness involved. In this first phase, the neophyte has almost no control over his or her trances. The manner in which new candidates

are recruited to the profession may vary according to culture and geographical area, but altered states of consciousness are always present. Whether the neophyte is chosen by his or her group, inherits the profession from a shaman within the family, usually deceased, or is believed to have been chosen directly by the world of spirits and divinities, he or she will in any case have to undergo a fairly long period of apprenticeship during which he or she will be possessed repeatedly by supernatural beings.

Generally speaking this is the phase in which instruction is imparted to the neophyte. Instruction may take place in the course of dreams and visions, and at times may even be stimulated by the use of hallucinogenic substances or take place in the course of conditions that are perceived as states of confusion or illness. In many cases the repeated altered states of consciousness are often profound and violent, and they may be facilitated by factors such as deprivation of food, water, and sleep, exhausting exercise, exposure to very high or very low temperatures or continuous auditory stimulants such as the beating of drums and chants, and social and sensorial deprivation (Winkelman 2000, 70).

The neophyte loses his normal role within the social group, and trances, still uncontrolled, provoke behavior judged to be dangerous, which often infringes on the moral and social rules of the group. In many cases, altered states of consciousness involve cataleptic states of apparent death during which neophytes lie inert in their habitations without giving any signs of life. This particularly critical phase usually corresponds to the period in which the neophyte is kidnapped by supernatural beings and taken to their realm or places of residence. Here the candidate is tortured, often operated on, cut into pieces, purified, and then resuscitated by the spirits responsible for initiation.

The phase in which the neophytes undergo these involuntary body experiences that seem to come from outside agencies does not usually last long, though the process of initiation can last for years. The neophyte comes out of this experience a new person, a shaman, perfectly reinserted into his or her social group. The apprenticeship conducted by the spirits or in many cases by expert shamans means that the shamans can control their altered states of consciousness, once they have been acquainted with the mysteries governing the delicate equilibrium with the supernatural world, a world that from this time onward they will have to be able to control and manage. In this initial phase and up to the moment at which initiation takes place, it is very difficult and probably not correct to make a clear distinction between shamanic trance and the trance of possession, in that the altered states of consciousness that affect the neophyte for the most part bear the signs of possession. Generally speaking, the neophyte who has completed this initial period successfully will be presented as a shaman to the community in the course of initiatory ceremonies. During this time, candidates will demonstrate their skill in public and their ability to control their own trances, which from this moment onwards will cease to be a source of danger for the community.

The relationship has now changed. Initially it was the supernatural world that sought some form of contact with the world of humans and that dictated the rules of the relationship with the neophyte shaman. Now it is the shaman who uses his or her states of consciousness at will to communicate with the world of the spirits, maintaining a balanced position in his or her relationship with the latter and adopting strategies and different types of relationship with the latter for the good of the community as a whole.

Shamans enter into trance on different occasions, mainly to determine the cause of an illness or some form of calamity that has befallen the whole village or a single individual and establish the cure or most appropriate solution for the latter. Altered states of consciousness may also be used to carry out divinations, look for people or objects that have been lost, transform into an animal or another form, fight with enemies (mainly opposing shamans, witches, or wizards), or hold various types of ceremonies, particularly funerals during which shamans exercise their function of psychopomp (one who escorts souls to or from the world of the dead).

The reasons behind the uses, motivations, and causes that require the shamans to enter into trance are many and varied, but as noted above, despite the fact that external physical manifestations of the trance may be similar, at least two different typologies of trance are experienced by most shamans the world over (Ri-

boli 2002). The first type includes those altered states of consciousness in the course of which a specific supernatural being comes to the world of humans and is lodged within the body of the shaman. Shamans then assume the characteristics of the being who has possessed them—usually their guiding spirit, a divinity, the soul of an ancestor, a deceased person, or some other supernatural being. Shamans will take on characteristics, particularly when the possessing spirit is in animal form, such as a change in voice and the use of incomprehensible or unfamiliar languages belonging to another world. These trances also entail some form of possession, on the same level as initiatory trances, but the real difference lies in the fact that it is the shaman who has control over the latter and is no longer a passive participant. The shaman can now, to a certain extent, select the supernatural being he or she will be possessed by and for how long.

The second type of shamanic trance, the one on which Mircea Eliade based his work (Eliade 1989), is the journey to other cosmic zones carried out by the shaman in the course of the trance, during which the shaman's body remains on the earth and the soul travels to the heavens or the Underworld. This is no longer a case of possession but rather a state in which the soul of the shaman travels, often together with auxiliary spirits or upon his or her drum, to the worlds that, according to most of the different cultures or ethnic groups, exist above or below the level inhabited by humans. Shamans may also undertake magical journeys throughout the natural (often called middle) world while in a state of trance. As already indicated, the physical manifestations of both types of trance can be very similar: The shaman's body jerks and trembles, he begins to sweat profusely, he experiences sensorial detachment. In both instances, there is a journey. However, in a state of possession, the journey is undertaken by the supernatural being toward the shaman, whereas in the case of the shaman's journey, he is moving toward the world of the supernatural.

In general, travel to other cosmic zones is perceived as being much more dangerous than the phase in which supernatural beings come to the world of humans and possess the body of the shaman. The *Historia Norwegiae* (1880) presents the oldest account of shamanism practiced by the Saami (as reported by Hultkrantz 1992, 139), in which a shaman, in order to cure a woman who had fallen ill after witchcraft practiced by another shaman, decided to send his own soul in the form of a whale to the bottom of the sea. However, this move was anticipated by the other shaman, who transformed his guiding spirit, or more probably his own soul, into sharp poles on the seabed. The poles punctured the stomach of the whale and therefore also of the shaman in his state of trance; he died as a result. Following this, a friend of the deceased shaman, himself a shaman, embarked on another ecstatic journey, and managed to avoid the danger and cure the woman. This account highlights the dangers shamans can incur in the course of ecstatic travel, despite their ability to control their trances, in that they apparently have no control over unexpected events or obstacles encountered in the course of journeys to other worlds.

In conclusion, it is obvious that altered states of consciousness are absolutely necessary for both initiatory trances and the other two types, in order to allow communication and exchange between the world of humans and that of the supernatural to take place.

TRANSFORMATION

Shamanic transformation and shape-shifting has been documented and is well known worldwide, despite the fact that not much specific research has been conducted on the subject. Shamans from many parts of the world are believed to have the ability to change themselves into animals or other forms. In describing shamanism practiced by the Gran Chaco Indians, Alfred Métraux noted how a particularly able shaman transformed his soul into a bird, rodent, and even a piece of wax in order to overcome the obstacles encountered during one of his ecstatic journeys (Métraux 1967, 113). Transformation or metamorphosis into animal form is remarkably common and takes place for several different reasons. First of all, in many geographical and cultural contexts, animals represent the totem and mythical ancestors. On the subject of Siberian shamanism, Basilov reported that the link between shamanism and the more ancient cults of the clan was preserved in rituals and ceremonies; moreover, the shamanic costume emphasized the animal spirit from which the shaman as well as the whole clan descended. The relationship between the clan and the totem animal was later to be abandoned to some extent, but the image of the ancestor-animal still remained for a certain period (Basilov 1990, 31).

Uno Holmberg and Hans Findeisen classified four different types of animals dominant in Siberian shamanic costume: the reindeer, bear, bird, and deer (Holmberg 1922, 14–18; Findeisen 1957). The costumes represented the physical appearance of the animal, which in many cases also functioned as the initiator and guiding spirit, and they often included the representation of the skeleton of the animal in question. The zoomorphic symbolism of shamanic costumes was also an immediate indication of the specific cosmic area in which the shaman was operating: The figure of the bear was linked to the Underworld, the bird to the celestial spheres, and the reindeer or deer to both realms or even to the world in between these two. The Yakut and Buryat, like other groups, also differentiated between white and black shamans according to the world in which the shamans operated (Basilov 1990, 36–37). This distinction did not appear to be particularly clear, but in any case it is interesting to note that for several groups, the Tuvan in particular, one of the main spirits of the Underworld was the spirit of the bear. This is why Tuvan shamans often impersonated the bear in the course of séances dedicated to the Underworld. Another element that links shamanism to the animal world is represented by the connection to the world of hunting and the relationship of the shaman to the Lord of Animals and wild animals in general. The usage of animal skins, such as that of the bear as was the custom in ancient China, was and still is interpreted by the shaman as being equivalent to ac-

quiring the characteristics and powers of the animal itself.

A distinction must be made within the category of transformation according to whether it is only the soul of the shaman that transforms into an animal or other form or whether some form of physical metamorphosis is believed to actually take place. The different interpretations vary according to geographical area and according to different cultures, examples of which are described below.

Wolf-Shaman

One of the best and most complete indications of metamorphosis, training, and ceremonial cycle required for the shaman to be able to transform himself into a wolf was reported by Susana Eger Valadez among the Huichol Indians of Mexico (Valadez 1996, 267–305). Her account tells of the shaman Ulu Tennay, who spent six years training to become a wolf-shaman. The myth surrounding the origins of the Huichol describes that, in the beginning, men were part wolves, who lived in darkness without yet having acquired the art of hunting. One day, a Deer Person allowed the Father of the Wolves to hunt him. While the wolf was devouring him together with his companions, the Deer Person transformed into a peyote. The wolves ate him and acquired great wisdom. They came out of the darkness and into the sun, which gave them the option of choosing to become either wolves or human beings. They chose the second option, and the Father of the Wolves was the first person to construct a temple for the divinities, where a special place was set aside and dedicated to the Kumukemai Uruyare, the Arrow of the Wolves, so that human beings could always communicate with them. For the Huichol, wolves represented their mythical ancestors and were cultural heroes, fast, powerful, cooperative in hunting, carnivorous animals like man, and monogamous animals who chose their companions for life, which meant that the shaman who wished to obtain the status of wolf-shaman had to observe the same rules. It comes as no surprise that many Huichol shamans desire to attain the characteristics and power of wolves.

The account of Ulu Tennay describes the apprenticeship for those who wish to become wolf-shamans, which may continue from five to ten years, during which the candidate must visit five different wolf shrines and complete a precise ceremonial procedure, making offerings of various types. The shrines are dedicated to different colored wolves: red, yellow, white, blue, multicolored, or gray. The gray and multicolored wolves are the most powerful and the weakest are the red. In fact, only in the last two shrines, those dedicated to the blue and gray or multicolored wolves, will the candidate actually learn how to transform himself (it seems that this is a male-only transformation) into a wolf. Not all shamans reach the last level, though this does not affect their ability to become good and powerful shamans.

Only toward the end of the apprenticeship does the candidate meet real wolves, who take him to their lair over the course of various nights where the shaman learns to lose his fear and dance with them. It is believed that the wolves can induce the shaman to see various visions similar to those provoked by peyote. For this reason the candidate also takes the so-called wolf-kiéri plant *(Solandra Guttata).* At the end of the apprenticeship the wolves will show the shaman the place where he will return in the course of the next full moon. At a prearranged time, the candidate will go to this place and perform five somersaults, at the end of which his physical transformation into a wolf will be complete and he will be able to remain in this form for five days and five nights, after which he will have to revert back to human form.

Ulu Tennay, one of the wolf-shamans who completed this apprenticeship successfully, recounted that during his transformation he continued to see his human form though others only saw his animal form. Ulu Tennay's grandfather had also been a great wolf-shaman who would often come to the house with his wolf friends. This theme of the physical metamorphosis of the shaman into animal form is recurrent through Asia, Europe, and North and South America too. In California, different ethnic groups had medicine men called "bear-doctors" who were believed to be able to transform themselves into bears, their tutelary spirit, by simply putting on the bear's skin (Hultkrantz 1963, 99).

The famous Wolf-Rituals were celebrated by many ethnic groups in North America, and Franz Boas reported that for the Kwakiutl, as was the case with the Huichol, the wolf repre-

sented the mythical ancestors of the group, who had lived in times when the difference between humans and beasts was still unclear. The wolf and the marine killer whale were the most important figures in the initiation into the profession, and shamans preserved the shamanic powers of these two animals in the form of quartz crystals, which they could remove from their mouths. The Kwakiutl also maintained that the souls of hunters of terrestrial animals were reincarnated into wolves and those of hunters of marine animals into the killer whale (Boas 1935, 570).

The Copper Eskimo shamans are supposed to have been able to transform themselves into animals by whom they were possessed, sometimes assuming only a few characteristics and other times reaching actual metamorphosis, which would appear to have taken place in the presence of spectators (Jenness 1970, 193). Among the most common forms of metamorphosis were those involving transformation into the white bear, brown bear, wolf, dog, and even white man. Not only did the shamans of different Eskimo groups appear to know the secrets of metamorphosis, but some of them would even appear to have had the power to transform inanimate objects into living beings. Diamond Jenness reported that a shaman by the name of Pannatok, accused of not being very powerful by some of his onlookers, removed one of his mittens and transformed it first into a small, thin man and then back into a mitten and finally transformed both mittens into bears (Jenness 1970, 199).

Jaguar-Shaman (South America)

Shamanic metamorphosis is extremely common in South America, particularly in the Amazon area, where the most powerful shamans are believed to be able to transform themselves into jaguars. The role of the shaman, or *payé* as they are known by most ethnic groups, is seen within the society as being in many ways similar to that of the jaguar in the forest world (Reichel-Dolmatoff 1971, 100). The jaguar represents the sun, fertility, and the energy contained in nature. It is the protector of the forest and because of its color is often associated with fire, its roar being likened to thunder. It is also the only animal who is not controlled by the Master of the Game Animals. Throughout tropical America it is believed that shamans can transform themselves into jaguars and that, in this guise, they can take on the role of the assistant, protector, and even aggressor (Reichel-Dolmatoff 1975, 43). Many groups, among them the Desana and the Tukano, believe that even the souls of deceased shamans are transformed into jaguars. This identification with the feline form is even more evident in certain tribes in Columbia such as the Páez and the Kogi, who call themselves the Jaguar People and believe themselves to be the "children of the jaguar." Araucan shamanism believes that both shamans and sorcerers can transform their auxiliary spirits into animal form, usually that of a bird (Métraux 1967, 206–231).

It would appear that, particularly in tropical and subtropical areas of the American continent, the theme of metamorphosis can be related to the consumption of various hallucinogenic substances. The Kogi in Columbia take the *nebbi kuái* ("jaguar's testicles," or "sperm of the jaguar"), which is actually a substance with hallucinogenic properties whose ingredients are secret (Reichel-Dolmatoff 1975, 58–59). These substances may well give the shaman the illusion of undergoing actual metamorphosis. Once the shaman has assumed the characteristics of the animal, he may carry out both moral and immoral acts. In this new guise, he will be able to destroy an illness and interpret natural phenomena and dreams, or cause harm by possibly intentionally confusing reality with his visions. Jaguars, as large felines, are greatly feared by ethnic groups in the Amazon, and this is probably one of the reasons behind the potential ambivalence of the role of the shaman-jaguar. As is the case with the Tukano, for example, a society with a complex and oppressive series of regulations, the transformed payé may actually be exempt as shaman-jaguar from this society's rigid regulation (Reichel-Dolmatoff 1975, 131). The jaguar, or payé in the guise of a jaguar, may kill and eat any man without distinction, and might also satisfy his insatiable sexual desires by raping women and breaking the moral and social regulations of the group.

Shamanic Metamorphosis in Asia

Metamorphosis is also widespread on the Asian continent. In Mongolia, the Daur believed that

certain animals such as fish, birds, insects, and invertebrates were vehicles for shamanic spirits (Humphrey and Onon 1996, 101). In this case, as with many Siberian groups, it was not the body of the shaman that was believed to be subject to metamorphosis, but his or her soul. A similar concept is present in Malaysia with the Batek (Endicott 1979, 132–141). The members of this Semang-Negrito group believe that some particularly powerful shamans have tiger bodies that they can use in the forest. In the course of the night, when the shaman is sleeping, his shadow soul abandons his human body to enter that of the tiger. In the morning, when the shaman wakes up, his shadow soul returns to his human form and the tiger form that he had adopted in the course of the night goes to sleep in the depths of the forest.

Shaman-tigers are thought to protect those people who belong to their own ethnic group, who believe that without the shaman-tigers the whole community could be attacked by real tigers. Shaman-tigers are as likely to die as normal tigers, except for the fact that, in the case of illness or wounds, they, as shamans, know the cure. But if they were to be caught in a trap, they would face the same fate as a normal tiger, and there would be no escape. For this reason, when the shaman is in tiger form he stays as far away as possible from people, especially hunters, since the shaman-tiger, who often retains some of his human features, may well not be recognized by these features and could easily be killed. In this case, when the tiger body of a shaman is killed by mistake, the human body of the shaman also dies immediately. The opposite may also happen.

A similar concept has also been noted among the Chewong in Central Pahang of peninsular Malaysia, though the shamans, the *putao,* can also take on other forms apart from that of the tiger (Howell 1984, 103–104). The putao has several spirit-guides that enter into his body and unite with his persona. These spirits are often animals, and therefore it is believed that the putao may have one or more *ruwai,* vital spirits of the different animals representing his auxiliary spirits, within him. The putao may take on the features of these animals at will and may teach their disciples or fellow beings the mysteries of acquiring these abilities, on condition that the candidate is not afraid, as any sign of fear means that all teaching will have gone to waste.

In Nepal, the idea that certain shamans can transform into animals is linked to a mythical time, a golden age when shaman had many more powers than they have at present (Riboli 2000, 49). In many ethnic groups, particularly in southern Nepal, shamans who have the ability to transform into animal form, in particular that of a tiger, are known as *gurau,* or *gurao.* At present it is believed that very few gurau exist, and it is maintained that they have more powers than other shamans.

It must be noted that shaman-animals in different cultural and geographical contexts have characteristics different from normal animals. This is generally the case when the shaman is held to be physically transformed, as well as in those cases in which it is believed that it is only the soul of the shaman that undergoes transformation. The Tukano describe the payé transformed into jaguar form as being upside down. Its heart is on its back, and the spinal cord is in the place of the chest. This reversal is to allow these beings extra protection, as a payé-jaguar must be struck on its back, where its heart is, to be killed, whereas hunters usually strike a normal jaguar on its chest.

The Malaysian Chewong believe that putao-tigers will never attack man, and when they hunt in animal form, they always keep a piece of meat to one side for members of their social group (Howell 1984, 103). For the Batek, the faces of shaman-tigers bear similar features to those of the human forms of the shamans (Endicott 1979, 132). The Chepang in southern Nepal believe that in certain cases, the souls of dead shamans may transform into animals whose features or forms are not normal—such a being may not have a face or be missing one of its legs, and if a shaman's soul transforms into bird form, its beak or legs will be much larger than normal (Riboli 2000, 48–49).

In any case, some of the human features are carried over into the animal form taken on by the shaman, who, thanks to this metamorphosis, becomes much more powerful and almost invincible. In most Western religions, animals are considered inferior beings, but in indigenous religions, especially the shamanistic ones, animals are believed to be creatures with unusual powers, abilities, and strength. They do not belong to the world of humans and in many ways are closer to the supernatural world. Many ethnic groups believe that animals have

their own social order, language, and precise rules, often very similar to those of the world of humans. It is therefore not surprising that shamans in various parts of the world, as intermediaries between the world of humans and that of the supernatural, have always sought the means by which they could acquire part of the extraordinary powers attributed to the animal world.

TRANSVESTISM IN SHAMANISM

Transvestism in shamanism is a well-known phenomenon in the traditional cultures of the peoples of North and Central America, Siberia (paleo-Asians or northern Siberians), Central Asia, Malaysia, and Indonesia. In the nineteenth century it was already thought to be disappearing among, for example, the Kamchadals, Itelmens, and Koryaks in Siberia. But despite the struggle against remnants of the past within Uzbek (Basilov 1975), Chukchi, Koryak, and Chuvant communities, this phenomenon could be found in the former Soviet Union, even at the end of the twentieth century.

Most researchers think that the origin of transvestism in shamanism can be found in human psychology, psychophysiology, and psychobiology, which brought into being the archaic dualistic vision of the world. The phenomenon of a man taking on the attributes of the female gender is the most common, whereas the phenomenon of a woman taking on the attributes of a man is seldom mentioned.

Transvestism in shamanism may appear in several ways, from wearing parts of a woman's or a girl's dress during shamanic ceremonies to the phenomenon of a (supposedly) complete sex change. Ritual dressing as a member of the opposite sex during rites is more widespread than shamanism itself and very popular in, for instance, the practices of sorcery and magic. At one extreme, total adoption, even in everyday life, of the clothing, behavioral patterns, and habits of the opposite sex is the most vivid expression of transvestism in shamanism. However, shamans may adopt a less extreme course, changing the way they wear their hair (also practiced by ordinary shamans) and putting on women's adornments. They continue, however, to fulfill their traditional gender role; they are married to women, have children, and do a man's work.

There is also another type of shaman, those who feel the need to change their sex because of psychobiological motivations. They not only change their clothing and habits but also completely change their sexual and social orientation. Such a man would feel feminine, lose his physical strength and dexterity, and speak with a woman's pronunciation (in those cultures where there is a division into men's and women's language variants). He would do only women's work, communicate with women as his close friends, and, finally, "get married" to a man (preferably a close relative, for instance, a cousin). Marriage with a shaman of changed sex is considered to be quite normal in such societies, and usually the partners in such a marriage are faithful to each other, and the marriages last for a long time. The changed-sex shaman takes the whole responsibility of being a wife in such a marriage. Many of them start experiencing a mother's feelings; although they still are physiologically normal males, they want to have children like a woman. In cultures with this practice, the belief is that after a certain period of time, such a shaman can be so deeply involved in a woman's role that all sex indications change. Sometimes it is even believed that a shaman of changed sex can give birth to children.

Vladimir G. Bogoraz (1910) distinguished three stages in the transformation of Chukchi male shamans into shamans of changed sex: (1) change of hairdo, (2) wearing women's clothing, and (3) acquisition of women's habits and skills (involving pronunciation, work, feelings, and emotions), as well as the choosing of a husband and marriage. The first two stages are a characteristic feature of magic and mysticism specialists of lower rank.

Bogoraz observed the same transformations among women shamans of changed sex. They wore a man's clothing, spoke with a man's accent, did a man's job, and sometimes had weapons and participated in men's competitions. Some of them (among the Chukchi, for example) married young girls and fulfilled a husband's "duties": They wore a reindeer leg muscle on a stick and used it as a penis. Such a transformation in a woman often took place after the reproductive period was over, when a woman would have grown children. In the new "family," such a shaman might share her wife with men, but she was considered to be the father of newborn children.

This phenomenon reached its most developed expression among the Zuni *berdache* (Southwestern native North America). Although some of these men may have been individuals born with anomalous genitals, most were normal males (Roscoe 1991, 25). This phenomenon disappeared in the late nineteenth and early twentieth centuries (Roscoe 1991, 194).

The phenomenon of transvestism in shamanism is closely connected with the widespread idea of marriage between a shaman and a spirit, well known to researchers of shamanism in the Far East, the northeast of Siberia, and Central Asia (Sternberg 1925). A marriage between a shaman and a spirit could take different forms. It might occur a single time (during the rite of shamanic initiation), or it might involve episodic sexual contacts with the spirit. It also might be a relationship with the spirit as a constant sexual partner, a relationship that required a sex change from its inception. In such a case, the spirit either filled the sexual needs of the spouse, or required the shaman to be celibate. There have been several hypotheses concerning the sexual link between shamans and spirits based on the phenomenon of transvestism: There is, however, some disagreement among researchers with respect to interpretation.

The idea of a sexual link with a spirit is certainly not always present wherever transvestism in shamanism has been observed. For instance, the Ngadzhu-Dayak and Iban, peoples of

Malaysia and Western Indonesia, do not believe in the idea of a sexual link with a spirit, but they may use the euphemism that refers to such a link to describe the process by which a spirit enters the shaman's soul (Revunenkova 1980). This fact requires further investigation, because this is not the controlled process of spirit incorporation, but rather a shaman's obsession with a female spirit—*sangiang.*

Probably the idea of a lasting sexual partnership with a spirit prevailed in those areas where the shaman actively called or attracted spirits, because, as a rule, the first spirit who visited the shaman was the one who lived with him and whose appearance made the shaman experience a strong sense of ecstasy, sometimes even openly revealed sexual excitement. Usually the partner was the protector spirit, the spirit that initiated the election of the shaman of "changed sex." The first experience of sexual contact with this protector spirit by a shaman of changed sex might be experienced during the rite of initiation. A similar phenomenon might be observed when the shaman was totally possessed by the spirit. This experience, however, was not essential to the incorporation of the spirit, whether of an ancestor, animal, or bird, into the soul of the shaman.

Once a spirit had completed the sexual act with the shaman, it might appear later as a spirit helper, or it might not appear again. The various roles of a spirit in a shaman's life are known not only from observation of actual shamans, but also from folklore known to shamans. For instance, some shamans in Tuva were able to complete their initiation rites only after they had had sexual relationships with spirits of nature, and they observed that in this respect they were like heroes of folklore who had had such relationships (Kenin-Lopsan 1999, 34–44).

Such sexual emotions are quite normal for shamans, and it is possible to explain them by psychophysiological changes that occur when the shaman sinks into an altered state of consciousness: In some stages of this process, a shaman experiences strong sexual excitement and even deeper feelings.

In most cultures, a shaman of changed sex has been considered to be the strongest. This attitude may be connected with the idea that women's shamanism is powerful or, what is more likely, with the idea that the most powerful human being is the one who unites two opposed natures: male and female (and thus high and low, sky and earth, good and evil). From this point of view, transvestism is interpreted (and not only in shamanism) as the neutralization of the opposition of male and female, or as a search of balance between two contrary natures. For people of his own native group, a male shaman of changed sex is neither a man nor a woman, but at the same time both man and woman. Androgyny, a common feature of ancient religions (compare, for instance, the way Śiva is depicted with the left side of his body female, the right side, male) testifies to the same idea of the possibility of the union of two opposed natures reflected in transvestism.

It has been noted that women in certain societies play an important role in shamanism; therefore by the way of shamanic transvestism, male practitioners are also included in such societies (Basilov 1975). The priority of women in shamanism in certain societies is explained by the fact that, due to socioeconomic conditions of women in these societies, women are more inclined to religious activities and sink more easily into a changed consciousness, which is necessary for communication with the spirits. Other reasons for the prominence of women in shamanism in some cultures are not clear and may be closely connected with sexual issues in shamanism in general. A woman's activity as a shaman is very often limited to certain age periods; during the time a woman is able to bear children she is considered to be a weak shaman because giving birth to children damages shamanic inspiration. An interesting fact is that the men of the Kolima Chukchi only perform shamanic séances wearing clothes made of the skin of a foal—clothing that is usually worn by young unmarried girls (Vitashevskiy 1890, 38).

The study of transvestism in shamanism has a long history, the first observations having been made by travelers in the eighteenth century. Starting from the beginning of the nineteenth century, some hypotheses about the nature of transvestism in shamanism have been suggested, among them the idea of the psychopathological roots of this phenomenon; this theory continued to be popular on into the twentieth century (see, e.g., Devereux 1937). Transvestism in shamanism has also been seen as connected with creative development of the

personality. It is interesting to note that Chukchi shamans are often called inspired, referring to the maximal inspiration (creative, ecstatic, sexual) they experience during communication with their cohabitant spirits (Bogoraz 1910). Usually, the first time the shaman feels shamanistic inspiration is during the spirit's first visit, at the time of the initiation rite when the spirit orders the shaman to change sex and the first sexual experience with the spirit occurs. The activation of creativity is closely linked with the development of the shaman's full trance capacity. Modern neurophysiology has been seen as providing evidence for the theory that there is a close relationship between the development of creative potential and extrasensory (shamanistic) talents (Kharitonova 1995, 239–240; Sviderskaya et al. 2001).

Some recent scholars in the field have pointed out that ritual transvestism does not neutralize the gender gap between man and woman; rather the reverse—it enhances gender differences as the shaman takes on different gender qualities. Sexual transformation is thus seen as a symbol of the fact that both men and women have creative natures, an especially important symbol in those cultures in which one of the sexes has no outlet for expression in the sacred sphere (Revunenkova 1980). Transvestism in shamanism has also often been seen as growing out of the awe felt in many traditional societies for those people who had mental and physical abnormalities, who were (and are) considered to be connected with protective supernatural forces (spirits). In many cultures shamans are considered to be close to spirits and deities precisely because of their ability to sexually transform. Thus, a male spirit could find in a male shaman capable of sexual transformation an appropriate sexual partner.

Bernard Saladin d'Anglure draws a parallel between a baby getting the name of an ancestor of the opposite sex and a shaman getting a protector spirit of the opposite sex. This indicates the significance of a shaman (or a child) gaining protector spirits of the opposite sex. This balance of both male and female spirits is desirable in order to have potent supernatural or protective power. This desirability and negotiation between both gender elements might provide a key to understanding transvestism in shamanism.

Whatever the theory about the nature of the role of transvestism in shamanism, it is clear that it does play a significant role. Wherever it occurs, it is closely linked with the essential shamanic function of mediating between human beings and the world of spirits.

TREES

When trees are associated with shamanic practices, they reflect the mythological attributes assigned to trees in the shaman's culture. Trees represent a connection between earth and sky, one that the shaman may use to climb into the Upper World or to descend, via the roots, to the Lower World. The branching of trees carries connotations of the interconnected web of life and spirit, which shamans must understand in order to perform their work.

Generally, trees and forests represent the realm of nature, and individual trees may be the repositories of clan, totem, or ancestor spirits. Certain species of tree may be assigned sacred attributes. Since shamans believe all plants have spirits, the souls of trees may be enlisted as spirit helpers in shamanic work.

A common motif is the Tree of Life, the *axis mundi,* or "world pole," whose roots are deep in the earth and whose branches disappear into the sky. This idea could be reflected in the tent or yurt pole that supports a house as the world tree supports the world. The World Tree is a representation of reality, located at a point considered to be the center of the world, as well as the connection between worlds in many traditional legends.

The concept of the World Tree is found in myths from the Mayan's First Tree of the World to the five-branched World Tree of India and Persia. (Eliade 1989). Both the divine mother goddess and martyrdom have been associated with this primal tree. The World Tree is symbolic of the axis of the earth, and to find it is to journey to the center of creation. Modern urban shamans may visualize a tree as a highway to the Upper and Lower Worlds, and this practice is found in many tribal cultures that practice shamanism (Cowan 1993, 111).

The Tree of Life represents immortality, due to trees' long lives and perseverance through seasonal cycles. The apparent death and resurrection of trees with yearly changes, or for evergreens the persistence of green when all other plants seem to die, led to the association of trees with the life of the human soul after death. In Indonesia, shamans will climb trees to search for lost souls. The souls of unborn children and of shamans are believed to perch in the branches of trees among the Goldi, Dolgan, and Tungus (Eliade 1989).

Sacred trees commonly figure in initiatory and healing rituals as well, both as symbols of the World Tree and because of powers associated with a specific type of tree. The culmination of the Samoyed shaman's initiatory journey was a visit to the Center of the World, where the Universal Land gifted the initiate with wood from the Cosmic Tree for making a sacred drum (Eliade 1989). The shaman's initiation among the Yakut also culminated in a visit to the World Tree, where gifts are received from the Supreme Being who resides there (Eliade 1989).

Odin hung for nine days from the World Tree in order to receive shamanic powers.

During the initiation of a Buryat shaman, the father shaman symbolically climbs into the sky by climbing a birch tree and making nine notches at the top to represent the nine levels of spiritual reality accessed by shamans. The candidates for shamanic initiation must climb nine birch trees in the ceremonial grounds to demonstrate their power to ascend into the nine levels of heaven, a necessity for successful shamanizing. Dolgan shamans also use nine trees to symbolize the ascent into nine heavens during healing rituals (Elaide 1989).

Funerary rites among the Lolo of western China included the shaman's accompanying the deceased's coffin while describing aloud the soul's journey back to the Lolo race's birthplace. The deceased then entered the realm of the dead from the Trees of Thought and Speech (Eliade 1989). Among contemporary Mongolian Buryat, it is believed that trees are the home of *gazriin ezen,* the ancestral souls of people who have died so long ago they are no longer remembered by their descendants. For this reason, trees must not be harmed or harvested needlessly in order to avoid offending these powerful ancestral spirits. Some Mongolian shamans were buried in pine trees, by peeling off some bark, carving a hollow for the shaman's remains, and closing the opening so the tree could heal itself (Sarangerel 2000, 37, 40–42).

The Yakut and other Siberian people relate certain species of trees with sacred birds, such as the birch and the eagle, which was the first shaman. The Irish associated the oak with the doorway between worlds, and ancient druids were initiated in sacred groves. The oak was seen as a store of solar fire, with links to sun worship (Frazer 1981, 369). Many who seek to revive pre-Christian European religions focus their ritual practices around oaks, holly trees, and forests.

Modern Mongolians also believe that certain trees are particularly sacred due to their growth patterns or location. Trees that grow in isolated areas must have power to grow where other trees do not. Trees growing near passes, springs, or other special places are treated like shrines and offered valuable items such as food or tobacco. Trees that survive being struck by lightning are thought of as shaman trees, since these trees have survived an "initiatory experience" that kills weaker trees (Sarangerel 2000, 40–42).

The way a culture views trees and forests can provide insight into the culture's worldview, as well as give clues to the meaning of ritual practices. Trees in particular are a rich source of information when studying associated shamanic activities.

URBAN SHAMANISM

Urban shamanism is the contemporary practice of ancient ecstatic techniques by modern city dwellers. Urban shamanism usually is not centered on religious and cultural beliefs; it focuses on experiencing transcendental states of consciousness. The goal of urban shamanism is the same as that of tribal practitioners—to deliberately achieve and control an extraordinary state of consciousness.

The current interest in shamanism emerged during the late 1960s and early 1970s. The drug culture of that time led to exploration of altered states of consciousness through the use of psychotropic drugs. Since some tribal cultures traditionally use hallucinogenic drugs such as peyote, nightshade, and others, the initial interest was in the hallucinogen. The connection between use of a mind-altering substance and shamanism led to a greater interest in the shamanic practices themselves.

Renewed interest in Eastern religions, and particularly in consciousness-altering practices such as yoga and meditation, also impacted the present-day shamanic revival. Another contributing factor in the shamanic revival was the displacement of many traditional tribal peoples from their native lands to urban environments. For example, the growth of Native American populations in cities such as Albuquerque, New Mexico, has led to powwows where tribal drumming and dancing are performed in public. This type of direct exposure to native cultural practices is a less studied influence on contemporary shamanic practices.

Several publications have had an influence on urban shamanism. Carlos Castaneda's books brought Yaqui culture and shamanic practices into the popular consciousness. Although Castaneda's work was controversial and criticized as being fictional, his books were widely read, and they presented a portrait of Don Juan as a modern shaman. In the early 1980s, Michael Harner published *The Way of the Shaman.* Harner is a trained anthropologist who began studying tribal cultures in the 1950s. His initial fieldwork with the Jivaro and Conibo Indians in the Amazon led to his interest in shamanism, and he distilled the essence of shamanic practice into what is known as Core Shamanism.

Harner teaches Core Shamanism in workshops, as well as conducting special training sessions through the Foundation for Shamanic Studies in Mill Valley, California. Harner founded and is a director of this nonprofit organization.

The New Age movement's emphasis on the exploration of spiritual disciplines and alternative healing techniques influenced many to explore shamanism for enhancing self-knowledge and healing. Ecological awareness and the desire to heal the planet itself influenced some people to seek an earth-centered spirituality like that of the Native Americans or the Australian Aboriginals. As part of the New Age movement, a large number of books referencing shamanism and shamanic trance as ways to access spiritual healing powers were published in the 1980s and 1990s, and such books continue to appear today.

Psychologists following the theories of Carl Jung, Fritz Perls, and others began investigating shamanism as an adjunct to traditional methods of psychotherapy. Guided imagery, soul retrieval, and use of a drum to achieve a relaxed, receptive state are shamanic techniques that have been used in psychotherapy, typically with good results. As the field of psychology moves toward acceptance of anecdotal evidence, more studies of primitive methods for achieving emotional wholeness are being explored.

Investigation of human potential also dovetails with urban shamanism. Many human potential texts deal with pushing the boundaries

of human consciousness; ancient shamanic techniques have been reexamined in this context. Shamanism is still being explored as an effective method of altering consciousness without drugs, as are the methods of biofeedback, meditation, and hypnosis.

Interest in trance dancing and ecstatic movement is another thread in the pattern of urban shamanism. Gabrielle Roth's work in dance, ritual, and theater explored shamanic trance states in the context of urban environments. There are parallels with the rave movement, where achieving ecstasy through hours of dance to percussion-laden music is the goal, with or without the aid of psychoactive drugs.

During the 1990s alternative healing methods gaining wider recognition within the Western medical profession. Interest in the mind's abilities to effect physical cures led to exploration of meditation, trance, and shamanic techniques as ways to stimulate the body to heal itself. Medical professionals observed that prayer, imagery, and focusing the mind toward wellness could lead to faster healing. Rituals that use trance techniques can be used to achieve the physical and mental states needed to push the body toward health. Studies of shamanism in psychoneuroimmunology, a new field of scientific inquiry, are ongoing.

The core practices of most urban shamans are similar to those of traditional tribal shamans. Use of drums, rattles, bells, and other percussion instruments to aid in achieving a trance state is typical. Ecstatic dancing is common, as are healing rituals. Some urban shamanic practitioners may gather to seek information as a group, sharing their adventures as a way of validating their experience.

Because the focus of the practice is on direct experience and not cultural or religious ritual, urban shamanism occurs in diverse contexts. One common forum for city shamans is the drum circle, where a number of people gather in a park, under a bridge, or in a studio, church, theater, or private residence.

Drum circles vary in purpose. Participants may choose a common theme for a shamanic journey, such as visiting a specific location in nonordinary reality or seeking answers to a common problem. The focus may be on personal transformation, for example, to overcome a trait perceived as limiting, such as fear of change or chronic anger. Planetary healing rituals are common, during which the participants direct energy to cleaner air or water. There is often a sense of tribe as urban shamans gather to do their work.

Urban shamanism finds expression in the arts as well. Experimental theater and performance artists incorporate trance dance, drumming, and elements of ritual in public performances. Contemporary shamanic art, such as the paintings of Susan Seddon Boulet, appears in galleries throughout the world.

The current shamanic revival is the result of numerous historical, scientific, and cultural trends. These influences are dynamic, as is the ancient practice of shamanism itself.

VISIONS AND IMAGERY: WESTERN PERSPECTIVES

The anecdotal and ethnographic literature on shamanism has always contained reports of anomalous experiences in which the shaman "sees" or "hears" a sacred reality unseen and unheard by anyone else in a given social context. The literature names this class of experiences *visions,* after the primary sensory modality reported in the literature. However, this term has traditionally included auditory experiences, such as the common anomalous experience of the hearing of spirit songs. Visions are nonordinary experiences in which the private and subjective visual, auditory, tactile, olfactory, and gustatory mental imagery of the shaman is described as achieving the intensity and vividness of normal sensory perception. This term is reserved, however, for experiences that are phenomenologically similar to, but ontologically distinct from, ordinary experience—they are sacred, as opposed to profane, or mundane. These different kinds of being, the sacred and the mundane (or profane), are of course not exclusive to shamanism-based societies but appear to be universal cognitive categories of human experience. Visions are perhaps best viewed as a medium through which shamans encounter spirits and sacred realms.

Historical Interpretations

Although there seems never to have been any dispute over the phenomenology of the visions of shamans, since the sixteenth century European travelers, explorers, and ethnographers have differed markedly in their interpretations of the ontological status of these visions. Western speculations about the "reality" of the subjective experiences of shamans reflect historically contingent, cognitive categories of meaning with regard to repugnant, unusual, bizarre, or "primitive" human behavior. Often such speculations mirrored Western attitudes toward the supernatural, evil, disease, madness, and medicine. Unlike disease or lunacy or apparent evidences of supernatural evil, shamanism was an exotic, distant anomaly not witnessed in the everyday life of most people. Therefore, reports of unusual ritual behaviors and anomalous experiences such as visions served as a powerful magnet for European cultural fantasies. Such social, medical, and scientific cultural fantasies about the visions of shamans can be viewed as comprising six models.

Supernatural Model

Sixteenth- and seventeenth-century Christian (usually Roman Catholic) clerics have left the oldest records of encounters with indigenous shamans. With the European witch hunts still fresh in mind, these observers interpreted the visions of shamans as deriving from a satanic source, and shamans as pagan servants of the Devil akin to European witches or necromancers. For example, French Franciscan priest André Thevet, who observed the shamanism of the indigenous Tupinamba inhabitants near Rio de Janeiro, tells us in his 1557 memoir that "by the end of his [the shaman's] invocations, the spirit comes to him whistling, as they say, and piping." However, Thevet then makes it clear he regards this as "abusive magic" and a form of forbidden communication with "evil spirits" (cited in Narby and Huxley 2001, 14–15).

Legerdemain Model

By the 1720s, shamans were commonly interpreted as nothing more than liars, charlatans,

tricksters, quacks, and jugglers. Hence, all reports of magical flights to sacred realms, or spirit songs, or the "seeing" of harmful objects or spirits in the bodies of patients were regarded by these new Age of Reason skeptics as pure bunk. The most famous proponent of this skeptical view of shamans and their visions was Johann George Gmelin (1709–1755), a German university professor of chemistry and botany at Tübingen who had traveled through Siberia between 1733 and 1743 and published a four-volume account of his experiences in 1751–1752. Such a view of shamans is also reflected in a play published in 1786 by Empress Catherine the Great of Russia, *Der sibirische Schaman, ein Lustspiel* (The Siberian Shaman, a Comedy).

Pharmacological Model

By the 1760s, the scientific rationalism of the era led to pharmacological explanations for the visions of shamans. Prominent among these materialists who acknowledged the reality of the shaman's visions while debunking their other claims was the Russian botanist Stepan Petrovich Krasheninnikov (1713–1755). During an expedition to Kamchatka in eastern Siberia (recounted in a memoir published the year of his death) he observed shamans entering trances and reporting visions after ingesting brewed potions made from hallucinogenic mushrooms, hence acknowledging a material cause for these very real experiences that were, in his view, mistakenly interpreted as supernatural in origin. At the time of the psychedelic era that began in earnest in the 1960s, anthropologist Michael Harner edited a 1973 volume on *Hallucinogens and Shamanism,* which revived this materialistic and deterministic thesis.

Romantic Science Model

Late eighteenth-century German romanticism influenced the sciences of that era, including the anthropological speculations of Johann Gottfried Herder (1744–1803) about shamans and the reality of their visions in the editions of his *Ideen zu einer Philosophie der Geschichte der Menschheit* [Ideas to a Philosophy of the History of Mankind] between 1784 and 1791. Herder reframed the shaman as an artist, poet, healer, and musician (like Orpheus), as well as a spiritual specialist and a practitioner of legerdemain. The German romantic exaltation of the imagination, particularly the visual imagination, is mirrored in Herder's emphasis on the positive, creative nature of the strength of the imagination exhibited by shamans.

Psychiatric Model

With the rise of "mad-doctoring," or psychiatry (as it was later called), as an emerging medical specialty circa 1800, a new scientific paradigm for interpreting anomalous experiences as symptoms of underlying mental disorder came into vogue. Although previous European observers had often commented on the similarity of the ritual behaviors and the reported visions of shamans to the behavior of European lunatics, the usual interpretation was that they were possessed by Satan or were faking. After 1800, however, observers of shamanism had access to a growing technical literature filled with diagnostic labels that could not be applied as "explanations" of the behavior and experience of shamans. The psychiatric model of the visions of shamans largely begins in the Russian literature of the 1860s. Following the literature of the French alienists, who dominated psychiatry until the Germans took the lead in the 1860s, Russian scholars began to interpret the visions and ritual behaviors of shamans as forms of monomania, "demonomania," hereditary degeneration, epilepsy, and hysteria. Russian ethnographers continued to rely primarily on the French psychiatric literature even in the twentieth century. For example, in *The Psychomental Complex of the Tungus* (1935), Sergei Mikhailovich Shirokogoroff built upon ideas about dissociation, trances, and hysteria derived from the works of French psychiatrist Pierre Janet published in the 1880s and 1890s.

With the widespread popularity of psychoanalysis in the United States, England, and France by the early 1920s, Freudian diagnostic terms such as *neurosis* were applied to shamans, and their visions were now seen as hallucinations caused by an underlying mental disorder and therefore a serious sign of a break with reality. The influence of Freudian psychoanalysis generated a mistaken literature equating shamans with persons who have psychotic disorders such as borderline psychosis and schizophrenia. Occasionally the visions of shamans

have been the victims of further "medical materialism" (to use William James's term) and have been reduced to neurological disorders such as the seizures of temporal lobe epilepsy, but this sort of neuromythological speculation seems to be disappearing.

Psychological Model

The ascendancy of cognitive psychology in the 1960s and 1970s forced interpreters of shamanism to rethink their interpretations of the visions that were reported by so many shamans as essential to their healing and divination work. This led to an extensive literature that explained shamanic visions as either byproducts of altered states of consciousness or as enhanced mental imagery, as understood in the experimental literature in cognitive science on mental imagery and the brain.

Altered States of Consciousness. In an effort to escape exclusively psychiatric and pathological interpretations of visionary phenomena, the "trances" or "ecstasies" in which visions occurred were reframed as "altered states of consciousness." These were unusual mental states, in which behavior, identity, memories, and subjective consciousness were altered, but they were not necessarily abnormal or psychopathological. It had long been noted by historians of comparative religion that many religious rituals around the world involved physiological and psychological techniques for inducing trances in order to enable the experience of sacred realms and spiritual entities. Fasting, sensory deprivation in vision pits, meditating, dancing, ingesting hallucinogenic plants, all were common "techniques of ecstasy," to use Mircea Eliade's famous phrase. The use of the concept of altered states of consciousness is at the core of many definitions of shamanism.

Although conceptual confusion still reigns when it comes to the various operational definitions of an altered state of consciousness, let alone different categories of altered states of consciousness, within anthropology a distinction offered in 1968 by Erika Bourguignon is still generally regarded as useful. In a survey of the use of deliberately induced altered states of consciousness in religious rituals around the world, Bourguignon found that one could group them into two distinct types, trance (T), and possession trance (PT), which were also correlated with societal complexity and certain aspects of the practitioner. Trance was an altered state of consciousness in which visions were the dominant experience. Visionary trance was found to be most characteristic of traditional, nonliterate, nomadic hunting-gathering-fishing societies in which shamanism was the primary religious expression, and the practitioners were mainly male. Possession trance was an altered state of consciousness in which the religious practitioner (usually female) became possessed by spirits during a community ritual; it was correlated with more complex societies that were not nomadic (evidencing at least the technologies of agriculture and livestock) and might even be urban. After Bourguignon's useful conceptual contribution, the literature on the use of altered states of consciousness in shamanism became rather repetitive and, by the mid-1980s, had essentially reached a dead end.

Mental Imagery. Following advances in the research by cognitive scientists, in 1985 Richard Noll argued that mental imagery was the most important psychological dimension of shamanism to investigate if the visions of shamans were to be understood. What was important was not that consciousness was altered, but that mental imagery was enhanced. Since mental imagery was being studied extensively in the lab, including neuroimaging studies that showed that the same neurological substrates in the brain were used in visual perception and visual mental imagery (suggesting the reason shamans report their visions as having the vividness and intensity of actual visual perceptions), the relevance of this new knowledge for understanding visions was obvious.

Shamans report both spontaneous and self-induced, or cultivated, visions. The spontaneous experience of visions occurs throughout the lives of shamans, but they are often reported prior to their training as signs of a "calling" to this healing profession. The classic "initiatory sickness" of many shamans that begins their role transformation often contains descriptions of spontaneous, uncontrollable visual or auditory encounters with spirits, who also often "possess" novices and afflict them with emotional and physical distress. The successful shaman who is healed from his initiatory illness is one who has mastered his spirits and who can

initiate and terminate his visionary trances at will. Perhaps shamanism is a tradition of *mental imagery cultivation* that has strong links to other magico-religious traditions worldwide. Step one of the visionary training of the shaman is learning to increase the vividness of his or her mental imagery, and step two would then be to increase the shaman's control of mental imagery. Controlling mental imagery may be analogous to the phenomenon of "spirit mastery" that is so essential to the practice of shamanism. A common metaphor for mental imagery enhanced through training is *the transformation of the shaman's eyes,* or the development of an "inner" or "spiritual" sight. Thus, with respect to the experimental literature on mental imagery and the brain, the visions of the shaman may have found a new cultural interpretation.

WITCHCRAFT AND SORCERY IN SHAMANISM

Witchcraft and sorcery are in many societies understood as essentially the same phenomenon, or at least closely linked; shamanism is usually held to be quite distinct from witchcraft and sorcery. Despite a clear distinction between these two categories, several lines of evidence indicate that phenomena labeled as sorcery and witchcraft have their deep origins in activities related to shamanism. The primary characteristics emphasized in the usual conceptualization of shamanism (e.g., the use of "ecstasy" and community healing activities) are very different from the predominantly negative characteristics of sorcerers and witches (e.g., causing illness and death), but some characteristics of shamans are similar to those associated with witches and sorcerers. These include nighttime activities; personal interaction with the spirit world and control of spirits; animal familiars and transformation into animals; the ability to fly; and causing illness and death through the theft of the victim's soul or projection of objects or malignant spirits into the body of the victim.

Evidence of the intimate relationships between shamanism and witchcraft is found in ethnographic studies, cross-cultural research, historical analyses, and linguistic data. Many cultures with shamanic traditions recognize that shamans may specialize in a good healing path or in an evil path of causing harm to others. Cross-cultural studies provide evidence of empirical similarities and support for an evolutionary theory, according to which shamanistic practices became transformed into what is called sorcery and witchcraft (Winkelman 1992). This transformation was a consequence of the development of politically integrated societies and priesthoods and their violent efforts to eradicate shamanistic practices. These efforts involved the persecution of local shamanistic healers by leaders of complex societies with priestly religions, who attacked local healers as witches and sorcerers to justify their elimination. Historical and linguistic evidence reveal continuity of sorcery and witchcraft with shamanism. Linguistic evidence of the ancient meanings of the root of the term *witch (weik)* reveals shamanic referents.

The Dark Side of Shamanism

The concept of the shaman as a spiritual healer has often distracted attention from the potential shamans have to use their power negatively, a use of power that provides support for the theory that links them directly to sorcerers and witches. Cross-cultural studies of shamanism suggest that shamans are characterized by a dual moral nature, having both the ability to heal and to do harm (Winkelman 1992). Shamans are in fact normally viewed as having the capacity to do both good and evil, unlike mediums, who are typically seen as not having the capacity to create evil effects. In many shamanic cultures, shamans are viewed as having to make a choice of a good or evil path, using their powers to help or harm others. But even where shamans choose "good" healing paths, they acquire the basic power and skills used in causing harm to others. Intrinsic to the shamans' healing techniques are practices of returning the illness-causing spirits, spells, or objects (e.g., magical darts) to the person who sent them to the victim. Returning the illness-causing agents can cause death to the original perpetrator and uses the same basic process by which illness and death are caused by shamans practicing sorcery.

These intimate relationships of the powers of shamans to those of sorcerers and witches

are illustrated in the interaction and relationships of the Jivaro curing (good) shamans and bewitching (bad) shamans (Harner 1973a). Both curing and bewitching shamans acquire their power in the same fashion, purchasing "magical darts" and training from other shamans. These magical darts are spirit servants, acquired by swallowing the magical darts that are regurgitated by their teachers. Both curing and bewitching shamans swallow the magical darts given by teachers. Those initiates who become bewitching shamans are those who cannot resist the desire to use the darts to bewitch when they later emerge from their mouths. Those who resist the impulse to use the dart to bewitch, and instead re-swallow the dart, become healers. Both curing and bewitching shamans share power over the darts and get their powers from the strength of the darts. Bewitching shamans cause illness and death by projecting the darts into the body of their enemies, while curing shamans cure by using their own darts to remove the bewitching darts. Curing shamans use the darts to form protective shields and to capture and incorporate the darts of bewitching shamans. Curing shamans extract the darts of bewitching shamans by regurgitating darts identical to those seen in the patient's body. These regurgitated darts are held in the mouth to capture and incorporate the dart that the curing shaman sucks out of the patient's body.

In many shamanic practices, the curing shaman may return the extracted dart to the bewitching shaman as a part of the healing process, potentially killing the bewitching shaman or client who contracted the service. And as among the Jivaro, in many cultures the curing shaman may also be suspected of being a bewitching shaman as well, particularly if their patients have incurable illnesses or die. Among the Jivaro, the curing and bewitching shamans are often thought to be in collusion: the bewitching shaman makes people sick so that the curing shaman may profit from healing them.

Cross-Cultural Studies of Shamans, Sorcerers, and Witches

Michael Winkelman's cross-cultural study of magico-religious practitioners found a group empirically distinct from shamans; this other group of empirically similar practitioners was labeled the sorcerer/witch (1992). Although the ability to engage in what is considered to be sorcery is part of the practice of shamans, shamans' principal characteristics, associated with healing, divination, hunting, and group leadership, are not typically found in the sorcerer/witch. Shamans are also found in societies quite distinct from those of sorcerers/witches. Cross-cultural data shows that shamans are found in hunter-gatherer, pastoral, and incipient agricultural societies, whereas sorcerer/witch practitioners are found in societies with agricultural subsistence patterns, political hierarchies, and social stratification (Winkelman 1992). The practitioner groups labeled as shamans and sorcerers/witches do not both occur in the same society.

The sorcerers/witches are generally believed to be only involved in malevolent activities, such as causing illness and death or destruction to crops and livestock. These practitioners are thought to be able to transform themselves into animals, to fly, to control spirits, and to capture and consume the souls of others. They may engage in other immoral activities—cannibalism, incest, eating feces and corpses, killing kin. They are generally both males and females, and may be killed for their actual or suspected activities. While they may deliberately engage in their activities, they are often thought to exercise their influences unconsciously, particularly as a consequence of envy, jealousy, anger, greed, or desire for revenge.

The Psychosocial Dynamics of Sorcery and Witchcraft

Although to some the words *witchcraft* and *sorcery* seem to be two different terms for the same thing, this is not always true. Consequently, anthropological conceptualizations of sorcery and witchcraft have emphasized Edward Evans-Pritchard's characterizations and distinctions derived from the Zande (Africa) (Evans-Pritchard 1937; cf. Murdock 1980). Azande sorcery involved the use of spells, poisons, and medicines to destroy health and property or manipulate relations of love. This is a deliberate ritual use of magical techniques to harm others. Witchcraft was an inherited psychic power that caused illness or death, but was exercised unconsciously and unintentionally as a result of jealousy and envy. Witches were thought to

transform themselves into animals during sleep and to fly about with other witches and animals, eating the body organs and soul of their victims. The Zande distinction between witches and sorcerers is not made by all societies, some of which see both characteristics combined to varying degrees.

The presence of specialized practitioners for doing sorcery or witchcraft is associated with higher levels of political integration (beyond the local community). Cross-cultural studies also indicate that societal differences in the importance of sorcery versus witchcraft are associated with specific sociopolitical conditions (Murdock 1980; Winkelman 1992). Witchcraft and sorcery beliefs are usually not found in the same society; for the most part, witchcraft (in the sense of a practice with unconscious dynamics) is found in association with more complex societies (those characterized by, e.g., political integration and classes) and patrilineal descent, particularly in Africa and the circum-Mediterranean regions. In contrast, sorcery is predominant in small-scale societies without jurisdictional hierarchies, such as those found in aboriginal America.

Cross-Cultural Data on Relations of Shamans and Witches

Cross-cultural research (Winkelman 1992) shows both the common magico-religious and ritual activities and beliefs attributed to shamans and sorcerer/witches and similar conceptual relationships, organization, and structure, illustrating their common roots. Shamans and sorcerers/witches are the only groups of magico-religious practitioners that have a major involvement in malevolent activities as central aspects of the professional role. Other types of shamanistic healers may also engage in sorcery, but this is generally considered a minor aspect of the role. As mentioned above, cross-cultural studies (Winkelman 1992) show that while sharing the aspect of malevolent magic, shamans and sorcerers/witches are found in distinct kinds of societies: hunter-gatherer, pastoral, and incipient agricultural societies in the case of shamans, and agricultural societies with political hierarchies and social stratification in the case of sorcerers/witches. Their similar functions (malevolent magic) combined with lack of shamans and sorcerers/witches in the same societies lends indirect support to the latter's origins in the malevolent functions of shamanism.

Historical Evidence in European Societies

The shamanic source of witchcraft phenomena is indicated by Michael Harner (1973b), who documented the use of hallucinogenic plants by many of those who were persecuted as witches by the Inquisition. He suggested that the beliefs about witches flying and transforming into animals were based upon the experiential effects of the hallucinogens. Although he noted differences between shamans and European witches, he nonetheless suggested that the concepts of shamanism may have to be expanded to include central aspects of early European witchcraft. The attack upon these shamanistic practices by hierarchical priestly religions is indicated by other scholars (e.g., Murray 1921, 1933; Simmons 1974; Hoyt 1981), who characterize some of those accused of witchcraft as members of fertility cults and nature religions. Fertility cults, pre-Christian community religious practices, and the spiritual and healing practices associated with women's traditions were all aspects of the supposed witchcraft attacked by the Catholic Church and its Inquisition as a part of a struggle for ideological supremacy in early modern Europe.

Linguistic Evidence of Continuities between Witchcraft and Shamanism

Weik- is an Indo-European root that refers to magico-religious practices and other activities; *weik-* is the root of witchcraft, wizard, and (sacrificial) victim. It is generally viewed as representing the negative and devalued aspects of the supernatural, but also has a range of other meanings that have nothing to do with the negative stereotypes of witchcraft, but rather point to the broader context of shamanic traditions.

The Indo-European root *weik-* was reported in the *American Heritage Dictionary* to have five general meanings (Morris 1981, 1548). In the list that follows, shamanic associations are also noted:

1. "Words connected with magic and religious notions" such as *divination, wizard,*

bewitch, the Latin *victima,* and words for animals used as sacrificial victims;
2. "Clan (social unit above the household), . . . dwelling, house . . . with derivative *vaisya,* settler"; this meaning bears no relationship to witchcraft, but does reflects the social leadership roles of shamanism;
3. "To be like . . . likeness, image, icon"; these meanings are connected with the shamanistic use of enactment and the fundamental role of imagery in shamans' visionary experiences;
4. "To bend, wind . . . turn"; these meanings are widely associated with the roots of the term *shaman* in the languages of Asia; and
5. "To conquer"; this meaning is unrelated to witchcraft, but does encompass both the shamans' battle with spirits and their hunter/warrior role.

These linguistic roots of the word *witch* have little association with the contemporary or historical meanings of the word. The roots do, however, have substantial relations to shamanistic activities and related magico-religious practices. Concepts of magic, religion, divination, imitative magic, and other meanings are more directly related to shamanistic activities than the ideas typically attributed to witchcraft. The shaman is a group clan leader. Durkheim's idea that religion was the basis for the constitution of society is reflected in the shaman's activities being the most important collective functions in hunter-gatherer societies. Furthermore, the actual practices of contemporary Wicca or witches correspond neither to the attributes of witchcraft used by the Inquisition nor the characteristics subsumed under Evans-Pritchard's and Murdock's uses of the term. The contemporary Wicca movement is a neopagan development; it is focused upon healing, fertility, and personal transformation of consciousness, as exemplified in shamanism, rather than the typical negative features associated with witchcraft beliefs. Accurate appraisal of witchcraft reveals numerous shamanic connections in contemporary society and in antiquity, reflecting the shamanic roots of Indo-European religion and the term *weik-*.

The characteristics of practitioners called sorcerers and witches originate in shamanistic healers and their transformation as their communities are subjected to political and religious integration by complex societies. Both the original characteristics of these shamanistic practitioners (e.g., soul flight, capturing souls, animal associations, nighttime activities) and the products of persecution (distortion, exaggeration, negative attributions) contribute to the characteristics typically attributed to sorcerers and witches.

Overview

NORTH AMERICA

North America, though technically representing the landmass from the Arctic Ocean through Central America, for the purposes of this encyclopedia is considered to end at the Mexican border. Nevertheless, some reference will be made in this section to entries on Mexican practices. However defined, North America has been the home of many shamanic and other spiritual practices. The indigenous peoples of North America presented a considerable complexity at the time of the arrival of the Europeans, reflected in thousands of languages and independent cultural groups. But in spite of this diversity, certain commonalities have been noted within regions, leading to the concept of the "culture area." Culture areas are geographical regions where the cultures share substantial commonalities in terms of subsistence, technologies, economies, family, and sociopolitical organization. The culture areas of North America include the Arctic, Subarctic, Plateau, Northwest Coast, California, Great Basin, Southwest, Plains, Northeast, and Southeast. Although significant differences are found within culture areas, particularly the Southwest, many culture area commonalities are attested to both ethnographically and in the archaeological record. Today these cultures are represented in three major language families: Paleo-Indian, Na-Dene, and Aleut-Eskimo.

Prehistory: Paleo-Asian Immigration

There is a general agreement among anthropologists that Native Americans are descended from Paleo-Asians who migrated to the North American continent at least 15,000 years ago, perhaps as long as 30,000 years ago. Native Americans, who tend to emphasize their emergence here in the Americas, do not generally accept this anthropological model. Linguistic and genetic evidence indicates that the first of these waves of Paleo-Asian or Paleo-Indian hunter-gatherers arrived in North America following herds of game animals crossing the Bering land bridge between Eurasia and the Americas. This original wave of immigrants had spread to the tip of South America by 11,000 years ago. A second wave of immigration out of Siberia beginning between 12,000 and 14,000 years ago provided the basis for the Na-Dene and their descendants, known as the Athabaskan speakers. The third wave of immigration left Siberia beginning around 9,000 years ago and provided the basis for the Aleut-Eskimo cultures.

Prehistory: Cultural Development Sequences

These three waves of prehistoric immigrants that provided the basis for Native American cultures had a subsistence strategy based upon a hunter-gatherer subsistence technology. The first wave is referred to as Paleo-Indians and big game hunters. These societies, which were organized in bands, must have had shamanistic practices, given the widespread presence of shamanism in Pa-

leo-Asian and Native American cultures, its presence tens of thousands of years ago in Eurasia, and the biological basis for shamanism.

These big game hunters and their cultures were replaced by what is called the Archaic cultural tradition, beginning about 10,000 years ago. The Archaic cultures, reflecting adaptations made to climatic and environmental changes, focused on the hunting of smaller animals and relied on more varied foods, particularly seeds, nuts, and grains. The Archaic cultures developed increasing social and political complexity, attested to in complex mound building, particularly in the eastern and southern areas. Increasingly complex religious organizations, reflected in monumental architecture and public ceremonials, may have begun to compete with shamanism. Archaic cultures mostly disappeared 3,000 years ago; some, however, persisted through European contact, as seen in the cultures of the Great Basin.

Beginning about 4,000 years ago, new cultural traditions emerged, based upon complex agriculture. Contention exists whether these agricultural traditions were invented in the eastern and southwest areas, or whether the agricultural traditions that developed there were diffusions from Mesoamerica. An agricultural lifestyle based on corn, beans, and squash led to the development of permanent settlements, regional economies, large population centers, and complex social organizations. These agricultural societies, exemplified in the Mississippian Traditions, may have led to the formation of true states. Some of these cultures disintegrated shortly after 1500 B.C.E. as a consequence of the epidemic diseases that spread across North America in advance of direct contact with the Europeans. The complex agricultural societies survived in other parts and the Southwest. These agricultural communities developed other forms of religious activity, represented in priests, whose social and sacred power came to supplant that of the shamans and their successors. These priests were allied with chiefs of lineages who controlled resources, the ritual calendar, and agricultural cycles.

Shamanism and Other Religious Practices

Native American spiritual practices have often been globally characterized as shamanic. Such simplistic characterizations ignore the many different religious forms found among North American peoples and the substantial differences between many of those practices and the classic form of shamanism, observed in Arctic, or Siberian shamanism. What is known as Core Shamanism are the cross-cultural similarities in shamanic practitioners. The differences in spiritual healing practices are noted in Winkelman's entry "Cross-Cultural Perspectives on Shamans." He proposes the term *shamanistic healing* for the diverse healing practices involving spirit relations and altered states of consciousness. The widespread and central role of shamanic practices in many indigenous cultures of North America is well attested to in the selections in this section, but some entries, such as "American Indian Medicine Societies," illustrate that many Native American religious practitioners are not shamans as illustrated by cross-cultural research, but rather more like healers and priests who place little emphasis on altered states of consciousness.

The decline in Core Shamanism in more complex societies and its transformation into different types of shamanistic healing practices are attested to in the very different religious healing traditions of the agricultural societies (see, e.g., the entries "Choctaw Shamanism" and "Pueblo Religion and Spirit Worlds"), as well as in the medicine societies in other groups (see, e.g., "Iroquois [Haudenosaunee] Shamanism and Secret Societies"). The differences of these practices in comparison to Core Shamanism and other forms of religious and spiritual healing are also attested to in the entry "New Orleans Voudou," which focuses on African-derived practices in New Orleans. Systematic differences in religious healing practices are found cross-culturally. These findings have suggested to many scholars, including the author of this overview, the importance of distinguishing the (classic) shamans of hunter-gatherer and other technologically simple societies from universally distributed "shamanistic healers," practitioners who use altered states of consciousness to interact with the spirits on behalf of community and clients.

Introduction to the Entries

The maintenance of classic shamanic traditions is well attested to in the cultures of the Arctic Circle, such as the Inuit (or Eskimo), and Greenland, as well as in the hunter-gatherer and simple agricultural societies of the Southwest and Mexico. The entries "Inuit Shamanism" and "Greenland Shamanism" illustrate the ancient linkages among Arctic practices, which are reflected in similar terms (*angakut* among the Inuit, *angakkoq* in Greenland). Inuit and Greenland practices reflect Core Shamanic features in the close links to animals and the souls of the dead, the inclusion of female practitioners, the soul journey, and the presence of the dark side of shamanism, the potential to do sorcery. The Greenland practices also emphasize the Core features of the shamanic visionary journey in "dream time," reflected in the meaning of the term *angakkoq.* Here and elsewhere (among, e.g., the Yupik), training for the profession was open to everyone. However, only those who were willing to brave the difficult and terrifying training involved in the encounter with the spirit world could hope to achieve the status of shaman, who would have to battle the evil spirits that had caused illness through stealing an unfortunate person's soul.

The importance of Core Shamanic practices—above all accessing an altered state of consciousness through the use of sacred plants—is also well attested to in some societies of North America (see, e.g., the entry "Yokuts Shamanism," as well as "Huichol Shamanism," covered in the next section). Tobacco is such a widespread power plant in the Americas that it often goes unmentioned in accounts. Other plants such as those of the *Datura* species have also been widely used in North American spiritual practices. Datura was frequently used in initiatory rites that often included all of the populace, not just shaman-initiates. The Huichol use of peyote (*Lophophora* spp.) still in the present day reflects the persistence of many shamanic features—male and female practitioners, animal allies, the ability to carry out sorcery, extraction of illness-causing objects, the use of dreams, and so on. Other hunter-gatherer groups, as illustrated in the entry "Great Basin Hunters and Gatherers" covering groups of the Great Basin (Paiute, Shoshone, and Numic), reveal the persistence of classic shamanic practices in North America into the twentieth century. Men and women alike could engage in the vision quest to obtain spirit helpers, which were often accessed through spontaneous dream experiences. Similar aspects of classic shamanism are attested to in the entry "Yuman Shamanism," where the ancient practices of the different Yuman-speaking cultures of Baja California are described.

Where Core Shamanic practitioners persisted, they typically involved people who had to maintain ordinary work and social responsibilities, rather than being exclusively religious specialists. These exceptional individuals were the most important interface with the spirit world for most societies. A theme attested to in most areas is the access of both men and women to the status of shaman, although men generally predominated. Commonalities in their approach to the spirit world include the induction of altered states of consciousness through the use of drumming and chanting. The central role of relationships with a variety of spirits as the basis of shamanic practice and power is attested to across these numerous cultures. The shamanic cultures emphasized the central role of animal relations and dream experiences as part of shamanic powers. These shamans also had ambiguous roles as sorcerers who could kill as well as heal. One theme of shamanism widely attested to in North America is that the shaman-to-be was required to engage in arduous and dangerous activities to initiate contact with the spirits. In addition to dangerous plant medicines, solitary vision quests, prolonged solitude, long treks in the wilderness, and being lost in the desert or tundra might produce contact with the spirits that trained the future shaman. The subsequent training by other shamans is found in some societies, but in many of the technologically simpler groups, the community validated the successful training of the shaman as they participated in the new shaman's practices.

The practices of classic shamanism, however, did not fare well in the encounters with European invaders. The hunter-gatherer groups, where these practices were most prevalent, were less likely to survive the onslaught than the agricultural societies of North America. In many cases we have very limited accounts of these prior traditions, as illustrated in the entry "Yupik Shamanism." Agricultural peoples have generally maintained different kinds of practices. Some, like the Pima, maintain

living, though threatened, traditions while others like the Yuman died out in the twentieth century. As attested to in the entry "Piman Oral Literature and Shamanism," Piman shamans have traditionally acquired power in songs learned from spirits during dreams. They cure by smoking tobacco, sucking out intrusive objects and spirits, blowing their powerful breath upon the patients, and singing their curing songs in all-night ceremonies. But most agricultural peoples lost the shamanic basis in the social transformations that accompanied taking up agriculture. However, in the entry "Hopi Shamanism" the author tells us that some evidence indicates that beliefs about shamanism continued among the Hopi after they became agriculturists, but the last famous shaman died early in the twentieth century.

There are many spiritual healing practices in North American cultures that do not resemble Core Shamanism, though the authors frequently point out shamanistic elements. The entries "Pueblo Religion and Spirit Worlds," "Choctaw Shamanism," "Ojibwa Shamanism," "Iroquois (Haudenosaunee) Shamanism and Secret Societies," and "American Indian Medicine Societies" all provide examples of spiritual healing practices quite different from classic shamanism. One of the distinctive features of spiritual healing in these more complex societies is the presence of priests and chiefs, hereditary political leaders with religious power, more related to ritual than to altered states of consciousness, animal powers, and soul flight. The Choctaw priests and chiefs engage in practices associated cross-culturally with highly stratified and centralized agricultural societies. The Choctaw also believed in the presence of another kind of practitioner associated with more complex societies, the witch, who was often killed for actual or suspected malevolent activities. Pueblo religious activities (including those of the Hopi already mentioned) also reflect the dynamics of more complex societies, with the Kachina society dancers and their ceremonial calendar.

Another change in shamanic practices occurring with increasing societal complexity is increasing specialization, reflected among the Ojibwa in the four different kinds of shamanistic practitioners (including some who only diagnose illness but do not cure). The various kinds of religious specialists discussed in the entry "Lakota Shamanism" also illustrate significant differentiations that may occur, including the differentiation of the "sorcerer," or "witch," from those who heal and perform community ceremonies. The entry "Navajo Shamanism" also illustrates this diversification of the shamanistic role in its discussion of various kinds of healers, including hand tremblers, stargazers, and singers. With these more complex societies, there is generally a decline in the importance of the vision quest and of altered states of consciousness, often reflected in the belief that the practitioners of old were far more powerful. Among the Hopi, for example, the vision quest is replaced with a ceremonial sponsor who makes it possible for the person to be initiated and trained.

The entry "American Indian Medicine Societies" also provides examples of the spiritual dynamics of more complex societies, where "medicine societies," professional organizations and religious confraternities, have a significant role in religious healing practices. These have significant non-shamanic features—payment for training, official recognition of professional status, and organizations that control access to the profession. These societies do, sometimes, maintain shamanic features such as a vision quest and power animals. But it is normally in their mythology, oral traditions, and artifacts that evidence is found of the shamanic practices of the past, which are also a way of enhancing shamanistic power in the present, as illustrated in the entries "North American Oral Traditions and Shamanism" and "Yupik and Inupiaq Masks."

The decline, and even demise of shamanism among Native American societies was due to both internal and external factors, principally increasing societal complexity and the emergence of the power of priests, together with the impact of invasions and the imposition of Christian religious forms on native societies. The Christian mind-set of the Europeans meant that they tended to view Native American practices as forms of "devil-worship" or witchcraft. Consequently, violence was often used to eradicate these indigenous practices. In many cases, the shamanic traditions, as practiced in efforts to adapt to the changes imposed by outsiders, met with brutal repression, as reflected in the entry "Ghost Dance and Prophet Dance." A general decline and disappearance of indigenous shamanic and spiritual practices was further produced by laws passed by the U.S. Congress in the late nineteenth century that made it a federal crime for Native Americans to possess

medicine bundles and other sacred objects. The shamanic practices of most Native American groups have died out due to the drastic impacts on their cultures by Europeans, especially Christian missionaries who forbade and demonized their shamanistic practices and jailed their healers. The hunter-gatherers, where Core Shamanic practices predominated, were the groups least prepared to adjust to the European invaders. Sedentary agriculturalists seem to have fared better, with their cultural matrix better able to adapt to colonization. They continued spiritual practices that emphasize ritual rather than altered states of consciousness.

But in some societies shamanic practices have completely died out. They may not, however, be gone forever. One theme of shamanism widely attested to in North America is that people acquire their ability to develop their shamanic potential through deliberate or incidental contact with the spirits. This occurs in dreams, deliberate vision quests involving prolonged solitude, long treks in the wilderness and being lost in the mountains, desert, or tundra, and visiting sacred sites that might produce contact with the spirits. There is a widespread belief in Native America and other parts of the world that the spirits directly taught the shamanic initiate. These traditions of learning directly from the spirits hold open the possibility of resuscitation of shamanic practices in the many cultures where it has disappeared. Oral traditions served as teaching devices for shamanic initiates and others in society. These oral traditions have often survived as mute reminders of important traditions of the past. Just as anthropological records of cultural life more than a century ago have contributed to cultural revivals, so too can these records of shamanic practices of the past serve as stimuli for a reintroduction of shamanism into the present and future.

AMERICAN INDIAN MEDICINE SOCIETIES

Priests and healers in many American Indian nations were (and are) organized into "medicine societies," *medicine* here meaning both medicinal substances and spiritual therapies. Some medicine societies resemble guilds, or professional organizations, others are more like religious confraternities. Epidemics, wars of conquest, and policies suppressing indigenous religions and practices have attenuated these societies, but in many First Nations they have persisted. At the core of many American First Nations' religious practices are portable shrines termed medicine bundles. These are sets of holy objects that embody cosmological and spiritual concepts and manifestations. They are kept wrapped up to protect untrained persons from inadvertently calling up power that can be dangerous if mishandled. Pragmatically, each object in the bundle is a mnemonic for prayers, songs, and ritual movements in the ceremony that celebrate and elicit its holy power. Medicine bundles may be privately owned or national treasures in the custody of designated priests; such bundles were central to many Mesoamerican rituals and were associated with royal authority (López Austin and López Luján 2000, 37) as well as in general in North America. Medicine societies may comprise priests and assistants dedicated to one or more medicine bundles, or may be gatherings of owners or custodians of bundles incorporating the same or related powers.

Whether medicine societies' members should be called shamans is a debated issue (Kehoe 2000); practitioners most like Siberian shamans, such as Ojibwa (Anishinaabe) shaking-tent mediums, were not organized into medicine societies, and important medicine societies such as the Pawnee Doctors' Lodge and Ojibwa Midéwiwin do not closely resemble Siberian practices. As would be expected, nations with large populations usually had formally organized societies, and nations in areas that could only support low-density populations, such as the Subarctic and Desert West, relied more on private apprenticeships and informal ties.

Alexander Lesser's *The Pawnee Ghost Dance Hand Game* (1933) is a classic study of a medicine society and its persistence. The Pawnee of the Central Plains speak a Caddoan language and are probably related to the Late Prehistoric (Mississippian) kingdom on the Arkansas River with its capital at Spiro, eastern Oklahoma. European incursions in the seventeenth century found the Pawnee living in earth-lodge villages, raising maize, and journeying west for large organized bison hunts. Losing half their population in the generation forced off their homeland onto an Oklahoma reservation (1876), the Pawnee were deprived also of the knowledge and holy icons cared for by priests who died before they could train novices. Then in 1891, a Pawnee preached the message of the Paiute prophet Wovoka (Jack Wilson) that the recently dead could appear in visions, urge retention of their rituals, and instruct survivors in the procedures. With renewed spirit, the Pawnee continued the Doctors' Dances and Buffalo Dance, resuscitated the Bear Dance, and refurbished the holy medicine bundles that had not been buried with priests. Lesser noted that elements of Wovoka's Ghost Dance ritual (Kehoe 1989; Mooney 1896) were incorporated in some of the Pawnee revivals (1933, 112). Modifications such as Lesser described were not out of line with traditional Plains First Nations' religions highly valuing personal revelations (visions); at the same time, normally it was important to correctly replicate icons and procedures, in the case of the Pawnee Bear Dance through meetings of all who could recall it (Lesser 1933, 110).

To take the Pawnee as an example, in the past and the present, this nation recognizes both community rituals with cosmological reference, and the rituals of "medicine men" (doctors) that call on nonhuman creatures to assist in healing. Both types are focused on medicine bundles. In the past, it was noted that each spring and fall, men whose healing power came from the same animal gathered to ritually renew their bundles; in late summer, the most learned and respected doctors jointly held the Medicine Lodge, a monthlong series of public demonstrations. Spectacular enactments of death and revivifying, such as a Bear Doctor transforming into a bear, bloodily slashing himself, then transforming back, making the wound disappear in the process, impressed even skeptical European observers. Doctors were trained through years of apprenticeship, and in their rituals they sang that they stood where their father or grandfather had stood, alluding to the vision originally inaugurating that mode of doctoring (Parks 1981, 18).

The most famous medicine society is the Midéwiwin (Midé People) of the Ojibwa, or Anishinaabe, of the northern Midwest and Canada (Hoffman 1891; Howard 1977). Holding its ceremony in the spring when families are gathered at prime fishing stations, the Midéwiwin convenes doctors and novices in a long bark-covered lodge. Members pass through a set of four ranks, at each stage learning more religious and medical knowledge and demonstrating mastery before public audiences. Each member experiences ritual death by being shot with a magical shell, the "medicine arrow," then revived by the senior members. This experience, with the songs and medicinal herbs they are taught, enables Midé people to cure illness and nullify sorcery. In the past, many Ojibwa communities had a shorter Midéwiwin ceremony in the fall and had Midé priests bless their harvest of wild rice, a staple food. Recitation of the history of the Midéwiwin at the ceremonies familiarized audiences with Ojibwa cosmology and history, providing a framework for the Grand Medicine Society.

The Cheyenne (Moore 1996) of the northern Plains held a ritual, Massaum, immediately following their annual Sun Dance, in the same great tribal camp. Massaum reenacted the beginning of close relationships between animals and humans, when the daughter of holy beings married a Cheyenne. She called forth all the animals from their dens (brush-covered lodges in the camp circle), and as their masked, costumed embodiments emerged into the open camp, people needing healing or blessing came to them. Novices could also apprentice directly to practicing doctors, forming medicine societies deriving power from one or another animal patron. The Cheyenne formalized apprenticeship by expecting each doctor to accept four novices. Medicinal herbs as well as prayers, songs, and touching with amulets form the repertoire of Cheyenne doctors.

The Ho-chunk (Winnebago), in Wisconsin, speak a Siouan language, but they shared many ritualized doctoring performances with Pawnee and other American First Nations. Early in the twentieth century, a man named Thundercloud told anthropologist Paul Radin that he had obtained his curing power by fasting, during which he saw the beings who live in a doctors' village in the sky, those who live in a village in the ocean, and finally a grizzly bear who lives at St. Paul (at the junction of the Minnesota and Mississippi Rivers). These many spirit doctors demonstrated their powers and manner of performance to Thundercloud, who was then able to reenact these and heal people (Radin 1923, 227–228). Unlike the Pawnee, the Ho-chunk did not hold a grand Doctors' Lodge performance; the public observed doctors' powers when they attended patients.

The Iroquois of the Northeast have six medicine societies: an umbrella organization called Shake the Pumpkin, encompassing all the members of the five others; Little Water Medicine Society, which dispenses an animal-based medicine mixed with water; the Little People Society, which invokes small spirit beings; the Company of Mystic Animals—Bear, Buffalo, Eagle, and Otter—a women's society that invokes the power of these beings; the Husk Faces, a society that uses cornhusk masks; and the False Faces, a society that uses wooden masks. These last two represent, respectively, spirits of the agricultural fields and spirits of the forest, and maskers of each are able to cure by blowing through a handful of hot ashes, then rubbing these on the patient. The societies recruit from persons who have been cured by them, the appropriate society to effect a cure becoming known through a dream or divination. Unlike Midéwiwin or Pueblo societies,

Iroquois medicine societies meet in patients' homes rather than in their own lodge or meeting room. Each has its set of songs, ritual dance, and apparel. The False Faces march through the houses in the community each spring and fall to cleanse them from disease, and the society meets at the Midwinter New Year ceremonies to renew its power. The masks themselves embody the spirits of the trees from which they emerged through carving, and so should be treated as guests in members' homes, not shut away in storage between rituals (Fenton 1987; Tooker 1978, 459–461).

Southeastern nations such as the Muskokee (Creek) and Choctaw formally trained doctors, men and women (Swanton 1928, 617–620). Swanton (1946) speaks of "schools." After training, doctors needed to fast and pray alone in the forest to secure a spirit ally before practicing, although they also used medicinal plants, as well as sucking out disease, divination, and prescribing sweatbaths. They also had methods of preparing their ballplayers for success in a game. They went to patients' homes, or performed divinations and illusions in public. About 1730, a French officer testified that he and his men asked a doctor to "make the otter dance for them" in the village plaza. The man threw his otter-skin pipe bag into the open space, then himself went "repeatedly into the fire" without getting burned, until the otter skin "was seen to swell out, come to life, and to run between the legs of the Frenchmen, some of whom having felt of it, found that it was like a true otter." Having convinced the foreigners, the otter "diminished in size" until it was once again only a bag (Swanton 1931, 229). Diseases could be attributed to witches who might be discovered and executed, as might the doctors themselves when patients died. In addition to doctor-diviners, Muskokee and Choctaw recognized rainmakers. One eighteenth-century observer described a meeting of rainmakers who boiled a particular plant in an open field where they "danced and sang," but only if the sky was cloudy (Swanton 1931, 241). Prophets, who for the Muskokee had to be the younger of twins, were distinct from doctors and rainmakers.

Pueblos in the Southwest have a number of formal organizations responsible for civic life. Among them are medicine societies of doctors. Isleta Pueblo, on the Rio Grande, had their "Town Fathers," who inducted members by requiring fasting, four days of formal instruction, demonstration of skill, and swallowing a grain of corn symbolizing the member's new "medicine person's heart." They had a meeting place with an altar holding "corn mother" figures representing each of the members. For minor illnesses, one member would treat a patient; for severe or protracted illness several members would together act as sucking doctors (sucking out signs of disease). In epidemics the men patrolled the village at night, running down a suspected witch (who might transform into an animal) and burning its effigy, as a rag doll with a black corn kernel heart, in the society's meeting house (Ellis 1979, 358–360). The Town Fathers also ritually cleansed agricultural fields and livestock before planting. Isleta soldiers (who constituted the Warriors' Society) guarded the Town Fathers, and the women's section of the Warriors' Society cleansed their meeting house and prepared symbolic material to be swallowed by sufferers from "weak heart." It should be noted that many Pueblo communities do not approve of divulging, much less publishing, information on spiritual matters, including curing, and some of the Isleta information was, in the community's view, improperly betrayed by a resident (Ellis 1979, 364–365).

Northwest Coast nations (along the Pacific from southern Alaska to the Oregon-California border) staged elaborate theatrical performances dramatizing legendary events and the relationship between humans and other beings of their world. In these nations with well-articulated social ranks, practitioners of spiritual healing had recognized statuses, ranging from simply having been cured in this manner, to possessing the highest powers enabling practitioners to kill or cure. These most powerful doctors were engaged by aristocrats to protect them and assist their political work, especially war. People would turn to spiritual practitioners allied with a supernatural being if ordinary medicines known to everyone had been ineffective. To become a doctor, a person fasted alone in the forest to receive promise of aid from a spirit being. Many doctors came from families of doctors and were encouraged to go out to fast frequently as children (Jenness 1955, 65–68); they could also frequently observe their parents doctoring. Practicing doctors had younger assistants serving apprenticeships.

When the aspirant believed association of a spirit being had been secured, he or she publicly performed the song and dance of that being and was then able to treat patients. As in the community rituals in the same area, drama was enhanced with illusions (Codere 1990, 372). Kwakiutl, the most fully described Northwest Coast nation, recognized several distinct kinds of "shamans"—"great shamans," sucking doctors, "feeler-shamans" who cured by blowing and stroking along the patient's body, "feelers" who stroked patients' heads to discern whether the soul had passed through, "dreamers," and "seers." They practiced as individuals, but four "great shamans" might meet to formally accept a novice apprenticing to one of them (Boas 1930, 1–56, 266–278). The term *medicine societies* does not fit comfortably for Northwest Coast communities, where rank and offices were central, rather than associations of individuals, nor is there any close fit between Siberian shamans and the native doctor in these societies.

CHOCTAW SHAMANISM

Like many native societies of the southern part of North America, the Choctaw emerged out of the collapse of the Mississippian societies that had come before them. Between 700 and 900 C.E., Mississippian people, ideas, and sacred objects began moving out from sites on the Mississippi River. Chiefs and priestly cults began to consolidate political and sacred power by forming chiefdoms and by overseeing the construction of ceremonial centers, earthen mounds, and public plazas that expressed their corporate authority. Mississippian societies were often highly stratified and centralized, although most people inhabited small farming hamlets that were scattered across the countryside. And whether the chiefdoms were large or small, most depended on maize, beans, and other crops for subsistence.

Mississippian leaders derived their authority in part by controlling outside sources of power. Whether they obtained rare minerals from the Great Lakes region or kindled fires from the divine sun, chiefs and priests mediated between the insiders they governed and the outsiders who lurked on the borders of their chiefdoms. Hernando de Soto's expedition across the southern part of North America in the early 1540s brought Europeans into the Mississippian world. Such contacts also introduced diseases that decimated the Mississippians. In response to the ravages of disease and the subsequent collapse of the Mississippian chiefdoms, the chiefs and cults fell out of power, and the survivors dispersed.

Several remnant populations coalesced in present-day Mississippi in a number of towns along the Pearl, Chickasawhay, and Tombigbee Rivers. When the French founded Biloxi and Mobile in the late 1600s and early 1700s, they called the inhabitants of several such towns Choctaw, and over the course of the eighteenth century the Choctaw nation began to take shape.

In the eighteenth century Choctaw lived in towns. Women typically farmed and lived in the inside world, while men hunted and warred in the outside world. People traced their kinship through their mother, and generally maternal clans educated children, while fathers played a more distant role in their children's upbringing. Men usually moved in with their wives' clans and depended upon the clans for food, clothing, and shelter. Political power and religious authority had become more decentralized in comparison to Mississippian times, but equally ancient notions of power and its sources persisted.

Owing to their Mississippian past, Choctaw tended to regard outsiders and outside forces as having particularly strong sacred powers. When they scanned the forests that surrounded their towns, for example, they saw the homes and haunts of a variety of monstrous creatures, which often mixed either male and female forms or human and animal forms in the same body. Despite their violation of Choctaw taboos against such mixing, these creatures could provide individuals with special powers. Choctaw who lived in Louisiana in the early twentieth century, for example, reported that monsters like Nalusa Falaya could transform good men into evil ones by trapping them in the forest, causing them to faint, and then pricking them with a magic thorn.

For medical knowledge, people turned to Kwanokasha, a man the size of a small boy who

lived in a cave hidden in rough country. Kwanokasha hunted for children in the forest. He took little boys and girls back to his cave where he introduced them to three spirits. Each spirit presented the children with different gifts. One offered a knife, one offered poisonous plants, and the third offered good medicine. Children who accepted the knife would grow up to become murderers, those who took the poisonous plants were destined to be witches, and those few who took the good medicine would be trained by the spirits to become doctors.

Newcomers like the Spanish, French, and English only enhanced the range of powers Choctaw could locate in the outside world. The black-robed Jesuit priests who arrived in the Lower Mississippi Valley in the early eighteenth century to spread the Catholic faith offered conspicuous kinds of power of the same sort that Nalusa Falaya and Kwanokasha had offered. In one instance, a group of warriors stole some of the priest's sacred objects to use in their own dances and ceremonies. One hunter approached a Jesuit to ask for help in the hunt. Father Nicholas Lefevre was happy to baptize the young man, but was shocked when the hunter returned and demanded that his baptism be reversed because the Jesuit's magic had not given him a successful hunt.

Whereas the French tended to have good relations with the Choctaw, the English did not. In the late 1690s English traders had instigated Chickasaw slave raids against the Choctaw. Hundreds of Choctaw were captured and enslaved. While guns gave English allies the upper hand in the slave raids, the traders' command of sacred power threated the Choctaw nation's livelihood. In 1730 one chief charged an Englishman with impregnating a shipment of blankets with a medicine made from cane sugar. The medicine, the chief alleged, had caused smallpox to spread throughout the nation. The chief went on to denounce the genocidal intent of the English shamans and attributed all of the problems he and his people were having to their malicious work.

If the sources of shamanism as Choctaw understood them typically came from outside their world, practitioners often used their powers to address problems inside their society. Shamans, for example, conjured the ancient Mississippian image of the circle and cross to invoke the powers and forces of the universe. To conjure rain in times of drought the shaman would leave town and enter the forest where he or she would clear an open space for the ceremonies. Within the clearing the shaman traced on the ground a large circle enclosing a cross and then stood over the image. For four days and four nights the shaman called on the wind and water spirits to bring back the rain to the parched fields of maize.

Political leaders also sought the power that came through contact with outsiders in order to strengthen their nation. In the late eighteenth century a prophet-chief named Taboca gained tremendous authority through his mastery of sacred spaces and the power of the sun. He was also well connected with settler society, having traveled more widely than any of his contemporaries. He demonstrated his wisdom and sacred power by forging a relationship with the United States. In January 1786 Taboca led his fellow Choctaw in an eagle tail dance to demonstrate their peaceful intentions and the high regard in which they held the American commissioners. At the conclusion of the dance, Taboca presented the Americans with embers from a sacred fire kindled in the Choctaw nation. He then took embers from the American fire to take back to his home. The exchange of fires thus bound the two peoples together under the watchful gaze of the Sun, and the shaman Taboca had made it all possible.

Choctaw shamans, however, did not always work in what the public took to be its best interests. Depending on how people perceived the workings of the shaman's cures or poisons, they could be identified as helpful healers and seers or as witches to be driven by death or by flight out of their communities. In the 1810s and 1820s, for example, Choctaw suffered under enormous stress as the United States attempted to acquire their land, convert them to Christianity, and change their way of life. The stresses and strains that Choctaw experienced unleashed an outburst of attacks against shamans who had, for whatever reason, been identified as witches. Known as "man killers" and "spoilers of things sacred," these dark shamans threatened the security of the society. Opponents charged that while appearing as normal people in the daytime, these shamans shed their bodily forms at night and floated through air as glowing apparitions. Wherever

they flew they shot arrows imbued with the medicine of misfortune, illness, and accidents. After the execution of a handful of such people the situation got so bad that people began to flee their towns for fear of being accused, and Protestant missionaries and Choctaw officials struggled to put a stop to the killings.

No matter their power, however, the arrows that delivered the shamans' bad medicine could not, according to popular belief at the time, harm people who descended from both European and Choctaw parents. Why such people were immune to the arrows is unclear, but perhaps they represented an outside force whose strength was beyond the witches' malevolent power. Chiefs who shared Euroamerican and Choctaw ancestry believed every bit as much as did common folk in the disruptive powers of shamans, and perhaps even saw those shamanistic powers as inimical to their own political and religious programs. In 1829 Greenwood LeFlore, David Folsom, and other chiefs who sat on the national council passed a law empowering anyone who found the glowing entrails that dark shamans left behind while they flew about through the night to put the shaman to death.

If LeFlore and other leaders of the 1820s and 1830s sought to fight witchcraft, they cast Christianity as an alternate form of shamanistic power in order to save their people from the pressures of the outside world. At camp meetings throughout the Choctaw nation in the 1820s, people began having visions of their newfound sacred power. One man, for example, told a group that had gathered to hear religious testimony that he had seen himself born and raised in a dark wilderness. While pushing through bushes and brambles, the man came upon a candle's light, the power of Christianity, and he immediately made his way to the light to seize the new source of power. Another man had to swim up from a muddy river to see the light.

The power these men claimed by seeing the light was new, but it fit within older traditions about the nature of power, goodness, and badness. The association of the new power with dark locations in forests and rivers, far away from human habitation, echoed Kwanokasha's cave where the spirits offered children knowledge of knives, or poisons, or medicines. If Choctaw understanding of how shamanistic power worked and where its sources lay persisted throughout the contact period, the expression of both the power and its origins nevertheless had changed to reflect the changing world they inhabited.

GHOST DANCE AND PROPHET DANCE

The Ghost Dance and the multitude of Prophet Dances of the indigenous peoples of North America are a special category of the larger phenomenon of shamanic experience. The core of shamanism, as this encyclopedia points out in myriad ways, is the experience of

going to a spirit world and being shown visions or given songs that are taken back and shared with one's community in ceremony or used in individual healing rites. The Prophet Dances and the Ghost Dance refer to shamanic experience particularly shortly before or after the contact period; the vision relates to how the Native American community is to act, dance, and sing to avert the prophesied or already all too present dangers of change, disruption, and disease. After the decimation of the buffalo and the Plains way of life, the Ghost Dance was developed to bring back the ancestors and the game and to make the whites disappear (Mills 1982, Mooney 1965). Prophecies and accompanying rites assuredly occurred in the millennia prior to 1492. Indeed many Native Americans speak of the present world as the fourth world, implying that others have come and gone, or emerged and been transformed before; most shamanic cultures have or have had group rites to maintain world harmony (Mills 1982, 1986). However, the major elements of the Prophet and Ghost Dances were in response to the existing or prophesied advent of Eurocentric colonization and its threat to the indigenous way of life.

The first phenomenon that reflects a prophetic movement was the League of the Iroquois, which is said to have occurred before or soon after white contact (Mills 1982). This movement did not predict the end of the world but rather the beginning of a new era in which great peace would prevail through the formation of the League of the Iroquois, or Ho-Do-Nau-Sau-Nee. This message of the Iroquois prophet Dekangivida, who is believed to have given it before any contact with Europeans, was spread by the now legendary Hiawatha. But as settler society moved in, peace and harmony did not prevail; therefore, new Prophet Dances emerged. The Delaware and Shawnee Prophet Dances of 1760 and 1790 among the Eastern Algonquian Indians occurred after the Delaware tribe was forced to move from the Atlantic seaboard, their aboriginal home, to the Ohio and Susquehanna Rivers; the dances were associated with military attempts to oust or curb the influx of whites. These hopes met military defeat, and these eastern Indians were moved onto reserves in Kansas and Oklahoma (Thurman 1973). The Iroquois were never so displaced; they experienced a period of cultural degradation, during which a new Seneca prophet named Handsome Lake emerged in 1799 offering a new economic base consonant with white society and a new ethic that said they "must cease drinking, quarrelling and witchcraft" (Wallace 1966, 32). The Handsome Lake religion soon became amalgamated with the older traditional religion and remains active today; its followers are known as the People of the Long House. A less Christianzed group of traditionals is also active. In the Northwest Plateau areas of southern British Columbia and the state of Washington, a Prophet Dance emerged prior to local contact with Europeans, spreading to California and the Great Basin, where it reemerged as the Ghost Dance of 1870 and 1890, responding to the drastic change produced by contact with Europeans.

Leslie Spier (1935) noted that this Prophet Dance grew out of aboriginal shamanic thought in the Northwest Plateau area, which was the center of prophet movements that often predated contact. The Plateau Prophet Movement typically included a dance and moral precepts, particularly the precept of nonviolence, adherence to which would avert disaster and the end of the world. The further northward spread of the Prophet Dance was part of what Spier calls the second Christianized form of the Prophet Dance, which dates from 1820 to 1836. The prophetic visions of the Witsuwit'en prophet Bini, dated variously from 1830 to 1870, spread through the Gitxsan and Tsimshian to the Tlingit and Haida. Bini, having come back to life after many days of apparent death, foretold the coming of the horse, trains, airplanes, and priests, or "black robes" (Jenness 1943; Mills 1982, 104–108; Mills 1994, 166–170; Spier 1935, 39).

The prophets of the Sekani (Jenness 1937), as of the Beaver or Dunneza (Mills 1982, Ridington 1978), introduced dances and predictions of change and counsel about making peace. Carrier prophets (between the Sekani and Witsuwit'en) included a woman, Nokskan, whose counsel reflected or presaged the Durieu system of corporal punishments introduced by Oblate missionaries (Jenness 1943, 550). While the Christianized version was spreading northward to the Mackenzie River Athapaskans, the Prophet Dances were spreading almost like wildfire to the south, southeast, and southwest of the Interior Plateau. The Smohalla cult of

1860, the Ghost Dance of 1870, the Shaker religion begun in 1882, and the Ghost Dance that culminated in the Battle of Wounded Knee of 1890 were all part of this movement. The nexus spread to California and manifested as the Earth Lodge and Bole-Maru practices (DuBois 1939). In 1889 Wovoka, the Paiute Ghost Dance visionary, forged the classic Ghost Dance, which quickly spread to the Plains (Jorgensen 1986, Mooney 1965).

Sherman Alexie starts his story "Distances" with the following epigram, attributing it to "Wovoka, the Paiute Ghost Dance Messiah": "All Indians must dance, everywhere, keep on dancing. Pretty soon in next spring Great Spirit come. . . . The game be thick everywhere. All dead Indians come back and live again. . . . White can't hurt Indians then. Then . . . big flood comes like water and all white people die, get drowned. After that, water go away and then nobody but Indians everywhere and game all kinds thick" (Alexie 1993, 104).

These words catch the essence of the prophetic vision that fueled the Ghost Dance of 1890. The Ghost Dance was practiced with fervor by those whose relatives had died in droves; it was the only dance where the practitioners themselves fell unconscious and experienced reunion with their deceased relatives. The Oglala Sioux visionary Black Elk's connection with the Ghost Dance bespeaks the interpenetration of the shamanic tradition with the Ghost Dance: As a child of nine (in 1872) Black Elk, when sick unto death, had a major prophetic vision of the breaking of the sacred hoop of the Sioux Nation, and of the larger order, and of the hoop's eventual reconstruction. Black Elk was instructed by an elder to turn his vision into a dance complex. Later he traveled to Canada with Sitting Bull; later both Sitting Bull and Black Elk joined Wild Bill Cody's Wild West show and traveled to Europe. Returned, in 1889 Black Elk encountered the Ghost Dance as practiced at Wounded Knee. Initially skeptical of the Ghost Dance, when Black Elk observed it he was surprised at how closely elements of the Ghost Dance resembled his great vision. He received a vision of holy shirts made and painted in a certain way. Known as Sun Dance shirts, they became part of the Ghost Dance. The wearers believed the Sun Dance shirts would protect them from bullets. The Ghost Dance was outlawed in part due to the misperception that the demise of the white people was to happen through armed assault. Black Elk was camped nearby on December 29, 1890, when the U.S. 7th Calvary moved in and killed men, women, and children gathered to practice the Ghost Dance at Wounded Knee (Jorgensen 1986; Neihardt 1988). Black Elk said, "Something else died there in the bloody mud, and was buried in the blizzard. A people's dream died there. It was a beautiful dream" (cited in Neihardt 1988, 230).

Tradition and Continuity of the Ghost Dance

It is by no means clear that these dances have completely ceased to be practiced. Not only do writers evoke them in powerful stories of renewal and hope, the heirs of the dance tradition still play an important role in some places.

Sherman Alexie (1993, 104–109) poses the Ghost Dance vision at the beginning of a story that evokes a future time when something unnamed has decimated most of the white men and most of the Indians are still alive; the Urban Indians are returning to the reserve where they are dying off. There Tremble Dancer, an Urban Indian, dances as her limbs fall off. The Tribal Council says the Skins, those who lived on the reservation, cannot marry the Urbans. The Others come from a thousand years ago, and the tallest takes Tremble Dancer, who comes back with a big belly: Salmon flop from her. James Sakej Youngblood Henderson took the imagery a step further, resonating beyond, beneath, around, and through the apparent defeat at Wounded Knee. Henderson said, "Post-colonial Ghost Dancing" was and is "not a messianic movement but a sustained vision of how to resist colonization" (2000, 57). In Henderson's vision, the dances placed the spirits "back into deep caves of Mother Earth, where they would be immune from the colonizers' strategies and techniques" (58). He saw these forces, like Alexie's Others, forging a Dance that renews the ecological forces that re-create traditional consciousness, which in turn will bring about an Aboriginal (as ecological) renewal.

In the east, the Handsome Lake Long House is still active, although there are tensions between the Handsome Lake followers and the Traditionalists. In California, Cora DuBois (1939) depicted the prophetic movements as

dying out. However, in 1993 Greg Sarris told the story of their continuation, describing the California context in the lives of Mabel McKay and her mentor. North of the Plateau area, the Beaver, or Dunneza, in British Columbia had a series of prophets; the last one passed away in 1977. They continue to practice the Prophet Dance as a funeral rite and as a community renewal, as in Treaty 8 Days, or Doig/Halfway Days. The person picked out by Charlie Yahey, the last Beaver/Dunneza prophet, as his potential successor as prophet, plays a different role. This leader and sometimes elected chief has had the out-of-body experiences when seriously ill that are the usual starting point for prophetic vision and experience of new song; he sings the old songs strongly. But he has not brought back any new songs, although he seeks out seclusion and receives messages at times of greatest trial. His message is adapted for contemporary society: He practices and encourages sobriety, bolstered by born-again Christian ceremony and rhetoric (Mills 1986). In the Northwest (southwest of the Beaver) Bini, the Witsuwit'en, or Western Carrier, prophet is noted as returned or reincarnated in the form of an elder who was and is a community leader and hereditary chief, one among the many who launched the ground breaking Delgamuukw land claims court case, asking for recognition of ownership and jurisdiction over 22,000 square miles of their traditional territory (Mills 1994). Bini-come-back practices Catholic rites and sometimes born-again rites, but especially the ritual of the potlatch, which empowers the chiefs to continue to steward the resources of their territories.

On the Northern Plains, Ghost Dancing has rolled into the resurgence of the Sun Dance, which Henderson portrayed as truly infusing ancient power into the universe and which anthropologist Jorgensen termed "giving power to the powerless." The Sun Dance and its accompanying sweat lodge ceremonies have spread widely from the Plains, so that some of its rites and sweats are practiced in most of North America, including in the geographic area of the potlatch, which has likewise been resurrected, after having been outlawed from 1886 to 1950. The American Indian Movement (AIM) sit-in at Wounded Knee in 1973 represented a form of postcolonial or countercolonial Ghost Dancing created by the joining together of young activists such as Mikmaq Ana Mae Aquash, Dennis Banks, and Russell Means with traditional spiritual leaders. Leonard Peltier, the AIM activist serving time for the shooting of a CIA agent, although Amnesty International states that there is no evidence that he is responsible, represents a continuing legacy of the Ghost Dance and of Wounded Knee (Matthiessen 1983). Note that the Lakota Sioux commemorated the passing of seven generations (the equivalent of a hundred years) since the Battle at Wounded Knee, not with a Ghost or Sun Dance per se, but with ceremony and song surrounding a memorial ride on horseback from the place where Bigfoot was killed to the site where the survivors fled from Wounded Knee. This communal memorial horseback ride took several weeks and was repeated for four years (Rhine 1992).

Mooney noted that the Ghost Dance did not spread to the Pueblo people, yet in 1976 the Hopi led a three-day Earth Healing dance and ceremony in Vancouver British Columbia in conjunction with the UN Habitat Forum (Mills 1982). They were impelled to do so by the prophecies of their elders, which they say are from the time before Euro-American contact. The prophecies say that they must deliver the message to the world represented by the United Nations that the earth must be respected by its inhabitants or the earth will be destroyed. The message is different from the Ghost Dance; the whites do not disappear; on the contrary the necessity is to reach and teach the encompassing cultures and nations of the world to listen to and care for the earth, to reestablish what Black Elk called the sacred hoop. The Hopi felt satisfied that they were allowed to deliver this message to the UN Habitat Forum, after having been refused an audience twice, first by the World Congress of Religions, and the second by the United Nations Assembly in New York.

Anthony Wallace (1956) provided a model of the prophet as someone who articulates a resolution to a crisis that a large portion of the people are experiencing. Note how Wallace's model differs from an indigenous one, as articulated by Henderson, who saw the spirit forces as real and resurgent and the apparent victory of the colonizer, in the massacre at Wounded Knee as elsewhere, as illusory, temporary. The Ghost Dancers efforts, Henderson said, "were a

The Ghost Dance by the Oglala Sioux at Pine Ridge Agency. Kakota/Frederic Remington, Pine Ridge, South Dakota, 1890. (Library of Congress)

noble sacrifice for future generations"(Henderson 2000, 58). The Dance of the Ghosts, as Henderson and others imply, is far from ended.

GREAT BASIN HUNTERS AND GATHERERS

Shamanism in the North American Great Basin is a complex of beliefs and practices concerned with health, magic, and the sacred among the indigenous Numic-speaking hunters and gatherers. Concepts and knowledge of curing, disease, witchcraft, and sorcery are organized in an implicit ritually defined context.

The Numic-speaking peoples are grouped by tribal affiliation and linguistic criteria; they include Northern Paiute and Mono (Western Numic), Western Shoshone, Northern Shoshone, Eastern Shoshone, and Comanche (Central Numic), and the Southern Paiute and Ute (Southern Numic). Past and current distributions of Numic populations covered a large area in the Far West and Midwest. By the late 1800s, the Numa were situated either on reservations or in colonies within Nevada and Utah, eastern California, southern Oregon and southern Idaho, western Wyoming, southern Colorado, and southern Oklahoma.

Economic and political aspects of Numic culture have been characterized at three levels: nuclear family or family clusters, patrilineal bands, and composite bands (Steward 1938, 1955, 1970). Within these parameters, sociocultural variation within the Numic-speaking populations is at a maximum, and a distinct individualism prevails (Liljeblad 1986, 641). This individuality is largely responsible for the great variation in cultural forms and social structures. Elements and components of shamanism (novices and masters, shamanistic beliefs and customs, practices and traditions, sacred rituals and ceremonies) differ largely by locality and dialect (Miller 1986, 99–100). Due to their public nature, curing performances are common experiences, and therefore the novice is familiar with the performance procedures and techniques for healing. There are no initiations, secret societies, or other organizations to which shamans belong. Usually, competition and contest mark the relationship among shamans (Park 1938, 45–46; Whiting 1950, 38–42).

Shamanic Power

Whether unsolicited, inherited, or from a voluntary quest, shamanic power can be obtained by both men and women in Numic culture. Although women might have powers as great as their male counterparts, outstanding male practitioners generally outnumber women. As recipients of power *(puha* or *buha),* shamans may enlist help from a myriad of supernatural agents, such as animals, supernatural beings, or environmental phenomena, to act as spirit helpers or guardian spirits (Kelly 1936, 129; 1938, 151; Miller 1983, 69; Park 1938, 15; Whiting 1950, 27–32).

Supernatural powers are obtained in dreams. A prospective shaman might involuntarily dream of power (in the form of spirit helpers), or seek out guardian spirits through dreams at sacred places (e.g., caves). Dreaming is a necessary prerequisite even for inheritance of shamanic ability through family members. Re-

peated unsolicited dreams are common to the novice shaman, but differ in form and content in different shamans. In general, auditory sensations predominate at first: The spirit helper instructs the novice about paraphernalia, songs to sing, and the dances to be carried out while curing. Spirits and the power that accompanies them might be revealed on an individual basis and at different times in the dreams of the novice. Spirits are quite varied and include birds, animals, ghosts, implements, and supernatural elements (Kelly 1936, 129; 1938, 151–152; Miller 1983, 69–72; Park 1938, 18, 22–23; Whiting 1950, 28–32).

In all cases, novice shamans dream their own dreams, furnish their own paraphernalia, and have to follow the instructions given to them by their own spirit helpers. Paraphernalia include pipe, tobacco, rattle, beads, bones, feathers, and down. These items are carried in a crude bag of badger, otter, or weasel skin. The bag is always guarded and kept near the shaman at all times. Instructions from dreams are to be strictly adhered to, or the shaman might lose the power bestowed by the spirit helper, or might sicken and die. Violations of new routines set by the spirits (e.g., specific daily activities, food taboos), loss of paraphernalia, or not following instructions might trigger loss of power, sickness, and sometimes even death (Kelly 1936, 130–132; 1938, 152–161; Park 1938, 32–36; Whiting 1950, 33–42).

Vision quests or power quests in the Great Basin were simple and did not involve self-torture. Adults seeking more power would visit certain sacred places (e.g., caves) in the mountains. Instructions from the spirit helper were to be strictly observed and followed. Without strict adherence to the dictates of the spirit helper(s), many seekers fail to acquire power. To the east, groups like the Northern and Eastern Shoshone, Comanche, and Ute adopted a Plains lifestyle and indulged in fasting, wakefulness, and prolonged isolation. These groups also adopted the Sun Dance, which overrode the simplicity of the Great Basin power complex (Kelly 1936, 129; Park 1938, 27–28).

Whether involuntarily acquired, inherited, or sought, the power of a prospective shaman is controlled by the guardian spirit(s). The loss of power is a constant threat and concern to the shaman. Shamans might experience power loss for a number of reasons: ignoring instructions, mistreatment of paraphernalia, thoughtless or deliberate acts of others, all of which might cause the shaman to sicken and even die. Power, therefore, is both malignant and benign: threatening the shaman with sickness and death as well as curing others. In the case of multiple powers represented by different spirit helpers, the shaman might involuntarily forfeit a particular power without the loss of other powers. The loss, however, would always be accompanied by sickness (Park 1938, 32–33; Whiting 1950, 34–35).

Causes of Illness

For the Numic peoples, disease was supernatural in nature and the product of sorcery, dreams, or other supernatural events or activities. Two factors, intrusion of pathological objects and soul loss, were responsible for major illness. For shamans, there was the additional risk of loss of the power granted by the spirit helpers. Lesser disorders were treated by home remedies, such as drinking boiled sage for colds (Park 1938, 37; Whiting 1950, 33–37).

For major ailments, the most common cause is a dream. These dreams, on the whole, are not directed at the dreamer, but at relatives and members of the immediate family. Dreams of ghosts or the foretelling of sickness by the dreamer frequently indicate that a relative will become ill or die. When dreams of this type are remembered, the dreamer prays to the sun in order to alleviate the effects of the dream. Frequently the dream cannot be remembered, illness results, and a shaman is called to treat the patient. In the curing ceremony, the shaman discovers the dream and the person who dreamed it. The dreamer must confess the dream and relate its content publicly. Not until the dreamer confesses the content of the dream to the shaman can a cure be made. If the dreamer cannot be found, any attempt at curing will be unsuccessful. Dreams about animals (e.g., coyote, antelope, mountain sheep, gopher, and so on) may also cause illness (Kelly 1936, 130; Park 1938, 38–39).

Ghosts are a great cause of consternation among the Numic-speaking peoples. These apparitions appear in dreams and may be directly responsible for soul loss. (It is believed that the soul is located in the head or chest.) In dreams, a ghost indicates serious illness, and that illness

may only be prevented or cured by instructions from the shaman. In cases of soul loss, the shaman attempts, through trance, to return the soul to the body. The Numic people believe that the soul wanders around the camp and may be refused entrance to the afterworld. Whether it is still in the camp or already in the afterworld, the shaman persuades the soul to return (Kelly 1936, 133; 1938, 152–163; Park 1938, 40–42; Whiting 1950, 35–37).

Another form of illness is believed to be caused by sorcery. Shamans who used their powers in antisocial ways were often called people eaters and greatly feared. These sorcerers focus their thoughts on a particular object (e.g., stone, worm, lizard, or miniatures of men or animals) and supernaturally place the diseased object in the body of the recipient. The sorcerer's prime method is concentration; sympathetic or contagious magic are seldom used. Other methods include touching the recipient, handling the recipient's food, or smoking a pipe with the person. Sorcery performed for personal gain or in response to requests from other individuals is unheard of; for the sorcerer works for his own secret gratification. After a time, sorcerers are believed to have become unable to control their powers, the lust for killing having taken over. Sorcery is punishable by death. The sorcerer was believed to deliberately cause illness through dreams, and shamans who worked for the good of the group would name both the nature of the illness and the person that had the dream. Sorcerers were put to death publicly on the accusations of shamans. Public executions of known sorcerers were carried out by men, and sorcerers' houses would be burned down around them. Great respect, based on fear, was given to suspected sorcerers (Kelly 1936, 133–134; 1938, 155–163; Park 1938, 42–45; Whiting 1950, 55–66).

Curing Rituals

Public rather than private curing is the primary goal and function of the shaman. Doctoring, or curing, represents the principal ceremonial activity and stands as the main religious component among these hunters and gatherers. Generally, the shaman or doctor performs the healing ceremony without the assistance of other shamans. The exception to this would be in a case of inherited power, when the experienced shaman (usually the father) might assist the novice in the first curing ceremony.

The performance is always held in the house or shelter of the patient and the patient's family. The ceremony customarily lasts two or three nights. In the latter case, the doctor rests on the second night and continues the ceremony on the third night. In cases of serious illness, the family may sometimes employ two shamans; one for each night of the ceremony (Kelly 1938, 152–162; Park 1938, 45–46; Whiting 1950, 38–39).

Doctors charge a fee for their service. Aboriginally, the fee consisted of blankets, horses, beads, and the like, but with the coming of the whites the fee was three to five dollars. This fee is generally paid before the ceremony commenced. Unpaid debt or overcharging brings illness to the shaman. If the local shaman is unsuccessful, a well-thought-of shaman of a neighboring group is called in to treat the patient. According to the earliest accounts, the shaman's specialization in healing originally plays a greater role in the treatment of the patient. Rattlesnake power is used to combat snakebites, and power derived from a waterbaby (a small mythical figure who inhabits lakes or permanent ponds) is employed to ward off sickness caused by waterbabies. Ghost power is used for soul loss. Some doctors have greater powers than others on the basis of their successful cures and experiences (Park 1938, 45–46; Whiting 1950, 38–39).

The curing performance usually takes place at night. Exceptions to this would be snake bites, wounds, or acute illness. The doctor instructs the family to prepare a willow stick of predetermined size, usually three to four feet in length, to be placed by the patient's head. In some groups, such as the Southern Paiute, this stick is replaced by the shaman's own personal cane or staff. In a way based on the shaman's dreams, the stick or wand is decorated with feathers, down, and beads, and painted with red and white bands (Kelly 1936, 131–132; Park 1938, 48; Whiting 1950, 38–39).

The shaman has two assistants: an interpreter, or talker, and a female dancer. According to the earliest accounts, the talker was originally always male, but in the more recent past women could be talkers. On the other hand, women have always been the dancers, although some shamans do not employ a dancer at all. In

a loud clear voice, the talker repeats what the shaman says so that the audience understands. The talker sits at the shaman's left, repeating what is said and initiating the singing of songs. The dancer, on the other hand, dances behind the shaman, carries a basket with beads or pebbles, and uses the basket as a rattle. Dancing three or four feet behind the shaman, the dancer follows the shaman in a counterclockwise direction around the fire, shaking the basket as a rattle in time to the dance steps (Park 1938, 50–51).

Doctoring has traditionally been a nighttime activity, and shamans sit and converse with the audience or concentrate on their powers and the cause of the illness before the ceremony starts. Footwear is removed, and the patient's head is pointed to the south. The shamans always sits behind the patients' head (thus to the south of the patient) and when dancing always travel counterclockwise, mimicking the direction of a whirlwind. Shamans place pieces of the paraphernalia in front of themselves and then sing five songs calling their spirit helpers; the talker and the audience join in the singing. The shamans' pipe is lit and passed to the talker and the audience in a counterclockwise direction (Park 1938, 48–49).

Soul loss is commonly associated with the patient being unconscious, and in such cases the shaman quickly goes into an altered state of consciousness. If the patient is conscious, the shaman's entry into an altered state is optional, depending on the strength of his powers. The illness is attributed to a disease object being present. The shaman usually attempts to suck out the object with his mouth or a bone or willow tube. With the interpreter and audience singing, the shaman continues the sucking until the object is located and extracted. No cutting or biting is employed by the shaman.

An intermission is called around midnight, when the family of the patient supplies food prescribed by the shaman. The food is handed out, and its consumption is strictly observed, making sure that the food isn't wasted or dropped and the unconsumed part is buried. The shaman does not usually take part in the meal, but carries on conversations with the audience. After the intermission, the extraction would continue until daybreak, when the shaman's songs become weak. At daybreak the ceremony ends until the following night. The shaman gives the family instructions (e.g., about avoiding certain foods, painting the patient, and so on) and retires for the day, only to resume the ceremony the next night. The feather wand stays by the patient's head during the entire ceremony. Two native paints (red and white) from natural soil deposits are used regularly in the ceremony. Use of these paints is at the shaman's discretion; they might be applied to the patient and audience as well as to the shaman and the shaman's assistants. Sleight-of-hand performances are also at times part of the ritual among the Numic groups. If the patient dies, the shaman is not held liable or responsible for the death. However, the shaman is obligated to return the fee if the patient dies within a few days after the ceremony (Kelly 1938, 131–133; Park 1938, 51–58).

Other Shamanic Roles

A shaman is always present in the event of intertribal or outside warfare. Other features in the shaman's repertoire include weather control, prophecy, clairvoyance, and antelope charming. The extent and scope of each varies among the Numic groups. Weather control is extremely variable—a constant among some groups and limited among others. The shaman demonstrates control over supernatural powers by interceding on behalf of the group. Certain shamans have the ability to predict the future. Dreams are the most common method of prophecy. A shaman might dream of death, sickness, and warfare; awaken; and tell others the prophecy. The prophecies are only about harmful events or activities like those above; nothing successful or benevolent or favorable can be predicted. Theft and the location of lost articles can also be found out by some shamans. This ability is considered by some a luxury and not within the scope of shamanic practices, per se (Kelly 1936, 136; 1938, 153–165; Park 1938, 60–62).

Although sporadic, communal activities play a key role in the economy of Numic hunters and gatherers. Rabbit and mud hen drives are mainly secular events with a hint of religious overtones (e.g., prayers, observation of omens). In these drives, shamans play no substantial role, and the powers they possess are of little value. Only in the antelope drive might the shaman use power in a religious or ritual con-

text. Antelope shamans get their antelope power from an antelope spirit helper, although a person with antelope power may also have other powers from other spirit helpers. Antelope power is the only power used in antelope drive. Although women can acquire antelope power, they are not allowed to be antelope shamans; only men can charm antelope. The antelope shaman directs every aspect of the drive (Park 1938, 62–63; Steward 1938, 34–36; 1955, 109–110). The nature of shamanic power can be graphically illustrated by an account of a typical drive.

Spring might find the food stockpiles dwindling; public appeal for an antelope drive becomes intense, and an antelope shaman is invited to charm the antelope. Using scouts, word of mouth, or dreaming, the shaman locates and determines where a sagebrush rope corral should be erected. The corral is the property of the antelope shaman. When the sagebrush ropes are finished, the actual construction of the corral is completed in one day. A dance is held that same night inside the corral or at a camp near the corral. (The dance might be held for a few hours or all night.) The antelope shaman sings his antelope songs to make the animals docile. The shaman goes into an altered state of consciousness so that antelope can be herded into the corral. Music at the charming ceremony is made with a rasp employing a bowstring and horns. (The rattle, traditionally employed in the curing ceremony, is never used.)

Certain taboos are strictly observed. Menstruating or pregnant women and their husbands are excluded. Sexual intercourse is forbidden among spouses, as is flirting among young people. Relieving oneself in the proximity of the corral is forbidden, as is the loss of personal property by participants. The ceremony lasts three to five days, during which the participants focus their thoughts on the antelope. Two messengers are sent out daily to surround the antelope and drive them into the corral. On the last day of the ceremony, the antelopes are corralled, and the first three antelope killed are given to the antelope shaman and his two messengers (assistants). Then all other antelope are killed, and the meat is distributed among the participants. This is the only major ritual that is not concerned directly with disease control among the Numic people (Park 1938, 62–66; Steward 1938, 34–36).

A Final Word

The above description of shamanistic beliefs, practices, and traditions apply principally to people of the interior of the Great Basin; other Numic groups on the fringe or beyond the Great Basin are influenced by and adopt many of the traits of neighboring non-Numic groups. Nevertheless, the individualism that characterizes the whole Numic cultural spectrum is the defining feature of the economical, social, political, and religious components of their culture.

GREENLAND SHAMANISM

The missionary Hans Egede, who arrived on the west coast of Greenland in 1721, made the first detailed observations of the séance of the Greenlandic shaman, the *angakkoq* (plural *angakkut,* modern West Greenlandic spelling). He was sent out by the Danish king to convert the heathen Eskimos, and he kept valuable records of his encounters with the Greenlandic angakkut.

> A number of spectators assemble in the evening at one of their houses, where, after it is grown dark, every one being seated, the angekkok causes himself to be tied, his head between his legs and his hands behind his back, and a drum is laid at his side; thereupon, after the windows are shut and the light put out, the assembly sings a ditty, which, they say, is the composition of their ancestors; when they have done singing the angekkok begins with conjuring, muttering, and brawling; invokes Torngarsuk [a major spirit], who converses with the angekkok. . . . In the meanwhile he works himself loose, and as they believe, mounts up into Heaven through the roof of the house, and passes through the air till he arrives into the highest heavens, where the souls of angekkut poglit, that is, the chief angekkuts, reside, by whom he gets information of all he wants to know. All this is done in the twinkling of an eye. (Egede 1818, 189–191)

This short description gives important details about the central elements of the Greenlandic séance: the role of the participants in singing the angakkoq on his journey, the tying up of the angakkoq, the drumming that induces an altered state of consciousness, the invocation of the spirits, the journey to the spirit world, the communication between the mediator, the shaman, and the spirits, and the return of the angakkoq with information from the spirits, which secure the survival of his society. A possible translation of the word *angakkoq* is "visionary and dreamer" from the word *angavoq,* "roaming about," and the special skill connected with the angakkoq was *silanigtalersarput,* the capacity of seeing clearly in darkness and through clothes, skin, and flesh into the center of a human being. The angakkoq was the wise communicator with the world of the spirits on behalf of human beings, to whose secrets he had direct access.

The people that Hans Egede encountered represented the last in a long history of migration from Alaska through the Canadian Arctic to the west coast of Greenland. They belonged to the Thule culture, a name given by archaeologists that refers to a site in northernmost Northwest Greenland. These neo-Eskimos, now referred to as Inuit, had moved down along the west coast of Greenland starting in the thirteenth century, following in the footsteps of the Dorset culture. Their culture originated in the northwest of Alaska, and even today there are similarities between the languages spoken by the Inuit of that area and the Inuit languages of Greenland. The hunting area had to be large enough to sustain small settlements, and a constant movement of hunting grounds took place following the migration of the animals. The last known migration of people from arctic Canada into the Thule district happened around 1865 (Gad 1984, 23ff.). The game was

mostly sea mammals such as seal, walrus, and whale, but birds and caribou were also an important part of the diet. In the winter the dwellings were made out of peat and stones, whereas in the summer the Greenlanders lived in skin tents.

The role of the angakkoq was to communicate with the ever present spirits who would threaten the equilibrium of the settlement. Training to be an angakkoq was open to persons of both sexes, but anyone who wanted to acquire a reputation as a skilled angakkoq had to be especially gifted. It was necessary to learn from an older angakkoq where to search for the connection to the spirit world. There were often two apprentices training at the same time. At a specific lonely place, in a cleft or cave, the apprentices started to rub a stone upon another stone around in the direction of the sun. This was done for three days consecutively, and then a spirit would emerge from the cleft. It would turn its face toward the sunrise and ask what the apprentice wanted. The apprentice would then die under the most terrible pains, partly from fear, partly from exhaustion, but the following day he was revived. It was a frightening experience to accumulate helping spirits, as one apprentice recounted:

> I cast a stone out into the water, which was thereby thrown into great commotion, like a storm at sea. As the billows dashed together, their crests flattened out on the top, and as they opened, a huge bear was disclosed. He had a very great, black snout, and, swimming ashore, he rested his chin upon the land; and, when he then laid one of his paws upon the beach, the land gave way under his weight. He went up inland and circled round me, bit me in the loins, and then ate me. At first it hurt, but afterwards feeling passed from me; but as long as my heart had not been eaten, I retained consciousness. But, when it bit me in the heart, I lost consciousness, and was dead. When I came to myself again, the bear was away, and I lay wearied out and stark naked at the same place by the lake. I went down to the sea, and, having walked a little, I heard someone coming running after me. It was my breeches and boots that came running, and, when they got past me, they fell down on the ground, and I drew them on. (Holm 1914, 298ff.)

The accounts of the different apprentices' experiences of training vary, but the common thread is the overcoming of fear by facing the terrifying spirits. Included in the training is also a symbolic death. The process of dying and being revived is a well-known part of the initiation of the shaman worldwide. It is necessary to die and overcome the fear of death to be able to interact with the world of the dead.

Women could train to become angakkut, though often childbirth would interfere with their training. One female apprentice on the east coast of Greenland narrated an instruction from the spirit world of how to rid herself of her husband. She should either cut a piece of his hair and throw it after him when he went out in his kayak, or she should put dogs' hair between the soles of his boots. "If you place them there he will be robbed of his soul. When he has been robbed of his soul he will die" (Thalbitzer 1923, 457).

The behavior of the apprentice would be altered as he neared the end of the training, which until then had been undertaken in secrecy. The final process of coming forward in his society as a full-fledged angakkoq would make him dangerous for his fellow men. Blood might trickle from his mouth, he might roll up his facial skin, or he might swallow large objects, all of which would terrify his audience to death. They could only protect themselves by having sharp weapons or by sitting on greasy places, which the spirits resented. This process would last for about three days, after which he would be a fully educated angakkoq (Rosing 1963, 215ff.).

The role of the new angakkoq was, assisted by his helping spirits, to interact with the spirit world, which consisted of a variety of spirits connected with specific places or specific functions. The most important spirit was the Mother of the Sea, who reigned over the game, and it was a highly dangerous task for the angakkoq to travel to her. He was therefore dependent on strong helping spirits on the journey. The Mother of the Sea would be covered with the filth of human transgression of taboo rules, and it would be the task of the angakkoq to cleanse her. The moment he entered her dwelling place she would seize him, and they would fight; she was very strong, and he would have been unable to manage had his helping spirits not come to his assistance. In

the end they overcame her resistance and started to wash her, afterwards combing her hair, which was a difficult task, for the hair was all entangled (Rasmussen 1938, 127). When the dirt had been cleared away, the Mother of the Sea would release the animals. The angakkoq would return to the audience participating in the séance and name the specific transgression of taboo rules that had led to the game being kept away from the shores.

The angakkoq would also interact with the souls of human beings and restore them if they had been stolen or gotten lost. Every person consisted of a soul, a body, and a name. The soul was immortal and resided outside the person, but followed it, as the shadow follows a man in the sunshine. Although the soul was thus not inside the body, the body and the soul were nevertheless inseparable as long as a person was alive; for when the soul left the body, the body pined away and died. Consequently a man's soul could be stolen by an angakkoq, who would bury it in the snow, and the hole had to be covered with the fleshy side of a dog's skin. Then the person would inevitably die, unless another angakkoq, favorably inclined to the victim, could find the soul that had been stolen and bring it back to the body. After the death of the body, the soul ascended into heaven or went down into the sea. It was attractive to reside in either place (Rasmussen 1908, 106). But the concepts of the number of souls in a human being varied considerably depending on the narrator. Some believed that there were several souls in the different limbs of a human being. Another important concept was the *inua,* the "owner" of the visible world. This term was applied to nature, objects, and even emotions. The inua could move outside its place of origin but was always closely connected to it.

To communicate with the souls of the dead or to restore a soul to a sick human being, the angakkoq would undertake a séance. The most important paraphernalia that the angakkut used to enter into an altered state of consciousness was the drum. The drum consisted of a round ring of wood over which was stretched the skin of a bear's bladder or the gut of a seal sewn together. Before use the drum skin was moistened, and it gave out a booming note when the wood ring was struck with the stick, which as a rule was made of wood. During a séance a dry skin was placed in the entrance of the house, which would rattle when the spirits arrived. In the séance the angakkoq was seminaked and there was no use of the elaborate garments that are known from other cultures. There are no accounts of masks being used by an angakkoq either. The area in which the séance took place had to be clean, and new dry skins were hung at door and windows.

> When the interior of the house had become quite dark, the shaman performing the invocation would often be seized with an inexplicable feeling of fear, and some have told that they trembled so violently at something unpleasant and unknown that they had a feeling of being about to die. It was thought that the drum in the hand of the shaman possessed mystic and supernatural power that helped to summon the spirits. It would become alive in the course of the séance, and floated freely about the house without being touched by the shaman's hand. (Rasmussen 1938, 95)

One of the tasks of the angakkoq was to confront the *tupilak,* a magical creature whose aim was to destroy the enemy of the maker. It could be created by ordinary members of society, but when it was invisible, the angakkoq was the only one able to see it during the séance. It was made of the bones of various animals, moss, skin, seaweed, a kayak sleeve, or an old mitten. It was created near water and animated with magical songs. It might be made to suck the sexual organs of the maker to give it strength. It was the physical manifestation of revenge. When, however, it had been sent out against a victim it blindly obeyed orders. Should the intended victim prove to be of greater strength, he could order the tupilak to turn against its maker, who then became the hunted victim (Petersen 1964, 75). The role of the angakkoq was to realize that a tupilak was there during a séance and perhaps manage to destroy it in a dramatic battle.

One of the most famous and detailed descriptions of a séance of an angakkoq was undertaken by Gustav Holm in 1884 when traveling up along the east coast of Greenland. The angakkoq walked as if in a dream and sat down on a skin on the floor. Then he arranged the flat stone and the drum with great care. His hair was tied back, and a thong was pressed

Wooden eskimo figure representing a spirit of a nineteenth-century east Greenlandic shaman called Taqhisima. Each shaman was associated with one or more special spirits, or familiars, on whom they relied for help in curing, divining, and communicating with other spirits. (Werner Forman/Corbis)

down over his forehead, his hands and arms up to his elbows were bound so tightly that they became blue. Meanwhile the angakkoq was puffing and groaning as if he were succumbing to a great power and at the same time drawing the attention of the onlookers to the fact that it was impossible for him to loosen his bonds. The lamps were then extinguished.

> Immediately the spirits were invoked with the cries: "*Goi! goi goi goi*"—now one voice, now more, sometimes from one end of the house sometimes from another. During this the Angakok grunted, puffed and sighed loudly. Suddenly, the skin at the door started to rustle as if it was moved by a strong wind. The drum began to beat first slowly then gradually more rapidly. . . . During the most terrible noise the platform and the window-sill were sometimes shaken. Now the Angakok was heard lying under a heavy superior force, groaning, wailing, screaming, whining, whispering, now the spirits were heard some of whom had coarse, others tiny, others lisping or whistling, voices. Often a demonical, screeching, mocking laughter was heard. The voices sometimes came from above, sometimes from under the ground, now from one

> end of the house, now from the other, now outside the house or in the entrance passage. Cries of: *"hoi! hoi! hoi!"* faded away as if into the remotest abyss. With immense skill the drum was beaten, often moving round in the house, and especially hovering above my head. The drum often accompanied singing, which at times was subdued as if coming from the Underworld. Beautiful singing by women sometimes came from the background. (Holm 1888, in Jakobsen 1999, 124–126)

After the deafening noise everything suddenly became quiet, and then in came the fearsome spirit Amórtortoq. It had black arms, and whoever touched it would become black and die. It went with heavy steps about the house and on the platform and roared: "A—mo! a—mo!" Everybody fled to the corner of the platform, afraid that the spirit would touch one of them.

The séance had lasted about an hour when the *tartok* (helping spirit) started to retreat and after a while somebody asked if the lamps could be lit, but the angakkoq answered that the tartok was still present. The drum was not heard anymore, and it was thought that the tartok had left. Soon the drum started again, and its departure proceeded to the rattling of skins and the dying away of the singing. The lamps were lit in the opposite order to that in which they had been extinguished, and everybody sat as before the start of the séance. The angakkoq sat bathed in sweat in the same place as at the beginning. His hands were still bound behind him in the same fashion as before, but not nearly as thoroughly. As this description shows, the séance was a very elaborate performance requiring several skills.

Healing Functions

One of the major functions of the angakkoq was to perform healing on sick members of the society. Disease was interpreted as being caused by the soul leaving the body or by something alien penetrating the patient. The soul could either be stolen by another angakkoq or simply go astray, or it could be in the land of the dead. If the latter was the case, a full séance was necessary, as a journey had to take place. It was then the task of the angakkoq to restore the soul to the patient, or even change it, when the damage to the soul was beyond cure. The angakkoq might use the healthy souls of animals to replace soul parts. A diagnostic treatment to assess the condition of the patient was described by the missionary Hans Egede.

> At times they use this way of curing the sick; they lay him upon his back, and tie a ribbon, or a string, round his head, having a stick fastened to the other end of the string, with which they lift up the sick person's head from the ground, and let it down again; and at every lift he communes with his Torgak, or familiar spirit, about the state of the patient, whether he shall recover or not; now, if his head is heavy in lifting it, it is with them a sign of death; if light, of recovery. (Egede 1818, 193–194)

Often, however, the healing was performed as a conversation between the sick person and the shaman, in which the angakkoq would induce hope of recovery in the patient by referring to similar cases where the ill person became well again or by narrating the happiness in the Otherworld. Apart from head-lifting, sucking out the illness and blowing on the sick person might also take place as means of healing, and these methods could be used outside the séance by laypersons, often women, who had the skill of healing. The séance was used in more grave situations to invoke the help of the spirits, who together with the angakkoq, might travel and retrieve the soul of the sick person from the Otherworld. There might be a set of rules of behavior that the patient and his family had to follow to achieve health. The whole healing procedure was aimed at restoring the health of the ill person by magic. Little was done in the nature of using remedies, except injunctions in connection with food (Jakobsen 1999, 94).

As disease was interpreted as soul loss or soul stealing, people who undertook such secret endeavours were highly feared, and the deeds of the *ilisiitsoq,* or witch, who stole the soul, were punished with great violence. The *ilisiitsut* were seen as evil-minded people, often women, who brought misfortune and death. This kind of action was interpreted as directed against the whole community, and the punishment was death, sometimes instigated by the angakkoq.

The missionaries, however, saw these onslaughts as directed against the weaker members of society.

Disease and death could also result from the transgression of taboo rules in connection with the burial of a dead person. Death was a complication for the society, as the dead person could take revenge on the living if the protective rules were not followed. Among the Polar Eskimos in northwest Greenland, people involved in the burial had to stay silent in their houses and were not allowed to take their clothes off at night for five days. When these days had passed, they had to wash themselves to cleanse off the impurities. This ritual was performed to avoid the power of the dead person having an impact on the lives of the living.

The angry soul of a diseased person, the possible attack of the ilisiitsoq, or the random onslaught of evil spirits, all threatened the survival of the single individual and the community as a whole. It is therefore not surprising that the person who held the power of protecting the society against these unpredictable dangers of disease and misfortune was presented as the hero in the myths. In these tales the angakkut were credited with important abilities and skills of interaction with the supernatural forces, mostly malevolent spirits. The need for communication with the spirit world stemmed from a dysfunction in the society itself caused by human emotions running out of control, which again displaced the equilibrium in the settlement. Often the theme of a tale was enmity and violent revenge. The supernatural forces could be engaged by ordinary members of the society to destroy enemies.

As the angakkoq was able to prevent these onslaughts, he was presented as the typical mythical hero, who left ordinary reality and went to nonordinary reality to fight with the malevolent forces on behalf of his society. Here the real battle took place, which made it possible for the angakkoq to return with the knowledge that would lead to the establishment of guilt and expiation by the guilty through adhering to the rules dictated by the offended spirits. The tales about his combats, his supernatural encounters, and his magical skills all served the purpose of supporting and sustaining belief in the power of the angakkoq. The stories of the angakkut of old times confirmed the trust of the community in the abilities of certain human beings to serve the interests of all by mastering the skills and insight needed to deal with spirits. The stories, therefore, ratified those skills and supported the belief in the power of the séance (Jakobsen 1999, 105).

European Perspectives

Some Europeans, however, told a different tale of the powers of the angakkut and how they used those powers. In these accounts they were highly feared and used their powers to control the settlement. One of the famous angakkut was Maratsi, who lived on the east coast of Greenland at the beginning of the twentieth century. He was sought out by people in connection with curing illness and solving murder cases. He was praised for his power over the spirits, although he himself claimed to the Europeans that he did not possess such skills. He had a difficult personality and had committed murders and theft and had threatened women who would not sleep with him with soul stealing. One observer described the transformation of Maratsi during a song fight. He came across as wild and evil, his eyes wide open and his teeth protruding: "Over his whole figure was something so wild and misanthropic that I fully understood the demonic fear that he induced in his fellow countrymen" (Kruuse 1912, 40).

The arrival of the Europeans in Greenland, the missionaries on the west coast in the eighteenth century and the explorers, scientists, and missionaries on the east coast in the nineteenth century, changed Greenlandic society's belief system dramatically, and today there is no known traditional shamanism taking place in Greenland. The influence of Danish culture on the role of the angakkoq among East Greenlanders is well described in an account of the performance of Salomon, the grandson of the great angakkoq Avgo: He "held a seance with lamps extinguished and for two hours filled the air with the most remarkable sounds, knocking, drumming, singing, screaming, wheezing, howling, hissing, and distorted speech—and then when the lamps were lighted and a company of about seventy people in cotton anoraks, woollen sweaters, and cloth trousers roared with laughter at Salomon's weirdly amusing performance, and he demanded a packet of rolled oats as his fee—certainly, the

old days have gone for ever in Angmassalik" (Mathiassen 1933, 144).

HAUDENOSAUNEE SHAMANISM

See Iroquois (Haudenosaunee) Shamanism and Secret Societies (North America)

HOPI SHAMANISM

Although shamanism is no longer practiced among the Hopi in its original form, enough evidence remains to allow a clear picture of an agricultural society in which shamanism was once firmly institutionalized and played a central role.

The Hopi Indians, descendants of the prehistoric Anasazi and speakers of a Uto-Aztecan daughter language that is distantly related to the Classical Nahuatl of the Aztecs, represent the westernmost group of the Puebloan culture pattern in the American Southwest. Referred to as Moqui for many years after their encounter with the Spanish conqistadors in 1540, their true tribal name is *Hopiitu,* "Civilized Ones." Sedentary farmers with a maize-centered agriculture, impressive architecture, and an elaborate ceremonial cycle, they thus set themselves off, in typical ethnocentric fashion, from some of their nomadic neighbors such as the Navajos, Utes, Paiutes, and Yavapais.

Residing today in eleven villages situated on mesa spurs at the southern end of Black Mesa in northeastern Arizona, the Hopi are widely known for their aesthetically appealing arts and crafts as well as their colorful ceremonial open-air performances, especially the masked Kachina dances and the Snake ritual. Removed from the mainstream Euro-American society, the Hopi for a long time succeeded in shielding

their culture from outside influences. However, ever accelerating acculturation after World War II has taken a heavy toll on both their language and their culture.

There exists today a near-consensus of opinion among scholars that shamanism is humankind's oldest religious paradigm. In particular, it is believed that, the world over, simple hunter-gatherers of prehistoric antiquity practiced a shamanistically oriented brand of religion. The demise of archaic hunter-gatherer bands and the emergence of horticulturists and farmers, however, does not imply that shamanism became extinct, at least not where the American Southwest is concerned. Shamanism's survival was assured because agriculturists such as the Hopi continued to have the same metaphysical, psychic, healing, and fertility needs as their ancestors.

Although intimations of shamanistic practices are relatively few in the large corpus of Hopi ethnographic data and traditional narratives, there is sufficient evidence that shamanism was once firmly institutionalized among these agriculturalists, and that Hopi culture has what might be regarded as a shamanic view of the world, "in which everything—not only animals but also plants and rocks, wind and rain—may be imbued with spirit" (Vitebsky 1995, 15).

A few lexemes in the Hopi language provide some insight in this connection. Thus, the shaman was known as *povosqa* (plural *povosyaqam*) at Second Mesa and as *poosi'ytaqa* (plural *poosi'yyungqam*) in the Third Mesa dialect area. Etymologically connected to *poosi,* "eye," *povosqa* literally translates "one who does seeing," whereas *poosi'ytaqa* means "one who has an eye." *Seer* thus perhaps best captures the notion of the Hopi shaman, with "seeing" relating of course to the diagnosing and curing of illness and disease. As a rule, this seeing was enhanced by the use of a *ruupi,* "crystal," the shaman's "third eye." For this reason, shamans were sometimes called *ruupi'yyungqam,* "crystal owners."

At one time, all Hopi shamans had to be members of the so-called *poswimi.* Literally denoting "eye society," the word corresponds to our notion of a shaman society. Its individual members, all of whom were male, termed *poovost* or *poswiwimkyam,* were basically "men with X-ray vision." According to Alexander Stephen, who recorded much of the Hopi lifeway at the First Mesa community of Walpi in the 1890s, the poswimi was already "wholly extinct" at that time, although some of its members were still alive (1936, 281). Describing it as "a society of occult medciners," he referred to the actual poovost as "eye-seekers" (Stephen 1894, 212). Mischa Titiev, characterizing the poswimi as "the *real* curing society," reported that the last great medicine men at Oraibi passed away before 1906 (1972, 69).

Not many details are available on the selection criteria for a potential Hopi shaman or how he acquired his professional knowledge. One can assume that entry into the poswimi sodality was primarily obtained through an established initiation process, as is or was the case for other religious societies such as the Al, Kwan, Wuwtsim, and Taw. As a rule, this route required a ceremonial sponsor. That initiation was, indeed, the standard way to gain access to the society is borne out linguistically by the lexeme *wimkya,* "initiated member," whose plural form occurs in the above-mentioned compound *poswiwimkyam,* "initiated members of the eye society."

Totally absent from the Hopi ethnographic record are references to initiation by means of an intentional vision quest, one of the hallmarks of shamanism among many other Native American tribal groups. Biological inheritance is equally unattested. Evidence that involuntary dreams may occasionally have induced an individual to take up the office of the shaman is contained in a brief reference by Jerrold Levy. In this case, a man who survived a lightning strike "later dreamed that he had been chosen by the cloud deities, who imbued him with their healing power" (Levy 1994, 319).

One way in which a Hopi shaman apparently received his call was by virtue of his clan membership (Levy 1994, 319). Another standard method for a person to become a shamanic practitioner was through suffering an illness, or when the patient was saved in a life-threatening medical situation. Finally, qualification for the office of shaman was automatically assured in Hopi society when a person survived a lightning strike. The following folk statement explains this cultural belief:

> When the rain strikes you, you are either alone or in the company of somebody. If you

> are alone, the rain will revive you by itself; but only if you're a Hopi, because Hopi have fasting practices. If someone is with the person who got struck, one must not attempt to help the victim, but leave the place. The rains then restore the person by themselves. If the other person would stay, he would merely delay the rains. There are many who have clearly been struck by lightning that talk about this. For this reason also, one is not supposed to walk past a thing struck by lightning, nor does one approach it, until it has been properly purified.
>
> People also say that whenever a person survives a lighting strike, he gets initiated into the business of curing. By being struck, he gets to see things in a clear way and, as a result, learns the things that pertain to medicine and healing. (Malotki and Gary 2001, xxx)

In addition to being organized in a shamanic sodality, the Hopi shaman derived his supernatural potency from animal familiars. Also known as spirit helpers, companion animals, tutelary spirits, or spirit guides, they were the shaman's supernatural aids or alter egos, who empowered him to perform his extraordinary manipulations and shamanic healing tasks. The Hopi term for an animal familiar seems to have been *na'at,* "father," not, however, in its sense of "biological father," but here with the implication of "ceremonial father, godfather." This is evident from the following text:

> Medicine men typically have animal familiars such as game animals or other creatures that roam the land. As a rule, the animal called upon as a godfather is that which one desires to equal in power. With the help of this animal the medicine man then practices the art of healing.
>
> The seer or shaman will sometimes call on a wolf as a godfather and even dress like one when he shamanizes. Others come to have the bear or eagle as a helping spirit. Even the little mouse will qualify, for it is very skillful. However, while medicine men will call on the powers of these animals, they never change into them. Still, they possess their hearts and may dress like them as they treat a patient. They have incorporated the magic skill of these animals. (Malotki and Gary 2001, xxxi; cited in Malotki 1993, 164–165)

The total identification of the shaman with his animal familiar is most obvious perhaps in his attempt to impersonate it in the course of the curing session. This impersonation is tantamount to shamanic transformation, as may be gathered from the following Hopi text:

> When I was still a child, a man by the name of Yoto used to shamanize. No sooner had he swallowed his medicine than something happened to him. This Yoto had a hawk for a father or animal familiar, and so he behaved and screamed like one. Like a hawk he had his wings spread out and flew up, even climbed on top of things. Shamans will typically have one of the game animals, bears, pronghorn, all sorts of beasts, even mountain lions, for helpers. Thus, with a bear for an animal familiar, he will act like one too. Growling like a bear he feels around his patients and removes from them the foreign objects that are causing the disease. (Malotki and Gary 2001, xxxi)

Strong corroboration for the employment of spirit animals comes from the Hopi domain of witchcraft. Described as *lööq unangwa'ytaqa,* "one who has two hearts," the Hopi sorcerer is believed to possess the heart of his godfather animal in addition to his own and to assume its guise while pursuing his evil intents (Malotki 1993, 63). Although some of the animals serving him overlap with those aiding the shaman, others would never be called upon by the shaman, especially the coyote. This difference is evident from numerous Hopi stories in which human-animal metamorphosis is a recurring theme. In those dealing with witchcraft, the coyote is most frequently mentioned, along with the nighthawk, the dove, the crow, the raven, the owl, the wolf, and the fox.

There is convincing evidence that the Hopi shaman used the trance state to effect his cure. Levy, in recounting a personal experience when a healer from Second Mesa performed a sucking cure on him, stated that the trance state was induced by hyperventilation and lasted approximately one minute (1994, 310).

Whereas this relatively mild form of inducement was employed in his case by a *tuuhikya,* that is, a regular "medicine man," the bona fide shaman of old appears to have resorted to more powerful methods. This is strongly intimated

Honovi-Walpi snake priest, from the famous Hopi Snake dance, one aspect of the elaborate Hopi ceremonial year, ca. 1910. (Library of Congress)

in the following folk statement that, in its reference to an unspecified *ngahu,* alleged that the Hopi shaman consumed a particular medicine that may have heightened his visionary command and the diagnostic faculties of his all-seeing eye.

> Long ago, when a person became sick, he went to a shaman. The shaman was of course an initiated member of the Shaman society. If he was not very sick, the shaman treated him at any time of the day. If the patient was gravely ill, though, he did his shamanic diagnosing only at night.
>
> Whenever the shaman was going to practice at night, he used a special *ngahu* or "medicine." Upon eating this medicine, it got like daylight for him. Or he smeared something across his eyes, and then it got as clear as day for him. This is what people say, so I know about it.
>
> After first swallowing some sort of medicine the shaman can see whatever *tuukyayni,* or "foreign object implanted by someone through black magic," is causing the ailment. He then removes this foreign object. Nowadays, no one practices this skill anymore. The medicine-men certainly don't do it. Only those who had learned this technique and were properly initiated were like that. (Malotki and Gary 2001, xxxiv)

As may be gathered from this testimonial, Joseph Jorgensen's contention that Hopi shamans differed from the quintessential pattern of the North American shaman in that they lacked the use of the trance state (1980, 564) is therefore not borne out. One can safely assume that Hopi shamans were versed in all aspects of a plant's medicinal properties and capable of separating those that were beneficial from those that were harmful or even fatal. Their pharmacopoeia would, naturally, also have contained an assortment of botanical hallucinogens. Among these would have been jimson weed (*Datura* sp.), Indian tobacco *(Nicotiana trigonophylla),* four-o'clock *(Mirabilis multiflora),* and the hallucinogenic mushroom species psilocybe *(Psilocybe coprophilia)* and fly agaric *(Amanita muscaria).* Of these, *Datura* appears to be the most qualified to have served the shamans as a hallucinogen and a consciousness-altering agent. It also happens to be the one hallucinogenic substance most frequently referred to in the Puebloan ethnographic literature.

In addition to exploiting *Datura*'s psychotropic properties as a chemical inducement of altered states of consciousness, the Hopi shamans also appear to have intentionally utilized it as a sight- and vision-altering drug. Unfortunately, the simple statement above that the shaman "smeared something across his eyes, whereupon it got as clear as day for him," does not specify the plant that was involved in the procedure. A similar practice is reported for the Zuni Indians, Hopi Pueblo neighbors to the southeast. Apparently the plant extracts, bits of the powdered root, were directly inserted into the eye (Stevenson 1985, 386).

In addition to *Datura,* the Hopi shaman exploited the psychotomimetic properties of four-o'clock. Known as *soksi* in the Hopi dialect of Third Mesa, its root was masticated "to induce vision while making diagnosis" (Whiting 1966,

75). Confirmation for the hallucinatory power of this plant was obtained in the following statement from a Hopi informant: "Whenever someone eats four o'clock he will see [i.e., have visions of] all sorts of beings" (Malotki and Gary 2001, xxxvii).

Nothing is known about the consumption of consciousness-altering mushrooms by Hopi shamanic practitioners, although psilocybe (*Psilocybe coprophilia*) and fly agaric (*Amanita muscaria*), both strongly psychedelic, are native to the Colorado Plateau. Hopi use of tobacco, finally, was not for reasons of hedonistic indulgence, but was limited to a ritual context. A common element of Hopi stories, therefore, is the ritualistic use of tobacco when something important is to be discussed, or when *pahos* (prayer feathers or sticks) have been made and the makers wish to "blow their desires" into them. To be more effective ceremonially, both *Nicotiana attenuata* and *Nicotiana trigonophylla,* the two native tobacco species occurring in the Hopi environment, were mixed with other plants. The resulting mixtures were known as *yoyviva,* "rain tobacco" (Whiting 1966, 89) or *omawviva,* "cloud tobacco" (Stephen 1936, 599). The billowing smoke, which was never inhaled but primarily dispensed from pipes, was thought to be associated with clouds and hence capable of bringing rain. No ethnographic evidence exists, however, that the mind-altering plant was employed as a vehicle of ecstasy or altered states of consciousness by Hopi shamans.

In addition to these essentially defining aspects of shamanism mentioned above, Hopi oral literature, mythology, and ethnography contain a series of shamanic motifs and themes that corroborate the fact that shamanism was once an integral part of Hopi culture. Among them are references to magical flight, the world tree (*axis mundi,* "axis of the world"), the cosmic mountain, journeys between various cosmic regions, psychopomps, and other aspects. For reasons of spatial limitations these motifs cannot be addressed here; the reader is therefore referred to the detailed discussion in *Hopi Stories of Witchcraft, Shamanism, and Magic* (Malotki and Gary 2001, xxxix–xlix).

INUIT SHAMANISM (CENTRAL ARCTIC)

Shamanism, or *angakuniq,* has always been a central feature of Inuit societies. The accounts of the first European explorers in the Arctic give some account of shamanic practices. Thus the practice of *qilajuq,* "headlifting," is re-

ported by Best in his *True Discourse* of the voyages of Martin Frobisher published in 1578:

> These people are great enchaunters and use manye charmes of Witchcraft. For when their heads do ake, they tye a great stone with a string unto a sticke, and with certaine prayers & wordes done to the sticke, they lifte up the stone from ground, which sometimes with all a mans force they cannot stir, & sometime againe they lifte as easily as a feather, and hope thereby with certaine ceremonious words to have ease and helpe. (Cited in Stefansson 1938, 127)

Qilajuq was one of the most widely employed divinatory practices, and even today many elders remember their parents doing it. Shamanism in the Central Arctic was extensively documented by G. F. Lyon (1824), Franz Boas (1888), Edmund James Peck (in Boas 1904, 1907; Laugrand, Oosten, and Trudel 2000), Knud Rasmussen (1929, 1930, 1931), and many others. It flourished in the Arctic until the advent of Christianity, in the eighteenth century in Labrador, the end of the nineteenth century in South Baffin Island, and the early twentieth century in Kivalliq; in 1936 the first missionary arrived among the Nattilingmiut. When Christianity arrived, shamanism went underground, but even in the early twenty-first century shamanism plays an important part in Inuit discourse. Sickness and death may still be attributed to the machinations of the *angakkuit,* or shamans.

According to Boas, on Baffin Island "The persons, who can see the souls of men and of animals and who are able to visit Sedna, are called *angakut.*" They cured the sick, drove away evil spirits, procured game, influenced the weather, and exposed hidden transgressions.

In Inuit cosmology the world was populated by many spirits. There were those who once had been human beings, such as Sedna (South Baffin Land), or Nuliajuk (Nattlingmiut); Takaana Kapasaluk (Iglulingmiut), the *inua* (person, owner) of the sea and the sea game; and Aninga (the person, owner of the moon, a great hunter). In addition, there were the *tarniit,* the shades or souls of human beings or existent species of animals that were still around; *ijirait,* the mountain or caribou people; *inugarulligait,* small people; *qallupilluit,* sea people; *tarriassuit,* shadow people; *kukiligasiait,* those with claws; and many others. All these beings had to be respected and approached in the correct way. Inuit have traditionally been hunters, and to survive they had to kill animals, who were conceived of as spiritual beings endowed with shades or souls. Those dead human beings and animals were thought to be especially dangerous. In 1921, the old Ivaluardjuk explained to Knud Rasmussen: "The greatest peril of life lies in the fact that human food consists entirely of souls . . . which . . . must be propitiated lest they should revenge themselves on us for taking away their bodies" (cited in Rasmussen 1929, 56). Special rules applied to dealings with spirits and animals. If they were not observed, problems such as illness and famine might arise. Then it was up to the shamans to find a solution.

Men and women could perform as shamans. Inuit elders often state that female shamans were more powerful, but in the the descriptions of shamanism we find mainly men. In order to be an *angakkoq* (plural angakkuit), a shaman, a person needed *qaumaniq* (enlightenment), entailing the capacity to see souls and spirits, and *tuurngait* (helping spirits) who assisted him in his tasks. There were many helping spirits. The missionary Peck collected a list of 347 helping spirits in South Baffin land (in Laugrand, Oosten, and Trudel 2000) Usually a shaman had between six and ten helping spirits. They might be *tarniit* of dead people, spirits such as the inua of the sea or unknown entities such as a blubbercutter or a white sailor. Each *tuurngaq* (singular of tuurngait) had its specific qualities and could be used for specific purposes.

Inuit usually did not like outsiders to witness their shamanic practices. Thus many descriptions of shamanic séances are based on oral accounts by Inuit or on a description of séances specifically organized for the benefit of the outsider. These verbal accounts are usually very rich and give a vivid account of the proceedings of the séance.

People could become shamans in many ways. They might be trained as shamans, or they might become shamans because of an accident, like Niviatsian, who was almost killed by a walrus, or Uvavnuk, who was struck by a ball of fire (Rasmussen 1929, 120, 122) In the Kivalliq area it is related that a shaman was put under

water for five days (Rasmussen 1930, 58). The shaman Igjugaarjuk was isolated in an igloo for thirty days (Rasmussen 1930, 52–53) until he had his first visions. An initiation was always a very strong experience. The old angakkoq Ava related, "My first helping spirit was my namesake, a little aua. When it came to me, it was as if the passage and roof of the house were lifted up, and I felt such power of vision, that I could see right through the house, in through the earth and up into the sky" (Rasmussen 1929, 119). Each initiation had its own history. Usually an initiation entailed meeting with a helping spirit and the acquisition of qaumaniq, enlightenment, the power to see. Boas wrote in an account of South Baffin Island: "When a person becomes an angakok, a light covers his body. He can see supernatural things. The stronger the light is within him, the deeper and farther away he can see, and the greater is his supernatural power" (Boas 1907, 133).

The shaman usually received an *angaluk,* or *tapsi,* a shamanic belt, made of the white fur of the belly of a caribou, after his initiation. To this angaluk he attached the gifts he received from the community and small miniature knives such as snow knives, that could be used to kill *tupilait,* evil spirits. The late Tungilik from Naaujaat, who had practiced as an angakkuq for several years, related:

> When people found out that I was an *angakkuq,* the belt was made for me out of white caribou skin. I would be given little things, for that was what the *tuurngaq* wanted. I would tie these little things onto the fringe. There would be a little string attached to tie them to the fringe. . . .They looked like little toys and were tied to the fringe. These were called *qalugiujaq.* (Tungilik and Uyarasuk 1999, 90–91)

A shaman did not always come out in the open. Thus in a workshop in Rankin Inlet, Inuit elders indicated that the wife of the famous angakkoq Qimuksiraaq was a more powerful shaman than he was because she was able to hide from him that she was actually a shaman. There were many shamans in Inuit society, and Inuit shamanism may be described as family shamanism. In the past Inuit often lived in small camps consisting of few families and in summer dispersed over the land. Each family needed one or more shamans to be able to deal with problems caused by spirits. But there were families where more shamans occurred than in other families. There were powerful and less powerful shamans, and each shaman had his or her own qualities and skills. Each family had its own traditions. Therefore in each area there were different patterns. Thus in the South Baffin area helping spirits were often viewed as givers of game and rarely qualified as evil spirits, whereas in Kivalliq much emphasis is laid on the killing of tupilait, spirits sent by shamans to harm people.

Shamans used a special vocabulary. Although it is often referred to as the language of the shamans, it was in fact considered as the language of the helping spirits. Rasmussen noted that this vocabulary was not the exclusive property of the shamans (1931, 122). It was used by everyone who wanted to communicate with the spirits. Spiritual beings, specific objects or places were referred to by metaphors, images, analogies, and the like. For example, *tukto,* caribou, was referred to as *kumaruaq,* "the big louse" (viz. of the earth) (Rasmussen 1931, 309); *tiklertaaq,* "the beating one," was the heart *(uumat); tarejumaq,* "shadow-maker," designated the angakkuq; *tau,* "shadow," referred to an *inuk* (person). In this vocabulary an object or living being was only referred to obliquely: A property, a form of behavior, or an essential aspect, like the shade, might be referred to. The reference to the angakkuq as tarejumaq, related him to the concept of *tarniq,* "shade," derived from the root *taaq,* "dark," which played an important part in the shamanic complex. By referring obliquely to an animal or a human being, one avoided invoking its spirit directly. Kappianaq from Iglulik explained how the tuurngait expressed themselves through the voice of the angakkuq: "Angakkuit were able to imitate all kinds of noises, bird and bears. The voice that they had was the voice of their tuurngaq, which comes into them" (Oosten and Laugrand 2001).

The angakkuit played an important part in procuring game, healing the sick, and correcting the weather. These actions usually required a collective confession of transgressions by the members of the community *(annianiq, qaqqialiq)* to free the path for the shaman. All transgressions of a patient had to be confessed

Luke Nuliajuk from Gjoa Haven demonstrating the technique of qilaniq at the Elders workshop in Kugaaruk (Pelly Bay) in June 2004. (Courtesy of Cornelius Remie)

if the patient was to be cured. A patient who did not confess was bound to die.

One of the hardest feats of the shamans was the descent to the inua of the sea. When the Inuit did not observe the ritual rules (hiding miscarriages and bestiality were considered the worst offences), the owner of the sea would not make the game available to the Inuit, and people would starve. The angakkuq had to make his descent to her house on the bottom of the sea. The following account is based on that given to Rasmussen by the old angakkuq Aua.

When the angakkuq went to the spirit of the sea, he wore only kamiks and mittens. The angakkuq sat behind a curtain on the sleeping place. The people who were present loosened their thongs and clothes, and the lamps were extinguished. After some time the angakkuq began to call upon the helping spirits, saying, "The way is made ready for me; the way opens before me." All the participants answered: "Let it be so." When the helping spirits had arrived the earth opened under the angakkuq, who cried: "The way is open," and those present answered: "Let the way open before him; let there be way for him." The angakkuq receded under the earth. One heard the sighs of the dead namesakes of the angakkuit. Those present called them by name and then the sighs ceased. After some time they began again. Meanwhile the sighs of the dead were heard as if they were under the sea, and one heard the blowing and splashing of creatures coming up to breathe (Rasmussen 1929, 124–125).

The oldest members of the community sang:

We reach out our hands
to help you up;
we are without food,
we are without game.
From the hollow by the entrance
you shall open,
you shall bore your way up.
We are without food,
and we lay ourselves down
holding out hands
to help you up
(Rasmussen 1929, 126).

The angakkuq had to pass through great dangers in his journey to the lowest depths of the sea. He had to avoid great rolling stones that threatened to crush him, and he had to pass the sea spirit's dog, who guarded her house. If he came to a great wall around her house he had to kick it down. When he entered the hut of the sea spirit she sat with her back to the lamp and to the animals swirling in a great pool to the right of the lamp. Her hair was dirty because of the transgressions of men. When the father of the sea spirit attempted to grasp the angakkuq he had to say: "I am flesh and blood," and then he would not be hurt. Then he turned the sea spirit to the lamp and combed her hair until she had calmed down. Then the angakkuq said: "Those up above can no longer help the seals up by grasping their foreflippers," and she answered in the language of the tuurngait: "The secret miscarriages of women and the breaches of taboo in eating boiled meat bar the way for the animals." The angakkuq then had to continue to appease her, so that finally she would let the game go free. Then the angakkuq

returned coming up out of the earth like a creature of the sea coming up to breathe. A general confession of ritual transgressions followed, taking many hours. When all transgressions had been confessed the séance ended and everybody was sure that the game would now be abundant (Rasmussen 1929, 123–129).

Another major task of a shaman was correcting the weather. When a blizzard continued to blow and the Inuit could not go out to hunt, the angakkuit had to cut the wind (South Baffin area), or tame the wind with whips (Nattilik area). Thus angakkuit fulfilled many useful social tasks. But there was also a dark side to shamanism. Shamans were often associated with witchcraft (*ilisitsuq*). There was much competition among shamans. Also, shamans could use their knowledge and techniques to kill other people, for example, by sending tupilait against them. Tungilik related how another angakkoq tried to kill his father:

> Back then the *angakkuit* would use their *tuurngait,* and if a person gave in then they killed him. If the *angakkuq* started trying to kill people who weren't doing anything to them, then they in turn were killed. There was an *angakkuq* who was trying to fight my father. My father ignored him for a while but he got tired of it, so he in turn had his *tuurngaq* kill the other *angakkuq.* I do not exactly know how. (Tungilik and Uyarasuk 1999: 93).

When Christianity arrived, shamans often tried to combine Christian and shamanic ideas, especially in the areas under the influence of the Anglican missions. The result was a series of religious upheavals. Thus Christianity was introduced in Iglulik by Umik, described by the late Rose Iqallijuq as part shaman, part Christian. Finally Inuit decided that Christianity and shamanism did not go well together. But that did not mean that shamanism disappeared completely. Victor Tungilik from Naaujaat practiced after he became a Christian, and apparently many others did as well. Much knowledge of shamanism is still preserved among Inuit elders, especially in the Kivalliq and Nattilik area, where Christianity arrived relatively late. Even the late Nutaaraluk from Iqaluit stated emphatically that each community will always have shamans. Today some Inuit elders plead for a more positive approach to shamanism, arguing that it can be helpful to overcome the many social problems of modern Inuit society. They think the good things of shamanism and Christianity should be combined. Whether that is feasible still remains to be seen.

IROQUOIS (HAUDENOSAUNEE) SHAMANISM AND SECRET SOCIETIES

Iroquois (Haudenosaunee) culture belongs to the Woodland Culture area (which is also called the Northeast Culture area) of North America, and Iroquois shamanistic ideas are, according to texts from the seventeenth century to the present, strongly associated with celestial and woodland spiritual beings. In terms of shamanistic practice, people's dream experience has also played a crucial role.

Iroquois documented history, from *The Jesuit Relations* of the seventeenth century to contemporary ethnographies, reveals historical changes in Iroquois shamanism, influenced by cultural contact with European cultures and religions and also due to indigenous religious creativity. For example, twentieth-century ethnographies have reported that there are two different kinds of shamanism, the public kind, usually performed as part of annual ceremonies, and the secret-society rituals performed in a private house. Though the early historical documents do not mention the second kind, it is reasonable to assume that the secret-society rituals were performed even in those days. Another issue is related to shamanistic ideas associated with the spiritual beings of the woods. As far as the early historical texts are concerned, it is rather difficult to obtain similar information, though it is likely that spiritual beings of the wood also played an important role in the shamanism of the seventeenth century.

Dream experience is clearly of continuing importance in Iroquois shamanism. Dream experience reveals messages from spiritual beings and conveys what kind of ritual needs to be performed for a person who has had a dream. For example, anybody who has had a dream of a False Face spirit (seen as a disembodied figurehead) would have to ask a member of the False Face Society to perform the rituals of the society for him. And in the various kinds of "secret" societies, such as the Bear Society or the Otter Society, for which membership is restricted only to those who have gone through their healing rituals, many spiritual animals belonging to the woods are seen as sources of power. As seen in *The Jesuit Relations* of the seventeenth century, dreams played a central role as a medium through which a message from a celestial being was conveyed to the person who had the dream (Thwaites 1896–1901, vols. 12, 13; v. 54, 141–143). Later, in the mid-twentieth century, ethnologist Frank G. Speck wrote: "The dream sphere of people such as the Iroquois has been recognized as the dominant factor operating in questions involving cause and cure of sickness. A fundamental difference between their dream-world and our own lies in their overt realization of the importance of animal spirits and of the preternatural spirit forces of the universe as they pervade the whole structure of Iroquois cultural existence" (Speck 1949, 40). Though emphasis has shifted from the strong obligatory nature of dream messages to the people's belief in the dream, the dream experience itself remains of central importance to Iroquois shamanism.

One of the major changes in Iroquois shamanism happened early. The early texts show shamanistic behavior as a familiar part of life, one that was not kept secret. After the Iroquois Confederacy lost its prestigious political and military status in the 1770s, the public practice of shamanism declined and then disappeared. In the nineteenth and twentieth centuries, shamanistic activities (except those of the False Face Society) were no longer seen on public occasions, which were limited to the well-orchestrated rituals of the secret medicine societies. It is possible that this change might have been caused by the cultural pressure of Euro-American Christian influence at that time.

More detailed accounts of specific practices and beliefs from the two periods for which most material exists, the seventeenth century

and the twentieth century, will provide a more vivid picture of Iroquois shamanism. The seventeenth-century primary sources on Iroquois shamanism come from Jesuit missionaries visiting New France. Though their prejudices and their missionary purpose influence their descriptions of the indigenous religious practices and beliefs, it is possible to find useful descriptions of Iroquois shamanism in the Jesuit documents.

Iroquois false face mask. (Werner Forman/ Corbis)

Shamanic Practices in the Jesuit Relations

The Jesuits reported that the Iroquois performed a variety of religious practices, including hot-coal handling in healing rituals, divination, and sending off the soul of the deceased. In one case, in order to remedy a disease striking the village, a shaman ordered a lacrosse game to be played as a medicine ritual (Thwaites 1896–1901, vol. 10, 185–187). The shamans also had the ability to handle hot coals in their mouths (Thwaites 1896–1901, vol. 12, 23). This continued to be seen in a different form in reports of the False Face Society in the twentieth century, which told of masked ritual dancers holding hot coals in their hands and rubbing ashes on the patient, though the emphasis in terms of efficacy seems to have shifted from the personal ability of shamans, in the seventeenth century to the spiritual force at work, in the twentieth century (Speck 1995, 91–93).

From Jesuit documents of the seventeenth century, it is possible to know the view of the soul held by the Hurons (one of the Iroquoian-language speaking peoples), as well as their related shamanistic practice in terms of diagnosing illnesses (Thwaites 1896–1901, vol. 39, 19–21). The Huron recognized three kinds of illness. The first was due to natural causes, the second was caused by the soul of the patient desiring something, and the third was caused by "sorcerers." The second kind is most relevant to note here. According to the Huron, besides the ordinary desires, human beings might have a kind of desire that involved a migration of the soul into the object desired. The soul would reveal this desire by means of dreams. If these dreams were fulfilled, the soul would remain content. Otherwise, it would be vexed and revolt against the body, causing various infirmities and sometimes death. If a person dreamed of some distant thing, it meant that the soul had gone forth from the body, in order to become present in that dreamed of thing. For this reason, the Hurons diligently observed dreams, in order to know the desires of the soul. Shamans *(arendigoguanne)* had the ability to know the desire of the soul by receiving a vision of the object desired from a powerful spirit called Oki dwelling in them. The shamans discovered the hidden desires of the sick person by looking into a basin full of water, by acting as if possessed by some power, or by hiding themselves in some secret place.

A description of a Huron shamanistic healing ritual was given by a Jesuit missionary.

> One day, ten or twelve of shamans were gathered around a man who had an earache. They took into their mouth a certain mysterious water, and blew it with violence over the sick man's cheeks and temples; and he who acted as chief of the group ordered others to throw some of this water also on the hair and head of the man, and even on the mat where he was lying, to drive away the evil spirits of the disease in the man's ear. They then all drank of

> the same liquor, and took the medicine that was to cure the sick man. . . .When the Jesuit priest asked the sick man where his ailment was, and how he felt, one shaman replied, saying that two little evil spirits had already come out of his ear, and now only one was left, who was more obstinate than the others. (Thwaites 1896–1901 vol. 53, 285–287)

Twentieth-Century Secret Societies

The twentieth-century ethnographies have much to tell about various medicine societies, including the secret societies' rituals. There are scholarly debates concerning the meaning of *secret,* but here it simply means that only the members know who else belongs to the society. Those who became sick and were then cured by a certain secret society would be accepted into the society as new members. Arthur Parker studied several important secret societies, such as the Little Water Society, the Bear Society, the Eagle Society, and others (Parker 1909). Each society had its own origin legend and its own set of songs and dances.

When American ethnologist Frank G. Speck, who was well accepted by the Seneca people, was sick, his Seneca friends informed him of their wish to perform a curative ritual and asked him about his most recent dream. When Speck replied that he had dreamed of an eagle-like bird, the Seneca decided to perform the Dew Eagle Society dance. At the ritual, those who were present were the speaker, the singers, the dancers, and Speck himself. Especially interesting were the dancers who imitated the movement of the eagle. They appeared "in Indian costume, wearing back cloth leggings bordered with ribbon work and beadwork in Iroquois style and design, with breech clothes of the same material, and feather bonnets of the Plains Indian (Sioux) type. One of the latter had dark eagle feathers, the other turkey wing feathers" (Speck 1949, 49). The two youthful costumed dancers then advanced to the central space and assumed a squatting posture facing each other over the feather sticks and rattles. Facing each other, crouching in the center of the room, they shook their rattles in time with those of the singers. They moved the feather sticks up and down as they crouched, without shifting their feet. Their action simulated the movement of two eagles on the ground, bowing and dipping.

Among the Iroquois medicine societies, the False Face Society is the most well known, and William N. Fenton's *The False Faces of the Iroquois* (1987) is an excellent work for interested readers to refer to.

According to Fenton, there are three kinds of masked medicine societies, the False Face Society, the Husk Faces, and the Society of Mystic Animals. The first two conform to a ritual pattern, which governs all Iroquois medicine ceremony. The pattern consists of "an invitation by messenger, an announcement of intent at the meeting, a tobacco invocation to the spirit forces requesting their cooperation, the specific ritual, and a terminal feast" (Fenton 1987, 23–24). The dancers of the False Face Society wear curved wooden masks, which are called by several names in different Iroquois settlements. The Seneca and the Mohawk term for the mask means *face,* whereas the Onondaga usually call a mask a Hadui (Hunchback), after the mythical figure masks are made to resemble. The False Face Society specializes in curing nosebleed, paralysis, and dental and muscular disorders. Those who have these physical symptoms or dream of a False Face spirit or encounter such a spirit in the woods would be required to ask the False Face Society to perform the ritual for them. Since the False Face Society is not a secret society, the members appear in so-called traveling rites in spring and autumn to purge the settlement, and as beggars and throwers of hot ashes at the Midwinter Ceremony. Due to their public appearances, False Face Societies are the best known to the outsider. Ritualistic procedures are necessary in making the face mask itself from the wood since it has a sacred connotation; the face resembles the figure of the mythic Hadui, who challenged the Creator over who could move the mountain. The mask worn by the dancer represents the spirit of this Hadui, now living on the rim of the earth.

In a False Face Society ritual, the masked dancer could be regarded as a shaman since, though the mask itself is important, the dramatic behavior of the men who don the masks counts far more in the role of the False Face Society. Individual talent in dancing and acting as well as in singing determines the effectiveness of the medicine ceremony. The following is a very abridged ritual scenario. The singer sings a song while shaking the turtle rattle, and the masked dancers dance, dip their hands in the

embers, rub them together, utter nasal whines, and blow ashes on the head, shoulders, elbows, and knees of patients who have come forward as required by dreams or who are obliged to renew a former cure. A matron distributes tobacco among them, and each dancer returns thanks by blowing ashes on her head. They depart with a kettle of mush (Fenton 1987, 298).

Despite five hundred years of historical conflicts and coexistence with the Euro-American culture, indigenous Iroquois (Haudenosaunee) religious and cultural traditions are still intact on several reservations, where their traditional hereditary government still functions. Though situations vary from one reservation to another, indigenous shamanic traditions continue to exist in today's complicated Iroquois society.

LAKOTA SHAMANISM

Lakota religion combines complex, formal ceremonies with individual seeking of visions and healing rites. As members of community with special spiritual powers and knowledge, religious specialists, or shamans, play a role in every aspect of Lakota religion.

The Lakota are a confederation of seven tribes of Teton, or western Sioux, Indians, including the Oglala, Sicangu (Brulé), Miniconjou, Itazipco (Sans Arc), Oohenumpa (Two Kettle), Hunkpapa, and Sihasapa (Blackfoot—not to be confused with the Blackfoot nation of Montana and Alberta), speaking the western, or "L," dialect of the Dakota language. Lakota people occupy several reservations in central and western South Dakota, including Pine Ridge, Rosebud, Lower Brule, Crow Creek, Cheyenne River, and Standing Rock. The combined Lakota tribes have about 64,000 enrolled members, with approximately 61 percent living on reservations. The Lakota appear to have split off from proto-Siouan groups of the Ohio Valley, gradually moving westward to the Great Lakes, southern Wisconsin and Minnesota, and eventually into the western Dakotas. After reaching the western Plains about 1750, the Lakota lived primarily by hunting bison. They lived in portable hide tepees, using dogs and horses as pack animals. Social structure was based on the *tiyospaye,* "camp," a small hunting group of closely related families. These gathered into larger bands and tribes during summer, and the various tribes came together once a year for the Sun Dance.

The Lakota pushed their way across the Dakotas through a series of hard-won victories against Arikara and Mandan villagers control-

ling access to the Missouri River crossings, as well as against Cheyenne, Kiowa, and Crow groups on the western Plains. Treaties in 1851 and 1868 granted most of the western Dakotas to the Lakota and allied bands of Cheyenne and Arapaho. The so-called Red Cloud's War of 1866–1868 drove U.S. military installations from the Powder River country west of the Black Hills and for a short time secured the area for the Lakotas. In 1874, however, gold was discovered in the Black Hills, and non-Indians began to pour into the Great Sioux Reservation. The Battle of the Little Bighorn in 1876 was a short-lived victory for the Lakota and Cheyenne. During 1877, nearly all Lakota were confined to smaller reservations. The great buffalo herds were gone, and in 1877 the U.S. government forced the Lakota and their allies to concede the Black Hills under threat of withdrawing the food and clothing rations now needed for basic survival. The Lakota struggle to regain the Black Hills continues today. Most tribes have refused to accept compensation for the illegal taking of this sacred land, asserting that the Black Hills are not for sale.

During the early reservation period, the U.S. government abolished all native religious practices. The most violent expression of this policy was the Wounded Knee Massacre of 1890, when Lakota participation in the Ghost Dance religion precipitated a panic among the non-Indian population of the area. In response to religious prohibitions, Lakotas moved their intertribal gatherings to national holidays, such as Independence Day, and conducted other ceremonies such as the Sun Dance, sweat lodge, and vision quests in secret. Today, religious prohibitions no longer apply, and Lakota religion is being revitalized. The main problems facing traditionalists today are isolation from sacred sites, such as those in the Black Hills, loss of knowledge of some ceremonies and rituals, and expropriation of Lakota practices by entrepreneurs and practitioners of New Age religion.

Like many Plains Indian nations, the Lakotas recognize several types of religious specialists. The closest thing to an inherited position is that of Keeper of the Sacred Pipe, the sacred bundle most central to Lakota religion and identity. Each new Keeper is selected from the younger generation of the same family and trained by the current Keeper in the care and use of the Pipe. Other people become religious specialists through a series of successful vision quests and training from elders with the appropriate knowledge. Visions provide both the realization that one will become spiritually powerful and also provide special knowledge, such as ceremonial practices, medicinal herbs, ways of telling the future, and methods of healing. Individuals' spiritual powers and roles in society have varied greatly. Lakotas recognize several categories of religious specialists: the *wicasa wakan* (holy man) or *winyan wakan* (holy woman), *pejuta wicasa* or *pejuta win* (male or female herbalist), *wapiya wicasa* or *wapiya win* (male or female healer), and *wakan kaga* (one who enacts a spirit being, either male or female). The religious specialists conduct ceremonies, mentor young people undergoing their first vision quest, seek spiritual messages about the future, and treat physical and mental problems. Many are believed to have the ability to travel to and from the spirit world.

The categories are not absolute, and many individuals act in more than one capacity. Each healer or holy person has a unique set of powers and knowledge; thus, a petitioner chooses the one most suited to address a particular need. Healers and herbalists are called upon to help the sick and wounded. The main duty of wakan kaga persons is to enact their visions in public, but some also provide cures or charms, and historically they performed ceremonies such as the girls' puberty ritual and predicted the outcome of war expeditions. Their visions—most often of lightning, bears, wolves, buffalo, elk, or deer—determine their exact duties and powers. Another category of shaman was the *wicahmunga* or *wihmunga.* Sometimes translated as "witch" or "wizard," these terms refer to individuals who supposedly use their powers secretly to cause sickness or death, to give luck in gambling, or to create love charms.

The wicasa wakan and winyan wakan learn a series of sacred songs, actions, and speech from other holy persons during a long apprenticeship. A person becomes a wicasa wakan or winyan wakan in response to an especially powerful vision, usually received as a young teenager or child. Nicholas Black Elk received his great vision when he was nine years old and unconscious from a serious illness. This vision is described in the well-known and romanticized book *Black Elk Speaks;* an unembellished version can be found in *The Sixth Grandfather*

(DeMallie 1984). Sometimes the fulfillment of the vision is postponed until much later in life, especially for women. Often the vision is understood and fulfilled only after the individual has undergone a personal trauma, such as illness or injury. He or she then receives another communication from the spirit world and seeks the help of a holy person in interpreting the messages. This step is followed by a formal vision quest, lasting four days and nights, that reveals whether the person should become a holy one. The wicasa wakan or winyan wakan is expected to receive powerful visions throughout his or her lifetime, eventually mastering the ability to pass into and out of the spirit world at will. This familiarity with the spirit world allows the holy person to understand the meaning of others' visions, signs about the future, and the correct way to conduct ceremonies. Sometimes the spirits communicate the details of a new ceremony to the holy person, who will then teach it to the other people. Some holy persons hold the position for life, but others train a younger person to take over their ministry as they grow old.

Lakota holy men in the late 1800s defined a shaman as a wise man who communicates with the spirits, has knowledge of medicine, conducts ceremonies, and is respected and feared. Little Wound said in 1896 that he had received his shaman's knowledge from a vision of the Wind, but he kept the vision itself secret. Only shamans receive visions of the invisible spirit beings, but anyone might have a vision of a visible spirit being. (Apart from tobacco, no drugs were used in the vision quest or any other traditional Lakota ceremony.) Shamans are able to speak for Wakan Tanka, the great mystery, and are, along with the vision, the means for Wakan Tanka to communicate with people and grant them *sicun,* special personal powers. Each shaman has a unique set of songs and prayers for each of the sixteen principal gods or spirit beings. Some shamans head groups focused on a particular spirit the members have experienced in a vision. Along with the shamans' prestige and power comes danger. Other holy persons can try to harm them or their sicun. Historically, if shamans were found to have deceived the people they could be punished, even killed, by the tribal marshals.

All Lakota religious specialists live as ordinary men and women, except when called on to doctor the sick or conduct ceremonies. Their religious duties do not exempt them from other obligations, but give them an additional role to fulfill. When asked to intervene in a case of bodily illness, healers and herbalists today will first determine whether the person is suffering from an "Indian" sickness or a "white man" sickness. In the latter case, the patient is referred to an M.D. for treatment. If the sickness is thought to be one that existed before white contact, the Indian herbalist or healer will use his or her knowledge to treat the person. Treatment consists of varying combinations of medicines, ceremonies, and conjuring. Generally, herbalists and healers specialize in particular types of illnesses and medicines. Their range of abilities and knowledge of medicines is limited by the visions they have received and their apprenticeship under experienced healers. Men, women, and transgender individuals can fill any of the specialties; it appears, however, that all midwives are women and most of those who treat wounds are men.

The Yuwipi is a common Lakota healing ceremony, used to help individuals in physical or mental distress. It is an example of the trans-Siberian shamanic "shaking tent" rituals. During this ceremony, participants sit around the edges of a completely dark room. Before all light is extinguished, the shaman is bound tightly in a quilt and placed on the floor at the center of the room within an altar space. During the prayers and singing that follow in the pitch-black room, participants typically see tiny blue lights dancing about the room, and may see animals or other creatures, as well. At the end of the ceremony, light is allowed in, and the shaman is found to be free of the constraints, often approaching the house from outside.

Some Indians (and non-Indian posers) now hold Indian ceremonies and healing rites for non-Indians for profit. Some have adopted Indian-sounding names and published books with fabricated information about purported Lakota traditions or stories. These entrepreneurs play on public ignorance of the complexities of Lakota religion and on popular stereotypes that view Indians as inherently spiritual and in a state of harmony with the natural world. The practice of selling ceremonies and religious items disturbs traditionalists, who feel that the ceremonies are meant for the benefit of the Lakota community. They resent others

turning sacred knowledge into a commodity and violating cultural constraints on who is entitled to such information. The traditional community resents the modification of ceremonies into forms that are more acceptable to outsiders, such as omitting meat feasts. They worry that their own young people will be confused by such changes and by New Age practices brought into traditional ceremonies. Although the American Indian Movement passed a resolution against such activities in 1984, they have no way of enforcing this prohibition, and the practices continue.

NAVAJO SHAMANISM

The tradition of shamanism among the Navajo has changed with changing times, but it is still a strong and valuable part of their way of life. Its persistence reflects the success of this people in preserving the essence of their distinctive worldview.

Background

The Navajo (or *Diné,* as they call themselves; see Downs 1972) constitute the largest Native American society in North America, with a population nearing 300,000 in 2002. They are a Western Apachean people, related historically and linguistically to the Chiricahua and Jicarilla Apaches, and they speak one of the still thriving Athabaskan languages. They inhabit the largest Indian reservation (25,209 square miles) in North America, which covers roughly a fifth of the state of Arizona and parts of southern Utah and western New Mexico. The Navajo homeland (Dinétah) is mostly semiarid high desert plateau country, with some forest and mountain areas, and bounded symbolically by the four sacred mountains: Blanca Peak (Sis Naajiní), in Colorado, to the east; Mount Taylor (Tsoodził), in New Mexico, to the south; the San Francisco Peaks (Dook'o'¥osłííd), in Arizona, to the west; and Hesperus Peak (Dibé Nitsaa), in Colorado, to the north.

The Navajo are a proud, resilient, and pragmatic people, who have borrowed cultural elements from the various societies with which they have come into contact over the course of their history, including Hispanic, Anglo, and Pueblo societies (Iverson 2002). Originally nomadic hunters and gatherers, the Navajo later took up sheepherding and horticulture. Today they practice agriculture ranging from horticulture to intensive agriculture, as well as maintaining sizable herds of sheep, with some horses and cattle. Because of their burgeoning population and the deterioration of their land from overgrazing, they are increasingly reliant upon employment, both on the reservation and in surrounding cities and towns. They are a matrilineal society, and matrilineages and matriclans are extremely important elements in their social life, both politically and economically. Although most Navajo today still more or less adhere to their traditional religion, many now be-

long to the pan-tribal Native American Church, or "peyote religion" (Aberle 1966). Also, various evangelical Christian sects have made headway on the reservation.

The Way of Beauty

The Navajo worldview is essentially a spiritual cosmology, addressing most of the matters of ultimate concern that define any of the world's major religions. What makes Navajo religion quite distinct and so very interesting is its emphasis upon the central concept of *hózhǫ́*—a term that is hard to gloss in English, usually translated as "beauty." The term however also carries other connotations, especially "harmony," "proper order," "health," and "goodness" (in the moral sense). It is important at the outset to understand that hózhǫ́ for the Navajo is as much an internal mental state—an existential state of being—as it is a philosophical concept about the metaphysical quality of things "out there" (Witherspoon 1977, 151). Hózhǫ́ is a spiritual path, a way of life, an ideal and dynamic process of living, and a quality that one wants to realize in one's being to match its natural counterpart in nature. It is toward celebrating, restoring, and maintaining this hózhǫ́ state of being that virtually all Navajo shamanism is directed.

Hózhǫ́ refers to the natural state of both perceived external events and the hidden forces behind those events (Farella 1984). The Navajo—like so many other peoples around the globe—have noticed that we cannot actually see the air we breathe. We only know air by its movement and its effects (rustling of leaves, whirling dust, the sensation of the breeze on our skin, and so on). It is not surprising then that in Navajo cosmology the hidden, vital, motivating dimension of things is called *nilch'i,* or Wind (McNeley 1981). Physical reality—indeed, all things in the perceptual world, including people—are motivated by this one, vast,

cosmic Holy Wind that flows in and out of all things (*bii'asti,* the "animating energy within") and that underlies and vitalizes the normally hidden totality of the universe. Wind underlies the vitality, dynamics, and movement of nature, from the contemplation of which people may attain their intuitions about the purpose of existence. And it is an imbalance or disruption of that portion of the "wind that stands within" *(nilch'i hwii'siziinii)* each person that leads to disease and misfortune.

One of the main ways that the sense of hózhǫ́ can be lost is by forgetting. Hence, one returns to the state of beauty by remembering—by literally "re-membering," or re-collecting—by putting it all back together again in the properly healthy and wholesome way. One again "walks in beauty" by remembering what the Holy People *(Diyin Diné'e)* taught from the beginning of time, which is recorded in precise detail in the Sacred Stories handed down from generation to generation. Generally speaking, the Navajo believe that the only route to hózhǫ́ is to live in accord with the Way of the Holy People. If need be, one may be reminded of the hózhǫ́ way by instruction from a medicine man or elder, or by singing the appropriate songs, or by doing the proper rituals, such as greeting the dawn with an offering of corn pollen and prayer.

Navajo express various views about the relation of the Holy Wind and the Holy People (the Mountain People, for instance, and the Star People, the River People, the Rain People, the Corn People, Coyote, and Big Fly). For some Navajo, the Holy People are the Holy Wind personified—the Wind imagined (and sometimes directly experienced). For others, the Holy People exist in their own right and like everything else in reality are motivated by the Holy Wind. In either case, one of the major mnemonic devices for reminding people of the hidden aspects of the "way of beauty" is the imagery in iconographic art—that is, artworks that resemble and invoke heroic figures (e.g., the gods, or *yee'ii*), sacred themes and processes (e.g., the open circle), and mythological events (e.g., the slaying of monsters by the Hero Twins) that reveal the causally powerful, but hidden, spiritual dimensions of the world. Mnemonic imagery is depicted in statues, masks, prayer sticks, textile designs, jewelry, basketry, and sandpaintings. A piece of sacred art reminds the viewer of the teachings of the Holy People, and thus the mind is guided, in the presence of the object and its narrative associations, back onto the path of beauty, harmony, and health.

Shamans and Healing

Individuals may themselves realize that they have lost the way of beauty, or have contracted a disease, and they may diagnose the cause and cure of their own illness for themselves. Navajos for instance pay a great deal of attention to dreams as omens of misfortune or disease, and will self-diagnose based upon symbolic elements in a dream. If they become aware of the cause of their malady, they may seek out an herbalist (*azee¥ neigeedii,* "one who digs medicines") or a medicine man *(hataałi).* There are many ways one may become sick, including casual contact with non-Navajo people, proximity to lightning or whirlwind, contact with spiritually dangerous wild animals such as bear, coyote, scorpions, snakes, and the like, inappropriate behavior at a ceremonial, violating a taboo (e.g., attending a ceremony while menstruating), and proximity of the spirits of the dead. The greatly feared psychological disorder, known as the Moth Frenzy (*iichą́a:* symptoms of nervousness and anxiety, convulsions, fits of rage and violence), is associated with incest.

The most feared source of disease is witchcraft. Witches *(adiłgąshii)* are evil persons who learn to control the forces of evil *(hóchxǫ́),* the polar opposite of hózhǫ́, and therefore translated in English as "ugly," "destructive," "disharmonious," "chaotic," "unhealthy," and "evil"). Witches revel in doing things that normal people shun so as to disrupt the way of beauty. They are believed to commit incest, and to use the power of the Wind to acquire wealth and political power, to seduce lovers, and to injure or kill rivals. Witches are shapeshifters, turning into wild animals that move around rapidly at night (e.g., the famous Navajo "skin walkers," who adorn themselves with the skins of the dead, of coyotes, and the like). Witches may use powdered bone and flesh from a corpse to inflict "ghost sickness" on people, the symptoms being fatigue, blackened and swollen tongue, bad dreams, paranoia, confusion, dizziness and fainting, and the like. They may also propel magical objects, like bone fragments and pellets, into their victim,

causing them to sicken. Curiously, the Navajo do not recognize soul loss as a cause of disease, and so the healer does not go in search of the lost soul, as is so often the case in other North American shamanic traditions.

If a patient and the patient's family do not understand what is causing a disease, they may have recourse to healing specialists. Navajo culture does not include the status of the classic "flying shamans," whose rituals are primarily intended to evoke "ecstatic" alternative states of consciousness during which they travel to the Underworld or other spiritually potent places (Winkelman 1992), but there are two types of shaman healers recognized and valued by the Navajo that do share many other features in common with the classic pattern. These are the diagnostician and the medicine man.

The Diagnostician

The Navajo seer, or diagnostician (Levy, Neutra, and Parker 1987; Wyman 1936), uses one of three techniques for divining the causes of disease, as well as discovering the location of lost persons and articles, stolen property, sources of water, and witches: listening (*iists'aa'*; now considered extinct), hand trembling *(ndilniihii),* and stargazing (including moon-gazing, sun-gazing and crystal gazing; *deest'ii'*). Each of these is a technique intended to (or in the case of the listener, able to) evoke an alternative state of consciousness in which eidetic images (visual, or in the case of a listener, auditory) spontaneously arise in the practitioner's mind, and a diagnosis is rendered by interpreting those images. The diagnostician may also be a medicine man, although this combining of roles is quite rare. He (or she; pronouns will be alternated) may or may not formally discuss the disease with the patient before entering an alternate state of consciousness, but as he likely knows all about the patient's condition beforehand, in most instances the diagnostician enters the procedure with some relevant knowledge. Also, the information about the disease is considered to be coming directly from the Holy Wind and the powers of the Holy People—especially Gila Monster and Dark Wind, with whom hand-tremblers are closely associated—through the intervention of the diagnostician. If a healing ceremony is indicated, the patient will often undergo a short segment of the indicated ceremonial (e.g., the "blackening") to "test" whether the diagnosis is correct before undergoing the great expense of the full ceremony. Failure of a prescribed course of treatment is considered to be evidence of a false diagnosis.

Hand-trembling is the most common technique used among the Navajo today. Unlike the medicine man and the other two types of diagnostician, individuals become hand-tremblers by way of a calling. For instance, a person may spontaneously enter an alternative state of consciousness and exhibit characteristic trembling and convulsions during participation in a healing ceremony (especially auspicious during a Hand-Trembling Way), and then be recognized as having the gift of divinatory sight. A hand-trembler (usually a woman) will first bless her arm with corn pollen and then hold it over a patient; once the trembling begins, she enters an alternative state of consciousness in which her normal personality is submerged and during which she may see images that indicate both the cause of the disease and the indicated remedy, be that treatment by herbals or by a healing ceremony, or both. The hand-trembler may also draw images on the floor of the hogan while in an alternative state of consciousness, thus utilizing a kind of automatic writing, to produce a diagnostic image such as a lightning bolt, a circle, or a hole, which will indicate a diagnosis.

Stargazing is a skill that must be learned. The stargazing ritual may involve making an appropriate sandpainting, or not, depending upon circumstances. An apprentice stargazer is assigned an appropriate star by his teacher. The small sandpainting will represent his particular star. With or without the sandpainting, the stargazer will bless his eyes and the eyes of the patient with powder made from the lenses of the eyes of certain birds. He then goes outside and sings appropriate chants and prays for his star to show him the cause of the patient's distress. He will stare either at his star directly, or at the light from that star filtered through a crystal held up in front of him. He will enter an alternative state of consciousness in which images appear that are indicative of the correct diagnosis. The stargazer will often describe to the patient what he has seen and ask what the patient or other participants have seen during the ritual, and will render a diagnosis based

upon his interpretation of these images. Sometimes the diagnostician may use the moon or sun as the source of light.

The diagnostic technique called "listening" is by all accounts now extinct. But we do know that the technique was carried out in a similar way to stargazing. The listener would bless his ears and those of his patient with powder made from dried badger eardrums; he would then go outside away from the patient and chant and then listen for telltale sounds in the environment. Based upon the pattern of what he heard (lightning, a rattlesnake, a coyote howling, whatever it might be), he would render a diagnosis. The extent to which a listener would enter an alternative state of consciousness during his listening (a technique not uncommon among Buddhist meditators) is not known.

Medicine Man, or Singer

Once a diagnosis is made, by whatever technique, a healing ceremony (*hataał,* a "sing," or "chant"; see Reichard 1950) of the appropriate kind may be prescribed to return the patient to his or her natural state of hózhǫ́. There are over thirty major types of healing ceremonies, many with multiple subtypes. These different types are divided into Blessing Way ceremonies (intended to reinforce the state of hózhǫ́ and associated with women) and Protection Way ceremonies (designed to defend people from various kinds of assault, and associated with men). The patient or the patient's family seeks the services of a ceremonial healing shaman, or as the literature usually terms him, a "medicine man" (*hataałi,* "singer"; Frisbie and McAllester 1978) who specializes in the type of healing ceremony required.

Ceremonies may last only a day, or may take as long as nine days to complete (Faris 1990). They involve artistic creations—dramatic performances and chanting of songs that describe events during mythological time as laid down in the Sacred Stories. The rituals and artistic ingredients are considered to be gifts given by the Holy People to the Navajo in order that they may avail themselves of powerful forces of the Holy Wind and the Holy People that alone may bring about healing. The medicine man (rarely a woman may achieve this status) is someone who has apprenticed for many years under another older and more experienced medicine man. During the apprenticeship, the neophyte healer memorizes the stories, chants, and ritual techniques by which he will eventually handle a ceremony. He participates in his teacher's ceremonies as a helper. When the neophyte healer finally matures to the status of medicine man, he is given or builds a medicine bundle *(jish),* which contains many of the magical ingredients he will require in carrying out healing rituals.

A healing ceremony, or sing, may only occur within or around a traditional Navajo hut called a hogan—a round, five- or eight-sided hut made of logs, mud, rocks, or, in more modern times, brick, lumber, or concrete. Today most people no longer live in hogans, but rather in more modern buildings, such as ranch-style houses, row houses, and mobile homes. But even today, most medicine men will not consider holding a sing unless the family sponsoring the event provides a hogan (though this restriction has been loosened in modern times by some medicine men, who will now hold sings in modern houses). The reason for this stricture is that the myths and other texts that prescribe the techniques for symbolic healing require a hogan, and a hogan must be constructed in the proper way, with its one door pointing east, the direction of the rising sun. The daily cycle begins in the east with the rising sun, which is associated with birth, and proceeds clockwise through the south and west, and ends in the north, the latter being associated with night and death. By positioning symbols and people within and around the hogan in the proper way, one automatically positions them properly in relation to the four sacred mountains that define Navajoland and the four cardinal directions of the cosmos.

In certain ceremonies, the singer or his helpers will construct a sandpainting (also called a drypainting, for no sand is actually used) on the smooth dirt floor of the hogan. The painting is achieved by dribbling pulverized stone of various colors through the fingers, producing a great, colorful, open mandala, the eastern side of which is left open and pointed toward the door of the hogan, and thus toward the east. When people enter the hogan for activities during the sing, they move clockwise around the sandpainting and sit along the walls according to their gender, age, and status. Thus people become arranged properly relative to

each other, relative to the sandpainting, relative to the homeland, and ultimately relative to the cosmos—all because of the physical structure of the hogan. The sandpainting is in effect a portal to the Holy People, and when a patient is placed in the middle of the mandala, he is considered to be in a direct channel to the healing powers of the Holy People. In other words, healing is accomplished by returning the inner Wind of the patient to its natural state of harmony (hózhǫ́) with the cosmos. As it would remain powerful and potentially dangerous to others, the sandpainting is obliterated and every last bit of the colored powder from which it was made is swept up and disposed of outside to the north of the hogan.

NEW ORLEANS VOUDOU

New Orleans Voudou grew from the spiritual and survival complexes that exiled, enslaved Africans brought to Louisiana and fused with the magico-medical knowledge of indigenous Native Americans and the folk theologies and practices of French Catholicism. The traditions that evolved through the eighteenth and nineteenth centuries centered on *conjure,* (magical transformations of reality), public ceremonials of spirit possession, private rituals of spirit merger, and the social benevolent societies that Afro-Catholic free women of color founded.

Practitioners of New Orleans Voudou were called queens, doctors, or workers. They addressed both slavery and racism through spirit possession. They knew extensive magical formulas and manipulated the legal system to help slaves escape bondage. The women of Voudou violated civil codes on illegal assembly and put themselves in danger. It is rumored that they succeeded in commuting jail terms for prisoners and abolishing public executions by using spiritual power and political strategies together. They brought a variety of prayers and formulas to social relationships and to undertakings that involved love, luck, or the law.

The term *Voudou,* in various spellings, is part of scholarly controversies about African "survivals" and spiritual contributions to the New World. The word probably connoted the general name for a spirit or a deity in one or more West African languages. In New Orleans it became an invocation—a call to spirits. After the1820s, local newspapers used the word to refer to the social group itself, which white people viewed as a cult of "primitive superstitions." Voudou did not mean "snake worship"

to its adherents, although that is a common Anglo interpretation. The word *Voudou,* however, continues to call up racial and sexual stereotypes in contemporary popular usage. Today, the most commonly accepted translation of *Voudou* is "those who serve the spirits."

Historic and Scholarly Background

French colonial Louisiana was unique in the annals of the African diaspora. The majority of the African founders of the colony of Louisiana came directly from West and Central Africa. Contrary to common assumptions, they did not pass through the Caribbean first. Africans in colonial Louisiana outnumbered the less powerful Europeans two to one and brought skills in metallurgy, tropical agriculture, indigo production, irrigation, marketing, and medical care. Their imported cultural knowledge was crucial to the survival of the struggling colony. The largest group were Bambara-speakers from Senegambia (Hall 1992; Hanger 1997). The next largest contingent came directly to Louisiana from the kingdom of Kongo. Many were already Christians, well versed in Catholic catechism and religious traditions (Hall 1992, 275–315; Thornton 1987–1988). Africans carried embodied knowledge of public dances of spirit possession, songs, bands, and musical instruments such as drums, banjos, and tambourines directly to French Louisiana. They developed extensive practices of "master magic," called *gris-gris,* a potion or spell to help or harm someone. *Gris-gris* is the Voudou name for conjure; its folk cognate is *ju-ju.* Court cases in 1743 and 1773 acknowledged both the existence and effectiveness of gris-gris, or conjure, in eighteenth-century colonial Louisiana (Porteous 1934). These cases and many that followed led to accusations that Voudou practitioners were poisoners and sorcerers. Diverse documents, however, reveal that concepts of magical empowerment with the direct help of spiritual forces were deeply rooted in the Afro-Creole worldview.

Slavery in Louisiana did not look like slavery in the rest of the American South or in the Caribbean. Slaves were not always black, and blacks were not always slaves. French and Spanish colonial administrations feared uprisings and African-Indian alliances, and so they developed liberal policies of emancipation and manumission, and permitted regular and largely unrestrained public dances or ritual celebrations in places like Congo Square in New Orleans. Frenchmen took African and Native American women as slaves, companions, mistresses, employees, and wives. Free women of color in New Orleans outnumbered both white women and slave women; they became leaders in the Catholic Church and in the community. The women knew home health care—herbs, teas, poultices, bandaging, diagnosis, and treatment. They produced food, marketed it, and provisioned their families. In each generation women of color schemed to buy themselves, their children, and other family members out of slavery. Their activism led to the largest community of *gens de couleur libre,* "free people of color," in the United States, and to the spiritual complexes labeled Voudou. In southern Louisiana the intersection of sex and race forged a New World people called Creoles. Voudou, jazz, dances, cuisine, and architecture of the area have Creole roots. In New Orleans during the colonial and early national periods, Creole referred to the culture and cuisine of native-born, largely endogamous, French-speaking Catholics of all colors.

When Reconstruction ended in 1877, Jim Crow—the doctrine of separate but equal and the cornerstone of American apartheid—began. *Creole* became a contested racial category. Today the term *Creole* is at the center of intense public controversies over the politics of color and who can or cannot claim its heritage (Dominguez 1994; Hirsch and Logsdon 1992; Kein 2000).

The major sources of information about New Orleans Voudou are the following: (1) The staff of the WPA Federal Writers' Project in Louisiana, part of the Depression recovery programs of the 1930s, interviewed several hundred citizens, including people who had been previously enslaved (Clayton 1990), and many who had known the practitioners of Voudou. The interviews are housed in various state archives. (2) Zora Neale Hurston, novelist, anthropologist, and folklorist, did field research in New Orleans from 1929 to 1930. An African American and graduate student in anthropology at Columbia University, Hurston was initiated into New Orleans Voudou at least six times, the last time with a man whom she believed to be the grand-nephew of a famous

practitioner, Marie Laveau the Second. Her lyrical descriptions of these ceremonies are the best in the Voudou-Hoodoo literature (1931; 1990, 198–205). (3) Harry Middleton Hyatt, an eccentric Episcopal priest turned folklorist, privately published five volumes of interviews with Southern practitioners of what he called hoodoo, witchcraft, root-work, and conjuration. Between 1938 and 1940 Hyatt interviewed about thirty to forty practitioners and clients in New Orleans (1970–1978). (4) White journalists, travelers, and regional writers in the nineteenth century published accounts in newspapers, books, and magazines.

Practitioners

The major spiritual imperatives of New Orleans Voudou center on *protection* and *freedom.* Practitioners focused their spiritual intentions and magical strategies on social relationships—owners and slaves; bosses and workers; husbands and wives; lovers; neighbors; in-laws; policemen, judges, and lawyers. Voudou theology acknowledged and provided rituals to contact ancestors, Catholic saints, and other "natural" people who were once human. Other spirits were invoked in times of desperate need or suffering; some spirits volunteered their help through visions, mergers, or possessions.

The best-known priestesses, or practitioners, of New Orleans Voudou were Marie Laveau the First and Marie Laveau the Second, mother and daughter. Marie Laveau the First, also known as the Widow Paris, was born about 1801; she died on June 16, 1881, and is buried in Saint Louis Cemetery Number One, New Orleans' most historic city of the dead. She had a high social standing as a Creole fever nurse and was an active member of Saint Louis Cathedral and a counselor to men on Death Row in Parish prison. In these capacities, she did the work of a psychopomp (one who escorts souls to or from the world of the dead) for the dying, as well as conjure work to free prisoners or allow them a merciful death at a time when hangings were a spectator sport. Her known spiritual signatures were fire, the great serpent (le Grand Zombi), Saint Anthony, and the Virgin Mary.

Marie Laveau the Second, also known as Eucharist Glapion, was born February 2, 1827; she had disappeared by 1877—no reliable date of death, cause of death, or burial site for her are known. People speculated and gossiped about her; well into the twenty-first century, some in the community swore that she drowned and rose again. She was probably a hairdresser; she ran a spiritual practice out of her home, calling in spirits to counsel citizens about matters such as unfaithful husbands, disloyal friends, gambling reverses, bad bosses, ungrateful children, and court cases. On each June 23, Saint John's Eve, Marie the Second planned and led interracial Voudou ceremonials and parties at locations along the beaches of Lake Pontchartrain. Her known spiritual signatures were water, Saint John the Baptist, High John the Conqueror, and the Good Mother.

Both women were French-speaking Catholics, leaders in the Afro-Creole community, and both bore the children of men they could not marry. The mother and daughter have been routinely confused with each other throughout the nineteenth and twentieth centuries. Both Laveaus and many other free women of color for whom records exist maintained elaborate altars in their homes. They placed candles, holy or blessed water, offerings of food, legal documents or letters, statues to Catholic saints, spices or chemical compounds, and other ritual materials on them. When a client came with a problem, the priestess went to her altar and prayed, journeyed, or otherwise entered into an altered state of consciousness. Once in that state she merged with a spirit, who then spoke through her to the troubled client. The best published accounts of these spiritual sessions come from the thirty long Voudou prayers that Zora Neale Hurston collected (Hurston 1931). As the grand-nephew of Marie the Second explained to her, "Marie Laveau is not a woman when she answer the one who ask. No. She is a god, yes. Whatever she say, it will come so" (Hurston 1990, 195).

Theology and Philosophy of Voudou

Conjure—the magical means to transform reality—was an important shamanic activity of New Orleans Voudou. In the African American worldview, conjure means language and ritual to link magical and supernatural elements with medicinal practices and natural processes. Conjure produces two realities or states of consciousness and mediates between them. Conjurers have both worldly and spiritual insight. Voudou, or

Zora Hurston, Voudou dancer, beating a drum, 1937. (Library of Congress)

Hoodoo, practitioners in the American South often called themselves two-headed doctors—one head for consensual realities and the other for spiritual realms. In Eurocentric reasoning, however, conjure became synonymous with overheated imaginations at best and with witchcraft or sorcery at worst.

Voudou practitioners earned a formidable reputation for their ability to contact the spirits of deceased people. Women's social lives re-

volved around funerals, mourning rituals, and the annual observances of death. Infant mortality in New Orleans was exceptionally high, medical care almost nonexistent. Extensive Catholic and Creole mourning customs prescribed regular visits to family graves and encouraged prayerful contact with dead relatives and friends. A powerful and easily obtained ingredient in Voudou magical formulas was graveyard dust. The etiquette of visiting and cleaning graves in the cemeteries shaded easily into psychopomp work where the souls of the dead were consulted, consoled, and conducted to better places. These spiritual traditions are still practiced in New Orleans, where the cemeteries are major tourist attractions.

Since New Orleans Voudou lives in the shadow of its larger and more famous relative, Haitian Vodou, it has been assumed that the spirits each honored were the same. In New Orleans, however, a place-specific pantheon arose that was dominated by a female spirit in direct contact with the Good God (*Bon Dié* in Louisiana Creole French). This woman is variously called the Holy Mother, the Virgin Mary, the Good Mother, Mother-of-All, "lovely Lady dressed in blue," or Lady Luck. She is also Our Lady of Prompt Succor who saved New Orleans at the Battle of New Orleans in 1815 and from menacing hurricanes on many occasions. Other Catholic saints, particularly Saint Anthony and Saint John the Baptist, were honored. Some folk records mention Saint Peter, Saint Rita, Saint Michael, and Saint Joseph. The most popular saint of New Orleans—one not limited to Voudou—is Saint Expedite, who makes things happen quickly. Swift action is a special blessing, even a miracle. The spirits and saints of New Orleans Voudou respond to written instructions, forceful prayers, intense suffering, and personal sacrifice. They have also been known to take bribes and make deals (Hurston 1931; Hyatt 1970–1978).

The Laveaus and other priestesses danced with snakes and called on a serpent spirit named le Grand Zombi in their spirit possession rituals. The origin of the name is unclear. For African Christians from the kingdom of Kongo, the name of God was Zambi a Mpungu; in Saint Domingue, now known as Haiti, a zombi is a person raised from the dead, a person whose immortal soul has been stolen. In New Orleans, however, the Great Zombi seems to have been a fierce spirit of resistance and protest embodied in possession. Although these spirits and saints have obvious parallels in Africa or in Haiti, names like Damballah for the snake spirit or Erzulie for the female spirit are not found in existing documentary sources for Louisiana.

Everything in New Orleans Voudou bowed before intention and desire. A person's name was the chief ingredient of his identity, the essence of his living spirits. Wishes, prayers, blessings, or curses were spoken aloud or written down with a person's name and the intention attached. Holy water and candles set the intention. Nothing in New Orleans Voudou happened "naturally" or because it was "meant to be." There was no such thing as fate, coincidence, serendipity, or acausal synchronicity. Good luck and bad luck were not whims of the spirit world. They resulted from manipulation, maneuvering, magic, and the intentions and ritual actions of a master magician. Each practitioner used her own spiritual experiences to contact the spirits for advice. A practitioner could accomplish the same goal in any of a half dozen ways. New or different remedies to solve the same problem were not lies—not "made up on the spot." In Voudou philosophy, there were no either-or rules, good or bad moral choices. Pictures of saints doused with holy water, for example, could hurt people or help them, depending on the intention.

Voudou practitioners earned a reputation for "fixing," or putting a curse on, those who "crossed" them. They knew how to make their enemies ill or even kill them if necessary. The "voodoo dolls" sold in the French Quarter bear witness to these abilities, although there is no historical evidence that Voudou practitioners like the Laveaus ever made such dolls. These objects are probably more mercantile imagination than spiritual fact. Nonetheless, even ordinary citizens in New Orleans knew and gossiped about various recipes or prescriptions that used common household materials and prayers to wound others. In the logic of Voudou, however, the curse will rebound on the curser. If one can send misfortune to an enemy, a competitor, a rival, a bad boss, or an ex-lover, then they can in turn send it back. Spiritual power sent without compassion returns to injure the sender.

Rituals, Ritual Gatherings, and the Ceremonial Calendar

The Voudou orders met in parks, private homes, in businesses closed for the night, and at the bayous, swamps, or lakes near the city. The most important site was Congo Square, an open plaza on the northern boundary of the French Quarter (Cable 1976; Johnson 1995). Historic evidence shows that African-born enslaved and free people danced there on Sunday afternoons from the mid-1700s to the late 1850s when authorities closed it. Congo Square was a major market center, dance arena, community gathering spot, and ritual space—the crossroads, the focal point of Afro-Creole life, the epicenter of its mystical geography. Scholars regard it as the cradle of African American aesthetics, modern dance in America, and jazz, as well as of New Orleans Voudou. White people witnessed black people gathered in large numbers to do something that resembled religion. Journalists, travelers, and regional writers left eyewitness accounts of bands and their instruments, choruses, songs, ring dances, and spirit possession. The featured performers were women of color in loose white dresses and *tignons,* the headdresses or turbans Creole women of color wore in defiance of an edict that forbade them to wear bonnets like white Creole women.

No place in America is more directly associated with the roots of jazz than is Congo Square. Some scholars say that the ritual dances of the Voudous, called the Congo dance or the Creole dance, were the crucible of modern American dance (Johnson 1995). Women remained within their own tight circles and undulated in sinuous motions resembling snakes. Sometimes the Voudou practitioners danced with snakes, probably the nonpoisonous Louisiana *Coluber* species. With feet flat, a dancer slowly shifted her weight from one ankle to her thighs and then to her hips and torso as she imitated the movements of snakes, who have no legs. The women did not move their feet from the ground as they swayed in undulatory motions from ankles to shoulders. Men mimicked fighting as they danced in circles around the women who performed the constricted ankle-thigh-hip-shoulder step of the classic Voudou ritual dance. They leaped into the air and performed feats of gymnastic dancing. They had bands of bells attached to each leg, and at some dances they balanced bottles or carafes filled with alcoholic spirits on their heads. A chorus of those who knew the songs accompanied the dancers and the musicians. The orchestra or band set the beat with their often handmade instruments. Typically, the players had at least one large drum made from a wooden barrel covered with a cured animal skin and played with animal bones as beaters. There are reliable historic accounts of banjos and other stringed instruments, tambourines, and rattles made from gourds.

This description includes both the ritual dances, music, calendrical ceremonies, and initiation services of the Voudou orders, as well as what were probably secular Afro-Creole celebrations. The sexual excitement and spiritual power on these occasions are evident even in scandalized or confused eyewitness accounts. Witnesses reported chant-style songs, call-and-response lyrics, and a liturgical pacing of rituals from invocation to ritual release. Congo Square can also be interpreted as a site of resistance and confrontation, as well as creativity and spiritual evolution.

The two most significant holy days of New Orleans Voudou are November 1, the Day of the Dead, or All Saints' Day, and June 23, Saint John's Eve. Both are associated with Catholic as well as pre-Christian celebrations, and probably African ones as well. The Day of the Dead follows All Hallow Eve, or Halloween, part of the elaborate masking traditions in New Orleans. On All Saints' Day, citizens visit family tombs, make offerings, clean up, communicate with the dead, and honor their ancestors. The night of June 23, at midsummer, honors Saint John the Baptist and High John the Conqueror, a folk hero in Southern Hoodoo. The Voudou gatherings were typically opened by a priestess who rapped on the floor or ground three times—people said that this meant "Father, Son, and Holy Spirit" or "Faith, Hope, and Charity."

Sociomedical Shamanism

Nineteenth-century New Orleans had the highest mortality rates, the deadliest epidemics, and the worst public health system in the United States. The city's subtropical climate and below–sea level location, a chronic lack of

leadership, and appalling sanitation led to yellow fever, cholera, malaria, fulminating dysenteries, and other diseases (Duffy 1958, 1962). The population depended on "fever nurses"—women of color who had learned skills from female relatives, and who used techniques from African, Haitian, and American Indian ancestors. "Nursing women" like Marie Laveau the First were routinely identified as Voudou practitioners.

Women of color in New Orleans practiced an effective array of alternative, integrated, or holistic medicine. Besides their documented bedside skills, they had an extensive pharmacopoeia. Historic records mention ginseng, gum balsam, jalap, rhubarb, snakeroot, sarsaparilla, Saint John's wort, sassafras, copal tree, maidenhair ferns, cottonwood roots, acacia leaves, elderberry bark, sage, Indian hemp, holly leaves, and hundreds more plants and plant parts, many purchased at Native American markets. The first licensed pharmacist in America opened a French-style pharmacy in 1823 and ordered many materials and compounds from New York or Paris.

The practitioners of New Orleans Voudou had an extensive pharmacopoeia of chemicals and compounds, which they mixed and used primarily for conjure or magical work rather than for individual healing. In the Voudou section of the French pharmacy, there were oils of cinnamon, cassia, bergamot, "Sanguinaria Aragon" (bloodroot) or dragon's blood, antimony, iron wire, coffee beans, verbena, lemon grass, cochineal, guinea peppers, lodestones, cayenne pepper, iron filings, kerosene, elm bark tea, Saint John's root, and many other classic ingredients as well. The pharmacist sold love, luck, and control over capricious fate under various names: Love Success, Lucky Devil, As You Please, Attraction, and the famous Love Potion Number Nine. The shelves held some of Voudou's trademark formulas for a successful social life: Getaway Powder, Waste-away Tea, War Waters, the Essence of Three Thieves, and the Goddess of Evils. There were a wide assortment of powders whose names reveal their intention—dragging powders, stay-away powder, separation powder, confusement powder, disturbment powder, whirlwind powders, moving-on powders, and hot-foot powder. These Voudou materials were as conventional for that period as those the white medical establishment favored—harsh laxatives and purgatives, mercury, arsenic, or black leeches to suck blood.

Other than these formulas and compounds, which are still widely available, no known artifacts of New Orleans Voudou have survived. The police confiscated cartloads of ritual objects in raids during the 1850s and did not return them.

Relationship to Other Spiritual Traditions of the Diaspora

New Orleans Voudou is related through the African diaspora to Candomblé, Macumba, and other Afro-Brazilian religions, to Afro-Caribbean religions like Shango of Trinidad, and to Santería in Cuba. It is not the same thing as Haitian Vodou, Hoodoo in the American South, or Hollywood "voodoo."

Several waves of migration gradually shaped New Orleans Voudou in the nineteenth century. In 1809 a group of about ten thousand French-speaking Catholic Creoles came to New Orleans from Saint Domingue. (The Caribbean island was renamed Haiti after a successful revolution brought former slaves to positions of power on the island.) The "foreign French" roughly doubled the population of the city. The new Creoles did not bring what scholars now know as Haitian Vodou to New Orleans. But they probably enhanced some of the Afro-Catholic traditions already present, and certainly contributed to the French quality of the city in the period when Anglos and Protestants were trying to Americanize it. At the same time, they adjusted to their adopted city and blended in completely with the local population. The social and religious contexts of Vodou in Saint Domingue-Haiti and Voudou in New Orleans were not the same. A revolution built and exploded in Saint Domingue, leaving an independent black nation. In Louisiana, American racial laws and tensions intensified in slow steps.

The second wave of influence in New Orleans Voudou came from Southern Blacks who developed conjure, "master magic," and hands-on healing from their experiences with the plantocracy and slavery systems of the rural South. These powerful traditions are generally called Hoodoo in the literature. In the two decades before the Civil War and increasingly after Emancipation in 1863, English-speaking and evangelical or ecstatic Protestants, like the

earlier French Catholic Haitians, changed and were changed by the city. Historians and anthropologists have difficulty in teasing out the contributions of Southern African Americans after the Civil War and the folk Catholicism of Italian and Irish immigrants after the 1840s to the French Afro-Creole foundations of New Orleans (Dominguez 1994; Hirsch and Logsdon 1992; Kein 2000).

In 1877, Reconstruction and the federal occupation of New Orleans ended. The era of American apartheid called Jim Crow, "separate but equal" segregation, began. Local press and police escalated their attacks on the women of Voudou. Legislators at both state and local levels passed and enforced strict laws against fortune-telling, spiritual counseling, or any psychic activities that promoted good luck. Newspapers continued to recycle stories about orgies, boiling caldrons, black magic, and human or animal sacrifice. Hundreds of post-Laveau practitioners moved to Algiers, a suburb across the river from New Orleans.

At the beginning of the twentieth century, African American women started a unique group of churches in New Orleans, the Spiritual Churches—not to be confused with Spiritualism or the Spiritualist Movement. These churches were syncretic, based on native African spirit contacts through possession, an Afrocentric identification with Zionism, Israel, and the Israelites, Native North American Indian traditions, fundamentalist and ecstatic Christianity, nineteenth-century Spiritualism, and charismatic Catholicism (Jacobs and Kaslow 1991). A Native American revolutionary figure, Black Hawk, is widely celebrated both in homes and on church altars. African American men dressed as Native American warriors, or Mardi Gras Indians, lead street marches and dances dressed in elaborate feathered and sequined costumes. Practitioners today use titles such as spiritual advisors, palm readers, fortune-tellers, psychics, spiritual readers, prophets, or Reverend Mothers. Sometimes they speak of themselves or others speak of them as healers or healing mediums. They avoid words like *conjurer*, *doctor*, *queen*, or *rootworker*. Groups of women continue in the tradition of altars, personal adoration, contacts with saints and spirits, and sacramental services of initiation and baptism. They honor ancestors like "Mother Laveau." They build elaborate altars with candles, pictures of saints and spirit guides, photographs or statues of respected Indian chiefs, crucifixes, holy water, food, flowers, perfume, incense, rosaries, and letters to spirits.

Priestesses of Voudou still meet with small groups of followers in New Orleans, on Bayou Saint John, at private homes and parks, and even at Congo Square; all have been trained in Haiti or Africa (Glassman 2000). At the same time, Spiritual Churches provide an alternative to racism and internalized oppression; they offer direct experiences with the spirit world. The leaders of the Spiritual Churches point with pride to their Afro-Catholic roots. But they cannot afford to acknowledge their kinship with New Orleans Voudou.

NORTH AMERICAN ORAL TRADITIONS AND SHAMANISM

For the indigenous peoples of North America, oral traditions have traditionally provided an indispensable guide for coming to know and successfully navigating their mythic landscape, as well as a means of perpetuating that landscape. The oral traditions chronicle the primordial age of transformation when powerful mythic peoples molded the world into being and brought forth all that would be necessary for the human peoples to prosper. It is this landscape, inhabited by what are often referred to as the Animal Peoples with great spiritual powers, as well as dangerous monsters of all kinds, that the shaman must be capable of negotiating with skill. This is also the landscape traveled during a rite of passage into adulthood, during a healing ritual seeking the return of a sick relative's wandering soul, or during the final rite of passage upon a relative's death. In telling the oral traditions the shaman, as storyteller par excellence, helps educate the young and reiterates to the old the meanings and identities that are uniquely the tribe's heritage. In the characters and actions of the Animal Peoples are disseminated many of the archetypal personalities imbued in the human peoples, including the shamans themselves. And in the ritual act of telling the creation stories, the shaman speaks that landscape into existence, helping continue the meaning and vitality of all the world's inhabitants. To know and speak the oral traditions is to know and perpetuate the mythic landscape of the shaman.

The oral traditions comprise a vast body of stories, including those of the mythic beings of the primordial time of transformation before the arrival of humans, as well as those of human heroes and others of the age of humans. It is the powerful mythic beings, some of which are referred to as the Animal Peoples, who transformed a barren and foreboding landscape and prepared it for the coming of human peoples. Among these many mythic beings are Sedna (among the Inuit of the Arctic), who from the parts of her own fingers created many of the animals and fishes of sea, as well as establishing the rules of fishing those creatures. Good and Evil Twin (Iroquois of the Woodland Northeast), in a contest to see who was the most powerful, created the Rocky Mountains; in his defeat, Evil Twin established the False Face Society for curing sickness. Salmon (Plateau tribe) established fishing techniques and the character of such animals as the rattlesnake and wolf; Raven (Northwest Coast) first brought daylight and fresh water to a dark and polluted land. Changing Woman (Southwest) created human beings and the girl's coming of age rite, Kinaaldá. In their quest to find their father, Changing Woman's twin sons, Monster Slayer and Child of the Water, with great cunning and deceptive skills destroyed many of the treacherous monsters that once roamed the land. Scare Face (Plains), having been bullied by others for his distorted face, fasted, refusing all food and water, in the mountains and gained the aid of a guardian animal spirit. As a consequence of this "sacrifice," his scare was then removed, his despair overcome, and he became a prominent man among his people.

Prominent among the mythic beings is the trickster. In his various adventures and misadventures, the trickster is seen as having molded the land from the mud brought up from the sea's bottom, and then created the animals and plants and finally humans themselves. With his skills at deception he established the proper ways of behaving toward kinsmen, as well as toward an enemy. The trickster is known by many names. Among the Tsimshian of the Northwest Coast he is called TxäsEm, Raven, while among the Blackfeet he is known as Napi, Old Man, the Crow call him Isaahkawuattee, Old Man Coyote, and the Sioux, Iktomi, Spider. And for many of the tribes (of the Plains, Southwest, and Plateau) he is known simply as Coyote.

In the collective actions of these mythic beings, the landscape is shaped into form and embedded with all the gifts human peoples will come to need to survive. Among the gifts are the various plant and animal species, the forms of the tribal and family organizations, the ceremonies upon which the human peoples would depend, the teachings and ethical lessons, and the spiritual power itself (called, for example, *baaxpee* among the Crow and *suumesh* among the Plateau Salish; commonly referred to as medicine) needed to accomplish a rite of passage, or a hunting or healing ritual.

As accomplished storytellers, it is the shaman and the other elders of the community who are the caretakers of the oral traditions and responsible for continuing to tell the creation accounts and hero tales. Among the storytelling techniques employed to bring the stories alive are the judicious and skilled use of voice fluctuation and intonation, pauses, and hand gesturing and body language. It is not uncommon for the storyteller to continue his telling only as long as the listeners provide a verbal or visual cue of their continued involvement in the story. Should no such acknowledgments be offered, the story would cease at that moment, whether the story had come to its conclusion or not. All these techniques coalesce to help the listeners of the stories become participants in them, traveling with Coyote as he plays a trick on his younger brother or as he slays some monster threatening the other Animal Peoples. In sharing the oral traditions, the storytellers re-create for the participants the primordial time and place.

The participatory dimension of the telling is further strengthened by the performative nature of the native languages themselves. It is commonly held that what is spoken aloud has the power to bring forth that which is referred to. The "breath" is a channel to the animation of the heart. When one leaves after a visit with someone, to say in one's native language, "I'll see you later," helps to create such an outcome, but to say "Goodbye," could lead to never seeing that person again. When an Indian name is ritually conferred, the descriptive nature of that name helps nurture the child to become that name. One should never speak of a particular illness, or one runs the risk of contracting it. When the ancient words of an oral tradition are woven into the rich fabric of a story, the spoken story helps bring forth and animate the mythic landscape referred to. The oral traditions embody the creative power to help perpetuate the world and its many inhabitants.

For the members of the shaman's community it is essential that the oral traditions continue to be told. The benefits are varied yet indispensable. The oral traditions help instill an affective component in community life. In the humor and drama of the narratives the stories bring laughter as well as tears, contributing to the ethos of the community. Coyote's antics are sure to bring a smile and a laugh. The stories of tricksters and heroes thus serve as a primary means of entertainment.

The oral traditions provide an educational component to community life; they are textbooks. For the young of the community, the oral traditions provide an essential means of gaining knowledge of their culture, as well as the skills it will take to be successful within it. The stories convey the essential teaching and ethics of the mythic beings. With his competitive skills and self-serving intentions, Coyote can demonstrate just as easily how one should not behave toward a kinsmen, as how one can behave toward an enemy rival. In the example of Scare Face is established the structure of any vision quest: Someone is in need of help; he journeys far from home into the mountains to fast and pray; if his sacrifice is judged worthy, he is adopted by a guardian animal spirit and receives a medicine. The narratives instill among the youth and reaffirm among the elders a sense of their unique identity and heritage.

For the shaman in particular the oral traditions provide a map of the mythic landscape. As it abounds with monsters and dangerous paths, this is the landscape the shaman must know intimately in order to successfully travel it during a healing or hunting ritual, or some rite of passage. An Inuit *angakkoq* (shaman) must know of the numerous challenges that await his journey to the bottom of the sea and a visit to Sedna—huge rolling boulders, the snarl of a vicious dog, an abyss to be crossed, among other dangers. The narratives provide a symbolic language of cues and signs to better interpret the activities of an enemy, the buffalo, the camas roots, seasonal changes, or the dreams in which the Animal Spirits appear. Indeed, the generalized actions of the Animal Peoples of primordial age provide shamans with an archetype of their role. As the mythic beings, with their spiritual potency, transform a dangerous land, so too must shamans, acquiring the same potency and applying it in the various ritual transformations they attempt, be they rites of passage, or rites of healing, fishing, or hunting. The specific personalities of Animal Peoples can also become the model for a shaman's character. The shaman may identify himself as the self-serving, trickster Coyote, being manipulative and deceptive in the face of an enemy. Or the shaman can be self-effacing, like Scare Face, seeking to help others as a healer, or as a fishing or hunting shaman.

The oral traditions also provide an integrative component within the shaman's community, helping perpetuate the perennial landscape of the creation time. In the ritual act of giving voice to the oral traditions, the potency and meaning of the mythic age is brought into the immediate sense of time and place. Those people who listen to the stories become participants in the mythic landscape, and the animals, plants, humans, and spiritual inhabitants of that landscape are revitalized and rendered meaningful. With each of the stories anchored in the particular teachings of the Animal Peoples, to speak of the mountains and rivers of the oral traditions is to animate the landforms with the continued significance of those teachings. During the retelling of the oral tradition, a participant might run with the mischievous Coyote or travel with the anguished Scare Face. And after the telling, that same person might become Coyote or Scare Face as he confronts an enemy in battle or seeks his vision on a distant mountain site. Stories make the world.

OJIBWA SHAMANISM

The Ojibwa peoples in North American have a shamanic tradition rich in a variety of healing practices and rituals, which has been preserved to the present day.

Background

The Ojibwa tribal group is one of the largest and most widespread North American indigenous groups, with communities found in the states of Michigan, Wisconsin, Minnesota, North Dakota, and Montana of the United States, and in the Canadian provinces of Ontario, Manitoba, Saskatchewan, and Alberta. In Canada, over 130 First Nation groups contain at least some measure of Ojibwa membership, while there are 22 federally recognized Ojibwa bands in the United States.

An Algonquin speaking people, the Ojibwa share a common Woodlands cultural and linguistic heritage with such tribes as the Ottawa, Potawatomi, Menominee, and Cree. During more recent historical times, contact with the Dakota Sioux and Assiniboine led to the adoption of certain Plains cultural traits by the more westerly bands, creating a hybrid culture that diverges from the more dominant woodlands background.

Politically the Ojibwa to some extent observed the principle of hereditary chieftainship. When possible, a son would succeed his father in the position. However, if the son was deemed ineffectual or found lacking in some manner, he would certainly be passed over for a more worthy man. In most instances, however, the Ojibwa were formed into small bands that followed individual headmen who had distinguished themselves through bravery in warfare or success in hunting. Based on the will of the community, the ascendancy and influence of a particular headman could change, depending on the situation facing the group at the moment. Above all, a chief had to be a provider of the highest rank, giving freely to the needy and caring for the weak and infirm members of the tribe.

Ojibwa society is patrilineal and based on a clan (or totem) system. There are six main totems—the crane, catfish, bear, marten, wolf, and loon—that account for probably eight-tenths of the Ojibwa tribal group. Other less significant totems existed, but these were found only among some of the more remote bands of northern Ojibwa. Intermarriage within totems was taboo during historic times, but this custom is rarely observed in modern times. Families tended to be large during historic times. Extended family was and continues to be important to the Ojibwa.

Although Ojibwa are generally viewed as a peaceful people, warfare occupied an important place in their society. The status of a man was usually determined by his war success. Although small skirmishes were most common, often the Ojibwa would gather into large war parties several hundred strong to wage major campaigns against their enemies. Warfare was approached with limited ceremonialism. Members of war parties often performed divinations to determine their likelihood of success, looking for certain omens that might portend luck. Ojibwa bands were active in tribal warfare throughout the mid-nineteenth century in the United States and played a minor role in the Canadian Métis rebellions of the latter part of the nineteenth century.

Cosmology

Dreams play an important role in the spiritual life of the Ojibwa. In many ways dreams are seen as being more real than the waking world. Messages received in dreams often serve as omens that are interpreted for meaning by older community members with acknowledged power in dream interpretation. In historic times dreams were believed to have the power to predict such events as new ceremonies, war success, or success at hunting.

The Ojibwa cosmology is founded on the concept of a single, all-powerful deity known as Kitche Manitou. The name of this deity is commonly invoked during most prayers and divinations. Other manitou (spirits) may also be invoked. These tend to serve as more individualized spirit helpers and are often gained during fasting ceremonies.

Shamanism: Belief System and Practices

Although all individual Ojibwa are capable of obtaining some measure of spiritual power, certain individuals may obtain a more elevated

shamanic status. Of these individuals, there are four classes among the Ojibwa.

The first class includes those who perform a "sucking cure." Practitioners of this form of shamanism tend to be mainly men, hence the use of the male pronoun below, but women may attain mastery as well. These shamans are equipped with a set of sucking tubes and small bones through which they suck and spit out the illness as part of their procedure. They also administer certain medicines that have a variety of healing properties. The sucking treatment is commonly used to cure illnesses that are deemed to come from an invading force, or that are contained in particular regions of the body. The ceremony itself is generally held after sundown. In this ceremony a small quantity of water is placed in a bowl and set near the patient. The shaman proceeds by singing and accompanying himself with a rattle, tapping the patient's body at various places to determine the exact location of the illness. Once the place has been identified, the shaman proceeds to employ his tubes and bones to suck the intruding illness from the body of the subject. After a short while the shaman will blow the invading foreign substance from his tube into the bowl of water. Following the treatment, the patient is often given certain medicinal herbs to concoct a tea to drink for a prescribed period. This cure is often performed several times.

The members of the second group perform magical feats through the Wabanowin. The Wabanowin, "Dance of the East" is a fraternal society–based ceremony that is similar to the Midéwiwin ceremony described below, in that it includes a hierarchical system of mastery ranging from varying levels of apprenticeship to full mastery. Shamanic practitioners of this ceremony construct a large, circular lodge to represent the earth and sky. This lodge has two doors facing east and west and is left open near the top to allow for the viewing of the sky. Following purification, participants enter the lodge and begin a series of petitions to the spirits to be invoked. The ceremony itself involves the direct healing of individuals and the performance of magical feats. One of the more striking subceremonies of the Wabanowin involves the carrying of hot stones or the retrieval of meat from a boiling pot using only bare hands. This meat, when consumed by a person with an illness, is seen to have healing qualities.

The third class of shamans comprises those able to prophesy through the use of the conjuring booth, again generally male. The skills of a shaman of this kind may be used to cure, but may also be employed to locate lost items or individuals. The conjuring booth, or "shake tent," consists of a circular lodge created from several upright poles covered on the outside with an open top. To this structure, rattles or other noise-making devices are tied. To begin the ceremony, the shaman will enter the lodge to begin praying and singing. After a time the lodge will begin to shake violently. Strange lights and voices will be heard in addition to that of the performing shaman. After a time, he will exit from the lodge and will impart what he learned from the spirits he contacted during the ceremony. Variations to this ceremony sometimes include the shaman being wrapped in a blanket and bound tightly with ropes. He will then be placed in the lodge, only to exit after the ceremony completely freed of his bondage. Similar ceremonies to this may be found among other tribes, particularly the Sioux, who call it a Yuwipi.

Lastly, there are the members of the Midéwiwin, who acquire divinatory powers and are able to employ magical means for a variety of purposes. Open to both male and female participants, the Midéwiwin is an initiate-based society that generally focuses on the ceremonialism surrounding ritual death and rebirth as a form of shamanism.

The lodge for the ceremony is formed by bending saplings over to create a long, arched, east-west facing structure that is completely covered with brush. Within the lodge a central pole is erected and decorated. During the performance of the ceremony, singing and dancing play a central role, but the most significant act is that of the "shooting" of participants. This element involves the ritual death of the participant, brought about by being shot with a "medicine arrow" formed from a small shell called a *megis.* This megis is the means by which a participant is brought to death. Once brought to this shamanic state of death, the participant is ritually healed and brought back to life by the other members. The purpose of this ritual death and revival is to create a newly cleansed spirit for the participant. Other elements of the Midéwiwin include the imbibing of certain herbs and medicines, and the learning of various healing techniques.

Other shamanic ceremonies performed by the more westerly bands of Ojibwa include a variation of the Sun Dance learned from the Dakota Sioux, the Rain Dance (a Sun Dance–like ritual performed by Canadian bands), and the Cree-based Smoking Lodge ceremony. A unique shamanic society known as the Windigokanak is also found among members of the Turtle Mountain Band. This "clown mask" society wears strange masks in honor of the cannibalistic deity Windigo, and performs outlandish acts, including walking and taking backwards, doing strange or bothersome gestures, or other unconventional acts. The Windigokanak is almost exclusively linked to the Sun Dance ceremony and is similar in nature to the Heyoka of the Sioux culture.

Although these shamanic practices are less widespread in modern times, practitioners may be found among nearly all bands of the Ojibwa. Some of the shamanic practices have died out in certain bands, while others continue to flourish. Much of the loss of shamanism resulted from the marginalizing of Ojibwa bands on reservations and the systematic efforts by Indian agents to end these practices. As the Ojibwa strive to reclaim their culture in the twenty-first century, it seems certain, based on the author's observations, that these shamanic traditions will continue as a vital part of Ojibwa culture.

PEYOTE RITUAL USE (CENTRAL AMERICA AND NORTH AMERICA)

Sacramental peyote use originated some 10,000 years ago. A discussion of the evidence for that early use will be found in the entry, "Archaeology of Shamanism," together with some discussion of how it was used. The entries on "Entheogens and Shamanism" and "Central and South American Shamanism" provide a larger context. The focus of this entry is on current ritual use in the United States, with some discussion, for the sake of contrast, of the ritual use of peyote among the Huichol of Mexico (covered in more depth in the entry "Huichol Shamanism").

During the past 120 years members of more than 70 tribes throughout the United States of America have learned to reverently consume peyote in all-night ceremonies (Fikes 1996a). This new intertribal religion, which now has over 250,000 followers, evolved from that sacramental peyote use that originated some 10,000 years ago. Today's contemplative and orderly meeting for worship (usually held in a tepee) evidently began among the Lipan Apache about 200 years ago. Peyote itself is credited with having made converts of other tribes by transforming intertribal enemies into friends. Peyote's remarkable power to establish peace and trust among former enemies is explained in strikingly similar stories recited by Comanche and Kiowa peyotists. Comanche and Kiowa traditions refer to an occasion when one of their respective war chiefs arrived at an Apache peyote ceremony already in progress. The Apache leading that peyote ceremony proclaimed to each war chief (Comanche and Kiowa) that peyote had predicted he would come, inviting each war chief to attend the meeting. Each of them learned how to conduct the ceremony and returned to

teach it to his respective tribe (LaBarre 1989, 25, 111).

After American Indians were confined on reservations, circa 1890, the peyote religion spread rapidly, partly because aboriginal religions were becoming impracticable and because the federal government prohibited them. Peyote was hailed as an antidote to alcoholism, a teacher of righteousness, and a divine medicine. The peyote ceremony quickly crossed tribal boundaries, indirectly aided by white-controlled boarding schools whose English-only policy allowed students from various tribes to communicate and become friends (Fikes 2001; Stewart 1987). After 1890, when the railroad reached Laredo, Texas (the only U.S. state where peyote grows), the number of peyotists increased dramatically in Oklahoma and then among American Indian tribes in other states.

The growing use of peyote soon met with opposition, but sacramental peyote use has survived centuries of persecution. In 1620, sixty years after the Catholic priest, Sahagun, observed Aztec peyote use, peyote was denounced as diabolic and forbidden. Inquisition records from colonial Mexico indicate that peyotists were tortured and executed (Fikes 1996a, 168–169), yet the practice continued. As soon as federal Indian agents and Christian missionaries discovered Indians eating peyote (which they mistakenly called mescal), they suppressed its distribution and subsequently attempted to make it illegal. Congregations of peyotists responded to this threat to their religious freedom by incorporating as churches. The first two churches, whose articles of incorporation are explicitly Christian, were established in Oklahoma in 1914 and 1918 (Fikes 2001, 76). Since 1918, when the Native American Church (NAC) was established in Oklahoma, peyote use within the United States has become restricted to members of incorporated churches, not only the Native American Church of North America. In 1965 the federal government implemented an exemption to its antidrug legislation to protect the religious freedom of peyotists. Today more than 100 peyote (NAC) congregations are legally incorporated throughout the United States. The Texas Department of Public Safety cooperates with the federal Drug Enforcement Agency to prevent illegal peyote use.

Members of all NAC congregations revere peyote as a teacher and divine medicine. Many venerate peyote as the incarnation of Christ's Holy Spirit. One Winnebago peyotist, Albert Hensley, declared that peyote "is a portion of the body of Christ. . . . Christ spoke of a Comforter who was to come. It never came to Indians until it was sent by God in the form of this Holy Medicine" (Stewart 1987, 157). American peyotists are syncretistic, combining numerous native elements (such as eagle-bone whistles, tobacco, sage, feather fans, gourd rattles, cedar incense, a fireplace, and emphasis on the four cardinal directions) with biblical references, Christian baptism, and often recitation of the Lord's Prayer. Weston LaBarre, the first scholar to study the phenomenon (in the 1930s), believed that "peyotism is an essentially aboriginal American religion" (1989, 166, 292). Two other early researchers in the field, Omer Stewart and James Slotkin, regarded the peyote religion as an Indian version of Christianity (Fikes 2001, 76). Disagreement about this issue is likely to continue—NAC members interpret Bible passages as they see fit, without conforming to any dogma. Their morality is essentially Christian (Fikes 2001; Slotkin 1956b). Differences between the two dominant types of peyote meeting, Half Moon (which has more aboriginal elements) and Cross Fire (which has replaced tobacco with the Bible), are relatively slight (Fikes 1996a).

The way of life advocated by the NAC is called the Peyote Road; peyote meetings, which usually occur on a Saturday night, are led by a Roadman, a liturgical leader who has mastered the ceremony and who is dedicated to living a life according to the ethic of the Peyote Road (i.e., one distinguished by sobriety, good family relations, truthfulness, economic self-sufficiency, and the like). A Roadman is usually "ordained" when another Roadman is near death and feels obliged to select a successor (often his son or a close relative), or when a Roadman decides that someone has attained sufficient spiritual and ethical discernment to be appointed as a Roadman (Fikes 1996b, 136, 238). A Roadman selects four helpers to assist him in conducting each prayer meeting: a Sacred Water Woman (usually a wife or close relative), a Drum Chief, a Cedar Chief, and a Fireman (Slotkin 1956b). Typical purposes for prayer meetings include healing, baptism, birthdays,

Navaho Indians at a peyote ceremony in a hogan near Pinyon, December 1, 1954. In nightlong rites peyote cactus buttons, which contain the chemical mescaline (regarded by scientists as a hallucinogen), are eaten and used as a sacrament. (Carl Iwasaki/Time Life Pictures/Getty Images)

weddings, funerals, name giving, success in school, and safety for those in the military. Anybody with a specific prayer request solicits the aid of a particular Roadman. That person is expected to provide gifts to the Roadman and his four helpers.

Like shamans, Roadmen only conduct ceremonies when someone with a specific need requests it. Another significant similarity between shamans and peyotists (Roadmen included) is that personal experience or revelation, based on inspiration provided by the Peyote (or Holy) Spirit, is deemed fundamental to acquiring wisdom and healing. Even among Indians professing Christianity a shamanistic core remains, as this example reveals. After Reuben Snake of the Winnebago tribe was ordained as a Roadman in 1974, he directed a meeting intended to heal a woman whom Western doctors had scheduled for a hysterectomy. While Reuben prayed that the peyote he was preparing for her would be blessed and would heal her so that she could have more children, he suddenly heard voices praying along with him. "They were speaking in the Winnebago language and saying, 'Bless my daughter, bless my granddaughter.' . . . When we concluded our service she got up and said, 'I know that I am well.' . . . The doctor told her, 'Evidently you don't need an operation.' . . . About a year later she had another little boy" (cited in Fikes 1996b, 216).

In contrast to contemporary U.S. peyotists (whose prayer meetings bring personal benefits such as healing, safety, salvation, redemption, and revelation), a few Mexican Indian tribes still perform aboriginal peyote rituals intended to bring communal benefits (abundant subsistence and ecological adaptation). The Huichol, a Mexican tribe whose peyote rituals are regarded as the most ancient extant, make pilgrimages of nearly 400 kilometers (one way) to collect peyote, which they revere as the incarna-

tion of a divine spirit. Because the Huichol believe peyote contains the heart, spirit, and memory of Deer-Person, they must hunt him with arrows. Eating Deer-Person's heart (peyote), after complying with strict rules designed to enhance their spiritual purity (bathing, salt, and sex are prohibited during the pilgrimage), facilitates access to his wisdom. Without his divine spirit to guide them, Huichol shamans could not accurately diagnose or heal illness, or communicate effectively with ancestral nature spirits whose goodwill guarantees abundant sustenance and health.

Eating Deer-Person's heart reveals to Huichol shamans how to maintain harmony (by healing and performing elaborate rituals) in the world he established. To perpetuate the world Deer-Person organized (thus insuring abundant subsistence and ecological adaptation), Huichol peyote hunters must deposit offerings that honor and sustain the Sun-Father at the mountain where he was born. They are also obliged to return with peyote and sacred water required for performing rainmaking rituals essential for the growth of maize, the mainstay of their diet (Fikes 1993). Their peyote dance ritual, done at the end of the dry season, summons the Rain-Mother whose shrine they have visited while making their peyote pilgrimage, and includes consumption of peyote and corn beer and dancing.

The Huichol conviction that peyote embodies the heart of Deer-Person, their tutelary spirit, corresponds to the meaning peyote had for their cultural cousins, the Aztecs. The Aztec word, *peyotl* (or *peyutl*) denotes the pericardium, the envelope, or covering, of the heart (Fikes 1996a, 168; LaBarre 1989, 16)

PIMAN ORAL LITERATURE AND SHAMANISM

The Pima, or Pima-Papago, or O'odham, or Upper Pima (they have been called all four) have lived in southern Arizona, United States, and northern Sonora, Mexico, since the Europeans first came to these areas around 1550 B.C.E. Their home is a desert land broken by isolated mountains and crossed by a few medium-sized rivers, the largest being the Salt and Gila of today's Arizona. Their original territory was nearly identical with the range of the tall, green, candelabra-like saguaro cactus, famous in postcards from Arizona. Their land is now somewhat diminished in the United States and greatly in Mexico.

Neither Spain nor its successor, Mexico, nor the United States, had much material effect on the Pima until the 1880s, because the Pima were far from the colonizers' centers of settlement, their land was barren, and the Yavapai

and Apache north and east of the Pima were quite hostile to whites. (The Pima were generally friendly.) As late as 1940 there were still some people in remote villages of the U.S. Papago reservation who thought they were Mexican, not U.S., citizens. When the author first came to these people in 1960, many adults knew no English but did know some Spanish, and everyone spoke the native O'odham language. Now the Spanish language is almost gone among the U.S. Pima, and the native language is fading. The observations in this article pertain to the U.S. Pima at this time, 1960–2000, of steady anglicization. In this article, as much as possible the Pima speak for themselves on their shamanism via their traditional, O'odham-language literature.

Piman shamanism was and is a calling with two aspects. One aspect is getting the call, or shamanic empowerment, from spirits. The other is using that power. Among the Pima the empowerment comes in private spiritual encounters. The use of that power is usually social, however, that is, with (or against) other humans. It is not necessarily used face-to-face; sorcery, for example, is done at a distance. And even when other people are present as the power is used, they usually cannot see clearly what the shaman is doing. Thus, the experience of empowerment is not witnessed by others at all, and the use of that power, if witnessed, is seen through a glass darkly.

Empowerment and Songs

The main things that the shamans reveal to others about their empowerment experiences are the songs that they heard from the spirits who led them on dream journeys. The songs are ecstatic and are in the first person, but the person who speaks is the spirit teacher, not the human dreamer. Furthermore, although Pima fairly freely tell their "ordinary" dreams, including dreams of ghosts and omens, they do not freely tell what happens in dreamed shamanic empowerments. They sing what the spirits sang to them, and they stay silent about what they felt or saw.

Pima use songs for more than magical action, which seems to be the true, definitive shamanic activity. One other use of songs is for social dancing, that is, for having a good time rather than for changing the world through magic, as shamans do. The social dancing songs are as ecstatic as the ones shamans use, and like them they are traced to dreams, but they are only used for pleasure. Thus, they are shamanic in origin but not in use. Consistent with the general reluctance to report dreamed empowerment, social dance singers avoid saying they dreamed the songs that they sing. Even if they did dream them, they prefer to say that they picked them up from attending social dances. This denial takes pressure off the singers. If they had dreamed their songs, they would be shamans, and most people prefer to deny this.

Here is a medley of social dancing songs about shamans (*ma:kai* in Piman). Shamans are an important topic of these good-times songs. The medley is in the first person, which is characteristic of all Piman song; and the medley is typical, too, for the songs' brevity, concreteness, and ambiguity. Piman songs are cryptic poems. They have almost no nonsense words, but they reduplicate some syllables (not shown in the translations). They focus on moments. The English translations, made by the author and here published for the first time, stay close to the order and meaning of the Piman words.

(1) *Surely like a medicine man I do.*
Great blue rock
  Water inhale,
  With it my heart's
  Inside is wet.
(2) *I'm very medicine man,*
  I'm very medicine man.
Feather fluffs in a square's corners stand up,
  There inside sit, medicine-man think.
(3) *I'm not truly medicine man,*
  I'm not truly medicine man,
  I'm not truly medicine man:
  The darkness tells me.
(4) *Medicine-man water,*
  Medicine-man water,
  Inside enter.
Inside enter,
  Around it pass,
  Serenading the hands.

Those were four of several hundred Swallow social dancing songs that Paul Manuel sang for an elderly Pima and the author during weekly music lessons over three or four years at the turn of the 1980s. The "I" that speaks in the song is a Swallow-person, part human and part

bird, who took a human dreamer on journeys. Here the bird brags shamanically, as humans should not. Mr. Manuel generally gave the medley in the same order each time he sang about medicine men. In any one session he would sing about thirty-five songs, moving through various topics, all meant for people to dance to during a sunset-to-sunrise night of pleasure. These, then, are dreamed songs about shamans and meant for social dancing.

Using the Power

The discussion so far has established that the events of shamanic empowerment are private and are not described to the public. However, it is also important to consider the shrouded, ambiguous nature of Piman shamanic performances. At present the two main occasions when shamans use their power in the presence of other people are for the diagnosis and partial cure of sickness and for predicting the weather. About both occasions the Pima say the shaman's purpose is to "see" and thereby to "learn" something. Since in addition to looking the shamans also touch, smoke, suck, blow, sing, and listen, and since the whole process is mysterious, one can call these events multisensory divinations. Beside divining sickness and the weather, shamans in the past also sought the location of deer before ceremonial deer hunts, the location of enemies during war expeditions, and the location of sorcery missiles sent into villages by bad shamans. All five activities were divinatory. Each lasted a full night and used singing, sucking, blowing, and the rest in addition to seeing.

The diagnosis of sickness is called *duajida,* a word that literally means "vitalization." In these events the shaman, or medicine man, as the Pima say in English, pays a nightlong house call. There is a short form of diagnosis called *kulañmada,* literally "application of medicine" (the word for medicine is from the Spanish *curar*). For this short event the patient can go to the shaman in the daytime. When those findings are not enough, a nightlong duajida is necessary. For this the shaman comes to the patient's house. Because duajidas are private, and the patient is considered very ill, the events are not readily observed, neither by anthropologists nor by Pima who are not of the immediate family. The author saw two of them in close succession, both for the same individual.

On those occasions, most of the night was spent by the medicine man's singing songs he had obtained in dreams for use in diagnosing, or "vitalizing." The songs were not greatly different in content, imagery, and boastfulness from the social dancing songs quoted above, but they felt different because they were understood to be the personal property of the shaman, and they were used to save a life. The boasts were attributed to his spirit helpers, not to the shaman. The songs were sung in a growling rather than a crooning voice (social dancers croon), and no one found them amusing, as people find social dance songs.

An early high point in one of the duajidas was the departure of everyone but the patient to the outside of the house. The shaman had learned at that point in the ceremony that part of the patient's sickness was caused by sorcery. He went outside to find a sorcery missile, which was buried in the ground. He talked to it, and it seemed to talk back. There was a little grunted dialogue between him and the buried object—or so it seemed. He removed the object from the ground by sucking and put it in a can of kerosene he had brought for the purpose.

Although the sorcery removal was the most dramatic part of those duajidas, it was not the conclusion. That took place several hours later inside the house. The final act was the sucking of "strengths" *(gewkdag)* of various "dangerous objects" from the patient's body. These the patient had acquired unknowingly by acting wrongly during his life. The medicine man's job once the sorcery was cleared up was the identification and a preliminary, but lifesaving, removal of those strengths. The sorcery had been inflicted upon the patient because of hateful humans; the strengths were in him because of his own lapses, mainly toward animals.

The strengths pertain to and are believed to protect nonhumans. The idea is that certain animal species, and also some plants, were endowed with rights at the time of creation, and when humans trespass on those rights, the humans get sick. These sicknesses are unique to the Pima; they are their "Indian sicknesses." Treating them requires medicine men to diagnose them and lay ritualists to cure them by singing still more songs to the now identified offended species. Those final ceremonies are called "blowings" *(wusota),* and the people who perform them are called "blower people" *(s-wu-*

sos o'odham) not "shamans" *(ma:kai)*. The lay curers blow after each song to propel the song's words as a prayer to distant spirits; and after each set of four songs they arise from their seats, approach the patient, and blow onto him, or her, to cool the suffering. They do not suck. That action is reserved for shamans.

The most striking thing about this system of curing, which of course is only one aspect of Piman shamanism, is the importance placed on breath. Sucking is the strong, or heightened, form of breathing in, and blowing is the strong form of breathing out. Shamans monopolize the former, although they blow too, during their vitalizations and applications of medicine. Curers concentrate on the latter, and since their cures are called "blowings," we can say that they specialize in this aspect of heightened blowing (See Bahr et al. 1974, 222–276, for more on their blowing.)

Origins

Traditional Pima literature is kept in the memory, not on paper or in stone; it is oral literature. To this day men in particular do not like to read. We have seen in the Swallow songs one form of the traditional memorized literature. There are two more, prose and oratory.

The Pima told their ancient history in a prose laced with songs and orations. Because of their remoteness, that history was not challenged until the 1930s. Now, and especially since the 1970s, most people still believe it, but few know it as well as their ancestors did. The history ends just before the arrival of the whites. It tells how the whites originated locally and were sent east to grow up, but the story ends before the whites return. Nor did the old-timers tell stories about recent white and Indian relations. Anglo whites—also Mexicans, Africans, and Asians—are not characters in Piman oral literature. Piman-speaking shamans *are* characters, and the origins of the two aspects of shamanism are addressed.

There are three independent, full renditions of that ancient history on record. All were taken down before 1935, but two were only published recently. The three prove that narrators formed whole, comprehensive tellings of ancientness; and the three generally agree on what that past consisted of. The Pima have never had a central government, and there has never been an official mythology. But they not only had a language and their strength-caused, breath-cured sicknesses in common, they also had a general agreement on the events of their ancient past.

Early in the mythology, soon after the creation of the ancestral Pima, comes the origin of dreams:

> They [the newly created Pima] were always talking so that nobody could sleep with the racket [the sun and moon were already created, there was day and night]. Coyote [one of the original gods] said to Elder Brother [another god], "Do something so that they may rest." Elder Brother caused them to sleep with a deep sleep. He divided their hearts, one side the half of sleep, the other of wakefulness. The one half they used in the daytime and the other half at night.
> Again Coyote said to Elder Brother, "Do something to make them see things when they sleep, so they will have something to talk about."
> Earth Doctor [or Shaman, or Medicine Man, a third god] sang:
> "In the darkness my people sleep.
> In their sleep their spirits go journeying over the earth.
> In darkness they receive their wisdom."
> He sang again:
> "In the daytime when my people dream it shall not be powerful.
> The night dream is powerful.
> (In the day) their being may wander without receiving knowledge."
> After he had sung, that night the people all dreamed, and when they awoke they told their dreams (Bahr et al. 2001, 20–21, translated by Raymond Azul and Ruth Benedict).

Another narrator contributing to the same rendition (the two worked together) gave a more logical account of the origin of dreaming. First came the dreams and then the quieting sleep:

> Coyote said, "Do something so that even in their sleep the people will travel and see things (receive knowledge)." Elder Brother agreed and he sang [as above]. After he had sung that night all the people dreamed. Next evening they stayed up late telling each other

> their dreams. All night they kept Earth Doctor and Elder Brother and Coyote awake. Earth Doctor said to Elder Brother, "We must do something to keep them still at night." And Elder Brother caused them to sleep with a deep sleep. He divided their hearts; one half they were to use in the daytime, and the other half at night [as the other narrator also said]. After that, when they began to tell their dreams at night, the half that was filled with drowsiness overcame them and they fell asleep (Bahr et al. 2001, 20).

This is the one rendition of the mythology that attends to dreaming. Another mentions the origin but gives no story for it; the third is silent. This rendition disappoints in the following way. Dreaming is explained as a means to knowledge, but neither in this rendition nor elsewhere in any known Piman mythology is there an explanation of the nature of knowledge and power. The mythology does not treat them as a problem. Rather, it treats talkativeness, prolixity, as a problem.

Nothing is said in the texts about the difference between trance and dream, and indeed there is no Piman word for "trance" or "visionary state" as distinct from "dream." Nor is there a word for "magic" as opposed to "normal." There is an obscure phrase, *sai ju:kam* ("*sai*-doer"—the *sai* is not analyzable), that refers to the powers of medicine men, and might mean "magic." About power people say that a shaman has a special heart (*i:bdag,* "breathing-thing"), but they do not say what is special about that kind of heart.

The words *medicine man,* or *shaman,* or *doctor,* are frequent in the texts (all are translations for *ma:kai*), but they mainly occur in characters' proper names, for example, Earth Shaman, or South Shaman, or Elder-Brother Shaman. No origin is given for the status or vocation or power of shamans. Practically all the characters in the mythology have something exceptional about them, but they are not all called shaman. Many have the names of animal or plant species or of cosmic objects such as the sun. These characters are generally not called shaman, but are called Sun, Coyote, Ant, and the like. They are envisioned as partly human and partly sun, and so on. Finally not all fully human-looking characters are called shaman.

The ancient human-looking characters who are called shamans are what in English would be called gods. They surely do godlike things: They create people from mud, die and come back to life, make the sun, and sink into the Underworld or rise to the sky. Moreover, there is no god-word other than *shaman* in Piman mythology. Their gods are shamanic; their ancient shamans were gods.

Spirit Helpers

The duajida (all-night curing) and the other Piman shamanic performances are mainly to divine, that is, to learn something, and especially to see something, through mysterious means. This is what the Pima say. As noted above, however, the observed duajidas had an intermission in which the shaman went outside to suck something from the ground, and they ended with the sucking of "strengths" from the patient's body. But the patient isn't fully cured by those suckings. There must be further ceremonies by lay "blower" singers. Thus one can say that the sucking in a duajida is rather to gain information—"*this* is your sickness"—than to get rid of the problem.

The greatest part of a duajida is given over to the shaman's singing songs to the shaman's spirit helpers. It is said that the spirits respond to the songs by helping to identify the sickness. No one has told the author how the spirits do this, whether by helping the shaman to see, or whispering a name, or by some other means. Nor has anyone said whether or how the spirits act on the sickness itself. Surely there was no sign or sound of spiritual action in the observed duajidas. The patient lay still, and there were no mysterious thumps or other signs of spiritual activity, other than the sounds that seemed to come from the sorcery missile during the out-of-doors episode.

There are, however, many texts about how spirits performed actions helpful to ancient shamans. These come from the third and final form of Piman oral literature, oratory (or prayer, or chant). This form lies between song and prose in the length of its texts and the firmness of text memorization. Songs are memorized down to the last sound, and prose only to the level of plot, so that each telling is a paraphrase of the previous one. Oratory is memorized to the level of the word or phrase.

The following is one of the most beautiful of Piman orations. Among the Papago, or Tohono

O'odham, a version of it is used during summer rain ceremonies, the ceremonies in which shamans divine the future weather. Those Papago versions of the speeches do not have an established place in the history of creation; no one says who the original speaker was. The version given below is from the Pima, who like the Papago consider it a prayer for rain (and indeed the speech ends with rain), but who hold that it was spoken by the famous god Earth Doctor when the earth was newly created, before the creation of people. The speech moves through three parts, the first occupied with getting the new earth to lie still, the second with getting a house built on the newly quieted earth and then with blowing smoke clouds to make rain, and the third with planting and harvesting after the rain.

The third part gives the impression that people already exist, but one might say that those were people whom Earth Doctor anticipated would exist. The relevance of the speech for our consideration of shamanism is the succession of Earth Doctor's spiritual helpers. The speaker Earth Doctor is a human-appearing god-shaman; the helpers are animal persons. Earth Doctor does not seek to learn something hidden as do present-day shamans. Rather, he creates a part of the universe. (Note that several mockingbirds, a spider, and several measuring worms are called shamans in this text, as is a character named "of the Down Nest." The Pima language manuscript for the speech uses "shaman" only for the Downy Nest character. The other designations are a prior anthropologist's error.)

EARTH DOCTOR'S SPEECH FOR RAIN

[1. Quieting the Earth.]
In the beginning earth had no firmness.
In the west Black Mockingbird Shaman heard me and answered my cry.
He covered the earth with his flying;
Upon each tree, upon each mountain he rested.
He finished his work;
He said to the earth, "Remain fixed," but it would not.
Black Mockingbird Shaman, you failed.
But you left with us your black winds, black clouds.
When we ask, you will give us what we desire.
[Then Blue, White, and Yellow Mockingbirds try the same, fail, and leave behind winds and clouds.]
Up above the Shaman of the Downy Nest heard me and answered my cry.
He smoothed the earth and the hills
And overturned the mountains and the trees.
He finished his work, and the earth stood firm.
Down below Gray Spider Shaman heard me and answered my cry.
He bound the trees together as fagots are bound.
He encircled firmly the edges of the world.
He spun in the west the black carpet.
And set upon it the black palace.
And the earth stood firm.
He spun in the south the blue carpet,
And set upon it the blue palace,
And the earth stood firm.
He spun to the east the white carpet,
And set upon it the white palace,
And the earth stood firm.
He spun in the north the yellow carpet,
And set upon it the yellow palace,
And the earth stood firm.

[2. Earth, House, Sky.]
In the west Black Measuring Worm Shaman heard me and answered my cry.
He touched the earth four times in his coming.
He broke into four segments, and stood up the four crotched posts (of my dwelling).
[Then Blue, White, and Yellow Measuring Worms form the rafters, cross sticks, and outer ridges of the roof.]
Down below Yellow Gopher heard me and answered my cry.
He brought brush and covered the framework of my dwelling.
He made four gopher mounds about my dwelling, to the west, to the south, to the east, to the north.
And he brought the fine earth of the gopher mound and packed it upon the framework of my dwelling.
He finished his work.
And with my power I blew the smoke from my cigarette,
It rose and formed white clouds over the dome,
And rain came from the clouds and sprinkled the land.

[3. Gardening.]
In the land I planted seeds,
And they grew big stalks, broad leaves, beautiful flowers, perfect seeds.
I gathered my harvest and stored it.

And my young boys shall eat of it and have good health,
And my young girls shall eat of it and have good health,
And my old men shall eat of it and prolong their days,
And my old women shall eat of it and prolong their days

(Bahr et al. 2001, 179–182, spoken by Thomas Vanyiko, translated by Raymond Azul and Ruth Benedict).

The shamanic gods of Piman mythology needed spirits to help them. There are many orations about such helpers. Indeed the mythical shamans got more spiritual help than present shamans admit to. The ancient spirits did physical work for their shamans, whereas contemporary shamans leave the spirits' contributions ambiguous, and they imply that the help goes no farther than the supply of information.

Conclusion

This article has let Pima speak for themselves on their shamanism, but that speaking, from their oral literature, is organized around two observations by the author. The first is the reticence of people to tell what they felt during dreams in which they learned songs, and second is the ambiguity in the use of shamanic power.

The run of Swallow songs centers on a Swallow-person's denial of being a shaman. It is only the dark night that tells him things, he says. Of course had he admitted to being a shaman, the same statement would be true, for it is not only the shaman's personal power that does things, it is also the power of the spirits. The song and the entire short set play upon the ambiguity of shamanic power.

The prose on the origin of dreaming tells that dreaming was instituted to keep a noisy humanity quiet so the shaman-gods could rest. While the dreamers' bodies lay quietly, their spirits were off traveling. Alas, the awakened dreamers talked too much about what they had seen. From the foregoing discussion, it seems clear that as good Pima they should talk only about such songs as they heard, and should stay mum on what they saw while hearing them.

In the speech for rain, mockingbirds, great but unoriginal talkers, fail to quiet the earth, a poor showing (set right by the Downy Nest Shaman). Mockingbirds are noted by Pima for repeating the last statements they have heard. They voice no original thoughts; no one knows what they themselves think. In repeating spirits' songs, shamans resemble mockingbirds. But shamans as diviners must say something original at the end: what the sickness is, when it will rain, and so on. How they do so is a treasured mystery.

In short, their shamanism forbids human bragging. There are good studies of other shamanisms of the region: Alfred Kroeber's *Handbook of California Indians* (1925), for example, as well as George Devereux's *Mojave Ethnopsychiatry and Suicide* (1969), and James Mooney's *Ghost Dance Religion* (1891). Those studies and others like them are old, meaning on the positive side that they were made while the shamanisms were strong. But on the negative side, they stem from brief visits, and so they lack eyewitness observations and sensitivity to the feeling against bragging among the peoples of this area. Science brags, in the author's opinion ("this is the cause, necessary and sufficient"), while shamanism shrouds and dissimulates ("this is the cause, sufficient, but don't ask how I know").

PUEBLO RELIGION AND SPIRIT WORLDS

In Pueblo Indian society there are no individuals who are the sole healers or the sole intermediaries with the spirit world. Rather, the collective means of dealing with the spirit worlds that they use could be seen as having shamanistic aspects.

Background

The name *Pueblo* comes from the word for village used by the Spanish, who contrasted these Native Americans with the surrounding nomadic tribes. The different village peoples of the area, often referred to collectively as the Pueblo Indians, are not, however, culturally identical (De Mallie, Raymond, and Ortiz 1996). Many scholars group them according to their languages: Tanoan (with the three separate dialects of Tiwa, Tewa, and Towa), Keresan, Zuni, and Shoshonean (spoken by the Hopi). These Native Americans are probably descended from a group that resided to the west of where they are today. The ruins of their settlements still remain, and they are usually referred to by scholars with the Navajo word *Anasazi,* "Ancient Ones."

The Pueblo Indians live in what is now the Southwestern United States, for the most part along the Rio Grande, in New Mexico. In 1540, armed Spanish explorers ventured north from their settlement areas in Mexico and began the long and painful history of the Pueblo Indians' conflict with and eventual enslavement by the Spanish invaders. Today, nineteen of the more than ninety villages encountered by the Spanish remain. Unlike many other Native American tribes, the Pueblo Indians still live in many of the same places where they lived when Europeans encountered them. They have also been able to preserve much of their original culture despite religious persecution.

Pueblo Cosmology

Despite more than a hundred years of cultural and religious persecution, the Pueblo peoples retained most of their original cosmology and ritual practices. Eventually, the Europeans lessened their maltreatment of Pueblo people and learned how to coexist more peacefully, although they continued to consider Pueblo culture inferior to that of the Europeans. The Pueblo peoples have incorporated European influences into some aspects of their life, including material techniques, saints' festivals for each pueblo (as assigned to them by the Spanish), and varying amounts of compartmentalized Catholic observance (that is, they perform Catholic and native Pueblo practices at separate times and places without synthesis between them). Also, Pueblo religion has arguably incorporated aspects of other native people's religions as a result of greater contact with them in the last few hundred years.

In the original Pueblo languages, there is no word that corresponds to the English word *religion.* Religious practice was not separated from other daily activity. However, as a result of their religious persecution by the Spanish, the Pueblo people now tend to be quite secretive about their religious and cultural activities, limiting the extent to which outsiders are allowed to observe, participate in, or even be informed about the procedures or meaning of particular practices. This being said, many things are

known by scholars about Pueblo rituals and cosmology.

The Pueblo cosmology can be considered as having three distinct levels: the upper level of the sky and clouds, the middle level of human life on the surface of the earth, and the lower level of the underground spiritual realm. Most important to Pueblo ritual is the relationship between the Middle and Lower Worlds.

The Middle and Lower Worlds are both organized in concentric areas, with the village kiva, the ritual chamber, at the center; however in many ways the two realms are described as being antitheses of each other. Night above ground is day under the earth, summer above is winter below, and a deity who is repulsive above may be beautiful below. The oppositions of attributes between these realms are not seen as conflicting but rather as complementary. In the relationship between the human and the spirit worlds, neither one is subordinate to the other; rather they operate with different intentions but make arrangements for mutual benefit.

The center of ritual, and of a typical pueblo, is the kiva. The kiva is a round ceremonial chamber partially sunk into the earth. Its ritual entrance is a ladder protruding from a hole in the ceiling. There is also a small hole in a kiva's floor, which represents the connecting point between the Upper and Lower Worlds—the human and spirit worlds. The hole in the kiva floor also represents the original hole out of which the first people are said to have emerged.

Shrines surround the kiva, corresponding to the four directions; the shrines are placed according to the culturally significant boundaries of the pueblo. The first set of shrines encloses a ceremonial circuit through the pueblo that comes in contact with the kivas, clan houses, and village shrine. Next is the area bounded at the limits of the village itself. The third boundary encloses the usable agricultural land. Finally, shrines mark the limits of the land used for foraging and hunting.

In Pueblo society there is no religious position that could be simply described as a shaman. No single individual or group of people is an authority in all matters of ritual, healing, or contact with alternate reality. Instead, every pueblo has various groups, or "societies," that have particular ritual responsibilities. Esoteric knowledge is transmitted via these societies to each new generation. Which societies exist and how they operate is particular to each pueblo.

Pueblo Spirit Worlds

The Pueblo peoples have a large number of individual spirit personalities and deities. The deities are related to each other and are not arranged in a strict hierarchy of power. For example, there are two, somewhat immature, war god twins and their grandmother, the Spider Woman. There is a creator, an earth mother, a destroyer, and an embodiment of the most important food to a pueblo, maize. Also, liquid water is depicted, by all but the Tiwa, as the Feathered Water Serpent, which probably has its origin in Mesoamerican religion. The Water Serpent exists wherever there are lakes or springs. If the Water Serpent leaves, the body of water dries up.

The spirit world is ever present in Pueblo experience. Organic and inorganic objects as well as elemental forces are endowed with life and "breath," and have the potential to take human form. Animals, when no one is looking, may hang up their skins and become anthropomorphic animal people. Even stones, plants, and ritual masks have resident spirits with human-like behavior and particular powers and motivations. These spirits are not identical with their physical manifestations; rather rock people, for example, who inhabit particular rocks may come and go as they please. Some Pueblo rituals entice these spirits to enter or leave their homes in particular objects.

An important group of spirits is the cloud people. The cloud people are not simply related to the clouds in the sky, but also to the smoke and mist that rises from lakes. In many pueblos, humans are said to join the cloud people when they die, and a person's body is usually prepared with feathers and puffs of cloudlike cotton, and faces are rubbed with cornmeal, making them more cloud-like in appearance. The spirit of a dead person is said to return to the pueblo during certain ceremonies.

Kachina Spirits

Among the most important of spirit beings are the kachinas. Kachinas are distinct from the cloud people, although kachinas and cloud people are referred to by the same word in

Tewa. The particular pantheon of kachinas differs from one pueblo to the next, with fewer kachinas in eastern pueblos and many in western ones. There may be kachina forms of the sun, stars, thunderstorms, wind, squash, insects, and the like, the most frequent being the kachinas associated with important aspects of Pueblo agriculture. Some kachinas are considered ogres or cannibals. Their shrines are located on the edge of the pueblo's agricultural land, and they are said to eat children who misbehave or wander too far from the village. Their role is to enforce safe, appropriate, and adultlike behavior among children.

Upon death, a person may join the kachinas, but kachinas are not simply ancestor spirits. They are powerful beings who require veneration and respect from humans before they will use their power for human benefit. They can bring rainfall, fertility, healing, protection, and growth. Kachinas are represented as having humanlike relationships with each other. They may have sisters, uncles, and grandmothers. They may marry and have children. Kachinas are given visual reality, most importantly through masks and their symbolic roles in the ceremonial dances of the pueblo. Kachinas are also represented in small dolls, carved from wood. Sometimes the kachina dolls are carved very simply, but in Hopi and Zuni pueblos they are depicted very realistically like tiny dancers in full costume.

Kachina Dances and Ceremonies

In Pueblo Indian cultures, nearly every man and many women join to form societies that have the primary function of performing public masked ceremonies where dancers impersonate particular kachinas (Schaafsma 1994). The dancer who impersonates a kachina is referred to as "being invested by that spirit and becoming one with it" (Wright 1986, 14). In the Zuni Pueblo, there are six kachina societies. Zuni kachina societies are usually made up entirely of men. Among the Zuni, women can rarely become kachina society members, and some particular ceremonies explicitly exclude them. In other pueblos, such as the Hopi and Acoma, women are permitted to be members of such societies.

The kachina dances occur according to the ceremonial calendar of the pueblo. The particular ceremony corresponds most closely to the agricultural needs of the particular season. Typically, the kachinas viewed as oldest and most sacred appear in the spring and summer. The season for kachina dances among the Hopi lasts between the winter and summer solstices and is divided in half between two clans. The Keresan and Zuni pueblo kachina season is divided into three segments and lasts the entire year. The Tewa have kachina dances all year also, but the year is divided in half between winter and summer, each controlled by different moieties.

All adult kachina society members have masks made for them by the other society members. Some masks are communal property, and others are the property of individual dancers. Members must all have their own personal masks. There are a limited number of masks of any given type, so masks are freely lent between people and societies when their use is required for a particular ritual. A mask is decorated with paint and feathers for each ceremony, and when the ceremony is over, the feathers are removed, and the paint is completely scraped off, so that the mask's spirit can leave and is not trapped between ceremonies. When Zuni people move away from their pueblo, their masks are kept, cared for, and fed cornmeal like all other animate ritual objects. When members die, their masks are buried along with them and are said to follow them into the afterlife.

In addition to masks, dancers wear skirts and may have painted bodies. If they are impersonating kachinas associated with cold, winter, or the killing of people or animals, then dancers typically wear things that hit together making clanging sounds when they move. If the kachinas are associated with rain, flowers, or fertility, then they may have flutes, jewelry, or flowing hair and garments. The kachinas associated with war, and whose ceremonial role is that of a guard, are depicted with a frightening appearance. War kachinas are common because, until about the 1870s (when raids by other Native Americans ceased and the railroad moved in), warfare was an important activity for Pueblo people.

A kachina ceremony begins when the society members retreat to the appropriate kiva for a period lasting many days. Participants are often required to fast or abstain from particular food. They go through purification rites, which may

include bathing, hair washing, and emetics for internal cleansing. Complicated altars are constructed, and ritual objects such as prayer sticks are made of wood, painted, and adorned with feathers and plants according to their intended use. Masks are painted, and sacred objects are repaired. Participants ritually smoke tobacco, and characters may be impersonated and performances presented that only appear in the kiva and are never seen by anyone outside that particular society. The ceremony culminates in a public performance by all members of the appropriate society.

When children become old enough (between the ages of about seven and twelve), they are initiated into the kachina society of the godparent their own parents have chosen for them. The fact that their family members are behind the masks is not told to children until they are old enough to be initiated. The initiation usually consists of being lectured to by a society leader and ritually whipped by one or more kachinas. The initiation itself lasts a short time, but the new member's education will continue for many years.

Curing Societies

Independent of the kachina societies, are the curing societies, or medicine societies. One may be a member of multiple curing societies and other societies simultaneously. Rather than having a single, charismatic shaman for the sick and injured to turn to, each pueblo has multiple curing societies that share the ability to perform healing ceremonies. Individual healing does, however, occasionally occur, particularly among the Hopi.

Each curing society has a different set of duties and a different set of ailments that they can cure. Within a society there is often a medicine chief, usually a man, who performs most of each ceremony, while other members play supporting roles. Most curing societies receive their power through the invocation of particular "beast gods," who are also called upon by other pueblo members when hunting luck is needed.

When a pueblo member has a life-threatening illness and cannot be cured by conventional medicine, the life of that person is "given" to a curing society. The injured or sick member asks for the protection of the beast gods, promising that if the cure is successful, then that person will become a member of the society and participate in the curing of another in need. This is the primary way each society is perpetuated. Women and men can both enter most curing societies.

The curing societies are various and differ from one pueblo to another. Among the Zuni, there are twelve such societies, including the Coyote Society, made up of hunters, which cures illness said to be caused by deer; the Red Ant Society, which helps people with ant stings and skin diseases; the Cactus Society, which cures wounds caused by bullets or other pointed objects; and the Eagle-Down Society, which cures smallpox (Hultkrantz 1992). In addition to curing physical ailments, these societies often have other roles, including the performance of rain-calling ceremonies.

Due to the wall of secrecy that Pueblo peoples keep around their cultural practices, it is questionable whether any outsider has ever witnessed a Pueblo healing ceremony firsthand; still, based on scattered clues and secondhand accounts, some generalizations can be made. Many ceremonies begin with the offering of cornmeal to the six directions (the four cardinal directions plus the nadir and the zenith). The patient's face and body are painted. Members of the appropriate society dress in ritual attire and body paint, often depicting the relevant animal spirit. Because bears are considered the most powerful healers, the society chief may paint bear claws on his hands and embody the bear spirit during the performance, possibly in an ecstatic state. Foreign objects inside the patient's body are considered the cause of most illnesses. They must be extracted by bloodletting, massage, or sweating, among other ritual procedures.

Disease is commonly believed to be caused by a witch, who is generally someone practicing to cause harm rather than good. A witch may be a man or a woman and can cause calamities ranging from floods to sickness through the performance of rituals somewhat like the curing rituals. Witches may kill a person by stealing that person's heart, or they may send injurious things, like sharp objects or insects, into a person's body. Antisocial people of many different sorts may be suspected of being witches. Roaming at night, looking into other people's windows, or having wealth with no clear source

may make someone suspect. In the past, suspected witches were often killed or exiled; these days, however, they are more often simply ostracized. Many a suspected witch was probably saved by simply admitting to the crime because of the belief among the Pueblo that witches lose their power when they confess. Witches, like curing society members, are often described as becoming animals and getting their power from animals.

Clown Society

The clown society is sometimes also considered a curing society. Clown society members perform in loincloths and often hats, and paint their bodies with black and white, horizontal stripes in order to enact comical, as well as educational, performances that serve primarily to teach societal taboos by comically imitating people who violate them. Clown societies also seasonably depict the recovery of the Corn Maidens and revival of the maize crop and can perform some curing rituals.

YOKUTS SHAMANISM (CALIFORNIA)

The tradition of shamanism among the Yokuts of California lasted long enough into the twentieth century to allow much to be gathered about the crucial role played by the shaman in the life of the Yokuts. There are, however, several healers among the Yokuts plying their trade currently, well hidden in the social fabric. Although incompletely trained as traditional shamans, mostly due to incomplete memories of the tradition and the layers of professional apprenticeship required to assume the complete role of shaman, they nonetheless function as dreamers and diviners and do some psychological repairs in their communities to this day.

Background

The Yokuts comprised forty to fifty tribes located in and near the San Joaquin Valley, the southern half of the Great Central Valley of California. They have traditionally occupied lake, marsh, slough, estuarine, riverine, and plains environments on the valley floor, and foothills, river valleys, and canyons, of the Sierra Nevada mountains east of the Central Valley. Their traditional homelands lie from near sea level to two thousand meters above sea level in elevation.

The Yokuts speak dialects of the Yokutsan language family, one of four related families within the California Penutian language stock. Native people speaking dialects of this large and widespread language stock have been on the North American continent for at least eleven thousand years. The Yokuts were probably in their homeland five thousand years ago, living much as they were when the Spanish first

observed them in the eighteenth century (Shipley 1978, 81–83; Wallace 1978, 35).

Before Euroamerican intrusion, game, fish, acorns, seeds, and tule root formed an abundant food supply in the San Joaquin Valley; there are no famine tales from this area (Gayton 1930, 414). Yokuts selectively modified the landscape by fire to produce browsing for deer and to increase seed production.

The first European exploration into Yokuts lands was the Portola and Serra expedition of 1769. Following them came plagues, which caused a 90-percent loss of California Native life in the eighteenth and nineteenth centuries (Cook 1978, 91). Murder of Natives during gold rush anarchy and massacres by vigilante and military groups in the 1850s, legal enslavement in the 1860s, and abysmal reservation conditions completed the destruction of functioning Yokuts culture (Castillo 1978).

Today many Yokuts live in the Tule River Reservation; a few families live among the foothills as ranchers or woodsmen. Little of the aboriginal life shows in this existence, save for the continued use of native foods. Native language and kinship terms are sporadically in use; family totems are remembered, and official functions are performed on rare occasions. Otherwise the lives of the Yokuts are scarcely distinguishable from those of their neighbors.

Yokuts Social Organization: Chiefs, Shamans, and Datura

Yokuts shamanism was one of three elements intimately braided into native life: (1) the shaman, (2) the chief, and (3) the hallucinogenic experience. The shaman's knowledge and skill in manipulating the supernatural was complementary in effect to that of the chief's manipulation of secular power, and interactions between them and the people were governed by the society-wide shared experience of the hallucinogenic datura plant.

Legal authority over the people at large was wielded by chiefs who inherited their roles. The chief made decisions on village or tribal affairs. He (chiefs were always male) settled interfamily disputes and granted permission for the death penalty (Gayton 1930, 408).

An individual was born into his or her father's lineage. This basic patrilineal lineage and its totemic animal symbol was one of several lineages whose members lived together in tiny hamlets or larger villages under a chief and his underlings, whose offices were determined primarily by inheritance, secondarily by popular choice. Each lineage was placed in one of two groupings of lineages, and therefore every community and the larger tribe was divided into two halves, each half performing services for the other. Communities in a particular locale, such as a drainage basin or any defined area possessing sufficient resources, were grouped into a self-conscious "tribe" having dialectic distinctions and a name for the group speaking that dialect (Gayton 1930, 367).

The lineage was identified by a totemic animal, which was venerated. A hunter never killed his own totem and never ate its flesh, and when killed, the animal was redeemed by its lineage members from the hunter (Gayton 1930, 367; 1948, 29).

Certain totemic animals were symbols of functional roles in the tribe. The eagle was the totem of the chief, *tiya;* the dove was the totem of the chief's messenger, the *winatum,* and the shaman's messenger. The owl was the totem of the shaman, *anyutun.* The dance manager had the raven as his totem, and the official spokesman or intermediary between the chief and the people had the magpie as his totem. Men having the rattlesnake as their totem conducted the rattlesnake ceremony each spring; bear totem persons gave a dance in the fall; and clowning was performed by those with the coyote as their totem (Gayton 1930, 367–368).

Shamans had no legal authority, and they did not inherit their positions; they worked with supernatural forces. A shaman could heal the sick or perform sorcery. A doctor (shaman) was both feared and respected; but whether he (shamans were almost exclusively male) was more respected or feared depended entirely upon his personal character.(Gayton 1930, 388).

Public well-being was maintained largely through the fear of sorcery. This fear worked for public good; it served as a tool for chiefs when used by them through their shamans. If the peace of a community depended largely upon the personal character of each person, personal character in turn was determined or molded by belief in supernatural powers. Most members of the community had met supernatural beings during the jimsonweed ceremony, as a result of using the hallucinogenic datura

drink. This was a powerful experience, sufficient to create and reinforce the belief in supernatural beings. Shamans were the specialists who could manipulate supernatural powers, some of which could be turned against one. Sorcery as a deterrent of crime kept a balance of peace in everyday life. No one wanted to incur the displeasure of the chief or the public, for then a shaman could be called upon to bring sickness or death upon that person (Gayton 1930, 409–410).

Sources and Uses of Power

Not all people dreamed of getting power, *tipni,* nor, if one did so dream, need one become a shaman. Women were rarely shamans.

Anyone could seek assistance from supernatural powers for success in gambling, hunting, or general good health and luck. This was accomplished through dreams of animals and birds, which were acquired by the use of a tobacco emetic, a day- to weeklong meat fast, and praying to the animal both before and after its dream appearance. When a significant dream came to a person, he or she went out and "talked to it," went some distance from the house, smoked a little tobacco, and scattered grain down on the ground. A fast was maintained throughout the following day. The aspirant's helper was called *anechwal* (Gayton 1948, 31).

The shaman's dream helper usually was a weasel. The creature appeared in a dream during the night, spoke to him, saying "Use me," and gave him a song. The shaman took care to remember the song and would seek another encounter with his patron in a dream. If the creature appeared again, the shaman was told what to use as a talisman in making cures. The talismans, *walat,* of his dream helper were parts of animals or birds who were assisting him, or objects that they directed him to obtain. A walat, once used, lost its usefulness (Gayton 1930, 53, 388; 1948, 32).

When the novice doctor felt that his power was sufficient and had been tested by effecting small cures, he gave a public dance called the coming out ritual. Beginning inside the sweat lodge, he was accompanied by singers, wore full regalia, danced, communed with his dream helpers, and then went outside and cured a patient (Gayton 1930, 388–389; 1948, 169).

The doctor's power was not of a peculiar sort nor was it inherited. It was merely a greater quantity of dream experiences than those of an average person. The more such experiences one had, the greater one's knowledge of the spirit world would become, and the bond between the individual and this supernatural world would be increasingly strengthened (Gayton 1930, 389).

Some people were unwilling to become professional doctors and to cure for the purpose of making money, because of the danger of being killed if a patient died. A doctor who attempted to cure a patient and failed was open to suspicion; either he did not have sufficient power, or he had deliberately bewitched the person and was allowing him to die.

When a shaman was judged to be malicious, the chief consulted with the aggrieved family, officials, and elders, then called upon a shaman killer, *hiauta.* This was a man of special powers and great bravery who had Cooper's hawk as his dream helper. He was appointed to execute the condemned shaman (Gayton 1948, 26).

There are many tales of malicious shamans among the Yokuts. Perhaps shamans who were chronic users of the Daturya plant (jimsonweed) suffered severe (anticholinergic) interferences with the parasympathetic nerve impulses to its potent alkaloids atropine and scopolamine. Long-term use may have caused sufficient organic damage to create behavioral and mental changes in its users. Thus, drug poisoning may be at the root of some of the tales. The presence of the shaman killer in the culture suggests that abuse of power and toxic psychosis did occur with sufficient frequency among shamans to legitimize the role.

The Yokuts name for the datura plant and the drug derived from it is *tanyai.* The drug is administered as a water extract, a decoction of the roots. The roots selected must come from a dormant plant with no new spring growth in evidence. After the first new growth appears, the root becomes lethally toxic. The roots were simmered in water or roasted under ashes. The sap was wrung out of them into a large basket. Practicing shamans dried datura roots and powdered them for use anytime, eating it to obtain clairvoyant power (Gayton 1948, 39, 211).

Another toxic plant integral to the experience of the Yokuts shaman is tobacco, *Nicotiana rustica.* Both tobacco and datura are

members of the plant family *Solanaceae,* and both have anticholinergic properties, acting upon the nervous system in ways that can produce paralysis and death (Ray and Ksir 1999). Tobacco, *so'go'on,* was not cultivated or pruned. The leaves were gathered, dried, pounded, moistened, and made into cakes. Tobacco was mixed with baked, ground shells, moistened, and drunk by people who sought supernatural power. It caused vomiting and induced dreams. Doctors smoked and ate tobacco to induce a narcosis in which they saw the cause of the illness (Gayton 1948, 31, 93, 191).

Sickness and Curing

Shamans were called to cure headache, chest pains, bronchial congestion, vertigo, rheumatism, chills, and fever. Most illnesses were attributed to evil shamans, who shot malignant, intrusive objects into people. Less frequently ghosts, or offended supernatural animals or birds sent the intrusion. Rarely, if a person were shot, his soul "would not be where his body was, but away off" (soul loss) (Gayton 1948, 109–111).

In curing a patient, a doctor took with him an obsidian knife for cutting, a bunch of hand feathers to brush off the illness, and his talismans. Eagle-down strings were worn wrapped around the body. Special walat were pressed against the patient's body while the doctor prayed to the supernatural helper the walat represented. A powerful doctor, *mets angtu* (true, actual doctor), who cured with rubbing or brushing, was able to remove sickness without making any incision (Gayton 1948, 32–33, 169).

A cure usually lasted two days; the first call was made in the evening, and was for the purpose of diagnosis. When a doctor was in the process of curing a person, he never ate or drank, nor did he sleep. He would bathe, walk about in secluded places, and converse with his helper who would tell him what to do. Then he returned to perform the cure at noon of the following day. It was then that he announced the cause of the sickness and began to work by cutting, sucking, and brushing (Gayton 1948, 33).

Ceremonies

The Yokuts ceremonial cycle usually involved shamans as leaders, religious specialists, and key participants. For shamans who led ceremonies there were two classes of ceremony: (1) dramatic displays of control over death and (2) increase festivals.

The annual mourning ceremony, *Lonuiwis,* the largest and most complex of Yokuts ceremonies, was held in the summer or fall. Invoking the ritual number, six, it was six days long. The ceremony included shamans' displays and contests where one or more shamans caused other shamans to become unconscious, and then revived them (Gayton 1948, 41–44, 129; Powers 1877). The few ceremonies in which shamans were not leaders, but were participants, included the spring jimsonweed ritual and the flower festival. The two major ceremonies were the mourning ceremony and the jimsonweed initiation.

Jimsonweed Initiation

This ritual was based on the hallucinogenic properties of the plant *Datura metaloides.* The drug was administered as a water extract of the roots. The decoction was made by the leader, an old man who had datura as a dream helper. He took the youths away from the village for about two months, usually November and December. Young men and women drank the decoction early in the morning at the end of the first month of seclusion, and the drinkers fell unconscious. By evening the coma began to wear off, and the next morning the drinkers spoke their revelations. They could see people who were far away, see the causes of sickness, and see supernatural helpers (Gayton 1948, 38, 53, 118). It may have been at this time that initiates or shamans made polychrome paintings of their visions at sites where suitable rock outcrops abound (Whitley 2000).

The last recorded ceremonial use of datura was at the funeral of the Choinimni doctor, Pony Dick Watun, in 1949. Participants who spoke to the author about the experience in 1983 recalled it as "Indian television" that "let us see relatives in Bishop; we talked to them and saw what they were doing; we could see right through the mountains."

YUMAN SHAMANISM (NORTHERN BAJA CALIFORNIA)

The spiritual and healing traditions of the Yuman cultures have been characterized as a shaman-*toloache* complex, with *toloache* referring to the various species of the datura plant used in training shamans. These practices were attacked by missionaries, leading to their disappearance. Secondary accounts provided to anthropologists (Aschman 1968, Hohenthal 2001, Levi 1978, Meigs 1939, Owen 1962) illustrate that the practices were remarkably similar to the features of Core Shamanism identified by Michael Winkelman (1992). This entry describes these practices of the Yuman-speaking cultures of northern Baja California, specifically the Ipai or Tipai (also known as Digueño) and the related Pai Pai, Kiliwa, and Kumia. Shamans from the different groups were quite similar, as were other aspects of culture, due to their geographical proximity, similar environments, and shared hunter-gatherer lifestyles.

Shamans were primarily men, and referred to as *kusiyai* (with alternative spellings). The Digueño called them *simup kwisiyaya,* meaning "doctors of dreams." Shamans had various specializations: *kusiyai ñopa,* curing shamans; *kusiyai mispit,* sorcerers; *awi kusiyai,* specialists in snake bites; and *kwamyar,* weather specialists (Hohenthal 2001).

The role of greatest importance was healing; other principal activities involved diagnosis and divination and sorcery. Shamanic abilities included communication with the dead, prophecy, transformation into animals, and "magical flight," traveling great distances and with extraordinary speeds. Shamans were generally avoided out of fear. They all were thought to have the potential to kill through their supernatural powers.

Shamanic Power

Shamanic power was generally seen as innate, revealed in dreams, but needing to be developed through dream and datura experiences. Other sources of power included songs, crystals, and special relations with animals, all of which were acquired through dream experiences with spirits (Owen 1962). The animal guardian that revealed itself in the initiatory dream was another source of shamanic power. These special animal relations were believed to assist the shaman in hunting activities, to generally protect the shaman, and to provide guidance and direction to the shaman if he was lost.

Dreams were essential paths to shamanism. Although preliminary visions occurred in spon-

taneous dreams, other altered states of consciousness might be deliberately induced by fasting, sleep deprivation, smoking tobacco or sage, and ingestion of datura (Owen 1962). Dreams provided access to spirit communication and acquisition of power (Levi 1978). Although some activities took place under the supervision of older shamans, teachings by the spirits were the principal source of learning for the shaman. Spirits taught the songs that were learned in dreams, which were sung in curing rituals. Curing songs were unique to each shaman and could not be learned from other shamans. Many songs were not intelligible to others, even of the same tribe. It was thought that these songs had no power unless they were sung by the individual who had dreamed them, with the special relationship with the spirits in the dreams making the songs effective.

Datura in Shamanic Training

Homer Aschmann (1968) described the spiritual and healing traditions of the Yuman cultures as a shaman-toloache complex. Those whose dreams revealed that they had the potential to become shamans underwent initiation rites involving the use of datura. This central role of datura in shamanism is reflected in the similar terms, *kusi* (datura) and *kusiyai* (shaman). Datura put the initiate into a condition similar to dreaming that was used to acquire shamanic power. An older shaman organized the youth undergoing the datura ceremony, isolating them from the community in a cave or shelter. During a nighttime ceremony they consumed the prepared roots of the plant and used the visionary experiences induced by the plant to establish contact with the spirits. The visions occurring during this initiation activity revealed the nature of the person's power. Datura was ingested for as many as five days to develop their power.

Crystals

Acquisition of crystals began in dreams that revealed to the shamans the hidden location of their personal crystal. Crystals, or *wii'ipay* (living rocks), were one of the most powerful objects of a shaman (Levi 1978) and were an essential item for the practice of shamanism. Dreams provided instructions on how to extract the crystals and care for them. Care of the crystal was learned in special dreams during fasts, in which spirits conveyed instructions for the care of the crystal. Crystals made demands of the shaman as a condition of using their power, including feeding, attention, affection, and periods of sexual abstinence. The crystals were treated as people with whom the shaman had a personal relationship. They could be male or female, and could have human emotions such as jealousy, anger, and resentment. To avoid the potentially deadly consequences of the crystals' jealousy, shamans would bury them when they had sex. Crystals were described as being neither intrinsically good nor bad; they could be used both to heal and to kill. But their powers were always referred to as evil. It was believed that the power brought about by the crystal would do harm to the owner and others if the owning shaman was not strong enough to control the crystal's power.

Crystals could be deliberately used to inflict sickness and death. One way a shaman could use his crystal to inflict harm was to slip it under the victim's pillow. When the person was asleep, the shaman could channel power to the crystal, making the person go crazy or stop breathing (Levi 1978). The power of the crystal could be terminated by submerging it in a body of water. Nonetheless, inactive wii'ipay, as with other shaman tools, were generally not handled by others and were treated with great caution, even avoided. These stones were treated with so much reserve that it was considered bad luck even to speak of wii'ipay. Tipai shamans used crystals to heal and to kill as well, and bolder Tipai Indians were cited as using the powerful stones to help their luck in gambling (Hohenthal 2001; Levi 1978).

Healing Practices

Healing was the primary activity of shamans. Gifts were commonly awarded to the shaman for his services, whether the patient lived or died. These gifts could range from agricultural goods or leather to livestock, pesos, or even horses (Hohenthal 2001; Owen 1962). Most shamans were able to predict if a patient would live or die, often without even seeing the patient (Owen 1962).

Illness could be caused by many factors, including taboo violations, theft of one's soul by a

sorcerer, and the intrusion of sorcery powers or objects. Shamans treated physical, psychological, and spiritual conditions using a wide variety of techniques: ritual movements around the patient, made with reference to the cardinal directions; songs; herbal remedies; blowing on the patient and touching and massaging the body; sucking out objects, especially spines; warming and covering the body; manipulation of small human figures carved in wood; use of medicinal plants, especially tobacco; and imposition of dietary restrictions (Meigs 1939). A shaman might also hold a crystal in his hand while conducting healing ceremonies to increase his power and effectiveness in the healing ritual. Dream interpretation was also used to address psychological problems.

Tipai ceremonies involving shamans usually took place in the presence of the *kwelpai,* "chief," who acted as the elder, being the expert on the ancient procedure that directed the shaman (Hohenthal 2001). The Tipai shaman could use a short stick *(kotat')* to channel his power. These kotat' were tools used to heal and send spells by touching them to people or waving them around during an incantation. It was believed the shaman's power could remain in the kotat' after he used it, and it was dangerous to anyone who would handle it.

Healing ceremonies were quite lengthy, taking a day and a night. During this time, the shaman would ask the afflicted patient where it hurt or what was wrong. If he determined that he could heal the individual, he would sit by the patient and massage the body with his hands, manually manipulating the pain to a localized point on the body. Then, he might remove the pain with his mouth by sucking it out (Hohenthal 2001). One of Hohenthal's informants described a ceremony:

> The patient lies prone with his face pointing east, and the shaman sits to his left. . . . The shaman sings, and blows tobacco smoke over the head and body of the sufferer; he rocks back and forth and sometimes "appears crazy." . . . If this is possession, I do not know by what or by whom the shaman is possessed; maybe it's the tobacco the shaman smokes. The cure goes on all day until the victim feels better, or until he sweats profusely. During this time the curing shaman has felt all over the body of the sufferer and occasionally sucks with his lips certain parts of the body where it hurts. He spits out the disease in his hand and shows it to the victim, telling the latter that "now he will get better." The shaman does not walk around the patient during the curing process. (cited in Hohenthal 2001, 233).

Most healing shamans possessed great knowledge in first aid as well. It was not uncommon for a shaman to prescribe a special diet to be followed after the ceremony. One diet in particular is recalled in Hohenthal's paper: "After this [healing] the patient is put on a diet; he may eat only unsalted broth and boiled, bland foods with no meat fat pepper or tobacco. He must drink special water from mountain pools. Upon conclusion of the diet, which lasts a week, the patient bathes in tepid water" (Hohenthal 2001, 233).

Pai Pai shamans held curing sessions in the form of public ceremonies that anyone living near by could attend. Some tools of the Pai Pai shaman included small wood figurines resembling human beings. These figurines were treated much like healing crystals, in that they were used to channel the supernatural, and a person who was not a shaman would not handle them out of fear of their power (Owen 1962). Referred to as "the brother in-law of the people," these figurines were stored in caves when they were not being used (Owen 1962, 92). When they were used in ceremonies, they were thought to channel the spirits of long dead shaman with a reputation for curing certain types of illness. Thus in the event that some Indian was bitten by a snake, the spirit of a shaman that was particularly good at healing bites would be channeled.

Divination

Divination played a role in the diagnosis of illness and in determining other conditions of importance to the group. One shamanic divination activity involved the ability to channel the spirits of dead community members and ancestors, including the spirits of more powerful deceased shamans. This activity usually turned into a process that lasted almost all night, during which fire and food were specially prepared for the spirits being channeled (Owen 1962). Contact with the dead was achieved as

the shaman's spirit left his body and traveled looking for the soul of the deceased. The shaman attracted the spirit, which would enter the shaman and speak through the shaman's mouth. This speech was generally unusual and understood by few people. It provided an opportunity to interrogate the deceased to determine the cause of death, including the person responsible.

> A pole was put deeply into the ground and an old, brave man stood near it while another sat next to him and twirled a bull-roarer. When this is twirled the spirits come, and as they come the old brave man is sitting in front of the pole holding it with one hand. As the spirits enter [the brave man] he pulls and twists the pole, which is securely stuck in the ground. When the spirits enter him he falls as though dead and in a moment sits back up and the others have a clay pipe. . . . After a few puffs he says who it is that has arrived and says his name and asks, "why do you need me?" Then one of the elders comes forward to speak to him and tell the spirit why they called him. (Owen 1962, 93)

After the shaman, through the spirit, has understood the cause of the problem, he might call other spirits from the dead to help with the cure, or to find a witch among the living who could reverse a curse that was cast upon the sick individual.

Rock Art Sites

One of the most dramatic forms of evidence of the shamanic activities of the past is in the numerous rock art sites that are distributed in the Yuman areas. Rock art sites are generally interpreted as sources of power and places where shamans carried out rituals (Hedges 1976, 1985). Shamans were likely responsible for producing the rock art, using the sites in ceremonies, particularly initiations. One of the most dramatic survivals of this shamanic activity is at the Rumorosa site east of Tecate, Baja California, where a shamanic figure referred to as the *diablito* (little devil) is located. This rock shelter also serves as an astronomical device: The rays of the winter solstice sunrise form a dagger that crosses through the eyes of the shaman figure. Such evidence eloquently attests to the wisdom of these shamans in both supernatural and natural domains.

The Present

The shamanic practices of the Yuman peoples died out due to the impact on their cultures by Europeans, especially the missionaries, who deliberately sought to eradicate the indigenous religious practices. What have survived are beliefs about the shamans and fear about their powers. Today, Protestant and Evangelical churches are prominent features of the indigenous reserves. Yet the potential for shamanic revival exists in the traditional modes of shamanic access to the spirits through dreams.

YUPIK AND INUPIAQ MASKS (ALASKA)

Wooden masks were probably the most surprising items that early travelers observed in Alaska, and the first exploration expedition (1788–1792) to spend a winter in Alaska published pictures of six Aleut masks in its report (Sauer 1802: pl. 11; Merck 1980). These early explorers saw in these masks merely grotesque representations of human beings, used in festivities to mock others. Curiously enough, the masks they reproduced are unique; no mask of this type can be seen in anthropological museums, nor have they been described since. They are caricatural portraits of persons with facial painting or tattoos, labrets, and headdresses. At a later date outside observers saw masks as part of the paraphernalia used in ceremonies. In the nineteenth century the Yupik (i.e., Central Yupik and Alutiiq) masks rendered transformations of beings, usually representing an animal in the process of changing itself into a complex spirit, whereas the Inupiaq masks represented human faces with strongly typified traits differing from area to area.

The scanty information on masks, together with the very small number of masks collected before the arrival of the first professional collectors, is very puzzling, almost as if the masks were a rare item. The early collections by Cook, Billings, Langsdorff, and Krusenstern do not include masks. The oldest masks were collected by Ivan Veniaminov and Ilia Voznesienskii and are now kept in the Kunstkamera in St. Petersburg (Liapunova 1994). It has been suggested that masks were originally made of leather, a material that decays faster than wood and that can barely be recovered with current digging methods.

Many observers reported that the masks were used only one time; after the ceremony they were broken, burned, left on the tundra, or given to the children to play with (Lantis 1946, 191; Ray 1981, 28). This practice could partly explain why so few masks were collected in the early period of colonization; on the other hand, almost all the masks now kept in museums' collections seem to be old, showing signs of long use, of changes in their decoration and appendages. The method by which they were attached appears to have been modified, and their painting is fading. All this suggests that they were used over a long period of time. These traits are so characteristic of museum collections that a mask with fresh color that looks new is thought to have been made for sale. These signs of frequent use seem to contradict observations made in the field by travelers. Maybe traditions should not be seen as static, but subject to variations in time and from village to village, as is suggested by ethnographic collections.

Another possible explanation would take into account that most of the masks kept in museums were collected in the second half of the nineteenth century by Americans and Europeans who were passionate collectors, and whose collections include a large number of masks. Questions arise concerning these masks. Were the masks at that time no longer in use? Or were they desacralized so they could be sold? Did the wood and the carpenter's tools then available, and also the demands of the collectors, start an ephemeral but significant renaissance of this art form and thus produce masks with fresh color?

The fact that the majority of the masks were collected in the second half of the nineteenth century suggests a revival of the art of making masks, with an exceptional explosion of creativity in this field. This hypothesis of an art fallen into disuse and then revived could explain the changes in what was found. The travelers of the late eighteenth century reported on masks. Then, from the turn of the century to the 1840s, travelers reported that masks were no longer used (Langsdorff 1814 and Veniaminov 1840, cited in Ray 1981, 28) and are missing in all the important collections (Krusenstern, Choris, Leuchtenberg, Etholen, Wrangell, and Koprianof) from the first half of the nineteenth century. And then between 1870 and 1890 four collectors, Alphonse L. Pinart (Rousselot and Grahammer 2002), Edward William Nelson (1899), J. Adrian Jacobsen (Woldt 1884), and Sheldon Jackson (Corey 1987), were able to gather several hundred masks in a few years (Rousselot et al. 1991).

Archaeological Finds

Very few masks were recovered from excavations; most of those recovered are very small (about 2 inches, or 5 cm, in diameter), and are therefore called maskettes by archaeologists. They were made of walrus ivory. In locations where such maskettes were discovered, archaeologists believe that wooden masks had been in use but were lost due to poor conservation of wooden items or had been discarded after use. Nevertheless, full-sized masks belong to the inventories of some sites in south Alaska, especially from sites submerged in water where preservation of wooden objects is better (Jordan 1994).

Graves

Masks were sometimes found in connection with graves, as in a graveyard at Point Hope, where Sheldon Jackson gathered a large number of them in the 1890s (Corey 1987, xviii). In the Kuskokwim area of Southwest Alaska they were part of the wooden monument built for a deceased person (Ray 1982), and some were found with the corpses in graves. It is not clear whether the masks were placed on the faces or on the chests of the deceased to protect them or whether they were part of the equipment, such as tools, weapons, that the dead would need in the other world. These masks were portraitlike masks, or at least masks with a human face.

A mask from a subsequently famous archaeological site was discovered in 1943 by Helge Larsen of the National Museum of Copenhagen, near Point Hope, at the cemetary of the Ipiutak (a prehistoric tribal group). The composite mask was made of ivory, in such a way that the face of the deceased was mainly framed with the mask. The natural openings of the body were closed with ivory plugs, and the eye cavities filled with balls of ivory (Larsen and Rainey 1948). In the Aleutians, where whale hunting distinguished the successful hunters from the rest of the community, the hunter society concealed the corpses of deceased hunters in caves. They held ceremonies in these caves in which very special portrait masks were used. Probably at the end of the celebration the masks were broken, or more precisely they were slashed in two with an adze, as can be seen from the remains collected by William Dall (1878) and Alphonse Pinart (1875) in such caves (Rousselot 1990).

The limits of the information gathered from archaeological sites of the Arctic and Subarctic should not be underestimated. Digging in these areas is by and large limited to sites exposed to strong erosion, wind, and snow inland, and water damaging the stratigraphy of fluvial and coastal sites. Archaeologists depend heavily on ethnographical observations in their reconstruction of the original situation.

Ethnographical Data

Ethnographic data describing the use of masks can be gathered from the logs and books of travelers and missionaries from the second half of the eighteenth century and from the early nineteenth century; after the middle of the nineteenth century, Christianization of the native population had destroyed most of the indigenous religions. But "the spirit of mask-making had not died, and there were always some persons who had kept the tradition alive, usually by copying the old designs" (Ray 1981, 26).

Unfortunately, it was not until 1913 that the first description of a masked ceremony was published (Hawkes 1913). In 1911 Ernest Hawkes attended the Inviting-In Feast at Saint Michael, and he published a description of it.

As mentioned above, the masks are not present in the early collections; illustration of masks is also quite rare in early ethnographic works. Even stranger is the fact that masks are very rarely mentioned in the mythology and legends, but the explanation could be that spirits, supernatural beings, and ancient shamans did not need masks, since they had the ability to transform themselves.

Types of Mask

Such ethnographic reports as exist report that some masks representing human beings, birds, or sea animals were used purely for entertainment, and these could be carved by anyone. Other masks rendered visions or supernatural experiences of the shaman. In that case the shaman carved himself a mask or asked a skilled carver to represent his vision. In spite of this individualistic approach to mask making, each carver worked within the stylistic pattern characteristic of the area where he lived.

The size of masks varied considerably, the smallest covering half of the face or only the

forehead of the dancer, to the largest (up to 80 cm high). When the largest masks were used, the actor danced behind the mask, which hung from the ceiling of the community house. An assistant of the dancer pulled and lowered the rope on which the mask was attached, in accordance with the rhythm of the melody.

Another kind of mask was used in the Yukon-Kuskokwim area, the so-called finger mask (Ray 1981, 29). They were pairs of small masks that the dancer held in each hand, often the miniatures of a large face mask. The custom in southern Alaska was that the dancer should hold something in his hands; when it was not finger masks, it could be wands or rattles, or he might wear gloves.

The simplest masks were realistic portraits of persons or animals; such masks were more common north of the Yukon delta, the Inupiaq territory. East of Alaska, in what is now Canada, masks were made of just a rectangular piece of skin, with two holes for vision, and at the eastern end of the Inuit territory in Greenland, one-piece wooden portrait masks occurred, but often with distorted faces. South of the Inupiaq area, the Yupik made more complex masks. They were carved from driftwood and painted to represent an animal or the transformation of an animal, with the face of its spirit appearing. Rings of roots often encircled the central motif; these rings supported feathers, skins, or geometric pieces of wood radiating from the mask. These wooden appendages could also represent seals, birds, or human hands and legs.

Like masks made of a simple piece of skin, facial painting provided a temporary covering of the face (Fitzhugh and Crowell 1988, 141; Ray 1981, 28). The practice of facial painting is reported only by early observers, prior to the second half of the nineteenth century. The practice of facial painting might help to explain the lack of masks in the early period. Helmets and masks made of bent twigs are also reported from the Krusenstern-Davydov voyage (1802–1807) (Liapunova 1994, 187, 189).

Ceremonial mask, Nunivak, ca. 1929. (Library of Congress)

Meaning of Masks

At festivals the dancer wearing the mask reenacted his supernatural experiences or retraced the mythological perpetuity of a hero or spirit of early times (Lantis 1947, 200–201). The dancer, transformed by the mask, became the incarnation of the being the mask represented. The belief was that in primordial times, spirits had taught the ancestors the skills that human beings need to know to survive. In recalling the mythical past, those who performed the ceremony kept in touch with the spirits who make life possible on earth. The best hunting methods and technology would have been ineffective without the active cooperation of the spirits. Only the spirits could free the animals needed by the people, permitting a successful hunt. At ceremonies prior to the departure of an important hunting party, the shaman would visit the spirit that presided over the animals to be hunted, seeking assurance of a successful hunt.

The meaning of the masks was not recorded when they were collected, and today little is known about their iconography. Therefore it is not safe to say more than that many masks are the plastic representation of an experience with supernatural powers. Such experiences were the product of journeys to the spirit world, of a vision, or of a dream.

A clear interpretation can, however, be given of the kind of mask that represents an animal,

say a raven, holding other animals in his beak and his feet, or the kind that has animals on a hoop encircling the mask. The mask indicates that the spirit represented by the mask has command over the game. When the shaman wore this mask, he acted as if he were the spirit itself, deciding whether to give the game to the people. The shaman was no longer asking for game, but instead incorporated the spirit that was master of the game. The spirit announced his decision, speaking through the mouth of the shaman.

YUPIK SHAMANISM (ALASKA)

The Yupik Eskimo shaman *(angalkuq)* of southwestern Alaska held a central position in his society. He (though women could be shamans, most shamans were men) was the mediator between the world of the spirits and the people. His fellow tribesmen expected that he could predict the future, that he knew where the wild animals were, and that he could cure illnesses. Some shamans were able to fulfill these tasks only to a limited extent and instead specialized in a given area. The required abilities depended on the helping spirits who promised the shaman their support. Without the firm support of the spirits, the shaman was powerless. If he agreed to perform a task, he appealed to a benevolent spirit and sought his advice. If the specialized spirit turned a deaf ear to his appeal, the shaman understood that his helping spirit in this particular constellation was unable to show him the way to a solution. The shaman had to explain to those present that he could not solve the problem at hand.

The Yupik were animists who believed that all living creatures and important natural phenomena (like storms, wind, rain), celestial bodies (moon, stars, sun), and landmarks (river mouths, hot springs, mountains) had souls and personalities and led their lives concealed in the background. Their lives paralleled those of people and were patterned along anthropomorphic lines. They were capable of speech, either directly with the shaman or through an intermediary, the helping spirit. The role of the shaman was to make contact with the helping spirits and to negotiate with them.

Hardship in life such as illnesses, difficulties in obtaining provisions, or bad weather that makes hunting impossible could be solved on the basis of an agreement with the responsible spirit. First the accountable authority had to be established. The shaman, having determined the cause of the ill will of the spirit, negotiated with the spirit to obtain favorable terms for the people. The shaman made suggestions how to remedy the spirit's unhappiness, or the spirit dictated its terms; in both cases, new taboos would have to be observed to please the offended spirit.

Sickness was explained by the loss of the soul. The stolen soul was in another world. The shaman's helping spirit would look for the soul, and once it had located the soul, it was the shaman's job to get it and replace it in the patient's body. The lost soul would have been kidnapped by a malevolent shaman and hidden in a secret place in the Underworld. The shaman, after getting contact with his helping spirit and receiving from the spirit information about the approximate location of the soul, started his journey to the Underworld. He had to defeat numerous difficulties and eliminate malicious spirits that tried to create obstacles to his advance; eventually he reached the scared soul and brought it back to the patient. The shaman pressed it back with his hands into the patient's body, at the place where the soul originally resided. If the shaman were not able to recover the soul, the sickness would probably be fatal. The relatives of the patient might therefore ask the shaman to make a second attempt or ask another shaman to try to rescue the soul.

The sequence ideally started with the shaman drumming and calling his spirit and ended with the reintroduction of the soul into the body of the patient. Some shamans would comment while they were in trance on what was happening to them, others would relate what they experienced at the end of the séance, after recovering from their trance.

Becoming a Shaman

There was no institution for training candidates to be a shaman. Anyone who aspired to this vocation had the opportunity to become a shaman. In theory, everyone could try his hand at it. Those who became shamans had a peculiar vision in the loneliness of the tundra after a long exhausting march. A spirit appeared who felt lonely, sought company, and was ready to become friends with someone. In return for friendship, the spirit declared its willingness to help. These spirits displayed very human characteristics; the characteristics of the entities of the spirit world were very much like those of human beings. Having ties to other worlds was felt to mean that one had the future, normally fraught with uncertainty, better under control. Some of the more powerful spirits were believed to control the winds, migration of animals, and the weather. The other worlds in which the spirits operated were situated on the floor of the ocean and at the limit of the sky, where the moon, the sun, and the stars resided. Since each spirit had its own personality and definite competencies, the shaman might seek further helping spirits to extend his field of action.

The community confirmed the shaman in his role. Recognition came when it was established that he was a competent clairvoyant and healer. He was accepted in this role as long as he was effective, in other words as long as his helpful spirits supported him and he was useful to the community.

Since his position in the community was not institutionalized, the shaman did not differ from other members of the tribe. He led a completely normal life, one like others of his social class, age, and sex. Depending on demand, he called his talents into play in order to predict the future or act as healer. He interrupted his daily activities, took his drum, and called upon his helping spirits in order to find out whether he could answer the questions raised. He did not wear special dress that would distinguish him from others. His drum resembled those of other people. His special position was based on his experience with the spirit world and his successes. In addition to his helping spirits, he had songs and amulets. His knowledge of the other world allowed him to advise others on carving masks and making amulets.

When the shaman was urged to provide assistance, he first asked his helping spirits whether the question could be solved. He beat his drums and called upon them, mentioning the task with which he had been confronted in order to give the spirit the opportunity to take a stand in advance. If the spirit could not offer a solution, he generally would not answer the question. If he did answer, however, he would suggest calling upon a more powerful shaman or one specialized in this area. The drum was beaten for hours, calls were repeated, and dances were carried out in a confined space, all creating a monotony that put the shaman into an altered state of consciousness. In this condition he became more receptive to messages from the other world and could understand them. This part required no psychological prelude or drugs. However, such a séance could last several days.

Relationships between shamans were not always friendly. On the contrary, they were often marked by the struggle for influence and the favor of fellow tribesmen. Some shamans strove for dominance, tried to eliminate all obstacles in their way, and attempted to frighten people by alarming them in order to manipulate them better. Struggles between shamans were a frequent topic in stories, as the following story illustrates. The story goes that one of the shamans claimed dominance, tried to exclude the others, and used all kinds of dirty tricks to get rid of the competition. His opponent, on the other hand, was only trying to help his fellows. He did this while leading a normal life. He was modest and did not strive for fame or social recognition. If he was given a task, he had his helping spirits do the job. He himself did not act. They spoke from his mouth and directed his movements. This shaman was naive, and he fell into all the traps set for him. Only when his situation had become hopeless did he take drastic measures, which enabled him to free himself.

More than one story followed this general pattern, and sometimes the story told how the

gentle hero, who in some versions was originally an orphan, took cruel revenge and caused a great deal of bloodshed. The motive of eliminating evil was not central. Evil was perhaps first and foremost seen as that which opposes one's own interests. In the same manner the shaman would attempt to protect his village from the negative magic of foreign shamans who through a curse might send illnesses to revenge an insult, an injustice, or murder.

In the past, shamans supposedly were much more powerful. They could fly, walk on the ocean floor, and transform themselves into different animals as needed. Their bodies were insensitive to pain, and therefore they could cut or puncture themselves or expose themselves to flames or to coldness without suffering harm.

The Death of Shamanism

The core area of the Central Yupik around the Kuskokwim River remained relatively isolated until the United States bought Alaska in 1867 from Russia. Protected by its shallow coastal waters and the river mouth, with no safe natural landing places, the area was avoided by seagoing sailors, who preferred to anchor in Alexandrovsk, Bristol Bay, and Saint Michael at the mouth of the Yukon. The Orthodox Church exerted little influence. The situation changed, however, with the appearance of commercial fishing and the arrival of Protestant and Catholic missionaries in the last third of the nineteenth century. The Herrnhuter (Moravian Church) and the Jesuits were particularly active, establishing not only churches but also clinics with trained medical personnel. Shamanism stood for all that was "heathen and backward," which was countered directly by the Christian religion and Western medicine. The missionaries also had Western technology, in the form of materials, cast iron pots, firearms, plank boats, and so on, on their side, and the acceptance of that technology made daily life easier in many areas. Western innovations became dominant relatively rapidly, within one generation.

Symbiosis and Neo-Shamanism

After almost 150 years of Christianity, a certain return to traditional values can be observed. In an attempt to provide disoriented young people with social stability, elders usually try together with the local Christian clergymen to hold joint festivities of a religious nature. These ceremonies may be occasioned by a birth, a death, or a wedding, or by the introduction of young children into the community. Traditionally the entire village population is invited. Everyone eats, dances, and sings. Masks are carved and worn for such dances, and old songs are sung, as well as new ones commemorating personal events. The priest and a traditional master of ceremonies bless the food and the masks.

Overview

CENTRAL AND SOUTH AMERICA

Introduction: Geography, Human History, and Religion

The geographically and culturally diverse region comprising Mexico, Central and South America, and the Hispanic West Indies is often referred to as Latin America, in recognition of its predominantly Spanish and Portuguese colonial heritage. Strictly speaking, the term Central America refers to the isthmus connecting Mexico (geographically included in North America) and South America, and comprises the republics of Guatemala, Belize (formerly British Honduras), Honduras, El Salvador, Nicaragua and Costa Rica. Geographers, however, often use the nearly synonymous term Middle America to refer to the larger region of Mexico, Central America, Panama, and the West Indies (Cuba, Haiti, the Dominican Republic, Jamaica, Puerto Rico, and the Antilles). In the following regional entries, the term Central America is used in this latter, more inclusive sense. Mesoamerica, a term used frequently by anthropologists, is generally restricted to southern Mexico and western Central America, where the Maya civilizations once flourished. South America comprises Portuguese-speaking Brazil, Spanish-speaking Argentina, Bolivia, Chile, Colombia, Ecuador, Peru, Paraguay, Uruguay, and Venezuela, as well as the former colonies of Guyana (British) and Suriname (Dutch), and the dependency of French Guyana.

Approximately 80 percent of the Central and South American landmass is located within the tropical zone. High mountains of relatively recent origin are found in the Sierra Madre ranges of central Mexico, the volcanic highlands extending from Chiapas in southern Mexico through the Central American isthmus, and the mighty Andes mountain chain forming a backbone along the entire western extension of South America from northern Colombia to Tierra del Fuego in southern Chile. The combination of tropical life zones punctuated by high mountains gives Central and especially South America an almost unparalleled diversity of climatic and ecological zones, plant and animal life, and indigenous cultures and languages.

Central and South America were the last continents to be colonized by humans during the late Pleistocene. Traditional archeological estimates dated the arrival of humans to South America at no earlier than 8,000 years ago, but recent, somewhat controversial evidence dates a human occupation in Chile in southernmost South America at more than 12,000 years old. If confirmed, such early dates would help explain the tremendous cultural and linguistic diversity found especially in native South America, where thousands of languages and dialects have been documented and as many as a hundred distinct linguistic families have been proposed. No precise information exists concerning the human population of the Americas prior to the Spanish Conquest. Estimates for the combined indigenous population of North, Central, and South America at the time of conquest vary from eight million to 100 million. Estimates for the Inca Empire (western South America) alone vary from three to thirty-two million. Disease, military conquest, and assimilation

quickly reduced the native population by over 90 percent, and many cultural groups, especially in coastal regions, were extinguished or entirely assimilated.

The current population and cultural heritage of Central and South America reflects five centuries of conflict, coexistence, and mixing between several distinct and internally diverse peoples: the native inhabitants of the Americas and their descendants, often referred to as Amerindians; people of Iberian (Spanish or Portuguese) origins who made up the vast majority of the initial European colonization; enslaved West Africans and their descendants, brought mostly to northeastern South America (especially Brazil) and the Caribbean beginning in the early sixteenth century to provide plantation labor when enslaved Amerindians proved unable to resist disease and the privations of slavery; and finally, overseas immigrants of diverse European and Asian origins who began arriving in large numbers in the nineteenth century when former Spanish colonies achieved independence.

The religions of contemporary Central and South America reflect the tremendous cultural diversity and historical complexity of the region. Hierarchical state religions practiced in pre-Colombian kingdoms and empires such as the Aztec, the Zapotec, the Maya, and the Inca were persecuted and extinguished early in the Conquest. Persecution of indigenous religions was especially severe during the Spanish Inquisition, but has continued through the present, notably through the practices of Christian missionaries of diverse sects operating in remote, Amerindian-populated areas. The Jesuit Order was especially prominent in its missionary work with Indians during the early Conquest, promoting indigenous languages such as Tupi-Guarani as the *lingua franca* for Iberian colonies. But the Jesuits were expelled from Spain, Portugal, and all American colonies in the mid-1700s, and Franciscan and Dominican Orders came to dominate missionary work in the indigenous-populated hinterlands.

In the twentieth century, fundamentalist Protestant sects greatly expanded their missionary work with Indians as well as with the urban peoples of Latin America, aggressively competing with established Catholic traditions. Protestant-Catholic conflicts divide numerous indigenous populations of Central and South America, and in some cases these conflicts have turned violent, a recent example being among the highland Maya of Chiapas, where political and religious factors together contributed to the Zapatista uprising. Despite five centuries of missionary work and persecution, diffuse elements of pre-Colombian indigenous religions, including shamanism, survive to this day, in some cases inextricably blended with Iberian folk Catholicism or Protestant Christianity. The recent emergence of urban ayahuasca religions in Brazil attests to the tenacity and adaptability of shamanistic practices derived from indigenous roots.

Another important religious current in Central and South America is the West African–derived religious complex that includes Santería, Candomblé, Umbanda, and Voudou (Voodoo). Centering on possession and trance, these religions, together with fragments of the original African languages (notably Yoruba), have survived and flourished in coastal and island regions where the slave trade was most intense. Peripheral European mystical practices such as spiritism and theosophy arrived in Latin America during the 1800s and have blended with folk religions and alternative healing traditions in many urban areas. Minority religions brought by more recent immigrants to Central and South America include Judaism, Islam, Hinduism, and Buddhism.

Overview of the Entries

The twenty entries in this section attest to the tremendous cultural diversity, historical depth, and philosophical complexity of shamanism throughout an immense region. The entries cover a broad sample of cultural groups from southern Chile to New Mexico, from ancient to modern times, from indigenous forest people to urban dwellers of mixed African, Amerindian, and European descent. Despite their broad coverage, the entries are by no means exhaustive or even representative of the totality of shamanistic practices in this vast and diverse area.

The regional entry "Central and South American Shamanism" includes examples of indigenous shamanistic traditions from a wide range of geographical regions and historical moments, from pre-Colombian and early Conquest times through the present. The entry pays special attention to

Amerindian traditions of the western Amazon (Desana, Cashinahua, Jivaro, Matsigenka, Shipibo, Yaminahua, and others) not covered in other entries, while drawing comparisons between Amazonia and other culture areas. Despite the overwhelming cultural and geographical diversity covered, certain common features of native Central and South American shamanism are identified: the shamanic calling, usually communicated during dreams or illness; the shaman's initiation, which often involves the acquisition of a magical substance that embodies the shaman's power and serves as both a defensive and offensive weapon; the moral ambiguity of shamans, who can be both healers and sorcerers; the centrality of singing or chanting and percussion instruments (drum, rattle) during ritual performance; the notion of soul loss, spirit attack, and sorcery in illness etiology; the concept of a multilayered cosmos inhabited by spirits and traversed by the shaman during trance; and the common use of hallucinogenic and narcotic plants, the most widespread being tobacco and other nightshade relatives *(Datura, Brugmansia).* Such widely shared features attest to the ancient origins of Central and South American shamanism, which should be treated as a unique, parallel, and largely independent development, rather than merely an offshoot of "classic" Siberian shamanism.

The entry "Huichol Shamanism" describes the complex worldview of this colorful and proud people, who call themselves Wixárika, of the deserts of northern Mexico. Huichol shamans, known as *mara'akate,* use dreams, tobacco, the hallucinogenic peyote cactus, and other psychoactive plants to commune with Huichol gods, Catholic saints, and a variety of animal and plant spirits for purposes of divination and healing. Huichol shamans are also responsible for guiding the spirits of the dead to the sky above the sacred landscape of the peyote desert in San Luis Potosí, visited on periodic pilgrimages and peyote-gathering expeditions. The entry "Tarahumara Shamanism" describes religious and social practices among the linguistically related Rarámuri (more commonly known as the Tarahumara). Early in the Spanish Conquest, the Rarámuri took refuge in the rugged Sierra Madre mountain range and were thus able to survive as a people despite four hundred years of encroachment by Christian missionaries and European invaders. Rarámuri shamanism as well as social, economic, and ritual life revolve around the consumption of *tesguino,* a sacred alcoholic beverage made from fermented maize. Known as *owirúame,* "medicine makers," Rarámuri shamans are renowned for their ability to drink large amounts of tesguino without losing control of their faculties. The most powerful shamans also consume peyote. In addition to their healing functions, Rarámuri medicine makers preside over religious ceremonies, transmit myths and cosmological knowledge, and wield considerable political power.

The entries "Mayan Shamanism," "Mayan Cosmology," "Maya Bone Divination," and "Quiche and Zuni Divination" explore multiple facets of religion and healing among diverse Mayan peoples of Guatemala, Belize, and southern Mexico, currently numbering seven million and speaking thirty-two different languages. The first two entries demonstrate a clear continuity of shamanistic beliefs and practices through more than two thousand years of history, from the ancient Maya civilization through present-day Quiche and Yucatec Maya societies. Quiche healers perform charms, spells, songs, and myths, and also engage in hands-on manipulation, including bone setting, massage, herbal remedies, and midwifery. Detailed knowledge of the 260-day ritual calendar, a legacy of the ancient Maya, is used for divination, blessing, and various ceremonial purposes by a special class of priest-shamans known as keepers of days *(ajk'ij).* Yucatec Maya ritual specialists *(h'meno'ob)* use their knowledge of the cosmos to alter the acts and intentions of invisible spirits while also helping people to understand and fulfill their own role in the cosmos, thereby achieving good health and good fortune.

The third entry describes the practice of "bone arrangers" *(wikol baq)* among the Tz'utujiil Maya of Guatemala, who treat bodily injuries through a combination of magical and physical manipulation. Their powers are channeled through a divinatory object (animal bone, pebble, or the like) revealed to them in dreams or by supernatural means during their initiatory calling. The final entry of this group compares and contrasts the divinatory functions of shamans among the Quiche Maya and the Zuni of New Mexico. Shamans in both groups divine by gazing into water or crystals, casting lots, reading natural omens, using hallucinogenic drugs, or interpreting dreams. Despite overall similarities between the two traditions, the Zuni view divination and contact with

dead spirits as a life-threatening enterprise, to be carried out only by a small number of the most powerful priests. The Quiche, on the other hand, view divining and contact with dead spirits as an inborn talent or gift that is not particularly dangerous, and the profession is open to any who receive the proper calling.

The entry "Otomí Indian Shamanism" provides a description of shamanic practices that appear to be mostly extinct among this native group of the highlands of Hidalgo in central Mexico. Otomí shamanism revolves around two fundamental concepts: *zaki,* the life force of all beings that move, and *rogi,* companion animal spirits that are born together with and accompany every person through life. Otomí shamans traditionally prepared paper figures representing animal spirits and the zaki life force for use in healing and divining rituals. Present-day Otomí remember these beliefs and practices in great detail, but few if any practicing shamans remain. The author does not discuss the reasons for this loss, but mentions the presence of *curandero* healers whose practices are less specific to Otomí cosmology, reflecting more widely held Mexican folk beliefs. The entry "Curanderismo" describes this cosmopolitan system of folk healing, found in different forms throughout Latin America and Spain, and among Hispanic populations in the United States. Representing a fusion of Greek-derived humoral theory, nineteenth-century spiritism, Catholicism, Spanish folk beliefs, and indigenous concepts, *curanderismo* is a diverse body of practice that includes spiritual, psychological, and herbal healing.

"Amazon Funeral Rites and Shamanism" is a comparative study drawn from recent ethnographic work among diverse Amazonian indigenous groups of Brazil (Araweté, Baniwa, Bororo, Nambiquara, Kulina, Krahó, Warí). As healers and diagnosticians, shamans provide patients as well as bereaved family members with a culturally mediated conceptual framework for understanding illness, misfortune, death, and the fate of the soul. Ritual acts overseen by shamans during and after the funeral chart the course of the dead person's soul away from the land of the living toward the Underworld, and may open channels of communication between the living and the dead. Shamanic interventions and interpretations facilitate the mourning process while reaffirming social bonds and cosmological beliefs.

The entries "Dark Shamanism" and "Kanaimà Shamanism" draw on ethnographic examples among the Warao of the Orinoco delta and the Carib-speaking Patamuna, Akawaio, Makushi, and Pemon of the Guyana highlands to illustrate the phenomena of witchcraft and attack sorcery, also found widely in the Amazon basin. Though many cultural groups have separate words to distinguish between healing shamans and illness-causing "dark shamans," the distinction is not always so clear in practice, as the power to heal entails the power to kill. The indigenous notion of dark shamanism has evolved in response to external forces, such that the shaman's magical violence mirrors the violence of colonialism while also standing in opposition or resistance to it.

The entry "Ayahuasca Ritual Use" discusses the shamanistic complex surrounding ayahuasca, a powerful hallucinogenic, or "psychointegrator," brew consisting of *Banisteriopsis* vine, *Psychotria* leaves, and other admixtures. Ayahuasca allows shamans to access hidden information about the spirit world and the social and natural environments. Originally an indigenous practice of perhaps limited geographical distribution, ayahuasca use spread throughout the western Amazon, especially during the rubber boom (1895–1917), and was adopted by many indigenous and nonindigenous groups. Several ayahuasca-based ecstatic religions have emerged in contemporary Brazil, blending indigenous, African, spiritist, and Christian cosmology. Though fraught with questions of ethics and authenticity, the growing popularity of urban curanderos and esoteric tourism has contributed to a cultural renaissance of shamanism in some areas.

The entry "Peruvian Shamans" addresses common features found in the diverse indigenous and urban healing traditions of the three distinctive geographical and cultural regions of Peru: the coastal deserts, the Andean mountains, and the lowlands of the Amazon basin. As in Mesoamerica, archaeological and historical records demonstrate a persistence of pre-Colombian beliefs and practices despite five centuries of religious persecution and colonial domination. In recent years, shamanistic rituals and trappings have attracted attention as objects of tourist consumption and political propaganda.

The entries "Mapuche Shamanism" and "Toba Shamanism" cover native practices in the quite distinctive cultural and geographic region of the southern cone of South America. The Mapuche of southern Chile, with a population of over one million, are among the largest indigenous groups of South America. Originally, male and female Mapuche shamans *(machi)* were responsible for propitiating ancestral and natural spirits for purposes of healing, success in warfare, agricultural fertility, and other expressions of collective well-being. Today, Mapuche shamans are mostly women, and their functions include healing, fertility rituals, interpretation of customary law, and presiding over public ceremonies. The Toba of the Chaco region in northeastern Argentina believe all illnesses have a supernatural origin. Taboo violations and vengeful animal spirits were blamed in the past, but today the most common cause of illness is thought to be sorcery inflicted by dark shamans. Toba shamans receive their powers and carry out much of their healing through dreams, guided by helping spirits. They invoke these helping spirits during healing rituals as they suck, massage, and blow on the patient's body until the illness-causing object (a stone, stick, or gelatinous substance) emerges.

The entries "Santería" and "Afro-Brazilian Shamanism" discuss examples of the healing and religious customs of African origin found along the north coast of South America and throughout the Caribbean. Related to Haitian Voudou, Cuban Santería and Brazilian Candomblé and Umbanda stand in sharp contrast to the Amerindian shamanistic cosmologies and practices discussed in the other entries. Whereas Amerindian shamans enter the invisible world in trance to communicate with the spirits, the African deities (*orishás,* spelled *orixás* in Brazil) irrupt into the human world by possessing or "riding" their hosts. For this reason, the term *shaman* is applied rarely and with some hesitation to Afro-Cuban and Afro-Brazilian healers and religious practitioners. Nonetheless, some contact between African and indigenous traditions can be inferred, for example, from the use of tobacco cigars in Cuban Santería and the use of hallucinogenic datura preparations in Afro-Brazilian religions.

Ancient and deeply rooted in Amerindian spirituality, ritual, and mythology, shamanistic concepts have had an important influence on modern religion and popular culture. The entry "Latin American Literature and Shamanism" interprets the phenomenon of magical realism in Latin American literature as an expression of an underlying shamanistic worldview. The entry "Latin American Christianity and Shamanism" discusses the mutual and multiple influences between Christian and indigenous religions. Messianic indigenous movements in different regions and historical moments have manifested a distinctly shamanistic reinterpretation of Christian beliefs. By the same token, emergent religions and healing traditions among non-Indians in rural and urban areas have incorporated distinctly indigenous elements, notably the use of native hallucinogens.

Persecuted by Christian missionaries from the early days of the Conquest through the present, shamans have persisted in many regions and cultural groups. In some cases, shamanism has even come to flourish, exerting important and ongoing influences on broader cultural and religious movements in the Latin American melting pot. Rediscovered by scientists and the popular press in the 1950s, Central and South American shamanism served as inspiration for the psychedelic revolution of the 1960s and the New Age movement of the 1990s. These examples attest to the resilience and universal appeal of shamanism and ecstatic experience, reaching across cultures, geographic regions, and human history.

Glenn H. Shepard Jr.

AFRO-BRAZILIAN SHAMANISM

Shamanism in South America can be found in various regions and almost every modern country possesses its own typical form, derived from the specific ethnicity of its particular native culture. However, Afro-Brazilian shamanism differs from other shamanic practices derived more directly from pre-Columbian cultures in the Americas. It can be considered in its denominations of *Candomblé,* or *Umbanda,* in Brazil and in some neighboring countries, while similar practices in Central and North America are denominated *Santería.*

Candomblé is a form of shamanism widely practiced in Brazil that, like the practice of Santería of Central and North America, has maintained, in their purity, traditions originating in Africa. Unlike the other main form of shamanism practiced in Brazil, Umbanda, it has not been heavily influenced by Catholicism. Candomblé is the name given to a variety of African religious traditions in Brazil. Above all, it is a set of precepts, rules, and rites of a highly sophisticated nature, rites whose authentic practice is reserved for initiates. The term also refers to a community of devotees, who dance in sacred spaces that are oriented to Africa.

History and Belief System

It was during the seventeenth century that ships burdened with slaves began arriving in Brazil. These involuntary immigrants of varied ethnicities (*Jêjê, Marrin, Iorubá, Angolan, Congo,* and *Ketu* among others) possessed a very ancient metaphysical tradition, a tradition held to precede that of the pharaohs of Egypt, and having in common three characteristics:

- Belief in one God, as Creator and Ordainer
- Belief in a pantheon of deities who, from the beginning of the cosmos, have been the administrators of creation, with everything existing in it, including human beings and their passions
- Belief in two distinct worlds, the visible material world and the spiritual world

These three characteristics are shared by the most diverse religions and philosophies, differing only in the terms used. Thus, for example, the pantheon of *orixás* (guardian spirits) can be seen as the equivalent of the guardian angels of the Catholic Church and of the spirits of light of other religions.

Chants and rituals held in the main room of the house of Candomblé recall histories and legends of spiritual entities governing each individual human being. Held to the sound of *atabaques* (small drums), these rituals echo with chants in homage to the diverse orixás, telling the stories of their presence on earth in ancient times. The chants trace a complete history, replete with details concerning the customs of respective spirits and their relationships to one another, as they prepared the conditions necessary to human existence on this planet. The orixás had the function of preparing for and making possible biological existence on earth after the original creation of the planet. For example, Ossãe had the care of plants; Oxum, of fresh water; Yemanjá, of seawater; Oxumarê, of wisdom; and Xangō, of stones.

Cosmogenesis, the Origin of Spirituality, and Human Life

The synthesis that follows derives from the knowledge of the shaman practitioner of Candomblé, Gilson Souza Ferreira, hierarchical descendent of an important African lineage of Candomblé in the state of Bahia, Brazil.

Before Material Life

Two kinds of habitable worlds exist within the universe: stars and planets. Stars are continually formed by ethereal energies in a process of condensation, while planets are formed by energies already condensed. Every star possesses a nucleus, which is the source of its energy. Spiritual beings, eternal inhabitants of the star, are nour-

During "Macumba" sessions, African gods, Christian saints, and Amerindian shamans mingle to a background of frenzied drumming and the cries of followers, most of whom are in a trance. January 1, 1987. (Collart Herve/Corbis Sygma)

ished by the energy from its nucleus, which sustains their existence effortlessly.

Stellar inhabitants are endowed with acute mental faculties and great wisdom, but have always faced the problem of a scarcity of population in their respective worlds. Considering the vastness of the cosmos and its minute population, even communication among its inhabitants is difficult. Therefore, it was resolved to find a means of increasing their numbers throughout the universe; this resolve ultimately became the motive for the existence of the human race. The task of increasing the numbers of stellar inhabitants was delegated to beings known as stellar gods.

A new star was created for that purpose, combining the energies specific to each of the worlds contributing to it, and on that star the stellar gods convened with their retinues in what proved to be an unsuccessful effort to create new ethereal beings. One among them was chosen to remain as guardian of the new world, in company with his retinue and members of another retinue to assist him. So that he might have the necessary ascendancy over his assistants, the guardian received the diverse powers of every stellar god, which they transmitted to him prior to their return to their respective star worlds. Thus a new entity evolved, uniting in himself all power and wisdom from the entire universe, and he was acknowledged as Almighty God. It was he who subsequently found the means the stellar inhabitants were seeking to create new ethereal beings for populating all the stellar worlds. As for the star created and inhabited by Almighty God, it is known as heaven.

When the stellar gods reconvened with the Almighty in heaven to establish norms for the existence of ethereal beings throughout the entire universe, they encountered a new organization of their species, divided into two hierarchical categories:

- Celestial angels: those most directly linked to God Almighty, among them the

two known in our civilization as Christ and Lucifer (also called Lucius Fé in some houses of Candomblé)
- Primordial angels: the rest of the angelic population of the new star called heaven

Among the celestial angels, Lucifer (or Lucius) was distinguished by his great dedication to and confidence in God's plans for the new ethereal beings, the new souls, as they are traditionally called. Lucius's most important function was to accompany the Almighty in his work of populating the star worlds; as he did so, he observed that the newly created spiritual entities were excessively dependent and ingenuous in their behavior. Lucius considered them deficient in wisdom and self-confidence, lacking in the mental attitude appropriate to existence in the star worlds to which they were destined. For this reason, on his return to heaven, while expressing his great joy in the divine creation, he also requested the Almighty to create a new star near to heaven. The new spiritual beings would inhabit this star while they were still in a process of evolution, instead of being sent directly to their respective permanent star worlds, as originally planned. God and his aides agreed, and it was done.

The Creation of Material Worlds and Human Beings

Lucius also devised a solution whereby God created new material worlds, or planets, to be populated by his creatures for the purpose of evolution before being presented to the Almighty in heaven. The new beings would need to learn to control their impulses, so that their minds would be filled with knowledge of life values and they would evolve sufficiently to possess free will and to act and react properly. All these characteristics are seen as very important to the conscience/mind of a stellar inhabitant. Thus, after passing through an odyssey of lives in material worlds, or planets, in search of evolution, the spiritual beings would be prepared for presentation before God, after which they would continue onward to their respective stellar worlds, knowing how to make perfect use of their mental faculties.

This proposal by Lucius generated controversy among the stellar gods, since it brought into existence the dualism of good and evil. Egotism and iniquity were foreign to the stellar gods, and they were perplexed. According to the tradition, God concurred with this plan, perceiving that it would provide a way for the new spiritual beings to acquire the needed mental maturity. The stellar gods, however, did not agree immediately, since according to Almighty God's former promise to them, the newly created spiritual beings would be immediately sent to populate their respective star worlds.

Furthermore, by this plan, it would be necessary to involve nearly all the entities already existing, since when the new beings incarnated they would require nourishment from the energy of their stellar worlds during their material existence; without such protection, the mind in direct contact with the planetary atmosphere would destroy itself. The technology utilized to this end is superficially known to man as pertaining to the energetic field; it is maintained by a specific spiritual entity and his aides, also responsible for the entire task of spiritually protecting the new incarnate beings, until they are considered prepared to inhabit their stellar worlds.

Despite the initial resistance of the stellar beings, Almighty God gave his approval to the plan of the celestial angel Lucifer, who was named god of the star where all new beings must enter to receive those energies that provide the building blocks of an individual human personality, needed for existence in a material world. Thus equipped, the soul begins the process of evolution that will eventually prepare it to re-encounter the angelical mind, good and wise.

To implement the plan one more star was created, and in it the new spiritual beings awaited their guardians, or spiritual stellar energizers, in order to be conducted to the planet deemed appropriate to the prevailing mental evolution of each one. Once they accepted their role in this plan, the stellar beings assumed their proper responsibilities with respect to those who were to populate their star worlds. In such a manner life began for all the new creatures in the universe, including those of every living being on this or any other inhabited planet.

Comprehension of the Processes of Illness and Cure in Afro-Brazilian Shamanism

All religions, whatever their differing tenets concerning the relationship between humans

and divinity, offer counseling to those who seek an approach to their own connections to the spiritual life, and who want to increase their understanding of the importance of spirituality to human existence. Beyond these aspects held in common with other religions, Afro-Brazilian shamanism includes unique practices for treatment of physical and mental disturbances, when these are seen to be caused by energetic disequilibria. Practitioners are drawn to this belief system because they understand it as the only method possible for contact and relationship with the orixás, the spiritual entities who are believed to maintain the human energetic field and the equilibrium of mind and body.

The principal objective of setting up the houses of Candomblé, the actual physical centers of Candomblé activity, is the offering of assistance to those who seek spiritual guidance and solutions to problems of health. For example, a census carried out in 1980 by the Federacão Baiana do Culto Afro-Brasiliano registered 1500 Candomblé centers in Bahia. Each house is under the direction of its so-called spiritual caretaker, an ordained member holding the highest degree in the hierarchy of that house. During a consultation the spiritual caretaker, after casting seashells, establishes voluntary contact with the consulter's guardian spirit, or orixá, and, depending on the level of communication with the spirit world or extrasensory perception, proceeds to conduct some form of dialogue with the spiritual entity concerning the person under consultation.

Good health in the Afro-Brazilian tradition is understood as depending on the correct relationship of the orixás and the individual, a relationship mediated by the energetic field and the mind of the individual. In some circumstances, the light (energy) emanating from the guardian spirits (orixás) may be deficient, causing problems in the energetic equilibrium of the mind and body of the person asking for help. When such an energy deficiency exists, the individual may present vague and ill-defined symptoms, similar to those of functional disturbances, such as lack of physical energy and motivation, diminished libido, dizziness, headaches, and other physical and mental complaints without a defined pathological correlation. Where a definite clinical pathology already exists, the spiritual caretaker refers the patient to conventional medical treatment. Thus a harmonious coexistence is possible between those whose practice is based on Afro-Brazilian beliefs and those who practice conventional allopathic medical science.

The energy used in the process of revitalization is called *axé* (force), and its sources lie in the animal, mineral, and vegetable realms of nature. The rites used are reserved to the initiated and consequently are not performed in the main room of the houses. The rites involve making offerings of energetic essences to be metabolized and retained by the orixás, who thereby recover their capacity to act as protecting entities. Once these procedures have been completed, the individual, now properly sustained by guardian spirits, is expected to enjoy good health, at least with respect to the restoration of equilibrium of energy in mind and body. When indicated, treatment may be complemented by psychospiritual counseling.

AMAZON FUNERAL RITES AND SHAMANISM (BRAZIL)

In the crisis of death in native communities in the Brazilian Amazon, shamans provide ideas, information, and ritual resources to help individuals and groups cope with psychological trauma, social disruption, and cosmological imbalance. Shamanic knowledge and diagnoses offer frameworks of meaning to explain why someone died and to guide survivors about how to respond to the death. At funerals and during the period of mourning, shamans often act to protect people from ghosts and usher the spirit of the deceased out of the world of the living and into the world of the dead. In societies in which dead people's spirits are thought to join the world of animals and other spirits that influence natural processes such as human fertility and the productivity of hunting, fishing, or gardening, shamans' special relations to these spirits help ensure that each death will renew and strengthen life-giving relations between a native community and the spiritual forces on which its well-being depends.

Brazil is home to an estimated 350,000 native people who represent more than 200 indigenous groups and speak more than 180 different languages (Instituto Socioambiental 2000, 15). In the Amazonian region of the country's interior, native people live in a wide variety of circumstances today. In the most isolated areas of the rainforest, several dozen small groups still live independently, avoiding direct contact with outsiders. The vast majority of indigenous populations have experienced decades or centuries of interactions with the national society. In rural areas, most make their living from combinations of farming, hunting, fishing, gathering, and participation in the regional cash economy through wage labor or the sale of forest products, crops, and handicrafts. Growing numbers of indigenous people live on the margins of, or in urban areas in, the Amazonian cities and boomtowns that have grown rapidly since the 1970s with the construction of new roads and intensified economic development. Since the 1980s, secondary and postsecondary education and specialized training have become more widely available for native communities, and the number of indigenous teachers, health care workers, technicians, and administrators is growing.

Funerary rites and the practice of shamanism have been deeply affected by culture change and the history of indigenous communities' relations to outsiders and the national society. Dislocation and social disruption from disease, violence, and poverty, and coercive or persuasive interventions by government agents, missionaries, teachers, traders, and others have contributed to the abandonment or attenuation of many traditions. In particular, indigenous funeral practices that did not follow the national society's custom of burying bodies soon after death have been strongly discouraged. Cremation, cannibalism, exposure (allowing bodies to decompose out of the ground in the forest or a shelter), and the disinterment and reburial of bones have died out or been stamped out in many areas. Similarly, the deaths of elders, the influence of Christianity, and other cultural changes have contributed to the loss of much shamanic knowledge and ritual. In some areas, however, shamanism is now undergoing a revival and revitalization inspired by indigenous peoples' growing pride and self-confidence in being Indian, younger generations' interest in recovering and preserving their people's distinctive cultural traditions, and the influence of outsiders who value native healing practices from the perspectives of holistic medicine and New Age spirituality.

Historical change and cultural diversity in native Brazilian societies make it difficult to generalize about the region as a whole. The following account focuses on the more traditional activities of shamans described by ethnographers in the twentieth century.

As healers, shamans are intimately involved in events leading up to the moment when a sick person dies, but once death is final they may withdraw behind the scenes as close family

members take over the public roles of keening, crying, or chanting their sorrow, preparing for the funeral, and memorializing their loved one. Shamans serve as counselors and diagnosticians, providing families and communities with information and insight about the death, creating a cognitive framework to explain why death occurred, what it means, and what should be done. Robin Wright described how Baniwa shamans in northwestern Amazonas (a Brazilian state) interpret signs and omens after a death and shape mourners' emotional experiences by providing reassuring understandings based in what he called the "curative aspect of myth" (1998, 198–199).

Shamans often reappear as public figures in funerals and other rites of mourning, especially at moments when the spirit of the deceased is in transition and relations to its living relatives need to be restructured. A common idea is that a dead person's ghost wanders the earth for several days or weeks after the body has died, drawn by nostalgia and loneliness for its former life and companions, upon whom the ghost may inflict harm by causing illness, death, or accidents. Shamans are widely credited with the ability to communicate with the dead, and they often have the responsibility to persuade a ghost to leave the world of the living. Donald Pollock described how Kulina shamans in the western state of Acre perform a ritual in which, accompanied by women of the community, they sing the dead person's spirit out of the village and send it to the Underworld, in a movement that inverts the dynamic of curing rituals, in which shamans and women sing to attract animal helper spirits to enter the village to treat sickness (1993, 62). Among the Krahó of Tocantins in east central Brazil, a dead person's hungry spirit may return and speak through a shaman intermediary, demanding its favorite foods. To head off this visitation, a family asks a shaman to invite the spirit to a meal; after consuming the "spirit" of the foods, the dead have no right to make further demands on their living relatives (Cunha 1978, 40–41). Baniwa shamans teach the dead person's relatives orations to protect them from the soul of the deceased, and at the end of the mourners' period of seclusion and fasting, they perform a lengthy series of chants to repel the influence of the dead and make food safe to be consumed (Wright 1998, 198–199).

Among the Nambiquara in western Mato Grosso, a shaman escorts the spirit of the deceased to the abode of the dead in sacred caves behind waterfalls in the Serra dos Parecis mountains. In the Wasusu subgroup studied by Marcelo Fiorini (1997), at the funeral the shaman straddles the tree-bark coffin and bangs on it to usher the deceased's spirit into a gourd, which he then falls upon and breaks. The spirit enters the shaman's body and possesses him. Speaking through the shaman, the dead person addresses people at the funeral, telling of how he or she died, announcing prophecies, curing blemishes, and directing those present about how their lives should proceed. Acting through the shaman's body, the spirit claims its possessions and distributes these to relatives, who burn or scatter most of them. Some of the most cherished items may be carried by the possessed shaman to the sacred caves where the ancestors dwell.

On this ritual journey, Nambiquara shamans walk for many hours along a trail leading to the distant caves. Along the way, the dead person's spirit and possessions may be transferred from one shaman to another, with each shaman in succession becoming possessed and continuing the ritual journey. At the beginning of the twenty-first century, shamans of the Wasusu, Alãntesu, and Waikisu subgroups continue to take the spirit all the way to their groups' sacred caves, whereas Sararé shamans release the spirits of the dead in meaningful locations around their territory, and Hahãintesu dispose of them near large, ancient trees in the forest. The area around the sacred caves is now threatened and degraded by commercial logging.

Among the Bororo of Mato Grosso, one type of shaman, called the *aroe etawa-are* (shaman of the souls), plays a central role in an elaborate series of public mortuary ceremonies, during which he offers drink, food, and tobacco to the spirit of the deceased and chants a long series of esoteric songs (which must be sung without a single mistake), in performances that last two to seven hours (Crocker 1985, 308–309). The shaman of the souls assists the man whom the dead person's family chooses to act as a ritual "substitute" (*aroe maiwu,* "new soul") to personify the dead person in funeral dances before and after the corpse is buried. The body is placed in a shallow grave, and after its flesh has decomposed, the remains are disinterred and washed, and the ritual substi-

tute decorates the bones and skull and places them in a special funerary basket. During the night before the arrival of the bones and on the afternoon of the day when the bones are placed in the basket, the shaman of the souls chants solemn songs inviting the spirit of the deceased to enter its new dwelling, the basket. (If the deceased was himself a shaman of the type called *bari,* "shaman of the spirits", this role would be performed by another bari.) In the final disposal of the funerary basket of bones, the shaman places it in a grave in the ground or submerges it in a lake, and asks the spirits of Bororo ancestors to receive their new companion hospitably and accompany it on its dangerous journeys in the land of the dead (Viertler 1991, 100–105).

Relations to animals, especially jaguars and the major game that people hunt and eat, are at the center of shamanism in many native Brazilian societies. Shamans often receive their powers from animal spirits and have dual human-animal identities. Some native cosmologies see human-animal relations as a dynamic of reciprocal exchanges and cycling between the two social worlds. In some, the spirits of dead people are thought to join the animal world and return in the form of game to feed their living relatives. Shamans often mediate these relations between living people and their ancestors-turned-animals. In western Brazil, the Kulina of Acre and the Wari' of Rondônia believe that their dead return as white-lipped peccaries, pig-like wild animals, and shamans direct hunters to find the peccaries. Wari' shamans dream of their whereabouts (Conklin 2001, 208), and Kulina shamans summon them from the Underworld (Pollock 1993, 62).

The Bororo shaman of the souls consults the spirit of the deceased to learn the location of game that should be killed in its honor by the ritual substitute, whose duty it is to hunt and fish for his ritual "parents," and most importantly, to avenge the death by slaying a "revenge animal," ideally a jaguar or harpy eagle. The revenge animal is not eaten, but the shaman exorcises and blesses the other meat and fish, making it safe for consumption. Together, the shaman and ritual substitute reassert human agency in relation to the nonhuman forces that inflict death on people (Crocker 1985, 281–283; Viertler 1991, 82, 114).

The close relationship between the shaman of the souls and the role of the ritual substitute in Bororo mortuary rites extends to the making of shamans. Jon Christopher Crocker reported that men who become *aroe* shamans typically have acquired great prestige by being chosen multiple times to act as a ritual substitute (1985, 310). The dead person's family repays his services with gifts of body paint and ornaments, decorated bows and arrows, and ritual paraphernalia. This accumulation of symbolic wealth allows a man to carry out the duties of the shaman of the souls, which require a large inventory of instruments and ornaments (Crocker 1985, 310).

In many groups, shamans draw all or part of their powers from the ancestors; in some, the spirits of the dead select those who will become shamans (cf. Crocker and Crocker 1994, 103–104). Whether or not the ancestors endow them with their powers, shamans are widely recognized as authorities on the world of the dead. They are believed to be able to communicate directly with them and, unlike ordinary people, can travel to the villages of the dead and return alive. Shamans often serve as a bridge of communication between the dead and their living relatives, and such communications may provide closure in the mourning process. When a Wari' hunter kills a white-lipped peccary, he calls a shaman to use special vision to identify the ancestral spirit embodied in the carcass; the shaman converses with the dead person and relays information about other deceased relatives and events in the Underworld (Conklin 2001, 205). In the social process of mourning, the bereaved family awaits the shaman's news of an encounter with their dead relative, which is a definitive sign that the dead person's spirit has adjusted to its new existence in the society of the dead. Similarly Arawete shamans inform relatives when the spirit of the deceased is finally installed in its new status. During the period after mourning, the dead person's spirit speaks through the shaman and may sing in shamans' songs for many years (Viveiros de Castro 1992, 201, 218, 235).

Because of his close relationship with extrahuman spirits, a shaman's own spirit may be thought to have a destiny after death different from other people. In some groups, this may be reflected in differences in funerals for shamans (cf. Viertler 1991, 106; Wagley 1977, 195–196).

AYAHUASCA RITUAL USE

Ayahuasca is the most widely employed shamanic plant in northwestern and southwestern Amazonia, which spans the countries of Bolivia, Brazil, Colombia, Ecuador, and Peru, and along the Pacific coastal area of Colombia and Ecuador. Ayahuasca has a long history of ritual use among indigenous groups of the Upper Amazon (see for example the work of Rafael Karsten [1935] and Irving Goldman [1963]). Some prominent ethnographic examples include the shamanistic practices of the Tukano of Colombia (Reichel-Dolmatoff 1975), Shuar of Ecuador (Harner 1972; Karsten 1935), and Shipibo-Conibo of Peru (Gebhart-Sayer 1987; Arévalo 1986). Ayahuasca is considered the most complex psychoactive plant medicine used in shamanism in terms of its widespread cultural use and botanical additives. It is found in use among some seventy-two different ethnic groups representing twenty language families (Luna 1986). Ayahuasca is made from the *Banisteriopsis* vine, along with additives; the two most commonly added are the leaves of *Diplopterys cabrerana* and *Psychotria viridis.* Luis Luna (1986) reported as many as thirty plant additives, many of them also highly bioactive.

Shamanic Ayahuasqueros

A variety of sources indicate a wide range of traditional uses of ayahuasca, including healing, diagnosing causes of disease, determining cures, foreseeing the future, sending messages to other groups, contacting distant relatives, determining if wives were unfaithful, determining plans of the enemy, identifying sorcerers, and practicing love magic. Some of these uses are obsolete, especially those associated with warfare and headhunting, but other have continued. According to Oscar Calavia (2000), ayahuasca was used among the Yaminahua in warfare. This was also the case among the Shuar of Ecuador. Ayahuasca was involved in the rituals for the preparation of the *tsentsak,* or head trophy, to insure that the spirit of the killed warrior would be submitted to the will of the victorious one (Karsten 1935). Ayahuasca has also been the source of artistic inspiration, for instance among the Tukano of Colombia (Reichel-Dolmatoff 1978), the Shipibo-Conibo of Peru (Gebhart-Sayer 1985), and the Kashinawua of Peru and Brazil. Among the Siona of Colombia the main theme of cultural narratives is the journeys of shamans by means of the sacred brew (Langdon 1979). In healing, its uses include shamanic journeys to restore soul loss, ex-

traction of pathogenic objects, and shamanic fights with the animated agents of illness.

Luna (1986) pointed to the widespread use of ayahuasca in establishing relations with a special source of knowledge and power for dealing with all aspects of life and gaining direction and guidance throughout life. The plant spirits inherent in ayahuasca are viewed as active and intelligent beings that provide direction. In the Amazon the world is thought of being composed of various (spiritual) planes, which are accessible to specialists by means of altered states of consciousness. Ayahuasca facilitates traveling through those realms and access to information from the beings that populate them. It is also used to explore the natural environment. Among the Kamsá of Colombia, for example, it was reported that various plants are added to the basic ayahuasca preparation to study their properties, thus expanding their pharmacopoeia (Bristol 1965).

Luna's 1986 study provided evidence that all the main elements of Core Shamanism are present in these traditions. These include initiation procedures, which include sexual segregation, dietary prescriptions excluding the use of salt, sugar, alcohol, and food containing much fat, and repeated access to altered states of consciousness through the use of ayahuasca or other psychointegrator plants. Dismemberment and other sorts of symbolic death to acquire shamanic powers are also present. Through training, the novices contact animal and plant spirits and obtain from them magic songs they later use in their shamanic practice, including divination, finding lost objects, healing, and journeys to other realms. Concepts of illness include soul loss and soul journey to restore the lost soul, as well as the idea of illness as a pathogenic agent with material and spiritual components that the shaman can extract. Some traditional *ayahuasqueros,* as practitioners who use ayahuasca are called by Spanish speakers, claim to be able to transform themselves into various animals or elements of the natural world to explore various shamanic realms (typically underwater, earth, and sky) and to attack or to defend themselves from the attack of rival shamans.

Vegetalistas

Luna (1986) discussed ayahuasca use among urban mestizo groups of the Peruvian Amazon, as part of the broader healing practice of *vegetalismo,* so called because of its use of the knowledge of plants. An important part of the use of ayahuasca in this practice is the training and initiation of the practitioners, who follow many of the classic features of shamanistic practices in the way they are instructed by the plants as teachers, through the spirits of these plants. Training and initiation require extensive food restrictions and sexual abstinence and segregation from virtually all contact with women. Dietary prohibitions of alcohol, pork, chicken, fats, salt, sugar, condiments, fruit, vegetables, and cold beverages are widely reported. The preferred diet includes plantains, smoked fish, rice, and manioc. Violations of these prohibitions are believed to cause illness or even death. Diet is viewed as a tool helping to maintain the altered state of consciousness that permits the plant teachers to instruct, provide knowledge, and enable the initiate to acquire their power. The diet is viewed as a means of making the mind operate differently, providing access to wisdom and lucid dreams.

The training period involves learning songs, chants, and medicinal recipes, and enhancing the trainees' artistic and intellectual skills. Ayahuasqueros may continue to ingest these plants in group sessions with other practitioners to exchange information, renew their strength, or enhance their visionary powers. Experience with a range of different plant additives is viewed as part of learning about the various potentials that the plants provide. Tobacco is used as an essential part of the practices. Learning magical chants and songs taught by the spirits, receiving phlegm used in healing, and acquiring magical darts for defense and attack are central to the ayahuasquero's learning about the plant spirits and their powers. The chants learned serve many purposes—calling souls and spirits, affecting the actions of the ayahuasca or specific plant teachers, curing specific illnesses, and in love magic. The phlegm and darts are viewed as necessary protectors in any hostile spiritual world into which the initiate enters. They can also be used to harm others through sorcery. The visions produced under the influence of *Banisteriopsis*-based mixtures are a source of information about the causes of illness and spiritual forces involved in sickness and well-being.

Differences between urban and rural ayahuasca traditions have been noted. Urban use is generally under the administration of healing professionals treating strangers, while in rural settings practitioners are focused upon small kin groups. Walter Andritzky (1989) suggested that the use of ayahuasca by adult members of the community strengthened social cohesion and identity. He further suggested that ayahuasca helps people deal with the problems of acculturation. The rituals associated with ayahuasca use mediate between the Euro-American and indigenous worlds, creating a synthesis of the traditional and the new through the use of emotionally relevant images of culture change from the indigenous point of view. Ayahuasca apparently gives the user conscious access to the process of symbolization. The songs and long stories told by the healers about the mythological worlds structure visions and evoke experiences. These and other factors contribute to the powerful effects that characterize experiences induced by ayahuasca.

As mentioned at the beginning of this section, ayahuasqueros are a subset of a larger group, vegetalistas, a group that includes specialists in other plants, such as *tabaqueros,* who use tobacco; *camalongueros,* who use *camalonga* (unidentified); *toeros,* who use *toé* (*Brugmansia* sp.) and *paleros,* who use different *palos,* or trees. There are also practitioners who call themselves *oracionistas:* They carry out their tasks mainly with the use of prayers, many from books such as *La Santa Cruz de Caravaca,* widely used by healers in Latin American countries, *perfumeros,* who use the essence of various flowers, and Rosicrucians or members of other semisecret organizations (Dobkin de Rios 1984). Some practitioners use the term *chamán,* due to the influence of anthropologists and non-Amazonian visitors. All ayahuasqueros the author has met consider themselves Christians, and may invoke Jesus or Mary in their rituals. All of them engage principally in healing, and at times also divination.

Modern Ayahuasca Traditions

A growing interest by non-Amazonians in ayahuasca has produced a wide range of changes in these traditions and new perceptions of these sacred plants by other cultures. The sacred plants used by ayahuasqueros of traditional groups are now being employed by others: unqualified members of indigenous communities, mestizo practitioners with various degrees of expertise, and non-Amazonians. Amazonian practitioners suddenly find that their traditional knowledge has a value in the eyes of non-Amazonians and can be an important source of income. Indigenous groups have received the entrance of non-Indian and non-Amazonians differently. In some instances there has been a firm rejection of non-indigenous practitioners, in others an acceptance. The most notable example of rejection of non-indigenous use is the publication of the Yurayaco document issued by UMIYAC (Unión de Médico Indígenas Yageceros de la Amazonía Colombiana), an organization of Indian ayahuasqueros (or *yageceros*). They have denounced the use of ayahuasca by others, especially attempts by Loren Miller, an American citizen, to patent *Banisteriopsis caapi.* Other indigenous practitioners have agreed to share this knowledge with outsiders. Hilario Chiriap, a Shuar shaman from Ecuador, told the author of this entry that "white people are using ayahuasca and are going to use ayahuasca in the future; therefore we should at least teach them to use it properly" (personal communication). Don Hilario teaches foreigners about ayahuasca, emphasizing traditional dietary prescriptions, sexual segregation, and periods of intense training, preferably in isolation.

Due to several waves of migrations into the Amazon from the Brazilian northeast, indigenous and mestizo ayahuasca traditions have met Afro-Brazilian religious traditions, and a new ayahuasca phenomenon has emerged in Brazil. This use of ayahuasca as a sacrament by syncretic religious organizations is now found in every major Brazilian city and in other countries.

Three religious leaders from the Brazilian northeast created syncretic religious organizations having ayahuasca as their central sacrament: Raimundo Irineu Serra (1892–1971) and Daniel Pereira de Matos (1904–1958) in Rio Branco, Acre, and José Gabriel da Costa (1922–1971), in Porto Velho, Rondonia. A fourth religious leader, Sebastiâo Mota (1920–1990) was a follower of Irineu Serra, but created after his death a new religious organization that separated from the matrix. The Centro Eclético de Fluente Luz Universal Raimundo Irineu Serra (Eclectic Center of

Fluid Universal Light Raimundo Irineu Serra), or CEFLURIS, created in 1972, first expanded to urban areas of many Brazilian states, and later into other countries in Europe, the Americas, and Japan. The original nucleus created by Irineu Serra, known as Alto Santo, divided into several small nuclei, all located in Rio Branco, plus an offshoot in Porto Velho.

The religious organization created by Daniel Pereira de Matos, known as Barquinha, has also divided into various churches in Rio Branco, with smaller units in Brasilia and Salvador. The Uniâo do Vegetal (UDV), however, created in 1961 by José Gabriel da Costa, is experiencing the greatest growth. It is found in nearly every major Brazilian city, has members in all layers of society, and is spreading to other countries. Followers of Irineu Serra, Pereira de Matos, and Sebastiâo Mota call the sacred brew Santo Daime, while adepts of José Gabriel da Costa call it Vegetal. The use of ayahuasca in these religions served as the great cohesive force, especially in the aftermath of Amazonian economic ruin after the center of rubber production shifted to Southeast Asia in the beginning of the twentieth century.

Brazilian scholars such as Clodomir Monteiro (1983) and Edward MacRae (1992) have seen a kind of "collective shamanism" in the Santo Daime religions. The accounts of the way that Irineu Serra and Sebastiâo Mota got in touch with ayahuasca reveal shamanistic motives. Irineu Serra kept the typical shamanic diet of the Peruvian Amazon, and Sebastiâo Mota experienced a mystical operation in which he was healed. Brazilian religious organizations differentiate themselves from shamanic practices in that there is an emphasis on a doctrine, codified either in received hymns (as in the case of followers of Serra, Mota, and Pereira de Matos), or in stories transmitted orally in the case of members of the UDV. Barquinha is more closely associated with the incorporation of spirits (influenced both by Umbanda, an Afro-Brazilian religion, and Kardecism [referred to in the Afro-Brazilian entry as "kardecist spiritism," a form of spiritualism that originated in the nineteenth century in France]) than with shamanic flight, even though it is at the same time the closest to Amazonian sources in the importance in its cosmology of the so-called *encantados,* spirits incorporated in plants or animals. The Uniâo do Vegetal, on the other hand, actively rejects any kind of possession or incorporation, as well as any emphasis on healing or shamanic ecstasy.

There is a frequent movement of persons between different ayahuasca doctrinal lines; schisms occur within these religious organizations with the emergence of new charismatic religious leaders; the use of ayahuasca is gradually incorporated by other religious organizations. All these factors have contributed to the appearance of more and more groups led by neo-ayahuasqueros in religious, therapeutic, musical, and artistic settings. Shamanistic use of ayahuasca is thus a broad and complex concept encompassing indigenous use, mestizo use, the use of ayahuasca by some of the syncretic Brazilian religious organizations, and the recent use of ayahuasca by indigenous groups who did not use it traditionally, as well as by non-indigenous practitioners.

Ayahuasca users have been persecuted by many groups—missionaries, physician organizations, the military, and even guerrilla organizations. Among some groups the use of ayahuasca has disappeared altogether; other groups have adopted it at a later stage, and, as discussed above, collective ritual use of ayahuasca has been an important factor in strengthening social bonds. It appears that the indigenous groups that do maintain the ritual use of these sacred plants (e.g., the Shuar of Ecuador, the Shipibo of Peru, and some Tukano groups of Colombia) are likewise better able to maintain social cohesion in the face of opposing economic and cultural forces.

CENTRAL AND SOUTH AMERICAN SHAMANISM

Vast and rich, harboring tremendous biological, cultural, and linguistic diversity, and heirs to a glorious and tragic history, Central and South America have given rise to some of the most ancient, enduring, and spectacular examples of shamanistic practice documented. The Asiatic peoples who migrated to the Americas during the Pleistocene era appear to have brought with them a ritual complex that integrated religious and medical functions, centered around trance states, and may have involved hallucinogenic plant use. As in the case of the Siberian cultures to whom we owe the etymology of the term *shaman,* native societies throughout Central and South America distinguish ritual specialists who enter trance to commune with the spirits for purposes of healing, divination, and other matters of individual and collective well-being. Because of the presumed Asian origins of Amerindians, and also partly because the Siberian term happened to gain wide usage, certain west Asian traditions and similar Arctic and North American examples have been treated as original or more "pure" versions of shamanism than their Central and South American counterparts. Yet recent archeological and genetic evidence suggests a much more ancient date for the arrival of humans in the Americas than had

previously been assumed. Keeping this fact in mind, native Central and South American shamanism should be seen not as derivative of or secondary to "classic" Asian shamanism, but rather parallel, largely independent, and equally ancient bodies of practice that have evolved and diversified in response to heterogeneous ecological, sociocultural, and historical conditions.

Evidence for shamanism in pre-Columbian America is scant and sometimes speculative, but still it suggests a certain continuity of practice from ancient through contemporary times and throughout large geographic areas. Some consider geometric designs and animal motifs in ancient rock art in South America and elsewhere in the world as evidence of shamanistic practices in Paleolithic times (Williams 1993). Spectacular artistic and religious iconography at Chavin de Huantar, cradle of Andean civilization, includes representations of the hallucinogenic San Pedro cactus, suggesting an ancient and ongoing importance of hallucinogens and shamanism in highland and coastal Peruvian societies. Snuff kits and tablets containing hallucinogenic plants have been found at archaeological sites throughout South America, echoing shamanistic practices documented in historical and ethnographic accounts (Torres 1998). Pre-Hispanic artwork and early colonial manuscripts from Mexico depict hallucinogenic mushroom and plant species in ritual and mythological contexts; the importance of *Bufo* toads in Aztec and Mayan art and symbolism has been interpreted as evidence for the ritual use of hallucinogenic toad toxins in ancient Mesoamerican religion (Davis 1998, 232). Artwork and heiroglyphic writings of the ancient Maya describe trance states induced by fasting, bloodletting, and perhaps hallucinogenic preparations.

From the early days of the Conquest, explorers and missionaries observed and commented on the religious and medical practices of native societies. Having destroyed hundreds of priceless Aztec codices (painted books) documenting all aspects of life in ancient Mesoamerica, Spanish priests nonetheless continued to write their own accounts of indigenous worship, divination, healing, and other "pagan" customs. Juan de Córdova, a Dominican friar, was sent to live among the Zapotec of Oaxaca in the middle of the sixteenth century to investigate their "idolatrous rites," and was able to document surviving pre-Hispanic customs such as a hierarchical priesthood, ritual bloodletting, and religious uses of tobacco, *datura,* and hallucinogenic mushrooms (Marcus and Flannery 1978). Spanish natural historian Gonzalo Fernandez de Oviedo described the "very evil [vice]" of tobacco smoking among indigenous peoples of Hispaniola island (modern-day Haiti and the Dominican Republic), who were mostly extinct by the time his book was published in 1535 (cited in Narby and Huxley 2001, 11). Political and spiritual leaders among the Hispaniola islanders smoked large pipes of tobacco to commune with the spirits, heal the sick, and secure bountiful harvests or victory in warfare.

French priest André Thévet visited coastal Brazil in the mid-sixteenth century and provided a similar account about tobacco-consuming prophets (the term shaman did not enter the literature until much later) among the Tupinamba known as *pagé:* "impostors . . . people of evil custom," and "ministers . . . who . . . serve the Devil," in the good priest's opinion (cited in Narby and Huxley 2001, 13). The pagé isolated themselves and abstained from sex and social contact in order to carry out secretive healing and divining ceremonies during which they chanted (and probably consumed hallucinogens) to invoke spirits. Writing in the same period about Peru, Spanish priest Bernabé Cobo describes *achuma,* the hallucinogenic San Pedro cactus, as being "the plant with which the devil deceived the Indians of Peru in their paganism . . . Transported by this drink, the Indians dreamed a thousand absurdities and believed them as if they were true" (cited in Davis 1998, 172).

Despite their cultural bias, such early accounts provide us a glimpse into the shamanistic practices of societies that are now extinct or completely assimilated. Condescension and a disparaging attitude toward shamans continued to color the writings of missionaries, travelers, naturalists, and early anthropologists at least through the first decades of the twentieth century, when more sophisticated ethnographic accounts became available.

Shamanism and Gender

Shamanism in Central and South America has been most frequently documented as a male profession, but women are by no means excluded.

One of the earliest written records of shamanism in the Americas is from a Classic Mayan inscription concerning a noblewoman of Yaxchilan who, as shaman-priestess, carried out blood-letting rites and had visions of snakes and ancestor spirits (Schele, Freidel, and Parker 1993). Among the historical Carib, women shamans could sometimes surpass their male counterparts in importance; among the tribes of Patagonia, male shamans dressed as women (Dixon 1908), reminiscent of cross-dressing *(berdache)* in some North American and Siberian shamanic traditions. Maria Sabina, a female Mazatec shaman of Oaxaca, initiated American banker and mushroom enthusiast Gordon Wasson into the mysteries of the divine mushroom, and thus helped spark the psychedelic revolution of the late 1950s (Narby and Huxley 2001, 141).

Nonetheless, menstruating women are considered anathema to the shaman's practice in many traditions, as the odor and impurity of menstrual blood repel the deities or guardian spirits. Prolonged abstinence from sex and avoidance of contact with menstruating women are fundamental to the shaman's ethic, especially during initiation and immediately before and after trance rituals.

Shamanism in Lowland South America

In an important survey, Alfred Métraux (1949) reviewed three centuries of Western writings about shamanism in lowland South America, recovering important factual information while finding much irony in the unenlightened denunciations of some writers. He wrote that far from being impostors or ministers of evil, shamans are dedicated and indeed pious practitioners of native religion who perform important social, spiritual, and medical functions and are often held in high esteem by their fellows. Though widespread, shamanism is not universal among tropical forest tribes, being absent or extremely reduced among most Gé-speaking groups of central Brazil, for example. Where shamanism is practiced, a series of common themes and elements are found throughout large areas and in culturally and linguistically diverse groups.

Native peoples of the West Indies, Guyanas, Amazon basin, and as far south as Paraguay recognize ritual specialists known as *piai* (or pagé), a word of Tupi and Carib origin that is similar in meaning to the Siberian term *shaman.* The piai passes through an arduous period of apprenticeship that requires fasting, sexual abstinence, dancing, and the consumption of large amounts of tobacco. Among Tupi and Carib groups, the novice is subjected to painful ant stings. In some groups, emetic or psychoactive teas are consumed. By undergoing these privations, the apprentice shaman frees the soul from the physical body and is able to fly to distant realms or ascend the heavens by means of a twisted ladder, making contact with spirits in animal, human, or other forms. From among the available pantheon, the novice seeks out a more intimate association with one or more spirits who serve as guardians or guides for the shaman from then on.

In some cases, only people who receive a spiritual calling through dreams, visions, or severe illness undergo a shamanic initiation. In other traditions, especially those involving group consumption of pyschoactive plants, a substantial part of the population (especially young men) may undergo basic shamanic initiation rites, but only those who attain special visions or show exceptional virtuosity and healing skill go on to become master shamans. In most cases, the novice's apprenticeship is supervised by an older, more experienced master.

An important aspect of the South American shaman's training is the acquisition of esoteric songs, chants, and other invocations that are used to contact specific spirits, relate myths, recall the wayward souls of people who are ill, or describe sensations and adventures in the spirit world. Among the Akawaio of Colombia, songs are believed to be the wings of the shaman's magical flight; various bird spirits lend the shaman their "wings," in the form of specific songs, during trance. Healing songs of Kuna shamans of Panama employ symbols derived from myths to situate illness in the cosmos and address its underlying etiology (Lévi-Strauss 1963). In those shamanic traditions involving hallucinogenic plant use, songs and other auditory cues play an important role in guiding initiates or patients and manipulating the content of personal and collective trance experience. Rattles or packets of rustling leaves are widely used as a percussive accompaniment to the singing and as an auditory signal of the comings and goings of the shaman's winged soul.

The Yaminahua of Amazonian Peru and Brazil consider songs to be the shaman's most prized possessions and the essence of his power, knowledge, and ability to heal. Yaminahua songs employ "twisted," metaphorical language to build complex narratives that act as paths, guiding the shaman safely through the trance experience and the ambiguous, dangerous spirit world (Townsley 1993). Shamanic songs of the Matsigenka of southeast Peru come directly from the spirits, and are difficult to translate or interpret, as they contain much onomatopoeic, archaic, and other nonordinary language. Most songs are not rehearsed, remembered, or fully intelligible in ordinary states of consciousness, and seem to derive their power largely from their acoustic properties, augmented by hallucinogenic trance (Shepard 2004). Among the Shipibo of the Ucayali River, shamanic songs in conjunction with hallucinogens generate a multifaceted synesthesia, or mixing of the senses. Shipibo shamans in trance are able to perceive people's auras, lace-like patterns of interlocking geometric designs that become visually distorted and malodorous during illness. The shaman sings, smells, and visualizes geometrically patterned, "fragrant songs" to correct the deformed aura and thereby restore health (Gebhart-Sayer 1986).

The shaman's power is often attributed to the presence of a magical substance in or around his body or on his person, variously described as stones, crystals, arrows, darts, or a black or luminous phlegmlike matter (Métraux 1949; Chaumeil 1993). The magical substance is an embodiment of the spirit helpers, and often materializes or is transformed during trance to be manipulated in special ways, serving as both a shield and a weapon, a medicine and a poison. Matsigenka shamans of the Peruvian Amazon carry small stones or carved human figures known as *serepito* (tobacco stones), totemlike representations of invisible spirit helpers to which tobacco is continually fed (Baer 1992). Desana shamans of Colombia guard precious quartz crystals imbued with magical power and a complex symbolism uniting myth, mind, and the cosmos (Reichel-Dolmatoff 1979). Among the Jivaro of the Ecuadorian Amazon, the shaman gets his power from spirit helpers in the form of invisible darts *(tsentsak),* which are passed from master to apprentice and stored in the mouth, stomach, or elsewhere in the body (Harner 1973). Sorcerers cause illness and death by throwing tsentsak at victims, while healing shamans use their own tsentsak to suck out, absorb, and return sorcery darts.

Though widely considered vital for the collective well-being, shamans and their spirit allies also occupy a position of moral ambiguity. Undoing sorcery requires an intimate understanding of the black arts, and often involves firing the pathogenic factor back at the perpetrator. Most South American societies have terms to distinguish between good, or "healing shamans," and sorcerers, or "killing shamans." In practice, however, the distinction is not so clear, as the same set of techniques, powers, and spirits that allow the shaman to heal also allow him to kill and commit sorcery. Shamans, even those generally considered to be healers, are often prime suspects for sorcery accusations. In some cases, shamans may become targets for revenge killings by the families of sorcery victims (Brown 1978).

Mesoamerican Shamanism

Shamanistic practices among contemporary indigenous peoples of Mexico and Central America share many general similarities with those of South American societies; most of the circum-Caribbean indigenous groups who represented a direct link between the two culture areas were exterminated or assimilated. As in South America, Mesoamerican shamans may receive an initiatory calling through dreams or severe illness, or enter the profession by choice. In other cases, candidates for shamanism may be identified through inheritance, by surviving a lightning strike, or due to auspicious omens or calendrical indications at the time of birth. Mesoamerican shamans also generally undergo a prolonged period of apprenticeship, and tobacco and other psychoactive plants play an important role in many traditions. As in South America, chanting and singing are a key part of healing ceremonies and the trance experience. Divination is an important function of Mesoamerican shamans, since their contact with the world of spirits allows them to see things that are hidden from ordinary vision. As in South America, quartz crystals are important items in the shaman's toolkit. Huichol shamans are said to be able to capture the souls of sick people or the dead in quartz crystals, while

Mayan shamans gaze into crystals or cast them as lots for purposes of divination.

The contemporary Mexican and Central American indigenous societies where shamanism has been studied tend to be larger, more sedentary, and more hierarchical than their counterparts in lowland South America, though they are comparable in many ways to Andean societies. The distinction between shamans and priests in such hierarchical Amerindian societies becomes somewhat artificial, as shaman-healers may also officiate as priests in religious festivals and life-cycle ceremonies. To a greater extent than in lowland South America, native Mesoamerican and Andean religion and shamanism are inextricably blended with Spanish folk Christianity, reflecting five centuries of political, economic, and religious colonization. Indigenous shamans in Mexico and Guatemala as well as highland Peru and Bolivia often invoke native deities and Catholic saints in the same breath, and their syncretic personal altars and community churches blend indigenous and Christian symbols.

Healing Functions

Healing is a key function performed by Central and South American shamans. For many societies, shamans are the only hope for curing certain categories of illness, especially those associated with sorcery, spirit attack, and soul loss. Key features of shamanic healing throughout Central and South America are the calling back of wayward souls, usually through singing or chanting; the identification of harmful spirits or sorcerers who inflict illness, usually through visions in dream or trance; and the removal from the patient's body of intrusive objects believed to cause illness, usually through sucking, massage, or transference to some ritual object or sacrificial animal. The examination, diagnosis, and curing of the patient often take place in prolonged, elaborate, group-attended rituals during which the shaman enters trance through drug use or other means, sings or performs dramatically, handles symbolically potent objects, and manipulates the patient.

Many groups distinguish between therapy that relies primarily on contact with the spirits (i.e., shamanism) and that which employs plants and other empirical cures (herbalism, bone-setting, and the like). (Note that this distinction does not necessarily imply a dichotomy between supernatural and natural etiology or mental and physical ailments. Medicinal plants may be used to treat spiritual ills, and the spirit illnesses treated by shamans sometimes include introduced Western diseases.) The Cashinahua of the Peruvian Amazon describe two kinds of healers: those who possess "sweet medicine" *(dau bata)* and those who possess "bitter medicine" (*dau muka*) (Kensinger 1974). Sweet medicine consists of wild and cultivated herbs as well as animal glands, usually administered to the patient by a family member, sometimes but not always in consultation with a specialized herbalist. Bitter medicine is the esoteric domain of shamans, who use bitter hallucinogenic plants to enter trance and address the spiritual cause of illness. The Warao of the Orinoco delta make a similar distinction: Male shamans belonging to three classes—white shamans, black shamans, and priest-shamans—perform elaborate rituals to treat illnesses caused by the attack of spirits known as *hebu* (Wilbert 1996). Warao herbalists, exclusively women, use medicinal plants for treating illnesses caused by other means and administer their medicines without ritual accoutrements.

In some traditions, shamanism and herbal therapy overlap. Among the Maya of Mexico and Guatemala, herbal healers as well as bonesetters and midwives, like shamans, receive an initiatory call from spirits during dreams or illness. Krahó shamans of Brazil gain their considerable knowledge about plant medicines from animal spirits (Melatti 1974). Kamsá and Inga shamans of the Sibundoy valley in Colombia claim to have learned their extensive knowledge of medicinal plants directly from the plants themselves during drug-induced visions (Schultes and Raffauf 1990). In a similar vein, urban shamans, or *vegetalistas,* of Amazonian Peru obtain information about herbal medicines from plant spirits, perceived in dreams and other altered states as doctors, teachers, or mother spirits (Luna 1986). The Matsigenka shaman visits the realm of the guardian spirits to obtain new medicinal plant varieties and other cultigens (Shepard 1998). Sacred plants used by shamans to enter trance often have mundane, medicinal uses as well.

Even though he has been evangelized by the Salesian missionaries, it is best to keep out of the way of the pajé shaman when he wanders, machete in hand, with hallucinations in his head. Manturaca-Village Yanomami, Amazonas-Pic de Neblina, Brazil, August 1, 1990. (Herve Collart/Corbis)

Other Functions

Though an important and sometimes primary task, diagnosis and healing of illness is not the only function of the shaman. Shamans may also interpret omens, predict the future, charm game animals, control the natural elements, preside over ceremonies, perceive events occurring at distant locations, and kill enemies at a distance. In Mesoamerican societies, shamans often occupy formal positions of political and religious authority. Though lowland South American indigenous societies tend to be less hierarchical, shamans there may also wield some degree of political power. In diverse Central and South American cultures, powerful shamans are said to control the elements and other natural forces and have the ability to change into jaguars, pumas, wolves, eagles, hummingbirds, or other animals. Shamanism is often intimately associated with hunting and, in some cases, agriculture. The deer hunt among the Huichol of Mexico is an important occasion laden with shamanistic rituals and symbolism, for the deer is a deity that relays messages between the shaman and the gods. Mayan shamans bless maize seeds at the time of planting and harvest. For the Matsigenka, shamans created biological diversity in the mythical past, maintain the genetic diversity of crops through the present, and ensure the ongoing availability of game animals (Shepard 1998). Former shamans among the Tupi-speaking Tapirapé of central Brazil were able to locate game animals in their dreams, and performed public trance rituals during which they acted out fierce battles with spirits, enemy tribes, and dangerous natural forces such as thunderstorms (Baldus 1974).

In many Amerindian societies, collective well-being represents cosmological and ecological balance that can be upset when humans exceed their bounds and Nature settles her scores. The shaman serves as a kind of ambassador who negotiates with the spirits and the forces

of nature in order to restore or redefine the equilibrium of the cosmos-as-ecosystem. The Matsigenka believe shamans to be immortal, joining at the time of their physical death an invisible society of guardians who use magical powers and natural forces (lightning, earthquakes, river dynamics) to keep illness, demons, and the forces of evil at bay. Among the Kogi of Colombia's coastal mountains, *mamas* are priestlike specialists whose constant ritual interventions are necessary to bring fertility, ensure the continuity of natural processes, and guarantee the order of the universe. The mamas do not practice healing and are thus not considered shamans in the strict sense. But echoing the practices of shamans elsewhere, mamas make frequent use of a narcotic preparation (coca) and pass through a long initiation period during which they live in darkness, mastering techniques of breathing and meditation that allow them to enter trance and see the true nature of reality beyond the distractions of ordinary vision (Reichel-Dolmatoff 1976).

Psychoactive Plant Use

One striking aspect of Central and South American shamanism is the frequent use of hallucinogens, stimulants, narcotics, and other psychoactive substances for entering into contact with the spirit world. The most widespread of these is tobacco (*Nicotiana tabacum, N. rustica*), among the first plants to be domesticated in the New World (Wilbert 1987). Tobacco is mentioned in historical and modern accounts of native Central and South American religion and ritual in a myriad of forms, preparations, and modes of ingestion: snuffed, chewed, drunk, inhaled or swallowed as smoke, dripped in the nose, eaten as a concentrated paste, and even taken as an enema. Tobacco is especially important in the initiation of the novice shaman, who may consume huge doses in order to obtain an initiatory vision involving a spirit guide or helper. For the Matsigenka, tobacco and shamanism are synonymous: The word for shaman, *seripigari,* means literally, "the one intoxicated by tobacco" (Baer 1992). The master shaman among the Matsigenka swallows a quid of tobacco paste, regurgitates it, and gives it mouth-to-mouth to the apprentice, thus passing his magical substance and his shaman's soul *(isure)* through his tobacco (*isere*) (Shepard 1998). The dedicated shaman comes to crave tobacco as much as food, and may become so involved in the relationship with spirits that he withdraws from social affairs, eats little, and loses interest in sex (Kensinger 1974). Tobacco smoke is intimately associated with the notion of the shaman's magical breath, blown on patients to heal them or at enemies to kill them (Métraux 1949).

Datura meteloides, Datura stramonium (jimsonweed), and other naturally occurring nightshades belong, like tobacco, to the *Solanaceae* family, and were once used widely by indigenous peoples of North and Central America to induce profound, sometimes deathlike states of trance in rituals of initiation, divining, and healing. *Brugmansia* is essentially a domesticated *Datura,* and numerous species and varieties are cultivated by indigenous populations throughout Central and South America for their medicinal, narcotic, and hallucinogenic properties. Like the closely related *Datura, Brugmansia* contains potent bioactive and psychoactive tropane alkaloids. Widespread medicinal uses, for example setting broken bones and resolving difficult childbirth, recall similar biomedical applications of tropane alkaloids atropine and scopolamine. Ingested in moderate doses by shamans, sick people, or victims of misfortune who seek healing or revelatory visions, *Brugmansia* embarks the user on a journey in which reality and hallucination are utterly indistinguishable. Depending on the dose, the narcotic effects may last for one night, several days, or many weeks; excessive doses can cause insanity or death (Shepard 1998).

Among the Aguaruna Jivaro of Peru, the name for *Brugmansia* refers to a mythic hero, Bikut, from whose bones sprang three Aguaruna cultivars of the plant: "enemy *bikut,*" used by warriors to obtain killing visions that bring luck in warfare; "tranquility *bikut,*" used by shamans to obtain visions for healing and general prosperity; and "remedy *bikut,*" valued for its medicinal properties in setting bones and curing other illnesses, but which may confer witchcraft darts if taken frequently (Brown 1978). Other nightshade relatives are used for various medicinal, divinatory, and psychoactive purposes and as admixtures for hallucinogenic plants (Schultes and Raffauf 1990; Shepard 1998).

Natural hallucinogenic compounds used ritually in Mesoamerican religions became a focus

of scientific and popular attention beginning in the 1950s, and many were appropriated for recreational use. Known to the Aztecs as *teonanacatl,* "flesh of the gods," hallucinogenic mushrooms of the genera *Panaeolus* and *Psilocybe* have been used widely among indigenous groups of Mexico since ancient times. The Mazatec Indians of Oaxaca consider these mushrooms to be divine entities that travel to the earth on thunderbolts (Wasson 1990). The sacred drink of the Aztecs, *ololiuqui,* was prepared from the seeds of a morning glory *(Turbina corymbosa)* containing hallucinogenic compounds closely related to LSD. The peyote cactus *(Lophophora williamsii)* contains dozens of psychoactive alkaloids, including mescaline. The Huichol, Tarahumara, and other indigenous groups of the deserts of Northern Mexico gather and consume peyote in communal rituals, and their shamans use peyote to gain access to aspects of knowledge and power not attainable through other means. For the Huichol in particular, not only the cactus itself but also the mythical landscape of the peyote desert stand at the center of religion, cosmology, and spirituality (Furst 1990, 136–184).

South American shamans make use of a tremendous diversity of psychoactive plants and plant mixtures, containing some of the most potent hallucinogenic compounds known in nature. Shamans of the northwest Amazon use the tryptamine-laden red resin of several *Virola* species, trees in the nutmeg family, to prepare hallucinogenic powders for purposes of healing and divination. Known locally as *paricá* or *yopo,* it is taken as a snuff by Barasana, Cubeos, Kuripakos, Taiwanos, Tukanos, and other tribes of eastern Colombia and northern Brazil. The Bora and Witoto of Peru ingest it in the form of small pellets, while the Maku of Brazil consume the resin directly. Shamans and laymen alike among the Yanomami of Brazil and Venezuela inhale *Virola* snuff, known as *epena* (semen of the sun), at frequent rituals and feasts. During trance, a succession of spirits *(hekura)* enter the chest and take possession of the epena user, causing him to dance and gesticulate in ways specific to the possessing spirit. *Anadenanthera peregrina* (also known as *Piptadenia peregrina*) is a tree in the legume family whose seeds contains tryptamine alkaloids much like those found in *Virola* resin. Like *Virola,* it is used to prepare a hallucinogenic snuff by shamans of Colombia, Venezuela, and Brazil. Restricted in its natural habitat to the open grasslands, savannas, and dry forests of the Venezuela-Brazil border area, it appears to have been cultivated in the past throughout a much larger area (Schultes and Raffauf 1990).

Banisteriopsis caapi is a liana used in the preparation of a hallucinogenic beverage used widely throughout Amazonian Peru, Colombia, Ecuador, Bolivia, and western Brazil, known by various local and indigenous names: *ayahuasca, caapi, yagé, natema, kamarampi, vegetal,* and *hoasca.* In most accounts, the pounded liana is boiled with the leaves of one or more species of *Psychotria,* a shrub in the coffee family, among other admixtures. The principle hallucinogenic component is not provided by the *Banisteriopsis* itself but rather by *Psychotria,* containing demethyl tryptamine (DMT), a potent natural hallucinogen. Beta-carbolines in *Banisteriopsis* potentiate the effects of DMT, which otherwise would be inactive, via oral administration. Ethnobotanists have been as much intrigued by the vision-inducing qualities of the beverage as by the mystery of how tribal peoples with no knowledge of organic chemistry managed to identify, among the tens of thousands of available species, the synergistic properties of these two plants, neither of which is hallucinogenic when taken alone (Davis 1998, 164).

Like peyote, the San Pedro cactus *(Trichocereus pachanoi)* of highland and coastal Peru contains mescaline and other psychoactive alkaloids. Known in Quechua as *huachuma,* "cactus of the four winds," this hallucinogenic plant is found in the art and religious symbolism of ancient Andean civilizations beginning with Chavin de Huantar in the second millennium B.C.E., and continuing through Nazca, Moche, and Chimú reigns until shortly before the Spanish conquest (Davis 1998, 169–172). Little is known about how San Pedro was used in ancient religious or shamanistic practice. Despite the extinction or cultural assimilation of coastal native civilizations and four centuries of persecution by the Catholic Church, vestiges of the ancient cult seem to have survived in the practice of urban shaman-healers, or *curanderos,* in northern Peru (Sharon 1990).

The coca plant (*Erythroxylum coca*), the notorious botanical source of cocaine, was held sacred by the Inca, whose empire once

stretched along the Andes from modern-day Chile to Colombia. Today, shamans of the Andean region chew coca leaves mixed with alkali-providing ash or lime in order to facilitate meditation or trance when healing and performing other ceremonies. Dried coca leaves are also cast by shamans and priests for purposes of divination. Coca cultivation spread from the Andes to the heart of the Amazon basin, where the plant has been used by lowland indigenous peoples for ritual and social purposes, perhaps for centuries.

The discovery of LSD and the rediscovery of psychoactive plants in Amerindian religions led to a growing scientific and popular interest in hallucinogens, provoking a revolution in anthropological and psychological understandings of shamanism. Whereas earlier studies had focused on the supposed psychopathology of shamans, in the 1950s researchers began to appreciate the fundamental role of hallucinogenic compounds and altered states of consciousness in shamanic trance. Describing his first experience with ayahuasca, Michael Harner (1973, 15) wrote, “For several hours after drinking the brew, I found myself, although awake, in a world literally beyond my wildest dreams. . . . Transported into a trance where the supernatural seemed natural, I realized that anthropologists, including myself, had profoundly underestimated the importance of the drug in affecting native ideology.” In addition to providing new insights into native belief, firsthand experience of ritual hallucinogens by researchers may lead to profound personal insights and a paradigm-shifting reassessment of worldview (Narby and Huxley 2001, 301–305).

Although the use of narcotics and hallucinogens is conspicuous among Central and South American shamans, it is by no means universal. Krahó and other Timbira shamans of Brazil, for example, do not use any psychoactive plants during their apprenticeship or normal practice. Instead, they receive their call to the healing profession through a severe illness during which an animal appears, offering healing secrets and other special powers (Melatti 1974). Modern Mayan shamans of southern Mexico do not use the “magic mushrooms” so eagerly sought by foreign tourists, but they do consume tobacco snuff and rum during their curing ceremonies.

Other Observations

The data from Central and South America help debunk a number of popular misconceptions about shamanism. Contrary to the notion that shamans are only found in archaic hunting societies, shamanism in Central and South America has been documented in a wide range of social systems, including hunting, agricultural, and urban societies in ancient and modern times. Whereas some researchers consider trance and spirit possession to be distinct phenomena, Amerindian shamans do not appear to honor such a distinction. Among the Matsigenka, for example, trance is a form of possession in which the shaman and his brother or twin among the *Saangariite* spirits switch places: The spirit occupies the body of the shaman on the earthly plane while the shaman takes his brother’s place in the Saangariite village of the spirit world (Shepard 1998). The distinction between shaman and priest is also dubious in some South American and most Central American cases. Contrary to the notion of shamans as marginal members of society, shamans in many Central and South American groups have been found to wield considerable political power. Shamans are often rewarded in the case of a successful cure and may be afforded a degree of social prestige, even within egalitarian, small-scale societies. On the other hand, shamans who fail in their cures or predictions may be discredited or, especially in the case of suspected sorcerers, put to death. Yet in some situations, suspected sorcerers may be afforded a certain degree of respect and toleration for error so as to avoid provoking their wrath.

Change and Continuity

Beginning with the arrival of Columbus and continuing through the present, the conquest and colonization of the Americas by Europeans has unleashed warfare, epidemic disease, territorial dispossession, and forced cultural assimilation on native societies, leading to the extinction of many, the assimilation of others, and the marginalization and profound transformation of the surviving groups. Among the many aspects of indigenous society affected by these processes, shamanism, religion, and traditional healing are among the hardest hit. Initial contact with novel Western diseases resulted in virulent epidemics and extremely high mortality

rates, often leaving shamans among the dead and undermining the survivors' faith in traditional healing. Throughout the twentieth century, Catholic and Evangelical Protestant missionaries working with native communities have followed the example of their sixteenth-century forebears and vigorously discouraged shamanism and other manifestations of traditional healing and religion. The coincidence between devastating new diseases, the breakdown of the traditional social order, missionary propaganda, and the introduction of firearms—in conjunction with the inherent moral ambiguity of shaman-sorcerers—has sometimes led to a witch-hunting paranoia, driving shamans into hiding or extinction (Baldus 1974).

Despite such threats, shamanism has survived and even thrived in many Native American societies. More than just a therapeutic alternative, shamanism and traditional healing are an expression of indigenous religion, values, and worldview, and reflect five centuries of cultural and spiritual resistance. Contemporary Indian shamans of Mexico and Guatemala combine Christian and indigenous elements into a unique and dynamic body of belief and practice. Indigenous federations throughout the Peruvian Amazon have promoted programs to revitalize traditional medicine, resulting in a cultural renaissance of herbal therapy and ayahuasca-based shamanistic healing (Alexiades and Lacaze 1996). Shamanism has flourished in many South American cities and towns, where urban *curanderos* combine indigenous and Western cosmologies and ancient and modern symbols into a complex, contemporary brand of ecstatic healing. At the same time, native hallucinogens and indigenous as well as not-so-indigenous shamans have become a significant attraction for esoteric and spiritual tourism. While maintaining a healthy skepticism about local shamans and Western intermediaries who "sell out" to the demands of the New Age tourism market, Donald Joralemon (1990) noted that shamans have always been improvisers and innovators, adapting ancient techniques of ecstasy to fit the unique conditions of their particular society and worldview.

CURANDERISMO (THE AMERICAS)

The term *curanderismo* describes a holistic system, one in which the healer is connected with a spiritual aspect of healing. Curanderismo is found mainly in Latin America and in Mexican American communities in the United States. The system is similar to other holistic systems throughout the world that incorporate a designated individual such as a shaman who uses a variety of plants, herbs, symbolic articles, and prayer. Since Western industrialized society uses a biomedical model to define and treat disease, there is no equivalent term for curanderismo in modern technological practice. Nonbiomedical healing systems vary cross-culturally, but conceptually they focus on balance and harmony, which may be achieved by mental, physical, or spiritual methods (Balick et al. 2000, 344).

There is variability in how curanderismo is practiced. Healers may be either female *(curanderas)* or male *(curanderos),* and the treatment will be different in each geographic area, depending on the specific plants, traditions, body therapies, and religious beliefs of the particular country and group within that country. Since each country has its own traditions, predictably there will be differences in the actual methods and the choice of plants and herbs. Since there are no textbooks, each curandera's practice is highly idiosyncratic and dependent on her actual experience and training or apprenticeship.

To understand holism and the integrated system of curanderismo it is necessary to think in terms of process rather than product. Where Western medicine is didactic, and diagnosis is dependent on a variety of laboratory results and quantitative evidence, holistic medicine takes into account qualitative factors, such as the relationship of the patient with others, the environment, and supernatural forces. The concept of psychosomatic disease as a category separate from somatic disease does not exist. From the point of view of the Westerner's cognitive analysis, there are specific ailments that are classified as *culture-bound syndromes,* a term given to illnesses that have no equivalent in other cultures. These syndromes are legitimately diagnosed and adequately treated by the curandera. A few examples follow. *Ataque* is a culturally recognized emotional response to a great shock or bad news, characterized by hyperventilation, bizarre behavior, violence, and sometimes mutism. *Bilis* is an illness believed to be caused by strong emotions that result in an imbalance of bile, which "boils over" into the bloodstream. Symptoms include vomiting, diarrhea, headaches, dizziness, and migraine headaches. In *susto,* "soul loss," there is extreme anxiety, restlessness during sleep, depression, lethargy, anorexia, and lack of interest in appearance.

The Cartesian mind-body dichotomy, with its division between mental health and physical health, does not exist in curanderismo; a much earlier structure underlies this system, and that is the humoral scheme. In this ancient system, there were four elements—fire, air, water, and earth; four qualities—hot, dry, cold, and wet; and four humors—yellow bile, black bile, blood, and phlegm. The humoral theory began in China and India and later was incorporated by the Greek physician Hippocrates (ca. 460–377 B.C.E.). The Greek physician Galen (129–ca. 199 C.E.) elaborated on it, and later the belief spread to the Islamic world. When the Moors took over the Iberian Peninsula, Spanish and Portuguese physicians (and soon all of medieval Western Europe) adopted the humoral system, which they later brought to South and Central America (Helman 1994, 22).

The human body was conceived as a microcosm of the macrocosmic world. The amount and balance of these humors determined personality types and diseases that the individual was prone to acquire. When the humors were in balance, the body was healthy; excess or deficiency of one or more humors caused illness. In Latin America, the humoral theory has come to be called the Hot Cold Theory of Disease. Hot

and cold refer to symbolic power, not actual temperature. In order to keep the body in balance, prolonged exposure to any quality must be avoided. When a curandera or curandero diagnoses an individual, theories of hot and cold play an important part of the diagnosis and treatment. Since organs, diseases, foods, and liquids each are assigned "hot" or "cold" qualities, the healer must use a treatment to restore the balance. For example, in Puerto Rico, women after childbirth are treated with "hot" foods to prevent *lochia* (a normal discharge) from clotting.

A curandera is best understood within the framework of a non-Western medical system, the study of which is referred to as ethnomedicine (Brown 1998, 14). Her knowledge and techniques extend beyond the borders of any one culture or language. Hence, the meaning of the word is as varied within Hispanic cultures as are the methods (Perrone, Stockel, and Kreuger 1989, 85). The curanderas that were found in the new world in Spanish colonial culture spread their legacy to Spanish-American, Mexican-American, and Chicano groups, whose practitioners continue the tradition in Mexico, Guatemala, Nicaragua, Venezuela, Brazil, Puerto Rico, Argentina, Colombia, Cuba, and Spain.

The curandera is predominantly a practitioner in rural communities. Her methods include conversations with the family as well as the patient, and since she usually shares the same neighbors, the history she obtains will entail a lengthy process of interviewing more than one person. In contrast, at least one curandero practicing in the city of Bogotá, Colombia, has appropriated the ways of a biomedical healer and sees up to seventy patients a day. His consultations last a mere five to ten minutes (Press 1971, 744).

Spirit Worlds and Mexican Healers

Spirits are an essential part of the healing process, and although belief in spirits as causative agents in illness cannot be equated with the germ theory, it is a useful analogy. An alien spirit or force is blamed for the illness, but more important is the unconditional belief that the cure will be effective. Once this patient expresses this trust, the healer needs to determine the patient's faith in God, because no healing is possible without this belief.

In the mid-1800s, a movement known as spiritualism, or spiritism, spread throughout Europe and the United States (Kearney 1978, 19). Certain Mexican American groups were highly influenced by the movement, and a system closely related to curanderismo known as *espiritualismo* or *espiritismo* developed. Healers in espiritualismo incorporate ecstatic and trance states into their rituals. Dealing largely with illnesses that have a large emotional component, such as depression, paranoia and anxiety, healers in this system teach and believe that there are spirits, good and bad, who can enter them for the purpose of healing. Once inside, they speak through the healer. Other spirits or witches exist in other parts of the universe, but occasionally enter the atmosphere of the earth, where they threaten and cause health problems in the community. They too penetrate the minds of the healers or mediums. As the emotional intensity of the experience heightens, the patient experiences freedom from the problem. The shared worldview of the healer and patient, that is, that there are magical forces that have caused illness and can be expelled, serves to promote the reputation of the healer and the satisfaction of the patient.

In contrast, the supernatural world of the curandera is more concrete. One practitioner describes the object of her prayers as a sacred world primarily occupied by "the Lord," "God," "Jesus," or "Our Savior," (Perrone, Stockel, and Krueger 1989, 87). Both espiritualismo and curanderismo share dependence on a largely invisible world of spirits that can only be seen by the healing practitioners through special means of communication.

The Mexican American Curandera

In Mexican American culture, women who are thought to have a special gift of healing are known as curanderas (Stafford 1978, 12–22). A curandera may develop her lifestyle in many different ways, but typically, like the shaman, she is designated as special at birth. She has an awareness of a power that could be described as spiritual. The curandera may inherit her power to heal through a *don,* a "gift." If a child "cries in the womb," she will become a curandera.

Mexican Shaman Katuza, accompanied by his student-cum-muse Hikulima, holds healing herbs and chants as he sits in his Temazcal, a pre-Hispanic sauna designed to heal illness and discomfort, in his back yard. Katuza, an ex-alcoholic, who gave up drinking to become a mystical healer, treats people from all over the world for a wide variety of ailments at his lakeside home. (Daniel Aguilar/Reuters/New Media/Corbis)

There is an awareness of and dependence upon the intimate connection between nature and the healer, and this level of consciousness is spiritual. What a Westerner might call her pharmacognosy involves the knowledge of plants and treatments that is necessary for these medical practitioners. The curandera will learn about plants and treatments from a practicing healer, usually a close relative. A special curandera called a *partera* deals with pregnancy and childbirth. Her role could be compared to the medieval and Renaissance midwife who had exclusive contact with the health concerns of women.

Jesusita Aragon, a healer and midwife of northern New Mexico, was trained as a curandera and partera from the time she was a young girl. She lived in a rural community, and beginning at age thirteen she had firsthand experience watching her grandmother deliver babies. Prior to that, she helped deliver calves on the land where she was raised. It was not until she was forty that she began her solo practice, after a more than thirty-year "internship." Jesusita's vocabulary is interspersed with words that reflect her spiritual orientation, and she considers birth a miracle (Perrone, Stockel, and Krueger 1989, 116).

Gregorita Rodriguez, a native healer of Santa Fe, employs herbs, massage, and religion in her practice. She trained with her aunt, who was trained by Gregorita's grandmother. In her practice, touch is important, as is the energy she transfers to patients. She attributes her ability to heal to God; she focuses on feeling the patient's internal organs for indications that they are displaced. Her treatment consists of moving the displaced organs back to their normal positions (Perrone, Stockel, and Krueger 1989, 110).

Sabinita Herrera, a curandera from Truchas, New Mexico, broke with tradition, in that she learned about plants from her father instead of her mother. At age ten, she began taking trips with her father by horseback, two weeks at a time, to learn the names of roots and herbs growing in the highlands. She learned about conservation and ecology, carefully leaving some plants intact to grow and reproduce in the future. Her epistemology could be described as transcendental in Western terms: She describes feeling the spirit of life in the mountains, trees, streams, and air. As a continuation of her training, she learned how to clean, wash, and cut each plant. Drying required additional knowledge about which plants could remain outside and which were too fragile to remain subject to sun and rain. Her formal education went up to the seventh grade, but the close mentorship by her father gave her enough background to call herself a curandera by the time she was a young adult. Both philosophically and practically, she was well entrenched in her calling.

Not all curanderas are willing to make known their *remedios* (remedies). Their attitudes vary with regard to sharing their knowledge. An example of how Western culture has coopted parts of ethnomedicine is that in certain areas of the United States where there are large Hispanic populations and curanderas, a hospital will hire a herbalist. In this way, the curandera or other person with "folk knowledge" can assist in cases where a patient may have taken medicines from both systems. There is an increasing need for "alternative medicine" to be acknowledged in treating and diagnosing patients as society becomes more multicultural.

Since curanderismo has a long and complex history, each practitioner should be viewed in the context of his or her culture and chronology. An obvious syncretism of Native American indigenous belief, possibly related to Eurasian shamanism, and Christianity has developed during the well over four centuries since the Spanish first came to the New World. Interestingly, as Western medicine adopts more holistic therapies and assimilation dilutes closed communities, there is a growing commonality in the two systems, a shared recognition of the importance of belief in a spiritual dimension of healing.

DARK SHAMANISM (AMAZONIA)

The concept of *dark shamanism* is intended to draw attention to the systematic and fundamental place of assault sorcery and malevolent witchcraft within Amazonian shamanism as a whole. The term *dark shaman* therefore includes the many notions of *sorcerer* and *witch,* which have their own particular and complex histories in the region. Examples from the Warao of Venezuela and the Patamuna of

Guyana will be used here to illustrate the main features of this practice. Both groups are part of the tropical forest agricultural complex that is well known from the general literature on the region. The Warao inhabit the fluvial world of the Orinoco delta, and the Patamuna are mountain dwellers. Together they number around 12,000 persons.

A significant starting point for any general anthropological consideration of witchcraft and sorcery must be the widely used definitions that Edward Evans-Pritchard developed for the Azande, or Zande of the Sudan, that "the difference between a sorcerer and a witch is that the former uses the technique of magic and derives his power from medicines, while the latter acts without rites and spells and uses hereditary psycho-physical powers to attain his ends" (1937, 387). This distinction cannot, however, be neatly transposed to Amazonian cultures, for both sorcerers and witches act with an overt intentionality, and the notion of a psychophysical inheritance of a "witchcraft substance" is largely absent. Although magical techniques do pass from one generation to the next along kinship lines, such inheritance is not inevitable, and magical assaults are never unconscious to the same degree that Evans-Pritchard suggested for African witches.

The term *dark shaman* thus reflects distinct features of Amazonian assault sorcery and malicious witchcraft, but also alludes to the ambiguity inherent in all shamanic practice, such that even curing shamanisms may shade into the darkness of assault sorcery. The ability to cure entails the ability to kill. The lack of a clear indigenous distinction between beneficent and malevolent shamanisms in Amazonia also implies that the dark shaman has a broader knowledge and power than that of the mere witch or sorcerer, who have often been conceived of as marginal to the central spiritual or religious notions of the society from which they come.

A number of recent studies have begun to focus on this aspect of shamanic practice in Amazonia, and many suggest that dark shamanism has a key relevance to the overall spiritual and cosmological ideas of Amazonian peoples in general. There are also important links between the practice of shamanism and social and political goals broader than individual revenge or maliciousness. In particular, forms of dark shamanism have emerged strongly as responses to colonialism, epidemic disease, and modern development. In this way the practice of assault sorcery or malicious witchcraft can become markers of ethnic persistence and resistance to the encroachment of the modern world, based on understanding and responding to the violence of colonialism or development with the violence of magical and spiritual attack.

As with senior *piya* (curing shamans) of the Patamuna, among the Warao the *daunonarima,* literally "fathers of the wooden figurine," are also assault sorcerers. In Patamuna accounts of shamanic killing, reference is made to the "spirit masters" that are used to assail enemies, and these are similar to the figurines used by the daunonarima. This kind of assault sorcery is usually deployed in intervillage conflicts or as part of intergroup warfare, and the same is true for the Patamuna piya. However, this kind of shamanic assault is general and relatively indiscriminate in its effect, since it is directed to whole villages rather than specific individuals. In the case of the Patamuna, historical study has shown that this form of shamanic attack became less relevant as gun warfare emerged in the nineteenth century. As a result more specialized forms of assault sorcery, such as that known as *kanaimà,* became predominant. This was due to kanaimà's particular style of shamanic assault, individual assassination, which provided an appropriate complement to the emergence of smaller-scale military units under the individual leadership of powerful warriors. This historical change in military practice and social organization was therefore an important factor in the emergence of kanaimà practice over the last hundred years or so. The historicity of shamanism in general and the way shamanism changes ritually and symbolically in response to colonial and national intrusion is thus very apparent from the practices of dark shamans.

Comparisons between Warao and Patamuna assault sorcery, as well as with other groups such as the Baniwa, suggest a provisional tripartite distinction among the various forms of dark shamanism, based on the following characteristics: (1) the existence and possession of certain magical techniques that may be widely known, such as *talen* magic among the Patamuna or *hiuiathi* among the Baniwa, 2) the counteraggression of shamans against the attacks by outsiders—war shamanism, and (3) a class of dark

shamans who are initiates in a distinct system of ritual practice. Johannes Wilbert (1993, 92–125), for example, describes the *hoaratu,* dark shamans of the Warao, whose cosmological origins derive from the connections between humanity and the *Hebo* (Ancient Ones) residing at the cardinal points of the earth. The hoaratu ensure that the Scarlet Macaw and his spirits are continuously appeased with a constant supply of human victims.

As with kanaimà assault, to be killed by the hoaratu is to be completely erased ontologically; their victims have no hope of an afterlife in the spirit world. The physical dismemberment of a Warao who is assailed by the hoaratu is similar in purpose to the anal and oral mutilations carried out by the kanaimà, which detaches the human soul from its body and shatters its vital force. The inert flesh can then become divine food for the spirits. However, because feeding the gods sustains cosmological relations, there is a reluctant acceptance of the necessity for such dark shamans among the Warao, just as with the kanaimà among the Patamuna. The kanaimà are shamans dedicated to Makunaima, creator of all animals and plants, and so are responsible for ensuring the beneficence of Makunaima by a sacrifice of human flesh that feeds Kaikusi-yumu (Lord Jaguar) and nourishes Koumima (the Garden Spirit). However, Makunaima shared responsibility for the creation of the cosmic order with his younger brother Piai'ima, which has meant that, as with the Warao, there are other forms of shamanic intercession. In the case of the Patamuna there is an inherent conflict and tension involved in the relationships of the piya and kanaimà, mythically chartered by the conflicts between Piai'ima and Makunaima.

In this context it is apparent that, whatever the fear, pain, and death that dark shamans and similar ritual specialists may inflict upon humanity, they are an inevitable, persistent, and even a necessary part of the cosmic order. As a result dark shamans are not necessarily reviled even if they are feared; their very potency and secrecy allow them to become the source and symbol of an autonomous indigenous society and culture that is more than able to protect itself against the attacks of the outside world, be they attacks of a neighboring village or even the national state. Religious campaigns against "witchcraft," both in the New World and the Old, may be partly understood as part of the establishment of the authority of the state through the priestly control of the church. As a result, the identification of indigenous shamanisms, of whatever kind, with "satanic" practices and the "black arts" has been an important political tactic of Western Christian evangelism.

Unlike Africa, New Guinea, and Europe, native South America has not stimulated an extensive analysis of witchcraft and sorcery. Writings on Amazonia have mostly subsumed the topic of witchcraft and sorcery under the topic of shamanism. This tendency certainly reflects the ethnographic reality that curing shamans may also be assault sorcerers. This dual or ambiguous capacity of the shaman to heal and to cause harm has often been recognized in the ethnographic literature and is frequently referred to as the "moral ambiguity" of the shamans. Even curing shamans do not necessarily act out of solicitude for the sufferings of others but do so in return for payments, which are often quite substantial. The figure of the shaman also stands in contrast to priestlike specialists, whose functions are rarely considered ambiguous and are connected to "legitimate" social reproduction in the cosmological sphere. Nonetheless, as antiauthority figures, shamans have also been pictured positively. Broader connections between state power and shamanic ability, especially emanating from the dark side, are also evident from the history of various political regimes in the region—Haiti under "Papa Doc" Duvalier, Venezuela under the dictator Vicente Gomez (as well as others), or Guyana during the rule of Forbes Burnham (Taussig 1997; Whitehead and Wright 2003).

The tendency has been to concentrate on the morally "good" side, that is, the healing function of the shaman, as a vital service to both individuals and the community. However this tendency to emphasize only the positive, therapeutic, and socially integrative dimensions of shamanism is a distortion. Nonetheless, it is this image of the shaman that has proven very popular among well-educated North Americans, Europeans, and urban Latin Americans, who approach shamanism as a set of magical techniques that can be used for self-realization by attaining profound or mystical experience, and as a source of alternative therapy, both physiological and psychological. Ethnographic experi-

ence of Amazonian dark shamanism, as briefly outlined here, very much contradicts this imagery and provides a reminder of the complex and dangerous nature of actual Amazonian practices. The "dark" side—the shaman's power to destroy or inflict harm through sorcery and witchcraft—though recognized, has received little in-depth attention. In several of the most important contributions to the South American shamanism literature in recent years, the weight of attention is on the shaman's capacities to harness cosmic forces for the benefit of humanity. This is not to say that witchcraft and sorcery have been totally ignored, but some of the more notable extended studies have not been widely read in North America.

It is premature to suggest hard-and-fast contrasts between dark shamanism within the various cultural traditions in Amazonia, but certain tendencies do begin to emerge that may well be a useful basis for future research into shamanism generally. Among the Tupian groups shamanic power is always dangerous and threatening, even when it has a "curing" aspect. The historical and ethnographic sources refer to the cannibalistic nature of the shaman's rattles *(maraka)* and the imagery of the pet or captive suffuses the notion of shamanic assault. Among the Arawakan groups there seems to be an incipient notion of a witchcraft substance, not directly inheritable as in the African case, but nonetheless seen as a distinct penetration of the body, which is simultaneously seen as a disruption and an attack on the conviviality and siblingship hierarchy. In this guise dark shamanism is an attack on specific sets of social relationships rather than on sociality itself, suggesting particularly strong links between the exercise of power and shamanism in these societies. In the case of the Warao and the neighboring Carib peoples, there are hints that there is a far more legitimate role for the dark shaman. Even if the sorcerer is a highly antisocial figure, those social relationships are in any case seen as impermanent. The attacks of the dark shaman paradoxically ensure the possibility for sociality through his offer of human sacrifices to the predatory rulers of the cosmos, who might otherwise consume humanity utterly and destroy the possibility of growth and fecundity on the earth. In this sense the dark shaman enables, even though he does not aid, the construction of sociality and as such is an inevitable and necessary part of Amazonian spiritual life.

HUICHOL (WIXÁRIKA) SHAMANISM (MEXICO)

Huichol (Wixárika) Culture

Wixárika (Wixáritari pl.), is the name the "Huichol" use to distinguish themselves from other cultures, even though that is not the name familiar to Anglo-Americans. Their language belongs to the Utonahuan (Uto-Aztecan) language family. Wixárika homelands lie within the southern part of the Sierra Madre Occidental, or western mountain range. This area includes parts of the Mexican states of Jalisco, Nayarit, Durango, and Zacatecas. A number of Wixáritari have settled around Mexican towns

and cities such as Tepic, Nayarit; Guadalajara, Jalisco; and Mexico City as well. Some documented and undocumented Wixáritari also live in the United States.

Wixárika culture is not homogeneous; significant differences exist between communities closer to mestizo towns and cities and those located in the more remote areas of the sierra. In the sierra communities the political organization is based, to a large degree, on the civil-religious structure introduced by Spaniards during colonial times. Through the dreams and consensus of the wise old shamans of the community, collectively known as the *kawiterutsixi,* a new governor and tribal authorities are selected every year to fulfill government positions, commonly called cargos. These shamans also dream who will carry the cargo roles in the church to care for the antique carved wooden figures of Jesus Christ and a number of other saints, several of which have assumed Wixárika names. Some communities maintain rustic old colonial churches used primarily for the religious observances of Holy Week and baptisms, and for the changing of the government authorities. Additionally, some communities are organized by temple districts, which are distinguished by region and family lineage affiliations. Every five years the kawiterutsixi decide upon these cargo roles as well.

Wixáritari in the sierra live in ranches scattered throughout the countryside composed of extended family members. The principal shaman in the family presides over the ceremonies at the ranch. Family shamans and shamans in charge of the temples lead the ceremonies that mark the annual cycle, which is divided into the rainy season from around June to October, and the dry season from November to May. During the rainy season, Wixáritari focus their attention on cultivating and harvesting corn, beans, and squash. The dry season is the time when many Wixáritari hunt deer, go on the pilgrimage to the peyote desert, and make other pilgrimages and journeys within or outside of the sierra.

The Wixárika universe is divided into five sacred directions: To the east lies their sacred desert, Wirikuta, in the state of San Luis Potosí; located in the west along the Pacific Ocean near San Blas, Nayarit, is Haramaratsie. In the north are the sacred caves ’+t+tawita in the state of Durango, and in the south is Xapawiyemeta, Lake Chapala, in the state of Jalisco. The fifth direction is the center of all sacred spaces, the center of the temple, the center of the community, the center of Wirikuta. In this universe there are three worlds: the Upper World of the sky realm, *taheima;* the Underworld, *taheit+a,* where the sun travels at night; and the Middle World, *hix+apa,* the world of the living. The Wixárika pantheon is extensive, and virtually all the gods, *kaka+yarixi,* are associated with the forces of nature. Some of the major kaka+yarixi recognized for their formidable shamanic powers are Takutsi Nakawe, the grandmother goddess of creation, growth, and vegetation; Tatewari, grandfather fire; Maxa Kwaxi, Grandather Deer Tail; and Kauyumarie, the deer person, who also serves as the shamans’ messenger to communicate with the other gods.

Wixárika Shamans *(Mara’akate)*

Wixárika beliefs and traditions lie in the hands of the shamans, *mara’akame* (singular) or *mara’akate* (plural), who may be male or female. Male shamans are the public figures, while females carry out their profession in more domestic ranch settings, as they are much more circumspect about their shamanic powers and abilities. Women, for the most part, prefer to keep their specialist training secret, except among family members. This is because they fear that their male counterparts will be envious and resort to sorcery to take their powers away, as exemplified in a creation myth about the first mara’akame, Takutsi Nakawe, the grandmother of creation. With her powers and song Takutsi Nakawe created the world and all that exists. There were several male shamans who were jealous of Takutsi and her powers and decided to trick her. They asked her to perform a curing ceremony at their ranch. On the way there they got her drunk, killed her, and took her body apart in order to steal her powers. Takutsi escaped under the earth, where a hill formed and red brazil trees grew from her blood. Afterwards, according to the myth, male shamans became the leaders of the community, both as religious specialists in the temple and as tribal government authorities.

The Path to Becoming a Shaman

In Wixárika culture there are several ways that one realizes his or her calling to become a

shaman. Some children are believed destined from birth to be shamans; a child or baby's actions may indicate to family shamans and elders it is destined to be a son or daughter of a particular god (such as the fire god, Tatewari, or the god of deer and the hunt, Paritsika, or the god of rain N+'ariwame). The manner in which the child's destiny may manifest can vary. One example is if a child shows a proclivity to smoking the sacred tobacco used by shamans for ceremonial purposes. Tobacco is considered to be the plant ally of the fire god, Tatewari, and is only smoked ceremonially by shamans; hence, the parents would interpret this behavior as indicative of the child's calling to be a shaman and a protégé of Tatewari. Severe or prolonged illness can also be an indicator of a child's destiny to become a shaman. Other individuals who have not experienced these kinds of profound life events may choose to follow the shaman's path; in such a case it is said that the training is very challenging, for that person must work even more diligently to achieve this powerful role.

During the training a shaman initiate must remain chaste or faithful to a spouse for the five years or more of training; families strongly encourage children to complete their apprenticeship at a young age because as they grow older it is much more difficult to focus on their training. Individuals following the shaman's path seek out an experienced shaman, usually a family member or a shaman with whom the family has had a long friendship, to interpret the apprentice's dreams and signs sent by the gods, and guide him or her through the training. The actual learning, however, occurs through the personal relationship the shaman initiate develops with the Wixárika gods. Over the five-year training the apprentice focuses on his or her dreams and regularly consults with the guiding shaman to interpret them and solicit advice regarding actions to be taken.

There are two crucial achievements that must be accomplished during this five-year period. The first is acquiring the ability to remove illness-causing objects from a patient's body, as manifested by kernels of corn, small stones, charcoal, or deer hair. The second major challenge to meet is developing the ability to communicate with Kauyumarie, the messenger god, who is represented as a blue deer, yet appears in different forms in the dreams of shaman initiates. In his dreams Kauyumarie talks to the shaman apprentice, teaching him or her knowledge that will be useful in the training process. Kauyumarie is the link between the shaman and the gods, serving as the intermediary in the communication process.

In training to become a religious specialist, it is mandatory from the start that the shaman initiate make special vows to particular gods, and sometimes also popular Catholic saints from the local church. With these vows the novice leaves offerings of votive arrows painted with geometric and line designs using pigmented resins, and prayer bowls made from hollowed shells of gourds decorated with figures made of beeswax and sometimes other decorations. The miniature wax figures are affixed to the interior walls of the gourd and speckled with beads. Some of the images made from wax include a simple representation of the shaman apprentice, a corn plant, a deer, and in the center a mandala-like image indicating it as a *nierika,* a portal that will carry the initiate's prayers in the bowl to the realm of the gods. A beeswax candle also accompanies the votive arrow and bowl offerings. These are left every year at the sacred houses, caves, bodies of water, or shrines for the particular gods whose help is needed in the apprenticeship.

Shaman initiates may also seek to develop a special alliance with specific animals, such as the horned toad lizard *(Phyrnosoma),* the *teka,* which has the unique ability to squirt blood from its eyes as a defense mechanism; snakes, such as the *wiexu* (a kind of boa constrictor); and the venomous beaded lizard *(Heloderma horridum),* admired for the designs on its back. An alliance is made with any of these animals by catching it alive, cutting off the tip of its tail and anointing oneself with the reptile's blood on the cheeks, throat, inner wrists, and base of the feet. The animal is thanked and set free; its tail is kept with the other power objects collected by the shaman apprentice. This ritual must be performed with five horned toads, snakes, or beaded lizards sought as animal allies. In recognition of this alliance, the initiate completing his or her fifth year leaves an offering for that animal at its shrine located in the countryside. Shaman initiates may make pacts with other animals, such as hummingbirds and deer, through the act of eating the raw heart of a recently killed animal. This ritual is also per-

formed five times, after which offerings are left for the animal along with prayers (Eger 1978; Schaefer 1993, 2002).

Plant alliances are also crucial in this training. Two psychoactive plants that feature prominently in the lives of shamans and shaman apprentices are peyote *(Lophophora williamsii),* known as *hikuri,* and tobacco *(Nicotiana rustica),* called *makutse.* Peyote is a spineless cactus that contains mescaline, a naturally occurring mind-altering chemical; it is ritually consumed by Wixárika members young and old in family, temple, and community settings. Peyote consumption typically provides powerful visionary experiences enabling shamans and shaman apprentices to communicate with the gods and learn more about the Wixárika cosmos in ways that cannot be duplicated by other methods. Some children are introduced to peyote while in their mother's womb, or afterwards, through the milk of lactating mothers, if the mother has consumed peyote before nursing her child (Schaefer 1996b). Children whose family members have gone on the pilgrimage to the San Luis Potosí desert consume peyote brought back to the family ranch. Some children will also accompany their parents to the desert where they learn firsthand about peyote and consume it as well. A child who shows an affinity for peyote is looked upon as having the calling to become a shaman and will be encouraged to continue this path.

Making the pilgrimage to Wirikuta is not an absolute prerequisite for the training; however, this journey through sacred time and space in the Wixárika universe and the experiences gained from ingesting peyote over the course of the apprenticeship are intrinsic to the learning process of becoming a shaman. Often the guiding shaman will select specific peyote tops for the apprentice to consume; afterwards the initiate will describe the experience, and the shaman will interpret its meaning and what course of action, if any, should be taken.

Tobacco is also a vital part of the shamanic experience, and during their training shaman apprentices are introduced to this sacred plant. The particular type of tobacco used by shamans contains an extremely high level of nicotine (more than 18.76 percent ± 2.6 percent) and is strong enough to facilitate an altered state of consciousness (Siegel, Collings, and Diaz 1977, 22). The tobacco is carefully cultivated by shamans in their gardens; the first young leaves that appear on the plant are ritually harvested, brought to the temple, and ceremoniously placed into a miniature woven bag that is attached to the forehead of the first deer killed that season. This tobacco bag and the dried face of the deer are carried in the lead by the pilgrims on their journey to the peyote desert (Schaefer 2002). Shamans and shaman initiates smoke the tobacco rolled in cornhusk cigarettes during ceremonies, deer hunts, and on the peyote pilgrimage. Pilgrims who are shamans or shamans in training carry their own hollowed gourd containers filled with tobacco leaves. The tobacco is smoked in conjunction with peyote consumption; the nicotine from the tobacco and the mescaline from the peyote most likely enhance each other's visionary effects (Schaefer 1996a).

A third plant used by some shamans is a solanaceous plant called *kieri;* it is both revered and feared by many Wixáritari. Shamans or shaman apprentices desiring exceptional powers seek out this plant, leaving offerings and/or ingesting small amounts of it over a five-year period. Kieri is viewed as a dangerous ally: If too large a dose of the plant is consumed, the individual is likely to have a terrifying experience; in more extreme cases the pharmacological activities of kieri can cause madness and death. Wixáritari attribute these occurrences to the supernatural powers of the plant and the god associated with it of the same name; some also associate evil shamans and hexing with this plant (Yasumoto 1996; Furst 1989; Furst and Myerhoff 1966).

Power objects acquired through pilgrimages and quests are essential to the work of the shaman; both shamans and shaman apprentices continually add to their collections, which they guard in a woven palm leaf basket known as *takwatsi.* The basket and the feathered wands *(muwierite)* stored inside it are used for healing patients and communicating with the gods; they are the shaman's insignia and tools. Muwierite may be passed down from one generation of shamans to another in the family. A shaman may also acquire, through hunting or other means, the feathers from birds admired for their hunting abilities, such as hawks and other raptorial birds. Colorful plumage from parrots that inhabit the more tropical zones of the region are also sought for feathered wands. Another important object used by the shaman during all-night singing ceremonies is a circular

mirror that is placed on top of the shaman's mat *('itari)* by the fire. Throughout the night the shaman glances into the mirror where, it is said, he or she watches the movement of the sun on its journey through the Underworld. The shaman's mirror is also used when praying to peyote in the desert of Wirikuta. Other objects that may be kept in the shaman's basket are amulets, plants, stones, and other objects that hold special power or meaning.

A ceremony marking the completion of the novice's formative training occurs after five or more years. This event takes place after the shaman apprentice has successfully developed ongoing communication with the messenger deer god, Kauyumarie, and has learned to heal by sucking out intrusive illness-causing agents from a patient's body. A cow or young bull is sacrificed during this ceremony, and a number of offerings, as well as the shaman's power objects, are anointed with the animal's blood. The offerings are then placed in the sacred locations of the specific gods who were called upon to help in the training. Now fully initiated, the young shaman will begin to put his or her knowledge and skills into practice, learning through experience and from other trusted shamans. The young shaman will also continue to pursue more specialized training with the gods; in other words, throughout a shaman's lifetime he or she is presented with ongoing challenges that will ultimately lead to the acquisition of even greater knowledge, power, and prestige.

Shamans, especially those renowned for their abilities, may request payment for their services for healing patients. The shaman calculates the cost of services by factoring in the time involved and difficulty in treating a patient. Trade in food or goods, money, or the transfer of ownership of a young cow or bull to the shaman are all forms of payment; the latter is reserved for especially difficult cases in which the patient's life is seriously threatened. Consequently, a successful shaman may accumulate cattle or wealth in other forms throughout his or her career.

Powers and Responsibilities Held by Shamans

Wixárika shamans are, above all, diviners and healers. They consult the gods through their dreams to learn the causes of illness and misfortune that have befallen their patients, family, or community and how to rectify the situations. Through their dreams shamans learn auspicious times to have ceremonies, plant corn, and hunt deer, and they receive personal messages from the gods intended to guide them in their own lives.

Shamans also have the unique ability to perceive a person's personal designs. Every Wixárika is born with special designs called *nierika,* which are located on the cheeks, wrists, throat, and base of the feet, and are only visible to shamans and the gods. When a person is in a healthy state these designs appear bright and animated with movement; during illness, a person's designs appear faint, incomplete, without movement. To heal the illness or hex that has been placed on the patient, the shaman works to restore the patient's designs to their original state.

Another crucial function of shamans is leading the pilgrimage to the peyote desert, Wirikuta. The shaman is the chief navigator for the ranch or temple group to the sacred places. He explains the myths and histories of these locations and directs the pilgrims in the rituals, prayers, and leaving of offerings. On the pilgrimage several shamans may come along. One is the designated leader of the entire group; others assist the leading shaman and also focus their attention on guiding members of the group of pilgrims who are close kin. The leading shaman has extensive knowledge of the plants in this desert environment, especially peyote. In many respects he is the native botanist and pharmacologist, advising pilgrims on the different kinds of peyote and the quantities of peyote to be consumed.

Well attuned to the visionary experiences peyote can evoke, the shaman serves as a kind of psychologist, guiding the pilgrims during their inner journeys while in an altered state of consciousness induced by peyote, and later helping them interpret the meaning of their visions within the framework of a general Wixárika worldview.

Shaman Specialists

Shamans travel to the peyote desert with specific objectives in mind, such as healing a patient or themselves, or petitioning the gods for rain, plentiful crops, abundant cattle, and good health for family members. Shamans may also

go on the pilgrimage with the intention of gaining greater expertise in specific areas of esoteric knowledge. Some shamans are specialists in healing infertile couples desiring to have children; these shamans are recognized by the community for their powers to select the sex of the child, if the couple requests it, and to metaphysically place the fetus in the woman's womb. Other shamans may specialize in healing scorpion stings. Several types of scorpions in the *Centruroides* and *Vaejovis* families, with highly toxic venom, are endemic to the Wixárika sierra. A drop of venom injected into a human being from the tail of one of these scorpions can kill a baby, a young child, or an older adult. Shamans make special vows with the scorpion god, Paritsika, and form alliances with some of the animals associated with the scorpion in order to treat patients who have been stung.

Another shamanic tradition is the specialized training to become a wolf shaman. As with the other specialties noted above, this apprenticeship lasts five years, during which time the shaman leaves offerings to the wolf god Kumukemai at his mountain shrine and communicates with him through dreams. Wixáritari believe that a shaman who follows this path will eventually acquire the ability to transform himself into a wolf (Valadez 1996).

Gaining greater esoteric knowledge brings prestige to the male shaman and his family; this combined with fulfilling temple, church, and local government cargo responsibilities enable a shaman to elevate his power and status in the community. A shaman working his way up the hierarchical ladder must eventually achieve the ability to sing, calling upon Kauyumarie to help him lead ceremonies in public settings. Singing shamans lead temple and community ceremonies; those who complete the five-year temple responsibility of Tsaulixika, the singing shaman in charge of the temple, receive special recognition, especially if they complete this role in more than one temple. When the singing shaman in charge of the temple sings, his name changes to Tunuwame, which means Venus, or the morning star. Renowned shamans will be chosen to fulfill the elevated position of the kawiterutsixi, the wise old shamans, who determine the present and future directions the community shall take. Many shamans who achieve this distinguished role are also entrusted in one form or another with the responsibility of caring for the souls of members in the community and their ancestors.

From birth until death, and beyond, Wixárika shamans care for the souls of their family, their patients, and the members of their community. Oftentimes a shaman serves as a midwife, and, in this role, shortly before birth he or, more usually, she invokes the goddess Niwet+kame, who is keeper of the souls, asking her to provide a soul for the soon-to-be-born baby. The shaman then helps place the soul into the body (Furst 1967; Schaefer 2002). Five days after birth, a shaman officiates over the blessing and naming of the newborn and may be one of the adults who bestows a name on the baby. The shaman also is charged with locating the lost souls of sick or startled children and placing them back in their bodies.

Upon the death of an individual, the shaman leads the singing ceremony to find the soul of the deceased on its journey to the Otherworld and brings it to the ceremony, so that family members can make their farewells. Afterwards the shaman sends the soul of the deceased to the sky above the peyote desert of Wirikuta. A shaman who specializes in catching souls in the form of rock crystals may be appointed to bring the soul of the deceased back to the family in this form. Only the most experienced shamans are able to do this. During a singing ceremony, the shaman catches the rock crystal, which may come from within the fire, from the body of a hunted deer or sacrificed cow or bull, or from the corn field, or it may be caught in mid-air. The rock crystal is wrapped in a layer of cotton and fabric and attached to a votive arrow that is cared for inside the family shrine of the ranch. Rock crystals of these family members are brought out on ceremonial occasions, offered food and drink, and anointed with fresh blood from sacrificed animals (Furst 1967; Perrin 1996).

Shamans and Western Specialists in Religion and Health

The relations Wixárika shamans have with Western religious specialists vary; often they are tenuous. Some Wixárika do not allow priests to reside in their communities; however, depending upon the political climate, priests may receive permission to visit and of-

ficiate at ceremonies such as those held during Semana Santa, the Holy Week of Easter, that take place in the Catholic church in their community. Shamans will also carry out ceremonies in the church during this time, including baptismal rituals for Wixárika children, which establish godchildren and godparent kin relationships. Wixárika shamans may also make pilgrimages to Catholic churches to leave offerings and gather holy water, and some shamans will perform healing ceremonies for non-Wixáritari, including mestizos who are practicing Catholics. Catholic boarding schools in the Wixárika sierra have also put a strain on relations with shamans, especially if the curriculum in the school and the attitude of the staff strongly criticize Wixárika cultural beliefs and traditions and make no attempt to incorporate these into the children's education.

Even more problematic are the relations between shamans and Wixáritari who have converted to an evangelical form of Christianity. Wixáritari refer to them as *aleyluyas,* and explosive confrontations over religious beliefs and practices can occur, especially when the converts refuse to carry out traditional cargo roles they have been given, or when land and political power are involved.

As for medical doctors, shamans are more likely to have collegial relations with these Western specialists. Medical doctors who have received training or interacted with rural indigenous communities often work collaboratively with shamans in treating Wixárika patients. The patient will receive treatment from both the shaman and the doctor; medications prescribed by the doctor may be purified by the shaman before the patient takes them. Shamans also go to medical doctors for their ailments. The underlying belief held by many shamans is that Western doctors may be able to cure the body, but only shamans are able to discover the root cause or causes of the illness. Only shamans can treat the body and soul together. Through their knowledge and skills gained over many years of intensive study, Wixárika shamans fill a larger role in the culture than doctors can; they heal individuals and families, guide them on their lives' paths, and look after their well-being in this world and the afterworld.

KANAIMÀ SHAMANISM (AMAZONIA)

Kanaimà, a form of assault shamanism that involves ritual mutilation of its victims, is practiced among the peoples of the Guyana Highlands at the headwaters of the Branco, Caroni, and Essequibo rivers, a region known as the Circum-Roraima region, after Mount Roraima, which defines the point where the borders of Brazil, Venezuela, and Guyana meet. The principal practitioners of Kanaimà are the Carib-speaking peoples of this region, the Patamuna, Akawaio, Makushi, and Pemon. These peoples are known from the historical records of 200 years ago, and they have sustained much of their traditional culture in the face of repeated invasions by missionaries, miners, and loggers. The fact that three international borders also meet here has resulted in increasing attempts to develop the region economically. Shamanic practices also reflect this persistent presence of predatory strangers and have been affected accordingly. Historically shamanic forms of spirituality were prevalent in this region until the advent of extensive missionary work. However, the instability of the border also meant that no colonial power ever established itself definitively or exclusively in the region. As a result, although conversion to Catholic and Protestant religions has taken place, shamanic techniques themselves have borrowed from and been influenced by missionary work. In particular, Alleluia shamanism represents a borrowing of Christian forms of song and prayer. By the same token, resistance to missionary evangelism has been expressed through the practice of Kanaimà shamanism.

The Patamuna, the Akawaio, the Pemon, and the Makushi number about 20,000 persons, typically distributed in villages ranging from fifty to a hundred people. But this figure rises to nearly a thousand people where schools,

shops, or missions have induced greater agglomeration. The Guyana Highlands comprise both the heavily forested Pakaraima mountains, so named for the *pakara* (basket) shape of the granitic uplifts, *tepui,* that characterize the region, as well as the vast grassland savannas that surround the mountain regions. Communication between villages therefore most often involves walking rather than canoe travel, and most major settlements are about a day's walk apart, with smaller clusters of houses sometimes occurring in between.

These groups are all Carib speakers, and their languages are somewhat related, with the Patamuna being linguistically closest to the Akawaio to their north. Their general lifestyle is well known from the many descriptions of tropical forest manioc farmers that already exist, although no particular ethnographic study of any of these groups, except the Pemon, has been made so far. Socially these groups also broadly conform to other better known Cariban groups of the region, practicing cross-cousin marriage as a preference, ideally combined with a matrilocal residence rule (living with the wife's kin). Native society is, however, very much in flux, and Kanaimà itself plays into the construction and persistence of particular forms of sociality in important ways.

Kanaimà shamans are often socially marginal figures before their initiation, but gain in prestige by their new status and through the fear they can command. As a result Kanaimà practice can comprise whole families, especially in cases where the preferred rules of matrilocal residence are ignored and a kanaimà, with his sons, becomes a powerful force in social life. Kanaimà is also attractive to disempowered young men, working in the mining camps or at other wage labor jobs in the region, who are "befriended" by an adept practitioner. Many people mention having been approached in this way or in other contexts outside their home village. Nonetheless, Kanaimà's appeal is not limited to those of low social status; it must be remembered that Kanaimà is a powerful form of shamanism, understood as more powerful than other forms, and so may also be taken up by men previously initiated in shamanic techniques as a way to augment and extend their own ritual and spiritual power.

In the imagination of peoples of the highlands, Kanaimà is from the "first time"; it is a primordial force that has structured the universe and formed the world as we know it. Kanaimà is more ancient than warfare and more ancient than society itself. It is also a more powerful form of shamanism than the other forms of healing shamanism and magical action, called *piya* and *talen.* Thus in a sense Kanaimà exists outside history, or at least it is a universal and constant human possibility that is only contingently realized in the course of human history. In this way one may say that, although there is a history to the ritual practice of Kanaimà, Kanaimà as a way of being in the world is beyond time.

The aspect of temporal and spatial dislocation in Kanaimà is therefore an integral part of its ritual and symbolic force, for practitioners are able both to travel vast distances in a short space of time and to expand the length of their lives and the space in which their lives are lived by the means of the ritual practices that are involved in Kanaimà—that is, they have access to the plane of shamanic encounter and exploration *(karawali),* as well as being directly nourished by the production and consumption of the "honey," or juices, of necrosis *(maba),* derived from the bodies of their victims. Because its practitioners do not see Kanaimà as governed by the ordinary laws of space and time, it seems natural that they have no oral history of its practice, nor is there a synthetic account of the deeds of powerful killers and sorcerers except one founded on the historical testimony by the uninitiated, both native and colonial. The kanaimà act in a ritual space that is both then and now, simultaneously here and there, and part of the paradox and contradiction that appear in accounts of Kanaimà reflects this conflation of ritual and historical practice.

Kanaimà has been narrated in nonnative sources since at least the early nineteenth century. However, it is more generally assimilated in these works to revenge. As a result any instance of revenge was considered an instance of Kanaimà, and certainly native discourse might have alluded to Kanaimà in cases of violent or unexpected death. But this attribution of all revenge killings to Kanaimà meant that a vast array of different kinds of death were attributed to Kanaimà when they may not have been ritual killings at all. The result was inevitably that the nature of Kanaimà deaths appeared to be quite obscure. The claim that a killing was the

work of Kanaimà was therefore seen rather as the superstitious invocation of a spirit-ghoul than a reference to a distinct and ritually significant mode of death. Thus, as more systematic ethnographic observation began, and as the native discourse of Kanaimà certainly would have raised the possibility of action by kanaimàs in all manner of deaths and injuries, it could appear that a Kanaimà killing was no more than a vague attribution of sickness and injury to an all-encompassing evil force.

Thus the idea of Kanaimà as the name of an evil force equivalent to the Judeo-Christian Satan was central to the earliest ethnological and literary work on Kanaimà. Over time, however, Kanaimà came to be seen in early anthropological thinking as a functionalist mechanism for sustaining social order, and the ritual killing at the heart of Kanaimà practice was seen as a kind of "jungle justice" that regulated society and punished the "criminal." As a result the deeper symbolic and ritual meanings of Kanaimà were effectively ignored, or understood as an unfortunate welling up of Amerindian savagery.

In both the colonial literature and native oral testimony, Kanaimà refers to the killing of individuals through a violent mutilation of, in particular, the mouth and anus, into which are inserted various objects. The killers are then enjoined to return to the dead body of the victim in order to drink the juices of putrefaction. This ritual performance is designed to sustain cosmic relationships through the invocation of Makunaimá. Makunaimá is one of the original beings, and Kanaimà's orientation to the mythical figure of Makunaimá contrasts and conflicts with the better-known forms of beneficent shamanism, such as piya, which are mythically derived from Makunaimá's younger brother Piai'ima. The ritual performance of Kanaimà is as follows.

People may first realize that they are intended victims when the kanaimàs approach their house in the night, or on lonely forest trails *(asanda).* Kanaimàs alert their victims to their presence by making a whistling noise that imitates the night-owl. This stalking of potential victims is part of the ritual, and a direct physical attack could come at any time, even in daylight. The extended nature of this process is likened to hunting, since victims are gauged as to their likely resistance and their appropriateness as a ritual "food." In attacks victims may have minor bones broken and joints dislocated, while the neck will be twisted to try and induce injury and pain. This kind of attack is generally considered to be a preliminary to actual death and mutilation, or even a "training" exercise for kanaimà initiates. A lethal attack may follow, but, informants stress, this could be many months later. If the victim is to be ritually turned into "food," then they are struck down and physically restrained. It is then that the kanaimà carries out the ritual mutilation that is central to this form of shamanic assault. This involves several procedures that are intended to produce a lingering death. The tongue of a victim is pierced with the fangs of a venomous snake, and the victim is then turned over, and an iguana or an armadillo tail is inserted into the rectum so that the anal muscles can be stripped out through repeated rubbing. After the rectum has been opened up, the stomach of the victim is squeezed in order to force out a section of the sphincter muscle, which is cut. In this condition the body of the victim is rubbed all over with astringent plants. Finally, a thin pliable stick is doubled over and inserted into the rectum, so that it holds open the anal tract. Small packets of plant material are then rammed into the gut as deeply as possible, which is said to start a process of autodigestion. The victim in this condition also gives off the special aroma of Kanaimà enchantment, rotting pineapple.

Victims are thus unable to speak or to take any thing to eat or drink, and their bowel control is lost. As a result, the clinical cause of death is an acute dehydration aggravated by constant diarrhea. In this condition, victims usually last no more than three days. After death, the kanaimàs search out the burial place and wait for the onset of putrefaction in the corpse. In a tropical environment this is no more than a few days. When the burial is located, the kanaimàs return to it to complete the killing ritual. A hollow cane is driven through the ground directly into the stomach of the corpse. The stick is withdrawn, and the *maba* (honey-like) juices licked off. If such a corpse is "sweet" to the taste, it is dug up in order to recover jaw and finger bones, as well as a section of the anal tract. These body parts form part of the magical substances that enable the superior tracking skills of kanaimà assassins and are also used to avert the consequences of being unable to locate the corpses of future victims. The substance maba is itself likened to a narcotic, and

its ingestion also allows the kanaimà his special powers of fast, secretive movement.

Kanaimàs are the very epitome of antisociality and are therefore opposed by both piyas and Alleluia prophets on behalf of the community. However, no cure is believed to be possible following kanaimà assault, since the vital force *(ekati)* of the victim is considered to be driven out completely by the physical and ritual force of the attack. The persistence of Kanaimà practice is related to wider factors, particularly the way in which the possibility of Kanaimà inhibits the casual disrespect and oppression of outsiders, since the figure of the kanaimà has become widely known in the region. This leads to the paradox that, although the violent practice of kanaimà works against the integrity of the community, the possibility for community is sustained in other ways through both the external meanings of Kanaimà and the way in which kanaimàs also conduct important relationships with Makunaimá, creator of all plants and animals. Plant magic and hunting magic are therefore related to the charms and poisons used by kanaimàs for tracking and attacking their victims.

LATIN AMERICAN CHRISTIANITY AND SHAMANISM

Latin America represents a cultural area full of ethnic sociocultural diversity and creativity. Its very name implies the encounter between Spanish and Portuguese traditions and indigenous South American cultures and the development of *criollo* (people born in a land, the new, native generation) traditions as a consequence of it. This panorama led to the emergence of native interpretations of European religion and social customs. Given that the empires that conquered what is now Latin America were both Roman Catholic empires, the links between local shamanism and Christianity produced many cultural fusions and syncretisms that were and still are pervasive in all of Latin America throughout its history.

Introduction: History of Latin American Christianity

In the early days of the Conquest, Catholicism was the only religious framework accepted in the Spanish and Portuguese colonies in the New World. Indeed, from the arrival of Columbus in the late fifteenth century to the mid–nineteenth century, the Catholic Church was hegemonic in Latin America. The religious monopoly did not erase all native religions in spite of its efforts to do so; what happened instead was that the native religions adopted many Christian symbols, images, and ritual gestures, which became part of their own mythological horizons. Thus South American shamanisms interiorized Christian concepts (e.g., notions of God, the Devil, the Virgin Mary, Jesus, the Holy Ghost, the Bible, the angels), but they were reinterpreted according to native assumptions shaped by tradition and the historical contingencies of the colonial encounter. Different sociohistorical contexts determined variable symbolic adaptations and religious creativity; and the weight of Christian

symbolism and ritual depended upon the political economy of these cultural encounters.

Although it is safe to say that Latin America is still culturally Catholic in a general, diffused way, since the mid–nineteenth century several Protestant missions have arrived in the region. Their theological confidence in the individual interpretation of the Bible, together with their less hierarchical model of organization, produced a deep impact in indigenous and criollo populations.

These cultural encounters, always influenced by a subtle but potent Christian religious domination, produced various syncretic religious systems. Systems rooted in ancient shamanic traditions displayed these influences in various kinds of neoshamanism, in "native Christianities," and in "popular religions," in which Christian language and symbols played a key role.

During the early times of the Conquest and colonization (in the late fifteenth and sixteenth centuries), indigenous shamanic practices were regarded by the Europeans as closely connected with the Devil, and for that reason they had to be destroyed and replaced by the "true" religion. Nevertheless, indigenous religions in Mesoamerica, the Andes, Amazonia, Chaco, and Patagonia incorporated Christian elements as part of their own myths, rituals, and cosmologies. The processes of nation building throughout the nineteenth century did not radically change the influence of Catholicism and its ideology or the role played by religion and rituals in people's lives. That is apparent in Mexico and the Andes, where indigenous and criollo peoples still maintain religious systems that are complex and refined rereadings of the Christian message within pre-Columbian frameworks. All of them, in one way or another, condense the historical experience lived by each group in its relationships with indigenous and nonindigenous societies.

Shamanisms

Conceptually, three intertwined sets of shamanisms are connected with the Christian influence in Latin America. They are (a) indigenous religious movements organized as "Indian churches," which display shamanic features; (b) rural criollo religious practices, usually called *curanderismo,* which combine medieval beliefs and practices brought by the Europeans during the Conquest with indigenous shamanic elements; and (c) urban criollo curanderismo, combined with indigenous shamanism and different forms of peripheral European religious practices, such as spiritism (in Spanish, *espiritualismo* or *espiritismo*) and theosophy. In what follows, some examples of these categories are included to illustrate the conceptual and cosmological bridges built as a result of the contact between native shamanic ideologies and Christianity. In each case, if information is available, historical origins, initiation processes, cosmological features, healing techniques, and notions of illness are summarized.

Corona de Luciano

The Corona de Luciano (Luciano's Crown) is an example of reinterpretation of Protestant Christianity from a shamanic perspective. Indeed, it was a religious movement founded by a Pilagá individual named Luciano Córdoba. The Pilagá people, formerly nomadic hunter-gatherers of the Guaykuruan linguistic branch, live in the Central Chaco region (Formosa province, Argentina), mostly in rural agricultural settlements. The origin of this cult is related to the presence of North American and British evangelical missions in the Argentine Chaco since the early 1930s (see Miller 1980). In this context, Luciano had contacted an evangelical mission in El Zapallar (Chaco province) in the early 1940s. Then he experienced a divine revelation triggering an initiation process that led him to found a peculiar "church." He was called to propagate a religion, giving testimony of God's power. God had showed him a huge gourd rattle—a key shamanic instrument—filled with light, and it seemed that it could bring good things to people, and a lot of luck. In addition, God told him that he had "to perform His Words and to fulfill them very firmly" (Vuoto 1986, 22). After that visionary episode, he began his religious task.

His message did not purge shamanic elements that had persisted among his people but reintegrated them into a new cultural framework, more adapted to the context of cultural change the indigenous Chaco peoples were living at the time, with the advancement of capitalism and national institutions in the area. Luciano started to spread his movement throughout the Argentine Chaco. Mainly, he

granted spirits to people who participated in the religious services of La Corona, as the rounded elevation of dirt in which participants received these powerful entities was called. These entities were like shamanic auxiliary spirits; they had either traditional names, such as *A'eloq* (Crocodile), *Kiyok* (Tiger), *AwoGoik* (Moon), or biblical ones, such as Eva (Eve), San Pablo (Saint Paul), or San Lucas (Saint Lucas). A third category of spirits had to do with new elements of life in the context of expansion of capitalism and foreign Christian proselytism: Participants could receive the *espíritu de campana* (spirit of bell)—that marked time-table work—or the *espíritu del inglés* (spirit of English), which produced a "version" of the language spoken by evangelical missionaries. Between the 1940s and 1950s, almost all Formosan Pilagá and Toba settlements had a Corona; it implied a hierarchic local organization, headed by a male or female captain. This title resembled those of the indigenous leaders working in sugar mills in Salta and Jujuy; such a leader was called a *capitán de ingenio* (captain of sugar mill). These leaders mediated between nonindigenous bosses of white descent and the indigenous working crew. Many Chaco peoples used to migrate seasonally to sugar mills in northwestern Argentina; this activity was discontinued in the late 1950s.

During his tours Luciano was accompanied by white-dressed *secretarios* (secretaries). In many cases, he would "sell" spirits for a small fee. The religious cult consisted of a gathering of people in and around the Corona, and a series of dances and songs performed by the secretaries and the attendees. During those gatherings, either Luciano himself or the captains and secretaries asked the participants if they would want a spirit. If they nodded, they received one, and as suddenly as if they were shocked or hit by an invisible hand, they would start to dance in circles and sometimes fall on the ground. Any spirit granted by Luciano was generally felt as an intense presence, as heat in the chest, and a need to talk, walk, jump, and cry. In La Corona, healing was conducted by the hierarchy, using the traditional shamanic techniques of prayer, blowing, sucking, and hand imposition. Those who bought and received spirits were able to perform unusual activities, such as healing sick persons, knowing future events, talking with animals, plants, and natural phenomena, and performing dream journeys, and they gained luck in different kinds of work, love, and business. Possession by a spirit was a sign of membership in La Corona. As happened in Pilagá shamanism, spirits could leave a person for various reasons.

Luciano's movement not only presented a first, native reinterpretation of Protestant Christianity in the Argentine Chaco but also a critical millenarian attitude toward white culture. He preached that a time would come soon when the Pilagá and other indigenous peoples of the area would receive goods from heaven; a time of independence from white influence would begin. Ecstasy and joy experienced in La Corona gatherings would contribute to the fulfillment of that promise. La Corona established the sociological basis of the later emergence of Toba and Pilagá "evangelical churches" like the Iglesia Evangélica Unida (IEU, or United Evangelical Church, UEC), under Toba leadership (Miller 1980; Vuoto 1986). Indeed, many of these churches in Formosa province were established in the same areas as La Corona had been and with former members of La Corona. Luciano's movement decayed after his death in the midfifties. However, many former members who are currently members of the IEU manifest their former Luciano spirits when the religious cult reaches its sensorial climax of music and collective dance and prayer.

Curanderismo

As with that found throughout Latin America, popular curanderismo in southwest Colombia is a remarkable example of the dialectical fusion between three elements: indigenous cosmologies and healing techniques, the religion of the Spanish conquerors, and popular culture—the latter being an offspring of Spanish, African, and Amerindian cultural influences. In this regard, curanderismo is a sort of a popular shamanism practiced by individuals of European, African, Amerindian, or mixed descent, always having close connections with "pure" indigenous shamans of the Amazonian forest. The ideal of a primeval and powerful shamanism located in the heart of the forest is a pervasive symbol of legitimacy.

Popular curanderos participate in an informal network of ideas and activities that function outside any religious or secular institution. The

wide geographical range this network displays extends from urban and agro-industrial zones of the Cauca Valley—centered in the city of Cali—to the Amazonian border, also characterized by its dynamism, economic potential, and cultural pluralism. In curanderos' mythical and ideological horizon, the Amazonian forest appears as the locus of mystic and healing power, specifically of the knowledge and shamanic practices related to the use of *yagé*, a hallucinogenic infusion made with two plants, *Banisteriopsis caapi* and *Psychotria viridis.* Yagé is widely used in ritual practices by a number of Amazonian indigenous peoples; in some contexts it receives the name of ayahuasca.

The master-apprentice relationship in Colombian curanderismo is based on mutual reciprocity and trust, but it is also a source of tensions and conflicts, depending on the way shamanic power is actually used. As in many shamanic systems, a person's own illness—usually conceived of as caused by another competing curandero—is the initial step of his career as apprentice. (Curanderos are usually male, but there are cases of female specialists.) Power is obtained after the ingestion of yagé and the shamanic manipulations carried out by the master in the world of spirits. Curanderos' healing rituals follow the pattern of Amazonian shamanism, mainly of the Putumayo riverside (i.e., Kofán, Siona, and Ingano peoples) (see Langdon 1974; Matteson Langdon and Baer 1992; Chaumeil 1992). These elements include the drinking of yagé by the curandero and the patient together, singing as a way of accessing the spirit world and its power, and the practice of sucking the illness from the patient's body as a key healing technique.

The universe is composed of different interconnected layers, and the beings from the earth layer can penetrate into the other layers; in the process, they are able to transform themselves into animals or plants. Drinking yagé allows access to these spiritual planes and face-to-face interactions with the master spirits of hunting and fishing animals or the spirits involved in illness production. They are the so-called people of yagé who guide the person in the process of diagnosis and therapy of a disease. The cultural appropriation of yagé shamanic cosmology carried out by the curanderos is apparent in their myths of origin and in narratives about ascension through the different cosmic layers. The role of God and the angels occupying the upper layer of the universe, usually visited by every curandero seeking advice, knowledge, and power, along with the prayer to the Father, the Son, and the Holy Spirit as part of the consecration of yagé, accounts for the open dynamism and expansion of the cosmic structure. Furthermore, the spirits of saints from the Catholic pantheon coexist with powerful indigenous shamans and popular saints of the region.

Metasyncretism: Churches and Congregations

The third case of fusion between shamanism and Christianity can be identified in a "metasyncretism" of religious imagination and ritual practices institutionalized under the modality of churches or congregations. The example discussed here, the Santo Daime Church, is characterized by another kind of cultural interpretation regarding the use of ayahuasca. Originating in Brazil in the 1920s, this religious group displays a cosmological synthesis including elements from indigenous shamanism, Catholicism, Esoterism, spiritism, and Afro-American worship. During the twentieth century, the Santo Daime achieved an important institutional and international expansion, which also produced a splitting into several branches. Its current geographical and social range of influence extends from poor peasants of Brazilian central-southern Amazonia to professionals and artists living in Brazil's major cities. In addition, an increasing number of Santo Daime churches have been established overseas, mainly among middle-class individuals; there are more than fifty churches scattered in America, Europe, and Japan.

The founder of the movement was Raimundo Irineu Serra, an individual of African descent who lived in the state of Acre in western Brazilian Amazonia and used to work in rubber extraction. Serra, usually called Mestre Irineu, had been in contact with popular Catholicism, spiritism, Rosicrucianism, and Candomblé. These religions were reinterpreted after his experience contacting Tukano indigenous groups of the area and drinking the "Wine of Gods," another name for ayahuasca. Serra's ayahuasca visions put him in touch with several spirits of the forest, and finally with a white woman wearing

a light blue dress who lived in the moon, whom he identified as the Virgin Mary and the Queen of the Forest. She offered herself as protector and guide, communicating to him the need to found a new religion in which the use of ayahuasca would be the sacrament to reach divine illumination and bodily and spiritual healing. The town of Rio Branco, in the state of Acre, became the sacred territory of the Daime worship and the locus of spiritual pilgrimage from all over the country. Since the sacred drink is only produced in Acre, its network of distribution represents an extraordinary sociopolitical phenomenon in itself.

Santo Daime's key beliefs include reincarnation, protection of the forest, and protection of its natural species. The word *daime* does not refer to any particular spiritual entity but derives from the Portuguese imperative form, *dame* (give me!), used by Serra when he created the liturgy, a term that finally became synonymous with the sacred drink. The *daimistas,* that is, the followers of this movement, have reported many visionary experiences in which the Virgin Mary or Jesus Christ guides them in the path toward personal illumination and healing. These experiences share a common pattern, starting with vomiting and the perception of darkness, and afterwards, bright and multi-shaped lights. According to Santo Daime cosmology, these first sensations are understood as proper for a physical and spiritual "purgatory," from which the members have to elevate themselves in their journey seeking numinous potency and moral rectitude. The next step, once the purgatory has been left, appears as a flight, elevation, or flotation through space, from an absolute darkness to the perception of a potent and distant Light. In that moment of mystical contact, the followers exclaim out loud, "Daime," begging the Light to irradiate them with its power. In these cosmic journeys, encounters take place with different spiritual beings, such as angels, saints, animals, and even extraterrestrial aliens, located in intermediate layers. The journey ends in the Light of the Virgin Mary, the Forest Queen.

The Santo Daime cult relies heavily upon hymnals received in vision by Mestre Irineu and his heirs, Mestre Sebastiao and his son Mestre Alfredo. These hymns are conceived of as powerful words, means of spiritual elevation and religious pedagogy. They are sources of sacred and political prestige, which generate dispute among the main leaders of the movement. Moreover, the ritual itself is called Hymnal; separated by gender, participants gather together around a table, decorated with a cross and an eastern star composed of a Solomon's seal with an eagle over a crescent moon. The ritual includes music and hymns, and the doctrine is mainly transmitted through them. The ingestion of Daime, the sacred drink, in many stages produces an expansion of consciousness that allows the participants to clean their bodies and souls from conflicts, sins, sadness, and illnesses. This atmosphere of collective sharing and social utopia is sought to refresh the members after the suffering of human life.

LATIN AMERICAN LITERATURE AND SHAMANISM

Shamanism plays a major role in the creation of Latin American literature, evidence of shamanism's cross-cultural presence, even in modern society. Many Latin American literary works, frequently imbued with varying degrees of esoteric features and supernatural elements, are often described by such terms as *magic realism, marvelous real,* or *fantastic realism.* These extremely controversial designations spark heated debate among literary critics not only in terms of which works are representative of which genre but also over what constitutes the essential characteristics of each category. The application of a shamanic perspective (Overton 1994, 1999) in the analysis of Latin American literature serves to eliminate the controversy. Awareness of the influence of shamanism on storytelling allows a recognition that the often cryptic and enigmatic nature of these narratives recurrently stems from the presence of shamanistic characters, elements, and symbolism. These esoteric elements belong to a worldview whose origins can be traced to the shamanic belief systems of the three foundational cultures of the Latin American continent: the Native American, the African, and the Iberian. These underlying shamanistic traits constitute the cultural foundation of much of what is called magical realism, or the marvelous real. Hence, a more appropriate term for the genre, one that circumvents controversies and debates, is *shamanic realism* (Overton 1999). Representative works of shamanic realism include those by such celebrated authors as Gabriel García Marquez, Alejo Carpentier, Isabel Allende, and Julio Cortázar.

The Esoteric in Latin American Literature

Authors and critics of Latin American literature alike have long recognized the degree to which the esoteric, stemming from widespread cultural beliefs, abounds in Latin American literature. Indeed, the belief that an alternate reality fraught with magic, spirits, and ghosts coexists with ordinary reality is manifest throughout almost all of Spanish and Portuguese America. This cultural and even cognitive perspective has given rise to those characteristically Latin American productions seen as examples of magic realism. However, it is not only the presence of a magical worldview that characterizes Latin American literature but also the manner in which this worldview is presented to the reader. Amaryll Chanady (1985) distinguished the use of "resolved antinomy" in the context of magical realism, referring to the way "magical" reality and "ordinary" reality are juxtaposed in such a manner that the reader is led to a sufficient suspension of disbelief to consider the magical worldview as plausible. Such a resolved antinomy contrasts with the unresolved antinomy found in the fairy tale or the fantasy novel, in which magical and ordinary realities remain in opposition to each other.

Shamanistic Elements

Central to a characterization of the shamanistic origins of these literary devices is the recognition of the roots of this supernatural worldview in the three constituent cultures as well as the identification of key elements in representative literary works. The use of shamanistic symbolism in these texts is at times a most perplexing and challenging feature to identify and comprehend. Certain elements only acquire meaning as symbols, semiophores (i.e., objects that permit communication between ordinary and nonordinary realities [Ginzburg 1992]), or metaphors within a shamanistic framework, appearing otherwise inexplicable or bizarre. Bones, blood, fruits, trees, animals, numbers, names, rattles, drums, drumming, and even death, in and of themselves, reveal little of their esoteric significance when considered literally, outside the scope of their shamanistic context. In order to facilitate the recognition, comprehension, and analysis of the shamanic in these literary works, the author has developed a co-

herent framework called “la perspectiva chamánica” (Overton 1994), or “the shamanic perspective” (Overton 1999). As a tool for analysis, the shamanic perspective supplies the reader with an overview of the shamanic paradigm and a viewpoint from which to apply this knowledge to the literary narrative.

Key shamanistic elements in Latin American literature (Overton 1994, 1999) are characters with shamanistic “powers” to perform magic, who undergo initiation rites, shapeshift, contact or resurrect the dead, interpret dreams, heal, narrate from or transit into other realities (death, dreams, and the like), or who exhibit psychic abilities. In support of these shamanistic characters are others whose worldview and system of beliefs allows for divination, ghosts, reincarnation, possession, levels of nonordinary reality, a view of the interconnectedness of all things (web of life), and the relativity of time and space.

Shamanic Realist Literature

The term *shamanic realism* (Overton 1999) refers to the realistic presentation of an esoteric worldview that is not the result of the imagination of the author, but principally of a system of beliefs of cultural origin. When the shamanistic content of a fictional narrative is sufficient to support a cogent worldview, is set within a realistic context (historically, geographically, socially, politically, and so on), and is presented in the form of resolved antinomy, it can be considered to be a work of shamanic realism. The use of the term *shamanic realism* not only dissolves much of the controversy surrounding magical realism and the marvelous real in Latin American literature but also provides new insights and a more profound understanding of the stories themselves.

Shamanic realism is central to Isabel Allende’s *The House of the Spirits,* a novel set during a factual and historical period of intense political turmoil and transition in Chile. One of the novel’s principal characters is Clara, the family matriarch, endowed from childhood with quite extraordinary, and clearly shamanistic, capabilities. These shamanistic abilities include the capacity to move objects with her mind (psychokinesis), to predict the future (clairvoyance), experience events at a distance (precognition), read minds, channel and invoke spirits and ghosts, interpret dreams, and express irrefutably accurate premonitions, all displayed within the context of ordinary, realistic daily events. Another shamanistic figure in *The House of the Spirits* is old Pedro García who, in an episode reminiscent of the Pied Piper, performs the shamanic role of Master of the Animals, clearing an entire ranch of a devastating ant invasion.

Both the episode with the ants, as well as Clara’s shamanistic activities, illustrate well the presence of key elements of shamanic realism: a resolved antinomy that characterizes the whole narrative and the presence and activities of characters affirming a shamanic worldview. Not only is the background to the shamanistic feats of Clara, old Pedro García, and other shamanistic characters one of historically accurate everyday reality, but the reader is presented with other personages whose responses are congruous with the reader’s own likely responses: a certain degree of surprise, fear, or skepticism. Moreover, despite these feelings, these characters, when confronted with the “reality” of the events they experience, must undergo more than just a suspension of disbelief; they must accept these shamanistic phenomena, having had their authenticity confirmed by their own perceptions and experience. Similarly, the implied reader’s perspective, though confirmed as “normal” by these same characters, must also undergo a change and accept these occurrences as within the realm of the conceivable.

Similarly, Julio Cortázar’s short story “Axolotl” centers on two distinctly shamanic motifs: that of the existence of a spirit or consciousness that can leave the physical body, and that of the potential transmigration of this spirit or consciousness to another physical form. Narrated in first person, “Axolotl” recounts the story of an individual who becomes gradually more and more enthralled with the axolotl salamander, only to finally lose his human form and become one. The narrator’s consciousness, in quite shamanic terms, leaves his own physical body and is now “trapped” inside that of an axolotl, retaining, however, the same mental qualities it possessed while occupying its former human body. Consequently, despite the fact that the narrator is overcome by the sudden horror of being ensnared in a foreign physical form, he soon reaches the understanding that axolotl consciousness is equal to hu-

man consciousness. The resulting implication is that of equivalence between the consciousness of the axolotl and that of a human, a concept perfectly congruous with shamanic ideas of consciousness, spirit, or essence. Consciousness is viewed not as a uniquely human phenomenon but rather as one that characterizes other species, entities, and even objects.

Other shamanic elements can be found in García Marquez's short story "Blacamán the Good, Vendor of Miracles," in which the narrator recounts how, after undergoing a torturous initiation ordeal, he himself develops the shamanic powers to heal and resurrect the dead. The combination of shamanic motifs with the requisite realistic setting categorizes "Blacamán the Good, Vendor of Miracles" as a prime representative of shamanic realist literature.

Heralded as the prime example of the marvelous real, Alejo Carpentier's *The Kingdom of This World,* a novel set during a particular period of Haiti's history, is also a most notable illustration of shamanic realism. The novel details the role that the shamanistic voodoo religion played throughout the historical period beginning prior to the expulsion of French colonialists and extending through the demise of a despotic and corrupt black regime. The lives of two shamanic characters are central to its development.

The first of these shamanic characters, the black slave Macandal, is described as being renowned for his story-telling abilities, reminiscent of the narrative abilities of shamans around the world. Not only are his narratives considered entertaining to the slave population, but they are also informative, as they serve as a means for them to familiarize themselves with the shamanistic knowledge (history, religion, legends, and mythology) of their African homeland.

As a shamanic figure representative of the voodoo culture, Macandal undergoes the typical ordeal of a crisis of initiation in the form of a brutal accident resulting in the loss of an arm. Relegated to shepherd duties, the now one-armed Macandal sets out upon a path that brings him under the tutelage of the witch Mama Loi. Mama Loi is a reclusive shamanistic character who demonstrates the power to speak to animals, commune with the dead, and suffer boiling oil without sustaining burns. Utterly astonished by these feats is the character Ti Noël who, in concealing his own amazement, contributes to the resolved antinomy for the reader, who must both empathize with Ti Noël's perplexity as well as Macandal's acceptance of the event.

Shortly after his apprenticeship with Mama Loi, Macandal becomes a runaway slave, employing his new shapeshifting powers and knowledge of poisons to mount his insurrection against the French colonists. With the drums of voodoo pounding in the background, the beliefs of the slave population are reinforced by the alleged powers of this shamanic figure. To the slaves, reptile, insect, bird, or mammal are all manifest disguises of the powerful Macandal, a belief that continues even after his capture and brutal public execution.

Many years later, long after the French colonists are ousted by an insurrection inspired by voodoo, and after the subsequent black regime is in its turn overthrown by the mulattos, Ti Noël discovers his own shamanic shapeshifting powers during a voodoo drumming ritual. At first, Ti Noël attempts to escape the ordeals of the human condition through successive metamorphoses. In the end, however, he comes to realize that Macandal had employed these powers not as an escape from the world of men, but as a means to effect change in the kingdom of this world, thus recognizing the primarily social, rather than personal, purpose of the shaman. Compelled by this new insight, the now old Ti Noël commits his full shamanic powers to fight against the new oppressive regime of the mulatto rulers.

The term shamanic realism and the accompanying methods of literary analysis have as yet only been applied to the study of Latin American literature. Given the universal influence of shamanism, it would prove equally fruitful to apply the shamanic perspective to the works of any literary tradition, particularly one originating in the mingling of modern and traditional cultures that evinces similar shamanic elements and stylistic qualities.

MAPUCHE SHAMANISM

Mapuche shamanism is a vibrant practice. Wearing heavy silver jewelry, Mapuche shamans (*machi*) mount their altars and pound painted drums to propitiate ancestral spirits and the Mapuche deity. They perform a variety of rituals to heal Mapuche and non-Mapuche patients, renew their spiritual powers, and bring well-being to Mapuche in southern Chile, communities that struggle for economic survival, cultural rights, and sovereignty. Once a warrior nation that resisted Spanish colonial rule, the Mapuche became sedentary agriculturalists and, with the growing importance of land fertility, the shamans became mostly women.

The Mapuche number 1.2 million people, one of the largest indigenous populations in South America. The word Mapuche means "people of the land," from *mapu* (land) and *che* (people). The Mapuche language, Mapudungu, "language of the earth," is spoken by the older generations. The young either speak Spanish, the official language of Chile, or are bilingual. According to a 1992 census, 80 percent of Mapuche inhabit urban areas. Nevertheless, territory, land, and landscape remain central to their cosmology and identity. The Mapuche see their territories as sacred. Ancestral and nature spirits propitiated by their shamans are thought to live in stones, forests, rivers, volcanoes, and mountains.

In the early days, the Mapuche were accomplished guerrilla warriors who defended their territory against Inca and Spanish expansion. The Spaniards were unable to conquer them, and in 1643 they signed a treaty recognizing the sovereignty of the Mapuche nation south of the Bio-Bio River. After Chile won independence from Spain in the nineteenth century, Chilean armies defeated the Mapuche, seized their territories, and massacred their people. The Mapuche were placed on reservations, and their land was sold to settlers. The landless Mapuche had to work as wage laborers for farmers and forestry companies or migrate to the cities to become impoverished second-class citizens. The Mapuche suffered further assimilation under military dictatorship, but the return to democracy in Chile in 1989 saw the passage of indigenous laws recognizing Mapuche culture and language. Their rural communities are still threatened by the building of highways and hydroelectric dams, as well as by rapid exploitation of forests by the logging industry. Several Mapuche movements are struggling to gain recognition as a Mapuche nation (Bacigalupo 2004d).

Mapuche shamans, or *machi,* were traditionally the sons and daughters of prominent caciques, or chiefs, who were initiated into shamanhood through dreams and altered states of consciousness; they negotiated between the human world and that of spirits for the purpose of healing and collective well-being. Male machi performed spiritual warfare against the Spaniards by propitiating the spirits of Mapuche warriors and machi spirits (spiritual warriors), who continued warring against Spanish souls in the sky, using thunderbolts and volcanic eruptions as weapons. Machi accompanied Mapuche warriors to the battlefield and performed spiritual warfare from the sidelines. With curses, they blew tobacco toward enemy land. They invoked the moon, the sun, and the planets during military divinations. They pierced their tongues and penises with wooden

spindles and offered their blood to the spirits, requesting spiritual protection for Mapuche warriors (Bacigalupo 2004a).

The Mapuche believed that illness and death were produced through witchcraft, poisoning, and invisible darts, and they feared those who performed such acts, but they distinguished between shamans (machi) and witches *(kalku).* By the mid-eighteenth century the Mapuche had incorporated the Spanish association between women and witches, and the Mapuche stabbed and burned Mapuche women they thought were witches.

Male machi became less important after the Mapuche's military defeat and the splitting of lineages onto different reservations, which made the invocation of the ancestral spirits of particular lineages, military divinations, and the performance of spiritual warfare unnecessary (Faron 1964, 154; Bacigalupo n.d.). Agricultural production became crucial for survival under the reservations system, under which the Mapuche were relegated to small plots of eroded territory, and collective *ngillatun* (fertility) rituals were performed, primarily to ask deities for bountiful crops and fertile animals. The machi were considered *ngenküyen* (owners of the moon), who controlled the powers of generation and fertility and were gifted in dealing with problems between the sexes, infertility, and menstruation (Latcham 1922, 433). The idea that female machi, who can give birth from their bodies, are more effective in ensuring land fertility became widespread throughout the twentieth century, and female machi began to replace traditional male orators, *ngenpin,* in the performance of collective fertility rituals. Machi practice has become increasingly associated with domesticity, land fertility, and women's work (Bacigalupo 1996c, 2001a).

Cosmology

The Mapuche view the world as constituted by different forces that are in tension with each other. Illness, unhappiness, and bad crops result when these forces become unbalanced. All deities and spirits are said to have a good and bad side. They punish humans with illness, scarcity, and unhappiness if they do not perform rituals with offerings and animal sacrifice or if they transgress traditional religious or social norms called *admapu.* But if humans perform these functions, spirits and deities will reciprocate by granting them good harvests, abundance, and well-being.

The most common Mapuche perception is that the world is divided into three vertical planes. The Wenu Mapu, the spiritual dimension located in the sky, is where deities and ancestral spirits are believed to live. The Wenu Mapu is usually given a positive dimension associated with the colors white, yellow, and blue. The sun, the moon, and the stars are associated with the powers of life and generation and are also located in the Wenu Mapu. The Munche Mapu, the dimension of evil where the *wekufe* (ambivalent) spirits are believed to reside, is the reverse of the Wenu Mapu and is located under the earth. This dimension is associated with the colors bright red and opaque black, and with volcanic eruptions and whirlwinds. The Mapu, the earth, is the everyday dimension where the Mapuche live and work. This is where conflicting powers encounter each other and where the struggle between good and evil, life and death, health and illness takes place (Grebe, Pacheco, and Segura 1972; Dillehay 1990, 89; Marileo 1995; Bacigalupo 1996b). Nature spirits are also believed to live here. The Mapu is associated with the colors of nature, blood red and green.

The Mapuche organizing principle is a quadropartition, in which masculine and feminine and youth and old age are complementary and needed to obtain wholeness (Bacigalupo 1998a, 2005).

Myths, Deities, and Spirits

The Mapuche creation myth tells of a powerful spirit who controlled everything and possessed all possibilities and meanings within it. This spirit has appeared under different names: Füta Newen (big spirit) (Bacigalupo 1997), Elmapun (creator of the earth) (Marileo 1995), and Ngenmapu (sustainer of the world) (Carrasco 1986). The big spirit lived with a number of little spirits (children), who wanted power and rebelled, so the big spirit spat on them, and their bodies turned to stone. They fell to the earth and became mountains. Some spirits stayed trapped inside the earth in the Munche Mapu and turned the mountains into smoking and erupting volcanoes. They were the big spirit's sons, who became the first male warrior

spirits in the form of thunder, lightning, volcanoes, and stones. Some Mapuche believe their ancestors came from these spirits, called *püllüam* or *pillanes.* Other spirits were loyal to the big spirit and cried copiously over the mountains and ashes. These were the big spirit's daughters, who were transformed into stars who mourned their brothers. Their tears formed lakes and rivers. The earth was created from the mixture of water (daughter's tears) and ash from the volcanoes (brother's anger) and was therefore both male and female. The big spirit then became Elchen or Chau Elchefe, the creator of humankind, and divided itself into male sun and husband/father *(antü)* and female moon and wife/mother *(küyen).* Woman was created first from a daughter star and placed on earth as the giver of life. All plants, animals, and other forms of life arose from her footsteps. Man was created from a son lightning to protect and feed her. The moon (female/mother/wife) and the sun (male/father/husband) took turns looking over their children, thereby creating the balanced relationship between day and night (Marileo 1995; Bacigalupo 1997, 2005). The sun taught its children how to sow seeds, how to harvest, and about fire. The moon taught them the seasons in which they should sow.

The Mapuche believe there was a second creation of the world after its destruction in a deluge, which required the sacrifice of a human victim for the constitution of a new life and cosmos. The Mapuche deluge myth tells of two forces in constant struggle. The first force, Kai-Kai, is symbolized by water and ordinary lives frozen in the bowels of the earth, but when released produces floods and rains bringing death to humans and animals. The other force, Tren-Tren, is symbolized by dry and solid earth that lives on hills and mountains, and it counteracts Kai-Kai's actions by trying to save humans and animals with sunshine. Most of humanity drown in the flood or are transformed by Kai-Kai into sea lions, whales, fish, and mermaids. Some humans survive on the mountain and resort to cannibalism, producing further cosmic disorder. When only one couple is left, a machi reveals that they must pray and sacrifice their only child by throwing him into the waters to appease the divine anger. The couple performs the sacrifice and order is restored in the world. This myth explains the need for the Mapuche to periodically offer animal sacrifice and prayer in collective ngillatun rituals in order to maintain cosmic balance between different forces and avoid catastrophes (Mege 1997; Carrasco 1986). This myth was enacted literally by a machi from Isla Huapi in 1960 during a massive earthquake and a series of colossal tidal waves, which she thought would bring an end to the world. The machi had a young boy thrown to the waters to save the world.

The most powerful god of the Mapuche is Ngünechen, a deity with positive and negative aspects, who protects the Mapuche against the Chileans. The principles of age, gender, knowledge, and fertility present in Ngünechen are thought to be present in every aspect of nature and life, as well as in herbal remedies, crops, animals, and plants, and in cultural manifestations such as textile designs, songs, music, and movements (Bacigalupo 1998a). Ngünechen is perceived as the donor of life, traditional knowledge (*admapu),* and spiritual knowledge through dreams *(peuma)* and visions *(perimontun),* salvation, wealth, health, and well-being (Foerster 1993, 78–80). However, if the Mapuche don't reciprocate with offerings, animal sacrifices, and propitiations, Ngünechen will punish the community with drought, scarcity, and poverty. Machi must possess the four qualities of Ngünechen in order to be whole, see the world from different perspectives, heal, and intercede between ancestors, gods, spirits, and the community. Machi mimic the four aspects of Ngünechen to dispense knowledge and fertility to humans, animals, and crops in the ngillatun rituals (Bacigalupo 1997, 2005).

Wekufe are forces that can be benevolent or malevolent depending on who enters into contact with them (Schindler 1989; Kuramochi 1990, 45). In their negative dimensions, wekufe suck out body humors and cause deformations, illnesses and death. They have to be exorcised in healing rituals.

Altered States of Consciousness

Some machi ingest the hallucinogenic seeds of the *Miyaya* or *Chamico* (*Datura stramonium*) to produce altered states of consciousness, *küymi,* divine the future and exorcise evil spirits, and to treat pain, mental illness, asthma, and rheumatism. However, the most common form of contact between machi and the spirit

world is through dreams and rhythmic drumming. Through drumming machi contact the *filew,* the head of all machi, who lives in the Wenu Mapu and who grants living machi power and knowledge to diagnose and treat illnesses. Some authors argue that during altered states of consciousness the filew possesses the machi and the machi's soul is displaced (Alonqueo 1979; Kuramochi 1990; Métraux 1973). Others hold that the filew travels with the machi to other worlds (San Martín 1976, 192). In fact, machi engage in both possession and ecstatic flight and their experiences of ecstatic flight involve multiple, multilayered possessions (Bacigalupo 2004c). Machi also obtain the powers to heal, divine, and help others from a variety of different nature and astral spirits such as the moon, the stars, lightning, and rocks.

Machi are accompanied by a *dungumachife,* a person who speaks to the machi when she is in an altered state of consciousness and translates the machi's metaphoric language into lay Mapudungu. The machi also has a female helper *(llefu* or *yegülfe)* who plays the drum while the machi is in küymi, beats the drum for her, and brings her herbal remedies in healing rituals. The machi needs four male helpers *(afafanfe)* to crash sticks over the head of her patient, help her enter or exit küymi, and help her exorcise evil spirits. They must also have at least one *ñankan* (dance companion) to dance with when she is in altered states of consciousness.

Initiation and Ritual Tools

Mapuche individuals are often called to machi practice through dreams that reveal the medicinal and spiritual qualities of herbs. In their dreams, spiritual beings give them a shamanic drum *(kultrun),* a step-notched altar *(rewe),* and spiritual animals such as snakes, a horse, a bull, a sheep, or a chicken. The initiates often experience shamanic illnesses, which include fevers, boils, foaming at the mouth, insomnia, partial paralysis, and partial blindness. These symptoms are interpreted as being the actions of a machi who is pressuring the individual to become initiated, and the most severe symptoms disappear at initiation. Machi need to heal themselves before they can heal others (Bacigalupo 2001b). Some machi inherit their machi spirit from a deceased machi on the mother's side of the family and are thought to possess the qualities of the dead machi. Others are initiated directly by natural phenomena such as earthquakes and lightning. Other machi are initiated through a particular type of vision where a spirit reveals itself *(perimontun)* (Bacigalupo 1994). Machi often experience visions of snakes, horses, or bulls playing shamanic instruments such as the drum, trumpet, or flute, wearing machi ribbons or headdress, or dancing on the rewe. Machi may also see visions of wild nature spirits, Ngen, who offer them their powers (Bacigalupo 1996a).

The three most important Mapuche sacred plants are the *maqui* or *klon (Aristotelia maqui),* the cinnamon tree *Canelo* or *foye (Drymis winteri),* and the laurel or *triwe (Laurelia sempevirens).* The main machi ritual tools, the rewe, which symbolizes the tree of life, and the kultrun, the ritual drum, are made from these plants. The rewe, a step-notched tree trunk that represents the vertical cosmos, serves as a personal altar for the machi. Rewes usually face the east and have offerings placed at them. The rewe is made from laurel or oak wood, and branches of klon, triwe, and foye are tied to its side. Foye has a bitter taste and may produce vomiting, which also helps expel evil. Because the bark, root, and leaves of the foye are believed to have exorcising qualities, they can defeat evil spirits as well as bacteria and viruses. Knives, volcanic rocks, and sticks used to play games of *palin* (similar to hockey) are left on or beside the rewe to arm the fileu against the attack of evil spirits. Flowers, food, drink, and herbal remedies are left on the steps and at the foot of the rewe to feed, heal, and seduce the filew. The face and arms of either Ngünechen or the machi's filew are often carved on the rewe. The kultrun is a shallow drum made from a bowl of laurel or oak wood, covered by a goatskin and often conceived of as a womb. The laurel tree *(Laurelia aromatica)* is considered to have healing, soothing, integrating properties. It is used against fever, boils, rashes, indigestion, headaches, bad temper, tachycardia, and antisocial behavior (Bacigalupo 1998a, 2001b).

When the machi holds the kultrun she is symbolically holding the world in her hand. The machi screams four times into the kultrun before it is covered with the skin so that the drum holds her spirit and strength. Most machi

place pairs and fours of both male and female elements in the kultrun, representing the four principles contained in Ngünechen. Pairs and fours of seeds, wool, animal hides, laurel leaves, *llancato* (precious stones), and old coins placed inside the kultrun are all considered female because of their association with life, growth, and fertility. Pairs and fours of darts, bullets, cinnamon leaves, pieces of charcoal, and volcanic rock placed inside the kultrun are considered male because of their association with exorcism, war, or fire (Bacigalupo 1998b). The kultrun is sometimes referred to as *kawin-kura,* "the celebrating stones" (Ñanculef 1991). Machi often paint their kultrun with a cross that divides its face into quarters and represents the four corners of the Mapuche earth, or Mapu, the four seasons, the four winds, the four celestial bodies (Grebe 1973), and the four principles of Ngünechen. The center of the cross represents the middle of the earth, the place where the Mapuche locate themselves and their *ngillatuwe* (collective altar, *axis mundi,* or tree of life) (Marileo 1995, 93–102). Machi often paint suns, moons, and stars on their kultrun to call on these powers.

A Chilean Mapuche Indian witch doctor plays the "Kultrun" drum, a traditional musical instrument, during an indigenous New Year ceremony in Santiago, 24 June 2003. While Chilean Catholics commemorate the nativity of Saint John the Baptist, indigenous cultures celebrate their New Year. (Carlos Barria/Reuters/New Media/Corbis)

Other symbols associated with fertility are the *kaskawilla,* four sleigh bells that contain the sound of sacred waterfalls and rain; the *guada,* "calabash," which represents a womb with seeds in it; and the *metawe,* a clay vessel the machi fill with a drink made from maize or wheat called *muday,* which is perceived as the liquid of life and sometimes associated with semen or milk.

Healing Rituals

The Mapuche see illness as having bodily, mental, and spiritual components and treat them holistically. Machi distinguish between illnesses with natural or spiritual causes and classify them according to their origin, intensity, duration, and localization. Machi perform many types of healing rituals to cure these ailments. They diagnose illness by looking at urine samples *(willentun),* looking through the patient's used clothes *(pewuntun),* or by looking into the patient's eyes. Machi treat with herbal remedies *(lawen)* a number of "natural illnesses" produced by the excess of work, sadness, negligence, digestive and nutritional problems, and the malfunction of organs. Evil is the main cause of spiritually induced illnesses. Evil is viewed as a force that is external to the body of the patient and the family; it is activated when the Mapuche break social or ritual norms, such as the ideal of reciprocity and solidarity. Spiritual illness can also be produced by a number of evil spirits, *wekufetun,* by a kalku or witch (*kalkutun*), or by an ordinary person who places cursed objects in the victim's house *(infitun).* In their healing rituals machi exorcise evil and illness from the body of their patients, as well as giving them herbal remedies and advice on how to solve family or social conflicts (Bacigalupo 2001b).

The Datun is the most complicated and expensive healing ritual performed to treat people with serious spiritual illnesses. The machi visits

the patient's house at dusk to begin an all-night ritual to expel the evil spirits from the patient's body and house. The patient lies face up on the floor with head pointing east, and the family place foye and triwe branches by the head and feet. The machi dons her silver breastplate and headdress to protect her against evil spirits, places two crossed knives on the chest or under the head of the patient, and sits on a low bench looking through the doorway that faces east and sometimes smoking a cigarette to concentrate. The machi enters and exits altered states of consciousness throughout the ritual, alternating between possession and ecstatic flight (Bacigalupo 2004c). The machi begins with slow drumming and a narration of the history of her calling and initiation, and she names deities and spirits *(metrumtun).* Before entering into trance she takes a swig of a drink made of foye leaves and metal dust scraped from a knife. The machi plays a faster beat, the *trekan kawellu kultruntun,* the drumbeat of the traveling horse that gallops to other worlds to gain strength to enter and exit altered states of consciousness. While in an altered state of consciousness, the machi divines the patient's illness (pewuntun) and gives messages and cures *(wültruntun)* defined by filew or Ngünechen and communicates with several nature spirits and twelve warring spirits (Ñanculef 1991). The machi rubs the patient with herbal remedies, sucks the body to extirpate the illness, and gives herbal remedies to drink.

Rites of Passage

The most important moments in a machi's spiritual life are her initiation ritual *(machiluwün),* her renewal ritual *(ngeykurewen),* and her death ritual *(amulpüllün).* After a year or more of studying with a professor machi, initiates legitimize themselves as machi by publicly demonstrating their ability to drum, sing, and enter and exit altered states of consciousness in an initiation ritual (Métraux 1942, Robles Rodriguez 1911, 1912). Initiations are complex healing rituals performed by the initiate's professor machi and one or two other machi from the same machi school of practice. The initiate is healed from her spiritual illnesses *(machi kutran),* which was caused by a machi spirit to press the neophyte to become a machi. Initiation rituals last two days, beginning at dawn and ending at dusk, and often take place in April or May, when the red *kopiwe* flowers bloom.

The initiate's rewe is planted into the ground, and the neophyte is adorned with red kopiwe flowers, a blue headscarf and other scarves around her neck. The initiate first lies on a bed of herbal remedies, with a cinnamon branch standing at each corner. Each machi professor in turn performs a healing ritual for the initiate, during which she is rubbed with herbal remedies. Each machi enters into an altered state of consciousness separately and ascends the rewe of the initiate and shakes the branches.

During her initiation ritual, a machi is given one or more auxiliary animals, such as a horse, a sheep, or a chicken, that she has seen in dreams or visions. These animals are often painted blue around the eyes, mouth, and nose, and adorned with kopiwe flowers. These animals possess some of the initiate's spirit and cannot be eaten or sold. The initiate exchanges bodily humors such as saliva, breath, and sometimes blood with these animals and "dances" with them to the sound of her kultrun (Bacigalupo 2001b).

Funerary rituals for machi, called *amulpüllün* ("making the soul leave"), are important in order to help the machi's soul find its way to the Wenu Mapu. Funerary rituals usually last four days and three nights. Traditionally machi were buried lying within a carved wooden canoe *(wampo)* with another canoe upside down on top, which helped the dead cross the river of death into the other world. Today most deceased machi are buried in pine wooden caskets. At the end of the ritual the machi's rewe (altar) is pulled out of the ground and placed to rot in a nearby river. The machi's favorite objects and food are placed in the casket for the voyage to the other world. The casket is taken to the cemetery accompanied by machi and musicians for burial. A cross is placed by the grave, along with flowers and clay vessels containing *chicha* (a drink made from maize) and the drink called *mudai.*

The Ngillatun Ritual

At the beginning of the twentieth century machi began to officiate in collective ngillatun rituals to petition well-being and give thanks on behalf of the ritual congregation (usually

four or more communities). Louis Faron (1964) and Tom Dillehay (1985) saw nguillatun rituals as creating ethnic solidarity and integration in the ritual congregation. Mapuche today view the collective enactment of the gender and generational dimensions of the deity Ngünechen in its broader religious, economic, and political dimension. Through Ngünechen, machi obtain the good harvests, fertile animals, and well-being that allow the community to survive while at the same time creating the basis for a pan-Mapuche identity and combating adverse forces (Bacigalupo 2005). The ngillatun is a sacrificial rite where the community makes offerings of grains, mudai, water, herbal remedies, and the blood or meat of animals by the nguillatuwe (collective altar) and a secondary altar *(llangi llangi).*

The machi, the *longko* (chiefs), and the most important people of the community pray at the ngillatuwe. The ritual lasts between two and four days and involves a series of dances and prayers repeated symmetrically in series of four. Most ngillatun rituals begin and end with the *awün,* or *trilla,* in which horsemen gallop around the ritual field counterclockwise sixteen times, starting from the east. In a dance called *longkomeu,* groups of dancers move around the rewe in circles and then back and forth beside the altar. The *choykepurrun,* or *tregülpurrun,* is a dance performed by a group of young men who imitate the mating dance of the American ostrich. Tomás Guevara (1908) and Luis Manquilef (1914) associated this dance with a totemic cult.

Relation to Other Religions

Machi interpret the *admapu,* the customary law, resignify tradition, and hold spiritual and moral and judiciary authority over the community (Dillehay 1985). To the extent that machi represent the forces of healing and good and control the forces of evil on behalf of the community, they also perform political functions. Machi legitimize community events, actions, and political processes as well as the authority of Mapuche lonkos.

The Chilean majority view machi as symbols of ethnic minorities. These Chileans still perceive machi as exotic traditional folk practitioners, earth mothers, witches, and sexual deviants (Bacigalupo 2004b). Their politicians often invite machi to appear with them in public to justify their discourses about pluralism. The Mapuche also use machi as symbols of the traditional in their movements for political autonomy. Machi often combine ritual and politics. Some call on ancestral warriors and on Ngünechen to perform spiritual warfare to combat forestry companies who have taken their land and to rally for cultural rights and political autonomy (Bacigalupo 2004d).

The number of practicing machi has increased substantially in recent years and has expanded to urban areas. Machi practices are dynamic, flexible, and hybrid. Most machi are baptized Catholic and have incorporated and resignified elements from folk medicine, biomedicine, and Catholicism, as well as national symbols, into their healing epistemologies. Catholic priests have the reputation of being tolerant with machi and are often invited to participate in ngillatun and funerary rituals and sometimes to pray in them. Male machi who officiate in collective ngillatun rituals present themselves as "Mapuche priests," "spiritual doctors," and "biblical machi." By legitimizing themselves as doctors and priests, machi are more protected from labels of homosexuality and witchcraft. Female machi who officiate in ngillatun rituals often label themselves as "machi moon priestesses" "nuns," and "angels," and they have contact with Catholic nuns who give them images of the Virgin, Saint Francis, or Jesus (Bacigalupo n.d.).

The Bahai have gained followers among the Mapuche by recording and playing Mapuche music, including prayers performed by machi, on the radio. Evangelical pastors often depict machi practice as the art of the devil. Pentecostalism, however, has become popular in some Mapuche communities; it reproduces the central elements of Mapuche ritual and the role of machi, such as ancestor propitiation and healing with the help of spirits (Foerster 1993, 156–157).

MAYA BONE DIVINATION

Maya bone divination is a divination technique employed by Tz'utujiil Maya bonesetters to ascertain and treat bodily injury, and one of several divination methods found in Guatemala. Bilingual Spanish and Tz'utujiil Maya-speaking bonesetters of the towns of San Pedro la Laguna and San Juan la Laguna, known as *curanderos de hueso* (Spanish; "bone curers") or *wikol baq* (Tz'utujiil Maya; "bone arrangers"), utilize a small object to diagnose and treat clients. Called a *hueso* or *baq* (bone), this object is used to locate and identify injury in the body, particularly skeletal injury, and to then reduce the injury.

Tz'utujiil Maya bonesetters keep their bone sacra wrapped in a red cloth and either carry it on their person or store it in a home altar. The object may, to Western eyes, appear as a small animal vertebra or a smooth round pebble. When an injured person seeks a bonesetter's help, the bonesetter first talks with the client about the injury, visually inspecting it and estimating its severity. Then he or she produces the wrapped bone and holds it against the client's body. Some bonesetters report that the bone then moves of its own accord across the injured body, or that the bone, held in a moving hand, guides the hand's movement until the locus and type of injury is divined. The injury may be due to a simple blow, with temporary tissue bruising, or it may involve a strained or

sprained joint. In more serious cases, a fracture may be present. According to some bonesetters, the bone glides across the surface of the body, passing over areas of lesser injury but stopping abruptly where a bone is fractured. The bone thus identifies a fracture and locates it. Guided by the bone, the bonesetter will then manipulate the injured area, pushing and rubbing the bone against it. Later treatments can be applied as needed. The bone's ability to detect and treat is linked to its divine source and manner of its revelation.

Most bonesetters who use a divinatory bone learned about it through a dream or dreams. They have reported how, at one point in their lives, they had dreams in which they were told to enter the nearby hills where they would find an object, usually on a footpath. Some bonesetters have described how the objects they found, either actual bones or stones, would move, jump, or otherwise become very noticeable. Other bonesetters who had not dreamed about the objects yet who also encountered them have remarked that these objects really caught their eye because of their shape, sparkle, or their unusual location. Those who found such objects typically collected them and took them home. The discovery of the bones has signaled to many bonesetters that their healing vocations have been divinely ordained. Some bonesetters, however, have received an additional endorsement of their work in their dreams.

Numerous Tz'utujiil Maya bonesetters have reported dreaming of a male personage, usually described as an old man or an old sovereign, with dominion over many animals that accompany him. He either appears in a cave or out in the woods, that is, either inside or amidst the sacred hills and volcanoes flanking the Maya's lakeside communities. At some point in the dream sequence, the personage may draw attention to a disassembled human skeleton, which he reconstructs bone by bone, beginning with the feet and progressing toward the skull. The personage then instructs the dreamer to reconstruct the skeleton, sometimes telling the dreamer to use the sacred bone that he or she has found. Such dreams close with the admonition that the bonesetter must work to help others, and with the sense in the bonesetter that a "spirit-owner" of the hills has spoken to him or her.

The bonesetter is further confirmed in the vocation if midwives and parents reveal that the bonesetter was born with a *don* (gift), something referring to both a divinely sanctioned talent and a physical marking at birth. Children born with different types of cauls are considered predestined for curing and divining roles. Bonesetters generally find out about their birth marking, if any, after they have begun treating others, at which time their revelatory dreams, divining bone discoveries, and, sometimes, persistent health problems take on new meanings. Townspeople learn of how individual bonesetters were born with a don and subsequently found divinatory bones, and confer greater legitimacy upon those bonesetters.

The divining bone contains a magical potentiality that transforms it into a healing instrument in the bonesetter's hands. Other revealed objects from the hills possess a potentiality and can serve as ritual instruments, but the divining bone is the most respected of these sacra. In recent decades, Tz'utujiil Maya bonesetters have expressed how the divining bone seems to work like a magnet, detecting and cleaving to broken human bones, repairing these bones via unseen forces.

MAYA COSMOLOGY

Shamanic Cosmologies

The analysis of Maya cosmology within the context of Mesoamerican religions that is the focus of this article needs as a foundation a consideration of shamanic cosmologies in general. The cosmology of shamans is by definition

a description of worlds visited in a shamanic state, during voluntary and directed travel into nonordinary realms. Since these cosmologies are not accessible to investigators in ordinary states of consciousness, there are but two sources of information: (1) reports of personal experiences from those who have made these flights, and (2) the ritual symbolism of cultures that maintain shamanic traditions.

Both these sources include stories of overcoming death, whether by rebirth after periods of trial in the Underworld, or by conquering death-dealing demons on this earth. The celestial travels are generally reported as peaceful and joyful, giving information about the future and a sense of unity with nature, the souls of the deceased, and future generations. Such mystic experiences of unity through time and space, and unity with the Divine, are celebrated in the origin stories of many religious traditions.

Scholars of comparative religion such as Mircea Eliade (1989) maintain that the rituals and their underlying cosmologies are not illusions but rather guides to, or indicators of, the underlying framework of an invisible reality that structures our lives. Typically, shamanic cosmologies begin with a tripartite universe based on conceptions that predate both Galileo and the telescope, involving three levels: the sky world, this earth where humans live, and the Underworld of death and decay. These are connected by the daily travels of the sun, moon, and stars, who descend into their nightly tomb in the west, travel underground, and are reborn again in the east (with the planets traveling in more interesting patterns). Typically, these three worlds are connected by a central world tree, or a pillar, the cosmic axis of the world. Sometimes there are also connections in each corner of an earth conceived of as square, or rectangle, with the corners being the points of sunrise and sunset during the summer and winter solstices. The life cycle of human beings is likened to that of the sky beings, and also to the yearly cycle of plants that seasonally die, leaving seeds that sprout again when the rains come.

From the perspective of ritual participants, a traditional cosmology is a map to a numinous realm of forces that affect human life on the everyday level. Shamanic ritual is the technology of the sacred, the means for communication with this other realm, a process for knowing and communicating with spiritual beings. These beings are generally understood to inhabit the upper and lower levels, and to be accessible at specific times and places, through rituals conducted by experts, and sometimes even by non-experts following manuals, such as Michael Harner's *The Way of the Shaman* (1980), or traditional prescriptions for special circumstances.

Places where the creation of the present world occurred are sacred sites in traditional cosmologies. Spectacular natural formations and those with impressive views are often believed to have been created in those times and to facilitate access to spirit beings. Among these places are mountaintops, volcanoes, islands, geothermal springs, sinkholes in karstic terrain, stands of extremely old trees, mountain springs that are the headwaters of rivers, rock formations in valleys and mountains, waterfalls, whirlpools, inlets of the sea where waves create impressive patterns, and similar natural settings. Celestial events such as appearances of Venus, eclipses, full moons, and conjunctions of planets are also understood to be repetitions of the events that established contemporary cycles of time.

Numerology is associated with the cardinal directions and the three levels traversed by the sun in its daily circuit. The number three is more frequently emphasized in Old World cosmologies, in association with mother, father, and child, as well as the three levels, or worlds. In the Americas, although threes continue to have significance, fours and fives are also frequently found, associated with the quincunx, a four-sided structure oriented to the sun's path, but having a central point, connecting the three layers. Sometimes the sides are indicated by medial points and sometimes by points at their intersection, sometimes both; the center point is an indication of the vertical direction (up-down).

Maya Cosmology within Mesoamerican Religion

Mesoamerica refers to a cultural area: It includes Nahuatl traditions with roots in Teotihuacán, Tenochtitlán, and other pre-Columbian civilizations in the Valley of Mexico, the Mixtec traditions of Monte Alban, the Olmec of the Gulf Coast, and the Mayan traditions of Chiapas,

Guatemala, the Yucatan Peninsula, Belize, Honduras, and El Salvador. Throughout this area the same Three Sisters are traditionally planted together: corn, beans, and squash. Ancient cities show strong similarities in architecture and alignment to certain positions of the sun, moon, and a few planets. Their calendars generally include a ritual one of 260 days, which interacted with a yearly one of eighteen twenty-day months, with a dangerous five-day period in between years. In some areas the ritual calendar is still in use to some degree, in others it has been forgotten (Tedlock 1982).

Throughout the Mesoamerican area, ritual symbolism includes the three stones of the hearth, corn (as the staff of life), and the holy rain. The earth is also an important and sacred being. Thus, the practical aspects of physical life are seen as sacred, not relegated to the profane. Through agricultural rituals and mythology, corn is linked to the creation of humans and the path of the Sun-Christ that makes time and space each day and year (Gossen 1974). Corn, in turn is the primary ritual gift, the major ingredient in all the ritual foods and beverages given to the spirit beings who aid in curing the ill and calling the rain necessary for the growth of the corn. Corn thus functions as a symbolic Möbius strip, a gift from the Creator Spirit(s) to humans, and a gift from humans to the Creator Spirits, reminding them that farmers cannot grow corn without rain at the right time and in the right amount.

Of the many ethnographically documented Maya traditions, those of the Yucatan Peninsula are the focus of this article. This area was the heartland of Classic Maya civilization, and there the Maya have combined that heritage with the Spanish Catholicism brought by Franciscan missionaries in the sixteenth century. Today's Mayan practices do not fit the criteria of Eliade for shamanic traditions. Yucatec Maya ritual experts (referred to in their language as *h'men* in the singular and *h'meno'ob* in the plural) are not generally reported as using hallucinogenic substances nor do they report "flying" to other worlds in order to visit spirit beings. Their religious practices reflect a syncretism of ideas from both Spanish mission activity and pre-Columbian Maya history. Some scholars have reported a synthesis so complete that the original roots are no longer known, but the whole cosmology is one integrated system (Sosa 1986); in the Chiapas highlands Evon Vogt (1976) described the Christian elements as a gloss over surviving Mayan beliefs. Betty Faust (1988, 1998a, 1998b) has found indications that Mayan cosmological referents are clearer in household, healing, and agricultural rituals, while public Catholic holiday rituals have incorporated many Mayan symbolic elements within an integrated system that appears conventionally Catholic on the surface. Manuel Gutiérrez-Estevez (2002) has reported a belief that Maya spirit beings still have local power over rains and illnesses in Yucatan, but that after death the Christian God rules.

Archaeological and Historic Evidence of Mayan Cosmology

What is generally referred to as Mayan shamanism has a very long history, according to interpretations of iconography from Maya archaeological sites (e.g., Freidel, Schele, and Parker 1993). The kings performed self-sacrifice, letting their own blood in rituals that gave birth to their gods through visions associated with blood loss (Schele and Miller 1986). Other mind-altering practices included the smoking of a psychotropic variety of local tobacco and the use of hallucinogenic plants in ritual enemas portrayed on Classic Period (400–850 C.E.) ceramics (Furst and Coe 1977).

The ancient Maya called their gods (or spiritual emanations of the Divine) into the world of the living; they addressed them in ritual prayers and offered them ritual foods, beverages, and tobacco (and in extreme crisis, human sacrifices—like other ancient peoples), but there is no evidence of shamanic flight to celestial or infernal worlds. Only in the mythical stories of the events of Creation, is such flight found. The hero twins do travel to the Underworld, and after using their wits to vanquish the Lords of Death, they ascend into the heavens.

This story is found in the *Popol Vuh* (Tedlock 1985), a book discovered in the seventeenth century, written in the Mayan language in European letters and referring to a version originally written in another manner (possibly hieroglyphs). It includes the textual version of a sacred origin story whose major events were preserved in illustrations on Classic Period ceramics throughout the Maya area. A creator being of male and female aspects becomes a

multitude of beings who talk and decide to construct a four-sided universe with an Underworld, Xibalba, where the Lords of Death rule, and a world above where the sun (and secondarily other celestial spirit beings) establishes the structure of time and space for the earth world. They do so by measuring and marking it with a cord, just as traditional corn farmers lay out their fields before burning the forest to plant their crops.

Although this origin story is not part of the oral tradition of today's Maya speakers, Dennis Tedlock (1985) found that images and jokes in it were still recognizable to a ritual expert of the Maya K'iche' of Guatemala. Numerous ethnographic studies indicate that the Maya believe that the daily rising and setting of the sun indicates that it travels a circular path, moving under our world by night, to be reborn from the sea (or earth) in the morning (e.g., Gossen 1974). The moon and the stars also follow this path, while some celestial beings, called planets in English, do more interesting things. Mayan traditions guide interpretations of eclipses, comets, and the convergence of planets with reference to the hopes and fears of individuals on this earthly plane (Sosa 1986; Freidel, Schele, and Parker 1993; Milbrath 1999).

Early colonial documents provide information concerning a Postclassic cosmology, in which a four-sided plane is connected with a celestial pyramid of sky layers and an Underworld composed of layers in an inverted pyramid. The number of layers reported in each varies somewhat, according to the period and the region of the Mayan world. Generally the layers in the sky world are either thirteen or seven (sometimes with six levels and a seventh at the top, such that the sun climbs to the seventh and descends six more, totaling thirteen "steps" in all). In the Underworld there are generally five levels or nine steps, with four levels and a fifth at the bottom (so that walking down the inside of this inverted pyramid, the night sun would go down to the fifth and come up four more on the other side, making nine). The number of levels or steps in the Underworld does not appear as clear as the thirteen steps of the celestial world; sometimes it is even said that the Underworld also has thirteen steps. Both the celestial and the infernal pyramid worlds have a square base, connecting with the square earth, that floats on water, through which the dead (humans, sun, moon, stars) must swim to reach the underworld's inverted pyramid, whose eastern side they will climb up to escape the House of Death.

The traditional house yard, like the traditional corn field, is square and oriented to the same directions as the square earth, a square whose sides face the cardinal directions and whose intercardinal points may be established by the sunrise and sunset points at summer and winter solstice. There is disagreement among scholars concerning whether the directions of the Mayan universe are points indicating direction or more accurately sides of the so-called four-sided "Iguana House" of the Postclassic. There is general agreement concerning the central point of this square representing a channel of energy from the sun at noon. This central point was probably also associated with the times when the sun reaches its zenith, which occur at these tropical latitudes during the months of May and August and are among the foci of Mayan architecture in a number of ancient cities (Aveni 1980).

Ethnographic Descriptions of Yucatec Mayan Cosmology

Today's ceremonies still use basic symbols from the pre-Columbian past, as well as Christian referents, melding elements from both previous traditions into a new system (or, as some have claimed, using Christian symbols to disguise continuities from a pre-Christian past). Many ethnographers in the Mayan highlands and lowlands have reported the symbolic numbers and representations of the four-sided universe with a central axis through which energy can flow from the heavens. In some, the central axis is an invisible conduit available at noon that has replaced the sacred ceiba *(Ceiba pentandra)* of the ancient Maya (Sosa 1986; Hanks 1990; Freidel, Schele, and Parker 1993). The ubiquitous "green crosses" of churches and chapels throughout the peninsula also indicate a reference to this conduit, as well as having symbolic connections to the War of the Little Holy Cross *(Chan Santa Cruz).* This war began in 1847 under the instruction of a Talking Cross; it secured relative autonomy for a large population of traditional Maya in the territory of Quintana Roo until the first decades of the twentieth century.

Postclassic and early colonial references to color symbolism are associated with the cardinal directions (red with east, white with north, black with west, yellow with south, and blue-green with the vertical direction and the center). These associations have become attenuated over time, although the association of red with the east is still very strong, reflected in the red foods offered to the lords who come from the east.

The movement of the sun establishes east and west, and from the point of view of the journeying sun, north is on the right hand and south on the left. This association has been part of an explanation for counterclockwise ritual movement, such that the sun rises in the east and moves to his right hand (north), eventually setting in the west into the sea, where the night journey through the south will bring him back again to the east (Vogt 1976). This explanation is complemented by the observation that in Mayan latitudes, during the agricultural season, the sun is *between* its May and August zenith points and actually, observably, does travel north of zenith at noon (Faust 1998a).

Sunrise and sunset positions move from summer solstice to winter and back again, marking both a spatial and temporal framework. This quadrilateral framework has one side that faces east, with the sunrise points of summer and winter solstices forming its farthest northern and southern limits, respectively, and its center corresponding to sunrise at the equinoxes; the western side is similarly delimited by the positions of sunset at the solstices. Shadows and the position of the sun mark divisions of the day, while movements of the stars mark divisions of time at night. Thus the celestial world creates order on this flat earth where we live, an order that is visible by day and night in the ordered movement of celestial beings.

The two-dimensional square (sometimes presented as a rectangle) of Mayan cosmology contains a central point that refers to three dimensions, plus energy and time. Energy flows down a vertical channel from the sun at noon, and has as a reference the motion of the sun through time, formed by its passage through the sky. This channel also indicates the world above and that below, simply by its vertical direction. These Mayan concepts concerning a sacred geography of three worlds are based on naked eye astronomy (Aveni 1980) and inferences from human experience and emotions, understood as keys to spiritual realities. Mayan shamans locate their patients, their communities, and unusual events (hurricanes, comets, droughts, epidemics) within this space-time continuum, delimited by the charter myth of the ancestors and keyed to the locally observable landscape. Once the shaman has placed events and illnesses in relationship to the cosmos, he can interpret them, give counsel, apply medicines, and enact rituals. (Women do not traditionally conduct ceremonies for the Sacred Spirits, although the author has been told by a Mayan healer that it is possible for them to do so.)

The responsibility of the shaman can be understood to consist in a Janus-faced duality. He seeks to change the behavior and intentions of unseen beings affecting individual patients, local communities, and the human world in general. The other side of the shaman's responsibility is to orient human beings to their situation in the universe, teaching them their place and how they should behave. Patients must come to understand that they have obligations to the land, to the sea, to plants and animals, obligations to reproduce themselves and to care for the young, the old, and the sick. Illness is seen as a punishment for disobeying the rules of proper behavior. Patients will live more fully and happily if they understand clearly that the individual human being is like the sun and must therefore grow, reproduce, lose strength, and die, in an orderly sequence.

In this process, masculine and feminine functions are interdependent, and the forming of pairs is fundamental to life. Husband and wife have tasks that are culturally understood to be natural and complementary in the nurturing of the next generation. These responsibilities must be taught to daughter and son, forming another set of four—as the basic pattern of generational time. There is also a flexible acceptance of those born to be "different"; they are commonly understood to have special access to the sacred, combining both masculinity and femininity to an unusual degree. Understanding variation and complexity, long-term cycles, mediations, interdependencies, and processes of change are all part of the shaman's work; his job requires him to interpret his culture's cosmological system.

Mayan cosmologies are taught in ceremony, where symbolic actions and items give dramatic

form to knowledge that otherwise is (or was) also absorbed through traditional practices in daily life. In ritual actions and talk there are various levels of reference to cosmology: (1) As a static framework it is depicted with ritual objects; (2) its causal processes and natural cycles are presented through ritual actions; (3) relationships between the various parts of the cosmology, its structural integration and functioning, are explained in prayers, songs, and other recitations; and (4) more detailed explanations are given to the young and to potential converts. Interviews outside of the ceremony and observations of daily life provide other clues to the cosmology, the majority of which is normally not consciously thought about by the participants—except when crisis threatens. A traditional cosmology is the locally accepted framework for negotiation and decision making, a grammar of common sense.

Today's Mayan h'meno'ob communicate with spirit beings that can assist in healing, getting rich, making friends, finding a lover, locating a lost object, avoiding accidents, making appropriate decisions, guiding one's children, and influencing the behavior of the powerful. On another level, beyond this use of power for specific ends, is a quest for wisdom in one's own life and in guiding the path of others, with enlightenment concerning one's spirit self and its place in the universe.

MAYAN SHAMANISM

Certain Mayan traditional practices are referred to as *shamanism,* and in many ways they represent a form of classical shamanism. Certainly

the tradition is an ancient one, and it is still very much alive in the early twenty-first century.

Geographical, Linguistic, and Historical Background

The Maya have existed as a people for more than two millennia. The region in which they live includes all of the Yucatan Peninsula, Guatemala, Belize, parts of the Mexican states of Tabasco and Chiapas, as well as western portions of Honduras and El Salvador. This is a geographically diverse area that covers three life zones: the southern highlands with its adjacent Pacific coastline, a central lowland area of tropical forest, and a drier northern area covered with scrub forest. Today there are more than seven million Maya who speak thirty-two languages that are closely related but mutually unintelligible: Thus, a Maya from Yucatan would have difficulty understanding a Maya from Guatemala. The family structure is, and was in the past, a patrilocal extended family occupying two or more adjacent rooms in a dwelling or compound. Mayan history can be divided into the Preclassic (2000 B.C.E.–250 C.E.), Classic (250–909), Postclassic (909–1697), and Modern (1697–current) periods (Martin and Grube 2000, 8–9).

Cosmovision

The Mayan description of the basic composition of the cosmos, or cosmovision, is an intellectual product of Mayan daily life. Everything in the cosmos consists of two types of substance: One is masculine, hot, dry, and luminous, and the other is feminine, cold, wet, and dark. Though every being manifests a predominance of one of these pairs, it also contains a segment of the other. Chac, the rain divinity, for example, is primarily cold and wet, but holds a hot lightning bolt in one hand—thus combining masculine with feminine characteristics (Miller and Taube 1993, 59).

Among the most potent natural phenomena for the Maya are thunderstorms. Lightning is considered a masculine manifestation of fertilizing energy. In the myth of the origin of corn, a lightning bolt split open the rock containing seed corn. Lightning also comes in a more feminine form known as sheet or heat lightning. Shamans connect their bodies to this lightning in order to know the past and divine the future and the hidden present (Tedlock 1992, 53).

Directional symbolism centers on the daily path of the sun across the sky and through the Underworld: Key positions are east, zenith, west, and nadir. The terrestrial world is also divided horizontally into four quadrants with a fifth central place. These divisions express the four-fold nature of the ceiba tree, an *axis mundi* (axis of the world) located at the very center of the earthly world, with its roots in the Underworld and its branches in the sky. As the central tree of the universe, it is given the color of green, and the four trees surrounding it are associated with their directional colors: red (east), white (west), black (south), and yellow (north). These trees function as highways of the gods, each of whom is associated with one of the four "yearbearers," the days by which the 365-day years were named.

The year is divided into two seasons dominated by opposing cosmic forces. This duality is not polar but dynamic. Death, for example, engenders life. It is present in a pregnant woman's dark, water-filled womb. Life engenders death and is incarnated in the warrior figure of the sun that caused death in order to ensure the continuity of the world. The triumph of one of these opposing forces over the other would extinguish all existence; thus, to preserve the world, ongoing struggle is necessary (Saunders 2001).

Shamanism

The oldest religious healing tradition still in general use today is known as *shamanism.* Over the past thirty years it has become common practice to use the word *shaman,* from the Evenki language of Siberia, to refer to Mayan religious specialists whose skills include calendrical divination, dream interpretation, and spiritual healing (Gossen 1974; Vogt 1976; Carlsen and Prechtel 1994; Tarn and Prechtel 1997).

In the anthropological literature there has long been a distinction between the ceremonial and healing roles of shamans and priests. Whereas a shaman becomes a vehicle for divine healing through spirit possession and ecstatic trance, a priest heals by communicating with deities and ancestors, primarily through offerings and prayers. Among the Maya the role of shaman and priest overlap in such a way that

many individuals simultaneously serve a community in a priestly role as well as serving individuals in a shamanic role (Miller and Taube 1993, 152). As a result there was in the past and still is today rarely an individual who might be labeled either a shaman or a priest. Rather the same people practice a blend of priestly and shamanic roles in such a way that they might be described as priest-shamans, if most of their work is for a community, or as shaman-priests, if most of their work is for individuals (Tedlock 1992, 47–87).

Pre-Hispanic Shamanism

Among the priestly roles of shamans before the Spanish came was the ability to shape-shift into atmospheric phenomena, as well as into animal companions, in order to relay messages from the gods and ancestors to the people. To shape-shift, shamans used prayer, together with mantic processes including divining by lots and crystal gazing. Archaeological remains of divining crystals and sacred bundles containing seeds and beans for the casting of lots have been found. Priestly individuals known as *nawal winak,* "nawal persons," were portrayed in early manuscripts as possessing superhuman powers of transforming themselves into atmospheric phenomena as well as into animals, especially jaguars. Although these texts do not mention the use of psychoactive drugs to achieve a trance state, they do describe various practices such as fasting, sleep deprivation, and bloodletting, which permit communication with the gods.

The priest-shamans of the Quiche, the Mayan people of Guatemala, included rulers such as Gucumatz, Cotuha, Quicabe, and Cawizimah, who were referred to as both *kaman katik,* "our grandfathers, our grandmothers," and *kachuch kakaja,* "our mother, our father" (Mercedes de la Garza 1990, 127). The writers of the *Popol Vuh* identified Gucumatz, or the "plumed Serpent," as one of their earliest rulers. They called him "a true lord of genius" and described him as manifesting his spirit familiars, saying that "on one occasion he would climb up to the sky; on another he would go down the road to Xibalba [the Underworld]. On another occasion he would be serpentine, becoming an actual serpent. On yet another occasion he would make himself aquiline, and on another feline; he would become like an actual eagle or a jaguar in his appearance. On another occasion it would be a pool of blood; he would become nothing but a pool of blood" (Tedlock 1996, 186).

Although shamanism was once considered primarily a masculine vocation, in the Americas one of the earliest written records of an important shaman is that of a Maya noblewoman by the name of Lady K'ab'al Xook. She lived during the Classic Period in the ancient city of Yaxchilan, in what is now Chiapas, Mexico. She commissioned a series of carved stone lintels for her temple, in one of which she is portrayed as letting blood by running a long cord twisted with thorns through her tongue. In a second lintel she stands motionless before a huge rattlesnake standing on its tail with a human head emerging from its jaws. As a priest-shaman with knowledge of the heavens, her duties may well have included ritual sacrifices to the sun, moon, stars, and constellations.

The first clear representation of the sun as an important cosmological symbol appears in the form of a four-petaled element, commonly referred to as the kin sign. This is the Yucatec Mayan term for "sun" as well as for "day." In ancient Maya mythology the solar gods are youthful males, consistent with the strength and vigor of the rising sun. The sun was also identified with the most powerful creature of the forest, the jaguar. The moon, on the other hand, was represented as a young, beautiful woman. During the Classic period the moon goddess was portrayed as sitting on the crescent of the Maya hieroglyph for moon, holding a rabbit in her lap.

The Maya viewed the Milky Way as both a jaguar pelt thrown across the heavens, with each star a spot on its black fur, and as a crossroads. The Black Road, corresponding to the Great Rift in the Milky Way, traced the seasonal movements of constellations northward. It was this road that linked the zenith to the Underworld, Xibalba. The White Road, corresponding to the section of the Milky Way whose width is solid white, rather than being split lengthwise by the darkness of the Great Rift, linked the southern Underworld to the zenith. Battles and sacrifices were timed to coincide with the movements of the planets Jupiter and Venus (Tedlock 1999, 40–41).

The shamanic role of midwives is indicated in paintings that display them with jaguar char-

acteristics. Jaguars symbolically link the three cosmological domains—sky, earth, and Underworld—through their ability to climb tall trees, run long distances on land, and swim across lakes and rivers, as well as dwell in underground caves. In Maya hieroglyphic writing a sign consisting of a human face half-covered with a jaguar skin has been deciphered as "Jaguar Lord," indicating that the jaguar is the companion spirit of a priest-shaman.

On the four sides of a recently discovered Classic Maya polychrome vessel from the sixth century, known as the Birth Vase, there is a pictorial narrative and hieroglyphic text concerning the mythology and ritual of birth. It features midwives with jaguar, or shamanic, characteristics (Taube 1994). The significance of these women's actions can be understood by using information recorded during the colonial period.

A number of sources recorded that the Maya had religious leaders devoted to organizing and presiding over great community feasts. Among the Maya of Yucatan there was a hierarchy of religious leaders called *ah kinoob,* "those of the Sun," headed by a chief priest, or *ahau can,* "serpent lord." These shamans were closely associated with both snakes and jaguars. The serpent symbolized the generative energy of the world, representing water, blood, and fecundity. Because of its ability to give birth to itself (in the sense of shedding its skin) it was, and still is, also associated with shamanic initiations during which the novice dies and is reborn as a shaman. Several Mayan people had and still have myths and initiatory rites centering on the experience of being swallowed and then regurgitated by a great serpent (Mercedes de la Garza 1990, 136–137).

Modern Shamanism

Mayan religious life today is directed by a group of shamans and priests. Their recruitment reveals the presence of all of the classic ways of becoming a shaman: through sickness, dreams, ecstasies, and inheritance. At the heart of shamanic practice is the active pursuit of knowledge: the understanding of astronomical, animal, and human behavior, the recognition of healing plants and exploration of their uses, and an empathic approach to the human psyche. Individuals who are trained and initiated into the shaman role practice a combination of soul journeying and spirit possession. Hands-on healing practices encompass bone setting, massage, herbal healing, and midwifery. Shamans work out their own combinations of empirical and mystical ways of knowing, sustained by life-long experiences that lead to becoming respected elders. As oral performers they recite myths, charms, spells, songs, and genealogies of previous shamans. Herbalism is reserved for shamans, masters of the ecstatic trance, who are chosen by plant divinities and become experts in handling them (Tedlock 1992; Tarn and Prechtel 1997).

The effectiveness of shamanic healing depends upon a combination of empirical knowledge with the power of a patient's faith in the healing process. Like all healers worldwide, shamans use hope, suggestion, expectation, and a variety of rituals that elicit a powerful placebo effect. This effect, which has been called "the doctor who resides within," arises from a direct connection between positive emotions and the biochemistry of the body. Shamanic chants with their repetitive symbolism help to reorganize the chaos of illness through the emotional discharge of unconscious material. Confession and forgiveness elicit and restructure repressed memories in order to resolve conflicts. They reduce stress and reestablish harmonious relations by providing emotional catharsis, or the remembering and reexperiencing of painful memories.

In many Mayan communities today, shamans also practice divination with the help of the 260-day calendar, the *tzolkin,* "count of the days," and sacred bundles containing tree seeds, grains of corn, and rock crystals. The divinatory calendar is made up of two cycles, one consisting of an endlessly repeating sequence of thirteen day numbers and the other of an endlessly repeating sequence of twenty day names

The *ajk'ij,* "keeper of days," in Quiche, is a person who knows the 260-day calendar and uses it in divination. These daykeepers are recruited for this role in classical shamanic fashion, with divine election through birth, illness, and dreams, followed by marriage to a spirit spouse at initiation. The day a person is born helps to determine whether or not that person might be trained as a shaman. A person with a favorable birth date may have a series of dreams that indicate that he or she must come before the deities known as "mountain and plains."

Often a prospective shaman dreams of being chased by deer, horses, cows, or bulls, which indicates that he or she must arrive to give offerings at the local earth shrines, which manifest in dreams as large animals. An illness such as *cumatz,* "snake," in which one experiences sudden and extremely painful cramping in the arms, legs, torso, wrist, elbows, and ankles, is considered a shamanic call. Since daykeepers primarily practice divination and healing with individuals, they are shaman-priests.

There is also a small group of daykeepers who practice as priest-shamans, known as *chuchkajawib,* "mother-fathers." They are selected by patrilineages to serve in priestly roles for the community. They bless corn seeds and harvests, baptize newborns, marry adults, and commemorate ancestors at lineage shrines. They also undertake a series of pilgrimages to the sacred mountains and lakes of the four directions. There they address the deities, asking them for health, adequate rainfall, and protection from lightning, flood, hail, earthquakes, landslides, and fires. Although these individuals fulfill priestly roles for their communities, they also have the shamanic gift of "the speaking the blood," which enables them to connect to the electrical forces of the natural world and divine the future, know the past, and understand the hidden present in such a way as to be able to serve both the community and individuals (Tedlock 1992, 74–85).

OTOMÍ (ÑÄHÑU) INDIAN SHAMANISM (MEXICO)

Otomí Indian shamans live and work in the eastern mountains of Hidalgo and in surrounding states in the country of Mexico. The Otomí Indians of the highlands in Hidalgo, the State of Mexico, and Querétaro know of shamanic practices, but they seem to have few, if any, practicing shamans in their communities.

Many Otomí now prefer to be called by their native name "Ñähñu," a name that is used in this article. The sierra Ñähñu, the Ñähñu who live in the eastern mountains, base their shamanism on native religious beliefs that have pre-Columbian origins.

Sierra Ñähñu shamans are traditional Mesoamerican Indian shamans. Traditional Mesoamerican Indian shamans are regarded as authorities on unseen spirit worlds known to almost everybody in their societies through traditional myths. A traditional shaman is also a pastor who leads a flock of devoted followers and may be called on by the community to officiate at religious gatherings or to perform other public services. Traditional shamans may be contrasted with *curandero* shamans, who practice magical healing without the authority and prestige of being religious leaders in their communities. Curandero shamans draw on a wide range of folk beliefs including colonial Spanish and modern religious beliefs. The mythical basis of their rituals is more diffuse. Curandero shamans are often subdivided into specialties according to their mode of ritual curing.

Sierra Ñähñu shamans serve as diviners, curers, psychotherapists, and priests. The divinatory activities of the shamans are supported by the belief that they can see hidden aspects of the world of living beings. The curing activities of these shamans are supported by the ideas that all beings have an animating soul force and that each human is aided by one or more companion spirit animals. The psychotherapeutic activities are supported by the shamans' sensitivity to individual and familial problems. The priestly functions are supported by believers, or entire communities, who hire the shamans to officiate at traditional religious rituals. Both men and women can be shamans. Some seem to be more spiritual than others. They are highly respected for their knowledge. The native term for shaman means "a person with knowledge." People believe that shamans can see and understand things that ordinary people cannot.

These shamans perform divination with the aid of a censer, candles, wands, or a crystal. The censer is held before the images of tutelary beings on the shaman's altar and then taken to the patient. The nature of the illness is read in the way the smoke travels upward from the censer. The way in which a candle burns on the altar can also indicate the type of illness from which a patient suffers. The censer and the candle are means of communication with the tutelary beings represented by images on the altar. All shamans are in contact with tutelary beings that help them to cure. The shaman's visions of the beings guide the divination. Divination is often used to diagnose supernatural elements in an illness, but it also can be used to find thieves, locate missing persons, discover envious neighbors, and do other things.

Much of the work of sierra Ñähñu shamans is performed at altars. Religious people, shamans and others, often build oratories, small one-room buildings, to house an altar with religious images. Other altars are erected outside at sacred places such as mountaintops, caves, or springs.

The wands permit contact with tutelary beings. The wands, silver-tipped and black, are covered with sheaves of paper cuttings that attract the soul forces of the beings. Holding one wand in each hand, the shaman sits before the altar and enters a visionary trance. Petitioners come forward to receive advice about their lives. They believe that the shaman can see what is happening in their lives. Advice is given, and the shaman may end the trance by falling into a stupor. Devoted worshipers also enter such trances. Cannabis, a sacred plant called Santa Rosa, is often used to enhance the trance. The spirit of Santa Rosa calls them and gives them the power to see into the lives of others.

Crystals are used in the shaman's oratorio or while visiting patients. The crystals are made of natural quartz or cut glass. The dancing reflections of candlelight inside a crystal send messages to the shaman. The crystal may be brought near the patient to search inside the body for the source of an illness.

The concept of soul force, called *zaki,* is an essential part of the worldview that supports sierra Ñähñu shamanism. Not everyone believes in this worldview, but it is widespread enough in the sierra region to maintain traditional shamanism as a form of healing. Traditional sierra Ñähñu believe that everything that moves is animated by zaki. Everything with zaki is a being of some sort. A world without this force would be gray and dead, lit only by a feeble sun stationary in the heavens. All animals and plants would die and freeze. Nothing

would change. The most powerful zaki belong to the principal gods, Sun, Water, and Earth, who bring life to lesser beings. Lesser "lords" with qualities that Europeans would call supernatural control other events with their lesser zaki. Near the bottom of this hierarchy of power are humans, animals, and plants. The beings with the greater zaki dominate and are responsible for those with lesser zaki. As the divine Sun dominates all beings on earth, humans dominate animals and plants.

Sierra Ñähñu shamans use paper figures to represent the zaki of beings. The figures have a doll-like form with heads, arms, and legs. They are cut from letter paper, colored tissue paper, tinsel paper, or a special bark paper that the people make for this purpose. Although it is highly prized by tourists, the bark paper is used by shamans only for the most evil beings. People believe that the paper figures are able to attract the zaki and to put the beings under the control of the shaman. Therefore, through rituals incorporating the paper figures, a shaman is able to strengthen, motivate, and attract the beings. Zaki is a force for life, so strengthening a person's zaki restores their health. Zaki gives humans the desire to live and reproduce, so putting two human figures together causes a mutual feeling of attraction. To tie one figure to the hand of another results in feelings of submission and domination. Zaki is closely related to what Europeans would call feelings and motivations, conscious and unconscious.

The companion spirit animals *(rogi)* are beings in their own right. The sierra Ñähñu believe that when a human is born one or more rogi belonging to him or her are also born. They live in the mountains nearby. (All mountains are sacred, but some are more sacred than others.) The rogi protect the person, but they are also vulnerable themselves. If all of them die, the person will die. Paper figures in animal form representing the patient's rogi are cut during curing ceremonies. They aid the person in distress. Because the rogi are vulnerable too, a shaman may call upon his powerful rogi to defend the rogi of his client. The client's rogi are most often attacked by the rogi of a sorcerer. These battles take place in the mountains. Eagles and pumas are the most powerful rogi of a curing shaman. However, sorcerers may have powerful rogi too. Their rogi include owls and foxes, the nocturnal counterparts of the eagles and the pumas. The puma *(zate)* is the most revered and respected feline for the sierra Ñähñu, not the jaguar. This suggests that Ñähñu beliefs originated in the Mexican highlands where pumas roamed, rather than along the coast where the jaguars live. The Ñähñu participated in the Aztec empire in the highlands and derive much of their culture from that area.

Sierra Ñähñu shamanic curing utilizes both rituals and herbal medicines. Curing is seen as a process in which zaki is strengthened. It can be strengthened both by ritual and by medicine. The system is neither wholly magical nor wholly naturalistic. Ritual is critical when a patient feels that he or she has been threatened supernaturally. Then a shaman must act to neutralize the threat; otherwise, the patient may be doomed. Sorcery is a supernatural attack launched by an enemy. Sorcery-caused illnesses tend to be wasting illnesses that do not respond to medicines. People believe that some sorcery illnesses are caused by object intrusion. The object can be seen with the aid of a crystal and removed by magical sucking. If an illness lacks a suspicious origin, then it can be cured by medicines, which they say have been placed on earth by God to heal these illnesses. No distinction is made between herbal medicines and medicines purchased in a pharmacy, except that the former are cheaper and more available. Sometimes an ordinary disease cannot be cured by medicines, so God has willed that the person's time on earth is over. Shamans charge their patients for their healing work only if the cure is successful.

Sorcery is the use of magic to harm. Acts of sorcery do exist among the sierra Ñähñu: People have reported witnessing them, and sorcery implantations have been discovered. In practical terms, however, sorcery exists primarily in the minds of nervous ill persons. Sorcerers naturally conceal their activities, and none have been interviewed so far. Shamans do not advertise their ability to do sorcery, but everyone believes they have the ability. The ethics of a curing shaman demand that he or she abjure sorcery and only revert to it when ethically necessary. Some sierra Ñähñu shamans are a bit wild in their claims to supernatural power and teeter on this dangerous brink, but never seem to lose their balance. A shaman can ethically use sorcery to reflect a supernatural attack back on the attacker if a

greatly suffering client will accept nothing else. However, the shaman should exhaust all other possible means of neutralizing the sorcery and calming the client. Sorcery is regarded as a violent act that disrupts the peace of the community. It may result in revenge killing. Sorcery is a dangerous business both for a client and a shaman. The worst thing a shaman can do is to accept money for performing sorcery. After that, he or she can never return to honest membership in the community and will loose all power to heal, so it is said.

Sierra Ñähñu shamans serve priestly functions during traditional religious rituals. These rituals celebrate traditional gods and lords. Their general purpose is to create a reciprocal relationship between humans and the other more powerful beings. Since shamans know most about these beings, they give advice on how to perform the rituals. They act as the principal celebrants during the parts of a ritual where great care is necessary. However, they are seldom the sponsors of the ceremonies, which require the sponsor to contribute food and other offerings. The prestige and the supernatural benefits of a ceremony accrue to the sponsors. Often one sees sponsors working side by side with shamans in democratic cooperation. Shamans are always ready to step aside to allow clients to perform rituals that will benefit them. Offerings consist of candles, incense, liquor, cigarettes, money, soft drinks, food, cookies, and a variety of traditional flower decorations. Before a ritual, the male participants make the traditional flower decorations while the female participants cook the food. The most common type of ritual, the *costumbre,* starts in the evening and lasts all night. During a costumbre a shaman may give advice to participants, go into a trance to perform divination, and heal sick people. The healing is usually done at a time when it will not interfere with the ritual celebration that is taking place.

Noncuring rituals on which sierra Ñähñu shamans advise include pilgrimages to a mythical place where Goddess Lady Water lives, pilgrimages to mountain tops and caves to ask the gods for help, rituals to restore the fertility of fields, and rituals to imbue seeds with zaki.

Paper figures are used in most rituals. Only shamans and their assistants cut them. The ritual could be simply one to worship a god. To do this one must attract the zaki of the god with the paper figures. For example, the idol representing Goddess Lady Water is created by collecting water from a sacred spring in a bottle, attaching paper figures that represent her zaki to the bottle, and dressing the combination in miniature clothes. Images and paper figures are often dressed in miniature clothes for a ceremony. The paper figures may also represent the zaki of evil beings. A cleansing ceremony is performed by sierra Ñähñu shamans using a bundle of paper figures that represents evil winds. People believe that these wind beings can attack a person and cause an illness. It is also considered prudent to periodically cleanse a house in case such winds are lurking about. The paper figures of the evil winds are usually cut from tissue paper. They are offered foul-smelling incense and tallow candles. Tallow candles are made from animal fat and symbolize the carnivorous nature of the winds. The offerings and figures are wrapped in a bundle and passed around the bodies of the clients and around the inside of the house. The bundle is carefully taken to a remote location or thrown into a canyon so that the winds will not return.

PERUVIAN SHAMANS

Peruvian healers are known by various names, according to the therapeutic strategy utilized by the healer. Examples include *hueseros* (bonesetters), *comadronas* or *parteras* (midwives), *yervateras* or *herbolarios* (herbalists), and even *santiguadores* (those who pray over children to recover lost souls). In addition to varying by specialty, names also vary according to region and language community. For example, the specialist in herbal lore would be known as *hampicamayoc* in the Quechua-speaking highlands near Cuzco (Valdivia), *kallawaya* in the Aymará-speaking Southern highlands near the Bolivian border (Bastien), *vegetalista* in the Amazonian lowlands near Pucallpa (Luna), and so on. Some, though not all of these healers, might be described as shamans as Mircea Eliade (1989) defined the term. Those who fit this definition have been accepted by their communities as medical and religious specialists who cure by entering into an ecstatic trance to commune with and mediate between seen and unseen worlds on behalf of their patients. It is these shamanic healers and their rituals that are the focus of this essay.

Regional variations notwithstanding, there are many similarities in the form and function of shamanic ritual on Peru's desert plains, in the high Andes, and in the tropical forest. In the course of ritual ceremonies (most often held at night and in the company of assistants, patients, and family and community members), these shamanic healers send their shadow souls on mystical voyages to divine the cause of illness and to propitiate spirits and *encantos* (animated forces of nature). The offerings they give in order to strike deals with spirit familiars who assist in removing the magical darts or restoring the lost souls that are believed to be proximate causes of harm may be region-specific (llama fat and fetuses in the high Andes) or pan-regional. Among the latter are guinea pig flesh and blood, tobacco, powders derived from seashells and brightly colored stones, wine and cane alcohol, fragrant perfumes, white corn meal, sweets, money, and sacred plants. Objects embodying spirit power, such as rocks and minerals, crystals, seashells, plants, wooden staffs, and even Christian icons, give these shamans and their patients strength and protection from spirit attacks as well as revealing and "cleansing" magically caused illness. Their soul voyages may be accompanied by the beat of a rattle (whether the seed-filled gourd called *macana* or the dry-leaf bundle called *chacapa*) or by the sound of bamboo flutes, guitars, or drums. Often, though not always, the shaman chants or whistles magical songs called *tarjos* (on the coast) or *icaros* (in the tropical forest) during the journey.

Entheogens and Peruvian Shamanism

Throughout Peru, in the prehistoric, historic, and modern eras, the trance state so important to shamanic ritual has been facilitated by ingestion of alkaloid-rich plants that may be collectively termed *entheogens* (from the Greek; "something that causes the divine to reside within one") because of local beliefs about the sacred character of these plants and because of the ritual context of their usage. Sometimes called "hallucinogens" because of their mind-altering characteristics, these plants have included many species, including *willka* or *vilca (Anadenanthera peregrina* and *Anadenanthera colubrina), San Pedro* or *huachuma (Trichocereus pachanoi* and *Trichocereus peruvianus), ayahuasca (Banisteriopsis caapi), coca (Erythroxylum coca), floripondio, toé,* or *misha* (a collection of plants of the *Solanacea* family, including various species of *Datura* and *Brugmansia*) and *tabacco (Nicotiana rustica).* Contemporary shamans called *maestros curanderos* from Peru's northern coast and highlands brew a kind of tea made of the San Pedro cactus, which both they and their patients ingest during the all-night ceremonies to "see" the sources of illness that lie beyond empirical knowledge.

In the central and southern highlands, coca is both ingested and offered to the *apus* (sacred places) by the *paqo* or *altomisayoq* shaman as a part of the rituals of propitiation that are central to reestablishing harmony between individ-

uals and the natural world, their communities, and the cosmos. In the tropical forest to the east of the high Andes, *vegetalista* or *ayahuasquero* shamans painstakingly boil ayahuasca (together with *chacruna [Psychotria viridis]*) in a lengthy process that yields a thick brown, and very potent, concentrate. This bitter syrup is ingested by the shaman, who must dominate the spirit "mother" of the plant (which manifests as both a monstrous anaconda and a beautiful young woman) in order to receive instruction and aid about the sources of illness and the steps needed to restore health.

Prehistoric and Historic Evidence for Peruvian Shamanism

As outlined below, historic documents from as early as the sixteenth century also point to sustained use of entheogens by Peruvian shamanic healers. But use of sacred plants by Peruvian shamans has a time depth that goes far beyond the dawn of written history, a use that can be surmised from ancient depictions of psychotropic substances on pottery, in textiles, and in rock art that was created long before the arrival of the Spanish conquistadors. These visual representations predate the arrival of written language in Peru by at least 2,500 years and include depictions of healers, their patients, and their healing paraphernalia (including rattles; boxes of rocks, seeds, and plants; and ceramic jars and jugs). These visual representations also portray shamans utilizing coca, willka, and, most frequently, the hallucinogenic San Pedro cactus.

Many of the earliest (ca. 1500–500 B.C.E.) *Cupisnique* pots (from Peru's north central coast) that depict this cactus also contain imagery associated with animals such as jaguars or deer, mythological beings such as fanged serpents or jaguars with eye-spots, three-step stairways, and volutes. These symbols are associated with the shaman's ability to magically see beyond spatial and temporal barriers. They also indicate the ability to ascend and descend (in spirit) into the heavens and the Underworld in order to propitiate the gods, guide the dead to the afterlife, or retrieve lost souls and restore human health. Similar representations on *Nazca* pottery (from Peru's south coast, ca. 100 B.C.E.–600 C.E.) pair the San Pedro cactus with birds and mythological anthropomorphic figures that reflect similar symbolic elements. Later *Moche* and *Lambayeque* pottery (100–1350 C.E.) shows clearly human figures and mythological human-bird figures holding the San Pedro cactus while apparently in a trance-like state. These figures have been called female because they are most often wearing the cowls or shawl-like head coverings associated with female dress in the archaeological record. (See Sharon 2000 for detailed descriptions of the pottery representations discussed here.)

While these portrait-like depictions provide visual evidence for shamanic healing in pre-Colombian Peruvian coastal societies, the line drawings on many pieces of Moche pottery make it difficult to specify healer functions and roles in pre-Colombian coastal Peru. It is unclear, for example, when and whether shamanic healers evolved into a state-supported priest class responsible for propitiating Moche deities with human sacrifice. The difficulty interpreting fine-line pots stems from the problem that participants in Moche religious life are most often depicted as mythological beings rather than as humans. Debate rages among scholars about the correspondences between these mythological creatures and their human counterparts (see Hocquenghem 1987; Makowski et al. 2000; and Alva et al. 2000).

Colonial Depictions and Shamanic Transformations

With the sixteenth-century arrival of the Spaniards and the rendering of oral tradition into written accounts, much of the pre-Columbian cosmology associated with healing traditions has become known. As the author has summarized elsewhere, "From these reports, we know the sun and moon were worshiped as key and complementary deities, each presiding over a world "half" characterized by such contrasting qualities as right/left, sky/earth-sea, man/woman, fertility/fecundity, conquering/autochthonous" (Glass-Coffin 1999, 208). In addition to these, lesser deities associated with the stars, wind, mountains, caves, oddly shaped rocks, and the mummified remains of human ancestors were also believed to contain the divine power called *huaca* that was invoked and propitiated by shamanic healers—men as well as women.

With Spanish colonization of Peru, indigenous cosmologies that emphasized duality and

complementarity were transformed and demonized in accordance with European traditions. Colonial references to entheogens (especially to huachuma/San Pedro, vilca/willka, and coca) are frequent and generally deprecatory, associating the use of these psychotropics with devil worship and sorcery. One famous passage, written by Father Oliva in 1631 as part of a report about the church-sponsored campaigns to "extirpate idolatries," may serve as an example:

> The principal *caciques* and *curacas* [leaders] of this nation . . . in order to know the good or bad will of some to others drink a beverage they call Achuma which is a water they make from the sap of some thick and smooth cacti that they raise in the hot valleys. They drink it with great ceremonies and songs, and as it is very strong, after they drink it they remain without judgment and deprived of their senses, and they see visions that the Devil represents to them and consistent with them they judge their suspicions and the intentions of others. (cited in Sharon 1978, 43)

All those matters that were foreign to orthodox Catholicism were relabeled as either heresy or idolatry in ways that particularly impacted female healers, since women, according to the beliefs that accompanied Catholic priests on their New World voyages, had weaker constitutions than men and were prey to insatiable carnal desires. Devil worship was especially equated with the feminine, the autochthonous, and the underworld. The feminine side of Andean dualities became associated with expectations of *maleficio* (the act of causing harm through use of supernatural means), demonic pacts that were sealed through illicit and unnatural sexual intercourse, and participation in orgiastic rituals meant to overturn Christian values. Women were therefore persecuted by the ecclesiastic campaigns to extirpate idolatries in ways that demanded them to confess to the crimes of witchcraft and demonolatry.

These overlays of Catholic dichotomies of good and evil, holy and demonic, or even right and left onto indigenous dualities of sun and moon, Upper and Lower Worlds, and male and female can be seen in the curing altars of contemporary coastal healers. But an even more important legacy of these colonial transformations is the emphasis on sorcery or witchcraft (intentionally caused harm) as the raison d'être of contemporary healing practices. This is especially so in urban areas, where community economics that emphasize reciprocity and maintenance of social harmony have given way to the atomizing forces of the market (see Glass-Coffin 1991 and Dobkin de Rios 1973). But even in the Andean or tropical forest hinterlands, where *encantos,* or nature spirits, are seen as the main causes of misfortune, sorcery-caused illness is of grave concern.

The Role of the Shaman in Sorcery and Healing

Sorcery and shamanic healing are two sides of a single coin in contemporary healing practices throughout Peru. *Envidia* (envy), jealousy, retribution, and vengeance are reasons most often given by disgruntled neighbors, business associates, or family members (especially in-laws) who seek out the services of a *brujo malero* (sorcerer, evil witch) to maim, harm, or kill the offending party. If the brujo accepts the job, s/he will perform a ceremony in order to cause the victim harm. On the coast and in the highlands, the purpose of this ritual is most often described as engaging the help of spirit familiars to steal the victim's soul. In the lowlands, the objective is more likely to send magical darts called *virote* into the victim in order to cause the harm. These types of harm should not be seen as mutually exclusive, however, since ritual "cleansing" and "sucking" are key parts of the healing ceremony, even for victims who are believed to suffer from sorcery-caused soul capture. In all cases, sorcery is a manifestation of life out-of-balance because it presumes and thrives on social discord. The cure involves restoring harmony on several levels.

Sympathetic magic plays a key role in the delivery of the sorcery in both soul capture and spirit intrusion. In both cases, the sorcery may be facilitated by ingestion of a magical potion called a *brebaje* that is secretly slipped into the victim's food or drink. This type of sorcery is known as *daño por boca* (damage through the mouth) because it enters the victim through the mouth. The potion is said to contain powdered human remains, excrement, blood, or other foul and magically "charged" items. Or the sorcery may be facilitated by *aire,* which involves the victim coming into contact with a

A Mochica ceramic depicting a priest or shaman praying over, or attempting to cure, a person lying at his feet. The seated figure wears a feline hat and large ear disks; either his eyes are closed, he is blind, or he is communing with the world of the spirits. (Werner Forman/Corbis)

charm that the sorcerer has prepared or a doll or other image of the victim being stuck with pins, stamped on, burned, buried, or otherwise harmed.

Symptoms of sorcery tend to reflect the characteristics of the spirit-familiar that has captured and imprisoned the victim's shadow soul or of the magical dart that has been thrown at the victim. For example, victims whose souls have been bound to those of cemetery-dwelling cadavers tend to *chuparse* (to become thinner and thinner as the life is "sucked" from their bodies) until they begin to resemble the cadaver itself. Victims whose souls have been bound to the Devil are said to engage in demonic behavior and "unnatural" sexual activities. Examples might include child molestation, incest, or nymphomania. A victim whose soul has been bound to a bog or seep that is *encantado* (a force of nature that has innate spirit power) may also seep or sweat profusely, unable to retain vital fluids. Although these symptoms may mimic those that are biological in origin, their magical origins make them resistant to treatment by biomedical professionals.

In all cases, it is the role of the shamanic healer to undo the sorcery that has been caused by brujos. While many shamanic healers insist that they do only good, much of the literature suggests that the brujo or sorcerer and the healer are the same person, simply performing differing shamanic roles in accordance with the client's needs.

Shamanic Selection, Apprenticeship, Initiation, and Renewal

Throughout Peru, shamanic selection may be conferred by a number of indicators. A shamanic vocation and talent for seeing beyond the limits of empirical reality is believed to run in families. Practitioners often claim to be descended from a long line of shamans as a way of demonstrating both their power and their authenticity to potential clients. The vocation can also be indicated by being singled out at birth in some way. Being born a twin, having visible birthmarks, or having obvious birth defects are examples of this shamanic marking. Other indicators of shamanic vocation include the visions or dreams (whether or not inspired by the ingestion of entheogens) that signal a divine calling to serve one's community. These visions or dreams might reveal a proclivity for seeing into the spirit world, for divining the future, for healing the sick, or for commanding spirit familiars. Finally, shamanic vocation is most often revealed to the future practitioner through near-death experiences. Survival of a life-threatening illness that is either cured by another shaman or self-cured provides one example of this. Survival of an unusual environmental accident (especially that of being struck by lightning) provides another.

Means for receiving shamanic wisdom vary widely throughout the country. In the Amazonian lowlands, most ayahuasqueros insist that they learn directly from plant spirits and that they must prepare to receive this knowledge by means of a kind of vision quest. This quest includes a period of fasting and abstinence as well as removing oneself to the forest for a period of time. It also includes ingesting the plant in

question and enduring the toxic or psychoactive effects that result. The plant spirits may be very frightening, appearing to the supplicant as giant anacondas, jaguars, venomous snakes, or deformed creatures. But this fear must be overcome in order to receive the wisdom of these plants as well as the magical songs called *icaros* that carry and control this wisdom. In the central and southern highlands, visions and dreams are frequently cited as primary sources of apprenticeship. These are often received as the result of a vision quest that involves solitary journeys to high mountain peaks and endurance of the immense cold and fatigue that results from these vigils. During this quest, the seeker lights candles to the mountain gods while continually "feeding" the spirit of the place with coca, cigarettes, and alcohol. Northern curanderos are not considered truly powerful until they have undergone the long and dangerous pilgrimage to the sacred Las Huaringas lagoons in the high mountains that border on Ecuador. As part of this pilgrimage, initiates must bathe in the frigid waters of these highland lagoons to be cleansed of all impurities and to "sow" their shadow souls in the primordial waters of these lagoons. Called *ojos del mar* (eyes of the sea), these lagoons are considered portals for tapping into the cosmic energy of the universe that circulates between sky, earth, and Underworld, as well as the life force that animates all living beings.

As suggested above, shamanic work is tiring, difficult, and dangerous. It is tiring because rituals mainly occur at night and most shamans have other work and family obligations during normal waking hours. Therefore, a practitioner can expect to be chronically sleep-deprived. It is difficult because the ritual process requires continuous physical, mental, and spiritual preparation and sacrifice. The shaman's diet is especially strict in the Peruvian Amazon, where plant spirits require weeks or even months of fasting, purging, and abstinence from petitioners who seek their wisdom. Throughout Peru, ingestion of entheogens (and participation in the ritual process) frequently brings nausea, pain, anguish, and other discomfort as shamans relive the suffering of their patients. The shamanic vocation is also dangerous because practitioners become subject to spirit attack as a result of their work. These attacks derive both from the spirit forces that afflict their patients as well as from those sent by sorcerers who envy their success as healers and who wish them personal harm.

Shamanic Ceremonies and Ritual Paraphernalia

Shamanic ceremonies vary by region, but all include the key task of maintaining or restoring cosmic and social order. The northern curandero has the most elaborate healing altar, *mesa,* containing dozens of objects, *artes,* that are imbued with the spirit power of their places of origin. The mesa includes wooden staffs hewn from magical plants such as *chonta* (*Guilielma* sp.) and *hualtaco* (*Loxopterygium huasango*), whose spirits appear as a plant with sharpened spines and as an eagle respectively (Glass-Coffin, field notes 1988). They are used to defend against evil and guard the mesa from harm. In addition to the San Pedro brew, the mesa contains seashells, rocks (especially those taken from the highland lagoons in which the shaman's shadow has been sown), pre-Columbian pottery, and (sometimes) human skulls, as well as Christian saints and images. It also includes tabacco and a variety of liquids for feeding the spirits. The mesa of the highland paqo, or *yatiri,* usually contains a smaller number of these items, as well as *kintus,* offering bundles of coca, and carved *illas,* talismans depicting produce, livestock, and other representations of the good fortune desired by the petitioners. The mesa of the ayahuasquero is the least elaborate. It is usually limited to a few bottles (including the ayahuasca and sacred water used for cleansing and capturing evil) as well as the black tobacco cigarettes called *mapachos* that are the primary offering and food of the plant spirits. Additionally, it usually contains the chacapa leaf-bundle used to manage the plant spirits that facilitate curing.

The ritual process also varies by region. A typical coastal or northern highland San Pedro ritual lasts all night, from eight or nine o'clock until almost dawn the next morning. It involves the patient in several ritual activities that are associated with distinct phases of the ritual process. These tasks include ritual rubbing or cleansing of the patient with mesa objects (especially staffs) to both reveal and absorb the sorcery. They include diagnosing the patient while s/he stands before the mesa, as well as "raising" the patient and the mesa objects with

tabaco. This process involves macerating black tobacco in perfumes and cane alcohol and placing it in bivalve seashells or bull's horns, where it is nasally imbibed to allow the shaman to better see and combat the evil. Tasks also involve sucking the evil from various parts of the patient's body and capturing it into the ritual artifacts of the mesa, and blowing various liquids over the patient and the ritual field to purify and propitiate the spirit powers at work.

In the central and southern highlands, the *misas* (mesas) differ according to the function they are intended to serve. The *alta misa* is enacted to ensure an easy birth. It is considered quite different from the *kuti misa,* which is used to return sorcery to its origin. These are both different from the *chullpa misa,* which incorporates animal fat to make offerings to the spirits associated with ancient burials that have sent disease (Hurtado 2000, 140–141, for discussion). Depending on their function, these mesa rituals may occur at night or in the daylight, but their duration is much more limited than that of the all-night San Pedro ceremonies.

The ayahuasca ritual usually occurs at night and typically lasts a few hours only. In this ritual, the patients are less visibly involved than in the San Pedro ceremonies, and there are fewer discernable ritual activities that always occur. Among these are the ingestion of the ayahuasca, the whistling or singing of the magical icaro, the offering of tobacco smoke, and the sucking out of illness from key points on the patient's body.

However these rituals vary in terms of process, they all share some common objectives. The first of these is to call upon the spirit world (whether to divine the cause of illness, to remove illness or return illness, to prevent illness and misfortune, or to guide those present into the presence of the sacred). The second of these is to propitiate spirit familiars (whether of saints, of sacred places, of ancestors, or of plants) in order to accomplish these ends. And the underlying objective of all these healing rituals (as opposed to those that are intended to harm) is to restore balance and harmony between all participants and the natural, social, and cosmic worlds of which they are a part.

Gender and Healing

As suggested above, female shamans played an important role in religion and healing in Peru's pre-Columbian and colonial past. Until very recently, however, there was little evidence to support the assertion that Peruvian shamanism is a vocation open to women today. This absence of evidence may be attributed to issues of access (until recently, most investigators of Peruvian shamanism were themselves male). It may also reflect the reluctance of female healers to admit their participation in this vocation to all but the most intimate of friends.

In part, this reticence comes as a result of the social stigma attached to women who work as shamans. This stigma is the result of at least three factors. First, there is social dissonance between shamanic rituals, which tend to be outward facing and community-oriented, and social expectations that a woman's sphere of activity and influence should be in the home. Second, the colonial legacy of recasting female shamans as Devil-worshipping brujas has been internalized throughout northern Peru. Finally, commonly held beliefs about menstruation that restrict women from ingesting entheogens (especially ayahuasca) during menses may make it logistically difficult for women to do shamanic work during portions of every lunar cycle.

In spite of these obstacles, recent research on the coast and in the northern highlands has effectively challenged assumptions that shamanism is exclusively a male vocation (Camino 1992; Chávez 2000; Glass-Coffin 1998). Because of this work, their stories have begun to emerge, and the voices of female shamans have been added to the ethnographic record. Additionally, this ethnographic research has been framed in terms of wider theoretical debates about the impact of gender and structured social inequalities on the nature of spiritual and religious experience (Glass-Coffin 1999). In the last few years, this focus on gender, shamanism, and spiritual transformation seems to have been gaining popularity. It will most likely yield very interesting results throughout Peru as more traditional female healer roles, such as that of herbalist, midwife, and specialist in childhood illnesses of all types, are reinterpreted in terms of these and other themes.

New Age Transformations and Cautions

In Peru, after hundreds of years of persecution by both Church and State, shamanic healing has gained rapid acceptance over the last

decade. Sudden governmental endorsement of shamanic practice as a cultural heritage to be protected can be seen in the actions of Peru's two most recent presidents. In 1996, President Alberto Fujimori made a pilgrimage to the sacred lagoons of Las Huaringas, where he was ritually cleansed by a maestro curandero. In the year 2000, President Alejandro Toledo emphasized his indigenous genetic heritage as he paid homage to the mountain apus and to his high-Andes ancestors. This change in attitude about Peruvian shamanism accompanies the increasing popularity of shamanic healing in Peru and in the world at large. It also reflects the fact that cultural heritage has the potential for capital gain when it comes to shamanic tradition.

The plethora of books, videos, short-term tours, workshops, and training courses designed to introduce seekers to the "ancient wisdom" of shamanic healers, as well as the (often high) price tags associated with these offerings, attest to this potential. (See Glass-Coffin 1994 for further discussion). Recognizing this commercial potential, in the early to mid 1990s, Peruvian government agencies began promoting shamanic tourism as part of this nation's ancestral cultural legacy in hopes of enticing more foreign visitors to Peru (Flores 1996). But, even as the commodification of shamanism has brought more wealth to tour organizers and to government organizations, it has had more than a few unfortunate consequences. One is the tendency of commercialization to reduce Andean spirituality into mere merchandise for quick sale (Flores 1996, 25–26). The backlash has been significant, as groups of healers have begun organizing in protest. As outlined in the recent Tarapoto Declaration (November 2001), a group of more than fifty shamans from Peru and adjacent South American countries declared: "We categorically reject the improper use and manipulation of sacred plants and medicines employed in traditional medicines. We are especially concerned about charlatanism, new modalities of shamanic tourism, and the trafficking of plants and cultural symbols [by those seeking to patent ayahuasca and other plants used in shamanic rituals]" (author's translation).

In Peru, now more than ever before, shamanic practices have become politicized and co-opted. On the one hand, they are viewed as part of an indigenous heritage and contribute to a renewed sense of identity that is decidedly postcolonial and anti-European. On the other, they are viewed as a means to fuller participation in a global (and capitalistic) economic system. Whatever the motivation, it carries the threat, recently expressed by Alice Beck Kehoe, that the transformations involved will homogenize and obscure cultural and regional differences among shamanic healers, while reifying "Western construction[s] of a stereotyped, mythical Other" (Kehoe 2000, 102).

Accordingly, it is imperative to understand the various forms and functions of Peruvian shamanic traditions. With this background, one begins to understand the dynamic nature of cultural tradition. Additionally, with this background, one can better listen to and understand the Peruvian shamanic practitioners who increasingly demand to speak for themselves as they chart their various futures.

QUICHE AND ZUNI DIVINATION (GUATEMALA AND NEW MEXICO)

All forms of divination aid decision making by reviewing a current, past, or future situation or problem in light of different forms and types of knowledge in order to answer questions. The way such questions have been put and how the answers, called oracles, have been transmitted and interpreted has varied greatly between cultures. Although the practice of divination can be an individual act, as for example when it involves the interpretation of dreams or the observation of omens, it more often involves a dialogue between a diviner and an audience member or private client.

Diviners are specialists who use the idea of moving from a boundless to a bounded realm of existence in their practice. To do so they link diverse domains of representational information with emotional, or presentational, experience. In representational symbolism, intentional reference and inductive reality are

paramount, whereas in presentational symbolism meaning emerges as a result of an experiential immersion in the expressive patterns of the symbolic medium, which is grasped intuitively (Hunt 1995, 41–42).

Wherever a theory of divination has been elicited from practitioners of the art, there is recognition of overlapping inductive, intuitive, and interpretative narrative techniques and ways of knowing. Accordingly, divination involves complementary modes of cognition associated with representational and presentational symbolism. By combining these two types of symbolism into a single narrative structure, a diviner provides an overabundance of understanding. During the act of divination, individual poetic creativity operates: Jumbled ideas, metaphors, and symbols suggest various possible interpretations that slowly give way to an ordered sequencing and to more limited interpretations. Finally, through dialogue between diviner and client, these interpretations are superseded by an unambiguous classification of the causes of the situation and the material needed to respond to and change it (Tedlock 2001, 189).

Among the Quiche Maya of Guatemala and the Zuni of New Mexico, divination takes a number of forms, including water and crystal gazing, the casting of lots, or sortilege, the reading of natural omens, the use of hallucinogenic drugs, and the practice of remembering and interpreting dreams. In both of these societies divination is often separated from other discourse through the use of mechanical procedures, which are combined with visualization in order to ensure the necessary shift in cognitive processes.

There are a number of similarities between these two Native American societies and the divination systems they use. Both communities practice maize horticulture, and both have religious specialists who visit sacred springs and mountains that have directional orientations in order to divine. There are also important differences between them. The Zuni, with approximately ten thousand people, live in a single nucleated village, while the Quiche Maya, with over one million people, live spread out in seventy-two separate communities. There are also key religious differences between them: The ancestors are central beings for both groups, but the Zunis greatly fear them, whereas the Quiche have no fear of the dead. Zunis describe visitations of their ancestral deities in dreams as horrifying experiences that call for an immediate cure or else the dreamer will die. For the Quiche, ancestors are important beings whose dream visits are extremely positive experiences, even though such visits may also require a religious ritual to address the content of the divinatory message.

These differences can partly be understood in terms of the conceptual differences between these cultures with respect to being and essence, as well as differences in affective-cognitive categories and systems of divination. According to Zuni ontology people are of two kinds, raw (or soft) beings *(ky'apin aaho"i)* and cooked (or ripe) beings *(akna aaho"i);* the latter are also known as daylight beings *(tek'ohannan aaho"i).* Cooked, or daylight, beings depend on cooked food and are protected by the Sun Father. Raw beings, including deer, ants, rainstorms, corn plants, and the dead, eat food that is either raw or else has been sacrificed to them by cooked or daylight people. Quiches lack a single term analogous to the Zuni concept of "being" or "person," with its reach beyond humans into animals, plants, and natural phenomena. Instead, humans, whether living or dead, are classified as *winak* and are totally distinct from all nonhumans. Articulate speech is the most important single feature separating humans (winak) from animals *(chicop).*

Among the Zuni, the diviners are members of the rain priesthoods *(uwanam aashiwani)* who go into seclusion with their sacred bundles from the summer solstice into early fall each year. The first set of retreats are those of the *tek?ohannan ?aashiwani,* "daylight priests," representing the sacred directions. These are followed by the retreats of the *tehkwinan ?aashiwani,* the "night priests," representing the constellations. During the retreats they open their bundles, remove the sacred objects, and set them out on a cornmeal-and-gemstone altar. They then sit down and wait, sometimes for hours or even days, until a bird or animal leaves tracks on the surface of the altar. The size, shape, and directionality of the tracks are then carefully examined for the oracle they give.

At the time of the creation of the world the mythic progenitors of the rain priests divined in a similar way the hiding place of Corn Mothers during a famine. Today human priests

accept private clients who wish to know the location of lost or stolen objects (Tedlock 1976).

> Whenever a private client consults them they divine by sprinkling ground *Datura inoxia* (*D. meteloides*), or jimsonweed leaves, roots, and blossoms, along the inside of their arms from wrist to elbow. When the hallucinogen sinks into their skin and takes effect the Ahayuuta, or twin war gods, appear before them. These tiny beings, without uttering a word, take them by the hand around the village showing them where the missing objects now reside. (Tedlock 1979, 506–507)

Two of these priests, the sun priest and the daylight bow priest, do not have sacred bundles. Instead, they wander among the fields and make pilgrimages to distant mountaintops in order to "try themselves." At this time they put powdered jimsonweed root in their eyes, ears, and mouths and communicate with birds in order to divine the past, present, and future (Stevenson 1904, 386). This possession of the priests by sacred animals is widespread in Native America. It reflects a level of human awareness and a mode of perceiving the natural world that is more universal and far older than the perspectives of the great religions that have shaped human beliefs over the last two to three thousand years (Loewe and Blacker 1981, 25).

For the Quiche, those who conduct religious rituals, including divinations, are *ajk'ij,* "keepers of the days" (i.e., the calendar) and *chuchkajawib,* "mother-fathers." These terms designate two organized groups of diviners and shaman-priests consisting of more than twenty thousand women and men. They are recruited in classical shamanic fashion, including divine election through birth, sickness, and dreams, and their initiation involves a marriage to a spirit spouse. Compared with their peers, these diviners excel in insight, imagination, fluency in language, and knowledge of cultural traditions. During a divination they construct usable knowledge from oracular messages. To do so, they link diverse domains of representational information and symbolism with emotional or presentational experience (Tedlock 1992).

The language in which these diviners address their gods and transmit their answers back is highly poetic and thick with figures of speech. By contrast, the language in which diviners speak to their client is mundane. They ask simple questions and later offer interpretations that fill gaps in the client's narrative understanding of past, hidden present, or future time. It is said that when both members of a married couple are trained as diviners and they each seek an answer to the client's question at the same time, their combined pronouncements will shed more light than will those of a diviner working alone.

The casting of lots is a commonly used divinatory technique among the Quiche. It combines the use of hallucinogenic seeds of the Palo Pito tree (*Erythrina corallodendrom*) and quartz crystals, with narratives centering on the interpretation of the days within the indigenous pre-Columbian calendar and the use of a shamanic gift called *coyopa,* "sheet lightning." Such lightning races through the diviner's body, resulting in *kacha' uqui'que'el,* "the speaking of the blood." Since the body of the diviner is a microcosm with its own cardinal points, including mountains, plains, lakes, and winds, the embodied movements are interpreted according to their location, direction, and speed. The mapping of the meanings onto a human body proceeds according to sets of paired terms, which are in a relationship of dialectical, interlocking complementarity rather than dualistic opposition. It takes a combination of these radically different divinatory methods, together with a discussion between a diviner and the client, to acquire proper understanding, *ch'obonik.* Each of these interlocking embodied iconic and narrative systems combines multidimensional inductive, intuitive, and interpretative ways of knowing with a dialogical narrative in order to reveal both the future and the past, as well as to diagnose illness, to comfort, and to heal.

The differences in divinatory systems between Zuni and Quiche are traceable to a combination of ontological and psychological differences. For the Zuni all forms of divination are a deathlike breach of the fragile boundary between daylight, or cooked, persons and raw persons. Only the most powerful Zuni, those who are members of the rain priesthoods, have knowledge of divination and psychopharmacology, which allows them to *pikwayina,* "pass

through to the other side," and enter the world of the sacred, dangerous, and miraculous.

For the Quiche, on the other hand, since it is merely the free soul that wanders, the practice of divination is a much less threatening experience. The dead, although they lose their corporeality, retain their personal names, thoughts, memories, emotions, and their membership in the human category of being. When a living Zuni recognizes the individuality of a dead person in a dream, it implies that the dreamer is as good as dead. The recognition of a dead person for the Quiche would merely be a meeting of free souls that might provide an opportunity to divine something of importance from the dead person.

SANTERÍA (AFRO-CUBAN TRADITION)

The term *Santería* refers to a network of Cuban-based traditions in which African religious forms, including rituals of spirit possession with strong shamanic elements, subsume elements of European Catholicism. The term, often translated from Spanish as "the Way of the Saints," refers specifically to practitioners' devotion to Catholic *santos* (saints) aligned with particular *orishas* (elsewhere spelled *orixás*) the deities of western Africa who came to the Americas through the African slave trade. While the appellation *Santería* in fact derives from a dismissive characterization (implying "that crazy stuff about saints") used by critics during the late nineteenth and early twentieth centuries, it has become an accepted name since the 1940s, as the public visibility of Afro-Cuban traditions has increased throughout the Americas.

In Cuba, the term *Santería* (accented in Spanish) designates only one of the wide family of traditions descended from practices brought to the island by slaves from sub-Saharan western Africa. The term refers specifically to Regla de Ocha, the "system of Ocha [Orishas]," a practice connected to Yoruba speakers, who constituted the majority of slaves brought to Cuba during the nineteenth-century Atlantic trade. In Cuba, descendants of the Yoruba developed a distinct dialect called Lukumí (reputedly derived from the name of the Yoruba chieftainship, Ulkami). The language continues to operate as the sacred idiom of Regla de Ocha, and adherents to the Santería tradition are thus often identified as Lukumí. Other traditions in Cuba linked to west Africa include the following: Palo Monte and Palo Mayambe, associated with Bantu speakers and popularly called Congo; Arará, connected to the Fon, a people from Benin and Nigeria; and the secretive brotherhood of Abakuá, or Carabalí, frequently called *ñáñigüismo,* in reference to the use of ritual objects called *nganga.* Nevertheless, all of these so-called Afro-Cuban traditions have intertwined over the course of the century as adherents have converged, not only in the cities and towns of Cuba but also in Puerto Rico, the Dominican Republic, the United States, and elsewhere. In the meantime, the

term *Santería* has gained greater currency outside of Cuba as the umbrella term for the entire range of practices.

With their strong links to west African *orisha* devotion, the Santería traditions belong to an even broader family of "Afro-Atlantic" systems including (but not limited to) Brazilian Candomblé, Haitian Vodoun, West Indian Obeah, and North American Voodoo. Each of these systems stands as a distinctly American formation, in which west African theological and liturgical traditions, within the crucible of a European colonial context, take on non-African elements, especially of European Christianity and rationalist fraternal orders like the Masons. Thus, Santería, like its kindred Afro-American traditions, took shape under—and undoubtedly as a response to—the extreme sociohistoric pressures of Cuba's centuries-old export economy, which depended upon forced labor by people of color. Although circumstances have changed radically for many of Santería's contemporary adherents, it is within the rubric of perceived social crisis that many of them actively seek the curative possibilities of shamanic communication with powerful spirits.

Santería and Shamanism

Shaman and *shamanism* are terms infrequently used in either practitioners' or scholars' descriptions of Santería. Accordingly, the concepts should be employed conditionally with respect to these Afro-Cuban traditions. Classic characterizations of shamanism, such as Mircea Eliade's, have emphasized the independence and subjectivity of the shaman: The shaman communicates with the spirits, usually through a journey of the soul to other realms, without being "possessed," or taken over, by them (Eliade 1989, 5). Although Afro-Cuban lore includes accounts of distinguished figures with abilities to assume animal form, those same legends acknowledge the extreme rarity of such cases. Raul Canizares, a Santería scholar and priest, notes that these exceptional personalities all belong to one of two categories: (1) special members of the secret Abakuá society, or (2) Santería practitioners who trained with indigenous American *curanderos* (healers) (Canizares 1999, 92).

Much more typically, the Afro-Cuban "shaman" is not a seeker distinguished by uniquely intense ecstatic experience. He or she does not enter the world of the spirits. Rather, the deities irrupt in the human world: The spirits possess, or "mount," people who are not necessarily community leaders; in turn, the independent personality of the mounted person is displaced as a *santo-orisha* (a combination deity of a saint aligned with a west African orisha) takes over the body in order to be seen and heard.

Balance of Power: Ashé, Ancestors, and Orishas

Santería practice pivots around the organizing principle of *ashé.* The term, the Lukumí derivation of the Yoruba *asé* (grace), refers to the world's fundamental life source, its vital energy. Although the concept points to some ultimate power, an essential aspect of ashé is a sense of

balance. In other words, the possession of vitality hinges upon proper equilibrium of forces. Accordingly, Santería practitioners often identify the aim of their ritual obligations as the attainment and maintenance of balance in their own lives, in their community, and in the world at large.

Because Santería cosmology outlines a variety of spiritual and material spheres that include departed ancestors, transcendent gods, and imminently active deities, as well as human, animal, and natural communities, the maintenance of balance and the propagation of ashé requires open and productive relations with a wide range of co-inhabitants. Practitioners seek to curry the favor of the orishas in particular. The orishas—according to legend, African ancestors who have attained especially powerful and venerated status in the spirit realm—control much of what goes on in the world and thus stand as elemental powers. In Cuba, as in other parts of the Americas, the orishas have been correlated with different Catholic saints and, accordingly, also earn the name of *santos* (saints), or *santo-orishas.*

Community: Seeking Family Balance

The underlying search for ashé in Santería practice illuminates the shamanic aspects of the Afro-Cuban traditions. But if proper equilibrium depends upon stable and productive relations with the entire spectrum of living entities, the pursuit of ashé, including any shamanic techniques deployed, unfolds most immediately within the context of a particular community and its specific history. Accordingly, Santería involves independent communities of practitioners. In theory as well as practice, the Afro-Cuban traditions maintain no overarching institutional framework. Rather, Santería exists as a network of autonomous *ilés* ("communities," or "families," from the Yoruba word for house) determined by particular rites of initiation that commit members to a specific santo-orisha. A family member's length of time in the ilé determines that member's communal responsibilities: More recent initiates, regardless of actual age, depend upon "older" family members for guidance in nurturing the ilé's strength of spirit, which pivots around the group's relation to its patron santo-orisha.

The center of the community is an elder priestess or priest—the *madrina* (godmother) or *padrino* (godfather)—who safeguards house traditions and presides over initiations into the ilé. The godparents are distinguished members of the priesthood known in Spanish as *santeras* and *santeros* (females and males, respectively, who "work the saint'") and in Lukumí as *iyalorisha* (or *iyalocha*) and *babalorisha* (or *babalocha*) ("mother for the orisha" and "father for the orisha").

Santería also includes a special class of exclusively male priests, viewed by many practitioners as the traditions' highest leaders, called *babalaos* (Yoruba for "father of mystery"). The babalaos serve as masters of a particular path of esoteric knowledge known as *el camino de Orula* (the path of Orula). As devotees of Orula, the powerful deity of wisdom thought to have been present at the inception of the world, the babalaos practice a special art of divination called *Ifá.* This process involves the reading of the *tablero de Ifá,* a series of images onto which a special chain (the *opele,* or *okuele*) is cast.

While Ifá remains the exclusive domain of the babalaos, many other santeros and santeras practice the popular form of divination called *dilogun.* This method of prognostication involves expertise with a series of verses, each of which correlates to a specific pattern formed when sixteen cowry shells are thrown. Santería practitioners frequently consult both a babalao and an *italero,* the dilogun expert, for guidance with the usual life issues (health, wealth, and love) as well as for the protocol of major ritual events. With their understanding of the structure of the world, including the workings of the spirits, the babalaos or italeros situate a past or impending event and prescribe an *ebo,* a course of action. The ebo might involve an offering of fruit, the sacrifice of an animal (often a chicken), or the use of particular plants and herbs (as, for example, in a cleansing ceremony called a *despojo*).

While almost all babalaos and italeros possess some advanced training in the administration of different ebos, nonspecialized priests remain indispensable to the execution of ritual obligations. First, theological conventions emphasize the necessary interdependence of esoteric divination practices and other, more visceral, forms of knowledge. Accordingly, much of the

priesthood specializes in *el camino de santo* (the path of the saint). Whereas Orula's path leads toward structures of spiritual truth set in place at the beginning of creation, the second *camino* seeks the intimate recognition of wisdom as it plays out, or irrupts, in the changing material world in which humans reside. This more corporeal mode of knowledge acquisition is associated with the everyday workings of spirits in the world, especially the santo-orishas. These spirits are demanding and unpredictable, even if the divination arts of the babalaos and italeros suggest that these powerful entities operate within an enduring and patterned cosmic structure.

Ceremony: A Community in Motion

The responsibilities and hierarchies of power in the Santería traditions determine frames of action, yet all members of the community carry a measure of influence and importance that ultimately limits leaders' power. If the division of labor within the priesthood, figured in the independent but intertwining pathways of esoterica and corporeality, suggests a certain balance of power within Santería practice, the execution of key ceremonies only reinforces that sense of mutual dependence within an ilé.

The shaman emerges within that necessarily collective framework. The essential relations within and between ilés that frame shamanic activity are highly visible in a common, yet absolutely fundamental, Santería ritual known alternatively as a *tambor* (from the Spanish for "drum"), *bembé* (Lukumí for "drum feast"), *güiro* (rasped gourds), or *toque de santo* (literally, "saint's rhythm" in Spanish). The ilé's hierarchy, centered most immediately around the santeros who organize and nurture the ritual, determines the general structure of the ceremony. However, the success of the tambor ultimately depends upon other members of the community, who are not necessarily prominent figures: The celebration aims to "bring down" at least one santo-orisha, and it is to the more marginal members of the community that the spirits often come. In this way, the tambor can develop in a seemingly paradoxical direction, with initially unassuming participants taking on the ceremony's central role as personifications of the deities. Yet, significantly, this shamanic inversion of power holds together the community, as all members become integral players in potentially life-saving, or ashé-inducing, conference with the spirits.

Tambores, which almost always occur in the house of a santera or santero, mark a variety of events, including an initiate's anniversary or the annual feast of a particular santo-orisha (correlated with the Roman Catholic liturgical calendar), or they may be held to entreat or to honor a deity's help with a specific affair. The celebrations center on the performance of at least one *oru,* a ritual song-cycle used to communicate with a specific santo-orisha. While a specially trained percussion ensemble establishes the communicative foundation of the tambor on sacred drums called *bata,* every other attendee plays a specific role. All present are expected to join in the singing and dancing to the best of their knowledge and ability, with advanced initiates leading the assembly in the intricate prayer-songs and dances.

The unique combination of percussion tone and rhythm and of singing and dancing not only represents but also literally embodies a santo-orisha, with the effect that the deity arrives among the celebrants. The spirits actually live within the music—sound is divine body—and so a santo-orisha is made manifest by proper execution of its particular oru and then can inhabit other bodies, including those of the humans who are properly aligned (through song and dance) with the music.

Innumerable accounts of spirit possessions at celebratory feasts have been recorded (e.g., Canizares 1999, chapters 1 and 10; González-Wippler 1992, chapter 10; Hagedorn 2001, chapter 3). Katherine Hagedorn, a North American musicologist, gave a rich description of a 1997 tambor near Havana in honor of one of the most important santo-orishas, Eleguá, the lord of passageways, who opens the gates to prosperity. Hagedorn recounts how the spirit mounts a nondescript participant:

> A lanky, sad-looking, middle-aged man occasionally danced in front of the drums, moving listlessly, lethargically. His dance steps belonged to Eleguá, but he executed them without enthusiasm, without continuity. . . . At one point he crouched in the corner of the room, near the drummers, and began to cry, looking around furtively at the other guests. He seemed weak and depleted, out of

place. . . . An electric current passed through the man. He became live, in the same way that a wire becomes live when electricity passes through it—taut, uplifted, energized, his eyes big and bright, with no trace of sadness. He looked as though someone had possessed his body from the inside and was now using his eyes as windows, lighting them up like candles. [Someone] said, "Eleguá has come." (Hagedorn 2001, 77–78)

In this case, the santo-orisha offers guidance about ways of achieving material subsistence in the face of Cuba's crushing shortage of basic necessities.

This tambor illustrates the peculiar shamanic tendencies of Santería practice: A community in need of help seeks to establish direct contact with the spirits, but the entire community must work hard to bring down the deity and keep it active in and for the group's well-being, for its acquisition and management of ashé. Everyone, including the most unlikely community members, must work with and for each other. In response, the Africa-based santo-orishas will reciprocate and work hard for the community, no matter if it is based in the mountains of eastern Cuba, the ports of Havana, Miami, the Bronx, or anywhere else.

TARAHUMARA SHAMANISM (MEXICO)

Despite four centuries of contact with Europeans, the Tarahumara, also known as the Rarámuri, remain one of the most populous and culturally conservative indigenous peoples in Mexico. Numbering around seventy thousand, they are characterized by a spirit of independence, practicality, and resilience. In their own language, which belongs to the Pima-Cora branch of the Uto-Aztecan language family, they usually refer to themselves as "Rarámuri," meaning "human beings," although they also employ the term more specifically as an ethnonym to differentiate them from other indigenous peoples. Because virtually all Rarámuri ceremonies are concerned with healing individuals, communities, crops, or livestock, shamans *(owirúame),* who are usually men, occupy a central place in Rarámuri culture.

Geographic and Historical Background

Situated in the southwestern portion of Chihuahua in northern Mexico, the Rarámuri are dispersed over approximately 35,000 square kilometers of the Sierra Madre Occidental. This area, known as the Sierra Tarahumara, is about half the size of the territory they occupied prior to European contact. Despite a series of uprisings meant to dislodge the foreigners from their country, the lure of rich silver mines, prime grazing lands, and vast stands of timber continued to draw outsiders. Following further encroachments and military defeats in the seven-

teenth and eighteenth centuries, the Rarámuri developed more passive forms of resistance (Levi 2003). The Rarámuri also physically withdrew from their northern uplands and eastern plains to the rougher country located south and west. There they sought refuge in some of North America's most spectacularly corrugated landscape, an area of rugged pine-clad highlands, serpentine canyons, and mile-deep semitropical gorges. The inhospitality of this broken terrain, coupled with the fact that it was virtually inaccessible until the 1960s when the Chihuahua al Pacifico Railway finally penetrated the region, conspired to help the Rarámuri survive into the twenty-first century. Of equal or greater significance, however, has been the Rarámuri's own genius for adapting a culture to the exigencies of this environment and developing a socioreligious system that emphasizes reciprocity, healing, simplicity, and beauty.

Impact of Christian Missionaries

Jesuits entered Rarámuri territory in 1601. Before they were expelled from the New World in 1767, Jesuits established a series of missions among the Rarámuri. Franciscans subsequently assumed control of the ecclesiastical enterprise in the Sierra Tarahumara, and they in turn were replaced by nonmonastic clergy after the missions were secularized in 1859 (Merrill 1993). Neither of these latter groups had much impact on the Rarámuri, who were effectively left in charge of the crumbling adobe churches until the Jesuits resumed missionary activity around 1900. Historically, missionaries opposed the persistence of aboriginal religious beliefs and practices even though Rarámuri selectively combined their indigenous religion with elements of Christianity. Shamanism was particularly frowned upon, since it was regarded as superstitious trickery or devil-inspired sorcery. With the advent of liberation theology, however, Jesuits by the 1970s were increasingly accepting of the Rarámuri's syncretic religion (Velesco Rivero 1983; Robles 1991). Although shamanism is still discouraged, shamans today are at least tolerated by most Jesuits.

By contrast, Evangelical Protestant missionaries, who became active in the Sierra Tarahumara during the second half of the twentieth century, remain staunchly opposed to shamanism in all forms. Protestantism has, however, had little impact. A major impediment to conversion has been the Evangelical prohibition on the consumption of alcohol; thus, given that the ritual drinking of fermented maize beer *(tesguino)* is basic to Rarámuri social and religious life, the new religion has made few inroads. When conversions do occur, they often cause tensions and rifts in the families and communities affected.

Community Organization

Prior to the colonial period, leadership was vested in village headmen. No supra-local organization existed, except during periods of crisis when war captains and shamans became temporary leaders, a strategy for mobilization that continued into the twentieth century. Normally, Rarámuri socioreligious life oscillates between two levels of organization, corresponding to aboriginal and colonial institutions respectively (Bennett and Zingg 1935). During most of the year, Rarámuri live in widely scattered hamlets *(rancherías)* where they cultivate maize, beans, and squash, herd sheep and goats—using the manure to fertilize their fields—and augment their diet by hunting and gathering. In some areas, they move seasonally from the highlands to the warmer canyons during the winter, reversing this pattern in the summer.

In front of each house is a domestic dance patio, or *awírachi.* This household dance plaza is the primary site of ritual activity in the ranchería, becoming a focus of communal celebration whenever a family hosts a ceremony. On these occasions, crosses and pine saplings representing the deities are erected on the dance patio, as well as an altar upon which offerings of food, drink, and various "medicines" *(owáame)* are placed. Large earthenware pots of sacred fermented maize beer are also set before the patio crosses. Whenever possible, shamans officiate in these contexts. The primary rituals performed here are the Yúmari and Tútuburi dances. Both typically involve animal sacrifice and are meant to thank the deities for their bounty or avert their anger and prevent misfortune. Shamans also conduct rites of passage such as birth, death, and naming ceremonies (Slaney 1997). Generally, in the rancherías the ceremonies conducted are fundamentally aboriginal in origin, and religious leadership is vested in local shamans.

The other level of organization centers on the pueblos that were established by the Jesuits during colonial times and the civil and religious offices they instituted to oversee the community. Each pueblo minimally consists of a church, a Rarámuri governor *(siríame),* and his assistants. Rarámuri from the surrounding rancherías periodically congregate at the pueblos on Sundays and certain Catholic holidays, such as Easter Week, when they celebrate elaborate dances and ceremonials combining indigenous and Christian elements. The Catholic holidays celebrated by Rarámuri are associated with the agricultural calendar. Some pueblos also have mestizos, or non-Indians, called *Chabochi,* ("whiskered ones," in Rarámuri) who dominate the region economically, politically, and numerically. Most Rarámuri remain scattered in the rancherías, a fact that also has helped shamanism and its frequently clandestine ceremonies survive—away from the eyes of the clergy and mestizos based in the pueblos (Levi 1999a).

The Jesuits and their pueblos caused a political and religious split among the Rarámuri that endures to this day (Kennedy 1996). The vast majority of Rarámuri are baptized and nominally affiliated with pueblo churches. These people are known either as *pagótame,* meaning "washed ones," or *rewéame,* literally "named ones." About 5 percent of the Rarámuri are *gentiles,* "unbaptized." The latter live in the canyon country and the most remote reaches of the mission districts. Gentiles reject officials in the pueblos and instead have their own authorities. Nor do they attend the pagótame ceremonies and dances held at the churches on Catholic holidays. Nevertheless, even though they repudiate the sacrament of baptism, cemetery burial, and affiliation with the churches, in most other ways the religion and shamanic practices of gentiles and pagótame is virtually identical, especially in the rancherías, where both groups practice the same set of rituals.

Intoxicants and Altered States of Consciousness

Fermented maize beer, called either *batari* or *suwí* in the native language and *tesguino* in local Spanish, is fundamental to Rarámuri society, economy, and religion (Lumholtz 1902). Prodigious amounts of the sacred, mildly intoxicating beverage are consumed at *tesguinadas.* These ritual drinking parties—whether convened for agricultural purposes or curing ceremonies—were vigorously opposed by colonial Catholic missionaries, as they are today by Evangelical Protestants. Yet tesguino, together with the social networks it creates and the symbolism it invokes, is in many ways constitutive of Rarámuri culture (Applbaum and Levi 2003). Whenever the domestic economy requires more labor inputs than are available to single households, a family hosts a tesguinada. This event involves brewing a batch of tesguino and inviting a group of people for a day of drink, celebration, and cooperative labor. In fact, the network of people with which a person customarily drinks during tesguinadas—known as that individual's tesguino network—is the most important unit of social organization above the level of the household (Kennedy 1996, 132).

Tesguino is likewise critical to Rarámuri religion and shamanism. According to one myth, God stood in the middle of the earth and tossed a gourd full of tesguino up and to the four directions. Where the drops fell, Rarámuri sprouted up like corn plants, thereby explaining, say Rarámuri, why they live dispersed to this day. Similarly, no tesguinada can begin without a shaman, or in his absence the host, first offering tesguino to God by going to the dance patio, which represents the world, and tossing a dipperful up and to the cardinal points, thus mimetically reenacting the gestures by which Rarámuri society was originally created. The beverage is indispensable to the shaman and his work, tesguino being the most ubiquitous medicine used in cures. The sacramental beer is not only taken internally, but also is applied by the shaman externally to points on the patient's body where the souls reside.

Given their prestige in the community, which equals or exceeds the pueblo governor as well as the wealthiest man, shamans are almost always invited to tesguinadas. A shaman's eminence is related to the scope of his tesguino network. Thus, when Rarámuri say that a shaman "drinks very far," they are saying that he is a man of renown because he is invited to tesguinadas in distant rancherías. Shamans are honored by being given their own pot of tesguino to allocate to the individuals they wish. Although participants at tesguinadas are supposed to get "beautifully inebriated" *(bayóame*

rikú), shamans are distinguished by their ability to drink yet retain their faculties. In view of the amount shamans are required to drink in their line of work, this attribute is important in allowing them to remain in control of the social scenarios over which they are often presiding.

Some shamans also make use of peyote *(híkuri)* and other hallucinogens, such as *bakánowi*—a term identified with the roots from a variety of plants—to enhance their powers. These plants, which are both ingested and kept as talismans, are conceptualized as highly potent agents with souls in the form of humans. When all other cures fail, people turn to them. They are associated with costly and elaborate nightlong ceremonies and the most revered category of shamans, known as *si'páame,* meaning "rasper." This term derives from the distinctive musical instrument used in the híkuri and bakánowi ceremonies—a notched hardwood stick that is rasped back and forth with another stick, making an eerie sound when placed atop an inverted gourd that functions as a resonator. Bakánowi grows in the western canyons. It is often referred to euphemistically by the names of other plants, since it does not like to hear its name spoken aloud (Levi 1999a). Bakánowi like to sing, and they are very good at imparting healing chants to their owners. Híkuri lives in the high deserts to the northeast of Rarámuri country, and the most renowned peyote shamans likewise come from the eastern part of the Rarámuri's homeland, especially in the vicinity of Narárachi. Special expeditions are undertaken to procure the plant, and it is considered the most powerful, and potentially dangerous, substance in the Rarámuri system of shamanic healing (Bennett and Zingg 1935, 291–295; Lumholtz 1902, 356–379).

Worldview and Cosmology

Combining esoteric knowledge with healing arts, the shaman, termed *owirúame,* meaning "medicine-maker," is at once primary medical practitioner and religious functionary among the Rarámuri. In addition to the pueblo governors, who allude to Rarámuri cosmology in their stylized speeches, owirúame are the primary sources of expert knowledge concerning the belief system. Shamans expound the Rarámuri worldview in their curing chants, ritual actions, and consultations with patients. They also claim direct knowledge of these matters, having conversed with the deities and spirits, tracked lost souls, and traveled to distant parts of the universe in their dreams and visions.

Rarámuri worldview is predicated on maintaining relations of balanced reciprocity among cultural, natural, and supernatural orders of existence. Rarámuri shamans stand at the intersection of these dimensions of reality. The relations of reciprocity that the Rarámuri hold as the norm in their transactions with each other also serve as the model for their relations with supernatural entities. Chief among the forces that must be kept in balance are relations among souls, God, the devil, and other supernatural beings such as the Peyote People *(Híkuri),* Rainbow People *(Konemí),* Storm People *(Ukwí),* Whirlwind People *(Ripibíwiri),* Flying Demons *(Uríbe),* and River Snake Monsters *(Rikomí).* God, known as Onorúame, "One Who is Father" is associated with the sun, and his wife, Eyéruame, "One Who is Mother," is linked with the moon. Rather than conceptualizing these as separate deities, some shamans speak of them as if they were complementary aspects of a single divinity conceived of as both father and mother and referred to as *Omá Newarúame* (Creator of All) or *Omá Umerúame* (Almighty). This Rarámuri conception of the creator as a dual-gendered Father-Mother is reminiscent of Ometeotl, the ancient Aztec God of Duality, who similarly is both male and female and who, like Omá Newarúame, created the cosmos. God's older brother is the devil, who is also married. God is said to be the father of the Rarámuri, just as the devil is regarded as the father of the *Chabochi*, non-Indians.

The Rarámuri believe the cosmos is composed of multiple layers, described as disks called *namókame,* a word related to the verb *namoma,* which refers to placing things on top of each other. Some Rarámuri therefore say the cosmos looks "like a stack of tortillas." Most believe there are three levels below the surface of the earth *(wichimoba),* as well as three levels in the upper world, making seven planes in all. God lives on the highest level above. According to Rarámuri, this place looks much like the Sierra Tarahumara, while the devil lives on the lowest plane of the Underworld, a land of darkness lit only by fires and small lights. In the center of the sky there is a hole *(nasipa iwáame)*

that allows souls to move back and forth between the planes when people die, dream, or become inebriated. When Rarámuri die, their souls go above to be with God, just as the souls of dead Chabochi go below to be with their father in the Underworld. Located at the cardinal points around the periphery of the world are four pillars *(tona)* that support the planes of the universe. These columns are watched over by *gentile* shamans, whose souls guard the pillars in their dreams. Some Rarámuri add that the world is prevented from tilting and kept firmly in place by *pagótame* shamans.

Myth and Belief

According to Rarámuri cosmogony, the world was created and destroyed several times before the present. Earlier creations were characterized by social and physical upheavals. Earthquakes and floods beset earlier epochs. Evil giants roamed the earth. People lacked domesticated plants and animals, were ignorant of ritual knowledge, and practiced cannibalism and ceaseless warfare. God destroyed these creations in various ways, causing boiling rain to pour from the sky and making the sun pass very close to the earth.

Rarámuri myths detail how the world came to be the way it is, account for the differences between peoples, legitimize inequalities, and valorize shamanic practices. When God and his elder brother decided to make people, God fashioned his figures from clay, while the devil made his from ashes. The former became the Rarámuri; hence they have the color and qualities of the earth—generous, quiet, and enduring. By contrast, the latter became the Chabochi, who, like ashes, are not only light in color but are best kept away—denoting filth and fiery dispositions, danger and death, separation and boundary. These symbolic associations derive from quotidian affairs. As farmers, Rarámuri conceptualize the soil as a source of goodness and fertility, whereas ashes in daily life are viewed disparagingly as dirt, a waste product from evening fires that must be cleared away from morning hearths. Not surprisingly, ashes also figure prominently in funerary rituals designed to separate the living from the dead, and also as a medicine employed by shamans to keep away evil forces. Given these symbolic contexts, it is logical that ashes have apotropaic (warding off evil) functions in Rarámuri shamanism.

Other shamanic practices are reflected elsewhere in the myths. Continuing the myth mentioned above, God made his figures come alive by blowing *(iwítia)* on them. The devil, however, was unable to animate his figures, so God blew life into them. Salient here is the fact that an important technique used by contemporary shamans to cure their patients is to blow on them, thus replicating the means by which God imparted his strength and soul to the First People. The conceptual interconnection between life, breath, soul, and strength manifested in Rarámuri myth and ritual is even reflected linguistically. In the Rarámuri language the word *iwériga* not only means "soul" but also "breath" and—together with the word *iwérari,* meaning "strength," and *iwérasa,* a shout of encouragement to dancers and footracers meaning "have stamina"—forms parts of the same paradigmatic set (Merrill 1988, 95).

Training

Although shamans say that they learn their curing chants directly from God and other supernatural beings, they learn their actual craft by apprenticing themselves to master shamans. The latter usually teach members of their own family, although it is not uncommon for those who are not relatives to learn also. The apprentice, who feels himself called to the healer's art by God—having experienced the same dream on multiple occasions or watched his own soul move about—starts by being told to observe his dreams and control the wanderings of his soul. During this time he assists the master shaman with his curing ceremonies, and the two are often seen together. After several years the apprentice may begin curing on his own, but this trial period is also risky, for should he fail to effect cures the apprentice could be accused of misusing his nascent powers. The more senior the master shaman is, the more likely the apprentice also will enjoy a good reputation.

Treatment Protocol and Types of Practitioners

When Rarámuri become ill, they first try home remedies. If these fail, they will consult a shaman, who questions the patient about the nature of his illness. The shaman's first recom-

mendations are herbal remedies. Since Rarámuri country ranges from tropical gorges to pine-studded highlands, shamans have an extensive pharmacopoeia from which to draw; nearly 300 different botanical species have been identified as medicinal plants (Bye 1985). Purification techniques involving sweating as well as bathing in the fragrant smoke of cedar *(Cupressus arizonica)* are also employed. If these procedures do not work, a more serious illness, involving an affliction of the soul and requiring complex ritual, is suspected.

Conceptions of the soul are central to the worldview of the Rarámuri and to Rarámuri shamanism (Merrill 1988). All humans have multiple souls: men have three large souls and women have four. Rituals associated with men are performed three times and those for women four times. Large souls are located in the head and upper torso. Both sexes also have numerous small souls situated throughout their bodies in their extremities and joints. It is primarily through communication with souls that Rarámuri shamans affect their cures. Illnesses, especially grave ones, come about when a person has lost one or more of his or her souls. A soul can be knocked out of a person if the individual is frightened, falls, or fights. Souls also can be lost when people dream, since dreams are understood as authentic perambulations of the soul. Human souls can be endangered by contact with witches and other powerful spirits.

Shamans cure by restoring the lost or weakened soul. While dreaming or meditating, the shaman sends his own powerful soul to search the universe for the patient's missing soul. If the soul cannot be captured in this manner, additional healing is required in the form of a curing ceremony. These rituals entice the lost soul to return home through the use of medicines and symbols connoting beauty, strength, and goodness. They also propitiate greedy, powerful beings to release the soul by offering the supernatural food, tesguino, and the meat of sacrificed animals. These medicines and offerings are placed before the patio crosses on the domestic dance plaza (awírachi). If the curing ceremony is taking place inside the house, the shaman or his assistant circles the awírachi with food or drink before administering them, usually feeding the patient as if he or she were a baby.

Chanting, dancing, and ritual reciprocity are integral to curing ceremonies. They model basic axioms of Rarámuri worldview: the primacy of balanced exchange, the contiguity of moral and cosmological orders, and the unity of ethics and aesthetics, health and harmony (Levi 1999b). Because exposure to that which is *chati*—"bad" or "ugly" (both physically and morally)—can cause illness, conversely contact with things deemed *semati*—"beautiful," "clear," "good"—is the way to heal. Curing chants thus make frequent use of the word semati. The chants describe landscapes of height, beauty, and power. They depict beautiful ceremonies atop mountains, the rising sun cresting a ridge at dawn, and the third level of heaven, home of God, source of magnificence and health. Vigorous dancing by the shaman, patient, and others in the curing party demonstrates strength and the embodiment of power. The rituals conclude with the shaman giving thanks to God and those assembled formally drinking tesguino from the vessel that was a focus of the ceremony; those assembled drink in an order reflecting their social proximity to the patient. The shaman then converses privately with the patient, giving instructions on what to do in the coming days in order to recover.

Because there exists a dynamic equilibrium among different orders of reality, plants, animals, and humans all participate together in idioms of health and illness. Well-being is based on harmony, and shamans are charged with the responsibility of securing this encompassing wholeness through their curing ceremonies, which prevent as well as alleviate illness. Since "curing" something and "caring" for something are closely allied concepts in the Rarámuri worldview (Merrill 1988, 137), crops, livestock, and people all require periodic curing ceremonies and are healed in similar ways—curing ceremonies for humans often extending out into corrals and fields.

Witches *(sukurúame)* are the malevolent counterpoint to shamans. Rarámuri are very afraid of witches and frequently, albeit guardedly, make witchcraft a topic of conversation (Pastron 1977). People accused of witchcraft typically exhibit behavior that is aberrant according to Rarámuri mores, such as hoarding food or other goods, rather than sharing the items with other community members (Passin

1942). Witchcraft accusations are serious and serve as a means of social control. Witches are said to attack the souls of people and livestock, especially when they sleep. Often this is accomplished when they send the evil beings known as *orimá* and *risagíki* to assault their victims by eating their souls. These evil beings are described as birdlike creatures, invisible except to the witches who send them and the shamans who battle them, either in their dreams or by tossing ashes or crushed chili peppers in their direction. Witches also cause people to become ill by sending small objects, such as maggots or rocks, into their bodies. People afflicted in this manner must go to a special type of shaman, known as a *waníame,* who expels the disease object by sucking it out of the patient's body using a reed tube. The intrusive object is shown to the patient, thereby demonstrating that the victim is healed. Another type of specialist, mentioned above, is the si'páame, the peyote shaman or "rasper." The latter are the most highly regarded shamans among the Rarámuri and may be supported entirely by their profession. A third type of religious practitioner, who is not necessarily a shaman, is the *sawéame,* "chanter," who intones wordless chants with a handheld rattle *(sawára)* for hours on the dance patios (awírachi) during Yúmari and Tútuburi ceremonies.

The rasping instrument identifies the si'páame, the sucking tube the waníame, and the rattle the sawéame; other artifacts are associated with the owirúame, or general-practitioner shamans. Chief among these is the cross *(kurasi).* Just as tesguino is the most basic medicine, so crosses are the most basic curing devices used by shamans. Crosses are referred to metaphorically as sunflowers *(sewáchari)* in ritual language. This is significant because flowers symbolize spiritual power and divine fire in many Uto-Aztecan languages (Hill 1992). The shaman's curing crosses either may be small homemade wooden crosses constructed individually for each cure and left with the patient at the end of the ceremony to apply to the afflicted parts of the body as an aid to recovery, or they may be metal crucifixes *(sukristo)* attached to rosaries acquired in trade from Chabochi and reused in different ceremonies. Shamans frequently blow their breath over a cross onto the person they are healing. Crosses also are involved in the practice of *uchémera,* the anointing or pressing of medicinal liquids, chiefly tesguino, to the head, chest, back, arms, legs, and joints—the parts of the body where souls reside. Among other "medicines" used by shamans in ceremonial cures are ashes, crushed chili peppers (*Capsicum* spp.), red ochre, corn meal, a solution of water and cooked hearts of maguey (*Agave* spp.), native tobacco *(Nicotiana rustica),* and the powdered wood of *Buddleia cordata,* whose stench keeps away serpents and other malevolent spirits, just as the fragrance from *morewá*—a prized substance manufactured by wasps from the sap of various species of *Bursera,* which Rarámuri use as incense—attracts blessings and the favorable countenance of God.

Functions

Rarámuri shamans perform social, psychological, and spiritual functions. As medical practitioners who cure via religious modalities, they intercede on behalf of individuals and whole communities with supernatural beings, averting misfortune and restoring health. According to Rarámuri disease etiology, shamans cure by recovering lost souls, a practice that in psychological terms returns a sense of wholeness to fractured selves. When drought or other calamities plague Rarámuri farms, shamans perform ceremonies that seek blessings for the entire community. Emphasizing Rarámuri ideals of sharing, harmony, and mutuality, shamans encourage people to gather more often for rituals to make offerings to the deities, reminding them that every animal sacrificed for ceremonial purposes and eaten in a communal feast will be given back to the owner on his farm in the afterlife. The function of the shaman, therefore, is to bring about wholeness in the broadest sense, not only of individuals but also communities, and not only humans, plants, and animals but also the organic unity between all of them and the spiritual order. The idea that the shaman's work brings about wholeness is even expressed linguistically. The generic word for "ceremony," all of which are healing rituals in some sense, is omáwari. This term derives from the word *omá,* denoting "all," "complete," "unimpaired"—in a word, "whole."

Shamans make things whole during omáwari by symbolically realigning relations of reciproc-

ity that have become unbalanced. Whatever else may be going on in the spiritual dimension, in terms of social analysis, this means diagnosing and repairing damaged social relations between the patient and others in the community. Factions or strained relations in the community may be impinging on the patient, and these tensions can become manifested in the body as illness (Levi 1999b). The shaman cures by making the patient a subject of concern and sympathy, drawing together family and friends in cooperative ritual. Curing also requires that patients assume responsibility for their recovery by becoming active participants in their own healing. Patients are therefore enjoined to assist with the ceremony, correct any behaviors that violate Rarámuri mores, anticipate signs of returning strength in both dreams and waking life, and gradually demonstrate recovery by again becoming functioning members of society, participating fully in the give and take of social life. In this way, both individual and community are mutually healed and rendered whole.

TOBA SHAMANISM (ARGENTINA)

The Toba carried out a nomadic, hunter-gatherer way of life until the Argentine army conquered and colonized the Chaco region in the late nineteenth century. In this context, the Toba and other indigenous groups of the region were forced to settle down, becoming peasants. Traditionally they practiced a form of shamanism characterized by the quest of auxiliary spirits. After the introduction of Pentecostalism in the 1940s, Toba shamanism began to incorporate Christian elements. This entry is based on the author's own observations and the anthropological literature of the area.

Background

The Toba, or Qom, live in the Chaco region, a more or less woody subtropical plain located in northeastern Argentina, close to the Paraguayan border. Currently they live in the provinces of Formosa, Salta, and Chaco. There are also important migrations to the south, mainly to cities such as Rosario and Buenos Aires. Two major groups of Toba peoples can be identified—western and eastern—and there are historical, linguistic and cultural differences between these two groups. This article deals with the eastern Toba, who inhabit the eastern sectors of Formosa and Chaco provinces, and number about 20,000 individuals. Western Toba number about 1,500. Argentina's total indigenous population is estimated at 300,000, a bit less than 3 percent of the country's total population.

The Toba use the term *Doqshi* (whites, Christians), to refer to nonindigenous individuals. Interestingly, although the word *Qom* refers to themselves, sometimes its meaning may include other neighboring indigenous peoples, and from a more general perspective, all native groups of the world.

The Toba, as well as the Pilagá and Mocovi peoples, speak a language of the Guaykuruan linguistic branch. Until the late 1880s they lived as hunting-gathering nomadic bands migrating seasonally throughout a more or less enclosed territory. Bands comprised groups of extended families of bilateral descent. There was a sexual division of labor; women gathered, prepared food, and took care of the children; men hunted, built houses, and went to war against indigenous enemies. Leadership was based upon heritage and personal charisma, mainly shamanic and political skills. Political authority was maintained not by coercion but by consensus, and an orientation toward the group was the rule; the socioeconomic system was based upon reciprocity. War was launched against traditional rival groups like the Maka (Matako-Maka) from Paraguay or the Mocovi, competing basically for the control of natural resources, territory, and captives.

After the military conquest undertaken by the Argentine armed forces in the 1880s, the Chaco region was opened for colonization by national and foreign colonists, chiefly from western and central Europe. Colonizers occupied former native lands, establishing lumber mills, farms, and small shops. Indigenous peoples, among them the Toba, were forced to move away from their territories to live either scattered throughout the region or settled in state-sponsored reservations and Catholic missions. The federal government funded them to "help" the task of introducing "civilization" to the natives, perceived as "savage," "pagan," and "lazy" by white society. For that reason, the arrival of colonists radically changed the Toba way of life, introducing Western forms of labor, mainly agriculture and cattle raising, and time-scheduled activities. Migration to sugar mills located in eastern Chaco province (Las Palmas) or in Salta and Jujuy provinces (Tabacal, and La Esperanza) were also byproducts of this process. As a result, the Toba gradually became "workers" instead of hunters.

While the socioeconomic system went through important changes, religious beliefs and practices changed at a slower pace. Indeed, shamanism was a vital force in leadership, social control, and healing until the late 1950s, when European and North American missionaries appeared in the area. As an indirect consequence of foreign Protestant missions in the area, the Toba organized churches of their own, which embodied a native reading of Christianity, influenced by the indigenous worldview and shamanic ideology. Many former leaders

became pastors, and they started to oppose shamanism. Nevertheless, shamans *(pi'ioGonaq)* continued in their careers, though under heavy cultural criticism. In this conflicting context, today there are new young shamans who have been church leaders in the past.

Present-day Toba live in communities that emerged out of the settlements depicted above. They are mostly rural, but migration to towns and major cities of the region and elsewhere have produced a growing number of what are called *Barrios Toba* (Toba Neighborhoods). Rural settlements vary in size from 100 to 20,000 hectares, according to historical contingencies. Urban barrios are very small. In all cases, population runs from 120 to 5,000 individuals. Land is owned communally in the rural areas, recognized by recent national and provincial laws concerning indigenous issues. In urban sites, either communal or individual ownership can occur.

In rural communities such as La Primavera (Formosa province) or Colonia Aborigen Chaco (Chaco province), remnants of former bands live together, at times following old patterns of alliance. However, in terms of spatial disposition, houses and farm fields are grouped following the boundaries of extended families and allied groups. The economy of current Toba communities rests upon agriculture, cattle, and work for wages in white neighboring farms, towns, and in jobs paid by the government. More recently, the elaboration of crafts has become an important source of income.

Shamanic Worldview

The Toba have traditionally conceived of the universe as a series of superimposed layers traversed in the center by a pole or stick. They are inhabited by different kinds of nonhuman beings (generically called *jaqa'a*), regarded as "owners" of the natural and social world (plants, animals, climate, and also activities). The layers they recognize are earth *('alwa),* underneath *(ka'ageñi),* and several skies further above *(pigempi).* Within the earth plane, they identify different domains, such as forest *(hawiaq),* field *(ne'enaGa),* palm grove *(chaesat),* water *('etaGat),* and night *(pe).* To accomplish any activity, humans have to have contact with these beings, mainly through dreams *(lchoGon),* but also in specific daylight contexts, such as daydreams *(loGok)* and personal encounters *(nachaGana).* With the introduction of Protestantism the cosmological map underwent some conceptual changes; the "old" powerful beings came to be labeled as demoniac and located in the earth and in realms beneath the earth. The new nonhuman beings, such as God and Jesus, were (and are) seen as living in the realm of sky, the place of positive and benevolent beings.

In Toba mythology the work of the Cultural Hero *(Ta'anki')* is associated with shamanic skills, which imply knowledge and power to deal with the forces of nature. In earlier times, humans had animal shape, and the world was radically different from the present. Catastrophes caused by fire and water signaled the end of mythical time. Afterwards, human beings as we know them today appeared, and the world acquired its current properties and geographical features: among others, illness, suffering, and death. Ta'anki' provided accurate knowledge, through shamanic techniques, to treat the newly human, but somehow weak, condition.

Becoming a Shaman

Basically, shamans (who may be either male or female, although the former are more numerous) are initiated mostly through a series of dreams in which nonhuman beings approach and contact the dreamer. If the dreamer wishes to accept the offering of power, beings such as NwaGanaGanaq, the "Owner of Palm Grove," can grant them power (*haloik*) to have certain control and understanding of the living species of that area. Haloik also implies skills to heal and to harm people, because for the Toba the nature of haloik is ambiguous and cannot be reduced to a simple good-evil dualism.

Other contexts of initiation derive from daydreaming and personal encounters with nonhuman beings, which proceed, generally, the same way as in dreams. Finally, a shaman can introduce saliva containing shamanic power into some relative's mouth. Gradually, people experience changes, mostly in dreams, when they start receiving the proper teachings to become shamans. In all cases, shamanic power implies close links with nonhuman entities, mainly from two categories. The one, and hierarchically superior, is called *ltaGaiaGawa,* "(spiritual) helper" or "partner"; the other is called *lowanek,* "vigilante" or "collaborator." Lowanek

usually reside within the shaman's body, playing the role of "guards" protecting the shaman from any attack that originated in other shamans, maintaining the shaman's health, and also, when sent to another person, producing illness. LtaGaiaGawa, in turn, usually live outside the person's body, and play a major role in the knowledge the shaman will have about illness, therapy, sources of food in hunting and gathering, or the fate of crops and related activities.

Shamanic Healing

For the Toba illness is never a natural fact; it is always produced by some harmful shaman, or by non–human beings. In the past, illness was related to the violation of food and behavioral taboos during critical stages of life (i.e., pregnancy, birth, child rearing, menstruation, mourning). In this case, the Toba thought that animals could punish the violators or their families, producing diseases that shamans had to treat through hard negotiations with these animals' owners.

Social recognition of the shamanic condition is a gradual process involving a series of successful healings. Currently, news circulates about the success of shamans both among the Toba and the white people, and usually there are no interethnic tensions with regard to curing diseases, at least in the rural areas. Shamans usually combine praying, blowing, sucking, singing, and laying on of hands as their main therapeutic techniques. They also receive key information about a patient's illness from their ltaGaiaGawa, who communicate with them in dreams or during the therapy itself, as a concrete partner in the healing session. Therapy involves several sessions, held during or after sunset; however, in cases of need it can be carried out anytime. Currently, shamans do not use specific ritual artifacts. Back in the early 1960s they still used gourd rattles and sometimes small drums to perform their rituals. There exists the idea that shamans themselves are their own "instrument" of therapy through their techniques and bodily fluids (saliva, mucus). When a sick person shows up at a shaman's house, he makes the patient comfortable by asking what the problem is. With that information, he starts calling his ltaGaiaGawa through songs or prayer. Once the communication is established, he uses his hands to locate the disease, which sometimes smells "like a snake." Then he blows and sucks while singing to communicate with the harmful agent inside the patient's body. Once the agent is identified, the shaman has to persuade it to leave the body. After discovering the identity of the evil agent, which is usually a lowanek sent by another shaman, he proceeds to extract it by a series of deep suckings and blowings. The session ends when the harmful lowanek is shown to the occasional audience in the guise of a jelly–like, gray substance, a pebble, or a small wooden stick. Generally, shamans can extract from sick persons only those lowanek that live in their own bodies. Each successful healing strengthens the shamanic power and social prestige of the healer.

Shamanic Power

Toba shamans have very busy nocturnal lives because it is during the night that they compete with others for power, since shamanic power is not infinite. For that reason, shamanic power is always subject to gains and losses due to successful or failed healings; it also occurs during contests called *ñi'igena.* In them, shamans try to test their competitors' power, perceived during the night as a power field of light. If one shaman cannot approach the other's power field, it is a proof of weakness. In other contexts, shamans throw each other bright "rays" of light or stonelike objects named *pon,* which, if not stopped, will mean an important power drain. Although shamans are respected—and also feared—their life is difficult.

Shamans have the skill to take conscious control of dreams. For that reason, either during their contests, or when carrying out their nightly "walks" to find information about sick persons, they can project their consciousness into their ltaGaiaGawa, the auxiliary spirit. It is their ItaGaiaGawa who travel through the space of night, which the Toba regard as a true cosmological realm, with plenty of danger, uncertainty, and scary creatures.

Among the Toba the possession of haloik does not always involve the shamanic condition. Indeed, all humans, in order to perform their activities, must have a relationship with nonhuman beings, a relationship that provides them with a certain amount of power and

knowledge. Thus they gain the skills to be good hunters, harvesters, gamblers, lovers, soccer players, and so on. This association takes place in dreams, in which the owners usually teach people how to carry out specific tasks. Ordinary people, however, can neither heal nor harm, nor can they control their dreams as the shamans do.

Shamanism and Christianity

The Iglesia Evangélica Unida (IEU), the only Toba native church in Argentina, has incorporated ritual symbols from Protestant Christianity. One could describe the process as condensing ancestral shamanism within a Christian language and ritual. For example, IEU religious services, called *culto* (cult), have the same formal steps as any evangelical service. In healing, however, they use the shamanic techniques described above, although now in many cases believers understand illness as a divine punishment for a sinful life. Through a critical evangelically oriented reading of the past, sins are commonly linked to pre-Christian customs. Toba churches also gather together extended families and allies, under the leadership of a pastor. Often, a community has as many churches as extended families living there. A good church is one whose pastor is a successful healer, for every church must be a place where there is power. If not, people will quit and go somewhere else. In this sense, church membership is dynamic and temporary.

Pastors and shamans also have a political role in contemporary Toba communities, which they share with members of the younger generation whose status is based on their schooling experience and knowledge of Spanish laws. All have to deal, one way of the other, with white officials on behalf of their constituencies.

Overview

EUROPE

Europe is defined as the large landmass west of the somewhat artificial division from Asia marked by the high Himalayan plateau and separated from the African continent to its south by the Mediterranean Sea and, to a lesser extent, in the eastern regions by the Black Sea and the narrow Bosporus and Sea of Marmara. At both the Bosporus and the Straits of Gibraltar the separation from Africa becomes negligible. The original inhabitants of Europe were foraging peoples, probably as early as one million years B.C.E., composed of migrants from northeastern Africa. The earliest evidence of human life is Homo erectus, dated to 850,000–700,000, followed by Neanderthals around 50,000. Evidence of their culture is found in cave paintings, such as those at Lascaux in France and Altamira in Spain, which have been seen as suggesting that shamanism was involved in the hunt; moreover, carvings and figurines of corpulent females from this period, such as the Venus of Willendorf in Austria, indicate a role for a goddess of fertility as the mistress of beasts.

The art of agriculture spread from Mesopotamia first into the Balkan region and the Aegean islands, bringing with it a different mode of settled living, which led to the establishment of urban centers and a new version of the goddess as presiding over vegetative renewal, adapted from the Mesopotamian cycles of annual drought to the recurrent cycle of seasonal winters. Around 1800 B.C.E., a new people, conveniently termed the Indo-Europeans, began migrating from the central Asian highlands, perhaps bringing with them Siberian techniques of shamanism, and assimilated the indigenous populaces, imposing their own language and tradition of male dominance, as seen in sites such as Knossos on Crete and Mycenae on the Greek mainland. From these beginnings came Greek civilization, which, after it evolved into the classical culture of the fifth century, was spread through the conquests of Alexander the Great to the rest of eastern Europe (as well as into Asia Minor and beyond). This Hellenized world was assimilated by the rising political power of Rome and became part of its empire.

The Romans (or Latini) themselves, were a branch of these same migrating Indo-Europeans, who displaced the earlier inhabitants of Europe. These earlier inhabitants were marginalized, but they persisted with their languages and religions in the north as the Finno-Ugrians (ancestors of the present-day Hungarians, Bulgarians, Ostyak and Vogul peoples, Lapps, Estonians, and others) and in the mountains of the Pyrenees as the Franco-Cantabrians, now know as Basques. The Roman Empire spread Greco-Roman culture through much of Europe and the British Isles, though less completely at its frontiers. With the conversion of the Emperor Constantine in the fourth century and the removal of the capital from Rome to Constantinople, the part of Europe that was part of the Roman Empire began to become Christianized.

During the period of the decline and fall of the Roman Empire in the west, the Germani, whom the Romans had considered barbarians, or "wild men" *(feri),* and had never been able to conquer, descended upon the south into the Mediterranean lands and established centers of their own. The most important of these people were the Goths, Vandals, Suebi, Franks, Alemanni, Burgundians,

and Lombards, all of whom eventually accepted Christianity and the Roman culture that went with it.

As for those they conquered, it had been mainly only the urban centers that had been deeply influenced by the conversion of the Roman Empire to Christianity. Just as the old religions continued beyond the borders of Rome's control, in the most northern and eastern fringes of Europe and in Ireland, so they continued in rural environments in the rest of Europe among the "country folk," the *pagani,* whence the pejorative designation of the old religions as paganism. Eventually the official religion of the whole of Europe, including the country regions, was Christianity, but in many ways it was a Christianity shaped by the religions it defeated; many of the customs surrounding Christmas, for example, are of pagan origin. Pagan myths and beliefs also survived unnoticed in folktales and festival rites, as noted in "Russian Folklore and Shamanism." Sometimes, as with Iceland's late adoption of Christianity in the tenth century, the official conversion of the country served the purpose of commercial integration with the dominant mainland culture, rather than reflecting a true change of faith.
